THE CITY OF PLEASANTON

MEMORANDUM

Date: July 9, 2019

From: Gerry Beaudin, Director of Community Development – Community Development Department

Subject: Case Nos. PUD-105 and P14-0852 / Johnson Drive Economic Development Zone (JDEDZ) Supplemental Air Quality Analysis

---

Following the City's certification of the Supplemental Environmental Impact Report (SEIR) and approval of the JDEDZ, "an unincorporated association" of persons calling themselves Pleasanton Citizens for Responsible Growth (the "Petitioners") filed a lawsuit asking the court to rescind the City Council's JDEDZ approvals due to alleged violations of the California Environmental Quality Act (CEQA). Petitioners alleged that the SEIR had an incomplete air quality analysis related to the Stoneridge Apartment Community (located on the west side of I-680 near Stoneridge Mall at 6250 through 6450 Stoneridge Mall Road). In September 2018, the City and Costco agreed to rescind the JDEDZ approvals in order to perform supplemental air quality analysis for the JDEDZ project. In return, Petitioners dismissed the lawsuit.

In working with the City's outside counsel, Rick Jarvis of Jarvis, Fay & Gibson, LLP, and environmental consultant, Environmental Science Associates (ESA), the City decided to expand the scope of work beyond the supplemental air quality analysis in order to more comprehensively identify and mitigate for any additional impacts created by the JDEDZ. Accordingly, the City directed ESA to prepare the following analyses:

- Health Risk Assessment (HRA)
- Updated Air Quality Technical Memorandum – Criteria Pollutant Emissions Analysis
- Greenhouse Gas Analysis
- Energy Resources Technical Memorandum

The methodology and a summary of the findings, as well as any newly identified impacts and mitigations, unveiled by the analyses listed above is provided in subsequent sections of this memorandum. Full copies of each of the analyses, including their appendices and/or any attachments are attached to this memorandum and/or are available by request to the City's Planning Division.

Additionally, this memorandum includes a summary of the findings of the Economic Impact Analysis prepared by ALH Economics that was circulated for public comment as part of the Draft SEIR in 2015. No changes have been made to the Economic Impact Analysis; however; the City has agreed to recirculate this analysis for additional public comment pursuant to a request from the Petitioners. The full Economic Impact Analysis including any appendices and/or any attachments are attached to this memorandum and/or are available by request to the City's Planning Division.

Health Risk Assessment

The HRA evaluates potential health risks associated with toxic air contaminants (TACs) resulting from the JDEDZ. Health risks were assessed for exposure of nearby sensitive receptors to TAC emissions resulting from construction and operation of the JDEDZ. The HRA was conducted to evaluate whether construction and operation of the JDEDZ would expose sensitive receptors to substantial concentrations of TACs or respirable particulate matter, and whether JDEDZ project-level impacts related to TAC exposure would be significant. The HRA was also prepared to assess the exposure of sensitive receptors to cumulative concentrations of TACs and respirable particulate matter from construction and operation of the JDEDZ when combined with past, present and other reasonably foreseeable development in the vicinity, including existing permitted stationary sources and Interstates 680 and 580.

The HRA evaluates JDEDZ risks at existing on-site businesses and surrounding residential units, businesses and fitness clubs that are within 1,000 feet of the JDEDZ boundary. Both sensitive receptors and worker receptors within the study domain were included. Although the Bay Area Air Quality Management District (BAAQMD) does not consider worker receptors as sensitive receptors, and therefore does not require that HRAs include worker risk evaluation, the HRA includes worker risk for existing off-site and existing on-site worker exposures to provide a comprehensive and conservative assessment of potential risk associated with the JDEDZ.

The maximum potential lifetime excess cancer risk associated with the JDEDZ is 5.4 in a million (occurs at an off-site residential receptor location), which would not exceed the BAAQMD cancer risk threshold of 10 in a million. The maximum potential chronic health risk associated with the JDEDZ is 0.52 (occurs at an off-site worker receptor location), which would not exceed the BAAQMD's hazard index threshold of 1. The maximum potential annual average $PM_{2.5}$ concentration associated with the JDEDZ is 0.22 micrograms per cubic meter ($\mu g/m^3$) (occurs at an off-site worker receptor location), which would not exceed the BAAQMD's threshold of 0.3 $\mu g/m^3$. Therefore, JDEDZ project-level impacts due to exposure of TACs to sensitive receptors would be less than significant.

The maximum potential cumulative lifetime excess cancer risk associated with the JDEDZ and all background TAC sources within 1,000 feet of the project is 86.5 in a million (occurs at an off-site worker receptor location), which would not exceed the BAAQMD cumulative cancer risk threshold of 100 in a million. The maximum potential cumulative chronic health risk associated with the JDEDZ is 0.64 (occurs at an off-site worker receptor location), which would not exceed the BAAQMD's hazard index threshold of 10. The maximum potential cumulative annual average $PM_{2.5}$ concentration associated with the JDEDZ is 0.59 $\mu g/m^3$ (occurs at an off-site worker receptor location), which would not exceed the BAAQMD's threshold of 0.8 $\mu g/m^3$. Therefore, cumulative impacts due to exposure of TACs to sensitive receptors would be less than significant.

Updated Air Quality Technical Memorandum - Criteria Pollutant Emissions Analysis

The technical memorandum presents the updated criteria pollutant emissions analysis for Section 4.B – Air Quality of the SEIR for the JDEDZ. As noted above, a HRA has been prepared and is also being added to the SEIR. Consistent with new modeling data used for the HRA, this technical memorandum supplements Section 4.B of the Draft SEIR with an updated analysis of criteria pollutants emissions including reactive organic carbon (ROG), nitrogen oxides (NO_X), construction related exhaust particulate matter (PM), particulate matter with an aerodynamic diameter equal to or less than 10 microns (PM_{10}), particulate matter with an aerodynamic diameter equal to or less than 2.5 microns ($PM_{2.5}$), and carbon monoxide (CO).

The technical memorandum also discusses health effects of criteria pollutants along with the JDEDZ's potential cumulative health-related impacts consistent with the California Supreme Court's ruling in *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502.

Consistent with the HRA, this analysis uses the updated and conservative assumptions about the timing of construction and the scope of project-related activity within the JDEDZ project area. For near-term activities, such as the first phase of construction, realistic assumptions are made based on the anticipated construction activity and phasing of development. For longer-term activities that may occur beyond the first phase of development, such as the development of commercial and retail space during phase 2, more conservative assumptions were made in order to provide a worst-case analysis of potential JDEDZ impact, because the actual construction activity and phasing of this development is currently unknown. These assumptions are provided in greater detail in Chapter 1 of the technical memorandum.

For construction, this analysis shows the Project's criteria pollutant emissions are below the corresponding BAAQMD significance thresholds except for NO_X emissions from Phase 1 construction. Phase 1 construction NO_X emissions are estimated to be an average of 55.74 pounds per day (lbs./day), exceeding the significance threshold of 54 lbs./day. Therefore, mitigation is required to reduce JDEDZ impacts during Phase 1 construction. As such, all off-road equipment greater than 50 horsepower would be required to have engines that meet United States Environmental Protection Agency (USEPA) Tier 3 off-road emission standards. ***Implementation of this mitigation measure would reduce this impact to a less-than-significant level.***

For operations, Phase 1 operational activities are estimated to be an average of 54.60 pounds of ROG per day (lbs./day), exceeding the significance threshold of 54 lbs./day. Therefore, mitigation is required to reduce JDEDZ impacts during Phase 1 operations. As such, the JDEDZ would require all future tenants and building owners to use low-volatile organic compound (VOC) paints during maintenance activities. The VOC content of paints shall not exceed 10 grams of VOCs per liter. ***Implementation of this mitigation measure would reduce this impact to a less-than-significant level.***

Because of certain updated JDEDZ project details used in this analysis as compared to those used in the Draft SEIR (e.g. changes in square footage of some proposed land uses, construction phasing and equipment fleets), the conclusions with regard to the JDEDZ's criteria pollutants emissions have changed with this updated analysis. ***For example, conclusions about construction emissions changed from less than significant for all criteria pollutants in the Draft SEIR to less than significant with mitigation in this updated analysis (due to average daily unmitigated emissions during Phase 1 construction exceeding the BAAQMD threshold); the conclusions about project operational emissions have changed from significant and unavoidable impacts (attributable to average daily and total annual NO_X and PM_{10} emissions) during full buildout operations in the Draft SEIR to less than significant for all operational scenarios including the full buildout operations.***

Greenhouse Gas Analysis

Following the original approval of the project and certification of the JDEDZ SEIR, the California Office of Planning and Research adopted amendments to the CEQA Guidelines, including changes to CEQA Guidelines section 15064.4 addressing analysis of GHG emissions. Further, Senate Bill 32 (2016) set a statewide GHG emissions reduction target of 40 percent below 1990 levels by 2030. The amendments became effective on December 28, 2018. The City's adopted Climate Action Plan (CAP) is only considered qualified through 2020 for purposes of GHG analysis under CEQA, but project buildout is expected to occur beyond 2020. In

accordance with these legislative changes, the City has added analysis of the project's GHG emissions to the recirculated SEIR.

Pursuant to revised section 15064.4 and Appendix G of the Guidelines, the City has discretion whether to assess GHG emissions quantitatively or qualitatively and to establish thresholds of significance. Since there is no applicable quantitative threshold (e.g., neither the City's CAP nor the Bay Area Air Quality Management District's emissions threshold are qualified to be consistent with SB 32's 2030 targets), the City used the qualitative threshold provided in CEQA Guidelines section 15064.4(b), which considers whether the Project complies with applicable plans, policies, regulations, and requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions.

The California Air Resources Board's 2017 Scoping Plan Update is intended to reduce GHG emissions to meet the statewide targets set forth in SB 32. The Association of Bay Area Governments' (ABAG) and Metropolitan Transportation Commission's (MTC) Plan Bay Area 2040 is designed to achieve regional GHG reductions from the land use and transportation sectors as required by SB 375 and the state's long-term climate goals. The City's CAP is designed to reduce local GHG emissions to support the statewide target for 2020 set forth in AB 32 and put the City on an emissions trajectory that is consistent with the State's longer-term targets.

The City's GHG analysis determined that the project would be consistent with the 2017 Scoping Plan Update, Plan Bay Area 2040, and the City's CAP. The analysis found that because the Project is consistent with these applicable plans and policies to reduce GHG emissions, and because the Project implements certain project design features (e.g. EV charging stations), the Project would generate an incremental contribution to climate change compared to existing conditions, but would not generate enough GHG emissions on its own to significantly influence global climate change. ***Therefore, the analysis determined that the project would not have a significant effect on the environment.***

Energy Resources Technical Memorandum

The technical memorandum analyzes the impacts on energy resources due to construction and operation of the JDEDZ. In accordance with the requirements of the CEQA Guidelines, specifically Appendix G, Environmental Checklist, and Appendix F, Energy Conservation, this assessment provides an estimate of energy consumption for the JDEDZ and the potential impacts from associated construction and operational activities. The assessment includes the categories and types of energy consumption resulting from the JDEDZ, the calculation procedures used in the analysis, and any assumptions or limitations.

Construction of the JDEDZ would occur in two phases. Phase 1 would begin in 2020 with a one-year duration and Phase 2 would begin in 2030 with a one-year duration. Each of the construction phases would utilize energy for necessary on-site construction activities and to transport materials, soil, and debris to and from the site. Phase 1 construction would consume approximately 114,345 gallons of diesel and 19,813 gallons of gasoline during the one-year construction timeframe. Phase 2 construction would consume approximately 64,504 gallons of diesel and 14,051 gallons of gasoline during the one-year construction timeframe.

Phase 1 diesel consumption would represent approximately 0.10 and 0.003 percent of total 2017 diesel fuel consumption in Alameda County and California, respectively. Phase 1 gasoline consumption would represent approximately 0.006 and 0.0002 percent of County and State 2017 gasoline consumption, respectively. Phase 2 diesel consumption would represent approximately 0.06 and 0.002 percent of County and State 2017 diesel consumption, respectively. Phase 2 gasoline consumption would represent approximately 0.002 and 0.0001

percent of County and State 2017 gasoline consumption, respectively. The estimated annual average construction fuel usage would represent a very small fraction of annual (2017) fuel usage in Alameda County and the State. As stated in the HRA prepared for the JDEDZ, Phase 1 would not require haul trucks to export rubble resulting from the demolition of existing buildings at the site; all rubble and new construction and demolition debris would be reused on-site. By using this material on-site as construction base, the JDEDZ would eliminate both disposal trips for the demolition debris and haul trips for new aggregated fill material, thus eliminating the diesel fuel consumption associated with each truck trip. The JDEDZ would comply with applicable construction regulations that affect energy demand, such as idling restrictions that would result in less fuel combustion and energy consumption and minimize the JDEDZ's construction-related energy use. ***As a result, construction energy impacts would be considered less than significant.***

Operational energy consumption would occur from building energy needs (electricity and natural gas), off-site water supply and wastewater treatment, and from transportation fuels (e.g., diesel and gasoline) used for vehicles traveling to and from the site, transportation refrigeration units (TRUs), and emergency generators. JDEDZ operations would occur in two phases. Phase 1 operations would commence in 2021 and Full Buildout operations would commence in 2031.

