TABLE OF CONTENTS

Section			Page
Executive Summary			ES-1
1.0	Introduction		1.0-1
2.0	Project Description		2.0-1
3.0	Environmental Impact Analysis and Mitigation Measures		3.0-1
	3.1	Aesthetics	3.1-1
	3.2	Agriculture and Forestry	3.2-1
	3.3	Air Quality	3.3-1
	3.4	Biological Resources	3.4-1
	3.5	Cultural Resources	3.5-1
	3.6	Energy	3.6-1
	3.7	Geology and Soils	3.7-1
	3.8	Greenhouse Gases	3.8-1
	3.9	Hazards and Hazardous Material	3.9-1
	3.10	Hydrology and Water Quality	3.10-1
	3.11	Land Use and Planning	3.11-1
	3.12	Mineral Resources	3.12-1
	3.13	Noise	3.13-1
	3.14	Population and Housing	3.14-1
	3.15	Public Services	3.15-1
		3.15.1 Fire Protection	3.15-1
		3.15.2 Police Protection	3.15-1
		3.15.3 Schools	3.15-1
		3.15.4 Library	3.15-1
	3.16	Parks and Recreation	3.16-1
	3.17	Transportation, Traffic, and Safety	3.17-1
	3.18	Tribal Cultural Resources	3.18-1
	3.19	Utilities and Service Systems	3.19-1
		3.19.1 Solid Waste	3.19.1-1
		3.19.2 Wastewater	3.19.2-1
		3.19.3 Water Supply	3.19.3-1
	3.20	Wildfire	3.20-1
	3.21	Cumulative Impacts	3.21-1
4.0	Alternatives		4.0-1
5.0	Other CEQA Considerations		5.0-1
6.0	List of Preparers		6.0-1
7.0	Glossary		7.0-1

Appendices

1.0 Notice of Preparation and Comments on Notice of Preparation
2.0 Plan Project List
3.3 Health Risk Assessment
3.4 Biological Resources Technical Report
3.5 Cultural Resources Technical Report
3.7 Paleontological Resources Technical Report
3.13 Aviation Noise Technical Report

LIST OF FIGURES

Figure		Page
2.0-1	SCAG Region	2.0-43
2.0-2	SCAG Subregions	2.0-44
2.0-3	Existing Transit Network (2018)	2.0-45
2.0-4	Existing Arterial System (2016)	2.0-46
2.0-5	Existing Regional Goods Movement System	2.0-47
2.0-6	Major Airports in SCAG Region	2.0-48
2.0-7	Existing Land Use	2.0-49
2.0-8	SCAG Growth Priority Areas	2.0-50
2.0-9	SCAG Region Proposed Job Centers	2.0-51
2.0-10	Transit Priority Areas	2.0-52
2.0-11	High-Quality Transit Areas throughout the SCAG Region in 2045	2.0-53
2.0-12	Neighborhood Mobility Areas	2.0-54
2.0-13	Livable Corridors	2.0-55
2.0-14	2045 Plan Transit Network	2.0-56
2.0-15	Major Rail Projects	2.0-57
2.0-16	Major Highway Projects	2.0-58
2.0-17	Major HOV Projects	2.0-59
2.0-18	Planned Regional Express Lane Network	2.0-60
3.1-1	Land Use Patten in SCAG Region	3.1-41
3.1-2	State Designated and Eligible Scenic Highways and Vista Points	3.1-42
3.2-1	Farmland in the SCAG Region	3.2-32
3.2-2	Forest Lands in the SCAG Region	3.2-33
3.3-1	Annual Average Concentration of PM2.5	3.3-85
3.3-2	Maximum 8-Hour Ozone Concentrations (ppm)	3.3-86
3.3-3	Air Quality Basins and Monitoring Stations	3.3-87
3.3-4	Overview Freeway Segments Evaluated in HRA	3.3-88
3.4-1	Designated Critical Habitat in the SCAG Region	3.4-100
3.4-2	Sensitive Wildlife Species Reported in the SCAG Region	3.4-101
3.4-3	Essential Habitat Connectivity and Natural Landscape Blocks within the SCAG Region	3.4-102
3.7-1	Geomorphic Provinces	3.7-44
3.7-2	Alquist-Priolo Zones and Potential Areas of Probabilistic Ground Acceleration	3.7-45
3.7-3	Areas of Potential Liquefaction	3.7-46
3.7-4	Areas of Potential Landslides	3.7-47
3.7-5	Areas Susceptible to Tsunamis	3.7-48
3.7-6	General Soil Types	3.7-49
3.7-7	Soils with Moderate to High Erosion Potential	3.7-50
3.7-8	Connect SoCal Projects in Relation to Geologic Hazards	3.7-51
3.9-1	Airports in the SCAG Region	3.9-61
3.10-1	Regional Water Quality Control Boards	3.10-70
3.10-2	Watersheds in the SCAG Region	3.10-71
3.10-3	Areas Vulnerable to Sea Level Rise	3.10-72
3.11-1	SCAG Region	3.11-48
3.11-2	Existing Land Uses	3.11-49
3.11-3	Protected Areas in the SCAG Region	3.11-50

