## CEQA-Level Drainage Report – Ocean Kamp

March 5, 2020

### 1. Introduction and Purpose

The proposed Ocean Kamp project is a combined mixed-use/community resort project located near the Oceanside airport along the 76 Expressway in Oceanside, CA. This CEQA-level drainage report provides a basis for preliminary detention basin sizes and trunk storm drain design. Estimated flows from the project storm drain outfalls are quantified and assessed in relation to the adjacent San Luis River and regional flood control basins along the U.S. Army Corps of Engineers (USACOE) levee at the river. Supporting calculations, exhibits, and narrative for the project drainage designs are included in the Appendices of this report. A Storm Water Quality Management Plan (SWQMP) is provided separately with the project submittal.

### 2. Project Description

#### Location

The project is located at the former Oceanside Drive-in location at Foussat Road and Mission Road, and adjacent to the 76 Expressway in Oceanside, CA.

#### Proposed Project

The developers of the Ocean Kamp project are proposing a resort with wave pool on the southerly one-third of the site. Extensive planting, landscaping, and decorative hardscape features will accent the large wave pool/beach with smaller pools, lawn areas, cabanas, and bungalows proposed along the entire perimeter of the wave pool. Retail shops, hotel buildings, and a parking lot are proposed further out along the project loop road, north of the wave pool. Future residential areas are proposed north and east of the loop road, with densities ranging from 11 to 25 dwelling units per acre. Those areas are currently mass-graded and development plans are pending. All calculations in this report account for the future developed conditions of these areas.

#### Existing (Pre-Developed) Conditions Drainage Patterns

The Existing (pre-developed) Condition Hydrology Map is the same as was used in the 2007 report that Tory R. Walker Engineering (TRWE) prepared for the Pavilion Project. That map is provided in Appendix E of this report. The 90-acre site is bounded by the San Luis Rey River channel and levee to the northwest, Park Pond and Fireside Channel and Master Drainage Facility AD box culvert to the northeast and east, the State Route 76 Expressway to the south, and Foussat Road and Middle Pond to the west. The middle third of the site was formerly paved for the old drive-in theater and swap meet. Park Pond and Middle Pond were both constructed with the San Luis Rey Levee and Channel Project in the late 1980s and are designed for local flood attenuation when the San Luis Rey River is at flood stage. A utility/powerline corridor bisects the easterly third of the property; the northerly portion of the corridor drains west, with an outfall at the 48-inch RCP storm drain crossing the levee (Node 29 on the existing conditions map). The southerly portion drains south to the 76 Expressway. From there, runoff flows westerly in an existing

## CEQA-Level Drainage Report – Ocean Kamp

March 5, 2020

concrete trapezoidal channel along the north edge of the expressway, and then into a headwall/60-inch RCP storm drain (Node 15). The storm drain continues west along the expressway, with an outfall into Middle Pond just west of Foussat Road. The westerly quarter of the site (between Foussat and Old Foussat) currently drains southwesterly to a low point in Foussat, where a 24-inch RCP storm drain conveys runoff south to the 60-inch RCP storm drain (Node 18). The remaining middle portion of the property drains west and north to the existing headwall and 48-inch RCP storm drain just east of the Foussat Road bridge (Node 29). The 48-inch storm drain conveys runoff through the levee into the San Luis Rey River. In summary, the two project discharge points are Node 19 (southwest corner 60-inch RCP outfall just west of Foussat), and Node 29 (48-inch outfall into the San Luis Rey River).

### Developed Conditions Drainage Patterns and Designs

The proposed project drainage design is intended to generally match existing drainage patterns. Approximately 60% of the resort and retail areas drain southwest to the outfall at the existing 60-inch storm drain near Foussat Road. Runoff from the southerly portion of the SDGE easement and the proposed residential area to the east also contribute to the existing 60-inch storm drain. Within the resort area, approximately 25 acres drain to the large (30k square feet) combined stormwater treatment - detention basin (Basin 1A) at the southwest corner of the site. Flow attenuation is provided within this basin, and outflows are piped to join the existing 60-inch storm drain along the 76 Expressway. The combined total outflow at the 60-inch outlet into Middle Pond is summarized in the conclusions section of this report and compared with existing condition flows.

Portions of the areas north and east of the wave pool drain north into the project loop road and large treatment-detention basin (Basin 2) just north of the loop road. Runoff from the northerly future residential area is also treated and attenuated in this basin. From there, flows join the loop road trunk storm drain and continue to the San Luis Rey River through the aforementioned 48-inch storm drain outfall near the Foussat Bridge. Portions of the SDGE easement and easterly residential areas (treated at small basins within those areas) drain to the loop road trunk storm drain and also to the outfall at the existing 48-inch pipe. There are two separate trunk storm drains proposed in the loop road; one for untreated flows (leading to Basin 2), and one for treated flows (treated upstream).

### Drainage at Easterly Edge of Project

The approximately 4-acre area at the easterly boundary will remain as open space; the northerly half of this area will drain north toward the Fireside Channel, and the southerly half will drain to the existing box culvert (Oceanside Master Facility AD). No runoff will flow to the adjacent residential tract along Fireside Drive.

