EXECUTIVE SUMMARY

In support of the Environmental Impact Report being prepared in accordance with CEQA, this study was conducted to analyze the potential traffic impacts of the proposed Miramar Hotel project (the proposed project) in the City of Santa Monica. This report describes existing transportation network conditions, identifies the base assumptions and methods used to analyze the project's traffic impacts on intersection and street operations, summarizes the findings of the analysis, and also provides a comparative analysis of the traffic impacts of the project versus those of alternatives to the project. The key findings and conclusions of the study are summarized below.

PROJECT DESCRIPTION

The proposed Miramar Hotel project site is located at 1133 Ocean Avenue/101 Wilshire Boulevard on the City of Santa Monica block bounded by Wilshire Boulevard, Ocean Avenue, California Avenue, and Second Street (the "Hotel Parcel"). The Hotel Parcel is approximately 192,063 square feet (4.4 acres) in size. Upon completion, development on the Hotel Parcel will consist of:

- Rehabilitation and ongoing hotel use of the historic Palisades Building (a City-designated landmark)
- Preservation and protection of the Moreton Bay Fig Tree (a City-designated landmark) as a focal point of the Project
- Relocation of the main entry drive from Wilshire Boulevard to 2nd Street
- Removal of the existing surface parking lots
- Demolition of all non-landmarked buildings
- Construction of two new buildings (referred to as the Ocean Building and the California Building)
 - Including 60 new residential condominium units
 - 312 hotel guest rooms
- 6,600 square feet of retail space, 12,500 square feet of spa and fitness space, and 19,708 square feet of restaurant space
- Expansion of public and guest open space areas on the ground level and in building terraces and rooftops
- Construction of a subterranean parking garage beneath the newly constructed buildings and open space

Additionally, the Project will include the development of the parcel located at 1127/1129 2nd Street (the "Second Street Parcel"). The Second Street Parcel, which is located directly across 2nd Street from the Hotel Parcel, is approximately 15,000 square feet (0.3 acre) in size and is currently used as surface parking lot by the hotel. The Second Street Parcel development would include a 100% affordable housing component with a minimum of 30 and a maximum of 48 affordable apartments.

The Project will include three vehicular access points to/from the Project Site:

- A new entry court on 2nd Street to serve the Project's hotel and restaurant/retail uses and provide an access alternative for residents
- A secondary access driveway on California Avenue, located approximately 100 feet east of Ocean Avenue, to serve employees only and provide direct access to the underground parking while appropriately disbursing trips around the Hotel Parcel
- A modified entry and access driveway on Ocean Avenue for use by residents to provide direct access to the underground parking structure.

The 2nd Street Entry Court, the Ocean Avenue Entry and the California Avenue Entry would provide direct access to the subterranean parking.

SUMMARY OF IMPACTS

This study analyzed 51 intersections for potential traffic impacts. The proposed project is expected to generate a total of approximately 256 weekday AM peak hour trips, 224 weekday PM peak hour trips and 416 weekend midday peak hour trips. Taking into account the removal of the existing uses, the proposed project is expected to generate net-new travel of approximately 85 trips in the weekday AM peak hour, 81 trips in the weekday PM peak hour and 96 trips in the weekend midday peak hour.

Approval Year (2020) Plus Project Intersection Analysis

Based on the City of Santa Monica impact criteria, the addition of project traffic is expected to result in significant traffic impacts at four locations under Approval Year (2020) conditions:

1. Palisades Beach Road & California Avenue
3. Ocean Avenue & California Avenue
14. 2nd Street & Wilshire Boulevard
42. Lincoln Boulevard & California Avenue

TABLE ES-1
SUMMARY OF PROPOSED PROJECT INTERSECTION IMPACTS

No.	INTERSECTION	PEAK HOUR	APPROVAL YEAR (2020)	FUTURE YEAR (2025)
1	PALISADES BEACH ROAD & CALIFORNIA INCLINE	AM PM WKND	X	X
3	OCEAN AVENUE & CALIFORNIA AVENUE	AM PM WKND	X X	X X X
14	SECOND STREET & WILSHIRE BOULEVARD	AM PM WKND	X X X	X X X
42	LINCOLN BOULEVARD & CALIFORNIA AVENUE	AM PM WKND	X	X X
Total Impacted Intersections:			4	4

Future Year (2025) Plus Project Intersection Analysis

Based on the City of Santa Monica impact criteria, the addition of project traffic is expected to result in significant traffic impacts at the same four locations under Future Year (2025) conditions:

1. Palisades Beach Road & California Avenue
3. Ocean Avenue & California Avenue
14. 2nd Street & Wilshire Boulevard
42. Lincoln Boulevard & California Avenue

Intersection Mitigation Measures

Mitigation measures for the four significant impacts under the Approval and Future with Project conditions were considered. Three of the four impacts could be mitigated to less-than-significant levels with changes to signal operation and, in the case of 2nd Street & Wilshire Boulevard, restriping of travel lanes. The impact at Lincoln Boulevard & California Avenue, an all-way stop-controlled intersection, cannot be fully mitigated without potential secondary impacts to pedestrian safety goals and policies outlined in the City's Land Use and Circulation Element (LUCE). Therefore, under both the Approval Year (2020) and Future Year (2025) conditions, the project would result in significant and unavoidable impacts at one intersection.

Segment Analysis

The addition of project traffic is expected to result in significant impacts at 5 of the 11 analyzed street segments, which all have significance thresholds of one trip under the City of Santa Monica's criteria. The following segments are impacted by the proposed project:

- 2nd Street between Wilshire Boulevard and California Avenue
- California Avenue between Ocean Avenue and 2nd Street
- California Avenue between 2nd Street and 3rd Street
- California Avenue between 3rd Street and 4th Street
- California Avenue between 4th Street and 5th Street

No feasible mitigation measures are available to fully mitigate all street segment impacts, including relocating the project's access point or turn restrictions that would limit motorists that arrive or depart the project site from using the public street grid and these street segments. Therefore, the project impacts to these street segments would be significant and unavoidable.

1. INTRODUCTION

Fehr & Peers evaluated the potential traffic impacts of the proposed Miramar Hotel project in the City of Santa Monica. This report identifies the baseline traffic conditions of the transportation network, describes the methodology and assumptions for the analysis, and summarizes the findings of the study that was conducted as part of the environmental impact report (EIR) for the proposed project.

PROJECT DESCRIPTION

The proposed Miramar Hotel project site is located at 1133 Ocean Avenue/101 Wilshire Boulevard on the City of Santa Monica block bounded by Wilshire Boulevard, Ocean Avenue, California Avenue, and 2nd Street (the "Hotel Parcel"). The Hotel Parcel is approximately 192,063 square feet (4.4 acres) in size. Upon completion, development on the Hotel Parcel will consist of:

- Rehabilitation and ongoing hotel use of the historic Palisades Building (a City-designated landmark)
- Preservation and protection of the Moreton Bay Fig Tree (a City-designated landmark) as a focal point of the Project
- Relocation of the main entry drive from Wilshire Boulevard to 2nd Street
- Removal of the existing surface parking lots
- Demolition of all non-landmarked buildings
 - Construction of two new buildings (referred to as the Ocean Building and the California Building) Including 60 new residential condominium units
 - 312 hotel guest rooms
- 6,600 square feet of retail space, 12,500 square feet of spa and fitness space, and 19,708 square feet of restaurant space
- Expansion of public and guest open space areas on the ground level and in building terraces and rooftops
- Construction of a subterranean parking garage beneath the newly constructed buildings and open space

The Project will include three vehicular access points to/from the Hotel Parcel:

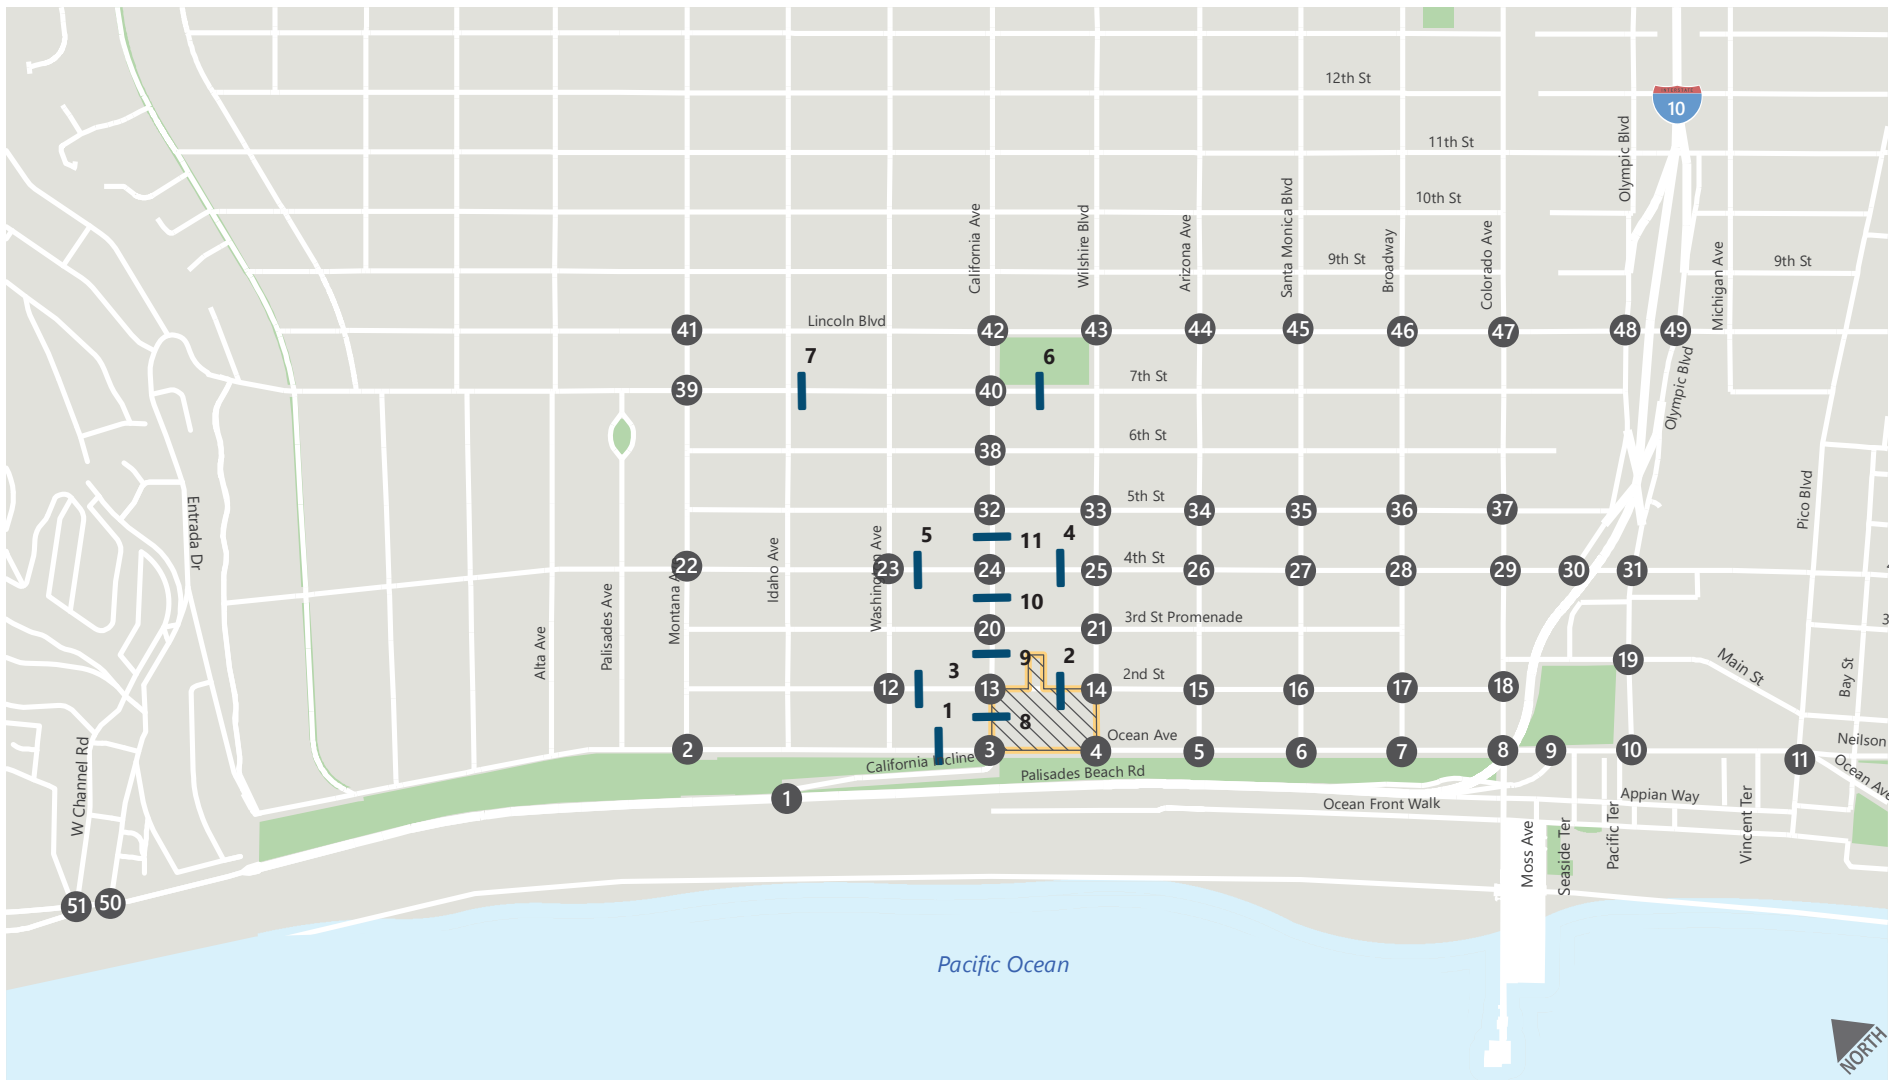

- A new entry court on 2nd Street to serve the Project's hotel and restaurant/retail uses and provide an access alternative for residents
- A secondary access driveway on California Avenue, located approximately 100 feet east of Ocean Avenue, to serve employees only and provide direct access to the underground parking while appropriately disbursing trips around the Hotel Parcel
- A modified entry and access driveway on Ocean Avenue for use by residents to provide direct access to the underground parking structure.

The 2nd Street Entry Court, the Ocean Avenue Entry and the California Avenue Entry would provide direct access to the subterranean parking.

Additionally, the Project will include the development of the parcel located at 1127/1129 2nd Street (the "Second Street Parcel"). The Second Street Parcel, which is located directly across 2nd Street from the Hotel Parcel, is approximately 15,000 square feet (0.3 acre) in size and is currently used as surface parking lot by the hotel. The Second Street Parcel development would include a 100% affordable housing component with a minimum of 30 and a maximum of 48 affordable apartments.

Site Plan

STUDY SCOPE

In accordance with CEQA and City requirements, this study covers a range of various topics, including intersection operations, regional transportation network operations, vehicle miles traveled, residential street segments, and project alternatives.

Intersection Operations

This study evaluates the project's potential to impact intersection operations of the surrounding street system as a result of project-generated vehicle trips. Specifically, the project's peak hour traffic impacts during the typical weekday AM (7:30 to 9:30 AM) and PM (5:00 to 7:00 PM) peak periods were evaluated. In addition, since the project site is located in the Downtown district where weekend traffic volumes tend to be relatively high, the study also analyzed traffic impacts during the weekend midday peak period (1:00 to 5:00 PM) for all locations on and west of Lincoln Boulevard.

