## Introduction

Since publication of the Draft Environmental Impact Report/Environmental Impact Statement, the following substantive changes have been made to this appendix:

- Corrections were implemented to the location of the San Mateo Avenue/Scott Street intersection (Tables 1 and 3), to intersection numbering for the Arguello Street/Whipple Avenue and El Camino Real/Whipple Avenue intersections (Table 1), to delay estimates for GX50 (Table 6), and to the intersection description for GX57 (Table 6).
- A new table was added (Table 7), which summarizes the 2029 and 2040 Plus Project conditions with potential traffic mitigation measures.
- An attachment was added to the appendix which includes traffic count sheets for the Bayshore Boulevard/Industrial Way intersection, which had been inadvertently omitted from the San Francisco to San Jose Project Section Transportation Technical Report.

This appendix provides technical data and figures related to the assessment of intersection delays for the San Francisco to San Jose Project Section (Project Section or project). When Senate Bill (SB) 743 was signed into law on September 27, 2013, the transportation impact analysis under the California Environmental Quality Act (CEQA) shifted away from auto delay toward consideration of greenhouse gas reductions, with a focus on multimodal transportation networks and land use mixes. Vehicle miles traveled (VMT) was chosen as the new metric for evaluating transportation impacts under CEQA. SB 743 does not prevent counties or cities from continuing existing transportation impact analyses, including use of vehicular level of service (LOS) in their general plans, but for CEQA analysis, lead agencies are required to shift to a VMT metric by July 1, 2020. Therefore, intersection LOS was not considered for CEQA impacts. However, since this environmental document is a combined document for the purposes of both CEQA and the federal National Environmental Policy Act (NEPA), intersection delays were evaluated to determine project effects under NEPA and this appendix provides the technical data supporting that analysis.

## Intersection Operations

The operation of intersections is based on various intersection characteristics such as traffic volumes, lane geometry, and signal phasing, which are used to estimate the average control delay experienced by motorists traveling through an intersection. Analysts evaluated intersection LOS operations. Intersections of roadways classified as a collector or above that would be physically modified by the project or would serve 50 or more project trips in either the AM or PM peak hour were analyzed. Analysts evaluated traffic conditions at intersections using the method from Chapter 19 of the *Highway Capacity Manual* (Transportation Research Board 2010). The detailed methodology is presented in Section 3.2.4.3, Methods for Impact Analysis, of the environmental impact report (EIR)/environmental impact statement (EIS) for the Project Section.

An effect on signalized intersections was deemed to occur if the Plus Project condition would result in a LOS E or F and an increase in average traffic delay of 4 seconds or more over the No Project condition. An effect on unsignalized intersections was deemed to occur if the Plus Project condition would have a LOS E or F and the project would result in an increase in traffic delay of 5 seconds or more (measured as average delay for all-way stop or worst-movement delay for side-street stop intersection), and if the intersection satisfies one or more traffic signal warrants<sup>1</sup> for at least 1 hour of the day. Five seconds of delay is the increase for unsignalized intersections (rather than the 4 seconds used for signalized intersections) because it only applies to a single movement rather than for the entire intersection, as is the case for signalized intersections.

Intersection operations were studied under the following conditions:

- Existing conditions

---

<sup>1</sup> Traffic signal warrants define minimum conditions under which signal installation may be justified.

- Existing Plus Project conditions (effects from permanent road closures and relocations)
- 2029 No Project conditions
- 2029 Plus Project conditions (effects from permanent road closures and relocations, and project operations)
- 2040 No Project conditions
- 2040 Plus Project conditions (effects from permanent road closures and relocations, and project operations)
- 2029 and 2040 Plus Project conditions with potential traffic mitigation measures

AWSC = all-way stop controlled

EB = eastbound

SF = San Francisco

CMP = congestion management plan

I- = Interstate

SJ = San Jose

CT = California Department of

LOS = level of service

SR = State Route

Transportation

NB = northbound

SSSC = side street stop controlled

D = Diridon

SB = southbound

WB = westbound

Whole intersection average delay reported for signalized intersections. Whole intersection average delay and worst approach delay (in parentheses) reported for unsignalized intersections.

