SECTION 1.0 INTRODUCTION

This document is an Addendum to the Final Environmental Impact Report (EIR), State Clearinghouse No. 2013091076, prepared by the Rosedale-Rio Bravo Water Storage District. The District approved, constructed, and is operating portions of the project (Stockdale East, Stockdale West, and the Central Intake).

The proposed project consists of the following sites: Stockdale East, Stockdale West, the Central Intake Pipeline alignment, and a third project site that may be made up of non-contiguous parcels. There is approximately 26,000 AF of available storage under Stockdale West and approximately 18,400 AF of available storage under Stockdale East (Thomas Harder & Co., 2013). This is additive to Rosedale's existing 1.7 million AF of storage that underlies its services area, given that Stockdale East and Stockdale West are outside of Rosedale's boundary. However, Rosedale would manage the Stockdale Properties and their associated storage along with the Conjunctive Use Program. Once the third Stockdale project site has been identified, the associated storage underlying the site would be determined. Rosedale has identified a third project site that is discussed in this Addendum.

Portions of the third project site have now been identified are proposed for inclusion into Rosedale's Conjunctive Use Program.

The purpose of this Addendum to the Stockdale Integrated Banking Project Final EIR is to analyze the potential environmental impacts associated with the construction and operation of the portions of the third project site that have been identified and acquired. The four parcels, totaling approximately 315 acres, are shown on **Figure 1**. This Addendum has been prepared pursuant to the California Environmental Quality Act (CEQA) Guidelines Section 15164, to describe the modifications to the original approval and evaluate whether the proposed modifications present any new significant impacts not identified in the Final EIR, or increase the severity of any identified significant impacts, that would require preparation of a subsequent or supplemental EIR.

As documented in the analysis presented below, the proposed modifications would not result in substantial changes that warrant preparation of a subsequent or supplemental EIR pursuant to Sections 15162 and 15163 of the CEQA Guidelines.

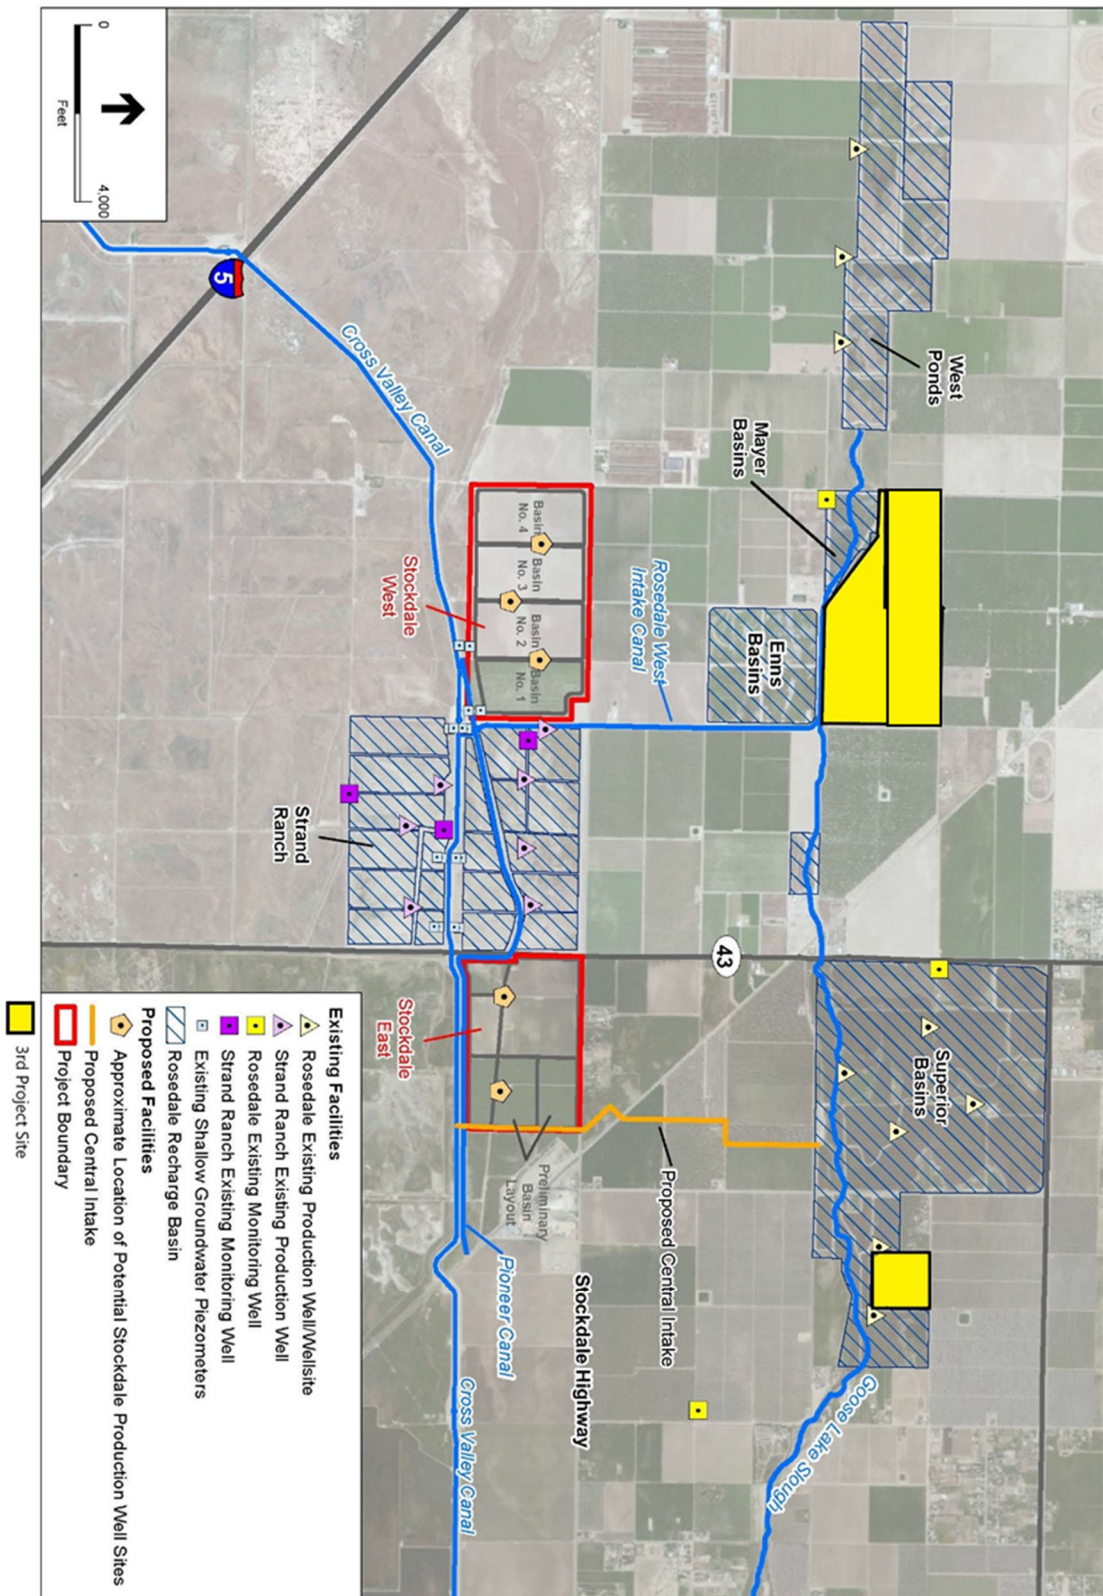

Figure 1.

SECTION 2.0 PROJECT BACKGROUND

Prior to the completion of the EIR, Rosedale's Conjunctive Use Program managed approximately 470,000 acre feet (AF) of stored groundwater in the underlying basin, which has an estimated total storage capacity in excess of 1.7 million acre-feet (AF) (Sierra Scientific Services, 2009). The Conjunctive Use Program encompasses a broad range of activities intended to benefit Rosedale and its landowners through better management of the groundwater resource, integrating and incorporating all of Rosedale's available facilities to this end. Rosedale has groundwater banking agreements with several participants as part of the Conjunctive Use Program, such that all recharge must occur in advance of extraction. Water supplies for the Conjunctive Use Program are supplied by the participating water agencies and include, but are not limited to, high-flow Kern River water and supplies from the Central Valley Project (CVP) and State Water Project (SWP). Currently, the infrastructure for the Conjunctive Use Program includes over 1,000 acres of recharge basins and several recovery wells. The current Program provides for maximum annual recharge of approximately 228,600 acre-feet per year (AFY) and maximum annual recovery of approximately 89,500 AFY. Rosedale certified a Final Master EIR covering the Conjunctive Use Program in July 2001. In addition, Rosedale has certified subsequent CEQA documents for individual project components. The recharge and recovery amounts identified in Stockdale Integrated Banking Project Final EIR are in addition to the amounts identified in the Master EIR for Rosedale's Conjunctive Use Program, additional CEQA documentation, and subsequent addenda.

SECTION 3.0 PURPOSE OF ADDENDUM

The Final EIR evaluated potential impacts from construction and operation of the Stockdale East and Stockdale West banking areas as well as the Central Intake. The FEIR also identified and discussed the intention to develop a third project site, portions of which have now been identified. Therefore, this Addendum to the Final EIR analyzes the potential effects of constructing and operating portions of the third project site within Rosedale's Conjunctive Use Program.

Under CEQA, the lead agency or a responsible agency shall prepare an addendum to a previously- certified Final EIR if some changes or additions are necessary to the prior EIR, but none of the conditions calling for preparation of a subsequent or supplemental EIR have occurred (CEQA Guidelines §§ 15162, 15164). Once an EIR has been certified, a subsequent EIR is only required when the lead agency or responsible agency determines that one of the following conditions has been met:

- (1) Substantial changes are proposed in the project, or substantial changes occur with respect to the circumstances under which the project is undertaken, which require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects [CEQA Guidelines §15162(a)(I)],
- (2) New information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete,

shows any of the following:

- a) The project will have one or more significant effects not discussed in the previous EIR;
- b) Significant effects previously examined will be substantially more severe than shown in the previous EIR;
- c) Mitigation measures or alternatives previously found not to be feasible would in fact be feasible and would substantially reduce one or more significant effects of the project, but the project proponents decline to adopt the mitigation measure or alternative; or
- d) Mitigation measures or alternatives which are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponents decline to adopt the mitigation measure or alternative [CEQA Guidelines §15162(a)(3)].

The Rosedale-Rio Bravo Water Storage District has evaluated the potential environmental impacts of the proposed modifications as set forth below. The District, acting as the Lead Agency, has determined that none of the CEQA conditions listed above apply and that this Addendum to the adopted Final EIR is the appropriate environmental documentation for the proposed modifications and fully complies with CEQA, as described in the CEQA Guidelines. An addendum does not need to be circulated for public review, but rather can be attached to the Final EIR (CEQA Guidelines §15164(c)). Prior to initiating the modified Project, the District will consider this Addendum together with the adopted Final EIR and will make a decision regarding the modified Project [CEQA Guidelines §15164(d)].

SECTION 4.0 PROPOSED MODIFICATIONS

The proposed project would allow the Rosedale-Rio Bravo Water Storage District (Rosedale) to more effectively utilize available aquifer storage in the Kern County Sub-basin by developing additional groundwater recharge and conveyance facilities. The facilities would be incorporated into its groundwater Banking and Conjunctive-Use Program (Master EIR Rosedale-Rio Bravo Water Storage District, 2001). The facilities will expand the District's annual maximum recharge by 61,000 AFY up to 290,000 AFY, and maximum banking capacity of 700,000 AF. The properties that make up the portions of the third project site are as follows:

- (1) **Bowling Recharge Pond.** This property is approximately 40 acres, and bound on two sides by Rosedale's existing Superior recharge area. The Bowling property had been fallowed for at least 20 years and was leased and improved into a pilot recharge pond in 2017. The Bowling property has a net wetted surface area of approximately 36 acres, with 1 interbasin structure on the property. Pond berms are constructed with compacted earth from the project site from approximately two to six ft. in height. Berms also serve as roadways. Resultant pond depths are typically 0.5 ft. to 4 ft. No further improvements are anticipated; completed recharge basins and interbasin structures are shown in **Figure 2**. RRBWSD acquired this property in 2019. The facility would be maintained and operated by Rosedale. Expected recharge rates of around 0.6 ft/day (experienced during pilot recharge operations) could result in an average water supply benefit of 0.6 ft/day x 81 days per

year x 36 acres x 3% loss rate = 1,697 AFY, with an annual maximum recharge amount of about 8,000 AF. No new recovery facilities are anticipated to be constructed on the property. The Bowling property has no existing wells.

- (2) **McCaslin Recharge Ponds.** These properties are approximately 275 acres and are adjacent to Rosedale's existing Goose Lake Channel, as well as the Enns and Mayer recharge areas. These McCaslin properties had been farmed to almond trees for 14 to 20 years; Rosedale has or intends to acquire the properties. Recharge ponds with a net wetted surface area of about 250 acres, and 6 to 10 interbasin structures would be constructed on the properties. Pond berms are constructed with compacted earth from the project site at approximately two to six ft. in height. Berms also serve as roadways. Resultant pond depths are typically 0.5 ft. to 4 ft. A conceptual pond layout is shown in **Figure 3** and a typical interbasin structure is shown in **Figure 4**. Expected recharge rates of around 0.6 ft/day (based on adjacent existing recharge operations) could result in an average water supply benefit of 0.6 ft/day x 81 days per year x 250 acres x 3% loss rate = 11,800 AFY, with an annual maximum recharge amount of about 53,000 AF.

Adjacent to the property, water diversion structures in and from the Goose Lake Channel would also be constructed. A typical intake structure to serve the property as shown in **Figure 5**, and a typical diversion structure in the Channel as shown in **Figure 2-7**.

No new recovery facilities are anticipated to be constructed on the properties. The McCaslin property has two existing well. The well, estimated to produce about 1500-2500 gpm, will not offer additional recovery capacity for the Rosedale Banking and Conjunctive Use Project but may be used to temporarily replace capacity from existing and adjacent Enns wells shown on **Figure 2-4**. Should production be limited for reasons such as maintenance, quality, or diminished capacity these wells could serve as replacements to offer backup/redundancy. The well could be plumbed into existing Rosedale conveyance pipelines and conveyance canals by means of approximately 500 linear feet of buried PVC pipeline from 15 to 21 inches in diameter.

Figure 2.

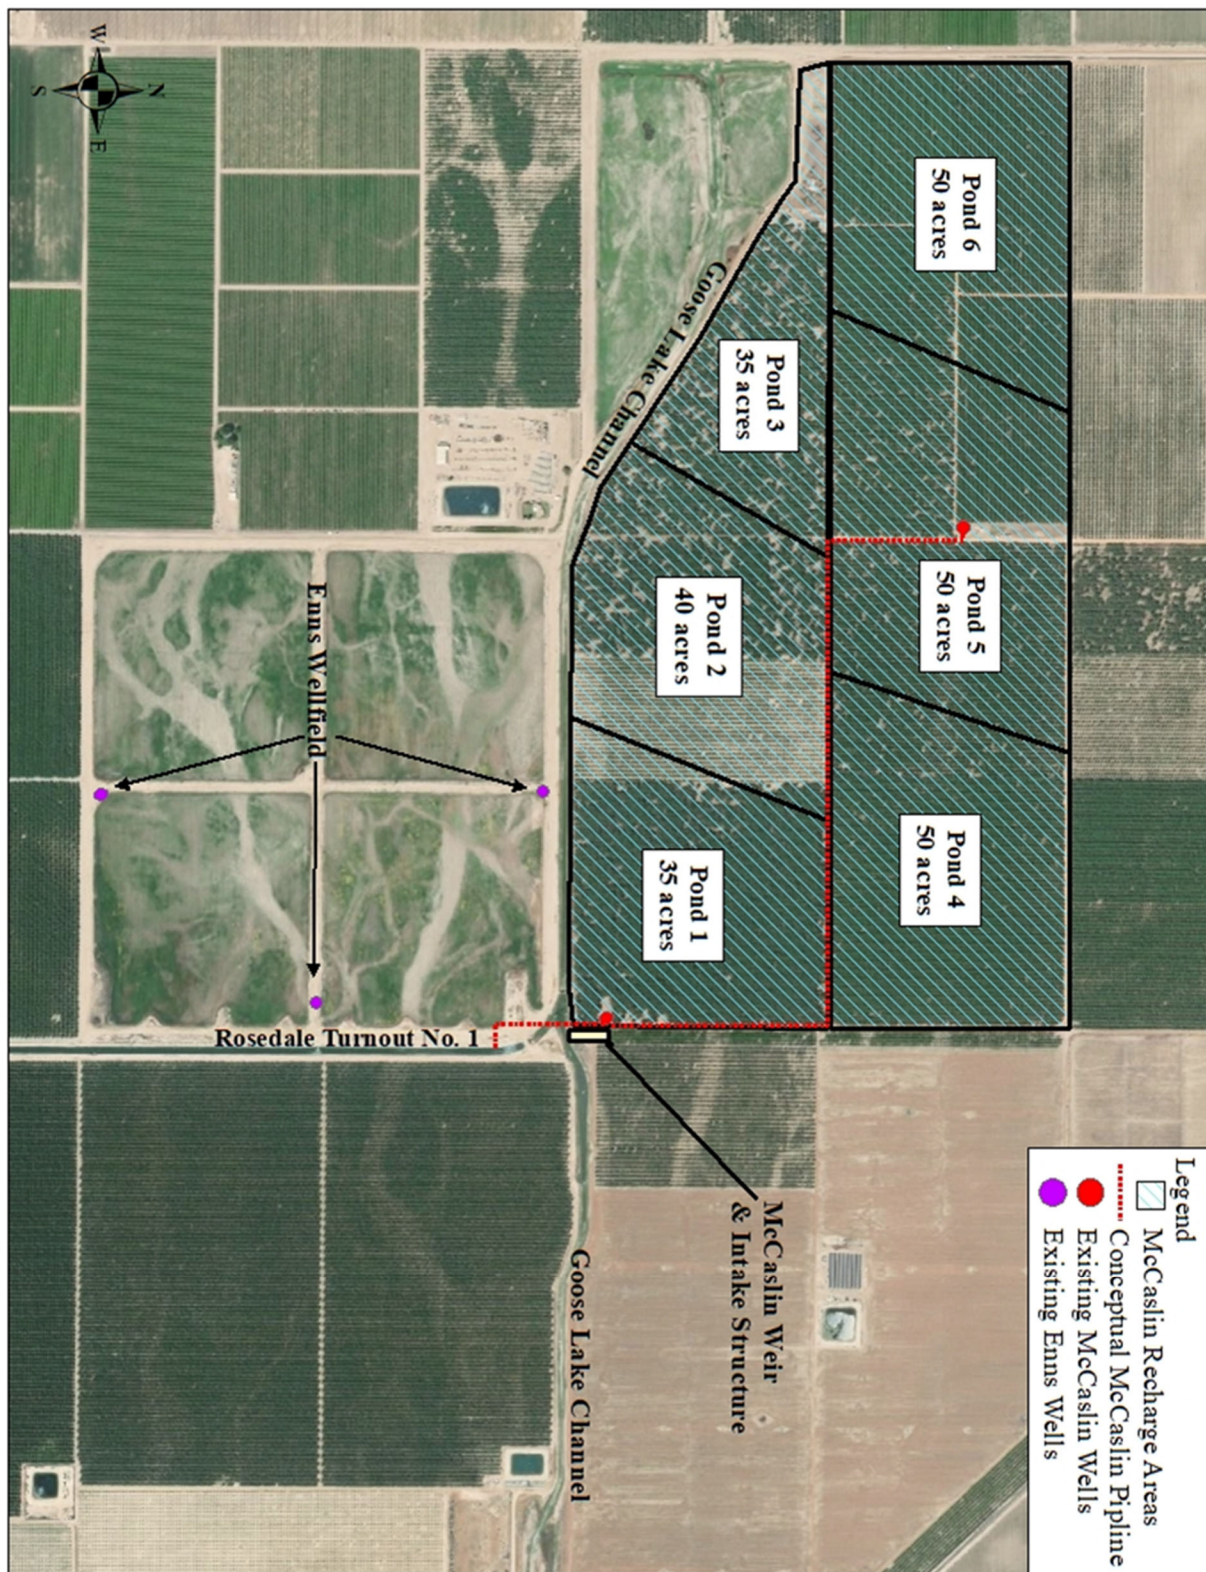

Figure 3.

Figure 4.

Figure 5.

Figure 6.

SECTION 5.0 ENVIRONMENTAL ANALYSIS

This Addendum evaluates the potential for the modified project to result in new or substantially greater significant impacts compared to the impacts disclosed in the certified Stockdale Integrated Banking Project Final EIR. The proposed modifications do not have the potential to change the regulatory framework, impact discussion, mitigation measures or significance conclusions for the following environmental topics analyzed in the adopted Final EIR: Aesthetics, Agricultural and Forestry Resources; Air Quality, Biological Resources, Cultural Resources; Geology, Soils and Seismicity; Greenhouse Gas Emissions; Hazards and Hazardous Materials; Hydrology and Water Quality; Land Use and Planning; Mineral Resources; Noise; Transportation and Traffic; and Utilities and Energy.

Potential impacts to all of the environmental topics listed above result from construction and operation of the groundwater recharge ponds. Since the Final EIR analyzed the Stockdale East project site, which includes 200 acres of groundwater banking project that is nearly identical in nature to the sites discussed herein, all potential impacts to the environmental topics listed above have already been analyzed and mitigated as necessary to avoid significant affects. Additional site-specific Biota and Cultural studies were completed and attached as **Appendix A and Appendix B**. Findings and proposed mitigation measures are the same as those found in the FEIR and will be complied with by RRBWSD. The proposed modifications would not result in new or more severe significant impacts that would not be addressed by the existing Mitigation and Monitoring plan (**Appendix C**).

The following sections analyze whether the potential impacts of the proposed activities have the potential

to cause new or more severe impacts warranting the preparation of a subsequent or supplemental EIR.

SECTION 6.0 SUMMARY OF ENVIRONMENTAL EFFECTS

As discussed in this Addendum, the proposed modifications would not change the conclusions of the certified Final EIR. The proposed modifications would not result in a new significant impact or substantially increase the severity of a previously identified significant impact. No mitigation is required beyond the existing commitments contained within the MMRP, all of which have been satisfied in full. The proposed modifications to the previously approved Project do not meet any of the conditions that would require the preparation of a subsequent or supplemental EIR as set forth in Sections 15162 and 15163 of the CEQA Guidelines.

SECTION 7.0 DETERMINATION

Section 15164(a) of the CEQA Guidelines states the following:

The lead agency or responsible agency shall prepare an addendum to a previously certified EIR if some changes or additions are necessary but none of the conditions described in Section 15162 calling for the preparation of subsequent EIR have occurred. The proposed modifications to the original Project would not result in new significant environmental effects or a substantial increase in the severity of previously identified significant effects.

Furthermore, new information associated with the proposed modifications does not indicate that: the Project will have one or more significant effects not discussed in the adopted Final EIR; significant effects previously examined will be substantially more severe than shown in the adopted Final EIR; mitigation measures or alternatives previously found not to be feasible would in fact be feasible; or mitigation measures or alternatives which are considerably different from those analyzed in the adopted Final EIR would substantially reduce one or more significant effects on the environment, but the Project proponents decline to adopt the mitigation measures or alternative. Accordingly, an addendum has been prepared as opposed to a supplemental or subsequent EIR. The Rosedale-Rio Bravo Water Storage District is adopting this Addendum in accordance with the CEQA Guidelines Section 15164.

1 INTRODUCTION

1.1 Purpose and Scope

The purpose of this biological resources assessment (BRA) report is to describe and analyze the potential impacts to biological resources within the proposed work area for the proposed McCaslin Recharge Ponds (Project), which are one component to the overall Groundwater Banking and Conveyance Improvement Project, led by the Rosedale-Rio Bravo Water Storage District.

Overall, the scope of this analysis has taken into consideration sensitive habitats and special-status plant and animal species known to occur (or likely to occur) within or directly adjacent to the site, and potentially regulated jurisdictional features that may be present. The intent of this report is to assist the Rosedale-Rio Bravo Water Storage District with seeking grant funding with the U.S. Bureau of Reclamation for this component of the overall project, and this report would be sufficient for future environmental documents or agency coordination and consultation.

1.2 Project Description

The District recently acquired approximately 115 acres of land, known as the McCaslin Property located in the Kern County of the Southern San Joaquin Valley, west of the city of Bakersfield. In addition to the McCaslin Property, the District recently obtained an additional 80 acres that borders the northern boundary of the McCaslin Property. Herein, for ease of reference, the entire area is referred to as the Project site. As currently proposed, the District seeks to clear and grub the existing almond orchards, build recharge berms and inter-basin flow structures within the Project site. Specifically, this would include the construction of approximately 100 net acres of direct recharge ponds via the placement of 108,000 CY of compacted levees that are approximately 2-5 feet in height. As a result, upwards of 15,000 acre-feet per year (AFY) (typically 2 years in 10) of recharge water will be conveyed from pond to pond via 6 inter-basin check structures. Water would be conveyed into the facility by means of a newly constructed sluice gated intake and diversion weir within the Goose Lake Channel. Approximately 50 cubic feet per second (cfs) of intake capacity would be required to serve this site. The District's proposal for increased groundwater storage capabilities and better water management tools will more efficiently utilize surface water supplies in wet years and benefit the District's and Kern County Sub-basin's goal of groundwater sustainability.

The Project is located within the Tupman U.S. Geological Survey (USGS) 7.5-minute topographical quadrangle; Township 29 South, Range 25 East, Section 27, 28, and 34, East Mount Diablo Base and Meridian, County of Kern, State of California. Refer to Figure 1 and 2.

1.3 Biological Study Area

For the purposes of this report, the biological study area (BSA) encompasses the Project site and a visual survey buffer of 0.5-mile from the boundary of the property. The surrounding buffer of 0.5-mile was survey for the purposes of identifying any existing Swainson's hawk nests that may be in the area. Visual surveys were only conducted within property that is already owned by the District or within the legal public right-of-way. Surveys were not conducted from within any other privately owned agricultural orchards or other developed areas that were not owned by the District.

For the purposes of this analysis, SWCA considers the entire Project site will be impacted. This includes the existing plans for the McCaslin property and plans to be developed for the additional 80 acres of property adjacent and north of the McCaslin property proper.

