INTRODUCTION

The purpose of this report is to introduce the Travel Demand Forecasting (TDF) model built for Santa Monica's Land Use and Circulation Element (LUCE) update. This report describes the model development process in general, and how this process was applied to develop the City of Santa Monica model, including the sources of data used to develop key model inputs.

GENERAL DISCUSSION OF THE TDF MODEL

This section summarizes the answers to commonly asked questions related to TDF models and how the City can use a TDF model.

What is a TDF model?

A TDF model is a computer program that simulates traffic levels and travel patterns for a specific geographic area. The program consists of input files that summarize the area's land uses, street network, travel characteristics, and other key factors. Using this data, the model performs a series of calculations to determine the amount of trips generated, the beginning and ending location of each trip, and the route taken by the trip. The model's output includes projections of traffic volumes on major roads, and peak hour turning movements at certain key intersections.

How is a TDF model useful?

The City TDF model will be a valuable tool for preparing long-range transportation planning studies, such as Santa Monica's General Plan Update. The travel model will be used to estimate the average daily and peak hour traffic volumes on the major roads in response to future land use, transportation infrastructure, and policy assumptions, and form a consistent basis by which to analyze the different potential land use scenarios. Additionally, using these traffic projections, transportation improvements will be identified to accommodate the changing traffic patterns associated with the General Plan's preferred land use alternative.

How do we know if the TDF model is accurate?

To be deemed accurate for projecting traffic volumes in the future, a model must first be calibrated to a year in which actual land use data and traffic volumes are available and well documented. A model is accurately calibrated when it replicates the actual traffic counts on the major roads within certain ranges of error established in *Travel Forecasting Guidelines* (Caltrans, 1992) and it demonstrates stable responses to varying levels of inputs. The Santa Monica model has been calibrated to 2008 base year conditions using actual traffic counts, census data, and land use data surveyed and compiled by City staff.

Is the City of Santa Monica TDF model consistent with standard practices?

The City of Santa Monica model is consistent in form and function with standard travel forecasting models used in transportation planning. The model includes a land use/trip generation module, a gravity-based trip distribution model, and a capacity-restrained equilibrium traffic assignment process. The travel model utilizes Version 5.0 of the TransCAD Transportation GIS software, which is consistent with many of the models used by local jurisdictions in California and throughout the nation. The Southern California Association of Governments (SCAG), the metropolitan planning organization (MPO) for Southern California, maintains their current regional travel demand model in TransCAD.

How can the TDF model be used?

The TDF model can be used for many purposes related to the planning and design of the City's transportation system. The following is a partial listing of the potential uses of the TDF model:

- To update the land use and circulation elements of the General Plan
- To conduct a city-wide traffic impact fee program
- To evaluate the traffic impacts of area-wide land use plan alternatives
- To evaluate the shift in traffic resulting from a roadway improvement
- To evaluate the traffic impacts of land development proposals
- To determine trip distribution patterns of larger land development proposals
- To support the development of transportation sections of Environmental Impact Reports (EIRs)
- To support the preparation of project development reports for Caltrans

STUDY AREA AND STREET NETWORK

Figure 1 shows the study area for the City travel demand forecasting model. The model area encompasses the City of Santa Monica and neighboring areas in the City of Los Angeles that have high levels of interaction with Santa Monica. The study area contains all areas that may experience land use changes under *Santa Monica LUCE* and the LUCE alternatives.

SUMMARY OF THE INPUT DATA

DATA COLLECTION

A data collection effort was undertaken at the outset of the *Santa Monica LUCE* process. Data sources include SCAG for street network and regional travel data, Caltrans and the City of Santa Monica for traffic count data, and the City of Santa Monica for land use, and street network data.

LAND USE DATA

Land use data is one of the primary inputs to the Santa Monica model, and this data is instrumental in estimating trip generation. The model's primary source of land use data is the City's parcel-level land use database (maintained in a GIS format). This database provides information on how much development currently exists within each traffic analysis zone (TAZ) (discussed below). The City's land use data is supplemented by SCAG TAZ-based data for areas in the City of Los Angeles bordering the City of Santa Monica.

Land use in the model is divided into a variety of residential and non-residential categories. The City of Santa Monica model employs 30 land use data categories to describe land use in the City, as shown in Table 1.

TRAFFIC ANALYSIS ZONE SYSTEM

Travel demand models use traffic analysis zones (TAZs) to subdivide the study area for the purpose of connecting land uses to the street network. TAZs represent physical areas containing land uses that produce or attract vehicle-trip ends. Since SCAG is the MPO for the area, the TAZ system for the Santa Monica model was developed to nest within SCAG's TAZ system. After reviewing the TAZ layer used in the SCAG regional model, along with the street network and recent aerial photographs, a set of TAZ boundaries was created for the Santa Monica model to achieve the following local area enhancements:

- Large TAZs were subdivided, allowing for a more detailed assignment of local traffic to the highway network. This level of detail was necessary to forecast traffic volumes at the turning movement level.
- Considerable detail was added to the TAZ system in the downtown street grid to allow for a detailed traffic assignment and a more accurate calculation of the 4D variables (density, diversity of land uses, design of the streetscape, and access to regional destinations).
- TAZs were created to be consistent with large developments such as the Water Garden and Santa Monica Place.

The resulting 2008 model TAZ system includes 824 zones in the model area, of which 599 zones cover the City of Santa Monica and the remaining 225 cover the surrounding areas of the City of Los Angeles. Detailed maps showing the TAZ numbers in all portions of the model area are included in Appendix A.

Also included in the TAZ structure are the external stations or gateways at points where major roadways provide access into the model area. The external gateways represent all major routes by which traffic can enter or exit the study area and capture the traffic entering, exiting, or passing through the model area. Table 2 contains a list of the 22 external gateways numbered from 1001 to 1022 that were established for this model. Figure 2 illustrates the locations of the external stations.

STREET NETWORK

The street network for the base year conditions is derived from the City's GIS roadway centerline file. The model street network includes all freeways, state highways, arterials, collectors, and local roads within the study area (see Figure 1). These classifications are based on the City's 1984 General Plan circulation element and reflect existing conditions.

The streets shown in Figure 1 are classified in four major categories and form the primary street network that is represented in the model structure. As is typical for urban-area models, the model network focuses on the most used facility types. Residential streets are included as well, not to precisely replicate individual travel patterns but to distribute traffic volumes more realistically. The four major street categories are described below.

Freeways

Freeways are high-capacity facilities that primarily serve longer distance travel. Access is limited to interchanges typically spaced at least one mile apart. Interstate 10 is the freeway that runs directly through the Santa Monica model area.

Highways

Roadways designated as highways are typically State highways that are not limited-access freeways. In Santa Monica, these facilities serve travel between the City and its neighboring jurisdictions. The primary highway in Santa Monica is SR 1 (PCH). Portions of Lincoln Boulevard and Santa Monica Boulevard are also designated as State Routes in Santa Monica. However, these facilities function more like arterials and are coded as such in the model.

Arterials

Roadway segments classified as arterials are major roads that provide connections within the City, between the City and neighboring areas, and through the City (cut-through traffic). Arterials in Santa Monica typically have two lanes in each direction, with travel speeds of 30-35 miles per hour (mph).

Collectors

Collectors are facilities that connect local streets to the arterial and highway system, and may also provide direct access to local land uses. Collectors typically have one lane in each direction, with speeds of 25-30 mph. In Santa Monica, streets that fulfill this purpose but are primarily located in residential areas are called feeders.

For each of its records, the street network database includes a street name, distance, functional class, speed, capacity, and number of lanes. These attributes were checked using maps, aerial photographs, and other data provided by the City. Table 3 shows the initial roadway speeds, lanes and capacities used for each roadway class in the model. Where necessary, these values were then modified to reflect current conditions at specific locations.

For a representative sample of network links, traffic counts for daily, AM peak hour, and PM peak hour have been coded for validating the model. These traffic counts were collected as part of the City's ongoing count program.

TABLE 3
TYPICAL ROADWAY SPEEDS AND CAPACITIES

Roadway Classification ¹	Speed (MPH)	Total Through Lanes	Lane Capacity (Vehicles per hour per lane)	Total Facility Capacity (Vehicles per hour)
Freeway	65	4-10	2,000	8,000-20,000
Highway	50	4-6	1,200	4,800-7,200
Arterial	30-35	4	900	3,600
Collector/Feeder	25-30	2	600	1,200
Local	25	2	600	1,200
Ramp	30	1	1,800	1,500
Centroid Connector ²	30	2	10,000	20,000

¹ City of Santa Monica Land Use and Circulation Element, 1984.

² Centroid connectors are abstract representations of the starting and ending point of each trip, and thus should have no Source: Fehr & Peers, 2009.

DESCRIPTION OF THE MODEL CALIBRATION PROCESS

Model calibration is the process by which parameters for the model are determined. These parameters are based on comparing travel estimates computed by the model with actual data from the area being modeled. This section provides a general description of the calibration steps and the adjustments made during the process to achieve accuracy levels that are within Caltrans guidelines.

TRIP GENERATION RATES

Trip generation rates relate the number of vehicle trips going to and from a site to some measure of the intensity of use at the site. Each trip has two ends, a “production” and an “attraction”. By convention, trips with one end at a residence are defined as being “produced” by the residence and “attracted” to the other use (workplace, school, retail store, etc.), and are called “Home-Based” trips. Trips that do not have one end at a residence are called “Non-Home-Based” trips.

There are eight trip purposes used in the Santa Monica model:

1. Home-Based Work (HBW): trips between a residence and a workplace.
2. Home-Based Other (HBO): trips between a residence and any other destination.
3. Non-Home-Based (NHB): trips that do not begin or end at a residence, such as traveling from a workplace to a restaurant, or from a retail store to a bank.
4. School (SCHOOL): trips to and from a school.
5. College (COLLEGE): trips to and from a college.
6. Recreational (REC): trips to and from the beaches and parks.
7. Internal to External Commute Trips (IXHBW): Work trips of model area residents who work outside the model area
8. External to Internal Commute Trips (XIHBW): Work trips of model area employees who live outside the model area.

Trip generation rates are initially defined for total trips and later split by trip purpose, for both productions and attractions.

The most widely used source for individual project vehicle trip generation rates in the transportation planning field is *Trip Generation, 8th Edition* (Institute of transportation Engineers [ITE], 2008). This book contains national averages of trip generation rates for a variety of land uses in what are generally suburban locations. The ITE land use categories tend to be very specific, while model land use categories (accounting for all land use in the City) tend to be more general. ITE rates are appropriate for smaller site specific uses, such as traffic studies for development review, and they can provide a starting point for travel models by capturing the interaction between all land uses in the City. However, the unique local characteristics of Santa Monica require the development of specific trip generation rates for the model.

A traffic impact study uses ITE trip generation rates because, in most cases, the project being examined shares characteristics with the information contained in *Trip Generation, 8th Edition*. In other words, both the traffic impact study and the ITE rates rely on single-use, isolated projects that have plenty of free

parking and little or no interaction with other nearby uses. When assessing the impact of an individual project, the ITE rates are typically appropriate since they can correctly mimic the site being analyzed in the traffic impact study.

The Santa Monica model, on the other hand, generates trips by purpose, and balances productions to attractions. The model also has trip rates calibrated to local conditions and other advanced trip generation features such as the cross classification of dwelling units by vehicle availability. Traffic impact studies rely on ITE trip rates that only vary based on land use type or size. While these trip rates are a valid starting point for model calibration and validation, they have a different purpose and are not necessarily suitable for demand forecasting without customization.

Certain ITE rates are more applicable to Santa Monica model rates because of their comparable level of detail. For example, both ITE and the Santa Monica model have a generic office category. Some ITE rates, however, cannot be used directly because the land use category is not the same as the City's land use classifications. For example, ITE's restaurant categories include high turnover restaurant, fast food restaurant, fast food restaurant with drive-through with seating, fast food restaurant with drive-through and no seating, etc. By necessity, Santa Monica restaurant rates represent a compilation and average of those rates customized to the City. It is important to recognize that ITE rates are also averages, based on driveway counts at multiple locations, so the utilization of average rates within the Santa Monica model is entirely appropriate.

The 2008 trip generation rates were initially based on residential trip generation surveys, the SCAG regional model, the San Diego Association of Governments' (SANDAG) trip generation survey, recently calibrated models in similar areas, and *Trip Generation, 8th Edition*. For example, calibrated trip generation rates from Santa Barbara and West Hollywood were used as a starting point. These areas were selected because they share socioeconomic and land use characteristics with the City of Santa Monica. The rates were then modified to account for local conditions based on counts, production-to-attraction balancing (discussed below), and the difference between ITE and model land use definitions. The final Santa Monica trip generation rates are unique to the Santa Monica model, and they are ultimately based upon the results of successful model calibration and validation.

PRODUCTION/ATTRACTION BALANCING

Local trips (internal-to-internal, or I-I) are trips that both start and end in the study area. One of the basic assumptions of any travel model is that the total number of local trips produced is equal to the total number of local trips attracted. It is logically assumed that if a journey is started somewhere, it must have an ending somewhere else. If the total productions and attractions are not equal, the model will typically adjust the attractions to match the productions, thus ensuring that each departing traveler finds a destination. While it is never possible to achieve a perfect match between productions and attractions prior to the automatic balancing procedure, the existence of a substantial mismatch in one or more trip purposes indicates that either land use inputs or trip generation factors may be in error.

Table 4 summarizes the local trip productions and attractions from the Santa Monica travel model for each trip purpose, prior to the application of the automatic balancing procedure. Guidelines published by Federal Highway Administration's Transportation Model Improvement Program (TMIP) and National Highway Cooperative Research Program (NCHRP) suggest that, prior to balancing, the number of productions and attractions should match to within plus or minus 10% (i.e., the production-to-attraction ratio should be within the range of 0.90 to 1.10). The results shown in Table 4 indicate that the 2008 model meets the published guidelines for all trip purposes.

TABLE 4
TRIP PRODUCTION TO ATTRACTION RATIOS BY PURPOSE

Trip Purpose	Production/ Attraction Ratio	Percent of Total Daily Vehicle Trips	
		2008 Santa Monica Model ¹	California ²
Home-Based Work (HBW)	1.00	22%	21%
Home-Based Other (HBO)	1.00	47%	48%
Non-Home-Based (NHB)	1.00	32%	31%
Total		101%	100%

¹ The trip purposes listed are the broad categories applied in most every travel model. The more specific Santa Monica trip purposes are subsets of these broader trip purposes, and have been aggregated here for ease of comparison. IXHBW and XIHBW are subsets of the HBW trip purpose. School, College, and REC are subsets of the HBO trip purpose.

² 2000-2001 California Statewide Household Travel Survey Final Report, June 2002.

Note: May not total 100% due to rounding

Source: Fehr & Peers, 2009.

In addition to production and attraction balancing, the percent of total trips for each purpose were checked for reasonableness. Typical values are provided below:

- HBW¹ trips 18% to 27% of all trips
- HBO trips: 47% to 54% of all trips
- NHB trips: 22% to 31% of all trips

This information, in conjunction with trip generation rate comparisons and trip purpose distributions discussed later in this report, indicates that the trip generation component of the Santa Monica model is performing reasonably.

FURTHER REFINEMENT

In addition to the standard trip generation procedures, certain enhancements were added to the Santa Monica model to better capture local trip making characteristics and provide the ability to test certain policy options for future development scenarios. These enhancements include dividing the model area into four “area types” and cross-classifying multifamily households by auto ownership.

Area Types

The model area contains a variety of development patterns, each with different land use characteristics and associated trip making patterns. To account for these differences, the model area was divided into four “area types.” The four area types, shown in Figure 3, have their own associated trip generation rates and internal/external trip making characteristics.² Trip generation rates for each land use in each area type are shown in Table 5.

Area type 1 represents Downtown Santa Monica and the Special Office District. This area contains the greatest concentration of commercial and retail land uses within the boundaries of the model. These land uses are grouped together because of their similar density and propensity to attract trips from outside the model area. These two locations differ from the rest of the model area by exhibiting high levels of walkability and a lower propensity for driving. The boundary between area type 1 locations and the rest of the model was based on the likelihood of pedestrian travel between complementary land uses.

Modal choice is strongly determined by auto availability, and since most people arrive in Downtown Santa Monica and the Special Office District by car, the locations covered by area type 1 were defined by two factors that counteracted what otherwise would have been a predisposition towards driving. Distance from parking garages was the first factor. People are more likely to walk than drive when the distance they need to travel is a quarter mile or less. The second factor was a high density of complementary land uses. Driving trips are eliminated when people can park once and walk to multiple destinations.

¹ The trip purposes listed are the broad categories applied in most every travel model. The more specific Santa Monica trip purposes are subsets of these broader trip purposes, and have been aggregated here for ease of comparison. IXHBW and XIHBW are subsets of the HBW trip purpose. School, College, and REC are subsets of the HBO trip purpose.

² Internal/External trip making is explained in the Trip Distribution section below

¹ The ITE manual does not stratify multifamily dwelling units by auto ownership. ITE multifamily rates range from 4.18 to 6.72 depending on the dwelling type. Rates based on auto ownership were developed from National Household Travel Survey (NHTS) data for the City of Santa Monica. NHTS rates range from a minimum of 1.16 to a maximum of 12.52.

² Not all non-residential land use categories are present in each area type. 2008 trip generation rates were only developed for land uses present in 2008 in each area type.

Source: Fehr & Peers, 2009.

Complementary land uses also allow people who do not arrive by car (by way of public transit, biking, walking) to carry out multiple trips within their walking radius.

Area type 2 represents the remaining residential and commercial portion of Santa Monica. This area has development patterns generally consisting of connecting streets, and a mixture of residential and non-residential land uses.

Area type 3 represents the beach areas in the model area. These areas contain a large portion of the recreational land use. Most of the commercial land uses in the area support the recreational land uses. There is limited residential development in area type 3.

Area type 4 represents the areas of the City of Los Angeles surrounding the City of Santa Monica.

Multi-Family Unit Vehicle Ownership

In order to provide the ability to test certain potential policy alternatives, multi-family dwelling units were divided into three types representing varying levels of automobile ownership. Auto-ownership data for each census tract in Santa Monica was obtained from the 2002 National Household Travel Survey, which is conducted by the United States Census Bureau. The total number of multifamily units in each census tract was apportioned to the relevant multi-family trip generation category based on the percentage of households at each level of auto ownership.

TRIP DISTRIBUTION (GRAVITY MODEL)

Once the trip generation step has determined the number of trips that begin and end in each zone, the trip distribution process determines the specific destination of each originating trip. The destination may be within the zone itself, resulting in an intra-zonal trip. If the destination is outside of the zone of origin, it is an inter-zonal trip. Internal-internal (I-I) trips originate and terminate within the model area. Trips that originate within but terminate outside of the model area are internal-external (I-X), and trips that originate outside and terminate inside of the model area are external-internal (X-I). Trips passing completely through the model area are external-external (E-E).

The trip distribution model uses a gravity model equation to distribute trips to all zones. This equation estimates an accessibility index for each zone based on the number of attractions in each zone and a friction factor, which is a function of travel time between zones. Each attraction zone is given its share of productions based on its share of the accessibility index. This process applies to the I-I, I-X, and X-I trips. The E-E trips are added to the trip table prior to final assignment.

Friction Factors

Friction factors, also known as travel time factors, determine the relative attractiveness of each destination zone based on the travel time between TAZs and the number of potential origins and destinations in each TAZ. These factors are used in the trip distribution stage of the model. The 2008 Santa Monica model friction factors are based on data reported in national modeling reference documents such as National Cooperative Highway Research Program (NCHRP) 365, and modified based on local conditions and comparison with the SCAG model. See Appendix B for friction factor curves.

Trips between the Model Area and External Areas

One of the important inputs to a travel model is an estimate of the amount of travel between the study area and neighboring areas outside the model. These are typically called internal-external, or I-X/X-I, trips.

The United States Census Bureau surveys residential and work locations at the place level. Table 6 illustrates the distribution of work locations for Santa Monica residents, while Table 7 illustrates the distribution of residential locations for Santa Monica employees. The census data is specific to Santa Monica, while the model area also encompasses parts of neighboring Los Angeles. It is assumed that a certain percentage of Santa Monica employees who live outside the City of Santa Monica live in the neighboring area of Los Angeles included in the model area.

Based on this data, the proportion of HBW trips entering and leaving the study area was estimated. For non-work trip purposes, information from the SCAG Regional Model was used to develop an initial estimate of the percent of HBO and NHB trips that travel between Santa Monica and other areas. These estimates were then refined using the City's land use database. Table 8 summarizes the proportion of trips by purpose and area type that are assumed to have one end outside the model area.

After the number of I-X/X-I trips was estimated, these trips were distributed to the stations around the perimeter of the model area using external station weights. External station weights were based on counts collected at each external station. The number of through trips at each station was subtracted from the count and the remainder was made up of I-X/X-I trips. The resulting external station weights are presented in Figure 4.

Through Trips

Through trips (also called external-external, or EE trips) are those that pass through the study area without stopping inside the study area. The major flows of through traffic in the Santa Monica area use I-10, PCH and Lincoln Boulevard, with lower volumes of through traffic using other streets. The size of these flows was estimated based on Caltrans traffic counts and the SCAG Regional Model. The through trips were modified in conjunction with the external station weights so that results at the model gateways accurately represented observed data. The resulting through trip matrix is summarized in Table 9.

TRIP ASSIGNMENT

The trip assignment process determines the route that each vehicle trip takes from origin to destination. The model selects these routes in a manner that is sensitive to congestion and the desire of drivers to minimize overall travel time. It uses an iterative, capacity-restrained assignment, and volume adjustments are made that progress towards equilibrium. This technique finds a travel path for each trip that minimizes travel time, while taking into account congestion delays caused by other trips in the model.

The general assignment process includes the following steps.

- Assign all trips to the links along their selected paths.
- After all assignments, examine the volume on each link and adjust its impedance based on the volume-to-capacity ratio.
- Repeat the assignment process for a set number of iterations or until specified criteria related to minimizing travel delays are satisfied.

Source: SCAG

Calibration of the street network included modification of the centroid connectors to more accurately represent the location at which traffic accesses local roads; adjustment of speeds from posted speed limits to reflect the attractiveness of the route and the prevailing speed of traffic; and refinement of turn penalties.

Turn Penalties

Turn penalties are used to prohibit or add delay to certain turning movements. The Santa Monica model prohibits traffic from getting off a freeway ramp and then immediately getting back on. The model also prohibits traffic from making turns across impassable medians. In addition, the model does not allow U-turns in order to avoid counter-intuitive traffic routing. Information on prohibited turns was provided by the City and supplemented with field surveys. Turn penalties may be in effect during the entire day, or only during one or both peak periods.

MODEL VALIDATION

Model validation is the term used to describe model performance in terms of how closely the model's output matches existing travel data in the base year. During the model development process, these outputs are used to further calibrate model inputs. The extent to which model outputs match existing travel data validates the assumptions of the inputs.

Traditionally, most model validation guidelines have focused on the performance of the trip assignment function in accurately assigning trips to the street network. This metric is called static validation, and it remains the most common means of measuring model accuracy.

Models are seldom used for static applications; however, by far the most common use of models is to forecast how a change in inputs would result in a change in traffic conditions. Therefore, another test of a model's accuracy focuses on the model's ability to predict realistic differences in outputs as inputs are changed. This method is referred to as dynamic validation. This section describes the highest-level validation checks that have been performed for the Santa Monica model.

STATIC VALIDATION

The most critical static measurement of the accuracy of any travel model is the degree to which it can approximate actual traffic counts in the base year. Caltrans has established certain trip assignment guidelines for models forecasting future year traffic in *Travel Forecasting Guidelines* (California Department of Transportation, November 1992). The validity of the Santa Monica model was tested under daily, AM peak hour, and PM peak hour conditions. Model volumes were compared to existing traffic counts at 198 individual count sites for daily validation, and 560 count sites for AM and PM peak hour validation. The results are shown in Tables 10 and 11.