Phase 1 operations would have an annual electricity demand of approximately 5.19 million kilowatt-hours (kWh), which represents approximately 0.006 percent of Pacific Gas & Electric Company (PG&E) network sales for 2017. Phase 1 operations would represent approximately 0.05 percent of electricity supplied by PG&E to the County in 2017. Phase 1 operations would have an annual natural gas demand of approximately 4.43 million standard cubic feet (scf), which represents approximately 0.002 percent of the PG&E network sales for 2017. Phase 1 operations would represent approximately 0.01 percent of natural gas supplied by PG&E to the County in 2017.

Phase 1 operations would consume approximately 94,880 gallons of diesel and 1,089,881 gallons of gasoline annually associated with vehicle trips. Phase 1 diesel consumption would represent approximately 0.08 percent and 0.002 percent of County and State 2017 diesel consumption, respectively. Phase 1 gasoline consumption would represent approximately 0.19 percent and 0.007 percent of County and State 2017 gasoline consumption, respectively.

Full Buildout operations would have an annual electricity demand of approximately 7.07 million kWh, which represents approximately 0.009 percent of PG&E's network sales for 2017. Full Buildout operations would represent approximately 0.06 percent of electricity supplied by PG&E to the County in 2017. Full Buildout operations would have an annual natural gas demand of approximately 4.73 million scf, which represents approximately 0.002 percent of PG&E's network sales for 2017. Full Buildout operations would represent approximately 0.01 percent of natural gas supplied by PG&E to the County in 2017.

Full Buildout operations would consume approximately 237,540 gallons of diesel and 1,342,830 gallons of gasoline annually associated with vehicle trips. Full Buildout diesel consumption would represent approximately 0.21 and 0.006 percent of County and State 2017 diesel consumption, respectively. Full Buildout gasoline consumption would represent approximately 0.23 and 0.009 percent of County and State gasoline 2017 consumption, respectively.

The amount of energy used would represent an insubstantial fraction of the region's available energy supply and capacity. The JDEDZ would be consistent with energy efficiency standards in the applicable Title 24 Energy Efficiency Standards for Nonresidential Buildings and the Title 24 Building Energy Efficiency Standards, referred to as the California Green Building Standards (CALGreen) Code and include electric vehicle supply equipment (EVSE) to promote transportation energy efficiency. Additionally, the Costco warehouse would be designed to include solar at the time of opening which would reduce its consumption of electricity provided by PG&E.

Because the JDEDZ would be consistent with energy efficient building standards and promote transportation energy efficiency, it would not result in the wasteful, inefficient, and unnecessary consumption of energy or preclude opportunities for improving overall fuel efficiency and future energy conservation. The JDEDZ project also would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency. As a result, operational energy impacts would be considered less than significant.

Economic Impact Analysis

The Economic Impact Analysis prepared by ALH Economics, was circulated for public comment as part of the Draft SEIR in 2015. No changes have been made to the Economic Impact Analysis; however; the City has agreed to recirculate this analysis for additional public comment pursuant to a request from the Petitioners. ***As a refresher, the Economic Impact Analysis indicates that impacts generated by the JDEDZ on the market area's[1] existing retail environment would be limited.*** The Economic Analysis projects that Phase I sales in the JDEDZ (i.e., the sales resulting from a club retail use and a limited amount of general retail uses) could result in a decrease in annual sales by existing market retailers of approximately $26.7 million, or 0.9 percent of the market area's existing $3 billion in annual retail sales, which is a nominal impact.

The proposed JDEDZ's effect on the local economy is projected to be focused in three specific retail categories: gasoline stations, home furnishings and appliances, and food and beverages. In the first two categories (gasoline stations, and home furnishings and appliances), sales within the JDEDZ would amount to a combined 1.1 percent or less of existing market area sales, which would not be considered substantial when spread among the numerous gas stations and home furnishing and appliance stores in the market area. While food and beverage sales within the JDEDZ would amount to 7.4 percent of existing market sales, the new market demand alone generated between now and buildout of the JDEDZ would be sufficient to recompense existing businesses for these potentially diverted sales. Accounting for the fact that sales diverted from existing stores to a club retail use would be widely dispersed among numerous supermarkets, ethnic food stores, and other small food markets (rather than concentrated in a single store or small number of stores), there would be limited effects on existing food and beverage retailers.

The Economic Impact Analysis also concludes that the JDEDZ would have no adverse economic effects on downtown businesses, primarily because downtown offers a unique and different shopping environment than a club retailer, and most downtown businesses sell goods that are quite different from those sold at club retailers. On the positive side, the economic study also notes that a Costco could generate enhanced visibility for existing businesses in the proposed JDEDZ, benefits associated with local availability of low-cost food and gas, and possible long-term increases in property values.

[1] The "market area" for this study comprises 18 full census tracts and three partial census tracts spanning the City of Pleasanton, the majority of the City of Dublin, and some unincorporated Alameda County areas south of the City of Pleasanton and northwest of the City of Dublin. The market area was determined through review of drive times to the project site and the locations of other nearby club retail stores, with consideration also given to natural and man-made features, such as topography and freeway access.

Conclusion

With the supplemental environmental analyses now complete, pursuant to CEQA, the City is now recirculating the revised environmental analyses as well as the previously circulated Economic Impact Analysis for public comment. **That public comment period will be 45 days commencing at 8:00 a.m. on July 10, 2019 and ending at 5:00 p.m. on Friday, August 23, 2019.** All public comments should be sent in writing or via email to:

Eric Luchini
Associate Planner
City of Pleasanton Planning Division
P.O. Box 520
Pleasanton, CA 94566-0802
eluchini@cityofpleasantonca.gov

Subsequent to the public comment period and consideration of and response to any comments as required by CEQA, City staff intends to schedule the JDEDZ project for reconsideration by the Planning Commission and City Council in the Fall of 2019.

CHAPTER 1

Executive Summary

This Health Risk Assessment (HRA) evaluates potential health risks associated with toxic air contaminants (TACs) resulting from the Johnson Drive Economic Development Zone (EDZ) project (project) located in the City of Pleasanton (City). Health risks were assessed for exposure of nearby sensitive receptors to TAC emissions resulting from construction and operation of the project. This HRA was conducted to evaluate whether construction and operation of the project would expose sensitive receptors to substantial concentrations of TACs or respirable particulate matter, and whether project-level impacts related to TAC exposure would be significant. This HRA was also prepared to assess the exposure of sensitive receptors to cumulative concentrations of TACs and respirable particulate matter from construction and operation of the project when combined with past, present and other reasonably foreseeable development in the vicinity, including existing permitted stationary sources and Interstates 680 and 580.

The HRA evaluates project risks at existing on-site businesses and surrounding businesses and fitness clubs that are within 1,000 feet of the project boundary. Both sensitive receptors and worker receptors within the study domain were included. Although the Bay Area Air Quality Management District (BAAQMD) does not consider worker receptors as sensitive receptors, and therefore does not require that HRAs include worker risk evaluation, this HRA includes worker risk for existing off-site and existing on-site worker exposures to provide a comprehensive and conservative assessment of potential risk associated with the project.

The maximum potential lifetime excess cancer risk associated with the project is 5.4 in a million (occurs at an off-site residential receptor location), which would not exceed the BAAQMD cancer risk threshold of 10 in a million. The maximum potential chronic health risk associated with the project is 0.52 (occurs at an off-site worker receptor location), which would not exceed the BAAQMD's hazard index threshold of 1. The maximum potential annual average $PM_{2.5}$ concentration associated with the project is 0.22 micrograms per cubic meter ($\mu g/m^3$) (occurs at an off-site worker receptor location), which would not exceed the BAAQMD's threshold of 0.3 $\mu g/m^3$. Therefore, project-level impacts due to exposure of TACs to sensitive receptors would be less than significant.

The maximum potential cumulative lifetime excess cancer risk associated with the project and all background TAC sources within 1,000 feet of the project is 86.5 in a million (occurs at an off-site worker receptor location), which would not exceed the BAAQMD cumulative cancer risk threshold of 100 in a million. The maximum potential cumulative chronic health risk associated with the project is 0.64 (occurs at an off-site worker receptor location), which would not exceed the BAAQMD's hazard index threshold of 10. The maximum potential cumulative annual

average $PM_{2.5}$ concentration associated with the project is 0.59 µg/m^3 (occurs at an off-site worker receptor location), which would not exceed the BAAQMD's threshold of 0.8 µg/m^3. Therefore, cumulative impacts due to exposure of TACs to sensitive receptors would be less than significant.

Please refer to Chapter 6, *Results*, for additional detail on the findings of this HRA.

Introduction

Environmental Science Associates (ESA) has prepared this HRA in support of environmental clearance under the California Environmental Quality Act (CEQA) for the Johnson Drive Economic Development Zone project located in the City of Pleasanton.

This HRA evaluates fine particulate matter and health risks associated with TACs resulting from the proposed project in concurrence with BAAQMD guidance. Specifically, it presents the methods that were used to evaluate potential health risks to on-and off-site sensitive receptors from both project construction and project operations. Health risks were evaluated for exhaust particulate matter ($PM_{2.5}$), Diesel Particulate Matter (DPM), and speciated TACs associated with total organic gases (TOG).

This HRA makes certain conservative assumptions about the timing of construction and the scope of project-related activity within the project area. For near-term activities, such as the first phase of construction, realistic assumptions are made based on the anticipated construction activity and phasing of development. For longer-term activities that may occur beyond the first phase of development, such as the development of commercial and retail space during phase 2, more conservative assumptions were made in order to provide a worst-case analysis of potential health risks, because the actual construction activity and phasing of this development is currently unknown. These assumptions are provided in greater detail below.

Project Understanding

Project Location

The project site consists of 12 parcels in the northwestern part of the City as shown in **Figure 1,** *Vicinity Location Map***.** The city is generally bounded to the west by the Pleasanton ridgelands, to the north by Interstate 580 (I-580) and the city of Dublin, to the east by the city of Livermore and unincorporated Alameda County, and to the south by San Francisco Water Department lands and other rangelands. Interstate 680 (I-680) bisects the western portion of the City, intersecting I-580 in the northwestern part of the city. The approximately 40-acre project site area is located southeast of the intersection of I-680 and I-580, a major regional transportation node.

Project Description

The project site would be developed with approximately 148,000 square feet (sf) of club retail (Costco store) with a 20-pump (dispensers) gas station on parcel 6. Parking for up to 800 vehicles and landscaping and site improvements, including bio-retention areas to manage on-site stormwater runoff and trees planted throughout the parcel to provide shading and visual screening around the perimeter, could also be developed on this parcel. A 231-room hotel consisting of approximately 132,000 sf and 5,000 sf of retail would be developed on parcels 9 and 10, and the remaining parcels would be developed with approximately 184,000 sf of retail space.

Johnson Drive Health Risk Assessment

Figure 1
Project Vicinity Map

ESA

Construction

Buildout of the proposed project area would be completed in two phases. Phase 1 would develop Parcels 6, 9, and 10, all of which are currently vacant; Phase 2 would develop the remaining parcels and assumes demolition of existing improvements. Phase 1 would include two components: Phase 1A includes construction of a Costco retail store and Costco gas station on Parcel 6; Phase 1B includes construction of a 231-room hotel and 5,000 sf of retail space on parcels 9 and 10. Phase 1 construction would commence in the second quarter of 2020 and have a duration of approximately one year. Phase 1 construction sub-phases include: grading/excavation, drainage/utilities/sub-grade, foundation/concrete pour, building construction, architectural coatings, and paving. A detailed construction schedule and construction equipment list was provided for Phase 1A by the City and Costco. The construction schedule and equipment fleet for Phase 1B was estimated based on CalEEMod defaults for the hotel and retail space and adjusted using the more detailed construction phase types provided by the City. The default schedule was also adjusted assuming all construction would occur in 2020. Phase 2 construction is conservatively assumed to commence in the first quarter of 2030 and have a duration of approximately one year. Phase 2 construction sub-phases include: demolition, grading/excavation, drainage/utilities/sub-grade, foundation/concrete pour, building construction, architectural coatings, and paving. Similar to Phase 1B, the construction schedule and equipment fleet for Phase 2 was estimated based on CalEEMod defaults for the Phase 2 anticipated land uses and adjusted using the more detailed construction phase types provided by the City. The default schedule was also adjusted assuming all construction would occur in 2020. The construction schedule is summarized in Table 1.

TABLE 1
CONSTRUCTION SCHEDULE [a]

Phase	Subphase	Start Date	End Date	Number of Work Days [b]	Hours per day [c]
Phase 1A	Grading/Excavation	4/6/2020	5/10/2020	30	8
	Drainage/Utilities/Sub-Grade	4/22/2020	4/29/2020	7	8
	Foundations/Concrete Pour	4/29/2020	5/15/2020	15	8
	Building Construction	5/16/2020	7/24/2020	60	8
	Architectural Coatings	5/28/2020	7/24/2020	50	8
	Paving	7/17/2020	7/24/2020	7	8
Phase 1B	Grading/Excavation	4/6/2020	6/15/2020	51	8
	Drainage/Utilities/Sub-Grade	6/16/2020	6/30/2020	11	8
	Foundations/Concrete Pour	7/1/2020	7/30/2020	22	8
	Building Construction	7/31/2020	2/23/2021	148	8
	Architectural Coatings	2/24/2021	3/20/2021	18	8
	Paving	3/21/2021	4/5/2021	11	8
Phase 2	Demolition	1/7/2030	2/3/2030	20	8
	Grading/Excavation	2/4/2030	3/2/2030	20	8
	Drainage/Utilities/Sub-Grade	3/3/2030	4/6/2030	25	8
	Foundations/Concrete Pour	4/6/2030	4/28/2030	15	8
	Building Construction	4/30/2030	11/11/2030	140	8
	Architectural Coatings	11/12/2030	12/9/2030	20	8
	Paving	12/10/2030	1/7/2031	21	8

NOTES:

[a] The Construction schedule for Phase 1A was provided by the City and Costco. The construction schedules for Phase 1B and Phase 2 were estimated based on the total duration of each construction period (one year for Phase 1B occurring in 2020 and one year for Phase 2 occurring in 2030) and the CalEEMod defaults for project land uses under development for Phases 1B and 2.