### Residential Areas North and East of Loop Road and SDGE Easement – Infrastructure

The residential area north of the loop road, and west of the SDGE easement, will be approximately 40% single family detached (11 DU/AC), and 60% multi-family attached, with a cul-de-sac street feeding several private driveways throughout. A large detention/treatment basin and a neighborhood park are planned on either side of the cul-de-sac. Drainage infrastructure for both residential areas will include roof downspouts to landscaped areas, private drainage pipes, catch basins at sumps, trunk private storm drains, and grass swales where there is available space. The cul-de-sac street will include a trunk public storm drain that will outlet into the detention basin and curb inlets.

### Resort Area Infrastructure

The northerly parking lot area will drain to the loop road, with sheet flow, V-gutters where needed, and catch basins/private storm drains to be located and sized at the final engineering stage of the project. Buildings and parking areas east of the main parking lot will have downspouts, areas of sheet flow, V-gutters, catch basins and private storm drains again leading to the loop road.

The resort area includes grass areas, pools, hardscape walkways, and perimeter buildings/commercial areas. Roof downspouts will outlet onto grass and planter areas wherever feasible. A network of private catch basins and storm drains will convey runoff westerly to the large treatment/detention basin. Runoff in the parking areas west of the resort area will be captured in catch basins and trunk storm drains, discharging into the basin. Areas south of the wave pool area will drain to the southerly loop road, which slopes west toward the large basin.

### **3. Hydrologic Methodology and Discussion**

Rational Method hydrologic calculations are provided for the developed conditions using San Diego County Hydrology Manual (SDCHM) methodology. Flows for three storm events, the 2, 10, and 100-year design storms were calculated using AES (Advanced Engineering Software) which routes and confluences flows in a nodal system. AES calculates runoff using the Rational Method based on estimated runoff coefficients and times-of-concentration (see Appendix B for output). The project runoff totals for existing and developed conditions are summarized in Table 1. The basis for the hydrology calculations is provided with the hydrology maps in Appendix E, with corresponding drainage boundaries, initial subareas, and discharge points illustrated. The project site consists of Soil Type D, with the proposed imported fill. The land cover consists of pavement, landscaped areas, buildings, pools, hardscape, seating lawns, etc. Runoff coefficients were assigned based on the combinations of land cover/imperviousness and proposed use. Peak flow rates from the Rational Method calculations were input into the detention basin routing calculations. Detained peak flow values were also reentered into the rational method calculations for post-detention basin flows.

#### 4. Detention Basin Routing

Detention basin routing calculations for the 100-year, 6-hour storm event are provided for the project's several combined treatment-detention basins. We used a Modified-Puls routing of the BMP facilities in SWMM with the Rational Method Hydrograph procedure per the San Diego County Hydrology Manual (SDCHM). Peak flows were obtained using the Rational Method per the SDCHM. The design storm and runoff hydrographs (generated per the SDCHM) were routed through the BMPs in order to satisfy the drainage study Q<sub>100</sub> criteria. Backup calculations are provided in Appendix C.

#### 5. Retention Analysis and Hydraulics

As noted previously, the northern portion of the proposed project drains to the existing 48-inch storm drain under the levee, which incorporates a flap gate to prevent backwater flow from the San Luis Rey River. In order to satisfy City of Oceanside criteria, we determined the onsite storage volume required for full retention of the runoff volume from a 10-year, 24-hour storm event for the area tributary to the 48-inch pipe (assuming 100-year water surface elevation in the San Luis Rey River and the 48-inch flap gate is closed). We performed a HEC-HMS model hydrologic analysis of the subbasin and used the NRCS Unit Hydrograph method to calculate the 10-year, 24-hour runoff volume. We then prepared preliminary calculations demonstrating that the runoff volume can be temporarily retained within the onsite storm drain system, BMP-2 (basin), and the SDGE easement area. The ponded elevation within the SDGE easement area is 37.1 feet, just over one foot of ponding.

We performed a preliminary hydraulic analysis of the existing 48-inch storm drain and the loop road trunk storm drain and confirmed that the system has sufficient capacity to convey the onsite 100-year peak flow. The analysis assumes a 10-year water surface elevation in the San Luis Rey River per City of Oceanside criteria. The analysis continues upstream in the loop road to the SDGE easement (Node 604 on the Developed Conditions Hydrology Map).

#### 6. Middle Pond & Park Pond

##### Park Pond

The project design currently routes no runoff north to Park Pond. Runoff for the northerly half of the site flows to the 48-inch storm drain outlet at the San Luis Rey River and is detained in Basin 2 as noted above in Sections 4 and 5.

##### Middle Pond

Project runoff from the resort area/southwest portion of the site, will be significantly attenuated in Basin 1A, the large basin west of the wave pool. After attenuation, flows combine with runoff from Route 76 and Foussat Road, and outlet into Middle Pond. The combined area is 51.5 acres, which is a slight increase from the existing condition contribution of 49 acres. Using the USACOE

## CEQA-Level Drainage Report – Ocean Kamp

March 5, 2020

General Design Memorandum (GDM) for the San Luis Rey River Levee Project as a reference, the total tributary area for Middle Pond is 3.3 square miles. The small increase in contributing area from the proposed Ocean Kamp project is therefore inconsequential in terms of flood risk, runoff rate, or storage volume. On-site attenuation and increased pervious cover and infiltration throughout the resort landscaping provides a net decrease from the site to Middle Pond for each of those measurables. As noted in the summary and the hydrology map, the developed condition 100-year flow is reduced with the project, due to extensive detention.

