Superior Ready Mix Concrete
Mr. Arnie Veldkamp
1508 W. Mission Road
Escondido, CA 92029

Subject: Limited Groundwater Investigation Report, Proposed Otay Hills Quarry, Case Numbers: P04-004, RRP04-001

Dear Mr. Veldkamp:

AECOM is pleased to present you with this modeling and analysis report of water in the proposed Otay Hills Quarry located in the San Ysidro Mountains in southern San Diego County, California. The field work, modeling and analysis, and this report were completed in accordance with our contract dated July 14, 2011 and the County of San Diego letter dated June 14, 2011.

The proposed pit may extend to an elevation of 100 feet above mean sea level if water conditions allow. The area of the top of the pit is planned to be about 88 acres (see Figure 1). At the conclusion of mining the pit will be backfilled and reclaimed. Water demands for processing aggregate, dust control and concrete mixing have been estimated at 75 acre-feet per year (afy). This water is expected to originate from municipal sources. However, where there is water accumulated in the pit, the operations would utilize these sources so long as they met water quality standards for the intended use (e.g., concrete mixing).

A land use analysis for the small tributary basin has been prepared by EnviroMINE and is included as an attachment to this report. The analysis concludes that there are no groundwater-dependent homes in the basin, nor are any expected to be developed under the current General Plan. As discussed with the County Groundwater Geologist, because there are no groundwater-dependent homes in the surrounding basin nor are there likely to be any at basin buildout; this project is *not* subject to the County Groundwater Ordinance.

Water Quality Sampling

On September 15, 2011, Stehly Brothers Drilling purged approximately 1.3 well volumes (1,179 gallons) from an existing well located on assessor's parcel number (APN) 648-050-14 near the northern boundary of the proposed excavation (labeled Well 5 on Table 3 below and Figure 1).

AECOM recorded the pH, temperature, oxidation reduction potential, conductivity, and dissolved oxygen until the readings substantially stabilized. The final recorded field measurement of the well purge water is presented in Table 1 below.

Table 1: Final Field Measurement of Well Purge Water

Parameter	Reading	Units
pH	7.17	pH units
Temperature	26.74	Degrees Celsius
Oxidation Reduction Potential	153	Millivolts
Conductivity	3.92	Millisiemens
Dissolved Oxygen	5.65	Milligrams per liter (mg/L)

Based on these field measurements of the development water, the water is in an oxidizing condition.

Following purging, the well was sampled and the samples were transported to Test America under chain-of-custody procedures and analyzed for:

- General Minerals: bicarbonate, carbonate, chloride, chemical oxygen demand, nitrate (as N), phosphate, sulfate, total dissolved solids (TDS), cyanide, and sulfide
- Dissolved metals (antimony, arsenic, barium, beryllium, cadmium, calcium, chromium, cobalt, copper, iron, lead, magnesium, manganese, mercury, nickel, potassium, selenium, silver, sodium, thallium, tin, vanadium, and zinc) by EPA Series 6000/7000.

Dissolved metals samples were filtered by the laboratory to remove particulates. Results are summarized in Table 2 below. Complete analytical results are presented in Appendix A.

Table 2: Groundwater Sample Analytical Results

Analyte	Concentration (mg/L)	Analyte	Concentration (mg/L)
Dissolved Metals		General Minerals	
Antimony	Non-detect	Alkalinity, total (as CaCO ₃)	260
Arsenic	Non-detect	Alkalinity, bicarbonate	310
Barium	0.017	Carbonate	Non-detect
Beryllium	Non-detect	Hydroxide	Non-detect
Cadmium	Non-detect	Chemical oxygen demand	Non-detect
Calcium	160	Chloride	900
Chromium	Non-detect	Cyanide – total	Non-detect
Cobalt	Non-detect	Nitrate-N	0.18
Copper	0.032	Orthophosphate – PO ₄	Non-detect
Iron	Non-detect	Sulfate	200
Lead	Non-detect	Sulfide	Non-detect
Magnesium	81	TDS	2,200
Manganese	0.072		
Mercury	Non-detect		
Nickel	Non-detect		
Potassium	4.2		
Selenium	0.024		
Silver	Non-detect		
Sodium	520		
Thallium	Non-detect		
Tin	Non-detect		
Vanadium	Non-detect		
Zinc	0.1		

mg/L: milligrams per liter

Non-detect – analyte not detected above reporting limit

Water Balance Model

AECOM prepared a monthly water balance spreadsheet model for a 30-year period taking into account the worst-case periods of past rainfall (i.e., 1977 to 1980 and 1992 to 1998 as identified by the County) to estimate the amount of water that would be anticipated to accumulate within the pit.