In consultation with the City of Santa Monica and City of Los Angeles staff, 51 intersections in the project vicinity were selected for analysis. These intersections were selected as the ones most likely to be affected by project-generated trips. Per City of Santa Monica traffic study guidelines, all 51 study intersections were analyzed using the *Highway Capacity Manual* (HCM) (Transportation Research Board, 2010) operations methodology. A total of 43 intersections are currently controlled by traffic signals. The study examined the intersections for each of the traffic scenarios. The intersections are listed below and illustrated in Figure 1:

1. Palisades Beach Road & California Incline
2. Ocean Avenue & Montana Avenue
3. Ocean Avenue & California Avenue
4. Ocean Avenue & Wilshire Boulevard
5. Ocean Avenue & Arizona Avenue
6. Ocean Avenue & Santa Monica Boulevard
7. Ocean Avenue & Broadway
8. Ocean Avenue & Colorado Avenue
9. Ocean Avenue & Moomat Ahiko Way
10. Ocean Avenue & Olympic Drive
11. Ocean Avenue & Pico Boulevard
12. 2nd Street & Washington Avenue (unsignalized)
13. 2nd Street & California Avenue (unsignalized)
14. 2nd Street & Wilshire Boulevard
15. 2nd Street & Arizona Avenue
16. 2nd Street & Santa Monica Boulevard
17. 2nd Street & Broadway
18. 2nd Street/Main Street & Colorado Avenue
19. Main Street & Olympic Drive
20. 3rd Street & California Avenue (unsignalized)

21. 3rd Street & Wilshire Boulevard
22. 4th Street & Montana Avenue
23. 4th Street & Washington Avenue (unsignalized)
24. 4th Street & California Avenue
25. 4th Street & Wilshire Boulevard
26. 4th Street & Arizona Avenue
27. 4th Street & Santa Monica Boulevard
28. 4th Street & Broadway
29. 4th Street & Colorado Avenue
30. 4th Street & I-10 Westbound Off-Ramp
31. 4th Street & I-10 Eastbound On-Ramp
32. 5th Street & California Avenue (unsignalized)
33. 5th Street & Wilshire Boulevard
34. 5th Street & Arizona Avenue
35. 5th Street & Santa Monica Boulevard
36. 5th Street & Broadway
37. 5th Street & Colorado Avenue
38. 6th Street & California Avenue (unsignalized)
39. 7th Street & Montana Avenue
40. 7th Street & California Avenue (unsignalized)
41. Lincoln Boulevard & Montana Avenue
42. Lincoln Boulevard & California Avenue (unsignalized)
43. Lincoln Boulevard & Wilshire Boulevard
44. Lincoln Boulevard & Arizona Avenue
45. Lincoln Boulevard & Santa Monica Boulevard
46. Lincoln Boulevard & Broadway
47. Lincoln Boulevard & Colorado Avenue
48. Lincoln Boulevard & I-10 Westbound Ramps/Olympic Boulevard
49. Lincoln Boulevard & I-10 Eastbound On-Ramp
50. Pacific Coast Highway (SR-1) & Entrada Drive (Caltrans/City of Los Angeles)
51. Pacific Coast Highway (SR-1) & Chautauqua Boulevard/Channel Road (Caltrans/City of Los Angeles)

To analyze the project's impacts on the 51 study intersections, the following traffic scenarios were analyzed in the study:

- Existing Conditions (2017/2018) – The analysis of existing conditions provides the basis for the assessment of Approval Year (2020) and Future Year (2025) traffic conditions. This assessment is based on the citywide weekday and weekend traffic counts collected by the City in 2017 (weekend counts were collected in 2018 for 17 intersections). The existing conditions analysis included a description of key area streets and highways, traffic volumes at intersections, and operating conditions of the intersections.
- Approval Year (2020) "No Project" Conditions – This scenario reflects the base traffic conditions expected in the project's anticipated Approval Year (2020) without the project and provides the baseline by which the project's impacts in the Approval Year were evaluated. It includes cumulative development projects that have been or will be completed between the 2017/2018 baseline counts and 2020. This scenario provides the baseline conditions against which project impacts were evaluated. The latest version of the City of Santa Monica's Travel Demand Forecasting Model (TDFM) was used to project Approval Year (2020) No Project traffic forecasts.
- Approval Year (2020) Plus Project Conditions – This scenario reflects the traffic conditions expected in the project's anticipated Approval Year (2020) with inclusion of the project's trips. This scenario identifies the potential traffic impacts of the project on Approval Year traffic operating conditions by adding project-generated trips to the Approval Year (2020) No Project traffic forecasts. The City's TDFM was used to inform project trip distribution and trip assignment under Approval Year (2020) conditions.
- Future Year (2025) "No Project" Conditions – This scenario reflects the future traffic conditions expected in the year 2025 without the project. This scenario identifies future operating conditions of the study intersections as a result of regional growth and known "cumulative projects" in the study area by year 2025. This scenario also accounts for future street network changes that would affect traffic conditions. The Future Year (2025) No Project forecasts were also developed using the City's TDFM.
- Future Year (2025) Plus Project Conditions – This analysis reflects the traffic conditions expected in the Future Year (2025) with inclusion of the project's trips. This scenario was developed using the same methodology described for the Approval Year plus Project conditions.

Residential Street Segments

In addition, due to the project's proximity to residential neighborhoods, the project's impacts on the weekday and weekend operations of street segments surrounding the project site were analyzed. The 11 street segments listed below were analyzed.

1. Ocean Avenue north of California Avenue
2. 2nd Street between Wilshire Boulevard and California Avenue
3. 2nd Street between California Avenue and Washington Avenue
4. 4th Street between Wilshire Boulevard and California Avenue
5. 4th Street between California Avenue and Washington Avenue
6. 7th Street between Wilshire Boulevard and California Avenue
7. 7th Street between Washington Avenue and Idaho Avenue
8. California Avenue between Ocean Avenue and 2nd Street
9. California Avenue between 2nd Street and 3rd Street
10. California Avenue between 3rd Street and 4th Street
11. California Avenue between 4th Street and 5th Street

Vehicle Miles Traveled

Authorized in September of 2013, Senate Bill (SB) 743 directed the Office of Planning and Research (OPR) to revise the CEQA Guidelines (Title 14 of the California Code of Regulations sections and following to establish new criteria for determining the significance of transportation impacts and define alternative metrics for traffic LOS. OPR adopted final guidelines in December 2018, and the provisions of SB743 are now in effect, with agencies having an opt-in period until July 1, 2020. At the time of this publication, the City of Santa Monica has not adopted VMT-based impact criteria. Project VMT analysis is included later in this report for informational purposes.

The estimates of VMT for the proposed project are based on the OPR guidance, which recommend evaluating each component of a mixed-use project independently. For residential uses, the suggested metric is VMT per capita. Guidance is provided for several broad land use types that account for majority of the development projects that are proposed (residential, office, retail). The proposed project includes Hotel, Retail, and Restaurant (which are fundamentally from retail from a travel perspective), and Residential. While there is no office-type land use for this project, employee VMT estimates were calculated.

Project Alternatives

Additionally, in accordance with CEQA Section 15126.6, this study analyzes the traffic impacts of alternatives to the project.¹ As permitted by CEQA, the alternatives are evaluated at a lesser level of detail than the project. These project alternatives are:

- Alternative 1 – No Project
- Alternative 2 – Ocean Ave Transition Zone Tier 2
- Alternative 3 – Hotel Only on Hotel Parcel (No Condominiums)
- Alternative 4 – Reduced Height and Density
- Alternative 5 – Alternate Massing
- Alternative 6 – Modified Access

Further descriptions of these alternatives are provided in Chapter 7, Project Alternatives.

ORGANIZATION OF REPORT

This report is divided into seven chapters, including this introduction. Chapter 2 describes the existing circulation system (including the roadway network, public transit, bicycle/pedestrian facilities), traffic volumes at intersections, and operating conditions of the intersections in the study area. Chapter 3 describes the methodologies used to develop future cumulative traffic forecasts and project traffic volumes. Chapter 4 presents an assessment of potential project traffic impacts on intersection operations in the vicinity of the project site. Chapter 5 presents a discussion of potential mitigation measures to address the identified intersection traffic impacts. Chapter 6 presents the analysis of potential project traffic impacts on nearby street segments. Chapter 7 analyzes the potential traffic impacts that could result from the project alternatives and compares them to the project.

¹ As required by CEQA, the study analyzes a range reasonable alternatives to the project and include ones that are potentially feasible, would "feasibly attain most of the basic objectives of the project," and would avoid or substantially lessen any of the project's significant effects.

2. EXISTING TRANSPORTATION CONDITIONS

The project site is located in the Downtown district of the City of Santa Monica. The Downtown district includes a dense urban mix of residential, retail, restaurant, office, entertainment, recreational, and institutional uses. A network of streets and sidewalks serving all modes of mobility supports circulation throughout the city, intermixing automobiles, buses, and people walking and bicycling. Additionally, the western terminus station for the Expo Light Rail Transit line (Expo Line) is located in the Downtown at 4th Street/Colorado Avenue (about ½ mile from the project site).

Due to the project site's proximity to popular destinations such as the Third Street Promenade, the Santa Monica Pier, and the oceanfront, nearby intersections can become congested during peak hours including weekends, holidays and events, as drivers navigate the Downtown. A discussion of the key circulation facilities in the Project study area is provided below:

EXISTING STREET AND FREEWAY SYSTEM

The project site is located at 1133 Ocean Avenue/101 Wilshire Boulevard and 1127/1129 2nd Street in the Downtown district of the City of Santa Monica. The project site is specifically bounded by California Avenue on the north, 2nd Street on the east, Wilshire Boulevard on the south, and Ocean Avenue on the east. The adjacent streets are described below:

- California Avenue is a one-lane east-west roadway that provides surface street access to the Downtown. California Avenue fronts 350 feet of the northern edge of the project site.
- 2nd Street is a one-lane north-south roadway that serves as a key entrance to California Avenue and Wilshire Boulevard. 2nd Street fronts the Hotel Parcel for about 600 feet of the eastern edge of the parcel and 120 feet of the western edge of the Second Street Parcel.
- Wilshire Boulevard is a two-lane east-west roadway that also provides surface street access to the Downtown. Wilshire Boulevard fronts the Hotel Parcel for about 350 feet, with two existing driveways accessing the Hotel Parcel.
- Ocean Avenue is a two-lane north-south roadway that runs along the western edge of the City of Santa Monica. Ocean Avenue fronts 600 feet of the eastern edge of the Hotel Parcel.

The Project Site has regional access via nearby arterials and freeways. The Pacific Coast Highway (PCH) is located at the foot of the Palisades bluff at the west edge of Ocean Avenue, just to the west of the Hotel Parcel. The California Incline (at California Avenue) provides direct access to PCH, and PCH in turn, provides access to the Santa Monica Freeway ("I-10"), which is located approximately 0.75 miles southeast of the California Incline, and the Pacific Palisades community to the north. The Hotel Parcel is located on Wilshire Boulevard, a major east-west arterial with an interchange at the San Diego Freeway ("I-405"), approximately

four miles to the east of the Hotel Parcel. Wilshire Boulevard also intersects 4th Street, 5th Street and Lincoln Boulevard, which provide direct access to the I-10 approximately 0.75 miles southeast of the Hotel Parcel.

The LUCE defines the street system according to its use by various modes including walking, biking, transit, and automobile. These street types include Boulevard, Special Streets, Downtown Commercial, Neighborhood Commercial, Major Avenue, Secondary Avenue, Minor Avenue, Industrial Avenue, Neighborhood Street, Shared Street, Parkway, Pathway, Bikeway, Highway, and Alley. The city streets surrounding the proposed project are described below based on their designations in the LUCE:

- Boulevard – Boulevards are regional transportation corridors with continuous mixed-use and commercial land uses. Boulevards provide access for all forms of transportation but emphasize transit and walking. Regional auto traffic is accommodated here in order to minimize regional traffic on parallel local streets. Boulevards in the study area include Wilshire Boulevard, Santa Monica Boulevard, Lincoln Boulevard (Wilshire Boulevard to Pico Boulevard), Ocean Avenue (California Avenue to Pico Boulevard), Main Street (Colorado Avenue to Pico Boulevard), and 4th Street (Wilshire Boulevard to Pico Boulevard).
- Special Streets – These streets are unique and ceremonial streets requiring special consideration. In the study area, the Third Street Promenade is a Special Street between Wilshire Boulevard and Broadway.
- Commercial: Downtown – These streets provide access for all transportation and support downtown Santa Monica. Downtown Commercial streets in the study area include Wilshire Boulevard (Ocean Avenue to 11th Street), Arizona Avenue (Ocean Avenue to Lincoln Boulevard), Santa Monica Boulevard (Ocean Avenue to 11th Street), 2nd Street (Wilshire Boulevard to Colorado Avenue), 5th Street (Wilshire Boulevard to Olympic Boulevard), 6th Street (Wilshire Boulevard to Colorado Avenue), 7th Street (Wilshire Boulevard to Olympic Boulevard), and Lincoln Boulevard (Wilshire Boulevard to Pico Boulevard).
- Avenue: Major – These streets serve regional automobile trips and provide access for all modes of transportation. They are designed to discourage regional auto traffic from using Secondary or Minor Avenues. The Major Avenues in the study area include the California Incline and Olympic Boulevard (4th Street to Lincoln Boulevard).
- Avenue: Secondary – These streets distribute auto trips onto Minor Avenues and Neighborhood Streets, often serving regional bicycle trips. Secondary Avenues in the project area include Broadway, Colorado Avenue, and Olympic Drive (Ocean Avenue to 4th Street).
- Avenue: Minor – These streets serve local auto and bicycle trips. Minor Avenues in the study area include 4th Street (Wilshire Boulevard to northern city limits), 7th Street (Wilshire Boulevard to northern city limits), and 11th Street (Wilshire Boulevard to Ocean Park Boulevard).

- Neighborhood Street – These streets primarily serve abutting buildings. Neighborhood Streets in the study area include 5th Street (Wilshire Boulevard to Montana Avenue), Arizona Avenue (Lincoln Boulevard to 11th Street), 9th Street, 10th Street, and Lincoln Boulevard (Wilshire Boulevard to northern city limits).
- Parkway – Parkways serve as linear parks incorporating continuous landscaping, recreational bikeways and pedestrian paths. The Pacific Palisades Parkway in the study area is west of Ocean Avenue.

Lane configurations at the study intersections are illustrated in Appendix B1.

EXISTING PUBLIC TRANSIT SERVICE

Santa Monica's Big Blue Bus and the Los Angeles County Metropolitan Transportation Authority (Metro) provide a dense network of public transit service throughout the study area. The project site is directly accessible via transit from most of Santa Monica and much of the Los Angeles metropolitan area including Downtown Los Angeles, UCLA/West Los Angeles, Century City, LAX, Venice, Culver City.

Metro Exposition Line LRT and Downtown Santa Monica Station

The project site is located approximately ½ mile north of the Downtown Santa Monica Station of the Exposition Light Rail (Expo LRT) line, which is the western terminus of the line. The Downtown Santa Monica Station is located at 4th Street/Colorado Avenue. The Expo LRT began operation in Santa Monica in May 2016, connecting Santa Monica through West Los Angeles to Culver City and continuing to downtown Los Angeles. The Expo LRT line makes 19 stops including the Downtown Santa Monica station and connects with other Metro rail service in downtown Los Angeles. Service operates daily from about 4:00AM through 2:00AM, with peak headways of six to eight minutes in both directions and off-peak headways between 12 and 20 minutes. A new connecting line along Crenshaw Boulevard is under construction and will open in 2020, providing service south towards LAX and connecting with the Metro Green Line.