Figure 1. Project Vicinity Map

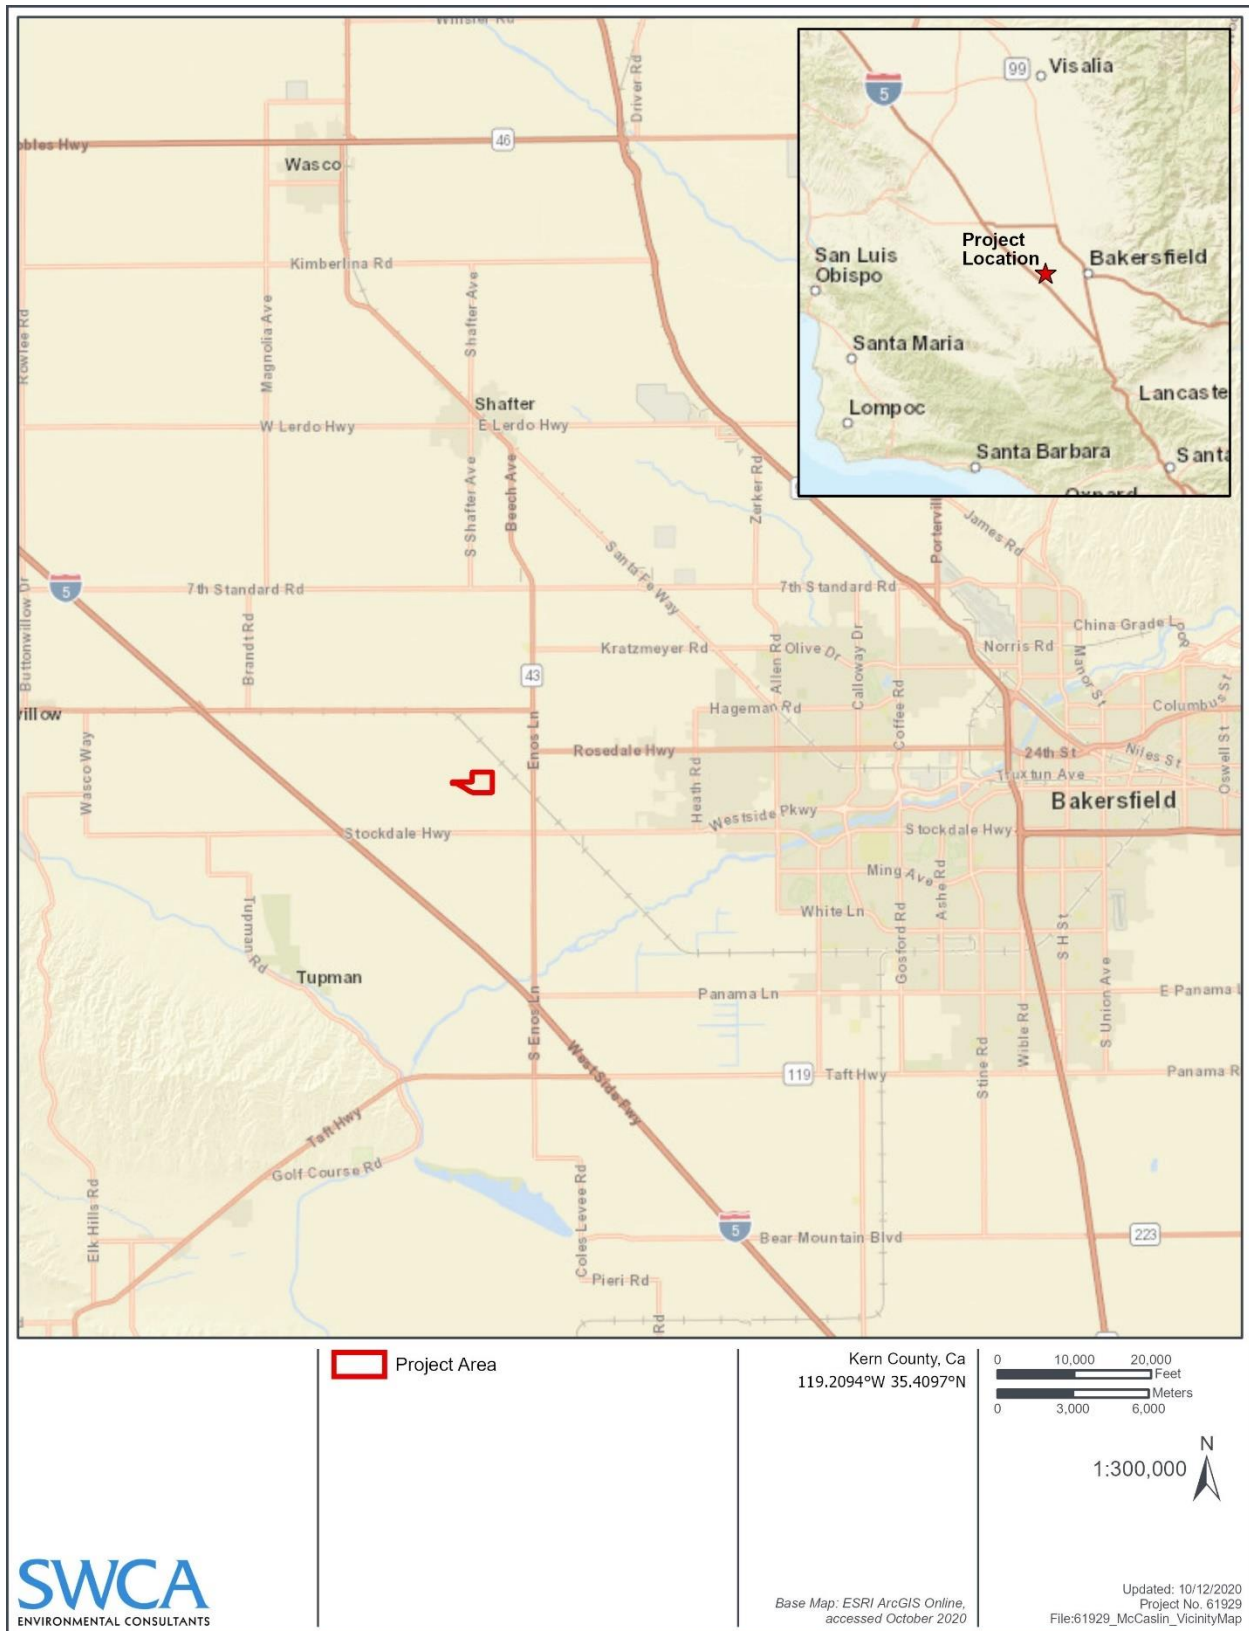

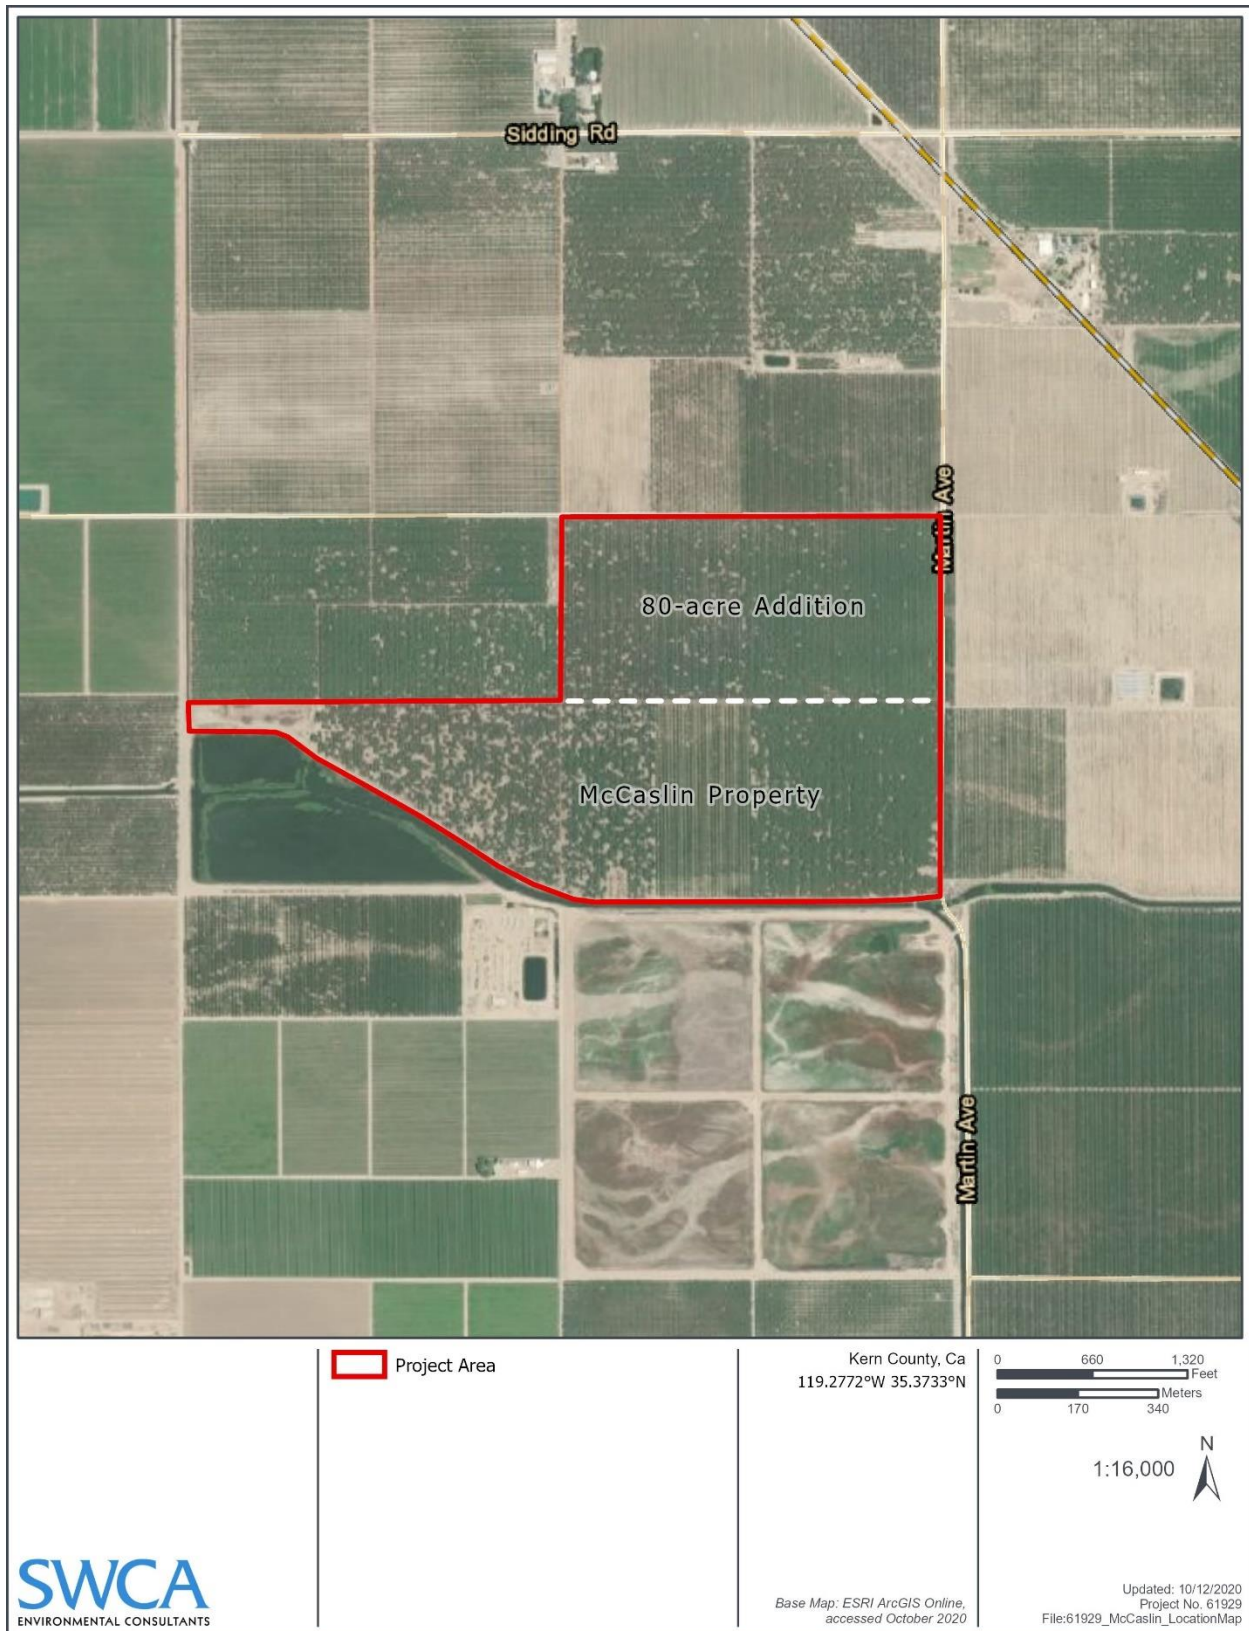

Figure 2. Project Location Map

1.4 Study Methodology

1.4.1 Database Query and Literature Review

Prior to conducting a field survey, SWCA conducted a review of the California Department of Fish and Wildlife (CDFW) California Natural Diversity Database (CNDDDB) to generate lists of special-status species with documented occurrences in the area. SWCA also utilized the CNDDDB database to identify previously documented occurrences of plant and animal species within a 5-mile radius of the Project site. The CNPS Online Inventory of Rare and Endangered Plants (CNPS 2020) was also reviewed for other occurrence records of special-status plants in the region. Because these lists are regional in nature, an analysis of the range and habitat preferences of the listed species was conducted to identify which species have the potential to occur in or near the BSA. SWCA evaluated the elevation range, soil types, and habitat preferences of the identified species to determine which species have potential to occur within the BSA prior to conducting field surveys. Species with habitat present were closely considered for potential presence within the Project site. In terms of a literature search, SWCA reviewed the Stockdale Integrated Banking Project Draft Environmental Impact Report prepared by ESA (2013). SWCA also took into consideration recent studies and information generated by SWCA for the James Groundwater Recharge Project and Kern River Bike Path Western Extension, which are in the region.

1.4.2 Reconnaissance Survey

A reconnaissance level survey was conducted by Jon Claxton, SWCA Natural Resources Team Lead and Senior Biologist, Benjamin Ruiz on July 24, 2020. The survey consisted of a combination of walking and driving the perimeter of the McCaslin Property and additional 80 acres to the north. Based on discussion with the District, SWCA understands that the resource agencies may be concerned with the potential for raptor nesting within the actively farmed almond orchards. Therefore, surveyors entered the orchards to verify whether any existing raptor nests occur within the almond trees. SWCA biologists also visual surveyed the surrounding 0.5-mile buffer to identify existing raptor nest in the area. As mention in Section 1.3, these efforts were limited to property owned by the District, or public right-of-way. Surveyors utilized 10x42 binoculars and a spotting scope as needed. Within the Project site, SWCA also evaluated the area for the presence of any dens or burrowing activity within the Project site. Due to the existing site conditions, active agricultural practices, and overall lack of suitable habitat, SWCA did not conduct any focused species surveys.

2 ENVIRONMENTAL SETTING

2.1 Description of the Existing Biological and Physical Conditions

2.1.1 Biological Conditions

In total, the 195-acre Project site consists almost entirely of actively almond orchards (agriculture) and existing dirt roadways utilized for agricultural practices. Aerial basemap imagery of the study area that is contained within this report is representative of the study area conditions at the time of the survey. Specifically, the Project site consists of approximately 191 acres of actively managed almond orchards, and approximately 9.25 acres of developed/ruderal habitat. Non-native annual grassland and weedy species dominated areas of vegetation that were not almonds. Representative species include foxtail brome (*Bromus madritensis*), wild oat (*Avena fatua*), Mediterranean grass (*Schismus* spp.), rancher's fireweed (*Amsinckia menziesii*), and weedy species like black mustard (*Brassica nigra*) and Russian thistle (*Salsola tragus*). Due to the ongoing agricultural activities within the Project site, there was no evidence of small mammal burrows or dens within the Project site. The almond orchard trees were on average approximately 15-18 feet in height.

2.2 Physical Conditions

2.2.1 Topographical and Climatic Conditions

The Project site is flat and exhibits little change of topography. The elevation of the Project site is approximately 290 feet above mean sea level (AMSL). The Project site is located in the southern part of the San Joaquin Valley, which is bounded on the west by the Temblor Range, on the south by the San Emigdio and Tehachapi Mountains, on the east by the Sierra Nevada, and on the north by agricultural fields of San Joaquin Valley.

Climatic conditions in this region of the southern San Joaquin Valley are typical of a Mediterranean climate and are characterized by hot, dry summers and cold, moist winters. Average annual temperatures vary from a high mean temperature of 97 degrees Fahrenheit in July to a low mean temperature of 36 degrees Fahrenheit in December and January. Precipitation mainly occurs between October and April, with an average annual rainfall of 5.8 inches. The wettest month of the year is usually January, with an average rainfall of 1.4 inches. Yearly precipitation patterns are quite variable and this high variability coupled with extremes in temperature creates a harsh and unpredictable environment for a variety of plants and wildlife. The availability of water or soil moisture is a critical factor that determines the broad distribution of vegetation types and associated wildlife species in the region.

2.2.2 Soil Conditions

According to the U.S. Department of Agriculture, Natural Resources Conservation Service (NRCS) Soil Survey (NRCS 2020) for northwestern Kern County (CA666), three different soil types occur within the Project site, including: Granozy loamy sand, (0 to 2 percent slopes), Wasco sandy loam, Wasco fine sandy loam, Westhaven fine sandy loam.

2.2.3 Hydrologic Conditions

Regional hydrology is mostly dependent upon the Kern River, which begins on the western slope of Mount Whitney in the southern Sierra Nevada and flows in a southwest direction where it terminates in the western portion of the southern San Joaquin Valley to the southwest of the Project site. Most of the Kern River water is diverted for agricultural or groundwater recharge. During extremely wet years, the Kern River reaches the flood channel located on the west of the valley floor and carries water into the Buena Vista Lake Basin.

The Project site, which is actively farmed, is currently served by a weir in the Goose Lake Channel, which receives water from the Kern River at the Kern River Turnout. The Project site is categorized by the Federal Emergency Management Agency (FEMA) as Flood Zone X, which consists of areas with a 0.2% chance of flooding. The USFWS National Wetland Inventory (NWI) identified the Goose Lake Channel as lake (lacustrine) habitat that is littoral with unconsolidated substrates that are intermittently flooded and impounded.

Figure 3. Soils Map

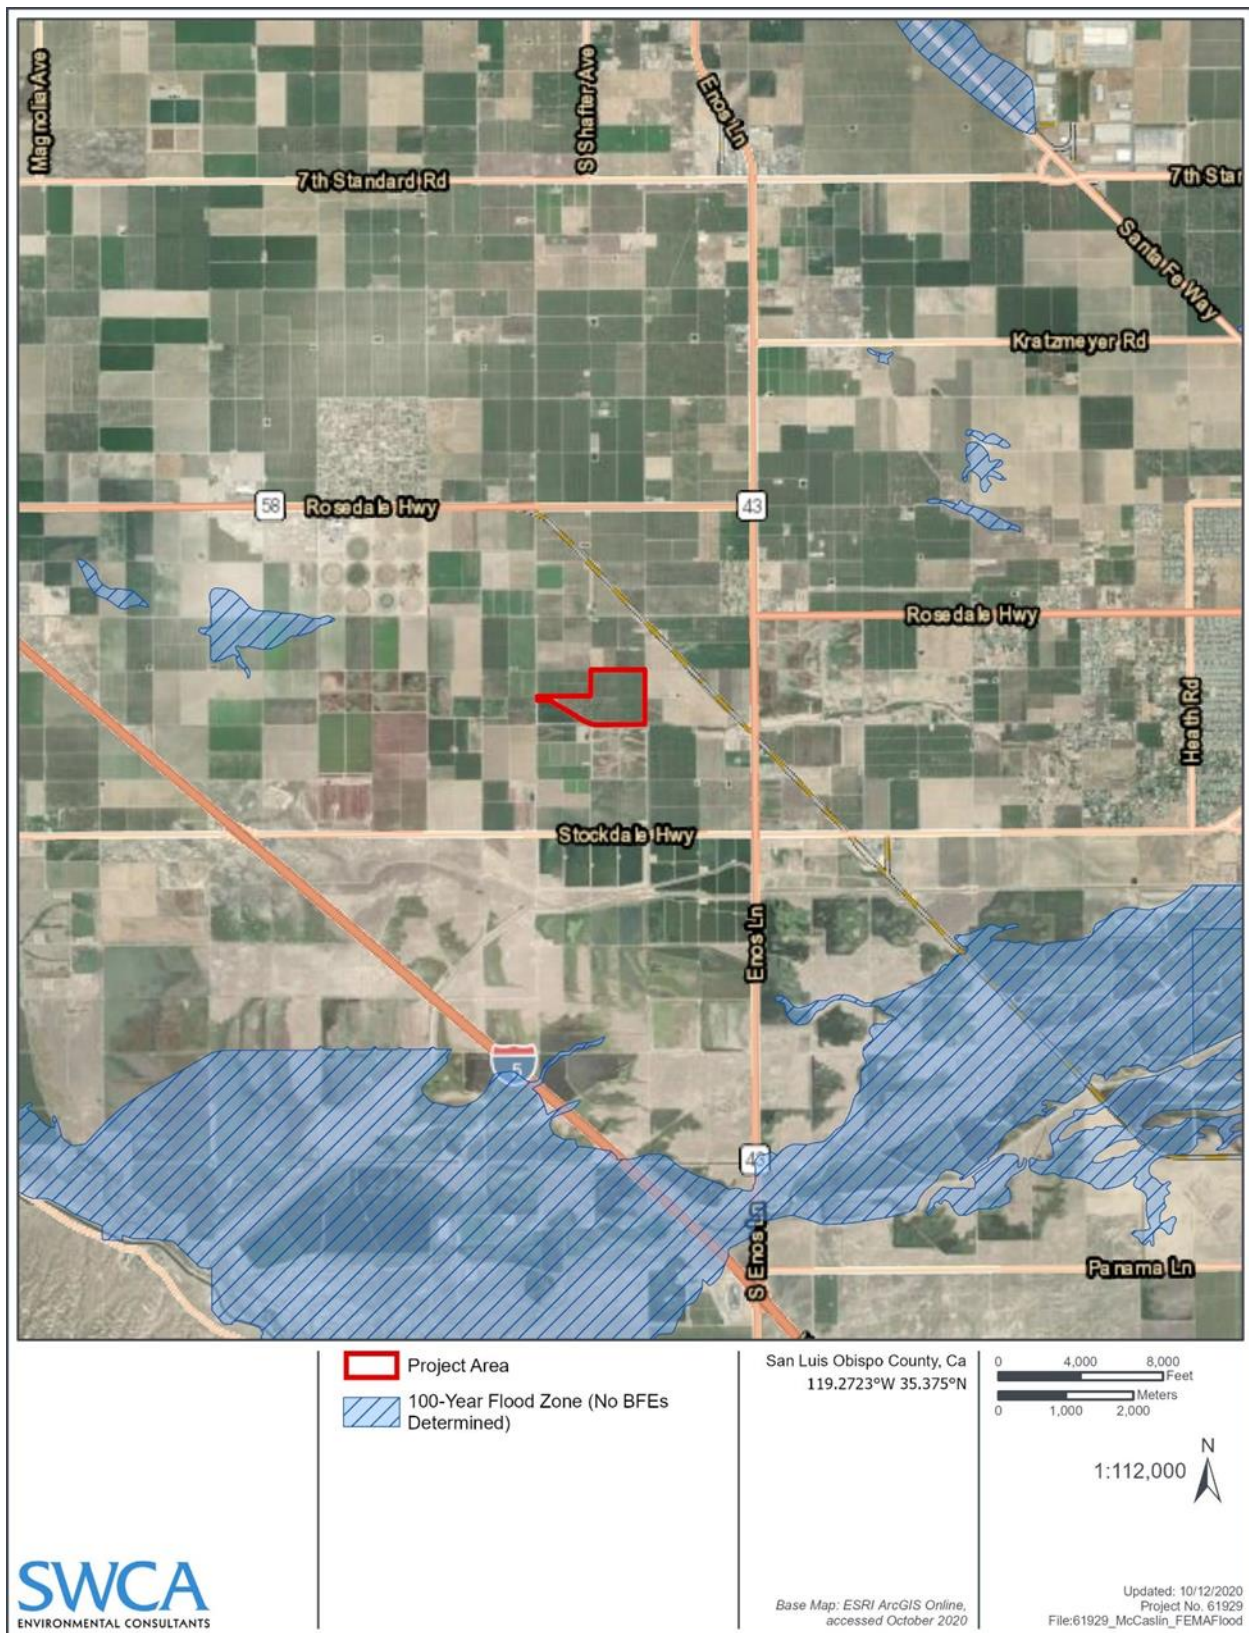

Figure 4. FEMA Flood Zones Map

2.3 Regional Species and Habitats and Natural Communities of Concern

Regional species of concern include “special-status species.” Special-status species include taxa that are: 1) federally or state listed as endangered, threatened, or rare; 2) candidates for federal or state listing as endangered, threatened, or rare; 3) proposed for federal or state listing as endangered, threatened, or rare; or 4) considered special concern species by the federal government (i.e., former USFWS Federal Species of Concern) and CDFW (i.e., SSC species), or those that appear on the CNDDDB Special Animals List (CNDDDB 2020). Regional species of concern also include taxa afforded protection or considered sensitive under various laws (e.g., NEPA, CEQA, MBTA) or under Sections 3503 and 3503.5 of the California Fish and Game Code (e.g., nesting birds), and those taxa recognized as locally important or sensitive by CNPS (CNDDDB 2020; CNPS 2020).

Habitats and natural communities of concern include those that are regulated or considered sensitive by federal, state, and/or local agencies or NEPA/CEQA. The known occurrences of sensitive species and sensitive habitats have been inventoried and mapped, to varying degrees of accuracy, by the CNDDDB (CDFW 2020).

2.3.1 Regional Habitats and Natural Communities of Concern

The CNDDDB (2020) documents regional habitats and natural communities of concern that are considered sensitive that occur within the search area. Figures 5 and 6 provide a graphical depiction of the location of the documented occurrences of these sensitive biological resources within a 5-mile radius to the project site. The following tables provide a general habitat description of these resources, as well as an evaluation as to whether these species and sensitive habitats have the potential to occur within the Project site. A determination of whether these habitats are present (HP) or absent (A) within the BSA helps to support the rationale.

2.3.2 Special-Status Plant Species

For the purposes of this section, special-status or “sensitive” plant species are defined as the following:

- Plants listed or proposed for listing as threatened or endangered under the ESA (50 CFR 17.12 for listed plants and various notices in the Federal Register for proposed species).
- Plants that are candidates for possible future listing as threatened or endangered under the ESA.
- Plants that meet the definitions of rare or endangered species under CEQA (State CEQA Guidelines, Section 15380).
- Plants considered by the CNPS to be “rare, threatened, or endangered” in California (Lists 1B and 2 in CNPS 2013).
- Plants listed by CNPS as plants about which we need more information and plants of limited distribution (Lists 3 and 4 in CNPS 2013).
- Plants listed or proposed for listing by the State of California as threatened or endangered under the CESA (14 CCR 670.5).
- Plants listed under the California Native Plant Protection Act (California Fish and Game Code Section 1900 et seq.).
- Plants considered sensitive by other Federal agencies (i.e., U.S. Forest Service, Bureau of Land Management), state and local agencies, or jurisdictions.

Figure 5. CNDDDB Plant Occurrences Map

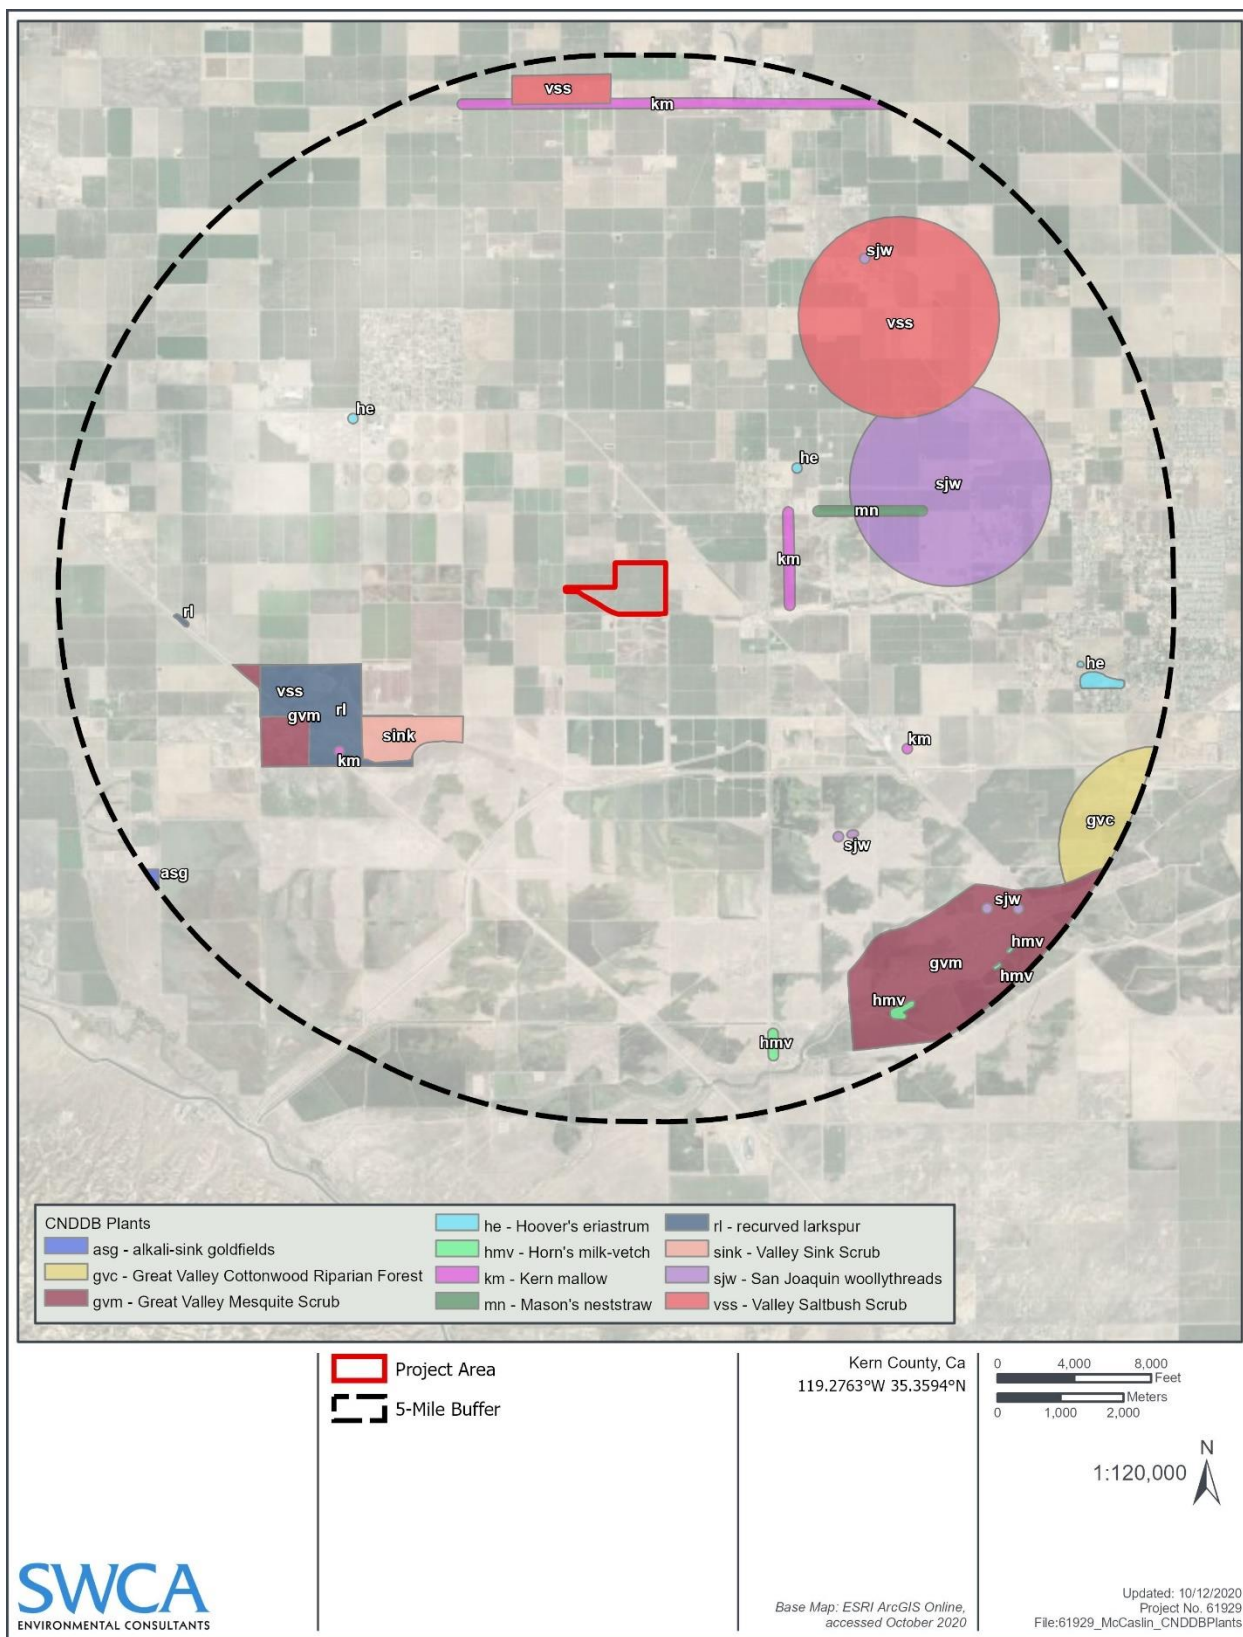

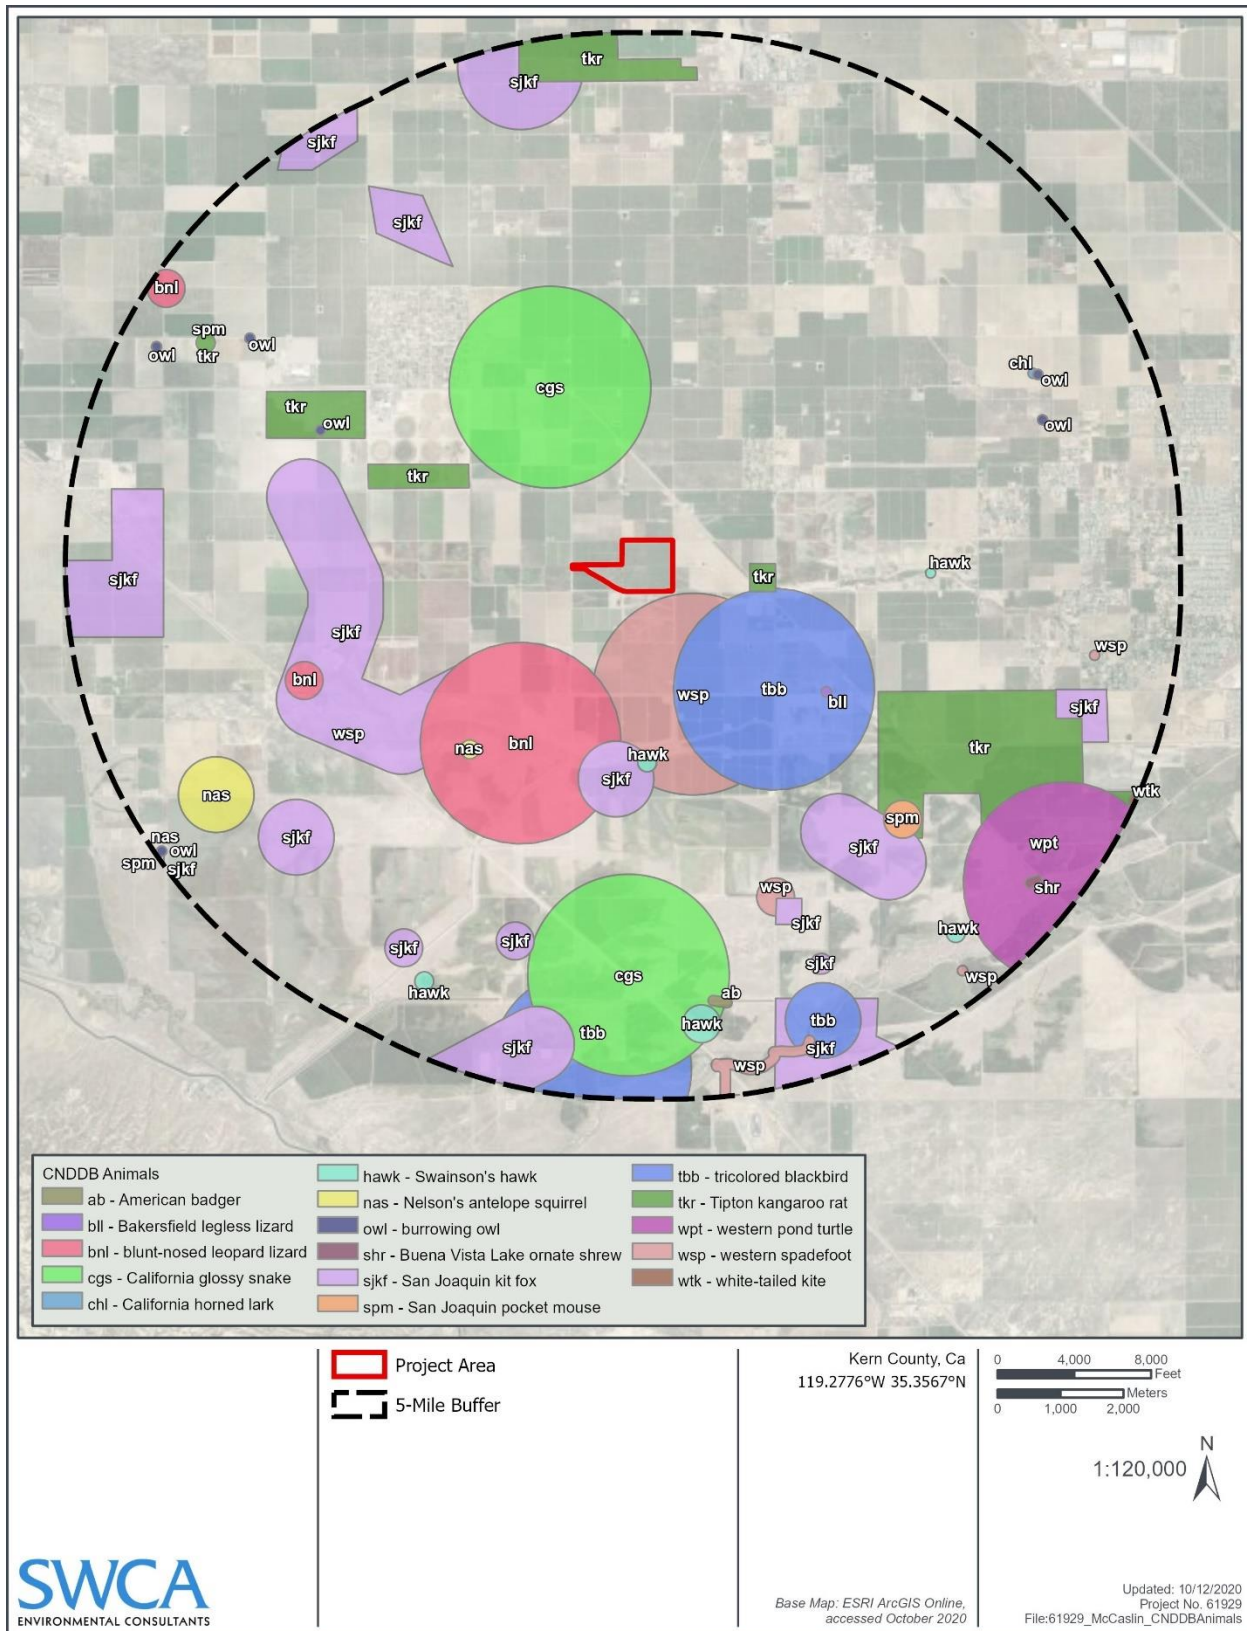

Figure 6. CNDDDB Animal Occurrences Map

Based on a 5-mile radius query of the CNDDDB a total of seven special-status plant species have been documented in the vicinity. Because the list of special-status plant species is considered regional, an analysis of the range and habitat preferences of the listed species was conducted to identify which species have the potential to occur in or near the BSA. The evaluation considered the existing conditions, elevation, and soils within the BSA. As a result of the best information available and the analysis conducted by SWCA, it was determined that no suitable habitat is present for the following 5 special-status plant species (shaded in grey within Table 4). Species outside of the 5-mile radius were not evaluated further because the BSA is located outside of their known geographic ranges and considered unlikely to occur.