Link volume results from model runs were examined and checked for reasonableness. Links where model results varied substantially from the observed counts were identified, and the characteristics of these links were reviewed to ensure that the link attributes reflected local operating conditions. In some cases, link characteristics such as speeds were modified to better reflect conditions on the ground.

Comparison Techniques

Travel model accuracy is usually tested using four comparison techniques:

- The volume-to-count ratio is computed by dividing the model volume by the actual traffic count for individual roadways (or intersections) area-wide.
- The maximum deviation is the difference between the model volume and the actual count divided by the actual count.
- The correlation coefficient estimates the relationship between actual traffic counts and the estimated traffic volumes from the model.
- The percent root mean square error (RMSE) is the square root of the model volume minus the actual count squared, divided by the number of counts. It is a measure similar to standard deviation in that it assesses the accuracy of the entire model.

TABLE 10 RESULTS OF DAILY MODEL VALIDATION		
Validation Item	Criterion for Acceptance	Model Results

RMSE	40% or less	25%	29%
Source: Fehr & Peers, 2009.			

Validation Guidelines

For a model to be considered accurate and appropriate for use in travel forecasting, it must replicate actual conditions within a certain level of accuracy. Since it would be impossible for any model to replicate all counts precisely, validation guidelines have been established by Caltrans and other agencies. Key validation standards for daily travel models based on the Caltrans guidelines are summarized below:

- At least 75 percent of the roadway links for which counts are available should be within the maximum desirable deviation, which ranges from approximately 15 to 60 percent depending on total volume (the larger the volume, the less deviation is permitted).
- All of the roadway screenlines should be within the maximum desirable deviation, which ranges from approximately 15 to 64 percent depending on total volume.
- The two-way sum of the volumes on all roadway links for which counts are available should be within 10 percent of the counts.
- The correlation coefficient between the actual ground counts and the estimated traffic volumes should be greater than 88 percent.

Although not stated in the Caltrans standards, an additional Fehr & Peers validation guideline was applied to the Santa Monica model:

- The RMSE should not exceed 40 percent.

DYNAMIC VALIDATION

The traditional approach to the validation of travel demand models is to compare the link volumes for the model's base year to actual traffic counts. This approach provides information on a model's ability to reproduce a static condition. While reproducing these conditions is very important, it is also important to know that the model will produce stable and reasonable results when various inputs such as land use are changed. The following section presents a selection of the dynamic validation results.

Land Use Changes

A basic form of dynamic validation is to vary the amounts of a particular land use type and compare the magnitude and direction of change from the original forecast. Of particular interest are changes in:

- Vehicle Trips (VT)
- Change in VT per land use unit change (VT/DU or KSF)
- Vehicle Miles Traveled (VMT)
- Change in VMT per land use unit change (VMT/DU or KSF)
- Vehicle Hours Traveled (VHT)
- Change in VHT per land use unit change (VHT/DU or KSF)
- Vehicle miles traveled per vehicle trip (VMT/VT)

This form of dynamic validation was performed on the Santa Monica model by adjusting the number of multi-family one car dwelling units and the retail development in TAZs 150 and 539. These zones were

selected due to their geographic location and the existing land use mix within the zone. To isolate each of these changes, tests were done sequentially, changing one item at a time.

Figure 5 shows the location of the zones that were used for dynamic validation. Zone 150 is located downtown near the intersection of 5th Street and Santa Monica Boulevard and contains a broad mix of residential and non-residential land uses. Zone 539 is located near Clover Park and contains only single-family dwelling units. The values added to a zone were selected based on adjacent land uses. The results are shown in Table 12.

- The change in VT per added DU ranges from 2.7 – 3.2. This is reasonable given the mix of land uses in the various zones and the different trip generation rates of each area type. Within each individual area type there is slight variability, showing stable trip generation across the range of land use magnitudes. The average vehicle trips per added DU are lower for zone 150 due to the abundance of other land uses for the residents to interact with.
- Adding a single DU to the model is a test of how much noise (random error) is in the model. Total VMT changed by between 7 and 25 vehicle miles per day per dwelling unit added, depending on the zone it was added to. Both zones showed a little noise when a single dwelling unit was added. However, both zones perform very well when a realistic quantity of development is added.
- The VHT per DU change is fairly stable around -3.0 to 1.4. There is some noise when adding a single dwelling unit to zone 539. Again, the noise at this extremely small level of change is no longer present for typical increases in the level of development.
- Adding retail land uses to either zone shows a high level of stability and logical results in all metrics. VT/KSF is lower downtown than in the zone near Clover Park, which would be expected given the character of the surrounding area. Similarly, VT/KSF generally declines with an increase in the quantity of retail land use added. Finally, VHT/KSF is greater downtown where travel is generally slower than in other parts of the City.

¹ VT, VMT, and VHT, as reported here, represent all model area trips on the model network, including through trips. This approach is taken to measure the effect of these changes on the model area as a whole. Performance measures reported in other documents using model data may differ in methodological approach.

DRAFT MEMORANDUM

Date: April 10, 2015

To: Rachel Kwok, City of Santa Monica

From: Tom Gaul, Jeff Pierson, and Jill Liu, Fehr & Peers

Subject: *City of Santa Monica Travel Demand Forecasting Model Update Report*

Ref: SM13-2611

Fehr & Peers has completed a comprehensive update of the City of Santa Monica's Travel Demand Forecasting Model (TDFM). The base year of the model was upgraded from 2008 to 2013 conditions using network and land use information collected during fall 2013. The TAZ system was also updated to be consistent with the previously expanded TAZ system for the Bergamot Area Plan analysis. New traffic volumes were collected during this period to calibrate and validate the base year model.

The model framework was rewritten to run in an updated version of TransCAD (version 5.0 R4, build 2025). The model structure was also updated to make it easier to manage different scenarios (weekday and weekend) and forecast years (2013, 2025, and 2030). Assignment options can now be selected from directly within the new model interface. In addition, several preparation procedures that were previously calculated outside of the model have been incorporated into the model framework to reduce the number of steps required to run the model.

As part of the model update, Fehr & Peers used the best available tools to prepare and analyze the results from the model. The Southern California Association of Governments (SCAG) 2012 Regional Transportation Plan (RTP) model provided information about the land use and trips outside of the City of Santa Monica. The City's TRAFFIX database, which was used to analyze intersection level of service (LOS), has been upgraded to PTV's VISTRO platform to incorporate more robust signal timing information and to use the *Highway Capacity Manual* (HCM) (Transportation Research Board, 2010) LOS methodology. Finally, the greenhouse gas (GHG) emissions calculations are now done in the latest version of the EMFAC software (EMFAC2011-SG) provided by California Environmental Protection Agency's Air Resources Board.

BACKGROUND

The City of Santa Monica Travel Demand Forecasting Model was originally developed in 2009 to analyze the potential impacts of the 2030 Land Use and Circulation Element (LUCE). The development of and calibration of this model was documented in *Santa Monica LUCE Model Development Report* (Fehr & Peers, December 2009). Since the development of the original 2008 and 2030 weekday models, weekend models as well as several interim year development review models were also developed. The 2030 planning scenario model has also been used to analyze the potential impacts of both the Bergamot Area Plan and the Downtown Specific Plan. Significant network enhancements were made for both of these projects to improve the quality of the model results.

The purposes of this model update were numerous:

- Update the base year of the model to 2013 conditions
- Merge all model years and scenarios into a consistent framework
- Incorporate the latest regional assumptions from the SCAG 2012 RTP
- Upgrade the model interface to run in a more recent version of TransCAD
- Combine all previous model improvements into the base year model
- Streamline the model preparation process to decrease model run time
- Use the latest tools to prepare model inputs and analyze results (TDM+ and EMFAC2011)

BASE YEAR MODEL INPUT DATA

The data that were used as inputs to the updated model were collected in September 2013. Traffic counts were collected during this time by both Fehr & Peers and the City of Santa Monica. The City also provided information on land use and street network changes that had occurred since the 2008 model was developed. Information on land use and street network changes outside the City of Santa Monica was collected from the 2012 SCAG RTP.

Land Use Data

The City of Santa Monica maintains a parcel database with information on existing land use quantities. Fehr & Peers was provided with the changes in land use since the 2008 survey was conducted. The changes include both demolition and construction of new projects. These changes by land use category are shown in Table 1.

In addition to land use within the City of Santa Monica, the model also includes land use information for the neighborhoods bordering the City, within one mile of the city limits. This data is compiled from the most recent version of the SCAG RTP model and was disaggregated to match the Traffic Analysis Zone (TAZ) system in the City's model. The land uses changes for these areas are also shown in Table 1.

TABLE 1. BASE YEAR MODEL LAND USE COMPARISON

Land Use Category	Units	2008	2013	Delta
<i>City of Santa Monica</i>				
Single-family	Dwelling Units	7,584	7,565	-19
Multi-family	Dwelling Units	41,086	41,625	539
Convalescent Care	Dwelling Units	366	366	0
<i>Residential Subtotal</i>	<i>Dwelling Units</i>	<i>49,036</i>	<i>49,556</i>	<i>520</i>
Office	Thousand Square Feet	10,271	10,281	10
Creative Office	Thousand Square Feet	3,483	3,877	394
Government Office	Thousand Square Feet	416	389	-27
Medical Office	Thousand Square Feet	2,058	2,052	-7
Hospital	Thousand Square Feet	958	1,185	226
Retail	Thousand Square Feet	3,485	3,715	230
Personal Services	Thousand Square Feet	2,110	1,939	-171
Cultural	Thousand Square Feet	494	541	48
Entertainment	Thousand Square Feet	765	780	14
Nightlife	Thousand Square Feet	72	53	-19
Restaurant	Thousand Square Feet	1,177	1,240	63
Automotive	Thousand Square Feet	57	55	-2
Lodging	Thousand Square Feet	1,157	1,196	39
Religious	Thousand Square Feet	219	220	1
Police and Fire	Thousand Square Feet	226	226	0
Light Industrial	Thousand Square Feet	1,553	1,547	-5
Heavy Industrial	Thousand Square Feet	142	127	-15
<i>Employment Subtotal</i>	<i>Thousand Square Feet</i>	<i>28,643</i>	<i>29,423</i>	<i>780</i>
K-8 School	Students	8,391	8,391	0
High School	Students	4,148	4,148	0
College	Students	30,000	30,000	0
Airport	Based Aircraft	500	500	0
Recreation	Acres	328	321	-7
<i>Adjacent Neighborhoods</i>				
Residential	Dwelling Units	40,738	40,669	-69
Office	Employees	32,733	30,440	-2,293
Retail	Employees	3,993	3,917	-76
Industrial	Employees	4,585	3,814	-771
Education	Employees	5,854	5,458	-396
<i>Employment Subtotal</i>	<i>Employees</i>	<i>47,165</i>	<i>43,629</i>	<i>-3,536</i>

The land use changes within the City of Santa Monica show a 1 percent increase in dwelling units and a 3 percent increase in employment between 2008 and 2013. For the model area outside of the City, the SCAG 2012 RTP data shows a decrease in the number of dwelling units by less than half a percent and a decrease in the number of employees by 7 percent. This change likely reflects a refinement in how SCAG estimates total employment rather than an indication that the actual number of employees has decreased. Another change not shown in the table is the classification of households in the SCAG model. The 2012 RTP separates single-family and multi-family households for the first time. This information allows a better estimate of the number of vehicle trips generated outside the City since single-family homes generate more vehicle trips than multi-family homes. Combined with the decrease in employment, the net impact of these two changes from the SCAG data is fewer vehicle trips generated in the portion of the model outside the City of Santa Monica.

Traffic Analysis Zone System

Travel demand models use TAZs to subdivide the study area to connect land uses to the street network. TAZs represent physical areas that contain land uses that produce or attract vehicle trips ends. The 2008 model included 599 TAZs in the City of Santa Monica and 225 TAZs for the areas outside of the City. The number of TAZs in Santa Monica was increased to 612 in the 2030 forecast model used to analyze the Bergamot Area Plan.

For this model update, those TAZ changes were replicated in the new 2013 model to provide consistency between the base and future scenarios. The boundaries of TAZs around Tongva Park were adjusted to better align with the development that has occurred since 2008. A single TAZ was also added in this area to separate the land uses north and south of the I-10 freeway. The final number of TAZs that represent the City of Santa Monica in the new 2013 model is 613. The number of TAZs outside the City was unchanged.

Street Network

The model street network includes all freeways, state highways, arterials, collectors, and local roads within the study area. Modifications to the street network were made to incorporate changes that occurred between 2008 and 2013. The final street network used in the model is consistent with the roadway network when traffic counts were collected in September 2013. Any lane reductions or turn restrictions associated with construction activities at that time were included in the model. The network was modified to reflect changes associated with the following projects:

- Construction of Metro Expo Light Rail Line extension along Colorado Avenue
- Median installation along Ocean Avenue between Olympic Boulevard and Pico Boulevard
- Removal of on-street parking to provide a second travel lane on westbound Santa Monica Boulevard between 2nd Street and 5th Street
- Santa Monica Place renovation

Each street in the model is coded with free flow speed, hourly capacity, and the number of lanes. While the land use data and TAZ system are consistent across all scenarios, the attributes of the street network can vary by time of day or day of the week across the five analysis periods in the model:

- Weekday: Daily, AM Peak Hour, and PM Peak Hour
- Saturday: Daily and Midday (MD) Peak Hour

Within the model area, there are only two locations where the number of travel lanes changes throughout the day. There are weekday peak hour parking restrictions on:

- Wilshire Boulevard between Centinela Avenue and Barrington Avenue
- Santa Monica Boulevard between Bundy Drive and Barrington Avenue

Other network attributes are adjusted during the calibration process for each time period to reflect actual conditions at specific locations.

BASE YEAR MODEL CALIBRATION

A travel model is calibrated by adjusting certain parameters to match travel estimates from the model with data from the actual area being modeled. Parameters from the 2008 calibrated model were used as starting points and only adjusted when necessary.

Trip Generation

Trip generation rates relate the number of vehicle trips going to and from a site to some measure of the intensity of use at the site. Each trip has two ends: a production and an attraction. By convention, trips with one end at a residence are defined as being produced by the residence and attracted to the other use (workplace, school, shopping, etc.) and are called home-based trips. Trips that do not have one end at a residence are called non-home-based trips. There are six trip purposes used in the model:

- Home-based work (HBW) trips are between a residence and a workplace
- Home-based other (HBO) trips are between a residence and any other destination
- Non-home-based (NHB) trips do not begin or end at a residence
- School (SCHOOL) trips are to or from a K-12 school
- College (COLLEGE) trips are to or from a college or university
- Recreational (REC) trips are to or from parks and beaches

School, college, and recreational trips are a type of home-based other trip and have been separated in the model to better calibrate those trip purposes. For each land use type, the total daily trips are divided among the six trip purposes. While the trip rates are consistent between the 2008 and 2013 models, the trip purpose percentages were slightly adjusted to balance the total production trip ends and attraction

trip ends for each purpose. Table 2 shows the percent of daily vehicle trips by purpose for both 2008 model and the 2013 model.

TABLE 2. BASE YEAR DAILY TRIP PURPOSE PERCENTAGES

Purpose	2008 Weekday	2013 Weekday	2008 Saturday	2013 Saturday
Home-based work	25%	26%	8%	8%
Home-based other	42%	41%	55%	53%
Non-home-based	27%	26%	28%	28%
School	3%	3%	0%	0%
College	3%	3%	0%	0%
Recreation	1%	1%	9%	10%

The table shows consistent results between the two models, which is expected since only minor changes in land use occurred between 2008 and 2013. In both models, the Saturday scenario has fewer home-based work, school, and college trips than the weekday scenario. There are corresponding increases in home-based other and recreation trips.

Trip generation rates are defined for daily total trips by land use type and then split among the various trip purposes and analysis periods. The model uses different trip rates for the weekday and weekend scenarios. The daily trip generation rates in the 2008 weekday model were developed from a variety of sources. These included residential trip generation surveys, the *Trip Generation, 8th Edition* (ITE, 2008) the 2008 SCAG RTP model, a San Diego Association of Governments (SANDAG) trip generation survey, and other calibrated models within Los Angeles County developed by Fehr & Peers. The daily trip generation rates in the 2008 Saturday model were primarily developed using information from *Trip Generation, 8th Edition*.

After reviewing the daily trip generation rates by land use type, it was determined that no substantial changes had occurred since the rates were initially developed that would justify changing the values for the 2013 model. Tables 3 and 4 show the trip generation rates for the weekday and Saturday scenarios. There are four area types in the model, which allows different trip rates to be assigned based on specific development patterns with different land use characteristics and trip making patterns. Area 1 is Downtown Santa Monica and the Special Office District. Area 2 is the remaining residential and commercial areas of Santa Monica. Area 3 is the coastal area and Area 4 is outside the City of Santa Monica.

TABLE 3. BASE YEAR WEEKDAY DAILY VEHICLE TRIP GENERATION RATES

Trip Distribution

Trip generation determines the number of trips that begin and end in each TAZ. Trip distribution determines the specific destination of each origin trip. The trip distribution model uses a gravity model equation to distribute trips to all zones. This equation estimates an accessibility index based on the travel time between zones and a friction factor to distribute trips. The friction factor relates the attractiveness between zones to the travel times. These are developed based on information from the SCAG regional model and research from the National Cooperation Highway Research Program (NCHRP).

The gravity model can only be applied to trips which begin and end within the model study area. These are referred to as internal-internal (I-I) trips. Trips which begin or end outside of the model area are referred to as internal-external (I-X) trips or external-internal (X-I) trips. Trips which pass through the model area without stopping are referred to external-external (X-X) trips.

Since the gravity model can only be applied to I-I trips, the number of I-X and X-I trips must be determined before the model can be run. These percentages are determined for each purpose and are based on information from the U.S. Census Bureau and the SCAG regional model. Information from the 2010 Census and the Longitudinal-Employer Household Dynamics (LEHD) Program shows that 20 percent of Santa Monica residents work within Santa Monica and only 14 percent of Santa Monica employees live within Santa Monica. Table 5 shows the final internal (I-I) and external (I-X and X-I) split for all six trip purposes for the 2008 and 2013 weekday and Saturday scenarios.

TABLE 5. BASE YEAR DAILY TRIP DISTRIBUTION PERCENTAGES (INTERNAL/EXTERNAL)

Purpose	2008 Weekday	2013 Weekday	2008 Saturday	2013 Saturday
Home-based work	17% / 83%	16% / 84%	12% / 88%	11% / 89%
Home-based other	31% / 69%	30% / 70%	26% / 74%	25% / 75%
Non-home-based	64% / 36%	62% / 38%	50% / 50%	46% / 54%
School	83% / 17%	81% / 19%	80% / 20%	85% / 15%
College	28% / 72%	28% / 72%	27% / 73%	34% / 66%
Recreation	18% / 82%	16% / 84%	20% / 80%	20% / 80%
All Trips	38% / 62%	37% / 63%	31% / 69%	29% / 71%

The distributions were determined based on several criteria. The initial estimates were based on information from NCHRP and the SCAG regional model. These estimates were further refined to ensure that the all production trip ends have an attraction trip end for internal-internal trips. For example, before balancing, the model area has over 2.5 times more HBW attraction trip ends than production trip ends. The final step in balancing the internal/external splits checks that the total volume at each of the external model gateways matches the observed count data. There are 22 gateways in the model, including the I-10 freeway. External-external trips are determined from the SCAG regional model and are adjusted to ensure consistency with observed count data and internal-external and external-internal trips.

Trip Assignment

The trip assignment process determines the routes that each vehicle trip takes from its origin to its destination. The model assignment algorithm determines paths based on the shortest travel time between two locations, while taking into account congested delays. The model uses an iterative procedure until a specified convergence criterion is met or the total iterations are completed.

Calibration of the street network included adjusting the locations where TAZs connect to the network to more accurately reflect travel behavior and vehicle access points. Free flow speeds and roadway capacities were adjusted to model the attractiveness of given facilities and the prevailing speed of traffic. The adjustments were also based on the presence of design characteristics that may reduce vehicle speeds or capacities such as lane widths, bike lanes, on-street parking, or mid-block crosswalks.

BASE YEAR MODEL VALIDATION

Model validation compares the model's estimated results to observed travel data. During the model development process, this data is used to further calibrate the model inputs. The extent to which model results match observed travel data validates the assumptions of the input parameters.

Static Validation

The most critical static measurement of the accuracy of any travel model is the degree to which it can approximate observed traffic counts during the base year. Caltrans has established certain trip assignment guidelines in *Travel Forecasting Guidelines* (Caltrans, 1992). These requirements are listed below:

- At least 75 percent of the roadway links for which counts are available should be within the maximum desirable deviation, which ranges from 15 percent to 60 percent (the larger the volume, the less deviation permitted)
- All of the roadway screenlines should be within the maximum desirable deviation, which ranges from 15 percent to 64 percent (the larger the volume, the less deviation permitted)
- The two-way sum of the volumes on all roadway links for which counts are available should be within 10 percent of the count volume
- The correlation coefficient between the volumes on all roadway links for which counts are available and the observed counts should be greater than 0.88

Although not stated in the Caltrans guidelines, an additional Fehr & Peers validation requirement is that the percent root mean square error (RMSE) should be less than 40 percent.

Screenlines are boundaries drawn across a street network to determine the total volume crossing the boundary. Screenline accuracy determines whether the volume moving across the model area is consistent with the observed volumes. The following screenlines were used for model validation:

- Marguerita Avenue
- Washington Avenue
- Wilshire Boulevard
- Arizona Avenue
- Santa Monica Boulevard
- Colorado Avenue
- Olympic Boulevard
- Pico Boulevard
- Pearl Street
- Ocean Park Boulevard
- 4th Street
- Lincoln Boulevard
- 14th Street
- Cloverfield Boulevard
- 26th Street
- Bundy Avenue & Centinela Avenue

Three weekday scenarios (daily, AM peak hour, and PM peak hour) and two Saturday scenarios (daily and midday [MD] peak hour) were statically validated. The validation results are shown in Tables 6 and 7. The number of observed count locations is also shown for each scenario.

TABLE 6. WEEKDAY SCENARIOS VALIDATION RESULTS

Metric	Criterion	Daily	AM Peak Hour	PM Peak Hour
Observed locations	-	217	217	217
Percent of links within max dev.	At least 75%	76%	75%	75%
Percent of screenlines within max dev.	100%	100%	100%	100%
Deviation of two-way sum of all links	Within 10%	5%	7%	9%
Correlation coefficient	Greater than 0.88	0.96	0.93	0.94
Percent RMSE	Less than 40%	22%	30%	32%

TABLE 7. SATURDAY SCENARIOS VALIDATION RESULTS

Metric	Criterion	Daily	MD Peak Hour
Observed locations	-	75	75
Percent of links within max dev.	At least 75%	75%	83%
Percent of screenlines within max dev.	100%	100%	100%
Deviation of two-way sum of all links	Within 10%	6%	1%
Correlation coefficient	Greater than 0.88	0.96	0.94
Percent RMSE	Less than 40%	19%	22%

The results from both tables show that all scenarios are statically validated.

Dynamic Validation

Static validation confirms the ability of a travel model to reasonably reproduce a static (singular) condition. Dynamic validation verifies the models applicability to changes in land use and the street network. The 2008 model was dynamically validated to changes in land use quantities. Since the development of the 2008 model, it has been routinely applied for project specific analyses. These projects have included both land use and network changes. Each of these applications has further proven the model to be dynamically valid for both types on input changes required of a travel model. For these reasons, no further dynamic testing was completed.