All Big Blue Bus and Metro bus lines operating in Downtown Santa Monica have a connecting stop within a few hundred feet of the Downtown Santa Monica station. Bikesharing stations, bicycle lane facilities, and bicycle service facilities are located either adjacent or very close to the station as well.

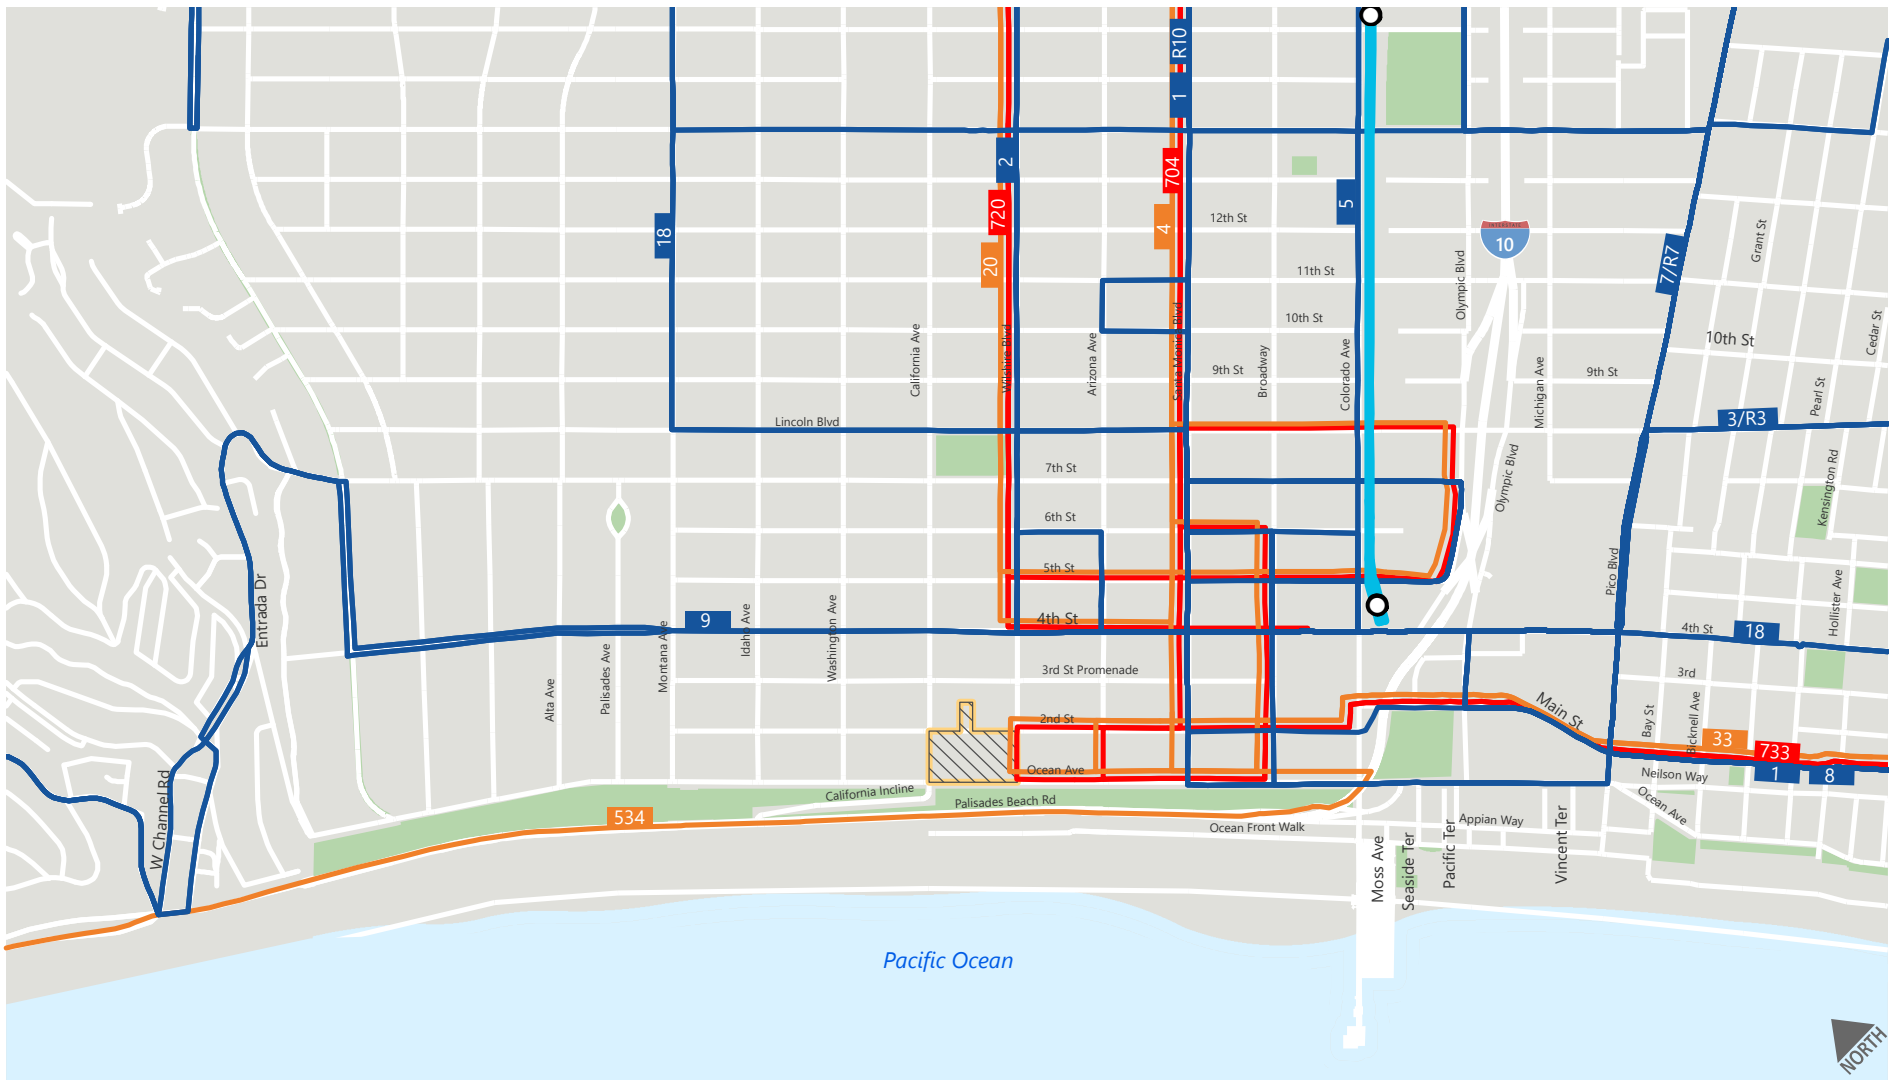

Public Buses

Figure 3 shows the transit lines and stops near the project site. There are 6 fixed-route bus lines within ¼-mile of the project site:

- Big Blue Bus Line 2 (Wilshire Boulevard) – Line 2 runs from the Civic Center through downtown Santa Monica to UCLA. Headways are approximately 15-20 minutes. The stop closest to the project site is at 4th Street & Wilshire Boulevard.
- Big Blue Bus Line 3 / Rapid 3 (Lincoln Boulevard) – Line 3 runs from the Metro Green Line/Aviation Station along Lincoln Boulevard to downtown Santa Monica via Lincoln Boulevard and 4th Street. Headways are approximately 10 minutes during weekday and weekend peak periods and 15-20 minutes off-peak. The stop closest to the project site is at 4th Street & Wilshire Boulevard.
- Big Blue Bus Line 5 (Olympic Boulevard) – Line 5 runs between downtown Santa Monica and Century City via Colorado Avenue and Olympic Boulevard and continues from Century City to the Palms Expo Line Station. Headways are every 20-30 minutes during the weekday. The stop closest to the project site is on 4th Street and East of Wilshire Boulevard.
- Big Blue Bus Line 9 (Pacific Palisades) – Line 9 runs from the Civic Center through downtown Santa Monica to Pacific Palisades. In the study area, Line 9 operates on 4th Street with headways of 30 minutes during the weekday and weekend peak hours. The stop closest to the project is on 4th Street & Wilshire Boulevard.
- Metro Line 20 / Rapid 720 (Wilshire Boulevard) – Line 20/720 operates on Wilshire Boulevard between Santa Monica and Downtown Los Angeles. Rapid 720 service is limited-stop operating throughout the day with 10-minute headways in the peak period and peak direction and approximately 15-20 minute headways at other times. Overnight, local service on Line 20 operates on approximately 20-30 minute headways after BBB Line 2 ceases operation. The stop closest to the project is on 2nd Street at Wilshire Boulevard.
- Metro Line 33 / Rapid 733 (Venice Boulevard) – Line 33/733 provides service on Venice Boulevard and Main Street between Santa Monica and Downtown Los Angeles. The Rapid 733 operates with 15-20 minute headways throughout the day. Line 33 extends local service along Main Street to Santa Monica from Venice during the late evening and overnight periods. The closest stop to the project site is on 2nd Street at Santa Monica Boulevard.

Transit Lines

- Big Blue Bus
- Expo Line
- Metro Local
- Metro Rapid

 Project Site

Miramar Hotel Project - Existing Transit

EXISTING BICYCLE AND PEDESTRIAN FACILITIES

Bicycle Network

Downtown Santa Monica hosts a dense network of bicycle facilities including some immediately adjacent to the project site. Bicycle lanes extend in both direction on California Avenue from Ocean Avenue to 17th Street, and then on Ocean Avenue on both sides from Wilshire Boulevard to California Avenue. The existing bicycle facilities within ½ mile of the project site are listed below.

The following streets near the project have marked bicycle lanes separating bicyclists from vehicles:

- Ocean Avenue between San Vicente Boulevard and Bicknell Avenue
- 2nd Street between Montana and Colorado Avenue, serving the City's Bike Center
- Main Street between Colorado Avenue and the Santa Monica southern city boundary
- 6th Street between Montana Avenue and Colorado Avenue
- 7th Street between Wilshire Boulevard and Olympic Boulevard
- Broadway between 5th Street and Centinela Avenue
- California Avenue between Ocean Avenue and 26th Street
- The California Incline includes a two-way cycletrack with a connecting bridge across the Pacific Coast Highway for beach access
- Arizona Avenue between Ocean Avenue and the eastern city limit
- 11th Street between Olympic Boulevard and Wilshire Boulevard

In addition to these facilities, the City has recently marked various streets in the Downtown area as shared-vehicle/bicycle lanes and included bicycle detection zones at signalized intersections. These lanes have been painted with "sharrow" markings. Streets with these markings include 4th Street, Broadway, and Colorado Avenue. Additional designated future bicycle routes with shared lane marking are proposed in the City's 20-Year Bicycle Implementation Plan. A number of intersections in downtown Santa Monica have also been equipped with bicycle detection cameras.

A review of 2019 weekend peak hour bicycle counts in the Miramar study area shows that cycling activity is highest at Ocean Avenue & California Avenue. The bicycle counts for four intersections are listed below:

1. Ocean Avenue & California Avenue: 155
2. Ocean Avenue & Wilshire Boulevard: 85
3. 2nd Street & Wilshire Boulevard: 39
4. 3rd Street & Wilshire Boulevard: 42

Bicycle Parking

Bicycle parking is available throughout the study area, including in many parking structures, on-street racks, and at public and private facilities. For example, indoor bicycle parking and lockers are provided in Parking Structures #1, #3, #5, #6, and #7 in Downtown. The City continues to install racks throughout the Downtown. In addition, the Bike Center, located on Colorado Avenue at Parking Structure 8 of the Santa Monica Place Mall provides secure bike parking and a variety of mobility services, including retail, bike repair, bike rental, attended bike parking, public information on alternative transportation, and a variety of additional related service.

Bike Share

The City also offers the Breeze Bike Share service, which allows residents, visitors, and employees to ride a public bicycle for their travel needs within the City. The bikeshare program makes several hundred "smart" bicycles available at more than 80 stations citywide including downtown, and in Venice in the City of Los Angeles.

Pedestrian Facilities

Pedestrian activity is high in the Downtown, and sidewalks are present on all streets throughout the Downtown. In 2016, the City converted pedestrian crossings and signals at the following Downtown intersections to "scramble" types, in which pedestrians are given an exclusive phase to cross in any direction while vehicles hold:

- Ocean Avenue & Colorado Boulevard
- 2nd Street & Wilshire Boulevard
- 2nd Street & Arizona Avenue
- 2nd Street & Santa Monica Boulevard
- 2nd Street & Broadway
- 2nd Street & Colorado Avenue
- 3rd Street & Wilshire Boulevard
- 4th Street & Wilshire Boulevard
- 4th Street & Arizona Avenue
- 4th Street & Santa Monica Boulevard
- 4th Street & Broadway
- 4th Street & Colorado Avenue

Santa Monica also recently updated many other traffic signals in the study area to include a “leading pedestrian interval” (LPI), which holds all vehicle movements (red signal) for several seconds at the start of a pedestrian phase to improve safety by giving pedestrians a head start and improve their visibility to motorists. Signals (other than those listed above) along Wilshire Boulevard, Ocean Avenue, and elsewhere have been updated with LPIs since 2017. The new LPI timings are incorporated in this analysis.

Signalized intersections throughout the study area have marked or textured crosswalks and pedestrian countdown signals. Signalized pedestrian walk signals are either automatic at the intersection or actuated by pedestrians by push-button. All intersections have accessible curb ramps.

A review of 2019 weekend peak hour pedestrian counts in the Miramar study area shows that walking activity is highest at Ocean Avenue & California Avenue. The pedestrian counts for four intersections are listed below:

1. Ocean Avenue & California Avenue: 877
2. Ocean Avenue & Wilshire Boulevard: 461
3. 2nd Street & Wilshire Boulevard: 728
4. 3rd Street & Wilshire Boulevard: 711

OTHER TRANSPORTATION CHOICES

Shared Mobility Technologies

The growth of privately-operated Transportation Network Companies (TNCs) like Lyft and Uber has also changed the way people move in and around the City. TNC's provide app-based platforms to connect passengers with drivers who use personal, non-commercial vehicles. Lyft and Uber have become the most recognized and ubiquitous forms of shared mobility. Research around the nation in recent years suggests that usage of Lyft and Uber is generating an increase in traffic². Other research has suggested this result is in part because many users are making trips they would not have made previously, and in some cases replacing transit trips.

Since late 2017, the City has seen the burgeoning of dockless mobility devices, including Bird and Lime electric scooters, on City streets. These dockless mobility devices have taken off in Santa Monica and the region. Dockless systems allow scooters and bikes to be left in any location. In June 2018 the City adopted new regulations to address safety concerns associated with dockless mobility devices. Their influence is included in existing count data as bicycles, but no assumption of changes to mobility behavior are included in the analysis given the new and rapidly changing circumstances as well as lack of available data.

EXISTING INTERSECTION LEVELS OF SERVICE

The following section describes existing peak hour traffic volumes at the 51 study intersections, the methodology used to analyze operating conditions at the intersections, and resulting levels of service (LOS) for the selected study intersections under existing conditions. LOS measures vehicle delay at intersections and on roadways. LOS is a method for characterizing the operational conditions at an intersection generally accounting for measures such as speed, delays, travel time, freedom to maneuver, traffic interruptions, and comfort and convenience.

