

2**EXECUTIVE SUMMARY****2.1 INTRODUCTION**

The Executive Summary chapter of the Environmental Impact Report (EIR) provides an overview of the Winery and Farm Brewery Zoning Text Amendment Project (proposed project) (See Chapter 3, Project Description, for further detail) and provides a table summary of the conclusions of the environmental analysis provided in Chapters 4 through 12. This chapter also summarizes the alternatives to the proposed project that are described in Chapter 13, Alternatives Analysis. Table 2-1 contains the potential environmental impacts associated with the proposed project, the significance of the impacts, the proposed mitigation measures for the impacts, and the significance of the impacts after implementation of the mitigation measures.

2.2 SUMMARY DESCRIPTION OF THE PROPOSED PROJECT

The proposed project includes the amendment of the existing Winery Ordinance that regulates wineries in the unincorporated portions of Placer County. All of the existing wineries, as well as current and pending farm breweries, are located in the western-central portion of the County. While the Winery Ordinance applies to all unincorporated portions of Placer County, the geographic study area of this EIR is appropriately focused on the areas of western Placer County where wineries and farm breweries are currently concentrated. The policy focus of the proposed Zoning Text Amendment is to preserve and protect farmland while supporting the tenets of agri-tourism. The existing Winery Ordinance consists of Section 17.56.330 (Wineries) and Section 17.04.030 (Definitions) of the Placer County Code. Generally, the proposed amendments include the following substantive changes: redefine the term Events; define the term Farm Brewery; modify the minimum parcel size; create a table outlining special event allowances and maximum capacity at certain types of events; clarify the hours of operation; update the standards for potable water and waste disposal; and update the standards for access. A detailed project description can be found in Chapter 3, Project Description, of this EIR.

2.3 ENVIRONMENTAL IMPACTS AND PROPOSED AND RECOMMENDED MITIGATION

Under the California Environmental Quality Act (CEQA), a significant effect on the environment is defined as a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project, including land, air, water, mineral, flora, fauna, ambient noise, and objects of historic or aesthetic significance. Although the proposed project would not result in direct development of new wineries or farm breweries, implementation of the proposed project could cause significant impacts related to the ability to hold events by right, as further discussed in the Project Description chapter of this EIR. If an impact is determined to be significant, applicable mitigation measures are identified, as appropriate. This EIR requires mitigation measures to be implemented as part of the proposed project to reduce potential adverse impacts to a less-than-significant level. Such mitigation measures are noted in this EIR and are

found in the following technical chapters: Biological Resources; Cultural Resources; and Noise. These mitigation measures are also summarized in Table 2-1 at the end of this chapter. The mitigation measures presented in the EIR will form the basis of the Mitigation Monitoring and Reporting Program. An impact that remains significant after implementation of mitigation measures is considered a significant and unavoidable impact.

2.4 SUMMARY OF PROJECT ALTERNATIVES

This section presents a summary of the evaluation and alternatives considered for the proposed project, which include the following:

- No Project Alternative;
- Wedding CUP Requirement Alternative; and
- Reduced Intensity Alternative.

The following summary provides brief descriptions of the three alternatives to the proposed project that are evaluated in this EIR. For a more thorough discussion of project alternatives, please refer to Chapter 13, Alternatives Analysis.

No Project Alternative

The County has decided to evaluate a No Project Alternative, which assumes that the County would not approve the proposed Zoning Text Amendment and the currently adopted Winery Ordinance would not be altered. The adopted Winery Ordinance would continue to apply to existing and future wineries within Placer County, but would not explicitly address farm breweries.

A total of six promotional events per year would continue to be permitted at the existing facilities with an Administrative Review Permit (ARP). An ARP requires review by Planning Department staff and the Zoning Administrator, who must be able to make the findings set forth in Section 17.58.140(A) of the County Code of Ordinances. In addition, the minimum parcel size for establishment of a winery in the Residential (RA and RF) and Agricultural and Resource (AE, F, FOR) zoning districts would continue to be 4.6 acres. Large production wineries (20,000+ cases annually) would not require a 10-acre minimum parcel size. Furthermore, because the Winery Ordinance would not be updated to include clarified hours of operation, existing and future wineries within the County would continue to operate with unrestricted hours.

Because the No Project Alternative would not increase the minimum requirement of on-site planted vineyards from one acre to two acres for future wineries, future wineries developed within the County would not be required to provide the same focus on production of agricultural goods as would be required under the proposed Zoning Text Amendment. In addition, because the No Project Alternative would not require a 10-acre minimum parcel size for by-right development of new wineries within the Residential and Agricultural and Resource zoning districts, potential incompatibilities with existing agricultural operations could continue to occur. Thus, the No Project Alternative would not meet the project objectives.