LIST OF FIGURES (continued)

Figure		Page
3.11-4	General Plan Land Use Designations	3.11-51
3.11-5	Commercial Land Uses in the SCAG Region	3.11-52
3.11-6	SCAG Region Open Space, Recreation, and Agricultural Uses	3.11-53
3.11-7	Tribal Lands in the SCAG Region	3.11-54
3.11-8	Los Angeles County Significant Ecological Areas	3.11-55
3.11-9	Regional Conservation Plans in the SCAG Region	3.11-56
3.12-1	Mineral Resources in the SCAG Region	3.12-13
3.14-1	Employment Density in the SCAG Region	3.14-30
3.16-1	Regional Recreation and Open Space Areas within a 45-Mile Radius of 2045 HQTAs	3.16-30
3.17-1	2019 AM Peak Period Congestion Delay on Regional Freeway System	3.17-72
3.17-2	2045 AM Peak Period Congestion Delay on Regional Freeway System	3.17-73
3.17-3	2019 PM Peak Period Congestion Delay on Regional Freeway System	3.17-74
3.17-4	2045 PM Peak Period Congestion Delay on Regional Freeway System	3.17-75
3.17-5	Amtrak Railways	3.17-76
3.17-6	Existing Regional Bikeways	3.17-77
3.17-7	Existing and Proposed Regional Bikeways (2045)	3.17-78
3.17-8	Existing Regional Goods Movement System	3.17-79