Existing Traffic Volumes

The most recent traffic volume count data was collected in 2017 by the City of Santa Monica and Fehr & Peers. Counts were collected in the fall (when school was in session) for weekday AM and PM peak periods and in the summer for weekend midday period (additional weekend counts were collected in 2018 for 17 intersections). The highest one-hour volume in each period at each intersection was selected for use in this study, providing a conservative, worst-case analysis. The existing traffic volumes for the analyzed peak hours and the lane geometry of each intersection are shown in Appendix B1.

Level of Service (LOS) Methodology/Definition

In accordance with the City's adopted impact analysis, the "Operational Analysis" method from *Highway Capacity Manual* was employed to perform signalized intersection LOS analysis at all signalized study intersections.

The HCM 2010 operational method determines two key operating characteristics of signalized intersections. The first characteristic is the average stopped delay experienced per vehicle. The second is the volume-to-capacity (V/C) ratio at intersections. Both metrics are based on the amount of traffic traveling through the intersection, the turning movements of that traffic, the lane geometries, and other factors affecting capacity such as pedestrian volumes at the street crosswalks. These characteristics are used to evaluate the operation of each signalized intersection, which is described generally in terms of LOS.

LOS categories range from excellent, nearly free-flow traffic at LOS A to overloaded, stop-and-go conditions at LOS F. Table 1 provides LOS definitions for signalized intersections using the HCM 2010 methodology. Table 2 provides LOS definitions for unsignalized intersections using the HCM 2010 methodology. The LOS definitions and ranges of delay shown in these tables represent average conditions for all vehicles at an intersection across an entire hour. Delays longer than the average condition are experienced by motorists on certain movements and/or during peak times within the peak hour.

Of the 51 study intersections, 43 are signalized and 8 are unsignalized. Of these intersections, 33 are classified as Arterial intersections, and 18 are classified as Collector intersections.³ The City of Santa Monica's adopted criteria has designated LOS D as the minimum desirable LOS at arterial intersections and LOS C as the minimum desirable LOS at collector street intersections. The minimum desirable LOS – the design condition – allows for some queuing and delays at intersections during peak periods. At intersections operating at an undesirable LOS, delays and queuing are greater than what is considered acceptable.

Existing Levels of Service

The results of the analysis of existing weekday AM and PM and weekend midday peak hour conditions at the study intersections using the HCM 2010 methodology are summarized in Table 3. As shown, eight of the 51 study intersections currently operate at poor conditions during at least one of the analyzed peak hours under the existing conditions scenario:

1. Palisades Beach Road & California Incline (LOS E during the AM and weekend peak hours)
3. Ocean Avenue & California Avenue (LOS F during the PM and weekend peak hours)
14. 2nd Street & Wilshire Boulevard (LOS E during the PM peak hour, LOS F during the weekend peak hour)
16. 2nd Street & Santa Monica Boulevard (LOS F during the PM peak hour, LOS E during the weekend peak hour)
19. Main Street & Olympic Drive (LOS F during the AM peak hour, LOS E during the weekend peak hour)
47. Lincoln Boulevard & Colorado Avenue (LOS E during the AM peak hour)
48. Lincoln Boulevard & I-10 WB Off-Ramp (LOS F during the AM peak hour)
51. Pacific Coast Highway & Channel/Chautauqua (LOS F during the AM peak hour, LOS E during the PM and weekend peak hours)

³ Functional street classifications used with respect to LOS are based on the City's previous Circulation Element. The 2010 LUCE has adopted a different typology for streets in the City, but the significance criteria have not yet been revised.

TABLE 1
LEVEL OF SERVICE DEFINITIONS FOR SIGNALIZED INTERSECTIONS
HCM 2010 METHODOLOGY

Level of Service	Average Stopped Delay per Vehicle (seconds)	Definition
A	≤ 10	EXCELLENT. No vehicle waits longer than one red light and no approach phase is fully used.
B	> 10 and ≤ 20	VERY GOOD. An occasional approach phase is fully utilized; many drivers begin to feel somewhat restricted within groups of vehicles.
C	> 20 and ≤ 35	GOOD. Occasionally drivers may have to wait through more than one red light; backups may develop behind turning vehicles.
D	> 35 and ≤ 55	FAIR. Delays may be substantial during portions of the rush hours, but enough lower volume periods occur to permit clearing of developing lines, preventing excessive backups.
E	> 55 and ≤ 80	POOR. Represents the most vehicles intersection approaches can accommodate; may be long lines of waiting vehicles through several signal cycles.
F	> 80	FAILURE. Backups from nearby locations or on cross streets may restrict or prevent movement of vehicles out of the intersection approaches. Tremendous delays with continuously increasing queue lengths

3. TRAFFIC FORECASTS

TRAFFIC PROJECTIONS

Travel Demand Forecasting Model (TDFM) Projections

The Santa Monica LUCE (adopted in July 2010) provides a framework for integrating land use and transportation to reduce vehicle trips; encourage walking, bicycling and transit use; and create active, pedestrian-oriented neighborhoods. The LUCE establishes the goal of achieving no net new PM peak period vehicle trips generated within Santa Monica. There are three ways that trip generation rates are reduced in response to future conditions: the D's (i.e., density, diversity, destination, etc.),⁴ the Expo LRT, and LUCE TDM strategies.

As part of the City's LUCE update, the City developed its first comprehensive, citywide TDFM. The TDFM was calibrated to a base year of 2013, based on 2013 land use data and 2013 traffic counts. The City of Santa Monica's land use data is supplemented by Southern California Association of Governments (SCAG) traffic analysis zone (TAZ)-based data for areas in the City of Los Angeles bordering the City of Santa Monica. The TDFM forecasts future conditions for the City's transportation network in the form of traffic volumes for daily, as well as AM, PM, and weekend midday peak hours. The model contains the major roadways in the City and considers the trip reduction effects of walking, bicycling, and transit, including the Expo Light Rail Transit (Expo) line. The model also includes all identified development projects and street network changes. Additional details are provided in Appendix C.

The TDFM contains a number of enhancements that allow it to capture the effects of land use and circulation element policy initiatives on traffic congestion. These enhancements include the effects of sustainable development patterns (e.g., mixed-use and transit-oriented development), urban streetscape design factors, alternative transportation networks, parking pricing and management, and TDM programs.

The TDFM outputs forecasted traffic volume estimates for intersections in the study area. These forecast volumes are loaded into the City of Santa Monica's VISTRO database for intersection level of service analysis. VISTRO is a software tool that evaluates intersection delay based on traffic turning volumes at intersections.

⁴The D's are a simple means of quantifying the transportation benefits of smart growth. They predict reductions in per-capita vehicle trips and miles in response to increases in development density, diversity, design and destination and other patterns within a region.

Approval Year and Future Year Traffic Conditions

To evaluate the potential impacts of the proposed project on intersections for the surrounding street system, it was necessary to develop estimates of Approval Year (2020) and Future (2025) traffic forecasts in the area both without and with project traffic:

- To develop the Approval Year (2020) scenario without the project, the land use file in the TDFM was updated to include the development projects with the model area that were completed or anticipated to be completed between the time of the model base year (2013) and Approval Year (2020). The model forecast informs the travel pattern changes, which are then applied to the Existing Year 2017 counts to develop the Approval Year (2020) No Project forecast. These projected traffic volumes, referred to as Approval Year No Project projections, represent the conditions expected during the project's Approval Year and provide the baseline for the Approval Year Plus Project traffic impact analysis. Appendix D1 lists the development projects included in the Approval Year land use forecasts.
- To develop the Future Year (2025) Scenario without the project, the land use file in the TDFM was updated to include the list of approved and pending (proposed) projects. These projects are conservatively assumed to all be completed between 2013 and Future Year (2025). Similar to the 2020 forecasts, land use and through trips outside the city were linearly interpolated. These projected traffic volumes, referred to as Future No Project projections, represent the conditions expected during year 2025 and provide the baseline for the Future Plus Project traffic impact analysis. Appendix D2 lists the development projects included in the Future Year land use forecasts.
- The traffic generated by the proposed project was estimated and assigned to the surrounding street system. The Santa Monica TDFM was run to provide information on trip distribution patterns for retail and residential land uses in this part of the city and that information was used as a guide to assign project trips to the roadway network. The project traffic was added to the Approval Year No Project scenario and Future No Project projections to form the Approval Year plus Project and Future Year plus Project traffic projection scenarios respectively.

Once these traffic projections were developed, analyses were conducted to determine the effect of the proposed project. The difference between no project and plus project scenarios represents the incremental changes in traffic attributable to the project itself.

TRIP GENERATION ESTIMATES

Santa Monica Trip Generation Rates

Santa Monica is generally characterized by compact urban development, high levels of public transit service, walkable and bike-friendly streets, and employer-sponsored Travel Demand Management (TDM) programs. The unique local characteristics of Santa Monica (such as compact density, availability of transit, diversity of land uses) require the development of specific trip generation rates to estimate trips associated with land uses in Santa Monica. These Santa Monica-specific trip rates are more appropriate for estimating trip generation rather than standard ITE rates which are more reflective of suburban locations.

Local trip generation rates were developed and calibrated for existing conditions as part of the Santa Monica TDFM development for a variety of land use types, including residential, retail, and restaurant. As part of the model development, these "existing" trip generation rates were initially based on residential trip generation surveys, the SCAG regional model, the San Diego Association of Governments' (SANDAG) trip generation survey, models in similar areas, and *Trip Generation, 8th Edition* (ITE, 2010). The rates were then modified to account for local conditions based on counts, production-to-attraction balancing, and the difference between ITE and model land use definitions.

The existing Santa Monica trip generation rates are unique to the Santa Monica model, and they are ultimately based on the results of model calibration and validation. Two sets of rates were developed reflecting the different levels of trip reduction effectiveness for different areas of the City. The first includes areas of the City in Downtown Santa Monica and the Special Office District, which are determined to have lower trip generation rates through calibration and validation of the Santa Monica TDFM (reflecting characteristics such as higher built environment density, numerous transit lines, and a greater share of pedestrian trips). The second rate includes the remainder of the City.

As part of the development of the TDFM, existing calibrated Santa Monica trip generation rates were modified to reflect the effectiveness of the TDM/trip reduction strategies required by the City (and consistent with what was envisioned in the LUCE). Since the City of Santa Monica trip generation rates assume a robust TDM program, the project applicant will be required to prepare and implement a TDM plan that achieves the targeted levels of trip reductions as set forth in the development agreement.

Existing Trip Generation Rates

Although the City's TDFM include a variety of trip generation rates for various uses, the model does not include trip generation rates for hotel uses. The existing hotel includes a 301-room hotel, with 13.599 ksf of restaurant space, 1.235 ksf of retail, and 5.569 ksf spa and fitness. To estimate trip generation that accurately reflect the site's unique uses and characteristics, the trip generation rates for the hotel and related non-residential uses were empirically derived from surveys provided by the applicant. A consulting firm hired by the applicant conducted intercept surveys on a typical weekday and weekend at on-site entrance and departure locations around the existing hotel site to obtain method of arrival and trip purpose data. The

data was then converted to vehicle trips from which the trip generation rates for all analysis periods were then derived. The data was taken during periods of higher than average occupancy at the hotel (96-97% occupancy). Therefore, they are more conservative than conditions during normal occupancy. The applicant's trip generation study memorandum is included in Appendix E.

Non-employee and employee survey respondents who stated that they were arriving or leaving by: (a) valet parking at the hotel; (b) driving and parking at off-site locations; (c) using a TNC; or (d) using a third-party private car were counted as vehicular trips. Loading dock staff also counted each truck arrival and departure from the loading dock as a vehicular trip. Non-vehicular travel, such as by bike, scooter or walking (except to an off-site vehicle) was also documented. The surveys also identified the purpose of the trip resulting in distinct trip generation rates for guests of the hotel, restaurant, spa/fitness, and retail.

Employee trips were also calculated using separate rates. The employee peak hour trip generation and inbound/outbound splits are substantially different from other uses. The trip generation detail shows that the majority of employees arrive outside of the peak traffic hour of analysis.

The empirical employee trip generation is an important separate element for this project because the existing hotel provides no on-site parking for employees, meaning that these trips currently arrive and depart from the surrounding neighborhood on-street parking, rather than the project site itself. The existing Miramar Hotel provides effectively no employee parking on-site. Almost all hotel employees generally park at metered parking along Ocean Avenue, California Avenue and 2nd Street, at unmetered parking along the east side of Ocean Avenue, and potentially at unmetered parking in the surrounding neighborhood. The majority of residential streets in the project study are located in preferential parking zones, such that parking is restricted to residential permit holders between 6:00PM and 8:00 AM.

Hotel, restaurant, and spa guests currently using Fairmont Miramar facilities generally enter the site from a driveway on Wilshire Boulevard. Valet service is available on-site, with vehicles either being moved to parking within the loop driveway, and on a surface lot at the corner of Wilshire Boulevard & Ocean Avenue. Additional valet vehicle storage is available in a lot along 2nd Street between Wilshire Boulevard and California Avenue. Finally, the project site has access to an overflow valet lot on the south side of Wilshire Boulevard on evenings and weekends.

Existing guest traffic was assigned to enter the site via the Wilshire Boulevard driveway. Approximately two-thirds of users were assumed to be parked in the main parking lot. The additional one-third of vehicles were assigned to the 2nd Street valet parking lot. Most valet trips to the 2nd Street lot were assumed to travel clockwise around the block via Wilshire Boulevard, Ocean Avenue, California Avenue and 2nd Street. A portion of the valet trips were also assumed to travel there by making a left turn out of the Wilshire driveway, a left turn at the intersection of 2nd Street & Wilshire Boulevard, and a right turn into the lot. Valets returning cars to the main entrance were assumed to travel on 2nd Street and Wilshire Boulevard, and from there drivers would then exit the driveway to their ultimate destinations. In accounting for the off-site valet, most of the additional traffic was ultimately added to 2nd Street & Wilshire Boulevard. With the addition of more on-site parking under the proposed project, these linked trips were removed from the network.

Notes:

[a] Rates derived empirically to reflect site-specific conditions, as documented in LLG Memo: "Addendum Trip Generation Report" (July 29, 2019)

[b] Trip generation for project land use in 2020 from TDFM (Area Type 1), without Expo reduction from Table 14 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #820 Shopping Center, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.

[c] Trip generation for project land use in 2020 from TDFM (Area Type 1), without Expo reduction from Table 14 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #220 Multifamily Housing, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.

[d] Based on market conditions and to provide future operational flexibility, the Project proposes to allow owners of condominiums the ability to periodically make their units available for use as hotel guest rooms. A maximum of 10 of the condominium units would be utilized as hotel guest rooms at any one time. These 10 units were analyzed as condominiums for the purpose of this study, which is conservative because residential trip generation rates are similar or higher than hotel trip generation rates.

Project Trip Generation

The project includes 60 new residential condominium units, 312 hotel guest rooms, 6,600 square feet of retail space, 12,500 square feet of spa and fitness space, and 19,708 square feet of restaurant space. Based on market conditions and to provide future operational flexibility, the Project proposes to allow owners of condominiums the ability to periodically make their units available for use as hotel guest rooms. A maximum of 10 of the condominium units would be utilized as hotel guest rooms at any one time. These 10 units were analyzed as condominiums for the purpose of this study, which is conservative because residential trip generation rates are similar or higher than hotel trip generation rates. Because the proposed project would redevelop the site with similar hotel, restaurant, lounge and spa-fitness uses, using the empirically-derived trip generation rates for these uses from the existing site is the most accurate means of estimating the future trip generation for the various hotel land uses.