The water balance considered monthly inflows from direct precipitation, runoff from the tributary basin, and groundwater inflow from sidewall seepage (provided the level of water in the pit was below the recent static water level). Outflows considered included losses from surface water evaporation and the use of water for site operations (assuming all site usage was from groundwater). When inflows exceeded outflows the net water was considered to be accumulated water in the pit.

Inflows

Direct precipitation was estimated by multiplying the nearby Lower Otay Reservoir monthly rainfall data and the area of the top of the pit (88 acres).

Measurements of runoff from stream gauging stations provide the most accurate depiction of runoff occurring within a given watershed. Since runoff records are unavailable for this small watershed, runoff was estimated. The United States Department of Agriculture (USDA) Soil Conservation Service (SCS) developed the Curve Number Method which considers the hydrologic soil group and land use type in determining an antecedent runoff condition (USDA, 1986). The technique is based on a simplified infiltration model of runoff and empirical approximations. The method is based on selection of a curve number that has been developed by empirically rating the hydrologic performance of a large number of soils and vegetative covers throughout the United States. The type of land use dictates the amount of impervious cover and greatly influences the ability of water to infiltrate the soil surface. While the method was designed for a single storm event, it can be scaled to find average monthly runoff values.

Runoff curves were developed for various combinations of hydrologic soil groups and land uses (County of San Diego General Plan Update Groundwater Study. 2010). Runoff from the contributing watershed was calculated by multiplying the area of the small basin draining to the proposed pit and monthly contributing runoff using the SCS equation below:

$$Q = (P-I)^2 / (P-I+S)$$

Where:

Q = monthly contributing runoff (inches)

P = monthly rainfall (inches reported at the Lower Otay Reservoir)

S = runoff factor of 2.05 (calculated as [(1000 / CN) - 10])

I = initial abstraction of 0.41 (estimated as 0.2 * S)

CN = curve number for hydrologic soil group (estimated as 85 per email conversation with Chang Consultants).

Groundwater inflow from sidewall seepage into the pit was calculated by multiplying the area of the pit (below the recent static water level) with the assumed hydraulic conductivity and an assumed hydraulic gradient of 1 ft/ft. The actual hydraulic gradient is likely underestimated when the water level in the pit is significantly lower than the static water level but more closely approximates the gradient when the water level in the pit is near the static water level,

On the other hand, the small contributing basin and low storativity of the bedrock would potentially result in significant declines in groundwater levels surrounding the quarry pit. These lower groundwater levels would reduce the hydraulic gradient and may strand shallow water-bearing fractures. These would both likely result in lower groundwater inflows to the quarry pit and therefore lower water levels in the pit as compared to those estimated by the spreadsheet.

Outflows

The standing water surface area in the pit will vary depending on geometry and water level in the excavation. A lookup table was constructed which estimated this surface area. Losses from surface water evaporation were calculated by multiplying the surface area with the potential evaporation recorded from the Lower Otay Reservoir. Assumed water use for site operations was 75 (afy).

The bottom of the proposed excavation is proposed to be approximately 100 feet mean sea level (msl). At the time of drilling the static water level in Well 5 was reported at about 300 feet below ground surface (bgs). The ground surface at the well was estimated to be about 670 feet above mean sea level based on inspection of the USGS topographic map. Therefore the static water level in the area is estimated to be approximately 370 feet msl. The direction of groundwater flow is assumed to be generally from the east to the west.

AECOM relied on reported well yields from the five known wells drilled in the vicinity of the proposed pit. Note that the other 4 wells were abandoned and grouted at the time of drilling. As discussed above, Well 5 was purged and sampled by AECOM. The median and mean estimated well yields of the five wells are approximately 4 and 7-1/2 gpm, respectively. Discounting Well 3 - due to a shallow, and possibly perched, water table - the mean of the remaining 4 wells is roughly 4 gpm. The location of Well 5 is shown on Figure 1. The exact locations of the other 4 wells are hard to determine based on the sketches provided by the driller, but they are reported to be located in the general area of the proposed pit. A summary of the reported well yields is provided in Table 3 below:

Table 3: Reported Well Yields

Well Name	Assessor's Parcel Number	Total Depth Drilled (feet bgs)	Reported Well Yield (gpm)
Well 1	648-050-16	1,513	4
Well 2	648-050-16	1,360	10
Well 3	648-050-16	1,010	20 ¹
Well 4	648-050-16	1,010	2
Well 5	648-050-14	1,013	0.5

¹: note that the water in the water-bearing fracture in this well was reported to be only 60 to 70 feet deep.
 gpm: gallons per minute

Driller reported well yields are based on short-term airlifting performed at the end of drilling and often overestimate long-term well capacity. The driller-reported well yields in Table 3 roughly translate to hydraulic conductivities on the order of 0.001 to 0.1 feet per day (ft/d).