LIST OF TABLES

Table		Page
ES-1	2019-2045 Population, Households, and Employment Projections in the SCAG Region	ES-5
ES-2	Connect SoCal Expenditure (in Billions)	ES-6
ES-3	Connect SoCal Goals	ES-7
ES-4	Connect SoCal Guiding Principals	ES-7
ES-5	Summary of Project Impacts, Mitigation Measures, and Residual Impacts	ES-18
2.0-1	2019-2045 Population, Households, and Employment Projections in the SCAG Region	2.0-14
2.0-2	Recent Growth Trends in SCAG Growth Priority Areas	2.0-16
2.0-3	Connect SoCal Expenditure (in Billions)	2.0-17
2.0-4	Connect SoCal Revenue Sources	2.0-18
2.0-5	Connect SoCal Goals	2.0-21
2.0-6	Connect SoCal Guiding Principles	2.0-21
2.0-7	Connect SoCal Performance Measures	2.0-23
2.0-8	Selected Transit Capital Project	2.0-32
2.0-9	Sample Major Highway Projects Committed by the Counties	2.0-36
3.1-1	Caltrans Scenic Highways Program: Examples of Visual Quality Intrusions	3.1-3
3.1-2	Urban, Suburban, and Rural Land Use Patterns by County	3.1-8
3.1-3	Caltrans Designated Vista Points	3.1-10
3.1-4	Officially Designated State Scenic Highways	3.1-12
3.1-5	Officially Designated County Scenic Highways	3.1-13
3.1-6	Roadways Eligible for State Scenic Highway Designation	3.1-13
3.1-7	Historical Significance of State and Local Agency Bridges	3.1-15
3.1-8	Existing Sources of Nighttime Light in SCAG Region	3.1-20
3.1-9	Summary of County and City Policies and Ordinances in the SCAG Region	3.1-25
3.2-1	SCAG Region by Land Use Category (2016)	3.2-4
3.2-2	Important Farmland within the SCAG Region (2016)	3.2-5
3.2-3	SCAG Region Average Annual Acreage Change (1984-2016)	3.2-6
3.2-4	Estimated Maximum Direct Potential Loss of Important Agricultural Land	3.2-22
3.3-1	American Lung Association Report Card for SCAG Region	3.3-13
3.3-2	Population-Weighted Asthma Rate per 10,000	3.3-14
3.3-3	2019 Nonattainment Areas in the SCAG Region for all Criteria Pollutants by County by NAAQS	3.3-17
3.3-4	CAAQS Area Designations	3.3-18
3.3-5	Criteria Pollutant Emissions by County—Existing Conditions	3.3-19
3.3-6	Peak Criteria Pollutants Readings for the SCAG Region Air Basins	3.3-22
3.3-7	National Ambient Air Quality Standards	3.3-27
3.3-8	California Ambient Air Quality Standards	3.3-34
3.3-9	SCAQMD Air Quality Significance Thresholds	3.3-47
3.3-10	MDAQMD and AVAPCD Air Quality Significance Thresholds	3.3-48
3.3-11	ICAPCD Operational Air Quality Significance Thresholds	3.3-49
3.3-12	2016 AQMP Forecast of Annual Average Total Emissions in SCAB	3.3-56
3.3-13	On-Road Mobile-Source Criteria Air Pollutant Emissions by County – Existing Condition (2016) vs Plan (2045)	3.3-58
3.3-14	AQMP Forecast of Annual Average Off-Road Mobile Emissions in SCAB	3.3-59

LIST OF TABLES (continued)