[b] Phase 1A construction will occur Monday through Saturday (6 days per week) based on information provided by the City and Costco; Phase 1B and Phase 2 will occur Monday through Friday (5 days per week) based on CalEEMod defaults.

[c] Construction equipment would operate for 8 hours maximum per day during a 10-hour workday (7 am to 5 pm) based on information provided by the City and Costco along with CalEEMod defaults.

There are several existing on-site buildings that house various commercial and/or retail uses, comprising approximately 224,700 sf of space. These buildings will remain until Phase 2 construction begins and would be fully demolished during Phase 2 construction. Project construction would not require export haul trucks as existing rubble and new construction and demolition debris would be reused on-site. The project would require approximately 1,360 trucks for soil import, 2,040 concrete trucks, and 3,330 vendor trucks over the entire construction

duration. Additional information on construction activities is presented in the section below and in Chapter 2, *Emission Calculation Methods*.

Operations

Phase 1 operations are expected to begin in the second quarter of 2021 following the completion of construction. Phase 1 operation is expected to include a Costco club retail store, Costco gas station, a 231-room hotel, and some ancillary retail associated with the hotel project. Additionally, there is an existing FedEx facility located at the southern portion of the project site; FedEx delivery trucks will contribute to the project's cumulative $PM_{2.5}$ exhaust and DPM emissions until Phase 2 construction begins, when the FedEx will be removed (as mentioned above, all existing buildings will be demolished in Phase 2). To simplify the cumulative risk calculations and to be conservative, this HRA modeled the FedEx sources as part of the project's Phase 1 operations until Phase 2 operation begins.

Project Phase 2 operations are expected to begin the first quarter of 2031 following the completion of Phase 2 construction. The specific tenants are unknown for the new development in Phase 2, but are expected to be mainly retail and commercial uses. Additional information on operational activities is presented in Chapter 2, *Emission Calculation Methods*.

Objective

Health risks were estimated for potential exposure to DPM, $PM_{2.5}$ exhaust from combustion sources, exhaust and evaporative TACs from operational gasoline vehicles, and evaporative TACs from the gas station. There are no major sources of other TAC emissions from project construction and operations. This HRA evaluates health impacts at all existing sensitive receptor locations (e.g., residences, daycares, schools) and all existing adult/worker receptor locations (e.g., business employees, and fitness club users) within 1,000 feet of the project site.

Methods

The approach for this HRA is consistent with BAAQMD and Office of Environmental Health Hazard Assessment (OEHHA) guidance. Consistent with guidelines and recommendations from these agencies, this HRA evaluates the estimated incremental increase in lifetime cancer risks and non-cancer chronic risk from exposure to project-related construction and operational sources, including construction equipment, traffic and stationary combustion sources such as generators, evaporative TACs from the gas station, as well as delivery vehicle idling, etc.

Report Organization

This HRA is divided into seven chapters as follows:

- **Chapter 1 – Introduction** describes the purpose and scope of the HRA, the project description, the objectives and overall methods used in the HRA, and outlines document organization.

- **Chapter 2 – Emission Calculations** describes the methods that were used to estimate DPM and TAC emissions from construction and operation of the project.

- **Chapter 3 – Receptor Identification** describes the potential receptor locations that are within 1,000 feet from the project site boundary that were evaluated in this HRA. Both sensitive receptors and worker receptors within the study domain were included.

- **Chapter 4 – Air Dispersion Modeling** presents the air dispersion modeling, the data used in the model (e.g., meteorology, source characterization, sensitive receptor characteristics, terrain) to generate the ground level $PM_{2.5}$ and TAC concentrations.

- **Chapter 5 – Risk Characterization Methods** provides an overview of the methods used to conduct the HRA (such as cancer risk and non-cancer chronic risks).

- **Chapter 6 – Results** presents the estimated excess lifetime cancer risks, non-cancer chronic risks, and $PM_{2.5}$ concentrations for the project. This chapter includes the cumulative HRA analysis results.

- **Chapter 7 – Modeling Uncertainties** summarizes the critical uncertainties associated with the HRA modeling for both $PM_{2.5}$ exhaust and TACs.

[THIS PAGE INTENTIONALLY LEFT BLANK]

CHAPTER 2

Emission Calculations

Pollutants of Concern (POC)

The HRA evaluates health risks associated with the proposed project based on exposure of sensitive receptors to POCs, including DPM, toxic components of TOGs, as well as $PM_{2.5}$ exhaust.

While DPM is a complex mixture of gases and fine particles that includes over 40 substances that are listed by the United States Environmental Protection Agency (USEPA) as hazardous air pollutants and by the California Air Resources Board's (CARB) as toxic air contaminant, the DPM analysis will use PM_{10} emissions as a surrogate for DPM emissions.[1] OEHHA guidance indicates that the cancer potency factor to be used to evaluate cancer risks were developed based on whole (gas and particulate matter) diesel exhaust, and that the surrogate for whole diesel exhaust is DPM, with PM_{10} serving as the basis for the potential risk calculations.[2]

As discussed below, the TAC analysis for construction only considers DPM because all construction equipment, including off-road equipment, vendor trucks, and haul trucks, is assumed to be diesel-fueled.

The only TAC emissions included in the operational HRA are from mobile sources and the proposed Costco gas station, which is consistent with BAAQMD and OEHHA guidance (BAAQMD considers small natural gas combustion sources, such as hot water heaters and boilers, to be minor, low-impact sources).[3] During project operations, exhaust and evaporative TOG emissions would be generated from light-duty gasoline cars (traveling to and from the project site) and gas station activities (including customer fueling, fuel spillage, and venting from an underground storage tank). The BAAQMD has developed weighted toxicity values for tailpipe and evaporative TOG losses that incorporate the individual toxicity of each compound that make

1 OEHHA, "For the Proposed Identification of Diesel Exhaust as a Toxic Air Contaminant" Part B: Health Risk Assessment for Diesel Exhaust, May 1998, https://www.arb.ca.gov/toxics/dieseltac/part_b.pdf. Accessed November 2018.

2 OEHHA, The Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments, August 2003, https://oehha.ca.gov/media/downloads/crnr/hraguidefinal.pdf. Accessed November 2018.

3 BAAQMD, Recommended Methods for Screening and Modeling Local Risks and Hazards, May 2012. http://www.baaqmd.gov/~/media/files/planning-and-research/ceqa/risk-modeling-approach-may-2012.pdf?la=en. Accessed November 2018.

up TOG.[4] This analysis updated the risk factors in the BAAQMD analysis with the latest data in CARB's Hotspots Analysis and Reporting Program (HARP) database (see detail in Table 2 below). The summation of all of the individual weighted toxicity values developed by BAAQMD is then cumulatively weighted and applied in the risk and hazard calculations explained in Chapter 5, *Risk Characterization Methods*. By developing and using the weighted toxicity factors for tailpipe TOG and evaporative TOG for risk calculations, there is no need to speciate the TOG into specific TAC components in emission calculations and/or the health risk calculations. As discussed below in the *Emission Calculation Methods* section and Chapter 5, *Risk Characterization Methods,* health risks from construction only included DPM because all construction equipment, including vendor and haul trucks, are assumed to be diesel-fueled, and DPM is the primary TAC of concern for diesel-fueled equipment and vehicles. For operations, the health risk analysis includes DPM exhaust emissions from delivery trucks and on-site emergency generators and speciated TACs associated with TOG emissions from light-duty gasoline vehicles and the gas station. Speciation and toxicity values for TAC components of TOG emissions are shown below in Table 2.

[4] BAAQMD, Recommended Methods for Screening and Modeling Local Risks and Hazards, May 2012. http://www.baaqmd.gov/~/media/files/planning-and-research/ceqa/risk-modeling-approach-may-2012.pdf?la=en. Accessed November 2018.

TABLE 2
GASOLINE VEHICLE TOG SPECIATION AND TOXICITY [a]

Toxic Compounds	EMFAC Gasoline TOG Speciation (% TOG)	Unit Factor	Inhalation Cancer Potency Factors (mg/kg-day)$^{-1}$	Weighted Inhalation Cancer Potency Factor (mg/kg-day)$^{-1}$ Calculated	Chronic Non-Cancer Reference Dose (ug/m^3)	Unit Chronic Non-Cancer Risk Weighted Factor (ug/m^3) Calculated

NOTES:

[a] Speciation data and weighted toxicity calculations are based on Table 14 and Table 15 of the BAAQMD Recommended Methods for Screening and Modeling Local Risks and Hazards (May 2012).

ABBREVIATIONS:

mg/kg-day – milligrams per kilogram per day
ug/m^3 – micrograms per cubic meter

In addition to evaluating the health risks from exposure to DPM and TACs, the HRA also evaluates annual average $PM_{2.5}$ exhaust concentrations. This is consistent with BAAQMD's May 2017 CEQA Guidelines, *California Environmental Quality Act: Air Quality Guidelines*, which indicate that $PM_{2.5}$ be evaluated in community-scale impacts of air pollution based on scientific studies and recommendations by the Bay Area Health Directors to the BAAQMD's Advisory Council.[5]

Fugitive emissions associated with diesel fueling at the gas station was not included per guidance from the BAAQMD. Diesel fuel dispensing is exempt from District permitting requirements due to the very low vapor pressure of diesel fuel. Although BAAQMD HRA procedures don't specifically discuss diesel fueling at gas stations, the BAAQMD has indicated that for CEQA purposes, TAC emissions and associated health risks from diesel fuel dispensing would likely be very small due to the very low vapor pressure of diesel fuel.[6]

There are no major sources of other TAC emissions from project construction and operations, so additional TACs were not included in the HRA.

Emission Calculation Methods

This analysis used the emissions factors from California Emissions Estimator Model (CalEEMod) version 2016.3.2, CARB's EMission FACtor 2017 (EMFAC2017) model and BAAQMD guidance documents for calculating project's construction and operational emissions.

For construction, the health risk analysis only considers DPM and conservatively assumed all construction equipment, including vendor and haul trucks, will be diesel-fueled. All DPM emissions are assumed to be equal to PM_{10} emissions from equipment and vehicle exhaust. For operations, the health risk analysis includes DPM from heavy-duty delivery trucks, emergency generators, and TACs from the project's new vehicle trips and gas station operations.

The following sections discuss methods used to calculate emissions of DPM, $PM_{2.5}$ exhaust, and TACs associated with TOG emissions for each source associated with the project. The section is separated into construction emissions and operational emissions. All assumptions used to estimate construction and operational emissions are included in the HRA appendices. See Appendix A for emission calculation details.

Construction Emissions

Project construction-related emissions of DPM and $PM_{2.5}$ exhaust (e.g., off-road equipment exhaust, and on-road vehicle exhaust) were estimated using project-specific construction-phasing

5 BAAQMD. 2017. California Environmental Quality Act Air Quality Guidelines. May 2017. Available at http://www.baaqmd.gov/~/media/files/planning-and-research/ceqa/ceqa_guidelines_may2017-pdf.pdf?la=en. Accessed: November 2018.

6 Carol Allen, Assistant Manager, Engineering Division, BAAQMD. Email correspondence with ESA on November 27, 2018.

schedule and equipment mix for Phase 1A provided by the City (including information provided by Costco), and CalEEMod defaults where specific information was not available, such as for Phase 1B and Phase 2. Annual average construction-related DPM and $PM_{2.5}$ exhaust emissions for each construction phase and year of construction was estimated.

Off-road Equipment

This HRA estimated off-road construction equipment emissions using the emission factors in the CalEEMod User's Guide, Appendix D. 2020 Emission factors were used for Phase 1 construction and 2030 emission factors were used for Phase 2. Equipment horsepower and load factors were based on CalEEMod default values. Off-road equipment emissions were estimated based on **Equation 1** below.

Equation 1: $$E_{phase} = \sum_{i} (Activity_i * EF_i * LF_i * HP_i) * Conv$$

Where:

E_{phase} = Total exhaust emissions for the phase, pounds per day
Activity = Equipment activity, hours per day
EF = Engine emissions factor, grams/horsepower-hour (CalEEMod/OFFROAD2011)
LF = Engine load factor, unitless (CalEEMod/OFFROAD2011)
HP = Engine horsepower, hp (CalEEMod/OFFROAD2011)
Conv = Conversion factor, 0.002205 pounds/grams
i = Equipment type

On-road Mobile Sources

In addition to off-road equipment, project construction would require on-road vehicles for vendor trips, concrete truck trips, and soil movement and import trips. As mentioned earlier, all demolition and construction debris will be recycled on-site so that there will be no export haul truck trips. Emissions from worker trips were not included in the HRA because the vast majority of worker trips will be conducted in gasoline vehicles, which do not emit DPM, and are therefore not a significant source of health risks.[7]

[7] CalEEMod assumes that worker vehicles consist of 50% light-duty auto (or passenger car), 25% light-duty truck type 1 (LDT1), and 25% light-duty truck type 2 (LDT2). According to EMFAC2014 (the on-road vehicle emission factor model used in CalEEMod version 2016.3.2), approximately 99.91% of total miles driven in the BAAQMD in 2020 by passenger cars, LDT1, and LDT2 vehicles are gasoline-powered.

