EXECUTIVE SUMMARY

This report documents efforts to identify potential health risk effects that may occur as a result of construction and operations of the Burbank to Los Angeles Project Section of the California High-Speed Rail (HSR) Project.

The California High-Speed Rail Authority proposes to construct, operate, and maintain an electric-powered HSR system in California. When completed, it will run from San Francisco to Los Angeles in under three hours, at speeds in excess of 200 miles per hour. The system will eventually extend to Sacramento and San Diego, with 800 miles of track and up to 24 stations.

The Burbank to Los Angeles Project Section is approximately 14 linear miles and would travel through the cities of Burbank, Glendale, and Los Angeles on an existing railroad corridor. It would be located within a narrow and constrained urban environment, crossing major streets and highways, with portions adjacent to the Los Angeles River. The Burbank to Los Angeles Project Section would include HSR stations near Hollywood Burbank Airport and at Los Angeles Union Station (LAUS). The HSR alignment would be entirely grade-separated so that the proposed HSR service would not interrupt or interface with other modes of transport, including vehicles, bicycles, and pedestrians.

This Health Risk Assessment (HRA) provides an analysis of localized air pollutant concentrations from the construction phase of the proposed project. The HSR Build Alternative would include several different types of construction activities. This assessment focuses on air pollutants from construction vehicle exhaust and fugitive dust entrainment from soil disturbance activities. Both criteria pollutants and toxic air contaminants were assessed for localized impacts. Analyses were conducted that considered chronic (long-term) and carcinogenic health risks. These analyses followed U.S. Environmental Protection Agency (USEPA), California Office of Environmental Health Hazard Assessment (OEHHA), and South Coast Air Quality Management District (SCAQMD) modeling guidance. Localized air pollutant analyses for roadway vehicles accessing the HSR stations during the operations phase can be found in the *Burbank to Los Angeles Project Section: Air Quality and Global Climate Change Technical Report* (California High Speed Rail Authority and the Federal Railroad Administration 2019).

The HRA includes three separate components: (1) emission inventory; (2) dispersion modeling; and (3) health risk calculations. Emissions from the construction of the HSR Build Alternative were calculated using the California Emission Estimator Model (CalEEMod) and emission factors from the California Air Resources Board (CARB) EMFAC and OFFROAD model. Dispersion modeling was performed using the U.S. EPA American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD) model with meteorological data from the closest SCAQMD monitoring station. Sensitive receptors were placed at ground level at off-site residential, off-site school, and off-site recreational park locations. Cancer risk was calculated using the most recent (March 2015) Office of Environmental Health Hazard Assessment (OEHHA) guidelines for HRAs.

Construction activities associated with the Build Alternative would result in criteria pollutant emissions. Mass burden emission analysis includes maximum daily and annual emissions generated within the SCAQMD for each year of project construction. Emissions of CO and NO_x would exceed the SCAQMD's CEQA thresholds. Construction of the Build Alternative would also exceed the general conformity *de minimis* levels for NO_x. Under the General Conformity Rule, CO and NO_x emissions exceeding the *de minimis* levels can demonstrate conformity by conducting air quality modeling to show that CO and NO₂ concentrations would not cause or contribute to an increase in the severity or frequency of National Ambient Air Quality Standards (NAAQS) violations. Six discrete construction areas that would generate air pollutant emissions in heavy construction areas proximate to sensitive receptors were selected for evaluation. These construction areas include the Burbank SEM Tunneling and Cut and Cover area (i.e., below-grade alignment from Burbank Airport Station to Victory Place); the Burbank Boulevard grade separation area; the Glendale 2-mile rail segment area (i.e., between State Route (SR) 134 and Los Feliz Boulevard); the Metrolink Central Maintenance Facility (CMF) reconfiguration area; the Main Street grade separation area; and the LAUS Platform area. Maximum emissions from these

construction areas were estimated for the duration of construction and assigned to the construction areas where they would occur, relative to the distance to nearby sensitive receptors. The total CO and NO₂ emission concentrations were compared against the NAAQS and the California Ambient Air Quality Standards (CAAQS). The air pollutant dispersion analysis found that CO concentrations were below both the NAAQS and CAAQS. The 1-hour NO₂ concentration would exceed the both the NAAQS and CAAQS. Air pollutant concentrations for diesel particulate matter (DPM) were used in health risk calculations, which evaluated the chronic and carcinogenic health risks at sensitive receptors located near the construction work areas.

As a result of the health risk assessment, the analysis concludes that the various construction activities associated with six discrete construction areas would not generate pollutant concentrations of the magnitude that would result in health risks that exceed the applicable the SCAQMD significance threshold of 10 in one million. None of the discrete construction areas would result in exceedances of applicable thresholds for chronic hazard indices from the construction of the B-LA rail alignment. Therefore, the various construction activities associated with each of the discrete construction areas would not generate pollutant concentrations that result in health risks that exceed applicable thresholds.

1 INTRODUCTION

This report analyzes the potential for localized air quality impacts from the construction phase of the HSR Build Alternative for the Burbank to Los Angeles Project Section. The construction of the proposed project would likely progress in a predetermined series of smaller construction activities planned to accommodate the requirements of all the elements of the project. The areas that were analyzed for potential localized air quality impacts are based on the magnitude of air pollutant emissions, the proximity of sensitive receptors, and the exposure period to these pollutants.

This report describes the methods used to develop construction emission rates for each area of focus, the air pollutant dispersion modeling methods for construction emissions, and the estimated associated health risk impacts. Air pollutant dispersion modeling results were used to predict the ambient impacts of criteria pollutant emissions and evaluate these impacts with respect to the National Ambient Air Quality Standards (NAAQS) and the California Ambient Air Quality Standards (CAAQS). Health risk calculations were performed to evaluate the excess cancer risks and the acute and chronic noncancer health impacts on sensitive receptors located near the construction work areas.

This page intentionally left blank

2 POLLUTANTS OF CONCERN

Criteria pollutants and toxic air contaminants (TAC)¹ were assessed for localized impacts. The following criteria pollutants were considered in this analysis of potential localized impacts:²

- Carbon monoxide (CO)
- Nitrogen dioxide (NO₂)

Noncriteria TACs were also analyzed for potential localized impacts. Sources of TACs include construction equipment exhaust, especially diesel fuel vehicles and equipment. The California Air Resources Board (CARB) and the California Office of Environmental Health Hazard Assessment (OEHHA) have identified TACs that may be emitted from construction vehicle and equipment sources. Construction equipment exhaust may contain diesel particulate matter (DPM), which has been identified by CARB as a TAC based on its potential to cause cancer and other adverse health problems, including respiratory illnesses and increased risk of heart disease. Analyses were conducted that considered chronic (long-term) carcinogenic, chronic non-carcinogenic, and acute (short-term) health risks. These analyses were conducted following OEHHA and South Coast Air Quality Management District (SCAQMD) modeling guidance.

¹ TACs are similar to hazardous air pollutants, a federal term for noncriteria pollutants that pose health impacts.

² Ozone and its precursors (reactive organic gases and oxides of nitrogen [NO_x]) are classified as regional impacts due to the atmospheric transport and chemical conversions that take place over long distances and time scales. Therefore, they are not analyzed in terms of localized impacts. Lead emissions are not considered because the mass emissions of this pollutant are very small and are unlikely to exceed the ambient air quality standards. Lead is quantified as a TAC component since it contains health toxicity factors.

This page intentionally left blank

3 MODELED CONSTRUCTION AREAS

Construction of the project would generate emissions of ROG, NO_x, CO, SO_x, PM₁₀, PM_{2.5}, CO₂, CH₄, and N₂O that could result in short-term air quality and GHG effects. Emissions would originate from off-road equipment exhaust, employee and haul truck vehicle exhaust (on-road vehicles), site grading and earth movement, demolition, building construction, paving, and architectural coating. These emissions would be temporary (i.e., limited to the construction period of between the years 2020 and 2028) and would cease when construction activities are complete.

Combustion exhaust, fugitive dust (PM₁₀ and PM_{2.5}), and fugitive off-gassing (ROG) were estimated using a combination of emission factors and methodologies from CalEEMod, version 2016.3.2, the CARB's EMFAC2014 model and OFFROAD2011 based on project-specific construction data (e.g., schedule, equipment, haul truck material volumes) provided by the project engineering team.

3.1 Project Design Features

The Authority has developed IAMFs that would avoid or minimize potential air quality effects. Because IAMFs are included as part of the project design, they are not considered mitigation and are included as part of the project construction emissions estimate. Specifically, the following emissions benefits achieved by the IAMFs developed by the Authority were assumed in the modeling (refer to Section 9, High Speed Rail Project Impact Avoidance and Minimization Features, for full list of IAMFs):

- Fugitive dust reductions from earthmoving best management practices (AQ-IAMF#1):
 - PM from ground disturbance (i.e., scraping and grading activities), 61 percent
 - PM from unpaved vehicle travel (i.e., re-entrained road dust), 55 percent
 - PM from demolition, 36 percent
- VOC reductions (93 percent) from application of architectural coatings (AQ-IAMF#2).
- Criteria pollutant and GHG reductions from use of renewable diesel (AQ-IAMF#3) in all off-road diesel-powered engines (Lovegrove and Tadross 2018):
 - PM, 30 percent
 - CO_{2e}, 99.1 percent
- Criteria pollutant and GHG reductions from use of Tier 4 off-road engines (AQ-IAMF#4). Emissions reductions vary by pollutant and equipment type. Emissions were modeled using Tier 4 emission rates from CalEEMod.
- Criteria pollutant and GHG reductions from use of model year 2010 or newer on-road engines in heavy-duty, diesel powered trucks (AQ-IAMF#5). Emissions reductions vary by pollutant, analysis year, and air basin. Emissions were modeled using emission rates derived from the CARB's EMFAC2014 model.

While the project design also includes emissions benefits achieved by the implementation of typical control measures such as water sprays, enclosures, and hoods at new concrete batch plants to minimize fugitive dust emissions (AQ-IAMF#6), the modeling for the project section did not account for these emissions benefits because the Authority anticipates that concrete for project construction would be supplied by existing batch plants in the region and that one concrete batch plant may be needed. These existing batch plants would be subject to air quality permits from SCAQMD and would comply with district rules to minimize emissions.