- Horn's milk-vetch (*Astragalus hornii* var. *hornii*)
- recurved larkspur (*Delphinium recurvatum*)
- Kern mallow (*Eremalche kernensis*)
- Hoover's eriastrum (*Eriastrum hooveri*)
- Alkali-sink goldfields (*Lasthenia chrysantha*)
- San Joaquin woollythreads (*Monolopia congdonii*)
- Mason's neststraw (*Stylocline masonii*)

Although the surveys conducted within the BSA were not conducted within the appropriate blooming period for these species the BSA provides no habitat conditions for these species to occur as the impact area is entirely within active orchard fields and areas surrounding the orchard are frequently disturbed by typical agriculture practices. None of the above-mentioned species, or any other sensitive plant species, was observed. No further background or impact analysis of these species is provided within this report.

2.3.3 Special-Status Animal Species

For the purposes of this section, special-status or "sensitive" animal species are defined as the following:

- Animals listed or proposed for listing as threatened or endangered (including delisted species) under the ESA (50 CFR 17.11 for listed animals and various notices in the Federal Register for proposed species).
- Animals that are candidates for possible future listing as threatened or endangered under the ESA.
- Animals that meet the definitions of rare or endangered species under CEQA (State CEQA Guidelines, Section 15380).
- Animals listed or proposed for listing by the State of California as threatened and endangered under the CESA (14 CCR 670.5).
- Animal species that are fully protected in California (California Fish and Game Code, Section 3511 [birds], Section 4700 [mammals], Section 5050 [reptiles and amphibians], and Section 5515 [fish]).
- Birds protected by the MBTA, the Bald and Golden Eagle Protection Act, and/or California Fish and Game Code Section 3503.
- California Species of Special Concern to CDFW (Jennings and Hayes 1994 for amphibians and reptiles; Shuford and Gardali 2008 for birds; Williams 1986 for mammals).
- Other animal species considered USFWS Birds of Conservation Concern, on the CDFW Watch List, or otherwise included in the CDFW Special Animals List (CDFW 2009).

Based on the CNDDB, a total of 16 special-status animal species have been documented in the Project vicinity (CNDDB 2020). Because the list of special-status animal species is considered regional, an analysis of the range and habitat preferences of those species was conducted to identify which sensitive animal species have the potential to occur in or near the Project site. As a result of the best information available and the analysis conducted by SWCA, it was determined that the following 6 special-status animal taxa may occur within the BSA, including nesting migratory birds:

- burrowing owl (*Athene cunicularia*)
- Swainson's hawk (*Buteo swainsoni*)
- White-tailed kite (*Elanus leucurus*)
- western pond turtle (*Emys marmorata*)
- American badger (*Taxidea taxus*)
- San Joaquin kit fox (*Vulpes macrotis mutica*)

Table 1. Natural Communities Evaluated for Potential Occurrence

Common Name	General Habitat Description	Habitat Present/ Absent	Rationale
Valley Sink Scrub	Occurs on sandy to loamy soils and alluvial fans of southern San Joaquin Valley and Carrizo Plains. Dominated by cattle spinach (<i>Atriplex polycarpa</i>).	A	No Potential to Occur: The BSA does not support valley sink scrub (i.e., areas dominated by cattle saltbush).
Valley Saltbush Scrub	Occurs on sandy to loamy soils in the southern and southwestern San Joaquin Valley and the Carrizo Plains of San Luis Obispo County. An open habitat with 10%–40% relative cover with a low growing herbaceous understory. Dominant species include cattle spinach, spiny saltbush (<i>Atriplex spinifera</i>), and arrowscale (<i>Atriplex phyllostegia</i>). Habitat extirpated from within its range due to agriculture conversion, groundwater pumping and flood control activities.	A	No Potential to Occur: The BSA does not support valley saltbush scrub (i.e., areas dominated by cattle spinach or spiny saltbush).
Valley Sacaton Grassland	A poorly drained and tussock forming grassland community dominated by valley sacaton (<i>Sporobolus airoides</i>) and saltgrass (<i>Distichlis spicata</i>). This plant community has been reduced along its range in the Tulare Lake Basin and along the San Joaquin Valley.	A	No Potential to Occur: The BSA does not support valley sacaton grassland (i.e., areas dominated by valley sacaton and saltgrass).
Great Valley Cottonwood Riparian Forest	Great Valley Cottonwood riparian plant community. Occurs along streams and tributaries of the Great Valley, at 15–2,000 meters AMSL.	A	No Potential to Occur: Though some Fremont cottonwood (<i>Populus fremontii</i>) individuals occur within the BSA within the Goose lake canal, a community dominated by cottonwoods was not observed during surveys.
Great Valley Mesquite Scrub	Great Valley Mesquite Scrub plant community occurs within the Sacramento and San Joaquin Valleys at elevations of 15–1,500 meters AMSL.	A	No Potential to Occur: The BSA does not support Great Valley Mesquite Scrub.

Table 2. Special-Status Plant Species Evaluated for Potential Occurrence within a 5-mile radius

Common Name	Scientific Name	Status Federal/State/CNP S	General Habitat Description	Habitat Present/Absent	Rationale
Horn's milk-vetch	<i>Astragalus hornii</i> var. <i>hornii</i>	–/–/1B.1	Annual herb that occurs in alkali playa, meadows, seeps and wetlands. Typically at elevations of 15–300 meters AMSL. Blooming period: May–June.	A	Suitable Conditions Absent / Species Absent: Suitable habitat for this species was not observed in the BSA.
recurved larkspur	<i>Delphinium recurvatum</i>	–/–/1B.2	Chenopod scrub, cismontane woodland, and valley and foothill grassland. Elevation: 3–790 meters AMSL. Blooming period: March–June.	A	Suitable Conditions Present / Species Absent: Suitable habitat for this species was not observed in the BSA.
Kern mallow	<i>Eremalche kernensis</i>	FE	Annual herb that occurs in chenopod scrub and valley and foothill grassland. Elevation: 70–1,290 meters AMSL. Blooming period: March–May.	A	Suitable Conditions Present / Species Absent: Suitable habitat for this species was not observed in the BSA.
Hoover's eriastrum	<i>Eriastrum hooveri</i>	DL/–/4.2	Annual herb belonging to the phlox family that occurs in chenopod scrub, pinyon and juniper woodland, and valley and foothill grassland 50–915 meters AMSL. Blooming period: March–July.	A	Suitable Conditions Present / Species Absent: Suitable habitat for this species was not observed in the BSA.
Alkali-sink goldfields	<i>Lasthenia chrysantha</i>	–/–/1B.1	Marshes and swamps (coastal salt), playas and vernal pools. Elevation: 1–1,220 meters AMSL. Blooming period: February–June	A	Suitable Conditions Absent / Species Absent: Suitable habitat for this species was not observed in the BSA.
San Joaquin woollythreads	<i>Monolopia congdonii</i>	FE	Annual herb found in chenopod scrub and valley and foothill grassland habitat in sandy soils. Elevation: 60–800 meters AMSL. Blooming period: February–May.	A	Suitable Conditions Present / Species Absent: Suitable habitat for this species was not observed in the BSA.
Mason's neststraw	<i>Stylocline masonii</i>	–/–/1B.1	An annual herb that occurs in clay soil among chenopod scrub, coastal scrub and valley and foothill grassland. Elevation: 50–400 meters AMSL. Blooming period: March–April.	A	Suitable Conditions Absent / Species Absent: Suitable habitat for this species was not observed in the BSA.

Table 2. Special-Status Plant Species Evaluated for Potential Occurrence within a 5-mile radius

Common Name	Scientific Name	Status Federal/ State/CNP S	General Habitat Description	Habitat Present/ Absent	Rationale
--------------------	------------------------	--	------------------------------------	--	------------------

General References: CNDDDB RareFind 5, 5-mile radius search from BSA, accessed October 12, 2020.

Absent (A) – no habitat present and no further work needed. Habitat Present (HP) – habitat is, or may be present. The species may be present.

Present (P) – the species is present. Critical Habitat (CH) – project footprint is located within a designated critical habitat unit, but does not necessarily mean that appropriate habitat is present.

Status Codes: No Status (--); Federal Endangered (FE); Federal Threatened (FT); Federal Proposed (FP); Federal Proposed Endangered (FPE); Federal Proposed Threatened (FPT); State Endangered (SE); State Threatened (ST); State Rare (SR); California Native Plant Society (CNPS): Rare, threatened, or endangered in California and elsewhere (Rank 1B); Rare, threatened, or endangered in California, but more common elsewhere (Rank 2); Plants that about which more information is needed (Rank 3); A watch list plant of limited distribution (Rank 4); Threat Code: Seriously endangered I California (over 80% of occurrences threatened / high degree and immediacy of threat) (.1); Fairly endangered in California (20-80% occurrences threatened) (.2); Not very endangered I California (<20% of occurrences threatened or no current threats known) (.3).

Table 3. Special-Status Animal Species Evaluated for Potential Occurrence

Common Name	Scientific Name	Status Federal/ State/Other	General Habitat Description	Habitat Present/ Absent	Rationale
Amphibians					
western spadefoot	<i>Spea hammondi</i>	–/–/SSC	Prefers open areas with sandy or gravelly soils, in a variety of habitats including mixed woodlands, grasslands, coastal sage scrub, chaparral, sandy washes, lowlands, river floodplains, alluvial fans, playas, alkali flats, foothills, and mountains.	A	Suitable Conditions Absent / Species Absent: Suitable habitat and breeding areas were not observed.
Reptiles					
blunt-nosed leopard lizard	<i>Gambelia sila</i>	FE/SE/FP	Endemic to the San Joaquin Valley of central California. Inhabits open, sparsely vegetated areas of low relief on the San Joaquin Valley floor and in the surrounding foothills. Found in non-native grassland and Valley Sink Scrub communities. Also occurs in valley needlegrass grassland, alkali playa, and <i>Atriplex</i> grassland.	A	Suitable Conditions Absent / Species Absent: Protocol surveys were not deemed necessary as there is no suitable habitat within the BSA.
western pond turtle	<i>Emys marmorata</i>	–/–/SSC	Aquatic species occurs in wetlands, marshland, swamps, artificial flowing waters, standing and flowing waters from the Sacramento/San Joaquin Valleys, flowing and standing waters on the Klamath north coast and standing and flowing waters on the south coast.	P	Suitable Conditions Present / Very Low Potential to Occur: The immediate Project area does not contain suitable aquatic habitat for this species; however, during estivation, this species may travel up to 1,000 feet from an aquatic habitat and burrow. There is a possibility this species could occur within Goose Lake Channel but it is unlikely as there may not be sufficient standing water during periods of the year.
California glossy snake	<i>Arizona elegans occidentalis</i>	–/–/SSC	Nocturnal snake that inhabits arid scrub, rocky washes, grasslands, chaparral.	A	Suitable Conditions Present / Potential to Occur: No suitable habitat is present within the BSA and it is unlikely that the species would forage within the BSA.

Table 3. Special-Status Animal Species Evaluated for Potential Occurrence

Common Name	Scientific Name	Status Federal/ State/Other	General Habitat Description	Habitat Present/ Absent	Rationale
Birds					
Swainson's hawk (nesting)	<i>Buteo swainsoni</i>	–/ST/–	Swainson's hawks are known to occur throughout the Central Valley primarily along riparian systems. They most often nest in riparian areas in large trees but also will utilize lone trees and isolated cottonwood stands. Valley oak, Fremont cottonwood, walnut, and large willow are most often the trees used for nesting.	P	Suitable Conditions Present / Species Absent: The BSA provides no foraging habitat for this species. Isolated riparian areas immediately south of the Project site within Goose Lake Channel may provide suitable nesting habitat in the future, but no nests were identified during the July 2020 survey. It is very unlikely the species would nest within the active almond orchard fields.
white-tailed kite (nesting)	<i>Elanus leucurus</i>	–/–/FP	Kites inhabit fairly open country typically in cismontane woodland, riparian woodland, marshes, wetlands, valley and foothill grasslands and coastal scrub. Hovers above ground to hunt prey.	A	Suitable Conditions Absent / Species Absent: Suitable habitat necessary to support this species was not observed within the Project area. The species was also not observed during any of the field surveys conducted at the Project site. It is possible the species could occur over the Project site as an infrequent forager.
western burrowing owl (burrowing sites and some wintering sites)	<i>Athene cunicularia</i>	–/–/SSC	Open, dry grasslands, deserts, and scrublands. Subterranean nester, dependent upon burrowing mammals.	A	Suitable Conditions Absent / Species Absent: Suitable habitat necessary to support this species was not observed within the Project site.
California horned lark	<i>Eremophila alpestris actia</i>	–/–/WL	Inhabits marine intertidal splash zone communities, meadows, and seeps.	A	Suitable Conditions Absent / Species Absent: Suitable habitat necessary to support this species was not observed within the Project area. The species was also not observed during any of the field surveys conducted at the Project site.

Table 3. Special-Status Animal Species Evaluated for Potential Occurrence

Common Name	Scientific Name	Status Federal/State/Other	General Habitat Description	Habitat Present/Absent	Rationale
tricolored blackbird (nesting colony)	<i>Agelaius tricolor</i>	–/SC/SSC	Occurs in non-native vegetation in open cultivated lands and pastures as well as marshes. Requires freshwater marshes with cattails, tule, bulrushes, and sedges for breeding habitat.	A	Suitable Conditions Absent / Species Absent: Suitable habitat necessary to support this species was not observed within the Project area. The species was also not observed during the field survey conducted at the Project site.
Mammals					
Tipton kangaroo rat	<i>Dipodomys nitratoides nitratoides</i>	FE/SE/–	Inhabits saltbush scrub and sink scrub communities in the Tulare Lake basin of the southern San Joaquin Valley. Also occurs in terrace grasslands lacking woody shrubs. Needs soft friable soils that escape seasonal flooding. Digs burrows in elevated soil mounds at bases of shrubs.	A	Suitable Conditions Absent / Species Absent: Protocol-level surveys for kangaroo rats were not necessary as there is no evidence of small mammal burrows or suitable habitat within the BSA.
Buena Vista Lake ornate shrew	<i>Sorex ornatus relictus</i>	FE/–/SSC	Inhabits marshlands and riparian areas in the Tulare Lake basin. Uses stumps and logs for cover.	A	Suitable Conditions Absent / Species Absent: Camera trapping surveys were not necessary for this species as there is no suitable habitat within the Project site.
San Joaquin kit fox	<i>Vulpes macrotis mutica</i>	FE/ST/–	Inhabits annual grasslands or grassy open stages with scattered shrubs; needs friable sandy soils for burrowing, and suitable prey base.	P	Suitable Conditions Present / Potential to Occur: Marginally suitable foraging habitat is present within the agricultural and ruderal land within the Project site and adjacent areas. Due to the transitory nature of this species and the presence of marginally suitable habitat, there is a potential that this species may cross the Project site.

Table 3. Special-Status Animal Species Evaluated for Potential Occurrence

Common Name	Scientific Name	Status Federal/ State/Other	General Habitat Description	Habitat Present/ Absent	Rationale
Nelson's antelope squirrel	<i>Ammospermophilus nelsoni</i>	–/ST/–	Found in Western San Joaquin Valley from 200 to 1,200 feet AMSL on dry sparsely vegetated loam soils. Needs widely scattered shrubs, forbs, and grasses in broken terrain with gullies and washes. Digs burrows or use kangaroo rat burrows.	A	Suitable Conditions Absent / Species Absent: The Project site does not support any significant chenopod vegetation directly within the Project site although such habitat does exist on adjacent properties. The species was not identified during any of the field surveys conducted at the Project site.
San Joaquin pocket mouse	<i>Perognathus inornatus</i>	–/–/SA	Inhabits cismontane woodland, Mojavean desert scrub, and valley and foothill grassland	A	Suitable Conditions Absent / Species Absent: The Project site does not support any significant chenopod vegetation directly within the Project site although such habitat does exist in adjacent properties.
American badger	<i>Taxidea taxus</i>	–/–/SSC	Occurs in open stages of shrub, forest, and herbaceous habitats; needs uncultivated ground with friable soils.	A	Suitable Conditions Absent / Species Absent: The Project site does not support a large enough prey base for American badger. Ground squirrels are managed as part of standard agricultural practices.

General References: CNDDDB RareFind 5, 5-mile radius search from BSA, accessed October 12, 2020.

Absent (A) – no habitat present and no further work needed. Habitat Present (HP) – habitat is, or may be present. The species may be present.

Present (P) – the species is present. Critical Habitat (CH) – project footprint is located within a designated critical habitat unit, but does not necessarily mean that appropriate habitat is present.

Status Codes: No status (–); Federal Endangered (FE); Federal Threatened (FT); Federal Proposed (FP); Federal Proposed Endangered (FPE); Federal Proposed Threatened (FPT); Federal Critical Habitat (FCH); Proposed Federal Critical Habitat (PCH); Bald and Golden Eagle Protection Act (BGEPA); Migratory Bird Treaty Act (MBTA); Marine Mammal Protection Act (MMPA); State Fully Protected Species (FP); State Endangered (SE); State Candidate (SC); State Threatened (ST); State Candidate Threatened (SCT); California Fish and Game Code §3503 and §3503.5 (§); CDFW California Special Concern Species (SSC); Not formally listed but included in CDFW “Special Animal” List (SA); Not formally listed but included in CDFW “Watch List” (WL).

Page Intentionally Left Blank

3 IMPACT DISCUSSION AND RECOMMENDATIONS

The emphasis of this analysis is to identify sensitive biological resources that could be impacted by the proposed project, using a conservative approach assuming that direct impacts would be limited to the Project site, which includes the McCaslin property and the additional 80 acres to the north. The analysis also includes consideration to indirect impacts to raptor species within a 0.5-mile buffer from the Project site. The following analysis is intended to address the species questions provided within the Initial Study Checklist for projects subject to CEQA. The intent is for this analysis to be easily transferred to any future CEQA documentation, as needed.

3.1 Project Effect on Unique or Special-Status Species or their Habitats

Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

3.1.1 Plants

The surveys conducted within the BSA were not conducted within the appropriate blooming period for those special-status plant species that were considered. However, due to the frequent and long-term effects related to agricultural practices within the Project site, the BSA provides no suitable conditions for special-status plant species to occur. The Project site is frequently disturbed by grading activities, almond harvesting, herbicide application, etc. As currently proposed, the Project is expected to have no impact on sensitive plant species. No mitigation is necessary.

3.1.2 Wildlife

3.1.2.1 REPTILES

Western Pond Turtle

Western pond turtle was not identified within the Project area during any of the field surveys conducted in 2020; however, there is a very low potential that this species could occur in nearby water features and could utilize upland habitat to estivate during drought periods, or to lay a clutch of eggs. Western pond turtle may travel up to 1000 feet from their typical aquatic habitat to estivate. The following measures are recommended to avoid and minimize any potential impact to this species. These measures are intended to be inclusive of other sensitive species described in the following sections as well.

- BIO-1** Prior to construction, a qualified biologist will provide an environmental awareness training session to all personnel. At a minimum, the training will include: 1) an overview of the regulatory requirements for the Project; 2) descriptions of the special-status species in the Project area and the importance of these species and their habitats; 3) the general measures that are being implemented to minimize environmental impacts; and 4) the boundaries within which equipment and personnel would be allowed to work during construction.
- BIO-2** Prior to construction, a qualified biologist should conduct a pre-construction survey for the presence of sensitive species no earlier than 30 days before the start of construction.
- BIO-3** If sensitive species are observed within the Project site during construction or the pre-activity survey, the District will immediately contact the appropriate agency(ies) under

whose jurisdiction the discovery falls to determine how to proceed and avoid take to the maximum extent practical.

BIO-4 During the site-disturbance and/or construction phase, any contractor or employee that inadvertently kills or injures a special-status species, or who finds any such animal either dead, injured, or entrapped, will be required to report the incident immediately to the District. The District will then immediately notify the appropriate agency(ies) under whose jurisdiction the discovery falls to determine how to proceed and avoid take to the maximum extent practical.

Implementation of BIO-1 through BIO-4 will reduce potential impacts to special-status reptiles to a level that is less than significant.

3.1.2.2 MAMMALS

San Joaquin Kit Fox

Although evidence of SJKF was not identified within the BSA, the presence of this species is inferred as the species is known to occur in the area and is highly mobile. SJKF have been identified approximately 2 miles to the south of the BSA based on the CNDDDB records. Potential direct impacts may occur because of construction equipment activities.

Impacts to these species would be avoided and minimized by implementation of recommendations BIO-1 through BIO-4 in addition to the following:

BIO-5 To prevent inadvertent entrapment of San Joaquin kit fox or other animals during the construction phase of a Project, all excavated, steep-walled holes or trenches more than 2 feet deep will be inspected and covered at the close of each working day by plywood or similar materials. If the trenches cannot be closed, one or more escape ramps constructed of earthen-fill or wooden planks will be installed. Before such holes or trenches are filled, they should be thoroughly inspected for trapped animals. If at any time a trapped or injured special-status species is discovered, the District will immediately contact the appropriate agency(ies) under whose jurisdiction the discovery falls to determine how to proceed and avoid take to the maximum extent practical.

BIO-6 During the site-disturbance and/or construction phase, all construction pipes, culverts, or similar structures or materials that contain a hole with a diameter of 3 inches or greater and that are stored at a construction site for one or more overnight periods will be thoroughly inspected for kit foxes and other special-status species before the pipe is subsequently buried, capped, or otherwise used or moved in any way. If a kit fox is discovered during this inspection, the pipe or culvert shall not be disturbed (other than to move it to a safe location if necessary) until after the kit fox has escaped.

BIO-7 Prior to, during, and after the site-disturbance and/or construction phase, use of pesticides or herbicides will be in compliance with all federal, state, and local regulations. This is necessary to minimize the probability of primary or secondary poisoning of endangered species utilizing adjacent habitats, and the depletion of prey upon which special-status species depend.

BIO-8 Any fencing installed during the project construction should meet the following specifications:

- a. If a wire strand/pole design is used, the lowest strand should be no closer to the ground than 12 inches.
- b. If a more solid wire mesh fence is used, 8 × 12-inch openings near the ground should be provided every 100 yards.

BIO-9 During construction, food related trash will be placed in enclosed containers and removed at the end of each work week. At the end of construction, all construction related trash and debris will be removed from the work site and properly disposed of.

Implementation of recommendations BIO-1 through BIO-9 will reduce potential impacts to San Joaquin kit fox to a level that is less than significant.

3.1.2.3 BIRDS

Swainson's Hawk

Protocol surveys for Swainson's hawk were not conducted as part of this study. Marginal habitat occurs within the Goose Lake Channel, and it is understood that the resource agencies have concerns that this species may nest within the active almond orchard. While there is no evidence of Swainson's hawk in this area, the species is highly migratory and there is a potential that nesting pairs in the future may occur in subsequent years prior to construction.

In addition to the implementation of recommendations BIO-1 and BIO-2, the following measure is recommended.

BIO-10 If during the pre-construction survey any active nests are discovered within 0.5 mile of the Project site, the District will coordinate with the appropriate agency(ies) to determine the appropriate construction setback distances. Construction-free buffers will be identified on the ground with flagging, fencing, or by other easily visible means, and will be maintained until the biologist has determined that the young have fledged.

Implementation of recommendations BIO-1, BIO-2 and BIO-10 will reduce potential impacts to Swainson's hawk to a level that is less than significant.

Burrowing Owl

Protocol surveys for burrowing owl were not conducted as part of this study; however, this species is known to occur in the area and may utilize the Project area or the surrounding habitat for denning purposes. No sign of this species was observed within the Project study area during the various field surveys that were conducted. Implementation of BIO-1 through BIO-4 will reduce potential impacts to bird species to a level that is less than significant.

Nesting Migratory Birds (Class Aves)

Project activities could have the potential to directly and/or indirectly impact a variety of nesting migratory bird species. Project activities, including vegetation removal, equipment use, and associated noise could impact nesting migratory birds and/or special-status bird species adjacent to the Project study area. No active nests were noted during surveys conducted in 2020. Implementation of recommendations BIO-1 through BIO-10 will reduce potential impacts to bird species to a level that is less than significant.

3.2 Project Effect on Extent, Diversity, or Quality of Native or other Important Vegetation

Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service?

Based on a query of the CNDDDB, a number of sensitive vegetative communities have been recorded within 5 miles of the proposed Project (see Table 3). None of these sensitive vegetative communities are present within the Project site. The project is expected to have no affect on these resources. Therefore, no additional measures are necessary.

3.3 Project Effect on Wetland or Riparian Habitat

Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means? (See Environmental Setting.)

A formal wetland delineation was not conducted as part of this study due to the lack of evidence of wetland features within the Project site, as defined by CWA Section 404. However, the Goose Lake Channel may be considered a federal and state jurisdictional feature. However, the hydrology of the channel is completely controlled through a weir that diverts water from the Kern River; thus, the channel is operated in a manner like irrigation canals that are not considered jurisdictional features. No avoidance and minimization measures are necessary.

3.4 Project Effect on Movement of Resident or Migratory Fish and Wildlife Species.

Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

The proposed Project would not have any effect on the movement of resident species within the channel. There are no migratory fish species within the Kern River. No avoidance and minimization measures are necessary.

3.5 Project Effect on Local Policies or Ordinances Protecting Biological Resources

Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance? (See Environmental Setting.)

The County General Plan (Kern County Planning Department 2007) includes the federal, state, and local statutes, ordinances, and policies that govern the conservation of biological resources that must be considered by the County during the environmental review process. The Land Use, Open Space, and Conservation Element of the Kern County General Plan provides for a variety of land uses that ensure future growth while simultaneously providing for the conservation of agricultural and natural resources. Section 1.10, "General Provisions," of the Element provides goals, policies, and implementation measures for discretionary projects.