On-road Haul Trucks, Concrete Trucks, Worker Trips, And Vendor Trips

Emissions from on-road import haul trucks, concrete trucks, and vendor trips were estimated using EMFAC2017. 2020 Emission factors were used for Phase 1 construction and 2030 emission factors were used for Phase 2. The project would require a total of approximately 1,360 truck trips for soil import, 2,040 concrete truck trips, 3,330 vendor truck trips, and 39 paving truck trips over the entire construction duration for both Phase 1 and Phase 2. This HRA assumes that Phase 1A construction would require approximately 400 soil import truck trips, 600 concrete truck trips, 1,050 vendor truck trips, and 7 paving truck trips; Phase 1B construction would require approximately 340 soil import truck trips, 510 concrete truck trips, 970 vendor truck trips, and 11 paving truck trips; and Phase 2 construction would require 620 soil import truck trips, 930 concrete trucks, 1,310 vendor truck trips, and 21 paving truck trips (all numbers above refer to round-trips).

On-road emissions of DPM and $PM_{2.5}$ exhaust were calculated for each year to estimate total cancer risk and annual average $PM_{2.5}$ exhaust concentrations for the HRA. DPM and $PM_{2.5}$ exhaust emissions generated by on-road vehicle trips were calculated for each phase of construction using **Equation 2**.

Equation 2: $$E_{phase} = \sum_{i} (Activity_i * EF_i * Distance_i) * Conv$$

Where:

E_{phase} = Total exhaust emissions for the phase, pounds per day
Activity = Vehicle trips, trips per day
Distance = Vehicle trip length, miles per trip
EF = Engine emissions factor, grams/mile (EMFAC2017)
Conv = Conversion factor, 0.002205 grams/pound
i = Vehicle type

Haul Truck Idling

Idling emissions associated with heavy-duty trucks (haul trucks, concrete trucks, material delivery trucks, water trucks, etc.) were estimated based on the anticipated number of truck trips as provided by the City and idling emission factors for heavy-duty vehicles from EMFAC2017 for on-road emissions. It was assumed that for haul trucks' and concrete trucks' idling activities would total 15 minutes per trip, representing three separate 5-minute idling occurrences: check-in to the site or queuing at the site boundary upon arrival, on-site idling during loading/unloading, and check-out of the site or queuing at the site boundary upon departure. The 5-minute limit per idling occurrence is consistent with the CARB's Air Toxics Control Measure (ATCM) to Limit Diesel-Fueled Commercial Motor Vehicle Idling. Emission factors for heavy-heavy-duty-trucks (HHDT) vehicles idling from EMFAC2017 were used to calculate emissions.

DPM and $PM_{2.5}$ exhaust generated by on-site heavy-duty truck idling for each phase were calculated using emission factors from EMFAC2017 and **Equation 3**.

Equation 3: $$E_{phase} = \sum_{i} (Activity_i * Time_i \div Conv_1 * EF_i) * Conv_2$$

Where:

E_{phase} = Total exhaust emissions for the phase, pounds per day
Activity = Vehicle trips, trips per day
Time = Vehicle idle time, 15 minutes per trip (CARB ATCM)
$Conv_1$ = Conversion from minutes to hours, 60 minutes per hour (standard conversion)
EF = Idle emissions factor, grams/idle-hour (EMFAC2017)
$Conv_2$ = Conversion factor, 0.002205 grams/pound
i = Vehicle type

Operational Emissions

Operational emissions considered in this analysis include the following:

- Tailpipe TOG emissions from new gasoline vehicle trips generated by the project, including exhaust from vehicle running, idling and startup;
- Evaporative TOG emissions from new gasoline vehicles trips generated by the project, including running, rest, hot soak and diurnal losses;
- Evaporative TOG emissions from the transfer and storage of gasoline at the gas station (i.e., underground tank filling, tank breathing, vehicle fueling and spillage); and
- $PM_{2.5}$ exhaust and DPM emissions from new project-related delivery trucks traveling and idling, delivery trucks with transportation refrigeration units (TRU), and emergency generators located at the Costco club retail store and the hotel.

Additionally, there is an existing FedEx facility located at the southern portion of the project site, the delivery trucks of which will contribute to the project's cumulative $PM_{2.5}$ exhaust and DPM emissions until Phase 2 construction begins (as mentioned above, all existing buildings will be demolished in Phase 2).

Mobile Sources

Project Vehicle Trips (Light-Duty Vehicles)

Operation of the proposed project would generate exhaust TOG and $PM_{2.5}$ emissions from light-duty vehicles. Trip rates for Phase 1 and Phase 2 land uses were based on the project's Supplemental Environmental Impact Report (SEIR) Traffic Study (these trip rates include the pass-by trip percentage values presented in the Draft SEIR Traffic Study).[8] It was assumed the trip rates represent light-duty vehicle categories. The light-duty vehicle categories included in the analysis are: light-duty autos (LDA), light-duty trucks (LDT1 and LDT2), and medium-duty vehicles (MDV). A weighted emission factor was generated for light-duty vehicles based on the population distribution of these light-duty categories. The light-duty population distribution for LDA, LDT1, LDT2, and MDV were 59 percent, 6 percent, 21 percent, and 13 percent, respectively. Trip lengths were based on the distance light-duty vehicles would travel on-site within the EDZ to reach the specific land use.

Exhaust and evaporative TOG emissions would be generated from light-duty vehicles. TOG emissions are composed of TACs in varying quantities as discussed above and presented in Table 2. It was assumed that all vehicles traveling to the site (excluding heavy-duty delivery trucks) would be gasoline-powered (i.e., visitors driving light-duty automobiles), and DPM is therefore not a concern for these vehicles.[9] Estimates of gasoline-related TOG emissions were based on the CARB's EMFAC2017 TOG emission rates for gasoline vehicles. The HRA estimated TOG and $PM_{2.5}$ exhaust emissions from light-duty vehicles using Equation 2 above, and calculated health risks from these emissions following the methods described in Chapter 5, *Risk Characterization Methods*.

Heavy-Duty Delivery Trucks

The proposed project will also include trucks delivering materials and goods to the project site. This analysis assumed all delivery trucks will be diesel-fueled HHDT. Delivery truck trip lengths were based on the distance along Johnson Drive to a specific project land use (e.g., the trip distance for trucks traveling to FedEx would be shorter than the trip distance for trucks traveling to Costco). The number of trucks operating per day (i.e. round trips) are shown in **Table 3** below. The HRA estimated DPM and $PM_{2.5}$ exhaust emissions from delivery vehicles using Equation 2 above, and calculated health risks from these emissions following the methods described in Chapter 5, *Risk Characterization Methods*.

8 Johnson Drive Economic Development Zone Transportation Impact Analysis, Fehr & Peers, 2015.

9 According to EMFAC2014 (the on-road vehicle emission factor model used in CalEEMod version 2016.3.2), approximately 99.91% of total miles driven in the BAAQMD in 2020 by passenger cars, LDT1, and LDT2 vehicles are gasoline-powered.

TABLE 3
DAILY TRUCK DELIVERIES [a]

Source	Trucks per Day (round trips) [b]
Phase 1	
FedEx [c]	390
Costco Store	10
Costco Gas Station	6
Hotel/Retail	29
Phase 2	
Retail	83

NOTES:

[a] Daily trucks for the FedEx, the Costco store, and the Costco gas station were based on information from the City (including information provided by Costco). Daily trucks for the hotel and retail land uses were based on the daily trips generated by these land uses, as supplied by the SEIR's Traffic Study, and multiplied by the HHDT default fleet mix percentage from CalEEMod.

[b] The total number of trucks per day represents the number of daily round-trip truck trips assumed in the modeling.

[c] The FedEx is an existing facility currently operating on the southern portion of the project site. Although It is not considered part of the proposed project, to be conservative, impacts from the FedEx were included.

SOURCE: ESA 2018

Delivery Truck Idling

Idling emissions associated with delivery trucks at loading docks and other locations were estimated based on the anticipated number of delivery trips at each land use. Idling emission factors for HHDT vehicle types were obtained from EMFAC2017. It was assumed that idling activities would total 15 minutes per trip (see description above for construction vehicle idling). Project-related delivery vehicle idling emissions were calculated using Equation 3 above.

TRUs

Delivery trucks would generate DPM and $PM_{2.5}$ exhaust emissions from the use of truck-mounted diesel-powered TRUs. It was assumed that 75 percent of Costco trucks, 25 percent of all other project trucks (including hotel and retail delivery trucks), and FedEx delivery trucks would operate a TRU for two hours per trip on any given day. TRU emissions were based on emission factors from CARB's ATCM.

For mobile source emissions, the HRA conservatively used EMFAC2017 emission factors for the calendar year 2021 for all year of Phase 1 operations occurring from 2021 to 2030, and EMFAC2017 emission factors for the 2031 calendar year for full buildout operations during 2031 and afterward.

Stationary Sources

Emergency Generators

This analysis assumed both the Costco store and hotel would each have one 1,000 kilowatt (kW) back-up diesel generator. Although the specific tenants are unknown for the new development in Phase 2, they are expected to be mainly retail and commercial. Because general retail and commercial buildings typically don't require the use of emergency generators, no emergency generators were assumed to be part of Phase 2. Emergency generator emissions were estimated based on a maximum annual operation schedule of 50 hours each generator, consistent with emergency standby engine testing limits established in BAAQMD Regulation 9-8-330.3.

Emissions factors for the generators are equal to emission standards for New Stationary Emergency Standby Diesel-Fueled Compression Ignition Engines with power greater than 560 kW.[10] DPM and $PM_{2.5}$ exhaust emissions generated by emergency diesel generators are calculated using **Equation 4**.

Equation 4: $E = N * EF * LF * HP * Conv$

Where:

E = Total exhaust emissions, pounds per day

N = Number of emergency generators

EF = Engine emissions factor by pollutant, grams/horsepower-hour (CARB, 2010 standards, power > 560 kW [CARB2010])

LF = Engine load factor, 0.74, unitless (Carl Moyer Program, CalEEMod default)

HP = Engine power, 1,000 kW for each generator

Conv = Conversion factor, 0.002205 grams/pound

Because the CARB emission standards do not include PM_{10} or $PM_{2.5}$, the total PM emissions standard was multiplied by 0.960 to determine the PM_{10} emission rate, and the PM emissions rate was multiplied by 0.937 to determine the $PM_{2.5}$ emission rate (for internal-combustion engines, distillate, and diesel-electric generation).[11]

Gas Station

The HRA assumed the Costco gas station would have 20 pumps and an annual gasoline throughput of approximately 26,640,000 gallons, as provided by the City. In addition to

[10] CARB, Final Regulation Order, The Airborne Toxic Control Measures for Stationary Compression Ignition Engines, 2011. https://www.arb.ca.gov/diesel/documents/FinalReg2011.pdf. Accessed November 2018.

[11] SCAQMD, Final-Methodology to Calculate Particulate Matter (PM) 2.5 and PM 2.5 Significance Thresholds, October 2006, http://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/particulate-matter-(pm)-2.5-significance-thresholds-and-calculation-methodology/final_pm2_5methodology.pdf?sfvrsn=2. Accessed November 2018.

emissions associated with fuel delivery trucks and customer trips as discussed above for operational mobile sources, this HRA also included the following emission sources at the gas station:

- Tailpipe TOG emissions from customer vehicle queuing/idling and startup; and
- Evaporative TOG emissions from the transfer and storage of gasoline at the gas station (i.e., underground tank filling, tank breathing, vehicle fueling and spillage).

The HRA assumed each customer vehicle will idle at the gas station for a total of 10 minutes. This is a conservative assumption which is likely to overestimate the average customer idling time and idling-related emissions. The gas station is required to comply with the best achievable control technology (BACT) since it can emit more than 10 pounds per day of volatile organic carbon (VOC) emissions, and using Phase I and Phase II vapor recovery equipment with vent valves is considered BACT for gas dispensing facilities. Therefore, evaporative TOG emission calculations used the loading, breathing, refueling and spillage losses emission factors for Phase I and Phase II vapor recovery equipment with vent valves in the California Air Pollution Officers Associate's (CAPCOA) *Gasoline Service Station Industrywide Risk Assessment Guidelines*.[12]

[12] CAPCOA, Air Toxics Hot Spots Program, Gasoline Service Station Industrywide Risk Assessment Guidelines, November 1997, https://www.arb.ca.gov/ab2588/rrap-iwra/GasIWRA.pdf. Accessed November 2018.

CHAPTER 3

Receptor Identification

Existing receptor locations that are within 1,000 feet from the project site boundary were evaluated for effects of project construction and operational activities, as shown in **Figure 2,** *Project Boundary and Modeling Extant*. Both sensitive receptors and worker receptors within the study domain were included. Sensitive receptors evaluated in the analysis included:

- Daycares:
  - Love & Care Christian Preschool at Valley Bible Church – This is a daycare within the project boundary that will be demolished in Phase 2, it accepts children from two years old to Pre-K;
  - ClubSport Pleasanton (CSP) – This location has adult gym and also a Kids World program that accepts children from six weeks to 17 years old.
- Off-Site Residences:
  - Residences in the Stoneridge Apartment Community (west across from I-680);
  - Residences in the Val Vista neighborhood, southeast of project site;
  - Residences along Stonedale Drive, southwest of project site; and

There are no new onsite sensitive receptors associated with the project because there would be no residential land uses at the project site and no childcare or daycare facilities. Therefore, the residential receptors included in the HRA are all off-site.