3.2 Regulatory Control Measures

The control measures required by both SCAQMD's Rule 403 (Fugitive Dust) and Rule 1113 (Architectural Coatings) are relatively the same or similar to AQ-IAMF#1 and AQ-IAMF#2, respectively. Accordingly, no additional reductions from compliance with air district rules are assumed in the emissions modeling.

The length of the HSR Build Alternative is approximately 14 miles. For the purposes of this analysis, the following six construction areas were evaluated for the potential to cause localized air quality effects:

- Burbank SEM Tunneling and Cut and Cover Construction Area
 - Construction of a 1.8-mile segment of the below grade alignment south of Burbank Airport Station to Victory Place
- Burbank Boulevard Overcrossing Construction Area
 - Construction of a grade separation Burbank Boulevard over new rail tracks along with the demolition of several buildings, construction of at-grade tracks south to Alameda Avenue, and rail bridge over Alameda Avenue.
- Glendale 2-Miles Rail Segment
 - Construction of a 2-mile segment of the at-grade alignment between SR 134 and Los Feliz Boulevard
- Metrolink Central Maintenance Facilities (CMF) Rail Track Reconfiguration Area
 - Construction of at-grade rail tracks from SR-2 to SR-110
 - Reconfiguration of the Metrolink CMF
- Main Street Grade Separation Construction Area
 - Construction of grade separation areas (Main Street)
 - Construction of the at-grade rail track alignment
- LAUS Platform Construction
 - Construction of the LAUS platforms

3.3 General Assumptions for Methodologies

The sources of air pollutants analyzed in this HRA include heavy equipment usage (bulldozers, backhoes, tractors, excavators, cranes, etc.) and trucks travelling to and from the sites (i.e., concrete trucks, excavation haul trucks, demolished material haul trucks, etc.).

Analysts used project section-specific data provided by the project engineers, including construction equipment lists and the construction schedule, for construction associated with the rail alignment, and performed calculations for each year of construction, which are anticipated to occur from 2020 to 2028. The analysis groups major construction activities into the following categories:

- Land Clearing
- Land Clearing Haul Roads
- Earthmoving
- Tunneling Cut-and-Cover
- Materials Handling
- Laying Track At-Grade
- System Facilities
- Buildings Demolition
- Bridge Demolition
- Elevated Structures Roads
- Elevated Structures Rail
- Roadway Construction
- Burbank Airport Station Construction
- Maintenance Station Facilities
- LAUS Platform Construction

A brief description of the approach and rationale for each construction area is provided in the following sections.

Each of these construction areas were evaluated independently of each other. These six discrete construction areas were selected based on the magnitude of construction, the resulting emissions, and proximity to sensitive receptors, including residents, schools, daycare centers, recreational parks, and hospitals. These selected construction areas were determined to have the highest total maximum daily emission rates; therefore, those emissions were used as a conservative representation of all construction components of the 14-mile alignment. It is assumed that if the selected construction areas do not show an exceedance of the CAAQS/NAAQS, neither will the other localized construction areas. This conclusion is based on the assumption that these selected construction areas will have the highest construction emissions and that any areas with fewer construction activities will have lower ambient air quality impacts. Assumptions about the construction equipment and vehicle estimates were obtained from the HSR construction engineering team and these variables were used in the setup of the AERMOD analysis. Section 5 provides more detailed modeling source parameters.

Since the six discrete construction areas analyzed were selected to represent the worst-case scenarios for construction-related air quality and health risk impacts on the maximum number of sensitive receptors along the Burbank to Los Angeles alignment, not every construction areas results are shown in Sections 4 through 7 applies to every project section Build Alternative. The selection of discrete construction locations was independent of Build Alternative, but the range of areas was designed to capture risks from all project section within the Build Alternative. In cases where multiple construction activities pass through a construction area, the analysis was defined using the highest emissions.

3.4 Burbank SEM Tunneling and Cut and Cover Construction Area

For the Burbank Airport Station to Victory Place rail track segment, a 1.8-mile segment of the alignment from south of the Burbank Airport Station to Victory Place was selected to represent the worst-case scenario of below grade rail construction activities. The construction emissions associated with this construction area include several different phases, such as installation of below-grade airport station, buildings demolition, cut-and-cover tunneling, earthmoving, land clearing, and both below- and at-grade track construction. For localized impacts, the analysis evaluated construction of the tunneling, cut-and-cover, and the at-grade portion of the track. The analysis assumed that emissions from project construction within the remainder of this segment would result in lower emission concentrations because they would have a reduced magnitude of construction activities and/or fewer sensitive receptors in the immediate proximity. The selected segment for analysis is adjacent to residential, commercial, and industrial buildings, as well as schools and recreational parks. Receptors were set at the project fence line boundary, discrete Cartesian receptors extending out to approximately 1,000 feet (300 meters) at up to 25 meters receptor fence line spacing to develop air pollutant concentration contours.

3.5 Burbank Boulevard Overcrossing Construction Area

For the Burbank Boulevard Overcrossing segment, the construction emissions associated with heavy equipment activities from Burbank Blvd Bridge (Road) to Alameda Ave Bridge (Rail) construction area. These construction activities would include bridges and buildings demolition, earthmoving, land clearing, elevated structures roads and rail construction, and both at-grade track and road construction. Receptors were set at the construction work boundary, discrete Cartesian receptors extending out to approximately 1,000 feet (300 meters) at up to 25 meters fence line grid spacing to develop air pollutant concentration contours.

3.6 Glendale 2-Miles Rail Segment

For the Glendale 2-Miles rail segment, a 2-mile segment of the alignment from SR 134 to Los Feliz Boulevard was selected to represent another worst-case scenario of rail construction and track realignment activities. The construction emissions associated with this construction area include several different phases, such as mobilization, demolition, earthmoving, land clearing, at-

grade track construction, and roadway/rail bridges. For localized impacts, the analysis evaluated construction of a 2-mile-long portion of the track. The analysis assumed that emissions from project construction within the remainder of this subsection would result in lower construction emission concentrations because they would have a reduced magnitude of construction and/or fewer sensitive receptors in the immediate proximity. The selected segment for analysis is adjacent to residential and low-income housing, commercial and industrial buildings, and schools. Receptors were set at the construction work boundary, discrete Cartesian receptors extending out to approximately 1,000 feet (300 meters) at up to 25 meters fence line grid spacing to develop air pollutant concentration contours. One roadway (Chevy Chase Drive) is proposed to be closed within this segment, and one new grade separation (Goodwin Avenue) would be built. Two existing railroad bridges (Colorado Street and Los Feliz Boulevard) would require modifications and widening.

3.7 Metrolink CMF Reconfiguration

The existing Metrolink CMF would be reconfigured as part of the HSR Build Alternative, with two electrified tracks placed along the west side of the CMF and two non-electrified tracks located along the east side. This construction area would require relocation and expansion of the rail yard and separation of the HSR alignment from the Amtrak and Metrolink tracks and maintenance facilities. For this analysis, several discrete Cartesian receptors for the local area was set up to evaluate pollutant exposure at residential units and schools. Based on the predominantly westerly wind information from the meteorological data, it is noted that the neighboring schools, playgrounds, parks, and residential areas are located on the downwind side of the CMF. Construction emissions and predicted air concentrations were modeled up to approximately 1,000 feet (300 meters) around the construction area.

3.8 Main Street Grade Separation Construction Area

The new Main Street grade separation was chosen to be the representative construction area for grade separation construction activity, due to the proximity of two large freeway intersections and residential units. This area was modeled using an extensive fence-line receptor network extending outward to cover all residential and mixed-use properties. Discrete receptor locations were set to represent the William Mead Homes just southwest of the Main Street grade separation area.

3.9 Los Angeles Union Station Platforms Construction Area

Emissions from LAUS Platforms construction would be a result of mass site grading and excavation, underground and aboveground facilities construction (i.e., train boarding platforms, the station building, pick-up/drop-off facilities for private autos, and the transit center for buses and shuttles), asphalt paving activities for surface roadways and parking areas, and architectural coatings. Emissions from LAUS Platforms would result from the construction of two 1,000-foot platform, four HSR tracks, and installation of the overhead catenary system. Where applicable, emissions resulting from worker trips, vendor trips, and construction equipment exhaust were included. CalEEMod was used to estimate emissions from the construction phases of the HSR stations.

4 EMISSIONS AND EMISSION RATES

4.1 Emissions from Construction Activities

Construction emissions for the HSR Build Alternative were quantified and analyzed. Proposed project construction activities expected to occur during the maximum daily and average annual construction period were summarized according to the construction schedule presented in Section 3.0 of the CalEEMod output files included in Appendix A of the Air Quality and Global Climate Change Technical Report. Emission estimates were broken down for each year of construction, from 2020 through 2028. Since the precise schedule is yet to be determined, the maximum construction emissions in pounds per hour were used to represent the worst-case emissions for the purpose of emission dispersion modeling and evaluation for a localized impact and potential for a human health risk impact.

Table 4-1 provides a summary of the maximum hourly construction emission data inputs in the dispersion model for each construction phase.

4.2 Emissions for Modeled Construction Work Areas

The emissions shown in

Table 4-1 were applied to the representative construction work areas for use in air dispersion modeling. Pollutant emissions were allocated to represent the types of construction activities and the relative size of the construction area.

Table 4-1 Construction Emission Data Inputs for the High-Speed Rail Build Alternative (pounds per hour)

5 DISPERSION MODELING METHODOLOGY

As the construction activities of the HSR Build Alternative have the potential to cause health impacts on nearby sensitive receptors, AERMOD was used to conduct detailed dispersion modeling analyses to quantify these potential impacts. AERMOD is approved by the U.S. Environmental Protection Agency (USEPA) for estimating the air quality impacts associated with point and fugitive sources in simple and complex terrain. The model was used to simulate meteorological and terrain conditions that affect air pollutant dispersal from construction emission sources and predict pollutant concentrations near the construction work areas. This allowed for a comparison of localized impacts of these construction emissions to the NAAQS and the CAAQS.