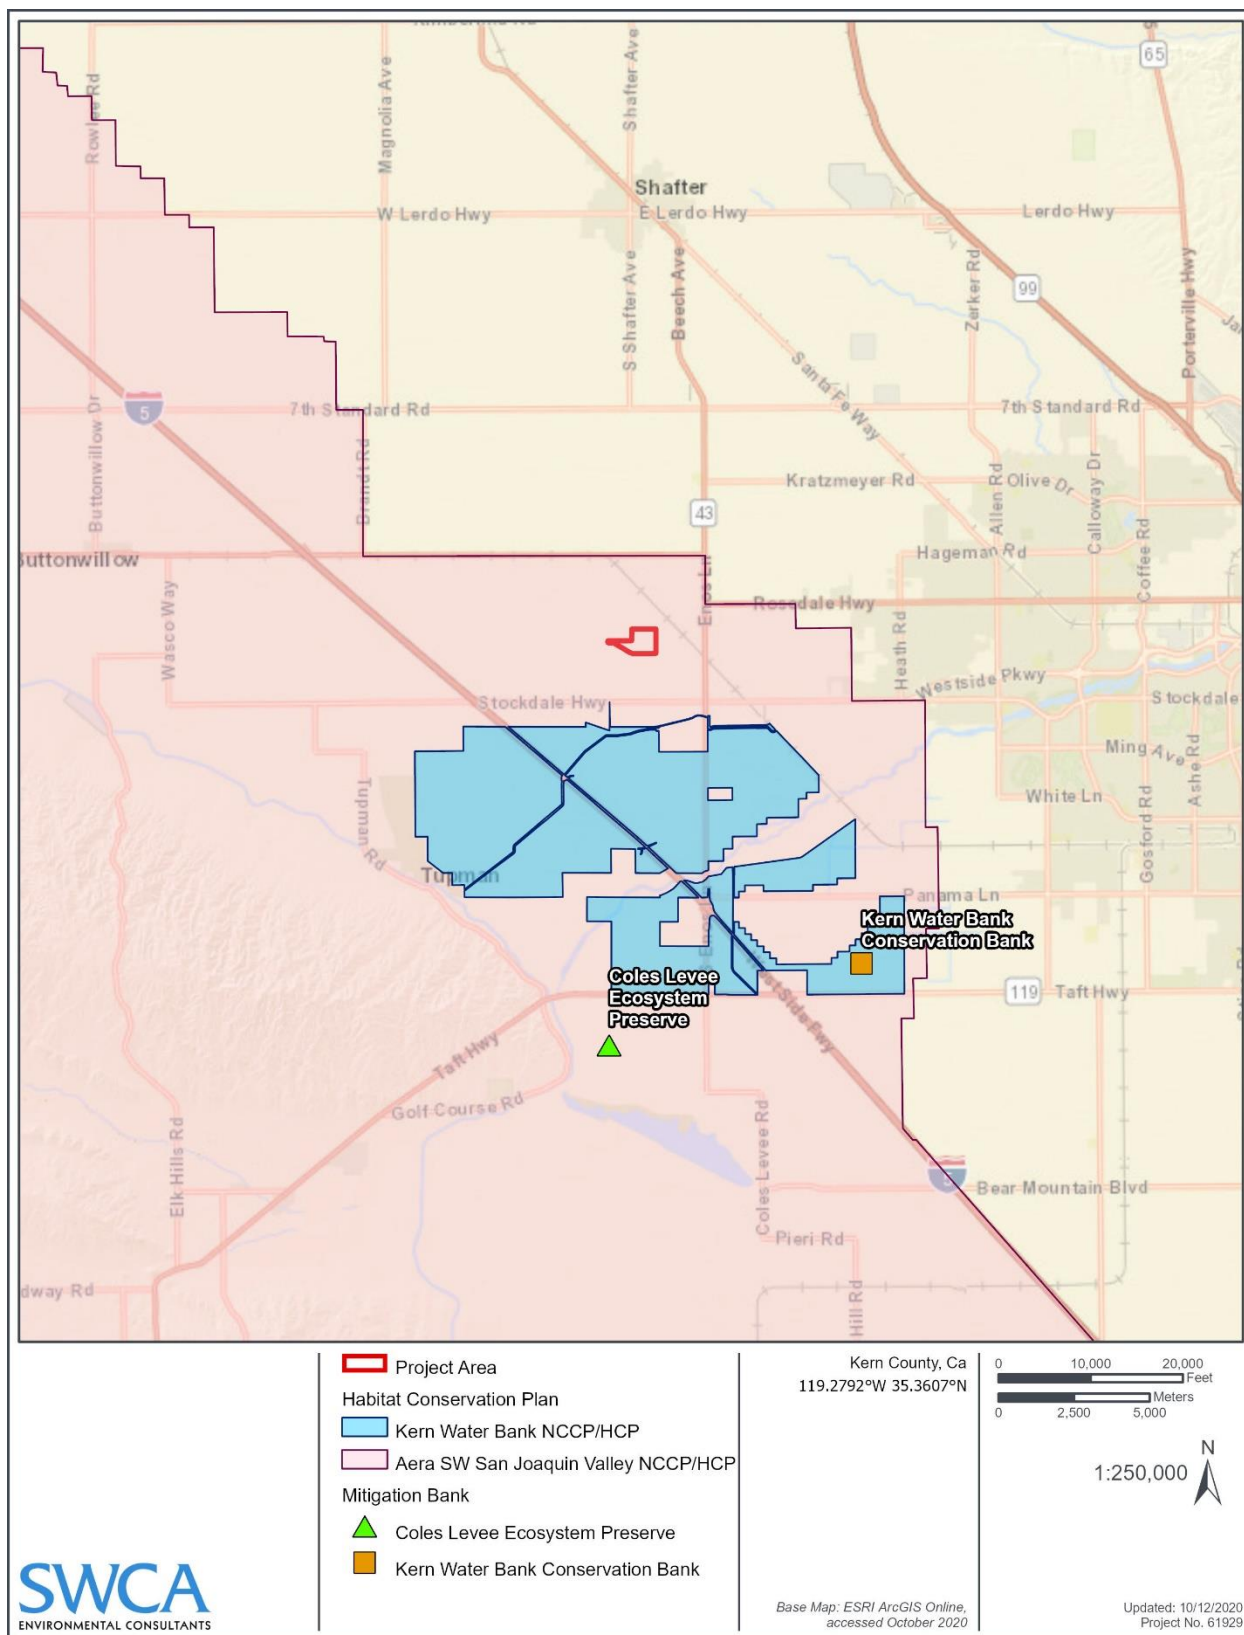

As currently proposed, the Project would not be in conflict with any of these General Provisions. No further measures are necessary.

3.6 Project Effect on Habitat Conservation Plan, Natural Community Conservation Plan or other approved local, regional, or state habitat conservation plan

Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan? (See Environmental Setting.)

The proposed Project is outside of the boundaries of any HCP/NCCP or other approved local, regional, or state habitat conservation plans. Figure 7 below depicts the location of the project site to known HCP/NCCP or other approved local, regional, or state habitat conservation plan areas. No additional mitigation is necessary.

Figure 7. Location of Nearby HCP/NCCP or Mitigation Banks

MANAGEMENT SUMMARY

An intensive Class III cultural resources inventory/Phase I survey was conducted for the Rosedale-Rio Bravo Water Storage District (RRBWSD) Groundwater Banking and Conveyance Improvement Project (Project), Kern County, California. This study was conducted by ASM Affiliates, Inc., with David S. Whitley, Ph.D., RPA, serving as principal investigator. Background studies and fieldwork for the survey were completed from June – July 2020. The study was undertaken to assist with the preparation of an environmental document consistent with the National Environmental Policy Act (NEPA) and with Section 106 of the National Historic Preservation Act (NHPA) of 1966, as amended (54 USC 306108; 36 CFR Part 800), and well as the California Environmental Quality Act (CEQA). The proposed project is designed to improve the efficiency of the RRBWSD through better management of surface water supplies in wet years by increasing recharge pond capacity, increasing water conveyance capacity, and improving measurement and management systems. The Project area is located within the RRBWSD service area, within and west of Bakersfield, Kern County, California. The APE for the project involved 4 separate locations for different Project components. The horizontal APE in total was 196.5-acres (ac) while the vertical APE was 10-feet (ft).

A records search of site files and maps was conducted at the Southern San Joaquin Valley Archaeological Information Center (AIC), California State University, Bakersfield, and a search of the Native American Heritage Commission (NAHC) *Sacred Lands File* was completed. These investigations determined that the study area had not been previously surveyed in its entirety and no sites or sacred lands were known within it. Two previously recorded historical resources, the Cross Valley Canal and the Goose Lake Slough/Rio Bravo Canal, had been recorded within the Project APE. Both resources had been previously determined not eligible for listing in the National Register of Historic Places (NRHP).

The Class III cultural resources inventory/Phase I survey fieldwork was conducted in July 2020. The two previously identified cultural resources were identified and their site record forms updated. No additional cultural resources were identified within the Project APE. Based on an evaluation of the two historical resources, they are recommended as not eligible for NRHP and California Register of Historical Resources (CRHR) listing.

1. INTRODUCTION AND REGULATORY CONTEXT

ASM Affiliates was retained by Rosedale-Rio Bravo Water Storage District (RRBWSD) to conduct an intensive Class III cultural resources inventory/Phase I survey for their proposed Groundwater Banking and Conveyance Improvement Project (Project), near Bakersfield, Kern County, California. The purpose of this investigation was to assist with compliance with Section 106 of the National Historic Preservation Act (NHPA) of 1966, as amended (54 USC 306108; 36 CFR Part 800), and with the California Environmental Quality Act (CEQA). The investigation was undertaken, specifically, to ensure that no significant adverse effects to historic properties or historical resources would occur as a result of the construction of this proposed project.

This current study included:

- A background records search and literature review to determine if any known archaeological sites were present in the proposed project areas and/or whether the project areas had been previously and systematically studied by archaeologists;
- A search of the NAHC *Sacred Lands File* to determine if any traditional cultural places or cultural landscapes have been identified within the project areas;
- An on-foot, intensive inventory of the study area to identify and record previously undiscovered cultural resources and to examine known sites; and
- A preliminary assessment of any such resources found within the project study areas.

This study was conducted by ASM Affiliates, Inc., of Tehachapi, California, from June to July 2020. David S. Whitley, Ph.D., RPA, served as principal investigator, with Shannon Davis, M.A., RPH, Architectural Historian. ASM Associate Archaeologist Robert Azpitarte, B.A., RPA, conducted the fieldwork, with assistance from ASM Assistant Archaeologists Maria Silva, B.A., Margarita Lemus, B.A., and Ross Way, B.A.

This manuscript constitutes a report on the Class III cultural resources inventory. Subsequent chapters provide background to the investigation, including historic context studies; the findings of the archival records search; a summary of the field surveying techniques employed; and the results of the fieldwork. We conclude with management recommendations for the Study Area.

1.1 PROJECT DESCRIPTION, LOCATION, AND AREA OF POTENTIAL EFFECT

The Groundwater Banking and Conveyance Improvement Project is designed to improve RRBWSD's overall system efficiency by better managing wet year water supplies and increasing the District's ability to capture and store high flow surface runoff within the Kern Fan groundwater basin. Funding for the project would be provided by a 2020 WaterSMART grant from the Bureau of Reclamation. The Project would involve constructing approximately 195-acres (ac) of recharge ponds, turnout and weir structures, and supervisory control and data acquisition (SCADA) system improvements, located in four separate areas of potential effect (APE; Figures 1, 2, and 3). Specifically, the Project consists of the following components:

- 1. McCaslin Recharge Ponds and Weir:** RRBWSD seeks to augment its recharge pond operations by constructing approximately 195-ac of direct recharge ponds. It will accomplish this by placing levees approximately 2 and 5-feet (ft) high within and around the property. It is estimated that as much as 15,000 acre-feet per year (afy) of recharge water will be conveyed during extreme wet years (every 2 in 10 years), with a long-term average of at least 2,970 afy. The water will be conveyed from pond to pond by way of 6 inter-basin check structures. Water will be supplied to the facility by the Goose Lake Slough via a newly constructed sluice gated intake and diversion weir (McCaslin Weir). Approximately 50 cubic feet per second (cfs) of intake capacity would be required to serve the McCaslin Recharge Ponds site.
- 2. Houghton Weir:** The Houghton Weir is undersized and is inadequate for current operations. RRBWSD seeks to replace and modernize the upstream Houghton Weir in order to deliver the required amount of water to the proposed McCaslin Recharge Ponds. The Houghton Weir currently consists of nine flashboard bays. RRBWSD seeks to replace them with three automated Langmann Gates equipped with a SCADA system which will run on solar powered batteries. These upgrades would provide the added capacity for the McCaslin Recharge Ponds and other recharge areas in the District. It is estimated that wet years would provide water supplies to the project 3 out of every 10 years. This would result in an average of 2,772 afy of additional stored groundwater.
- 3. Kern River and Cross Valley Canals, Flow (CVC) Measurement and SCADA Improvements:** RRBWSD currently only conducts daily field measurements, essentially running blind. This necessitates conservative management operations to minimize potential facility and property damages from overtopping the system. Adding SCADA systems at critical inflow points (Cross Valley Canal Turnout and Kern River Turnout) will allow operators and managers to access real-time data and better manage the water potential. RRBWSD proposes installing data loggers with cellular-based transmitters to an existing flow meter and/or new water level transducers to allow for web-based data access at the above-mentioned two key locations.

The Groundwater Banking and Conveyance Improvement Project is located on the open flats of the San Joaquin Valley, within and west of the City of Bakersfield, Kern County, California. The McCaslin Recharge Ponds and Weir APE is the largest of the four Project components. It is located approximately 5-miles (mi) west of the City of Bakersfield near the intersection of Highway 43 and Stockdale Highway, on the north side of the Goose Lake Channel. Active agricultural fields/orchards surround this Project component. Elevation at this west end of the Project is approximately 330-ft above mean sea level (amsl). The Houghton Weir APE, also on the Goose Lake Channel, is within the suburban expanse of the City of Bakersfield, near the Westside Parkway at approximately 358-ft amsl. The SCADA improvements at the Kern River and CVC turn-outs are both further east, within the City of Bakersfield, at approximately 380-ft amsl. They are located near the junction of the Kern River, Goose Lake Channel, and Cross Valley Canal.

The Bureau of Reclamation, *Directives and Standards*, Appendix B (LND 02-01, p. B21) defines an APE as: “the geographic area(s) within which an undertaking may directly or indirectly cause changes in the character or use of historic properties, is any such properties exist.” The Bureau’s

Mid-Pacific Region, General Scope of work for Cultural Resources Investigations in California (2012, unpaginated) requires: “cultural resources inventories of the entire APE scaled appropriately to the individual project circumstances.” Based on consultation with Bureau staff, and with the exception of the McCaslin Recharge Ponds, the Project study area for this cultural resources inventory consists of the APE and buffers adequate to cover any construction and maintenance activities, or minor changes in the plans for such facilities, related to the building and operation of the Project and its component features. These are as follows:

McCaslin Recharge Ponds and Weir: The horizontal APE for the McCaslin Recharge Ponds is approximately 195-ac. This includes the recharge ponds and all construction staging, work and access areas.

Houghton Weir: Horizontal APE 50-meter (m) in diameter, or approximately 0.5-ac.

Kern River Canal Turn-out: Horizontal APE 50-m in diameter, or approximately 0.5-ac.

Cross Valley Canal turn-out: Horizontal APE 50-m in diameter, or approximately 0.5-ac.

The total horizontal APE is approximately 196.5-ac.

The vertical APE, consisting of the maximum depth of ground surface disturbance for the McCaslin Recharge Ponds and weir, is 10-ft, the maximum depth of excavation.

1.2 REGULATORY CONTEXT

1.2.1 National Historic Preservation Act

The NHPA of 1966, as amended (54 United States Code 306108), is the primary federal legislation that outlines the federal government’s responsibility to consider the effects of its actions on historic properties and affords the Advisory Council on Historic Preservation a reasonable opportunity to comment. Section 106 of the NHPA and its implementing regulations at 36 CFR Part 800 describes the process that the federal agency shall take to identify cultural resources and assess the level of effect that the proposed undertaking will have on historic properties. An undertaking is defined as a “...project, activity or program funded in whole or in part, under the direct or indirect jurisdiction of a federal agency.” This includes projects that are carried out by, or on behalf of, the agency; those carried out with federal assistance; those requiring a federal permit, license, or approval; and those subject to state or local regulation administered pursuant to a delegation, or approval by, a federal agency (54 U.S.C. 306108).

A cultural resource is a broad term that includes prehistoric, historic, architectural, and traditional cultural properties. Those cultural resources that are listed on, or are eligible for inclusion in, the National Register of Historic Places (NRHP) are referred to as historic properties. The criteria for NRHP eligibility are outlined at 36 CFR Part 60. Other applicable federal cultural resources laws and regulations that could apply include, but are not limited to, the Native American Graves Protection and Repatriation Act (NAGPRA), and the Archaeological Resources Protection Act (ARPA).

Compliance with Section 106 of the NHPA (36 CFR Part 800) follows a series of steps that are designed to identify and consult with interested parties, determine the APE, determine if historic properties are present within the APE, and assess the effects the undertaking will have on historic properties. Section 106 requires consultation with Indian Tribes concerning the identification of sites of religious or cultural significance and with individuals or groups who are entitled, or requested, to be consulting parties. The regulations at 36 CFR Part 800.5 require federal agencies to apply the criteria of adverse effect to the historic properties identified within the APE. The criteria of adverse effect, defined at 36 CFR Part 800.5(a)(1), states that:

“An adverse effect is found when an undertaking may alter, directly or indirectly, any of the characteristics of a historic property that qualify the property for inclusion in the National Register in a manner that would diminish the integrity of the property’s location, design, setting, materials, workmanship, feeling, or association.”

The 36 CFR Part 800 regulations include consultation with the State Historic Preservation Officer (SHPO) to provide an opportunity to comment on, and concur with, the Reclamations’ determinations. If the undertaking would result in adverse effects to historic properties, these adverse effects must be resolved in consultation with the SHPO and other parties identified during the Section 106 process before the undertaking can proceed to implementation.

1.2.2 National Register Criteria for Evaluation

The criteria for evaluation of NRHP eligibility are outlined at 36 CFR Part 60.4. A district, site, building, structure, or object must generally be at least 50 years old to be eligible for consideration as a historic property. That district, site, building, structure, or object must retain integrity of location, design, setting, materials, workmanship, feelings, and association as well as meet one of the following criteria to demonstrate its significance in American history, architecture, archeology, engineering, and culture. A district, site, building, structure, or object must:

(A) be associated with events that have made a significant contribution to the broad patterns of history; or

(B) be associated with the lives of people significant in our past; or

(C) embody the distinct characteristics of a type, period, or method of construction, or represent the work of a master, or possess high artistic values, or represent a significant and distinguishable entity whose components may lack individual distinction; or

(D) have yielded, or may be likely to yield, information important in prehistory or history.

A site must have integrity and meet one of the four criteria of eligibility to demonstrate its historic associations in order to convey its significance. A property must be associated with one or more events important in the history or prehistory in order to be considered for listing under Criterion

A. Additionally, the specific association of the property, itself, must also be considered significant. Criterion B applies to properties associated with individuals whose specific contributions to the history can be identified and documented. Properties significant for their physical design or construction under Criterion C must have features with characteristics that exemplify such elements as architecture, landscape architecture, engineering, and artwork. Criterion D most commonly applies to properties that have the potential to answer, in whole or in part, important research questions about human history that can only be answered by the actual physical materials of cultural resources. A property eligible under Criterion D must demonstrate the potential to contain information relevant to the prehistory and history (National Register Bulletin 15).

A district, site, building, structure, or object may also be eligible for consideration as a historic property if that property meets the criteria considerations for properties generally less than 50 years old, in addition to possessing integrity and meeting the criteria for evaluation.

1.2.3 California Environmental Quality Act

CEQA is applicable to discretionary actions by state or local lead agencies. Under CEQA, lead agencies must analyze impacts to cultural resources. Significant impacts under CEQA occur when “historically significant” or “unique” cultural resources are adversely impacted, which occurs when such resources could be altered or destroyed through project implementation. Historically significant cultural resources are defined by eligibility for or by listing in the CRHR. In practice, the federal NRHP criteria for significance applied under Section 106 are generally (although not entirely) consistent with CRHR criteria (see PRC § 5024.1, Title 14 CCR, Section 4852 and § 15064.5(a)(3)).

Significant cultural resources are those archaeological resources and historical properties that:

- (A) Are associated with events that have made a significant contribution to the broad patterns of California’s history and cultural heritage;
- (B) Are associated with the lives of persons important in our past;
- (C) Embody the distinctive characteristics of a type, period, region, or method of construction, or represent the work of an important creative individual, or possess high artistic values; or
- (D) Have yielded, or may be likely to yield, information important in prehistory or history.

Unique resources under CEQA, in slight contrast, are those that represent:

an archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets any of the following criteria:

- (1) Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
- (2) Has a special and particular quality such as being the oldest of its type or the best available example of its type.

- (3) Is directly associated with a scientifically recognized important prehistoric or historic event or person (PRC § 21083.2(g)).

Preservation in place is the preferred approach under CEQA to mitigating adverse impacts to significant or unique cultural resources.

Figure 1. RRBWSD Groundwater Banking and Conveyance Improvement Project, Kern County, California.

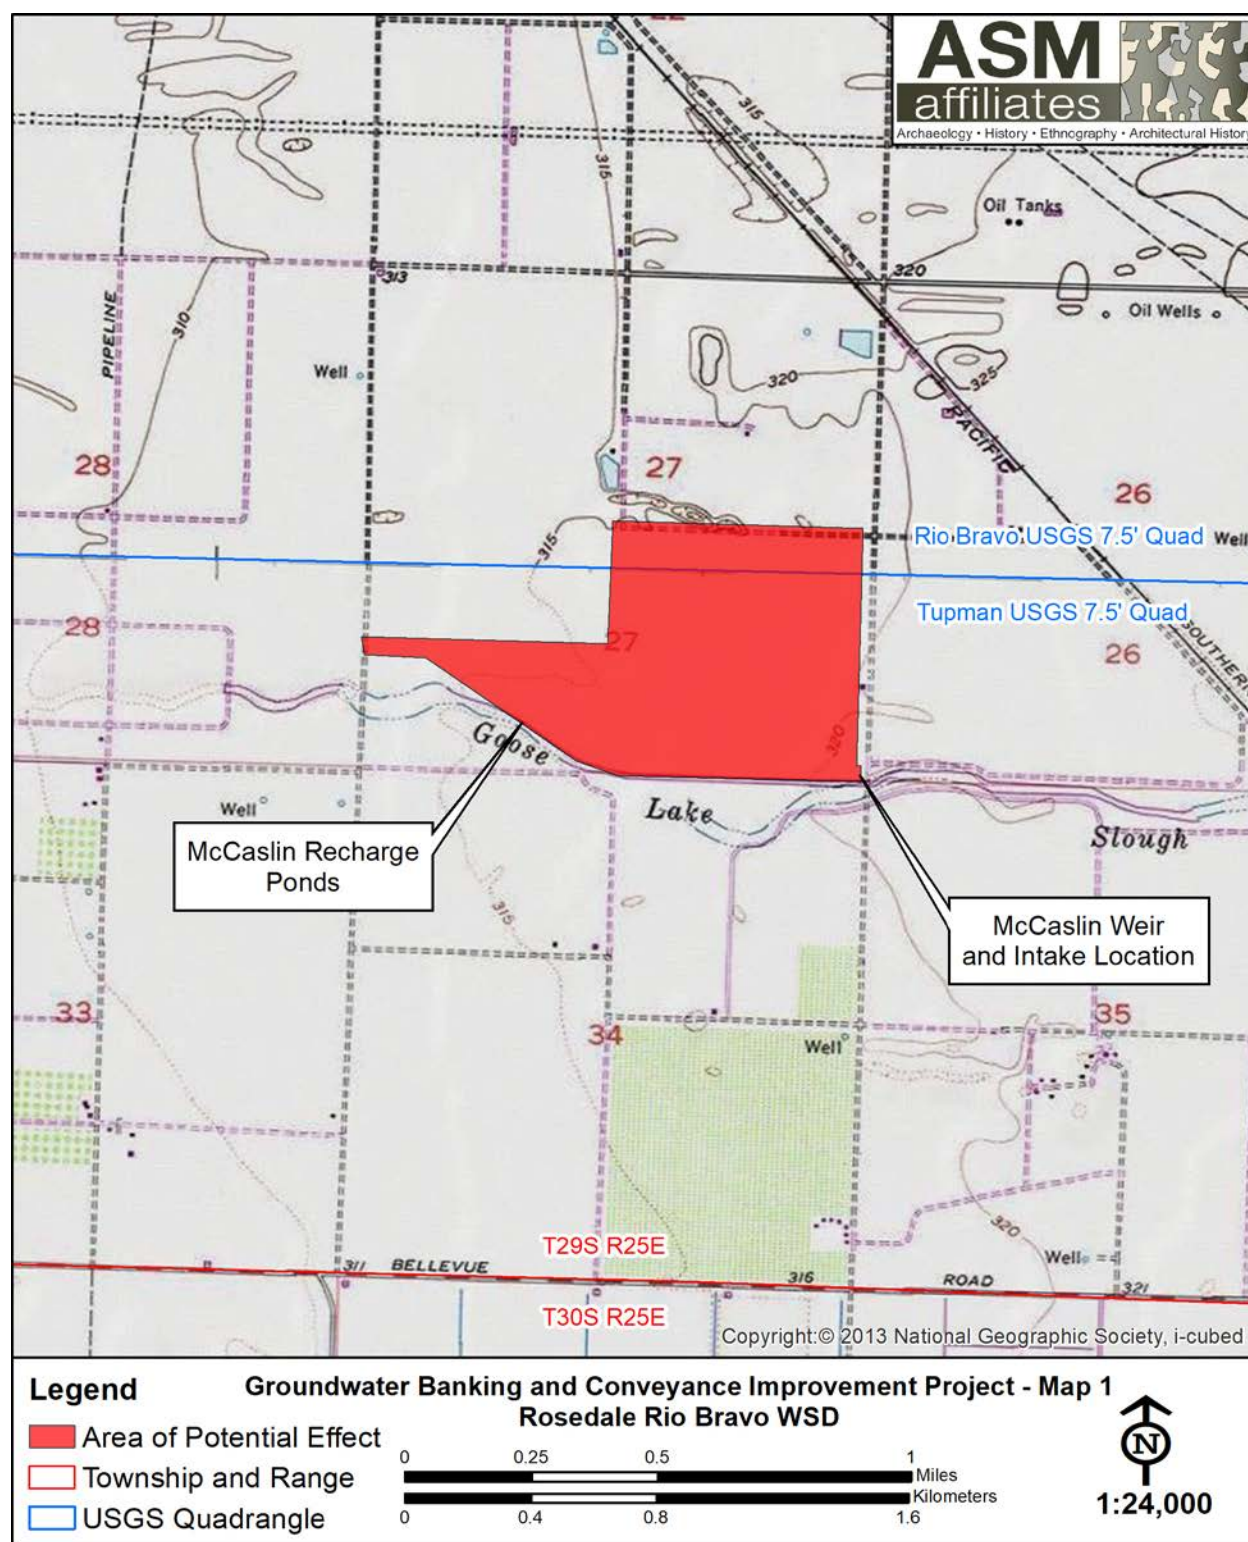

Figure 2. RRBWSD Groundwater Banking and Conveyance Improvement Project, western components.

2. ENVIRONMENTAL AND CULTURAL BACKGROUND

2.1 ENVIRONMENTAL BACKGROUND

The Groundwater Banking and Conveyance Improvement Project is located on the open flats of the San Joaquin Valley. Currently it may be characterized as a dry open valley bottom, but it is within the historical Kern River Delta, with the current (post-1868) Kern River channel a short distance to the south. Prior to reclamation and channelization, the region would have been a low lying, water rich area characterized by sloughs, marshes and swamps. Occasionally inundated by floodwaters, in most years the region would have been a swamp during the winter rainy season and marsh land during other parts of the year.

Historical and recent land-use has changed the vegetation that was once present within and near the project area, which now consists of orchards and agricultural fields (Figure 4a – 4d). Riparian Woodlands were likely present along Goose Lake Slough, which was channelized with the construction of the Isabella Reservoir and the Cross Valley Canal, and now operates as a controlled groundwater conveyance facility. Although the project area may have included the Valley Grassland community, depending upon drainage and seasonal storm systems, freshwater marshes are more likely to have been present (see Schoenherr 1992).

Figure 4b. McCaslin weir and intake area, looking north.

Figure 4c Houghton Weir, looking southwest.

Figure 4d. Kern River and Cross Valley Canal intake improvements area, looking west.

2.2 GEOARCHAEOLOGICAL BACKGROUND

The study area, adjacent to the Goose Lake Slough and the Kern River, is located within the Kern River Delta, historically a marsh/swamp that experienced periodic but significant flooding. Notably, Bakersfield was originally called “Kern Island” because of its seasonal flooding and location within this web of marshes and sloughs. These floods were of sufficient intensity to have destroyed early irrigation ditches dug for farming in 1861-1862, along with a levee intended to prevent inundation of Bakersfield in 1868 (Lynch 2006), for example. One result of the 1868 flood was the migration of the Kern River northwest, skirting the growing town, to its current channel—a move likely aided by the east side levee. In addition to saving the town, this helped push the stream northwest of the original channel.

Due to the marsh/slough/swamp conditions of the delta, combined with this degree of periodic flooding, prehistoric use of this area emphasized higher ground, typically consisting of low rises on the otherwise flat valley floor (Whitley 2006), or the foothills surrounding the valley. Villages associated with Buena Vista Lake illustrate this pattern: all known historical and prehistoric villages are concentrated along the western margin of the lake, where the higher elevations of the Elk and Buena Vista Hills abut the lake margin, rather than along the other lake edges which were periodically flooded. This was especially true for winter-aggregation phase villages which were occupied during the most likely period for seasonal flooding. While village locations typically were adjacent to water, and they thus moved over time as stream channels changed or lakeshores

transgressed or regressed, (relatively) high ground was always a critical variable for anything other than ephemeral land use (such as hunting and gathering).

The study area is entirely low-lying, with no recorded sites in the vicinity. It is adjacent to Goose Lake Slough and north of the post-1868 Kern River channel, however, suggesting that it was periodically flooded. The Rio Bravo 1931, Tupman 1933, and Stevens 1932 historic USGS topographical quadrangles, in fact, indicate that it was then crossed by small east-west drainages, with even lower lying ponds in the surrounding fields. High/Very High archaeological sensitivity for the Project area is then suggested by the soils mapping of the county and a site sensitivity model derived from that data (Meyer et al. 2010).

2.3 ETHNOGRAPHIC BACKGROUND

Penutian-speaking Yokuts tribal groups occupied the southern San Joaquin Valley region and much of the nearby Sierra Nevada. Ethnographic information about the Yokuts was collected primarily by Powers (1971, 1976 [originally 1877]), Kroeber (1925), Gayton (1930, 1948), Driver (1937), Latta (1977) and Harrington (n.d.). For a variety of historical reasons, existing research information emphasizes the central Yokuts tribes who occupied both the valley and particularly the foothills of the Sierra. The northernmost tribes suffered from the influx of Euro-Americans during the Gold Rush and their populations were in substantial decline by the time ethnographic studies began in the early twentieth century. In contrast, the southernmost tribes were partially removed by the Spanish to missions and eventually absorbed into multi-tribal communities on the Sebastian Indian Reservation (on Tejon Ranch), and later the Tule River Reservation and Santa Rosa Rancheria to the north. The result is an unfortunate scarcity of ethnographic detail on southern Valley tribes, especially in relation to the rich information collected from the central foothills tribes where native speakers of the Yokuts dialects are still found. Regardless, the general details of indigenous life-ways were similar across the broad expanse of Yokuts territory, particularly in terms of environmentally influenced subsistence and adaptation and with regard to religion and belief, which were similar everywhere.

This scarcity of specific detail is particularly apparent for southern valley tribal group distribution. According to Kroeber (1925:478), the Tulamni occupied the edges of Buena Vista Lake and the southwestern end of the valley, the Hometwoli lived in and around Kern Lake to the east, the Tuhohi (or Chuxoxi) resided near the mouth of Kern River as it drained north into Tulare Lake, and Yauelmani territory comprised the southeastern side of the valley, extending north into Bakersfield proper. The study area then likely falls within Yauelmani territory. Kroeber identifies the villages of *Tsineuhiu*, west of Bakersfield on the Kern River, *Woilo* in Bakersfield proper, *Kuyo* south of Bakersfield, *Tulamniu*, at the northwestern edge of Buena Vista Lake, *Hoschiiu* on Bitter Water Creek, and *Wogitiiu*, near McKittrick. None of these villages are within or close to the Project APEs.

Most Yokuts groups, regardless of specific tribal affiliation, were organized as a recognized and distinct tribelet; a circumstance that almost certainly pertained to the tribal groups noted above. Tribelets were land-owning groups organized around a central village and linked by shared territory and descent from a common ancestor. The population of most tribelets ranged from about 150 to 500 peoples (Kroeber 1925).

Each tribelet was headed by a chief who was assisted by a variety of assistants, the most important of whom was the *winatum*, a herald or messenger and assistant chief. A shaman also served as religious officer. While shamans did not have any direct political authority, as Gayton (1930) has illustrated, they maintained substantial influence within their tribelet.

Shamanism is a religious system common to most Native American tribes. It involves a direct and personal relationship between the individual and the supernatural world enacted by entering a trance or hallucinatory state (usually based on the ingestion of psychotropic plants, such as jimsonweed or more typically native tobacco). Shamans were considered individuals with an unusual degree of supernatural power, serving as healers or curers, diviners, and controllers of natural phenomena (such as rain or thunder). Shamans also produced the rock art of this region, depicting the visions they experienced in vision quests believed to represent their spirit helpers and events in the supernatural realm (Whitley 1992, 2000). Most such sites are associated with their villages.