For worker receptors, this analysis evaluated project risks at existing on-site businesses and surrounding businesses and fitness clubs that are within 1,000 feet of the project boundary. Although the BAAQMD does not consider worker receptors as sensitive receptors, and therefore does not require that HRAs include worker risk evaluation under CEQA, the HRA includes worker risk for existing off-site and existing on-site worker exposures to provide a comprehensive and conservative assessment of potential risk associated with the project. All on-site worker receptors would be removed as part of Phase 2 demolition activities in 2030. On-site workers would be exposed to all Phase 1 construction emissions and Phase 1 operational emissions for 10 years. Off-site worker receptors evaluated included:

- ClubSport Pleasanton;
- Val Vista Park;
- Lifelight Fitness;

- Crossfit Pleasanton;
- Kungfu Dragon USA;
- Norcal Volleyball Club;
- Total Player Center Baseball; and
- All existing off-site employees within 1,000 feet of the EDZ.[13]

[13] Sakura Gakuen school is not included as an offsite sensitive receptor because it is a language school. Students only are present for a maximum of 2 hours a day for language lessons during summer camp or after school. In addition, the school is located more than 1,500 feet from the project boundary. As such, it was not included as a sensitive receptor.

CHAPTER 4

Air Dispersion Modeling

The HRA was conducted following methods in the BAAQMD Air Toxics NSR Program Health Risk Assessment Guidelines, the BAAQMD Recommended Methods for Screening and Modeling Local Risks and Hazards document, and the 2015 OEHHA Air Toxics Hot Spots Program Guidance (2015 OEHHA Guidelines).[14,15,16] The 2015 OEHHA Guidelines were used to determine health risk from all TAC sources associated with the project, including the gas station. Although the BAAQMD NSR guidelines state that any HRA for gasoline dispensing facilities should follow the procedures described in the 2003 OEHHA Health Risk Assessment Guidelines for the Air Toxics Hot Spots Program (2003 OEHHA Guidelines), and not the 2015 OEHHA Guidelines, BAAQMD Regulation 1-102 *More than One Emission Standard* states: "*Where a person is subject to more than one emission standard for the same air contaminant, the more stringent shall apply.*"[17] Based on guidance from the BAAQMD, applying Regulation 1-102 to this HRA means that the 2015 OEHHA Guidelines should be used for all TAC sources associated with the project, including the gas station, because the 2015 OEHHA Guidelines are more stringent than the 2013 OEHHA Guidelines.[18]

Model Selection and Parameters

This analysis used the American Meteorological Society/Environmental Protection Agency regulatory air dispersion model (AERMOD version 18081) to estimate concentrations of DPM, $PM_{2.5}$ exhaust, and organic TACs at on- and off-site sensitive receptors. Besides the discrete receptors identified in Chapter 3, grid receptors were placed 20-meters apart covering the existing off-site residential and commercial areas within 1,000 feet of the project boundary. Each receptor was placed at a height of 1.8 meters above terrain height, which represents the default breathing

height for ground-floor receptors. Children at the on-site daycare were placed at a height of 0.5 meters to represent child breathing zones. Besides receptors, the AERMOD model requires numerous other inputs, such as meteorological data, source parameters, and topographical data. The following sections explain the major inputs used for this analysis.

For each receptor location, AERMOD generates air concentrations that result from emissions from multiple sources. AERMOD model requires numerous inputs, such as meteorological data, source parameters, topographical data, and receptor characteristics. AERMOD modeling parameters can be found in Appendix A.

Meteorological Data

This analysis used the AERMOD-ready meteorological dataset of the nearest meteorological air monitoring site - the Livermore Municipal Airport, which includes five years of data that was downloaded from the CARB's meteorological database.

Modeling Terrain

Terrain and elevation data was imported from the United States Geological Survey's (USGS) National Elevation Dataset (NED) (United States Geological Survey 2013). The dataset consists of ground surface elevation data for the United States, Canada, and Mexico. Elevations for all receptors and buildings were based on a NED dataset with a 10-meter resolution.

Based on the land use characteristics in the project vicinity, urban dispersion coefficients were used in AERMOD. The site was modeled with the urban population of 83,007 for July 1, 2017.[19] (US Census Bureau 2018). The urban option in AERMOD accounts for increased turbulence associated with the urban heat island effect.

Modeled Source Characters

As noted above, construction sources include off-road construction equipment, on-road diesel trucks (including haul trucks and material delivery trucks), and diesel truck idling. Operational sources include light- and heavy-duty truck travel, idling, TRU operation, emergency generators, and exhaust and evaporative TOGs from gas station activities. The modeling parameters used in AERMOD for each source are discussed below.

Emission rates from the various emission sources (e.g. construction activities, vehicle traffic, emergency generators, gas stations, and delivery trucks) were based on the anticipated hours of activity for each source and other information as described in Chapter 2, *Emission Calculations*, above. Each emission source was modeled separately within AERMOD. The analysis used a unitized emission rate concept for each source group, where each source group is modeled with a

Buildings

Project Boundary

[19] US Census Bureau, F… , 2017. https://www.census.g… tycalifornia. Accessed November 2018.

unitized emission rate of 1 gram/second (g/s). The modeled concentration at each receptor (micrograms per cubic meter [μ/m^3]/[g/s]) represents a "dispersion factor," which was then multiplied by the actual emission rate of each source group to determine actual concentrations, and the final result from all the sources was superimposed. This approach is called the "Summation Concept", which is conservative because the concentration and deposition fluxes at each receptor are the linear addition of the resulting values from each source groups. When modeling annual $PM_{2.5}$ emissions, the actual emissions rate of each source was used instead of a unitized emission rate.

Construction

The sections below describe how construction activities were modeled in AERMOD. Different source groups were modeled to represent emissions for each construction phase (i.e., Phase 1A, Phase 1B, and Phase 2). To reflect the duration of construction activities, Phase 1A construction was modeled as operating between 7 AM and 5 PM, 6 days a week, based on information provided by the City; Phase 1B and Phase 2 construction activities were modeled as operating between 7 AM and 5 PM, 5 days per week, based on CalEEMod default values. Detailed construction modeling parameters are presented in Appendix A.

Off-road Equipment

The exhaust emissions from off-road construction equipment were modeled as multiple areas sources equal to the size of the construction areas, with a 5-meter release height and 1.4-meter initial vertical dispersion.[20,21]

For all construction activities, an even distribution of construction emissions over the entire area of construction for each construction phase was used. This approach is appropriate because the location of where off-road equipment would operate is not known and it assumes emissions would originate from all potential locations within the construction source grid.

On-road Mobile Sources

Haul Routes

A line volume source (i.e., line sources as a series of volume sources) was placed along Johnson Drive (the only road with access to the project site). The haul route was modeled with a 10-foot release height and spanned along Johnson Drive from the northern side of the project site to Interstate-680.[22,23]

---

20 Release height based on SCAQMD, Final Localized Significance Threshold Methodology, July 2008. http://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/final-lst-methodology-document.pdf?sfvrsn=2. Accessed November 2018.

21 The San Francisco Community Risk Reduction Plan: Technical Support Documentation, December 2012. http://www.gsweventcenter.com/Appeal_Response_References/2012_1201_BAAQMD.pdf. Accessed November 2018.

22 The haul route is preliminary and subject to change, but is the most likely haul route for construction and is not anticipated to change substantially.

Haul Truck Idling

DPM emissions for truck idling were calculated using EMFAC2017 emission factors and were assumed to occur along Johnson Drive ranging from 50 to 250 meters. Idling emissions were modeled as line volume sources with a release height of 10 feet to represent haul trucks checking in and out of the construction site, as well as emissions from loading/unloading activities.[24] Although loading/unloading activities are likely to occur farther away from the construction site boundary, modeling these emissions at this location would be more conservative because emissions would be closer to surrounding sensitive receptors.

Operation

AERMOD-modeled operational emissions sources are shown in **Figure 3,** *Modeled Operational Sources*.

Mobile Sources

Project Vehicle Trips (Light-Duty Vehicles)

Line volumes sources were used to represent $PM_{2.5}$ exhaust and TOG emissions from on-road travel of light-duty gasoline vehicles. Line volume sources of various lengths were used to represent trip lengths and are based on the destination of the light-duty vehicles. A release height of two meters for light-duty vehicles was used based on BAAQMD's CRRP-HRA.[25] Additionally, $PM_{2.5}$ and TOG idling emissions from light-duty vehicles were modeled as line volume sources with a release height of two meters.

Delivery Vehicles

The project site would generate daily truck deliveries for its various land uses. Trucks would generate DPM emissions during three main activities: traveling to and from the project site, idling on-site, and on-site TRU operation for a portion of the trucks. Delivery truck trip lengths were based on the distance along Johnson Drive to a specific project land use (e.g., the trip distance for trucks traveling to FedEx would be shorter than the trip distance for trucks traveling to Costco). These sources were modeled as line volume sources with a release height of 10 feet.[26]

Line Volume Source representing Trucks and Light-Duty Vehicle Emissions

Point Source representing Emergency Generators

Volume Source with Point Source to represent Gas Station Fueling/Spillage/Venting

Buildings

Project Boundary

Stationary Sources

Emergency Generators

Emergency generators at Costco and the hotel were modeled as point sources in AERMOD. Generator activity was based on the maximum activity allowed by a BAAQMD permit for emergency generators (50 hours per year), 1,000-2,500-KW engines, and the CalEEMod default load factor of 0.74 (see Chapter 2). It was assumed the generators would be located at grade and have a release height of 2.16 meters.

Gas Station

Gas station emissions were modeled in accordance with CAPCOA guidance for gasoline dispensing stations.[27] As described in Chapter 2, gas station emissions would consist of evaporative TOG emissions from customer fueling, fuel spillage, and venting of an underground gasoline storage tank. Volume sources were used to represent customer fuel and fuel spillage emissions. Customer fueling had a release height of one meter and fuel spillage had a release height of zero feet. Point sources with a release height of 12 feet were used to represent loading and venting emissions for the underground storage tank.[28] Also, as discussed in Chapter 2 above, fugitive emissions associated with diesel fueling at the gas station was not included per guidance from the BAAQMD.[29]

CHAPTER 5

Risk Characterization Methods

In March 2015, OEHHA updated the methods for estimating cancer risks to use higher estimates of cancer potency during early life exposures and uses different assumptions for breathing rates and length of residential exposures. The new guidance, *Air Toxics Hot Spots Program Guidance Manual for the Preparation of Health Risk Assessments*, incorporates advances in risk assessment with consideration of infants and children using Age Sensitivity Factors (ASF) (OEHHA 2015). These updated exposure factors can result in numeric life-time health risk values to be approximately two to three times higher than those calculated under the previous OEHHA guidelines. Based on consultation with the BAAQMD, this HRA was performed in accordance with OEHHA's 2015 guidelines to quantify potential impacts from TACs emitted during project construction and operation.[30]

This analysis calculated the project-level lifetime excess cancer risk, chronic health impacts, and annual average $PM_{2.5}$ exhaust concentrations to estimate project-specific and cumulative health risks for both construction and operational emissions. These calculations were based on the emission calculation methods identified in Chapter 2 above, annual average pollutant concentrations from AERMOD discussed in Chapter 4, and accepted dose and risk calculations from OEHHA and BAAQMD, as discussed below.

Acute health impacts associated with short-term exposure to TACs (such as 1-hour and 8-hour exposures) are expected to be insignificant. For DPM sources, according to the BAAQMD, *"Diesel exhaust particulate matter should be used as a surrogate for all TAC emissions from diesel-fueled compression-ignition internal combustion engines*," and DPM does not have an acute reference exposure level.[31,32] BAAQMD confirmed via correspondence with ESA that DPM from internal combustion engines is used as a surrogate to evaluate the combined impacts of all individual TACs found in diesel engine exhaust, and because DPM does not have an acute

[30] The BAAQMD HRA guidance for gas station project and non-gas station project are different. Since this project has TAC emissions from both gas station and non-gas station project components, the project team consulted the BAAQMD in July 2018, and was instructed to use the 2015 OEHHA method consistently for all project components.

[31] BAAQMD, Staff Report: Proposed Amendments to: BAAQMD Regulation 2, Rule 5: New Source Review of Toxic Air Contaminants, January 2016. Table 2-5-1 Toxic Air Contaminant Trigger Levels. http://www.baaqmd.gov/~/media/files/planning-and-research/rules-and-regs/workshops/2016/reg-2-5/revised-trigger-levels_jan_2016-pdf.pdf?la=en. Accessed December 2018.