Bolded entries with an asterisk (\*) identify locations that would experience LOS E or F in one or both peak hours.

A = Atherton

AWSC = all-way stop controlled

B = Brisbane

BG = Burlingame

CMP = congestion management plan

CT = California Department of Transportation

D = Diridon

EB = eastbound

GX = grade crossing

I = Interstate

LOS = level of service

MB = Millbrae

MF = maintenance facility

MP = Menlo Park

MV = Mountain View

Whole intersection average delay reported for signalized intersections. Whole intersection average delay and worst approach delay (in parentheses) reported for unsignalized intersections.

Bolded entries with an asterisk (\*) identify locations that would experience LOS E or F in one or both peak hours.

NB = northbound

PA = Palo Alto

RC = Redwood City

SB = southbound

SBr = San Bruno

SF = San Francisco

SJ = San Jose

SM = San Mateo

SR = State Route

SSF = South San Francisco

SSSC = side street stop controlled

SV = Sunnyvale

US = U.S. Highway

WB = westbound

D = Diridon

EB = eastbound

GX = grade crossing

I = Interstate

LOS = level of service

MF = maintenance facility

NB = northbound

MB = Millbrae

SB = southbound

SR = State Route

US = U.S. Highway

WB = westbound

Whole intersection average delay reported for signalized intersections. Whole intersection average delay and worst approach delay (in parentheses) reported for unsignalized intersections.

Bolded entries with an asterisk (\*) identify locations that would experience LOS E or F in one or both peak hours.

**Table 7 2029 and 2040 No Project and Plus Project Mitigated Level of Service at Intersections in San Francisco to South San Francisco, San Bruno to San Mateo, San Mateo to Palo Alto, Mountain View to Santa Clara, and San Jose Diridon Station Approach Subsections**

Whole intersection average delay reported for signalized intersections. Whole intersection average delay and worst approach delay (in parentheses) reported for unsignalized intersections.

Entries **bolded with an asterisk (\*)** identify locations with LOS E or F in one or both peak hours. **Shaded bolded** entries with the word "Adverse" identify locations of adverse effects under NEPA as defined by the criteria.