BASE YEAR MODEL RESULTS

The Land Use and Circulation Element (LUCE) that was adopted in 2010 established the following metrics to be analyzed for general plan consistency:

- Citywide PM peak hour vehicle trips
- Citywide vehicle miles travelled (VMT) per capita
- Citywide vehicle greenhouse gas (GHG) emissions
- AM and PM peak hour corridor travel times
- AM and PM peak hour intersection level of service (LOS)

The travel model produces the first four metrics and can be used to forecast turning movement volumes for future scenarios to calculate LOS. The results from the 2008 base year weekday model were used to establish baseline conditions for each of the metrics. These same metrics are reported from the new 2013 weekday scenarios.

Citywide PM Peak Hour Vehicle Trips

The 2008 base year weekday PM peak hour model produced 60,100 vehicle trips generated within the City of Santa Monica. These trips either originate from or are destined to a location within Santa Monica, or both. This total includes trips from outside the model area as well as the area outside the City but within the model that originate within or are destined to the City. The new 2013 base year weekday PM peak hour model produced 59,600 trips for the City of Santa Monica, a decline of 1 percent.

There are several factors that contribute to the 1 percent difference in PM peak hour trips generated within the City of Santa Monica. The increases in households and employment within the City generate more trip-ends. However, the decreases in employment in the model area outside the City reduce the number of trips generated in the portion of Los Angeles surrounding the City of Santa Monica. The net impact from these two changes is a slight decrease in trips entering Santa Monica from the model area outside the City. While minor, these differences contribute to the 1 percent difference. These results do

not necessarily indicate that the actual number of trips generated within the City of Santa Monica has decreased from 2008 to 2013.

Citywide Vehicles Miles Travelled

The model calculates daily vehicle miles travelled for all City of Santa Monica trips within the model area. The VMT per capita is calculated using total population and employment. Table 8 shows the VMT calculations for the 2008 and 2013 weekday daily scenarios.

TABLE 8. CITYWIDE VEHICLE MILES TRAVELLED

Scenario	VMT	Population	Employment	Total Service Population (Population + Employment)	VMT per Capita
2008 Weekday	2,038,000	95,247	94,206	189,453	10.8
2013 Weekday	1,970,000	92,484	98,280	190,764	10.3

The VMT estimates in the table above only calculate miles travelled within the model area. The mileage associated with trips after they leave the model is not accounted for in these estimates. As discussed, the estimate of total trips generated within the City decreased, which correlates with the decrease in vehicle miles travelled. VMT also decreases slightly because more trips are internalized within the City of Santa Monica compared with the 2008 weekday results. These trips stay within the model and have their destination within the City instead of the area outside the City.

Santa Monica staff provided an updated population estimate for 2013 that is less than the 2008 estimate. With an increase in employment between 2008 and 2013, the total service population (population and employment) increases by less than one percent. The decrease in VMT per capita (per service population) is thus primarily correlated with lower trip generation in areas outside the City. Again, these reductions do not necessarily indicate that VMT per capita has decreased within the City of Santa Monica between 2008 and 2013.

Citywide Vehicle Greenhouse Gas Emissions

EMFAC is a software tool developed by the California Air Resources Board (CARB) to estimate greenhouse gas emissions from VMT. Since the 2008 model was developed, CARB updated the software from EMFAC2007 to EMFAC2011. This comprehensive update dramatically streamlines the data input process and reduces the number of required inputs. The reported metrics also vary slightly between the two versions of the software.

EMFAC2011 requires total VMT and VMT by 5mph speed bin to estimate GHG emissions. The vehicle average fleet mix for Los Angeles County is included in the software and was used for this analysis. The average speed profile from the model was applied to all vehicles types. Table 9 shows the weekday daily

GHG estimates for the 2008 and 2013 models. 2008 results are calculated in EMFAC2007 and 2013 results are calculated in EMFAC2011.

TABLE 9. CITYWIDE VEHICLE GREENHOUSE GAS EMISSIONS

Scenario	2008 Daily	2013 Daily
EMFAC Vehicle Fleet Analysis Year	2008	2013
Carbon Dioxide (CO ₂) (tons/day)	1,490	1,171
Carbon Dioxide (CO ₂) (Pavley) (tons/day)	-	1,111
Carbon Monoxide (CO) (tons/day)	16.93	7.02
Nitrous Oxides (NO _x) (tons/day)	3.03	1.72
Sulphur Oxides (SO _x) (tons/day)	0.01	0.010
Total Organic Gases (TOG) (tons/day)	2.31	0.83
Reactive Organic Gases (ROG) (tons/day)		0.76
Particulate Matter (<10 microns) (tons/day)	0.13	0.14
Particulate Matter (<2.5 microns) (tons/day)	-	0.070
Gasoline Fuel Consumed (gallons/day)	-	102,239
Diesel Fuel Consumed (gallons/day)	-	15,200

While the total daily VMT estimated by the model decreased by 3 percent, this does not solely account for the magnitude of the differences in GHG results between 2008 and 2013. The reason for the discrepancies is more likely due to changes in the EMFAC software and assumptions internal to the program.

AM and PM Peak Hour Corridor Travel Times

Fifteen corridors throughout Santa Monica have been identified for calculation of travel time during the PM peak hour. The congested travel times from the model provide an estimate of overall corridor travel time; however, the model has not been calibrated or validated to these measurements. The model only calculates link level delay and does not include delay associated with signalized or unsignalized intersections. Table 10 shows the AM and PM peak hour travel times for the selected corridors. Separate travel times are provided for each direction of travel.

As requested, Linscott, Law & Greenspan, Engineers (LLG) has prepared this parking analysis for the proposed Miramar Hotel Redevelopment project (the "Project") located in the City of Santa Monica. The Project site consists of two parcels: The Main Parcel located on the block bounded by Wilshire Boulevard to the south, California Avenue to the north, Ocean Avenue to the west, and 2nd Street to the east; and the Second Street Parcel located across Second Street from the Main Parcel.

Specific uses for the Miramar Hotel Redevelopment project are as follows:

- 312 hotel guestrooms;
- Up to 60 residential units¹;
- 6,600 square feet of retail;
- 12,500 square feet of spa;
- 13,000 square feet of meeting room/function space; and
- 19,728 square feet of indoor and outdoor restaurant/lounge space
 - 11,355 square feet of indoor customer serving restaurant/lounge space
 - 8,373 square feet of outdoor customer serving restaurant/lounge space.

In considering the appropriate amount of on-site parking for the Project, LLG has considered (i) the rates set forth in the Zoning Ordinance updates as part of the Downtown Community Plan, (ii) Coastal Commission parking requirements for residential projects in the Coastal Zone, (iii) a shared parking demand assessment performed in a manner consistent with the Urban Land Institutes' *Shared Parking* manual, (iv) parking demand information about two comparable luxury hotel projects in the region, and (v) parking supply information about comparable luxury residential projects in the region.

The goal is for the Project's proposed parking supply to be appropriately sized so as not to encourage unnecessary travel by private automobile, but also adequately accommodate surges in parking demand related to special events, and therefore not adversely affect existing on-street and off-street public parking in the local area.

¹ All residential units assumed to contain two or more bedrooms.

In total, the Applicant has proposed that 477 parked vehicles be accommodated on-site. If necessary, to accommodate peak parking demand, an additional 60 vehicles can be accommodated through use of parking spaces across from the Project site at 120 Wilshire Boulevard. Parking for the Project would be provided as follows:

- 428 striped parking spaces on-site;
- 49 additional vehicles accommodated on-site in drive aisles by valet parking attendants; and
- 60 parking spaces available at 120 Wilshire Boulevard during weekday evenings and on weekends.

The Second Street Parcel (currently used for hotel parking) will be developed with an affordable housing project with its own on-site and below-grade parking.

Downtown Community Plan

In 2017, the City of Santa Monica adopted the Downtown Community Plan. As part of this process, the City amended the Zoning Ordinance to create parking rates for the Downtown (the “Downtown Rates”). The off-street parking rates for development projects in the Downtown differ from the previous Code parking in three important aspects:

- Overall parking rates are generally reduced for individual land uses, recognizing that more trips in Downtown Santa Monica are made by the non-private automobile such as by walking, biking, taxi/limousine, shared ride services (e.g., Uber/Lyft), etc.
- The Zoning Ordinance further reduces the parking rates for ancillary uses within Downtown hotels (e.g., retail, restaurants, spa services), recognizing that many patrons of these services are hotel guests. A 50% reduction in parking rates for ancillary uses within hotels is required under the provision.
- Within the Downtown Community Plan area, there is no minimum parking requirement; instead a maximum number of allowable parking spaces is provided per the Santa Monica Zoning Ordinance.

The City of Santa Monica Municipal Code (Table 9.28.060) provides the off-street parking requirements for development projects. **Table 1** below provides the calculation of parking for the Project based on the off-street parking rates provided in the Zoning Ordinance for the Downtown.

Table 1
Downtown Parking Calculation
Miramar Hotel Redevelopment

Use	Size	Downtown Rate	No. of Spaces	Proposed Supply
Retail	6,600 s.f.	1 sp./300 s.f. x 50%	11	11
Spa	12,500 s.f.	1 sp./300 s.f. x 50%	21	21
Meeting Room	13,000 s.f.	1 sp./250 s.f.	52	52
Restaurant/Lounge (indoor)	11,355 s.f.	1 sp./300 s.f. x 50%	19	19
Restaurant/Lounge (outdoor)	8,373 s.f.	1 sp./300 s.f. x 50%	14	14
Hotel	312 rooms	1 sp./2 rooms	156	156
Subtotal Hotel Only			273	273
Residential	60 units	1 sp./unit (residents)	60	120
		1 sp./15 units (guests)	4	15
Subtotal Residential Only			64	135
Subtotal (Before Buffer)			337	408
5% Buffer			17	20
Total Permitted Maximum			354	428

As shown on *Table 1*, the total parking spaces for the Project based on the Downtown Rates would be 354 spaces (including a Citywide standard 5% buffer, which LLG also recommends). However, the Project's location adjacent to residential uses and in the Coastal Zone compel a site-specific assessment to ensure the Project will not adversely affect existing on-street and off-street public parking in the local area. Thus, the proposed supply of 428 striped parking spaces on-site exceeds the Downtown Rates by an additional 74 spaces.

Per the City code, the Downtown Rates for Multiple-Unit Dwelling Unit with 2 or more bedrooms are 1 space/unit for residents and 1 space/15 units for their guests. However, the Project anticipates the parking demand for each unit will exceed the

code parking rate based on the mix of the residential units and the Project's location on the periphery of the Downtown in the Coastal Zone. Moreover, LLG understands area residents have commented that it is critical for the Project to accommodate all of its parking on-site and not to generate spill-over parking impacts in the area.

In lieu of the Downtown Rates, the Project proposes to provide 2 spaces/unit for residents, and 1 space/4 units for residential guests, plus a 5% "buffer" factor. The ratio of 2 spaces/unit for residents is consistent with the City's parking requirements for residential projects located in the "Citywide" district per the City code and with the Coastal Commission's *Regional Interpretive Guidelines, South Coast Region Los Angeles County*. The proposed rate of 1 space/4 units for residential guest parking is also consistent with the Coastal Commission's *Regional Interpretive Guidelines, South Coast Region Los Angeles County* and similar to the Citywide rate of 1 space/5 units for residential guest parking.

Although the Project site is located in the Downtown Community Plan Area, use of the Citywide parking rates for the residential component is more appropriate for the Project given the Project's location and anticipated unit mix. The Citywide parking rates were adopted by the City Council in July 2015 as part of a comprehensive Zoning Ordinance Update. In conjunction with the Zoning Ordinance Update, the City conducted extensive review and research with respect to appropriate parking rates to apply to new development projects. Part of this effort included retention of the planning firm Nelson Nygaard to provide recommendations to the City with respect to parking demand rates.

Nelson Nygaard issued a draft report in January 2013² (the "Nelson Nygaard report") containing the following:

- A literature review of parking ordinances in other areas similar to the City of Santa Monica, including within the Coastal Zone;
- Analysis of census tract data with respect to vehicle ownership within the City of Santa Monica, including census tracts within the Coastal Zone;
- A review of empirical parking demand data that had been recently collected in the City of Santa Monica; and
- Recommendations for updated parking rates for development projects based on their study of this information.

² *Parking Zoning Ordinance Update – Draft Report*, Nelson Nygaard, January 2013.

On page 3-9 of the Nelson Nygaard report, it states: “Residential parking requirements have been recommended to reflect actual parking demand... As Census data shows in Chapter 1, household vehicle ownership rates can vary considerably from 0.86 to 2.68 vehicles per household... Given this wide variety in demands, residential developers should be able to construct the amount necessary to meet the anticipated parking demand.” Accordingly, the Project proposes to provide 2 spaces/unit for residents (and 1 space/4 units for guests) in order to ensure the Project provides adequate parking for its residential uses, which is both important to avoid parking impacts in the nearby residential areas and to ensure the Coastal Commission is able to find that the Project does not interfere with public access to the coast.

In reviewing Santa Monica projects in the Coastal Zone, the Coastal Commission has emphasized the need for projects to “maintain and enhance public access to the coast by providing adequate parking facilities.”³ For the condominiums located in Santa Monica’s Coastal Zone at the Village at the Civic Center project (CDP #5-08-159), the Coastal Commission required 2 spaces/unit plus guest parking in accordance with its *Regional Interpretive Guidelines, South Coast Region Los Angeles County*.

Moreover, parking supply at other existing luxury residential developments in the vicinity of the Project were reviewed in conjunction with the proposal to provide 2 spaces/unit. Specifically, the following sites provide parking at or in excess of 2 spaces/unit:

- 603 Ocean Avenue – 2.45 spaces/unit (54 spaces for 22 units)
- 1755 Ocean Avenue – 2.08 spaces/unit (193 spaces for 93 units)
- 1705 Ocean Avenue – 2.4 spaces/unit (156 spaces for 65 units)
- 101 Ocean Avenue – 1.9 space/unit (114 spaces for 59 units)

If the added parking supply is not provided at the Project, future residents would likely be forced to rent parking spaces at nearby facilities, potentially adversely impacting available parking supply at nearby locations.

The proposed on-site parking supply for the Project is forecast to adequately accommodate regular day-to-day parking demand. The ability to accommodate 109 additional parked vehicles (49 on-site through the use of valet parking attendants, as well as 60 at 120 Wilshire Boulevard on weeknights and weekends) allows for more than a sufficient “buffer” of parking for the Project that may be associated with peak demand for larger events.

³ Coastal Commission Staff Report for Village at the Civic Center (CDP #5-08-159), p. 10.

Shared Parking Demand Assessment

The Urban Land Institute (ULI) shared parking methodology recognizes that different land uses have varying demands for parking throughout the day. For example, parking demand related to hotel guestrooms peaks in the late night and early morning hours when most hotel guests are in their rooms for the evening. By contrast, retail and spa services have their peak parking demand during daytime hours. Thus, under the shared parking methodology, a parking space that is used in the daytime by a retail or spa patron can be used again in the evening by a hotel guest. The sharing of parking spaces by multiple land uses reduces the overall amount of parking required for a mixed-use development.

Given the unique nature of this Project, the parking supply issues associated with the current hotel operations, and its location adjacent to residential uses in the Coastal zone, a shared parking demand analysis has been prepared for the proposed Project as a supplement to the Downtown Rates. This analysis is based on the shared parking methodology utilized by the City of Santa Monica at other approved hotel projects in Downtown Santa Monica, such as the 710 Wilshire project⁴ and the Courtyard/Hampton Inn projects.

The ULI's *Shared Parking* manual provides recommended hourly parking percentages or indices for individual land uses (hotels, retail, restaurants, etc.) based on parking demand studies conducted at existing developments. The parking demand data is submitted to and compiled by ULI and is the basis for the hour-by-hour parking demand factors published in the *Shared Parking* manual.

In utilizing the shared parking methodology, a peak parking demand factor must be identified for purposes of estimating the highest number of parking spaces generated by each individual land use component. For example, for the 710 Wilshire hotel project, the City's parking shared parking study prepared in 2011 utilized the City code parking rates in effect at that time as the peak parking demand factors, except for hotel guestrooms where a peak demand factor of 0.59 spaces per guestroom was used rather than the City code rate of one space per guestroom.

For the shared parking analysis prepared for the Project, updated peak parking demand factors were selected for use, in consideration of the prior hotel parking studies conducted by the City, as well as the more recent Downtown Rates. **Table 2** below provides a summary of the peak parking demand factors selected for use in the shared parking demand study.

⁴ *Traffic and Parking Study for 710 Wilshire Boulevard Hotel and Mixed-Use Project*, Fehr & Peers, May 2011

Table 2
Peak Parking Demand Factors for Shared Parking Analysis
Miramar Hotel Redevelopment

Use	Peak Parking Demand Rate	Comments
Hotel	0.5 spaces/guestroom	Same as Downtown Rates
Residential	2 spaces/unit (residents)	Same as Citywide code parking rates (exceeds Downtown Rates)
	1 space/4 units (guests)	Exceeds Downtown Rates
Retail	1 space/300 s.f.	Same as Downtown Rates, without 50% adjustment for hotel internal capture
Spa	1 space/300 s.f.	Same as Downtown Rates, without 50% adjustment for hotel internal capture
Restaurant	1 space/200 s.f.	Same as Downtown Rates, without 50% adjustment for hotel internal capture
Meeting Rooms	1 space/250 s.f.	Same as Downtown Rates

As noted in *Table 2* above, the peak parking demand factors selected for use are generally conservative (i.e., “worst case”) as many of the rates used are consistent or exceed the Downtown Rates. Briefly, the following is noted regarding the recommended peak parking demand factors:

- The recommended hotel peak parking rate (0.5 spaces/guestroom) is equal to the Downtown Rates, and similar to the parking rate used by the City in the parking study prepared for the 710 Wilshire hotel project (0.59 spaces/guestroom).
- The recommended peak parking rates for the residential components (residents and guests) are based on the discussion provided in the prior section regarding the need for adequate parking to serve residents and their guests.
- The recommended parking rates for the retail, spa, and restaurant components delete the 50% adjustment factor for hotel internal capture as provided in the Downtown Rates because these adjustments are already accounted for in the time-of-day parking demand analyses embedded in the ULI shared parking calculation.

Table 3 attached to this memorandum provides the parking demand analysis for the Project using the ULI shared parking methodology. The parking demand analysis provided in **Table 3** adds a 5% “buffer” to the total forecast demand to ensure that even during periods of peak demand that adequate parking is provided for all users of the Project and motorists will not need to search for the last remaining available parking space.

As shown in **Table 3**, a peak parking demand for 460 parking spaces is forecast for the Project based on the shared parking methodology used by the City in evaluating parking demand at other hotel projects. This peak demand is forecast to occur on a Saturday evening at 8:00 p.m. During most hours of the day, the 428 striped parking spaces on-site at the Project will adequately accommodate the forecast parking demand. In the late afternoon and early evening on weekends, parking attendants will utilize as-needed the additional 49 aisle spaces on-site and/or the 60 parking spaces at 120 Wilshire Boulevard. In general, the total available parking capacity for the Project of 537 vehicles can easily accommodate the forecast peak demand and ensure there is no parking impacts on the surrounding area.

It is noted that the shared parking forecast is highly conservative (“worst case”). For example, it assumes 100% utilization of all of the meeting room/function space at the Project. This is highly unlikely to occur because some of the function space will be configured as “board rooms” which are more likely to be utilized in the daytime for meetings, rather than on a Saturday night.

Also, as previously noted, the Project proposes that residential parking for residents and guests be reserved on a full-time basis, and therefore not “shared” with the other Project components. This further ensures that parking demand for the residential component, as well as for the rest of the Project, will be accommodated on-site throughout the day.

The parking demand analysis is intended to account for parking generated by all users: hotel guests, visitors/patrons, employees, residents, etc. With respect to employees, the existing hotel does not provide parking for employees. Thus, parking demand data related to current hotel employees is not available. Further, the existing hotel valet operation aggregates its parking data related to guests/visitors by area of the hotel (e.g., hotel guests, spa visitors, restaurant patrons, etc.) and is summarized on a monthly basis, and not on an hourly basis similar to the shared parking demand analysis.

Despite the limitation of the available data related to current parking demand at the existing hotel, the data was reviewed and analyzed and found to be consistent with the shared parking analysis prepared for the Project in this report.

Parking Analysis at Comparable Luxury Hotel Projects

To further demonstrate the adequacy and conservative nature of the shared parking demand study prepared for the proposed Project as described in the prior section, a parking analysis was conducted at two luxury hotel sites in the Los Angeles area that are deemed to be similar to the proposed Project. The sites studied were The Ritz-Carlton and JW Marriott at L.A. Live in Downtown Los Angeles, and The Ritz-Carlton in Marina del Rey. It is noted that while the Ritz-Carlton and J.W. Marriott are two separate hotels within the L.A. Live site, they utilize some common facilities (including driveway access and parking) and therefore are analyzed herein as one project. The L.A. Live and Marina del Rey hotel properties are considered appropriate for analysis for purposes of evaluating the adequacy of parking for the Project based on the following:

- **Location:** All three properties (L.A. Live, Marina del Rey and proposed Project) are in the urban portion of the Los Angeles area.
- **Nearby Attractions:** All three properties are located near uses that would generate walking trips. For example, the L.A. Live property is near L.A. Live and Staples Center, the Marina del Rey property is on the waterfront and the Project is adjacent to coastal attractions and Downtown Santa Monica.
- **Similar Amenities:** All three properties have similar ancillary uses including restaurant, lounge/bar space, spa/fitness center, meeting rooms, etc.

The components of the L.A. Live and Marina del Rey properties are as follows:

- L.A. Live Ritz-Carlton and JW Marriott
 - Guestrooms: 1,001 guestrooms
 - Meeting Rooms: 75,610 square feet
 - Spa/Fitness Center: 8,000 square feet
 - Retail: 530 square feet
 - Restaurants: 14,500 square feet
 - Bar/Lounges: 10,100 square feet
 - Residential: 55 occupied units
- Marina del Rey Ritz-Carlton
 - Guestrooms: 304 guestrooms
 - Meeting Rooms: 35,000 square feet
 - Spa/Fitness Center: 3,500 square feet
 - Retail: 1,260 square feet
 - Restaurant: 4,290 square feet
 - Bar/Lounges: 2,500 square feet

The parking analysis of the two existing hotels consisted of the following two steps:

- 1) Forecast the peak Saturday parking demand at the two existing hotels following methodology used in preparing the shared parking demand analysis for the proposed Project; and
- 2) Conduct parking utilization counts at the two existing hotels on a Saturday and compare the actual parking demand to the forecast prepared as part of task 1).

Parking demand forecasts were prepared for the L.A. Live and Marina del Rey properties utilizing the same parking demand forecast methodology used for the Project as provided in the prior section. That is, it is based on the peak parking demand rates listed in *Table 2* above and incorporates the time-of-day parking indices recommended in the ULI's *Shared Parking* manual.

Parking counts were conducted at the L.A. Live and Marina del Rey properties on Saturday, March 24, 2012 from 6:00 a.m. to 12:00 a.m. midnight to document existing utilization, which was then compared to the hourly forecasts.

Table 4 provides the parking demand forecasts for the L.A. Live property for a Saturday condition. *Table 4* also provides a comparison of the forecast hourly parking demand to the actual parking counts observed. Similarly, **Table 5** provides the parking demand forecasts and actual observed hourly parking counts for the Marina del Rey property for a Saturday condition.

A summary of this comparison is provided below in **Table 6**. Specifically provided is the following parking data based on the Saturday forecast and observed counts. As seen in *Table 6*, the forecast peak hour parking demand at the L.A. Live and Marina del Rey properties – utilizing the same methodology as was used in the shared parking demand analysis provided for the Project – overstates the actual parking demand counted at the two sites. Therefore, it is reasonable to conclude that the shared parking demand analysis prepared for the Project provides a conservative “worst case” assessment of the potential parking demand related to the proposed Project.