[32] CARB, Consolidated Table of OEHHA/ARB Approved Risk Assessment Health Values, August 2018. https://www.arb.ca.gov/toxics/healthval/contable.pdf. Accessed December 2018.

health effects value, you cannot calculate acute health risks from DPM.[33] Therefore, the HRA does not include acute impacts associated with DPM. For organic TACs speciated from TOG emissions associated with light-duty gasoline vehicles and gas station operations, acute health impacts are not considered a risk-driver based on the following sources:

- The CAPCOA Gasoline Service Station Industrywide Risk Assessment Guidelines states, "*It is not necessary to determine the one-hour maximum downwind concentration of substances in gasoline vapors. Appendix I contains a discussion on the relative toxicity of substances in gasoline. It shows that benzene is the most important substance driving the risk assessment. It also shows that xylene is the only substance which is associated with acute adverse health effects. Not until the benzene emissions are three orders of magnitude above the 10 per million cancer risk threshold, do the emissions of xylene begin to cause acute adverse health effects. Therefore, it is not likely the downwind xylene concentrations will ever need to be determined unless the gasoline throughput caused the cancer risk to exceed 100 per million.*"[34]
- BAAQMD Regulation 2, Rule 5: New Source Review of Toxic Air Contaminants states, for GDFs, "*Considering the differences between the acute and chronic trigger levels for benzene, acute impacts are not likely to be a dominant issue for benzene emission projects, such as GDFs. Cancer risk is expected to be the dominant health effect for 1,3 butadiene as well, but acute health impacts could become more significant for projects emitting nickel and nickel compounds.*"[35]
- The BAAQMD Recommended Methods for Screening and Modeling Local Risks and Hazards document states for roadways: *"… the tables do not include acute or chronic noncancer hazards since the maximum hazards estimated from the highest AADT [average annual daily traffic] were found to be extremely low*" and for permitted stationary sources, such as GDFs, *"… the screening values do not include acute hazard index since the maximum values were found to be extremely low.*"[36] Therefore, the BAAQMD risks and hazards screening analysis tools used to conduct the cumulative HRA do not contain acute health risk values, and thus acute health risks were not included in the cumulative HRA.
- The BAAQMD Risk and Hazards Emissions Screening Calculator (Beta Version), which calculates acute risk from GDFs based on worst-case meteorology and other conservative screening criteria, indicates that the acute hazard index for the proposed gas station would be approximately 0.011 at 100 feet from the gas station (the location of the closest off-site

[33] Carol Allen, Assistant Manager, Engineering Division, BAAQMD. Email correspondence with ESA on November 29, 2018.

[35] BAAQMD, Staff Report: Proposed Amendments to: BAAQMD Regulation 2, Rule 5: New Source Review of Toxic Air Contaminants, September 2016. http://www.baaqmd.gov/~/media/files/planning-and-research/public-hearings/2016/reg-2-rule-5/0205_sr_102516-pdf.pdf?la=en. Accessed December 2018.

[36] BAAQMD, Recommended Methods for Screening and Modeling Local Risks and Hazards, May 2012. http://www.baaqmd.gov/~/media/files/planning-and-research/ceqa/risk-modeling-approach-may-2012.pdf?la=en. Accessed November 2018.

worker receptor to the gas station). This calculation was based on calculated daily emissions of benzene, toluene, and xylene from gas station operations as presented in Appendix A. This value of 0.011, which reflects conservative screening methods and is therefore likely higher than would be determined using the refined modeling methods used in this HRA for other TAC sources, is well below the BAAQMD non-cancer hazard index threshold of 1.

Consequently, the HRA does not further quantify the insignificant acute health impacts associated with the project's TAC emissions.

Also, as discussed in Chapter 2 above, fugitive emissions associated with diesel fueling at the gas station was not included per guidance from the BAAQMD.[37]

Exposure Assessment

Cancer risk as a result of exposure to DPM and organic TACs included in this analysis occurs exclusively through the inhalation pathway. Therefore, the HRA only evaluated cancer risks and chronic impacts from inhalation and no other exposure pathways (e.g., dermal and ingestion pathways). Exposure parameters used in the analysis can be found in Appendix A. Risk was calculated for resident, daycare, and worker receptor types. The HRA determined the Maximally Exposed Individual Resident (MEIR) and the Maximally Exposed Individual Worker (MEIW) for both on-site and off-site residents and workers. There are no new onsite sensitive receptors associated with the project because there would be no residential land uses at the project site and no childcare or daycare facilities. Therefore, the residential receptors included in the HRA are all off-site. The only on-site sensitive receptors are located at the daycare at the Love & Care Christian Preschool at Valley Bible Church, which is an existing facility (and is assumed to be removed during Phase 2 construction).

This analysis conservatively evaluated the receptor exposure scenarios discussed below. Details of each scenario are shown in **Table 4**, *Cancer Risk Scenarios*.

- **Off-site residents (Scenarios 1 & 2):** Scenario 1 evaluates resident cancer risk from all construction and operational activities from 2020 (the beginning of project construction) to 2050 (representing a 30-year residential exposure, consistent with OEHHA and BAAQMD guidance). Scenario 2 evaluates resident cancer risk from full buildout operations (i.e., operation of both Phase 1 and Phase 2) from 2031 to 2061 (representing a 30-year residential exposure). For off-site residents, because child resident exposure assumptions are more conservative than those for adult residents, a conservative approach of considering all off-site residential receptors as initially child (infant) residents was used in this HRA, consistent with BAAQMD guidance. Once child receptors have been exposed for 16 years, adult exposure parameters were used. The resident risk calculations were consistent with the BAAQMD guidance of 350 days per year and 30 years of exposure.

[37] Carol Allen, Assistant Manager, Engineering Division, BAAQMD. Email correspondence with ESA on November 27, 2018.

- **Off-site gym user receptors at CSP (Scenarios 3 & 4):** The CSP facility's Kids World program allows a child of 6 weeks to 3 months old to stay at the facility for a maximum of one and half hours per day, and a child 3 months or older to stay for a maximum of four hours per day, through age 17. For cancer risk calculations, this HRA conservatively assumed an individual would be present four hours per day, seven days per week, 350 days per year from birth to 30 years old (representing a highly conservative and unlikely scenario of 30-year total exposure starting with a child exposure from age 3 months to age 16 at the Kids World program and then an adult user exposure from age 16 through 30 as a gym user). Scenario 3 evaluates cancer risk from all construction and operational activities from 2020 to 2050. Scenario 4 evaluates cancer risk from full buildout operational activities from 2031 to 2061. Both represent a 30-year exposure.

- **Off-site existing worker receptors (Scenarios 5 & 6):** These scenarios include existing off-site worker exposure to construction and operational emissions. Scenario 5 evaluates existing off-site worker cancer risk from all construction and operational activities from 2020 to 2045. Scenario 6 evaluates existing off-site worker cancer risk from full buildout operations from 2031 to 2056. Risks at existing off-site non-residential areas where workers are present (including workers at the CSP) were calculated using a worker exposure scenario based on 8 hours per day, 250 days per year, and 25 years of exposure, consistent with OEHHA and BAAQMD guidance for worker exposure.

- **On-site existing daycare receptors (Scenario 7):** Child receptors were evaluated for the daycare at the Love & Care Christian Preschool at Valley Bible Church. Daycare receptors were assumed to be exposed to all Phase 1 construction emissions and a maximum of four years of Phase 1 operations, because the daycare serves children ages two through pre-K (age 5), and longer daycare children exposures are not likely. The daycare risk calculations were consistent with the BAAQMD guidance of 8 hours per day, 250 days per year of exposure.

- **On-site existing worker receptors (Scenario 8):** The worker/teacher receptors for the Love & Care Christian Preschool at Valley Bible Church and workers located at other existing on-site businesses (see list above) were assumed to be exposed to all Phase 1 construction and Phase 1 operation until Phase 2 construction starts in 2030. The daycare and existing businesses were assumed to be demolished during Phase 2 construction. Therefore, existing on-site worker receptors were not exposed to Phase 2 construction or operational emissions. The existing on-site worker risk calculations were consistent with the BAAQMD guidance of 8 hours per day, 250 days per year of exposure.

With regard to scenarios 1 and 2 for off-site residents, the HRA included a 3rd trimester exposure starting in year 2020 with Phase 1 construction (and extending for 30 years with Phase 1 operations, Phase 2 construction, and Phase 2 operations) but did not include a 3rd trimester exposure starting in year 2030 for Phase 2 construction. The 2030 exposure scenario was not included because associated health risks would be less than the 2020 exposure scenario, as off-road construction equipment continues to get cleaner as old equipment is retired, new equipment with more stringent emissions controls are phased into the construction fleet, and more stringent emissions standards for off-road equipment is introduced. Based on the emissions modeling conducted for the project, DPM emissions associated with construction in 2020 are approximately

7.5 times higher than DPM emissions associated with construction in 2030; therefore, DPM exposure and resulting cancer and chronic risk for the 2030 3rd trimester exposure scenario would likely be 5-10 times lower than the risk estimated in the HRA for scenarios 1 and 2. The same rationale holds with regard to scenarios 3 and 4 for off-site child gym user receptors at CSP; the HRA included infant exposure scenarios starting in the year 2020 with Phase 1 construction (and extending for 25 years with Phase 1 operations, Phase 2 construction, and Phase 2 operations), but did not include infant exposure scenarios starting in the year 2030 with Phase 2 construction.

With regard to scenarios 5 and 6 for off-site existing worker receptors and scenario 8 for on-site existing worker receptors, the HRA did not include new on-site worker exposure because the included scenarios capture the potential worker-related risk from the project (also because the BAAQMD does not require worker risk analysis in HRAs for CEQA compliance). These scenarios consider both a full 25-year worker exposure (scenarios 5 and 6) and a 10-year exposure (scenario 8) for existing workers at the project site.

Cancer Risk Characterization

The exposure parameters used to estimate excess lifetime cancer risk for all potentially exposed populations for the HRA were obtained using risk assessment guidelines from OEHHA and BAAQMD.

Intake Calculation

The dose estimated for each exposure pathway is a function of the concentration of a chemical and the intake of that chemical. The intake factor for residential inhalation, IF_{inh}, was calculated as follows using **Equation 5**. The values used in this equation are presented in Appendix A.

Equation 5: $$I_{inh} = \frac{DBR * FAH * EF * ED * MAF * ASF * CF}{AT}$$

Where:

I_{inh} = Intake Factor for Inhalation (m^3/kg-day)
DBR = Daily Breathing Rate (L/kg-day)
FAH = Fraction of time at home (unitless)
EF = Exposure Frequency (days/year)
ED = Exposure Duration (years)
AT = Averaging Time (days)
MAF = Model Adjustment Factor (unitless)
ASF = Age Sensitivity Factor (unitless)
CF = Conversion Factor, 0.001 (m^3/L)

The dose estimated for each exposure pathway is a function of the concentration of a chemical and the intake of that chemical. The intake factor for on- and off-site worker, daycares, and

school inhalation, IF_{inh}, was calculated as follows using **Equation 6**. The values used in this equation are presented in Appendix A.

Equation 6: $$I_{inh} = \frac{DBR * EF * ED * MAF * ASF * CF}{AT}$$

Where:

I_{inh} = Intake Factor for Inhalation (m^3/kg-day)
DBR = Daily Breathing Rate (L/kg-day)
EF = Exposure Frequency (days/year)
ED = Exposure Duration (years)
AT = Averaging Time (days)
MAF = Model Adjustment Factor (unitless)
ASF = Age Sensitivity Factor (unitless)
CF = Conversion Factor, 0.001 (m^3/L)

The chemical intake or dose is estimated by multiplying the intake factor for inhalation, IF_{inh}, by the chemical concentration in air, C_i. This calculation is mathematically equivalent to the dose algorithm given in the current OEHHA guidance. Note for this HRA, the ED from Equations 5 and 6 were taken out to develop an annual risk factor independent of exposure duration, so that cancer risk can be calculated more directly based on the age bins and exposure durations for each age bin. See Appendix A for detail.

Toxicity Assessment

The assessment of toxicity determines the relationship between the magnitude of chemical exposure and the nature and magnitude of adverse health effects resulting from this exposure. Adverse health effects were calculated for both cancer and non-cancer endpoints. Toxicity values that are used to estimate the likelihood of adverse health effects occurring in humans at different exposure levels are identified as part of the toxicity assessment component of an HRA. The toxicity values used in the analysis for DPM and gasoline-related TACs are from OEHHA and BAAQMD.[38, 39] These toxicity values are for carcinogenic (cancer) and Hazard Index (non-cancer) effects.

Age Sensitivity Factors

The estimated excess lifetime cancer risks for children receptors (resident, daycare, and school) were adjusted using the ASFs recommended in the California Environmental Protection Agency

[38] OEHHA, Hot Spots Unit Risk and Cancer Potency Factors, https://oehha.ca.gov/air/air-toxics-hot-spots. Accessed November 2018.

[39] BAAQMD, Recommended Methods for Screening and Modeling Local Risks and Hazards, May 2012. http://www.baaqmd.gov/~/media/files/planning-and-research/ceqa/risk-modeling-approach-may-2012.pdf?la=en. Accessed November 2018.

(Cal/EPA) OEHHA Technical Support Document and 2015 OEHHA guidance.[40] This approach accounts for an "anticipated special sensitivity to carcinogens" of infants and children. Cancer risk estimates are weighted by a factor of 10 for exposures that occur from the third trimester of pregnancy to two years of age and by a factor of three for exposures that occur from two years through 15 years of age. No weighting factor (i.e., an ASF equal to one, which is equivalent to no adjustment) is applied to ages 16 to 70 years.

Cancer Risk Calculation

Excess lifetime cancer risks are estimated as the upper-bound incremental probability that an individual will develop cancer over a lifetime as a direct result of exposure to carcinogens. The risk is expressed as a unitless probability, and was calculated as the number of cancer incidences per million individuals in the HRA. The cancer risk for each chemical is calculated by multiplying the chemical intake or dose at the human exchange boundaries (e.g., lungs) by the chemical-specific cancer potency factor (CPF). For cancer risk, the BAAQMD guidance identifies a significant impact if a project would result in an incremental cancer risk that is greater than 10 per million for any receptor. **Table 4** below summarizes the cancer risk scenarios analyzed in this HRA.