### 7. Conclusions

As proposed, the Ocean Kamp project will not substantially alter existing drainage patterns. At Discharge Point 2, the 100-year flows and tributary area that run into the 48-inch outfall at the Foussat bridge are both less than with existing conditions. In addition, retention storage volume will be available within project pipes and the adjacent SDGE easement, such that 10-year storm volumes will be retained in the 100-year flow condition in the adjacent San Luis Rey River. At Discharge Point 1, the project will result in reductions as noted in Section 6 above.

A summary of existing and developed conditions runoff is provided in Table 1 below.

**Table 1: Project Outfall Flows and Tributary Areas**

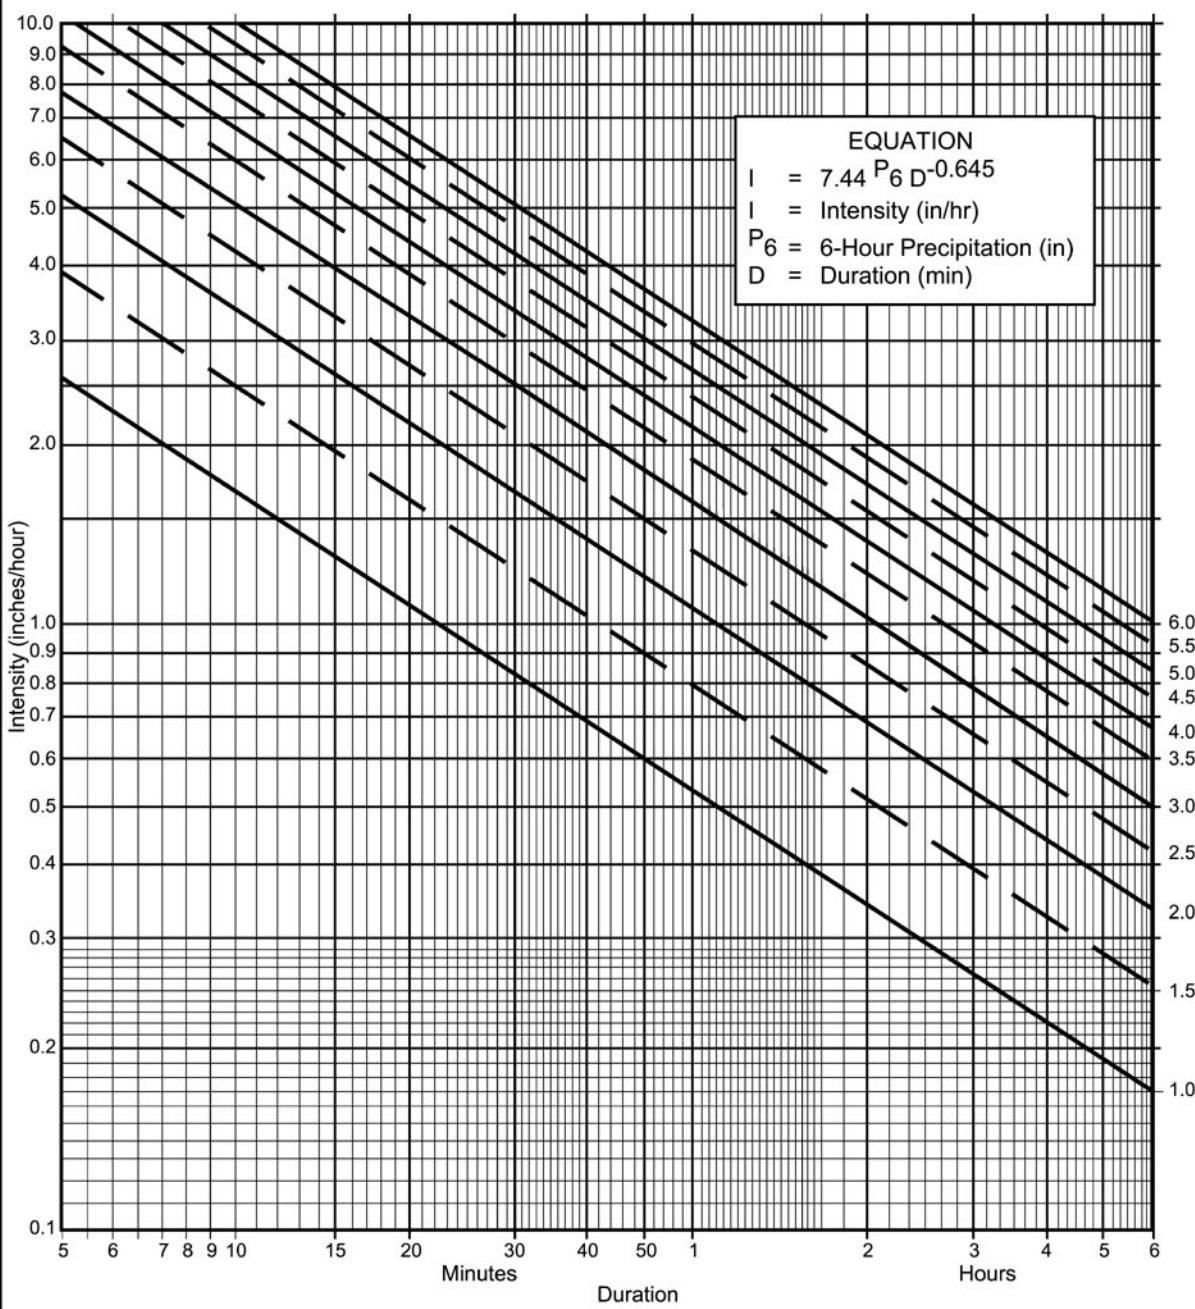

Location	Existing Conditions		Developed Conditions	
	Drainage Area (ac)	Q <sub>100</sub> (cfs)	Drainage Area (ac)	Q <sub>100</sub> (cfs)
Discharge Point 1 (60-inch RCP)	49.0	50.0	51.6	40.0
Discharge Point 2 (48-inch RCP)	64.1	68	48.1	24.8

## **APPENDIX A**

### **San Diego County Charts and Nomographs**

#### Directions for Application:

- (1) From precipitation maps determine 6 hr and 24 hr amounts for the selected frequency. These maps are included in the County Hydrology Manual (10, 50, and 100 yr maps included in the Design and Procedure Manual).
- (2) Adjust 6 hr precipitation (if necessary) so that it is within the range of 45% to 65% of the 24 hr precipitation (not applicable to Desert).
- (3) Plot 6 hr precipitation on the right side of the chart.
- (4) Draw a line through the point parallel to the plotted lines.
- (5) This line is the intensity-duration curve for the location being analyzed.