The centrality of shamanism to the religious and spiritual life of the Yokuts was demonstrated by the role of shamans in the yearly ceremonial round. The ritual round started in the spring with the jimsonweed ceremony, followed by the rattlesnake dance and (where appropriate) first salmon ceremony. After returning from seed camps, fall rituals began in the late summer with the mourning ceremony, followed by first seed and acorn rites and then the bear dance (Gayton 1930:379). In each case, shamans served as ceremonial officials responsible for specific dances involving a display of their supernatural powers (Kroeber 1925).

Subsistence practices varied from tribelet to tribelet based on the environment of residence. Throughout Native California, and Yokuts territory in general, the acorn was a primary dietary component, along with a variety of gathered seeds. Valley tribes augmented this resource with lacustrine and riverine foods, especially fish and wildfowl. As with many Native California tribes, the settlement and subsistence rounds included the winter aggregation into a few large villages, where stored resources (like acorns) served as staples, followed by dispersal into smaller camps, often occupied by extended families, where seasonally available resources would be gathered and consumed.

Although population estimates vary and population size was greatly affected by the introduction of Euro-American diseases and social disruption, the Yokuts were one of the largest, most successful groups in Native California. Cook (1978) estimates that the Yokuts region contained 27 percent of the aboriginal population in the state at the time of contact; other estimates are even higher. Many Yokuts continue to live in the region, especially in Tulare, Fresno and Kings counties to this day.

2.3.1 Significant Themes

The ethnographic period in the southern San Joaquin Valley extended from first Euro-American contact, in AD 1772, to the mid-1850s, when significant Euro-American movement into the region began and some tribal populations were moved onto reservations. The major significant historic themes during this period of significance involve the related topics of Historic-Aboriginal

Archaeology, and Native American Ethnic Heritage. More specifically, these concern the Adaptation of the Indigenous Population to Euro-American Encroachment and Settlement, and their Acculturation to Western Society. These processes included the impact of missionization on the San Joaquin Valley (circa 1800 to about 1845); the introduction of the horse and the development of a San Joaquin Valley “horse culture,” including raiding onto the coast and Los Angeles Basin (after about 1810); the use of the region as a refuge for mission neophyte escapees (after 1820); responses to epidemics from introduced diseases (especially in the 1830s); armed resistance to Euro-American encroachment (in the 1840s and early 1850s); response to the incursions of miners (from about 1857 to 1865); and, ultimately, the adoption of the Euro-American society’s economic system and subsistence practices and acculturation into that society. This last process likely had two manifestations: acculturation due to changes with movements onto reservations; and acculturation via the transition to wage labor working for small farms and ranches.

2.3.2 Associated Property Types

Site types that have been identified in the southern San Joaquin Valley in the general vicinity of the study area dating to the ethnographic period of significance primarily include villages and habitations, some of which contain cemeteries. The different social processes associated with this historical theme may be manifest in the material cultural record in terms of changing settlement patterns and village organization; the breakdown of traditional trading networks with their replacement by new economic relationships; changing subsistence practices, especially the introduction of agriculture initially via escaped mission neophytes; the use of Euro-American artifacts and materials rather than traditional tools and materials; and, possibly, changing mortuary practices.

Inasmuch as culture change is a primary intellectual interest in archaeology, ethnographic villages and habitations may be NRHP eligible under Criterion D, research potential. They may also be eligible under Criterion A, association with events contributing to broad patterns of history. Ethnographic sites, further, may be NRHP eligible as Traditional Cultural Properties due to potential continued connections to tribal descendants, and their resulting importance in traditional practices and beliefs, including their significance for historical memory, tribal- and self-identity formation, and tribal education. For Criteria A and D, eligibility requires site integrity (including the ability to convey historical association for Criterion A). These may include intact archaeological deposits for Criterion D, as well as setting and feel for Criterion A. Historical properties may lack physical integrity, as normally understood in heritage management, but still retain their significance to Native American tribes as Traditional Cultural Properties if they retain their tribal associations and uses.

2.4 ARCHAEOLOGICAL BACKGROUND

The southern San Joaquin Valley region has received minimal archaeological attention compared to other areas of the state. In part, this is because the majority of California archaeological work has concentrated in the Sacramento Delta, Santa Barbara Channel and central Mojave Desert areas (see Moratto 1984). Although knowledge of the southern San Joaquin Valley region’s prehistory is limited, enough is known to determine that the archaeological record is broadly similar to south-

central California as a whole (see Gifford and Schenk 1926; Hewes 1941; Wedel 1941; Fenenga 1952; Elsasser 1962; Fredrickson and Grossman 1977; Schiffman and Garfinkel 1981). Based on these sources, the general prehistory of the region can be outlined as follows.

Initial occupation of the region occurred at least as early as the *Paleoindian Period*, or prior to about 10,000 YBP (years before present). Evidence of early use of the region is indicated by characteristic fluted and stemmed points found around the margin of Tulare Lake, in the foothills of the Sierra, and in the Mojave Desert proper. (In each case, these are locations many miles distant from the study areas.)

Both fluted and stemmed points are particularly common around the Tulare Lake margins, suggesting a terminal Pleistocene/early Holocene lakeshore adaptation similar to that found throughout the far west at the same time; little else is known about these earliest peoples. Although human occupation of the state is well-established during the Late Pleistocene, relatively little can be inferred about the nature and distribution of this occupation with a few exceptions. First, little evidence exists to support the idea that these Paleo-Indians peoples were big-game hunters, similar to those found on the Great Plains. Second, the western Mojave Desert evidence suggests small, very mobile populations that left a minimal archaeological signature.

Substantial evidence for human occupation of California first occurs during the middle Holocene, roughly 7,500 to 4,000 YBP. This period is known as the *Early Horizon*, or alternatively as the Early Millingstone along the Santa Barbara Channel. In the south, populations concentrated along the coast with minimal visible use of inland areas. Adaptation emphasized hard seeds and nuts with tool-kits dominated by mullers and grindstones (manos and metates). Additionally, little evidence for Early Horizon occupation exists in most inland portions of the state, partly due to a severe cold and dry paleoclimatic period occurring at this time. Regardless of specifics, Early Horizon population density was low with a subsistence adaptation more likely tied to plant food gathering than hunting.

Environmental conditions improved dramatically after about 4,000 YBP during the *Middle Horizon* (or Intermediate Period). This period known climatically as the Holocene Maximum (circa 3,800 YBP) and was characterized by significantly warmer and wetter conditions than previously experienced. Archaeologically, it was marked by large population increase and radiation into new environments along coastal and interior south-central California and the Mojave Desert (Whitley 2000). In the Delta region to the north, this same period of favorable environmental conditions was characterized by the appearance of the Windmill culture which exhibited a high degree of ritual elaboration (especially in burial practices) and perhaps even rudimentary mound-building tradition (Meighan, personal communication, 1985). Along with ritual elaboration, Middle Horizon times experienced increasing subsistence specialization, perhaps correlating with the appearance of acorn processing technology. Penutian speaking peoples (including the Yokuts) are also posited to have entered the state roughly at the beginning of this period and, perhaps to have brought this technology with them (cf. Moratto 1984). Likewise it appears the so-called "Shoshonean Wedge" in southern California or the Takic speaking groups that include the Gabrielino/Fernandeño, Tataviam and Kitanemuk, may have moved into the region at this time, rather than at about 1,500 BP as first suggested by Kroeber (1925).

Evidence for Middle Horizon occupation of interior south-central California is substantial. For example, in northern Los Angeles County along the upper Santa Clara River, to the south of the San Joaquin Valley, the Agua Dulce village complex indicates occupation extending back to the Intermediate Period, when the population of the village may have been 50 or more people (King et al. n.d.). Similarly, inhabitation of the Hathaway Ranch region near Lake Piru, and the Newhall Ranch near Valencia, appears to date to the Intermediate Period (W & S Consultants 1994). To the west, little or no evidence exists for pre-Middle Horizon occupation in the upper Sisquoc and Cuyama River drainages; populations first appear there at roughly 3,500 YBP (Horne 1981). The Carrizo Plain, the valley immediately west of the San Joaquin, experienced a major population expansion during the Middle Horizon (W & S Consultants 2004; Whitley et al. 2007), and recently collected data indicates the Tehachapi Mountains region was first significantly occupied during the Middle Horizon (W&S Consultants 2006). A parallel can be drawn to the inland Ventura County region where a similar pattern has been identified (Whitley and Beaudry 1991), as well as the western Mojave Desert (Sutton 1988a, 1988b), the southern Sierra Nevada (W & S Consultants 1999), and the Coso Range region (Whitley et al. 1988). In all of these areas, a major expansion in settlement, the establishment of large site complexes and an increase in the range of environments exploited appear to have occurred sometime roughly around 4,000 years ago. Although most efforts to explain this expansion have focused on local circumstances and events, it is increasingly apparent this was a major southern California-wide occurrence and any explanation must be sought at a larger level of analysis (Whitley 2000). Additionally, evidence from the Carrizo Plain suggests the origins of the tribelet level of political organization developed during this period (W & S Consultants 2004; Whitley et al. 2007). Whether this same demographic process holds for the southern San Joaquin Valley, including the study area, is yet to be determined.

The beginning of the *Late Horizon* is set variously at 1,500 and 800 YBP, with a consensus for the shorter chronology. Increasing evidence suggests the importance of the Middle-Late Horizons transition (AD 800 to 1200) in the understanding of south-central California. This corresponds to the so-called Medieval Climatic Anomaly, a period of climatic instability that included major droughts and resulted in demographic disturbances across much of the west (Jones et al. 1999). It is also believed to have resulted in major population decline and abandonments across south-central California, involving as much as 90 percent of the interior populations in some regions including the Carrizo Plain (Whitley et al. 2007). It is not clear whether site abandonment was accompanied by a true reduction in population or an agglomeration of the same numbers of peoples into fewer but larger villages. What is clear is that Middle Period villages and settlements were widely dispersed across the landscape; many at locations that lack contemporary evidence of fresh water sources. Late Horizon sites, in contrast, are typically located where fresh water was available during the historical period, if not currently.

The subsequent Late Horizon can be best understood as a period of recovery from a major demographic collapse. One result is the development of regional archaeological cultures as the precursors to ethnographic Native California; suggesting that ethnographic life-ways recorded by anthropologists extend roughly 800 years into the past.

The position of southern San Joaquin Valley prehistory relative to patterns seen in surrounding areas is still somewhat unknown. The presence of large lake systems in the valley bottoms can be expected to have mediated some of the desiccation seen elsewhere. But, as the reconstruction of

Soda Lake in the nearby Carrizo Plain demonstrates (see Whitley et al. 2007), environmental perturbations had serious impacts on lake systems too. Identifying certain of the prehistoric demographic trends for the southern San Joaquin Valley and determining how these trends (if present) correlate with those seen elsewhere, is a current important research objective.

2.4.1 Significant Themes

Previous research and the nature of the prehistoric archaeological record suggest two significant themes, both of which fall under the general Prehistoric Archaeology area of significance. These are the Expansion of Prehistoric Populations and Their Adaptation to New Environments; and Adaptation to Changing Environmental Conditions.

The Expansion of Prehistoric Populations and Their Adaptation to New Environments theme primarily concerns the Middle Horizon/Holocene Maximum. Its period of significance runs from about 4,000 to 1,500 YBP. It involves a period during which the prehistoric population appears to have expanded into a variety of new regions, developing new adaptive strategies in the process.

The Adaptation to Changing Environmental Conditions theme is partly related to the Holocene Maximum, but especially to the Medieval Climatic Anomaly. The period of significance for this theme, accordingly, extends from about 4,000 to 800 YBP. This theme involves the apparent collapse of many inland populations, presumably with population movements to better environments such as the coast. It is not yet known whether the southern San Joaquin Valley, with its system of lakes, sloughs and swamps, experienced population decline or, more likely, population increase due to the relatively favorable conditions of this region during this period of environmental stress.

2.4.2 Associated Property Types

Given the physiographic and hydrographic nature of the southern San Joaquin Valley (low-lying alluvial flats prehistorically containing streams, sloughs, swamps and lakes), two primary site types can be expected for both themes: villages and camps, and resource exploitation/special activity areas. Archaeological evidence potentially pertinent to these themes could include settlement locations and sizes, trade patterns, and especially subsistence evidence.

Prehistoric sites would be primarily eligible under NRHP Criterion D, research potential. Eligibility would require integrity in the form of intact archaeological deposits, including preserved stratigraphic relationships, internal site features, and artifact associations.

2.5 HISTORICAL BACKGROUND

Spanish explorers first visited the southern end of the San Joaquin Valley in 1772, but its lengthy distance from the missions and presidios along the Pacific Coast delayed permanent settlement for many years, including during the Mexican period of control over the Californian region. In the 1840s, Mexican rancho owners along the Pacific Coast allowed their cattle to wander and graze in the San Joaquin Valley (JRP Historical Consulting 2009). The Mexican government granted the first ranchos in the southern part of the San Joaquin Valley in the early 1840s, but these did not

result in permanent settlement. It was not until the annexation of California in 1848 that the exploitation of the southern San Joaquin Valley began (Pacific Legacy 2006).

The discovery of gold in northern California in 1848 resulted in a dramatic increase of population, consisting in good part of fortune seekers and gold miners, who began to scour other parts of the state. Population throughout the area grew rapidly with this rush, with new immigrants ranching in the San Joaquin Valley to supply the miners and mining towns. Ranchers grazed cattle and sheep, and farmers dry-farmed or used limited irrigation to grow grain crops, leading to the creation of small agricultural communities throughout the valley (JRP Historical Consulting 2009).

After the American annexation of California, the southern San Joaquin Valley became significant as a center of food production for this new influx of people in California. The expansive unfenced and principally public foothill spaces were well suited for grazing both sheep and cattle (Boyd 1997). As the Sierra Nevada gold rush presented extensive financial opportunities, ranchers introduced new breeds of livestock, consisting of cattle, sheep and pig (Boyd 1997).

With the increase of ranching in the southern San Joaquin came the dramatic change in the landscape, as non-native grasses more beneficial for grazing and pasture replaced native flora (Preston 1981). After the passing of the Arkansas Act in 1850, efforts were made to reclaim small tracts of land in order to create more usable spaces for ranching. Eventually, as farming supplanted ranching as a more profitable enterprise, large tracts of land began to be reclaimed for agricultural use, aided in part by the extension of the railroad in the 1870s (Pacific Legacy 2006).

Following the passage of state-wide 'No-Fence' laws in 1874, ranching practices began to decline, while farming expanded in the San Joaquin Valley in both large land holdings and smaller, subdivided properties. As the farming population grew, so did the demand for irrigation. Settlers began reclamation of swampland in 1866 and built small dams across the Kern River to divert water into the fields. By 1880, 86 different groups were taking water from the Kern River. Ten years later, 15 major canals provided water to thousands of acres in Kern County.

As unproductive land was reclaimed in the southern San Joaquin Valley, grants were given to individuals who had both the resources and the finances to undertake the operation alone. A small agricultural settlement, founded by Colonel Thomas Baker in 1861 after procuring one such grant, took advantage of reclaimed swampland along the Kern River. This settlement became the City of Bakersfield in 1869, and quickly became the center of activity in the southern San Joaquin Valley, and in the newly formed Kern County. Located on the main stage road through the San Joaquin Valley, the town became a primary market and transportation hub for stock and crops, as well as a popular stopping point for travelers on the Los Angeles and Stockton Road. The Southern Pacific Railroad reached the Bakersfield area in 1873, connecting it with important market towns elsewhere in the state, dramatically impacting both agriculture and, eventually, oil production (Pacific Legacy 2006).

Three competing partnerships developed during this period which had a great impact on control of water, land reclamation and ultimately agricultural development in the San Joaquin Valley: Livermore and Chester, Haggin and Carr, and Miller and Lux, perhaps the most famous of the enterprises. Livermore and Chester were responsible, among other things, for developing the large

Hollister plow (three feet wide by two feet deep), pulled by a 40 mule team, which was used for ditch digging. Haggin and Carr were largely responsible for reclaiming the beds of the Buena Vista and Kern lakes, and for creating the Calloway Canal, which drained through the Rosedale area in Bakersfield to Goose Lake (Morgan 1914). Miller and Lux ultimately became one of the biggest private property holders in the country, controlling the rights to over 22,000 square miles, and their impacts were widespread. They recognized early-on that control of water would have important economic implications, and they played a major role in the water development of the state. They controlled, for example, over 100 miles of the San Joaquin River with the San Joaquin and Kings River Canal and Irrigation System ([http://en.wikipedia.org/wiki/Henry_Miller\(rancher\)\)](http://en.wikipedia.org/wiki/Henry_Miller(rancher))). They were also embroiled for many years in litigation against Haggin and Carr over control of the water rights to the Kern River. Descendants of Henry Miller continue to play a major role in California water rights, with his great grandson, George Nickel, Jr., the first to develop the concept of water banking, thus creating a system to buy and sell water (<http://exiledonline.com/california-class-war-history-meet-the-oligarch-family-thats-been-scamming-taxpayers-for-150-years-and-counting/>).

Numerous private irrigation systems were initially developed by individuals. The Wright Act of 1887, however, allowed the creation of public irrigation districts, greatly facilitating the funding and construction of water conveyance systems. The state-wide imbalance of water, with a drier southern and a wetter northern half of the state, and the problems that this entailed, were recognized as early as 1919, however. A report was completed in 1931, called the “State Water Plan,” calling for a north-to-south water transfer. The Central Valley Act, passed by the California legislature in 1933, with a \$170 million bond approved by voters that same year, was intended to initiate the implementation of that plan. The depths of the Great Depression prevented this from happening. The federal government then took over the Central Valley Project (CVP), as it was called, as a public works project, with construction beginning in 1935. The federal CVP was intended to supply water to Fresno, Tulare and Kern counties. Friant Dam, which created Millerton Lake, was completed in 1942. It supplies water for the Friant-Kern and Madera Canals. The Friant-Kern Canal, running along the east side of the valley, was constructed between 1945 and 1951 and is approximately 152-mi in length (<https://water.ca.gov/Programs/State-Water-Project/History>).

Although the CVP proved beneficial to San Joaquin Valley irrigation, a comprehensive, statewide water management system was still needed. The creation of the California Department of Water Resources in 1956 and the State Water Project (SWP) was the first step in this process. Construction of the Oroville Dam began in 1961, with the California Aqueduct built between 1963 and 1973. It now spans 444-mi from the San Joaquin-Sacramento River Delta in northern California south to Riverside County. It runs along the west side of the southern San Joaquin Valley (ibid).

2.5.1 Rosedale Area & RRBWSD History

The community of Rosedale is located immediately west of Bakersfield. It was formed in the late 1870s after investors enticed prospective buyers to lay claim to the land in the southern San Joaquin Valley. The dry climate of the valley and the rich soil it provided when irrigated from local water resources drew people to ranch and farm the land. The construction of the Calloway Canal in 1875 was an impetus for land sales in the area. People were drawn to the profitable irrigated land that this canal provided, sourcing its water supply from the Kern River. Marketing was particularly

focused on English settlers who emigrated from the United Kingdom to the area called “Rosedale” for its abundant natural supply of roses. S.W. Fergusson, manager of the Kern Land Company, printed ads in English newspapers proclaiming the abundance of farmland in Rosedale. In March 1890, the first English emigrants arrived in Rosedale and purchased land. By 1889, Rosedale had a town site and appeared to be growing. In the next few years, Rosedale residents suffered drought and the nation suffered financial panic in the mid-1890s. Colonization efforts failed by the turn of the twentieth century. Although the Santa Fe Railroad laid tracks through Rosedale in 1899, attempts at reviving the area failed (Lynch 2006).

Through the twentieth century, the Rosedale area became a quiet suburb of the growing city of Bakersfield. As irrigation efforts of the San Joaquin Valley increased in the twentieth century, more water districts, formed by local land-owners and farmers, were established.

The RRBWSD was founded in 1959, named after the community of Rosedale and the nineteenth-century Mexican moniker for the Kern River, “Rio Bravo” (Lynch 2006). It was created to construct and operate a groundwater recharge project to offset declining groundwater levels. These declines largely resulted from the construction of the Lake Isabella Dam on the Kern River, completed in 1954. Prior to the dam’s completion, seasonal flooding occurred on average every three years and served to replenish groundwater in the Rosedale area. With the loss of those periodic flood waters, groundwater control was required (RRBWSD 1997). Today RRBWSD covers 44,150-ac and has an annual maximum recharge of 234,000 acres-feet. Approximately 27,000-ac of the RRBWSD consists of irrigated agricultural lands, with the remainder comprising rural development and light industry.

The first water recharge project was initiated by RRBWSD in 1959 and completed in 1962, directed at capturing water supplies and percolating them into the underground aquifer using recharge basins and water conveyance systems. The RRBWSD delivery system consists of 25-mi of earthen canals, 2-mi of pipeline and a number of check structures and wells, including approximately 20 connections to landowner irrigation systems used for in-lieu groundwater recharge (ibid).

The Goose Lake Slough, which branches off the Kern River to the south of the Rosedale area, was initially modified in 1874 when the head of the slough was cleaned and enlarged and a regulator was placed across it (Grunsky 1898). Channelization of the slough started with the construction of the Cross Valley Canal in 1975 and continued into the 1990s. It is currently entirely channelized and it terminates in a series of RRBWSD recharge basins. Renamed the Goose Lake Channel, it connects to both the Kern River and the Cross Valley Canal.

The Cross Valley Canal is the Kern County Water Agency’s primary conduit for water delivered to and from the California Aqueduct (Kern County Water Agency 2014). The canal was built in 1975 and expanded between 2005 and 2012. It is now 21.5-mi in length (<https://www.kcwa.com/projects/>).

The sandy-bottomed Kern River proved very inefficient for moving water through the flats of the San Joaquin Valley. The Kern County Land (KCL) Company, successor to Miller and Lux, owned most of these rights. They created the concrete-lined Kern River Canal in 1963, which is south of

and parallels the current riverbed, to improve their water supply west of Bakersfield. The creation of the lined channel contributed to ground water problems in the City of Bakersfield. The City sued Tenneco in 1970, who had acquired KCL in 1967, obtaining their lands, infrastructure and water rights by legal settlement in 1976 for \$18 million (Stetson 1975; Water Resources Department 2003). The City now operates the Kern River Canal and controls use of the Kern River through its boundaries, which is usually dry west of Highway 99.

2.5.2 Significant Themes

Development of Irrigated Agriculture in the San Joaquin Valley, 1852-1964

As identified by Caltrans in the *Water Conveyance Systems in California Historic Context Development and Evaluation Procedures*, the “Development of Irrigated Agriculture” is a historically significant theme or event in the history of California and the Central Valley region. Properties associated with this theme are most likely to be eligible under NRHP/CRHR criterion A/1. In the years following California’s statehood and the gold rush, increasing population created a growing market for agricultural products. The total irrigated acreage in the state grew from 60,000-ac in 1860 to nearly 400,000-ac by 1880, an increase of more than 650 percent, and the San Joaquin Valley contained the highest percentage of that land (approximately 47 percent) (Caltrans 2000). Private water companies, land colonies, mutual water companies, and irrigation districts were established in the mid- to late nineteenth century to build irrigation systems to further develop the state’s agriculture industry. Irrigation districts became the most influential of these organizations, especially after state legislation—the Wright Act of 1887—irrigation districts grew in number, power, as well as the actual amount of irrigated land throughout the state. Forty-nine irrigation districts were organized between 1887 and 1896, most of them located between Stockton and Bakersfield. However, by the late 1920s, only seven of the original districts were still in existence, among them the Modesto, Turlock, and Tulare irrigation districts (Caltrans 2000). Under the impetus of increased demand during World War I, agricultural production reached a new peak in 1920. Companies like Pacific Gas & Electric and San Joaquin Valley Light and Power helped finance large irrigation reservoirs to feed district canals in return for the power generated. By 1930, there were 94 active districts in California, and the land watered by these agencies mushroomed to 1.6 million acres (Caltrans 2000). Irrigation districts provided more than 90 percent of the surface water used for irrigation in the San Joaquin Valley before the Central Valley Project came online in the 1940s (Caltrans 2000). Most were located in the San Joaquin Valley, with the most successful in Modesto, Turlock, Merced, and Fresno.

The period of significance for this theme begins with the earliest developments of irrigated agriculture in the San Joaquin Valley, with the construction of the earliest earthen ditches in Visalia in 1852. Irrigated agriculture continues to be an important industry and influence in the Valley. The period of significance ends in 1964 following recommended guidance for closing a period of significance 50 years ago when activities continued to have importance, but no more specific date can be defined to end the historic period, and there is no justification for exceptional significance to extend the period of significance to an end date within the last 50 years (National Register of Historic Places 1997).

2.5.3 Associated Property Types

Water Conveyance Systems

Following the framework established by Caltrans in *Water Conveyance Systems in California Historic Context Development and Evaluation Procedures*, the water conveyance system is the property type that has the potential to reflect this theme and period. Components and features of water conveyance systems include diversion structures, conduits, flow control devices, cleansing devices, and associated resources and settings. Water Conveyance Systems that are associated with Development of Irrigated Agriculture in the San Joaquin Valley, 1852-1964 will be eligible under NRHP Criterion A/CRHR Criterion 1 for their association with this significant theme if:

- the association with the theme is important--simply because a water conveyance existed during the period of significance is not enough for that system to be eligible;
- the resource retains high overall integrity because of the high number of comparable examples. The property should retain most of the seven aspects of integrity: location, design, setting, materials, workmanship, feeling, and association.
- Due to the nature of this type of resource, repairs and modifications are acceptable but not if those modifications substantially modified the resource.

Water Conveyance Systems that are associated with Development of Irrigated Agriculture in the San Joaquin Valley, 1852-1964 will be eligible under NRHP Criterion B/CRHR Criterion 2 for their association with this significant theme if:

- they associated with an important person's productive life *and* the property that is most closely associated with that person;
- the resource retains high overall integrity because of the high number of comparable examples. The property should retain most of the seven aspects of integrity: location, design, setting, materials, workmanship, feeling, and association.
- Due to the nature of this type of resource, repairs and modifications are acceptable but not if those modifications substantially modified the resource.

Water conveyance systems will rarely be found eligible under Criterion B/2. In California notable names for which there might be associations with water planning, construction, or engineering include: Anthony Chabot, George Chaffey, Frederick Eaton, William Mulholland, George Maxwell, Robert Marshall, Elwood Mead and C. E. Grunsky (Caltrans 2000).

2.5.4 Technological Innovation in Irrigated Agriculture in California, 1852-1964

Properties associated with the technological innovation in irrigated agriculture in California are most likely to be eligible under NRHP/CRHR criterion C/3. Caltrans clearly defines the historic context for this theme in the "Legacy of Irrigation Canals" section of the context, while ASM has defined a period of significance based on the Caltrans context (Caltrans 2000). The below is a direct excerpt from the context:

The earliest irrigation water conveyances in California were roughly made, earthen ditches to divert water. Techniques used to construct irrigation canals have varied widely during the various periods of California's history, from the relatively short, hand-dug, early masonry and tile ditches, to horse-scraped and hand-dug earthen irrigation ditches, to the large concrete-lined, machine-formed irrigation canals of the middle decades of the twentieth century. Evidence of these changes in scale, methods of construction, and knowledge of engineering are reflected in the remaining physical resources found on the landscape today. Substantial regional variation exists with respect to the adoption and dissemination of the new technologies, such as where and when concrete replaced wood in the engineering works of major irrigation canals. These regional differences can be explained in part by cultural traditions with respect to water management, ownership of water rights, and environmental factors, but economics, politics, and the formation of particular types of irrigation institutions also played significant roles.

Older canals were often subject to substantial change over time. A common change was to expand the system in order to serve more acreage. Unless pumps are used, irrigation canals rely on gravity to move water, and they can provide service only to land lying below the canal's water level. As irrigated acreage expanded, water companies frequently consolidated smaller ditch systems, moved the point of diversion upstream, and built a high-line canal to service new acreage. In this manner, pioneer canals were often absorbed into larger systems, frequently by irrigation districts, to pull in more potentially irrigable lands. Segments of earlier irrigation systems might remain largely intact within the larger framework of a new irrigation system, or the changes could be such that the old separate irrigation system would become, in essence, a typical component of a new 1920s irrigation district canal.

Another important factor is that water is notoriously difficult to control; it can be, and frequently is, an engine of destruction. Flood waters, for example, repeatedly overwhelmed the flimsy wooden control structures built on nineteenth and early-twentieth century irrigation systems in the San Joaquin Valley. Canals were also often altered as a result of improvements designed to counteract the normal erosion that occurs from water moving through earth-lined canals. Improvements to stabilize canals ranged from realigning segments of the channel, to lining ditches or putting them in pipe, to replacement of checks, drops, culverts, or other regulation structures. These improvements were sometimes carried out system-wide, sometimes on a piecemeal basis. In light of the proclivity for change and the wide diversity of canal materials and modes of construction, adequate documentary research is essential to understand the evolution of an important irrigation canal and to assess its integrity (Caltrans 2000).

The period of significance for this theme begins with the earliest developments of irrigated agriculture in California, with the construction of the earliest earthen ditches in Visalia in 1852. Technological innovations in agricultural irrigation are ongoing, but the period of significance ends in 1964 following recommended guidance for closing a period of significance 50 years ago when activities continued to have importance, but no more specific date can be defined to end the historic period, and there is no justification for exceptional significance to extend the period of significance to an end date within the last 50 years (National Register of Historic Places 1997).

2.5.5 Associated Property Types

Water Conveyance Systems

Following the framework established by Caltrans in *Water Conveyance Systems in California Historic Context Development and Evaluation Procedures*, the water conveyance system is the property type that has the potential to reflect this theme and period. Components and features of water conveyance systems include diversion structures, conduits, flow control devices, cleansing devices, and associated resources and settings. Water Conveyance Systems that are associated with Technological Innovation in Irrigated Agriculture in California, 1852-1964 will be eligible under NRHP Criterion C/CRHR Criterion 3 for their association with this significant theme if they are/have:

- unique values;
- the best or good example of the property type as one that possess distinctive characteristics of the type and through those characteristics clearly illustrates at least one of the following;
 - the pattern of features common to a particular class of resources
 - the individuality or variation of features that occurs within the class;
 - the evolution of that class; or
 - the transition between classes of resources
- the earliest, best preserved, largest, or sole surviving example of particular types of water conveyance systems;
- a design innovation of evolutionary trends in engineering
- designed by a figure of acknowledged greatness in the field or by someone unknown whose workmanship is distinguishable from others by its style and quality *and* be a good example of that designer's work;
- the resource retains high overall integrity because of the high number of comparable examples. The property should retain most of the seven aspects of integrity: location, design, setting, materials, workmanship, feeling, and association.

A large water conveyance system with multiple components will often be evaluated as a district rather than as a single property. An eligible historic district must possess a significant concentration or linkage of resources that are united historically or aesthetically by plan or physical development. It should be a significant and distinguishable entity, although its components need not possess individual distinction (Caltrans 2000).

3. ARCHIVAL RECORDS SEARCH

An archival records search was conducted at the California State University, Bakersfield, Southern San Joaquin Valley Archaeological Information Center (IC), by IC staff members to determine: (i) if prehistoric or historical archaeological sites had previously been recorded within the study area; (ii) if the project area had been systematically surveyed by archaeologists prior to the initiation of this field study; and/or (iii) whether the region of the field project was known to contain archaeological sites and to thereby be archaeologically sensitive. Additionally, a search of the NAHC *Sacred Lands File* was conducted in order to ascertain whether traditional cultural places or cultural landscapes had been identified within the project area of potential effect (APE). The results of this archival records search are summarized here.

The records search at the IC indicated that six previous archaeological surveys had been completed that covered portions of the APE (Table 1; Confidential Appendix A). An additional six previous archaeological surveys had been conducted within a 0.5-mi radius. No archaeological resources were identified within the Project APE according to the records search. Two previously recorded linear historical resources are however present: the Cross Valley Canal (P-15-008026) and the Goose Lake Slough/Rio Bravo Canal (P-15-0008121). These are discussed below. Two additional built environment resources are located within 0.5-mi of the APE (Table 3).