Wedding CUP Requirement Alternative

Under the Wedding CUP Requirement Alternative, all of the changes included in the proposed Zoning Text Amendment would still apply, with the exception of the inclusion of weddings as a category of Special Event. Weddings would not be permitted by-right at wineries/farm breweries within the County. Rather, each facility would be required to obtain discretionary approval of a Conditional Use Permit (CUP) by the Placer County Planning Commission, which would ensure site-specific review of the facility. For facilities which are granted a CUP to conduct weddings, such weddings would still be subject to all applicable restrictions included in the proposed Zoning Text Amendment.

Although weddings hosted at wineries and farm breweries would help to support agri-tourism within the County, the Wedding CUP Requirement Alternative would require additional approvals prior to hosting weddings. Thus, the Alternative would be less supportive of agri-tourism and the needs of winery/farm brewery owners within the County. However, generally, the project objectives would be met under the Wedding CUP Requirement Alternative.

Reduced Intensity Alternative

The Reduced Intensity Alternative is tied to the State's public water system requirements. Pursuant to Section 116275 of the California Health and Safety Code, a public water system is required if a facility serves more than 24 people daily, 60 days or more per year. Such standards currently apply to all wineries and farm breweries within Placer County. The type of public water system required is a Transient-Noncommunity (TNC) water system, which includes restaurants, campgrounds, small wineries, motels and other non-residential facilities. Consequently, existing and future study facilities seeking to host more than 24 people daily, 60 days or more per year, as a result of the proposed Zoning Text Amendment, would be required to install a public water system and obtain a permit from the State Water Resources Control Board (SWRCB). Any new public water wells would need to be constructed in accordance with the California Department of Water Resources Bulletin 74-81, "Water Well Standards, State of California."

In addition to the restrictions on the number of Special Events permitted per year under the proposed project, the Reduced Intensity Alternative would limit the total number of event days permitted at each study facility to 59 per year. The other changes included in the proposed Zoning Text Amendment would still apply. The event quota could be met with Agricultural Promotional Events only, or with a mix of Agricultural Promotional Events and Special Events. By restricting the number of event days permitted annually to 59 total, events at existing and future study facilities within the County would not necessitate the installation of new public water wells and associated improvements, and any associated environmental effects would be avoided.

Because the Reduced Intensity Alternative would substantially curtail the total number of events permitted annually at existing and future study facilities, the Alternative could conflict with the needs of winery/farm brewery owners within the County. In addition, because Agricultural Promotional Events would help to support agri-tourism and agricultural production at wineries and farm breweries within the County, limiting such events could conflict with the County's goals of

supporting agriculture. Therefore, the project objectives would be only partially met under the Reduced Intensity Alternative.

Environmentally Superior Alternative

An EIR is required to identify the environmentally superior alternative from among the range of reasonable alternatives that are evaluated. Section 15126(e)(2) of the CEQA Guidelines requires that an environmentally superior alternative be designated and states, "If the environmentally superior alternative is the 'no project' alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives." In this case, the No Project Alternative would be considered the environmentally superior alternative. As discussed in Chapter 13 of this EIR, all impacts resulting from the proposed Zoning Text Amendment would be fewer under the No Project Alternative. In addition, the significant and unavoidable cumulative traffic impact identified for the proposed Zoning Text Amendment would be avoided.

Under the Wedding CUP Alternative, impacts related to biological resources, cultural resources, and transportation and circulation would be similar to the proposed Zoning Text Amendment. Impacts related to noise would be fewer, as Mitigation Measures 9-3 and 12-8 related to weddings would not be required. Under the Reduced Intensity Alternative, impacts to biological resources, cultural resources, and noise would be similar to the proposed Zoning Text Amendment, while impacts related to transportation and circulation would be fewer as a result of the reduced number of annual events occurring at study facilities within the County. In addition, while impacts related to utilities and service systems were dismissed as less than significant in this EIR, such impacts would be fewer under the Reduced Intensity Alternative. The significant and unavoidable cumulative traffic impact identified for the proposed Zoning Text Amendment would not be avoided under either the Wedding CUP Alternative or the Reduced Intensity Alternative.

Given that the Wedding CUP Alternative and the Reduced Intensity Alternative would result in generally similar environmental impacts, neither alternative is clearly environmentally superior to the other. However, due to the fact that the Wedding CUP Alternative would result in fewer impacts such that mitigation measures identified for the proposed project related to noise would not be necessary, whereas the Reduced Intensity Alternative would still require all the same mitigation measures as the proposed project, the Wedding CUP Alternative would be considered the environmentally superior alternative.