BAAQMD has developed weighted toxicity values for tailpipe and evaporative TOG losses that incorporates the individual toxicity of each compound that make up TOG.[41] This analysis updated the risk factors in the BAAQMD analysis with the latest data in the CARB's HARP2 database. The summation of all of the individual weighted toxicity values developed by BAAQMD is then cumulatively weighted and applied in the risk and hazard calculations for tailpipe TOG and evaporative TOG.

Excess lifetime cancer risk occurs exclusively through the inhalation pathway and was calculated according to **Equation 7**.

Equation 7: $$Risk_{inh} = C_i * IF_{inh} * CPF_i * CF_1 * CF_2$$

Where:

$Risk_{inh}$ = Cancer risk; the incremental probability of an individual developing cancer as a result of inhalation exposure to a particular carcinogen (per million)

C_i = Average annual air concentration of chemical, from AERMOD (μ/m^3)

IF_{inh} = Intake Factor for Inhalation (m^3/kg-day)

CPF_i = Cancer potency factor for chemical (mg chemical/kg body weight-day)$^{-1}$

[40] Cal/EPA, Technical Support Document for Cancer Potency Factors: Methodologies for derivation, listing of available values, and adjustments to allow for early life stage exposures. May 2009. https://oehha.ca.gov/media/downloads/crnr/tsdcancerpotency.pdf. Accessed November 2018.

CF_1 = Conversion factor, micrograms to milligrams (mg/µg)

CF_2 = Risk per million individuals

i = Chemical

TABLE 4
CANCER RISK SCENARIOS

Scenario	Age Group	Project Component Exposure	Start Date	End Date	ED (years)
Scenario 1: Off-site Resident, Construction + Operation	3rd Trimester	Phase 1 Construction	4/6/2020	7/5/2020	0.25
	Age 0<2 Years	Phase 1 Construction	7/6/2020	4/5/2021	0.75
	Age 0<2 Years	Phase 1 Operation	4/6/2021	7/5/2022	1.25
	Age 2<16 Years	Phase 1 Operation	7/6/2022	1/6/2031	8.5
	Age 2<16 Years	Phase 2 Construction	1/7/2030	1/6/2031	1
	Age 2<16 Years	Full Operation	1/7/2031	7/6/2036	5.5
	Age 16<30 Years	Full Operation	7/7/2036	4/5/2050	13.75
Scenario 2: Off-site Resident, Full Operation	3rd Trimester	Full Operation	1/7/2031	4/6/2031	0.25
	Age 0<2 Years	Full Operation	4/7/2031	4/6/2033	2
	Age 2<16 Years	Full Operation	4/7/2033	4/6/2047	14
	Age 16<30 Years	Full Operation	4/7/2047	1/6/2061	13.75
Scenario 3: CSP Gym User, Construction + Operation	Age 0<2 Years	Phase 1 Construction	4/6/2020	4/5/2021	1
	Age 0<2 Years	Phase 1 Operation	4/6/2021	4/5/2022	1
	Age 2<16 Years	Phase 1 Operation	4/6/2022	1/6/2031	8.75
	Age 2<16 Years	Phase 2 Construction	1/7/2030	1/6/2031	1
	Age 2<16 Years	Full Operation	1/7/2031	4/6/2036	5.25
	Age 16<30 Years	Full Operation	4/7/2036	4/6/2050	14
Scenario 4: CSP Gym User, Full Operation	Age 0<2 Years	Full Operation	1/7/2031	1/6/2033	2
	Age 2<16 Years	Full Operation	1/7/2033	1/6/2047	14
	Age 16<30 Years	Full Operation	1/7/2047	1/6/2061	14
Scenario 5: Off-site Worker, Construction + Operation	Age 16<70 Years	Phase 1 Construction	4/6/2020	4/5/2021	1
	Age 16<70 Years	Phase 1 Operation	4/6/2021	1/6/2031	9.75
	Age 16<70 Years	Phase 2 Construction	1/7/2030	1/6/2031	1
	Age 16<70 Years	Full Operation	1/7/2031	4/5/2045	14.25
Scenario 6: Off-site Worker, Full Operation	Age 16<70 Years	Full Operation	1/7/2031	1/6/2056	25
Scenario 7: On-site Daycare	Age 2<9 Years	Phase 1 Construction	4/6/2020	4/5/2021	1
	Age 2<9 Years	Phase 1 Operation	4/6/2021	4/5/2025	4
Scenario 8: On-site Worker	Age 16<70 Years	Phase 1 Construction	4/6/2020	4/5/2021	1
	Age 16<70 Years	Phase 1 Operation	4/6/2021	1/6/2031	9.75

Chronic Health Impacts

Non-cancer effects of chronic (i.e., long- term) DPM and other TAC exposures were evaluated using the Hazard Index (HI) approach consistent with OEHHA guidance. The chronic HI is calculated by dividing the maximum modeled annual average concentration at the maximum impacted receptor by the Reference Exposure Level (REL). The REL is the concentration at or below which no adverse health effects are anticipated. RELs for DPM and TACs were obtained from OEHHA and BAAQMD. For example, OEHHA has recommended an ambient concentration of 5 micrograms per cubic meter ($\mu g/m^3$) as the chronic inhalation REL for DPM exhaust. Chronic inhalation REL for TACs associated with tailpipe and evaporative TOG were based on the BAAQMD's weighted toxicity calculation methods and the latest data in the HARP2 database. The BAAQMD guidance identifies a significant impact if a project would result in an incremental chronic HI that is greater than 1.0. For chronic HI impacts, this HRA analyzed the following potential worst case scenarios: Phase 1 Construction, Phase 1 Operations plus Phase 2 Construction, and Full Buildout Operations.

$PM_{2.5}$ Concentrations

Annual $PM_{2.5}$ exhaust concentrations were estimated for the following four scenarios: Phase 1A and Phase 1B Construction (2020), Phase 1 Operation (2021-2029), Phase 1 Operation plus Phase 2 Construction (2030), and Full Buildout Operations (2031). Among them, the potential worst case annual $PM_{2.5}$ scenarios are Phase 1 Construction, Phase 1 Operation plus Phase 2 Construction, and Full Buildout Operations, which were the three scenarios summarized in this HRA regarding $PM_{2.5}$ concentration impacts. The BAAQMD guidance identifies a significant impact if a project would result in an incremental annual $PM_{2.5}$ concentration greater than 0.3 $\mu g/m^3$.

Cumulative Risk

Consistent with BAAQMD's CEQA Guidelines, cumulative exposure to $PM_{2.5}$ and TACs were evaluated by calculating the exposure of sensitive receptors to the cumulative effect of existing, proposed project (construction and operation), and reasonably foreseeable future sources of $PM_{2.5}$ and TAC emissions within 1,000 feet of the project site boundary or a sensitive receptor. All receptor types were included in the cumulative analysis.

The cumulative analysis included the cancer risk, chronic risk, and annual average $PM_{2.5}$ exhaust concentrations from the sources discussed below. The BAAQMD guidance identifies a cumulative significant impact if a project and the cumulative sources combined would exceed the following:

- An excess cancer risks levels of more than 100 in one million;
- A chronic HI greater than 10; and
- Annual $PM_{2.5}$ concentrations greater than 0.8 $\mu g/m^3$

The BAAQMD Risks and Hazards Stationary Source Screening Analysis tool and the Risks and Hazards Highway Screening analysis tool were used to estimate cancer risk, chronic risk, and annual average $PM_{2.5}$ exhaust concentrations from nearby sources located within 1,000 feet of the project boundary. These BAAQMD tools only include cancer risk values for residential receptors with an exposure duration of 30 years. This HRA conservatively applied these 30-year residential cancer risk values to all receptor types, including daycare and worker receptors. Compared to residential exposure parameters and residential cancer risks, daycare and worker receptors generally have reduced exposure parameters and lower cancer risk. Therefore, by combining residential cancer risks for cumulative sources to worker and daycare cancer risks for project-related sources, the cumulative cancer risks presented for worker and daycare receptors in this HRA are overestimated.

Future Development Projects

Upon review of the City's Community Development Department Update memorandum, there are no projects that are planned, approved, or under construction within 1,000 feet of the project site.[42] Therefore, no future development projects were included in the cumulative analysis.

Existing Stationary Sources Within 1,000 Feet of the Project Site

The BAAQMD Risk and Hazards Stationary Source Screening Analysis tool was used to estimate cancer risk, chronic risk, and annual average $PM_{2.5}$ exhaust concentrations from sources located within 1,000 feet of the project boundary or 1,000 feet from a sensitive receptor.[43] **Table 5** lists the sources within 1,000 feet of the project boundary or sensitive receptor along with their maximum cancer risk, hazard index, and annual average $PM_{2.5}$ exhaust concentrations at each source location (i.e. as if a sensitive receptor were located at the source itself) based on the BAAQMD's screening calculator. Impacts from these sources were dependent upon the distance between the source and the impacted receptor. The screening tool used a distance multiplier to refine values based on the distance from the source and impacted receptor and provided values up to 918 feet. A majority of this project's impacted receptors are located further than 918 feet from these stationary sources. To be conservative, the scaled risk for all receptors located further than 918 feet from these sources represents the scaled risk value at 918 feet. Additionally, the cancer risk values in the screening tool are based on 2003 OEHHA guidance. In order to be consistent with 2015 OEHHA guidance, cancer risk values from the screening tool were scaled up by a factor of 1.3744 based on BAAQMD guidance.[44, 45]

44 Lau, Virginia. Bay Area Air Quality Management District. February 3, 2016—email communication with the San Francisco Environmental Planning Department and Ramboll Environ.

The locations of source ID 15892 and ID 1371 in the BAAQMD screening tool keyhole markup language (kml) file were inaccurate. Source ID 15892, an emergency generator for the Livermore-Amador Valley Water Management Agency (LAVWMA), was located in the roadway along Johnson Drive; Source ID 1371, an emergency generator for the Dublin San Ramon Services District, was located on the soccer field at Val Vista Park. Based on review of these sources in the BAAQMD's Toxic Inventory Report and information obtained through web search, the locations of each source were moved to their actual location associated with their respective facility locations. Additionally, Source ID 10984, an emergency generator for the Clorox Services Company, has moved from 7200 Johnson Drive as shown in the screening tool to 4900 Johnson Drive, which is greater than 1,000 feet from the project boundary or any sensitive receptor within 1,000 feet of the project boundary, and was therefore not considered in the cumulative analysis.

There are no additional permitted stationary sources within 1,000 feet of the project boundary. The nearby Dublin San Ramon Services District Water Treatment Facility is not a substantial source of TAC emissions; however, the HRA includes emissions and risk from the stationary diesel emergency generator at the Dublin San Ramon Services District Water Treatment Plant. The BrightView landscaping facility is also not a source of TAC emissions, and is therefore not permitted by the BAAQMD.

TABLE 5
CUMULATIVE SOURCES

Source ID [a]	Cancer Risk [b] (per million)	Hazard Index	Annual $PM_{2.5}$ Concentration ($\mu g/m^3$)
15892 (LAVWMA generator)	53.01	0.019	0.012
1371 (DSRSD generator)	153.19	0.353	8.16
17583	63.63	0.023	0.113

NOTES:

[a] Sources included in cumulative analysis are either 1,000 feet from the project boundary or a sensitive receptor in accordance with BAAQMD guidance. Sources 15892 and 1371's locations in the BAAQMD-provided kmz file do not appear to be accurate, because both sources are associated with water district's operations but they appear to be in roadway or soccer field. Therefore, this HRA adjusted their locations based on the actual location of their associated facilities in aerial map. Two other sources, G9073 and G7484, are private fleet fueling operations that fall within 1,000 feet from the project boundary; their risk values were shown as na in the BAAQMD screening tool, therefore they were not assumed to not pose significant health risk and not included in the cumulative analysis.

[b] Cancer risks are based on 2003 OEHHA methodology, for the cumulative HRA, these values will be scaled up by a factor of 1.3744.

45 The scaling factor represents the average difference in residential cancer risk, as calculated using the latest 2015 OEHHA guidance, compared to the original 2003 OEHHA guidance. In other words, using the updated cancer risk calculations and age sensitivity factors from the 2015 OEHHA guidance, calculated residential lifetime excess cancer risk is 1.3744 times higher than residential cancer risk as calculated using the original 2003 OEHHA guidance.

SOURCE: BAAQMD, Stationary Source Screening Analysis Tool – Alameda_2012, May 2012. http://www.baaqmd.gov/plans-and-climate/california-environmental-quality-act-ceqa/ceqa-tools. Accessed November 2018.

Freeway Sources Within 1,000 Feet of the Project Site

The BAAQMD Risks and Hazards Highway Screening analysis tool was used to estimate cancer risk, chronic risk, and annual average $PM_{2.5}$ exhaust concentrations up to 1,000 feet from freeway segments of Interstates 680 and 580.[46] A majority of impacted receptors are located further than 1,000 feet from freeway segments. To be conservative, the scaled risk for all receptors located further than 1,000 feet from freeway segments represents the scaled risk value at 1,000 feet. Similar to stationary sources, the cancer risk values in the screening tool are based on 2003 OEHHA guidance. In order to be consistent with 2015 OEHHA guidance, cancer risk values from the screening tool were scaled up by a factor of 1.3744 based on BAAQMD guidance.

CHAPTER 6

Results

Project Health Risks

This section presents the results of the HRA, including cancer risk, chronic health impacts, and $PM_{2.5}$ exposures as a result of project construction and operations. Maximum potential risks from exposure to construction DPM, operational DPM, and speciated TACs from TOG emissions are summarized for all on-site and off-site receptor types analyzed in the HRA. Results are presented for the MEIR and the MEIW in the tables and figures below.