#### Application Form:

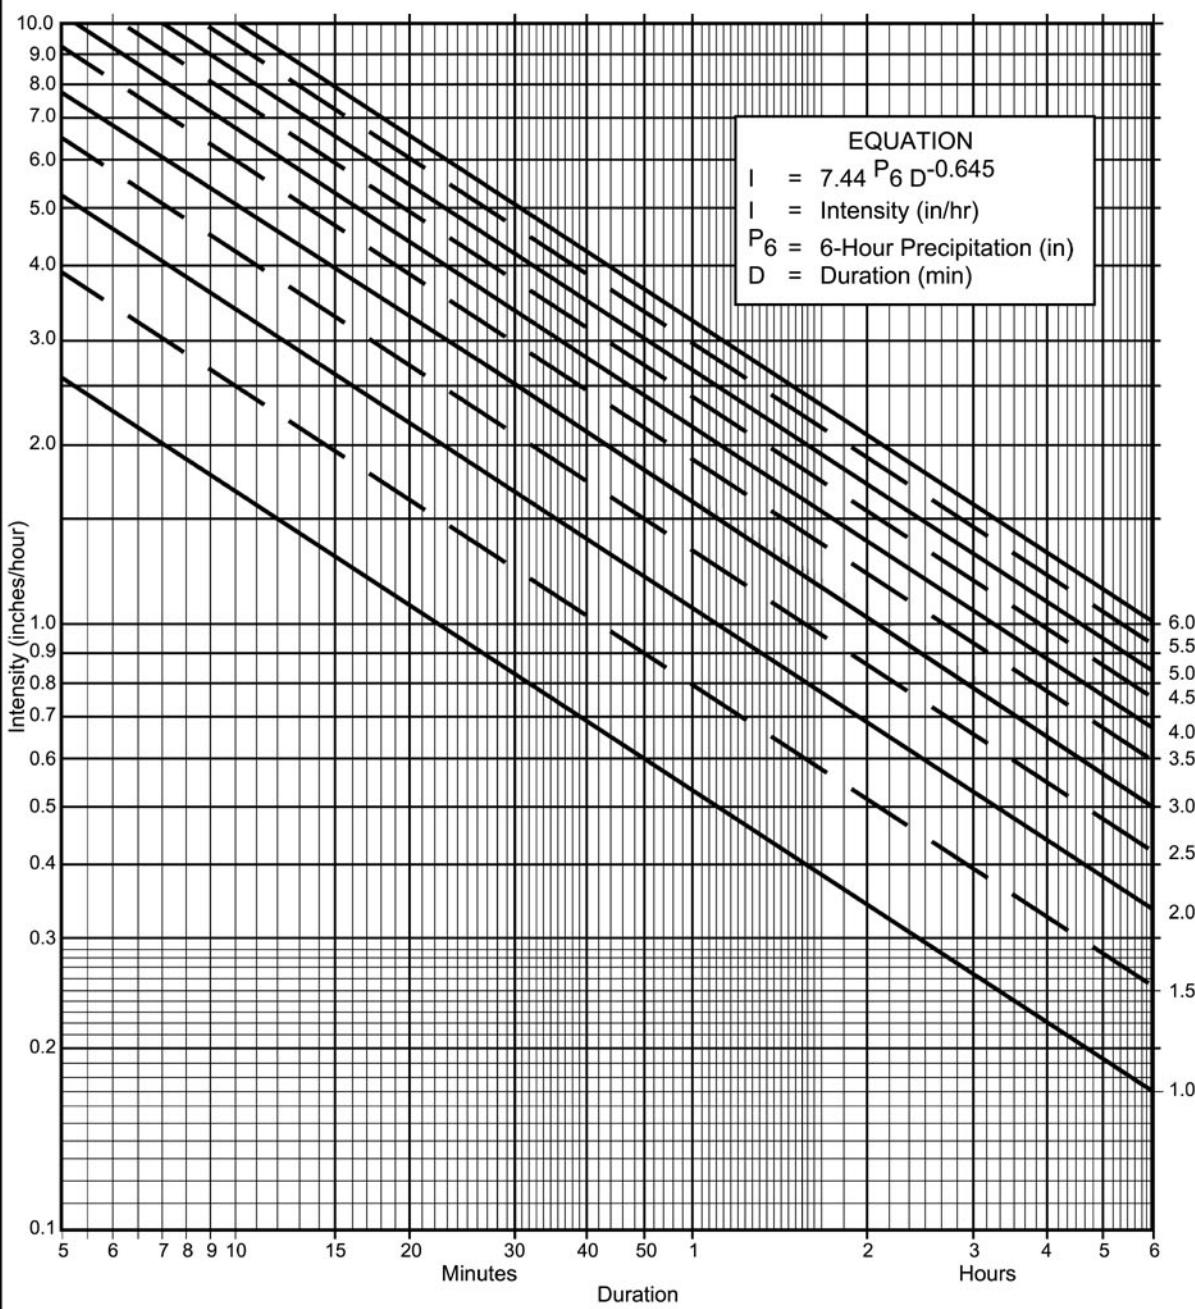

- (a) Selected frequency 10- year
- (b)  $P_6 = \underline{1.8}$  in.,  $P_{24} = \underline{3.3}$  in.  $\frac{P_6}{P_{24}} = \underline{55}$  %<sup>(2)</sup>
- (c) Adjusted  $P_6^{(2)} = \underline{\text{N/A}}$  in.
- (d)  $t_x = \underline{\text{  }}$  min.
- (e)  $I = \underline{\text{  }}$  in./hr.

Note: This chart replaces the Intensity-Duration-Frequency curves used since 1965.

EPA STORM WATER MANAGEMENT MODEL - VERSION 5.1 (Build 5.1.013)

537-03

\*\*\*\*\*

NOTE: The summary statistics displayed in this report are based on results found at every computational time step, not just on results from each reporting time step.

\*\*\*\*\*

\*\*\*\*\*

## Analysis Options

\*\*\*\*\*

Flow Units ..... CFS

## Process Models:

Rainfall /Runoff ..... YES  
 RDII ..... NO  
 Snowmelt ..... NO  
 Groundwater ..... NO  
 Flow Routing ..... YES  
 Ponding Allowed ..... NO  
 Water Quality ..... NO

Infiltration Method ..... GREEN\_AMPT

Flow Routing Method ..... KINWAVE

Starting Date ..... 01/01/2000 00:00:00

Ending Date ..... 01/01/2000 12:00:00

Antecedent Dry Days ..... 0.0

Report Time Step ..... 00:01:00

Wet Time Step ..... 00:01:00

Dry Time Step ..... 00:01:00

Routing Time Step ..... 10.00 sec

\*\*\*\*\*

Runoff Quantity Continuity	Volume	Depth
	acre-feet	inches

\*\*\*\*\*

Initial LID Storage .....	0.370	2.100
Total Precipitation .....	0.000	0.000
Outfall Runon .....	9.949	56.527
Evaporation Loss .....	0.000	0.000
Infiltration Loss .....	0.000	0.000
Surface Runoff .....	4.011	22.791
LID Drainage .....	5.356	30.431
Final Storage .....	0.951	5.403
Continuity Error (%) .....	0.004	

