After reviewing our job folder, I discovered that soil sample #1 was retrieved from the excavation which was 5.4 T.V.H. However, sample #2 which was retrieved from the stockpile excavation was and extremely high. LCI was not aware that this sample was retrieved from the stockpile excavation, so spoils were pushed back in, compacted and then concreted. I searched our job folder to see if any documented direction was given by either Kern County Environmental Health or the soil tester on what to do with the removed soil, but was unable to find any document direction.

Please get back with me on what direction to take as soon as possible.

Regards

John Jones President

Unocal Corporation 2175 N California Blvd. Walnut Creek, Ca. 94596

Re: Unocal #4734, Hwy 99 & Grapevine, Lebec, Ca.

Dear Sir:

On September 9, 1988 a Petro Tite Line Test was performed at the above-referenced location. The test was performed by George Yarbrough, LCI Technician. The NFPA Code 329.02 criteria for a tight system is a maximum loss of .05 gallons per hour. Because of the almost infinite variables involved, this is not intended to be a mathematical tolerance and is not the permission of actual leakage.

During the stand-pipe test procedure the internal liquid hydrostatic pressure applied to the underground tank system is generally two to three times greater than normal liquid storage pressures. This increase in hydrostatic pressure will amplify the indicated rate of leak accordingly.

LINE TEST

Tank No. 1 -#87

Product - Unleaded

The test showed a minus .007 gallons per hour. Based on the above criteria, we find the tank tested mathematically tight.

Tank No. 2 -#92 Product - Super The test showed a minus .008 gallons per hour. Based on the above criteria, we find the tank tested mathematically tight.

This concludes our test and findings. If you have any questions regarding the results, please contact me. It is your responsibility to notify your local County Health Department,

Environmental Health, within thirty (30) days of the results of this test. This notification is required by the California Administrative Code, title 23 Waters, Chapter 3 Water Resources Contol Board, Sub-chapter 16 Underground Tank Regulation, Article 4.30.

We have enjoyed working with you on this project. If you need any further information, please feel free to call.

Regards,

Steve Coldren

Tank Testing Coordinator

Re: Unocal #4734, Hwy 99 & Grapevine, Lebec, Ca.

Dear Mr. Canus:

This letter is to confirm our telephone conversation of July 8, 1988 @3:30 arranging an inspection at the above-referenced location for Wednesday July 13, 1988 @ 11:00. If there is any changes from our arranged date and time, we will contact your office well in advance.

Thank you for your cooperation in this matter.

Regards,

Annette Fagundes

.POST ON PREMISES.

CONDITIONS AS FOLLOWS:

- This permit applies only to the modification of an existing facility 1. involving the installation of blending valves, lining, and the extension of product piping.
- 2. All construction to be as per facility plans approved by this department and verified by inspection by Permitting Authority.
- All equipment and materials in this construction must be installed in accordance with all manufacturers' specifications.
- Permittee must contact Permitting Authority for on-site inspection(s) with 48 hour advance notice.
- Backfill material for piping to be as per manufacturers' specifications. 5.
- Permittee must contact Permitting Authority and arrange for an inspection prior to backfilling. Generally, inspections will be made of:
 - a. Piping system with liner
 - b. Any other inspection deemed necessary by Permitting Authority.

But the Part of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the Control of the C

PERMIT TO CONSTRUCT UNDERGROUND STORAGE FACILITY

PERMIT NUMBER 330097B ADDENDUM

- 7. All underground metal connections (e.g. piping, fittings, fill pipes) to tank(s) must be electrically isolated, and wrapped to a minimum 20 mil thickness with corrosion-preventive, gasoline-resistant tape or otherwise protected from corrosion.
- 8. Liner shall be installed by a trained experienced liner contractor and installation at site approved by the Pemittiing Authority.
- 9. Monitoring requirements for this facility will be described on final "Permit to Operate."

SUMMARIES OF LABORATORY ANALYTICAL METHODS: SOIL SAMPLES

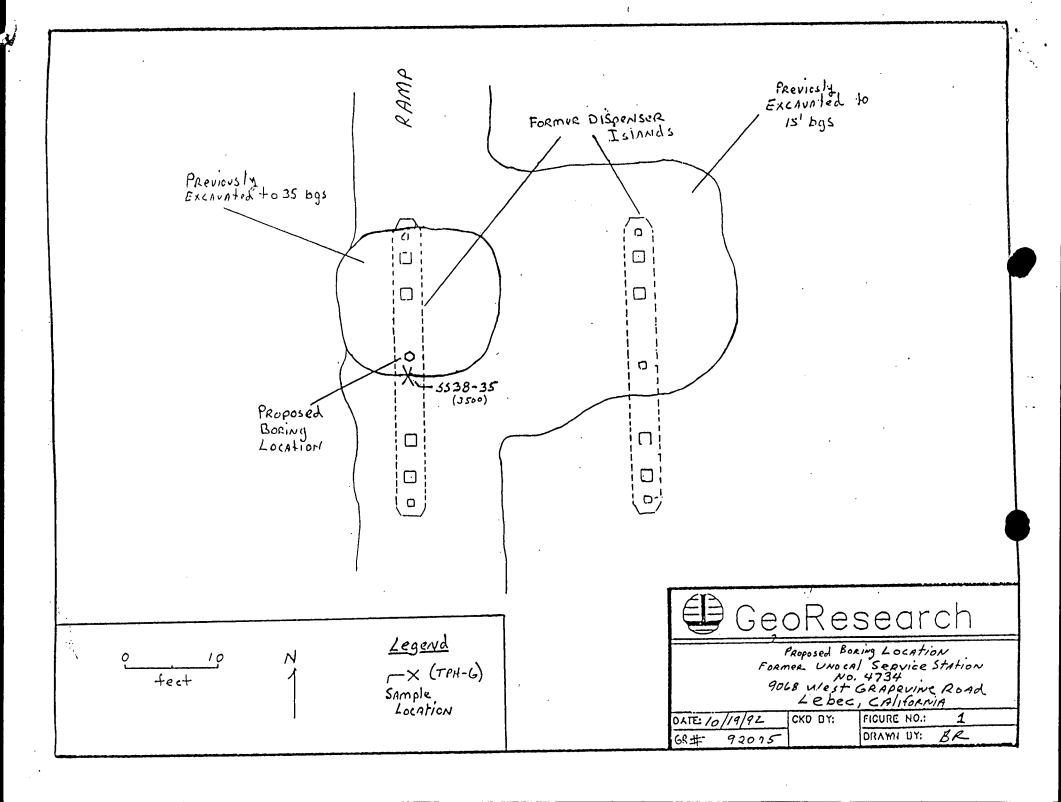

The following briefly describes laboratory analyses performed on soil samples in accordance with the specified EPA or California Department of Health and Safety methods.

Modified EPA Method 8015: Total Petroleum Hydrocarbons

This method speciates and quantifies total petroleum hydrocarbons (TPH) by the use of a gas chromatograph/flame ionization detector (GC/FID). Pentane is utilized as the solvent extractant for TPH within soil samples. The pentane and any extracted solvents are injected on a capillary column. The hydrocarbon compounds are detected by the FID.

EPA Method 8020: Benzene, Toluene, Total Xylenes, Ethylbenzene Organic volatile aromatics in soil samples are detected on a gas chromatograph/photoionization detector (GC/PID). Pentane is utilized as the solvent extractant for potential aromatics within soil samples. The pentane and any extracted solvents are injected on a packed column. The aromatics are detected by the PID.

Soil samples are analyzed by a California-certified hazardous waste laboratory. Quality Assurance/Quality Control measures, such as percent reproducibility, percent recovery, and spike analyses, are employed by the laboratory to validate the results. In addition, the laboratory results are reviewed by qualified personnel before release.

RE: UNOCAL SERVICE STATIONS

KERN COUNTY JOB #1284

MINOR PIPE MODIFICATIONS

AND BLEND VALVE INSTALLATION

Dear Ms. Boyce:

On behalf of Unocal 76 we are submitting these plans and fee of \$1800.00 (\$100.00 per facility) for minor piping modifications at each Unocal leased service station within your jurisdiction:

| #3507 - #3609 - #3655 - #4888 - #5488 - #5573 - #6089 - | Bakersfield Bakersfield Bakersfield Bakersfield Bakersfield Bakersfield Bakersfield Bakersfield Bakersfield | s.s. | #7225 #4669 #5334 #4734 #5895 #5716 #3596 | Bakersfield Bakersfield Delano Greenfield Lebec Lost Hills Oildale Ridgecrest |
|---------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|------|-------------------------------------------------------------|-----------------------------------------------------------------------------------|
| #6106 - | Bakersfield | | #2989 | |

These modifications will be minimal, involving about 0-10% of the total existing piping system which is currently monitored with Red Jacket leak detectors. Providing these changes and installing a U.L. listed "Blend Valve" within selected dispensers will allow the service station dealer to provide an additional gasoline product to the customer.

We are requesting at this time a variance from secondary containment requirements on these minor modifications. Please see our formal letter, attached.

Please review these plans and advise this office of your approval. The installation contractor has been given responsibility for obtaining and meeting all other local permits and requirements.

Page Two March 8, 1988 Ms. Ann Boyce

As per your conversation with Paul Yamamoto of our office, the Contractor will be installing a pan under the dispensers.

As our client has developed a very rigid schedule, any assistance you can provide us in expediting your processing would be greatly appreciated. We will be available to assist you with any and all questions you might have at (415) 461-8890. Please advise us when permits are ready to be picked up.

No As-Builts should be required as all construction will be as designed.

Again, your assistance is greatly appreciated.

Very truly yours,

ROBERT H. LEE & ASSOCIATES, INC.

RE: REQUEST FOR VARIANCES FROM SECONDARY

CONTAINMENT REQUIREMENTS ON SHORT PIPING ADDITIONS

Dear Ms. Boyce:

Unocal 76 has embarked upon a region wide program to provide an additional gasoline product to their consumers at all service stations. Rather than install another underground tank, Unocal has opted to perform minor modifications to existing product and vapor recovery piping at the dispenser islands and in some cases only underneath the dispensers themselves to provide this third product. Additional product piping of approximately 0-10 feet in length or 0-10% of the total piping may be required.

On behalf of Unocal we request your consideration for a variance from secondary containment requirements on minor new additions to product piping for the following reasons:

- 1. From 1974-1976, Unocal voluntarily replaced all galvanized product piping with corrosion resistant fiberglass piping at all service stations as part of their own Phase I Leak Prevention Program.
- 2. Unocal has established as part of their Phase II Leak Prevention Program an ongoing tank replacement project through which all single wall tanks and piping will be replaced with double wall tanks and secondarily contained piping at all service stations. This program has been in effect for several years and it is Unocal's intent to eventually eliminate all single wall steel tanks and single wall piping from their system of service stations.
- 3. Red Jacket Line Leak Detectors are installed and are operating at all service stations.

Page Two March 8, 1988 Ms. Ann Boyce

- 4. All stations with single wall fueling facilities are being precision tested for tightness on an annual basis as required by State and/or local law.
- 5. Station dealers are required by law as well as their lease agreements to perform daily inventory reconciliation on their motor vehicle fuels and to advise both government agencies and company representatives when specified discrepancies occur.

In addition, there are real limitations on funds, time and availability of manpower for this project. Unocal's resources are finite. Secondary containment requirements for a project of this magnitude may make it difficult or impossible to complete with available resources.

It is also felt that the dollars and effort spent on creating and monitoring a hybrid double/single wall fueling system might be more effectively and efficiently spent within the context of Unocal's ongoing tank replacement program through which "complete" tank and piping systems are replaced at all service stations on a prioritized basis.

Your consideration of the above is greatly appreciated. Should you have any questions or response regarding this matter, please do not hesitate to contact our office at (415) 461-8890.

Very truly yours,

ROBERT H. LEE & ASSOCIATES, INC.

STATEMENT OF LIMITATIONS AND PROFESSIONAL CERTIFICATION

Information provided in this report for GeoResearch Project Number 92075 is intended exclusively for Unocal Corporate Environmental Remediation and Technology for the evaluation of petroleum hydrocarbon occurrence as it pertains to the subject site at the time the data were collected. The professional services have been performed in accordance with practices generally accepted by professional geologists, hydrologists, engineers, and environmental specialists. No other warranty, expressed or implied, is made. with all subsurface investigations, there is no guarantee that the work conducted will identify any and all sources or locations of contamination. This report is issued with the understanding that Unocal Corporate Environmental Remediation and Technology is responsible for ensuring that the information contained in this report is brought to the attention of the appropriate regulatory The enclosed report has been reviewed by an engineering geologist certified in the state of California and whose signature and certification number appear below.

Blair Redfearn Senior Staff Geologist Warren W. Gross, C.E.G. No. 1528

WARREN W. GROSS ≦No. 1528 ØCERNEED

Associate Geologist

EXECUTIVE SUMMARY

In October of 1992, GeoResearch observed the demolition of Unocal Service Station No. 4734 located at 9068 West Grapevine Road, Lebec, California. The USTs and associated product lines and dispensers were removed, soil samples were collected from these areas, and laboratory analysis was completed. The purpose of our activities was to observe and document the condition of soils with respect to the presence of petroleum hydrocarbons and other tested analytes, direct the removal of these soils, and prepare a written report presenting the results of these efforts.

Soils containing petroleum hydrocarbons were identified in five areas: 1) beneath the dispenser islands, 2) beneath the gasoline/diesel USTs, 3) the southeast corner of the property where a possible radiator repair area was located, 4) along the northern property boundary, and 5) beneath the concrete paving immediately east of the gasoline USTs.

Areas 2) through 5) were successfully remediated by excavation. The impacted soil was excavated and confirmation samples were collected which indicated that any significant concentrations of petroleum hydrocarbons had been removed.

Approximately 300 cubic yards of soil was excavated from beneath the west dispenser island to a depth of 37 feet bgs. Confirmation samples collected from the excavation's north and east sidewalls suggest that significant concentrations of hydrocarbons have been largely removed from these areas.

The source of the gasoline release appeared to have been near the dispensers on the north end of the west island. Below a depth of approximately ten feet bgs, the gasoline appeared to have traveled vertically with little lateral spreading due to the coarse and permeable nature of the soils. Soils with significant concentrations of gasoline appear to have been removed above a depth of approximately 30 feet bgs. Soil samples collected from excavation's south and west sidewalls demonstrate that concentrations of TPH-G as high as 3,500 mg/kg are present beyond the limits of the excavation. Additional soil sampling and analysis below a depth of 35 feet bgs will be necessary to establish the limit of vertical migration of gasoline.

Approximately 1,200 cubic yards of soil was excavated and stockpiled on-site. Of this 1,200 cubic yards of soil, approximately 700 cubic yards was utilized as backfill. Approximately 300 cubic yards of soil was transported to Laidlaw's Class II disposal facility as non-hazardous. Approximately 200 cubic yards of boulders were removed from the stockpiled soil and disposed.

1.0 INTRODUCTION

In October of 1992, GeoResearch observed the demolition of Unocal Service Station No. 4734 located at 9068 West Grapevine Road, Lebec, California (Figure 1). During that time, the USTs and associated product lines and dispensers were removed. Soil samples were collected from these areas and laboratory analysis was completed. The work was completed in accordance with a California Business Plan Remedial Action Plan (CBP RAP) which was submitted to Unocal and authorized by Mr. Robert Boust on May 13, 1992.

The purpose of our activities was to observe the condition of soil underlying the station facilities, document the condition of soils with respect to the presence of petroleum hydrocarbons and other tested analytes, direct the removal of these soils, and prepare a written report presenting the results of these efforts. Mr. Boust also authorized GeoResearch to direct excavation of stained soil adjacent to the station (north) on Tejon Ranch property (not a part of the station lease). Mr. Jeff Warren of Tejon Ranch authorized the work. Investigation of the fate of discharged surface drainage into on-site storm drains is not included in this report.

Station demolition was conducted by Wegener Construction Company of Bakersfield, California. Soil samples were submitted to GEOTEST of Long Beach, California, a state of California Department of Health Services (CAL-DOHS)-certified laboratory. Soil samples required by the Kern County Environmental Health Services Department (KCEHSD) were collected under the direction of Hazardous Materials Specialist, Mr. Chris Finberg. Permits, uniform hazardous waste manifest, tank disposition documentation, and soil compaction certifications were provided by Wegener (Appendix A).

Two 10,000-gallon steel gasoline USTs (super and regular), one 10,000-gallon fiberglass diesel UST, and one 280-gallon steel waste-oil UST were located on the site (Figure 2). Also located on the site were eight fuel dispensers on two service islands, two automotive hoists located in the service bays, three abandoned and filled seepage pits, one abandoned septic tank, and a separate garage building.

2.0 SITE BACKGROUND

The site is located adjacent to Interstate 5 at the Grapevine exit, approximately 20 miles south of Bakersfield and 9 miles north of Lebec, California. The Unocal station occupied the site from 1961 until October, 1992 under a lease agreement with Tejon Ranch. A Texaco service station is located directly across Grapevine Road (identified on Figures 2 and 3 as "Frontage Road") from the station. An unlined drainage channel passes along the south side of the site. A restaurant formerly located east of the site burned

approximately six years ago and the building was demolished. The land remains unimproved.

GeoResearch reviewed a Phase I Environmental Site Assessment report prepared for the subject property (PHR, 1991). states that a leak in a super (92 octane) product dispenser was discovered and repaired in June of 1981. The piping to the dispensers had been replaced the previous month. Unocal files reportedly contained no information regarding remedial activities or even the location of the leak. Mr. Rose recalled that the repair had taken place but was unable to recall which dispenser had been involved. The Phase I report indicated that Unocal files did not contain information regarding UST replacement since the original UST installation in 1961. Mr. Rose, the former station manager, reported that the tanks were replaced after he acquired the dealership in 1977.

A phase II investigation was conducted by GeoResearch at the site in January of 1992 (GeoResearch, 1992). This investigation included drilling sixteen soil borings near the former USTs, dispenser islands, seepage pits, and near the southeast corner of the detached garage (Figure 2). Additional borings were drilled north and east of the station on Tejon Ranch property. This investigation located the presence of petroleum hydrocarbons in three areas on the site: below the north end of the easternmost dispenser island (island closest to the building) where a crack in the island was receiving gasoline spillage, beneath the concrete paving near the gasoline USTs, and near the southeast corner of the detached garage. The southeast corner of the detached garage was reported to have been a radiator repair area prior to Mr. Rose's acquisition of the property.

3.0 GEOLOGY/HYDROLOGY

Soils beneath the site consist of Pleistocene age material of the Tulare formation which is derived from alluvium and bedrock off the Tehachapi Mountains approximately one-half mile to the south (personal communication with KCEHSD geologist, Tom Haselbacher). As observed during the phase II investigation and excavation activities, shallow soils consist predominantly of silts and silty sands. Coarse granitic gravels, cobbles, and boulders were encountered from near the surface to 45 feet bgs.

According to Mr. Haselbacher, ground water in the vicinity of the site is estimated to be 1,000 to 1,200 feet bgs. An unlined drainage channel passes to the south of the site (Figures 1 and 2).

4.0 OBSERVATIONS/PROCEDURES

During the removal of the buildings and surface paving, GeoResearch personnel observed the soil conditions. Areas in which soil samples were required by the KCEHSD, as well as in other suspect areas, were marked for accurate relocation after station demolition. Soils in suspect areas were monitored with an organic vapor analyzer (OVA) for a preliminary indication of the presence of hydrocarbons.

For soil sample identification purposes, the Diesel UST was designated T1, the southernmost gasoline UST as T2, and the northernmost gasoline UST as T3. The waste-oil UST was designated as WO. Soil samples were identified by their location and depth. For example, sample # T1-N-14 was collected beneath the north end of T1 (diesel UST) at a depth of 14 feet bgs. Soil samples collected near the product lines were designated PL#-depth. Soil samples collected near the automotive hoist were designated H#-depth. Soil samples collected near the fuel dispensers were designated D#-depth. Stockpile samples were designated SP-#. The remaining soil samples were designated SS#-depth.

Soil samples were collected in accordance with KCEHSD requirements and according to standard GeoResearch procedures (Appendix B). Mr. Finberg was on site during the required sampling activities. Additional soil was removed from areas in which laboratory data indicated petroleum hydrocarbons remained. Confirmation samples were subsequently collected and analyzed for the appropriate constituents.

Ninety three soil samples were collected and preserved for laboratory analysis (Figures 3 and 4). An additional 53 soil samples (composited into 19 samples for analysis) were collected from excavated soil stockpiles (Figure 8).

4.1 SERVICE BAY AREA

A clarifier near the northernmost automotive hoist contained approximately 80 gallons of bright yellow-green liquid. The liquid was subsequently pumped out by M.P. Environmental Service Inc. of Bakersfield, California for disposal with other rinsate removed from the gasoline, diesel, and waste-oil USTs. These fluids were transported to Gibson Oil Refining and Recycling of Bakersfield, California (Appendix A).

Neither the concrete clarifier vault nor the underlying soil was stained or showed evidence of leakage when it was removed. Soil beneath the two automotive hoists (8 feet bgs) did not appear to be stained or show evidence of leakage.

UN4734TC.FNL2 012593F

4.2 UST EXPOSURE

Soil beneath the concrete slab covering the gasoline USTs was stained black. This staining was consistent with the UST overspill and seepage of automotive fluids into cracks in the concrete. This surficial staining extended east of the USTs toward the eastern property boundary to a depth of approximately 4 feet bgs (Figure 3). Approximately 75 cubic yards of soil was subsequently excavated to remove the stained soil. Confirmation samples were collected in the underlying unstained soil (Figure 3). The soil was stockpiled separately on-site (samples SP-5 through SP-7 and SP-14 through SP-16, Figure 8).

A 10-inch Transite water main was located approximately 2-feet bgs trending east-west across the site and immediately adjacent to the southern edge of the gasoline UST pit. Prior to removing the surface material off the USTs, the water main was capped at points east and west of the gasoline USTs under the direction of Tejon Ranch personnel. Capping the water main facilitated re-routing the water supply around the gasoline USTs so they could be excavated and removed. The section of water main which was visible in the UST pit was removed.

The diesel UST pit had been backfilled with pea gravel. The pea gravel above the tank near fill port (center) was stained brown and contained strong diesel odors. This stained pea gravel was removed and stockpiled separately.

Soil above and surrounding the waste-oil UST was not observed to be stained or show evidence of overfill or leakage.

4.3 UST REMOVAL

The gasoline and waste-oil USTs appeared rusted with moderate corrosion pitting upon their removal. No holes were observed in the USTs. The fiberglass diesel UST appeared to be in good condition without evidence of cracks or leaking seams.

Soil from 16 to 18 feet bgs beneath the east end of the gasoline USTs was stained gray-green and possessed gasoline odors. Approximately 220 cubic yards of soil was removed from the gasoline UST pit to unearth the tanks and remove soil with evidence of petroleum hydrocarbons. The soil was stockpiled on-site and stockpile samples were collected (soil samples SP-1 through SP-4 and SP-8 through SP-13).

The pea gravel beneath the center of the diesel UST was stained brown. The pea gravel backfill extended to a depth of approximately 15 feet bgs. This pea gravel as well as the underlying stained soil was excavated and removed to a depth of 19 feet bgs (approximately 40 cubic yards). Approximately 120 cubic

yards of soil which did not contain notable evidence of diesel fuel was removed from the top, sides, and beneath each end of the diesel UST. These soils were stockpiled separately on-site and stockpile samples were collected (soil samples SP-23 through SP-30).

Soil beneath the waste-oil UST was not noticeably stained and did not show evidence of a hydrocarbon release. Approximately 15 cubic yards of soil was removed from the waste-oil pit (to facilitate UST removal) and stockpiled on-site. Soil samples SP-17 through SP-19 were collected from the stockpiled soil.

4.4 PRODUCT LINES/DISPENSER ISLANDS

Black-stained soil with gasoline odors was observed adjacent to the dispenser islands immediately below the concrete paving. This soil was removed during the subsequent excavation of soil from beneath the islands.

The fiberglass gasoline product lines extended from the USTs to the west sides of the dispenser islands (Figure 3). The diesel product line extended from the diesel UST to the east side of the diesel dispenser (west island, south end). Abandoned steel product lines were found extending from the gasoline UST pit to the east sides of the dispenser islands. According to Wegener Construction, all the product lines had been purged prior to their arrival. No product was encountered during the line removal.

Pea gravel and soil beneath a product line elbow, adjacent to the former diesel dispenser, was saturated with diesel. Subsequent excavation and soil sampling demonstrated that diesel fuel in these soils was limited to less than 3 feet bgs in vertical extent.

Three air/water dispensers were located on each island; one at each end and one in the center (Figure 4). These air/water dispensers were constructed of 6-inch square metal housings which were placed in the ground to a depth of approximately 9 feet bgs. When the dispenser islands were removed, soil beneath the north ends and centers of the islands was observed to be stained dark greenish-black and contain very strong gasoline odors. When the air water dispensers were removed from the north ends and the centers of the islands, they were observed to be coated with the same greenish-black soil as was observed immediately beneath the islands.

Soil samples were collected under the direction of Mr. Finberg at 2 and 6 feet below the product lines and the fuel dispensers at 15 feet intervals (Figure 3). The product lines were approximately 1 foot bgs near the fuel islands. Soil beneath the north ends of both dispenser islands was stained black and contained strong gasoline odors. Soil samples collected from the required locations beneath the dispensers (D1-7 and D4-7) confirmed that hydrocarbons were present.

Sampling trenches at the north end of each island were excavated to depths of 15 feet bgs for the east island and 21 feet bgs for the west island (Figures 5 and 6). These excavations were completed to define the vertical extent of gasoline in the soil prior to the soil's actual removal. Soil encountered were primarily course with some silt and abundant cobbles to boulders. Laboratory results for soil samples D1-21 and D4-15 suggested that the vertical limit of the hydrocarbons had been reached (Figure 6). Both of these excavations were temporarily backfilled and marked for re-location following the USTs removal, when space was made available for the excavation of the affected soil.

Soil was excavated beneath the east dispenser island until laboratory results of confirmation samples indicated that soil containing petroleum hydrocarbons had been adequately removed (Figures 3 and 4). Black soil staining was observed in this area to a depth of 10 feet bgs. Soil was excavated to a depth of 20 feet bgs. Approximately 200 cubic yards of soil was excavated and stockpiled on-site from beneath the north end of the east island. Soil samples were collected from the stockpiles and submitted to GEOTEST (SP-38 through SP-47).

Gasoline odors were encountered in soil beneath the north end of the west dispenser island to depths greater than 21 feet bgs (Figure 4). Field observations and laboratory data indicated that the vertical limit of the gasoline in soil had not been reached. Ramps were excavated in the north and south walls of the excavation (Figure 4). From these ramps, the excavator was able to remove soils containing petroleum hydrocarbons to a depth of 37 feet bgs. Soils were similar to those described above (coarse with cobbles to boulders) with no apparent bedding. The deposits appeared to be of high permeability. During the removal of soil below 30 feet bgs, boulders were encountered as large as 3 feet in diameter. Field observations indicated that all soils containing gasoline were removed above a depth of approximately 30 feet bgs.

The 10-inch water main located south of the west island prevented further excavation from the north. According to laboratory reports for confirmation samples, hydrocarbons were still present in the bottom of the excavation, at depths in excess of 35 feet bgs. Further excavation in this area was impractical with the available equipment. Approximately 300 cubic yards of soil and boulders was excavated and stockpiled on-site from this area. Soil samples were collected from the stockpiles and submitted to GEOTEST (SP-31 through SP-37).

4.5 RADIATOR REPAIR AREA

Approximately 25 cubic yards of soil was excavated from near the southeast corner of the former detached garage and stockpiled onsite (Figure 3). Soil samples SP-20 through SP-22 were collected

from the stockpiled soil (Figure 8). During the previous GeoResearch investigation at the site, petroleum hydrocarbons were identified in this area at a depth of 5 feet bgs. On the basis of the previous investigation's findings, soil was excavated to a maximum depth of 8 feet bgs and confirmation samples were collected. Soil discoloration or evidence of hydrocarbon releases were not evident at the surface or beneath the surface.

4.6 NORTHERN PROPERTY BOUNDARY

Soils north of the station lease were previously identified (GeoResearch, 1992) as an area which regularly received surface runoff containing automotive fluids (Figure 3). Soil staining was visible from the surface to a depth of approximately 3 to 5 feet bgs. All soils with visible staining were removed (approximately 200 cubic yards) and stockpiled on-site. Soil samples SP-48 through SP-53 were collected from the stockpiled soil.

4.7 SEEPAGE PITS

According to site diagrams provided by Unocal, two seepage pits were located north of the station lease (Figure 3). Only one of these seepage pits was found. The concrete top of the pit was found at approximately 2 feet bgs. The seepage pit had been backfilled with concrete to within approximately 3 feet of the surface (Figure 3).

The seepage pit shown on the site plan east of the former station was not located during the site observations. It is assumed that the pit was backfilled and abandoned as Unocal's general arrangement plan indicates (see PHR, 1991).

5.0 LABORATORY RESULTS

5.1 ANALYTICAL PROCEDURES

Selected soil samples were analyzed on-site by GEOTEST. The information obtained from the mobile laboratory was utilized to direct the scope of further site investigations.

Analyses completed in the mobile laboratory included total petroleum hydrocarbons as gasoline (TPH-G) and total petroleum hydrocarbons as diesel (TPH-D) in accordance with Cal/DOHS methods, benzene, toluene, ethylbenzene, and total xylenes (BTEX) according to EPA Method 8020, and total recoverable petroleum hydrocarbons (TRPH) according to EPA Method 418.1 (Appendix C).

Selected soil samples were analyzed by GEOTEST in Long Beach for TPH-D, TPH-G, TRPH, and for halogenated volatile organics according to EPA Method 8010. Selected samples were submitted to Core Laboratories of Anaheim, California to be analyzed for total organic halocarbons (TOX) in accordance with EPA Methods. Laboratory results and chain-of-custody documents are included in Appendix D. Soil sample numbers marked with a diamond in Tables 1 through 7 indicate soils which were subsequently excavated.

5.2 GASOLINE, DIESEL, AND WASTE-OIL USTS

According to laboratory reports, soil collected beneath the center of the diesel UST at 17 feet bgs (sample T1-C-17) contained 2,200 mg/kg TPH-D with no BTEX detected (Table 1, Figure 3). Sample T1-C-19 collected at 19 feet bgs, did not contain of TPH-D; however, did contain toluene and total xylenes (0.006 and 0.016 mg/kg, respectively). T1-N-14 contained 0.019 mg/kg total xylenes. No other samples obtained beneath the diesel UST were found to contain hydrocarbons. Soil samples were also collected from each sidewall of the diesel pit (SS13-17, SS14-17, SS15-18, and SS16-18) at 17 and 18 feet bgs. None of these sidewall samples were reported to contain TPH-D or BTEX.

According to laboratory reports, a soil sample collected beneath the west end of the southernmost gasoline UST at 18 feet bgs (T2-W-18) contained 150 mg/kg TPH-G and low concentrations of toluene, ethylbenzene, and total xylenes (Table 2). Soil sample T2-W-20 was collected at 20 feet bgs was not reported to contain TPH-G or BTEX. A TPH-G concentration of 3.5 mg/kg was reported in soil collected beneath the east end of the UST at 19 feet bgs (T2-E-19) with no BTEX detected.

Mr. Finberg requested that samples be collected from stained soil beneath the east end of the northernmost gasoline UST. In this sample, soil containing TPH-G at 170 mg/kg was reported at 16 feet bgs (T2-E-16, T3-E-16). Traces of toluene, ethylbenzene, and total xylenes were also reported in this sample. Soil sample T3-E-18 was collected at 18 feet bgs at the same location and contained TPH-G at 1.3 mg/kg and total xylenes of 0.018 mg/kg. Sidewall samples collected in the gasoline UST pit at 18 feet bgs (SS5-18, SS6-18, SS7-18, and SS8-18) were not reported to contain TPH-G or BTEX.

Soil collected beneath the waste-oil UST was collected at 10 and 14 feet bgs (WO-C-10 and WO-C-14) (Table 3). Samples collected from the bottom of the excavation were analyzed for TRPH, total lead, and TOX. According to laboratory reports, TRPH and TOX were not detected. Total lead was reported to be 3.1 mg/kg and 2.3 mg/kg in samples WO-C-10 and WO-C-14, respectively. Soil samples were also collected from the excavation sidewalls at 13 feet bgs (SS9-13, SS10-13, SS11-13, and SS12-13). The sidewall samples were not reported to contain TRPH.

According to laboratory reports, three of the samples (SS2-2, SS3-2, and SS4-2) collected from east of the gasoline USTs were reported to contain no TRPH above detection limits (Figure 3, Table 5). Sample SS1-2 was reported to contain a TRPH concentration of 62 mg/kg.

5.3 REQUIRED DISPENSER ISLAND SAMPLING

Soil samples were collected at 2 and 6 feet beneath each set of fuel dispensers located at the ends of the dispenser islands as required by the KCEHSD (Table 4). Soil samples collected near the south end of the east island (D3-3 and D3-7), were analyzed for TPH-G and BTEX. Sample D3-3 was not reported to contain TPH-G or BTEX. Sample D3-7 was not reported to contain TPH-G; however, did contain 0.007 mg/kg toluene. Sample D3-3 was not reported to contain TRPH.

Soil samples collected near the south end of the west island (D2-3 and D2-7) were analyzed for TPH-D, TPH-G, and BTEX. Sample D2-3 was not reported to contain TPH-D, TPH-G, or BTEX. Sample D2-7 was not reported to contain TPH-G or TPH-D; however, did contain 0.007 and 0.009 mg/kg benzene and toluene, respectively. Sample D2-3 was not reported to contain TRPH.