Table 6
L.A. Live and Marina del Rey Parking Demand Comparison

Time Period	L.A. Live Ritz-Carlton/JW Marriott (Table 4)		Marina del Rey Ritz-Carlton (Table 5)	
	Forecast Parking Demand	Actual Parking Demand	Forecast Parking Demand	Actual Parking Demand
<u>Weekend</u>				
Peak of Forecast	891 (9 pm)	355 (9 pm)	319 (9 pm)	215 (9 pm)
Peak of Actual	818 (7 pm)	388 (7 pm)	311 (8 pm)	223 (8 pm)

Review of Potential Findings for Excess Parking

In order to avoid parking impacts in the adjacent neighborhood and to ensure the Project does not interfere with public access to the coast, the Project proposes to provide 428 parking spaces rather than the 354 parking spaces provided under the City code. LLG understands the Project will be approved through a development agreement process and therefore provides the City with flexibility on the appropriate parking rates and requirements for the Project. However, Subsection 5(b) of Section 9.28.040(A) of the City Code requires the Planning Commission to make five findings related to permitting additional parking. While not required for this Project, these findings are relevant to this parking analysis and therefore discussed below.

- i. *Parking provided in excess improves the pedestrian, transit, and bicycle network.*

Response: The additional parking will ensure that residents and their guests will have adequate parking on-site. A shortage of on-site parking may result in motorists driving through the local neighborhood, searching for street parking, potentially causing adverse interface with pedestrian, transit, and bicycle services.

- ii. *Vehicle movement on or around the project site associated with the excess parking does not unduly impact pedestrian spaces or movement, transit service, bicycle movement, or overall traffic movement in the district.*

Response: The residential project driveway is proposed on Ocean Avenue. The residential component is not a high generator of vehicle traffic. Therefore, the number of inbound and outbound vehicle trips is expected to be nominal, resulting in minimal interface with pedestrian, transit or bicycle services. The excess parking is intended to provide on-site vehicle storage in lieu of utilizing off-site parking resources.

- iii. *Accommodating excess parking does not degrade the overall urban design quality of the project proposal.*

Response: The excess parking, being all below-grade, does not result in any changes to the urban design of the Project. No additional or widened driveways are required to accommodate the additional on-site parking spaces.

- iv. *All above-grade parking is architecturally screened, and the excess parking does not diminish the quality and viability of existing or planned landscaped enhancements.*

Response: All Project parking is located in the below-grade structure. Further, the provision for the excess parking supply does not require revisions to the Project's proposed landscape design.

- v. *Where off-street parking is proposed that exceeds the maximum quantities specified, such parking shall not be the principal use of the property.*

Response: The Project is a mixed-use hotel and residential development and the additional parking is proposed for use by the Project's residential component, which is not the principal use of the Project.

Conclusion

In conclusion, the Project's proposed parking supply will accommodate the Project's peak parking demand but not encourage unnecessary travel by private automobile, avoiding impacts to the adjacent neighborhood and maintaining appropriate public access to the coast.

RE: Miramar Redevelopment Project (the "Project")
Addendum Trip Generation Study

Dear Rachel,

As a follow up to the City's request for an additional on-site trip generation survey focused on the bungalow, traffic engineering firm Linscott Law & Greenspan ("LLG") has modified the previously submitted trip generation report dated March 19, 2019 ("Initial Trip Generation Report") to conservatively account for TNC (transportation network company) trips and utilization of the City's TDFM rates for retail, market rate housing and affordable housing. This Addendum Trip Generation Study dated July 27, 2019 ("Updated Trip Generation Report") is attached.

This additional analysis and addendum was completed at the request of the City to further address anticipated trip generation impacts of the Project, in relation to both current trips from existing hotel operations as well as to the changes in vehicular trips anticipated in the Downtown Community Plan ("DCP") Environmental Impact Report. Because the Project is both consistent with, and smaller than, the buildout of the project site anticipated in the DCP, Project-related trips are within the trip counts anticipated by the DCP.

The results of both the previous and new empirical trip studies discussed in the attached report were applied to calculate trips for the Project. Using the conservative assumptions as directed by the City and F&P, the Updated Trip Generation Report concludes that the Project would generate a small incremental increase of some types of trips above existing hotel operations. Though not addressed in the Updated Trip Generation Report, we note that this incremental increase is in turn a very small fraction of the incremental increase anticipated for the overall DCP area.

The empirical study methodology for both the Initial Trip Generation Report and the Updated Trip Generation Report did not include any reduction in trips based on the Project's mandatory compliance with the Transportation Demand Management Ordinance, or from implementation of any additional TDM

measures that may be included in the Development Agreement or that the DCP requires for the Project. Because these TDM measures were not factored into the studies, the study methodology overstates total trip generation for the Project. We anticipate that factoring in such TDM measures would show that the Project will cause a net decrease in trips – even utilizing the conservative assumptions described in the Updated Trip Generation Report. We would however request that the incremental trips, as reduced by TDM measures, be incorporated into any analysis evaluating the DCP increment.

Please feel free to call me at 310-899-4184 or e-mail me at dpeterson@athensdevco.com with any questions on the attached.

P.S. We will also be providing via email (separately) the spreadsheets with the bungalow survey detail for Wednesday June 19, 2019 and Saturday June 22, 2019 for the City and F&P's use and review.

MEMORANDUM

Executive Summary

Linscott, Law & Greenspan, Engineers ("LLG") previously prepared a trip generation study¹ (the "Trip Generation Study") for the proposed Miramar Hotel Redevelopment project (the "Project") located in the City of Santa Monica ("City"). The purpose of the Trip Generation Study was to compare weekday daily, weekday morning (AM) and afternoon (PM) peak hour, Saturday daily and Saturday mid-day (MD) peak hour trip generation from existing operations on the Project site with future Project trips using applicable site-specific and comparable development empirical data. This analysis was based on recently-conducted trip generation surveys as requested by the City as part of the Environmental Impact Report process. The Trip Generation Study was submitted to the City of Santa Monica for review and comment.

In response to comments and feedback from the City and F&P, this Addendum Trip Generation Study has been prepared to address the following:

- (1) Transportation Network Company (TNC) Trips. The surveys conducted at the existing hotel for the Trip Generation Study document trips to and from the site by various modes of travel, including TNC trips (e.g., Uber and Lyft, as well as taxis). In the initial Trip Generation Study dated March 19, 2019, each TNC trip is counted as one vehicle trip generated by the use (e.g., hotel guestrooms, restaurants, spa and fitness facilities) based on the understanding that the TNC driver would have generated a preceding or subsequent fare at or in close proximity to the hotel. The City and F&P directed use of a more conservative approach assuming that each arrival or departure via a TNC vehicle would actually generate two trips (e.g., the TNC arriving to drop-off a hotel guest would then immediately generate a departure trip assuming the TNC vehicle leaves without a new fare). Accordingly, the trip generation rates derived in this Addendum Trip Generation Study have been adjusted to assume two vehicle trips per arriving or departing TNC trip.

¹ Trip Generation Study Conducted in Conjunction with the Proposed Miramar Hotel Development, Linscott, Law & Greenspan, Engineers, March 19, 2019.

- (2) Retail Trip Rates. The initial Trip Generation Study dated March 19, 2019 provided derived trip rates for the retail component at the existing hotel based on the actual trip generation survey data. It is noted that the retail component is located within the existing hotel and is used primarily by hotel guests (i.e., the retail use does not face out to the street and nor does it have a separate walk-in entrance from the streets adjacent to the existing hotel). Therefore, the trip generation rates for the existing hotel are significant below the rates established in the City's Travel Demand Forecasting Model² (TDFM). The City and F&P noted some of the Project retail components will be different (i.e., will primarily face onto Wilshire Boulevard, and will have separate walk-in entrances from the street. Because of its greater visibility and accessibility, the City and F&P noted that the retail component at the Project may generate more external vehicle trips per square foot of floor area than the retail component at the existing hotel. Accordingly, the City and F&P directed use of the retail trip rates provided in the City's TDFM for purposes of forecasting vehicle trips associated with the retail component at the Project, which are more conservative (i.e., generate more vehicle trips) than the retail trips rates derived from the trip generation survey data.
- (3) Residential Trip Rates. The initial Trip Generation Study dated March 19, 2019 provided derived trip rates for market-rate and affordable residential uses based on driveway counts conducted at three existing nearby market-rate and three affordable residential projects. These actual trip rates were lower than the trip rates provided for residential uses in the TDFM. The City and F&P directed use of the market-rate and affordable trip rates provided in the City's TDFM, which is more conservative (i.e., generate more vehicle trips) than the residential trip rates derived from the nearby residential project survey data. Accordingly, the trip generation forecasts provided in the in the Addendum Trip Generation Study for the market-rate and affordable residential elements of the Project utilize the trip rates provided in the City's TDFM document.

² *Santa Monica Travel Demand Forecasting Model Trip Generation Rates*, Fehr & Peers, October 2011.

- (4) Bungalow Trip Rates. The initial Trip Generation Study dated March 19, 2019 provided derived trip rates for the Bungalow component at the existing hotel. As explained in the Trip Generation Study, the Bungalow will be replicated in the Project in terms of floor area and use. Further, as documented in the Trip Generation Study, the Bungalow trip generation characteristics are unique to this use (i.e., not the same as the other food and beverage uses within the existing hotel) and it is reasonable to assume that the Bungalow's current vehicle trip generation will remain the same as part of the Project.

After reviewing the initial Trip Generation Study, the City and F&P directed completion of a supplemental survey of trip generation at the existing Bungalow whereby: a) arriving patrons be surveyed to determine total count and travel mode (similar to the prior surveys); b) departing patrons be counted (without conducting verbal surveys of travel mode); and c) the travel mode splits determined for the arriving patrons be applied to the counted departing patrons. It was determined by the City and F&P that the supplemental transportation surveys focus to the weekday PM peak hour and Saturday MD peak hour (i.e., in lieu of conducting surveys over a 24-hour period as was conducted with the Trip Generation Study) because the focus of the transportation analysis are the weekday and Saturday peak hours.³ The supplemental transportation surveys conducted at the Bungalow for this Addendum Trip Generation Study are detailed in a following section.

A. Supplemental Bungalow Trip Generation Study

The Traffic Solution was retained to conduct the supplemental transportation survey at the Bungalow for the three hour weekday PM peak period starting at 4:30 PM and ending at 7:30 PM on Wednesday June 19, 2019, as well as a four hour weekend peak period starting at 1:00 PM and ending at 5:00 PM, the Saturday MD peak period on Saturday June 22, 2019. All of the trip generation surveyor technicians engaged by the Traffic Solution were deployed at the single point of entry and exit for customers at the Bungalow. Three technicians were stationed at the entry/exit location to engage arriving guests to Bungalow during the peak period surveys and one technician was stationed at the entry/exit location to count departing guests from Bungalow for the peak period surveys.

³ As noted in the Trip Generation Study, the Bungalow is closed during the weekday morning (AM) peak hour and thus, no surveys are required during this period.

All guests arriving to the Bungalow were interviewed and respondents stated that they were arriving by either: (a) driving and parking with the on-site valet; (b) driving and parking at an off-site location; (c) using a TNC; (d) using a third-party private car and were counted as vehicular trips; or (e) arriving by transit. The Traffic Solution technicians also documented non-vehicular travel, such as by bike, scooter or walking (except to an off-site vehicle). Additionally, the Traffic Solution also requested information from the arriving guests regarding their City of origin for their trip to the Bungalow. Finally, all departing Bungalow guests were counted during the peak period surveys, but not separately interviewed as previous attempts to interview departing guests from this use had been deemed unreliable.

Results from the surveys were collected in 15-minute increments over the three-hour peak period on Wednesday, June 19, 2019 and the four-hour peak period on Saturday, June 22, 2019. Results were then consolidated into a spreadsheet and allocated among six classifications: onsite car; off-site car; TNC; transit; walk; other. The survey data has been transmitted to the City and F&P for their review and use.

B. Supplemental Bungalow Trip Generation Study Results

This section summarizes the results of the supplemental on-site Bungalow trip generation surveys conducted on Wednesday June 19, 2019 and Saturday June 22, 2019. As a point of information, the supplemental trip generation surveys by Traffic Solution occurred during the summer month of June, with the hotel guestroom occupancy at 88% on Wednesday June 19, 2019 and 97% on Saturday June 22, 2019 – both higher than the hotel’s average occupancy rate of about 87%.

Table A and **Table B** provide a summary of the peak hour data for the supplemental trip generation surveys conducted at the Bungalow during Wednesday, June 19, 2019 and Saturday, June 22, 2019, respectively. It is noted that the peak hour trip generation data for the Bungalow was derived for 6:30 – 7:30 PM during the weekday and 2:00 – 3:00 PM on a weekend to correspond with the peak hours of the existing hotel as documented in the initial Trip Generation Study dated March 19, 2019. As shown in **Table A** and **Table B**, the travel modes derived from the surveys of arriving patrons were applied to the count of departing patrons for the purpose of determining outbound vehicle trips generated. As previously stated, patrons arriving or departing via a TNC resulted in two vehicle trips generated in this study (e.g., a patron arriving at the Bungalow via a TNC was counted as two vehicle trips).

[1] Hotel peak hour occurred from 2:00 PM to 3:00 PM.

[2] Vehicles doubled to account for Uber, Etc. trips arriving and/or leaving after dropping off/picking up patrons.

C. Updated Trip Generation Analysis

Table C⁴ has been prepared to provide an updated analysis of vehicle trips generated by the components of the existing hotel during the weekday AM and PM peak hours, as well as the Saturday MD peak hour based on: i) the updated trip generation data for the Bungalow based on the supplemental transportation surveys as described above; and ii) counting each arrival or departing patron or employee using the TNC travel mode as two vehicle trips. In addition, as indicated above, **Table C** utilizes the City's TDFM rates for the Project's retail and residential components (instead of being based on the prior empirical data utilized in the initial Trip Generation Study dated March 19, 2019) as the City and F&P have indicated that they feel that both of these components of the Project are not unique compared with other retail and residential uses in the City, and therefore, should not have separate, project-specific trip generation rates. As shown in **Table C**, the components of the existing hotel generate 171 vehicle trips during the weekday AM peak hour, 141 vehicle trips during the weekday PM peak hour, and 321 vehicle trips during the Saturday MD peak hour.

Table D⁵ provides the updated derivation of the peak hour trip generation rates for the components of the existing hotel based on the supplemental Bungalow transportation data and the doubling of the TNC vehicle traffic counts as previously described.

The updated trip generation forecast for the Project during the weekday AM and PM peak hours, as well as the Saturday MD peak hour, is provided in **Table E⁶**. The peak hour trip rates provided in **Table E** have been updated from the Trip Generation Study based on the following: i) the City's TDFM trip rates are utilized for the retail component of the hotel, as well as for the market-rate and affordable residential elements of the Project; ii) use of the updated trip rates for the hotel components provided in **Table D** (except for the retail use). **Table E** also reflects the updated calculation of peak hour vehicle trips generated by the existing hotel as summarized in **Table C**.

As shown in **Table E**, the Project is forecast to generate 250 vehicle trips during the weekday AM peak hour, 219 vehicle trips during the weekday PM peak hour, and 413 vehicle trips during the Saturday MD peak hour. When compared to the calculated vehicle trips generated by the existing hotel, the Project is forecast to result in 79 net new vehicle trips during the weekday AM peak hour, 78 net new vehicle trips during the weekday PM peak hour, and 92 net new vehicle trips during the Saturday MD peak hour.

⁴ The trip counts in **Table C** replace the corresponding peak hour data provided in Table 2 of the Trip Generation Study.

⁵ The trip rates in **Table D** replace the corresponding peak hour data provided in Table 3 of the Trip Generation Study.

⁶ The trip forecasts for the Project in **Table E** replace the corresponding peak hour data provided in Table 5 of the Trip Generation Study.

Table C
THIRD PARTY VEHICLE COUNTS [1], [2]
MIRAMAR HOTEL

RE: 30-Day Notice: Tribal Consultation per AB 52
Miramar Hotel Project, Environmental Impact Report

Dear Chairperson Salas,

The City of Santa Monica is preparing an Environmental Impact Report (EIR) for the proposed Miramar Hotel Project (proposed project). The City invites your participation and consultation regarding any concerns related to Tribal Cultural Resources pursuant to Assembly Bill (AB) 52 and Public Resources Code (PRC) §21080.3.1, Formal Notification of Decision to Undertake a Project, and Notification of Consultation Opportunity. Below is a description of the project location and summary of the proposed project:

Project Location

The project site encompasses two parcels in the Downtown district of the City of Santa Monica, County of Los Angeles (see Figure 1 – Project Location).

The main parcel, occupied by the Miramar Hotel, is approximately 4.5 acres in size and is located at 1133 Ocean Avenue (Main Parcel). The Main Parcel is currently improved with 301 hotel rooms and related hotel programming space located within a number of buildings. There are two city-designated landmarks located on the Main Parcel – the Moreton Bay Fig Tree and the six-story Palisades Building.

The other parcel is located directly across the street to the east at 1127 2nd Street (Second Street Parcel). The Second Street Parcel is currently improved with a surface parking lot. The Santa Monica Freeway (I-10) is located less than one mile to the south of the site and provides regional access. Pacific Coast Highway to the west of the project site also provides regional access. Local access is provided via Wilshire Boulevard, Ocean Avenue, and Second Street.

Project Description

The proposed project would involve redevelopment of the Main Parcel and Second Street Parcel. The Main Parcel would include a new mixed-use hotel and residential project with ground level open space, food and beverage facilities, meeting space, and ground floor retail uses along Wilshire Boulevard. The two City-designated landmarks would be retained. The Second Street Parcel would include a new 100% affordable housing development. The table below provides the conceptual land use program for the proposed project:

Land Use	Proposed SF/DU
Guestrooms	312 rooms (11 net new)
Food and Beverage Space	11,500 sf (4,418 net new)
Meeting Space	13,000 sf (net reduction of 5,525)

Planning and Community Development
City Planning Division
1685 Main Street, Room 212
Santa Monica, CA 90401

Retail	6,600 sf (5,365 net new)
Spa/Fitness Facility	12,500 sf (6,931 net new)
Market Rate Residential Units ¹	Up to 60 DU
Affordable Residential Units ²	Up to 48 DU
¹ Actual number of units has not been determined, but will not exceed 60.	
² Actual number of affordable housing units on the Second Street parcel has not been determined, but will not be less than 30.	

The proposed total above grade floor area would be approximately 502,157 sf; the current hotel on the main parcel consists of approximately 262,284 sf of floor area.

In addition to retaining the two City-designated landmarks, the Main Parcel is proposed to be redeveloped with two new buildings, the California Building and the Ocean Building (Figure 2 – Conceptual Site Plan and Figure 3 – Project Rendering). The California building would be seven stories (~79 feet tall) and would include hotel guestrooms and amenities. The Ocean Building would range in height between two-stories (29 feet) at Wilshire Boulevard, seven stories along Second Street, and ten stories (a maximum of 130 feet) in the center of the Main Parcel. It would include hotel guestrooms and other hotel programming (spa, meeting space, and food and beverage), residential units, and ground floor retail along Wilshire Boulevard. The existing Landmark Palisades Building would be rehabilitated for continued use as hotel guestrooms. In addition, the existing Landmark Moreton Bay Fig Tree on the project site would be preserved and featured. The Main Parcel would also include ground level open space that would consist of an approximately 14,000 sf publicly accessible open space at the corner of Wilshire Boulevard and Ocean Avenue and approximately 36,000 sf of open space around the Moreton Bay Fig Tree. These open space areas would be activated with food and beverage uses. A three level subterranean garage below the Main Parcel would provide for up to 428 striped parking spaces. Vehicular access is proposed on Second Street (main hotel entrance), Ocean Avenue (residents only), and California Avenue (employees only).

The Second Street Parcel would be redeveloped with up to 48 affordable housing units and subterranean parking.

AB52 Consultation

State law under Assembly Bill 52 (Public Resources Code Section 21080.3.1(d)) provides California Native American tribes 30 days to request consultation regarding possible significant effects that implementation of the Project may have on tribal cultural resources. The request must be in writing to the City of Santa Monica and must identify a lead contact person. The City of Santa Monica will begin the consultation process within 30 days of receiving the tribe's request for consultation. The consultation may include a discussion concerning the environmental review necessary for the Project, the significance of tribal cultural resources discovered, the significance of the Project's impacts on tribal cultural resources, and, if necessary, Project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend. The consultation does not limit the ability of the tribe to submit information to the City of Santa Monica regarding the significance of the tribal cultural resources, the significance of the Project's impact on tribal cultural resources, or any measure the tribe feels are appropriate to mitigate the potential impacts. If you wish to informally submit information, written comments may be sent to:

RE: 30-Day Notice: Tribal Consultation per AB 52
Miramar Hotel Project, Environmental Impact Report

Dear Chairperson Morales,

The City of Santa Monica is preparing an Environmental Impact Report (EIR) for the proposed Miramar Hotel Project (proposed project). The City invites your participation and consultation regarding any concerns related to Tribal Cultural Resources pursuant to Assembly Bill (AB) 52 and Public Resources Code (PRC) §21080.3.1, Formal Notification of Decision to Undertake a Project, and Notification of Consultation Opportunity. Below is a description of the project location and summary of the proposed project:

Project Location

The project site encompasses two parcels in the Downtown district of the City of Santa Monica, County of Los Angeles (see Figure 1 – Project Location).

The main parcel, occupied by the Miramar Hotel, is approximately 4.5 acres in size and is located at 1133 Ocean Avenue (Main Parcel). The Main Parcel is currently improved with 301 hotel rooms and related hotel programming space located within a number of buildings. There are two city-designated landmarks located on the Main Parcel – the Moreton Bay Fig Tree and the six-story Palisades Building.

The other parcel is located directly across the street to the east at 1127 2nd Street (Second Street Parcel). The Second Street Parcel is currently improved with a surface parking lot. The Santa Monica Freeway (I-10) is located less than one mile to the south of the site and provides regional access. Pacific Coast Highway to the west of the project site also provides regional access. Local access is provided via Wilshire Boulevard, Ocean Avenue, and Second Street.

Project Description

The proposed project would involve redevelopment of the Main Parcel and Second Street Parcel. The Main Parcel would include a new mixed-use hotel and residential project with ground level open space, food and beverage facilities, meeting space, and ground floor retail uses along Wilshire Boulevard. The two City-designated landmarks would be retained. The Second Street Parcel would include a new 100% affordable housing development. The table below provides the conceptual land use program for the proposed project:

Land Use	Proposed SF/DU
Guestrooms	312 rooms (11 net new)
Food and Beverage Space	11,500 sf (4,418 net new)
Meeting Space	13,000 sf (net reduction of 5,525)

Planning and Community Development
City Planning Division
1685 Main Street, Room 212
Santa Monica, CA 90401

Retail	6,600 sf (5,365 net new)
Spa/Fitness Facility	12,500 sf (6,931 net new)
Market Rate Residential Units ¹	Up to 60 DU
Affordable Residential Units ²	Up to 48 DU
¹ Actual number of units has not been determined, but will not exceed 60.	
² Actual number of affordable housing units on the Second Street parcel has not been determined, but will not be less than 30.	

The proposed total above grade floor area would be approximately 502,157 sf; the current hotel on the main parcel consists of approximately 262,284 sf of floor area.

In addition to retaining the two City-designated landmarks, the Main Parcel is proposed to be redeveloped with two new buildings, the California Building and the Ocean Building (Figure 2 – Conceptual Site Plan and Figure 3 – Project Rendering). The California building would be seven stories (~79 feet tall) and would include hotel guestrooms and amenities. The Ocean Building would range in height between two-stories (29 feet) at Wilshire Boulevard, seven stories along Second Street, and ten stories (a maximum of 130 feet) in the center of the Main Parcel. It would include hotel guestrooms and other hotel programming (spa, meeting space, and food and beverage), residential units, and ground floor retail along Wilshire Boulevard. The existing Landmark Palisades Building would be rehabilitated for continued use as hotel guestrooms. In addition, the existing Landmark Moreton Bay Fig Tree on the project site would be preserved and featured. The Main Parcel would also include ground level open space that would consist of an approximately 14,000 sf publicly accessible open space at the corner of Wilshire Boulevard and Ocean Avenue and approximately 36,000 sf of open space around the Moreton Bay Fig Tree. These open space areas would be activated with food and beverage uses. A three level subterranean garage below the Main Parcel would provide for up to 428 striped parking spaces. Vehicular access is proposed on Second Street (main hotel entrance), Ocean Avenue (residents only), and California Avenue (employees only).