\*\*\*\*\*

Flow Routing Continuity	Volume	Volume
	acre-feet	10^6 gal

<sup>1</sup> Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

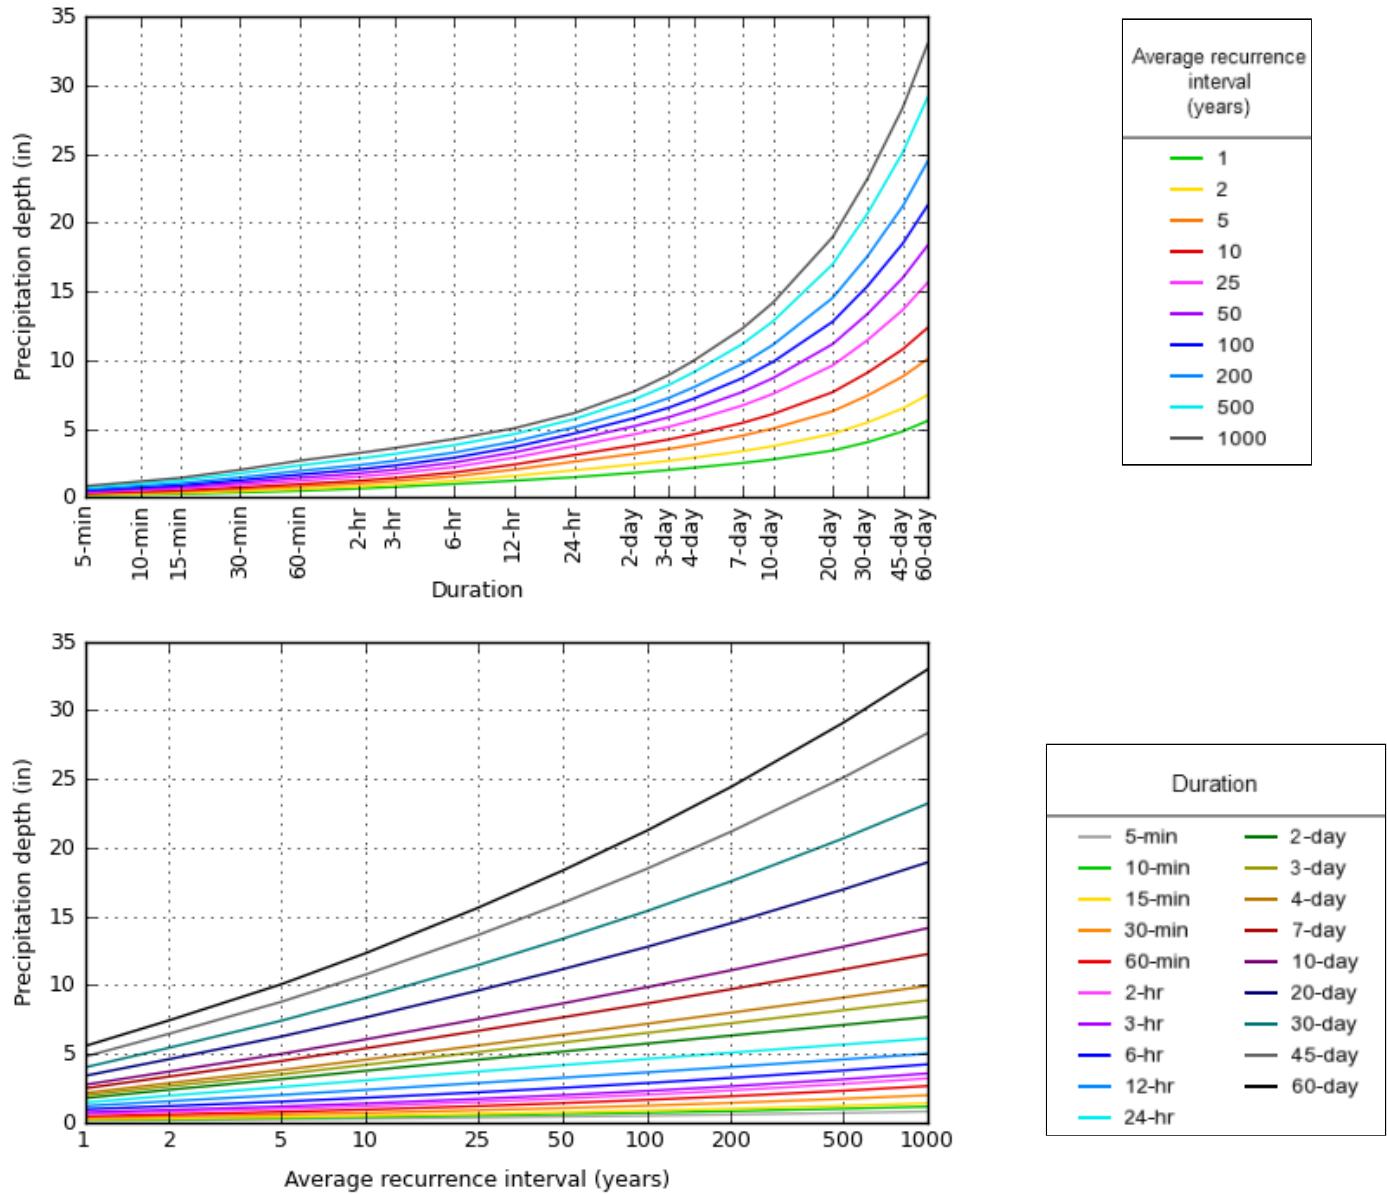

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

## HEC-HMS Inputs

---

Basin	Condition	Area (ac)	Area (mi <sup>2</sup> )	<sup>1</sup> CN	Impervious (%)	<sup>2</sup> T <sub>c</sub> (min)	<sup>3</sup> Lag (min)
BYPASS <sup>4</sup>	Proposed	15.0	0.023438	81	25.5%	15.0	12.00
DMA-2	Proposed	33.1	0.051719	81	61.0%	10.0	8.00

Notes:

<sup>1</sup> Pervious area Curve Number per 2003 SDCHM Table 4-2. Pervious areas assumed to be landscaped with native vegetation corresponding to "Open brush" cover description.

<sup>2</sup> Time of concentration taken from AES Q<sub>10</sub> calculations

<sup>3</sup> Lag is equal to 80% of the time of concentration.