Soil samples collected near the north end of the east island were analyzed for TRPH, TPH-G, and BTEX. Sample D4-3, collected at 3 feet bgs, was reported to contain 1,400 mg/kg TRPH, 1,200 mg/kg TPH-G, and 0.28, 39, 15, and 78 mg/kg BTEX, respectively. Sample D4-7, collected at 7 feet bgs, was reported to contain 1,200 mg/kg TRPH, 4,500 mg/kg TPH-G, and 0.84, 100, 59, and 660 mg/kg BTEX, respectively.

Soil samples collected near the north end of island #2 were analyzed for TPH-G, and BTEX. According to laboratory reports, sample D1-3 contained 14 mg/kg TPH-G and 0.098, 0.47, 0.16, and 1.5 mg/kg BTEX, respectively. Sample D1-7 was reported to contain 1,100 mg/kg TPH-G and 3.8, 12, 12, and 110 mg/kg BTEX, respectively. D1-7 was reported to contain 330 mg/kg TRPH.

Soil samples were collected along the product lines south of the dispenser islands at 3 and 7 feet bgs. According to laboratory reports, these samples did not contain TPH-G, TPH-D, benzene, ethylbenzene, or total xylenes; however, one sample contained toluene near the detection limit (Table 4).

5.4 DISPENSER ISLAND EXCAVATIONS

5.4.1 East Dispenser Island

Soil excavation and sampling was conducted in addition to that required by the KCEHSD beneath the dispenser islands. Soil samples were collected beneath the east island at 4 and 8 feet bgs where a crack in the island apparently acted as a conduit for spilled gasoline (D5-4 and D5-8). Soil sample D5-4 was not reported to contain TPH-G or BTEX. Soil sample D5-8 was reported to contain 2.0 mg/kg TPH-G and toluene, ethylbenzene, and total xylenes of 0.026, 0.012, and 0.29 mg/kg, respectively.

Soil beneath the northern half of the east island was excavated to a depth of 20 feet bgs (Figures 4 through 7). Soil samples D4-11, D4-15, and D4-20 were collected at 11, 15, and 20 feet bgs. Soil sample D4-11 was reported to contain 1,600 mg/kg TRPH. Soil sample D4-15 was reported to contain 5.3 mg/kg TPH-G and toluene, ethylbenzene, and total xylenes of 0.19, 0.067, and 0.60 mg/kg respectively. This sample was not reported to contain TRPH. Soil sample D4-20 was not reported to contain TPH-G or benzene; however, did contain 0.011, 0.009, and 0.097 mg/kg toluene, ethylbenzene, and total xylenes, respectively.

Excavation beneath the east island continued until laboratory data indicated that the hydrocarbons had been adequately removed. Confirmation samples collected from each sidewall of the excavation (SS27-15, SS28-15, SS29-15, and SS30-15) were analyzed for TPH-G and BTEX. According to laboratory reports, none of the sidewall samples contained TPH-G. One sample (SS29-15) was reported to contain toluene and total xylenes of 0.006 and 0.016 mg/kg, respectively. The other three sidewall samples were not reported to contain BTEX.

5.4.2 West Dispenser Island

Soil beneath the north end of west island was sampled at 10 and 21 feet bgs (D1-10 and D1-21) for a preliminary assessment of the vertical extent of TPH-G/BTEX. Sample D1-10 was reported to contain TPH-G at 3,000 mg/kg and BTEX at 0.43, 41, 44, and 530, respectively. Sample D1-21 was reported to contain TPH-G at 8.9 mg/kg and toluene, ethylbenzene, and total xylenes of 0.007, 0.010, and 0.11 mg/kg, respectively.

The north end of the west island was excavated to a depth of 21 feet bgs. Field observations and OVA readings at 21 feet bgs indicated that gasoline was still present. Excavation continued to a depth of 30 feet bgs and confirmation samples were collected from the excavation bottom and the sidewalls (D1-30, SS33-29, SS34-29, SS35-29, and SS36-29). Soil sample D1-30, collected from the

excavation bottom at 30 feet bgs contained TPH-G at 2,900 mg/kg and BTEX of 0.043, 64, 53, and 450 mg/kg, respectively. Soil sample SS34-29, collected from the north sidewall at 29 feet bgs, contained TPH-G at 1,600 mg/kg and toluene, ethylbenzene, and total xylenes of 6.8, 12, and 100 mg/kg, respectively. Soil sample SS35-29, collected from the east sidewall, contained a TPH-G at 320 mg/kg and BTEX of 0.006, 0.22, 0.45, and 6.1 mg/kg, respectively. Soil samples SS33-29 and SS36-29 were not analyzed.

Excavation of soil containing TPH-G/BTEX continued to a depth of 37 feet bgs. Soil samples were collected from the excavation sidewalls at 35 feet bgs (SS37-35, SS38-35, SS39-35, and SS40-35). Soil sample SS37-35, collected from the north sidewall was not reported to contain TPH-G or BTEX. Soil sample SS39-35, collected from the east sidewall was not reported to contain TPH-G; however, did contain traces of toluene and total xylenes. Soil sample SS38-35, collected from the south sidewall, was reported to contain TPH-G at 3,500 mg/kg and BTEX at 0.013, 69, 58, and 530 mg/kg, respectively. Soil sample SS40-35, collected from the west sidewall, was reported to contain TPH-G at 3,300 mg/kg and BTEX of 0.030, 57, 50, and 400 mg/kg, respectively.

5.5 RADIATOR REPAIR AREA

Four soil samples (SS23-6, SS24-2, SS25-2, and SS26-6) were collected in the former radiator repair area. According to laboratory reports, soil from this area contained TRPH as high as 72 mg/kg (Table 5). This soil was subsequently excavated, stockpiled on-site, and confirmation samples SS31-5 and SS32-8 were collected at 5 and 8 feet bgs. These confirmation samples were not reported to contain detectable concentrations of TRPH (Table 5).

5.6 NORTHERN PROPERTY BOUNDARY

Six soil samples were initially collected from this area at 2 and 3 feet bgs after the visually stained soil had been removed (SS17-2, SS18-3, SS19-3, SS20-3, SS21-3, and SS22-3) (Table 6). TRPH was reported to range from non-detectable to as high as 110 mg/kg (SS20-3). Subsequently, additional soil was removed and soil sample SS20-5 was collected. This sample was reported to contain 73 mg/kg TRPH. Additional soil was removed and sample SS20-6 was collected at 6 feet bgs and was not reported to contain TRPH.

6.0 STOCKPILED SOIL/SOIL DISPOSAL

Approximately 1,200 cubic yards of soil was excavated and stockpiled on-site, in 12 different stockpiles, from the excavation activities (Figure 8). Fifty-three soil samples were collected to characterize the stockpiles. The soil samples were composited into

19 samples by GEOTEST and analyzed for TPH-G, BTEX, TPH-D, or TRPH (Table 7, Figure 8).

Approximately 300 cubic yards of soil removed from the diesel and waste-oil UST excavations, area east of the gasoline USTs, radiator repair area, and the northern property boundary was disposed off-site. The soil was transported by Dillard Trucking of Byron, California to Laidlaw Environmental Services Inc. of Buttonwillow, California for disposal as non-hazardous waste (Appendix A). These soils were characterized by the analysis of samples SP-5 through SP-7, SP-14 through SP-30, and SP-48 through SP-53, as shown in Table 7. Average TRPH and TPH-D concentrations in the disposed soils were approximately 400 and 1,050 mg/kg, respectively.

Approximately 300 cubic yards of soil from the dispenser excavation which had been reported to contain TPH-G as high as 400 mg/kg, Approximately 200 cubic yards of boulders were remained on-site. removed from the stockpile by Whitten Excavation (subcontractor to Wegener Construction) and hauled to a local landfill in Gavin, California for disposal as unclassified material. During the removal of the boulders, the soil was monitored with the OVA in accordance with the San Joaquin Valley Unified Air Pollution Control District (SJVUAPCD) guidelines. At no time did the concentration of volatiles, as measured by a properly calibrated hnu photoionization detector, exceed 50 ppm within 3-inches of the soil surface. The remaining 100 cubic yards of soil was re-sampled and analyzed by GEOTEST for TPH-G and BTEX (SP1-4, SP2-2, SP3-2, SP4-4, and SP5-1). According to laboratory reports, TPH-G ranged from 19 to 24 mg/kg. The only BTEX constituents detected were total xylenes. Total xylenes were reported to range from nondetectable to 0.034 mg/kg (Table 6). Verbal permission from Mr. Finberg of the KCEHSD was subsequently granted to utilized this soil as backfill for the excavations located near the southeast corner and north side of the station lease.

7.0 BACKFILL/COMPACTION

Backfill and compaction of the excavations was performed by Whitten Excavation under the direction of Wegener Construction Company. Compaction certification was provided by Smith and Associates of Bakersfield, California (Appendix A).

Prior to backfilling operations, Mr. Finberg approved the use of approximately 600 cubic yards of the stockpiled soil for use as backfill material (verbal communication to Mr. Blair Redfearn of GeoResearch, October 28, 1992). According to laboratory reports, this soil contained concentrations of TPH-G and TRPH of up to 24 and 71 mg/kg, respectively, with traces of ethylbenzene and total xylenes (SP-1 through SP-4, SP-8 through SP-13, and SP-38 through

SP-47, Table 7). This soil was utilized in the dispenser island excavation. The gasoline, diesel, and waste-oil excavations were backfilled with imported soil.

8.0 SUMMARY/CONCLUSIONS

GeoResearch observed the station demolition and removal of the USTs and appurtenances. The gasoline, diesel, and waste-oil USTs were observed to be in good condition without evidence of holes or leakage. Ninety-three soil samples were collected and preserved for laboratory analysis. An additional 53 soil samples (composited into 19) were collected from soil stockpiles on-site.

Soils containing petroleum hydrocarbons were identified in five areas:

- 1) Beneath the dispenser islands
- 2) Beneath the gasoline/diesel USTs
- 3) The southeast corner of the property where a radiator repair facility was reportedly historically located,
- 4) Along the northern property boundary
- 5) Beneath the concrete paving immediately east of the gasoline USTs

Areas 2) through 5) were successfully remediated by excavation. Confirmation samples were collected which indicated that significant concentrations of petroleum hydrocarbons had been removed. Soil beneath the east dispenser island was excavated to a depth of 20 feet bgs. According to laboratory reports, confirmation samples collected in the excavation demonstrate that the hydrocarbons have been removed.

Approximately 300 cubic yards of soil was excavated from beneath the west dispenser island to a depth of 37 feet bgs. Confirmation samples collected from the excavation's north and east sidewalls suggest that significant concentrations of hydrocarbons have been largely removed from these areas.

The source of the gasoline release appeared to have been near the dispensers on the north end of the west island. Below a depth of approximately ten feet bgs, the gasoline appeared to have traveled vertically with little lateral spreading due to the coarse and permeable nature of the soils. Soils with significant concentrations of gasoline appear to have been removed above a depth of approximately 30 feet bgs. Soil samples collected from the excavation's south and west sidewalls demonstrate that concentrations of TPH-G as high as 3,500 mg/kg are present beyond

the limits of the excavation. Additional soil sampling and analysis below a depth of 35 feet bgs will be necessary to establish the limit of vertical migration of gasoline.

Approximately 1,200 cubic yards of soil was excavated and stockpiled on-site. Of this 1,200 cubic yards of soil, approximately 700 cubic yards was utilized as backfill. Approximately 300 cubic yards of soil was transported to Laidlaw's Class II disposal facility as non-hazardous. Approximately 200 cubic yards of boulders were removed from the stockpiled soil and disposed.

PERMIT FOR CLOSURE OF

TANK(S) AT ABOVE

LOCATION

PERMIT EXPIRES October 29, 1992

APPROVAL DATE July 29.

APPROVED BY

Chris Finberg

Hazardous Materials Specialist

POST ON PREMISES

CONDITIONS AS FOLLOWS:

It is the responsibility of the Permittee to obtain permits which may be required by other regulatory agencies prior to beginning work (i.e., City Fire and Buildin Departments).

Permittee must notify the Hazardous Materials Management Program at (805) 861-3636 two working days prior to tank removal or abandonment in place to arrange for required inspections(s).

Tank closure activities must be per Kern County Environmental Health and Fire Department approved methods as described in Handbook UT-30.

It is the contractor's responsibility to know and adhere to all applicable laws regarding the handling, transportation or treatment of hazardous materials.

The tank removal contractor must have a qualified company employee on aite supervising the tank removal. The employee must have tank removal experience prior to working unsupervised.

If any contractors other than those listed on permit and permit application are to be utilized, prior approval must be granted by the <u>specialist</u> listed on the permit. Deviation from the submitted application is not allowed.

Soil Sampling:

Tank size less than or equal to 1,000 gallons - a minimum of two samples must be retrieved from beneath the center of the tank at depths c approximately two feet and six feet.

Tank size greater than 1,000 to 10,000 gallons - a minimum of four samples must be retrieved one-third of the way in from the ends of each tan at depths of approximately two feet and six feet.

C. Tank size greater than 10,000 gallons - a minimum of six samples must be retrieved one-fourth of the way in from the ends of each tank and beneat the center of each tank at depths of approximately two feet and six feet.

Soil Sampling (piping area):

A minimum of two samples must be retrieved at depths of approximately two feet and six feet for every 15 linear feet of pipe run and under the dispenser are:

November 23, 1992 Job No. 92-K-1A

WEGENER CONSTRUCTION COMPANY 1710 Calloway Drive Bakersfield, California 93312

ATTENTION: MR. DOUG WEGENER

RE: CERTIFICATION OF SOIL COMPACTION IN PITS DESIGNATED A.B.C. & D AT UNDOAL STATION #4734 GRAPEVINE ROAD AT 1-5

LEBEC, CALIFORNIA

GENTLEMEN:

PLEASE REFER TO THE ATTACHED SITE SKETCH FURNISHED TO THE UNDERSIGNED BY MR. WEGENER. IT IS AN 84" x 11" PLAT ON A "GEO RESEARCH" LETTERHEAD AUTHORED BY "BLAIR REDFEARN" AND DATED OCTOBER 23, 1992. The subject drawing depicts the location of the "PITS" to be filled at this site, along with the location of "spoil piles". I have superimposed the letters A,B,C, and D on the Dispenser Area Pit, Diesel Pit, Waste Oil Pit and Gas Pit, in that order respectively. In addition, I have similarly lettered the "Relative Compaction" sheets that were used to record the field density test results at each corresponding pit. These sheets, along with two maximum density curves, one for the onsite material used and one for the imported material used, are all attached to this letter.

ALL VISIBLE IMPROVEMENTS ABOVE THE GROUND HAD BEEN REMOVED BEFORE OUR FIRM WAS CALLED TO THE SITE.

PIT "A" WAS UNIQUE FROM THE OTHER PITS IN THAT THERE WAS A PILOT TRENCH MEASURING 9' \times 9' \times 9' \times 9' at the center of the larger PIT. In this lower level pit, natural onsite soils was placed to a depth of seven feet. At this juncture Michigan L-90 front end loader with a full three cubic yard bucket commenced the compaction effort. When sufficient effort had been applied, the remaining fill, up to the 18 foot depth, was judiciously filled and compacted and tested at the 18 foot depth. The filling of the larger Pit "A" continued to the natural ground surface.

THE USABLE NATURAL SOIL MATERIAL THAT WAS STOCKPILED ON SITE WAS UTILIZED TO MAKE THE FILLS WHEN POSSIBLE. IMPORTED SOIL MATERIAL WAS USED TO COMPLETE THE FILL TO THE LEVEL OF THE ADJACENT SOIL SURFACE ELEVATION.

ALL FILL MATERIAL PLACED WAS COMPACTED TO THE DEPTH SHOWN ON EACH OF THE DESIGNATED "RELATIVE COMPACTION" SHEETS THAT CORRESPOND TO THE PITS SIMILARLY DESIGNATED, 1.E., A,B,C, or D.

ALSO, ALL OF THE FILL ABOVE THE DEPTH SHOWN WAS COMPACTED TO AT LEAST 90% OF MAXIMUM DENSITY. MAXIMUM DENSITY WAS DETERMINED IN ACCORDANCE WITH ASTM D-1557-78 METHOD A.

THE CONTRACTOR WAS ADVISED AT THE DUTSET OF THE WORD THAT IN THE EVENT A DENSITY TEST FAILED, THE STRATA IN WHICH THE FAILURE OCCURRED WOULD HAVE TO BE SCARIFIED, THE MOISTURE CONTENT ADJUSTED, THE SOIL REMIXED AND COMPACTED UNTIL THE MINIMUM RELATIVE COMPACTED IS REACHED.

THE UNDERSIGNED CERTIFIES THAT THE SOIL PLACED IN THE PITS AND TESTED MEETS THE SPECIFIED 90% OF MAXIMUM DENSITY AND SAID SOIL WILL CARRY THE LOADS OF A ONE STORY WOOD FRAME BUILDING.

Yours Truly,

SMITH & ASSOCIATES, A DBA OF HARRY C. Ellingston, Inc.

November 12, 1992 Job No. 92-K-1A

Wegener Construction Company 1710 Calloway Drive Bakersfield, California 93312

Attention: Mr. Doug Wegener

RE: Certification of Soil Compaction in Pits Designated

A, B, C, & D at

Unocal Station #4734 Located at 9068 Grapevine Road at I-5

Lebec, California

Gentlemen:

Please refer to the attached site sketch furnished to the undersigned by Mr. Wegener. It is an 8½" x 11" plat on a "Geo Research" letterhead authored by "Blair Redfearn" and dated October 23, 1992. The subject drawing depicts the location of the "pits" to be filled at this site, along with the location of "spoil piles". I have superimposed the letters A, B, C, and D on the Dispenser Area Pit, Diesel Pit, Waste Oil Pit and Gas Pit, in that order respectively. In addition I have similarly lettered the "Relative Compaction" sheets that were used to record the field density test results at each corresponding pit. These sheets along with two maximum density curves, one for the onsite material used and one for the imported material used, are all attached to this letter.

All visible improvements above the ground had been removed before our firm was called to the site.

The usable natural soil material that was stockpiled on site was utilized to make the fills when possible. Imported soil material was used to complete the fill to the level of the adjacent soil surface elevation.

All fill material placed was compacted to the depth shown on each of the designated "Relative Compaction" sheets that correspond to the pits similarly designated, i.e., A, B, C, or D.

Also, all of the fill above the depth shown was compacted to at least 90% of MAXIMUM DENSITY. Maximum density was determined in accordance with ASTM D-1557-78 Method A.

The Contractor was advised at the outset of the work that in the event a Density Test failed, the strata in which the failure occurred would have to be scarified, the moisture content adjusted, the soil remixed and compacted until the minimum Relative Compaction is reached.

The undersigned certifies that the soil placed in the pits and tested meets the specified 90% of Maximum Density and said soil will carry the loads of a one story wood frame building.

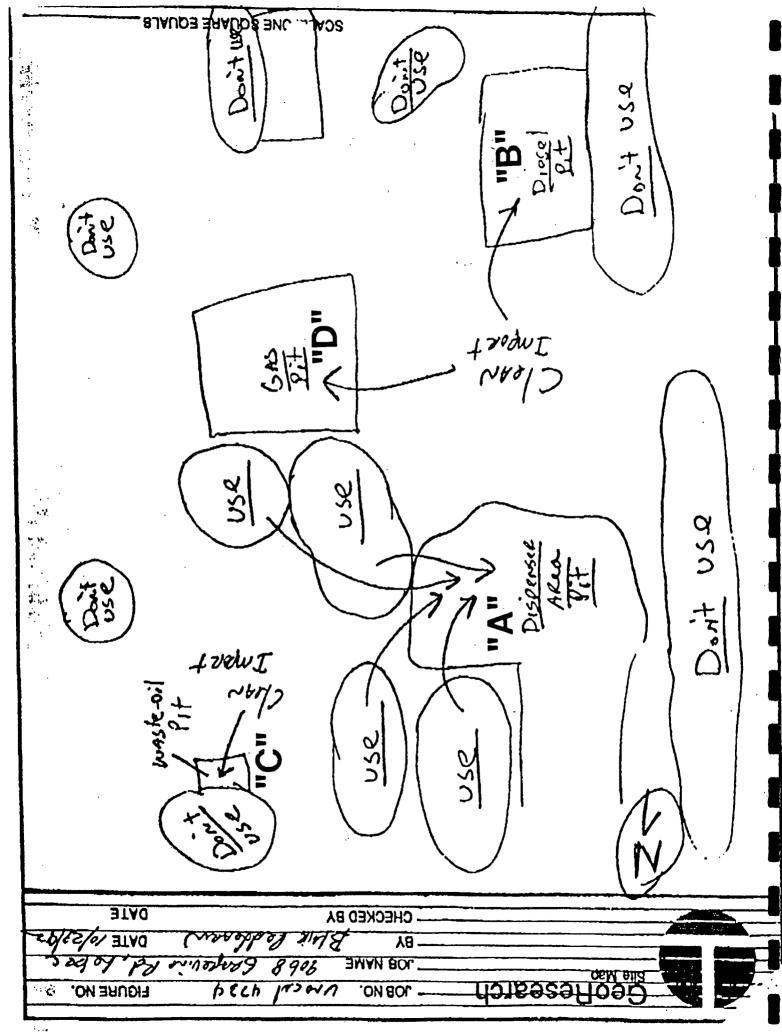

Yours truly,

SMITH & ASSOCIATES, a DBA of Harry C. Ellingston, Inc.

Harry C. Ellingston, Jr.

APPENDIX B

GEORESEARCH PROCEDURES

GEORESEARCH SOIL SAMPLING PROCEDURES FOR UNDERGROUND STORAGE TANKS AND ASSOCIATED FACILITITES

The following procedures are utilized for the collection of soil samples:

- i. Soil samples are obtained under the direction of a professional engineer, geologist, or authorized representative of a State-approved laboratory. Sample numbers and locations are approved by the city/county inspector, if present on-site.
- ii. All soil samples at tank removal sites are taken from the backhoe bucket, unless the excavation has been safely graded or shored. Soil samples will be collected from the interior portions of the excavator bucket, away from the bucket's edges and teeth, to avoid potential cross-contamination. Approximately one inch of soil is removed from the surface area where the sample is to be collected and a clean, 6-inch long, 1-inch minimum diameter brass ring will be pounded into the soil using a wooden mallet, or equivalent tool. No headspace will be present in the ring once the sample is collected.
- iii. In shallow excavations, as in under product lines, soil samples may be taken by driving the brass tube directly into the trench sidewall.
 - iv. Soil samples are collected in thin-walled stainless steel or brass cylinders 6" long by 1.5" or 2" diameter. Cylinders are pounded into the soil with a wooden mallet or equivalent method when not using an auger or drilling equipment.
 - v. Each end of the cylinder is covered with aluminum foil, capped with polyethylene lids, taped, and labeled.
 - vi. Samples are transported in an ice chest containing blue ice or equivalent and kept at approximately 4 degrees centigrade until delivery to a California Department of Health Services-approved analytical laboratory.
- vii. Chain-of-custody records produced in accordance with U.S. E.P.A. requirements are kept to track the possession of a sample from the time it is taken in the field until the time it is analyzed.

APPENDIX C

ANALYTICAL METHODS

SUMMARIES OF LABORATORY ANALYTICAL METHODS: SOIL SAMPLES

The following briefly describes laboratory analyses performed on soil samples in accordance with the specified EPA or California Department of Health and Safety methods.

EPA Method 418.1: Total Recoverable Petroleum Hydrocarbons
Infrared spectrometry (IR) is utilized to define concentrations of
total recoverable petroleum hydrocarbons (TRPH) in soil samples.
Freon is used to extract potential hydrocarbons from the sample.
The extractant is then analyzed by IR for TRPH concentrations.

Total Petroleum Hydrocarbons - Gasoline

The volatile components of gasoline are determined by purge and trap followed by gas chromatography/flame ionization detector (GC/FID). A small amount of sample (about 1 gram) is placed in a purge vessel and 5 ml water added. The sample is purged for a specific time and the volatiles absorbed on a trap. After purging the trap is heated and the volatiles swept into the GC. The analytes are separated using a capillary column and detected using an FID. The total petroleum hydrocarbon as gasoline (TPH-G) is determined as the total amount of volatiles detected.

EPA Method 8020: Benzene, Toluene, Total Xylenes, Ethylbenzene Organic volatile aromatics in soil samples are detected on a gas chromatograph/photoionization detector (GC/PID). Pentane is utilized as the solvent extractant for potential aromatics within soil samples. The pentane and any extracted solvents are injected on a packed column. The aromatics are detected by the PID.

Total Petroleum Hydrocarbons - Diesel

Total petroleum hydrocarbons as Diesel (TPH-D) is determined by extracting a soil sample with pentane. The extract is analyzed by gas chromatography with a flame ionization detector (GC/FID). The TPH-D is determined as the total amount of compounds detected in the range where diesel elutes from the capillary column.

EPA Method 6010: ICP-AES Metals

Up to 23 metals can be analyzed for simultaneously by Inductively Coupled Plasma-Atomic Emission Spectroscopy (ICP-AES). The soil sample is digested with strong acid and the digest aspirated into the ICP. The metals are detected by monitoring the atomic emission lines of the various elements.

QUALITY ASSURANCE FOOTER

All methods are taken from one of the following references:

- (1) EPA SW-846, Test Methods for Evaluating Solid Waste, Third Edition, November 1990
- (2) Standard Methods for the Examination of Water and Wastewater, 17th Edition, 1989
- (3) EPA 600/4-79-020, Methods of Chemical Analysis for Waters and Wastes, March 1983
- (4) Federal Register, Friday, October 26, 1984 (40 CFR Part 136) (5) American Society for Testing and Materials, Volumes 5.01, 5.02, 5.03, 1992

All methods of chemical analysis have a statistical uncertainty associated with the results. Unless otherwise indicated, the data in this report is within the limits of uncertainty as specified in the referenced method. Quality control acceptance criteria are based either on actual laboratory performance or on limits specified in the referenced method.

The time of analysis indicated on the QA report may not reflect the actual time of analysis for QC samples.

All data reported on an "as received" basis unless otherwise indicated.

Data reported in the QA report may lower than sample data due to dilution of samples into the calibration

range of the analysis.

Sample concentrations for solid samples are calculated on an as received basis.

FLAGS, FOOTNOTES, AND ABBREVIATIONS

kс = Not calculable due to values lower than the detection limit.

N.I. = Not Ignitable

S.I. = Sustains Ignition

= Relative Percent Difference

= Surrogate recoveries were outside acceptable ranges due to matrix effects.

= Surrogate recoveries were not calculated due to dilution of the sample below the detectable range for the surrogate.

= Matrix spike recoveries were outside acceptable ranges due to matrix effects.

= Relative Percent Difference (RPD) for duplicate analysis outside acceptance limits due to actual differences in

the sample matrix.

- = The limit listed for flammability indicates the upper limit for the test. Samples are not tested at temperatures above 140 Fahrenheit since only samples which will sustain ignition at temperatures below 140 are considered flammable.
- = Results for this hydrocarbon range did not match a typical hydrocarbon pattern. Results were quantified using a diesel standard, however, the hydrocarbon pattern did not match a diesel pattern.
- = Results for this hydrocarbon range did not match a typical hydrocarbon pattern. Results were quantified using a gasoline standard, however, the hydrocarbon pattern did not match a gasoline pattern.

STATEMENT OF LIMITATIONS AND PROFESSIONAL CERTIFICATION

Information provided in this report; Environmental Site Assessment, Unocal Service Station 4734, 9068 West Grapevine Road, Lebec, California; for GeoResearch Project Number 92075 dated April 7, 1992, is intended exclusively for Unocal Refining and Marketing Division for the evaluation of petroleum hydrocarbons as it pertains to the subject site at the time the data were collected. The professional services provided have been performed in accordance with practices generally accepted by other geologists, hydrologist, hydrogeologists, engineers, and environmental scientists practicing in this field. No other warranty, either expressed or implied, is made. with As all subsurface investigations, there is no quarantee that the work conducted will identify any and all sources or locations of contamination. report is issued with the understanding that Unocal Refining and Marketing is responsible for ensuring that the information contained in this report is brought to the attention of the appropriate regulatory agency. The enclosed report has been reviewed by a geologist who is registered in the state of California and whose signature and license number appear below.

EXECUTIVE SUMMARY

GeoResearch has conducted an environmental site assessment at Unocal Service Station #4734 located at 9068 West Grapevine Road, approximately 20 miles south of Bakersfield, California (Figure 1). This work was authorized by Mr. Bob Boust of Unocal on November 25, 1991. The purpose of the assessment was to detect and determine the extent of any significant concentrations of petroleum hydrocarbons and selected other parameters which may have resulted from the fuel storage and dispensing facilities, motor vehicle service facilities, and other identified areas of concern.

Mr. Boust also authorized GeoResearch to conduct additional investigations of areas adjacent to the station (north and east) on Tejon Ranch property not a part of the station lease, pursuant to discussions with Kern County Environmental Health Services Department (KCEHD) and Mr. Jeff Warren of Tejon Ranch.

At the Unocal station, soil containing concentrations of total recoverable petroleum hydrocarbons (TRPH) was identified in a radiator repair area and beneath the concrete covering the gasoline tanks. The volume of soil which is impacted by TRPH in these areas is estimated to be 150 cubic yards.

Soils containing concentrations of total petroleum hydrocarbons as gasoline (TPH-G) were identified beneath the east service island at the Unocal station. A soil volume as great as 500 cubic yards may be impacted; however, the actual volume of soils containing TPH-G could be substantially less.

On Tejon Ranch property, soil containing concentrations of petroleum hydrocarbons was identified north and east of the station just off the asphalt, near a storm drain discharge pipe located north of the station, and northwest of the storm drain discharge pipe where the water flows from the pipe following a surface channel.

One storm drain on the Unocal station site was found to discharge to the surface channel north of the station. TRPH and TPH-G concentrations were identified along this drainage channel and adjacent to the asphalt immediately north of the station. The estimated total amount of soil in these areas impacted by the TRPH and TPH-G is 100 cubic yards.

Only one very small patch of stained soil was observed to the east of the station. However, TRPH and TPH-D were detected in a sample (SS-4-1) which was not within the identified zone of soil staining.

1.0 INTRODUCTION

GeoResearch has conducted an environmental site assessment at Unocal Service Station #4734 located at 9068 West Grapevine Road, Lebec, California (Figure 1). This work was authorized by Mr. Bob Boust of Unocal on November 25, 1991. The purpose of the assessment was to detect and determine the extent of any significant concentrations of petroleum hydrocarbons and selected other parameters which may have resulted from the fuel storage and dispensing facilities, motor vehicle service facilities, and other identified areas of concern.

Mr. Boust also authorized GeoResearch to conduct additional investigations of areas adjacent to the station (north and east) on Tejon Ranch property not a part of the station lease, pursuant to discussions with Kern County Environmental Health Services Department (KCEHD) and Mr. Jeff Warren of Tejon Ranch. These additional investigations included drilling and sampling two soil borings by hollow stem auger methods north of the station near abandoned seepage pits and twelve soil borings by hand auger methods (SS-1 through SS-12) in areas of observed soil staining. These additional investigations also included tracing the discharge path from a storm drain adjacent to the station. A work plan for the additional investigations was prepared and submitted to the KCEHD and approved on January 21, 1992.

In addition, a small volume of material removed from a storm drain on the property was characterized and disposed, in accordance with the request of Mr. Boust.

2.0 SITE BACKGROUND

The site is located adjacent to Interstate 5 at the Grapevine exit, approximately 20 miles south of Bakersfield and 9 miles north of Lebec, California. The Unocal station has occupied the site since 1961 under a lease agreement with Tejon Ranch. A Texaco service station is located directly across Grapevine Road (identified on Figures 2 and 3 as "Frontage Road") from the station. drainage channel passes along the south side of the site. restaurant formerly located east of the site burned approximately five years ago and the building was demolished. The land remains unimproved and is frequently used as a truck parking area. Unocal station dealer, Mr. Rose, reported that truck drivers commonly change their oil in this area, sometimes letting the used oil drain onto the bare soil. A vacant lot to the north of the station is undeveloped but has been graded level. Mr Rose reported that a structure was located on this parcel in the past and that the area was utilized for parking for the Cristo umbrella exhibit last fall.

According to Mr. Rose, the station has been a major stopping point for travelers on the way to Tejon Pass or coming down from the pass, frequently to utilize the public watering station located on the station site adjacent to Grapevine Road. The property slopes east from Grapevine Road. When fluids are discharged to the pavement around the station from automobiles or trucks, the fluid ultimately flows into one of the storm drains located north and east of the station (Figure 3).

Two 10,000-gallon underground gasoline storage tanks (USTs) (super and regular), one 10,000-gallon diesel UST, and one 280-gallon waste-oil UST are located on the site. Also located on the premises are eight fuel dispensers on two service islands, two automotive hoists located in the service bays, three abandoned and filled seepage pits, one abandoned septic tank, and a separate garage building. The original usage of the separate garage is not known. According to Mr. Rose, the southeast corner of the garage building may have been utilized as a radiator repair facility prior to his taking over the station 14 years ago.

Mr. Rose has reported that the station no longer performs any automotive repair or servicing except snow tire replacement on California Highway Patrol vehicles during bad weather on the pass.

On October 7, 1991, the KCEHD received a complaint regarding the dumping of antifreeze and waste oil on the ground near the station. An investigation was conducted the following day by the KCEHD and violations of the California Health and Safety Code, Section 25250.5 were cited (Appendix A). The observations of the KCEHD inspector included dark soil staining in three areas north and east of the station lease.

The Cristo umbrella exhibit was conducted in the Tejon Pass area last fall. One of the viewing locations was near the station and the adjacent vacant properties were utilized as parking areas. We understand from discussions with Mr. Rose that the soil was oiled by CalTrans for dust control and that some of the oiled dirt was tracked onto the paving surrounding the service station by the cars parking in these areas. These oils were washed into the storm drains at the station by rains and the daily wash down activities conducted by the station, primarily the storm drain located between and to the east of the two station buildings (Figure 3).