Furthermore, the SCAQMD requires that all Health Risk Assessments be prepared in accordance with the *OEHHA Air Toxic Hot Spots Program Risk Assessment Guidelines* (OEHHA 2015a) and using the USEPA's AERMOD air pollutant dispersion model (USEPA, October 2019), the CARB guidance,³ and the CARB computer program. The detailed information on the methodology and data used to conduct the air dispersion modeling is summarized below.

5.1 Inputs

Model: AERMOD Version 19191 was used to conduct the modeling analysis.

Meteorological Data: AERMOD requires meteorological data as input into the model. These are typically processed using AERMET, a pre-processor to AERMOD. AERMET requires surface meteorological data, upper-air meteorological data, and surface parameter data. The SCAQMD has several meteorological data sets that have been processed using AERMET available on its website.⁴ For the 1.8-mile segment, the 2-mile rail segment, and the Metrolink CMF, the nearest representative meteorological data (Burbank data set) were used. For the Main Street crossing and LAUS platform areas, the nearest representative meteorological data (Central Los Angeles data set) were used. Five years of meteorological data from 2012 through 2016 for the Burbank area and data from 2010 through 2011 and 2014 through 2016 for the Central Los Angeles area were used. The SCAQMD contracted the government meteorologist at Miramar to pre-process upper-air data from the Miramar meteorological station into the five-year Burbank meteorological dataset, making the entire dataset ready to use in AERMOD. The pre-processed data set is certified to meet the USEPA data quality requirements for use in AERMOD for regulatory modeling.

Terrain: The SCAQMD required surface roughness of approximately 3 feet (1 meter). Terrain data was downloaded from the U.S. Geological Survey data center and configured for the Universal Transverse Mercator coordinate system, matching the modeling domain of approximately 23,000 feet (7,000 meters) in all directions from the center of the project site. National Elevation Dataset 1/3 10-meter terrain data were downloaded for AERMOD use in determining the receptor elevation to be modeled.

Receptors: Receptors were modeled using a fence-line grid with various receptor spacing from the project fence line to approximately 1,000 feet (300 meters). For the rail segment, the sites were conservatively modeled with sensitive receptors located adjacent to the modeled construction work areas. All receptors were modeled at a height of approximately 6 feet (1.8 meters). All six work areas were set with 25-meter fence-line grid spacing and additional lateral grid spacing at up to 25-meter intervals to approximately 1,000 feet (300 meters). Discrete receptors were placed at sensitive receptor locations (e.g., residential units, senior citizen centers, and elementary schools) to analyze pollutant concentrations.

Source Parameters: Construction work areas were modeled as area (open pit and polygon areas) sources. The area sources were assumed to have a release height of 10 feet (3 meters). Table 5-1 provides a summary of model source parameters. Sources were modeled using the urban land use option, and the population of Burbank, Glendale, and downtown Los Angeles was used for receptor density.

Table 5-1 AERMOD Model Source Parameters

| Construction Work Area | Source Type | Size of Modeled Area ¹ | Release Height |
|--|--------------|--|-----------------------|
| Burbank Tunneling Cut & Cover 1.8-Mile Segment (between Burbank Airport Station and Victory Place) | 1st Open Pit | 1,596,819 square feet (148,349 square meters) | 10 feet (3 meters) |
| | 2nd Areapoly | 701,929 square feet (65,211 square meters) | 10 feet (3 meters) |
| Burbank Boulevard Overcrossing Area | Areapoly | 828,546 square feet (76,975 square meters) | 10 feet (3 meters) |
| Glendale 2-Mile Segment (between SR 134 and Los Feliz Boulevard) | Areapoly | 1,637,313 square feet (152,111 square meters) | 10 feet (3 meters) |
| Metrolink CMF Area | Areapoly | 1,957,237 square feet (181,833 square meters) | 10 feet (3 meters) |
| Main Street Grade Separation | Areapoly | 599,446 square feet (55,691 square meters) | 10 feet (3 meters) |
| LAUS Platforms | Areapoly | 115,687 square feet (10,748 square meters) | 10 feet (3 meters) |

Source: California High Speed Rail (2019)

¹ The sizes of modeled areas are shown as dimensions of length and width where the modeled work area is a rectangular shape. For irregularly shaped modeled work areas, such as those modeled as polygon area sources (Areapoly), the approximate area of the source is shown.

Model Output Options

The AERMOD dispersion model can provide results for different averaging time periods, such as hourly, daily, and annual. The averaging times used for the ambient air quality standards and concentration thresholds are different for each pollutant. To compare the modeling results to the applicable ambient air quality standards and thresholds, criteria pollutant concentrations were calculated as outlined below:

- **NO₂:** The one-hour average, 24-hour average, and annual average concentrations were calculated. The one-hour average was calculated using the multiyear average of the eighth-highest one-hour daily maximum value for each year, consistent with the statistical description of the ambient air quality standard. The annual average concentration was calculated using the average of the five years of meteorological data. In order to convert the NO_x emissions to NO₂ emissions, a default ambient NO₂/NO_x ratio method representing the extent of conversion by distance is applied.
- **CO:** The one-hour and eight-hour averages were calculated. The maximum one-hour and eight-hour concentrations for the five years of meteorological data were used.

6 COMPARISON TO THE AMBIENT AIR QUALITY STANDARDS

In order to determine if the incremental concentrations associated with construction emissions would cause or contribute to exceedances of the NAAQS and the CAAQS, the appropriate background concentrations for all attainment pollutants are required. For a given pollutant, the appropriate background concentration is added to the incremental concentration estimated from the air dispersion modeling. If the combined value exceeds the NAAQS or CAAQS of that pollutant, then the emissions could contribute to exceedances. The background concentrations were based on the SCAQMD-reported monitoring background values where available. For pollutants and averaging times that did not have reported background values from the SCAQMD, the highest recent values of CARB monitors near the HSR Build Alternative were conservatively used, as noted for each pollutant in the following tables.

Table 6-1 and Table 6-2 show the estimated CO and NO₂ ambient air concentrations for each of the construction work areas, respectively. The predicted one-hour NO₂ and annual NO₂ ambient impacts would exceed the one-hour NAAQS and CAAQS standards. The predicted annual NO₂ would exceed the CAAQS. The predicted one- and eight-hour CO ambient impacts for all of the work areas are below the NAAQS and CAAQS.

Table 6-1 Carbon Monoxide Concentrations from Construction Emissions

| Construction Area | Maximum Incremental Off-Site Average CO Concentration (µg/m ³) Unmitigated | | Background CO Concentration (µg/m ³) ¹ | | Total Off-Site CO Concentration (µg/m ³) | | NAAQS (µg/m ³ equivalent) | | CAAQS (µg/m ³ equivalent) | |

7 HEALTH IMPACTS METHODOLOGY

TACs can result in a variety of health impacts. Health impacts are typically classified as carcinogenic (cancer causing) or noncarcinogenic (noncancer-causing). The severity of these adverse health impacts from TACs are typically based on the amount of exposure to the TAC. The methodology used to determine the severity of a health impact is described below for both carcinogenic and noncarcinogenic impacts. Carcinogenic health impacts are typically represented as the estimated excess lifetime cancer risk. SCAQMD considers an excess cancer risk of 10 in 1 million or greater to be significant. Noncarcinogenic health impacts are measured as a hazard index (HI). SCAQMD considers a HI of 1 or greater to be significant (SCAQMD 2015).

7.1 Exposure

The exposure parameters used for estimating the excess lifetime cancer risk and chronic noncancer HI for all potentially exposed populations were obtained using risk assessment guidelines from the OEHHA (unless otherwise noted) and are presented below.

The inhalation dose is a function of the concentration of a chemical and the intake of that chemical. The dose can be calculated as follows:

$$Dose = \frac{Conc * TAF * DBR * ET * EF * ED * CF}{AT}$$

Where:

| | | |
|------|---|--|
| Dose | = | Dose of chemical (mg/kg-day) |
| Conc | = | Chemical concentration in air (µg/m ³) |
| TAF | = | Time Adjustment Factor ⁵ (unitless) |
| DBR | = | Daily Breathing Rate (L/kg-day) |
| ET | = | Exposure Time (hours/day) |
| EF | = | Exposure Frequency (days/year) |
| ED | = | Exposure Duration (years) |
| CF | = | Conversion Factor (m ³ /L and mg/µg) |
| AT | = | Averaging Time (days) |

7.2 Toxicity Assessment

The toxicity assessment characterizes the relationship between the magnitude of exposure and the nature and magnitude of adverse health effects that may result from such exposure. Toxicity values are used in conjunction with the calculated exposures to estimate the likelihood of adverse effects occurring. These adverse health effects are classified into two broad categories: cancer and noncancer endpoints. This section presents the toxicity assessments for DPM.

Diesel exhaust, a complex mixture that includes hundreds of individual constituents, is identified by the state as a known carcinogen. Consistent with California regulatory guidelines, this Health Risk Assessment used DPM as a surrogate measure of carcinogen exposure for the mixture of chemicals that make up diesel exhaust as a whole. Table 7-1 shows the toxicity values for DPM. Although certain components of DPM may pose acute and chronic noncancer health risks, cancer risk is typically the driving health impact for DPM (CARB 2019).

⁵ This factor adjusts the concentration to account for the overlap in time of sources and receptors, and is used for school and daycare receptors.

Table 7-1 Toxicity Factors

| Pollutant | Cancer Potency Factor ¹ | Chronic Reference Exposure Level | Acute Reference Exposure Level |
|-----------|------------------------------------|----------------------------------|--------------------------------|
| DPM | 1.1 | 5 | N/A |

Sources: Office of Environmental Health Hazard Assessment, *Hot Spots Unit Risk and Cancer Potency Values* as of May 2019, <https://oehha.ca.gov/media/CPFs042909.pdf>; Office of Environmental Health Hazard Assessment, *Air Toxicology and Epidemiology: All OEHHA Acute, eight-hour and Chronic Reference Exposure Levels* as of November 2019, <https://oehha.ca.gov/air/general-info/oehha-acute-8-hour-and-chronic-reference-exposure-level-rel-summary>

¹ Cancer potency factors were restricted to inhalation risks.

DPM = diesel particulate matter

N/A = not applicable

OEHHA = Office of Environmental Health Hazard Assessment

7.3 Risk Characterization

The SCAQMD generally categorizes potential health impacts from TACs as carcinogenic and noncarcinogenic effects. The following sections describe how these risks are characterized and calculated.