Trip generation rates for the new residential and renovated retail uses are based on Table 14 of the *Santa Monica Travel Demand Forecasting Model Trip Generation Rates*. The inbound-outbound split of trips in each peak period is applied based on *Trip Generation Manual, 10th Edition* (Institute of Transportation Engineers, 2017). The inbound/outbound splits for residential land use are from #220 Multi-Family Housing and the retail use are from #820 Shopping Center. The mix of residential unit sizes assumed is based on information provided by the project applicant.

As shown in Table 4, the proposed project is expected to generate approximately 256 weekday AM peak hour trips, 224 weekday PM peak hour trips and 416 weekend midday peak hour trips. Taking into account the removal of the existing uses, the proposed project is expected to generate a net increase of approximately 85 trips in the weekday AM peak hour, 81 trips in the weekday PM peak hour and 96 trips in the weekend midday peak hour.

Project Traffic Distribution and Trip Assignment

The trip distribution pattern was informed by a select zone analysis of the project site using the City's TDFM. Following consultation with City of Santa Monica staff, it was determined to be appropriate for distributing new trips generated by the proposed project. Figure 4 shows the trip distribution pattern.

The information described above was used to assign the project-generated traffic to the study intersections, as shown in Appendix B.

Project Site Access

The proposed project's Hotel Parcel will have three entrances to a subterranean parking structure. Employees will enter the project site eastbound on California Avenue via a right-in/right-out driveway. The driveway will be located such that only eastbound vehicles can access the driveway and exiting vehicles must turn right onto California Avenue heading eastbound.

Condominium residents will access the proposed project site using a driveway on Ocean Avenue. Residents will also be able to use the valet service by entering the site at the 2nd Street entrance. All other visitors to the Hotel Parcel arriving by motor vehicle will access the site on 2nd Street. The Second Street Parcel vehicular access will be via the 2nd Court alleyway, a two-way north-south located east of 2nd Street.

TRANSPORTATION DEMAND MANAGEMENT PROGRAM REQUIREMENTS

As required by the City's TDM Ordinance, a TDM plan would be required as a condition of approval for the proposed project, and the applicant would be required to conduct yearly monitoring and reporting. The specific TDM strategies to be implemented by the developer would be finalized as part of the Development Agreement process; however, based on the City's TDM ordinance and Downtown Community Plan, the following TDM strategies would be implemented at minimum:

TDM Coordinator – A single transportation coordinator would design, manage and update the project's TDM program. Duties would include:

- Setting up a Transportation Management Association (TMA) on site to administer TDM programs
- Maintaining a Transportation Information Center (TIC)
- Facilitating ride-matching online and through data collection and info boards
- Publishing alerts, resolving emergency issues, evaluating programs, and recommending improvements
- Acting as mechanism to distribute commuter incentives
- Producing promotional and survey materials
- Evaluating TDM program effectiveness
- Advocating for improved transit service
- Developing parking management plans
- Facilitating financial support for formation of vanpools and carpools
- Providing discounted transit fares or passes
- Developing bike-to-work and walk-to-work promotions
- Coordinating emergency rides home
- Managing preferential parking for high occupancy vehicles (HOVs)

This is a common position for programs that serve a large number of employees and/or residents. The position would require, at a minimum, a part-time coordinator.

Areawide Transportation Management Association – Developer shall be required to participate in the establishment of a geographic-based Transportation Demand Management Association (TMA) that may be defined by the City. TMAs provide employees, businesses and visitors of an area with resources to increase the amount of trips taken by transit, walking, bicycling, and ridesharing. If the City adopts a requirement that a TMA be formed for this geographic area, the Developer shall attend organizational meetings and provide traffic demand data to the TMA. This element would

also require the project to provide the TMA with data related to traffic demand, which could help the City to better understand travel behavior at the site.

Transit Pass Subsidy – A transit pass subsidy has the potential to be an effective TDM strategy for the project's employees. Santa Monica's Big Blue Bus and Metro provide frequent local bus and regional rail transit service near the project site. For project employees, the most efficient way to incentivize the use of transit is to subsidize monthly transit passes. To do this, employers participate in an employer pass program and subsidize a portion of the cost of a monthly transit pass.

Ridesharing (Carpool and Vanpools) – Ridesharing is typically a primary focus of employee TDM strategies. By providing preferential parking for carpools, the TDM program should actively encourage carpooling among employees at the site. Most importantly, the TDM program should implement a ridesharing matching service that coordinates potential carpool opportunities. Metro's CommuteSmart.info website can easily facilitate this service. Offering incentives to carpools is another means of increasing carpool participation.

Parking Pricing – Pricing parking would help to decrease trips. Since free parking acts as a subsidy for trip making by car, allowing parking to be priced according to market rates would encourage the replacement of auto trips by transit, bicycle, and pedestrian trips when possible.

Parking cash out is another price-based tool for making walking, bicycling, and transit more attractive travel options compared to driving. In a parking cash out program, employers offer commuters who forgo their parking spaces the monthly value of those parking spaces. Although the proposed project may not be mandated to comply with existing parking cash out legislation, the proposed project could still choose to implement a parking cash out program as part of the TDM plan.

Unbundled Parking – Unbundled parking would mean that parking spaces in the new building would be leased separately from residential units and commercial space, and allow residents of nearby buildings to lease these spaces at comparable rates as nearby building tenants.

Guaranteed Ride Home (GRH) – GRH is a commute trip reduction service that provides emergency rides to participating employees who do not have a private automobile available at the office for use. This may alleviate some of the worries employees may have when considering not having their own automobile available for use at the office.

Bicycle Facilities – Commuter bicycle facilities such as secure bicycle parking (short-term and long-term bike racks and lockers), and shower and personal locker facilities help reduce peak period and daily automobile trips to and from project sites. In light of providing bicycle facilities as a TDM strategy, the proposed project would be subject to the most current zoning code for bike parking requirements which includes short term for visitors, on site bike share for employees, and secure bike parking for employees.

Carshare Service – Make a car sharing service available within the project, if such a service is commercially available from a third party provider on commercially reasonable and feasible terms.

Bicycle Sharing Area – Provide a reasonable amount of publicly-accessible space for a bicycle sharing program station in conjunction with any bicycle sharing program instituted by the City or other operator.

Transportation Information Center and TDM Web Site Information – A TIC is a centrally-located commuter information center where project employees could obtain information regarding commute programs and obtain real-time information for planning travel without using an automobile. A TIC typically provides information about transit schedules, commute planning, ridesharing, telecommuting, bicycle and pedestrian routes and facilities, on-site services, and local-serving businesses.

Wayfinding Signage – Wayfinding signage is visible, useful signage strategically placed in and around a project site that conveniently directs pedestrians to project elements and major external destinations (transit stations, theaters, libraries, etc.) and provides information for transportation options (taxi, transit maps, bike sharing, etc.). Typically, pedestrian-oriented signage is posted at major entrance/exit points to the project and at key internal locations.

Commuter Club – This is a workplace organization that provides incentives for employees to choose alternative modes of transportation to-and-from work. In order to become a member, employees agree to use alternative modes of travel (including walk, bike, transit, carpool or vanpool) to travel to work for a minimum number of days per week (e.g., three days per week). As a member, employees are entitled to various discounts at local businesses, special offers and monthly raffle prizes. These benefits must be determined and negotiated by the project applicant.

The Transit Cooperative Research Program (TCRP) Chapter 19 reports that TDM programs are most effective when people have alternatives to auto travel, such as public transit. There may be some variability between land uses on the proposed project site, but the success of the TDM program will depend on how well it supports those who want to make trips by a means other than driving alone. The proposed project's TDM strategies will be most effective at reducing peak hour trips when worker shifts begin or end during peak hours. Converting these auto trips into transit, bicycle, or pedestrian trips would directly remove cars from the street during the AM and PM rush hours. In this way, the TDM program can reduce trips for all employees on the site—from restaurant workers to retail salespeople to fitness center staff.

Monitoring, Reporting and Enforcement

In compliance with the LUCE, the applicant would be required to implement TDM measures so as to not exceed the trip generation estimates calculated for the Approval Year (2020) and Future Year (2025) as provided in Table 4. In order to ensure that the trip generation estimated in this traffic study would not be exceeded, a period of annual monitoring and reporting would be required as a condition of approval for the project and would be incorporated into the Development Agreement. The applicant would be required to summarize the results of the trip monitoring program, determine whether trip reduction goals and/or Average Vehicle Ridership (AVR) targets are being achieved, and describe the TDM efforts in place to reduce vehicular trip making in an annual report delivered to the City.

The City, at its discretion, would determine the type of enforcement and may require implementation of additional TDM strategies and possible monetary (or other) penalties if annual monitoring determined that the trip generation estimates are being exceeded and/or AVR targets were not being met.

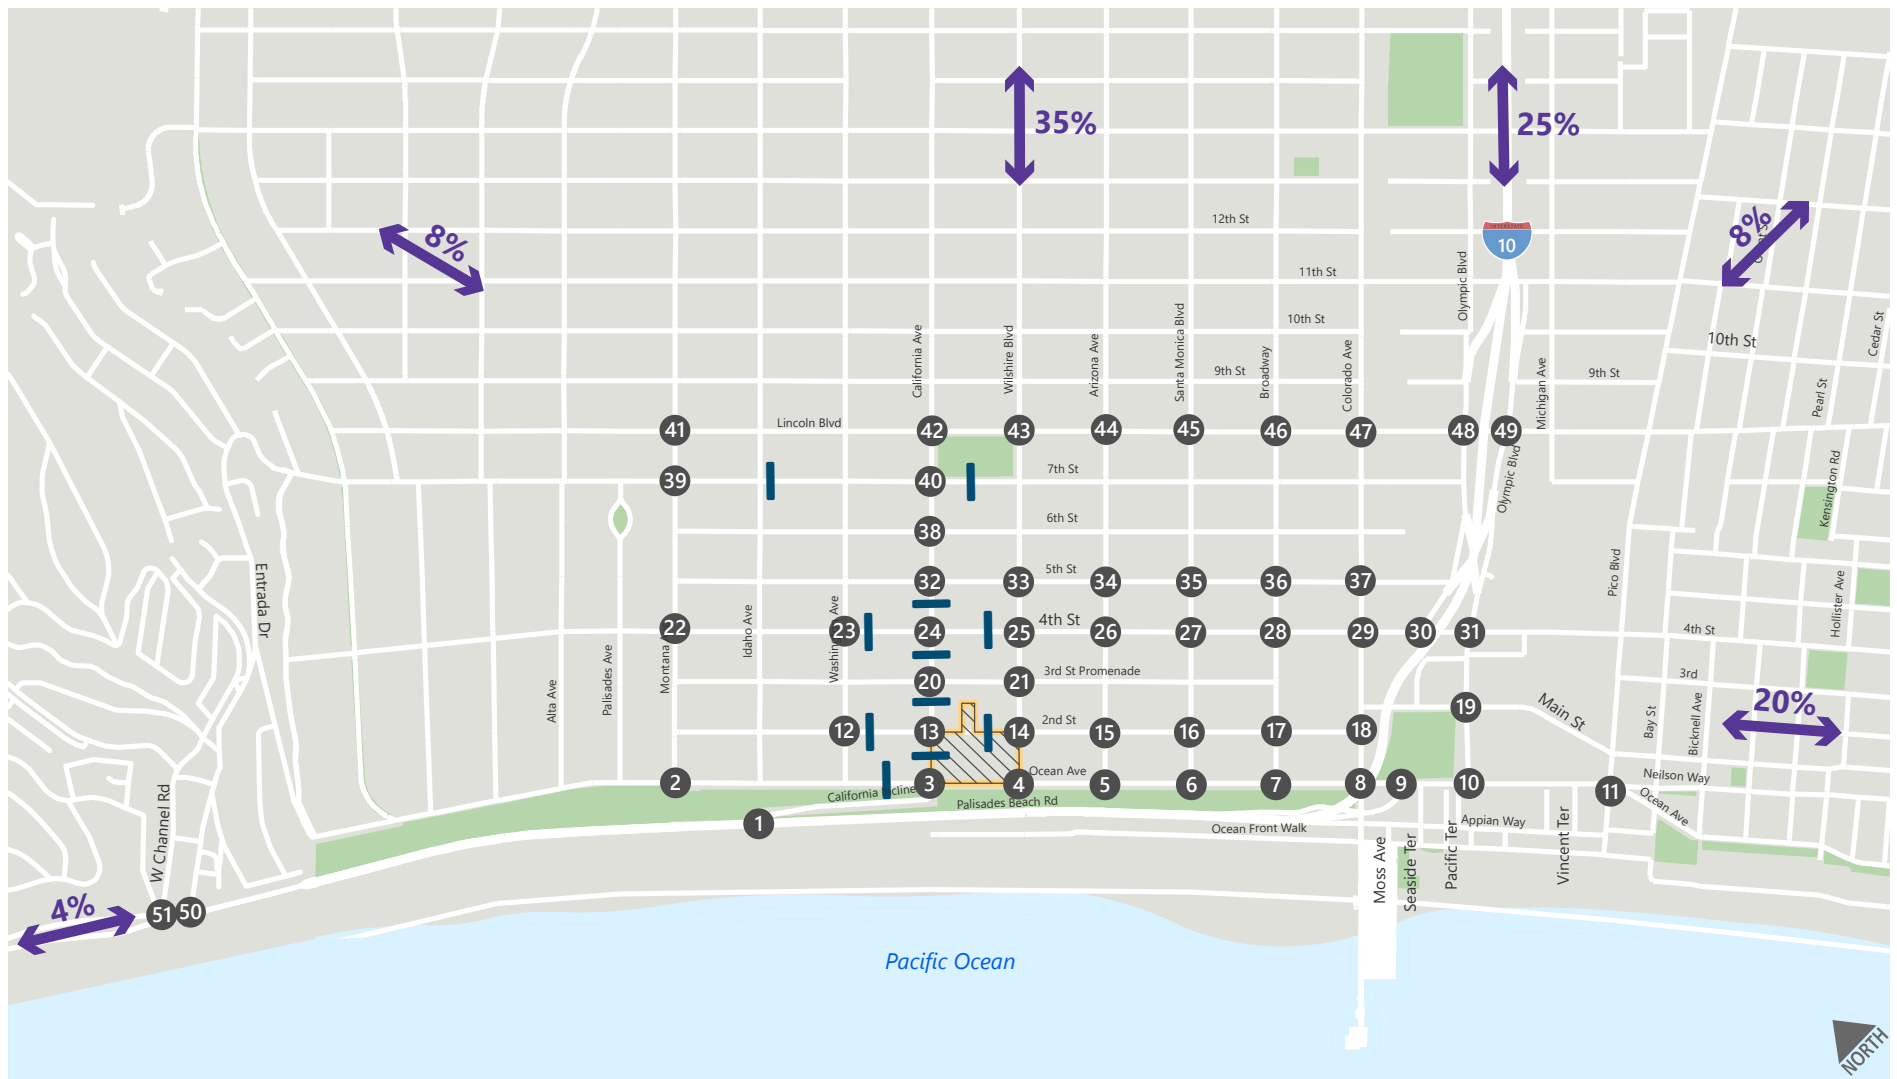

Figure 4
Miramar Hotel Project - Trip Distribution

FUTURE IMPROVEMENTS ASSUMPTIONS

As part of the adopted Downtown Community Plan, the City envisioned that Wilshire Boulevard would be transformed into a more pedestrian-friendly street. The DCP identified the Wilshire Boulevard streetscape project, which would create widened pedestrian space along this street between Ocean Avenue and 4th Street through a reduction in vehicle lane space. This Wilshire Boulevard improvement is still in the conceptual stages, and planning for this improvement has not yet begun. As part of this conceptual improvement, the sidewalk on the south side of Wilshire Boulevard in this segment would be widened to improve the pedestrian environment between the 3rd Street Promenade and Palisades Park on Ocean Avenue.