Eventually, the combination of soil, debris, and petroleum products that washed into the storm drain created a complete blockage of the drain. We understand that the drain was cleared out by Tejon Ranch personnel and the material placed in trash bags and secured under plastic sheeting adjacent to the storm drain. Unocal contacted GeoResearch and requested that an assessment of the material be completed and that the material be properly disposed.

GeoResearch reviewed a Phase I environmental Site Assessment report prepared for the subject property (PHR, 1991). The report states that a leak in a super (92 octane) product dispenser was discovered and repaired in June 1981. The piping to the dispensers had been replaced the previous month. Unocal files reportedly contained no information regarding remedial activities or even the location of the leak. Mr. Rose recalled that the repair had taken place but was unable to recall which dispenser had been involved. Although the Phase I report indicated that Unocal files did not give indication of UST replacement since the original UST installation in 1961, Mr. Rose reported that the tanks were replaced after he acquired the dealership in 1977.

3.0 GEOLOGY/HYDROLOGY

Soils beneath the site consist of Pleistocene age material of the Tulare formation which is derived from alluvium and bedrock off the Tehachapi Mountains approximately one-half mile to the south (personal communication with KCEHD geologist, Tom Haselbacher). As observed during the subsurface site investigation, shallow soils consist predominantly of silts and silty sands. Coarse granitic gravels and cobbles were periodically encountered from near the surface to 45-feet bgs.

According to Mr. Haselbacher of the KCEHD, ground water in the vicinity of the site is estimated to be 1,000 to 1,200 feet bgs. An unlined drainage channel (dry stream bed) passes to the south of the site (Figures 1 and 2).

4.0 PROCEDURES

4.1 INITIAL SITE INVESTIGATION

On October 30, 1991, GeoResearch conducted a reconnaissance of the station site and discussed the storm drain problem with station personnel (see Section 2.0). The materials removed from the storm drain were described and sampled. Soil samples were collected from the materials in six trash bags in laboratory-supplied glass jars and submitted to GEOTEST of Long Beach, California, a California Department of Health Services (DOHS)-certified laboratory. composited sample was analyzed for total recoverable petroleum hydrocarbons by US EPA Method 418.1. Subsequently the composite sample was submitted to Applied Environmental Sciences of Costa Mesa, California, a DOHS-certified laboratory, for the completion of a 96-Hour Acute Aquatic Toxicity Bioassay. The waste was profiled and transported to McKittrick Waste Disposal Site in McKittrick, California, a Class II disposal facility, by Kroeker Environmental Services of Fresno, California.

4.2 SITE ASSESSMENT - UNOCAL SERVICE STATION

GeoResearch notified Ms. Corrina Dominguez of Unocal of the proposed schedule and the nature of site assessment (drilling) activities in a letter dated November 27, 1991.

The KCEHD was contacted regarding drilling permit requirements. A permit was not required for the proposed soil borings since no release of petroleum products from the station facilities was known to have occurred. A site-specific health and safety plan was prepared and all field work was performed in accordance with the plan.

Analytical laboratory services for this project were provided by GEOTEST, via a mobile laboratory stationed on site as well as the in-house laboratory facilities in Long Beach. Underground utility detection services were provided by Spectrum E.S.I. of San Fernando, California. Kern Concrete Cutting of Bakersfield, California provided concrete sawing and coring services for all borings completed beneath concrete slabs. Drilling services were provided by Spectrum Exploration Inc. of Signal Hill, California.

A geophysical survey was conducted to locate detectable underground utilities in the areas where drilling was proposed. The locations of the detected site improvements were marked on the surface and locations selected where drilling and hand augering could be conducted safely. GeoResearch contacted Underground Service Alert before drilling to locate selected subsurface utility lines near the site.

A truck-mounted CME 55 drill rig equipped with 6-inch continuous flight hollow stem augers was utilized for the drilling and sampling of thirteen soil borings. Prior to drilling, hand augering was performed to a depth of up to 5-feet bgs (if possible) in an effort to find any unidentified underground utilities. Four hand auger borings were completed in locations where drill rig access was not practical. Hollow-stem auger borings were designated SB-# and hand auger borings were designated HA-#. Soil samples collected on Tejon Ranch property were designated SS-#. All field activities were supervised or performed by a qualified geologist under the direction of a Certified Engineering Geologist and in accordance with the GeoResearch field procedures outlined in Appendix C.

Undisturbed soil samples were collected from the hollow-stem auger borings at five feet bgs, and thereafter at five foot intervals utilizing modified California split-spoon samplers fitted with 2-inch by 6-inch-long brass tubes. The soil was logged and described in accordance with the Unified Soil Classification System (USCS) and recorded on "Field Log of Boring" forms (Appendix D). Soil samples from the 5-foot intervals were also placed in resealable plastic bags, screened with an organic vapor analyzer (OVA), and

measurements were recorded on the boring logs. Soils encountered in the hand auger borings were also logged and monitored with the OVA. Soil samples from the hand auger borings were also collected in brass tubes from undisturbed soils, utilizing a driven sampler. Drill cuttings from the borings were placed on and covered with plastic sheeting east of the garage area (Figure 2).

Four of the hollow stem auger borings (SB-1, SB-2, SB-3, and SB-5) were drilled near the existing gasoline and diesel USTs. These borings were originally projected to be drilled to 40 feet bgs. Large rocks were encountered while drilling soil boring SB-2, north of the gasoline tanks, resulting in a maximum depth of penetration of 17 feet bgs.

Four soil borings were drilled at ends of the two dispenser islands (SB-4, SB-10, SB-11, and SB-12). These borings were drilled at an angle of 15 degrees off vertical, bearing toward the middle of the dispenser in an effort to obtain soil samples directly below the dispenser and associated piping. Due the rocky conditions of the soil, two of these borings (SB-4 and SB-11) could not be drilled to their scheduled depth of 45 feet bgs. Soil boring SB-4 had a total depth of 32 feet bgs and soil boring SB-11 had a total depth of 22 feet bgs.

Two soil borings (SB-6 and SB-7) were drilled northeast of the station on Tejon Ranch property near a filled and abandoned seepage pit and a 1000-gallon filled and abandoned septic tank. Soil boring SB-6 could not penetrate past 21 feet bgs. According to the site diagram, 21 feet bgs corresponded to the total depth of the seepage pit. Soil Boring SB-7 was subsequently drilled approximately 2 feet north of SB-6 to 35 feet bgs.

Soil borings SB-8 and SB-9 were drilled on the east side of the station. SB-8 was drilled next to a 280-gallon waste-oil tank to a depth of 30 feet bgs and SB-9 was drilled to a depth of 40 feet bgs adjacent to a filled and abandoned seepage pit .

Four soil borings were completed by hand auger methods by GeoResearch. These borings were completed in the center of the east pump island (HA-1), in the possible radiator repair area (HA-2 and HA-3), and on the east end of the gasoline tanks (HA-4). Attempts were made to hand auger in the center of the west pump island and next to the automotive hoist; however, the large rocks in the soils prevented the completion of borings in those areas. The drill rig was not utilized to drill HA-4 due to uncertainties about the exact location of the adjacent USTs.

Seventy-two soil samples were collected from these borings and preserved for laboratory analysis. Selected soil samples were analyzed on-site, immediately following their collection, by a GEOTEST mobile laboratory in order to utilize the results to determine the scope of further site investigations. Analyses

completed in the mobile laboratory included total petroleum hydrocarbons as gasoline (TPH-G) in accordance with Cal-EPA methods, benzene, toluene, ethylbenzene, and total xylenes (BTEX) according to EPA Method 8020, and total recoverable petroleum hydrocarbons (TRPH) according to EPA Method 418.1.

Additional soil samples were analyzed in the GEOTEST laboratory in Long Beach, California for total petroleum hydrocarbons as diesel (TPH-D) in accordance with Cal-EPA methods, halogenated volatile organics according to EPA Method 8010, and California Assessment Manual (CAM) metals as specified in Title 22 of the California Administration Code, in accordance with EPA Method 6010 (and cold vapor for mercury). Those metals with concentrations exceeding ten times the Soluble Threshold Limit Concentration (STLC) were further analyzed to quantify the soluble concentrations. Laboratory results and chain-of-custody documents can be found in Appendix E.

Soil samples collected in the radiator repair area were also tested for acidity on-site. This was accomplished by mixing soil with distilled water, filtering out the soil, and recording the pH of the filtered water. These tests were performed as an indication of whether or not acids associated with the radiator repair facility or from battery storage practices were present in site soils.

All hollow stem auger borings were backfilled with cement/bentonite slurry utilizing 4.5 to 6.5 gallons of water/94-pound bag of portland cement. Hand auger boring HA-1, drilled to a depth of 3 feet bgs, in the center of the east pump island was backfilled with hydrated bentonite chips and capped with concrete (Figure 3). Hand auger borings HA-2 and HA-3, inside the possible radiator repair area, were drilled to depths of 5 feet and 3 feet bgs respectively and were backfilled with clean native soil. Hand auger boring HA-4 was backfilled with cement/bentonite slurry.

4.3 TEJON RANCH SOIL SAMPLING

A work plan was submitted and approved by Mr. Robert Boust of Unocal and Mr. Terry L. Gray of KCEHD for assessment of identified soil staining north and east of Unocal #4734 (Appendix F).

Twelve soil borings were completed by hand auger methods on the Tejon Ranch property adjacent to the Unocal site lease to evaluate the magnitude of hydrocarbon concentrations evidenced by soil staining found north and east of the station (Figure 3). The soil borings on Tejon Ranch property were completed to depths ranging from 1 to 5 foot bgs and backfilled with native soil. Four of these soil borings were completed east of the station in a vacant lot (SS-1, SS-2, SS-4, and SS-5). Two borings were completed north of the station, just off the asphalt surface (SS-6 and SS-7). One boring (SS-3) was drilled north of the station near the service road at the discharge point of a 4-inch pipe leading from the

station. Five borings (SS-8, SS-9, SS-10, SS-11, and SS-12) were drilled north of the station along the flow path of fluid leading from the 4-inch discharge pipe to the area north of the freeway on-ramp (Figure 3).

Thirty soil samples were collected from the Tejon Ranch soil borings. Selected soil samples were initially analyzed on-site by GEOTEST for TRPH. Of these samples, those which contained high TRPH concentrations (up to 6,000 mg/kg) were selectively analyzed for TPH-d, TPH-g/BTEX, and CAM metals.

5.0 FINDINGS

5.1 INITIAL SITE INVESTIGATION

5.1.1 Observations

Five partially filled trash bags were found underneath a plastic tarp near the storm drain located east of the gasoline USTs. The contents of the bags was a sand and oil sludge. The oily sludge was dark brown to black and had a petroleum odor. The total volume of the material was estimated to be approximately one-half cubic yard. During the short time that GeoResearch personnel were on site, several automobiles pulled into the station to top off radiators from the public water stations located on the site along Grapevine road. Some of the cars had obviously overheated and were discharging water, antifreeze, and oily engine residue onto the pavement.

5.1.2 Analytical Results

Samples collected from the trash bags were composited and analyzed for TRPH. Laboratory results indicated that TRPH was 1000 mg/kg. The completion of a 96-hour acute aquatic toxicity bioassay test established that the material was not hazardous by this standard (LC $_{50}$ greater than 500 mg/kg). Laboratory results for the composited sample collected from the trash bags are located in Appendix E.

5.1.3 Soil Disposal

A Generators Waste Profile was completed on Unocal's behalf certifying the material as nonhazardous (Appendix G). The trash bags and their contents were transported to McKittrick Waste Disposal Site located in McKittrick, California by Kroeker Environmental Services on November 13, 1991. The waste haulers manifest and certificate of waste disposal are included in Appendix G.

5.2 SITE ASSESSMENT - UNOCAL SERVICE STATION

5.2.1 Field Observations

Soils encountered at this site consisted mostly of silts, silty sands, and sands with varying amounts of granitic gravels and cobbles. These soils resulted in difficult drilling conditions for both the drilling rig and hand augering. This coarse, granitic material was observed to be weathered at shallower depths and easily drilled with a truck-mounted drill rig; however, unweathered and impenetrable deeper in the alluvium.

Hand auger boring HA-1 was advanced to a depth of 3 feet bgs in the center of the east pump island. Soil from this boring had a strong petroleum odor, slight greenish staining, and an OVA reading of 200 ppm. The boring was located adjacent to a small crack in the concrete extending across this service island which, according to station employees, is a point of gasoline spillage when fueling cars. The boring could not be advanced below 3 feet bgs due to auger refusal.

When the concrete was cut to drill soil borings SB-5 and HA-4, the soil immediately beneath the concrete was observed to be dark brown to black. The staining extended to 5-inches below the concrete and the soils had a petroleum odor. This soil resembled the black oily soil removed from in the clogged storm drain located approximately 60-feet east and the black oily stained soil found north of the station at the storm drain discharge point (Figure 2). A sample was collected (SB-5-surf) and submitted for laboratory analysis.

During hand augering inside the radiator repair area (Figure 2), a large white object was encountered at a depth of about six inches. Initially, it appeared that the object could be a large pipe or a tank. Partial excavation of the object revealed that it was merely a large boulder.

Soil staining was not definitively identified in any soil samples collected from the station property except in hand auger boring HA-1 and beneath the concrete covering the two gasoline USTs. No elevated OVA readings or other field evidence of volatile organics were noted except in HA-1, as noted above.

Several episodes of auto service and repair by the general public on the station property were observed by GeoResearch personnel during site investigations. This included radiator draining and refilling, fuel filter changing (with gasoline spillage), and other repair work.

5.2.2 Analytical Results

Soil collected in hand augered boring HA-1 at 3 feet bgs in the center of the east pump island contained a concentration of 7,400

mg/kg TFH-G and BTEX of 32, 640, 180, and 1,300 mg/kg, respectively (Table 1). The soil sample collected from hand auger boring HA-4 at 8.5 feet bgs, drilled at the east end of the gasoline UST did not contain concentrations of TPH-G or BTEX.

None of the soil samples from the hollow stem auger borings around the UST's, pump islands, and septic systems were reported to contain TPH-G, benzene, or ethylbenzene above laboratory detection limits. One soil sample SB-12-20, collected at the north end of the east pump island at 20 feet bgs, contained concentrations of toluene and total xylenes of 0.1 mg/kg and 0.017 mg/kg, respectively (Table 1).

Soil samples collected from soil borings SB-1, SB-3, SB-7, SB-8, SB-9, and SB-13, drilled near the waste-oil and diesel tanks, seepage pits, and radiator repair area were selectively analyzed for purgeable halocarbons by EPA Method 8010 and for TPH-D and TRPH. Three samples were analyzed for halogenated compounds, eight for TPH-D, and eleven for TRPH. Concentrations of the constituents analyzed for were not detected in any of the borings (Table 2).

A sample was collected of the black oily soil, immediately beneath the concrete covering the two gasoline tanks, while drilling soil boring SB-5. This soil sample (SB-5-surface) was analyzed for TRPH and contained a concentration of 730 mg/kg.

Two soil samples were collected from each boring hand augered in the former radiator repair area (HA-2 and HA-3) and analyzed for TRPH. HA-2 contained TRPH concentrations of 360 and 370 mg/kg at 1 and 5 feet bgs, respectively. The samples from HA-3 contained TRPH concentrations of 760 and 680 mg/kg at 1 and 3 feet bgs, respectively (Table 2). Soil samples HA-2-1 and HA-3-1 were additionally analyzed for CAM metals (Table 3). Soil sample HA-3-1 was reported to contain 79 mg/kg of arsenic which exceeds 10 times the STLC concentration of 5 mg/L. This sample was then analyzed to determine the concentration of soluble arsenic compounds. A concentration of 2.1 mg/L was reported (Table 4).

Measurements of pH which were recorded from soil samples collected in the radiator repair area ranged from 9.9 to 7.9, indicating slightly alkaline soils.

5.2.3 Product/Vapor Return Line Damage and Repair

While cutting the concrete for soil boring SB-5, located at the west end of the gasoline tanks, a gasoline product line was severed by the concrete saw. This line was located approximately 5-inches bgs, partially encased within the base of the concrete. The emergency shut off switch was immediately turned off and the release was confined to an estimated 18-gallons of gasoline. This 18-gallons was estimated by calculating the volume of the length of the product line which gasoline would drain out of when the

pressure is released. According to Mr. Rose, 18 gallons is the maximum amount of gasoline that could have been lost. GeoResearch immediately notified Unocal of the release and an unauthorized release form was submitted to the KCEHD (Appendix B). A permit was obtained for the repair by All America Trenching of Clovis, California. FHEMCO of Tulare, California performed the repairs of the cut pipe under the supervision of All America Trenching. Additional concrete cutting was required to repair the cut line. When the additional concrete was removed from around the cut pipe, FHEMCO personnel observed the scene and commented that the gasoline which had been released appeared to have been trapped between the bottom of the concrete and the black oily soil under the concrete, causing it to spread laterally beneath the concrete.

Chris Finberg, KCEHD Hazardous Materials Specialist, was on-site during the repair work. A soil sample was required by the KCEHD at six feet bgs beneath where the product line was cut. The drill rig was utilized to collect the required sample by drilling soil boring SB-5 at this location. The 6 foot sample was collected and analyzed, as directed by Mr. Finberg. Concentrations of TPH-G or BTEX were not found. Mr. Finberg stated that no more action would be required.

Soil boring SB-10, drilled at the south end of the east pump island, hit a fiberglass vent return line at 3 feet bgs. The emergency shut-off switch was immediately turned off upon discovery of the broken line and the augers were removed from the hole. The two hand auger borings completed at this location prior to drilling had both passed within inches of the vent line. The site diagram supplied by Unocal indicated that the lines should have been further to the north. Careful inspection of the soils surrounding the vent line by GeoResearch personnel did not give any evidence of the release of gasoline. Unocal was immediately informed of the incident and authority was given by Unocal to contact FHEMCO to perform the repairs. Kern County Air Pollution Control Board (APCD) and KCEHD were notified of the incident and stated that no permit was required for the line to be repaired.

5.3 TEJON RANCH SOIL SAMPLING

5.3.1 Introduction

In response to the complaint of antifreeze and waste oil dumping at the Unocal station and the subsequent observations by the KCEHD, as discussed in Section 2.0, a meeting was held on January 3, 1992 to discuss the situation. Mr. Terry Grey of the KCEHD and Mr. Jeffery Warren of Tejon Ranch were among those present. Mr. Warren reported the observations made by his consultant and the results of an analysis of water collected from the discharge of the four inch PVC pipe located to the north of the station. In addition to the staining reported in the investigations presented in this report,

some patches of staining to the east of the station were noted by the Tejon Ranch consultant (Appendix F - figure) It was agreed that Unocal would submit for KCEHD approval a plan for the characterization of soils in the areas where soil staining had been observed and the identification of the source of the discharge from the pipe.

A work plan was subsequently prepared by GeoResearch on behalf of Unocal for the assessment of identified soil staining north and east of Unocal #4734 (Appendix F). The work plan was submitted and approved by Mr. Robert Boust of Unocal and Mr. Terry Gray of KCEHD. The field work was conducted concurrently with the assessment of the service station property. The areas of soil staining to be addressed were:

- The path of drainage of the discharge from the PVC pipe north of the station;
- The areas of stained soil immediately adjacent to the asphalt north of the station and to the east of the station.

5.3.2 Drainage Course North of Station

5.3.2.1 Field Observations

The storm drain located northwest of the service bay on the Unocal site was suspected to be the source of the discharge from the four inch PVC pipe. The discharge pipe leading from the storm drain was traced north toward a sewer manhole by a geophysical survey; however, an obstruction in the pipe prevented tracing the pipe completely. Several attempts to clear the blockage were made. Eventually, Drain X Plumbing of Bakersfield, California was utilized to clear out the obstructed drain pipe. After the drain had been cleared, the drain was again flushed with water. This time it was confirmed that the storm drain was connected to the 4-inch discharge pipe located along the service road north of the station.

The soil around the four inch discharge pipe was stained dark brown to black and had an oily sheen at the surface. The native soils in this area were a brown silty sand. Some light staining persisted to between 3 and 4 feet bgs. The soil was unconsolidated and wet over an area of approximately 4 feet by 4 feet, from the surface to approximately 2 feet bgs. OVA readings recorded were 15 ppm from 6-inches to 1 foot bgs and 5 to 8 ppm from 2 to 4 feet bgs (Table 5). Water flowing out of the pipe at the time of our initial observations had a slight greenish tint reminiscent of antifreeze. Discharge observed later was clear. The discharge rate varied from a slow trickle to no flow.

The flow path for the liquid flowing out of the discharge pipe was to the northeast, along the shoulder of the I-5 south on-ramp, then

under the road through a culvert and fanning out into an open field (Figure 3). Soil along the flow path was lightly stained in places to 2 feet bgs. OVA readings from soil samples in this area were less than 5 ppm. North of the culvert where SS-10-2 was collected, the soil was wet and lightly stained down to 4 feet bgs. OVA readings recorded were 50 ppm at 1 foot bgs, 20 ppm at 2 feet bgs, and 6 ppm at 4 feet bgs (Table 5). Soil further down gradient (east), where the discharge fanned out and any remaining flow infiltrated into the soil, was observed to be wet and possibly slightly stained from the surface to 2 feet bgs; however, the OVA did not detect organic vapor concentrations above 1 ppm.

5.3.2.2 Analytical Results

One hand auger boring was advanced to a depth of 4 feet bgs near the storm drain discharge point. Soil samples collected at 1 and 2 ft bgs (SS-3-1, SS-3-2) contained TRPH concentrations of 490 and 170 mg/kg, respectively (Table 6). These samples were subsequently analyzed for TPH-G/BTEX. Soil sample SS-3-1 contained TPH-G concentrations of 96 mg/kg and BTEX concentrations of 0.30, 1.2, 0.42, and 2.7 mg/kg, respectively. This sample was also analyzed for CAM metals (Table 3). The lead concentration in soil sample SS-3-1, 59 mg/kg, exceeded 10 times the Soluble Threshold Limit Concentration (STLC). The concentration of soluble lead was therefore determined and reported to be below method detection limits (Table 4). Concentrations of TPH-D were not detected in SS-3-1. Soil sample SS-3-2, collected from the same hand auger boring at 2 ft bgs, did not contain detectable concentrations of TPH-G/BTEX. The sample collected at 4 feet bgs in this boring (SS-3-4) did not contain detectable concentrations of TRPH.

Soil samples SS-8-# through SS-12-# (where # represents the depth of the sample), were collected from hand auger borings along the drainage path of the fluid discharged from the storm drain (Figure 3). Soil samples SS-8-1 and SS-8-2, collected from an area of light soil staining, were analyzed for TRPH. These samples contained TRPH concentrations of 29 and 56 mg/kg, respectively (Table 6). No TRPH was reported in sample SS-9-1, which was collected along a portion of the drainage path in which only minor occasional staining was observed.

A TRPH concentration of 6,000 mg/kg was reported for soil sample SS-10-1. This sample was additionally analyzed for TPH-G/BTEX. The TPH-G concentration was subsequently reported to be 1,200 mg/kg and BTEX concentrations of 0.20, 6.2, 4.5, and 42 mg/kg, respectively, were reported. This sample was also analyzed for CAM metals. A total lead concentration of 66 mg/kg was reported which exceeded 10 times the STLC. Subsequently, a soluble lead concentration of 0.039 mg/L lead was determined, which does not exceed the TTLC. The sample collected at 2 ft bgs in this boring was analyzed for TRPH; however, concentrations above detection limits were not reported.

Soil samples SS-11-1 and SS-12-1 were analyzed for TRPH. According to laboratory reports, these samples did not contain detectable concentrations of TRPH.

5.3.3 Soil Staining North and East of Station

5.3.3.1 Field Observations

An area of moderate to heavy soil staining was observed adjacent to the asphalt and between the two planters north of the station (Figure 3). An oily sheen was present in places. From the distribution of the staining it was apparent that the hydrocarbons had run or been washed off of the asphalt. The darkest soil staining was restricted to the upper few inches of soil. Only light staining was observed below a depth of one foot (Table 5). Soil sample locations are shown on Figure 3. All soils encountered were classified as a brown silty sand. No significantly elevated organic vapor readings were obtained with the OVA.

One small (approximately four feet across) patch of lightly stained soil was observed at the edge of the asphalt along the east side of the station (Figure 3). The staining was adjacent to the low point in the asphalt which apparently channeled drainage from the site. No other areas of soil staining were identified east of the station; however, the soil was wet from recent rains and several large puddles were present. All soils encountered in this area were classified as brown silty sands. Soil sample locations are shown on Figure 3. No soil staining was observed below one foot bgs. The samples were monitored with the OVA. No organic vapors were detected.

5.3.3.2 Analytical Results

Two hand auger borings were completed immediately north of the station in the area where hydrocarbons have run off of the asphalt and accumulated in the soil (Figure 3). Soil samples were collected and submitted for analysis at 1, 2, and 4 ft bgs (SS-6-1, SS-6-2, and SS-6-4, respectively). SS-6-1 and SS-6-2 contained TRPH concentrations of 210 and 190 mg/kg respectively. The sample collected at 4 foot bgs (SS-6-4) did not contain TRPH according to laboratory reports. The 1 ft bgs sample (SS-6-1) was subsequently analyzed for TPH-G/BTEX and TPH-d. This sample did not contain detectable concentrations of TPH-D. Soil sample SS-7-1 did not contain detectable concentrations of TRPH, TPH-G/BTEX, or TPH-D. These laboratory results are summarized in Table 6. The laboratory analytical reports are included in Appendix E.

One soil sample, SS-4-1, collected east of the station (Figure 3), contained concentrations of TRPH at 120 mg/kg (Table 6). This sample was subsequently analyzed for TPH-G/BTEX and TPH-D. Detectable concentrations of TPH-G/BTEX were not found; however, this sample did contain 270 mg/kg TPH-D according to laboratory reports (Table 6, Appendix E).

6.0 SUMMARY

6.1 UNOCAL SERVICE STATION

Soils underlying and around Unocal Service Station #4734 consist of predominantly silts and silty sands with abundant gravel and cobbles up to at least 5 inches in diameter. Petroleum hydrocarbons were identified in shallow soils in limited areas on Unocal property as follows:

Soil collected at 3 feet bgs in the center of the east pump island contained concentrations of TPH-G up to 7,400 mg/kg and BTEX (32,640, 180, and 1300 respectively). Soil boring SB-12, drilled at an angle beneath the east pump island only encountered traces of toluene (0.1 mg/kg) and total xylenes (0.017 mg/kg) at 20 feet bgs.

Black stained soil was identified beneath the concrete slab covering the two 10,000-gallon gasoline tanks. This soil resembled soil found in the clogged storm drain east of the tanks and soil found at the storm drain discharge north of the station. This staining was not observed past approximately 5-inches below the concrete slab and was observed in two locations (SB-5 and HA-4). Soil beneath the concrete was not observed to be stained in soil boring SB-2, north of the gasoline tanks.

Yard drainage from the station is accommodated primarily by two storm drains located north and east of the station (Figure 3). This drainage includes not only precipitation and any spillage from station refueling operations, but radiator fluids and other spillage from automobile servicing and repair by the general public. Drainage from much of the west side of the station passes directly over the top of the tanks to the storm drain east of the station. Eighteen gallons of gasoline was dispersed into surficial soils in this vicinity as the result of the cut product line.

Soil borings drilled near the gasoline, diesel, waste tanks, seepage pits, and septic tank did not contain concentrations of petroleum hydrocarbons according to laboratory reports. Evaluation of the shallow soils beneath the west pump island and inside the service bay near the automotive hoist was not possible utilizing hand auger methods because of the rocky soil. No soil staining was apparent at the surface in these locations.

The radiator repair area contained concentrations of TRPH as high as 370 mg/kg at 5 feet bgs and 760 mg/kg at 1 ft. bgs in hand auger borings HA-2 and HA-3. Rocky soil conditions prevented augering deeper than 5 feet bgs. Soil boring SB-13, drilled to a depth of 20 feet bgs adjacent to the area, did not encounter detectable concentrations of TRPH.

6.2 TEJON RANCH PROPERTY

Soil containing TRPH concentrations of up to 120 mg/kg and TPH-D concentrations of up to 270 mg/kg at 1 foot bgs is present east of the station just off the asphalt surface. Minimal surface staining was apparent in this area. The hydrocarbons detected were not from a sample collected in an area of identified soil staining. No hydrocarbons were detected at depths in excess of one foot in this area.

Soil containing TRPH of up to 210 mg/kg at 1 foot bgs and 190 mg/kg at 2 feet bgs was found north of the station, just off the asphalt. A soil sample collected at 4 feet bgs in the same boring did not contain detectable concentrations of TRPH. An area of approximately 1,000 square feet appears to have surficial soil staining.

It was confirmed that the discharge from the end of the four inch pipe north of station originated from the storm drain on the north side of the Unocal station property. Soil in the area of the discharge was found to contain TPH-G concentrations of up to 96 mg/kg and BTEX concentrations of 0.30, 1.2, 0.42, and 2.7 mg/kg, respectively. TRPH concentrations were found to be 490 and 170 mg/kg at 1 and 2 feet bgs, respectively. TPH-D was not found at 1 foot bgs and TRPH was not indicated at a depth of 4 feet bgs according laboratory reports.

Soil samples collected across the freeway on-ramp near the culvert, were found to downstream of the pipe discharge, TRPH of up to 6,000 mg/kg concentrations of at 1 foot bgs of up to 1,200 mg/kg. concentrations concentrations were reported to be 0.20, 6.2, 4.5, Soil collected at 2 feet bgs did not contain respectively. Soil collected further east detectable concentrations of TRPH. gradient) in the same drainage path did not contain Stained soils were observed over a total concentrations of TRPH. area of approximately 400 square feet along the drainage course.

No metals concentrations were found in excess of TTLC or STLC limits in either of the two samples analyzed for metals.

7.0 CONCLUSIONS

7.1 UNOCAL SERVICE STATION

Based on soil staining patterns, surficial soils appear to have relatively low permeabilities which have helped to restrict the penetration of hydrocarbons to shallow soils in most areas of the property. Hand auger boring HA-1, encountered a high concentration of TPH-G at 3 feet bgs and deeper samples could not be obtained. It appears that this is, at least in part, the result of gasoline having been spilled on the island and percolating through a small crack in the service island concrete at this location. The leak from the dispenser which occurred in 1981 may also have contributed to the gasoline detected at this location. The volume of impacted soils in the service island area cannot be determined without further investigation; however, an upper limit can be estimated based on the absence of gasoline in the four slant borings completed at the ends of the service islands. Assuming a source of gasoline release at the center of one service island which spreads laterally at the same rate as it penetrates vertically, such contamination should not exceed a depth of approximately 22 feet before extending to the location of one of the borings around the service islands. represents a potential cone of contamination with a height of 22 feet and a radius of 22 feet. This represents a soil volume of on the order of 500 cubic yards. The actual volume of soil containing TPH-G in the service island area may be substantially less.

The radiator repair area contained concentrations of TRPH of up to 760 mg/kg at 1 foot bgs and 370 mg/kg at 5 feet bgs. Soil boring SB-13, drilled adjacent to the area, did not encounter TRPH. Assuming in this case that TRPH was distributed equally over the entire area (approximately 10 by 25 feet) it appears likely that TRPH would have been encountered in the adjacent SB-13 if hydrocarbons penetrated beyond a depth of ten feet. Assuming a maximum depth of penetration of ten feet over this area, the volume of impacted soil would be on the order of 100 cubic yards.

Dark staining was observed in surficial soils in SB-4 and HA-4. A TRPH concentration of 730 mg/kg was reported for a sample of this stained soil. This staining appears to be limited to the upper one foot of soil between the station and garage, where drainage from the west side of the station is channeled on the way to the storm drain. This stained soil may have resulted from the infiltration of surface drainage through joints in the concrete. Assuming an impacted area approximately 20 by 60 feet, approximately 40 to 50 cubic yards of soil may be impacted.

Soil beneath the service bay area and the west pump island were not evaluated due to soil conditions which precluded hand augering. No staining of the surficial soils (beneath the concrete) was noted.

7.2 TEJON RANCH

The area immediately north of the station, just off the asphalt, is an area of observed automobile maintenance and automotive fluid discharge. This discharge has resulted in stained soil containing concentrations of TRPH at this location. The deepest depth at which TRPH was identified was 2 feet bgs. The area of stained soil was on the order of 1,000 square feet. Assuming an average depth of penetration by hydrocarbons of 1 1/2 feet, the volume of impacted soil may be expected to be on the order of 55 cubic yards.

Clearly identifiable soil staining along the path of drainage from the storm drain discharge pipe north of the station was limited to a few small patches, most notably at the end of the discharge pipe and downstream of the culvert under the freeway on-ramp (Figure 3). TPH-g/BTEX and TRPH were identified in these soils to depths of up to 2 feet. Assuming an areal extent of 800 square feet and an average depth of penetration of hydrocarbons of 1 1/2 feet, the volume of impacted soils along the path of the drainage is estimated to be on the order of 45 cubic yards.

Only one very small patch of stained soil was observed to the east of the station. Hydrocarbons were detected in only one of the three soil samples analyzed from this area, at a depth of one foot. However, the TRPH and TPH-D were detected in a sample (SS-4-1) which was not within the identified zone of soil staining and a deeper sample was not collected at this location. It appears that soil staining may not be apparent in this area in soils containing low concentrations of petroleum hydrocarbons (less than 1,000 mg/kg).

December 10, 1991

RECEIVED

DEC 1 2 1991

Mr. Jeff Warren Tejon Ranch P.O. Box 1000 Lebec, CA 93243

Dear Mr. Warren:

D. W. DAYSLER UEC 1 0 1991

This office received a complaint on October 7, 1991, regarding the dumping of antifreeze coolant and waste oil onto the ground at the Union 76 Service Station at the bottom of the Grapevine.