I- = Interstate

NB = northbound

SB = southbound

EB = eastbound

WB = westbound

LOS = level of service

MOWF = maintenance of way facility

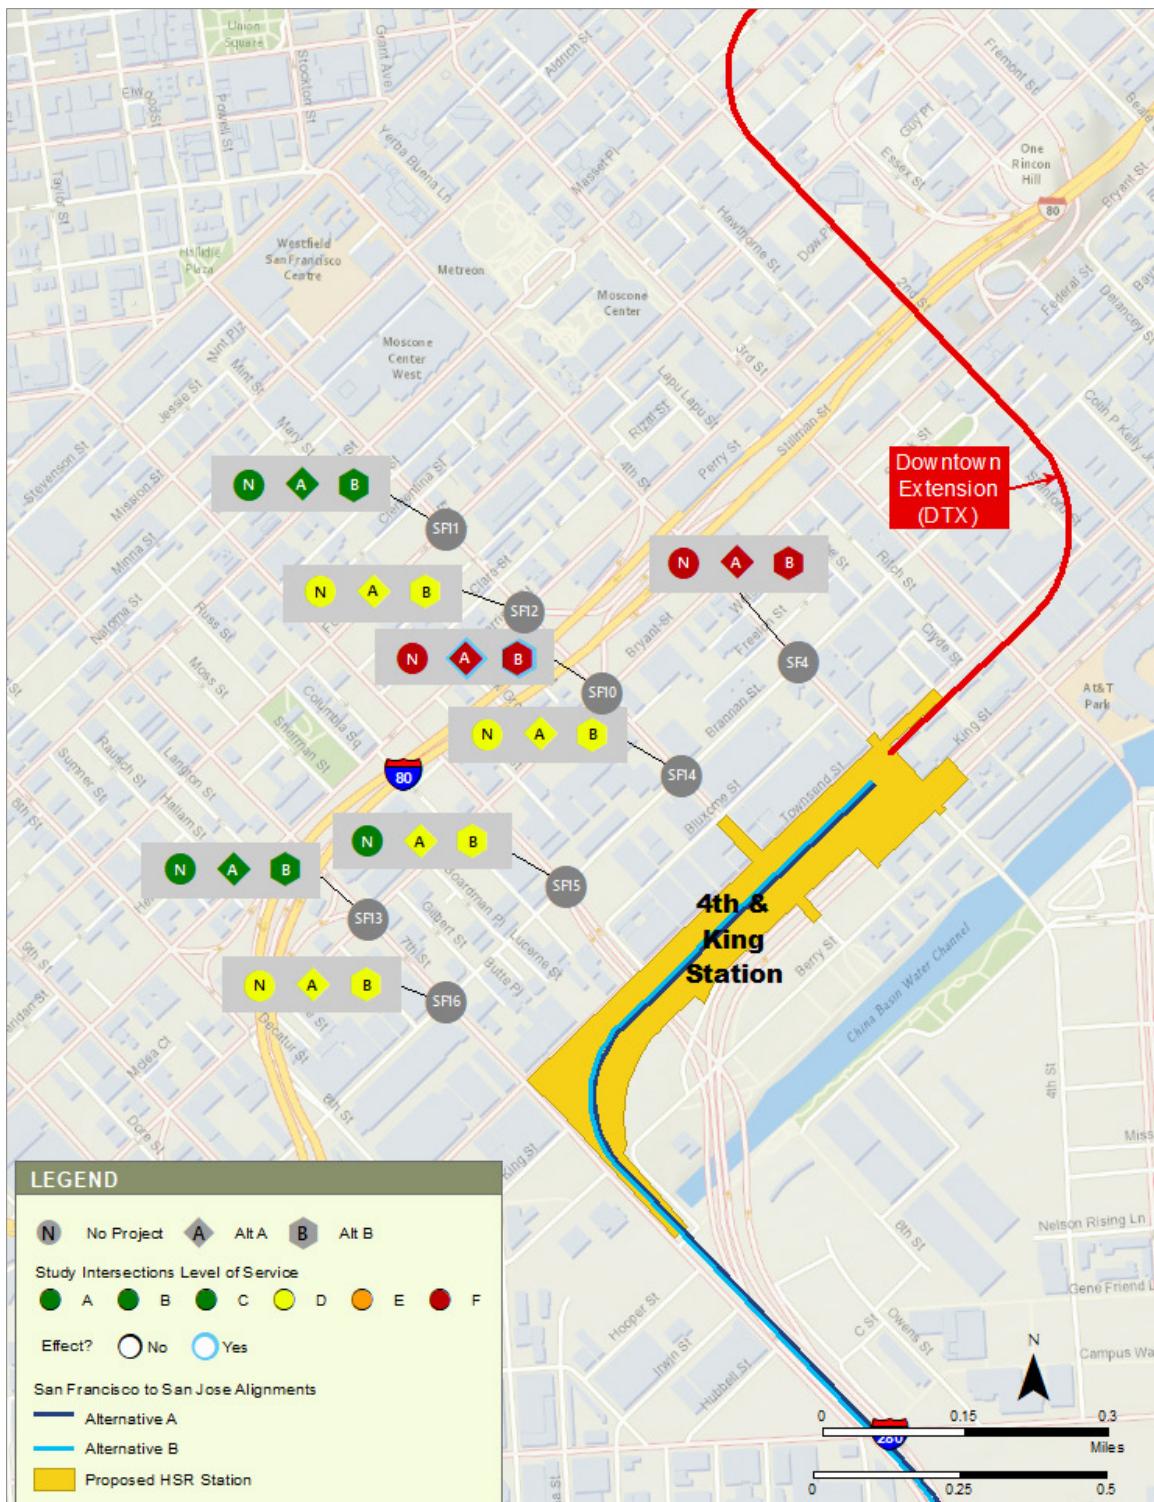

Ext. = Extension

US = U.S. Highway