7.3.1 Carcinogenic Effects

Excess lifetime cancer risks are estimated as the upper-bound incremental probability that an individual will develop cancer over their lifetime as a direct result of exposure to potential carcinogens. The estimated risk is expressed as a unitless probability. The cancer risk attributed to a chemical is calculated by multiplying the chemical intake or dose at the human exchange boundaries (e.g., lungs) by the chemical-specific cancer potency factor. Table 7-2 lists the specific cancer potency factors used in this analysis.

Table 7-2 Exposure Factors

| Population | Age | FAH | DBR/BW (L/kg-day) | ET | EF (days) | ED (years) | CF | AT (years) | ASF |
|--------------|-----------------|------|-------------------|------|-----------|------------|----------|------------|-----|
| Residential | 0 | 1 | 361 | 0.96 | 350 | 9 | 0.000001 | 70 | 10 |
| | 0 to <2 months | 1 | 1,090 | 0.96 | 350 | 9 | 0.000001 | 70 | 10 |
| | 2 to <9 years | 1 | 631 | 0.96 | 350 | 9 | 0.000001 | 70 | 3 |
| | 9 to <16 years | 1 | 572 | 0.96 | 350 | 9 | 0.000001 | 70 | 3 |
| | 16 to <30 years | 0.73 | 261 | 0.96 | 350 | 9 | 0.000001 | 70 | 13 |

Source: Office of Environmental Health Hazard Assessment, Air Toxics Hot Spots Program Guidance Manual for the Preparation of Risk Assessments (February 2015)

1. The FAH is used to adjust the modeled concentration to account for overlap in time of construction emissions and school exposure. This is an adjustment from 24 hours to eight hours and from seven days per week to five days per week. This is consistent with OEHHA guidance.
 2. The mean DBR was used based on recommendations from the OEHHA (2015) and normalized to BW.
 3. The ET accounts for the fraction of time an individual is at the location based on recommendations from OEHHA (2015).
 4. The EF accounts for the number of days of exposure per year.
 5. The ED accounts for the amount of time in years an individual is at the location based on recommendations from OEHHA.
 6. The AT is based on a 70-year exposure.
 7. ASFs are included to adjust the cancer potency factor for early-age exposure based on recommendations from OEHHA (2015).
- ASF = Age Sensitivity Factor
 AT = Averaging Time
 BW = body weight
 CF = Conversion Factor
 CRAF = Cancer Risk Adjustment Factor
 DBR = daily breathing rate
 DBR/BW = daily breathing rate normalized to body weight
 ED = exposure duration
 EF = exposure frequency
 ET = exposure time
 FAH = frequency of time spent at home
 L/kg = liters per kilogram
 OEHHA = Office of Environmental Health Hazard Assessment
 TAF = time adjustment factor

The estimated excess lifetime cancer risk for a resident child, a daycare child, and a schoolchild were adjusted using the age sensitivity factors (ASF) recommended by OEHHA (OEHHA 2015). This approach accounts for the “anticipated special sensitivity to carcinogens” of infants and children. Cancer risk estimates are weighted by a factor of 10 for exposures that occur from the third trimester of pregnancy to two years of age, and by a factor of three for exposures that occur from two years through 15 years of age. No weighting factor (i.e., an ASF of one, which is equivalent to no adjustment) is applied to ages 16 years to 70 years.

For example, individual cancer risk is directly proportional to the frequency and duration of exposure to TACs, modified by age sensitivity factors. The age sensitivity factors multiply the risk by 10 for third-trimester fetuses to age 2 (labeled by OEHHA as “0 < 2”); by 3 for children age 2 to 16 (“2 < 16”), and by 1 for persons age 16 and older.

For each receptor type, the youngest expected age range was modeled in the Health Risk Assessment to produce the most conservative (highest) risk result. For example, the calculation of residential cancer risk assumes that the exposed person is in the third trimester before birth at the beginning of the exposure period. This assumption maximizes the use of the childhood age sensitivity factors in the cancer risk calculation. Moreover, the calculated cancer risk is increased even further during childhood years by using higher breathing rates per body weight than adults.

For each sub-period calculated in this health risk assessment, the average annual construction emissions that would occur during that sub-period were used. The cancer risk results for each sub-period were then summed to obtain the cancer risk for the 9-year construction exposure duration. For example, the residential cancer risk for the proposed project was determined by calculating once for each of three sub-periods. The first sub-period represents a receptor age of $0 < 2$, assumes an exposure duration of two years, and uses construction emissions averaged over the 9-year construction period. The second sub-period represents a receptor age of $2 < 16$ and assumes an exposure duration of 9 years (i.e., the maximum construction duration period). The third sub-period represents a receptor age of $16 < 30$ and also assumes an exposure duration of 9 years. The cancer risks calculated for these three sub-periods were then summed to obtain the total cancer risks for the 9-year construction exposure duration.

The equation used to calculate the potential excess lifetime cancer risk for the inhalation pathway is as follows:

$$\text{Risk}_i = \text{Dose}_i * \text{CPF}_i * \text{ASF}$$

Where:

- Risk_i = Cancer Risk; the incremental probability of an individual developing cancer as a result of inhalation exposure to a particular potential carcinogen (unitless)
- Dose = Dose of chemical (mg/kg-day)
- CPF_i = Cancer Potency Factor for Chemical i (mg chemical/kg body weight-day)¹
- ASF = Age Sensitivity Factor

7.3.2 Noncarcinogenic Effects

The potential for exposure to result in chronic noncancer effects is evaluated by comparing the estimated annual average air concentration (which is equivalent to the average daily air concentration) to the chemical-specific noncancer chronic reference exposure levels.

When calculated for a single chemical, the comparison yields a ratio termed a hazard quotient (HQ). To evaluate the potential for adverse chronic noncancer health effects from simultaneous exposure to multiple chemicals, the HQs for all chemicals are summed, yielding an HI. Conservatively, HIs are the sum of individual HQs, regardless of organ system. Table 7-2 lists the specific reference exposure levels used in this analysis.

The equations used to calculate the chemical-specific HQs consist of the following:

$$\text{Chronic HQ}_i = C_i \div \text{REL}_i$$

Where:

- Chronic HQ_i = Chronic Hazard Quotient for Chemical_i (unitless)
- C_i = Annual Average Air Concentration for Chemical_i (µg/m³)
- REL_i = Chronic Noncancer Reference Exposure Level for Chemical_i (µg/m³)

The OEHHA has not identified potential health risks associated with acute exposure to DPM. As such, acute exposures to DPM are not evaluated further in this analysis.

7.4 Health Risk Assessment Results

For cancer impacts, a threshold of 10 excess cancers in 1 million is used. For a chronic HI, a threshold of 1.0 is used. According to the construction localized emission concentrations from the AERMOD dispersion modeling analysis, construction activities along the alignment (including roadway modifications or grade separations) would present an incremental increase in DPM emissions from construction equipment exhaust that would generate an incremental cancer risk of 2.97 in 1 million for the residential receptor. Table 7-3 presents the highest cancer risk and chronic hazard indices at the maximally exposed individual sensitive receptor location modeled for each work area under the nine-year construction exposure period. Each of the six discrete construction locations analyzed were designed to represent the “worst-case” in terms of construction-related air quality and health risk impacts, typically those that have a large amount of construction activity with exhaust vented to the air near sensitive receptors along the B-LA rail alignment. As shown in Table 7-3, none of the sensitive receptors nearby the six construction areas would exceed the cancer risk thresholds or the chronic hazard indices.

Table 7-3 Diesel Particulate Matter Cancer Risk Associated with Construction Emissions

8 UNCERTAINTIES IN HEALTH RISK

The process of assessing health risks and impacts includes a degree of uncertainty. The level of uncertainty is dependent on the availability of data and the extent to which assumptions are relied upon in cases where the data are incomplete or unknown. All HRAs, including this HRA, rely upon scientific studies in order to reduce the level of uncertainty; however, it is not possible to completely eliminate uncertainty from the analysis. Where assumptions are used to substitute for incomplete or unknown data, it is standard practice to err on the side of health protection in order to avoid underestimating or underreporting the risk to the public. Therefore, as discussed earlier, this HRA used for the purpose of the EIR/EIS followed standard practice of side of health protection in cases where assumptions were relied upon. In general, sources of uncertainty that may lead to an overestimation or an underestimation of the risk include: (1) extrapolation of toxicity data in animals to humans; (2) uncertainty in the estimation of the emissions; (3) uncertainty in the air dispersion models; and (4) uncertainty in the exposure estimates. These sources of uncertainty, as they relate to the HSR Build Alternative, are describe in greater detail below. In addition to uncertainty, there exists “a natural range or variability in the human population in such properties as height, weight, and susceptibility to chemical toxicants.”⁶ As mentioned previously, it is typical to err on the side of health protection by assessing risk on the most sensitive populations, such as children and the elderly. Some examples of uncertainty or overestimation may include:

- Receptor exposure duration: The HRA assumes residents would be exposed to HSR Build Alternative related construction DPM concentration for almost 20 hours per day, 350 days per year. Although fraction of time at home was taken into consideration, most residents would leave the house during the daytime hours for work, school, or other activities away from home. Residents, who leave the home, particularly during daytime hours when construction activity would be taking place on the project sites, would experience a substantially lower exposure duration and a substantially lower risk level.
- Emissions estimation: Emissions from diesel powered equipment are assumed to be running continuously during the construction workday. While some equipment may run continuously during each work day, some equipment may sit idle or be used for only a few hours per day. The HRA assumes a worst-case scenario where all equipment would be running during the workday generating DPM emissions.
- Dispersion modeling parameters: The AERMOD dispersion model is able to account for dust deposition while in transport through the air, which would deplete the plume (lower concentration). As an emissions plume travels from the source to the receptor, heavier particles may drop out of the plume resulting in lower concentrations for receptors located farther away from the source. As a worst-case scenario, the dispersion modeling did not account for plume depletion due to deposition as sensitive receptor are located relatively close to the construction emissions generating activities.