2.5 AREAS OF CONTROVERSY

Areas of controversy that were identified in NOP comment letters, and are otherwise known for the region include the following:

- Preservation of the agricultural and rural character of the area;
- Traffic increases along smaller County roads;
- Increases in noise associated with events;
- Impacts to groundwater supply;
- Incompatible land uses;

- County enforcement of the Winery Ordinance;
- Safety hazards related to winery and brewery events;
- Cumulative effects on the environment from concurrent events at multiple facilities;
- Issues related to adequate parking for events; and
- Wastewater disposal.

2.6 SUMMARY OF IMPACTS AND MITIGATION MEASURES

Table 2-1 summarizes the impacts identified in the technical chapters of this Draft EIR. In Table 2-1, the proposed project's impacts are identified for each technical chapter (Chapters 4 through 12) in the Draft EIR. In addition, Table 2-1 includes the level of significance of each impact, any mitigation measures required for each impact and the resulting level of significance after implementation of mitigation measures for each impact.

| TABLE 2-1 SUMMARY OF IMPACTS AND MITIGATION MEASURES | | | |
|--|--|----------------------------|---|
| Impact | Level of Significance prior to Mitigation | Mitigation Measures | Level of Significance after Mitigation |
| 4. Agricultural Resources | | | |
| 4-1 Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (“Farmland”), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use, or involve other changes in the existing environment which, due to their location or nature, could result in the loss or conversion of Farmland (including livestock grazing) or forest land to non-agricultural or non-forest use. | LS | <i>None required.</i> | N/A |
| 4-2 Conflict with General Plan or other policies regarding land use buffers for agricultural operations. | LS | <i>None required.</i> | N/A |

|--------|---|---|--|
| | | <p><i>noise source and the receiver. The effectiveness of a barrier depends upon blocking line-of-sight between the source and receiver, and is improved with increasing the distance the sound must travel to pass over the barrier as compared to a straight line from source to receiver. The difference between the distance over a barrier and a straight line between source and receiver is called the "path length difference," and is the basis for calculating barrier noise reduction.</i></p> <p><i>Barrier effectiveness depends upon the relative heights of the source, barrier and receiver. In general, barriers are most effective when placed close to either the receiver or the source. An intermediate barrier location yields a smaller path-length-difference for a given increase in barrier height than does a location closer to either source or receiver.</i></p> <p><i>As a rule of thumb, sound barriers located relatively close to the source or sensitive receptor generally provide an initial noise reduction of 5 dB once line of sight between the noise source and receiver has been interrupted by the barrier, and an additional noise reduction</i></p> | |

|--------|---|--|--|
| | | <p><i>of approximately 1 dB per foot of barrier height after the barrier intercepts line of sight.</i></p> <p>2. <u><i>Shielding and Absorption Provided by Vegetation</i></u></p> <p><i>Trees and other vegetation are often thought to provide significant noise attenuation. However, approximately 50 to 100 feet of dense foliage (so that no visual path extends through the foliage) is typically required to achieve a 5 dB attenuation of noise. Thus the use of vegetation as a noise barrier is, therefore, frequently an impractical method of noise control unless large tracts of dense foliage are part of the existing landscape. However, in cases where such vegetation exists between the proposed events and nearby sensitive receptors, an evaluation of the sound attenuation provided by such vegetation should be included in the project-specific noise analysis.</i></p> <p><i>Vegetation can be used to acoustically "soften" intervening ground between a noise source and receiver, increasing ground absorption of sound and thus increasing the attenuation of sound with distance. Planting of trees and shrubs is also of aesthetic and psychological value, and may reduce adverse public reaction to a noise source</i></p> | |

| | | <p><i>by removing the source from view, even though noise levels will be largely unaffected.</i></p> <p><i>In summary, the effects of vegetation upon noise transmission are minor unless there is considerable intervening vegetation between the source and receptor. Where the amount of intervening vegetation is not substantial, the benefits may be limited to some increased absorption of high frequency sounds and in reducing adverse public reaction to the noise by providing aesthetic benefits.</i></p> <p>3. <u>Direction of Sound Travel</u></p> <p><i>Sound propagation is not affected by gravity. As a result, sound travels uphill similar to sound traveling downhill, provided all other variables are equal. In cases where sensitive receptors are located above or below a noise source with no intervening structures, topography, or substantial vegetation, no additional shielding offsets should be applied for these features.</i></p> <p>4. <u>Other Sound Mitigation Options</u></p> <p><i>Other options for sound attenuation which should</i></p> | |