Table 1 Survey Reports Within the APE.

Report No	Year	Author (s)/Affiliation	Title
KE-00707	1988	Napton, L. Kyle and Greathouse, E.A./ California State University, Stanislaus Foundation, Institute for Archaeological Research	Cultural Resource Investigation of the Proposed Kern River Parkway Project, City of Bakersfield, Kern County, California

Site No.	Description
P-15-002050/ CA-KER-2050H	Southern Pacific Railroad
P-15-017761/ CA-KER-9798H	Pioneer Canal

The NAHC *Sacred Lands File* includes no sacred sites or tribal cultural resources within or near to the Project APE. Outreach letters were sent to tribes and tribal organizations on the NAHC contact list (Confidential Appendix A). Follow-up emails were also sent. No knowledge of or concern with tribal cultural resources was expressed by the groups and individuals contacted.

In addition to these sources, historical USGS topographical quadrangles and historical aerial photographs (at historicaerials.com) were examined to determine changes in land-use within the Project APE. These sources were particularly helpful in verifying the periods of construction and modification of linear historical structures.

The Goose Lake Slough was channelized and its course regularized between 1994 and 2017; it is now called the Goose Lake Channel. This canal was recorded in 1993 by JRP Historical Consulting as P-15-0008121, the Rio Bravo/Goose Lake Canal. It was evaluated for eligibility to the NRHP in 1997 and 2004 and was determined not eligible by consensus.

A portion of the Cross Valley Canal was completed in 1975 but it was extended and modified between 2005 and 2012. This historical resource was also recorded in 1993 by JRP Historical Consulting as P-15-0008026, the Cross Valley Canal. It was evaluated for eligibility to the NRHP in 1997 and 2004. It was determined not NRHP eligible by consensus.

4. METHODS AND RESULTS

The RRBWSD Groundwater Banking and Conveyance Improvement Project would construct recharge ponds, improve weir and intake structures, and add SCADA improvements to existing structures in order to better manage water resources. Construction access to each of these features will occur using existing road routes, and all project ground-surface disturbance will occur within previously disturbed areas. The APE was surveyed under the direction of David S. Whitley, Ph.D., RPA, by ASM Associate Archaeologist/Crew Chief Robert Azpitarte, B.A., with assistance in the field by ASM Assistant Archaeologists Maria Silva, B.A., Ross Way, A.A., and Margarita Lemus, B.A.

Survey was conducted in order to identify surface artifacts, archaeological indicators (e.g., shellfish or animal bone), historical features (e.g., water control structures), and/or archaeological deposits (e.g., organically enriched midden soil); to tabulate and record surface diagnostic artifacts and/or features; site sketch mapping; preliminary evaluation of site integrity; and site recording, following the California Office of Historic Preservation Instructions for Recording Historic Resources, using DPR 523 forms. Special attention was paid to rodent burrow back dirt piles, in the hope of identifying sub-surface soil conditions that might be indicative of archaeological features or remains. No cultural resources were collected during the survey.

Photographs were taken of the APE during the survey. All built environment resources were identified and photographed. GIS data points were taken of each cultural resource. Fieldwork for the Project was conducted in August 2020. Soils in the study area are sandy-silty alluvium with very few lithic clasts, reflecting a soils origin in deltaic and/or riverine hydrological processes. Surface visibility was excellent throughout the study area.

The McCaslin Recharge Ponds and Weir APE was examined with the field crew walking parallel transects across the fields at 15-m intervals. The other three Project components/APEs (Houghton Weir and Kern River Turnout and Cross Valley Canal Turnout) were surveyed using a 50-m radius around each proposed location, again with parallel transects walked at 15-m spacing, to ensure that access and staging areas were covered.

4.1 INVENTORY RESULTS

Two previously recorded cultural resources, the Goose Lake Slough/Rio Bravo Canal (P-15-0008121), and the Cross Valley Canal (P-15-0008026). No other cultural resources were identified within the APE. Site record form updates for these resources are included in Confidential Appendix B. Original records for the Goose Lake Slough and Cross Valley Canal are available in Confidential Appendix C.

4.1.1 P-15-008121 (Goose Lake Slough and Houghton Weir)

Two segments (A and B) of this previously recorded built environment resource were recorded during the Class III inventory/Phase I survey. The Goose Lake Slough, now Goose Lake Channel, is a water conveyance system with both earth- and concrete-lined, open-canal conduit and control

structures. The Houghton Weir control structure is located in Segment A. Segment B is the proposed location of the weir for the McCaslin Recharge Ponds.

The Goose Lake Slough was a natural drainage that first modified in 1874 when a regulator was built across the cleaned and enlarged head of Goose Lake Slough (Grunsky 1898). The slough itself remained unchanged for 80 years, until the mid-1950s when it was initially channelized in conjunction with the construction of Isabella Reservoir (Whitley et al. 2015). One segment of the canal was recorded by JRP Historical Consulting Services (JRP) in 1993 near Renfro Road. This segment of the canal was named the “Rio Bravo Canal” by JRP. They reported a dirt-lined canal with a top width of 58-ft, a bottom width of 38-ft, and a depth of 5-ft. Additionally, they recorded six corrugated steel culverts conveying water from the canal under Renfro Road.

Based on an examination of air photos, additional channelization and regularization of the course of the Goose Lake Slough continued between 1994 and 2017. Based on this imagery, all but a small segment in the approximate middle of the drainage had been straightened by 2017. Other changes include the construction of a series of ponds where the drainage is crossed by the Westside Parkway (currently being converted to the Highway 58 freeway extension to Interstate 5). The construction of the parkway, a 4-lane elevated freeway, likewise required the straightening of segments of the canal on both sides of this roadway.

Segment A consists of an approximately 100-ft long segment of the Goose Lake Slough with Houghton Weir at the center. The weir acts as a bottleneck in the Goose Lake Slough, creating a reservoir on the east side which is approximately 230-ft wide. On the west, the canal narrows to approximately 60-ft wide. The channel is earth-bottomed in this section of the canal. Broken concrete blocks have been placed along the floor and banks of the canal on the down-canal side of the weir as erosion control. It is unclear where the blocks originated, though it is possible they are from a previous demolished version of the weir.

The weir is approximately 40-ft long (north/northwest by south/southeast) and spans a constriction in the Goose Lake Slough. It consists of nine slightly angled flashboard bays with steel supports and a steel walkway over the top. The weir is anchored by concrete support walls on either side, built atop a concrete platform. The concrete support walls and base are approximately 15-ft wide. The overall height of the weir is approximately 9-ft high (12-ft total including the walkway handrail). Based on historic aerial imagery, the existing Houghton Weir was constructed sometime between 1952 and 1968. It was likely constructed when the Goose Lake Slough was initially channelized in the mid-1950s in conjunction with the construction of the Isabella Reservoir (Whitley et al. 2015).

Segment B is located approximately 6.5-mi west at the southeast corner of the proposed McCaslin Recharge Ponds, where they intersect the channel. The segment measures approximately 230-ft northeast by southwest and the west edge of the recorded segment ends at the Rosedale Turnout No. 1 Channel. The segment varies between 40-ft wide and 60-ft wide. The channel is earth-bottomed at this spot, which currently has no existing structures.

4.1.2 P-15-008026 (Cross Valley Canal)

The Cross Valley Canal was completed in 1975 to bring SWP water from the California Aqueduct to Bakersfield. It was originally 17-mi in length but it was extended and modified between 2005 and 2012. It is now approximately 21-mi long. Five segments of the original stretch of the canal were recorded in 1993 by JRP Historical Consulting who noted that it was all concrete lined.

A segment approximately 300-ft long was recorded during the current study, at the location of the turn-out to the Goose Lake Channel. The canal is concrete sided at this location with two small embayments serving as the turn-outs, immediately upstream of a major control structure with two downstream outlets. Examination of air photo imagery shows that this portion of the Cross Valley Canal experienced major modifications between 2005 and 2008, with the addition of a second small embayment/turn-out and the construction of a second downstream outlet on the canal. The segment of this canal and its control structures are then recent/contemporary in age.

5. SUMMARY AND NRHP/CRHR ELIGIBILITY EVALUATIONS

An intensive Class III cultural resources inventory/Phase I survey was conducted for the proposed RRBWSD Groundwater Banking and Conveyance Improvement Project, near Bakersfield, Kern County, California. A records search of site files and maps was conducted at the Southern San Joaquin Valley IC and a search of the NAHC *Sacred Lands File* was completed, with outreach letters sent to tribes and tribal organizations on the NAHC contact list. Two historical cultural resources, the Goose Lake Slough/Rio Bravo Canal (P-15-0008121) and the Cross Valley Canal (P-15-8026) had been recorded within the Project APE. Both resources had been previously determined not eligible for NRHP listing by consensus. No sacred sites or tribal cultural resources were identified within or adjacent to the Project APE.

Site record forms updates were completed for segments of the two previously recorded resources within the Project APE. No additional cultural resources of any kind were identified within the APE. NRHP eligibility evaluations of the two previously recorded resources are discussed below.

5.1 P-15-008121 (GOOSE LAKE SLOUGH/RIO BRAVO CANAL)

A segment of this resource was first recorded by JRP Historical Consulting in 1993. Its NRHP eligibility were evaluated by the Federal Highway Administration (FHWA) and Department of Energy (DOE) in 1997 and 2004 and it was determined not eligible by consensus in all cases. We concur with these previous determinations.

Two segments recorded during the current study are located in suburban Bakersfield. They reflect the channelization, modification and regularization of the direction and course of this water conveyance channel that have been ongoing since the 1950s. Although the use of the Goose Lake Slough for agricultural purposes was associated with an important historical event, the Development of Irrigation Agriculture in the San Joaquin Valley, and thus could be NRHP/CRHR eligible under Criterion A/1, the recorded segments lack integrity of design, materials, location, setting, feeling and association, and they are not eligible under this criterion for this reason. The segments are not associated with an important historical individual and therefore are not eligible under Criterion B/2. The two segments lack integrity of design and materials and represent components of a common property type that is not notable for either of these qualities; the segments are thus not eligible under Criterion C/3. The two segments, finally, cannot potentially contribute to our knowledge of history that is not better attained in archival materials, and they are not eligible under Criterion D/4.

The two recorded segments of P-15-0008121 are therefore recommended as not NRHP/CRHR eligible as historic properties or significant or unique historical resources.

5.2 P-15-008026 (CROSS VALLEY CANAL)

Five segments of this resource were recorded by JRP Historical Consulting in 1993. Their NRHP eligibility was evaluated by the FHWA and DOE in 1997 and 2004 and they were determined not eligible by consensus in all cases. We concur with these previous determinations.

The Cross Valley Canal was constructed in 1975 and, taken as a whole, it currently does not meet the age criterion for inclusion in the NRHP or the CRHR. The recorded segment, moreover, was heavily modified between 2005 and 2008 and is thus contemporary in age. The recorded segment of the Cross Valley Canal is recommended as not NRHP/CRHR eligible for these reasons.

5.3 RECOMMENDATIONS

Two cultural resources, the Goose Lake Slough/Rio Bravo Canal and the Cross Valley Canal, are located with the RRBWSD Groundwater Banking and Conveyance Improvement Project APE. The recorded segments of these two resources are recommended as not NRHP/CRHR eligible based on lack of integrity or age. A Determination of No Effect on Historic Properties/No Adverse Impact on Historical Resources is therefore recommended for this Project. In the unlikely event that cultural resources are encountered during the construction or operation of the proposed Project, however, it is recommended that an archaeologist be contacted to evaluate the discovery.

Please forward a copy of any resulting reports from this project to the office as soon as possible. Due to the sensitive nature of archaeological site location data, we ask that you do not include resource location maps and resource location descriptions in your report if the report is for public distribution. If you have any questions regarding the results presented herein, please contact the office at the phone number listed above.

The provision of CHRIS Data via this records search response does not in any way constitute public disclosure of records otherwise exempt from disclosure under the California Public Records Act or any other law, including, but not limited to, records related to archeological site information maintained by or on behalf of, or in the possession of, the State of California, Department of Parks and Recreation, State Historic Preservation Officer, Office of Historic Preservation, or the State Historical Resources Commission.

Due to processing delays and other factors, not all of the historical resource reports and resource records that have been submitted to the Office of Historic Preservation are available via this records search. Additional information may be available through the federal, state, and local agencies that produced or paid for historical resource management work in the search area. Additionally, Native American tribes have historical resource information not in the CHRIS Inventory, and you should contact the California Native American Heritage Commission for information on local/regional tribal contacts.

Should you require any additional information for the above referenced project, reference the record search number listed above when making inquiries. Invoices for Information Center services will be sent under separate cover from the California State University, Bakersfield Accounting Office.

Thank you for using the California Historical Resources Information System (CHRIS).

Sincerely,

Celeste M. Thomson
Coordinator

Additional information may be available through the federal, state, and local agencies that produced or paid for historical resource management work in the search area. Additionally, Native American tribes have historical resource information not in the CHRIS Inventory, and you should contact the California Native American Heritage Commission for information on local/regional tribal contacts.

Should you require any additional information for the above referenced project, reference the record search number listed above when making inquiries. Invoices for Information Center services will be sent under separate cover from the California State University, Bakersfield Accounting Office.

Thank you for using the California Historical Resources Information System (CHRIS).

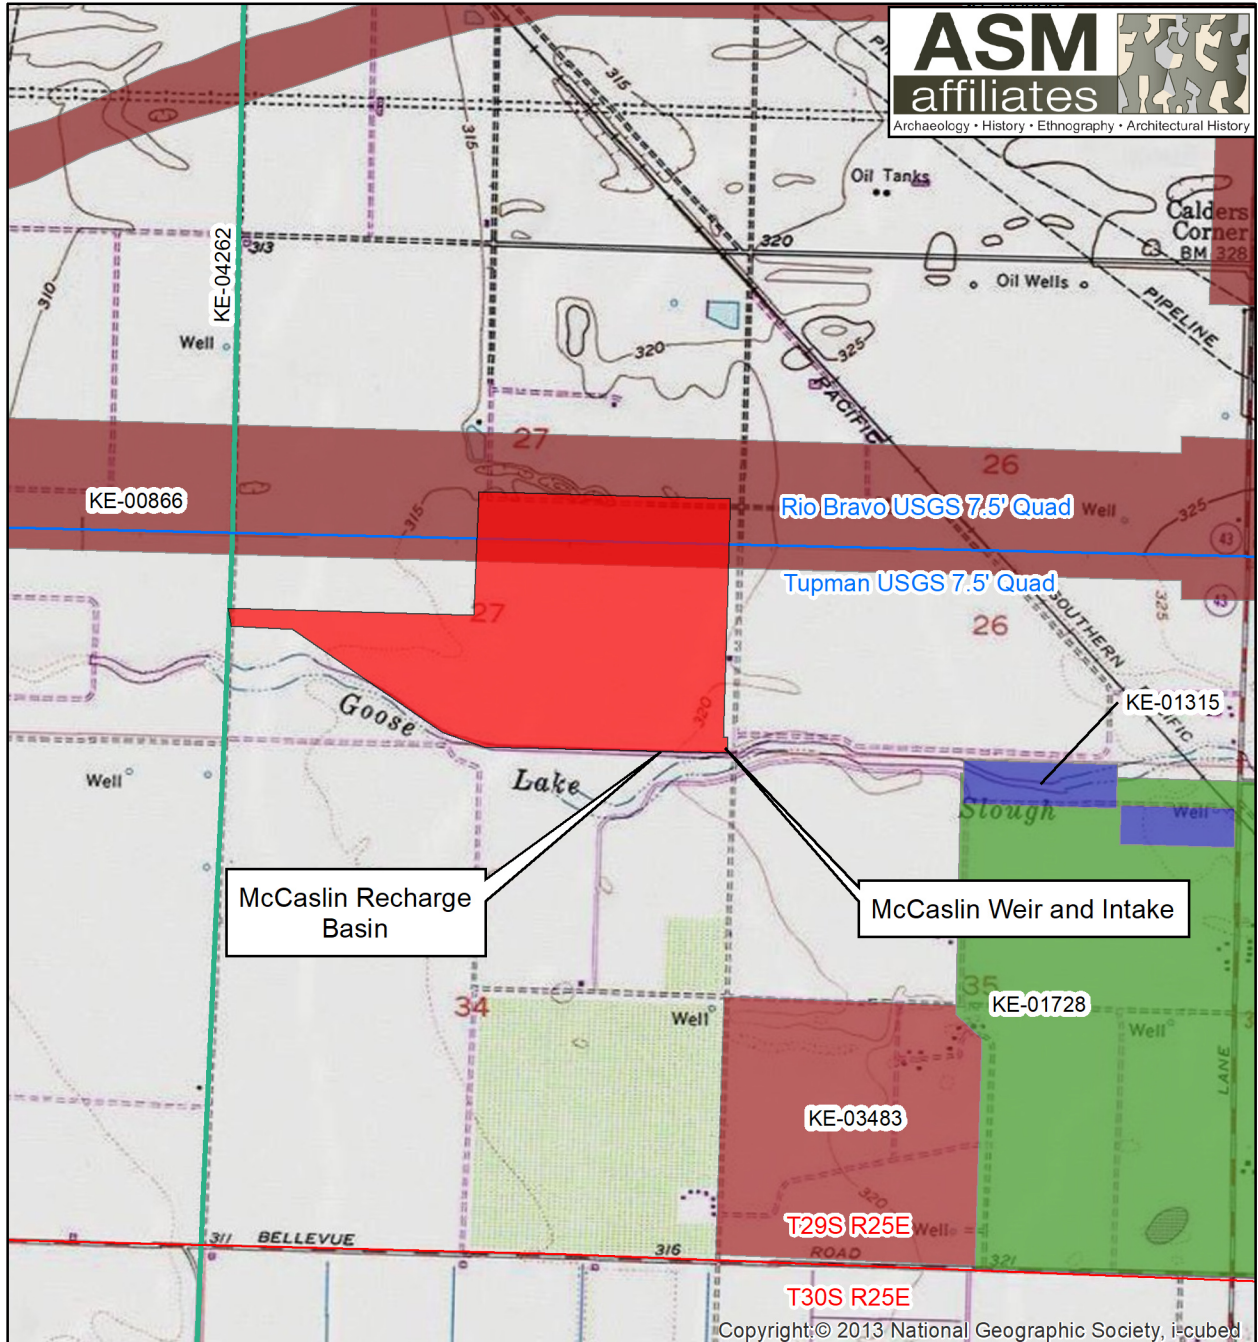

Sincerely,

Celeste M. Thomson
Coordinator

NATIVE AMERICAN HERITAGE COMMISSION

June 29, 2020

Peter Carey

ASM Affiliates

Via Email to: pcarey@asmaffiliates.com**Re: Rosedale Rio Bravo WSD WaterSmart2020 McCaslin Recharge Basin Project, Kern County**

Dear Mr. Carey:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: Nancy.Gonzalez-Lopez@nahc.ca.gov.

Sincerely,

Nancy Gonzalez-Lopez
Cultural Resources Analyst

*P3a. Description: (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The Segment of the Cross Valley Canal recorded during the current study is located at the turnout from the Cross Valley Canal to the Goose Lake Slough (Goose Lake Canal or Channel). The Cross Valley Canal was constructed in 1975 to move water from the California Aqueduct to urban Bakersfield (Agency Functions – Kern County Water Agency 2018, USBR 2018). The recorded segment is about 300-ft (northeast-southwest) in length. The width of the canal from the top width of the canal is approximately 48-ft, while the bottom width is estimated to be 30-ft (the canal was filled with water at the time of the recording). This segment of the Cross Valley Canal was heavily modified between 2005 and 2008 and is thus contemporary in age. This segment is therefore recommended as not NRHP or CRHR eligible since it does not meet the age criterion.

*P3a. Description: (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The Goose Lake Slough (Goose Lake Canal/Channel) was first modified in 1874 when a regulator was built across the cleaned and enlarged head of Goose Lake Slough (Grunsky 1898). The slough itself remained unchanged for 80 years until the mid-1950's when it was channelized in conjunction with the construction of Isabella Reservoir (Whitley et al. 2015). One segment of the canal was recorded by JRP Historical Consulting Services (JRP) in 1993 near Renfro Road. This segment of the canal was named the "Rio Bravo Canal" by JRP. They reported a dirt-lined canal with a top width of 58-ft, a bottom width of 38-ft, and a depth of 5-ft. Additionally, they recorded six corrugated steel culverts conveying water from the canal under Renfro Road. ASM recorded two separate segments (Segment A and Segment B) of Goose Lake Slough during the current survey. Houghton Weir is located within the Goose Lake Slough within Segment A, while Segment B only consists of a portion of the Goose Lake Slough itself.

Page 2 of 7

Resource Name or #: (Assigned by recorder): P-15-008121 UPDATE

L1. **Historic and/or Common Name:** Goose Lake Slough/Goose Lake Canal or Channel

L2a. **Portion Described:** ☐ Entire Resource ☒ Segment ☐ Point Observation **Designation:** Segment A; Segment B

b. **Location of point or segment:** **Segment A (at weir):** Zone 11N, 304454mE / 3915162mN; **Segment B (center):** Zone 11N, 293802mE / 3916327mN

L3. **Description:** Segment A consists of an approximately 100-ft long segment of the Goose Lake Slough with Houghton Weir at the center. The weir acts as a bottleneck in the Goose Lake Slough, creating a reservoir on the east side which is approximately 230-ft wide. On the west, the canal narrows to approximately 60-ft wide. Broken concrete blocks have been placed along the floor and banks of the canal on the down-canal side of the weir as erosion control. It is unclear where the blocks originated, though it is possible they are from a previous version of the weir.

L4. **Dimensions:** (In feet for historic features and meters for prehistoric features)

- a. **Top Width:** Segment A (upstream of weir): ~220-ft; (downstream of weir): ~90-ft. Segment B: between 75-ft and 50-ft
- b. **Bottom Width:** Segment A (upstream of weir): ~195-ft; (downstream of weir): ~60-ft. Segment B: between ~50-ft and ~30-ft
- c. **Height or Depth:** Segment A: ~9-ft; Segment B: ~6-ft
- d. **Length of Segment:** Segment A: 130-ft (northeast-southwest); Segment B: 237-ft (northeast-southwest)

L5. **Associated Resources:** Houghton Weir: The weir is approximately 40-ft long (north/northwest by south/southeast) and spans a constriction in the Goose Lake Slough. It consists of nine slightly angled flashboard bays with steel supports and a steel walkway over the top. The weir is anchored by concrete support walls on either side and built atop a concrete platform. The concrete support walls and base are approximately 15-ft wide. The overall height of the weir is approximately 9-ft high (12-ft total including the walkway handrail). Based on historic aerial imagery, the Houghton Weir was constructed sometime between 1952 and 1968. It was likely constructed when the Goose Lake Slough was channelized in the mid-1950s in conjunction with the construction of the Isabella Reservoir (Whitley et al. 2018).

L6. **Setting:** Located on the open flats of the southern San Joaquin Valley east of the City of Bakersfield.

L7. **Integrity Considerations:** The two segments of the Goose Lake Slough/Channel lack integrity of design, setting, materials, location, association and feeling. They are recommended as not NRHP or CRHR eligible.

L8a. **Photograph, Map or Drawing:** See Continuation Sheet

L8b. **Description of Photo, Map, or Drawing:** See Continuation Sheet

L9. **Remarks:** Another segment of the Goose Lake Slough/Channel was determined not NRHP eligible by the FHWA and DOE in 1997 and 2004.

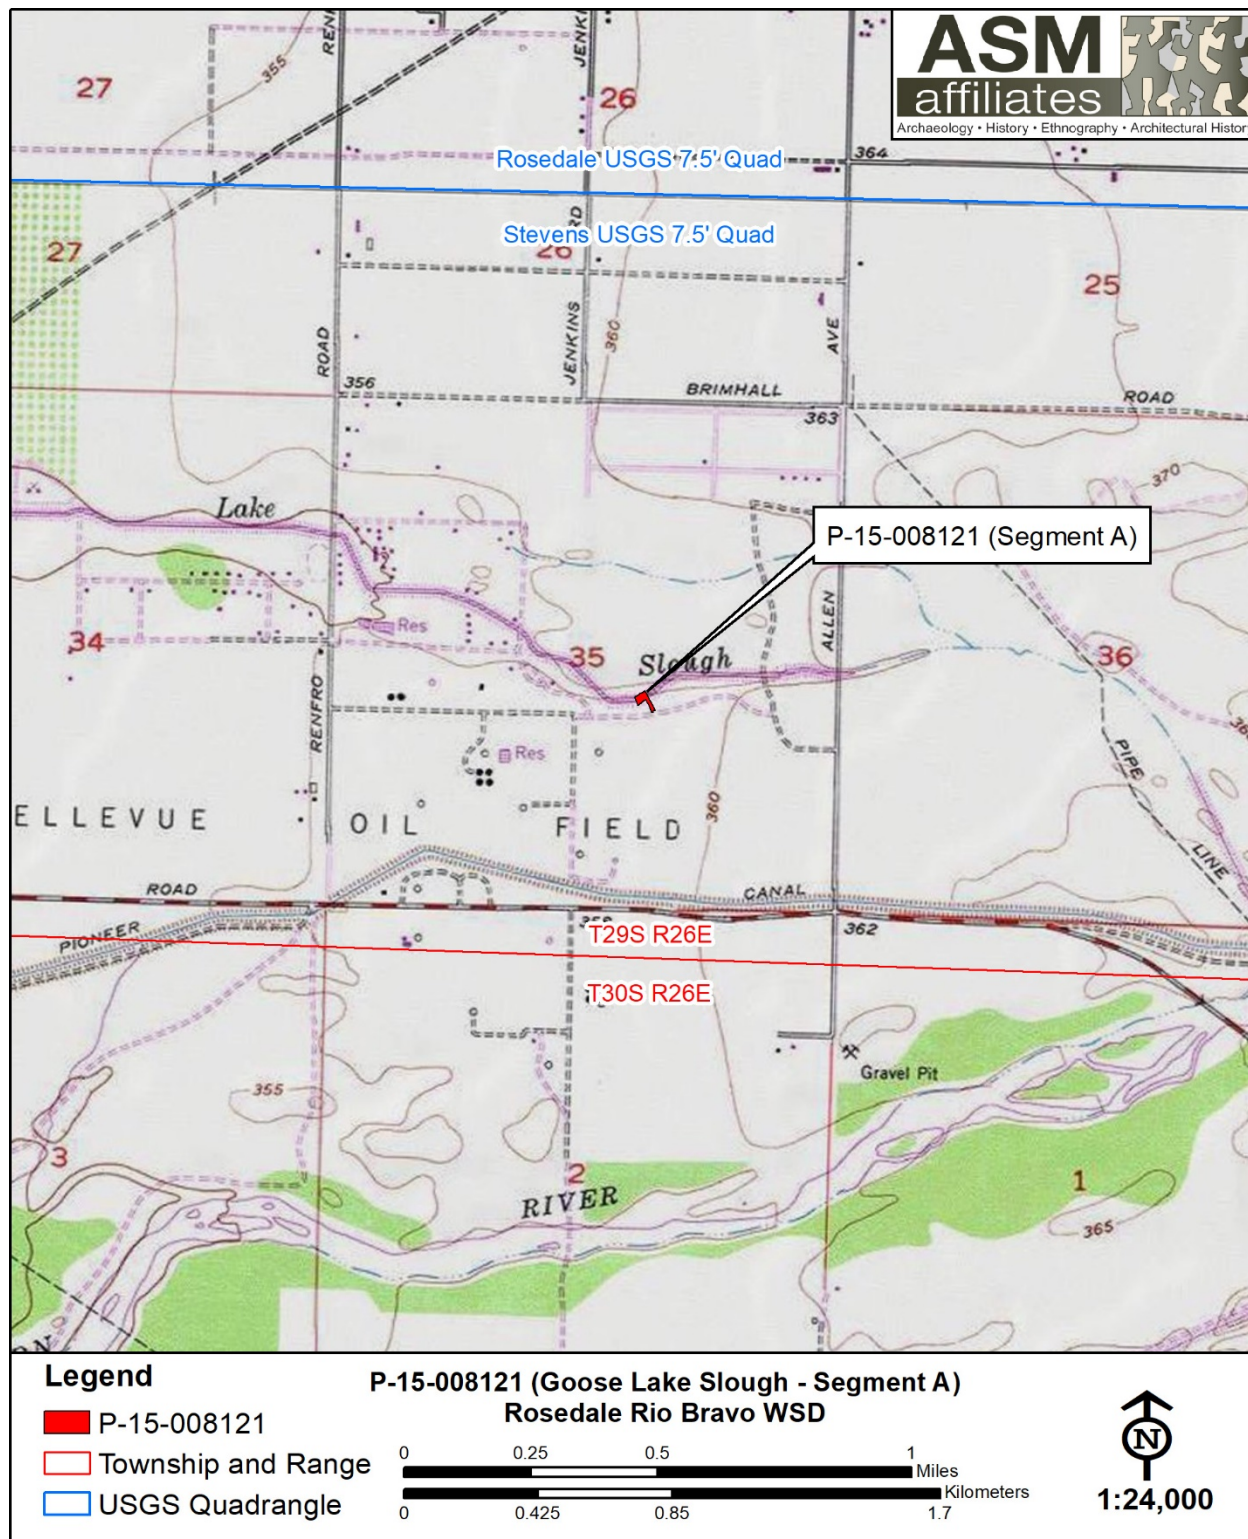

L10. **Form Prepared by:** P. Carey, ASM Affiliates Inc., 20424 W. Valley Blvd., Suite A, Tehachapi CA, 93561

CANAL FEATURE INVENTORY FORM

Developed by JRP Historical Consulting Services

PROJECT: Highway 58 Route Adoption Study, Tier 1 EIS/R

LOCATION NO: CVC-1

PHOTO DATE: August 16, 1993

1. Name of Feature: **Cross Valley Canal**
2. Location of recordation: CVC-1 is located west of Enos Lane and south of the Stockdale Highway.
3. Other locations for recording this feature: CVC-2, CVC-3, CVC-4, and CVC-5
4. Structures at or near this location: Pumping Plant No. 2 of the Cross Valley Canal is located within the canal at this site. Also located nearby is the Rosedale-Rio Bravo Water Storage District Turnout No. 1.
5. Setting at this location: The area is surrounded by agricultural fields.
6. Integrity considerations for this feature: This section of the canal retains its original alignment and geometry, and is concrete lined.
7. Attributes at this location (measurements in feet):
 Top width: Unable to measure - no access.
 Bottom width: Unable to observe due to high flows
 Height or Depth: Unable to observe due to high flows
 Material: Concrete lined.

CANAL FEATURE INVENTORY FORM

Developed by JRP Historical Consulting Services

PROJECT: Highway 58 Route Adoption Study, Tier 1 EIS/R

LOCATION NO: CVC-2
PHOTO DATE: August 16, 1993

1. Name of Feature: Cross Valley Canal
2. Location of recordation: CVC-2 is located south of where the Pioneer Canal crosses the Asphalt Branch of the SPRR, due south of an oil processing plant.
3. Other locations for recording this feature: CVC-1, CVC-3, CVC-4, and CVC-5
4. Structures at or near this location: Dirt access roads, bounded by chain-link fences, parallel the canal.
5. Setting at this location: The area surrounding the canal is agricultural.
6. Integrity considerations for this feature: The canal appears to retain its original alignment, geometry, and materials.
7. Attributes at this location (measurements in feet):

Top width: Unable to measure - no access.

Bottom width: Unable to observe due to high flows

Height or Depth: Unable to observe due to high flows

Material: Concrete lined.