9 CONCLUSIONS

The HSR Build Alternative was evaluated to determine whether the emissions associated with construction would result in localized adverse air quality impacts. The maximum CO and NO₂ emission concentrations were compared against the NAAQS and CAAQS. The air pollutant dispersion analysis found that CO concentrations were below both the NAAQS and CAAQS. The 1-hour NO₂ concentration would exceed the both the NAAQS and CAAQS. In addition, the impacts were assessed by evaluating the increased DPM concentrations and conducting a Health Risk Assessment. In summary, the representative six discrete construction areas would not generate DPM concentration that would result in health risks that exceed applicable the SCAQMD significance threshold of 10 in one million or the for chronic health indices. The findings of significance for potential localized impacts are discussed in Section 3.3 of the Draft Environmental Impact Report/Environmental Impact Statement for the proposed project.

*** MODEL SETUP OPTIONS

SUMMARY ***

**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --

**NO GAS DEPOSITION Data Provided.

**NO PARTICLE DEPOSITION Data Provided.

**Model Uses NO DRY DEPLETION. DRYDPLT = F

**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for 7 Source(s),
for Total of 1 Urban Area(s):

Urban Population = 104834.0 ; Urban Roughness Length = 1.000 m

**Model Allows User-Specified Options:

1. Stack-tip Downwash.
2. Model Assumes Receptors on FLAT Terrain.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Urban Roughness Length of 1.0 Meter Used.

**Other Options Specified:

- FASTAREA - Use hybrid approach to optimize AREA sources;
also applies to LINE sources (formerly TOXICS option)
- ADJ_U* - Use ADJ_U* option for SBL in AERMET
- CCVR_Sub - Meteorological data includes CCVR substitutions
- TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: PM_10

**Model Calculates 1 Short Term Average(s) of: 24-HR
and Calculates PERIOD Averages

**This Run Includes: 7 Source(s); 1 Source Group(s); and
484 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 0 VOLUME source(s)
and: 2 AREA type source(s)

and: 0 LINE source(s)
and: 0 RLINE/RLINEXT source(s)
and: 5 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with 0 line(s)

**Model Set To Continue RUNNING After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 16216

**Output Options Selected:

Model Outputs Tables of PERIOD Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor
(RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting
(PLOTFILE Keyword)
Model Outputs Separate Summary File of High Ranked Values
(SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for
Calm Hours

m for
Missing Hours

b for
Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 236.00 ;
Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC
; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.6 MB of RAM.

**Input Runstream File: aermod.inp

**Output Print File: aermod.out

**Detailed Error/Message File: HSR_B-LA_DPM_BAS_Tunnel_Cut_Cover.err

**File for Summary of Results: HSR_B-LA_DPM_BAS_Tunnel_Cut_Cover.sum

*** MODEL SETUP OPTIONS

SUMMARY ***

**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --

**NO GAS DEPOSITION Data Provided.

**NO PARTICLE DEPOSITION Data Provided.

**Model Uses NO DRY DEPLETION. DRYDPLT = F

**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for 7 Source(s),
for Total of 1 Urban Area(s):

Urban Population = 104834.0 ; Urban Roughness Length = 1.000 m

**Model Allows User-Specified Options:

1. Stack-tip Downwash.
2. Model Accounts for ELEVated Terrain Effects.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Urban Roughness Length of 1.0 Meter Used.

**Other Options Specified:

FASTAREA - Use hybrid approach to optimize AREA sources;
also applies to LINE sources (formerly TOXICS option)
ADJ_U* - Use ADJ_U* option for SBL in AERMET
CCVR_Sub - Meteorological data includes CCVR substitutions
TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Accepts FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: CO

**Model Calculates 2 Short Term Average(s) of: 1-HR 8-HR

**This Run Includes: 7 Source(s); 1 Source Group(s); and
461 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 0 VOLUME source(s)
and: 2 AREA type source(s)
and: 0 LINE source(s)

and: 0 RLINE/RLINEXT source(s)
and: 5 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with 0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 16216

**Output Options Selected:

Model Outputs Tables of Highest Short Term Values by Receptor
(RECTABLE Keyword)

Model Outputs External File(s) of High Values for Plotting
(PLOTFILE Keyword)

Model Outputs Separate Summary File of High Ranked Values
(SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for
Calm Hours

m for
Missing Hours

b for
Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 236.00 ;
Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC
; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.6 MB of RAM.

**Input Runstream File: aermod.inp

**Output Print File: aermod.out

**Detailed Error/Message File: HSR_B-LA_CO_BAS_Tunnel_Cut_Cover.err

**File for Summary of Results: HSR_B-LA_CO_BAS_Tunnel_Cut_Cover.sum

ADJ_U*

*** MODEL SETUP OPTIONS

SUMMARY ***

**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --

**NO GAS DEPOSITION Data Provided.

**NO PARTICLE DEPOSITION Data Provided.

**Model Uses NO DRY DEPLETION. DRYDPLT = F

**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for 7 Source(s),
for Total of 1 Urban Area(s):

Urban Population = 104834.0 ; Urban Roughness Length = 1.000 m

**Model Allows User-Specified Options:

1. Stack-tip Downwash.
2. Model Accounts for ELEVated Terrain Effects.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Ambient Ratio Method Ver 2 (ARM2) Used for NO2 Conversion
with a Minimum NO2/NOx Ratio of 0.500
and a Maximum NO2/NOx Ratio of 0.900
7. Urban Roughness Length of 1.0 Meter Used.

**Other Options Specified:

FASTAREA - Use hybrid approach to optimize AREA sources;
also applies to LINE sources (formerly TOXICS option)
ADJ_U* - Use ADJ_U* option for SBL in AERMET
CCVR_Sub - Meteorological data includes CCVR substitutions
TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Accepts FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: NO2

**Note that special processing requirements apply for the 1-hour NO2
NAAQS - check available guidance.

Model will process user-specified ranks of daily maximum 1-hour values
averaged across the number of years modeled.

For annual NO2 NAAQS modeling, the multi-year maximum of PERIOD values
can be simulated using the MULTYEAR keyword.

Multi-year PERIOD and 1-hour values should only be done in a single model run using the MULTYEAR option with a single multi-year meteorological data file using STARTEND keyword.

**Model Calculates 1 Short Term Average(s) of: 1-HR
and Calculates PERIOD Averages

**This Run Includes: 7 Source(s); 1 Source Group(s); and
461 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 0 VOLUME source(s)
and: 2 AREA type source(s)
and: 0 LINE source(s)
and: 0 RLINE/RLINEXT source(s)
and: 5 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with 0 line(s)

**Model Set To Continue RUNNING After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 16216

**Output Options Selected:

Model Outputs Tables of PERIOD Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor
(RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting
(PLOTFILE Keyword)
Model Outputs Separate Summary File of High Ranked Values
(SUMMFILE Keyword)
Model Outputs External File(s) of Maximum Daily 1-hr Values by
Day (MAXDAILY Keyword)
Model Outputs External File(s) of Maximum Daily 1-hr Values by
Year (MXDYBYR Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for
Calm Hours
m for
Missing Hours
b for
Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 236.00 ;
Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC
; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.6 MB of RAM.

**Input Runstream File: aermod.inp

**Output Print File: aermod.out

**Detailed Error/Message File: HSR_B-LA_NO2_BAS_Tunnel_Cut_Cover.err
**File for Summary of Results: HSR_B-LA_NO2_BAS_Tunnel_Cut_Cover.sum

*** MODEL SETUP OPTIONS

SUMMARY ***

**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --

**NO GAS DEPOSITION Data Provided.

**NO PARTICLE DEPOSITION Data Provided.

**Model Uses NO DRY DEPLETION. DRYDPLT = F

**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for 3 Source(s),
for Total of 1 Urban Area(s):

Urban Population = 104834.0 ; Urban Roughness Length = 1.000 m

**Model Allows User-Specified Options:

1. Stack-tip Downwash.
2. Model Assumes Receptors on FLAT Terrain.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Urban Roughness Length of 1.0 Meter Used.

**Other Options Specified:

FASTAREA - Use hybrid approach to optimize AREA sources;
also applies to LINE sources (formerly TOXICS option)
ADJ_U* - Use ADJ_U* option for SBL in AERMET
CCVR_Sub - Meteorological data includes CCVR substitutions
TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: PM_10

**Model Calculates 1 Short Term Average(s) of: 24-HR
and Calculates PERIOD Averages

**This Run Includes: 3 Source(s); 1 Source Group(s); and
308 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 0 VOLUME source(s)
and: 3 AREA type source(s)

and: 0 LINE source(s)
and: 0 RLINE/RLINEXT source(s)
and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with 0 line(s)

**Model Set To Continue RUNNING After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 16216

**Output Options Selected:

Model Outputs Tables of PERIOD Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor
(RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting
(PLOTFILE Keyword)
Model Outputs Separate Summary File of High Ranked Values
(SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for
Calm Hours

m for
Missing Hours

b for
Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 236.00 ;
Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC
; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.5 MB of RAM.

**Input Runstream File: aermod.inp

**Output Print File: aermod.out

**Detailed Error/Message File: HSR_B-
LA_DPM_Burbank_Bridge_Construction Area.err

**File for Summary of Results: HSR_B-
LA_DPM_Burbank_Bridge_Construction Area.sum

*** MODELOPTs: NonDEFAULT CONC FLAT FASTAREA URBAN ADJ_U*

*** MODEL SETUP OPTIONS

SUMMARY ***

**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --

**NO GAS DEPOSITION Data Provided.

**NO PARTICLE DEPOSITION Data Provided.

**Model Uses NO DRY DEPLETION. DRYDPLT = F

**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for 3 Source(s),
for Total of 1 Urban Area(s):

Urban Population = 104834.0 ; Urban Roughness Length = 1.000 m

**Model Allows User-Specified Options:

1. Stack-tip Downwash.
2. Model Assumes Receptors on FLAT Terrain.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Urban Roughness Length of 1.0 Meter Used.