The Second Street Parcel would be redeveloped with up to 48 affordable housing units and subterranean parking.

AB52 Consultation

State law under Assembly Bill 52 (Public Resources Code Section 21080.3.1(d)) provides California Native American tribes 30 days to request consultation regarding possible significant effects that implementation of the Project may have on tribal cultural resources. The request must be in writing to the City of Santa Monica and must identify a lead contact person. The City of Santa Monica will begin the consultation process within 30 days of receiving the tribe's request for consultation. The consultation may include a discussion concerning the environmental review necessary for the Project, the significance of tribal cultural resources discovered, the significance of the Project's impacts on tribal cultural resources, and, if necessary, Project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend. The consultation does not limit the ability of the tribe to submit information to the City of Santa Monica regarding the significance of the tribal cultural resources, the significance of the Project's impact on tribal cultural resources, or any measure the tribe feels are appropriate to mitigate the potential impacts. If you wish to informally submit information, written comments may be sent to:

RE: 30-Day Notice: Tribal Consultation per AB 52
Miramar Hotel Project, Environmental Impact Report

Dear Mr. Alvarez,

The City of Santa Monica is preparing an Environmental Impact Report (EIR) for the proposed Miramar Hotel Project (proposed project). The City invites your participation and consultation regarding any concerns related to Tribal Cultural Resources pursuant to Assembly Bill (AB) 52 and Public Resources Code (PRC) §21080.3.1, Formal Notification of Decision to Undertake a Project, and Notification of Consultation Opportunity. Below is a description of the project location and summary of the proposed project:

Project Location

The project site encompasses two parcels in the Downtown district of the City of Santa Monica, County of Los Angeles (see Figure 1 – Project Location).

The main parcel, occupied by the Miramar Hotel, is approximately 4.5 acres in size and is located at 1133 Ocean Avenue (Main Parcel). The Main Parcel is currently improved with 301 hotel rooms and related hotel programming space located within a number of buildings. There are two city-designated landmarks located on the Main Parcel – the Moreton Bay Fig Tree and the six-story Palisades Building.

The other parcel is located directly across the street to the east at 1127 2nd Street (Second Street Parcel). The Second Street Parcel is currently improved with a surface parking lot. The Santa Monica Freeway (I-10) is located less than one mile to the south of the site and provides regional access. Pacific Coast Highway to the west of the project site also provides regional access. Local access is provided via Wilshire Boulevard, Ocean Avenue, and Second Street.

Project Description

The proposed project would involve redevelopment of the Main Parcel and Second Street Parcel. The Main Parcel would include a new mixed-use hotel and residential project with ground level open space, food and beverage facilities, meeting space, and ground floor retail uses along Wilshire Boulevard. The two City-designated landmarks would be retained. The Second Street Parcel would include a new 100% affordable housing development. The table below provides the conceptual land use program for the proposed project:

Land Use	Proposed SF/DU
Guestrooms	312 rooms (11 net new)
Food and Beverage Space	11,500 sf (4,418 net new)
Meeting Space	13,000 sf (net reduction of 5,525)

Planning and Community Development
City Planning Division
1685 Main Street, Room 212
Santa Monica, CA 90401

Retail	6,600 sf (5,365 net new)
Spa/Fitness Facility	12,500 sf (6,931 net new)
Market Rate Residential Units ¹	Up to 60 DU
Affordable Residential Units ²	Up to 48 DU
¹ Actual number of units has not been determined, but will not exceed 60.	
² Actual number of affordable housing units on the Second Street parcel has not been determined, but will not be less than 30.	

The proposed total above grade floor area would be approximately 502,157 sf; the current hotel on the main parcel consists of approximately 262,284 sf of floor area.

In addition to retaining the two City-designated landmarks, the Main Parcel is proposed to be redeveloped with two new buildings, the California Building and the Ocean Building (Figure 2 – Conceptual Site Plan and Figure 3 – Project Rendering). The California building would be seven stories (~79 feet tall) and would include hotel guestrooms and amenities. The Ocean Building would range in height between two-stories (29 feet) at Wilshire Boulevard, seven stories along Second Street, and ten stories (a maximum of 130 feet) in the center of the Main Parcel. It would include hotel guestrooms and other hotel programming (spa, meeting space, and food and beverage), residential units, and ground floor retail along Wilshire Boulevard. The existing Landmark Palisades Building would be rehabilitated for continued use as hotel guestrooms. In addition, the existing Landmark Moreton Bay Fig Tree on the project site would be preserved and featured. The Main Parcel would also include ground level open space that would consist of an approximately 14,000 sf publicly accessible open space at the corner of Wilshire Boulevard and Ocean Avenue and approximately 36,000 sf of open space around the Moreton Bay Fig Tree. These open space areas would be activated with food and beverage uses. A three level subterranean garage below the Main Parcel would provide for up to 428 striped parking spaces. Vehicular access is proposed on Second Street (main hotel entrance), Ocean Avenue (residents only), and California Avenue (employees only).

The Second Street Parcel would be redeveloped with up to 48 affordable housing units and subterranean parking.

AB52 Consultation

State law under Assembly Bill 52 (Public Resources Code Section 21080.3.1(d)) provides California Native American tribes 30 days to request consultation regarding possible significant effects that implementation of the Project may have on tribal cultural resources. The request must be in writing to the City of Santa Monica and must identify a lead contact person. The City of Santa Monica will begin the consultation process within 30 days of receiving the tribe's request for consultation. The consultation may include a discussion concerning the environmental review necessary for the Project, the significance of tribal cultural resources discovered, the significance of the Project's impacts on tribal cultural resources, and, if necessary, Project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend. The consultation does not limit the ability of the tribe to submit information to the City of Santa Monica regarding the significance of the tribal cultural resources, the significance of the Project's impact on tribal cultural resources, or any measure the tribe feels are appropriate to mitigate the potential impacts. If you wish to informally submit information, written comments may be sent to:

RE: 30-Day Notice: Tribal Consultation per AB 52
Miramar Hotel Project, Environmental Impact Report

Dear Tribal Officer Avila,

The City of Santa Monica is preparing an Environmental Impact Report (EIR) for the proposed Miramar Hotel Project (proposed project). The City invites your participation and consultation regarding any concerns related to Tribal Cultural Resources pursuant to Assembly Bill (AB) 52 and Public Resources Code (PRC) §21080.3.1, Formal Notification of Decision to Undertake a Project, and Notification of Consultation Opportunity. Below is a description of the project location and summary of the proposed project:

Project Location

The project site encompasses two parcels in the Downtown district of the City of Santa Monica, County of Los Angeles (see Figure 1 – Project Location).

The main parcel, occupied by the Miramar Hotel, is approximately 4.5 acres in size and is located at 1133 Ocean Avenue (Main Parcel). The Main Parcel is currently improved with 301 hotel rooms and related hotel programming space located within a number of buildings. There are two city-designated landmarks located on the Main Parcel – the Moreton Bay Fig Tree and the six-story Palisades Building.

The other parcel is located directly across the street to the east at 1127 2nd Street (Second Street Parcel). The Second Street Parcel is currently improved with a surface parking lot. The Santa Monica Freeway (I-10) is located less than one mile to the south of the site and provides regional access. Pacific Coast Highway to the west of the project site also provides regional access. Local access is provided via Wilshire Boulevard, Ocean Avenue, and Second Street.

Project Description

The proposed project would involve redevelopment of the Main Parcel and Second Street Parcel. The Main Parcel would include a new mixed-use hotel and residential project with ground level open space, food and beverage facilities, meeting space, and ground floor retail uses along Wilshire Boulevard. The two City-designated landmarks would be retained. The Second Street Parcel would include a new 100% affordable housing development. The table below provides the conceptual land use program for the proposed project:

Land Use	Proposed SF/DU
Guestrooms	312 rooms (11 net new)
Food and Beverage Space	11,500 sf (4,418 net new)
Meeting Space	13,000 sf (net reduction of 5,525)

Planning and Community Development
City Planning Division
1685 Main Street, Room 212
Santa Monica, CA 90401

Retail	6,600 sf (5,365 net new)
Spa/Fitness Facility	12,500 sf (6,931 net new)
Market Rate Residential Units ¹	Up to 60 DU
Affordable Residential Units ²	Up to 48 DU
¹ Actual number of units has not been determined, but will not exceed 60.	
² Actual number of affordable housing units on the Second Street parcel has not been determined, but will not be less than 30.	

The proposed total above grade floor area would be approximately 502,157 sf; the current hotel on the main parcel consists of approximately 262,284 sf of floor area.

In addition to retaining the two City-designated landmarks, the Main Parcel is proposed to be redeveloped with two new buildings, the California Building and the Ocean Building (Figure 2 – Conceptual Site Plan and Figure 3 – Project Rendering). The California building would be seven stories (~79 feet tall) and would include hotel guestrooms and amenities. The Ocean Building would range in height between two-stories (29 feet) at Wilshire Boulevard, seven stories along Second Street, and ten stories (a maximum of 130 feet) in the center of the Main Parcel. It would include hotel guestrooms and other hotel programming (spa, meeting space, and food and beverage), residential units, and ground floor retail along Wilshire Boulevard. The existing Landmark Palisades Building would be rehabilitated for continued use as hotel guestrooms. In addition, the existing Landmark Moreton Bay Fig Tree on the project site would be preserved and featured. The Main Parcel would also include ground level open space that would consist of an approximately 14,000 sf publicly accessible open space at the corner of Wilshire Boulevard and Ocean Avenue and approximately 36,000 sf of open space around the Moreton Bay Fig Tree. These open space areas would be activated with food and beverage uses. A three level subterranean garage below the Main Parcel would provide for up to 428 striped parking spaces. Vehicular access is proposed on Second Street (main hotel entrance), Ocean Avenue (residents only), and California Avenue (employees only).

The Second Street Parcel would be redeveloped with up to 48 affordable housing units and subterranean parking.

Re: AB52 Consultation request for the Miramar Hotel Project

Dear Rachel Kwok,

Please find this letter as a written request for consultation regarding the above-mentioned project pursuant to Public Resources Code § 21080.3.1, subd. (d). Your project lies within our ancestral tribal territory, meaning belonging to or inherited from, which is a higher degree of kinship than traditional or cultural affiliation. Your project is located within a sensitive area and may cause a substantial adverse change in the significance of our tribal cultural resources. Most often, a records search for our tribal cultural resources will result in a "no records found" for the project area. The Native American Heritage Commission (NAHC), ethnographers, historians, and professional archaeologists can only provide limited information that has been previously documented about California Native Tribes. For this reason, the NAHC will always refer the lead agency to the respective Native American Tribe of the area. The NAHC is only aware of general information and are not the experts on each California Tribe. Our Elder Committee & tribal historians are the experts for our Tribe and can provide a more complete history (both written and oral) regarding the location of historic villages, trade routes, cemeteries and sacred/religious sites in the project area.

Additionally, CEQA now defines Tribal Cultural Resources (TCRs) as their own independent element separate from archaeological resources. Environmental documents shall now address a separate Tribal Cultural Resource section which includes a thorough analysis of the impacts to only Tribal Cultural Resources (TCRs) and includes independent mitigation measures created with Tribal input during AB-52 consultations. As a result, all mitigation measures, conditions of approval and agreements regarding TCRs (i.e. prehistoric resources) shall be handled solely with the Tribal Government and not through an Environmental/Archaeological firm.

In effort to avoid adverse effects to our tribal cultural resources, we would like to consult with you and your staff to provide you with a more complete understanding of the prehistoric use(s) of the project area and the potential risks for causing a substantial adverse change to the significance of our tribal cultural resources.

Consultation appointments are available on Wednesdays and Thursdays at our offices at 910 N. Citrus Ave. Covina, CA 91722 or over the phone. Please call toll free 1-844-390-0787 or email admin@gabrielenoindians.org to schedule an appointment.

*** Prior to the first consultation with our Tribe, we ask all those individuals participating in the consultation to view a video produced and provided by CalEPA and the NAHC for sensitivity and understanding of AB52. You can view their videos at: <http://calepa.ca.gov/Tribal/Training/> or <http://nahc.ca.gov/2015/12/ab-52-tribal-training/>*

Thank you Rachel for your patience in receiving our response. Chairman Salas and Matthew have been in Northern California attending a CalEPA meeting this week and are returning today. Chairman Salas was able to review the mitigation language today and is in agreement with the language as you have written below. Once this language is incorporated into the project's environmental document, AB52 consultation will be complete. Thank you for your time and consideration in this matter.

Subject: RE: AB52 Consultation [1133 Ocean Ave](#) and [101 Santa Monica Blvd](#) in the City of Santa Monica

Thank you Matthew and Andy,

We've reviewed all the materials internally here and we suggest that the following mitigation measure be included in the EIR for both projects:

"Prior to issuance of demolition permit, the Applicant shall retain a Native American tribal monitor from the Gabrieleno Tribe. The appropriate Native American monitor shall be selected based on ongoing consultation under AB 52 and shall be identified on the most recent contact list provided by the Native American Heritage Commission. The Native American Monitor shall be present during construction excavations such as clearing/grubbing, grading, trenching, or any other construction excavation activity associated with the Project. The frequency of monitoring shall take into account the rate of excavation and grading activities, proximity to known archaeological resources, the materials being excavated (younger alluvium vs. older alluvium), and the depth of excavation, and if found, the abundance and type of prehistoric archaeological resources encountered. Full-time field observation can be reduced to part-time inspections or ceased entirely if determined appropriate by the Gabrielino Tribe."

Please let me know if you have approve of the above mitigation measure. If so, we will include in the EIRs and conclude AB52 consultation.

Thanks again.

Subject: AB52 Consultation [1133 Ocean Ave](#) and [101 Santa Monica Blvd](#) in the City of Santa Monica

Thank you for your time during the AB52 consultation for the project at [1133 Ocean Ave](#) and [101 Santa Monica Blvd](#) in the City of Santa Monica.

As stated in the Public Resource Code section 21080.3.1. (a) The Legislature finds and declares that California Native American tribes traditionally and culturally affiliated with a geographic area may have expertise concerning their tribal cultural resources and an area that has cultural value. According to section 21074. (a) "Tribal cultural resources" can be sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe.

Therefore, to explain our concerns for impacts to tribal cultural resources (TCR's) and how this project location may impact TCR's due to the location and the proposed ground disturbing activities, attached are screenshots, additional passages, and some explanatory text that was also verbally explained in the phone consultation for your project location.

The [101 Santa Monica Blvd](#) 1938 map indicates the project location within the Village of Suangna and Comicrabit. All of our mainland villages (sans our island villages) overlapped each other to help facilitate the movement of tribal cultural resources throughout the landscape and also to our sister tribes outside of our traditional ancestral territory. Village use areas were usually shared between village areas and were commonly used by two or more adjoining villages depending on the type, quantity, quality, and availability of natural resources in the area. Therefore, human activity can be pronounced within the shared use areas due to the combined use by multiple villages and TCR's may be present in the soil layers from the thousands of years of human activity within that landscape.

The [1133 Ocean Ave](#) 1938 and the 101 Santa Monica Blvd 1938 maps show the many trade routes around the project area. Trade routes were heavily used by our Tribe for movement of trade items, visiting of family, going to ceremony, accessing recreation areas, and accessing foraging areas. Within and around these routes contained seasonal or permanent ramadas or trade depots, seasonal and permanent habitation areas, and often still contain isolated burials and cremations from folks who died along the trail. These isolated burials are not associated with a village community burial site or ceremonial burial site, rather the location is simply where the person died and was buried where they died. Therefore, isolated burials are more concentrated and likely to occur in proximity to our trade routes, especially the major trade routes. Trade routes are considered "cultural landscapes", as stated in section 21074. (a) because the landscapes will house the objects, therefore, both cultural landscapes and cultural objects are protected under AB52 as a tribal cultural resource.

The [1133 Ocean Ave](#) 1938 and 101 [Santa Monica Blvd](#) 1938 maps indicate the hydrography or waterways that existed around the project area. All water sources were used by our Tribe for life sustenance. Along these watercourses and water bodies occurred seasonal or permanent hamlets, seasonal or permanent trade depots, ceremonial and religious prayer sites, and burials and cremation sites of our ancestors. These activities occurred around water, both inland and coastal, because these water areas create unique habitats and riparian corridors that provide an abundance of food and medicine resources along with aesthetically peaceful areas with running water,

shade trees, and shelter. Larger water bodies were high attractants for human activity and the banks and shores of these water bodies have a higher than average potential for encountering Tribal Cultural Resources of artifacts and human remains during ground disturbing activities. Waterways are a "cultural landscape", as stated in section 21074. (a) and are protected under AB52 as a tribal cultural resource.

Our ancient belief was that your soul travels towards the direction of the setting sun when you die because that is where the Creator is located. Thus, locations that have this viewscape and can see where the sun sets, especially at the ocean, were coveted or preferred locations for ceremonies by our spiritual leaders. Viewscapes showing the westerly skies with Catalina in the distance were coveted as well. Catalina was a very ceremonial and sacred island because it was one of the closest land masses to the setting sun (i.e. the place of the Creator). Therefore, all the powerful Spiritual Leaders inhabited the islands and viewscapes to the island from the mainland were important during ceremony on the mainland. Locations with this viewscape were chosen more than locations without this viewscape because of the spiritual significance of the island and the shamans who inhabited the island.

Due to the project site being located within and around a sacred village Suangna and Comicrabit , adjacent to sacred water courses, a major traditional trade route (Wilshire Blvd), there is a high potential to impact Tribal Cultural Resources still present within the soil from the thousands of years of prehistoric activities that occurred within and around these Tribal Cultural landscapes. Therefore, to avoid impacting or destroying Tribal Cultural Resources that may be inadvertently unearthed during the project's ground disturbing activities, attached is the mitigation language approved by our Tribal Government for use with this project.

1.0 INTRODUCTION

1.1 LOCATION

The Miramar Hotel Redevelopment site is located in the City of Santa Monica and consists of two parcels totaling an area of 4.75 acres. The first parcel "Hotel Parcel" is a full city block, and is bounded to the east by 2nd Street, to the west by Ocean Avenue, to the north by California Ave and to the south by Wilshire Blvd. The Main Project area is 4.41 acres. The second parcel "Second Street Parcel" is located to the east across Second Street from the Hotel Parcel totaling 0.34 acres and is an existing parking lot. The acreages were obtained from the ALTA Land Title Survey, dated 5/11/2016, which has been prepared by Fuscoe Engineering. The ALTA also includes legal descriptions of the parcels.

The Hotel Parcel currently consists of a 301-room hotel with approximately 262,284 square feet of floor area, and is comprised of the following:

- A six-story building called the Palisades Building, built in 1924, which is located a lot the southwest corner of Second Street and California Avenue intersection;
- A ten-story Ocean Building in the middle portion of the Hotel Parcel.
- A two-story meeting and back of the house building along Second Street.
- Several single-story and two-story buildings along Ocean Avenue and California Avenue.

A Vicinity Map is included below as Figure 1.

Figure 1 – Vicinity Map

1.2 PROJECT DESCRIPTION

Hotel Parcel

The proposed new *Miramar Hotel* will consist of a mixed-use luxury hotel, retail, and residential project, which is anticipated to contribute in a meaningful way to the pedestrian experience in Downtown Santa Monica. The redevelopment project will create new open spaces to encourage pedestrian activity to and through the site. More than 50% of the site is proposed as open space at ground level.

Project components on the Hotel Parcel consist of (i) the rehabilitation and ongoing hotel use of the historic Palisades Building (a City-designated landmark); (ii) the preservation and protection of the Moreton Bay Fig Tree (a City-designated landmark) as a focal point of the Project; (iii) the relocation of the main entry drive from Wilshire Boulevard to Second Street; (iv) the removal of the existing surface parking lots; (v) the demolition of all non-landmarked buildings; (vi) the construction of two new buildings (referred to herein as the Ocean Building and the California Building); (vii) the expansion of public and guest open space areas on the ground level and in building terraces and rooftops; and (viii) the construction of a subterranean parking garage beneath the newly constructed buildings and open space. Uses proposed on the Hotel Parcel include 312 hotel guest rooms, 60 market-rate condominium units, new retail spaces, new food and beverage spaces, a reduction in meeting/banquet space, and new spa and fitness center spaces. All parking for the aforementioned uses will be accommodated in the new subterranean garage with 428 striped spaces and an additional 49 aisle spaces for use by the hotel valet operations. Approximately 52% of the ground floor area on the Hotel Parcel will remain open space, including significantly wider sidewalks as well as new publicly-accessible open space and amenities along Ocean Avenue and Wilshire Boulevard. All new buildings and parking garage are assumed to be Type I construction.

Aerial View from Wilshire Boulevard and Second Street

Second Street Parcel

The proposed Second Street Parcel development consists of up to 48 affordable housing apartment units in a maximum six-story building above underground parking. The project will have a community space for its residents. The 100% affordable housing apartment building is assumed to be 5 stories of Type IIIB over one-story of Type I and a Type 1 subterranean parking garage.

Project information is included in Appendix 1 of this report.

1.3 PURPOSE OF THIS REPORT

The purpose of this report is to present the results of the fire and domestic water study, along with providing documentation of sewer capacity, for the proposed Miramar Hotel Redevelopment and the associated proposed 100% affordable housing building on Second Street. The report analyzes the adequacy of the existing City of Santa Monica water system to provide domestic and fire flows to the proposed redevelopment. In addition, the capacities of the City's existing sanitary sewer systems are evaluated.

The report will present calculations to confirm that the proposed project is projected to result in a net reduction of water usage when compared to the existing conditions. Furthermore, since sewer demand is approximately equivalent to the water usage (1:1 ratio per City of Santa Monica criteria as confirmed with Robert Banuelos, Department of Public Works), the reduction in water usage would result in an associated reduction in estimated sewer demand for proposed conditions, as compared to existing conditions.

Because the Project is projected to result in a net decrease in water demand in relation to existing conditions, the Project is not anticipated to require any incremental increase in water supply. The Downtown Community Plan ("DCP") Program Environmental Impact Report ("PEIR") confirmed that sustainable water supplies are adequate for buildout of the DCP (PEIR, p. 3.17-28). The Project is not projected to use any of the projected water supply increase needed for DCP implementation.

Because the Project is projected to result in a net decrease in sewage flows in relation to existing conditions, the Project is not anticipated to require any incremental increase in sewage conveyance or treatment capacity. The Project is not anticipated to require sewer system conveyance improvements needed for DCP implementation and thus is not projected to use any of the projected wastewater conveyance capacity increase needed for DCP implementation. The DCP PEIR also concluded that sewer treatment capacity was sufficient for DCP implementation without the need for additional treatment capacity mitigation. (PEIR Section 3.17)

The report also estimates water quantities required for fire suppression emergency response. The DCP PEIR concluded that DCP implementation would not require the need for new or physically altered fire protection systems that could result in significant environmental impacts. (PEIR p. 3.16-17) As required by PEIR MM PS-1, applicants for new buildings of seven stories or more must prepare a high-rise pre-fire plan to address "the type and capabilities of fire protection systems, the layout of the building, locations of stairwells and elevators, and how the evaluation will be handled." The fire water quantitative calculations included in this report will be used in the required pre-fire plan

for Project buildings that exceed seven stories that will be submitted for the Miramar Hotel Redevelopment during the permitting process.

2.0 METHODOLOGY

Fire hydrant flow tests were conducted by the City of Santa Monica to determine the available flow and pressures in the public water lines servicing the property. The fire hydrant locations were suggested by City staff in order to account for the entire project area for both the Hotel Parcel and Second Street Parcel. The locations and results of the fire flow tests are included in Appendix 2 of this report.