<sup>4</sup> Drainage area that bypasses BMP-2 (BASIN 2)

**Table 4-2 (Continued)**  
**RUNOFF CURVE NUMBERS<sup>1</sup> FOR PZN CONDITION = 2.0**

Cover Description	Cover Treatment or Practice <sup>2</sup>	Hydrologic Condition <sup>3</sup>	Average Percent Impervious Area <sup>4</sup>	Curve Numbers for Hydrologic Soil Groups:			
				A	B	C	D
Turf <sup>8</sup> .....		Poor .....	58	74	83	87	
		Fair .....	44	65	77	82	
		Good .....	33	58	72	79	
Water surfaces (during floods) .....			97	98	99	99	
Broadleaf chaparral .....		Poor .....	53	70	80	85	
		Fair .....	40	63	75	81	
		Good .....	31	57	71	78	
Desert shrub—major plants include saltbush, greasewood, creosotebush, blackbrush, bursage, palo verde, mesquite, and cactus .....		Poor .....	63	77	85	88	
		Fair .....	55	72	81	86	
		Good .....	49	68	79	84	
Herbaceous—mixture of grass, weeds, and low-growing brush, with brush the minor element .....		Poor .....	9	80	87	93	
		Fair .....	9	71	81	89	
		Good .....	9	62	74	85	
Narrowleaf chaparral .....		Poor .....	71	82	88	91	
		Fair .....	55	72	81	86	
Oak-aspen—mountain brush mixture of oak brush, aspen, mountain mahogany, bitter brush, maple, and other brush .....		Poor .....	9	66	74	79	
		Fair .....	9	48	57	63	
		Good .....	9	30	41	48	
Open brush .....		Poor .....	62	76	84	88	
		Fair .....	46	66	77	83	
		Good .....	41	63	75	81	

Basin Model [Basin 200] Current Run [10yr-24hr]