**Other Options Specified:

FASTAREA - Use hybrid approach to optimize AREA sources;
also applies to LINE sources (formerly TOXICS option)

ADJ_U* - Use ADJ_U* option for SBL in AERMET

CCVR_Sub - Meteorological data includes CCVR substitutions

TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: CO

**Model Calculates 2 Short Term Average(s) of: 1-HR 8-HR

**This Run Includes: 3 Source(s); 1 Source Group(s); and
298 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 0 VOLUME source(s)
and: 3 AREA type source(s)
and: 0 LINE source(s)

and: 0 RLINE/RLINEXT source(s)
and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with 0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 16216

**Output Options Selected:

Model Outputs Tables of Highest Short Term Values by Receptor
(RECTABLE Keyword)

Model Outputs External File(s) of High Values for Plotting
(PLOTFILE Keyword)

Model Outputs Separate Summary File of High Ranked Values
(SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for
Calm Hours

m for
Missing Hours

b for
Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 236.00 ;
Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC
; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.6 MB of RAM.

**Input Runstream File: aermod.inp

**Output Print File: aermod.out

**Detailed Error/Message File: HSR_B-
LA_CO_Burbank_Bridge_Construction_Area.err

**File for Summary of Results: HSR_B-
LA_CO_Burbank_Bridge_Construction_Area.sum

*** MODELOPTs: NonDEFAULT CONC FLAT FASTAREA ARM2 URBAN ADJ_U*

*** MODEL SETUP OPTIONS

SUMMARY ***

**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --

**NO GAS DEPOSITION Data Provided.

**NO PARTICLE DEPOSITION Data Provided.

**Model Uses NO DRY DEPLETION. DRYDPLT = F

**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for 3 Source(s),
for Total of 1 Urban Area(s):

Urban Population = 104834.0 ; Urban Roughness Length = 1.000 m

**Model Allows User-Specified Options:

1. Stack-tip Downwash.
2. Model Assumes Receptors on FLAT Terrain.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Ambient Ratio Method Ver 2 (ARM2) Used for NO2 Conversion
with a Minimum NO2/NOx Ratio of 0.500
and a Maximum NO2/NOx Ratio of 0.900
7. Urban Roughness Length of 1.0 Meter Used.

**Other Options Specified:

FASTAREA - Use hybrid approach to optimize AREA sources;
also applies to LINE sources (formerly TOXICS option)
ADJ_U* - Use ADJ_U* option for SBL in AERMET
CCVR_Sub - Meteorological data includes CCVR substitutions
TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: NO2

**Note that special processing requirements apply for the 1-hour NO2
NAAQS - check available guidance.

Model will process user-specified ranks of daily maximum 1-hour values
averaged across the number of years modeled.

For annual NO2 NAAQS modeling, the multi-year maximum of PERIOD values
can be simulated using the MULTYEAR keyword.

Multi-year PERIOD and 1-hour values should only be done in a single model run using the MULTYEAR option with a single multi-year meteorological data file using STARTEND keyword.

**Model Calculates 1 Short Term Average(s) of: 1-HR
and Calculates PERIOD Averages

**This Run Includes: 3 Source(s); 1 Source Group(s); and
298 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 0 VOLUME source(s)
and: 3 AREA type source(s)
and: 0 LINE source(s)
and: 0 RLINE/RLINEXT source(s)
and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with 0 line(s)

**Model Set To Continue RUNNING After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 16216

**Output Options Selected:

Model Outputs Tables of PERIOD Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor
(RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting
(PLOTFILE Keyword)
Model Outputs Separate Summary File of High Ranked Values
(SUMMFILE Keyword)
Model Outputs External File(s) of Maximum Daily 1-hr Values by
Day (MAXDAILY Keyword)
Model Outputs External File(s) of Maximum Daily 1-hr Values by
Year (MXDYBYR Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for
Calm Hours
m for
Missing Hours
b for
Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 236.00 ;
Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC
; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.6 MB of RAM.

**Input Runstream File: aermod.inp

**Output Print File: aermod.out

**Detailed Error/Message File: HSR_B-
LA_NO2_Burbank_Bridge_Construction_Area.err
**File for Summary of Results: HSR_B-
LA_NO2_Burbank_Bridge_Construction_Area.sum

*** MODELOPTs: NonDEFAULT CONC FLAT FASTAREA URBAN ADJ_U*

*** MODEL SETUP OPTIONS

SUMMARY ***

**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --

**NO GAS DEPOSITION Data Provided.

**NO PARTICLE DEPOSITION Data Provided.

**Model Uses NO DRY DEPLETION. DRYDPLT = F

**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for 1 Source(s),
for Total of 1 Urban Area(s):

Urban Population = 203054.0 ; Urban Roughness Length = 1.000 m

**Model Allows User-Specified Options:

1. Stack-tip Downwash.
2. Model Assumes Receptors on FLAT Terrain.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Urban Roughness Length of 1.0 Meter Used.

**Other Options Specified:

FASTAREA - Use hybrid approach to optimize AREA sources;
also applies to LINE sources (formerly TOXICS option)
ADJ_U* - Use ADJ_U* option for SBL in AERMET
CCVR_Sub - Meteorological data includes CCVR substitutions
TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: PM_10

**Model Calculates 1 Short Term Average(s) of: 24-HR
and Calculates PERIOD Averages

**This Run Includes: 1 Source(s); 1 Source Group(s); and
431 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 0 VOLUME source(s)
and: 1 AREA type source(s)

and: 0 LINE source(s)
and: 0 RLINE/RLINEXT source(s)
and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with 0 line(s)

**Model Set To Continue RUNNING After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 16216

**Output Options Selected:

Model Outputs Tables of PERIOD Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor
(RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting
(PLOTFILE Keyword)
Model Outputs Separate Summary File of High Ranked Values
(SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for
Calm Hours

m for
Missing Hours

b for
Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 236.00 ;
Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC
; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.6 MB of RAM.

**Input Runstream File: aermod.inp

**Output Print File: aermod.out

**Detailed Error/Message File: HSR_B-LA_DPM_Glendale_2-
Mile_Segment.err

**File for Summary of Results: HSR_B-LA_DPM_Glendale_2-
Mile_Segment.sum

*** MODEL SETUP OPTIONS

SUMMARY ***

**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --

**NO GAS DEPOSITION Data Provided.

**NO PARTICLE DEPOSITION Data Provided.

**Model Uses NO DRY DEPLETION. DRYDPLT = F

**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for 1 Source(s),
for Total of 1 Urban Area(s):

Urban Population = 203054.0 ; Urban Roughness Length = 1.000 m

**Model Allows User-Specified Options:

1. Stack-tip Downwash.
2. Model Accounts for ELEVated Terrain Effects.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Urban Roughness Length of 1.0 Meter Used.

**Other Options Specified:

FASTAREA - Use hybrid approach to optimize AREA sources;
also applies to LINE sources (formerly TOXICS option)
ADJ_U* - Use ADJ_U* option for SBL in AERMET
CCVR_Sub - Meteorological data includes CCVR substitutions
TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Accepts FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: CO

**Model Calculates 2 Short Term Average(s) of: 1-HR 8-HR

**This Run Includes: 1 Source(s); 1 Source Group(s); and
417 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 0 VOLUME source(s)
and: 1 AREA type source(s)
and: 0 LINE source(s)

and: 0 RLINE/RLINEXT source(s)
and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with 0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 16216

**Output Options Selected:

Model Outputs Tables of Highest Short Term Values by Receptor
(RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting
(PLOTFILE Keyword)
Model Outputs Separate Summary File of High Ranked Values
(SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for
Calm Hours

m for
Missing Hours

b for
Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 236.00 ;
Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC
; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.6 MB of RAM.

**Input Runstream File: aermod.inp

**Output Print File: aermod.out

**Detailed Error/Message File: HSR_B-LA_CO_Glendale_2-
Miles_Segment.err

**File for Summary of Results: HSR_B-LA_CO_Glendale_2-
Miles_Segment.sum

*** MODEL SETUP OPTIONS

SUMMARY ***

**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --

**NO GAS DEPOSITION Data Provided.

**NO PARTICLE DEPOSITION Data Provided.

**Model Uses NO DRY DEPLETION. DRYDPLT = F

**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for 1 Source(s),
for Total of 1 Urban Area(s):

Urban Population = 203054.0 ; Urban Roughness Length = 1.000 m

**Model Allows User-Specified Options:

1. Stack-tip Downwash.
2. Model Accounts for ELEVated Terrain Effects.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Ambient Ratio Method Ver 2 (ARM2) Used for NO2 Conversion
with a Minimum NO2/NOx Ratio of 0.500
and a Maximum NO2/NOx Ratio of 0.900
7. Urban Roughness Length of 1.0 Meter Used.

**Other Options Specified:

FASTAREA - Use hybrid approach to optimize AREA sources;
also applies to LINE sources (formerly TOXICS option)

ADJ_U* - Use ADJ_U* option for SBL in AERMET

CCVR_Sub - Meteorological data includes CCVR substitutions

TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Accepts FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: NO2

**Note that special processing requirements apply for the 1-hour NO2
NAAQS - check available guidance.

Model will process user-specified ranks of daily maximum 1-hour values
averaged across the number of years modeled.

For annual NO2 NAAQS modeling, the multi-year maximum of PERIOD values
can be simulated using the MULTYEAR keyword.

Multi-year PERIOD and 1-hour values should only be done in a single model run using the MULTYEAR option with a single multi-year meteorological data file using STARTEND keyword.

**Model Calculates 1 Short Term Average(s) of: 1-HR
and Calculates PERIOD Averages

**This Run Includes: 1 Source(s); 1 Source Group(s); and
417 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 0 VOLUME source(s)
and: 1 AREA type source(s)
and: 0 LINE source(s)
and: 0 RLINE/RLINEXT source(s)
and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with 0 line(s)

**Model Set To Continue RUNNING After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 16216

**Output Options Selected:

Model Outputs Tables of PERIOD Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor
(RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting
(PLOTFILE Keyword)
Model Outputs Separate Summary File of High Ranked Values
(SUMMFILE Keyword)
Model Outputs External File(s) of Maximum Daily 1-hr Values by
Day (MAXDAILY Keyword)
Model Outputs External File(s) of Maximum Daily 1-hr Values by
Year (MXDYBYR Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for
Calm Hours
m for
Missing Hours
b for
Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 236.00 ;
Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC
; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.6 MB of RAM.