Lifetime Excess Cancer Risk

Table 6 presents the modeled lifetime excess cancer risk for Construction plus Operations and Full Buildout Operations. *As shown below, the project would not exceed the 10 per million cancer risk threshold for any receptor type, therefore, project impacts would be less than significant*. The maximum impacted receptors for each scenario are shown below in **Figure 4,** *Project Cancer Risk*. The receptors shown in Figure 3 represent the locations with the highest cancer risk of all receptor types analyzed in the HRA. Only the maximum residential risk (maximally exposed individual resident, or MEIR) is shown for all residential receptor locations included in the HRA.

TABLE 6
PROJECT MAXIMUM INCREMENTAL INCREASE IN CANCER RISK

Receptor Type	Construction + Operations (per million)	Full Buildout Operations (per million)

Chronic Non-Cancer Impacts

Table 7 presents the modeled chronic health impacts during Phase 1 Construction, Phase 1 Operations plus Phase 2 Construction, and Full Buildout Operations. *As shown below, the project would not result in a hazard index greater than 1.0, therefore chronic health impacts would be less than significant*. The maximum impacted receptors for each scenario are shown below in **Figure 5,** *Project Chronic Health Impacts*. The receptors shown in Figure 5 represent the locations with the highest chronic risk of all receptor types analyzed in the HRA. Only the MEIR is shown for all residential receptor locations included in the HRA.

Cumulative Health Impacts

As described in Chapter 5, the cumulative analysis included cancer risk, chronic impacts, and $PM_{2.5}$ exhaust concentrations for existing stationary sources and freeway segments within 1,000 feet of the project site or sensitive receptor.

Cumulative Cancer Risk

Table 9 presents the modeled cumulative lifetime excess cancer risk for Construction plus Operations and Full Buildout Operations. *As shown below, cumulative impacts would not exceed the 100 per million cancer risk threshold for any receptor type, therefore, project cumulative impacts would be less than significant*. As discussed above, the cumulative cancer risks from existing TAC sources are based 30-year residential cancer risk, which was added to the project-level risk for all receptor types, including daycare and worker receptors. Because residential exposure parameters are more conservative than daycare and worker exposure parameters, the cumulative cancer risks presented for worker and daycare receptors in this HRA are overestimated. The maximum impacted receptors for each scenario are shown below in **Figure 7,** *Cumulative Cancer Risk.* The receptors shown in Figure 7 represent the locations with the highest cancer risk of all receptor types analyzed in the HRA. Only the MEIR is shown for all residential receptor locations included in the HRA.

TABLE 9
CUMULATIVE MAXIMUM INCREMENTAL INCREASE IN CANCER RISK

Based on BAAQMD's Community Air Risk Evaluation Program (CARE), the project area (zip code 94588) has a lifetime cancer risk of 105 per million.[47] Upon review of CARE's

[47] BAAQMD, Community Air Risk Evaluation Program, Identifying Areas with Cumulative Impacts from Air Pollution in the San Francisco Bay Area, Impacted Areas by Zip Code, 2014. http://www.baaqmd.gov/community-

methodology, lifetime cancer risk is based on an exposure duration of 70 years and exposure to 2015 TAC concentrations were constant throughout the entire 70-year exposure duration.[48,49] The methodology document for the CARE report states that exposure to 2015 TAC levels is a conservative assumption since Bay Area TAC concentrations have been following a strong downward trend in recent years. The project's cancer risk values are based on a maximum exposure duration of 30 years and accounts for declining emissions from mobile sources in future years (e.g., 2021 and 2031), and the results are reasonably lower than those estimated by the CARE.

Cumulative Chronic Impacts

Table 10 presents the cumulative chronic impacts during Phase 1 Construction, Phase 1 Operations plus Phase 2 Construction, and Full Buildout. *As shown below, cumulative impacts would not exceed a hazard index of 10 for any receptor type, therefore, project cumulative impacts would be less than significant*. The maximum impacted receptors for each scenario are shown below in **Figure 8,** *Cumulative Chronic Health Impacts.* The receptors shown in Figure 8 represent the locations with the highest chronic risk of all receptor types analyzed in the HRA. Only the MEIR is shown for all residential receptor locations included in the HRA.

CUMULATIVE $PM_{2.5}$ CONCENTRATIONS

Receptor Type	Phase 1 Construction (µg/m³)	Phase 1 Operations + Phase 2 Construction (µg/m³)	Full Buildout Operations (µg/m³)
Off-Site Residential (MEIR)	0.31	0.49	0.26
Off-Site Worker (MEIW)	0.37	0.59	0.39
CSP Gym User	0.35	0.35	0.38
On-Site Daycare	0.25	0.26	-
On-Site Worker (MEIW)	0.56	0.46	-
Annual $PM_{2.5}$ Threshold	0.8	0.8	0.8
Exceeds Threshold?	No	No	No

ABBREVIATIONS:
MEIR = maximally exposed individual resident
MEIW = maximally exposed individual worker
CSP = Club Sport Pleasanton
PM2.5 = Fine particulate matter less than 2.5 micrometers in aerodynamic diameter
µg/m³ = micrograms per cubic meter

Health Impact Summary

As shown in the tables above, the project would not result in significant impacts by itself or cumulatively for cancer risks, chronic impacts, or annual $PM_{2.5}$ exhaust concentrations.

CHAPTER 7

Modeling Uncertainties

Emission Calculations

There are a number of uncertainties contained within the CalEEMod model, which was used to calculate construction emissions for the proposed project. The model uses equations and emission factors that approximate actual activity and emissions associated with that activity, but they are only approximations. For example, CalEEMod uses off-road emission factors from the CARB's OFFROAD2011 model. These emission factors are based on ARB off-road equipment rule compliance reporting (including equipment populations and hours of use), load factors from academic studies, growth projections based on economic forecasts and ARB bounding scenarios, fuel consumption estimates from the USEPA NONROAD model, typical engine deterioration rates and fuel correction factors, and other databases that rely on user reporting and economic forecasts.[50] In addition, CalEEMod default assumptions were used where project-specific information was not available. These assumptions generally result in a conservative estimate of overall construction and operational emissions.

Many emission sources were estimated outside of the CalEEMod model (such as emergency generators, TRUs, truck idling, and delivery truck trips) using calculation methods and emission factors from a wide variety of organizations and agencies (e.g. USEPA, CARB, BAAQMD, and National Renewable Energy Laboratory. These methods and emission factors all contain some uncertainty because they are meant to approximate emissions based on typical engine operation and fuel combustion characteristics. In addition, many assumptions were used to estimate emissions for these sources. In general, similar to the CalEEMod default assumptions, these assumptions are conservative and likely result in an overestimate of actual emissions.

There are also uncertainties associated with the estimation of emissions from construction traffic, such as haul trucks and vendor commutes, and operational mobile sources, such as automobile trips and delivery trucks, since construction haul routes and trip generation were estimated by the City. However, conservative assumptions were generally used, likely resulting in an overestimate of actual emissions.

Air Concentrations and Source Representation

The source parameters used in the emissions modeling add uncertainty to the analysis. For all emission sources, this HRA used source parameters that are either recommended as defaults, are consistent with the BAAQMD methodology, and/or are expected to produce more conservative (i.e., overestimation of) results. Although differences may exist between the actual emissions characteristics of a source and its representation in the modeling, exposure concentrations used in this HRA represent a reasonable approximation of exposure concentrations.

Exposure Concentrations

When estimating pollutant exposures using the AERMOD dispersion mode, there is uncertainty embodied in the modeling. AERMOD's limitations provide a source of uncertainty in the estimation of exposure concentrations. According to the USEPA, errors of ±10 percent to 40 percent are typical for the highest estimated concentrations due to the limitation of the AERMOD algorithms.[51] The methods employed by this HRA consistently produce conservative results, and therefore estimated exposure concentrations are likely to be at or above actual exposure concentrations.

Exposure Assumptions

A number of assumptions must be made in order to estimate human exposure to chemicals. These assumptions include parameters such as breathing rates, exposure time and frequency, exposure duration, and human activity patterns (see Appendix A for these parameters). Although the best way to estimate central tendency is to use average values derived from scientifically defensible studies, many of the exposure variables used in this HRA per 2015 OEHHA guidelines are high-end estimates. For example, it is assumed that residential receptors and the CSP gym user receptors are exposed 250 days per year to project emissions. These assumptions are highly conservative, since most residents do not remain in their homes for these periods of time throughout the year, and do not necessarily reside at the same location or go to the same facility (e.g., CSP) for 30 years from birth. Furthermore, this analysis follows OEHHA guidance in evaluating outdoor air; however, indoor air concentrations may be different due to filtration or other reductions resulting from the building shell or Heating, Venting, and Air Conditioning systems. The combination of several high-end and conservative estimates used as exposure parameters may substantially overestimate chemical intake. The excess lifetime cancer risks calculated in this HRA are therefore likely to be overestimated.

Toxicity Assessment

The standard CPF established by Cal/EPA for DPM was used to estimate potential carcinogenic health effects from exposures to DPM emitted from project construction and operation. The CPF for DPM is derived by applying conservative assumptions which are intended to protect the most sensitive individuals in the potentially exposed populations.

To derive the CPF toxicity value for DPM, Cal/EPA makes several assumptions that tend to overestimate the actual hazard or risk to human health. CPFs used to estimate carcinogenic risk are also typically derived based on data from animal studies. These studies often administer high doses of a test chemical to laboratory animals, and the reported response is extrapolated to the much lower doses typical of human exposure. Very little experimental data are available on the nature of the dose-response relationship at low doses (e.g. whether a threshold exists or if the dose-response curve passes through the origin). Because of this uncertainty, a conservative model is used to estimate the low-dose relationship, and uses an upper bound estimate (the 95 upper confidence limit of the slope predicted by the extrapolation model) as the CPF. With this factor, an upper-bound estimate of potential cancer risks is calculated.

The Cal/EPA CPF for DPM (1.1 mg/kg-day) is used to estimate cancer risks associated with exposure to DPM from project construction and operation. However, the CPF is highly uncertain in both the estimation of response and dose. Due to inadequate animal test data and epidemiology data on diesel exhaust, the International Agency for Research on Cancer (IARC), a branch of the World Health Organization (WHO), had previously classified DPM as Probably Carcinogenic to Humans (Group 2). The USEPA had also previously concluded that the existing data did not provide an adequate basis for quantitative risk assessment.[52] However, based on two recent scientific studies IARC has re-classified DPM as Carcinogenic to Humans to Group 1.[53,54] This means that the IARC has determined that there is "sufficient evidence of carcinogenicity" of a substance in humans and represents the strongest weight-of-evidence rating in IARC's carcinogen classification scheme. Whether this determination by the IARC will provide additional impetus for the USEPA to identify a quantitative dose-response relationship between exposure to DPM and cancer is still unknown.

Risk Calculations

The USEPA states that the conservative assumptions used in a risk assessment, such as this HRA, are intended to assure that the estimated risks do not underestimate the actual risks posed by a

source. Further, that the estimated risks do not necessarily represent actual risks experienced by populations at or near a site.[55]

As noted above, the estimated risks in this HRA are based primarily on a series of conservative assumptions related to predicted environmental concentrations, exposure, and chemical toxicity. The use of conservative assumptions tends to produce upper-bound estimates of risk. The use of conservative assumptions is likely to result in overestimates of exposure and therefore risk, although it is difficult to quantify the uncertainties associated with all the assumptions made in this HRA. BAAQMD acknowledges this uncertainty by stating, "the methods used [to estimate risk] are conservative, meaning that the real risks from the source may be lower than the calculations, but it is unlikely that they will be higher".[56]

Note:
The City estimated project total truck for the grading/excavation and foundations/concrete pour for all phases, and building construction for Phase 1A, the truck trips of building construction of other phases were scaled based on landuse squarefeet as compared to Phase 1a. Paving phase is assumed to have one truck per day.

Construction PM2.5 Emissions

	Phase	Start Date	End Date	Number of Work Days	Hours per day	Emission Rate per work day (g/s)

4 Calculation takes variable emissions into account

Light-Duty Vehicle Emissions

Table 9: Light-Duty Vehicle Emissions for each Phase

Phase	Trips per Day (In/Out)	Trips per Hour (In/Out)	Roundtrips/Car Starts per Day	Roundtrips/Car Starts per Hour	Trip Distance (mi)	# of Cars Idling per Day	# of Cars Idling per Hour	Idling Duration (min) [2]	Speed (mph)	# of Hours a car is off onsite	Car Shutoffs per Trip per day
Phase 1A-Costco	7500	750	3750	375	0.69010				40	2	1
Phase 1A-Costco Gas Station [1]	3371	337	1686	169		1686	169	10	40	0.25	1
Phase 1B-Retail	156	16	78	8	0.69010				40	2	1
Phase 1B-Hotel (231 Rooms)	1845	185	923	92	0.69010				40	12	1
Phase 2-Retail	5596	560	2798	280	0.69010				40	2	1

1. Costco trips given in the Traffic Study include trips to both the store and gas station. Therefore, running emissions has been accounted for in the Phase 1A-Costco row, and gas station trips that were estimated based on CALEEMOD default are assumed to be part of the total Costco trips and only used for estimating other emissions (e.g., idling and startup) at the gas station.

2. ESA assumes a 10 minute idling time for each car waiting in line at Costco Gas Station.