CANAL FEATURE INVENTORY FORM

Developed by JRP Historical Consulting Services

PROJECT: Highway 58 Route Adoption Study, Tier 1 EIS/R**LOCATION NO:** CVC-3**PHOTO DATE:** August 16, 1993

1. **Name of Feature:** Cross Valley Canal
2. **Location of recordation:** CVC-3 is located where Coffee Road crosses the Cross Valley Canal.
3. **Other locations for recording this feature:** CVC-1, CVC-2, CVC-4, and CVC-5
4. **Structures at or near this location:** Pumping Plant No. 6 is located within the canal east of this point. A pipeline spans the canal to the southwest. Dirt access roads, bounded by fences, parallel the canal.
5. **Setting at this location:** A modern bridge carries Coffee Road across the Cross Valley Canal and the Kern River. There are commercial buildings located at Brimhall and Coffee roads, and Truxtun Avenue and Coffee Road. Northwest of Brimhall and Coffee roads are residences.
6. **Integrity considerations for this feature:** The canal appears to retain its original alignment, geometry, and materials.
7. **Attributes at this location (measurements in feet):**
Top width: Unable to measure - no access.
Bottom width: Unable to observe due to high flows
Height or Depth: Unable to observe due to high flows
Material: Concrete lined.

8. **Sketch, in cross section:**

David S. Whitley, Ph.D., RPA
Director/Project Manager/Principal Investigator

Firm Name: ASM Affiliates, Inc., Tehachapi, California

Total Years of Experience: 43

Employment History:

2009-current Director, ASM Affiliates, Inc., Carlsbad, California
1982-2009 Owner, W & S Consultants, cultural resource management consultants
1989-2000 Instructor, Division of Social Sciences and Humanities, UCLA Extension.
1987-1989 Postdoctoral Research Fellow, Rock Art Research Unit, Archaeology Department, University of the Witwatersrand.
1983-1987 Chief Archaeologist, Institute of Archaeology, and Lecturer, Dept. of Anthropology, UCLA.

Education:

Ph.D. 1982/Anthropology/University of California, Los Angeles
M.A. 1979/Geography/University of California, Los Angeles
B.A. 1976/Anthropology and Geography/University of California, Los Angeles

Additional Training:

2011 PASSPORT certification
1998 MSHA Certification, Surface Mining

Registrations:

1979 Register of Professional Archaeologists

Professional Memberships:

1981 American Anthropological Association
1977 Society for American Archaeology
1977 Society for California Archaeology
2010 Association of Environmental Professionals

Awards/Commendations:

2006 *Introduction to Rock Art Research* received Choice Outstanding Academic Book Award.
2004 Fulbright Senior Specialist Grant, Universidad de San Carlos, Guatemala.
2001 Thomas F. King Award for Excellence in Cultural Resource Management, Society for California Archaeology.
2000 *Art of the Shaman* (University of Utah Press) reached #4 on Amazon.com LA Best Seller list; French edition selected by U.S. State Department, African Section, as Ambassadorial Presentation volume.
1999 Listed in *Who's Who in America*
1997 Listed in *Who's Who among Hispanic Americans*
1999 Special Appreciation Award, California Indian Council.
1993 Fellow, American Anthropological Association.

1993	Special Appreciation Award, California Indian Council.
1991	Special Appreciation Award, Simi Valley Historical Society.
1989	Special Appreciation Award, Candelaria Indian Tribal Council.
1983	Golden Eagle Award, CINE Film Festival, Washington, D.C.
1983	Silver Medal, New York Film and Television Festival.
1983	Postdoctoral Research Fellowship, Association for Field Archaeology.
1976	A.B. degrees in Anthropology and Geography awarded Magna Cum Laude.
1971-1976	Honors at Entrance and College of Letters and Sciences Honors Program, UCLA.

Citizenship: USA

Languages: Spanish

References:

Mr. B. Joe Ashley, California Resources Corporation, Bakersfield, CA, (661) 301-6551

Dr. Ronald I. Dorn, Professor of Geography Arizona State University Tempe, AZ (480) 966-4245

Dr. Kelley Hays-Gilpin, Associate Professor, Department of Anthropology, Northern Arizona University, (520) 523-6564

Professional Profile:

Dr. Whitley specializes in the prehistoric archaeology and ethnography of far western North America, with particular interests in sacred sites, rock art, chronometrics and cultural heritage management. He has also worked in southern Africa, the European Upper Paleolithic and Guatemala. He has also directed a number of historical archaeological projects involving mining properties, water conveyance systems, and industrial archaeology in California. His professional publications include 17 books/monographs and approximately 100 articles and chapters. Included among his recent books are *The Rock Art of California* (University of Utah Press, 2000), the edited volume *Handbook of Rock Art Research* (AltaMira Press, 2001), and *Introduction to Rock Art Research* (Left Coast Press, 2005, second edition 2011), which received a *Choice* Outstanding Academic Book Award for 2006. His latest book is *Cave Paintings and the Human Spirit: The Origin of Creativity and Belief* (Prometheus Books, 2009). His publications have been translated into 5 languages beyond English.

Dr. Whitley has written nominations for 460 sites that are now listed on the National Register of Historic Places (NRHP), and the 100 site Carrizo Plain Archaeological National Historic Landmark (NHL) district, approved in 2012. Whitley has served as an expert witness in litigation and arbitration in California, Washington state, Nevada, Texas and Montana. He served on the State of California, Historical Resources Commission, in 1986 – 1987. For a decade he served on the Council of Directors of the ICOMOS International Rock Art Committee, and has served as the Secretary of the International Union of Prehistoric and Protohistoric Sciences (IUPPS) Prehistoric Art Committee. In 2001 he received the Thomas King Award from the Society for California Archaeology for Excellence in Cultural Resource Management.

Research Specializations

Hunter-gatherer ethnography, ethnohistory & archaeology
 Religion and art
 Culture and cognition/ Evolutionary psychology
 Western North America, southern Africa, Mesoamerica
 Method, theory and philosophy of science

Selected Project Experience:**Cultural Resource Studies, Hungry Valley State Vehicular Recreation Area, Gorman, California****CLIENT: California State Parks**

Directed the survey of 845-acres and the field assessment of 135 previously recorded sites within the 18,000-acres Hungry Valley SVRA, especially with respect to OHV damage. Responsible for client coordination, field assessment methodology and analysis and final report, including management recommendations.

Muroc School Renovation Project, Edwards AFB, Kern County, California**Client: Muroc Joint Unified School District**

Directed an archaeological survey of a 100-acres campus containing 4 schools and coordinated with architectural historians on the documentation and recording of over 50 buildings, for NHPA Section 106 compliance. Responsible for completing the final report, including recommended determination of effects. Conducted SHPO and tribal consultation for and under delegated authority by the Muroc JUSD.

Phase I Survey of 1,000-acres and 5-mile Tie-Line for the Alamo Springs Solar Project, Kern and Kings Counties, California**CLIENT: Ecology and Environment, Inc.**

Responsible for directing a Phase I survey/Class III inventory for a proposed 100-acres solar project on the Kettleman Plain. Managed the survey, report writing, management recommendations and client coordination.

Rock Art Damage Assessment, Fort Hunter-Liggett, Monterey County, California**CLIENT: Colorado State University**

Directed the documentation of two pictographs and an associated midden site, and assessed damages resulting from small-arms fire to these sites. Completed the final report, including mitigation measures and managements recommendations.

Phase I Survey of Approximately 480 Acres in the Mojave Desert for the Apollo Solar Projects, Kern County, CA Project Manager**CLIENT: Quad Knopf, Inc.**

Responsible for an intensive Phase I cultural resources survey for a proposed 480-acre solar project. Managed the survey, recommendation of eligibility, client coordination, and prepared the final report which included management and mitigation recommendations.

Phase I Survey of Approximately 266 Acres & Phase II Significance Evaluations for 10 Historic Sites in the Mojave Desert for the Inyokern Solar Project, Kern County, CA Project Manager**CLIENT: Quad Knopf, Inc.**

Responsible for an intensive Phase I survey and Phase II determination of eligibility for a proposed 266-acre solar project. Managed the survey and determinations of significance, client coordination, and prepared the final report, which included management and mitigation recommendations.

Class III Inventory of a Linear Project Area for Perdito Mine Road Construction, Inyo County, CA Project Manager**CLIENT: Silver Standard Resources, Inc.**

Responsible for an intensive Class III inventory for a proposed 160-acre mining project. Managed the survey, client coordination, and prepared the final report, which included management and mitigation recommendations.

Phase I Survey and Phase II Test Excavations, Tejon Grapevine Study Area, Kern County, CA Project Manager**CLIENT: Tejon Ranchcorp**

Coordinated Phase I archaeological survey of 15,315 acres and determinations of significance/test excavations for 19 sites for CEQA compliance, including crew assignment and scheduling, coordination of paleontological studies, consultation with agency personnel, and preparation of draft and final reports.

Henrietta Solar Project, Lemoore, Kings County, CA

Project Manager

CLIENT: Ecology and Environment, Inc.

Coordinated Phase I survey/Class III inventory and monitoring for 800-acres solar project involving Native American tribal outreach, preparation of a Cultural Resources Mitigation Monitoring Reporting Program (MMRP) and Worker Environmental Awareness Program (WEAP) training, and construction monitoring, including crew assignment and scheduling, consultation with agency personnel, and preparation of draft and final reports.

Rio Lobo 3D Geophysical Survey, Kings and Fresno counties, CA

Project Manager

CLIENT: California Resources Corporation

Coordinated Class III cultural resources inventory and paleontological survey of 115 linear miles of geophysical transects in the North Dome Oil Field for NHPA compliance, including crew assignment and scheduling, consultation with agency and applicant personnel, and preparation of draft and final reports.

Class III Inventories and NRHP Eligibility Evaluations, Kern, Kings and Fresno Counties, CA

Project Manager

CLIENT: Occidental of Elk Hills, Inc./Vintage Production California/California Resources Corporation

Coordinated on-call contracts involving Class III large-scale block surveys for NHPA compliance and NRHP eligibility evaluations, including crew assignment and scheduling, consultation with agency personnel, and preparation of draft and final reports. Over 20,000 cumulative acres surveyed, and 40 sites evaluated for NRHP eligibility.

California Valley Solar Ranch Phase II Test Excavation and Construction Monitoring, San Luis Obispo County, CA

Project Manager

CLIENT: Ecology and Environment, Inc.

Coordinated a contract involving a Phase II test excavation for CEQA and NHPA compliance, preparation of a Cultural Resources Mitigation Monitoring Reporting Program (MMRP) and Worker Environmental Awareness Program (WEAP) training, and construction monitoring, including crew assignment and scheduling, consultation with agency personnel, and preparation of draft and final reports.

Kern River Pipeline Mountain Pass Class III Inventory, San Bernardino County, CA

Project Manager

CLIENT: Ecology and Environment, Inc.

Coordinated a contract involving an inventory of an 8.65-mile lateral ROW and 24.5 miles of access roads, including crew assignment and scheduling, consultation with BLM and MolyCorp Mine personnel, and preparation of draft and final reports.

Coso NHL Management Plan, NAVFAC Southwest, Inyo County, CA

Co-Principal Investigator and Report Co-Author

CLIENT: NAWS China Lake

Prepared a management plan for the Coso NHL district, a 57-square-mile area containing the largest concentration of petroglyph sites in North America. This has involved coordination with stakeholders, including Native American tribes, development of management and conservation protocols, and identification and prioritization of future preservation tasks for the only rock art NHL situated west of the Rockies.

SDG&E On-Call Cultural Resource Studies and Sunrise Powerlink Archaeological Monitoring, San Diego County, CA
Project Manager

CLIENT: SDG&E and Burns and McDonnell Engineering

Coordinated a contract to provide archaeological services for powerline installation and maintenance projects involving 37 site evaluations for NRHP/CRHR eligibility and archaeological monitoring for the construction of the 118-mile-long Sunrise Powerlink transmission line from Imperial County to the coast in San Diego. Oversaw project coordination, assignment and scheduling of personnel, preparation of technical reports and Historic Properties Treatment Plan, and provided technical expertise in prehistory and Federal compliance.

Draft Environmental Impact Statement for the Marine Corps' MAGTF Land Expansion, San Bernardino County, CA

Co-Principal investigator and Co-Author

CLIENT: TEC Inc.

Prepared a cultural resources sections of a NEPA draft EIS for a proposed 150,000-acre land expansion.

Tejon Mountain Village Project, Kern and Los Angeles counties, CA

Principal Investigator and Report Author

CLIENT: DMB Pacific Ventures for Tejon Mountain Village LLC

Completed a Phase I survey of 28,000 acres and Phase II testing of 37 prehistoric and 3 historic sites, for CEQA and NHPA Section 106 compliance.

Archaeological Assessment of CA-INY-434 and -7117, Inyo County, CA

Principal Investigator and Field Director

CLIENT: Epsilon Systems Solutions

Prepared a condition assessments of petroglyph sites CA-INY-434 and -7117, involving site documentation and mapping, evaluation of current conditions and identification of natural and cultural impacts to the sites, and management recommendations for long-term preservation.

Centennial Project Survey and Testing, Los Angeles County, CA

Principal Investigator

CLIENT: Centennial Partners, LLC.

Conducted a Phase I survey of 16,000 acres and Phase II testing of 22 prehistoric sites for CEQA compliance.

Professional Appointments

2012-	Senior Research Fellow, Rock Art Research Institute, University of the Witwatersrand, Johannesburg.
2007 –	Secretary, Prehistoric Committee, International Union of Prehistoric and Protohistoric Sciences (IUPPS).
2006-2012	Advisory Board, Institute of Cognition and Culture, Queen's University, Belfast.
2003-	Adjunct Professor, School of Geographical Sciences, Arizona State University.
2002-2009	Series Editor, AltaMira Press, Archaeology of Religion.
1996-2008	Chair/Organizer, Society for American Archaeology, Rock Art Interest Group.
1996-2009	Chauvet Cave Research Advisory Committee, Ministere de la Culture, France.
1996-2009	Archaeological & Anthropological Advisor, Ventura County Cultural Heritage Board.
1992-2004	United States Representative, International Council on Monuments and Sites (ICOMOS), Comité International d'Art Rupestre (CAR), Council of Directors, 1997-2004.
1986-1987	Prehistoric Archaeologist, State of California Historical Resources Commission.

- 1980 Preliminary Investigations at a Site Complex on the North Ranch, Westlake, Ventura County, California, by DS Whitley et al, pp. 43-120. In *Inland Chumash Archaeological Investigations*, ed. DS Whitley, EL McCann and CW Clewlow, Jr. UCLA Institute of Archaeology, Monograph 15.
- 1980 An Unusual Lithic Feature from an Inland Chumash Site, by DS Whitley and CW Clewlow, Jr., pp.153-166. In *Inland Chumash Archaeological Investigations*, ed. DS Whitley, EL McCann and CW Clewlow, Jr. UCLA Institute of Archaeology, Monograph 15.
- 1980 Intra-Site Variability on Ven-261: A Test Case, by DS Whitley et al, pp. 167-186. In *Inland Chumash Archaeological Investigations*, ed. DS Whitley, EL McCann and CW Clewlow, Jr. UCLA Institute of Archaeology, Monograph 15.
- 1979 Introduction to Oak Park Prehistory, by CW Clewlow, Jr. and DS Whitley, pp.1-5. In *The Archaeology of Oak Park, Ventura County, California*, Volume III, ed. CW Clewlow, Jr. and DS Whitley. UCLA Institute of Archaeology, Mon. 11.
- 1979 A Historical Perspective on the Research at Oak Park, pp. 6-29. In *The Archaeology of Oak Park, Ventura County, California*, Volume III, ed. CW Clewlow, Jr. and DS Whitley. UCLA Institute of Archaeology, Monograph 11.
- 1979 Surface Archaeology at Oak Park, by DS Whitley et al, pp. 30-83. In *The Archaeology of Oak Park, Ventura County, California*, Volume III, ed. CW Clewlow, Jr. and DS Whitley. UCLA Institute of Archaeology, Monograph 11.
- 1979 Preliminary Excavations at CA-Ven-122, by DS Whitley et al, pp. 84-130. In *The Archaeology of Oak Park, Ventura County, California*, Volume III, ed. CW Clewlow, Jr. and DS Whitley. UCLA Institute of Archaeology, Monograph 11.
- 1979 The Excavation of the Oak Park Rockshelters, by CW Clewlow, Jr., et al, pp. 131-148. In *The Archaeology of Oak Park, Ventura County, California*, Volume III, ed. CW Clewlow, Jr. and DS Whitley. UCLA Institute of Archaeology, Monograph 11.
- 1979 The Organizational Structure of the Lulapin and Humaliwo, by DS Whitley and CW Clewlow, Jr., pp. 149-174. In *The Archaeology of Oak Park, Ventura County, California*, Volume III, ed. CW Clewlow, Jr. and DS Whitley. UCLA Institute of Archaeology, Monograph 11.
- 1979 The Ring Brothers Site Complex, by CW Clewlow, Jr., DS Whitley and EL McCann, pp. 1-10. In *Archaeological Investigations at the Ring Brothers Site Complex, Thousand Oaks, California*, ed. CW Clewlow, Jr., DS Whitley and EL McCann. UCLA Institute of Archaeology, Monograph 13.
- 1979 Artifacts from the Ring Brothers Site Complex, by DS Whitley et al, pp. 11-100. In *Archaeological Investigations at the Ring Brothers Site Complex, Thousand Oaks, California*, ed. CW Clewlow,
-

Jr., DS Whitley and EL McCann. UCLA Institute of Archaeology, Monograph 13.

- 1979 Subsurface Features, Tools Kits and a Sweathouse Pit at the Ring Brothers Complex, pp. 101-110. In *Archaeological Investigations at the Ring Brothers Site Complex, Thousand Oaks, California*, ed. CW Clewlow, Jr., DS Whitley and EL McCann. UCLA Institute of Archaeology, Monograph 13.
- 1979 Perspectives on the Ring Brothers Site Complex and the Archaeology of the Arroyo Conejo, by DS Whitley and CW Clewlow, Jr., pp. 111-126. In *Archaeological Investigations at the Ring Brothers Site Complex, Thousand Oaks, California*, ed. CW Clewlow, Jr., DS Whitley and EL McCann. UCLA Institute of Archaeology, Monograph 13.

List of Additional Publications on Request

Teaching Experience:

North American Prehistory
Eastern Mesoamerica (Maya sphere)
California Prehistory
Archaeological Field Training

North American Ethnography
Western Mesoamerica (Aztec sphere)
California Ethnography
World Rock Art

- 1989-2005 Instructor, Division of Social Sciences and Humanities, University of California, Los Angeles Extension
- 1987-1989 Post-doctoral Fellow, University of the Witwatersrand, South Africa
- 1983-1987 Chief Archaeologist/ Lecturer, University of California, Los Angeles

Film & Recording Credits:

- 2006 Archaeological consultant, "A Light in the Darkness" feature film, Bearsmouth Productions.
- 1998 Executive producer, Giant Records artist Chris Ward, "Angels Fly" CD.
- 1997-8 Archaeological consultant, "Visions on Stone" video, Maturango Museum.
- 1992 Executive producer, Giant Records artist Chris Ward, "Faith 'Aint Faith" CD.
- 1991-2 Anthropological consultant, "Blackfeather/Mystic" TV pilot, Hearst Entertainment/CBS.
- 1986 Senior script writer, "Invitation to Adventure", Institute of Archaeology, UCLA.
- 1986 Archaeological consultant, "Vibes" Columbia Pictures feature film.
- 1982 Script writer, "Rock Art Treasures of Ancient America", Dave Caldwell Productions.
- 1982 Script consultant, "Rock Art from the Mountains of Fire", RUJAC Productions.

Robert Azpitarte

Associate Archaeologist

Firm Name: ASM Affiliates, Inc., Tehachapi, California

Total Years of Experience: 8

Employment History:

2015-2019 ASM Affiliates, Inc., Associate Archaeologist
2017 Petra Resource Management, Field Technician
2011-2015 ASM Affiliates, Inc., Field Technician

Education:

B.A. 2012/Anthropology/California State University, Bakersfield
B.A. 2012/Art (Studio)/California State University, Bakersfield

Additional Training:

2018 PASSPORT Training
2016 CRC South Training

Professional Memberships or Affiliations:

2011-2018 Society for California Archaeology
2018 Society for American Archaeology
2012-2018 CSU Bakersfield Alumni Association

Professional Profile:

Mr. Azpitarte has held a number of positions of increased responsibility within the field of cultural resources management since 2011. Mr. Azpitarte has spent eight years documenting prehistoric and historic sites in California's Central Valley including numerous survey, testing, and data recovery projects. Mr. Azpitarte has also participated in Great Basin fieldwork in eastern and northern Nevada, as well as work in the lower and upper Mojave regions. Currently, Mr. Azpitarte serves ASM as an Associate Archaeologist.

Select Project Experience:

MOC Sharks Tooth Lease Survey, Kern County, CA

Crew Chief

CLIENT: Macpherson Oil Company

Conducted a Class III Inventory survey for approximately 356-acres near Round Mountain, California. Recorded and completed site record forms for newly identified sites; assessed the current condition of each cultural resource; mapped artifacts and site locations; and completed a technical report that documents and summarizes the archaeological record for this study area. The study was undertaken to assist with compliance with Section 106 of the National Historic Preservation (NHPA). *Reference:* Corey Eskew, Project Manager (ceskew@macphersonenergy.com).

Crimson Woodward Lease Survey, Kern County, CA

Crew Chief

CLIENT: Crimson Resource Management

Conducted a Class III Inventory survey for approximately 128-acres near Maricopa, California. Recorded and completed site record forms for newly identified sites; assessed the current condition of each cultural resource; mapped artifacts and site locations; and completed a technical report that documents and

summarizes the archaeological record for this study area. The study was undertaken to assist with compliance with Section 106 of the National Historic Preservation (NHPA) in anticipation of future work within the lease. *Reference:* Benny Hathaway, Special Projects Advisor (BHathaway@crimsonrm.com).

AEWSD Ground Water Metering Project, Kern County, CA

Crew Chief

CLIENT: Arvin-Edison Water Storage District

Conducted a Class III Inventory survey for approximately 51 existing water wells across the southeastern Southern San Joaquín Valley, California. Recorded and completed site record forms for newly identified sites; assessed the current condition of each cultural resource; mapped site locations; and completed a technical report that documents and summarizes the archaeological record for this study area. The study was undertaken to assist with compliance with Section 106 of the National Historic Preservation Act (NHPA) of 1966 and the California Environmental Protection Act (CEQA). *Reference:* Mark Dawson, P.E., Engineer (mdawson@aewsd.org).

San Lauren Project, Kern County, CA

Crew Chief

CLIENT: Quad Knopf, Inc.

Conducted a Class III Inventory survey for approximately 160-acres in Bakersfield, California. Recorded and completed site record forms for newly identified and previously identified sites; assessed the current condition of each cultural resource; mapped artifacts and site locations; and completed a technical report that documents and summarizes the archaeological record for this study area. The study was undertaken to provide compliance with the California Environmental Quality Act (CEQA). *Reference:* Chris Mynk, Principal Planner/ Project Manager (Christopher.Mynk@qkinc.com).

EPD Solar Weedpatch and Shafter Camp Project, Kern County, CA

Crew Chief

CLIENT: EPD Solutions

Phase II test excavations and determinations of significance were conducted at historic Weed Patch or Sunset Farm Labor Camp, and the Shafter Farm Labor Camp. Recorded and completed site record forms for the previously identified sites; assessed the current condition of each cultural resource; mapped associated camp features; and completed a technical report that documents and summarizes the archaeological record for this study area. The study was undertaken to provide compliance with the California Environmental Quality Act (CEQA) as well as the Kern County General Plan for the Weed Patch and Shafter Solar Projects. *Reference:* Jeremy Krout, President (admin@epdsolutions.com).

Gettysburg Solar Survey, Kern County, CA

Crew Chief

CLIENT: Quad Knopf, Inc.

Conducted a Class III Inventory survey for approximately 160-acres near Willow Springs, California. Recorded and completed site record forms for newly identified sites; assessed the current condition of each cultural resource; mapped artifacts and site locations; and completed a technical report that documents and summarizes the archaeological record for this study area. The study was undertaken to provide compliance with the California Environmental Quality Act (CEQA). *Reference:* Jaymie L. Brauer, Principal Planner/ Project Manager (Jaymie.Brauer@qkinc.com).

Pier East Area Survey, Tulare County, CA

Crew Chief

CLIENT: Tule River Indian Tribe

Conducted a Class III Inventory survey for approximately 250-acres within the Tule River Indian Tribe Reservations, California. Recorded and completed site records updates and site record forms for newly identified sites; assessed the current condition of each cultural resource; mapped artifacts and site locations; and completed a technical report that documents and summarizes the archaeological record for this study area. *Reference:* Kerri Vera, TRIR Department of Environmental Protection (tuleriverenv@yahoo.com).

Pier East Timber Salvage Project, Tulare County, CA**Crew Chief****CLIENT: Tule River Indian Tribe**

Conducted a Class III Inventory survey for approximately 565-acres within the Tule River Indian Tribe Reservations, California. Completed site records updates and site record forms for previously identified sites; assessed the current condition of each cultural resource; mapped artifacts and site locations; and completed a technical report that documents and summarizes the archaeological record for this study area.

Reference: Kerri Vera, TRIR Department of Environmental Protection (tuleriverenv@yahoo.com).

Red Rock Canyon Ricardo Complex, Kern County, CA**Crew Chief****CLIENT: California State Parks, OHMV Division**

Conducted a Class III Inventory survey for approximately 451-acres within the Red Rock Canyon State Park, California. Completing site records updates and site record forms for newly identified and previously identified sites; assessed the current condition of each cultural resource; mapped and recovered artifacts in danger of destruction or illicit collection by park visitors; cataloged and processed the recovered artifacts and additional artifacts at the Visitor Center for curation; and completed a technical report that documents and summarizes the archaeological record for this study area. *Reference:* Peggy Ronning, Museum Curator (Peggy.Ronning@parks.ca.gov).

CRC KNDU Facility Repair, Kings and Fresno County, CA**Crew Chief****CLIENT: California Resources Corporation**

Conducted a Class III Inventory survey for approximately 777-acres near Kettleman City, California. Recorded and completed site record forms for newly identified sites; assessed the current condition of each cultural resource; mapped artifacts and site locations; and completed a technical report that documents and summarizes the archaeological record for this study area. The inventory was undertaken in anticipation of future repairs to facilities within the Kettleman North Dome Unit. *Reference:* Palmira Hernandez, Regulatory Advisor (palmira.hernandez@crc.com).

Sand Ridge Preserve Project, Kern County, CA**Crew Chief****CLIENT: Center for Natural Lands Management**

Conducted a Class III Inventory survey for approximately 56-acres of the Sand Ridge Preserve in Bakersfield, California. Recorded and completed site record forms for newly identified and previously identified sites; assessed the current condition of each cultural resource; mapped artifacts and site locations; and completed a technical report that documents and summarizes the archaeological record for this study area. The study was undertaken to assist with compliance with Section 106 of the National Historic Preservation Act (NHPA). *Reference:* Greg Warrick, Preserve Manager (gwarrick@cnlm.org).

ENE First Solar, Kern County, CA**Crew Chief****CLIENT: Ecology and Environment, Inc.**

Conducted a Class III Inventory survey for approximately 3,019-acres near Rosamond, California. Recorded and updated 65 cultural resources within the proposed solar array blocks. assessed the current condition of each cultural resource; mapped artifacts and site locations; and completed a technical report that documents and summarizes the archaeological record for this study area. The study was undertaken to assist with compliance with the California Environmental Quality Act (CEQA) and Section 106 of the National Historic Preservation (NHPA). *Reference:* David Plumpton, Planner (DPlumpton@ene.com).

CRC Kettleman North Dome Block Surveys, Kings and Fresno counties, CA**Crew Chief****CLIENT: California Resources Corporation**

Conducted a Class III Inventory survey for approximately 473-acres within the Kettleman North Dome Unit (KNDU) Oilfield near Kettleman City, California. The project included the identification and recordation of historic sites. Subsequently processed and compiled data for an inventory report following Department of Interior standards.

CRC Kettleman North Dome Reworks Project, Kings County, CA

Crew Chief

CLIENT: California Resources Corporation

Conducted a Class III Inventory survey and monitored five well pads for the KNDU Reworks Project within the Kettleman North Dome Unit (KNDU) Oilfield near Kettleman City, California. The project included the identification and recordation of historic sites. Subsequently processed and compiled data for an inventory report following Department of Interior standards.

Alamo Springs Solar Survey, Kings County, CA

Crew Chief

CLIENT: Ecology and Environment, Inc.

Conducted a Class III Inventory survey for approximately 1000-acres and a 4.9-mile gen-tie corridor near Kettleman City, California. Subsequently compiled and processed data for a survey report following Department of Interior standards.

Southern California Edison Doble V2, San Bernardino County, CA

Crew Chief

CLIENT: CH2M Hill

Participated in Class III Inventory survey and site relocation for approximately 15-miles of a transmission corridor in Lucerne Valley and San Bernardino Mountains. Site updates were undertaken for 37 previously recorded sites. Data compiled during project was processed and submitted upon completion of survey.

Sultana CSD Well and Pipeline Project, Tulare County, CA

Crew Chief

CLIENT: Provost & Pritchard Consulting Group

Conducted a Class III Inventory survey for 160-acres near and within Sultana, California. Participated in NRHP Eligibility recordation for identified sites within the project area. Subsequently processed inventory and compiled data for an inventory report following Department of Interior standards.

HRSA Family Healthcare Network Project, Kings County, CA

Crew Chief

CLIENT: Provost & Pritchard Consulting Group

Conducted Phase II subsurface testing of approximately 2-acres in Hanford, California. Subsequently processed inventory data and lab results to compile an inventory report following Department of Interior standards.

Inyokern Solar Project, Kern County, CA

Crew Chief

CLIENT: Quad Knopf Inc.

Conducted a Phase I/Class III Inventory of 200-acres, as well as NRHP evaluations of 10 historic sites located within Inyokern. Subsequently processed inventory data and lab results to compile an inventory report following Department of Interior standards.

Rio Bravo and Wildwood Solar Projects, Kern County, CA

Crew Chief

CLIENT: Ecology and Environment, Inc.

Monitored the construction of multiple solar arrays near Buttonwillow and Wasco, California. Subsequently processed inventory data and lab results to compile an inventory report following Department of Interior standards.

Silver Standard Perdito Mine Project, Inyo County, CA**Crew Chief****CLIENT: Silver Standard Resources Inc.**

Conducted a Phase I/Class III Inventory of 40-acres within the Inyo Mountains. Subsequently processed inventory data and lab results to compile an inventory report following Department of Interior standards.

KWBA New Pioneer Turn-out and Ponds Project, Kern County, CA**Crew Chief****CLIENT: Kern Water Banking Authority**

Conducted a Phase I/Class III Inventory of 220-acres on Kern Water Banking Authority (KWBA) managed land near Bakersfield, California. Subsequently processed inventory data and lab results to compile an inventory report following Department of Interior standards.

CRC Section 20D Powerline and Pipeline Removal Project, Kern County, CA**Crew Chief****CLIENT: California Resources Corporation**

Conducted a Phase I/Class III Inventory of 118-acres, as well as NRHP evaluations of four historic sites within the Midway-Sunset Oilfield. Subsequently processed inventory data and lab results to compile an inventory report following Department of Interior standards.

Hungry Valley Site Relocation Project, Kern and Ventura counties, CA**Crew Chief****CLIENT: California State Parks, Off-Highway Motor Vehicle Recreation Division**

Conducted site relocations within 18,780-acres of Hungry Valley SVRA and 845-acres of newly acquired SVRA property. Subsequently processed inventory data and lab results to compile an inventory report following Department of Interior standards.

BVWSD Palms Project, Kern County, CA**Crew Chief****CLIENT: GEI Consulting, Inc.**

Conducted a Phase I/Class III Inventory for 1,110-acres for the Buena Vista Water Storage District (BVWSD). Subsequently processed inventory data and lab results to compile an inventory report following Department of Interior standards.