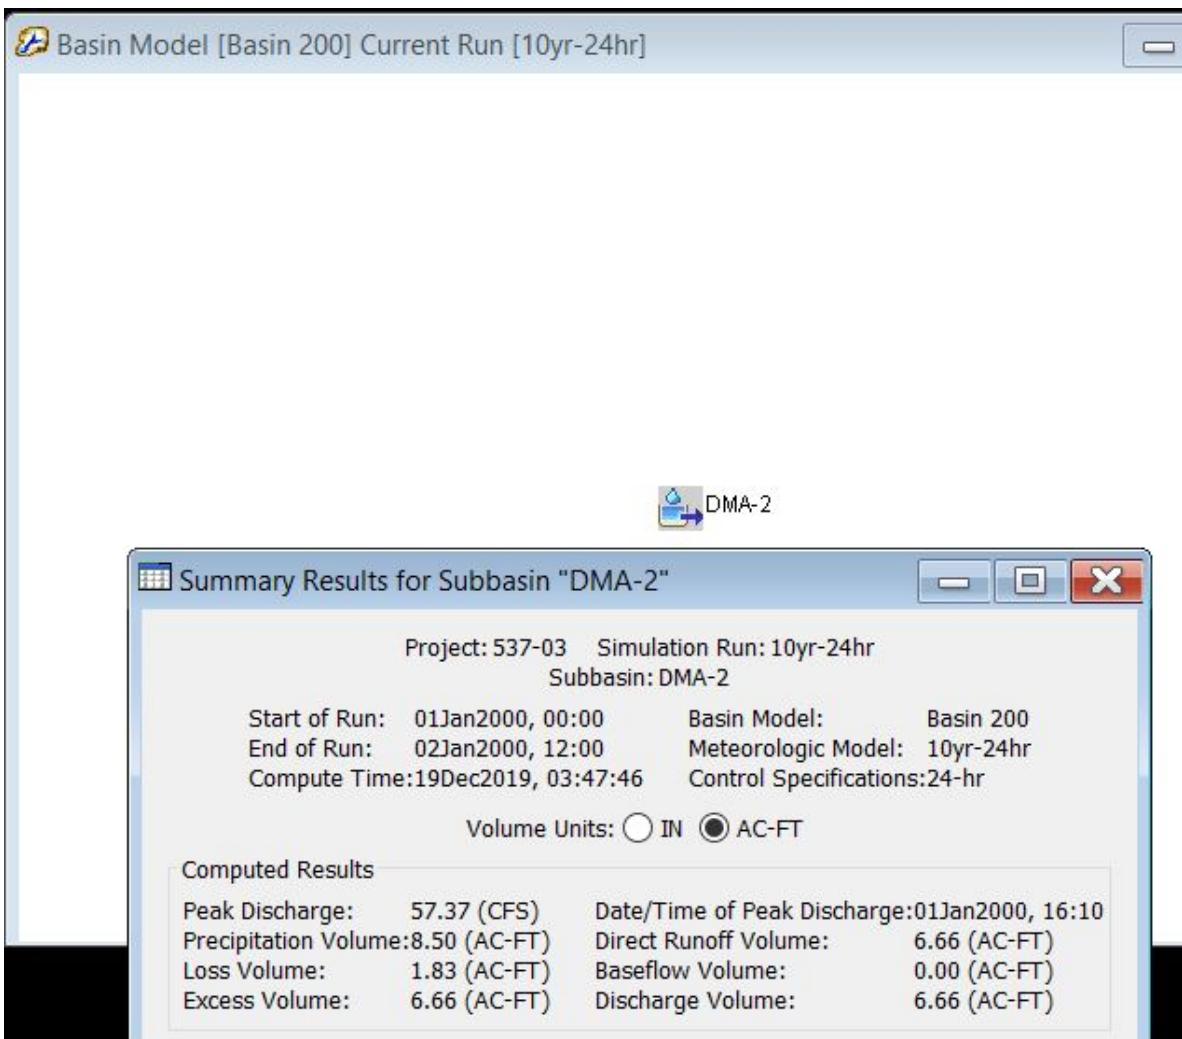

### Summary Results for Subbasin "BYPASS"

Project: 537-03   Simulation Run: 10yr-24hr  
Subbasin: BYPASS  
Start of Run: 01Jan2000, 00:00   Basin Model: Basin 200  
End of Run: 02Jan2000, 12:00   Meteorologic Model: 10yr-24hr  
Compute Time: 19Dec2019, 03:47:46   Control Specifications: 24-hr

Volume Units:  IN  AC-FT

#### Computed Results

Peak Discharge:	18.34 (CFS)	Date/Time of Peak Discharge:	01Jan2000, 16:15
Precipitation Volume:	3.85 (AC-FT)	Direct Runoff Volume:	2.26 (AC-FT)
Loss Volume:	1.59 (AC-FT)	Baseflow Volume:	0.00 (AC-FT)
Excess Volume:	2.26 (AC-FT)	Discharge Volume:	2.26 (AC-FT)

10-yr-24hr ONSITE RETENTION VOLUME AND PONDING DEPTH							
Basin ID	Runoff Volume from HEC-HMS (AC-FT)	Runoff Volume (CF)		SDGE Easement Area Stage-Storage