| levels in excess of standards established in the local General Plan, Community Plan or noise ordinance, or applicable standards of other agencies, or a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project. | | | |
| 12-8 Result in exposure of persons to or generation of non-transportation noise levels in excess of standards established in the local General Plan, Community Plan or noise ordinance, or applicable standards of other agencies, or a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project. | S | 12-8 <i>The Zoning Text Amendment shall be revised to state that when reviewing applications for new winery and/or farm brewery building permits, Placer County should compare the appropriate Table 12-12 setback requirements to the actual distances between the proposed sound source location and nearest sensitive receptor property line(s). If the actual setback distances are greater than those identified in Table 12-12 for the proposed type of sound source(s), then no additional acoustical analysis would typically be required. If, however, the actual distances between the proposed sound source locations and nearest sensitive receptor location(s) are less than those shown in Table 12-12, then a site-specific noise analysis should be required to evaluate compliance with the County's noise standards.</i> | LS |

| | | <p><i>The distances to the noise contours shown in Table 12-12 do not include any attenuation of sound caused by intervening structures, vegetation, or topography. In addition, the Table 12-12 contours do not take into account the directionality of amplified sound system speakers, which can be 10 to 15 dB lower behind the speaker than in front of the speaker. As a result, the Table 12-12 data should be considered worst-case. Therefore, it is likely that in most cases, the actual distances to the noise contours will be considerably less than those shown in Table 12-12. It shall be the function of the site-specific noise analysis to quantify the additional sound attenuation that would result from natural features, such as intervening topography (i.e. hills), structures, or vegetation, which are specific to the location for which the event permit is being processed. Specific information, which shall be included in project-specific noise analyses, is as follows:</i></p> <p style="margin-left: 40px;"><i>1. <u>Shielding by Barriers, Structures, or Topography</u></i></p> <p style="margin-left: 40px;"><i>Shielding of noise sources, which results in reduced sound levels at locations affected by such shielding, can result from intervening noise barriers, structures or topography. Site specific noise studies should include an evaluation of such shielding. If needed for compliance with the</i></p> | |

|--------|---|--|--|
| | | <p><i>County's noise standards, additional shielding of sound sources can be obtained by placing walls or other structures between the noise source and the receiver. The effectiveness of a barrier depends upon blocking line-of-sight between the source and receiver, and is improved with increasing the distance the sound must travel to pass over the barrier as compared to a straight line from source to receiver. The difference between the distance over a barrier and a straight line between source and receiver is called the "path length difference," and is the basis for calculating barrier noise reduction.</i></p> <p><i>Barrier effectiveness depends upon the relative heights of the source, barrier and receiver. In general, barriers are most effective when placed close to either the receiver or the source. An intermediate barrier location yields a smaller path-length-difference for a given increase in barrier height than does a location closer to either source or receiver.</i></p> <p><i>As a rule of thumb, sound barriers located relatively close to the source or sensitive receptor generally provide an initial noise reduction of 5 dB once line of sight between the noise source and</i></p> | |

|--------|---|--|--|
| | | <p><i>receiver has been interrupted by the barrier, and an additional noise reduction of approximately 1 dB per foot of barrier height after the barrier intercepts line of sight.</i></p> <p>2. <u><i>Shielding and Absorption Provided by Vegetation</i></u></p> <p><i>Trees and other vegetation are often thought to provide significant noise attenuation. However, approximately 50 to 100 feet of dense foliage (so that no visual path extends through the foliage) is typically required to achieve a 5 dB attenuation of noise. Thus the use of vegetation as a noise barrier is, therefore, frequently an impractical method of noise control unless large tracts of dense foliage are part of the existing landscape. However, in cases where such vegetation exists between the proposed events and nearby sensitive receptors, an evaluation of the sound attenuation provided by such vegetation should be included in the project-specific noise analysis.</i></p> <p><i>Vegetation can be used to acoustically "soften" intervening ground between a noise source and receiver, increasing ground absorption of sound and thus increasing the attenuation of sound with distance. Planting of trees and shrubs is also of</i></p> | |

|--------|---|---|--|
| | | <p><i>aesthetic and psychological value, and may reduce adverse public reaction to a noise source by removing the source from view, even though noise levels will be largely unaffected.</i></p> <p><i>In summary, the effects of vegetation upon noise transmission are minor unless there is considerable intervening vegetation between the source and receptor. Where the amount of intervening vegetation is not substantial, the benefits may be limited to some increased absorption of high frequency sounds and in reducing adverse public reaction to the noise by providing aesthetic benefits.</i></p> <p>3. <u>Direction of Sound Travel</u></p> <p><i>Sound propagation is not affected by gravity. As a result, sound travels uphill similar to sound traveling downhill, provided all other variables are equal. In cases where sensitive receptors are located above or below a noise source with no intervening structures, topography, or substantial vegetation, no additional shielding offsets should be applied for these features.</i></p> | |