Consistent with the Downtown Community Plan, the future traffic forecasts assumes that there would be a lane reduction on Wilshire Boulevard from two eastbound through lanes between Ocean Avenue and 4th Street to a single eastbound through or shared through-right lane.

Other Improvements

Signal timings at intersections are optimized under Future Baseline (2025) conditions to balance shifting demand patterns where applicable. Other possible roadway improvements would include the replacement of the Pier Bridge connecting Colorado Avenue with the Santa Monica Pier; however, this pending project has not been finalized, and so no change to the circulation of the Pier area has been assumed.

Bike Improvement Projects

The *City of Santa Monica Bicycle Action Plan* (City of Santa Monica, October 2011) includes recommended bicycle projects for 5-year implementation and 20-year vision plans. As of 2018, the majority of the 5-year implementation projects have been completed, including those nearest the project site. The Downtown Community Plan also identified further potential bike infrastructure improvements. The following projects, including the following projects in the vicinity of the project study area, are planned in the 20-year vision:

Ocean Avenue Cycle Track

- As called for in the Downtown Community Plan, the City is currently exploring the potential of installing a cycle track on the west side of Ocean Avenue.

Santa Monica Pier Improvements

- Short-term shared lane markings on the future Pier Bridge replacement from Ocean Avenue to Santa Monica Pier, which is anticipated within the next several years; Additionally, the City is exploring a connection from the Pier to the Beach Bike Trail.

Santa Monica Boulevard Bikeway

- Shared lane markings (identified in the *Bicycle Action Plan* as a green "super-sharrow") from Ocean Avenue to 6th Street/7th Street.

APPROVAL YEAR (2020) TRAFFIC FORECASTS

For the Approval Year (2020) analysis, weekday AM peak hour, weekday PM peak hour and weekend midday peak hour traffic conditions were developed to provide the baseline against which direct project impacts were evaluated. The land use file in the City's TDFM was modified to reflect anticipated near-term development projects that would be implemented through 2020. The TDFM provides a prediction of traffic pattern changes between the model base year (2013) and the approval year (2020). These changes are applied to the 2017 traffic counts to develop a final Approval Year (2020) No Project traffic forecast. Approval Year (2020) No Project traffic volumes, lane geometry at each intersection and LOS at each intersection are shown in Appendix B for the analyzed peak hours.

As described above, the traffic projections for the proposed project were developed using the following three steps: estimate the trip generation of the project, determine trip distribution, and assign the project traffic to the roadway system.

Project-generated traffic that would occur under each access option were assigned to the street system and added to the Approval Year (Year 2020) No Project traffic forecasts. The resulting traffic volumes represent the projected Approval Year (Year 2020) plus Project peak hour traffic volumes. The Approval Year (Year 2020) plus Project peak hour traffic volumes are shown in Appendix B. The Approval Year (Year 2020) plus Project scenario includes the projected new traffic from the development of the proposed project as well as the removal of existing traffic (shown in Appendix B) and are the basis of the analysis of the 2020 scenario's traffic-related impacts described in the following chapter.

FUTURE YEAR (2025) TRAFFIC FORECASTS

The City's TDFM produces cumulative traffic forecasts for the City of Santa Monica and surrounding areas of the City of Los Angeles for the Future Year 2025 and 2030. For consistency with the LUCE, the TDFM was used to project Future (2025) No Project traffic volumes analyzed in this study. Appendix B shows the Future (2025) No Project traffic volumes for the analyzed peak hours. The Future (2025) No Project traffic volumes incorporate the assumed future reconfiguration of Wilshire Boulevard between Ocean Avenue and 4th Street (as described in the Future Improvements Assumptions).

Future Year (2025) with Project forecasts represents the Future Year 2025 conditions with the addition of the project. The resulting traffic volumes represent the projected Future (Year 2025) peak hour traffic volumes. The Future Year (Year 2025) plus Project peak hour traffic volumes for volumes are shown in Appendix B. The Future Year (Year 2025) plus Project scenario includes the projected incremental traffic from the development of the proposed project scenario as well as the shift in existing traffic (shown in Appendix B) and are the basis of the analysis of the project's traffic-related impacts described in the following chapter.

4. TRAFFIC IMPACT ANALYSIS

The previous chapter described sets of traffic volume forecasts - the Approval Year (2020) No Project and Approval Year (2020) Plus Project, the Future (2025) No Project and Future (2025) Plus Project. These forecasts were analyzed to determine the Approval Year and Future Year operating conditions without and with the additional project-generated traffic and to identify the potential impacts of the proposed project on the surrounding street system. This chapter provides a discussion of the City's impact criteria and methodology used and summarizes the results of the analysis.

CRITERIA FOR DETERMINATION OF A SIGNIFICANT TRAFFIC IMPACT

In 1991, the City of Santa Monica established criteria for assessing whether project-related traffic would result in significant impacts on intersection operating conditions using the measure of automobile delay. The thresholds of significance, summarized in Table 5, depends on the classification of the streets at the intersection (e.g., arterial, collector, or local street) and the operating conditions of the intersection under cumulative plus project traffic conditions. Although street classifications were updated in the 2010 LUCE, for purposes of this report, streets are classified as arterials, collectors and local streets because these are the categories used in the City's adopted intersection thresholds of significance. The potential significance of a project's impact is measured by either the change in average vehicle delay (measured in seconds) or by a change in the intersection operating conditions to undesirable conditions. If the projected LOS is F, however, significance is defined in terms of a change in vehicle to capacity (V/C) ratio (as calculated by the HCM operational method), since the average vehicular delay cannot be calculated using the Highway Capacity Manual operational method if the intersection exhibits oversaturated traffic conditions.

Using the City of Santa Monica significance criteria summarized in Table 5, a project would not be considered to have a significant impact at an intersection if, for example, it is on an arterial street operating at LOS D with the addition of project traffic and the incremental change in the average vehicle delay is less than 15 seconds. If the intersection is operating at LOS E after the addition of project traffic and the average vehicle delay increases by any amount, however, this would be considered a significant project impact. All impacts on intersections projected to operate at LOS F are based on the V/C ratio, with project-related increases of 0.005 or greater considered significant.

At the time of this publication, the City of Santa Monica has not adopted VMT-based impact criteria. Project-level VMT analysis is included later in this report for informational purposes.

TABLE 5

Notes:

* Functional street classifications for Santa Monica Intersections in this table are from the City's previous Circulation Element. The 2010 Land Use and Circulation Element (LUCE) has adopted a different typology for streets within the City but the significance criteria have not yet been revised.

APPROVAL YEAR (2020) NO PROJECT – INTERSECTION CONDITIONS

The Approval Year (2020) No Project peak hour traffic forecasts described in Chapter 3 and shown in Appendix B were analyzed using the methodologies described in Chapter 2 to forecast LOS at the study intersections during the analyzed peak hours. Table 6 provides a summary of the Approval Year (2020) intersection level of service. Detailed Vistro LOS calculation worksheets are provided in Appendix B2.

As shown in Table 6, of the 51 study intersections, the following eight study intersections are projected to operate at LOS E or F during at least one of the analyzed peak hours:

1. Palisades Beach Road & California Incline (LOS E/F during AM and weekend peak hours)
3. Ocean Avenue & California Avenue (LOS E/F)
14. 2nd Street & Wilshire Boulevard (LOS E/F during the PM and weekend peak hours)
16. 2nd Street & Santa Monica Boulevard (LOS F during the PM and weekend peak hour)
19. Main Street & Olympic Drive (LOS F during the AM and weekend peak hours)
47. Lincoln Boulevard & Colorado Avenue (LOS E during the AM peak hour)
48. Lincoln Boulevard & I-10 Westbound Off-Ramp (LOS F during the AM peak hour)
51. Pacific Coast Highway & Chautauqua Boulevard (LOS E/F)

APPROVAL YEAR (2020) PLUS PROJECT TRAFFIC IMPACT ASSESSMENT

The Approval Year (2020) plus Project peak hour traffic volumes were analyzed to determine future operating conditions at the study intersections and to identify specific traffic impacts resulting from the addition of project-generated traffic. The results of this analysis are summarized in Table 6 for comparison with the Approval Year (2020) No Project intersection conditions. At some intersections, the vehicle delay in the future actually decreases slightly even as project trips are added. Under the HCM 2010 methodology, intersection delay is a calculation whereby the overall delay is not additive, but rather a weighted average of all movements. Adding trips to some movements which are already congested will increase overall delay, but adding trips to movements with available capacity could actually decrease the average delay value slightly.

Of the 51 study intersections, four study intersections were found to be significantly impacted by proposed project:

1. Palisades Beach Road (PCH) & California Incline (LOS E in the AM peak hour)
3. Ocean Avenue & California Avenue (LOS E in the AM peak hour, F in the PM peak hour)
14. 2nd Street & Wilshire Boulevard (LOS F in each peak hour)
42. Lincoln Boulevard & California Avenue (LOS D in the AM peak hour)

Notes:
* Average stopped delay per vehicle, in seconds.
** Indicates oversaturated conditions. Delay cannot be calculated.
A Arterial intersection
C Collector intersection

FUTURE YEAR (2025) NO PROJECT INTERSECTION CONDITIONS

The Future Year (2025) No Project peak hour traffic volumes described in Chapter 3 and shown in Appendix B were analyzed using the LOS methodologies described in Chapter 2 to project future LOS at the study intersections during the analyzed peak hours. The results of this analysis are summarized in Table 7. Detailed Vistro LOS calculation worksheets are provided in Appendix B.

As shown in Table 7, of the 51 study intersections, the following 16 study intersections are projected to operate at E or F LOS during at least one of the analyzed peak hours:

1. Palisades Beach Road & California Incline (LOS E during the AM peak hour)
3. Ocean Avenue & California Avenue (LOS E/F)
4. Ocean Avenue & Wilshire Boulevard (LOS E during the weekend peak hour)
7. Ocean Avenue & Broadway (LOS E during the weekend peak hour)
14. 2nd Street & Wilshire Boulevard (LOS E/F during the AM and weekend peak hours)
16. 2nd Street & Santa Monica Boulevard (LOS F during the PM and weekend peak hours)
19. Main Street & Olympic Drive (LOS F during the AM and weekend peak hours)
25. 4th Street & Wilshire Boulevard (LOS E during the weekend peak hour)
26. 4th Street & Arizona Avenue (LOS E/F during the PM and weekend peak hours)
31. 4th Street & I-10 EB On-Ramp (LOS E during the AM peak hour)
42. Lincoln Boulevard & California Avenue (LOS E during the AM and weekend peak hours)
44. Lincoln Boulevard & Arizona Avenue (LOS E during the PM peak hour)
47. Lincoln Boulevard & Colorado Avenue (LOS E/F during the AM and weekend peak hours)
48. Lincoln Boulevard & I-10 Westbound Off-Ramp (LOS E/F during the AM and weekend peak hours)
49. Lincoln Boulevard & I-10 Eastbound On-Ramp (LOS E during the weekend peak hour)
51. Pacific Coast Highway & Chautauqua Boulevard (LOS F)

C Collector intersection

FUTURE YEAR (2025) PLUS PROJECT TRAFFIC IMPACT ASSESSMENT

The Future Year (2025) plus Project peak hour traffic volumes were analyzed to determine future operating conditions at the study intersections and to identify specific traffic impacts resulting from the addition of project-generated traffic.

Table 7 summarizes the results of the Future (2025) plus Project Scenario A conditions. Of the 51 study intersections, four study intersections were found to be significantly impacted by the proposed project under Scenario A:

1. Palisades Beach Road (PCH) & California Incline (LOS E in the AM peak hour)
3. Ocean Avenue & California Avenue (LOS E/F in each peak hour)
14. 2nd Street & Wilshire Boulevard (LOS F in each peak hour)
42. Lincoln Boulevard & California Avenue (LOS E/F in the AM and weekend peak hours)

VEHICLE MILES TRAVELED (VMT) ANALYSIS

Background

Authorized in September of 2013, Senate Bill (SB) 743 directed the Office of Planning and Research (OPR) to revise the CEQA Guidelines (Title 14 of the California Code of Regulations sections and following to establish new criteria for determining the significance of transportation impacts and define alternative metrics for traffic LOS. Once the CEQA Guidelines are amended to include those alternative criteria, auto delay will no longer be considered a significant impact under CEQA.

OPR adopted final guidelines in December 2018, and the provisions of SB743 are now in effect, with agencies having an opt-in period until July 1, 2020. At the time of this publication, the City of Santa Monica has not adopted VMT-based impact criteria. Project VMT analysis is included in this report for informational purposes.

Screening Thresholds and VMT Significance Thresholds

OPR's CEQA Guidelines includes new Section 15064.3, subdivision (b)(1), which states that *"generally, projects within ½ mile of an existing major transit stop or an existing stop along a high quality transit corridor should be presumed to have a less-than-significant impact on VMT."* Per the *Technical Advisory*, this presumption would not apply, however, if project-specific or location-specific information indicates that the project will still generate significant levels of VMT. For example, the presumption might not be appropriate if the project:

- Has a Floor Area Ratio (FAR) of less than 0.75
- Includes more parking for use by residents, customers, or employees of the project than required by the jurisdiction (if the jurisdiction requires the project to supply parking)
- Is inconsistent with the applicable Sustainable Communities Strategy (as determined by the lead agency, with input from the Metropolitan Planning Organization)

Additionally, the Technical Advisory states that agencies may screen out VMT impacts using project size and maps:

- Absent substantial evidence indicating that a project would generate a potentially significant level of VMT, or inconsistency with a Sustainable Communities Strategy (SCS) or general plan, projects that generate or attract fewer than 110 trips per day generally may be assumed to cause a less-than significant transportation impact.
- Residential and office projects that locate in areas with low VMT, and that incorporate similar features (i.e., density, mix of uses, transit accessibility), will tend to exhibit similarly low VMT. Maps created with data from a travel survey or travel demand model can illustrate areas that are currently below threshold VMT. Because new development in such locations would likely result in a similar level of VMT, such maps can be used to screen out residential and office projects from needing to prepare a detailed VMT analysis.

The updated CEQA Guidelines apply prospectively, meaning that projects, such as this one, are not required to incorporate VMT as the primary transportation impact metric. This information is quantified here for informational purposes. No determination of significance is provided since the City of Santa Monica has not yet adopted significance thresholds for VMT or a methodology for determining impacts based on VMT.

The City of Santa Monica is in the process of drafting new VMT guidance for CEQA transportation review of projects and will be adopting new VMT based significance thresholds prior to July 1, 2020 in conformance with the new CEQA guidelines. Should the City adopt new significance thresholds based on VMT, the thresholds would apply prospectively to future projects (i.e., pending projects such as the Miramar Project would not be subject to the new thresholds).

VMT Analysis of Project

The VMT estimates for the proposed project are based on the OPR guidance, which recommend evaluating each component of a mixed-use project independently. Guidance is provided for several broad land use types (residential, office, retail) that account for majority of the development projects that are proposed. The proposed project includes hotel, retail, restaurant (which is fundamentally the same as retail from a travel perspective), and residential.