**Input Runstream File: aermod.inp

**Output Print File: aermod.out

**Detailed Error/Message File: HSR_B-LA_NO2_Glendale_2-
Miles_Segment.err
**File for Summary of Results: HSR_B-LA_NO2_Glendale_2-
Miles_Segment.sum

*** MODELOPTs: NonDEFAULT CONC FLAT FASTAREA URBAN ADJ_U*

*** MODEL SETUP OPTIONS

SUMMARY ***

**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --

**NO GAS DEPOSITION Data Provided.

**NO PARTICLE DEPOSITION Data Provided.

**Model Uses NO DRY DEPLETION. DRYDPLT = F

**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for 2 Source(s),
for Total of 1 Urban Area(s):

Urban Population = 800000.0 ; Urban Roughness Length = 1.000 m

**Model Allows User-Specified Options:

1. Stack-tip Downwash.
2. Model Assumes Receptors on FLAT Terrain.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Urban Roughness Length of 1.0 Meter Used.

**Other Options Specified:

FASTAREA - Use hybrid approach to optimize AREA sources;
also applies to LINE sources (formerly TOXICS option)
ADJ_U* - Use ADJ_U* option for SBL in AERMET
TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: PM_10

**Model Calculates 1 Short Term Average(s) of: 24-HR
and Calculates PERIOD Averages

**This Run Includes: 2 Source(s); 1 Source Group(s); and
473 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 0 VOLUME source(s)
and: 2 AREA type source(s)
and: 0 LINE source(s)

and: 0 RLINE/RLINEXT source(s)
and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with 0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 16216

**Output Options Selected:

Model Outputs Tables of PERIOD Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor
(RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting
(PLOTFILE Keyword)
Model Outputs Separate Summary File of High Ranked Values
(SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for
Calm Hours

m for
Missing Hours

b for
Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 87.00 ;
Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC
; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.6 MB of RAM.

**Input Runstream File: aermod.inp
**Output Print File: aermod.out

**Detailed Error/Message File: HSR_B-LA_DPM_CMF_Construction_Area.err
**File for Summary of Results: HSR_B-LA_DPM_CMF_Construction_Area.sum

*** MODELOPTs: NonDEFAULT CONC ELEV FLGPOL FASTAREA URBAN ADJ_U*

*** MODEL SETUP OPTIONS

SUMMARY ***

**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --

**NO GAS DEPOSITION Data Provided.

**NO PARTICLE DEPOSITION Data Provided.

**Model Uses NO DRY DEPLETION. DRYDPLT = F

**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for 2 Source(s),
for Total of 1 Urban Area(s):

Urban Population = 800000.0 ; Urban Roughness Length = 1.000 m

**Model Allows User-Specified Options:

1. Stack-tip Downwash.
2. Model Accounts for ELEVated Terrain Effects.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Urban Roughness Length of 1.0 Meter Used.

**Other Options Specified:

FASTAREA - Use hybrid approach to optimize AREA sources;
also applies to LINE sources (formerly TOXICS option)

ADJ_U* - Use ADJ_U* option for SBL in AERMET

TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Accepts FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: CO

**Model Calculates 2 Short Term Average(s) of: 1-HR 8-HR

**This Run Includes: 2 Source(s); 1 Source Group(s); and
446 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 0 VOLUME source(s)
and: 2 AREA type source(s)
and: 0 LINE source(s)
and: 0 RLINE/RLINEXT source(s)

and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with 0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 16216

**Output Options Selected:

Model Outputs Tables of Highest Short Term Values by Receptor
(RECTABLE Keyword)

Model Outputs External File(s) of High Values for Plotting
(PLOTFILE Keyword)

Model Outputs Separate Summary File of High Ranked Values
(SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for
Calm Hours

m for
Missing Hours

b for
Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 87.00 ;

Decay Coef. = 0.000 ; Rot. Angle = 0.0

Emission Units = GRAMS/SEC

; Emission Rate Unit Factor = 0.10000E+07

Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.6 MB of RAM.

**Input Runstream File: aermod.inp

**Output Print File: aermod.out

**Detailed Error/Message File: HSR_B-LA_CO_CMF_Construction_Area.err

**File for Summary of Results: HSR_B-LA_CO_CMF_Construction_Area.sum

*** MODEL SETUP OPTIONS

SUMMARY ***

**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --

**NO GAS DEPOSITION Data Provided.

**NO PARTICLE DEPOSITION Data Provided.

**Model Uses NO DRY DEPLETION. DRYDPLT = F

**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for 2 Source(s),
for Total of 1 Urban Area(s):

Urban Population = 800000.0 ; Urban Roughness Length = 1.000 m

**Model Allows User-Specified Options:

1. Stack-tip Downwash.
2. Model Assumes Receptors on FLAT Terrain.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Ambient Ratio Method Ver 2 (ARM2) Used for NO2 Conversion
with a Minimum NO2/NOx Ratio of 0.500
and a Maximum NO2/NOx Ratio of 0.900
7. Urban Roughness Length of 1.0 Meter Used.

**Other Options Specified:

FASTAREA - Use hybrid approach to optimize AREA sources;
also applies to LINE sources (formerly TOXICS option)

ADJ_U* - Use ADJ_U* option for SBL in AERMET

TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Accepts FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: NO2

**NOTE: Special processing requirements applicable for the 1-hour NO2
NAAQS have been disabled!!!

User has specified H1H on the POLLUTID keyword.

High ranked 1-hour values are NOT averaged across the number of
years modeled, and

complete years of data are NOT required.

**Model Calculates 1 Short Term Average(s) of: 1-HR
and Calculates PERIOD Averages

**This Run Includes: 2 Source(s); 1 Source Group(s); and
446 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 0 VOLUME source(s)

**Model Set To Continue RUNNING After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 16216

**Output Options Selected:

Model Outputs Tables of PERIOD Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor
(RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting
(PLOTFILE Keyword)
Model Outputs Separate Summary File of High Ranked Values
(SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for
Calm Hours
m for
Missing Hours
b for
Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 87.00 ;
Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC
; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.6 MB of RAM.

**Input Runstream File: aermod.inp
**Output Print File: aermod.out

**Detailed Error/Message File: HSR_B-LA_NO2_CMF_Construction_Area.err
**File for Summary of Results: HSR_B-LA_NO2_CMF_Construction_Area.sum

*** MODEL SETUP OPTIONS

SUMMARY ***

**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --

**NO GAS DEPOSITION Data Provided.

**NO PARTICLE DEPOSITION Data Provided.

**Model Uses NO DRY DEPLETION. DRYDPLT = F

**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for 3 Source(s),
for Total of 1 Urban Area(s):

Urban Population = 800000.0 ; Urban Roughness Length = 1.000 m

**Model Allows User-Specified Options:

1. Stack-tip Downwash.
2. Model Assumes Receptors on FLAT Terrain.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Urban Roughness Length of 1.0 Meter Used.

**Other Options Specified:

FASTAREA - Use hybrid approach to optimize AREA sources;
also applies to LINE sources (formerly TOXICS option)

ADJ_U* - Use ADJ_U* option for SBL in AERMET

TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: PM_10

**Model Calculates 1 Short Term Average(s) of: 24-HR
and Calculates PERIOD Averages

**This Run Includes: 3 Source(s); 1 Source Group(s); and
319 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 0 VOLUME source(s)
and: 3 AREA type source(s)
and: 0 LINE source(s)

and: 0 RLINE/RLINEXT source(s)
and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with 0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 16216

**Output Options Selected:

Model Outputs Tables of PERIOD Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor
(RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting
(PLOTFILE Keyword)
Model Outputs Separate Summary File of High Ranked Values
(SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for
Calm Hours
m for
Missing Hours
b for
Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 87.00 ;
Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC
; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.6 MB of RAM.

**Input Runstream File: aermod.inp
**Output Print File: aermod.out

**Detailed Error/Message File: HSR_B-
LA_DPM_Main_Street_Construction_Area.err
**File for Summary of Results: HSR_B-
LA_DPM_Main_Street_Construction_Area.sum

*** MODELOPTs: NonDEFAULT CONC ELEV FASTAREA URBAN ADJ_U*

*** MODEL SETUP OPTIONS

SUMMARY ***

**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --

**NO GAS DEPOSITION Data Provided.

**NO PARTICLE DEPOSITION Data Provided.

**Model Uses NO DRY DEPLETION. DRYDPLT = F

**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for 3 Source(s),
for Total of 1 Urban Area(s):

Urban Population = 800000.0 ; Urban Roughness Length = 1.000 m

**Model Allows User-Specified Options:

1. Stack-tip Downwash.
2. Model Accounts for ELEVated Terrain Effects.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Urban Roughness Length of 1.0 Meter Used.

**Other Options Specified:

FASTAREA - Use hybrid approach to optimize AREA sources;
also applies to LINE sources (formerly TOXICS option)

ADJ_U* - Use ADJ_U* option for SBL in AERMET

TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: CO

**Model Calculates 2 Short Term Average(s) of: 1-HR 8-HR

**This Run Includes: 3 Source(s); 1 Source Group(s); and
310 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 0 VOLUME source(s)
and: 3 AREA type source(s)
and: 0 LINE source(s)
and: 0 RLINE/RLINEXT source(s)

and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with 0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 16216

**Output Options Selected:

Model Outputs Tables of Highest Short Term Values by Receptor
(RECTABLE Keyword)

Model Outputs External File(s) of High Values for Plotting
(PLOTFILE Keyword)

Model Outputs Separate Summary File of High Ranked Values
(SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for
Calm Hours

m for
Missing Hours

b for
Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 87.00 ;

Decay Coef. = 0.000 ; Rot. Angle = 0.0

Emission Units = GRAMS/SEC

; Emission Rate Unit Factor = 0.10000E+07

Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.6 MB of RAM.

**Input Runstream File: aermod.inp

**Output Print File: aermod.out

**Detailed Error/Message File: HSR_B-
LA_CO_Main_Street_Construction_Area.err

**File for Summary of Results: HSR_B-
LA_CO_Main_Street_Construction_Area.sum

ADJ_U*

*** MODEL SETUP OPTIONS

SUMMARY ***

**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --

**NO GAS DEPOSITION Data Provided.

**NO PARTICLE DEPOSITION Data Provided.

**Model Uses NO DRY DEPLETION. DRYDPLT = F

**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for 3 Source(s),
for Total of 1 Urban Area(s):

Urban Population = 800000.0 ; Urban Roughness Length = 1.000 m

**Model Allows User-Specified Options:

1. Stack-tip Downwash.
2. Model Accounts for ELEVated Terrain Effects.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Ambient Ratio Method Ver 2 (ARM2) Used for NO2 Conversion
with a Minimum NO2/NOx Ratio of 0.500
and a Maximum NO2/NOx Ratio of 0.900
7. Urban Roughness Length of 1.0 Meter Used.