An investigation was conducted the following day. The following are violations of the California Health and Safety Code, Section 25250.5:

- Parallel to the western access road on the east side and north of the 76 Station, what appears to be waste oil and antifreeze/coolant were dumped in the dirt gutter. A portion of the contamination has crossed onto land owned by Tejon Ranch.
- 2. On the north side of the Union 76 Station there is an access driveway. It appears that motorists are stopping there and draining their motor oil and allowing it to run onto the soil. The ground here is at a slight angle and the oil runs directly from the asphalt onto the ground.
- 3. On the east side of the 76 Station, there appears to have been a waste oil spill to the ground.

To determine if the contaminated soil will be classified as a hazardous waste, sampling and laboratory analyses must be accomplished. Within thirty (30) days of receipt of this letter, you must excavate all visibly contaminated soil, place the soil onto plastic sheeting and cover it securely. A representative sample(s) must be collected and analyzed by a State Certified Hazardous Waste Laboratory for the following constituents: lead, arsenic, chromium, cadmium, total halogens, and polychlorinated biphenyls (PCB's). In addition, if

"M" STREET, SUITE SOO

BAKERSFIELD, CALIFORNIA 93301

(908) 861-3696 FAX: (805) 861-3429 Mr. Jeff Warren December 10, 1991 Page 2

laboratory analyses prove to exceed State regulatory criteria, remediation must also take place within thirty (30) days of receipt of these results. You must acquire an EPA generator number to dispose of a hazardous waste. You may obtain an EPA number by contacting the Department of Toxic Substances Control at (916) 324-1781.

Contact this office 48 hours prior to sampling. Forward a copy of the laboratory results to this office for review within fifteen (15) days of sampling.

In addition, during our inspection a metal plate was discovered covering an opening to the ground at the southeast corner of the old garage. Officials of the Unocal Corporation and Grapevine 76 Service Station have been unable to determine the status of this opening. Please determine the use of this opening and the terminus of any discharge from it.

If you have any questions, you may contact mo at (805) 861-3636, extension 582.

Sincerely,

Terry L Gray

Dear Bob,

Enclosed please find a copy of the Underground Storage Tank Unauthorized Release (Leak)/Contamination Site Report for the above-referenced site which was submitted on your behalf to the Kern County Environmental Health Services Department (KCEHD). Mr. Chris Finberg of the KCEHD has informed GeoResearch that it is their policy to forward the proper copies of the form to their respective agencies. If you have any questions please contact me at (209) 264-0444.

Sincerely,

Warren W. Gross

INTRODUCTION

Title 22, Section 66261.24, Article 6 of the California Code of Regulations establishes the criteria for the identification of hazardous and extremely hazardous waste. The Department of Health Services compiles and evaluates analytical data for compliance with the toxicity criteria for potentially hazardous waste.

These analytical data have been derived from water and environmental samples submitted to laboratories certified by the Department of Health Services for analysis. The California Department of Health Services 96-Hour Acute Aquatic Toxicity testing assures compliance to the California Code of Regulations and minimizes risk to the environment or threat to public health.

Laboratory certification by the Department of Health Services standardized the toxicity testing program by requiring certification of testing laboratories and by utilizing the procedures set forth by Dr. James Polisini, Department of Fish and Game, Water Pollution Control Laboratory. Following this methodology, a waste can be evaluated for potential hazardous waste declassification.

Toxicity testing conducted by MBC for this report was a static non-renewal acute toxicity test following Standard Methods and the procedures of Dr. James Polisini. Death was the effect measured and toxicity was reported as percent survivorship at 250 mg/ℓ , 500 mg/ℓ and 750 mg/ℓ concentrations. Original data worksheets will remain on file at MBC.

MATERIALS AND METHODS

Facilities

The bioassay was conducted in a laboratory located away from disturbances of non-laboratory personnel or other laboratory or heavy equipment. The laboratory, measuring approximately 12 x 16 ft, is insulated to protect it from rapid temperature changes. Shelves were provided which allow a capacity of 80 or more 5-gallon aquaria, as well as bench space for laboratory equipment and instruments.

Lighting was provided by double lamp, 8 ft fluorescent fixtures that were regulated by a 24-hour timer. The light was maintained on for 12 hours per day and off for 12 hours at night.

The temperature of the bioassay laboratory was maintained by a commercial 1-1/2 ton climate control unit. Temperature was controlled by a wall-mounted thermostat which provided accuracy to \pm 2°C.

A Model 2133 Rustrak continuous recording thermograph monitored the laboratory's temperature 24 hours per day. The Rustrak was calibrated as necessary to insure accuracy. A recording max-min thermometer was maintained within the laboratory to provide "back-up" temperature variation information.

Low pressure air was supplied to the bioassay laboratory for the purpose of slowly bubbling air into the exposure tanks to maintain an acceptable dissolved oxygen concentration. Filtered air was supplied via a Sutor-bilt oil-less blower which provides up to 340 ℓ /min at 0.35 kg/cm². The blower was equipped with a pressure equalizing expansion chamber and an adjustable pressure relief valve to maintain a constant delivery pressure and volume. Air was delivered to the bioassay room through PVC piping with numerous individual flow valves. Individual aquaria receive air through commercial plastic aquarium air tubing and a 3 mm inside diameter by 30 cm long soft glass tube which reached the bottom of the test container. Air was bubbled into the aquaria at a rate of approximately 30 $m\ell$ /min following the guidelines of Kopperdahl (1976) and Peltier and Weber (1985).

Test Containers

The bioassay was conducted in 5-gallon glass aquaria, approximately 26 cm high, 21 cm wide, and 41 cm long. For the definitive test, the aquaria contained a total of 15 liters of waste material and/or dilution softwater which provided a water depth within the test aquaria of approximately 20 cm.

Test containers were cleaned thoroughly with Liqui-Nox brand commercial glassware detergent and hot water, rinsed five times with hot water and soaked in a 10% HCl acid bath for a minimum of four hours and then rinsed five times with deionized water. In some cases it had been necessary to wash the test containers with an organic solvent prior to washing with the detergent to remove oil or tar-like droplets which adhere to the surface of test containers.

Determination of Water Quality Parameters

After dosage of the appropriate concentration of waste sample to the test aquaria, and at 24, 48, 72, and 96 hours subsequent to initiation of the bioassay exposures, the following instrumentation was utilized to determine water quality parameters for each of the test and control aquaria for pH, dissolved oxygen and temperature. Total alkalinity and hardness, both expressed as mg/t CaCO₃, were determined for subsamples of dilution water and the 750 mg/t concentration was obtained immediately prior to initiation and at the completion of bioassay testing.

A Cole-Parmer Model 5566 water analyzer was utilized for determining the pH of the exposure solutions. After stabilization of the reading, the pH was recorded on the static bioassay worksheet to the nearest 0.1 pH unit.

Dissolved oxygen concentrations (mg/ℓ) were determined by gently swirling the Cole-Parmer Model 5566 water analyzer in the aquarium to be monitored. Dissolved oxygen concentrations were recorded on the static bioassay worksheet to the nearest 0.1 mg/ℓ , only after stabilization of the reading.

Exposure temperature was determined by the Cole-Parmer Model 5566 water analyzer calibrated by a mercury bulb thermometer graduated to 0.1°C with calibration traceable to the National Bureau of Standards.

Alkalinity values were calculated by potentiometric titration to a preselected pH of 4.6 utilizing Method 403, *Standard Methods* (16th Edition).

Hardness values were calculated by the EDTA titration utilizing Method 314 B, Standard Methods (16th Edition).

BIOASSAY PREPARATION

Receiving and Acclimating Fish

The fathead minnows, *Pimephales promelas*, were received from the supplier at least 14 days prior to initiation of bioassay testing. Shipment of the test fish in hard freshwater and an atmosphere of bottled oxygen from the Thomas Fish Company located in Anderson, California was via Greyhound Bus Lines overnight to MBC. Upon receipt of the test fish, the plastic bags containing the fathead minnows were floated on the surface of an appropriately sized aquarium containing aged local (hard) drinking water in the temperature controlled bioassay laboratory. When the temperature of the water in the shipping water was within 0.5°C of the holding tank, each plastic bag was opened and the fish were gently eased into the initial acclimation water containing 0.066 *mglt* Methylene Blue, 3.22 *mglt* Nitrofurazone and 0.645 *mglt* Furazolidone as bactericidal agents. These bactericides were effective against both gram-negative and

gram-positive bacteria as well as fungus. These concentrations of bactericides were maintained in the acclimation water, while the hardness is slowly decreased to that of the reconstituted softwater utilizing a reservoir and siphons to slowly change over the water following guidelines in *Standard Methods* (16th Edition). The test fish were subsequently gently transferred using a fine mesh dip net to the maintenance tank for further acclimation until initiation of the bioassay.

During the acclimation period, up until 48 hours prior to initiation of the bioassay, the fathead minnows were maintained on a diet of Tetramin brand flake food and San Francisco Bay Brand frozen brine shrimp. Tetramin flake food was fed in the morning and brine shrimp in the evening, while observing the behavior and monitoring the quality of the acclimating fish. The quantity of food delivered at each feeding was based upon the quantity which the tank population would completely consume within approximately five minutes of feeding. During these observations, any sick or dead fish were removed and the numbers of each, as well as any observations, were noted in the acclimation tank log book.

Dilution Water Preparation

Dilution water for the bioassay was prepared following the formulation of Kopperdahl (1976) and Horning and Weber (1985) for artificially reconstituted softwater. The following table indicates the quantities of reagent grade chemicals utilized in preparing the synthetic freshwater. Reconstituted softwater was prepared in 208 liter linear polyethylene barrels by addition of the salts to deionized (resin exchange column) water followed by thorough mechanical mixing at least 48 hours prior to initiation of the bioassay. The reconstituted softwater was maintained within the same temperature-controlled laboratory in which the test fish were acclimated, and the bioassay was performed to ensure against any significant difference between acclimation and test water temperature which might induce additional stress in the test fish.

Quantities of reagent grade chemicals required to prepare reconstituted softwater and expected water qualities.

| NaHCO ₃ | 48.0 mg/l |

| Hq | 7.2-7.8 |
| Total Hardness: | 40-48 mg/L CaCO ₃ |
| Total Alkalinity: | 30-35 mg/t CaCO3 |

Handling and Storage of the Waste Sample

The sample was composited in a 177 m ℓ clear glass jar by a Geotest representative. The sample was kept on ice and delivered to MBC Applied Environmental Sciences' laboratories located in Costa Mesa, California, on 4 November 1991.

Upon arrival at MBC, the sample was listed in the Bioassay Sample Log Book located in the bioassay laboratory by the Manager of Technical Services. The sample was prepared immediately for bioassay testing. The remaining portion of the sample was stored at 4°C in a designated area of the cold storage locker labeled "SAMPLES FOR HAZARDOUS WASTE TESTING".

Qualitative Description of the Waste Sample

The qualitative description of the waste sample was as follows:

MBC sample number 92-056- Client identification: Composite of S-1, S-2, S-3, S-4, S-5 and S-6

A moist light brown fine sandy soil with some tarry clumps and a moderate petroleum odor.

WASTE SAMPLE PREPARATION

Dry Waste Material

The sample contained non-friable solid particles which did not pass through a #10 (two millimeter) sieve but could contain hazardous constituents. The portion of waste which remained on the #10 sieve was placed in a Pulverisette II automatic grinder for 5 minutes. The two portions of the sample were combined, mechanically homogenized and resieved. The sample was then weighed into pre-tared Erlenmeyer flasks to yield final replicate sample concentrations of 250 mg/L, 500 mg/L, and 750 mg/L. Approximately 200 mL of dilution water was added to each flask. The flasks were capped with parafilm, a neoprene stopper and aluminum foil and mechanically shaken for six hours.

TOXICITY TESTING

Dosing Test Aquaria

After shaking, the sample was dosed into the appropriately marked aquaria containing approximately 14 liters of dilution water. Dilution water was then added to the 15 liter mark to yield a final volume of 15 liters for all test conditions.

A reconstituted softwater (dilution water only) control was established as a quality assurance measure. All test conditions and controls were run concurrently.

Initial Water Quality Measurements

Prior to the addition of the test fish, preliminary water quality measurements were taken for dissolved oxygen and pH to determine if adjustment is necessary (Polisini 1988). No adjustment was necessary to either parameter.

An initial hardness and alkalinity test analysis was performed on the control and the 750 mg/t concentration.

Addition of Test Fish

The test fish (fathead minnows) were gently corralled and dip netted in small groups from the plexiglass maintenance tank into smaller aquaria to confirm species identity and the healthy condition of each individual fish to be utilized in the test. Fish exhibiting any abnormalities, disease, wounds, or unusual behavior or color patterns were removed and destroyed. Those fish which passed the individual screening inspection were randomly allocated to test aquaria and controls.

Ten fathead minnows were gently released into each of the test aquaria replicate and the control, taking care not to allow the dip nets to contact the exposure media.

Observations

Water quality parameters, enumeration of live organisms and any ancillary observations pertinent to the conduct of the bioassay were taken and recorded on the bioassay worksheets at initiation and subsequently at 24, 48, 72, and 96 hours after initiation of the bioassay exposures. Daily water quality parameters, live organism enumeration and ancillary observations are listed in Appendix A.

Alkalinity and Hardness Analysis

Total alkalinity and hardness, both expressed as mg/ℓ CaCO₃, were determined by replicate samples utilizing the procedures in Method 403 and 314B, Standard Methods (16th Edition). Subsamples of the dilution water control and the 750 mg/ℓ concentration were obtained immediately prior to initiation and at the completion of bioassay testing and the results are presented on the bioassay worksheets.

Determination of Test Fish Lengths and Weights

At the conclusion of the test, 20 of the surviving fish were wet weighed to the nearest 0.1 gram on an analytical balance and measured to the nearest millimeter. The data were recorded on a Bioassay Fish Weight/Length Measurements form. All surviving fish were then destroyed following the procedures in *Standard Methods* (16th Edition). Measurements are presented in Appendix B.

RESULTS

Standard DOHS Screening Bioassay

The 96-Hour Acute Aquatic Toxicity testing conducted by MBC was a static, non-renewal testing following the procedures in *Standard Methods* (16th Edition) and the procedures of Dr. James Polisini (1988). Death was the effect measured and toxicity was reported as percent survivorship at 250 mg/ℓ , 500 mg/ℓ and 750 mg/ℓ concentrations. Original data worksheets will remain on file at MBC.

MBC sample number: 92-056 - Client Identification: 92400-11 Composite of S-1, S-2, S-3, S-4, S-5 and S-6

PERCENT SURVIVORSHIP

250 mg/t 100% 500 mg/t 100% 750 mg/t 100%

The soil sample 92400-11 Composite of S-1, S-2, S-3, S-4, S-5 and S-6 PASSED the DOHS 96-Hour Acute Aquatic Toxicity testing at all concentrations tested. Currently, Title 22, Section 66261.24, Article 6 of the California Code of Regulations requires wastes to pass the 96-Hour Aquatic Toxicity testing with greater than 50% survival at the 500 mg/ℓ concentration for compliance. Utilizing the analytical data obtained from this test, the Department of Health Services can now evaluate the material for hazardous waste declassification.

APPENDIX C

GEORESEARCH PROCEDURES AND ANALYTICAL METHODS

NEEDS REVISED ADDITION GEORESEARCH PROCEDURES FOR SOIL SAMPLING USING A HAND AUGER

The following outline describes the procedures utilized by GeoResearch for soil sampling utilizing a hand auger.

- i. The clean sampler is lined with two clean, 1.5-inch diameter, stainless steel or brass tube and advanced to a specified depth where two samples can be obtained by driving the sampler into the soil with the drive hammer.
- ii. The tubes are removed from the sampler. The ends of each or either tube are covered with aluminum foil, covered with plastic caps, and taped with duct tape.
- iii. Each collected soil sample is labeled, recorded on a Chain-of-Custody record and placed on ice for transport to a certified hazardous waste laboratory.

GEORESEARCH PROCEDURES FOR SOIL SAMPLING DURING DRILLING

The following outline describes the procedures utilized by GeoResearch for soil sampling during drilling, using hollow-stem, continuous-flight augers.

- i. Soil samples are collected using a 2.0 to 2.5-inch inside diameter, modified California split-spoon sampler. The sampler is lined with two to three, 6-inch long, 2.0 to 2.5-inch diameter brass rings for containment of the soil samples.
- ii. To avoid cross-contamination of samples, the sampler and rings are washed prior to each use with non-phosphate detergent and double rinsed with distilled water.
- iii. At the prescribed sampling interval of 5 feet, the sampler is attached to the drive rod and driven 18 inches into undisturbed soil below the lead auger with a 140-pound hammer that is repeatedly dropped from a 30-inch height. The number of drops is recorded during each 6-inch increment and used as a qualitative determination of soil consistency and density.
- iv. The lead, or deepest, brass ring is recovered from the sampler, sealed by taping aluminum foil and plastic caps onto both ends, labeled, placed in a Zip-loc bag, and stored on blue ice while awaiting delivery to the laboratory for chemical analysis.
- V. The sample is recorded onto a Chain-of-Custody form to ensure traceability of the sample.
- vi. The sampled interval is classified using the remaining rings and described on a log of soil boring form, following the Unified Soil Classification System.
- vii. Every 20th sample will be analyzed in duplicate to determine analytical precision and accuracy.

SUMMARIES OF LABORATORY ANALYTICAL METHODS: SOIL SAMPLES

The following briefly describes laboratory analyses performed on soil samples in accordance with the specified EPA or California Department of Health and Safety methods.

EPA Method 418.1: Total Recoverable Petroleum Hydrocarbons
Infrared spectrometry (IR) is utilized to define concentrations of total recoverable petroleum hydrocarbons (TRPH) in soil samples. Freon is used to extract potential hydrocarbons from the sample. The extractant is then analyzed by IR for TRPH concentrations.

Modified EPA Method 8015: Total Petroleum Hydrocarbons

This method speciates and quantifies total petroleum hydrocarbons (TPH) by the use of a gas chromatograph/flame ionization detector (GC/FID). Pentane is utilized as the solvent extractant for TPH within soil samples. The pentane and any extracted solvents are injected on a capillary column. The hydrocarbon compounds are detected by the FID.

EPA Method 8020: Benzene, Toluene, Total Xylenes, Ethylbenzene Organic volatile aromatics in soil samples are detected on a gas chromatograph/photoionization detector (GC/PID). Pentane is utilized as the solvent extractant for potential aromatics within soil samples. The pentane and any extracted solvents are injected on a packed column. The aromatics are detected by the PID.

EPA Method 7420: Total Lead

Total lead concentrations in soil samples are determined by atomic absorption spectrophotometry. The sample is vaporized; a light source is passed through the vapor. The lead atoms absorb the radiation at characteristic wavelengths. This degree of absorption is measured photoelectrically for determination of total lead concentrations.

EPA Method 7421: Total Lead

Total lead concentrations in soil samples are determined by atomic absorption spectrophotometry. The sample is vaporized in a graphite furnace; a light source is passed through the vapor. The lead atoms absorb the radiation at characteristic wavelengths. This degree of absorption is measured photoelectrically for determination of total lead concentrations.

<u>California Code of Regulations: Metals</u> <u>California Administrative Code: Title 22 - Metals</u>

Soil samples are acid-digested to separate metals from the soil matrix. The digestate solution is analyzed on an atomic absorption (AA) spectrophotometer in conjunction with either a graphite furnace (GFAA) or a flame (FLAA) as the energy source. In FLAA determinations, the flame provides energy for dissociating the sample solution to atomic state for absorption measurement on the AA. GFAA allows gradual heating before AA measurements.

EPA 8010: Halogenated Volatile Organic Compounds

Halogenated volatile organic compounds are extracted from a soil matrix with hexane as the extract solvent. The extractant is injected on a gas chromatograph (GC) packed column. The compounds are detected on chromatograms run with an electron capture detector (ECD).

EPA Method 8015: Non-halogenated Volatile Organic Solvents

The non-halogenated volatile organic compounds are extracted from the soil matrix by methanol. The extractant is injected into a GC stainless steel packed column, and the non-halogenated compounds are detected on the FID.

Soil samples are analyzed by a California-certified hazardous waste laboratory. Quality Assurance/Quality Control measures, such as percent reproducibility, percent recovery, and spike analyses, are employed by the laboratory to validate the results. In addition, the laboratory results are reviewed by qualified personnel before release.

11 November 1991

Geo-Research 1713 Tulare Street, Suite 113 Fresno, California 93721

Attention: Mr. Jeff Adolf

Dear Mr. Adolf:

The following are the results of the California Department of Health Services (DOHS) 96-Hour Acute Aquatic Toxicity Bioassay performed on the soil sample Composite of S-1, S-2, S-3; S-4, S-5, S-6 (Geotest Project Number 92400-11) submitted on 4 November 1991. MBC utilized the latest California Department of Health Services procedures for testing the sample.

MBC Sample Number 92-056 - Client Identification: 92400-11 Composite of S-1, S-2, S-3, S-4, S-5, S-6

PERCENT SURVIVORSHIP

250 mg/l 100% 500 mg/l 100% 750 mg/l 100%

The Composite of S-1, S-2, S-3, S-4, S-5, S-6 sample PASSED the 96-Hour Acute Aquatic Toxicity testing at all concentrations tested. Currently, Title 22, Section 66261.24, Article 6 of the California Code of Regulations requires wastes to pass the 96-Hour Aquatic Toxicity testing with greater than 50% survival at the 500 mg/l concentration for compliance. Utilizing the analytical data obtained from this test, the Department of Health Services can now evaluate this material for hazardous waste declassification.

A full written report will be prepared later this week. Should you have any questions regarding procedures or results of this test, please contact me at your convenience.

Cordially,

MBC Applied Environmental Sciences

WORK PLAN FOR TEJON RANCH SOIL CHARACTERIZATION

GeoResearch

FILE COPY

1713 Tulare, Suite 113 Fresno, California 93721 (209) 264-0444 (800) 523-4786

January 9, 1992

Mr. Terry L. Gray
Kern County Environmental Health Department
2700 "M" Street, Suite 300
Bakersfield, CA 93301

Dear Mr. Gray,

In accordance with the authorization of Mr. Bob Boust of Unocal Corporation, we are submitting the attached letter regarding the proposed scope of work for the assessment of shallow soil conditions at Unocal Station No. 4734, 9068 West Grapevine Road, Lebec, California. Please contact the undersigned if you have any questions.

Sincerely,

Warren W. Gross

Senior Geologist

RE: Proposed Scope of Work, Assessment of Shallow Soil Conditions in Areas of Identified Staining North and East of Unocal Station No. 4734, 9068 West Grapevine Road, Lebec (Grapevine) CA, GeoResearch Project # 92075

Dear Mr. Boust:

In response to your request, pursuant to our meeting last Friday with Tejon Ranch representatives and Kern County Environmental Health Services Department (KCEHD) officials, GeoResearch is pleased to present this proposed scope of work as referenced above. GeoResearch personnel completed a site reconnaissance of Unocal Station 4734 and surrounding Tejon Ranch properties on January 7, 1992. Particular attention was given to the identification of areas of readily visible soil staining north and east of the station and to the determination of the path of drainage from the storm drains present on the station property. Mr. Terry Gray of KCEHD was present on site and our observations and soil assessment methodologies were presented to and discussed with him. The ground was water-saturated and light rainfall was intermittent during our site reconnaissance.

It appears that little or no automotive service or repair work is presently performed by the station. However, the station is a popular place for the public to stop and cool down overheating engines, refill radiators, and even perform repairs and other auto servicing. This activity continues despite the signs posted at all station entrances prohibiting such activities. These activities have contributed significantly to the soil staining observed in the areas investigated.

Four storm/area drains have been identified on the station property, as shown on the enclosed figure. Connections to these drains were investigated by Spectrum E.S.I. of San Fernando, CA, a

GenFesserent is a countrie of GENSEPVICES a California comporation

Mr. Bob Boust January 9, 1992 GR# 92075 Page 2

utility detection service, in December 1991 and indicated on the surface of the pavement. These markings were examined during our site reconnaissance and considered with respect to the locations of sewer manholes on the sewer line installed by Tejon Ranch (Figure 1). All drain connections appear to trend directly toward sewer manholes (or tie into another drain from which drainage is so directed). Connections of these drains to the sewer have not been verified.

A connection between the pipe identified at the contaminated water release point shown on the enclosed figure with a storm drain at the station could not be made. A hose inserted into the northernmost station drain did not produce an observable change in flow at the pipe located north of the site; however, the soil conditions observed around the pipe discharge are consistent with those that would be expected of waters discharging from this drain. No alternative source for the discharge was identified.

Soil sample locations were selected and marked with wooden stakes at locations which appeared to be representative of the degree of soil staining in the areas of our investigation. These soil sample locations are indicated on the enclosed figure. At each location soil samples were collected at depths of 1/2 to 1 foot, two feet, and four feet, if soil conditions permitted. The shallow sample was collected in a laboratory-supplied glass jar within a shallow excavation. Deeper samples were obtained by hand-augering to the top of the sample interval and driving a brass sample tube into the soil. All samples were preserved for potential laboratory analysis.

Six soil sample locations were selected in the path of drainage from the pipe identified to the north of the station (Area #1 on the figure). The effluent from the discharge pipe was clear at the time of our site reconnaissance. Dark soil staining with associated hydrocarbon odors were noted only in the immediate area of the discharge pipe. Small patches of light to moderate soil staining were evident along the flow path of the drainage above the on-ramp culvert. Light soil staining was apparent in the sandy soil near the discharge from the culvert below the freeway on-ramp.

Two soil sample locations were selected near the driveway along the north edge of the site (Area #2 on the figure). Soils in this area were heavily oil-stained, apparently due to flow off of the asphalt surrounding the station.

Four soil sample locations were selected east of the station (area #3 on the figure). A small patch of moderate soil staining was observed immediately adjacent to the asphalt at a low point where drainage off of the asphalt is apparent. No other soil staining

Mr. Bob Boust January 9, 1992 GR# 92075 Page 3

was observed in this area, although light soil staining could have been obscured by the damp soil conditions and darker staining could have been present beneath puddles of water. Soil sample locations were selected in areas which appeared to be those which would receive runoff from the asphalt surrounding the station, whether by natural storm runoff or clean up operations performed by station personnel.

We propose to analyze the uppermost soil sample from each location for total recoverable petroleum hydrocarbons (TRPH) by US EPA Method 418.1. Those samples which test positive for TRPH would be further analyzed for total petroleum hydrocarbons as gasoline and diesel (TPH-g and TPH-d), by California Department of Health Services-approved methods, and for BTEX by US EPA Method 8020. addition, all soil samples will be field screened with an organic vapor analyzer (OVA). Selected samples exhibiting elevated OVA readings would also be analyzed for TPH-g, TPH-d, and BTEX. soil sample from the area of the discharge pipe north of the station, that with the highest TRPH concentration, would also be analyzed for 17 heavy metals as identified in the California Administrative Code. Additional analyses may be performed, based on field observations and the results of the analyses discussed above.

As we have discussed previously, the two abandoned septic systems on the property will be investigated by soil borings adjacent to these facilities. Analytes will include TRPH, TPH-g/BTEX, TPH-d, and halogenated volatile organics (US EPA Method 8010). We do not propose that the areas of additional seepage pits penciled in on the plan provided by Mr. Jeff Warren be investigated unless contamination is identified at the original two facilities which we have planned to investigate.

During our site reconnaissance, Mr. Gray pointed out an area east of the northeast corner of the paved area east of the site which recieves drainage from the site and is somewhat stained. The area is on the Cal-Trans right-of-way and soil staining does not appear to be heavy or extensive.

Mr. Bob Boust January 9, 1992 GR# 92075 Page 4

Please contact me if you have any questions. Upon your approval, I will fax a copy of this letter directly to the KCEHD and Tejon Ranch.

Sincerely,

Warren W. Gross

VII. Comments

Upon a review of the data, this site should qualify as a low risk site and be a candidate for closure. In 1998, two 10,000 gallon, one 8,000 gallon and one 500 gallon tanks were removed from the site. Initial soil samples 6' beneath the tanks indicated TPG contamination of 1,100 ppm and MTBE of 4.7 ppm. Soil borings were advanced to a depth of 80 feet. Contamination attenuated to TPH and MTBE of non-detect. The depth to first groundwater is 600 feet bgs.

INSTRUCTIONS

EMERGENCY

Indicate whether emergency response personnel and equipment were involved at any time. If so, a Hazardous Material Incident Report should be filed with the State Office of Emergency Services (OES) at 2800 Meadowview Road, Sacramento, CA 95832. Copies of the OES report form may be obtained at your local underground storage tank permitting agency. Indicate whether the OES report has been filed as of the date of this report.

LOCAL AGENCY ONLY

To avoid duplicate notification pursuant to Health and Safety code Section 25180.5, a government employee should sign and date the form in this block. A signature here <u>does</u> not mean that the leak has been determined to pose a significant threat to human health or safety, only that notification procedures have been followed if required.

REPORTED BY

Enter your name, telephone number, and address. Indicate which party you represent and provide company or agency name.

RESPONSIBLE PARTY

Enter name, telephone number, contact person, and address of the party responsible for the leak. The responsible party would normally be the tank owner.

SITE LOCATION

Enter information regarding the tank facility. At a minimum, you must provide the facility name and full address.

IMPLEMENTING AGENCIES

Enter names of the local agency and Regional Water Quality Control Board involved.

SUBSTANCES INVOLVED

Enter the name and quantity lost of the hazardous substance involved. Room is provided for information on two substances if appropriate. If more than two substances leaked, list the two of most concern for cleanup.

DISCOVERY/ABATEMENT

Provide information regarding the discovery and abatement of the leak.

SOURCE/CAUSE

Indicate source(s) of leak. Check box(es) indicating cause of leak.

CASE TYPE

Indicate the case type category for this leak. Check one box only. Case type is based on the most sensitive resource affected. For example, if both soil and ground water have been affected, case type will be "Ground Water". Indicate "Drinking Water" only if one or more municipal or domestic water wells have actually been affected. A "Ground Water" designation does not imply that the affected water cannot be, or is not, used for drinking water, but only that water wells have not yet been affected. It is understood that case type may change upon further investigation.

CURRENT STATUS

Indicate the category which best describes the current status of the case. Check one box only. The response should be relative to the case type. For example, if case type is "Ground Water", then "Current Status" should refer to the status of the ground water investigation or cleanup, as opposed to that of soil. Descriptions of options follow:

 $\underline{\text{No Action Taken}}$ - No action has been taken by responsible party beyond initial report of leak.

Leak Being Confirmed - Leak suspected at site, but has not been confirmed.

Preliminary Site Assessment Workplan Submitted - workplan/proposal
requested of/submitted by responsible party to determine whether ground
water has been, or will be, impacted as a result of the release.

Preliminary Site Assessment Underway - implementation of workplan.
Pollution Characterization - responsible party is in the process of fully
defining the extent of contamination in soil and ground water and assessing
impacts on surface and/or ground water.

Remediation Plan - remediation plan submitted evaluating long term remediation options. Proposal and implementation schedule for appropriate remediation options also submitted.

Cleanup Underway - implementation of remediation plan.

<u>Post Cleanup Monitoring in Progress</u> - periodic ground water or other monitoring at site, as necessary, to verify and/or evaluate effectiveness of remedial activities.

 $\underline{\text{Case Closed}}$ - regional board and local agency in concurrence that no further work is necessary at the site.

IMPORTANT: THE INFORMATION PROVIDED ON THIS FORM IS INTENDED FOR GENERAL STATISTICAL PURPOSES ONLY AND IS NOT TO BE CONSTRUED AS REPRESENTING THE OFFICIAL POSITION OF ANY GOVERNMENTAL AGENCY

REMEDIAL ACTION

Indicate which action have been used to cleanup or remediate the leak. Descriptions of options follow:

<u>Cap Site</u> - install horizontal impermeable layer to reduce rainfall infiltration.

 $\underline{\mathtt{Excavate}}$ and $\underline{\mathtt{Dispose}}$ - remove contaminated soil and dispose in approved site.

 $\underline{\textbf{Excavate}}$ and $\underline{\textbf{Treat}}$ - remove contaminated soil and treat (includes spreading or land farming).

Remove Free Product - remove floating product from water table.

Pump and Treat Groundwater - generally employed to remove dissolved contaminants.

Enhanced Biodegradation - use of any available technology to promote bacterial decomposition of contaminants.

Replace Supply - provide alternative water supply to affected parties.

Treatment at Hookup - install water treatment devices at each dwelling or other place of use.

<u>Vacuum Extract</u> - use pumps or blowers to draw air through soil.

<u>Vent Soil</u> - bore holes in soil to allow volatilization of contaminants.

<u>No Action Required</u> - incident is minor, requiring no remedial action.

COMMENTS - Use this space to elaborate on any aspects of the incident.

SIGNATURE - Sign the form in the space provided.

DISTRIBUTION

If the form is completed by the tank owner or his agent, retain the last copy and forward the remaining copies intact to your local tank permitting agency for distribution.

- 1. Original Local Tank Permitting Agency
- State Water Resources Control Board, Division of Clean Water Programs, Underground Storage Tank Program, P.O. Box 944212, Sacramento, CA 94244-2120
- 3. Regional Water Quality Control Board
- Local Health Officer and County Board of Supervisors or their designee to receive Proposition 65 notifications
- Owner/responsible party.

UNDERGROUND STORAGE TANK CLOSURE

November 4, 1994

Chevron U.S.A. Inc. 1300 So. Beach Boulevard La Habra, California 90632-2833

ATTN: Mark Horne

SUBJECT: CASE NO:

NO: 600015

Location:

8977 Grapevine Road (I-5/Grapevine Exit), Lebec, CA

Dear Mr. Horne:

This letter confirms the completion of site investigation and remedial action for the underground storage tank(s) formerly located at the above-described location.

Based upon the available information and with the provision that the information provided to this agency was accurate and representative of site conditions, no further action related to the underground storage tank release is required.

This notice is issued pursuant to a regulation contained in Title 23, California Code of Regulations, Division 3, Chapter 16, Section 2721 (e).

Please telephone Dolores Gough at (805) 861-3636, if you have any questions regarding this matter.

1

Sincerely.