The estimates of project VMT are based on the total trip generation estimates presented in Table 4. The proposed project is estimated to generate a total of 2,970 daily trips among all of the proposed uses. For office-type uses, the suggested metric is VMT per employee. While there is no office-type land use for this project, employee VMT estimates were calculated using the applicant's own projection of employees – inclusive of the hotel, condominiums, and restaurant space. For residential uses, the suggested metric is VMT per capita. Finally, hotel guests, restaurant and retail visitors VMT are analyzed together and provided for informational purposes.

The following steps were used to estimate project-related VMT, which are compared with citywide averages for context. For each use, the total trips are multiplied by the average trip length for that type of trip from the Santa Monica TDFM TAZs at and around the project site; that number of total miles is divided by the number of people related to that use (employees, residents, other visitors). The following sections detail the assumptions and VMT calculations for each trip type in this project: employees, residents, and all other visitors.

Employee VMT

- For office/employment VMT, determine the number of employees for the project: The project applicant estimates that total employment for the hotel will be 387 employees.
 - As discussed in Chapter 3, employee trips were estimated based on empirical data. The project would generate 303 daily employee trips. Based on the project applicant's survey of employee trip generation, a substantial portion of current employees carpool or use transit to work, which is anticipated to continue under the proposed project.
 - City of Santa Monica's travel demand forecasting model (TDFM), discussed in Chapter 3, includes data on the average daily trips, VMT, and trip length and by trip purpose for each traffic analysis zone (TAZ), as well as the citywide averages. The Proposed Project is located in the Santa Monica TDFM TAZ 78. The average home-based work trip attraction in TAZ 78 is 12.6 miles, which is slightly higher than the Citywide average of 12.1 miles.
- Multiply the estimated employee trips by the trip length, and then divide by the number of employees to calculate average VMT per employee. Thus 303 employee trips of 12.6 miles each

equals 3,818 total miles. Dividing the total miles by 387 employees equates to 9.9 VMT per employee. This is about half of the Citywide average of 19.2 VMT per employee.

Residential VMT

- Estimate the total number of people for all dwelling units for the project. The proposed project is planned to include a total of 108 dwelling units (60 condominiums and 48 affordable housing units).
 - The average household size for this census tract (Census Tract 7014.02) is 1.5. Applying this factor to the total number of dwelling units results in 162 people. In this case, the proposed project dwelling unit mix is primarily 2 or 3-bedroom units or more, which is different from the existing mix of predominantly 1-bedroom housing in the Census tract. Therefore, the citywide 2017 American Community Survey 5-Year Estimates⁵ for Santa Monica provides the estimate of project household size for the condominiums. The condominiums are assumed to have an average household size of 2.41 persons. Empirical data on household size of affordable apartments in Santa Monica, provided by the project applicant⁶, provides the household size estimate for the affordable housing units. The affordable housing 1-bedroom units are assumed to have an average household size of 1.39 persons, and the 2-3 bedroom units are assumed to have an average household size of 3.43 persons. Applying these factors to the proposed unit mix results in an estimated project population of 275 people.
 - As discussed in Chapter 3, the project would generate 552 daily residential trips.
 - City of Santa Monica's travel demand forecasting model (TDFM), discussed in Chapter 3, includes data on the average daily trips, VMT, and trip length and by trip purpose for each traffic analysis zone (TAZ), as well as the citywide averages. The residential use for the Proposed Project is located in the Santa Monica TDFM TAZ 78 and 79. The average home-based productions trip length in TAZs near to the project site is 5.33, which is slightly lower than the Citywide average of 5.4 miles.
- Multiply the estimated residential trips by the trip length, and divide by the total number of residents to calculate average VMT per capita. Thus 552 residential trips of 5.33 miles each equals

⁵ <https://www.census.gov/programs-surveys/acs/data.html>

⁶ Household size assumptions for affordable apartments in Santa Monica by number of bedrooms was provided in a conversation with the project applicant on December 2, 2019

2,942 total miles. This equates to 10.7 VMT per capita. This is greater than the Citywide average of 9.0 VMT per capita.

- While residential infill in dense urban areas with good walking, biking, and transit access (non-automotive modes) such as downtown Santa Monica are known to ultimately decrease VMT, as analyzed this project would result in a VMT per capita higher than the Citywide average. The VMT per capita is affected by the assumptions described above, particularly the assumptions of project trip generation and the ultimate residential population of the project (the 'per capita'). The assumptions for project population were developed as described above.
- While the trip lengths for this area are short, reflecting the high degree of non-automotive access, the project trip generation assumption is based on a conservative approach for the purpose of analyzing intersection LOS, which seeks to evaluate a worst-case scenario for traffic operations per the City's current impact assessment methodology. The worst-case scenario assumptions for this project assume a trip generation rate (as shown in Table 4) based on a 2-car-per-household for all units of 2 or more bedrooms.
- Acknowledging the high degree of non-automotive access that downtown Santa Monica enjoys, the project applicant proposes to build no more than one parking space per affordable unit (48 units and 48 or fewer parking spaces), which would significantly lower the actual project trip generation (estimated to be about 481 daily trips compared with the conservatively-estimated 552 shown in Table 4). Using the lower trip generation rate assumptions for the affordable units would reduce the VMT per capita to about 9.3, only slightly higher than the Citywide average.
- Likewise, reducing the parking per unit ratio for the market-rate condominiums would further reduce the estimated trip generation. Even a slight reduction in the market rate parking supply would likely result in a lower project VMT per capita than the City average.

Hotel Visitors and Guests (Non-Employee and Non-Residential) VMT

- Estimate the number of non-employee and non-residential trips to and from the project. If 855 daily project trips are made by employees and residents, then the remaining 2,115 daily trips are made by hotel guests and patrons of the restaurant and retail space who are not otherwise staying at the hotel.
- The average trip length for 'home-based-other' trip attractions and 'non-home-based' trip attraction in TAZ 78 is 7.4 miles. The average trip length for non-home-based trip productions in TAZ 78 is 5.6 miles. These trip types represent all other travel activity that is not directly related to commute trips or home-based trips, which would include hotel visitors. Applying these trip lengths to the estimated non-employee and non-residential inbound and outbound trips yields an estimate of 13,748 miles per day. This likely represents a conservative analysis to estimating VMT for commercial uses since it does not account for the potential that new commercial (i.e., retail and restaurant) development can result in a redistribution of trips rather than the creation of new trips. Thus, it does not account for the potential that some trips would replace trips that would otherwise be made to and from other commercial destinations in the area.

When added to the 3,818 estimated miles of employee trips per day and 2,942 estimated miles of residential trips per day, total daily VMT for the Proposed Project is estimated to be 20,508 miles⁷.

⁷ Subtracting the existing VMT from the Project VMT, the total net new daily VMT for the project is 7,115 miles.

5. ANALYSIS OF POTENTIAL INTERSECTION MITIGATION MEASURES

An investigation was conducted for potential mitigation measures to reduce or eliminate the significant intersection impacts identified. The emphasis was to identify physical improvements that could be implemented within the existing roadway right-of-way (ROW). At most locations in Santa Monica, the streets are already built to their maximum potential width. Reconfiguring the streets to provide additional capacity for vehicles could have negative secondary impacts such as loss of parking, conflicts with bicycle or pedestrian modes, and would conflict with the LUCE objectives and City policies to decrease vehicle miles traveled.

All four impacted intersections in Future Year (2025) are also impacted in Approval Year (2020). As discussed below, physical improvements were considered to reduce the severity of the proposed project's Approval and Future Year traffic impacts. At two of the four impacted locations, adjustments to signal operation for split phasing, which is a more significant change than simply optimizing timing, could fully mitigate the impact without any likely secondary impacts. At two other intersections, the potential mitigation would require removal of on-street metered parking in order to restripe intersection approaches to add turn lanes. Parking is not considered an impact criteria under CEQA. These matters are discussed as follows for each of the impacted intersections.

APPROVAL YEAR AND FUTURE YEAR PLUS PROJECT MITIGATION MEASURES

Tables 6 and 7 summarize the Approval Year (2020) and Future Year (2025) intersection impacts according to the City's designated impact criteria and further indicate whether the impact can be physically or operationally mitigated. This section describes the potential mitigation measures that were reviewed for the significantly impacted intersections listed below.

1. Palisades Beach Road (PCH) & California Avenue
3. Ocean Avenue & California Avenue
14. 2nd Street & Wilshire Boulevard
42. Lincoln Boulevard & California Avenue

1. Palisades Beach Road (PCH) & California Incline

This intersection would experience a small increase in delay under the Approval and Future with Project conditions during the weekday AM peak period. This signal is on a state highway and controlled by the California Department of Transportation (Caltrans). A small percentage of project trips are forecast to use the California Incline to access the PCH northbound towards Malibu and Ventura, and southbound as the shortest path to reach I-10 eastbound from the project site. The current signal configuration permits eastbound and westbound movements during the same phase. Reconfiguring the signal to operate a split phase eastbound and westbound so that the minimal volumes exiting the Jonathan Club driveway (eastbound approach) are not conflicting with the significantly higher volume turning left from the westbound California Incline would likely reduce the project effect on overall intersection delay. Sometime prior to the reconstruction of the California Incline, this intersection was operated with split phasing. However, signal phasing and timing changes are not considered an appropriate mitigation measure as it conflicts with the City's ability to make future adjustments to signal timing as needed. Therefore, the impact remains significant and unavoidable.

3. Ocean Avenue & California Avenue

This intersection is impacted during the AM and PM peak hours under Approval and Future with Project conditions. Additionally, the intersection is forecast to operate at LOS F during the weekend midday peak hour, although the project does not cause an impact during that period. This intersection is a key location at the northwest corner of the proposed project site and provides access to and from the PCH, I-10 eastbound, and downtown Santa Monica. In 2018, the City of Santa Monica adjusted signal timing at this intersection to implement leading pedestrian intervals (described in Chapter 3), which increases all-red time for vehicles in order to improve pedestrian and bicyclist safety. This intersection is also the connection point between heavily-used north-south bike lanes on Ocean Avenue, east-west bike lanes on California Avenue, and a two-way cycletrack on the California Incline that provides pedestrian and bicycle access to the beach over the PCH.

The addition of project trips at this location increases overall intersection delay. The critical movement is the eastbound through from the California Incline, which shares a lane with left-turning traffic. The westbound approach experiences a similarly saturated condition, with a high volume of left and through movements sharing a lane. Reconfiguring and retiming the traffic signal to operate a split phase eastbound and westbound would remove vehicle conflicts between through and left movements, improving overall delay to LOS E or better in all "with Project" conditions. However, signal phasing and timing changes are not considered an appropriate mitigation measure as it conflicts with the City's ability to make future adjustments to signal timing as needed. Therefore, the impact remains significant and unavoidable.

14. 2nd Street & Wilshire Boulevard

This intersection is impacted during each peak hour under Approval and Future with Project conditions. This intersection is a key location at the southeast corner of the project site. This intersection is anticipated to operate at less-than-satisfactory conditions (LOS D or worse) under the Approval and Future Year without Project conditions, primarily due to the single shared lane on the southbound approach. The southbound approach is impacted by the addition of project trips, due to a single-lane approach to accommodate all movements. A possible mitigation is to remove four to eight on-street metered parking spaces on the westerly side of 2nd Street in order to stripe a two-lane southbound approach with one left-turn lane and one shared through/right-turn lane. Doing so may require the reconfiguration of the southbound bike lane on 2nd Street to possibly include a shared lane conflict marking (hatched green bike lane) similar to the existing configuration of the northbound approach. However, with approximately 25'-30' of width from the existing centerline to the curb, there appears that there would be sufficient space following the removal of parking to accommodate a left-turn pocket, a through lane, and the bike lane. The addition of a left-turn pocket would improve the intersection V/C to better than the without project conditions during all peak hours in the Approval and Future with Project conditions. Therefore, the impact at this location is less-than-significant after mitigation.

The LOS results at 2nd Street & Wilshire Boulevard after mitigation are as follows:

- Approval Year (2020) Plus Project with Mitigation (LOS / Delay / V/C):
 - AM: 33.63 / C / 0.251
 - PM: 88.43 / F / 0.372
 - Weekend Midday: LOS F / 88.43 / 0.372
- Future Year (2025) Plus Project with Mitigation:
 - AM: 29.50 / C / 0.407
 - PM: 106.48 / F / 0.459
 - Weekend Midday: LOS F / > 100 / 0.459

42. Lincoln Boulevard & California Avenue

This intersection is impacted during the AM peak hour under Approval plus Project conditions, and additionally during the weekend midday peak hour under Future plus Project conditions, due to the addition of project trips making northbound left turns and eastbound right turns. This unsignalized intersection is controlled in all directions by stop signs with single-lane approaches. A possible mitigation would be to restripe the northbound approach to include a left turn pocket and a shared through-right lane. Doing so would improve LOS to conditions better than the “without Project” condition in each case (LOS F or better). However, the addition of a left turn pocket at a stop-controlled intersection introduces additional conflict points between vehicles and with pedestrians and people riding bicycles or scooters. This location is a busy neighborhood intersection with a high volume of pedestrian and bicycle crossings, and adjacent to a school, a church and Reed Park. The addition of the left-turn pocket could cause a secondary impact to pedestrian safety, inconsistent with City goals and policies including T7.1 of the LUCE to “ensure that walking is safe for everyone, everywhere in Santa Monica.” Restriping the travel lanes to include a northbound turn pocket could also encroach on the space required for the southbound bus stop at this intersection. Because increasing pedestrian hazards is inconsistent with City policies, this mitigation is deemed infeasible, and therefore the impact remains significant and unavoidable.

6. STREET SEGMENT ANALYSIS

Because of the project site's location near a residential neighborhood, an analysis of the proposed project's potential impacts on street segments in the project vicinity was conducted. The analysis was conducted for the following 11 street segments:

1. Ocean Avenue north of California Avenue
2. 2nd Street between Wilshire Boulevard and California Avenue
3. 2nd Street between California Avenue and Washington Avenue
4. 4th Street between Wilshire Boulevard and California Avenue
5. 4th Street between California Avenue and Washington Avenue
6. 7th Street between Wilshire Boulevard and California Avenue
7. 7th Street between Washington Avenue and Idaho Avenue
8. California Avenue between Ocean Avenue and 2nd Street
9. California Avenue between 2nd Street and 3rd Street
10. California Avenue between 3rd Street and 4th Street
11. California Avenue between 4th Street and 5th Street

CRITERIA FOR DETERMINATION OF SIGNIFICANT TRAFFIC IMPACTS

The City of Santa Monica impact criteria used to evaluate potential traffic impacts on street segments are based on the existing average daily traffic (ADT) volumes and the projected level of volume increase that can be attributed to the project. The Santa Monica significance criteria have not yet been updated to reflect LUCE street classifications. While Ocean Avenue between California Avenue and Wilshire Boulevard was formerly functionally classified as an Arterial Street, for the purposes of this analysis the impact criteria for Collector streets have been applied. The current significance criteria for collector, feeder, and local streets are provided in Table 8.

TABLE 8 – CITY OF SANTA MONICA SIGNIFICANT IMPACT CRITERIA – SEGMENTS	
COLLECTOR STREETS	
A transportation impact is significant if the Base Average Daily Traffic Volume (ADT) is:	greater than 13,500 and there is a net increase* of one trip or more in ADT due to project related traffic
	greater than 7,500 but less than 13,500 and the project related traffic increases* the ADT by 12.5% or the ADT becomes 13,500 or more
	less than 7,500 and the project related traffic increases* the ADT by 25%
FEEDER STREETS	
A transportation impact is significant if the Base Average Daily Traffic Volume (ADT) is:	greater than 6,750 and there is a net increase* of one trip or more in ADT due to project related traffic
	greater than 3,750 but less than 6,750 and the project related traffic increases* the ADT by 12.5% or the ADT becomes 6,750 or more
	less than 3,750 and the project related traffic increases* the ADT by 25%
LOCAL STREETS	
A transportation impact is significant if the Base Average Daily Traffic Volume (ADT) is:	greater than 2,250 and there is a net increase* of one trip or more in ADT due to project related traffic
	greater than 1,250 but less than 2,250 and the project related traffic increases* the ADT by 12.5% or the ADT becomes 2,250 or more
	less than 1,250 and the project related traffic increases* the ADT by 25%

* Average Daily Traffic Volume "increase" denotes adverse impacts; "decrease" denotes beneficial impacts.