Henrietta Solar Project, Kings County, CA**Crew Chief****CLIENT: SunPower Corporation**

Conducted construction of a solar power generation facility on 670-acres in unincorporated Kings County, near Lemoore, California. Subsequently processed inventory data and lab results to compile an inventory report following Department of Interior standards.

Mediacom Fiberoptic Cable Project, Kern County, CA**Crew Chief****CLIENT: Mediacom Communications Corporation**

Conducted Phase II excavations for eight prehistoric sites along Hwy. 178 within the Kern River Valley. Additionally, a Phase I/Class III Inventory survey was conducted for 11-acres along Freeman Junction. Subsequently processed inventory data and lab results to compile an inventory report following Department of Interior standards.

Tejon Centennial Project, Los Angeles County, CA**Crew Chief****CLIENT: Centennial Founders, LLC**

Managed a field crew and conducted Phase II excavations for 20 prehistoric sites. Additionally, a Phase I/Class III Inventory survey was conducted for 768-acres within Tejon Ranch. Subsequently processed inventory data and lab results to compile an inventory report following Department of Interior standards.

Chico Martinez 3 APDs Construction Monitoring, Kern County, CA

Field Technician

CLIENT: California Resources Corporation

Monitored oil well pad construction for culturally sensitive materials during ground disturbing activities. Participated in recording (site/material recognition, artifact collection, GIS site mapping) of relevant materials.

Vintage Rio Lobo 3D Geophysical Survey Class III Inventory, Kettleman Hills, Kings and Fresno counties, CA

Field Technician

CLIENT: Vintage Production California

Assisted with the fieldwork (pedestrian survey, site recognition, GIS site mapping, and additional site recording) for a 9,000-acre study area.

Grapevine Project Phase II Testing, Kern County, CA

Field Technician

CLIENT: Tejon Ranch Corporation

Assisted in Phase II site excavation (STP; 1x1-m units), GIS site mapping, and data recording for 19 prehistoric archaeological sites.

Middlewater Pipeline Survey Class III Inventory, Kern County, CA

Field Technician

CLIENT: Quad Knopf

Assisted with the fieldwork (pedestrian survey, site recognition, GIS site mapping, and additional site recording) for this project.

Class III Inventory for Rochester Mining District, Pershing County, NV

Field Technician

CLIENT: Rye Patch Gold/Enviroscientists

Assisted with pedestrian survey, site recording, GIS site mapping, and additional site documentation.

Class III Inventory for BLM Rock Art, Lincoln County, NV

Field Technician

CLIENT: Bureau of Land Management, Caliente Field Office

Conducted pedestrian survey, site recognition, GIS site mapping, general prehistoric site recording for 10,000 acres study area, including identification and recordation of prehistoric and historic rock art.

Phase I Survey for Grapevine Project, Kern County, CA

Field Technician

CLIENT: Tejon Ranch Corporation

Conducted archival record searches at the Southern San Joaquin Valley Information Center and assisted with the pedestrian survey, site recognition, GIS site mapping, additional site recording for 15,000-acre study area.

Class III Inventory for Section 6D, Kern County, CA

Field Technician

CLIENT: Occidental of Elk Hills

Assisted in archival record searches at the Southern San Joaquin Valley Information Center, and assisted with the pedestrian survey, site recognition, GIS site mapping, and additional site recording for 640-acre study area.

Class III Inventory for Sections 2D, 4D, 5D, 9D, 12D, 18H, and 31G, Kern County, CA

Field Technician

CLIENT: Occidental of Elk Hills

Assisted in archival record searches at the Southern San Joaquin Valley Information Center and assisted with pedestrian survey, site recognition, GIS site mapping, and additional site recording for 3620-acre study area.

Class III Inventory for Sections 24B, 30B, and 22Z, Kern County, CA

Field Technician

Assisted in archival record searches at the Southern San Joaquin Valley Information Center, and fieldwork (pedestrian survey, site recognition, GIS site mapping, and additional site recording) for 1860 acres study area.

Phase I Survey for Blackwell Solar Park, Kings County, CA

Field Technician

CLIENT: Frontier Renewables

Assisted in archival record searches at the Southern San Joaquin Valley Information Center and pedestrian survey, site recognition, GIS site mapping, and additional site recording for 260-acre study area.

Class III Inventory for Mabry Project, Kern County, CA

Field Technician

CLIENT: Robert A. Booher Consulting

Assisted in archival record searches at the Southern San Joaquin Valley Information Center and pedestrian survey, site recognition, GIS site mapping, and additional site recording for 160-acre study area.

Class III Inventory for Venoco 3D Seismic Survey, Kern County, CA

Field Technician

CLIENT: Robert A. Booher Consulting

Assisted in archival record searches at the Southern San Joaquin Valley Information Center and pedestrian survey, site recognition, GIS site mapping, and additional site recording for this project.

Class III Inventory for Sections 21B, 27B, 29B and 36B, Kern County, CA

Field Technician

CLIENT: Occidental of Elk Hills

Assisted in archival record searches at the Southern San Joaquin Valley Information Center and pedestrian survey, site recognition, GIS site mapping, and additional site recording for 2460-acre study area.

APPENDIX C

FEIR Mitigation and Monitoring Plan

TABLE S-1
SUMMARY OF PROJECT IMPACTS AND MITIGATION MEASURES

Potential Impact	Mitigation Measure	Significance Determination
Aesthetics		
Impact AES-1: The proposed project could alter the existing visual character of the sites by changing the land use from agricultural production to a combination of groundwater recharge, water conveyance, and agricultural production.	None required.	Less than Significant.
Impact AES-4: The proposed project would create new sources of nighttime lighting.	Mitigation Measure AES-1: All nighttime construction lighting and security lighting installed on new facilities shall be shielded and directed downward to avoid light spill onto neighboring properties.	Less than Significant with Mitigation.
Agriculture and Forestry Resources		
Impact AGR-1: The proposed project would build groundwater banking and conveyance facilities on lands designated as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance.	None required.	Less than Significant.
Impact AGR-2: The proposed project could build groundwater banking facilities on lands under a Williamson Act contract.	Mitigation Measure AGR-1: If the third Stockdale project site is under a Williamson Act contract, then the use of the property would be managed as applicable in accordance with Kern County's <i>Agricultural Preserve Standard Uniform Rules</i> , which identify land uses that are compatible within agricultural preserves established under the Williamson Act.	Less than Significant with Mitigation.
Impact AGR-3: The proposed project could convert farmland to a combined land use of groundwater recharge and agricultural production.	Implement Mitigation Measure BIO-5.	Less than Significant with Mitigation.
Air Quality		
Impact AQ-1: The proposed project could conflict with or obstruct implementation of SJVAPCD air quality plan.	None required.	Less than Significant.
Impact AQ-2: Construction and/or operation of the project could generate emissions of criteria air pollutants that could contribute to existing nonattainment conditions.	None required.	Less than Significant.
Impact AQ-3: Construction and operation of the project could result in cumulatively considerable increases of criteria pollutant emissions.	None required.	Less than Significant.

TABLE S-1
SUMMARY OF PROJECT IMPACTS AND MITIGATION MEASURES

Potential Impact	Mitigation Measure	Significance Determination
Impact AQ-4: Construction and/or operation of the project could expose sensitive receptors to substantial pollutant concentrations.	None required.	Less than Significant.
Impact AQ-5: Operation of the project could create objectionable odors affecting a substantial number of people.	None required.	Less than Significant.
Biological Resources		
Impact BIO-1: Construction of the proposed project could result in adverse impact to special-status species.	<p>Mitigation Measure BIO-1: The following measures would reduce potential impacts to nesting and migratory birds and raptors to less than significant levels:</p> <ul style="list-style-type: none"> • Within 15 days of site clearing, a qualified biologist shall conduct a preconstruction, migratory bird and raptor nesting survey. The biologist must be qualified to determine the status and stage of nesting by migratory birds and all locally breeding raptor species without causing intrusive disturbance. This survey shall include species protected under the Migratory Bird Treaty Act including the tricolored blackbird. The survey shall cover all reasonably potential nesting locations for the relevant species on or closely adjacent to the proposed project site. • Nesting habitat should be removed prior to the bird breeding season (February 1 – September 30). • If an active nest is confirmed by the biologist, no construction activities shall occur within 250 feet of the nesting site for migratory birds and within 500 feet of the nesting site for raptors. The buffer zones around any nest within which project-related construction activities would be avoided can be reduced as determined acceptable by a qualified biologist. Construction activities may resume once the breeding season ends (February 1 – September 30), or the nest has either failed or the birds have fledged. <p>Mitigation Measure BIO-2: If construction activities are scheduled to take place outside of the Swainson's hawk nesting season (which runs from March 1 – September 15), then no preconstruction clearance surveys or subsequent avoidance buffers are required. If construction activities are initiated within the nesting season then preconstruction nesting surveys shall be conducted by a qualified biologist prior to ground disturbance, in accordance with the guidance provided in the <i>Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley</i> (Swainson's Hawk Technical Advisory Committee, 2000). The required windshield surveys shall cover a one-half mile radius around the project sites. If a nest site is found, the qualified biologist shall determine the appropriate buffer zone around the nest within which project-related construction activities would be avoided. In addition, the qualified biologist shall consult with Rosedale and/or IRWD to determine whether consultation with CDFW is necessary.</p> <p>Mitigation Measure BIO-3: A pre-construction survey shall be conducted for burrowing owls 14 to 30 days prior to clearing of the site by a qualified biologist in accordance with the most recent CDFW protocol, currently the <i>Staff Report on Burrowing Owl Mitigation</i> (CDFW 2012). Surveys shall cover suitable burrowing owl habitat disturbed by construction including a 500-foot buffer. The survey would</p>	Less than Significant with Mitigation.

TABLE S-1
SUMMARY OF PROJECT IMPACTS AND MITIGATION MEASURES

Potential Impact	Mitigation Measure	Significance Determination
	<p>identify adult and juvenile burrowing owls and signs of burrowing owl occupation. This survey shall include two early morning surveys and two evening surveys to ensure that all owl pairs have been located. If occupied burrowing owl habitat is detected on the proposed project site, measures to avoid, minimize, or mitigate impacts shall be incorporated into the proposed project and shall include, but not be limited to, the following:</p> <ul style="list-style-type: none"> • If owls are identified on or adjacent to the site, a qualified biologist shall provide a pre-construction Worker's Environmental Awareness Program to contractors and their employees that describes the life history and species protection measures that are in effect to avoid impacts to burrowing owls. Construction monitoring will also occur throughout the duration of ground-disturbing construction activities to ensure no impacts occur to burrowing owl. • Construction exclusion areas shall be established around the occupied burrows in which no disturbance shall be allowed to occur while the burrows are occupied. Buffer areas shall be determined by a qualified biologist based on the recommendations outlined in the most recent Staff Report on Burrowing Owl Mitigation (CDFW 2012). • If occupied burrows cannot be avoided, a qualified biologist shall develop and implement a Burrowing Owl Management Plan. The biologist shall develop the Plan in consultation with Rosedale and/or IRWD and shall coordinate with CDFW as necessary. <p>Mitigation Measure BIO-4: IRWD and Rosedale shall conduct a USFWS-approved "early evaluation" of the project area to determine if the project sites represent San Joaquin kit fox habitat. If the evaluation shows that the San Joaquin kit fox does not utilize the project sites, and the project will not result in take, then no further mitigation shall be required for this endangered species. If the "early evaluation" finds potential for the presence of kit fox, USFWS may require a San Joaquin kit fox survey to be conducted by a qualified biologist, in accordance with the most recent USFWS <i>San Joaquin Kit Fox Survey Protocol</i>. If it is determined that the San Joaquin kit fox has the potential to utilize the property then the following measures are required to avoid potential adverse effects to this species:</p> <ul style="list-style-type: none"> • Rosedale and/or IRWD shall initiate discussions with the USFWS to determine appropriate project modifications to protect kit fox, including avoidance, minimization, restoration, preservation, or compensation. • If evidence of active or potentially active San Joaquin kit fox dens is found within the area to be impacted by the proposed project, compensation for the habitat loss shall be determined and provided in consultation with USFWS and CDFW. <p>Mitigation Measure BIO-5: Prior to ground disturbing activities at the Goose Lake Slough and third Stockdale site, a qualified biologist shall conduct a pre-construction floristic survey and, if deemed necessary, focused rare plant survey of project areas to determine and map the location and extent of special-status plant species populations and natural communities of special concern within disturbance areas. Focused rare plant surveys shall occur during the typical blooming periods of special-status plants with the potential to occur. The plant surveys shall follow the CDFW Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities (November 24, 2009).</p> <p>If a special-status plant species is found to be present, and avoidance of the species and/or habitat is not feasible, the implementing agency shall retain a qualified botanist to prepare and implement a</p>	

TABLE S-1
SUMMARY OF PROJECT IMPACTS AND MITIGATION MEASURES

Potential Impact	Mitigation Measure	Significance Determination
	<p>Revegetation/Restoration Mitigation Plan.</p> <p>Mitigation Measure BIO-6: Prior to ground disturbing activities at the third Stockdale site, a habitat assessment shall be conducted by a qualified biologist to determine the potential for special-status wildlife species to occur within affected areas. If the habitat assessment determines that a special-status species has the potential to be present within a minimum of 500 feet of the construction zone, a qualified biologist shall determine whether subsequent focused surveys are required prior to project implementation to determine presence or absence.</p> <p>If a special-status wildlife species is found to be present, and avoidance of the species and/or habitat is not feasible, then Mitigation Measures BIO-1 through BIO-4 shall be implemented as appropriate, or Rosedale and/or IRWD shall consult with a qualified biologist to prepare a species-specific mitigation plan and determine whether consultation with wildlife agencies are recommended.</p>	
Impact BIO-2: The proposed project could have a substantial adverse effect on sensitive natural communities.	Implement Mitigation Measure BIO-5.	Less than Significant with Mitigation.
Impact BIO-3: The proposed project could have a substantial adverse effect on federally protected wetlands.	Mitigation Measure BIO-7: For project components that have potential to impact jurisdictional features, prior to ground disturbing activities, a qualified biologist shall be retained to conduct a jurisdictional delineation in areas that may be affected by the project. If jurisdictional resources are identified, the qualified biologist shall prepare a jurisdictional delineation report outlining the potential acreage of jurisdictional features that may be impacted. The jurisdictional delineation report will be submitted to USACE for a jurisdictional determination. If the delineation report determines that jurisdictional waters and/or wetlands are present within the project site, regulatory permits may be required prior to project impacts which include mitigation and/or compensation to reduce impacts to jurisdictional features to a less than significant level. Based on the results of the delineation report, permits required may include a 404 or Nationwide Permit from USACE, a 401 Certification from RWQCB and/or a Streambed Alteration Agreement from CDFW. Project impacts under 0.10 acres may not require a permit from USACE but only a notification of impact. The appropriate permits required to reduce impacts to jurisdictional features will be determined through initial consultation with the resource agencies.	Less than Significant with Mitigation.
Impact BIO-4: The proposed project could conflict with the Metropolitan Bakersfield Habitat Conservation Plan.	None required.	Less than Significant.
Cultural Resources		
Impact CUL-1: The project could cause a substantial adverse change in the significance of a historical or archaeological resource, as defined in CEQA Guidelines Section 15064.5.	Mitigation Measure CUL-1: In the event that prehistoric or historic subsurface cultural resources are discovered during ground-disturbing activities, all work within 50 feet of the resources will be halted and Rosedale or IRWD (as applicable) will consult with a qualified archaeologist to assess the significance of the find according to <i>CEQA Guidelines</i> Section 15064.5. If any find is determined to be significant, then Rosedale or IRWD and the archaeologist will meet to determine the appropriate avoidance measures or other appropriate mitigation. Rosedale or IRWD (as applicable) will make the final determination. All significant cultural materials recovered will be, as necessary and at the discretion of	Less than Significant with Mitigation.

TABLE S-1
SUMMARY OF PROJECT IMPACTS AND MITIGATION MEASURES

Potential Impact	Mitigation Measure	Significance Determination
	<p>the consulting archaeologist, subject to scientific analysis, professional museum curation, and documentation according to current professional standards.</p> <p>In considering any suggested mitigation proposed by the consulting archaeologist in order to mitigate impacts to historical resources or unique archaeological resources, Rosedale or IRWD will determine whether avoidance is necessary and feasible in light of factors such as the nature of the find, project design, costs, and other considerations. If avoidance is infeasible, other appropriate measures (e.g., data recovery) will be instituted. Work may proceed on other parts of the project site while mitigation for historical resources or unique archaeological resources is being carried out.</p> <p>Mitigation Measure CUL-2: For any project components not previously subject to archaeological survey (e.g., the third Stockdale site), prior to the initiation of ground disturbance, a qualified archaeologist shall be retained to carry out a Phase I Cultural Resources Survey of the project component. The Phase I Survey shall identify and evaluate the significance of any resources that may be directly or indirectly impacted by the proposed project. The Phase I Survey effort shall be documented in a Phase I Report. If as a result of the additional Phase I Survey any resource is found to be a historical or unique archaeological resource as defined in PRC Section 21084.1 and 21083.2(g), respectively, then Mitigation Measure CUL-1 shall be implemented.</p>	
<p>Impact CUL-2: The project could directly or indirectly affect a unique paleontological resource or site or unique geologic feature, as defined in CEQA Guidelines Section 15064.</p>	<p>Mitigation Measure CUL-3: In the event that paleontological resources are discovered, Rosedale or IRWD (depending upon the project component) will notify a qualified paleontologist. The paleontologist will document the discovery as needed, evaluate the potential resource, and assess the significance of the find under the criteria set forth in <i>CEQA Guidelines</i> Section 15064.5. If fossil or fossil bearing deposits are discovered during construction, excavations within 50 feet of the find will be temporarily halted or diverted until the discovery is examined by a qualified paleontologist. The paleontologist will notify the appropriate agencies to determine procedures that would be followed before construction is allowed to resume at the location of the find. If Rosedale or IRWD determines that avoidance is not feasible, the paleontologist will prepare an excavation plan for mitigating the effect of the project on the qualities that make the resource important. The plan will be submitted to Rosedale or IRWD for review and approval prior to implementation.</p> <p>Mitigation Measure CUL-4: Once the location of the third Stockdale site is determined (or any additional project components), prior to the initiation of ground disturbance, a paleontological literature, map, and museum locality review shall be conducted in order to assess the paleontological sensitivity of the project component. If the literature, map, and museum locality review identifies potentially sensitive paleontological resources, then a qualified paleontologist shall be retained to conduct a pedestrian survey and assessment of the project component. A report shall be prepared which summarizes the results of the survey and assessment and provides recommendations regarding implementation of mitigation, such as Mitigation Measure CUL-3.</p>	Less than Significant with Mitigation.

TABLE S-1
SUMMARY OF PROJECT IMPACTS AND MITIGATION MEASURES

Potential Impact	Mitigation Measure	Significance Determination
Impact CUL-3: The proposed project could result in adverse impacts to human remains.	Mitigation Measure CUL-5: If human remains are uncovered during project construction, Rosedale or IRWD (as applicable) shall immediately halt work, contact the Kern County Coroner to evaluate the remains, and follow the procedures and protocols set forth in Section 15064.4 (e)(1) of the <i>California Environmental Quality Act Guidelines</i> . If the Coroner determines the remains are Native American in origin, the Coroner shall contact the Native American Heritage Commission (NAHC). As provided in Public Resources Code Section 5097.98, the NAHC shall identify the person or persons believed to be most likely descended from the deceased Native American. The most likely descendent shall be afforded the opportunity to provide recommendations concerning the future disposition of the remains and any associated grave goods as provided in PRC 5097.98.	Less than Significant with Mitigation.
Geology, Soils, and Seismicity		
Impact GEO-1: The proposed project could expose new structures to adverse effects related to strong seismic ground shaking, ground failure, and liquefaction.	Implement Mitigation Measure HYDRO-2.	Less than Significant with Mitigation.
Impact GEO-2: The proposed project could result in soil erosion or the loss of topsoil.	Implement Mitigation Measure HYDRO-1.	Less than Significant with Mitigation.
Impact GEO-3: Operation of the proposed project could affect groundwater levels and result in on-site or off-site subsidence from compaction.	None required.	Less than Significant.
Greenhouse Gas Emissions		
Impact GHG-1: The proposed project could generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.	None required.	Less than Significant.
Impact GHG-2: The proposed project could conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.	None required.	Less than Significant.
Hazards and Hazardous Materials		
Impact HAZ-1: The proposed project could create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.	None required.	Less than Significant.

TABLE S-1
SUMMARY OF PROJECT IMPACTS AND MITIGATION MEASURES

Potential Impact	Mitigation Measure	Significance Determination
<p>Impact HAZ-2: The proposed project could create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.</p>	<p>Mitigation Measure HAZ-1: Prior to construction at Stockdale East, Rosedale shall collect representative samples of soils remaining in place near the oilfield as identified in the Phase 1 Environmental Site Assessment. The samples shall be analyzed for total petroleum hydrocarbons and pesticides. Rosedale shall avoid if feasible or otherwise remove from the site soils identified as containing hazardous quantities of contaminants and dispose of such soils in accordance with applicable hazardous waste regulations.</p> <p>Mitigation Measure HAZ-2: In the event that asbestos-containing materials are uncovered during project construction, work at the project sites shall immediately halt and a qualified hazardous materials professional shall be contacted and brought to the project sites to make a proper assessment of the suspect materials. All potentially friable asbestos-containing materials shall be removed in accordance with Federal, State, and local laws and the National Emissions Standards for Hazardous Air Pollutants guidelines prior to ground disturbance that may disturb such materials. All demolition activities shall be undertaken in accordance with California Occupational Safety and Health Administration standards, as contained in Title 8 of the CCR, Section 1529, to protect workers from exposure to asbestos. Materials containing more than one percent asbestos shall also be subject to San Joaquin Valley Air Pollution Control District regulations. Demolition shall be performed in conformance with Federal, state, and local laws and regulations so that construction workers and/or the public avoid significant exposure to asbestos-containing materials.</p> <p>Mitigation Measure HAZ-3: A Phase I Environmental Site Assessment shall be prepared for the Central Intake Pipeline and the third Stockdale project site to identify potential hazards and hazardous materials located within a one-mile radius. The construction contractor shall be informed of potential hazards and shall develop appropriate plans to avoid or remediate hazards.</p>	<p>Less than Significant with Mitigation.</p>
<p>Impact HAZ-3: The proposed project could emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.</p>	<p>Mitigation Measure HAZ-4: In the event the third Stockdale project site is located within a quarter mile of any school facilities, prior to construction, the contractors shall coordinate the proposed project construction route with the impacted school district and school facility to avoid school safety routes.</p>	<p>Less than Significant with Mitigation.</p>
<p>Impact HAZ-4: The proposed project could be located on a site which is included on a list of hazardous materials sites and could create a significant hazard to the public or the environment.</p>	<p>Implement Mitigation Measure HAZ-3.</p>	<p>Less than Significant with Mitigation.</p>
<p>Impact HAZ-5: The proposed project operation could cause an increase in airborne insect populations.</p>	<p>Mitigation Measure HAZ-5: IRWD and Rosedale shall coordinate with the Kern County Department of Public Health Services and the Kern Mosquito and Vector Control District prior to project operations to develop and implement, if necessary, appropriate insect abatement methods. Such methods shall not utilize any substances that may contaminate groundwater.</p>	<p>Less than Significant with Mitigation.</p>

TABLE S-1
SUMMARY OF PROJECT IMPACTS AND MITIGATION MEASURES

Potential Impact	Mitigation Measure	Significance Determination
Hydrology and Water Quality		
Impact HYDRO-1: The proposed project could violate water quality standards or waste discharge requirements during construction or project operation.	<p>Mitigation Measure HYDRO-1: The SWPPP for the proposed project shall include the following BMPs:</p> <ul style="list-style-type: none"> Establish an erosion control perimeter around active construction and contractor layout areas including silt fencing, jute netting, straw wattles, or other appropriate measures to control sediment from leaving the construction area. Stockpiled soils shall be watered, covered, or otherwise managed to prevent loss due to water and wind erosion. Install containment measures at fueling stations and at fuel and chemical storage sites. <p>Employ good house-keeping measures including clearing construction debris and waste materials at the end of each day.</p>	Less than Significant with Mitigation
Impact HYDRO-2: The proposed project could deplete groundwater supplies and lower the groundwater table through extraction of banked groundwater.	None required.	Less than Significant.
Impact HYDRO-3: Recharge operations on the proposed project site could result in groundwater mounding that could potentially impact underground structures or impair recharge efforts of adjacent groundwater banking operations.	Mitigation Measure HYDRO-2: Prior to operation of the project, Rosedale shall develop and implement a shallow groundwater monitoring plan for purposes of protecting subsurface structures of the Cross Valley Canal (CVC). Piezometers shall be installed adjacent to the CVC at Stockdale East and the third Stockdale project site if applicable. Piezometers have already been installed at Stockdale West. The location and design of the new piezometers shall be approved by the Kern County Water Agency (KCWA). Piezometers at the Stockdale Properties shall be used to monitor groundwater levels beneath the CVC. Prior to initiating the project, a California state licensed geotechnical engineer shall conduct an analysis to determine the critical depth at which shallow groundwater would pose a threat to the stability of CVC structures. Based on this analysis, the monitoring plan shall identify depths at which monitoring frequency shall change, such as from monthly to weekly to daily, as shallow groundwater levels approach the critical depth. The monitoring plan shall also identify the depth at which project operation would cease such that the critical depth would not be reached and the conditions under which project operation could resume. The monitoring plan shall be approved by KCWA.	Less than Significant with Mitigation.
Impact HYDRO-4: The proposed project could substantially alter the existing drainage pattern of a site that could result in substantial erosion or siltation on- or off-site.	Implement Mitigation Measure HYDRO-1.	Less than Significant with Mitigation.
Impact HYDRO-5: The proposed project could substantially degrade groundwater quality by the addition of recharge water.	Implement Mitigation Measure HAZ-1	Less than Significant with Mitigation

TABLE S-1
SUMMARY OF PROJECT IMPACTS AND MITIGATION MEASURES

Potential Impact	Mitigation Measure	Significance Determination
Impact HYDRO-6: The proposed project could place structures within a 100-year flood hazard area.	Mitigation Measure HYDRO-3: If the third Stockdale project site includes a flood hazard area, then associated project facilities would be designed either: (1) to avoid development within the flood hazard area, or (2) to ensure that flood hazards or flood elevations on neighboring parcels are not significantly altered.	Less than Significant with Mitigation.
Lane Use and Planning		
Impact LU-1: The proposed project could conflict with any applicable land use plan, policy, or regulation of the jurisdiction over the project.	Mitigation Measure LU-1: A General Plan Amendment may be requested from Kern County to eliminate the mid-section line setback requirements from the Stockdale properties.	Less than Significant (LU-1 is not required)
Impact LU-3: The proposed project could conflict with the Metropolitan Bakersfield Habitat Conservation Plan.	None required.	Less than Significant.
Mineral Resources		
Impact MRS-1: The proposed project could block access to oil resources beneath the Stockdale Properties.	None required.	Less than Significant.
Noise		
Impact NOISE-1: The proposed project could generate noise levels that exceed noise standards.	None required.	Less than Significant.
Impact NOISE-2: The proposed project could generate or result in excessive groundborne vibration or groundborne noise levels.	None required.	Less than Significant.
Impact NOISE-3: The proposed project could result in a substantial permanent increase in ambient noise levels in the project vicinity.	None required.	Less than Significant.
Impact NOISE-4: The proposed project could result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity.	Mitigation Measure NOISE-1: To reduce temporary construction related noise impacts at the third Stockdale site, the following shall be implemented by the construction contractor: <ul style="list-style-type: none"> a. Place all stationary construction equipment so that emitted noise is directed away from sensitive receptors nearest the project site. b. Locate equipment staging in areas that will create the greatest possible distance between construction-related noise sources and noise-sensitive receptors nearest the project site during all project construction. c. Ensure proper maintenance and working order of equipment and vehicles, and that all 	Less than Significant with Mitigation.

Potential Impact	Mitigation Measure	Significance Determination
	<p>construction equipment is equipped with manufacturers approved mufflers and baffles.</p> <p>d. Install sound-control devices in all construction and impact equipment, no less effective than those provided on the original equipment.</p>	
Transportation and Traffic		
Impact TR-1: The proposed project could conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system.	Mitigation Measure TR-1: For project features that require open-trench construction across roadways, the Construction Traffic Control Plan for the proposed project shall include measures that ensure Rosedale provides signage and flagging to alert motorists of pending and actual lane or road closures and detours. Such measures shall conform to the requirements of the Kern County Roads Department and any requirements of related encroachment permits.	Less than Significant with Mitigation.
Impact TR-2: The proposed project could conflict with an applicable congestion management program and reduce the level of service of surrounding roads and highways.	None required.	Less than Significant.
Impact TR-3: The proposed project could result in a substantial increase to hazards due to a design feature or incompatible uses.	Mitigation Measure TR-2: IRWD and Rosedale shall require the construction contractor to prepare and implement a Construction Traffic Control Plan that conforms to requirements of the Kern County Roads Department, California Department of Transportation District 6, and the California Department of Transportation Manual on Uniform Traffic Control Devices and Work Area Traffic Control Handbook. The construction contractor shall obtain all necessary permits for the work within the road right-of-way or use of oversized/overweight vehicles that will utilize county maintained roads, which may require California Highway Patrol or a pilot car escort. Implement Mitigation Measure HAZ-4	Less than Significant with Mitigation.
Impact TR-4: The proposed project could result in inadequate emergency access.	Implement Mitigation Measure TR-2.	Less than Significant with Mitigation.
Utilities and Energy		
Impact UTIL-1: The proposed project could require new or expanded water supply resources or entitlements.	None required.	Less than Significant.
Impact UTIL-2: The proposed project could require additional landfill capacity.	None required.	Less than Significant.
Impact UTIL-3: The proposed project could result in a substantial increase in energy consumption that could affect local and regional energy supplies.	Mitigation Measure UTIL-1: IRWD and Rosedale shall install energy efficient equipment, including pumps and motors, for operation of the proposed project.	Less than Significant with Mitigation.

TABLE S-1
SUMMARY OF PROJECT IMPACTS AND MITIGATION MEASURES

Potential Impact	Mitigation Measure	Significance Determination
Cumulative Impacts		
Impact CUM-1: Concurrent construction of several projects in the vicinity of the Stockdale Properties could result in cumulative short-term impacts associated with air quality, biological resources, cultural resources, noise, traffic, and water quality.	Mitigation Measure CUM-1: The construction contractor shall consult with appropriate local agencies and jurisdictions prior to initiating ground-disturbing activities, to determine if other construction projects will occur coincidentally at the same time and in the vicinity of the proposed project, depending on project schedule. Coordination of construction activities for coincident projects shall occur to ensure impacts to noise and traffic do not compound to be cumulatively significant and to ensure compatibility of activities within construction zones. Adjustments to construction schedules and plans shall be made accordingly as necessary.	Less than Significant with Mitigation.
Impact CUM-2: The proposed project and related projects could result in cumulative long-term impacts to groundwater resources.	Mitigation Measure CUM-2: Operation of the proposed project shall be conducted in accordance with the Long Term Project Recovery Operations Plan Regarding Rosedale-Rio Bravo Water Storage District Projects (Long Term Operations Plan). The Long Term Operations Plan requires monitoring of groundwater conditions; annual predictions of project-related groundwater declines in the area; definition of negative project impact (NPI) to neighboring wells relative to no-project conditions; triggers for implementation of mitigation measures based on NPI that affects neighboring well operation; and mitigation measures to be implemented for different categories of wells. Mitigation measures include, but are not limited to, providing compensation to lower well pumps; reducing or adjusting pumping to prevent, avoid, or eliminate the NPI; or drilling a new well.	Less than Significant with Mitigation.
Impact CUM-3: The proposed project and related projects could result in cumulative long-term impacts to agricultural resources.	None required.	Less than Significant.