On November 3, 2011, AECOM discussed the water balance model with Mr. Jim Bennett, the County Groundwater Geologist. As part of the discussions, a hydraulic conductivity of 0.02 ft/day was agreed to be generally representative of the conditions local to the proposed quarry, however there is considerable uncertainty in this value.

Water Quality Analysis

Using the water balance analysis above and the laboratory results for TDS; AECOM assessed potential changes to water quality with time. Direct rain and contributing watershed runoff inflows were multiplied by an assumed rainwater TDS concentration of 100 mg/L. Groundwater inflow and operational extraction outflow were multiplied by the Well 5 TDS concentration of 2,200 mg/L.

AECOM

Proposed Quarry Groundwater Letter Report
Otay Hills Quarry San Diego County, California

Conclusions

Using a hydraulic conductivity value of 0.2 ft/d the water balance model predicts that the water in the pit may rise as much as 200 feet (300 feet msl) without mitigation. Since it is not likely that the accumulated water could be discharged via storm drain or sanitary sewer it is not anticipated that mitigation is practicable. The spreadsheet predicts that water will slowly enter the excavation and will rise approximately 25 to 100 feet per decade.

Based on the 30-year water quality analysis, the maximum concentration of TDS in the accumulated pit water and is estimated to rise to be approximately 3,000 mg/L.

Note that there is considerable uncertainty in both the estimation of accumulated water in the pit and the TDS concentration of the accumulated water. It is possible that water will accumulate at slower or faster rates than those estimated herein. However, based on operational limitations of the equipment, since accumulated pit water would not likely be allowed into the sanitary sewer or storm drain system, and since the applicant has stipulated that he would not excavate the pit more than a few feet below standing water, the chance of significant accumulation in the pit is minimal.

Recommendations

Any well not used for the project shall be abandoned and a Well Destruction Permit obtained. Proof of destruction by a C57 licensed contractor is required prior to the approval of any grading, improvement plans, or recordation of the Final Map.

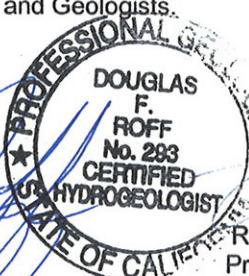

If you have any questions, please contact us at (858) 300-2701 or (858) 352-8243. We thank you for the opportunity to work with you.

The following statement is provided as required by Section 3066 of Title 16, Division 29 of the California Code of Regulations: We, the undersigned, are licensed by the California Board for Professional Engineers, Land Surveyors, and Geologists.

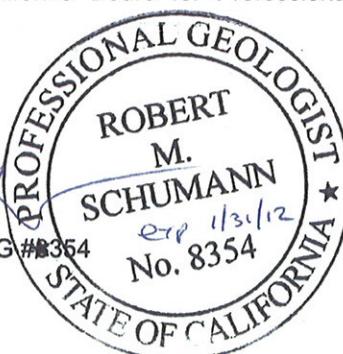

Very truly yours,

AECOM

Proposed Quarry Groundwater Letter Report
Otay Hills Quarry San Diego County, California

Laboratory Data

LABORATORY REPORT

Prepared For: AECOM Inc - San Diego
7807 Convoy Court, Suite 200
San Diego, CA 92111
Attention: Rob Schumann

Project: Otay Hills/60222529.1

Sampled: 09/15/11
Received: 09/16/11
Issued: 09/27/11 16:45

NELAP #01108CA California ELAP#2706 CSDLAC #10256 AZ #AZ0671 NV #CA01531

The results listed within this Laboratory Report pertain only to the samples tested in the laboratory. The analyses contained in this report were performed in accordance with the applicable certifications as noted. All soil samples are reported on a wet weight basis unless otherwise noted in the report. This Laboratory Report is confidential and is intended for the sole use of TestAmerica and its client. This report shall not be reproduced, except in full, without written permission from TestAmerica. The Chain of Custody, 1 page, is included and is an integral part of this report.