The net water usage for the two projects was evaluated by comparing the five-year baseline (existing) water usage for the existing hotel site with the proposed new water demand. The baseline usage for the Second Street Parcel is zero, since it is a vacant site. The baseline water usage was received from Savewater at City of Santa Monica and compared to the proposed water demand calculations for the Hotel Parcel and the Second Street Parcel, which were prepared by Zinner Consultants-GB Works in conjunction with Syksa Hennessy and were reviewed with the City's Department of Public Works, Water Resources Division, Office of Sustainability and the Environment staff.

The water usage calculations show that the proposed Miramar Hotel Redevelopment project's water demand is estimated to be reduced from existing conditions. Furthermore, since the sewer demand is approximately equivalent to the water demand, the project is estimated to result in a reduction of wastewater to the existing sewer system. The water usage baseline and proposed redevelopment calculations are included in Appendix 3 of this report.

Appendix B of the 2016 California Fire Code (CFC), which has been adopted by the City of Santa Monica Municipal Code per Section 8.40.010, was used to determine fire flow requirements for the project. Fire sprinklers are proposed throughout the buildings, which will result in reductions to the original tabulated fire flows. Since the hotel buildings will be connected without the use of exterior firewalls, the hotel was analyzed as one building for the purposes of the fire flow evaluation.

Appendix C of the CFC was used to analyze the adequacy of the existing fire hydrants.

Copies of each of Appendix B and Appendix C of the CFC are included in Appendix 4 of this report.

3.0 EXISTING WATER FACILITIES

Based on our review of the City of Santa Monica Water Atlas Map (Appendix 5), there are existing public water lines adjacent to the projects that will provide domestic and fire service. Domestic and fire services will be sourced from the same water mains.

There are three public water lines adjacent to the Hotel Parcel, as follows:

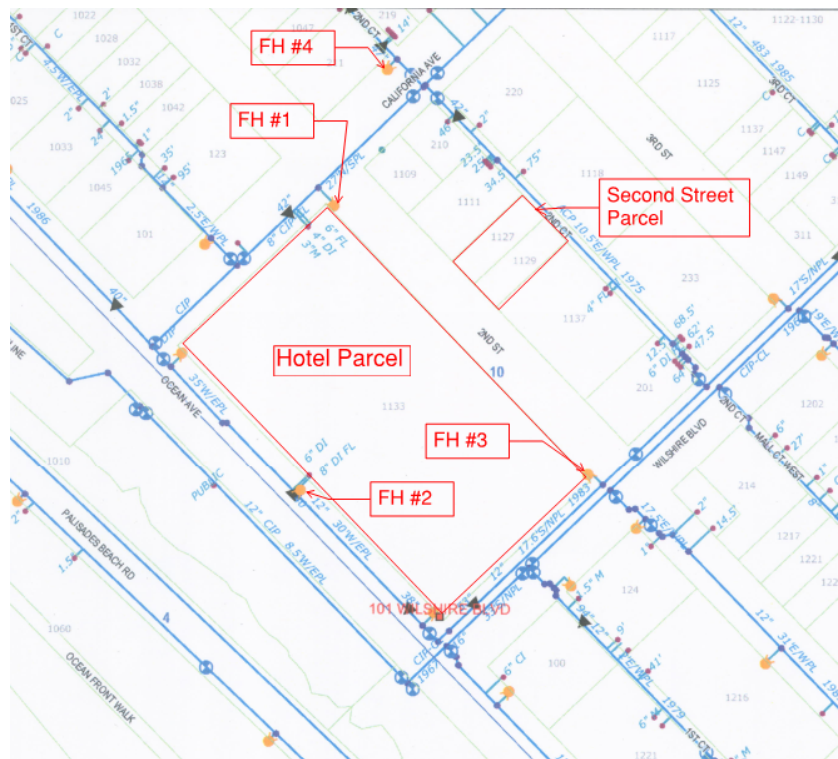

- 8" CIP in California Avenue
- 12" DIP in Ocean Avenue
- 12" ACP in Wilshire Boulevard

It is assumed that new service laterals will be installed for the proposed connections for the Hotel Parcel.

The City's Water Atlas Map shows that the Hotel Parcel is currently being serviced by the waterlines in California Avenue and Ocean Avenue. The proposed project on the Hotel Parcel may utilize the existing lines in California Avenue, Ocean Avenue, and Wilshire Boulevard. However, the specific mains to be utilized have not yet been determined. It is assumed that new laterals will be installed.

The Second Street Parcel will be serviced by the existing 8" ACP in Second Court. There is no existing water line in Second Street. It is assumed that a new service lateral will be installed for the proposed connection in Second Court.

The distance from the Second Street Project to the nearest hydrant is 270 feet to hydrant #4, as will be discussed in the next section. Hydrants #1, #2 and #3 are along the Hotel frontage, adjacent to the Hotel Parcel. The spacing between the hydrants in the vicinity of the projects does not exceed 350 feet. A snapshot of the City's waterlines and fire hydrant locations is shown below.

4.0 FIRE FLOW TEST RESULTS

The City of Santa Monica conducted fire flow tests using four hydrants located in the vicinity of the Hotel Parcel and the Second Street Parcel. As mentioned previously, the fire hydrant locations were suggested by City staff in order to account for the entire project area for both the Hotel Parcel and Second Street Parcel. The fire hydrant locations, as well as the results of the flow tests, are included in Appendix 2. Detailed calculations of the total available flow are included in Appendix 7.

4.1 FIRE HYDRANT #1 (62) CALIFORNIA AVENUE TEST RESULTS

The fire flow test results show that the total available flow for FH #1 is 1,921 gpm at 42 psi, or 2,285 gpm at 20 psi.

4.2 FIRE HYDRANT #2 (1298) OCEAN AVENUE TEST RESULTS

The fire flow test results show that the total available flow for FH #2 is 2,784 gpm at 42 psi, or 3226 gpm at 20 psi.

4.3 FIRE HYDRANT #3 (69) WILSHIRE BOULEVARD TEST RESULTS

The fire flow test results show that the total available flow for FH #3 is 2,505 gpm at 42 psi, or 2,914 gpm at 20 psi.

4.4 FIRE HYDRANT #4 (63) SECOND COURT TEST RESULTS

The fire flow test results show that the total available flow for FH #4 is 1,664 gpm at 42 psi, or 1,979 gpm at 20 psi.

5.0 FIRE FLOW & HYDRANT REQUIREMENTS

The required fire flow is based on the proposed construction type and proposed building floor area, in accordance with the 2016 California Fire Code (CFC).

The new hotel buildings are proposed to be Type I construction. The Second Street affordable housing project is proposed to be five stories of Type IIIB over one-story of Type I and a Type 1 underground parking garage. The buildings will be fully sprinklered. Therefore, the CFC allows 25% of the values obtained in Table B105.1 (2) to be used as the required fire flow, with a required minimum of 1000 gpm.

In accordance with CFC B104.3, the fire flow calculation area for Type I shall be the area of the three largest successive floors. While the above-grade floors have reduced floor areas, the subterranean parking levels, which occupy a greater area, will require fire protection, and will therefore govern for fire flow calculation area.

The areas of the three parking levels for the hotel are as follows (Appendix 1):

- LL1: 63,132 square feet
- LL2: 117,443 square feet
- LL3: 117,443 square feet

The total area of the largest three successive floors for the hotel is 298,018 square feet. Per the table in Appendix B105.1 included on the following page, the required fire flow for the hotel is 1,500 gpm at 2 hours.

Hotel Building (Including Subterranean Parking Structure)

For SI: 1 square foot = 0.0929 m², 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

a. Types of construction are based on the *California Building Code*.

b. Measured at 20 psi residual pressure.

Reduced to:
1,500 gpm @
2 hours

6,000 x 25%
= 1,500 gpm

The proposed Second Street affordable housing project is proposed to be a maximum of six floors over a subterranean parking structure. The parking structure and 1st floor are proposed to be Type I construction, while the 2nd through 6th floors are proposed to be Type IIB construction. The underground parking garage is estimated to be 15,000 square feet. The six stories of the building are estimated to be 6,800 square feet per floor. Per the table in Appendix B105.1 included on the following page, the required fire flow for the affordable housing project is 1,375 gpm for 2 hours.

2nd Street Parcel

For SI: 1 square foot = 0.0929 m², 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

a. Types of construction are based on the *California Building Code*.

b. Measured at 20 psi residual pressure.

1,500 x 25%
= 375 gpm

Reduced to
1,375 gpm
@ 2 hours

4,000 x 25%
= 1,000 gpm

Based on Appendix B of the CFC, the fire calculations show that the required fire flows for the project, using the 25% factor are as follows:

- Second Street Parcel: 1,375 gpm @ 2 hours
- Hotel Parcel including subterranean parking: 1,500 gpm @ 2 hours

Based on Appendix C of the CFC, for fire flow demand less than 1,750 gpm, one hydrant is required to service each project site. In addition, footnote "f" allow increases to the average hydrant spacing and maximum distance between hydrant and road frontage by 50-percent, which would allow (500 x 1.5 =) 750 feet spacing, and (250 x 1.5 =) 375 feet distance from road frontage to hydrant.

The spacing of the hydrants surrounding both projects is 350 feet. The spacing and distances are in conformance with the maximum spacing and distance requirements of Table C102.1 of Appendix C of the CFC.

6.0 DOMESTIC WATER & FIRE DEMAND

The detailed water usage calculations for the baseline (existing) and proposed redevelopment project are included in Appendix 3 of this report. The summary of results of the projected annual potable water use reduction is shown on the following table.

MIRAMAR REDEVELOPMENT
PROJECTED ANNUAL POTABLE WATER USE REDUCTION
 February 19, 2019

	Gallons Per Year
Hotel Guestroom Water Use	4,252,213.5
Other Nonresidential Water Use (Retail, Restaurants, Event Space, Spa/Fitness, Hotel Back of House)	8,211,879.5
Residential Water Use	1,936,580.5
Landscape Irrigation	1,655,275.0
Water Feature Evaporation Makeup	222,431.0
Projected Water Use	16,278,379.5
+ 20% Contingency	3,255,675.9
- Water Reuse	1,655,275.0
NEW MIRAMAR PROJECTED WATER USE	17,878,769.5
- Current Miramar Potable Water Use per City of Santa Monica	28,742,349.0
NEW MIRAMAR POTABLE WATER USE REDUCTION	-10,863,579.6
NEW MIRAMAR PERCENT POTABLE WATER USE REDUCTION	-0.38
Projected 1127/1129 2nd St. Affordable Housing Potable Water Use	1,255,273
New Miramar + Affordable Housing Potable Water Use Reduction	-9,608,306.6
Miramar + Affordable Housing Percent Potable Water Reduction	-0.334

Based on the table above, the required domestic water for each project is as follows:

- New Miramar Hotel Project on the Hotel Parcel: 34 gpm; (based on 17,878,770 gallons/year)
- New Second Street Affordable Housing Project on the Second Street Parcel: 3 gpm (based on 1,255,273 gallons/year)

The total available flow is as follows (Appendix 7):

- FH #1 (California Avenue): 2,285 gpm
- FH #2 (Ocean Avenue): 3,226 gpm
- FH #3 (Wilshire Boulevard): 2,914 gpm
- FH #4 (Second Street Project): 1,979 gpm

The required fire flow demand for each project are as follows (Appendix 8):

- Second Street Project: 1,375 gpm for 2 hours
- Hotel: 1,500 gpm for 2 hours

The calculations of total available flow are included as Appendix 7, and the fire flow requirement calculations are included in Appendix 8. The calculations show that the existing public water system is adequate to provide domestic and fire service to the proposed project. No improvements to the existing public water systems are anticipated to be required, including upsizing of public water mains.

Since there will be an estimated reduction in water usage, the sewer demand is also anticipated to be reduced, and the existing sewer system is projected to have capacity to convey the wastewater associated with the proposed redevelopment project.

7.0 SEWER CAPACITY

The calculations in this report show that the proposed water usage is projected to be less than the existing usage. Since the City of Santa Monica allows determination of wastewater usage to be approximately equivalent to the domestic water usage (1:1 ratio), the project is projected to result in a net reduction of sewer/wastewater demand to the City of Santa Monica's sanitary sewer system. Therefore, no improvements or upsizing to the existing public sewer system are anticipated to be required.

There is existing sewer infrastructure in the vicinity of the project site, as follows:

- 12-inch sewer in Second Street
- 18-inch sewer in California Avenue
- 18-inch sewer in Ocean Avenue

Based on our review, the Hotel Parcel currently connects to the existing public sewer at the following locations:

- One lateral in California Avenue
- Four laterals in Ocean Avenue
- One lateral in Second Street

The Second Street Parcel is not currently discharging into the public sewer system.

Sewer manhole flow monitoring was performed for a 2-week period in September 2018 to establish the status of the wastewater flows in the City's existing sewer system. The results of the monitoring are as follows:

- Manhole #1 in Second Street: 12-inch sewer; depth = 4.07" ($d/D = 0.34$; <0.5 ok) (flow = 0.683 cfs)
- Manhole #2 in California Avenue at Ocean Avenue: 18-inch sewer; depth = 2.96" ($d/D = 0.17$; <0.5 ok) (flow = 0.686 cfs)
- Manhole #3 in Ocean Avenue at Wilshire Boulevard: 18-inch sewer; depth = 2.82" ($d/D = 0.16 < 0.5$ ok) (flow = 0.877 cfs)

Based on the City of Santa Monica's criteria of depth/diameter (d/D) is less than 0.5, the results of the sewer manhole monitoring show that the existing sewer system has capacity to convey the wastewater associated with the existing development. Furthermore, since the sewer demand is expected to be reduced, as compared to the existing condition, the existing City's sewer system has adequate capacity to accept the projected flows from the proposed redevelopment projects.

Based on the results of the water demand analysis, and using the 1:1 (sewer/water) ratio, approved by the City of Santa Monica, the following are the wastewater flows that are projected to be generated by the proposed project (total is less than existing condition):

- Hotel Parcel: 34 gpm (= 0.08 cfs)
- Second Street Parcel: 3 gpm (= 0.007 cfs)
- Total Proposed Demand: 34 gpm + 3 gpm = 37 gpm (0.087 cfs)

Although the specific lateral connections have not been determined, the proposed depths in the sewer have been prepared for estimating purposes. The preliminary results are shown below:

- Manhole #1 in Second Street: 12-inch sewer; depth = 4.01" ($d/D = 0.34$; <0.5 ok) (reduced flow = 0.663 cfs)
- Manhole #2 in California Avenue at Ocean Avenue: 18-inch sewer; depth = 2.92" ($d/D = 0.17$; <0.5 ok) (reduced flow = 0.666 cfs)
- Manhole #3 in Ocean Avenue at Wilshire Boulevard: 18-inch sewer; depth = 2.79" ($d/D = 0.16 < 0.5$ ok) (reduced flow = 0.857 cfs)

Since the values listed above are for estimating purposes only, they are subject to revision based on locations of proposed sewer laterals, which will be determined during final design. The existing and proposed values are summarized in the following sewer comparison table:

MIRAMAR HOTEL REDEVELOPMENT PROJECT – SEWER COMPARISON TABLE

Sewer MH #	Location	Existing Pipe Diameter	Existing Wastewater Flow	Proposed Wastewater Flow	Flow Difference (Proposed – Existing)	Existing Condition Flow Depth	Proposed Condition Flow Depth
#1	Second Street	12"	0.683 cfs	0.663 cfs	-0.02 cfs	4.07" ($d/D=0.34$)	4.01" ($d/D=0.34$)
#2	California Avenue	18"	0.686 cfs	0.666 cfs	-0.02 cfs	2.96" ($d/D=0.17$)	2.92" ($d/D=0.17$)
#3	Ocean Avenue	18"	0.877 cfs	0.857 cfs	-0.02 cfs	2.82" ($d/D=0.16$)	2.79" ($d/D=0.16$)

A snapshot of the City's sewer manholes is shown below.

Based on the available capacities in the existing public sewer lines, it may be an option to discharge the wastewater from each project to a single public sewer line. Alternatively, several discharge locations may be utilized. Specific discharge locations will be determined during design phase of the projects. New sewer laterals are anticipated to be required. As requested by the City of Santa Monica, an exhibit has been prepared which shows the proposed locations of the sewer lateral connections, along with the estimated associated wastewater discharges. The proposed sewer exhibit is included in this report as Appendix 9, and the estimated discharge locations are tabulated below.

MIRAMAR HOTEL REDEVELOPMENT PROJECT – DISCHARGE LOCATIONS

Discharge Location	Estimated Wastewater Amount	Source
Ocean Avenue	0.026 cfs	Hotel Parcel
California Avenue	0.026 cfs	Hotel Parcel
2 nd Street	0.028 cfs	Hotel Parcel
2 nd Street	0.007 cfs	2 nd Street Parcel

8.0 CONCLUSION

The analyses in this report show that the existing City of Santa Monica water system is adequate to provide domestic and fire service to the proposed Hotel and Second Street Parcel Projects. The proposed water usage is projected to be less than the existing usage. The sewer system has capacity to accept the wastewater associated with the existing and proposed redevelopment project. No improvements or upsizing is anticipated to be required to the existing public sewer or water systems.

The back-up calculations, exhibits, and references are included in the appendices of this report.

Oriana and Susan –

As discussed, please find attached the existing hotel baseline water usage information as distributed by the City on 2017. See also email string below.

Let me know if you need anything further on this.

Thank you,

Dustin G. Peterson

Roxanne –

We did confirm with the hotel that those are the only two water usage accounts that we have with the City. Attached is the authorization from Ocean Avenue LLC to release the water usage information to John Zinner. Please let me know if you need anything further on this.

Thank you,

Dustin G. Peterson

Subject: RE: Miramar Historic Water Use

Hi Roxanne,

I found two accounts in our billing system for the Fairmont that have water usage (below). We should check with the property owner to make sure these are accurate and encompass all the accounts for water:

00601989-02
FAIRMONT MIRAMAR HOTEL
124 CALIFORNIA AVE CO
COMMERCIAL

00602009-02
FAIRMONT MIRAMAR HOTEL
1125 OCEAN AVE CO
COMMERCIAL

Also...the City requires approval from the account holder in order to release water usage data to anyone else such as the LEED consultant. I've attached a release authorization form.

In summary...

1. Can you check with the property owner (or authorized rep) to verify the accounts above and to see if there are any other water usage accounts under different names/addresses?
2. Can you have property owner (or authorized rep) complete the attached release form for their water accounts? They can place multiple account numbers on one form.

Please call with any questions!

Tom

Miramar Redevelopment
Projected Potable Water Use, February 13, 2019

Whole Building Water Use Calculation Table Utilizing DA Fixtures

Water Feature Evaporation Loss Makeup (waterfall, koi pond, scrim, 3 decorative pools) ¹⁴						609.4
Daily Baseline Water Use (GPD)					=	44,598.3
+ 20% Contingency					=	8,919.7
- Water Reuse (GPD) ¹⁵					=	4,535.0
DAILY NET POTABLE WATER USE (GPD)					=	48,982.9
x Days per Year					x	365.0
Annual Baseline Water Use (Gallons Per Year - GPY)					=	17,878,769.5
Current Hotel Annual Water Usage (GPY) per City of Santa Monica					-	28,742,349.0
MIRAMAR ANNUAL POTABLE WATER USE REDUCTION (GPY)					=	10,863,579.6
MIRAMAR PERCENTAGE POTABLEWATER USE REDUCTION					=	0.378
Projected 1127/1129 2nd St. Affordable Housing Potable Water Use					=	1,255,273.0
New Miramar + Affordable Housing Potable Water Use Reduction					=	9,608,306.6
Miramar + Affordable Housing Percent Potable Water Reduction					=	0.334

Assumptions
1. Water fixtures usage per previous Santa Monica Development Agreements
2. 515 guests per night (312 hotel rooms (or keys) x 1.65 estimated guests per room per day x 100% estimated occupancy rate).
3. Per PCP, hotel 1,824 SF pool surface + 200 SF spa surface = 2,024 SF. Avg 0.25 inch/0.021 ft evaporation per day, or 314.9 gallons to be made up.
4. Nonresidential occupants per California Plumbing Code Table A, Chapter 4 occupant load factor of 1 person/200 SF retail & 1 person/30 SF restaurant & event space 33 occupants for 6,600 SF ground floor retail 1,376 occupants for 41,251 SF restaurant & event space (11,355 SF food & beverage + 13,000 SF event space + 8,373 outdoor dining space + 8,543 SF back of house kitchens) 250 guests per day for 12,500 SF spa + fitness center (Miramar projection) + 384 daily hotel employees (Miramar projection) 2,043 nonresidential occupants
5. Kitchen sink water use 41,251 SF restaurant & event space/1 employee per 200 sf of restaurant (LEED uses 1/435 SF) x 50% prep works (vs. front of house) = 104 prep staff. 12.5 uses/day/prep worker assumed.
6. Employee shower use assumed to be 30% of employees/day (Miramar projection) = 116.
7. Commercial kitchen equipment water usage estimated utilizing Energy Star Certified Commercial Equipment calculator for 8,543 SF of commercial kitchen. Existing commercial kitchen is 4,200 SF. Estimate of 1,266,000 GPY (3,468.5 GPD) is a 33% savings over baseline.
8. Per Miramar, interior spa Jacuzzi pools surface = 800 SF (men's 120 SF + women's 120 SF + Coed 160 SF). Avg 0.25 inch/0.021 ft evaporation per day, or 124.5 gallons to be made up.
9. 60 residential units. 150 estimated occupants @ 2.5 occupants per unit (instead of 1.75 occupants per unit per American Communities Survey 2014 5-year estimate)
10. Energy Star certified Clothes Washer in each unit. Previous DA required WF= 3.2 = 5.08 gal per person per day.
11. Energy Star certified Dishwashers in each unit. Typical Energy Star performance = 4 Gallons per Cycle (GPC), or 0.43 gal per person per day.
12. Per PCP, 1155 SF common residential pool surface + 120 SF spa surface + 500 SF potential private pools = 1,775 SF. Avg 0.25 inch/0.021 ft evaporation per day, or 276.2 gallons to be made up.
13. Estimated landscaping water use per day per GGN estimate using efficient irrigation system for approximately 52,000 SF of surface irrigated area plus a roof terraces to be designed.
14. Ground level water features (waterfall, koi pond, scrim & 3 decorative pools + overage for possible additions) = 3,917 SF. Avg 0.25 inch/0.021 ft evaporation per day, or 559.2 gallons to be made up.
15. The recycled water volume is calculated to offset all irrigation potable water use.

Chapter / Section																					
B105.2			X																		

* The *California Code of Regulations* (CCR), Title 19, Division 1 provisions that are found in the *California Fire Code* are a reprint from the current CCR, Title 19, Division 1 text for the code user's convenience only. The scope, applicability and appeals procedures of CCR, Title 19, Division I remain the same.

APPENDIX B

FIRE-FLOW REQUIREMENTS FOR BUILDINGS

SECTION B101 GENERAL

B101.1 Scope. The procedure for determining fire-flow requirements for buildings or portions of buildings hereafter constructed shall be in accordance with this appendix. This appendix does not apply to structures other than buildings.

SECTION B102 DEFINITIONS

B102.1 Definitions. For the purpose of this appendix, certain terms are defined as follows:

FIRE-FLOW. The flow rate of a water supply, measured at 20 pounds per square inch (psi) (138 kPa) residual pressure, that is available for fire fighting.

FIRE-FLOW CALCULATION AREA. The floor area, in square feet (m²), used to determine the required fire flow.

SECTION B103 MODIFICATIONS

B103.1 Decreases. The fire chief is authorized to reduce the fire-flow requirements for isolated buildings or a group of buildings in rural areas or small communities where the development of full fire-flow requirements is impractical.