Steve McCalley, Director

Environmental Health Services Department

Ms. Dolores Gough Kern County Environmental Health Services Department 2700 "M" Street, Suite 300 Bakersfield, CA 93301

Subject:

Submittal of Letter Detailing Interim Remedial Action Plan for Former Chevron Service Station #9-8616, 9877 Grapevine Road, Lebec, California

Dear Ms. Gough:

On behalf of Chevron U.S.A. Products Co. (Chevron), Bechtel Environmental, Inc. (BEI) has prepared this letter to provide an interim remedial action plan for former Chevron Service Station No. 9-8616, located in Lebec, California (Figure 1). The remedial actions described in this plan are intended to address the results of the tank removal operations and subsequent site assessment activities, which indicate the presence of petroleum hydrocarbons in the vadose zone beneath the site.

Site Background/Previous Work

The site was formerly a Chevron retail service station facility which dispensed motor fuel since 1968 and was abandoned by Chevron in December of 1992, according to the Chevron Marketing Compliance Program Files. Four underground storage tanks (USTs) and associated piping were removed from the site on April 1, 1993 by B&T Service Station Contractors. A complete description of the UST removal activities can be found in the Tank Removal Report/Site Assessment Workplan dated October 6, 1993, prepared by BEI and subsequently submitted to the Kern County Environmental Health Services Department (EHSD). BEI staff observed UST and piping removal activities and collected soil samples at the bottom of the excavations. The sampling locations are shown on Figure 2.

Results of laboratory analyses for soil samples collected during tank removal activities indicate the presence of total petroleum hydrocarbons as gasoline (TPHg), benzene, toluene, ethylbenzene, total xylenes (BTEX), total recoverable petroleum hydrocarbons (TRPH), and total lead in soil beneath the site. Laboratory results are summarized in Table 1. The highest concentrations of TPHg and BTEX were found beneath the former 10,000-gallon UST and beneath the two northeastern-most pump islands. TRPH was detected beneath the former northern hoist inside the former service station building. Based on this

3.6 W 94

An Alliance of Chevron Corporation and Bechtel Environmental, Inc.

Ms. Dolores Gough July 8, 1994 Page 2

information, BEI submitted a workplan as part of the October 6, 1993 report to assess the vertical and lateral extent of petroleum hydrocarbons within soil in the vicinity of the former fuel USTs and their associated former dispenser islands.

Based on the EHSD approval of the October 6, 1993 workplan, BEI performed site assessment field activities from February 2 through 8, 1994. Nine exploratory soil borings (B1-B9) were drilled to depths ranging from 26 to 91 feet below ground surface (bgs), and 73 soil samples were collected. Locations of the borings and wells are shown on Figure 3. Exploratory soil boring B6 was converted to vadose-zone monitoring well VW6, and was completed to a depth of 40 feet (B6/VW6). Soil borings B7 and B8 were converted to vadose-zone probes VP7 and VP8, respectively, and completed to respective depths of 91 feet bgs and 51 feet bgs.

Thirty-one soil samples collected during the site assessment field investigation were laboratory-analyzed. Analytical results for samples from seven of the nine borings (B3 through B9) indicated non-detectable concentrations of TPHg and BTEX. Boring B1 contained TPHg and total xylenes below the clean up goals (proposed below), and boring B2 indicated TPHg just above the laboratory detection limit. Laboratory results are summarized in Table 2.

Ground water was not encountered in any of the nine exploratory soil borings which were drilled to a maximum depth of 91 feet bgs. Ground water beneath the site is estimated to be at a depth of 400 to 600 feet bgs (telephone conversation on July 28, 1993, between Mr. F. Scott Small of BEI and Ms. Lydia Von Sydow of EHSD).

Remedial Action

The planned remedial activities at this site include: 1) destruction of vadose-zone monitoring well and probes, 2) excavation and off-site disposal of petroleum-hydrocarbon impacted soil, and 3) backfill and compaction of excavated areas. Permits required to perform tasks relating to the remediation of the site will be obtained prior to undertaking the remedial actions.

The first phase of remedial action will be to destroy the vadose-zone monitoring well and probes previously installed at the site. The driller performing the well destruction will possess a C-57 license as required by California State law. The destruction of the well and probes is planned to be performed in the following order:

- Remove the wellhead.
- Drill out the bentonite seal.
- Pull out the well casing.
- Drill out the sand pack with 8- and 10-inch hollow-stem augers for the probes

Ms. Dolores Gough July 8, 1994 Page 3

and well, respectively.

- Backfill the open borehole with hydrated bentonite chips (or similar approved material) to approximately 5 feet bgs.
- Backfill the upper five feet of the borehole with non-impacted soil.

Subsequent to well destruction activities, petroleum hydrocarbon-impacted soil in the vicinity of the former northeastern-most dispenser islands and former fuel USTs will be excavated and disposed of off-site. The estimated lateral extent of excavation for each area is shown on Figure 3. Clean-up goals for excavation will be 100 mg/kg for TPHg and 0.3, 0.3, 1, and 1 mg/kg for BTEX, respectively, pursuant to Table 2-1 of the LUFT Manual (Attachment A). It is estimated that approximately 700 cubic yards of soil will be excavated in order to accomplish this objective. This may vary, however, based on field observations and results of analytical testing.

During the excavation process, soil samples will be collected and submitted to a state-certified, on-site mobile laboratory to evaluate whether clean-up goals have been achieved. Soil with petroleum-hydrocarbon impact above the stated clean-up goals will be removed from the site.

In the excavation beneath the former pump islands, soil samples will be collected at the bottom of the excavation beneath each pump island. Samples will also be collected in each sidewall at a ratio of one for every 15 feet of sidewall length. For excavations extending to less than 10 feet bgs, the sidewall sample will be collected at approximately 2 to 5 feet above excavation bottom. For excavations extending to greater than 10 feet bgs, the sidewall sample will be collected at approximately 5 to 10 feet bgs above excavation bottom.

In the excavation near the former UST pit, the soil previously used to backfill the former UST excavation will be re-excavated and segregated into impacted and non-impacted stockpiles based on the above clean-up goals. Samples will be collected in each sidewall at a ratio of one for every 15 feet of sidewall length. Sidewall samples will be collected at approximately 5 to 10 feet bgs above excavation bottom. The excavation will be extended deeper in the vicinity of sample TST17 to achieve clean-up goals. For this deeper excavation, a sample will be collected at bottom and from each sidewall.

Both excavated areas will be backfilled and compacted to Chevron specifications; the soil used for backfill will comply with clean-up goals stated above.

TRPH was detected in soil beneath the northern hoist at a concentration of 60 mg/kg (sample H2-10, collected at 10 feet bgs). No clean-up level exists in the LUFT Manual Table 2-1 (Attachment A) for TRPH. However, the clean-up level for diesel at this site pursuant to this table is 1000 mg/kg; since the carbon range of diesel is included within the TRPH range, it is proposed that a clean-up level of 1000 mg/kg also be used for TRPH.

Ms. Dolores Gough July 8, 1994 Page 4

Current TRPH levels detected in soil in this vicinity are far below this clean-up level; therefore, no action is planned for this area.

After completion of the planned remedial activities, a site assessment/remedial excavation report will be submitted to the EHSD for review, and if appropriate, for site closure. If you have any questions regarding this project, please contact the BEI project manager, Mr. Scott Small at (310) 807-2873 or the Chevron environmental representative, Mr. Mark Horne at (310) 694-7352.

Sincerely,

BECHTEL ENVIRONMENTAL, INC.

NOTES: Chemical testing was performed by NET Laboratories, Burbank, California.

(1) Total Petroleum Hydrocarbons (gas) and (full screen); Analyzed by EPA Method 8015 Modified.

(2) Analyzed by EPA Method 8020.

(3) Organic Lead; Analyzed by the DOHS Luft Method.

ND = Individual constituents of total petroleum hydrocarbons (TPH) were below the respective detection limits. TPH as gasoline is listed in a separate column.

The detection limit for each hydrocarbon constituent is 10 mg/kg.

-- Not Analyzed

ATTACHMENT A

Table 2-1

Leaching Potential Analysis for Gasoline and Diesel Using Total Petroleum Hydrocarbons (TPH) and Benzene, Toluene, Xylene and Ethylbenzene (BTXE)

The following table was designed to permit estimating the concentrations of TPH and BTXE that can be left in place without threatening ground water. Three levels of TPH and BTX&E concentrations were derived (from modeling) for sites which fall into categories of low, medium, or high leaching potential. To use the table, find the appropriate description for each of the features. Score each feature using the weighting system shown at the top of each column. Sum the points for each column and total them. Match the total points to the allowable BTX&E and TPH levels.

| | TE FURE | S C O R E | SCORE 10 PTS IF CONDITION IS MET IS | S C O R E | SCORE 9 PTS IF CONDITION IS MET | SC OR E | SCORE 5 PTS IF CONDITION IS MET |

Site Assessment Workplan for Former Chevron Station

No. 9-8616, 9877 Grapevine Road, Lebec, California

(Permit No. 600015)

Dear Mr. Horne:

The subject workplan prepared by Bechtel Environmental Inc. has been reviewed. The work proposed to determine the extent of gasoline contamination at this site is acceptable and may be started as scheduled.

Please notify this office at least 48 hours prior to initiating field activities. If you have any questions regarding this correspondence, I can be reached at (805) 861-3636.

Sincerely,

Steve McCalley, Director

Lebec, CA 93243

Known As

Chevron U.S.A., #98616

PERMIT #

600015

Dear Ms. Closs:

This letter is an official notice to inform you that the property described above has been determined by Kern County Environmental Health Services Department to be the site of an unauthorized release of hazardous materials from an underground storage tank. This notice is sent to you because our records indicate that you are a responsible party for this property.

As a responsible party, you must provide for all studies and work relating to the above-described property and the cost for oversight of these activities. California Health and Safety Code, Chapter 6.7, and Kern County Ordinance Code, Chapter 8.48, require a determination of the threat to the environment as a result of this release. THE RESPONSIBLE PARTY SHALL, ON A TIMELY BASIS, DEVELOP A SITE CHARACTERIZATION, FEASIBILITY STUDY AND REMEDIAL ACTION PLAN FOR KERN COUNTY ENVIRONMENTAL HEALTH SERVICES DEPARTMENT'S REVIEW AND APPROVAL BEFORE THE WORK IS INITIATED. Enclosed you will find Attachment "A", Handbook UT-35, which states the minimum required site work plan activities, the necessary requirements for selecting environmental contractors qualified to perform this work, a glossary of terms, example illustrations, and a section discussing the answers to commonly asked questions.

According to the criteria listed below and in Attachment "C", your site has been designated as environmentally sensitive. All environmentally sensitive sites are automatically enrolled into a State contract program for recovery of oversight costs. The environmental sensitivity criteria for sites are as follows:

- 1. Highest historic ground water is within 100 feet of ground surface, or
- 2. Nearest surface water in unlined conveyance is within 75 feet of tank(s), or
- 3. Nearest agricultural or domestic water well is within 75 feet of tank(s), or
- 4. Facility is located in a designated aquifer recharge area, or

Desiree Closs Subject: Chevron U.S.A., #98616 - Permit #600015 July 6, 1993 Page 2

5. Permitting Authority determines possible adverse environmental impact due to facility proximity to unique wildlife habitat areas.

The cost incurred by Kern County Environmental Health Services Department for the oversight of the work for the site characterization, feasibility study, remediation action plan, site remediation, and ongoing monitoring is not covered by any fees or permits. These costs will be recovered by Kern County Environmental Health Services Department under the terms of the State contract described below. The contract pertains only to costs associated with oversight.

STATE CONTRACT

The State Leaking Underground Storage Tank Local Oversight Program provides a mechanism for the State to reimburse the County for County oversight. The County will conduct the necessary oversight and bill the State Water Resources Control Board under this State contract. The State will then charge you, a responsible party, for both the costs incurred by the County and the State, pertaining to your site, under the State terms explained below:

Whereas the federal Petroleum Leaking Underground Storage Tank Trust Fund provides funding to pay the local and state agency administrative and oversight costs associated with the cleanup of releases from underground storage tanks; and Whereas the Leaislature has authorized funds to pay the local and state agency administrative and oversight costs associated with the cleanup of releases from underground storage tanks; and Whereas the direct and indirect costs of site investigation or remedial action at the above site are funded, in whole or in part, from the federal Trust Fund; and Whereas the above individual(s) or entity(ies) have been identified as the party or parties responsible for investigation and cleanup of the above site; YOU ARE HEREBY NOTIFIED that pursuant to Title 42 of the United States Code, Section 6991b(h)(6) and Section 25360 of the Health and Safety Code, the above Responsible Party or Parties shall reimburse the State Water Resources Control Board not more than 150 percent of the total amount of site-specific oversight costs actually incurred while overseeing the cleanup of the above underground storage tank site, and the above Responsible Party or Parties shall make full payment of such costs within 30 days of receipt of a detailed invoice from the State Water Resources Control Board.

If you should have any questions regarding this matter, please contact Susan Gonzales at (805) 861-3636, Extension 510.

Sincerely,

Steve McCalley, Director

Environmental Health Services Department

STEVE McCALLEY, R.E.H.S.
DIRECTOR

2700 "M" Street, Suite 300 Bakersfield, CA 93301 (805) 861-3636 (805) 861-3429 FAX

July 2, 1993

Desiree Closs Chevron U.S.A. P. O. Box 2833 La Habra, CA 90632

SUBJECT:

Location:

I-5 and Grapevine, Lebec, CA

Known As:

Chevron Service Station #98616

PERMIT #: 600015

Dear Ms. Closs:

The intent of this letter is to inform you of the necessary deadlines for work required at the property described above. As a responsible party for a leaking underground storage tank, you have previously received a letter from this Department notifying you of the required work necessary to identify the extent of the contamination. We are now requesting that this work, outlined in UT-35, be done in a timely manner.

In accordance with California Health and Safety Code, Chapter 6.7, and Kern County Ordinance Code, Chapter 8.48, the Kern County Environmental Health Services Department requires a determination of the threat to the environment. Accordingly, you must select an environmental contractor and submit a site characterization workplan proposal to this office within thirty (30) days from the date of this letter. The workplan must be approved by this Department before any work is started.

If you should have any questions regarding this matter, please contact me at (805) 861-3636.

Sincerely,

Steve McCalley, Director

Attention:

Ms. Carrie Georgi

Subject:

Laboratory Reports, Chevron Service Station # 9-8616, 9877 Grapevine Road

Dear Ms. Georgi:

This letter has been prepared in response to a conversation, held on June 8, 1993, between yourself and Carl J. Lind of Bechtel Environmental, Inc., (BEI) pertaining to Chevron U.S.A., Inc., (Chevron) service station #9-8616, located at the intersection of Interstate 5 and Highway 99 near Lebec. During the preliminary site assessment conducted as part of the under-ground storage tank (UST) abandonment on April 1, 1993, several soil samples were collected and submitted to a mobile laboratory for analysis. As you requested in the June 8 conversation the analytical laboratory reports for those samples are enclosed with this letter. Also enclosed are copies of the site sketch with sample locations and designations, and the format for sample label designations.

Please feel free to contact Mr. Lind at (310) 807-2405 if you have any questions regarding these procedures.

Sincerely,

BECHTEL ENVIRONMENTAL, INC.

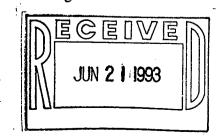

Carl J. Lind Geologist

TANK REMOVAL: SAMPLE DESIGNATION

FORMAT: <u>a b c d</u>

- $\underline{\mathbf{a}} = \mathbf{T}, \mathbf{P}, \mathbf{D}, \mathbf{SP}$: general sample locations where
 - \circ T = Tank
 - \circ **P** = **P**iping
 - o **D** = **D**ispenser
 - \circ $\mathbf{E} = \mathbf{E}_{\mathbf{x}}$ cavation
 - \circ $\mathbf{H} = \mathbf{H}_{oist}$
 - \circ C = Clarifier
 - \circ SP = StockPile
 - ST = Septic Tank
- $\underline{\mathbf{b}} = \mathbf{S}, \mathbf{P}, \mathbf{R}, \mathbf{L} / \mathbf{n}$: If samples are located with respect to
 - Tanks, then $\underline{\mathbf{b}} = \mathbf{S}$, \mathbf{P} , \mathbf{R} , \mathbf{L} ; where
 - S = Supreme unleaded
 - P = Plus unleaded
 - R = Regular unleaded
 - L = Leaded, regular
 - Piping, Dispensers, Excavation, Hoist, or Clarifier, then $\underline{\mathbf{b}} = \mathbf{n}$; where
 - \mathbf{n} = sequential sample numbers.
- $\underline{\mathbf{c}} = \mathbf{F}, \mathbf{C}, \mathbf{T} / \mathbf{A}, \mathbf{B}, \mathbf{C}, \dots / :$ If samples are located with respect to
 - Tanks, then $\underline{c} = F$, M, T; where
 - $\mathbf{F} = \mathbf{Fill} \ \mathbf{Fort}$
 - M = Middle (of tank)
 - T = Turbine;
 - StockPiles, then $\underline{c} = A, B, C, ...;$
 - where A, B, C, ... = succussive generations of stockpiles.
 - Piping, Dispensers, Excavation, Hoist, Clarifier, or Septic Tank then c = -1
 - $\underline{\mathbf{d}} = \mathbf{D} / \mathbf{n}$: If samples were collected from beneath
 - Tanks, Piping, Dispensers, Excavation, Hoist, or Clarifier then $\underline{\mathbf{d}} = \mathbf{D}$, where
 - D = Depth of sample, in feet;
 - else, if from soil StockPiles, then $\underline{\mathbf{d}} = \mathbf{n}$, where
 - \mathbf{n} = sequential sample numbers.

Examples:

If a soil sample is collected from beneath the fill port of the supreme unleaded tank at a depth of 14 feet, the sample would be labeled TSF14: where, T = tank, S = supreme unleaded, F = fill port (end of tank), 14 = 14 feet bgs.

Soil stockpile piles should typically be labeled with a consecutive letter: the first stockpile would be SPA, the second stockpile would be SPB, etc. If six soil samples are collected from the third soil stockpile, they would be labeled SPC1 - SPC6: where, SP = stockpile, C = third stockpile or stockpile "C", 1 - 6 = consecutive sample numbers.

If two soil samples are collected from beneath the third sampling point beneath a fuel dispenser but at depths of 4 and 7 feet bgs, the samples would be labeled D3-4 and D3-7, respectively: where, D = dispenser, 3 = third sample point, "-" separates the sample number from the depth, 4 & 7 = sample depths in feet bgs.

QUALITY ASSURANCE FOOTER

All methods are taken from one of the following references:

- (1) EPA SW-846, Test Methods for Evaluating Solid Waste, Third Edition, November 1990
- (2) Standard Methods for the Examination of Water and Wastewater, 17th Edition, 1989
- (3) EPA 600/4-79-020, Methods of Chemical Analysis for Waters and Wastes, March 1983
- (4) Federal Register, Friday, October 26, 1984 (40 CFR Part 136)
- (5) American Society for Testing and Materials, Volumes 5.01, 5.02, 5.03, 1992
- (6) EPA 600/4-89-001, Short-term Methods for Estimating the Chronic Toxicity of Effluents and Receiving Waters to Fresh Water Organisms
- (7) EPA 600/4-90-027, Methods for Measuring the Acute Toxicity of Effluent and Receiving Waters to Fresh Water and Marine Organisms, Fourth Edition

All methods of chemical analysis have a statistical uncertainty associated with the results. Unless otherwise indicated, the data in this report is within the limits of uncertainty as specified in the referenced method. Quality control acceptance criteria are based either on actual laboratory performance or on limits specified in the referenced method.

Notes: The date and time of analysis indicated on the QA report may not reflect the actual time of analysis for QC samples.

All data reported on an "as received" basis unless otherwise indicated.

Data reported in the QA report may lower than sample data due to dilution of samples into the calibration range of the analysis.

Sample concentrations for solid samples are calculated on an as received basis.

FLAGS, FOOTNOTES, AND ABBREVIATIONS (as needed)

NC = Not calculable due to values lower than the detection limit.

ND = Not detected

ug/L = Micrograms per liter

mg/L = Milligrams per liter

N.I. = Not Ignitable S.I. = Sustains Ignition

I(NS) = Ignites but does not sustain ignition

RPD = Relative Percent Difference

- (a) = Surrogate recoveries were outside acceptable ranges due to matrix effects.
- (b) = Surrogate recoveries were not calculated due to dilution of the sample below the detectable range for the surrogate.
- (c) = Matrix spike recoveries were outside acceptable ranges due to matrix effects.
- (d) = Relative Percent Difference (RPD) for duplicate analysis outside acceptance limits due to actual differences in the sample matrix.
- (e) = The limit listed for flammability indicates the upper limit for the test. Samples are not tested at temperatures above 140 Fahrenheit since only samples which will sustain ignition at temperatures below 140 are considered flammable.
- (f) = Results for this hydrocarbon range did not match a typical hydrocarbon pattern. Results were quantified using a diesel standard, however, the hydrocarbon pattern did not match a diesel pattern.
- (g) = Results for this hydrocarbon range did not match a typical hydrocarbon pattern. Results were quantified using a gasoline standard, however, the hydrocarbon pattern did not match a gasoline pattern.
- (h) = High dilution due to matrix effects

HSC 05 (4/87)

INSTRUCTIONS

EMERGENCY

Indicate whether emergency response personnel and equipment were involved at any time. If so, a Hazardous Material Incident Report should be filed with the State Office of Emergency Services (OES) at 2800 Meadowview Road, Sacramento, CA 95832. Copies of the OES report form may be obtained at your local underground storage tank permitting agency. Indicate whether the OES report has been filed as of the date of this report.

LOCAL AGENCY ONLY

To avoid duplicate notification pursuant to Health and Safety Code Section 25180.7, a designated government employee should sign and date the form in this block. A signature here does not mean that the leak has been determined to pose a significant threat to human health or safety, only that notification procedures have been followed if required.

DEPORTED R

Enter your name, telephone number, and address. Indicate which party you represent and provide company or agency name.

RESPONSIBLE PARTY

Enter name, telephone number, contact person, and address of the party responsible for the leak. The responsible party would normally be the tank owner.

SITE LOCATION

Enter information regarding the tank facility and surrounding area. At a minimum, you must provide the facility name and full address.

IMPLEMENTING AGENCIES

Enter names of the local agency and Regional Water Quality Control Board involved.

SUBSTANCES INVOLVED

Enter the name and quantity lost of the hazardous substance involved. Room is provided for information on two substances if appropriate. If more than two substances leaked, list the two of most concern for cleanup.

DISCOVERY/ABATEMENT

Provide information regarding the discovery and abatement of the leak.

SOURCE/CAUSE

Indicate source(s) of leak. Provide details on tank age; capacity and material if known. Check box(es) indicating cause of leak.

CASE TYPE

Indicate the case type category for this leak. Check one box only. Case type is based on the most sensitive resource affected. For example, if both soil and ground water have been affected, case type will be "Ground Water". Indicate "Drinking Water" only if one or more municipal or domestic water wells have actually been affected. A "Ground Water" designation does not imply that the affected water cannot be, or is not, used for drinking water, but only that water wells have not yet been affected. It is understood that case type may change upon further investigation.

CURRENT STATUS

Indicate the category which best describes the current status of the case. Check one box only. The response should be relative to the case type. For example, if case type is "Ground Water", then "Current Status" should refer to the status of the ground water investigation or cleanup, as opposed to that of soil

IMPORTANT: THE INFORMATION PROVIDED ON THIS FORM IS INTENDED FOR GENERAL STATISTICAL PURPOSES ONLY AND IS NOT TO BE CONSTRUED AS REPRESENTING THE OFFICIAL POSITION OF ANY GOVERNMENTAL AGENCY

REMEDIAL ACTION

Indicate which actions have been used to cleanup or remediate the leak. Descriptions of options follow:

Cap Site - install horizontal impermeable layer to reduce rainfall infiltration.

Containment Barrier - install vertical dike to block horizontal movement of contaminant.

Excavate and Dispose - remove contaminated soil and dispose in approved site.

Excavate and Treat - remove contaminated soil and treat (includes spreading or land farming).

Remove Free Product - remove floating product from water table.

Pump and Treat Groundwater - generally employed to remove dissolved contaminants.

Enhanced Biodegradation - use of any available technology to promote bacterial decomposition of contaminants.

Replace Supply - provide alternative water supply to affected parties.

Treatment at Hookup - install water treatment devices at each dwelling or other place of use.

No Action Required - incident is minor, requiring no remedial action.

 $\frac{\text{COMMENTS}}{\text{SIGNATURE}}$ - Use this space to elaborate on any aspects of the incident. $\frac{\text{SIGNATURE}}{\text{DISTRIBUTION}}$

If the form is completed by the tank owner or his agent, retain the last copy and forward the remaining copies in tact to your local tank permitting agency for distribution.

1. Original - Local Tank Permitting Agency

 State Water Resources Control Board, Division of Water Quality, Underground Tank Program, P. O. Box 100, Sacramento, CA 95801

3. Regional Water Quality Control Board

 County Board of Supervisors or designee to receive Proposition 65 notifications.

Owner/responsible party.

Attention:

Ms. Carrie Georgi

Subject:

Laboratory Reports, Chevron Service Station # 9-8616, 9877 Grapevine Road

Dear Ms. Georgi:

This letter has been prepared in response to a conversation, held on June 8, 1993, between yourself and Carl J. Lind of Bechtel Environmental, Inc., (BEI) pertaining to Chevron U.S.A., Inc., (Chevron) service station #9-8616, located at the intersection of Interstate 5 and Highway 99 near Lebec. During the preliminary site assessment conducted as part of the under-ground storage tank (UST) abandonment on April 1, 1993, several soil samples were collected and submitted to a mobile laboratory for analysis. As you requested in the June 8 conversation the analytical laboratory reports for those samples are enclosed with this letter. Also enclosed are copies of the site sketch with sample locations and designations, and the format for sample label designations.

Please feel free to contact Mr. Lind at (310) 807-2405 if you have any questions regarding these procedures.

Sincerely,

BECHTEL ENVIRONMENTAL, INC.

50 m 40016

FORMAT: <u>a b c d</u>

- <u>a</u> = T, P, D, SP: general sample locations where
 - o T = Tank
 - o P = Piping
 - D ≈ Dispenser
 - o E = Excavation
 - \circ **H** = **H**oist
 - C = Clarifier
 - SP = StockPile
 - ST = Septic Tank
- $\underline{\mathbf{h}} = \mathbf{S}, \mathbf{P}, \mathbf{R}, \mathbf{L} / \mathbf{n}$: If samples are located with respect to
 - Tanks, then $\underline{\mathbf{b}} = \mathbf{S}$, \mathbf{P} , \mathbf{R} , \mathbf{L} ; where
 - S = Supreme unleaded
 - P = Plus unleaded
 - R = Regular unleaded
 - L = Leaded, regular
 - Piping, Dispensers, Excavation, Hoist, or Clarifier, then b = n; where
 - n = sequential sample numbers.
- g = F, C, T/A, B, C, .../-: If samples are located with respect to
 - Tanks, then $\underline{c} = F$, M, T; where
 - $\mathbf{F} = \mathbf{Fill}$ port
 - M = Middle (of tank)
 - T = Turbine:
 - StockPiles, then $\underline{c} = A, B, C, ...;$
 - where A, B, C, ... = succussive generations of stockpiles.
 - Piping, Dispensers, Excavation, Hoist, Clarifier, or Septic Tank then $\underline{c} = -$.
- $\underline{\mathbf{d}} = \mathbf{D} / \mathbf{n}$: If samples were collected from beneath
 - Tanks, Piping, Dispensers, Excavation, Hoist, or Clarifier then $\underline{\mathbf{d}} = \mathbf{D}$, where
 - **D=** Depth of sample, in feet;
 - \circ else, if from soil StockPiles, then d = n, where
 - n = sequential sample numbers.

Examples:

If a soil sample is collected from beneath the fill port of the supreme unleaded tank at a depth of 14 feet, the sample would be labeled TSF14: where, T = tank, S = supreme unleaded, F = fill port (end of tank), 14 = 14 feet bgs.

Soil stockpile piles should typically be labeled with a consecutive letter: the first stockpile would be SPA, the second stockpile would be SPB, etc. If six soil samples are collected from the third soil stockpile, they would be labeled SPC1 - SPC6: where, SP = stockpile, C = third stockpile or stockpile "C", 1 - 6 = consecutive sample numbers.

If two soil samples are collected from beneath the third sampling point beneath a fuel dispenser but at depths of 4 and 7 feet bgs, the samples would be labeled D3-4 and D3-7, respectively: where, D = dispenser, 3 = third sample point, "-" separates the sample number from the depth, 4 & 7 = sample depths in feet bgs.

TANK REMOVAL: SAMPLE DESIGNATION

FORMAT: a high

- o g = T, P, D, SP; general sample locations where
 - o T = Tank
 - o P = Piping
 - o D = Dispenser
 - O E = Excavation
 - o H = Hoist
 - C = Clarifler ...
 - o SF = StockPile
 - ST = Septic Tank
- $\underline{\mathbf{p}} = \mathbf{S}, P, R, L / n$: If samples are located with respect to
 - Tanks, then b ≠S, P, R, L where
 - S ≈ Supreme unleaded
 - P = Plus unleaded
 - R = Regular unleaded
 - L = Lended, regular
- Plping, Dispensers, Excavetion, Hoist, or Clarifler, then b = n; where n = sequential sample numbers.
 - $c = F, C, T / A, B, C, ... / \cdot :$ If samples are located with respect to
 - Tanks, then $g = F_1 M$, T; where
 - F = Fill port
 - M = Middle (of tank)
 - T = Turbine:
 - StockPiles, then g= A, B, C, ...;
 - · where A, B, C, ... = succussive generations of stockpiles.
- Piping, Dispensers, Excavation, Holst, Clarifier, or Septic Tank then c = -.
 - o $\underline{\mathbf{d}} = \mathbf{D} / \mathbf{n}$: If camples were collected from beneath
- Tanks, Piping, Dispensers, Excavation, Hoist, or Clariffer then d = D, where
 - D= Depth of sample, in feet;
 - else, if from soil StockPiles, then d = n, where
 - n = sequential sample numbers.

Examples:

If a soil sample is collected from beneath the fill port of the supreme unleaded tank at a depth of 14 feet, the sample would be labeled TSF14: where, $T = \tanh$, S = supreme unleaded, F = fill port (end of tank), 14 = 14 feet bgs.

Soil stockpile piles should typically be labeled with a consecutive letter: the first stockpile would be SPA, the second stockpile would be SPB, etc. If six soil samples are collected from the third soil stockpile, they would be labeled SPC1 - SPC6: where, SP = stockpile, C = third stockpile or stockpile "C", 1 - 6 = consecutive sample numbers.

If two soil samples are collected from beneath the third sampling point beneath a fuel dispenser but at depths of 4 and 7 feet bgs, the samples would be labeled D3-4 and D3-7, respectively: where, D = dispenser, B = third sample point, *-* separates the sample number from the depth, A & 7 = sample depths in fact bgs.

- (7) EPA 600/4.90.027, Methods for Measuring the Acute Toxicity of Effluent and Receiving Waters to Fresh Water and Marine Organisms. Fourth Edition

All methods of chemical analysis have a statistical uncertainty associated with the results. Unless otherwise indicated, the data in this report is within the limits of uncertainty as specified in the referenced method. Quality control acceptance criteria are based either on actual laboratory performance or on limits specified in the referenced method.

The date and time of analysis indicated on the QA report may not reflect the actual time of analysis for QC samples. All data reported on an "as received" basis unless otherwise indicated. Data reported in the CA report may lower than sample data due to dilution of samples into the calibration range of the analysis. Sample concentrations for solid samples are calculated on an as received basis.

FLAGS, FOOTNOTES, AND ABBREVIATIONS (as needed)

- = Not calculable due to values lower than the detection limit.
- ND = Not detected
- ug/L ≖ Micrograms per liter
- mg/L = Milligrams per liter
- = Not ignitable N.I.
- = Sustains (gnition
- I(NS) = Ignites but does not sustain ignition
- = Relative Percent Difference RPD
- (a) = Surrogate recoveries were outside acceptable ranges due to matrix offects.
- = Surrogate recoveries were not calculated due to dilution of the sample below the detectable range for the surrogate. (b)
- Matrix spike recoveries were outside acceptable ranges due to matrix effects. (0)
- = Relative Percent Difference (RPD) for duplicate analysis outside acceptance limits due to actual differences in (d) the sample matrix.
- = The limit listed for flammability indicates the upper limit for the test. Samples are not tested at temperatures (e) above 140 fahrenheit since only samples which will sustain ignition at temperatures below 140 are considered
- = Results for this hydrocarbon range did not match a typical hydrocarbon pattern. Results were quantified using a (f) diesel standard, however, the hydrocarbon pattern did not match a diesel pattern.
- = Results for this hydrocarbon range did not match a typical hydrocarbon pattern. Results were quantified using & (g) gasoline standard, however, the hydrocarbon pattern did not match a gasoline pattern.
- = High dilution due to matrix effects

TANK REMOVAL: SAMPLE DESIGNATION

FORMAT: abcd

- $\underline{\mathbf{a}} = \mathbf{T}, \mathbf{P}, \mathbf{D}, \mathbf{SP}$: general sample locations where
 - T = Tank
 - P = Piping
 - $\mathbf{D} = \mathbf{D}$ ispenser
 - $\mathbf{E} = \mathbf{E} \mathbf{x} \mathbf{c} \mathbf{a} \mathbf{v} \mathbf{a} \mathbf{t} \mathbf{i} \mathbf{o} \mathbf{n}$
 - SP = StockPile
- $b = S, P, R, L / \underline{n}$: If samples are located with respect to
 - o Tanks, then $\underline{\mathbf{b}} = \mathbf{S}$, \mathbf{P} , \mathbf{R} , \mathbf{L} ; where
 - $S = \overline{S}$ upreme unleaded
 - P = Plus unleaded
 - $\mathbf{R} = \mathbf{R}$ egular unleaded
 - $\mathbf{D} = \mathbf{D}$ iesel fuel
 - $\qquad \mathbf{L} = \mathbf{L}$ eaded, regular
 - $\mathbf{U} = \mathbf{U}$ sed oil
 - o Piping, Dispensers, or an Excavation, then $\underline{\mathbf{b}} = \underline{\mathbf{n}}$; where
 - $\underline{\mathbf{n}}$ = sequential sample numbers.
- $\underline{\mathbf{c}} = \mathbf{F}, \mathbf{M}, \mathbf{T} / \mathbf{A}, \mathbf{B}, \mathbf{C}, \dots / :$ If samples are located with respect to
 - o Tanks, then $\underline{\mathbf{c}} = \mathbf{F}, \mathbf{M}, \mathbf{T}$; where
 - $\mathbf{F} = \mathbf{Fill} \ \mathbf{port}$
 - M = Middle (of tank)
 - T = Turbine;
 - o StockPiles, then c = A, B, C, ...; where
 - $A, B, C, \dots =$ successive generations of stockpiles.
 - o Piping, Dispensers, or an Excavation, then c = -.
- $\mathbf{d} = \mathbf{D} / \mathbf{n}$: If samples were collected from beneath
 - Tanks, Piping, Dispensers, or in an Excavation, then $\underline{\mathbf{d}} = \mathbf{D}$, where
 - D = Depth of sample, in feet;
 - o else, if from soil StockPiles, then $\underline{\mathbf{d}} = \underline{\mathbf{n}}$, where
 - \mathbf{n} = sequential sample numbers.