This entire report was reviewed and approved for release.

CASE NARRATIVE

- SAMPLE RECEIPT: Samples were received intact, at 2°C, on ice and with chain of custody documentation.
- HOLDING TIMES: All samples were analyzed within prescribed holding times and/or in accordance with the TestAmerica Sample Acceptance Policy unless otherwise noted in the report.
- PRESERVATION: Samples requiring preservation were verified prior to sample analysis.
- QA/QC CRITERIA: All analyses met method criteria, except as noted in the report with data qualifiers.
- COMMENTS: No significant observations were made.
- SUBCONTRACTED: No analyses were subcontracted to an outside laboratory.

DATA QUALIFIERS AND DEFINITIONS

- M1** The MS and/or MSD were above the acceptance limits due to sample matrix interference. See Blank Spike (LCS).
- M-3** Results exceeded the linear range in the MS/MSD and therefore are not available for reporting. The batch was accepted based on acceptable recovery in the Blank Spike (LCS).
- MHA** Due to high levels of analyte in the sample, the MS/MSD calculation does not provide useful spike recovery information. See Blank Spike (LCS).
- ND** Analyte NOT DETECTED at or above the reporting limit or MDL, if MDL is specified.
- RPD** Relative Percent Difference

Proposed Quarry Groundwater Letter Report
Otay Hills Quarry San Diego County, California

Land Use Analysis

(Inserted by EnviroMINE)

Land Use Analysis Otay Hills Groundwater Basin

Groundwater Study Area

The groundwater basin uphill from the the Otay Hills pit area is approximately 32.2 acres. This basin occurs east (upslope) of the proposed extraction footprint, to an elevation of approximately 1,024 feet AMSL. An area of approximately 214.9 acres of land surrounding and including the proposed pit has been selected for study (See attached map). This area could reasonably be expected to contribute groundwater to the pit at its maximum depth (100 feet above mean sea level). This 214.9-acre study area is the subject of the Land Use Analysis provided herein.

Significance Criteria for Groundwater Resources

The County's Guidelines for Determining Significance for Groundwater Resources states that by reducing groundwater storage to a level of 50% or less as a result of a project's groundwater extraction, a significant impact to groundwater resources occurs. There is potential for this to occur as a result of the Otay Hills project. However, the project proposes to preserve natural habitat on adjacent lands within the project's watershed area.

Land Use Within Groundwater Study Area

The County of San Diego General Plan, and the East Otay Mesa Specific Plan (EOMSP), govern allowable land uses within the subject groundwater study area. A majority of the study area is within the EOMSP and is designated Mixed Industrial, Rural Residential, Heavy Industrial, and State Route Right-of-Ways (2010 EOMSP). A relatively small portion of the study area is within a Landfill Initiative area of the County's General Plan. The Otay Hills project includes an application for a Specific Plan Amendment to address the land use concerns associated with long-term use of the project site following the end of mining operations. The Specific Plan Amendment would change the designation of approximately 36.3 acres of Mixed Industrial land to Rural Residential. These lands are found to the north and east of the proposed quarry site. In addition, approximately 85.7 acres of land currently designated Rural Residential would be designated as Mixed Industrial (See attached map).

Rural Residential allows low density residential development (1 du/20 acres) due to the occurrence of steep slopes and sensitive biological resources. Development in the residential designated areas may only proceed following detailed environmental review, approval of a resource conservation plan (as required by the EOMSP), and site plan review. With the exception of a 1.8-acre area, all of the Rural Residential land, within the study area, is owned by Superior Ready Mix. The Superior ownership will be placed into open space conservation. The adjacent property owner's 1.8-acre area consists of steep slopes and is located between the quarry project and a Landfill Initiative area. Therefore, approval of the Otay Hills project would likely prevent additional development within the Rural Residential areas.

Lands within the study area that are designated Industrial (Heavy and Mixed), and are outside the Otay Hills project footprint, occur west and south of the site. An

asphalt/ready-mix concrete plant facility was recently approved by the County for one of the two industrial pads located west of the site. These pads were constructed to include connections to water infrastructure from the Otay Water District and therefore will not utilize groundwater. The Otay Crossings project was also recently approved for the industrial property located south of the site. This development will not utilize groundwater.

For the reasons listed above, an exception to the groundwater storage Significance Criteria may be granted for the Otay Hills project.