**Other Options Specified:

FASTAREA - Use hybrid approach to optimize AREA sources;
also applies to LINE sources (formerly TOXICS option)

ADJ_U* - Use ADJ_U* option for SBL in AERMET

TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Accepts FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: NO2

**Note that special processing requirements apply for the 1-hour NO2
NAAQS - check available guidance.

Model will process user-specified ranks of daily maximum 1-hour values
averaged across the number of years modeled.

For annual NO2 NAAQS modeling, the multi-year maximum of PERIOD values
can be simulated using the MULTYEAR keyword.

Multi-year PERIOD and 1-hour values should only be done in a single model run using the MULTYEAR option with a single multi-year meteorological data file using STARTEND keyword.

**Model Calculates 1 Short Term Average(s) of: 1-HR
and Calculates PERIOD Averages

**This Run Includes: 3 Source(s); 1 Source Group(s); and
310 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 0 VOLUME source(s)
and: 3 AREA type source(s)
and: 0 LINE source(s)
and: 0 RLINE/RLINEXT source(s)
and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with 0 line(s)

**Model Set To Continue RUNNING After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 16216

**Output Options Selected:

Model Outputs Tables of PERIOD Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor
(RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting
(PLOTFILE Keyword)
Model Outputs Separate Summary File of High Ranked Values
(SUMMFILE Keyword)
Model Outputs External File(s) of Maximum Daily 1-hr Values by
Day (MAXDAILY Keyword)
Model Outputs External File(s) of Maximum Daily 1-hr Values by
Year (MXDYBYR Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for
Calm Hours
m for
Missing Hours
b for
Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 87.00 ;
Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC
; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.6 MB of RAM.

**Input Runstream File: aermod.inp

**Output Print File: aermod.out

**Detailed Error/Message File:
HSR_B_LA_NO2_Main_Street_Construction_Area.err
**File for Summary of Results:
HSR_B_LA_NO2_Main_Street_Construction_Area.sum

*** MODELOPTs: NonDEFAULT CONC FLAT FASTAREA URBAN ADJ_U*

*** MODEL SETUP OPTIONS

SUMMARY ***

**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --

**NO GAS DEPOSITION Data Provided.

**NO PARTICLE DEPOSITION Data Provided.

**Model Uses NO DRY DEPLETION. DRYDPLT = F

**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for 1 Source(s),
for Total of 1 Urban Area(s):

Urban Population = 800000.0 ; Urban Roughness Length = 1.000 m

**Model Allows User-Specified Options:

1. Stack-tip Downwash.
2. Model Assumes Receptors on FLAT Terrain.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Urban Roughness Length of 1.0 Meter Used.

**Other Options Specified:

FASTAREA - Use hybrid approach to optimize AREA sources;
also applies to LINE sources (formerly TOXICS option)

ADJ_U* - Use ADJ_U* option for SBL in AERMET

TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: PM_10

**Model Calculates 1 Short Term Average(s) of: 24-HR
and Calculates PERIOD Averages

**This Run Includes: 1 Source(s); 1 Source Group(s); and
82 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 0 VOLUME source(s)
and: 1 AREA type source(s)
and: 0 LINE source(s)

and: 0 RLINE/RLINEXT source(s)
and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with 0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 16216

**Output Options Selected:

Model Outputs Tables of PERIOD Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor
(RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting
(PLOTFILE Keyword)
Model Outputs Separate Summary File of High Ranked Values
(SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for
Calm Hours
m for
Missing Hours
b for
Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 87.00 ;
Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC
; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.5 MB of RAM.

**Input Runstream File: aermod.inp
**Output Print File: aermod.out

**Detailed Error/Message File: HSR_B-
LA_DPM_LAUS_Platform_Construction_Area.err
**File for Summary of Results: HSR_B-
LA_DPM_LAUS_Platform_Construction_Area.sum

*** MODELOPTs: NonDEFAULT CONC ELEV FLGPOL FASTAREA URBAN ADJ_U*

*** MODEL SETUP OPTIONS

SUMMARY ***

**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --

**NO GAS DEPOSITION Data Provided.

**NO PARTICLE DEPOSITION Data Provided.

**Model Uses NO DRY DEPLETION. DRYDPLT = F

**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for 1 Source(s),
for Total of 1 Urban Area(s):

Urban Population = 800000.0 ; Urban Roughness Length = 1.000 m

**Model Allows User-Specified Options:

1. Stack-tip Downwash.
2. Model Accounts for ELEVated Terrain Effects.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Urban Roughness Length of 1.0 Meter Used.

**Other Options Specified:

FASTAREA - Use hybrid approach to optimize AREA sources;
also applies to LINE sources (formerly TOXICS option)
ADJ_U* - Use ADJ_U* option for SBL in AERMET
TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Accepts FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: CO

**Model Calculates 2 Short Term Average(s) of: 1-HR 8-HR

**This Run Includes: 1 Source(s); 1 Source Group(s); and
82 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 0 VOLUME source(s)
and: 1 AREA type source(s)
and: 0 LINE source(s)
and: 0 RLINE/RLINEXT source(s)

and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with 0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 16216

**Output Options Selected:

Model Outputs Tables of Highest Short Term Values by Receptor
(RECTABLE Keyword)

Model Outputs External File(s) of High Values for Plotting
(PLOTFILE Keyword)

Model Outputs Separate Summary File of High Ranked Values
(SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for
Calm Hours

m for
Missing Hours

b for
Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 87.00 ;

Decay Coef. = 0.000 ; Rot. Angle = 0.0

Emission Units = GRAMS/SEC

; Emission Rate Unit Factor = 0.10000E+07

Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.5 MB of RAM.

**Input Runstream File: aermod.inp

**Output Print File: aermod.out

**Detailed Error/Message File: HSR_B-
LA_CO_LAUS_Platform_Construction_Area.err

**File for Summary of Results: HSR_B-
LA_CO_LAUS_Platform_Construction_Area.sum

ADJ_U*

*** MODEL SETUP OPTIONS

SUMMARY ***

**Model Is Setup For Calculation of Average CONCentration Values.

-- DEPOSITION LOGIC --

**NO GAS DEPOSITION Data Provided.

**NO PARTICLE DEPOSITION Data Provided.

**Model Uses NO DRY DEPLETION. DRYDPLT = F

**Model Uses NO WET DEPLETION. WETDPLT = F

**Model Uses URBAN Dispersion Algorithm for the SBL for 1 Source(s),
for Total of 1 Urban Area(s):

Urban Population = 800000.0 ; Urban Roughness Length = 1.000 m

**Model Allows User-Specified Options:

1. Stack-tip Downwash.
2. Model Accounts for ELEVated Terrain Effects.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.
6. Ambient Ratio Method Ver 2 (ARM2) Used for NO2 Conversion
with a Minimum NO2/NOx Ratio of 0.200
and a Maximum NO2/NOx Ratio of 0.900
7. Urban Roughness Length of 1.0 Meter Used.

**Other Options Specified:

FASTAREA - Use hybrid approach to optimize AREA sources;
also applies to LINE sources (formerly TOXICS option)
ADJ_U* - Use ADJ_U* option for SBL in AERMET
TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Accepts FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: NO2

**Note that special processing requirements apply for the 1-hour NO2
NAAQS - check available guidance.

Model will process user-specified ranks of daily maximum 1-hour values
averaged across the number of years modeled.

For annual NO2 NAAQS modeling, the multi-year maximum of PERIOD values
can be simulated using the MULTYEAR keyword.

Multi-year PERIOD and 1-hour values should only be done in a single model run using the MULTYEAR option with a single multi-year meteorological data file using STARTEND keyword.

**Model Calculates 1 Short Term Average(s) of: 1-HR
and Calculates PERIOD Averages

**This Run Includes: 1 Source(s); 1 Source Group(s); and
82 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 0 VOLUME source(s)
and: 1 AREA type source(s)
and: 0 LINE source(s)
and: 0 RLINE/RLINEXT source(s)
and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with 0 line(s)

**Model Set To Continue RUNNING After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 16216

**Output Options Selected:

Model Outputs Tables of PERIOD Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor
(RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting
(PLOTFILE Keyword)
Model Outputs Separate Summary File of High Ranked Values
(SUMMFILE Keyword)
Model Outputs External File(s) of Maximum Daily 1-hr Values by
Day (MAXDAILY Keyword)
Model Outputs External File(s) of Maximum Daily 1-hr Values by
Year (MXDYBYR Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for
Calm Hours
m for
Missing Hours
b for
Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 87.00 ;
Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC
; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.5 MB of RAM.

**Input Runstream File: aermod.inp
**Output Print File: aermod.out

**Detailed Error/Message File: HSR_B-
LA_NO2_LAUS_Platform_Construction_Area.err
**File for Summary of Results: HSR_B-

ATTACHMENT B: HUMAN HEALTH RISK ANALYSIS

This attachment contains the following summary sheets and calculations sheets for each of the scenarios analyzed:

1. Burbank Airport Station SEM Tunneling and Cut and Cover Rail Segment Construction Area
2. Burbank Boulevard Grade Separation Construction Area
3. Glendale 2-mile Track Segment Construction Area
4. Metrolink CMF Construction Area
5. Main Street Overpass Construction Area
6. Los Angeles Union Station Platform Construction Area

This page intentionally left blank

Notes:
 *** Chronic hazard quotient calculated for the maximally exposed individual. This is assumed to be the 30 to 70 year residential exposure. Average annual exposure concentration is used, calculated over five years of representative MET and Terrain data..
 * Based on the estimated 5-year average annual ground-level concentrations
 ** Regulatory acceptable threshold is 10 per million, or 1.00E-05.
Acronyms and abbreviations:
 DPM diesel particulate matter
 (µg/m3) micrograms per cubic meter
 Unacceptable cancer risk level, greater than 1.00E-5
 Unacceptable chronic hazard quotient, greater than 1.0E+0
 UTM Universal Transverse Mercator coordinate system (standard system to locate objects on the surface of Earth)