Examples:

If the sample is obtained from beneath the fill port of the supreme unleaded tank at a depth of 14 feet, then the sample would be labeled TSF14, ie.: T = tank, S = supreme unleaded, F = fill port (end of tank), 14 = 14 feet bgs.

If the sample is obtained from a soil stockpile the stockpile would typically be labeled with a consecutive letter. The third stockpile should be typically be labeled "C". If 6 samples are obtained from the stockpile the 6 samples would be labeled SPC1 - SPC6, ie.: SP = stockpile, C = stockpile "C", 1 - 6 consecutive sample numbers.

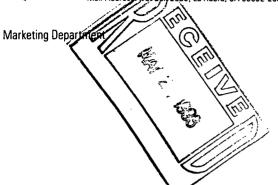

If two samples are obtained from beneath a fuel dispenser in the third sampling location but at depths of 4 and 7 feet bgs then the samples would labeled D3-4 and D3-7, respectively, ie.: D = dispenser, 3 = third sample location, - = separates the sample number from the depth of the sample, 4 & 7 = sample depths in feet, bgs.

Underground Storage Tank Financial Responsibility

Kern County Environmental Health Department 2700 "M" Street, Suite 300 Bakersfield, CA 93301

To Whom It May Concern:

The attached letter is being provided in order to comply with the requirement to demonstrate financial responsibility for underground storage tanks owned by Chevron U.S.A.

Financial responsibility applies to the attached list of service stations located in Kern County. If you have any questions, please contact Desiree Closs at (310) 694-7452.

Very truly yours,

Safety, Fire, Health and Environment Supervisor

DDC Enclosure

Chevron Corporation

225 Bush Street, San Francisco, California 94104-4289

M. R. Klitten Vice President, Finance April 30, 1993

UST FINANCIAL RESPONSIBILITY

To Whom It May Concern:

I am the chief financial officer of Chevron Corporation, 225 Bush Street, San Francisco, CA. This letter is in support of the use of the financial test of self-insurance and guarantee to demonstrate financial responsibility for taking corrective action and compensating third parties for bodily injury and property damage caused by sudden accidental releases and/or nonsudden accidental releases in the amount of at least \$1,000,000.00 per occurrence and \$2,000,000.00 annual aggregate arising from operating underground storage tanks.

Underground storage tanks at the following facilities are assured by this financial test or a financial test under an authorized State program by this guarantor: all underground storage tanks owned by Chevron U.S.A. Inc. in the United States are assured by this financial test.

A financial test and guarantee are also used by this guarantor to demonstrate evidence of financial responsibility in the following amounts under other EPA regulations or state programs authorized by EPA under 40 CFR parts 271 and 145:

| EPA REGULATIONS | | AMOUNT |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|------------------------------------------------------------------------|

<u>No</u>

19. Have financial statements for the latest fiscal year been filed with the SEC, the Energy Information Administration, or the Rural Electrification Administration?

X,

I hereby certify that the wording of this letter is identical to the wording specified in 40 CFR part 280.95(d) as such regulations were constituted on the date shown immediately below.

Date:

April 30, 1993

M. R. KLITTEN

VICE PRESIDENT, FINANCE

GUARANTEE

Guarantee made this April 30, 1993, by CHEVRON CORPORATION, a business entity organized under the laws of the State of Delaware, herein referred to as guarantor, to EPA Regional Administrators and/or state agencies implementing underground storage tank regulation for the states listed in Paragraph 2 (hereinafter collectively referred to as the "implementing agencies"), and to any and all third parties, and obligees, on behalf of CHEVRON U.S.A. INC. ("CUSA"), 575 Market Street, San Francisco, CA.

Recitals.

- (1) Guarantor meets or exceeds the financial test criteria of 40 CFR 280.95(b) or (c) and (d) and agrees to comply with the requirements for guarantors as specified in 40 CFR 280.96(b).
- (2) CUSA owns or operates the following underground storage tanks covered by this guarantee: underground storage tanks at various facilities in the States of:

Alabama
Alaska
Arizona
California
Washington, D. C.
Florida
Georgia
Hawaii
Idaho
Indiana
Kentucky
Louisiana
Maryland

Mississippi
Nevada
New Jersey
New Mexico
Ohio
Oregon
Pennsylvania
South Carolina
Tennessee
Texas
Utah
Virginia
Washington
West Virginia

This guarantee satisfies 40 CFR part 280, subpart H requirements for assuring funding for taking corrective action and compensating third parties for bodily injury and property damage caused by either sudden accidental releases or nonsudden accidental releases arising from operating the above-identified underground storage tanks in the amount of \$1,000,000.00 per occurrence and \$2,000,000.00 annual aggregate.

(3) On behalf of our subsidiary, CUSA, guarantor guarantees to implementing agencies and to any and all third parties that:

In the event that CUSA fails to provide alternative coverage within 60 days after receipt of a notice of cancellation of

this guarantee and the Director of the implementing agency has determined or suspects that a release has occurred at an underground storage tank covered by this guarantee, the guarantor, upon instructions from the Director, shall fund a standby trust fund in accordance with the provisions of 40 CFR 280.108, in an amount not to exceed the coverage limits specified above.

In the event that the Director determines that CUSA has failed to perform corrective action for releases arising out of the operation of the above-identified tanks in accordance with 40 CFR 280, subpart F, the guarantor upon written instructions from the Director shall fund a standby trust in accordance with the provisions of 40 CFR 280.108, in an amount not to exceed the coverage limits specified above.

If CUSA fails to satisfy a judgement or award based on a determination of liability for bodily injury or property damage to third parties caused by sudden and/or nonsudden accidental releases arising from the operation of the above-identified tanks, or fails to pay an amount agreed to in settlement of a claim arising from or alleged to raise from such injury or damage, the guarantor, upon written instructions from the Director, shall fund a standby trust in accordance with the provisions of 40 CFR 280.108 to satisfy such judgement(s), award(s), or settlement agreement(s) up to the limits of coverage specified above.

- (4) Guarantor agrees that if, at the end of any fiscal year before cancellation of this guarantee, the guarantor fails to meet the financial test criteria of 40 CFR 280.95(b) or (c) and (d), guarantor shall send within 120 days of such failure, by certified mail, notice to CUSA. The guarantee will terminate 120 days from the date of receipt of the notice by CUSA, as evidenced by the return receipt.
- (5) Guarantor agrees to notify CUSA by certified mail of a voluntary or involuntary proceeding under Title 11 (Bankruptcy), U.S. Code naming guarantor as debtor, within 10 days after commencement of the proceeding.
- (6) Guarantor agrees to remain bound under this guarantee notwithstanding any modification or alteration of any obligation of CUSA pursuant to 40 CFR part 280.
- (7) Guarantor agrees to remain bound under this guarantee for so long as CUSA must comply with the applicable financial responsibility requirements of 40 CFR part 280, subpart H for the above-identified tanks, except that guarantor may cancel this guarantee by sending notice by certified mail to CUSA, such cancellation to become effective no earlier than 120 days after receipt of such notice by CUSA, as evidenced by the return receipt.
- (8) The guarantor's obligation does not apply to any of the following:

- Any obligation of CUSA under workers' compensation, disability benefits, or unemployment compensation law or other similar law;
- Bodily injury to an employee of CUSA arising from, and (b) in the course of, employment by CUSA;
- Bodily injury or property damage arising from the ownership, maintenance, use, or entrustment to others of any aircraft, motor vehicle, or watercraft;
- Property damage to any property owned, rented, loaned (d) to, in the care, custody, or control of, or occupied by CUSA that is not the direct result of a release from a petroleum underground storage tank; and
- Bodily damage or property damage for which CUSA is obligated to pay damages by reason of the assumption of liability in a contract or agreement other than a contract or agreement entered into to meet the requirements of 40 CFR 280.93.
- Guarantor expressly waives notice of acceptance of this quarantee by the implementing agency, by any or all third parties, or by CUSA.

I hereby certify that the wording of this guarantee is identical to the wording specified in 40 CFR 280.96(c) as such regulations were constituted on the effective date shown immediately below.

Effective date: April 30, 1993

CERTIFICATE OF FINANCIAL RESPONSIBILITY

CHEVRON U.S.A. INC. hereby certifies that it is in compliance with the requirements of subpart H of 40 CFR part 280.

The financial assurance mechanism used to demonstrate financial responsibility under subpart H of 40 CFR part 280 is as follows:

Corporate guarantee of Chevron Corporation in the amount of \$1 million per occurrence, \$2 million annual aggregate, for the period commencing April 30, 1993, and which is anticipated to be renewed annually, with the next renewal scheduled to occur during the first 120 days of 1994. Said guarantee covers taking corrective action and compensating third parties for bodily injury and property damage caused by sudden accidental releases and nonsudden accidental releases.

> Kern County Health Department Environmental Health Services 2700 "M" Street, Suite 300 Bakersfield, California 93301

Attention:

Ms. Carrie Georgi

Subject:

Soil and Ground-Water Sampling Procedures

Dear Ms. Georgi:

This letter has been prepared in response to a conversation, held on March 8, 1993, between yourself and Carl J. Lind of Bechtel Environmental, Inc., (BEI) pertaining to Chevron U.S.A., Inc., (Chevron) service station #9-8616, located at the intersection of Interstate 5 and Highway 99 near Lebec. BEI has been retained by Chevron to perform a preliminary site assessment during the underground storage tank (UST) abandonment scheduled for April, 1993. As requested in the March 8 conversation, soil sampling procedures are attached. Also included are ground-water sampling procedures.

Please feel free to contact Mr. Lind at (310) 694-9302 if you have any questions regarding these procedures.

Respectfully submitted,

BECHTEL ENVIRONMENTAL, INC.

Edward A Morelan, RG 4832

BEI Sampling Procedures March 12, 1993

Soil Sampling Procedures

Soil samples may obtained by one of two procedures: by grab sample from a stockpile or excavation or as a relatively undisturbed sample from a drilled exploratory boring. Samples obtained from an excavation are typically retrieved with a backhoe from the bottom or sidewalls of the excavation. The soil samples are then collected from the bucket of the backhoe as a grab sample. Soil samples which are to be obtained in a relatively undisturbed condition are typically retrieved from soil borings established by hand auger or drill rig.

Soil samples obtained as grab samples are typically collected with a hand trowel or hand auger. Those samples collected with a hand trowel are packed into 4-ounce or 8-ounce glass jars such that few or no voids are visible. The jars are then sealed with a plastic lid. The samples collected with the hand auger are obtained from soil stockpiles after the auger has been driven approximately 6 inches into the soil. The first or second brass liner tube is removed from the sampler, the ends are covered with Teflon™ sheeting and sealed with plastic caps. Each sample is then labeled, sealed in a plastic bag, chilled and stored within an insulated cooler, and transported along with appropriate chain-of-custody documentation to the laboratory for analysis.

Exploratory soil borings are advanced with a truck-mounted hollow-stem-auger drill rig equipped with 5" to 8" O.D. augers. Soil samples are collected at 5-foot intervals in each boring starting at 5 feet below ground surface (bgs) to total depth. A BEI geologist and/or geotechnical engineer is on-site to visually log each soil boring based on drilling returns and soil samples collected. Samples are classified according to the Unified Soil Classification (USC) and ASTM (D2487 or 2488) Systems.

Modified-California 2-inch-I.D. split-spoon samplers are used to obtain relatively undisturbed soil samples from the drilled borings. The sampler is driven 12 to 24 inches into the undisturbed soil or until refusal (equivalent to 6 inches penetration or less per 50 blows) in accordance with a standard penetration test (ASTM Method D 1586). Sample catchers are used when loose sands are encountered in an effort to retain the sample within the split spoon. The effort taken to drive the sample the last 12 inches is recorded at 6-inch intervals, and the sampler is removed from the boring. Brass liner tubes in the split-spoon sampler are used to collect the soil samples. Typically, the first tube behind the cutting shoe is used for chemical analysis. The tube selected for chemical analysis typically contains little or no observable void space. This tube is removed from the sampler with as little disturbance as possible. The ends of the tube are covered immediately with TeflonTM film followed by plastic end caps. The outside of the tube is wiped free of soil and moisture, and a label is placed on it. The capped sample tube is sealed within a ZiplocTM bag, and placed on ice within an insulated container.

BEI Sampling Procedures March 12, 1993

Each sample is field tested utilizing a Photovac Microtip photoionization detector (PID). The contents of a second brass liner tube are placed in a ZiplocTM bag and allowed to volatilize for approximately 15 to 30 minutes. The TeflonTM tip of the PID is inserted through a small opening in the bag, and the highest reading of organic vapors within the headspace of each sample bag is recorded on the respective boring log.

At the conclusion of drilling, each soil borehole not converted to a ground-water monitoring well is backfilled with a cement/bentonite grout. Backfilled boreholes are barricaded a sufficient length of time to allow for backfill materials to set. The soil cuttings from soil borings and well-installation activities are containerized in 10-cubic-yard soil bins or 55-gallon drums. The soil containers are temporarily stored on-site in a secure location designated by the Chevron representative.

Ground-Water Monitoring Well Installation Procedures

The ground-water monitoring wells are constructed in accordance with Title 23, California of Regulations (CCR), Chapter 16, Article 4, Sections 2647 (Ground-Water Monitoring) and 2648 (General Construction and Sampling Methods). In addition, the driller possesses a C-57 license as required by California State law.

The well construction materials will typically consist of flush-threaded, 4-inch-diameter, schedule 40 PVC pipe. Screen slot width, length of the screened interval, and filter pack material will be determined based on site-specific conditions. Typically, the screened interval will extend 20 feet below to 10 feet above the static ground-water surface. A solid PVC casing typically extends from the top of the screened interval to the surface. Filter pack material is placed in the annular space around the screen to approximately two feet above the top of the screen. A seal of bentonite pellets with a thickness of approximately three feet is placed above the filter pack in an effort to effectively seal the collection zone of the well and to prevent the intrusion of the overlying concrete seal material into the filter pack sand around the screened portion of the well. A volclay grout or Portland cement/bentonite slurry is placed above the bentonite seal. A concrete sanitary seal of approximately 3 feet is placed from above the slurry to the ground surface. A traffic-rated vault box is installed after the well is set to help guard the exposed casing from damage and to provide security from unauthorized entry. A stand pipe may be used in lieu of a vault box if the site is inactive and secured with a chain-link fence.

Monitoring Well Development

Prior to the addition of bentonite pellets, the well is developed using surging and plunging to allow the filter pack sand to settle in the well. Additional filter pack is added to maintain the minimum of two feet thickness above the top of the screen as required. After the wells

BEI Sampling Procedures March 12, 1993

are completed, they are further developed by removing approximately 4 to 5 well volumes of water using a 5-gallon stainless steel bailer lowered into the wellbore by a truck. The amount of settleable solids are monitored with an Imhoff cone during the course of development and recorded. The purged water generated during the course of well development is containerized in 55-gallon DOT drums.

Wells are surveyed by a licensed surveyor with respect to mean sea level (msl). After the wells are completed, the elevations (with respect to msl) are measured for all of the ground-water monitoring wells, at a point marked and notched on each of the wells' PVC casing. This point is used as the reference for depth-to-ground-water measurements.

Ground-Water Sampling Procedures

The depth to ground water is measured with a well sounder in each well. Ground-water monitoring wells are also checked for the presence of liquid hydrocarbons prior to purging. If no liquid hydrocarbons are encountered, these wells are purged approximately 3 to 5 volumes of standing water, prior to sampling. Ground-water samples will not be collected from those wells containing liquid hydrocarbons.

Typically, a vacuum truck equipped with a one-inch-diameter PVC pipe stinger is utilized for purging. Water temperature, pH, conductivity, and turbidity are monitored and recorded during purging. Water accumulated during purging is containerized in 55-gallon DOT drums.

Ground-water samples are collected with a single-use, environmentally "clean" bailer attached and lowered into the well with nylon line. Both the bailer and nylon line are discarded after each use. All sampling equipment that comes into contact with the well is cleaned in accordance with decontamination procedures described below.

All sample containers are labeled to include: the Chevron project name and number; the well number; date of sampling; sampler's initials; preservative added (if any); any other pertinent information, as necessary. The sample containers are sealed, placed in packing materials, and placed on ice within an insulated container to await shipment to the chemical laboratory. Appropriate chain-of-custody documentation is prepared to accompany the samples.

BEI Sampling Procedures March 12, 1993

Decontamination and Disposal Procedures

Equipment that potentially contacts contaminated soil, drilling fluid, or water is decontaminated after each use. Decontamination consists of steam-cleaning or using a non-phosphatic detergent scrub solution (Liquinox) followed by a two-stage deionized/distilled water rinse prior to each use. After the equipment is decontaminated, it is stored away from the sampling areas.

Water generated from drilling activities is containerized in 55-gallon drums, vacuum trucks, or Baker tanks and temporarily stored onsite.

A drum/soil-bin inventory sheet is prepared for soil and water generated on the site as a result of field activities. The drum inventory sheet and laboratory results are then submitted to the Chevron representative.

Arrangements for the disposal of rinseate, purge water and soil cuttings are made by the Chevron representative. Subsequent disposal is performed under the direction of Chevron personnel by a Chevron-appointed subcontractor.

THIS APPLICATION BECOMES A PERMIT WHEN APPROVED

POST ON PREMISES

CONDITIONS AS FOLLOWS:

- 1. It is the responsibility of the Permittee to obtain permits which may be required by other regulatory agencies prior to beginning work (i.e., City Fire and Building Departments).
- 2. Permittee must <u>notify</u> the Hazardous Materials Management Program at (805) 861-3636 twenty-four hours <u>prior</u> to tank integrity test to allow the Hazardous Material Specialist-the option of performing an inspection.
- 3. Tank integrity test must be per Kern County Environmental Health and Fire Department approved methods as described in Handbook UT-20.
- 4. It is the state-licensed tester's responsibility to know and adhere to all applicable laws regarding the handling of hazardous materials.
- 5. The tank integrity testing company must have the state-licensed tester listed on the permit on site performing the test.
- 6. If any tester other than the one listed on the permit and permit application is to be utilized, prior consent must be granted by the approving specialist on the permit. Deviation from the submitted application is not allowed.
- 7. A modification permit must be obtained from the department prior to exposing the tank to retest or investigating a release or failed integrity test.
- 8. The following timetable lists pre- and post-tank integrity test requirements:

ACTIVITY

Complete permit application submitted to the Hazardous Material Management Program

Notify the approving specialist of date and time of the tank integrity test

Send written results of a test to the approving specialist

Notify the approving specialist of the results of a failed/inconclusive test

DEADLINE

At least one week prior to tank

integrity test

At least 24 hours before test

No later than 30 days after testing

is completed

No later than 24 hours after completion of analysis

RECOMMENDATIONS/GUIDELINES FOR THE PERFORMANCE OF A TANK INTEGRITY TEST ON UNDERGROUND STORAGE TANKS

This department is responsible for enforcing the state laws pertaining to underground storage tanks. Representatives from this department perform inspections to ensure that the job performance is consistent with permit requirements, applicable laws, and safety standards. The following guidelines are offered to clarify the interests and expectations of this department.

- 1. Job site safety is one of our primary concerns. Tank integrity tests are inherently dangerous. It is the tester's responsibility to know and abide by CAL-OSHA regulations. The state-licensed tester is responsible for any other testing company employees on the job site. Tools and equipment are to be used only for their designed function.
- 2. Properly state-licensed testers are assumed to understand the requirements of the permit issued. The tester is responsible for knowing and abiding by the conditions of the permit. Deviation from the permit conditions may result in a stop-work order.
- 3. The testing company will be held responsible for the post-test paperwork. Analyses documentation is necessary for each site in order to close a case file or move it into mitigation. When testers do not follow through on necessary paperwork, an unmanageable backlog of incomplete cases results. If this continues, processing time for completing new tank integrity tests will increase.

THE APPLICANT HAS RECEIVED, UNDERSTANDS, AND WILL COMPLY WITH THE ABOVE CONDITIONS OF THIS PERMIT AND ANY OTHER STATE, LOCAL AND FEDERAL REGULATIONS.

THIS FORM HAS BEEN COMPLETED UNDER PENALTY OF PERJURY AND TO THE BEST OF MY KNOWLEDGE IS TRUE AND CORRECT.

HAZARDOUS UNDERGROUND STORAGE FACILITY PERMIT SUMMARY OF CONDITIONS/PROHIBITIONS

CONDITIONS/PROHIBITIONS:

- 1. The facility owner and operator must be familiar with all conditions specified within this permit and must meet any additional requirements to monitor, upgrade, or close the tanks and associated piping imposed by the permitting authority.
- 2. If the operator of the underground storage tank is not the owner, then the owner shall enter into a written contract with the operator, requiring the operator to monitor the underground storage tank; maintain appropriate records; and implement reporting procedures as required by the Department.
- 3. The facility owner and operator shall ensure that the facility has adequate financial responsibility insurance coverage, as mandated for all underground storage tanks containing petroleum, and supply proof of such coverage when requested by the permitting authority.
- 4. The facility owner must ensure that the annual permit fee is paid within 30 days of the invoice date.
- 5. The facility will be considered in violation and operating without a permit if annual permit fees are not received within 60 days of the invoice date.
- 6. The facility owner and/or operator shall review the leak detection requirements provided within this permit. The monitoring alternative shall be implemented within 60 days of the permit issue date.
- 7. The facility underground storage tanks must be monitored, utilizing the option approved by the permitting authority, until the tank is closed under a valid, unexpired permit for closure.
- 8. Any inactive underground storage tank which is not being monitored, as approved by the permitting authority, is considered improperly closed. Proper closure is required and must be completed under a permit issued by the permitting authority.
- 9. The facility owner/operator must obtain a modification permit before:
 - Uncovering any underground storage tank after failure of a tank integrity test.
 - b. Replacement of piping.
 - c. Lining the interior of the underground storage tank.
- 10. The tank owner must advise the Environmental Health Services Department within 10 days of transfer of ownership.
- 11. Any change in state law or local ordinance may necessitate a change in permit conditions. The owner/operator will be required to meet new conditions within 60 days of notification.
- 12. The owner and/or operator shall keep a copy of all monitoring records at the facility for a minimum of three years, or as specified by the permitting authority. They may be kept off site if they can be obtained within 24 hours of a request made by the local authority.
- 13. The owner/operator must report any unauthorized release which escapes from the secondary containment, or from the primary containment if no secondary containment exists, which increases the hazard of fire or explosion or causes any deterioration of the secondary containment within 24 hours of discovery.

AEG:jrw (green\permit.p2)

MONITORING REQUIREMENTS: (MVF1S and WO6pr,gr)

- 1. All underground storage tanks designated as MVF 1 within the first page of this permit shall be monitored utilizing the following method:
 - a. Standard Inventory Control Monitoring (Tank gauging five to seven days per week). Kern County Environmental Health Services Department forms shall be utilized unless a facility form can provide the same information and has been reviewed and approved by the Environmental Health Services Department. (Monitoring shall be completed in accordance with requirements summarized in Handbook UT10.) This option cannot be used after January 1, 1993. AND
 - b. All tanks shall be tested annually utilizing a tank integrity test which has been certified as being capable of detecting a leak of 0.1 gallon per hour with a probability of detection of 95 percent and a probability of false alarm of 5 percent. The first test shall be completed before December 31, 1991, and subsequent tests completed each calendar year thereafter. All tank integrity tests completed after September 16, 1991, shall be completed under a valid unexpired permit to test issued by the Environmental Health Services Department.
 - c. After January 1, 1993, each tank shall be equipped with an in-tank level sensor, which is to be utilized on a monthly basis to monitor for releases. The equipment must be certified as capable of detecting 0.2 gallons per hour, defined at any normal operating product level in the underground storage tanks with a 95 percent probability of detection and a 5 percent probability of false alarm.
- 2. All underground storage tanks designated as WO6 within the first page of this permit shall be monitored utilizing the following method:
 - a. Each tank shall be equipped with a continuous monitoring device within the interstitial space, which must be connected to an audible and visual alarm system within 60 days of the issue date on page 1 of this permit.
 - b. All piping sumps shall be monitored manually or by utilizing an electronic monitoring device.
 - c. All pressurized piping systems shall install pressurized piping leak detection systems and ensure that they are capable of functioning as specified by the manufacturer. The mechanical leak detection systems must be capable of alerting the owner/operator of a leak by restricting or shutting off the flow of hazardous substances through the piping, or by triggering an audible or visual alarm, detecting three gallons or more per hour per square inch line pressure within one hour.
 - d. All pressurized piping systems shall be tested annually unless the facility has installed the following:
 - 1. A continuous monitoring system within secondary containment.
 - 2. The continuous monitor is connected to an audible and visual alarm system and the pumping system.

- 3. The continuous monitor shuts down the pump and activates the alarm system when a release is detected.
- 4. The pumping system shuts down automatically if the continuous monitor fails or is disconnected.

The first test shall be completed before December 31, 1991, and subsequent tests completed each calendar year thereafter.

- 3. All equipment installed for leak detection shall be operated and maintained in accordance with manufacturer's instructions, including routine maintenance and service checks (at least once per year) for operability or running condition.
- 4. A monitoring response plan shall be developed and submitted to the department for review and approval within 90 days of the issuance date of this permit.
- 5. An annual report shall be submitted to the Kern County Environmental Health Services Department each year after monitoring has been initiated. The owner or operator shall use the form provided along with the permit, or another which has received prior approval by the department.

STAFF REVIEW OF TIGHTNESS TESTING REPORTS

| Specialist reviewing the tightness test report: <u>Carrie Georgi</u> |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| , , , |
| Date tightness test reports were submitted: 8/15/91 |
| Date tightness tests were completed: $\frac{7/29/91}{}$ |
| Facility Permit Number: 600015 |
| Number of Tanks Tested at the site: 3 (list the tanks by their tank |
| numbers if provided) |
| Was the method a test of the entire tank system, piping alone, or just the facility tanks? (describe) The fest was performed on the |
| entire tank system. |
| Did the facility pass all tests: Yes No (if no, provide the leak rate and a description of the tank(s) that failed the test) (failure is |
| > 0.1 gal per hour) |
| |
| |
| The facility will do the following to investigate the failed test: |
| |
| |
| The test method certification that is submitted to the state specifies that each test method be completed in a certain manner. Is there anything within the results which would suggest that the tank test was improperly completed? Yes No |
| (describe) |
| |
| |

Re: Annual Precision Tank and Lines Test Result

Amy Dream:

Date

Enclosed are the required annual precision tank and line test results for the following Chevron owned service stations within your Chevron SEH

The above list may not be a complete list of Chevron owned sites within your city/county. Results for those not listed will be forthcoming.

If you have any questions, please call Marge Farrar, at (415) 842-9624.

Very truly yours,

R. B. Bellinger

Re: Installation of Annular Space Monitors

Chevron Stations:

#98109 - 1131 Oak Street, Bakersfield 180001C

#99615 - 3624 California St., Bakersfield /800/30

#98616 - Hwy. I-5 and Grapevine turn off, Lebec 4000 150

Dear Mr. Harrison:

Chevron U.S.A. Inc. is retrofitting all sites with previously installed double wall tanks and secondarily contained piping trenches (where installed) with continuous interstitial monitors to replace monthly visual monitoring. Chevron proposes to use API/Ronan monitors. The control panel will be mounted in the station building and is equipped with an audible and visual alarm. Enclosed is a brochure for your reference. If you would like to discuss the system in more detail, please contact the API/Ronan Representative, Bill Bunch at (408) 244-6739.

In the event of an alarm, our dealer will notify Chevron Central Maintenance Dispatch in San Ramon, California, for immediate investigation and corrective action.

If this proposal does not meet you requirements, please contact us promptly. Otherwise, we will proceed with installation.

If you have any questions or comments, please contact Cynthia Lambing-Ortega (415) 842-8667 or John Randall at (415) 842-9625.

Very truly yours,

C. G. Trimbach

John Randall, Engineer

INSTRUCTIONS: Please call for an inspector only when each group of inspections with the same number are ready. They will run in consecutive order beginning with number 1. \underline{DO} NOT cover work for any numbered group until all items in that group are signed off by the Permitting Authority. Following these instructions will reduce the number of required inspection visits and therefore prevent assessment of additional fees.

.POST ON PREMISES.

CONDITIONS AS FOLLOWS:

- A11 construction to be as per facility plans approved department and verified by inspection by Permitting Authority.
- All equipment and materials in this construction must be installed in accordance with all manufacturers' specifications.
- Permittee must contact Permitting Authority for on-site inspection(s) with 48 hour advance notice.
- manufacturers' Backfill material for piping and tanks to bе per specifications.
- Construction inspection record card is included with permit given to This card must be posted аt jobsite prior to initial Permittee. inspection. Permittee must contact Permitting Authority and arrange for each group of required inspections numbered as per instructions on card. Generally, inspections will be made of:
 - Tanks and backfill
- All underground metal connections (e.g. piping, fittings, fill pipes) to 6. tank(s) must be electrically isolated, and wrapped to a minimum 20 mil thickness with corrosion-preventive, gasoline-resistant tape or otherwise protected from corrosion.

LEON M HEBERTSON, M.D.
Director of Public Health
Air Pollution Control Officer

October 14, 1987

Jim Sampson Chevron U.S.A. 2 Annabel Lane, Suite 200 San Ramon, CA 94583

RE: A446-60

Mr. Sampson:

The Kern County Health Department has on file that the soil contamination that was located beneath the waste oil tank located at Chevron Station #8616 has been properly removed, transported, and disposed.

This department feels that there is no further contamination present at this site and considers abandonment A446-60 complete.

Sincerely,

Tom Mele

Environmental Health Specialist

Thomas a Mele of

PERMIT FOR CLOSURE OF

4 TANK(S) AT ABOVE

LOCATION

PERMIT EXPIRES June 8, 1993

APPROVAL DATE March 8, 1993

APPROVED BY

Carrie Georgi

Hazardous Materials Specialist

POST ON PREMISES.....

CONDITIONS AS FOLLOWS:

- It is the responsibility of the Permittee to obtain permits which may be required by other regulatory agencies prior to beginning work (i.e., City Fire and Building 1. Departments).
- Permittee must notify the Hazardous Materials Management Program at (805) 861-3636 two working days prior to tank removal or abandonment in place to arrange for required inspections(s).
- Tank closure activities must be per Kern County Environmental Health and Fire Department approved methods as described in Handbook UT-30.
- It is the contractor's responsibility to know and adhere to all applicable laws regarding the handling, transportation or treatment of hazardous materials.
- The tank removal contractor must have a qualified company employee on site supervising the tank removal. The employee must have tank removal experience 5. prior to working unsupervised.
- If any contractors other than those listed on permit and permit application are to be utilized, prior approval must be granted by the specialist listed on the permit. Deviation from the submitted application is not allowed.
- Soil Sampling:

ず.

- Tank size less than or equal to 1,000 gallons a minimum of two samples must be retrieved from beneath the center of the tank at depths of a. approximately two feet and six feet.
- Tank size greater than 1,000 to 10,000 gallons a minimum of four samples must be retrieved one-third of the way in from the ends of each tank b. at depths of approximately two feet and six feet.
- Tank size greater than 10,000 gallons a minimum of six samples must be retrieved one-fourth of the way in from the ends of each tank and beneath c. the center of each tank at depths of approximately two feet and six feet.
- Soil Sampling (piping area):
- A minimum of two samples must be retrieved at depths of approximately two feet and six feet for every 15 linear feet of pipe run and under the dispenser area.

PERMIT FOR PERMANENT CLOSURE OF UNDERGROUND HAZARDOUS SUBSTANCES STORAGE FACILITY

PERMIT NUMBER A 1842-60 ADDENDUM

- Soil Sample analysis:
 - a. All soil samples retrieved from beneath gasoline (leaded/unleaded) tanks and appurtenances must be analyzed for benzene, toluene, xylene, and total petroleum hydrocarbons (for gasoline).
 - b. All soil samples retrieved from beneath diesel tanks and appurtenances must be analyzed for total petroleum hydrocarbons (for diesel) and benzene.
 - c. All soil samples retrieved from beneath waste oil tanks and appurtenances must be analyzed for total organic halides, lead, oil and grease.
 - d. All soil samples retrieved from beneath crude oil tanks and appurtenances must be analyzed for oil and grease.
 - e. All soil samples retrieved from beneath tanks and appurtenances that contain unknown substances must be analyzed for a full range of substances that may have been stored within the tank.
- 10. The following timetable lists pre- and post-tank removal requirements:

<u>ACTIVITY</u> <u>DEADLINE</u>

Complete permit application submitted to Hazardous Materials Management Program

At least two weeks prior to closure

Notification to inspector listed on permit of date and time of closure and soil sampling

Two working days

Transportation and tracking forms sent to Hazardous Materials Management Program. All hazardous waste manifests must be signed by the receiver of the hazardous waste.