B103.2 Increases. The fire chief is authorized to increase the fire-flow requirements where conditions indicate an unusual susceptibility to group fires or conflagrations. An increase shall not be more than twice that required for the building under consideration.

B103.3 Areas without water supply systems. For information regarding water supplies for fire-fighting purposes in

rural and suburban areas in which adequate and reliable water supply systems do not exist, the fire code official is authorized to utilize NFPA 1142 or the *California Wildland-Urban Interface Code*.

SECTION B104 FIRE-FLOW CALCULATION AREA

B104.1 General. The fire-flow calculation area shall be the total floor area of all floor levels within the exterior walls, and under the horizontal projections of the roof of a building, except as modified in Section B104.3.

B104.2 Area separation. Portions of buildings which are separated by fire walls without openings, constructed in accordance with the *California Building Code*, are allowed to be considered as separate fire-flow calculation areas.

B104.3 Type IA and Type IB construction. The fire-flow calculation area of buildings constructed of Type IA and Type IB construction shall be the area of the three largest successive floors.

Exception: Fire-flow calculation area for open parking garages shall be determined by the area of the largest floor.

SECTION B105 FIRE-FLOW REQUIREMENTS FOR BUILDINGS

B105.1 One- and two-family dwellings, Group R-3 and R-4 buildings and townhouses. The minimum fire-flow and flow duration requirements for one- and two-family dwellings, Group R-3 and R-4 buildings and townhouses shall be as specified in Tables B105.1(1) and B105.1(2).

TABLE B105.1(1)
REQUIRED FIRE-FLOW FOR ONE- AND TWO-FAMILY DWELLINGS, GROUP R-3 AND R-4 BUILDINGS AND TOWNHOUSES

FIRE-FLOW CALCULATION AREA (square feet)	AUTOMATIC SPRINKLER SYSTEM (Design Standard)	MINIMUM FIRE-FLOW (gallons per minute)	FLOW DURATION (hours)
0-3,600	No automatic sprinkler system	1,000	1
3,601 and greater	No automatic sprinkler system	Value in Table B105.1(2)	Duration in Table B105.1(2) at the required fire-flow rate
0-3,600	Section 903.3.1.3 of the <i>California Fire Code</i> or Section 313.3 of the <i>California Residential Code</i>	500	$\frac{1}{2}$
3,601 and greater	Section 903.3.1.3 of the <i>California Fire Code</i> or Section 313.3 of the <i>California Residential Code</i>	$\frac{1}{2}$ value in Table B105.1(2)	1

For SI: 1 square foot = 0.0929 m², 1 gallon per minute = 3.785 L/m.

For SI: 1 square foot = 0.0929 m², 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

a. Types of construction are based on the *California Building Code*.

b. Measured at 20 psi residual pressure.

TABLE B105.2
REQUIRED FIRE-FLOW FOR BUILDINGS OTHER THAN ONE- AND
TWO-FAMILY DWELLINGS, GROUP R-3 AND R-4 BUILDINGS AND TOWNHOUSES

AUTOMATIC SPRINKLER SYSTEM (Design Standard)	MINIMUM FIRE-FLOW (gallons per minute)	FLOW DURATION (hours)
No automatic sprinkler system	Value in Table B105.1(2)	Duration in Table B105.1(2)
Section 903.3.1.1 of the <i>California Fire Code</i>	25% of the value in Table B105.1(2) ^a	Duration in Table B105.1(2) at the reduced flow rate
Section 903.3.1.2 of the <i>California Fire Code</i>	25% of the value in Table B105.1(2) ^b	Duration in Table B105.1(2) at the reduced flow rate

For SI: 1 gallon per minute = 3.785 L/m.

a. The reduced fire-flow shall be not less than 1,000 gallons per minute.

b. The reduced fire-flow shall be not less than 1,500 gallons per minute.

B105.2 Buildings other than one- and two-family dwellings, Group R-3 and R-4 buildings and townhouses. The minimum fire-flow and flow duration for buildings other than one- and two-family dwellings, Group R-3 and R-4 buildings and townhouses shall be as specified in Tables B105.2 and B105.1(2).

Exception: [SFM] Group B, S-2 and U occupancies having a floor area not exceeding 1,000 square feet, primarily constructed of noncombustible exterior walls with wood or steel roof framing, having a Class A roof assembly, with uses limited to the following or similar uses:

1. California State Parks buildings of an accessory nature (restrooms).
2. Safety roadside rest areas, (SRRA), public restrooms.
3. Truck inspection facilities, (TIF), CHP office space and vehicle inspection bays.
4. Sand/salt storage buildings, storage of sand and salt.

B105.3 Water supply for buildings equipped with an automatic sprinkler system. For buildings equipped with an approved automatic sprinkler system, the water supply shall be capable of providing the greater of:

1. The automatic sprinkler system demand, including hose stream allowance.
2. The required fire-flow.

APPENDIX B

FIRE-FLOW REQUIREMENTS FOR BUILDINGS

SECTION B101 GENERAL

B101.1 Scope. The procedure for determining fire-flow requirements for buildings or portions of buildings hereafter constructed shall be in accordance with this appendix. This appendix does not apply to structures other than buildings.

SECTION B102 DEFINITIONS

B102.1 Definitions. For the purpose of this appendix, certain terms are defined as follows:

FIRE-FLOW. The flow rate of a water supply, measured at 20 pounds per square inch (psi) (138 kPa) residual pressure, that is available for fire fighting.

FIRE-FLOW CALCULATION AREA. The floor area, in square feet (m²), used to determine the required fire flow.

SECTION B103 MODIFICATIONS

B103.1 Decreases. The fire chief is authorized to reduce the fire-flow requirements for isolated buildings or a group of buildings in rural areas or small communities where the development of full fire-flow requirements is impractical.

B103.2 Increases. The fire chief is authorized to increase the fire-flow requirements where conditions indicate an unusual susceptibility to group fires or conflagrations. An increase shall not be more than twice that required for the building under consideration.

B103.3 Areas without water supply systems. For information regarding water supplies for fire-fighting purposes in

rural and suburban areas in which adequate and reliable water supply systems do not exist, the fire code official is authorized to utilize NFPA 1142 or the *California Wildland-Urban Interface Code*.

SECTION B104 FIRE-FLOW CALCULATION AREA

B104.1 General. The fire-flow calculation area shall be the total floor area of all floor levels within the exterior walls, and under the horizontal projections of the roof of a building, except as modified in Section B104.3.

B104.2 Area separation. Portions of buildings which are separated by fire walls without openings, constructed in accordance with the *California Building Code*, are allowed to be considered as separate fire-flow calculation areas.

B104.3 Type IA and Type IB construction. The fire-flow calculation area of buildings constructed of Type IA and Type IB construction shall be the area of the three largest successive floors.

Exception: Fire-flow calculation area for open parking garages shall be determined by the area of the largest floor.

SECTION B105 FIRE-FLOW REQUIREMENTS FOR BUILDINGS

B105.1 One- and two-family dwellings, Group R-3 and R-4 buildings and townhouses. The minimum fire-flow and flow duration requirements for one- and two-family dwellings, Group R-3 and R-4 buildings and townhouses shall be as specified in Tables B105.1(1) and B105.1(2).

TABLE B105.1(1)
REQUIRED FIRE-FLOW FOR ONE- AND TWO-FAMILY DWELLINGS, GROUP R-3 AND R-4 BUILDINGS AND TOWNHOUSES

FIRE-FLOW CALCULATION AREA (square feet)	AUTOMATIC SPRINKLER SYSTEM (Design Standard)	MINIMUM FIRE-FLOW (gallons per minute)	FLOW DURATION (hours)
0-3,600	No automatic sprinkler system	1,000	1
3,601 and greater	No automatic sprinkler system	Value in Table B105.1(2)	Duration in Table B105.1(2) at the required fire-flow rate
0-3,600	Section 903.3.1.3 of the <i>California Fire Code</i> or Section 313.3 of the <i>California Residential Code</i>	500	1/2
3,601 and greater	Section 903.3.1.3 of the <i>California Fire Code</i> or Section 313.3 of the <i>California Residential Code</i>	1/2 value in Table B105.1(2)	1

APPENDIX C

FIRE HYDRANT LOCATIONS AND DISTRIBUTION

SECTION C101 GENERAL

C101.1 Scope. In addition to the requirements of Section 507.5.1 of the *California Fire Code*, fire hydrants shall be provided in accordance with this appendix for the protection of buildings, or portions of buildings, hereafter constructed or moved into the jurisdiction.

Exception: [SFM] Group B, S-2 and U occupancies having a floor area not exceeding 1,000 square feet, primarily constructed of noncombustible exterior walls with wood or steel roof framing, having a Class A roof assembly, with uses limited to the following or similar uses:

1. California State Parks buildings of an accessory nature (restrooms).
2. Safety roadside rest areas, (SRRA), public restrooms.
3. Truck inspection facilities, (TIF), California Highway Patrol (CHP) office space and vehicle inspection bays.
4. Sand/salt storage buildings, storage of sand and salt.

SECTION C102 NUMBER OF FIRE HYDRANTS

C102.1 Minimum number of fire hydrants for a building. The number of fire hydrants available to a building shall be not less than the minimum specified in Table C102.1.

SECTION C103 FIRE HYDRANT SPACING

C103.1 Hydrant spacing. Fire apparatus access roads and public streets providing required access to buildings in accordance with Section 503 of the *California Fire Code* shall be provided with one or more fire hydrants, as determined by Section C102.1. Where more than one fire hydrant is required, the distance between required fire hydrants shall be in accordance with Sections C103.2 and C103.3.

C103.2 Average spacing. The average spacing between fire hydrants shall be in accordance with Table C102.1.

Exception: The average spacing shall be permitted to be increased by 10 percent where existing fire hydrants provide all or a portion of the required number of fire hydrants.

C103.3 Maximum spacing. The maximum spacing between fire hydrants shall be in accordance with Table C102.1.

SECTION C104 CONSIDERATION OF EXISTING FIRE HYDRANTS

C104.1 Existing fire hydrants. Existing fire hydrants on public streets are allowed to be considered as available to meet the requirements of Sections C102 and C103. Existing fire hydrants on adjacent properties are allowed to be considered as available to meet the requirements of Sections C102 and C103 provided that a fire apparatus access road extends between properties and that an easement is established to prevent obstruction of such roads.

SECTION C105 REFERENCED STANDARDS

ICC	IFC—15	International Fire Code	C101.1, C103.1, Table C102.1
ICC	IRC—15	International Residential Code	Table C102.1

**TABLE C102.1
REQUIRED NUMBER AND SPACING OF FIRE HYDRANTS**

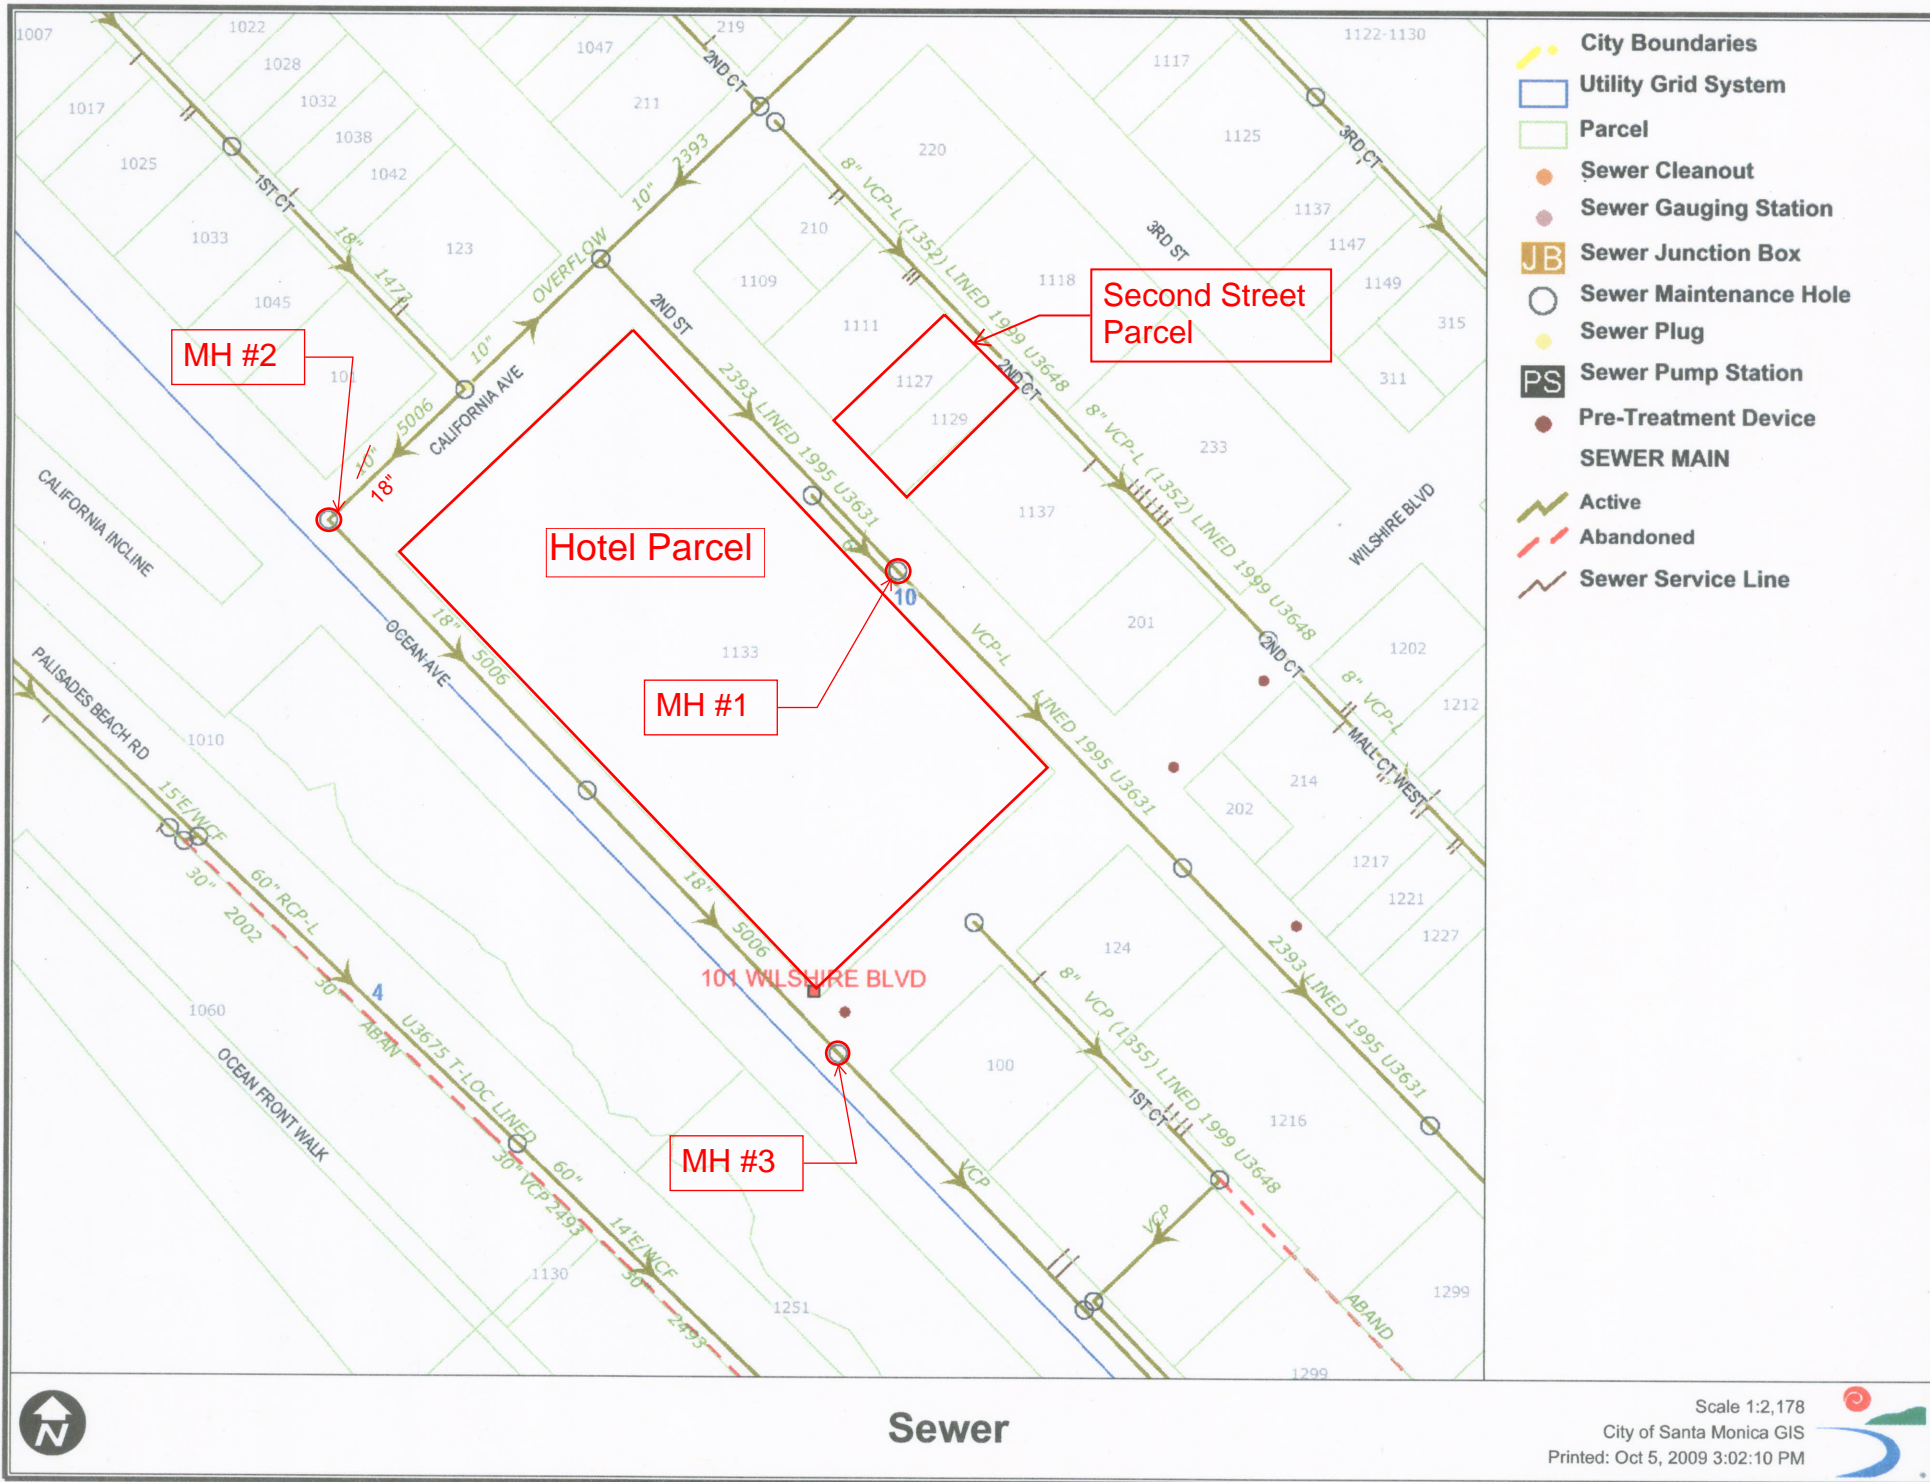

FIRE-FLOW REQUIREMENT (gpm)	MINIMUM NUMBER OF HYDRANTS	AVERAGE SPACING BETWEEN HYDRANTS^{a, b, c, f, g} (feet)	MAXIMUM DISTANCE FROM ANY POINT ON STREET OR ROAD FRONTAGE TO A HYDRANT^{d, f, g}
1,750 or less	1	500	250
2,000-2,250	2	450	225
2,500	3	450	225
3,000	3	400	225
3,500-4,000	4	350	210
4,500-5,000	5	300	180
5,500	6	300	180
6,000	6	250	150
6,500-7,000	7	250	150
7,500 or more	8 or more ^e	200	120

For SI: 1 foot = 304.8 mm, 1 gallon per minute = 3.785 L/m.

- a. Reduce by 100 feet for dead-end streets or roads.
- b. Where streets are provided with median dividers that cannot be crossed by fire fighters pulling hose lines, or where arterial streets are provided with four or more traffic lanes and have a traffic count of more than 30,000 vehicles per day, hydrant spacing shall average 500 feet on each side of the street and be arranged on an alternating basis.
- c. Where new water mains are extended along streets where hydrants are not needed for protection of structures or similar fire problems, fire hydrants shall be provided at spacing not to exceed 1,000 feet to provide for transportation hazards.
- d. Reduce by 50 feet for dead-end streets or roads.
- e. One hydrant for each 1,000 gallons per minute or fraction thereof.
- f. A 50-percent spacing increase shall be permitted where the building is equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1 of the *California Fire Code*.
- g. A 25-percent spacing increase shall be permitted where the building is equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.2 or 903.3.1.3 of the *California Fire Code* or Section P2904 of the *California Residential Code*.

2018.09 Wilshire & 2nd MH 2

MH monitored for 101 Wilshire Blvd Project & 2nd St Project

Access:

MH is in the NB lane of Ocean Av at its intersection w/CA Av

System Type:

Sanitary ☒

Storm ☐

Install Date: 8/30/2018

Map

Technology

Traffic Plan

Flow Meter

Meter Depth: 69"

MH Coordinates: 34.018216, -118.502797

Moderate open channel hydraulics with some turbulence due to 90-degree bend in trough

Avg Velocity	Avg Measured Level	Multiplier
4.25 fps	2.5"	1

Gas

O2	H2S	CO	LEL
20.9	0	0	0

Notes

Due to poor hydraulics in MH 2, moved downstream one MH & monitored the upstream line.

Traffic Safety

Used arrow board, barricades, cones & signs in accord w/approved TCP per CA MUTCD TC requirements.

Land Use

Residential	Commercial	Industrial	Trunk
	X		

Manhole Depth	94"
Monitored Pipe Size	10"
Inner Pipe Size (In/Out)	10"/18"
Pipe Shape	Round
Pipe Condition	Good
Manhole Material	Brick
Silt	0
Velocity Profile Data	*
Velocity Profile Taken	0.4 2-D
Sensor Offset	25.24"
Sensor Dist. to Crown	15.24"
Sensor Direction	Upstream
Flow Heading	South

Methods & Procedures & Equipment

Methods and Procedures

Utility Systems Science & Software provided Fuscoe Engineering with an off the shelf, non-proprietary flow monitoring solution that included three state of the art Hach Flo-Dar® AV Sensor systems. The project course of action is listed below. The US³ team:

- Assessed permitting and traffic control at the sites on 2nd St, California Av, and Wilshire Blvd for the 101 Wilshire Blvd Project and the 2nd St Project (Fairmont Miramar Hotel, Fuscoe Project No. 00886-003-01, Task R08B) in Santa Monica.
- Validated two of the sites for suitability for flow monitoring, but the California Av site had unsuitable hydraulics, so monitoring was moved downstream one manhole.
- Prepared the traffic control plans and obtained a City Encroachment Permit.
- Coordinated with the City wastewater Inspector for installation of equipment.
- Installed and removed traffic control in accord with approved traffic control plans for both the installation and removal of equipment.
- Installed and calibrated the flow monitoring equipment per manufacturer recommendations.
- Removed the equipment, validated the data and prepared the data reports.

