Revised 2011

Notice of Determination

San Diego International Airport (SDIA) – Additional Fuel Tanks

Project Description

The existing fuel farm at SDIA, constructed in the early 1990s, is located in the northeast corner of the Airport property, north of Runway 9-27 and the Aircraft Rescue and Fire Fighting facility, east of Marine Corps Recruit Depot – San Diego, and west of W. Washington Street and the Airport Traffic Control Tower. The existing fuel farm contains two 1-million-gallon aviation fuel tanks and is supplied by regional refineries via an existing fuel delivery pipeline. Any lapse or shortage in fuel delivery, as well as inspection and maintenance activities of on- or off-Airport fuel pipelines or the fuel farm systems, requires fuel to be delivered to the Airport via tanker truck, which results in substantially slower and less reliable replenishment of the fuel farm supply. Since the construction of the existing fuel farm, increased passenger enplanements have been accommodated through the use of larger aircraft and additional scheduled aircraft operations. In July 2018, the peak aviation activity month, the fuel farm could accommodate approximately two days of fuel reserves. The existing fuel reserve capacity is well below the industry standard (a 5- to 7-day supply of fuel) for airports similar to SDIA, making SDIA operations susceptible to inadequate fuel supply during pipeline malfunctions and facility maintenance.

The proposed Project would increase the capacity of the Airport's fuel storage facilities to accommodate an industry standard of 6 days of peak-period fuel demand reserves by constructing three 1,146,320-gallon (shell volume) fuel tanks, with a usable storage capacity of approximately 966,000 gallons each, adjacent to the existing fuel farm. The proposed cylindrical tanks would be approximately 58 feet high and 58 feet in diameter. Containment dike walls approximately 1 foot in width and 6 feet in height would be constructed on the east, west, and south periphery of the proposed tanks. The proposed containment dike walls would be connected to the fuel farm's existing containment dike walls to create an expanded containment area. Secondary containment dike walls would also be constructed between the proposed tanks and the primary dike wall. The secondary containment dike walls would be approximately 8 inches thick and 3 feet above grade. Upon completion, containment capacity for the fuel farm would exceed regulatory capacity requirements, enabling the containment system to capture 775,000 gallons above what is required by Chapter 22 of the National Fire Protection Association code. In addition to the proposed tanks, upgrades to the existing fire suppression system would be constructed as part of the proposed Project. Twenty-one foam makers would be installed at the fuel farm; six surrounding each of the existing fuel tanks and nine surrounding the proposed storage tanks. Additionally, one foam chamber would be installed at each of the proposed fuel tanks and existing foam monitors would be updated.

Construction of three additional aviation fuel tanks at the existing fuel farm is proposed to meet the industry standards for on-airport aviation fuel reserves. The proposed Project would facilitate existing aviation activity and would also allow for repair of the fuel storage and conveyance system to occur without compromising fuel service. The proposed Project would not increase the number of passenger or aircraft operations at SDIA.