No later than 5 working days for transportation and 14 working days for the tracking form after tank removal

Sample analysis to Hazardous Materials Management Program

No later than 3 working days after completion of analysis

- 11. Purging/Inerting Conditions:
 - a. Liquid shall be pumped from tank prior to purging such that less than 8 gallons of liquid remain in tank. (CSH&SC 41700)
 - b. Tank shall be purged through vent pipe discharging at least 10 feet above ground level. (CSH&SC 41700)
 - c. No emission shall result in odors detectable at or beyond property line. (Rule 419)
 - d. No emission shall endanger the health, safety, comfort or repose of any person. (CSH&SC 41700)
 - e. Vent lines shall remain attached to tank until the inspector arrives to authorize removal.

RECOMMENDATIONS/GUIDELINES FOR REMOVAL OF UNDERGROUND STORAGE TANKS

This department is responsible for enforcing the Kern County Ordinance Code, Division 8 and state regulations pertaining to underground storage tanks. Representatives from this department respond to job sites during tank removals to ensure that the tanks are safe to remove/close and that the overall job performance is consistent with permit requirements, applicable laws and safety standards. The following guidelines are offered to clarify the interests and expectations for this department.

- Job site safety is one of our primary concerns. Excavations are inherently dangerous. It is the contractor's responsibility to know and abide by CAL-OSHA regulations. The job foreman is responsible for the crew and any subcontractors on the job. As a general rule, workers are not permitted in improperly sloped excavations or when unsafe conditions exist in the hole. Tools and equipment are to be used only for their designed function. For example, backhoe buckets are never substituted for ladders.
- Properly licensed contractors are assumed to understand the requirements of the permit issued. The job foreman is responsible for knowing and abiding by the conditions of the permit. Deviation from the permit conditions may result in a stop-work order.
- 3. Individual contractors will be held responsible for their post-removal paperwork. Tracking forms, hazardous waste manifests and analyses documentation are necessary for each site in order to close a case file or move it into mitigation. When contractors do not follow through on necessary paperwork, an unmanageable backlog of incomplete cases results. If this continues, processing time for completing new closures will increase.

GENERAL INSTRUCTIONS:

- One FORM "A" shall be completed for all NEW PERMITS, PERMIT CHANGES or any FACILITY/SITE INFORMATION CHANGES.
- SUBMIT ONLY ONE (1) FORM "A" for a Facility/Site, regardless of the number of tanks located at the site.
- This form should be completed by either the PERMIT APPLICANT or the LOCAL AGENCY UNDERGROUND TANK INSPECTOR.

1

- Please type or print clearly all requested information.
- Use a hard point writing instrument, you are making 3 copies.

TOP OF FORM: "MARK ONLY ONE ITEM"

Mark an (X) in the box next to the item that best describes the reason the form is being completed.

I. FACILITY/SITE INFORMATION & ADDRESS (MUST BE COMPLETED)

Record name and address (physical location; of the underground tank(s). NOTE: Address MUST have a valid physical location including city, state, and zip code. P.O. BOX NUMBERS ARE NOT ACCEPTABLE

Include nearest cross street and name of the operator.

- Phone number must have an area code. If the night number is the same, write "SAME" in proper location Check the appropriate box for TYPE OF BUSINESS OWNERSHIP (ex. CORPORATION, INDIVIDUAL, etc.) Check the appropriate box for TYPE OF BUSINESS.
- If Facility/Site is located within an Indian reservation or other Indian trust lands, check the box marked "YES".
- Indicate the NUMBER of TANKS at this SITE.
- Record the E.P.A. ID # or write "NONE" in the space provided.

II. PROPERTY OWNER INFORMATION & ADDRESS (MUST BE COMPLETED)

Complete all items in this section, unless all items are the same as SECTION 1; if the same, write "SAME AS SITE" across this section. Be sure to check PROPERTY OWNERSHIP TYPE box.

III. TANK OWNER INFORMATION & ADDRESS (MUST BE COMPLETED)

Complete all items in this section, unless all items are the same as SECTION 1; If the same, write "SAME AS SITE" across this section. Be sure to check TANK OWNERSHIP TYPE box.

IV. BOARD OF EQUALIZATION UST STORAGE FEE ACCOUNT NUMBER (MUST BE COMPLETED)

Enter your Board of Equalization (BOE) UST storage fee account number which is required before your permit application can be processed. Registration with the BOE will ensure that you will receive a quarterly storage fee return in reporting the \$0.006 (6 mills) per gallon fee due on the number of gallons placed in your USTs. The BOE will code persons exempt from paying the storage fee so returns will not be sent. If you do not have an account number with the BOE or if you have any questions regarding the fee or exemptions, please call the BOE at 916-323-9555 or write to the BOE at the following address: Board of Equalization, Environmental Fees Unit, P.O. Box 942879, Sacramento, CA 94279-0001.

V. PETROLEUM UST FINANCIAL RESPONSIBILITY (MUST BE COMPLETED)

Identify the method(s) used by the owner and/or operator in meeting the Federal and State financial responsibility requirements. USTs owned by any Federal or State agency are exempt from this requirement.

VI. LEGAL NOTIFICATION AND BILLING ADDRESS

Check ONE BOX for the address that will be used for BOTH LEGAL AND BULLING NOTHICATIONS.

APPLICANT MUST SIGN AND DATE THE FORM AS INDICATED.

INSTRUCTION FOR THE LOCAL AGENCIES

The county and jurisdiction numbers are predetermined and can be obtained by calling the State Board (916)739-2421. The facility number may be assigned by the local agency; however, this number must be numerical and cannot contain any alphabetical. If the local agency prefers the State Board to assign the facility number, please leave it blank.

IT IS THE RESPONSIBILITY OF THE LOCAL AGENCY THAT INSPECTS THE FACILITY TO VERHY THE ACCURACY OF THE INFORMATION. THIS APPLICATION CANNOT BE PROCESSED IF THE BOE ACCOUNT NUMBER IS NOT FILLED IN. THE LOCAL AGENCY IS RESPONSIBLE FOR THE COMPLETION OF THE "LOCAL AGENCY USE ONLY" INFORMATION BOX AND FOR FORWARDING ONE FORM "A" AND ASSOCIATED FORM "B"(s) TO THE FOLLOWING ADDRESS.

INSTRUCTIONS FOR COMPLETING FORM "B"

GENERAL INSTRUCTIONS:

One FORM "B" shall be completed for each tank for all NEW PERMITS, PERMIT CHANGES, REMOVALS and/or any other TANK INFORMATION CHANGE.

This form should be completed by either the PERMIT APPLICANT or the LOCAL AGENCY UNDERGROUND TANK

Please type or print clearly all requested information.

Use a hard point writing instrument, you are making 3 copies.

TOP OF FORM: "MARK ONLY ONE ITEM"

- Mark an (X) in the box next to the item that best describes the reason the form is being completed.
- Indicate the DBA or Facility name where the tank is installed.

I. TANK DESCRIPTION - COMPLETE ALL ITEMS - IF UNKNOWN - SO SPECIFY

- Indicate owners tank ID # If there is a tank number that is used by the owner to identify the tank (ex. AB70789). Indicate the name of the company that manufactured the tank (ex. ACME TANK MFG.).

Indicate the year the tank was installed (ex. 1987).

Indicate the tank capacity in gallons (ex. 25,000 or 10,000 etc.).

II. TANK CONTENIS

1. If MOTOR VEHICLE FUEL, check box 1 and complete items B & C.

2. If not MOTOR VEHICLE FUEL, check the appropriate box in section A and complete items B & D.

Check the appropriate box.

Check the type of MOTOR VEHICLE FUEL (if box 1 is checked in A).

Print the chemical name of the hazardous substance stored in the tank and the C.A.S.#. (Chemical Abstract Service number), if box 1 is NOT checked in A.

III. TANK CONSTRUCTION - MARK ONE ITEM ONLY IN BOX A, B, C & D

- Check only one item in TYPE OF SYSTEM, TANK MATERIAL, INTERIOR LINING and CORROSION PROTECTION.
- If OTHER, print in the space provided.

IV. PIPING INFORMATION

Circle A if above ground; circle U if underground; and circle both if applicable.

If UNKNOWN, circle; or if OTHER, print in space provided.

Indicate the LEAK DETECTION system(s) used to comply with the monitoring requirement for the piping.

V. TANK LEAK DETECTION

Indicate the LEAK DETECTION system(s) used to comply with the monitoring requirements for the tank.

VI. INFORMATION ON TANK PERMANENTLY CLOSED IN PLACE

ESTIMATED DATE LAST USED - MONTH/YEAR (January, 1988 or 01/88).

ESTIMATED QUANTITY of HAZARDOUS SUBSTANCE remaining in the tank (in Gallons).

WAS TANK FILLED WITH INERT MATERIAL? Check 'Yes' or 'NO'.

APPLICANT MUST SIGN AND DATE THE FORM AS INDICATED.

INSTRUCTION FOR THE LOCAL AGENCIES

The state underground storage tank identification number is composed of the two digit county number, the three digit jurisdiction number, the six digit facility number and the six digit tank number. The county and jurisdiction numbers are predetermined and can be obtained by calling the State Board (916)739-2421. The facility number must be the same as shown in form "A". The tank number may be assigned by the local agency, however, this number must be numerical and cannot contain an alphabet. If the local agency prefers the State Board to assign the tank number, please leave it blank.

IT IS THE RESPONSIBILITY OF THE LOCAL AGENCY THAT INSPECTS THE FACILITY TO VERIFY THE ACCURACY OF THE INFORMATION. THE LOCAL AGENCY IS RESPONSIBLE FOR THE COMPLETION OF THE "LOCAL AGENCY USE ONLY" INFORMATION BOX AND FOR FORWARDING ONE FORM "A" AND ASSOCIATED FORM "B"(s) TO THE FOLLOWING ADDRESS.

INSTRUCTIONS FOR COMPLETING FORM *B*

GENERAL INSTRUCTIONS:

- One FORM "B" shall be completed for each tank for all NEW PERMITS, PERMIT CHANGES, REMOVALS and/or any other TANK INFORMATION CHANGE.
- 2. This form should be completed by either the PERMIT APPLICANT or the LOCAL AGENCY UNDERGROUND TANK INSPECTOR.
- 3. Please type or print clearly all requested information.
- 4. Use a hard point writing instrument, you are making 3 copies.

TOP OF FORM: "MARK ONLY ONE ITEM"

- 1. Mark an (X) in the box next to the item that best describes the reason the form is being completed.
- 2. Indicate the DBA or Facility name where the tank is installed.

I. TANK DESCRIPTION - COMPLETE ALL ITEMS - IF UNKNOWN - SO SPECIFY

- A. Indicate owners tank ID # If there is a tank number that is used by the owner to identify the tank (ex. AB70789).
- B. Indicate the name of the company that manufactured the tank (ex. ACME TANK MFG.).
- C. Indicate the year the tank was installed (ex. 1987).
- D. Indicate the tank capacity in gallons (ex. 25,000 or 10,000 etc.).

II. TANK CONTENTS

- A. 1. If MOTOR VEHICLE FUEL, check box 1 and complete items B & C.
 - 2. If not MOTOR VEHICLE FUEL, check the appropriate box in section A and complete items B & D.
- B. Check the appropriate box.
- C. Check the type of MOTOR VEHICLE FUEL (if box 1 is checked in A).
- D. Print the chemical name of the hazardous substance stored in the tank and the C.A.S.#. (Chemical Abstract Service number), if box 1 is NOT checked in A.

III. TANK CONSTRUCTION - MARK ONE ITEM ONLY IN BOX A, B, C & D

- 1. Check only one item in TYPE OF SYSTEM, TANK MATERIAL, INTERIOR LINING and CORROSION PROTECTION.
- 2. If OTHER, print in the space provided.

IV. PIPING INFORMATION

- 1. Circle A if above ground; circle U if underground; and circle both if applicable.
- 2. If UNKNOWN, circle; or if OTHER, print in space provided.
- 3. Indicate the LEAK DETECTION system(s) used to comply with the monitoring requirement for the piping.

V. TANK LEAK DETECTION

1. Indicate the LEAK DETECTION system(s) used to comply with the monitoring requirements for the tank.

VI. INFORMATION ON TANK PERMANENTLY CLOSED IN PLACE

- 1. ESTIMATED DATE LAST USED MONTH/YEAR (January, 1988 or 01/88).
- 2. ESTIMATED QUANTITY of HAZARDOUS SUBSTANCE remaining in the tank (in Gallons).
- 3. WAS TANK FILLED WITH INERT MATERIAL? Check 'Yes' or 'NO'.

APPLICANT MUST SIGN AND DATE THE FORM AS INDICATED.

INSTRUCTION FOR THE LOCAL AGENCIES

The state underground storage tank identification number is composed of the two digit county number, the three digit jurisdiction number, the six digit facility number and the six digit tank number. The county and jurisdiction numbers are predetermined and can be obtained by calling the State Board (916)739-2421. The facility number must be the same as shown in form "A". The tank number may be assigned by the local agency, however, this number must be numerical and cannot contain an alphabet. If the local agency prefers the State Board to assign the tank number, please leave it blank.

IT IS THE RESPONSIBILITY OF THE LOCAL AGENCY THAT INSPECTS THE FACILITY TO VERIFY THE ACCURACY OF THE INFORMATION. THE LOCAL AGENCY IS RESPONSIBLE FOR THE COMPLETION OF THE "LOCAL AGENCY USE ONLY" INFORMATION BOX AND FOR FORWARDING ONE FORM "A" AND ASSOCIATED FORM "B"(s) TO THE FOLLOWING ADDRESS.

INSTRUCTIONS FOR COMPLETING FORM "B"

GENERAL INSTRUCTIONS:

- One FORM "B" shall be completed for each tank for all NEW PERMIT'S, PERMIT CHANGES, REMOVALS and/or any other TANK INFORMATION CHANGE.
- 2. This form should be completed by either the PERMIT APPLICANT or the LOCAL AGENCY UNDERGROUND TANK INSPECTOR.
- 3. Please type or print clearly all requested information.
- 4. Use a hard point writing instrument, you are making 3 copies.

TOP OF FORM: "MARK ONLY ONE ITEM"

- 1. Mark an (X) in the box next to the item that best describes the reason the form is being completed.
- 2. Indicate the DBA or Facility name where the tank is installed.

I. TANK DESCRIPTION - COMPLETE ALL ITEMS - IF UNKNOWN - SO SPECIFY

- A. Indicate owners tank ID # If there is a tank number that is used by the owner to identify the tank (ex. AB70789).
- B. Indicate the name of the company that manufactured the tank (ex. ACME TANK MFG.).
- C. Indicate the year the tank was installed (ex. 1987).
- D. Indicate the tank capacity in gallons (ex. 25,000 or 10,000 etc.).

IL TANK CONTENTS

- A. 1. If MOTOR VEHICLE FUEL, check box 1 and complete items B & C.
 - 2. If not MOTOR VEHICLE FUEL, check the appropriate box in section A and complete items B & D.
- B. Check the appropriate box.
- C. Check the type of MOTOR VEHICLE FUEL (if box 1 is checked in A).
- D. Print the chemical name of the hazardous substance stored in the tank and the C.A.S.#. (Chemical Abstract Service number), if box 1 is NOT checked in A.

III. TANK CONSTRUCTION - MARK ONE ITEM ONLY IN BOX A, B, C & D

- 1. Check only one item in TYPE OF SYSTEM, TANK MATERIAL, INTERIOR LINING and CORROSION PROTECTION.
- 2. If OTHER, print in the space provided.

IV. PIPING INFORMATION

- 1. Circle A if above ground; circle U if underground; and circle both if applicable.
- 2. If UNKNOWN, circle; or if OTHER, print in space provided.
- 3. Indicate the LEAK DETECTION system(s) used to comply with the monitoring requirement for the piping.

V. TANK LEAK DETECTION

1. Indicate the LEAK DETECTION system(s) used to comply with the monitoring requirements for the tank.

VI. INFORMATION ON TANK PERMANENTLY CLOSED IN PLACE

- 1. ESTIMATED DATE LAST USED MONTH/YEAR (January, 1988 or 01/88).
- 2. ESTIMATED QUANTITY of HAZARDOUS SUBSTANCE remaining in the tank (in Gallons).
- 3. WAS TANK FILLED WITH INERT MATERIAL? Check 'Yes' or 'NO'.

APPLICANT MUST SIGN AND DATE THE FORM AS INDICATED.

INSTRUCTION FOR THE LOCAL AGENCIES

The state underground storage tank identification number is composed of the two digit county number, the three digit jurisdiction number, the six digit facility number and the six digit tank number. The county and jurisdiction numbers are predetermined and can be obtained by calling the State Board (916)739-2421. The facility number must be the same as shown in form "A". The tank number may be assigned by the local agency; however, this number must be numerical and cannot contain an alphabet. If the local agency prefers the State Board to assign the tank number, please leave it blank.

IT IS THE RESPONSIBILITY OF THE LOCAL AGENCY THAT INSPECTS THE FACILITY TO VERIFY THE ACCURACY OF THE INFORMATION. THE LOCAL AGENCY IS RESPONSIBLE FOR THE COMPLETION OF THE "LOCAL AGENCY USE ONLY" INFORMATION BOX AND FOR FORWARDING ONE FORM "A" AND ASSOCIATED FORM "B"(s) TO THE FOLLOWING ADDRESS.

ACTION HOME INSPECTION SERVICE

GENERAL INFORMATION ABOUT ASBESTOS

Asbestos is a naturally occurring mineral fiber which has served many useful functions as a component of numerous building materials. Its primary benefits have been as a strengthening agent, as an insulator, and as a fire inhibitor. Since the early 1970's, when asbestos was found to be a health hazard, it has been gradually eliminated from most construction materials.

Specifically, asbestos has been determined hazardous only when fibers are released into the air. When inhaled, these fibers can become lodged in lung tissues and can eventually result in cancer or asbestosis. But it is important that people not become unduly alarmed where asbestos is present: Not all forms of asbestos are necessarily hazardous. According to the EPA and the U.S. Consumer Products Safety Commission, "A health risk exists only when asbestos fibers are released from the material or product." and "If the material is in good condition, it is best to leave it alone."

The most common form of exposed asbestos in modern buildings is textured ceiling material, installed primarily during the 1960's and 70's. Sale of this material was banned in 1978, but products that had already been sold by that time could legally be installed thereafter. Other common forms of asbestos are insulation for heating ducts (a material that looks like gray cardboard), vinyl floor coverings, drywall taping compounds, and exhaust vents for gas appliances.

If asbestos materials are found to be in damaged condition, professional removal is advised. If remodeling is planned for a building, and the work involves disturbing asbestos-containing materials, that is also a time to have the material addressed by a licensed professional. Work of this kind should be done exclusively by a licensed asbestos abatement contractor. For further specific information regarding asbestos, check with the U.S. Consumer Products Safety Commission or the Environmental Protection Agency for their current advice.

ACTION HOME INSPECTION SERVICE

NARRATIVE ASBESTOS REPORT

February 26, 1993

Re: 8977 Grapevine Road, Lebec, CA

On February 26, 1993 the subject property was surveyed for the presence of possible asbestos containing material. The results of that inspection are as follows:

FINDING:

All exterior and interior building surfaces appear to be constructed of steel, brick, and glass, with ceramic tiles in the bathrooms only. The water-shed surface on the roof consists entirely of concrete tiles, and no insulation was observed on the warm air ducts in the forced-air heating system. The above are not regarded as potential asbestos-containing material. Therefore, no samples were taken for testing.

RECOMMENDATION:

No asbestos removal or abatement work is recommended.

If further information is required regarding the information in this report, please contact our office.

| LEBEC, CA 93243 | EL MONTE, CA 91731 | | |

Title 23, California Administrative Code (CAC), Section 2646 (e) requires the owner or operator of an underground storage tank utilizing inventory reconciliation as part of the required monitoring and leak detection system to submit on a quarterly basis a statement to the local agency under penalty of perjury, that either: the inventory reconciliation data is within allowable variations or a listing of the dates and variations that exceed the allowable variations. This form or a reasonable facsimile, when completed, will satisfy the quarterly reporting requirements. Please return a copy of this form to the Underground Storage Tank Program within thirty (30) days of the end of each calendar quarter, (March 31, June 30, September 30, and December 31).

For the calendar quarter ending 12-31-92, at the facility indicated above, records for all underground tanks monitored by inventory reconciliation indicate that:

a. ____ All inventory variations were within the allowable limits of Section 2644, CAC.

Inventory variations in excess of the allowable limits of Section 2644, CAC have occurred on the following days, in the listed amounts, for the following underground storage tanks (use back side of report if additional space is needed).

Proj. No. E87-045

Chevron USA, Inc. 2 Annabel Lane, Suite 200 San Ramon, Ca 94583

Attention: Mr. Jim Sampson

RE: Removal of Underground Storage Tank Chevron Service Station No. 8616 Grape Vine & Interstate 5 Kern County, California

Gentlemen:

In accordance with your authorization, we have completed soil sampling and chemical analysis of a soil samples obtained during the removal of one steel underground waste oil storage tank at the above-referenced project site. The Kern County Environmental Health Department was notified of the tank removal. Mr. Byron Williamson of Krazan & Associates, Inc. observed the tank removal and took soil samples during the removal.

Sampling and analysis was conducted to meet the requirements of the California Administrative Code, Title 23, Chapter 3, Subchapter 16, Section 2673, Subsection 2672.D.

The purpose of this investigation was to determine if significant soil contamination had occurred beneath the storage tank site.

Upon removal of the storage tank, the tank was visually examined for leaks and the surrounding soil within the excavation was examined for discoloration.

Two sample were obtained from beneath the tank at an approximate depth of two and six feet below the tank bottom. The samples were obtained from near the south end of the storage tank were soil discoloration had been observed. The soil samples were analyzed for Benzene, Toluene, Xylenes, Total

Puregeable Hydrocarbons, Oil & Grease and Total Organic Halides (TOX). The results of this analysis is presented in the table as follows:

Concentration of Gasoline Constituents in Soil Samples (Concentrations in ppm)

| Sample Depth | Benzene | Toluene | Xylenes | Total Purgeable Hydrocarbons | Oil & Grease | <u>TOX</u> |
|-----------------|---------|---------|---------|------------------------------------|-----------------|------------|
| 2 feet | 36.8 | 25.26 | 12.63 | 478.45 | 39.0 | 67 |
| 6 feet | N/D | N/D | N/D | N/D | 42.0 | 31 |

N/D - Not Detected

Results of the chemical analysis shows attenuation of product within the soil sample.

In consideration of an approximate depth to ground water of 650 feet and the attenuation of contamination noted within the six foot sampling, it would not appear that there is a significant threat to ground water resources.

If there are any questions or if we can be of further assistance; please do not hesitate to contact our office.

Respectfully Submitted, KRAZAN & ASSOCIATES, INC.

INSTRUCTION

EMERGENCY

Indicate whether emergency response personnel and equipment were involved at any time. If so, a Hazardous Material Incident Report should be filed with the State Office of Emergency Services (OES) at 2800 Meadowview Road, Sacramento, CA 95832. Copies of the OES report form may be obtained at your local underground storage tank permitting agency. Indicate whether the OES report has been filed as of the date of this report.

LOCAL AGENCY ONLY

To avoid duplicate notification pursuant to Health and Safety Code Section 25180.7, a designated government employee should sign and date the form in this block. A signature here does not mean that the leak has been determined to pose a significant threat to human health or safety, only that notification procedures have been followed if required.

REPORTED BY

Enter your name, telephone number, and address. Indicate which party you represent and provide company or agency name.

RESPONSIBLE PARTY

Enter name, telephone number, contact person, and address of the party responsible for the leak. The responsible party would normally be the tank owner.

SITE LOCATION

Enter information regarding the tank facility and surrounding area. At a minimum, you must provide the facility name and full address.

IMPLEMENTING AGENCIES

Enter names of the local agency and Regional. Water Quality Control Board involved.

SUBSTANCES INVOLVED

Enter the name and quantity lost of the hazardous substance involved. Room is provided for information on two substances if appropriate. If more than two substances leaked, list the two of most concern for cleanup.

DISCOVERY/ABATEMENT

Provide information regarding the discovery and abatement of the leak.

SOURCE / CAUSE

Indicate source(s) of leak. Provide details on tank age; capacity and material if known. Check box(es) indicating cause of leak.

CASE TYPE

Indicate the case type category for this leak. Check one box only. Case type is based on the most sensitive resource affected. For example, if both soil and ground water have been affected, case type will be "Ground Water". Indicate "Drinking Water" only if one or more municipal or domestic water wells have actually been affected. A "Ground Water" designation does not imply that the affected water cannot be, or is not, used for drinking water, but only that water wells have not yet been affected. It is understood that case type may change upon further investigation.

CURRENT STATUS

Indicate the category which best describes the current status of the case. Check one box only. The response should be relative to the case type. For example, if case type is "Ground Water", then "Current Status" should refer to the status of the ground water investigation or cleanup, as opposed to that of soil.

IMPORTANT: THE INFORMATION PROVIDED ON THIS FORM IS INTENDED FOR GENERAL STATISTICAL PURPOSES ONLY AND IS NOT TO BE CONSTRUED AS REPRESENTING THE OFFICIAL POSITION OF ANY GOVERNMENTAL AGENCY

REMEDIAL ACTION

Indicate which actions have been used to cleanup or remediate the leak.

Descriptions of options follow:

Cap Site - install horizontal impermeable layer to reduce rainfall infiltration.

Containment Barrier - install vertical dike to block horizontal movement of contaminant.

Excavate and Dispose - remove contaminated soil and dispose in approved

Excavate and Treat - remove contaminated soil and treat (includes spreading or land farming).

Remove Free Product - remove floating product from water table.

<u>Pump and Treat Groundwater</u> - generally employed to remove dissolved contaminants.

Enhanced Biodegradation - use of any available technology to promote bacterial decomposition of contaminants.

Replace Supply - provide alternative water supply to affected parties.

Treatment at Hookup - install water treatment devices at each dwelling or other place of use.

No Action Required - incident is minor, requiring no remedial action.

If the form is completed by the tank owner or his agent, retain the last copy and forward the remaining copies in tact to your local tank permitting agency for distribution.

I. Original - Local Tank Permitting Agency

 State Water Resources Control Board, Division of Water Quality, Underground Tank Program, P. O. Box 100, Sacramento, CA 95801

3. Regional Water Quality Control Board

 County Board of Supervisors or designee to receive Proposition 65 notifications.

Owner/responsible party.

Attention: Mr. Frank Lopez

RE: Underground Tank Tests
Station #8616
Highway I-5 & Grapevine
Lebec, California

Gentlemen:

In accordance with your authorization, we have completed underground tank tests at the above-referenced project on September 24, 1986. The results of these tests are summarized as follows:

| Tank No. | Tank Size | Tank Contents | Test Result (GPH) |
|---------------------------------------------|------------------------------------------|-----------------------------------------------------------|-------------------------------|
| \[\begin{array}{c} 1 \\ 2 \\ 3 \end{array} | 10,000 gal. 10,000 gal. 5,200 gal. | Unleaded Gasoline Regular Gasoline Premium Unleaded | * - SEE ATTACKED *044/pass |

^{*} Tests terminated

Testing of the regular and unleaded tanks were terminated as data suggests trapped air vapor pockets in the tanks.

Conversations with the Kern County Water Agency indicates depth to ground water at the project site is approximately 100 feet. Therefore, the tests were performed without elevating the standpipe to compensate for shallow groundwater conditions.

The criteria established of $\pm .050$ gallon/hour is a mathematical calculation based on actual liquid volume change and temperature change, and is not intended as a permission of a leak.

If you have any questions or if we can be of further assistance, please do not hesitate to contact our office.

Respectfully Submitted, KRAZAN & ASSOCIATES, INC.

Michael Erwin Principal Engineer RCE #18625

Re: Tank system testing 10-16-86 Chevron Sta. #8616 I-5 Grapevine Exit Lebec. Ca.

Dear Mark Nelson:

The tank systems tested at this location are identified as follows:

Tank system #1 West
Tank system #2 Center

10,000 Gallon Regular. 12,000 Gallon Unleaded.

The National Fire Protection Association's criteria for a tight tank system is a system with a rate of leak less than .050 gal/hr. These are calculated, mathematical tolerances only and are not meant to indicate the permission of any leak.

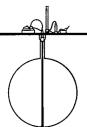

During the stand-pipe test procedure the liquid hydrostatic pressure applied to the underground tank system is generally two to three times greater than normal liquid storage pressures. This increase in hydrostatic pressure will amplify the indicated rate of leak accordingly.

Tank #1 showed a leak rate of +.026 gal/hr. Tank #1 is tight.

Tank #2 showed a leak rate of -.526 gal/hr. Tank #2 is leaking.

continued on page 2

Mark Nelson Page 2

The product lines were tested and found to be tight.

Prior to and after testing the tank bottoms were checked for water through the fill pipes, the results are as follows:

Tank system #1

0.00 Inches were recorded.

Tank system #2

0.00 Inches were recorded.

WJP/1eb

| PERMIT CHECKLIST |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Pacility CHEVRON STATION # 8616 Permit # 600015C |
| This checklist is provided to ensure that all necessary packet enclosures were received and that the Permittee has obtained all necessary equipment to implement the first phase of monitoring requirements. |
| Please complete this form and return to KCHD in the self-addressed envelope provided within 30 days of receipt. |
| Check: |
| <u>Yes</u> <u>No</u> |
| A. The packet I received contained: 1) Cover Letter, Permit Checklist, Interim Permit, Phase I Interim Permit Monitoring Requirements, Information Sheet (Agreement Between Owner and Operator), Chapter 15 (KCOC #G-3941), Explanation of Substance Codes, Equipment Lists and Return Envelope. 2) Standard Inventory Control Monitoring Handbook #UT-10. with the following forms: |
| a) "Inventory Recording Sheet" b) "Inventory Reconciliation Sheet with summary on reverse" c) "Trend Amalysis Worksheet" 3) Nodified Inventory Control Monitoring Handbook #UT-15 with form: "Quarterly Modified Inventory Control Sheet" with "Quarterly Summary on reverse" 4) An Action Chart for each inventory method (to post at facility) |
| B. I have examined the information on my Interim Permit, Phase I Monitoring Requirements, and Information Sheet (Agreement between Owner and Operator), and find owner's name and address, facility name and address, operator's name and address, substance codes, and number of tanks to be accurately listed (if "no" is checked, note appropriate corrections on the back side of this sheet). |
| C. I have the following required equipment (as described in Handbooks under "Before Starting") 1) Acceptable gauging instrument 2) "Striker plate(s)" in tank(s) 3) Water-finding paste |
| D. I have read the information on the enclosed "Information Sheet" pertaining to Agreements between Owner and Operator and hereby state that the owner of this facility is the operator (if "no" is checked, attach a copy of agreement between owner and operator). |
| E. I have enclosed a copy of Calibration Charts for <u>all</u> tanks at this facility (if tanks are identical, one chart will suffice; label chart(s) with corresponding tank numbers listed on permit). |
| F. As required on page 6 of Handbook #UT-10, all meters at this facility have had calibration checks within the last 30 days and were calibrated by a registered device repairman if out of tolerance (all meter calibrations must be recorded on "Meter Calibration Check Form" found in the Appendix of Handbook). |
| G. Standard Inventory Control Monitoring (Handbook #UT-10) and Modified Inventory Control Monitoring (Handbook #UT-15) were started at this facility in accordance with requirements described on interim permit conditions. Date Started |
| Signature of Person Completing Checklist: |

MANPOWER AGREEMENT

THIS AGREEMENT, made as of the 4th day of September, 1986, by and between CHEVRON U.S.A. INC., a corporation ("Company"), and Compu-Plan Management Services, Inc., a corporation ("Contractor"),

WITNESSETH:

Whereas Company owns and operates a motor fuel dispensing facility located at Hwy. I-5 and Hwy. 99, Lebec, CA 93243, and shown on the drawing attached hereto as Exhibit A (the "premises");

Whereas Company wishes to employ Contractor to provide Contractor's employees to collect payment from motorists and to perform certain other services in connection with the conduct by Company of its business at the premises; and

Whereas Contractor wishes to accept such employment;

Now, Therefore, the parties hereto agree as follows:

1. Effective date.

This agreement shall become effective **September 17**, 1986, and shall continue in effect until terminated in accordance with section 10 hereof.

2. Work to be done.

Contractor agrees to provide personnel to perform the services described in Exhibit B hereto (the "Work"). All such personnel shall be the employees of Contractor. All such Work shall comply with all applicable Federal, state and local laws and regulations, shall meet with the approval of Company and shall be performed in accordance with such procedures as Company may from time to time establish. Company shall have the right to direct and control all personnel furnished by Contractor in the manner and method of performing the Work. Contractor shall insure that the personnel provided for the Work are properly qualified. Training shall be the responsibility of Contractor. If Company notifies Contractor that it considers the performance of any of Contractor's employees in connection with the Work to be unsatisfactory, Contractor shall promptly relieve such employee of any responsibility for the Work and shall replace such employee with another.

3. Compensation of Contractor.

Company's motor fuel dispensing facility (and car wash, if any) on the premises shall be open for business for those hours and days specified in Exhibit C hereto. The number of Contractor's employees and the hours that shall be allocated to the Work are specified in Exhibit C. As Contractor's sole compensation hereunder, Company shall pay Contractor for the services provided by Contractor's employees at the rate of \$8.18 per hour (the "billing rate").