STREET SEGMENT METHODOLOGY

Consistent with the analysis of intersections, weekday and weekend analysis was conducted. Existing weekday and weekend average daily traffic (ADT) volume data was collected at the 11 street segment locations in 2018 and 2019. The existing daily traffic counts are provided in Appendix B. The existing daily traffic volumes on the street segments include the trips generated by hotel employees. Under existing conditions, the majority of employees do not have access to on-site parking. As such, employees arriving by vehicle generally park on streets near the project site. Some of those streets are located in the residential preferential parking zone. In these locations, it is impermissible to park without a residential permit between 6:00PM and 8:00AM. Other roadways have meters for short term (2 hours or less) parking. Existing employee vehicular trips were therefore assigned to locations with either unrestricted parking, generally farther from the site, or at long-term parking meters, which include 5-hour meters along Ocean Avenue and 9-hour meters along the south side of Washington Avenue and the west side of 2nd Street.

In accordance with the City of Santa Monica's adopted methodology, street segment analysis was conducted by assigning the new incremental daily project-generated trips to the street network and determining the percent increase in traffic that would result with the proposed project. Additionally, since the project would provide on-site employee parking (as compared to existing conditions where employees park on nearby streets), existing employee trips would be removed from the local street network, and were removed as part of the plus project analysis.

Table 9 shows the percent change in daily segment volumes for Existing (2019) plus Project conditions.

**TABLE 9
NEIGHBORHOOD STREET SEGMENT IMPACT ANALYSIS**

WEEKDAY								
No.	Segment	Analyzed Classification	Existing ADT	Existing Plus Project				
				Project ADT	ADT	% Change	Significance Threshold	Significant Impact?
1	Ocean Avenue North of California Avenue	Collector	13,592	-114	13,478	-0.8%	1 trip	NO
2	2nd Street Between Wilshire Boulevard and California Avenue	Feeder	4,718	1,335	6,053	28.3%	12.5%	YES
3	between California Avenue and Washington Avenue	Feeder	3,065	16	3,081	0.5%	25%	NO

7	Between Washington Avenue and Idaho Avenue	Collector	4,577	10	4,587	0.2%	25%	NO
8	California Avenue Between Ocean Avenue and 2nd Street	Local	6,679	168	6,847	2.5%	1 trip	YES
9	Between 2nd Street and 3rd Street	Local	6,099	442	6,541	7.2%	1 trip	YES
10	Between 3rd Street and 4th Street	Local	5,944	437	6,381	7.4%	1 trip	YES
11	Between 4th Street and 5th Street	Local	5,220	353	5,573	6.8%	1 trip	YES

STREET SEGMENT IMPACT ANALYSIS

As shown in Table 9, the application of the City of Santa Monica significance criteria for neighborhood traffic impacts indicates that the project would create significant traffic impacts at the following five locations for both weekday and weekend scenarios:

- Segment 2 – 2nd Street between Wilshire Boulevard and California Avenue (12.5% trip threshold)
- Segment 8 – California Avenue between Ocean Avenue and 2nd Street (+1 trip threshold)
- Segment 9 – California Avenue between 2nd Street and 3rd Street (+1 trip threshold)
- Segment 10 – California Avenue between 3rd Street and 4th Street (+1 trip threshold)
- Segment 11 – California Avenue between 4th Street and 5th Street (+1 trip threshold)

Given that the existing traffic volume on each of the analyzed California Avenue segments is above the level considered desirable for a local street (2,250 ADT), and that the addition of a single daily trip is considered significant, it is likely that additional segments of California Avenue east of the study area would also be significantly impacted by the proposed project.

NEIGHBORHOOD STREET MITIGATION MEASURES

Various traffic calming strategies were considered, such as the addition of curb extensions at neighborhood intersections and diverters along neighborhood street segments. While these traffic calming measures can reduce and slow traffic along a street, they do not eliminate traffic. Thus, even with traffic calming devices, the project would still contribute to traffic along the analyzed California Avenue neighborhood segments and the single trip threshold would be exceeded on segments 8-11. No feasible mitigation measures are available, including relocating the project's access point or turn restrictions that would limit motorists that arrive or depart the project site from using the public street grid and these street segments. Short of full closure of the affected street segments, which would not be acceptable since these streets serve adjacent land uses and carry vehicles that would then need to shift to other nearby streets, no feasible mitigation measures are available to reduce the number of potential project-related vehicle trips on these four street segments to a less than significant level (less than one trip per day). TDM strategies, identified in Chapter 3, would also reduce project traffic along these streets; however, without fully reducing net-new trips to 0 (or lower than the existing trip production), TDM strategies also would not mitigate impacts on segments where a single daily trip is the impact threshold. Therefore, the project impacts to these street segments would be significant and unavoidable.

The significant impact on segment 2 (on 2nd Street between Wilshire Boulevard and California Avenue) is due to project trips which increase the daily volume by more than 12.5%. The main project driveway access is located on this segment. Possible mitigations for this impact would include other access alternatives that disperse project traffic or fully relocate the main project driveway to another street such as Wilshire Boulevard or Ocean Avenue, and TDM strategies to reduce the overall trip generation. Over half of the daily project traffic estimated to use the project access on 2nd Street would need to be redistributed to one or more other driveways in order to fully mitigate this impact. Depending on the nature of alternative driveways, redistributing project traffic to other roadways could trigger additional intersection impacts and possibly secondary impacts to pedestrian and bicycle networks by adding new curb cuts or increasing the intensity of use at proposed driveways. It is also unknown if TDM strategies alone could reduce the daily trip generation by half so as not to exceed the 12.5% additional trips threshold. Therefore, this impact remains significant and unavoidable.

7. PROJECT ALTERNATIVES

In addition to the No Project, six action alternatives to the project were evaluated to determine their potential impacts on the surrounding transportation system as compared to the proposed project. Trip generation for each of the alternatives was estimated and compared with that of the proposed project, and a qualitative assessment of potential traffic impacts was made. A quantitative analysis of each alternative was not prepared as part of this study. The alternatives to the proposed project are described below:

1. **No Project.** Under the “No Project” alternative, the proposed redevelopment of the Miramar Hotel and the Second Street Parcel would not occur. The existing hotel and surface parking lot would remain and operations would remain the same.
2. **Ocean Ave Transition Zone Tier 2.** Alternative 2 assumes a 50’ height limit and 2.25 FAR. The historic Palisades Building would remain and new buildings would be developed in accordance with the height and FAR limits above. This alternative assumes 261 hotel rooms, which is fewer both than the proposed project and the existing hotel, and 50 condo units instead of the proposed 60 units. The Second Street Parcel would include 5 market rate apartments and 14 affordable units at 3 bedrooms each.
3. **Hotel Only on Hotel Parcel (No Condominiums).** This alternative maintains the proposed hotel configuration of 312 rooms, but does not include any condo units. The Second Street Parcel would include 9 market rate apartments and 3 affordable units at 3 bedrooms each.
4. **Reduced Height and Density.** This alternative assumes a maximum building height of 84’. The proposed hotel would include 226 rooms, which is fewer than the proposed project and the existing hotel. The alternative includes 45 condo units. The Second Street Parcel would include 6 market rate units and 13 affordable units at 3 bedrooms each.
5. **Alternate Massing.** This is a design alternative with the same number of hotel rooms, condos, and programming as the proposed project. The Second Street Parcel remains the same as the proposed project. Access under this alternative remains the same as the proposed project.
6. **Modified Access.** This alternative assumes the same land uses and programming as the proposed project for both the Hotel and Second Street Parcels, but removes the employee entrance to the hotel on California Avenue. Under this alternative, all employee trips are assigned to enter and exit at a driveway north of the proposed 2nd Street driveway and no driveway or associated trips are present on California Avenue.

ESTIMATED TRIP GENERATION FOR PROJECT ALTERNATIVES

The trip generation of each of the alternatives was estimated using the same methodology that was used for the proposed project. The resulting trip generation estimates for each alternative are shown in Tables 10 to 12. Table 13 compares trips generated by the proposed project with the six project alternatives. The estimated trip generation of each alternative is summarized below.

- Alternative 1 – Under this alternative, the project would not be constructed, and there would be no new trips generated to or from the project site. Existing uses would continue to generate trips.
- Alternative 2 – The trip generation for Alternative 2 would be 30 – 45% lower than that of the proposed project during each of the analyzed peak hours. As shown in Table 10, this alternative is expected to generate a net increase of 781 daily weekday trips, 46 trips in the AM peak hour, and 55 trips in the PM peak hour. This alternative is also expected to generate a net increase of 874 weekend daily trips and 63 trips in the weekend midday peak hour.
- Alternative 3 – The trip generation for Alternative 3 would be 35% - 40% lower than that of the proposed project during each of the analyzed peak hours. As shown in Table 11, this alternative is expected to generate a net increase of 631 weekday daily trips, 52 trips in the AM peak hours, and 47 trips in the PM peak hour. This alternative is also expected to generate a net increase of 881 weekend daily trips and 63 trips in the weekend midday peak hour.
- Alternative 4 – The trip generation for Alternative 4 would be considerably lower than that of the proposed project during each of the analyzed peak hours. As shown in Table 12, this alternative is expected to generate a net increase of 641 weekday daily trips, 25 trips in the AM peak hours, and 44 trips in the PM peak hour. This alternative is also expected to generate 628 weekend daily trips and 47 trips in the weekend midday peak hour.
- Alternative 5 – The trip generation for Alternative 5 would be the same to that of the proposed project.
- Alternative 6 – The trip generation for Alternative 6 would be the same to that of the proposed project.

Notes:

[a] Rates derived empirically to reflect site-specific conditions, as documented in LLG Memo: "Addendum Trip Generation Report" (July 29, 2019)

[b] Trip generation for project land use in 2020 from TDFM (Area Type 1), without Expo reduction from Table 14 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #820 Shopping Center, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.

[c] Trip generation for project land use in 2020 from TDFM (Area Type 1), without Expo reduction from Table 14 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #220 Multifamily Housing, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.

[d] Based on market conditions and to provide future operational flexibility, the Project proposes to allow owners of condominiums the ability to periodically make their units available for use as hotel guest rooms. A maximum of 10 of the condominium units would be utilized as hotel guest rooms at any one time. These 10 units were analyzed as condominiums for the purpose of this study, which is conservative because residential trip generation rates are similar or higher than hotel trip generation rates.

Notes:

[a] Rates derived empirically to reflect site-specific conditions, as documented in LLG Memo: "Addendum Trip Generation Report" (July 29, 2019)

[b] Trip generation for project land use in 2020 from TDFM (Area Type 1), without Expo reduction from Table 14 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #820 Shopping Center, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.

[c] Trip generation for project land use in 2020 from TDFM (Area Type 1), without Expo reduction from Table 14 in Santa Monica Travel Demand Forecasting Model Trip Generation Rates, is used so that rates account for LUCE TDM measures and proximity to the Expo LRT; in/out splits are applied from #220 Multifamily Housing, Trip Generation, 10th Edition, Institute of Transportation Engineers (ITE), 2017.

[d] Based on market conditions and to provide future operational flexibility, the Project proposes to allow owners of condominiums the ability to periodically make their units available for use as hotel guest rooms. A maximum of 10 of the condominium units would be utilized as hotel guest rooms at any one time. These 10 units were analyzed as condominiums for the purpose of this study, which is conservative because residential trip generation rates are similar or higher than hotel trip generation rates.

POTENTIAL TRAFFIC IMPACTS OF PROJECT ALTERNATIVES

Based on the projected trip generation of the proposed alternatives and a review of the incremental changes in delay and V/C under the proposed project, the following general conclusions can be made with regard to anticipated traffic impacts:

- Alternative 1 – By definition, no traffic impacts would occur under this alternative, as no new development and associated vehicle trips would occur on the project site.

No segment impacts would occur under this alternative.

- Alternative 2 – The severity of impacts that would occur under Approval conditions would be slightly less than that of the proposed project. Under Future conditions, the significant impact at the intersection of Palisades Beach Road & California Avenue would not be expected to occur. There would also be one less AM peak hour significant impact. The severity of impacts during the PM and Weekend peak hours would be reduced but still be considered significant. No additional significant traffic impacts would occur under this alternative.

The same number and location of segment impacts would occur under this alternative. No additional segment impacts would occur.

- Alternative 3 – The severity of impacts that would occur under Approval conditions would be slightly less than that of the proposed project. Under Future conditions, the significant impact at the intersection of Ocean Avenue & California Avenue would not be expected to occur. The Weekend peak hour impact at Lincoln Boulevard & California Avenue is also not expected to occur. The severity of the impacts that occur with the proposed project would be reduced but still be considered significant. No additional significant impacts would occur under this alternative.

The same number and location of segment impacts would occur under this alternative. No additional segment impacts would occur.

- Alternative 4 – The severity of impacts that would occur under Approval conditions would be slightly less than that of the proposed project. Under Future conditions, the significant impact at the intersection of Palisades Beach Road & California Avenue would not be expected to occur. There would also be one less AM peak hour significant impact. The severity of impacts during the PM and Weekend peak hours would be reduced but still be considered significant. No additional significant traffic impacts would occur under this alternative.

The same number and location of segment impacts would occur under this alternative. No additional segment impacts would occur.

- Alternative 5 – This alternative would generate the same level of trips as the proposed project for each of the analyzed peak hours, resulting in the same number and location of significant intersection impacts. This alternative would also result in the same number and location of segment impacts.

The same number and location of segment impacts would occur under this alternative. No additional segment impacts would occur.

- Alternative 6 - This alternative would generate the same level of trips as the proposed project, but access for employees would occur on 2nd Street instead of California Avenue. Each of the significant impacts that would occur with the proposed project would also occur with Alternative 6. However, with all employee trips now accessing the project site on 2nd Street, the severity of the impacts at 2nd Street & Wilshire Boulevard (Intersection 14) would increase under both Approval (2020) and Future Year (2025). Table 14 summarizes the results of the Approval Year (2020) plus Project Alternative 6 conditions and Table 15 summarizes the results of the Future (2025) plus Project Alternative 6 conditions.

Under this alternative, there would be one less segment impact on California Avenue between Ocean Avenue and 2nd Street due to the shift in employee access from California Avenue to 2nd Street. All other impacts remain the same. Table 16 summarizes the results for Existing plus Project for both weekday and weekend analysis periods.

As summarized in Table 17, Alternative 1 would avoid all of the significant intersection impacts associated with the proposed project. Alternatives 2, 3, and 4, there would be one less significant intersection impact in the Future Year than with the proposed project, though the number and location of significant intersection impacts under Approval conditions would be unchanged. The number and location of significant impacts for Alternative 6 would remain the same under Approval and Future conditions but the severity of the impact at one intersection would increase.

As summarized in Table 18, Alternative 1 would avoid all of the segment impacts associated with the proposed project. Alternatives 2, 3, 4, and 5 would generate the same number of segment impacts as the proposed project. One less segment impact would occur under Alternative 6.