# Culvert Report

## **Circular Culvert**

Invert Elev Dn (ft)	= 27.10
Pipe Length (ft)	= 104.00
Slope (%)	= 2.22
Invert Elev Up (ft)	= 29.41
Rise (in)	= 48.0
Shape	= Circular
Span (in)	= 48.0
No. Barrels	= 1
n-Value	= 0.013
Culvert Type	= Circular Concrete
Culvert Entrance	= Square edge w/headwall (C)
Coeff. K,M,c,Y,k	= 0.0098, 2, 0.0398, 0.67, 0.5

## **Embankment**

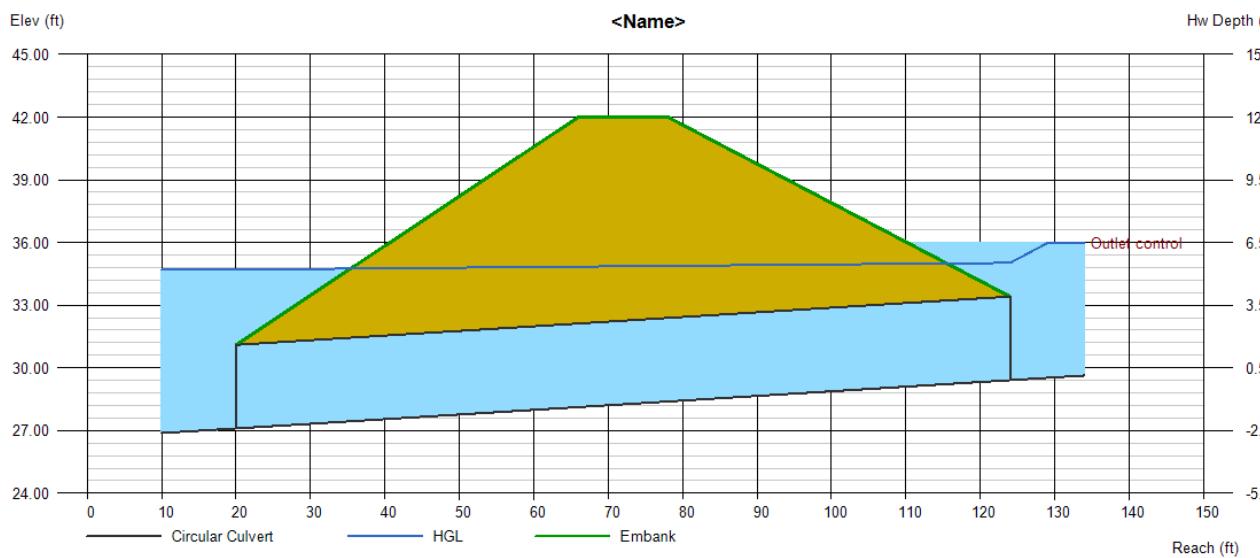

Top Elevation (ft) = 42.00  
Top Width (ft) = 12.00  
Crest Width (ft) = 300.00

## Calculations

Qmin (cfs) = 10.00  
Qmax (cfs) = 200.00  
Tailwater Elev (ft) = 34.7

## Highlighted

Qtotal (cfs)	=	80.00
Qpipe (cfs)	=	80.00
Qovertop (cfs)	=	0.00
Veloc Dn (ft/s)	=	6.37
Veloc Up (ft/s)	=	6.37
HGL Dn (ft)	=	34.70
HGL Up (ft)	=	35.02
Hw Elev (ft)	=	35.97
Hw/D (ft)	=	1.64
Flow Regime	=	Outlet Control