If it is necessary to cease normal operations on the premises for reasons beyond the reasonable control of Contractor during an eight-hour shift, whether caused by motor fuel shortage, power failure, strike by anyone other than the employees of Contractor, act of God, safety or health hazzard, or natural disaster, Company shall compensate Contractor at the billing rate for the entire shift.

If at any time Company elects (for reasonable business reasons) not to operate the motor fuel dispensing facility (and car wash, if any) on the premises, then, upon written notice from Company to this effect, Contractor shall cease to furnish its employees and Company shall not be required to pay Contractor for any services hereunder during such time as operations on the premises are shut down. Upon written notification by Company of the resumption of operations on the premises, Contractor shall resume furnishing its employees, and Company shall resume payments to Contractor as provided in this agreement.

Company shall issue checks to Contractor for services rendered on a weekly basis. Company shall have the right to set off any sums owed by Contractor to Company (whether or not arising hereunder) against any sums due from Company to Contractor hereunder.

At the request of Contractor, representatives of Company and Contractor shall meet and discuss possible changes in the billing rate specified herein to reflect increases in Contractor's pay scale to Contractor's employees and shall negotiate in good faith regarding any adjustments in the billing rate proposed by Contractor. If Company and Contractor are unable to reach agreement regarding the adjustments proposed by Contractor, Contractor may exercise its right pursuant to section 10 hereof to terminate this agreement upon 60 days' prior written notice to Company. The billing rate previously in effect hereunder shall continue to apply during such 60-day period.

Contractor's employees.

Contractor shall, at Contractor's own expense so long as this agreement is in effect, maintain full Workmen's Compensation Insurance and Employer's Liability Insurance covering all persons employed by or working for Contractor in connection with the performance of this agreement. Such insurance shall contain a provision that the insurance company shall have no right of subrogation against Company, Company's parent company, Chevron Corporation, or the subsidiary and affiliated companies of each of them (collectively "Company and its affiliates"). Such insurance shall also carry an Alternate Employer Endorsement naming Company and its affiliates as alternate employers. Contractor, upon request, shall furnish Company with satisfactory evidence of the maintenance of such insurance.

In the performance of this agreement, Contractor shall comply with all Federal, state and local labor laws, regulations and orders. Contractor shall pay, when due, to all personnel provided by it for the Work hereunder, all salaries, wages, fringe benefits and other forms of compensation and reimbursement payable as a result of the Work. Contractor shall withhold and pay over to the appropriate authorities in a timely manner all Federal, state and local personal income and other payroll taxes (including contributions or taxes assessed against employees) payable with respect to such compensation. Contractor accepts exclusive liability for all contributions required under Federal Social Security Laws and State Unemployment Compensation Laws or other payments under any laws of similar character as to all persons employed by and working for Contractor. Contractor shall in a timely manner make all reports concerning such personnel required by governmental authorities.

Contractor's employees shall not be entitled to receive any benefits under any employee benefit plan or program of any kind maintained by Company or its affiliates for their employees. Regardless whether Contractor's employees may be deemed to be employees of Company or its affiliates for any other purpose, Contractor's employees shall not be considered to be employees of Company or its affiliates for purposes of any such benefit plan or program.

Company, from time to time, may require Contractor to furnish evidence satisfactory to Company that Contractor has complied with the provisions of this section 4. Contractor shall indemnify, defend and hold harmless Company and its affiliates, and their respective directors, officers, agents and employees, from and against any and all expense, liability and claims, including but not limited to taxes, penalties and interest, resulting from Contractor's failure to comply with the provisions of this section 4.

The personnel provided by the Contractor for the Work shall, for purposes of Worker's Compensation laws, be Company's special employees and Contractor's general employees. Contractor shall inform all personnel provided to perform the Work of their special employment relationship with Company and the requirement that the Work be performed in accordance with standards specified by Company from time to time. Before any such person begins work pursuant to this agreement, Contractor shall obtain from each individual a signed copy of a special employee acknowledgement in the form attached hereto as Exhibit D and maintain all such acknowledgements in Contractor's files, providing any or all to Company at Company's request.

5. Accounting by Contractor.

Company shall maintain at the premises such quantities of motor fuels as Company may in its sole discretion determine. Contractor shall notify Company when stocks of such motor fuels need to be replenished in such manner as Company may from time to time direct. Title to such motor fuels shall remain in Company until such motor fuels are sold to motorists for Company's account, when title shall pass directly from Company to the motorist. All sales of Company motor fuels (and of car wash services, if any) shall be at retail prices determined by Company. The entire proceeds of all sales of Company motor fuels (and of car wash services, if any), both cash and credit card invoices, are the property of Company. No products other than Company motor fuels (and any authorized car wash services) shall be offered for sale on the premises except as expressly authorized in writing by Company. Contractor shall account to Company for sales of Company motor fuels (and of any car wash services) as set forth in Exhibit B. Contractor shall not be responsible for any loss of Company's motor fuels, cash, credit card invoices or other property at the premises due to theft, robbery or burglary; unless the robber, burglar or thief is an employee of Contractor or is acting in concert with an employee of Contractor, or unless due to the negligence of Contractor or its employees in performing the Work, in which event Contractor shall promptly reimburse Company for any such loss.

6. Company's motor fuel dispensing facility.

Company shall obtain and maintain any and all necessary governmental permits and licenses required or necessary for the operation on the premises of a motor fuel dispensing facility (and car wash, if any). Company shall pay any and all real or personal property taxes which may be assessed with respect to the premises or the storage or sale of Company motor fuels at the premises. Company shall be responsible for all charges for gas, electricity, water, sewerage and other services or utilities used in or consumed on the premises.

Except for the routine maintenance and minor repairs included within the Work, Company shall at all times maintain the premises and all improvements and equipment located thereon in good and safe condition in compliance with all applicable Federal, state and local laws and regulations relevant to the maintenance and operation of the premises. Upon being notified by Contractor that any part of the premises or any of Company's facilities are in need of repair, Company shall promptly repair or replace the same. Such repair or replacement shall be made at no cost to Contractor, unless such repair or replacement is necessitated by the negligence or intentional misconduct of Contractor or its employees, in which event Contractor shall promptly reimburse Company for the cost of such repair or replacement.

Contractor and Contractor's employees shall exercise all reasonable care to preserve and protect the premises, Company's facilities, motor fuels and other property located on or stored at the premises and any property of Company, which may be located in any convenience store operated by Contractor adjacent to the premises (any such adjacent convenience food store being shown on Exhibit A), including but not limited to Company's console and other equipment (if any) controlling the motor fuel pumps on the premises (collectively "Company's property"), from injury, harm or loss. Contractor shall not be responsible for any casualty to or loss of any of Company's property, except to the extent such casualty or loss is the result of the negligence or intentional misconduct of Contractor or its employees. Contractor shall promptly reimburse Company for any

injury, harm or loss to Company's property occasioned in whole or in part by the negligence or intentional misconduct of Contractor or its employees.

7. <u>Indemnity</u>.

Company shall indemnify, defend and hold harmless Contractor, its directors, officers, agents and employees, from and against all expense, liability and claims for damage to property or injury or death of persons (other than Contractor's employees) directly or indirectly resulting, or alleged to result, from anything occurring from any cause on or about or in connection with the sale of motor fuels at the premises, or the maintenance, upkeep, repair, replacement or operation of the premises, or anything located thereon, except to the extent such expense, liability or claim is the result of the negligence or intentional misconduct of Contractor or its employees.

Contractor shall indemnify, defend and hold harmless Company and its affiliates, and their respective directors, officers, agents and employees, from and against all expense, liability and claims for damage to property (including Contractor's property) or injury or death of persons (including Contractor's employees) directly or indirectly resulting, or alleged to result, from the negligence or intentional misconduct of Contractor or its employees.

8. Conflicts of interest.

No director, employee or agent of Contractor shall give or receive any commission, fee, rebate, gift or entertainment of significant cost or value, or enter into any business arrangement with any director, employee or agent of Company or its affiliates, other than as a representative of Company or its affiliates, without prior written notification thereof to Company. Any representatives authorized by Company may audit any and all records of Contractor for the purpose of determining whether there has been compliance with this section 8.

9. Federal regulations.

Contractor shall comply with Executive Order 11246, as amended by Executive Order 11375, and the rules and regulations issued thereunder, which are hereby incorporated by reference as appropriate. Upon execution of this agreement, Contractor shall sign and furnish to Company a Certificate of Nonsegregated Facilities in the form of Exhibit E hereto.

Regulations issued under the Rehabilitation Act of 1973 in Title 41, Chapter 60, Part 60-741 of the Code of Federal Regulations are incorporated herein by reference unless this agreement is exempted by Federal law, rules, regulations or orders of the Secretary of Labor issued pursuant to said Rehabilitation Act of 1973.

The regulations issued under the Vietnam Era Veterans' Readjustment Assistance Act of 1974 in Title 41, Chapter 60, Part 60-250 of the Code of Federal Regulations are incorporated herein by reference unless this agreement is exempted by Federal law, rules, regulations or orders of the Secretary of Labor issued pursuant to said Vietnam Era Veterans' Readjustment Assistance Act of 1974.

10. Termination.

Either party hereto may terminate this agreement without cause at any time by giving the other party 60 days' prior written notice of such termination.

Upon the happening of any of the following, Company or Contractor may, at its option without any further notice or demand, and in addition to any other rights and remedies given hereunder or by law, have the right to terminate this agreement forthwith by giving written notice of termination to the other party:

- (a) The other party by act or omission breaches or defaults on any other covenant, condition or provision of this agreement, which breach or default can be cured and such party fails to cure such breach or default within 10 days after written notice by the other party; or
- (b) The other party by act or omission breaches or defaults on any covenant, condition or provision of this agreement, which breach or default cannot be cured, or in the event of any breach or default by either party after notice of two previous breaches or defaults of any kind has been given hereunder regardless whether the party involved cured such previous breaches or defaults; or
- (c) The premises or a substantial portion thereof are destroyed or taken by eminent domain (the filing of an eminent domain action shall be deemed a taking), or should the operation of the premises as a motor fuel dispensing facility (and car wash, if applicable) be prevented by any law, ordinance or act of lawful authority.

Upon the happening of any of the following, Company may, at its option without any further notice or demand, and in addition to any other rights and remedies given hereunder or by law, have the right to terminate this agreement forthwith by giving written notice of termination to Contractor:

- (a) An unreasonable level of unexplained motor fuel inventory losses in any 30-day period; or
- (b) An unreasonable level of losses or shortages of motor fuels caused by customers who depart the premises without paying in any 30-day period.
 - (c) Failure to comply with Company's cash handling procedures.

Waiver by either party of one or more breaches or defaults hereunder shall not be deemed to be a waiver of any other or continuing breach or default hereunder. Termination of this agreement shall not relieve any party of responsibility for obligations incurred prior to termination.

11. Underlying Estates

Company's interest in the premises is or may be a leasehold estate derived from a third party whose interest in the premises may or may not be of record. If Company's underlying ground lease is terminated in any manner by either party thereto, Company may terminate this agreement upon giving Contractor thirty (30) days' prior written notice of such termination or, if it would not be practical for Company to give thirty (30) days' prior written notice, at Company's election upon giving Contractor prior written notice for such lesser period as is reasonable in the circumstances. Company shall in no way be liable to Contractor for any such termination, whether voluntary or involuntary.

12. Notices.

All written notices to be given under this agreement shall be posted by certified mail or personally delivered to the other party at the address set forth below, or at such other addresses as either party may designate by written notice to the other. Any such notice shall be deemed received when deposited in the United States mail with postage fully prepaid thereon or when personally delivered.

Company:

Contractor:

CHEVRON USA, INC. 2 Annabel Lane, Suite 200 San Ramon, CA 94583 Compu-Plan Management Services, Inc. 128 Chester Ave., Ste. C Bakersfield, CA 93304

General

This agreement is personal to Contractor and Contractor shall not assign any rights or delegate any duties that Contractor may have under this agreement, either voluntarily, involuntarily or by operation of law, or otherwise, without the prior written consent of Company. Any sale, conveyance, alienation, transfer or other change of interest in or title to beneficial ownership of 50 percent or more of the voting stock (or securities convertible into 50 percent or more of the voting stock) of Contractor, either voluntarily, involuntarily, by operation of law, merger or other corporate proceeding, or otherwise, shall be construed as an assignment of Contractor's rights hereunder. In the event of litigation between the parties hereto with regard to the subject matter hereof, the prevailing party shall be entitled to recover its costs and expenses of suit, including reasonable attorneys' fees, in connection therewith. The captions and headings throughout this agreement are for convenience of reference only, and the words contained therein shall in no way be held or deemed to define, limit, describe, explain or modify the meaning of any provision, the scope or intent of this agreement. As of its effective date, this agreement supersedes and terminates any and all prior agreements or understandings between Company and its affiliates and Contractor with regard to premises. This agreement constitutes the entire agreement between Company and Contractor with regard to the subject matter hereof including Exhibits A through E which are made a part of this agreement.

IN WITNESS WHEREOF, the parties hereto have executed this agreement as of the date first hereinabove set forth.

MOTOR FUEL DISPENSING FACILITY DIAGRAM

Drawing showing the premises (clearly delineate the premises from any adjacent convenience store):

CONVENIENCE STORE LEASE

THIS LEASE, made as of the 4th day of September, 1986, by and between CHEVRON U.S.A. INC., a corporation ("Landlord"), and Compu-Plan Management Services, Inc., a corporation ("Tenant"),

WITNESSETH:

That in consideration of the rents to be paid hereunder and covenants and agreements herein contained and to be performed, the parties hereto agree as follows:

1. <u>Leased premises.</u>

Landlord does hereby lease to Tenant, and Tenant does hereby lease from Landlord, that certain convenience store shown in the drawing attached hereto as Exhibit A located at Hwy. I-5 and Hwy. 99, Lebec, CA 93243, together with those convenience store fixtures listed in Exhibit B hereto (such store and fixtures being sometimes hereinafter collectively referred to as the "leased premises").

2. Term.

Subject to the earlier termination of this lease pursuant to section 11 hereof, the term of this lease shall be for a period of three (3) years and shall commence on September 17, 1986, and shall end on February 29, 1988.

3. Use of leased premises.

(a) Tenant shall use the leased premises only for the purpose of operating a convenience food store. As used herein "convenience food store" means a grocery store of the type commonly called a convenience store, which specializes in a limited line of fast-moving groceries, beverages and sundries and emphasizes fast service for customers purchasing a limited number of items. Tenant shall stock the leased premises with merchandise suitable and useful for the operation of such business and shall maintain the leased premises at all times so as to project an image to the public of a convenience food store of the highest quality. Tenant shall operate the premises in a first-class manner and in a manner comparable to any other convenience food stores operated by Tenant in the vicinity of the premises. Tenant shall not place signs or other advertising devices, electrical or nonelectrical, upon, and which are visible from, the exterior leased premises, without the prior written consent of Landlord. Landlord shall not unreasonably withhold its consent to the installation and maintenance of signs identifying Tenant's business.

Tenant shall operate the premises in compliance with all applicable Federal, state and local laws. Landlord does represent or warrant that the premises may lawfully be used as a convenience food store, and Tenant shall be solely responsible for obtaining and maintaining any and all necessary licenses, permits, governmental approvals or variances which may be required in order to operate a convenience food store on the premises. In the operation of Tenant's business on the premises, Tenant shall not utilize any of the trademarks, service marks or trade names utilized by Landlord or use any other identification, designation or marking of any kind at the premises which would identify the convenience food store or the products sold thereat with Landlord. Except as may otherwise be agreed in writing between Landlord and Tenant, Tenant shall keep the leased premises open for business and continuously operate the premises as a convenience food store during the following hours:

| 24 Hrs. a.m. to | p.m. each Monday,* |
|-----------------|--------------------------|
| 24 Hrs. a.m. to | p.m. each Tuesday,* |
| 24 Hrs. a.m. to | p.m. each Wednesday,* |
| 24 Hrs. a.m. to | p.m. each Thursday,* |
| 24 Hrs. a.m. to | p.m. each Friday,* |
| 24 Hrs. a.m. to | p.m. each Saturday, and* |
| 24 Hrs. a.m. to | p.m. each Sunday.* |

*Note: Full Service 14 Hours Per Day.

- (b) Tenant shall not, without Landlord's prior written consent, permit the leased premises to be used for:
 - (1) The sale of garden supplies; or
 - (2) The sale of any alcoholic beverages except beer or wine; or
 - (3) The sale of lottery tickets; or
 - (4) The sale of adult magazines featuring nudity; or
 - (5) The sale or rental of adult magazines, movies, video tapes or similar items featuring nudity; or
 - (6) Automatic teller machines, pay phones, video games, pinball machines, vending machines or any similar device; or
 - (7) Sales, services or other revenue producing activities not normally offered at convenience food stores (normal sales and services being enumerated in subsection (a) above); or
 - (8) Any other activity of a type that might conflict with the effective operation of the leased premises as a convenience food store.

4. Rent.

(a) Throughout the term of this lease, Tenant shall pay Landlord the following minimum monthly rent (the "fixed rent"): \$150.00. The fixed rent shall be paid by Tenant to Landlord in advance on or before the first (1st) day of each calendar month during the term hereof. The fixed rent shall be prorated for any period less than a calendar month included within the term hereof.

- (b) In addition to the fixed rent, Tenant shall pay to Landlord with respect to each calendar quarter during the term hereof a sum (the "percentage rent") equal to the amount (if any) by which 8 percent of Tenant's "adjusted gross sales" (as hereinafter defined) for the calendar quarter exceeds the amount of fixed rent paid by Tenant to Landlord in respect of such calendar quarter. The percentage rent shall be paid by Tenant to Landlord on or before the forty-fifth (45th) day following the end of such quarter.
- (c) As used in this lease, the term "adjusted gross sales" shall mean the gross amount (rounded to the nearest dollar) received or to be received from all sales, both cash and on credit, made on or from the leased premises by Tenant, from which gross amount there shall be deducted or excluded (i) refunds and allowances made to customers by Tenant in connection with merchandise sold by or returned to Tenant and (ii) sales or excise taxes on sales included in adjusted gross sales payable by Tenant to the taxing authority imposing such taxes.
- (d) Tenant shall keep current and accurate records of all sales, charges for services and other transactions affecting the computation of its adjusted gross sales, in accordance with usual accounting procedures applicable to the type of business conducted on the leased premises by Tenant. All such records shall be maintained by Tenant for at least two (2) years following their preparation. Tenant shall furnish Landlord at the time percentage rent is paid pursuant to subparagraph (b) above, a statement showing the adjusted gross sales made by Tenant during the applicable period. Each such statement shall be certified as accurate by an authorized officer of Tenant.
- (e) Landlord and its authorized representatives shall have the right, at all reasonable times, to examine Tenant's books and records pertaining to the business conducted by Tenant on the leased premises. Landlord may at any reasonable time cause an audit of Tenant's business to be made by a representative of Landlord. If any statement of adjusted gross sales previously given to Landlord by Tenant shall be found by such audit to understate, by three percent (3%) or more, Tenant's adjusted gross sales for the period covered by such statement, Tenant shall immediately pay the cost of such audit to Landlord; otherwise the cost of such audit shall be paid by Landlord. Immediately after such audit, Tenant shall pay Landlord any additional percentage rent thereby shown to be due, and Landlord shall refund to Tenant any overpayment of percentage rent thereby shown to have been paid.

Tenant's trade fixtures.

Tenant may at Tenant's sole cost and expense, install on the leased (a) premises, subject to Landlord's prior written consent, those necessary and useful trade fixtures for the operation of a convenience store (hereinafter referred to as "Tenant's trade fixtures") which upon consent of Landlord shall be identified in Exhibit C hereto. All such installation shall be done in accordance with plans previously approved by Landlord. Once installed Tenant shall use, maintain in good working order and replace if necessary with equivalent trade fixtures subject to Landlord's approval, all Tenant's trade fixtures. Tenant shall comply with all applicable Federal, state and local laws and regulations relevant to the use and operation of Tenant's trade fictures, and any additions, alterations, rearrangements or improvements thereto which may be required thereby shall be provided by Tenant at Tenant's sole cost and expense. If at any time Tenant's trade fixtures are either partially or wholly destroyed, Tenant shall promptly, repair or replace the same with equivalent fixtures satisfactory to Landlord. During the term hereof, Tenant shall not remove, suffer or permit Tenant's trade fixtures, or any part thereof, to be removed from the leased premises without Landlord's prior written consent. Tenant shall not sell, contract to sell, lease transfer, mortgage, grant a security interest in or otherwise encumber Tenant's trade fixtures or any part thereof, without Landlord's prior written consent.

Tenant shall pay when due all existing liens or encumbrances on and all taxes and assessments now or hereafter imposed on or affecting Tenant's trade fixtures. Except as provided in subsection (b) of this section 5, upon termination of this lease by expiration or otherwise, Tenant shall, at Tenant's sole cost and expense, remove from the leased premises Tenant's trade fixtures and all other personal property owned by Tenant thereon and repair all damage to the leased premises resulting from such removal.

(b) Upon termination of this lease by expiration or otherwise, Tenant shall, subject to the conditions set forth below, have the right to require Landlord to purchase Tenant's trade fixtures for a price equal to the original estimated cost thereof as set forth in Exhibit C hereto less one seventy-second (1/72) of such cost for each month since the installation date as set forth in Exhibit C hereto. Landlord shall have an obligation to purchase Tenant's trade fixtures hereunder only if (1) Tenant's trade fixtures are transferred to Landlord free and clear of all encumbrances, (2) Tenant's trade fixtures have been properly maintained in accordance with this lease, (3) Tenant notifies Landlord in writing prior to the termination of this lease of Tenant's election to require Landlord to purchase Tenant's trade fixtures, (4) Tenant surrenders possession of the leased premises and Tenant's trade fixtures to Landlord upon such termination, and (5) the sale of Tenant's trade fixtures is completed concurrently with such termination.

6. Maintenance of leased premises.

- Tenant has examined and inspected and knows the condition of the (a) leased premises and every part thereof and has received the same in good order and repair and accepts the same in their present condition. Except for Tenant's right to require Landlord to make certain major repairs to the leased premises as set forth in subsection (b) of this section 6, Tenant shall, throughout the term of this lease, at its sole cost and expense, maintain the leased premises and every part thereof, in good and sanitary order, and in a condition fit for Tenant's occupancy and shall repair all subsequent dilapidations of the leased premises which, if unrepaired, would render the same untenantable. Without limitation on the generality of the foregoing. Tenant shall perform the maintenance and repairs specified in Exhibit D hereto. If Tenant fails to make any necessary repairs, then, in addition to its other remedies, Landlord may make such repairs and Tenant shall on demand pay Landlord the reasonable cost thereof. Tenant shall not make any additions, alterations, rearrangements or improvements to the leased premises, or any property thereon, or remove any such property therefrom, without Landlord's prior written consent except as provided by section 5(a). Tenant shall keep the leased premises free and clear from any liens arising out of work performed, materials furnished or obligations incurred by or for Tenant.
- where occasioned by the negligence or willful misconduct of Tenant's agents or employees) to make all major repairs to and to replace when necessary only the following listed facilities and equipment owned or supplied by Landlord: heating, air conditioning and evaporative and refrigerative coolers; fire extinguishers; exterior painting; paving and driveways; piping; signs; wiring; roofs, plumbing, walls, fences and foundations of buildings. Tenant shall immediately discontinue the use of any such facilities or equipment needing repair or replacement to the extent necessary to make the repair or replacement and where necessary to preserve a safe and healthy environment. Landlord shall endeavor to cause such work to be done in a manner so as to minimize interference with the operation of Tenant's business on the leased premises. Tenant shall not be responsible for the payment of any rent to Landlord for the period when such work makes it impractical for tenant to operate a convenience food store on the leased premises, but Landlord shall not be responsible for any sales or profits lost by Tenant as a result of such interruption of Tenant's business.

7. Rights of access.

- (a) Landlord is currently engaged in the business of selling motor fuels to motorists on Landlord's property indicated on Exhibit A hereto (the "adjacent premises") adjacent to the leased premises. During the term hereof, Tenant shall have the right of unimpeded ingress and egress to and from the leased premises across such portion of the adjacent premises as Landlord may from time to time reasonably designate.
- (b) At all times during the term hereof, Landlord shall have the right to keep and maintain on the leased premises in its present location Landlord's console and other equipment controlling the motor fuel pumps on the adjacent premises, and Landlord and its designated representatives shall have the right to enter upon the leased premises at any time to operate and maintain such console and other equipment and to collect payment from motorists for motor fuels sold from the adjacent premises.
- (c) If there are rest rooms on the leased premises which are generally open to the public, Tenant shall at all times during the term of this lease permit Landlord's designated representatives and motorists patronizing the adjacent premises to have access to and to utilize such rest rooms without charge.
- (d) Landlord and its designated representatives shall have the right at any time to enter upon the leased premises to perform Landlord's obligations and to exercise Landlord's rights hereunder and to confirm the performance by Tenant of Tenant's obligations under this lease.

8. Utilities and Taxes.

- (a) Landlord shall pay, promptly and directly, or reimburse Tenant for, all charges and rentals for gas, electricity, water, sewerage and other services or utilities used in or consumed on the leased premises, except that all charges and rentals for telephone services shall be paid by Tenant.
- (b) Landlord shall pay all taxes on the real estate and Landlord's personal property, equipment and fixtures located on the leased premises and Tenant shall pay all taxes on Tenant's own personal property, equipment and fixtures located on the leased premises.

9. Indemnity.

Tenant shall indemnify, defend and hold harmless Landlord, Landlord'sparent company, Chevron Corporation, the subsidiary and affiliated companies of each of them (collectively "Landlord and its affiliates") and their respective directors, officers, agents and employees, from and against all expense, liability and claims for damage to property (including tenant's property) or injury to or death of persons (including Tenant's employees), directly or indirectly resulting, or alleged to result from anything occurring from any cause on or about or in connection with the maintenance, upkeep, repair, replacement or operation of the leased premises or anything located thereon unless due to the sole negligence of Landlord in performing or failing to perform its obligations hereunder.

10. Insurance

(a) Tenant shall maintain, at Tenant's own expense during the term hereof, insurance with respect to Tenant's business, the leased premises and all activities on the leased premises of the types and in the minimum amounts described generally as follows:

(1) Comprehensive General Liability Insurance (bodily injury and property damage) of not less than \$500,000 combined single limit per occurrence, including explosion hazard, personal injury, premisesoperations, products and completed operations, liquor liability. blanket contractual and independent contractorsliability coverages: **(2)** Business Automobile Liability Insurance (bodily injury and property damage) of not less than \$500,000 combined single limit per occurrence on all owned, non-owned and hiredvehicles: and (3) Excess liability insurance of not less than \$1,000,000 per occurrence in excess of the insurance required under (1) and (2) above, affording not less than the same coverage and including personal injury and property damage coverage. (b) The insurance required above shall include Landlord and its affiliates as additional insureds except with regard to occurrences that are the result of their sole negligence. (c) The insurance required above shall provide that it is primary coverage with respect to Tenant, Landlord and all other additional insureds. (d) The insurance required above shall provide that no cancellation or material change in any policy shall become effective except upon thirty (30) days' prior written notice to Landlord. (e) The insurance companies shall have no recourse against Landlord, or any other additional insured, for payment of any premiums or assessments under any policy issued by a mutual insurance company. **(f)** Tenant shall furnish certificates satisfactory to Landlord as evidence that the insurance required above is being maintained. (g) Tenant shall be responsible for all deductibles in all of Tenant's insurance policies. Tenant's indemnity and other obligations shall not be limited by the foregoing insurance requirements. 11. Default and termination. (a) Either party may terminate this lease at any time without cause by giving the other party sixty (60) days' prior written notice of such termination. (b) Each of the following events shall constitute an event of default under this lease: **(1)** Tenant shall fail or omit to pay any rent or any other sum payable hereunder and such failure or ommission continues for a period of ten (10) days after written notice by Landlord; Landlord or Tenant by act or omission breaches or defaults on any other covenant, condition or provision of this lease, which breach or default can be cured and such party fails to -6cure such breach or default within ten (10) days after written notice by the other party; or

- (3) Landlord or Tenant by act or omission breaches or defaults on any covenant, condition or provision of this lease which breach or default cannot be cured, or in the event of any breach or default by Landlord or Tenant after notice of two previous breaches or defaults of any kind has been given hereunder regardless whether the party involved cured such previous breaches or defaults.
- (c) Upon the happening of any event of default, the nondefaulting party may, at its option without any further notice or demand, and in addition to any other rights and remedies given hereunder or by law, have the right to terminate this lease forthwith by giving written notice of termination to the other party.
- (d) Waiver by Landlord or Tenant of one or more breaches or defaults hereunder shall not be deemed to be a waiver of any other or continuing breach or default hereunder. The subsequent acceptance of rent hereunder by Landlord shall not be deemed to be a waiver of any preceding breach or default by Tenant regardless of Landlord's knowledge of such preceding breach or default at the time of acceptance of such rent. No waiver of any provision of this lease by Landlord or Tenant shall be deemed to have been made unless and until such waiver shall have been reduced to writing and executed by the waiving party. Termination of this lease shall not relieve any party of responsibility for obligations incurred prior to termination.

12. <u>Destruction or condemnation</u>.

If the leased premises or a substantial portion thereof are destroyed or taken by eminent domain (the filing of an eminent domain action shall be deemed a taking), or should the operation of the leased premises as a convenience food store be prevented by any law, ordinance or act of lawful authority, either party may terminate this lease upon ten (10) days' written notice to the other or such longer notice as such party may elect to give. Tenant shall have no right or interest in any damages or compensation awarded as the result of taking by eminent domain, which shall be the sole property of Landlord.

13. <u>Underlying estates.</u>

(a) Landlord's interest in the leased premises is or may be a leasehold estate derived from a third party whose interest in the premises may or may not be of record. This lease is subordinate to all the terms and conditions of any lease ("Landlord's underlying ground lease") now in effect, or hereafter entered into, with such third party evidencing such leasehold estate of Landlord.

If Landlord's underlying ground lease is terminated in any manner by either party thereto, Landlord may terminate this lease upon giving Tenant thirty (30) days' prior written notice of such termination or, if it would not be practical for Landlord to give thirty (30) days' prior written notice, at Landlord's election upon giving Tenant prior written notice for such lesser period as is reasonable in the circumstances. Landlord shall in no way be liable to Tenant for any such termination, whether voluntary or involuntary. Tenant agrees that Tenant shall not, by act or omission, breach any of the terms and conditions of Landlord's underlying ground lease of which Tenant has notice.

(b) In order that Landlord may ascertain and verify the calculation of rents under Landlord's underlying ground lease, if the rent thereunder is based on receipts from sales of products or services at the premises, Tenant agrees to keep accurate books and records of the

quantity and dollar amount of all Tenant's sales of merchandise and services, and of Tenant's merchandise cost prices, and to make such books and records available to Landlord for inspection during regular business hours. Tenant further agrees that, if requested by Landlord, Tenant shall give Landlord on or before the fifteenth (15th) day of each calendar month a written statement of all business done at the leased premises during the preceding calendar month in such form and detail as is necessary to substantiate the calculation of rents under Landlord's underlying ground lease for the preceding month.

14. Assignment and subletting.

This lease is personal to Tenant, and Tenant shall not, without Landlord's prior written consent: assign this lease, or any interest therein (either voluntarily or by operation of law) by assignment or other arrangement having similar effect; let or sublet any part or the whole of the leased premises; mortgage this lease; become associated with any other person, directly or indirectly, as a partner or otherwise in regard to tenant's interest or operations under this lease; permit or suffer any lien or encumbrance to be placed upon this lease or interest created hereby or any part thereof; or permit any other person, firm or corporation to occupy the leased premises or any part thereof as a tenant or otherwise. Any sale, conveyance, alienation, transfer or other change of interest in or title to beneficial ownership of fifty percent (50%) or more of the voting stock (or securities convertible into fifty percent (50%) or more of the voting stock) of Tenant, either voluntarily, involuntarily, or by operation of law, merger or other corporate proceeding, or otherwise, shall be construed as an assignment of Tenant's rights hereunder.

15. <u>Surrender</u>.

Upon termination of this lease, by expiration or otherwise, Tenant shall peacefully and quietly surrender and yield up to Landlord, the leased premises and all appurtenances in as good order, condition and repair as the same were in at the execution of this lease, or into which they may be put, reasonable use and wear thereof excepted. Any property remaining on the leased premises after the termination of this lease shall be deemed to have been abandoned by Tenant and may be used or disposed of by Landlord in such manner as Landlord may see fit.

16. Holding over.

If Tenant holds over after the expiration of the term hereof, with or without Landlord's express or implied consent, such holding over shall not create a renewal of this lease by operation of law or otherwise, but shall create only a tenancy for month-to-month and for no longer term, upon all the terms and conditions hereof.

17. Notices.

All notices to be given under this lease shall be in writing and shall be posted by certified mail or personally delivered to the other party at the address set forth below or at such other addresses as either party may designate by written notice to the other. Any such notice shall be deemed received when deposited in the United States mail with postage fully prepaid thereon or when personally delivered.

18. General

In the event of litigation between Landlord and Tenant with regard to the subject matter hereof, the prevailing party shall be entitled to recover its costs and expenses of suit, including reasonable attorneys' fees, in connection therewith. Time is of the essence hereof.

The captions and headings throughout this lease are for convenience of reference only, and the words contained therein shall in no way be held or deemed to define, limit, describe, explain or modify the meaning of any provision, the scope or intent of this lease. All of the covenants of Tenant hereunder shall be deemed and construed to be "conditions" as well as "covenants" as though the words specifically expressing or imparting conditions and covenants were used in each separate instance. Effective as of the commencement of the term hereof, this lease supersedes and terminates any and all prior leases, other agreements or understandings between Landlord and its affiliates and Tenant with regard to the leased premises. This lease constitutes the entire agreement between Landlord and Tenant with regard to the subject matter hereof including Exhibits A through D which are made a part of this lease.

 $\underline{\text{IN WITNESS}}$ WHEREOF, the parties hereto have executed this lease as of the date first hereinabove set forth.