Equipment

SPECIFICATIONS

- **Enclosure**
 - IP68 Waterproof rating, Polystyrene
- **Dimensions**
 - 160.5 W x 432.2 L x 297 D mm (6.32 x 16.66 x 11.7 in.),
 - With SVS, D = 387 mm (15.2 in.)
- **Weight**
 - 4.8 kg (10.5 lbs.)
- **Operating Temperature**
 - -10 to 50°C (14 to 122°F)
- **Storage Temperature**
 - -40 to 60°C (-40 to 140°F)
- **Power Requirements**
 - Supplied by FL900 Flow Logger, Flo-Logger, or Flo-Station

- **Interconnecting Cable**
 - Disconnect available at both sensor and logger or Flo-Station
 - Polyurethane, 0.400 (± 0.015) in. diameter; IP68
 - Standard length 9 m (30 ft), maximum 305 m (1000 ft)
- **Cables – available in two styles:**
 - connectors at both ends
 - connector from sensor with open leads to desiccant hub, desiccant hub with connector to logger. A potting/sealant kit will be included. This can be used to run the cable through conduit.
- **Certification**
 - Certified to: FCC Part 15.245: FCC ID: VIC-FLODAR24
 - Industry Canada Spec. RSS210. v7: IC No.: 6149A-FLODAR24

SURCHARGE DEPTH MEASUREMENT

- Auto zero function maintains zero error below 0.5 cm (0.2 in.)
- **Method**
 - Piezo-resistive pressure transducer with stainless steel diaphragm
- **Range**
 - 3.5 m (138 in.), overpressure rating 2.5 x full scale

VELOCITY MEASUREMENT

- **Method**
 - Radar
- **Range**
 - 0.23 to 6.10 m/s (0.75 to 20 ft/s)
- **Frequency Range**
 - 24.075 to 24.175 GHz, 15.2 mW (max.)
- **Accuracy**
 - $\pm 0.5\%$; ± 0.03 m/s (± 0.1 ft/s)

DEPTH MEASUREMENT

- **Method**
 - Ultrasonic
- **Standard Operating Range from Flo-Dar® Housing to Liquid**
 - 0 to 152.4 cm (0 to 60 in.)
- **Optional Extended Level Operating Range from Transducer Face to Liquid**
 - 0 to 6.1 m (0 to 20 ft.) with 43.18 cm (17 in.) dead band, temperature compensated.
- **Accuracy**
 - $\pm 1\%$; ± 0.25 cm (± 0.1 in.)

FLOW MEASUREMENT

- **Method**
 - Based on Continuity Equation
- **Accuracy**
 - $\pm 5\%$ of reading typical where flow is in a channel with uniform flow conditions and is not surcharged, $\pm 1\%$ full scale max.

SURCHARGE CONDITIONS DEPTH/VELOCITY DEPTH (Std with Flo-Dar® Sensor)

- **Surcharge depth supplied by Flo-Dar® sensor.**

VELOCITY (Optional Surcharge Velocity Sensor)

- **Method**
 - Electromagnetic
- **Range**
 - ± 4.8 m/s (± 16 ft/s)
- **Accuracy**
 - ± 0.15 ft/s or 4% of reading, whichever is greater.
- **Zero Stability**
 - ± 0.05 ft/s

The Flo-Dar® Open Channel Flow Meters provide an innovative approach to open channel flow monitoring. Combining digital Doppler radar velocity sensing with ultrasonic pulse echo level sensing Flo-Dar® provides accurate open channel flow monitoring without the fouling problems associated with submerged sensors.

Perfect solution for Difficult Flow Conditions:

- Flows with High Solids Content
- High Temperature Flows
- Caustic Flows
- Large Man-Made Channel
- High Velocities
- Shallow Flows

Benefits

1. Personnel have no contact with the flow during installation.
2. Maintenance caused by sensor fouling is eliminated
3. Field Replaceable/Interchangeable Sensors and Monitors

How It Works

Flo-Dar® transmits a digital Doppler radar beam that interacts with the fluid and reflects back signals at a different frequency than that which was transmitted. These reflected signals are compared with the transmitted frequency. The resulting frequency shift provides an accurate measure of the velocity and the direction of the flow. Level is detected by ultrasonic pulse echo. Flow is then calculated based on the Continuity Equation:

$$Q = V \times A, \text{ Where } Q = \text{Flow}, V = \text{Average Velocity and } A = \text{Area}$$

Accurate Flow Measurements

Flo-Dar® provides the user with highly accurate flow measurements under a wide range of flows and site conditions. By measuring the velocity of the fluid from above, Flo-Dar® eliminates accuracy problems inherent with submerged sensors including sensor disturbances, high solids content and distribution of reflectors.

US³ Company Information

US³ is a California Corporation **Federal ID No. 33-0729605** and qualifies as a Minority Business Enterprise. US³ has certified as an MBE with the California Public Utility Commission's authorized clearinghouse, **Verification Number: 97ES0008**.

US³ is a specialty service company for the Water & Waste Water industry, providing monitoring and control for Utilities since 1996. US³ is in the forefront of this industry by taking the proven technological approaches developed in other high-tech industries and applying them to protect one of our most precious natural resources - our water.

US³ engineers and technical personnel have applied advanced instrumentation system technology to water/wastewater open channel flow monitoring, pipeline evaluation, engineering, and data analysis, all coupled to the power of the Internet. This unique integrated systems approach allows the company to bring greater insight and intelligence to gathering information about water/wastewater system performance of our clients, and in turn, to support the fulfillment of their commitments to manage and cost effectively design, operate, and maintain these systems.

Figure: US³ utilizes exclusively Hach March-McBirney Flo-Dar® Meters

Moreover, **US³** supports Municipalities, Consulting Engineering firms and other water/waste water systems integrators by providing temporary technical services for engineering, software programming and technical site maintenance and calibration site support work, primarily in the Water and Waste Water industries.

Figure: All technicians are certified for Confined Space Entry.

Detailed Calculations of Total Available Flow

Miramar Hotel & Second Street Parcels

Detailed Calculations of Total Available Flow

Fire Hydrant #1 (62) (California Avenue) – PALISADES BUILDING

$$Q_r = Q_f \times (H_r/H_f)^{0.54}$$

Static Pressure = 100 PSI

Residual Pressure = 42 PSI

Q_r = Rated capacity at 20 PSI

Q_f = Total test flow = 1921 gpm

H_r = Static pressure minus 20 PSI

H_f = Static pressure minus residual pressure

$$Q_r = 1921 \times ((100-20)/(100-42))^{0.54} = \mathbf{2,285 \text{ gpm}}$$

Total Available to Palisades Building: 2,285 gpm

Fire Hydrant #4 (63) (Second Court) – SECOND STREET PARCEL

$$Q_r = Q_f \times (H_r/H_f)^{0.54}$$

Static Pressure = 100 PSI

Residual Pressure = 42 PSI

Q_r = Rated capacity at 20 PSI

Q_f = Total test flow = 1664 gpm

H_r = Static pressure minus 20 PSI

H_f = Static pressure minus residual pressure

$$Q_r = 1664 \times ((100-20)/(100-42))^{0.54} = \mathbf{1,979 \text{ gpm}}$$

Total Available to Second Street Project: 1,979 gpm

Miramar Hotel & Second Street Parcels

Detailed Calculations of Total Available Flow

Fire Hydrant #2 (1298) (Ocean Avenue) (Other Hotel Buildings/Combined with FH #3)

$$Q_r = Q_f \times (H_r/H_f)^{0.54}$$

Static Pressure = 112 PSI

Residual Pressure = 42 PSI

Q_r = Rated capacity at 20 PSI

Q_f = Total test flow = 2784 gpm

H_r = Static pressure minus 20 PSI

H_f = Static pressure minus residual pressure

$$Q_r = 2784 \times ((112-20)/(112-42))^{0.54} = \mathbf{3226 \text{ gpm}}$$

Fire Hydrant #3 (69) (Wilshire Boulevard) (Other Hotel Buildings/Combined with FH #2)

$$Q_r = Q_f \times (H_r/H_f)^{0.54}$$

Static Pressure = 110 PSI

Residual Pressure = 42 PSI

Q_r = Rated capacity at 20 PSI

Q_f = Total test flow = 2505 gpm

H_r = Static pressure minus 20 PSI

H_f = Static pressure minus residual pressure

$$Q_r = 2505 \times ((110-20)/(110-42))^{0.54} = \mathbf{2914 \text{ gpm}}$$

Total Available to Other Hotel Buildings & Parking Structure: (3226 + 2914 =) 6,140 gpm

EXECUTIVE SUMMARY

RWDI was retained to conduct a pedestrian wind assessment for the redevelopment of the Miramar Hotel (the “Proposed Configuration” or the “Project”) in Santa Monica, California (Image 1). This study was requested to consider (i) any impacts on pedestrian comfort on sidewalks adjacent to the Project, and (ii) the comfort of the new open spaces being proposed as part of the Project.

Through its research and consulting practice since 1974, RWDI has developed wind speed criteria that have been widely accepted by municipal authorities as well as by the building design and city planning community. RWDI works extensively with architects during the project design phase and provides design recommendations and treatments as appropriate.

Wind conditions during both the summer and winter periods were studied at eighty-two (82) different locations using wind tunnel testing under both the Existing hotel configuration (the “Existing Configuration”) and the Proposed Configuration (Images 2a and 2b) and using local wind records (Image 3). The potential wind comfort conditions are predicted as shown on site plans in Figures 1a through 2b, while the associated predicted wind speeds are also listed in Table 1. These results can be summarized as follows:

- The majority of the wind comfort conditions for the 82 sensor locations are within a comfortable category for pedestrian use.
- Overall, the Project does not significantly impact wind speeds on the public-right-of-way around the Project site (i.e. sidewalks adjacent to and around the site) and the new open spaces provided as part of the Project will generally be comfortable for the proposed pedestrian use.
- On the sidewalks in the public-right-of-way adjacent and around the Hotel Parcel (defined below):
 - The wind speeds are comfortable for pedestrians during the winter months at all locations both in the Existing Configuration and with the Proposed Configuration.
 - The wind speeds are comfortable for pedestrians during the summer months at all but three (3) of the 82 wind sensor locations in both the Existing and Proposed Configurations. In the three locations where wind speeds are predicted to fall into the uncomfortable range, the proposed Project slightly increases the wind speed (by 1 mph) at a single location (sensor #4). Recent Project refinements which were not included in the study are expected to reduce wind speeds at this location.
- On the private property (Hotel Parcel and Second Street Parcel – to be defined below):
 - The wind sensor locations on and around the new affordable housing building on the Second Street Parcel show no uncomfortable wind conditions in the Proposed Configuration in either the summer or winter periods and comfortable wind conditions for pedestrian uses.

- The wind sensor locations in the proposed open spaces on the Hotel Parcel, including the Public Garden Terraces, the Miramar Gardens, the Moreton Bay Fig Tree and around the historic Palisades Building all show comfortable wind conditions for pedestrian use in the Proposed Configuration.
- There are three (3) sensor locations in the Proposed Configuration that show uncomfortable ratings (i.e. within 5-7 mph of comfortable) during the summer period. Two (2) are at the private residential entries at the hotel motor court (east of the Moreton Bay Fig Tree) and one (1) in the north Palisades Garden (hotel guest/residential open space). One of the two at the private residential entries and one in the north Palisades Garden also show an uncomfortable rating during the winter period in the Proposed Configuration. These areas are anticipated to be used primarily by hotel guests and residents and the wind conditions in these areas could be improved with design recommendations including landscaping treatments (which were not modeled in this study).
- Wind speeds at all locations studied at and around the Proposed Project are predicted to meet the pedestrian wind safety criterion.

1 INTRODUCTION

RWDI was retained to conduct a pedestrian wind assessment for the proposed redevelopment of the Miramar Hotel in Santa Monica, California. This report presents the project objectives, background and approach, and discusses of the results from RWDI's assessment.

1.1 Project Description

The proposed Project consists of two parcels totaling 4.7 acres (see Figure 1 below). The first parcel (The "Hotel Parcel") is a full city block bounded to the east by Second Street, to the west by Ocean Avenue, to the north by California Avenue and to the south by Wilshire Boulevard. The Hotel Parcel is 4.41 acres. The second parcel (the "Second Street Parcel") is located across Second Street from the Hotel Parcel totaling 0.3 acres and is an existing surface parking lot.

The Hotel Parcel currently consists of a 301-room hotel with approximately 262,284 square feet of floor area, and is comprised of the following:

- The six-story Palisades Building, built in 1924, which is located a lot the southwest corner of Second Street and California Avenue intersection;
- A ten-story Ocean Building in the middle portion of the Hotel Parcel;
- A two-story meeting and back of the house building along Second Street; and,
- Several single-story and two-story buildings along Ocean Avenue and California Avenue.

Hotel Parcel

The proposed Project will consist of luxury hotel, retail, and residential uses, which is anticipated to contribute in a meaningful way to the pedestrian experience in Downtown Santa Monica. The Project will create new open spaces to encourage pedestrian activity to and through the site. More than 50% of the site is proposed as open space at ground level.

Project components on the Hotel Parcel consist of:

- 1) the rehabilitation and ongoing hotel use of the historic Palisades Building (a City-designated landmark);
- 2) the preservation and protection of the Moreton Bay Fig Tree (a City-designated landmark) as a focal point of the Project;
- 3) the relocation of the main entry drive from Wilshire Boulevard to Second Street;
- 4) the removal of the existing surface parking lots;
- 5) the demolition of all non-landmarked buildings;
- 6) the construction of two new buildings;
- 7) the expansion of public and guest open space areas on the ground level and in building terraces and rooftops; and,
- 8) the construction of a subterranean parking garage beneath the newly constructed buildings and open space.

Uses proposed on the Hotel Parcel include 312 hotel guest rooms, up to 60 market-rate condominium units, new retail spaces, new food and beverage spaces, new meeting/banquet space, and new spa and fitness center spaces. All parking will be accommodated in a new subterranean garage.

Second Street Parcel

The proposed Second Street Parcel development consists of up to 48 affordable housing apartment units with new underground parking.

1.2 Study Objectives

The objective of the study was to assess the effect of the proposed redevelopment on local conditions in pedestrian areas on and around the study site. This quantitative assessment was based on wind speed measurements on a scale model of the Project and its surroundings in one of RWDI's boundary-layer wind tunnels. These measurements were combined with the local wind records and compared to appropriate criteria for gauging wind comfort and safety in pedestrian areas. The assessment focused on critical pedestrian areas, including, public sidewalks and garden spaces.

2 BACKGROUND AND APPROACH

2.1 Wind Tunnel Study Model

To assess the wind environment around the proposed Project, a 1:300 scale model of the Project site and surroundings was constructed for the wind tunnel tests of the following configurations:

- A - Existing: Existing site with existing surroundings (Image 2a), and,
- B - Proposed: Proposed Project with existing and future approved surroundings (Image 2b).

The wind tunnel model included all relevant surrounding buildings and topography within an approximately 1200 ft radius of the Hotel Parcel. No landscaping (other than the Moreton Bay Fig Tree) was included in the scale models. Had landscaping been included, it is expected the wind speed estimates provided in this study would be reduced. The wind and turbulence profiles in the atmospheric boundary layer beyond the modeled area were also simulated in RWDI's wind tunnel. The wind tunnel model was instrumented with eighty-two (82) specially designed wind speed sensors to measure mean and gust speeds at a full-scale height of approximately 5 ft above local grade in pedestrian areas throughout the study site. Wind speeds were measured for 36 directions in a 10-degree increments. The measurements at each sensor location were recorded in the form of ratios of local mean and gust speeds to the mean wind speed at a reference height above the model.

Image 1: Aerial View of Site and Surroundings (Photo Courtesy of Google™ Earth)

Image 2a: Wind Tunnel Study Model – Existing Configuration

Image 2b: Wind Tunnel Study Model – Proposed Configuration

2.2 Meteorological Data

Wind statistics recorded at Santa Monica Municipal Airport between 1988 and 2018, inclusive, were analyzed for the Summer (May through October) and Winter (November through April) seasons. This is the nearest weather station with long-term, representative wind data.

Image 3 graphically depicts the directional distributions of wind frequencies and speeds for these two seasons. Winds from the southwest direction are predominant throughout the year as indicated by the wind roses, with infrequent but relatively strong winds from the north through northeast directions in the winter season. Strong winds of a mean speed greater than 10 mph measured at the airport (at an anemometer height of 30 ft) occur for 20.5% and 16.3% of the time during the summer and winter seasons, respectively, and they are primarily from the southwest and north directions.

Wind statistics were combined with the wind tunnel data to predict the frequency of occurrence of full-scale wind speeds. The full-scale wind predictions were then compared with the wind criteria for pedestrian comfort and safety.

Image 3: Directional Distribution of Winds Approaching Santa Monica Municipal Airport From 1988 to 2018

2.2 RWDI Pedestrian Wind Criteria

The RWDI pedestrian wind criteria, which have been developed by RWDI through research and consulting practice since 1974, are used in the current study. These criteria have been widely accepted by municipal authorities as well as by the building design and city planning community. Regional differences in wind climate and thermal conditions as well as variations in age, health, clothing, etc. can affect a person's perception of the wind climate. Therefore, comparisons of wind speeds for the Existing and Proposed Configurations are the most objective way in assessing local pedestrian wind conditions. In general, the combined effect of mean and gust speeds on pedestrian comfort can be quantified by a Gust Equivalent Mean (GEM).

Comfort Category	GEM Speed (mph)	Description
Sitting	≤ 6	Calm or light breezes desired for outdoor restaurants and seating areas where one can read a paper without having it blown away
Standing	≤ 8	Gentle breezes suitable for main building entrances, bus stops, and other places where pedestrians may linger
Strolling	≤ 10	Moderate winds that would be appropriate for window shopping and strolling along a downtown street, plaza or park
Walking	≤ 12	Relatively high speeds that can be tolerated if one's objective is to walk, run or cycle without lingering
Uncomfortable	> 12	Strong winds of this magnitude are considered a nuisance for all pedestrian activities, and wind mitigation is typically recommended

Notes:

- (1) GEM speed = max (mean speed, gust speed/1.85);
- (2) GEM speeds listed above are based on a seasonal exceedance of 20% of the time between 6:00 and 23:00. Nightly hours between 0:00 and 5:00 are excluded from the wind analysis for comfort since limited usage of outdoor spaces is anticipated.

Safety Criterion	Gust Speed (mph)	Description
Exceeded	> 56	Excessive gust speeds that can adversely affect a pedestrian's balance and footing. Wind mitigation is typically required.

Notes:

- (1) Based on an annual exceedance of 9 hours or 0.1% of the time for 24 hours a day; and,
- (2) Only gust speeds need to be considered in the wind safety criterion. These are usually rare events, but deserve special attention in city planning and building design due to their potential safety impact on pedestrians.

3 RESULTS AND DISCUSSION

The predicted wind conditions are shown on site plans in Figures 1a through 2b located in the “Figures” section of this report. These conditions and the associated wind speeds are also represented in Table 1, located in the “Tables” section of this report.

Table 1 includes a comparison of the predicted wind speeds in the Existing Configuration and in the Proposed Configuration at 67 of the 82 sensor locations in both the winter and summer periods. Some sensor locations were not able to be tested in the Existing Configuration because of existing buildings at those particular sensor locations. The data in Table 1 indicates that the predicted wind speeds are relatively similar in the Existing and Proposed Configurations, with wind speeds varying slightly depending on the sensor location. For both winter and summer periods, GEM wind speeds (i.e. wind comfort conditions) at most of the sensor locations (85%) had a minimal change in wind speed between 0-2 mph and 14% had a change in wind speed between 3-5 mph. One sensor location had a change of 6 mph. The following is a discussion of the suitability of the predicted wind conditions for the anticipated pedestrian use of each area of interest.

Wind conditions comfortable for walking or strolling are appropriate for sidewalks and walkways as pedestrians will be active and less likely to remain in one area for prolonged periods of time. Lower wind speeds conducive to standing or sitting are preferred for areas intended for passive activities and where pedestrians are apt to linger.

Wind conditions that meet the safety criterion are predicted at all locations for both configurations assessed.

3.1 Existing Configuration

3.1.1 Hotel Parcel Sidewalks and Walkways

Wind conditions along public sidewalks and walkways around the Hotel Parcel are generally comfortable for walking or more passive pedestrian usage throughout the year (Figures 1a and 2a). These conditions are considered appropriate for sidewalks and walkways. Exceptions to these conditions include existing uncomfortable conditions to the north of the site, in the public-right-of-way along California Avenue (Locations 103 and 104 in Figure 1a) and to the south of the site, in the public-right-of-way along Wilshire Boulevard (Location 3 in Figure 1a) during the summer season.

3.1.2 Hotel Parcel Open Spaces

Wind conditions on the existing Hotel Parcel, including the areas surrounding the Moreton Bay Fig Tree and the gardens area on the north side of the site are comfortable for sitting or standing pedestrian usage throughout the year (Figures 1a and 2a). These conditions are considered suitable for outdoor garden spaces.

3.1.3 Second Street Parcel

Wind conditions around the Second Street Parcel are generally comfortable for strolling or more passive pedestrian uses throughout the year.

3.2 Proposed Configuration

3.2.1 Hotel Parcel Sidewalks and Walkways

With the addition of the proposed Project, future wind conditions along the expanded public sidewalks and walkways are predicted to remain similar to the existing conditions and comfortable for the anticipated pedestrian usage at almost all areas (Figures 1b and 2b). During the winter period, the sidewalks adjacent to the Project will remain comfortable for pedestrian use with the proposed Project. During the summer, the existing uncomfortable conditions, in the public-right-of-way along California Avenue are predicted to remain (Locations 103 and 104 in Figure 1b) and the existing uncomfortable location along Wilshire Boulevard (Location 3 in Figure 1a) is predicted to remain, but is re-located south to Location 4 (Figure 1b) which is predicted to fall into the uncomfortable category by 1 mph.

To help reduce wind speeds near Location 4, RWDI understands that the design team intends to chamfer the south corner of the Project adjacent to Location 4. This change, along with the incorporation of landscaping will help to reduce corner accelerating wind flows and create more suitable wind conditions for pedestrians in this area.

3.2.2 Hotel Parcel Open Spaces

In the proposed Hotel Parcel open spaces, including the Public Garden Terraces, the open space surrounding the Moreton Bay Fig Tree, and the areas around the Palisades Building the predicted wind conditions are generally expected to be comfortable for standing or sitting usage throughout the year (Figures 1b and 2b). These conditions are considered appropriate for the anticipated uses of these areas. East of the Moreton Bay Fig Tree, near the proposed porte cochere, increased wind activity is predicted at the two private residential entries due to prevailing winds channeling underneath the porte cochere (Locations 35 and 58 in Figures 1b and 2b).

In the Palisades Garden (designed primarily for hotel guests and resident use), slightly increased wind speeds compared to the Existing configuration are anticipated due to the proposed open design to Ocean Avenue and exposure to prevailing southwesterly winds. Comfortable wind speeds for walking and strolling are predicted throughout this hotel guest/resident open space area except for one location. The sensor location that results in uncomfortable conditions throughout the year (Location 90 in Figures 1b and 2b) may be reduced with the incorporation of landscaping treatment (not modeled in this study).

3.2.3 Second Street Parcel

With the addition of the proposed Project and the affordable housing building, the wind conditions at and around the Second Street Parcel are predicted to remain similar to the existing conditions and suitable for the anticipated pedestrian usage.

4 CONCLUSIONS

Based on the current wind tunnel study, the Project does not significantly impact wind speeds around the Project site (i.e. adjacent sidewalks) and the new open spaces provided as part of the Project will generally be comfortable for pedestrian use. At the location along Wilshire Boulevard with increased wind speeds (Location 4) the wind speeds will be reduced through recent revisions to the design. The sensor locations on the Hotel Parcel where the wind conditions are predicted to be uncomfortable can be improved with the introduction of wind control measures which may include denser landscaping, planters, and/or vertical hardscaping elements. Based on our consulting experience and understanding of wind flow patterns around the Project, with the implementation of these wind control measures, more favorable wind conditions on site can be anticipated.

5 APPLICABILITY OF RESULTS

This study was based upon a Conceptual Design Package dated February 15, 2018 received from Pelli Clarke Pelli Architects which were used to construct the scale model of the proposed Project. Should there be any design changes that deviate significantly from the Concept Design Package, the wind condition predictions presented may change.