Table		Page
3.3-15	AQMP Forecast of Annual Average Stationary Source Emissions in SCAB	3.3-60
3.3-16	Summary Maximum Exposed Individual Residential 30-Year Exposure Cancer Risk	3.3-78
3.4-1	Summary of Special-Status Species and Designated Critical Habitat in the SCAG Region	3.4-6
3.4-2	Federally and State Listed Species and Critical Habitat in the SCAG Region	3.4-7
3.4-3	Sensitive Wildlife Species Reported in the SCAG Region	3.4-12
3.4-4	Rare and Locally Important Plants Reported in the SCAG Region	3.4-18
3.4-5	Riparian Habitat and State Sensitive Plant Communities Reported in the SCAG Region	3.4-32
3.4-6	Sensitive Natural Communities within the SCAG Region	3.4-34
3.4-7	Federally Protected Wetlands and Waterways Reported in the SCAG Region	3.4-38
3.4-8	Potentially Protected Surface Water Features in the SCAG Region	3.4-40
3.4-9	Natural Landscape Blocks by County in the SCAG Region	3.4-41
3.4-10	Essential Connectivity Areas by County in the SCAG Region	3.4-42
3.4-11	Potential Riparian Connections in the SCAG Region	3.4-43
3.4-12	HCPs and NCCPs in the SCAG Region	3.4-44
3.4-13	Acres of Critical Habitat for Listed Species Potentially Affected by Connect SoCal Major Transportation Projects	3.4-66
3.4-14	Records of Listed Plant Species within 500 Feet of Connect SoCal Projects	3.4-67
3.4-15	Records of Listed Wildlife Species within 500 Feet of Connect SoCal Projects	3.4-68
3.4-16	Acres of Sensitive and Riparian Habitats within 500 Feet of Connect SoCal Major Transportation Projects	3.4-76
3.4-17	Blueline Streams and Rivers within 500 Feet of Connect SoCal Major Transportation Projects	3.4-77
3.4-18	Acres of Federally Protected Wetlands and Waterways within 500 Feet of Connect SoCal Major Transportation Projects.	3.4-81
3.4-19	Federally Protected Waterways Under Rivers and Harbors Act within 500 Feet of Connect SoCal Major Transportation Projects.	3.4-83
3.4-20	Areas Used for Wildlife Movement Potentially Affected by Connect SoCal Major Transportation Projects by County	3.4-87
3.4-21	Unincorporated Areas Subject to County General Plans Potentially Affected by the Connect SoCal Major Transportation Projects.	3.4-93
3.4-22	HCP's and NCCP's Potentially Affected by the Connect SoCal Major Transportation Projects	3.4-97
3.5-1	Archeological Resources Listed in the CHRIS	3.4-12
3.5-2	National Register of Historic Places Properties within the SCAG Region	3.5-13
3.5-3	National Historic Landmarks within the SCAG Region	3.5-14
3.5-4	California Historical Landmarks within the SCAG Region	3.5-16
3.5-5	California Points of Historical Interest within the SCAG Region	3.5-17
3.5-6	County Policies and Ordinances Relevant to the SCAG Region	3.5-31
3.6-1	Residential Energy Use and Cost per Household	3.6-36
3.6-2	Residential Energy and Water Cost per Household	3.6-36
3.6-3	Building Energy Consumption – Residential and Commercial	3.6-38
3.6-4	SCAG Region Estimated Transportation Fuel Consumption	3.6-39
3.6-5	Water Use – Residential and Commercial	3.6-40
3.6-6	Water-Related Energy Use	3.6-41

LIST OF TABLES (continued)

Table		Page
3.7-1	Characteristics of Major Faults in the SCAG Region	3.7-11
3.7-2	Potential Geologic Hazards Impacts from the Plan	3.7-30
3.8-1	Greenhouse Gases and Their Relative Global Warming Potential Compared to CO_2	3.8-4
3.8-2	Top Five GHG Producer Countries and the European Union (Annual)	3.8-11
3.8-3	GHG Emissions in California (2000 and 2017)	3.8-12
3.8-4	California Jurisdictions Addressing Climate Change in the SCAG Region (2016)	3.8-52
3.8-5	Greenhouse Gas Emissions from All On-Road Vehicles in the SCAG Region (Million Metric Tons per Year)	3.8-63
3.8-6	Greenhouse Gas Emissions from Other Transportation Sources in the SCAG Region (Million Metric Tons per Year)	3.8-63
3.8-7	Greenhouse Gas Emissions from On-Road Vehicles and Other Transportation Sources in the SCAG Region (Million Metric Tons per Year)	3.8-63
3.8-8	Greenhouse Gas Emissions All On-Road and Other Transportation Sources by County (CO_2) (Million Metric Tons per Year)	3.8-64
3.8-9	Greenhouse Gas Emissions for the SCAG Region from Three Primary Sources	3.8-66
3.8-10	SB 375 Analysis	3.8-74
3.8-11	Populatoin and VMT (2019 and 2045)	3.8-75
3.9-1	Number of Cleanup Sites by County	3.9-8
3.9-2	Leaking Underground Storage Tank Cleanup Sites	3.9-9
3.9-3	Hazardous Material Treatment Storage and Disposal Facilities in the SCAG Region	3.9-11
3.9-4	School, Hospitals, and Nursing Homes within One-Quarter Mile of Connect SoCal Transportation Projects	3.9-49
3.10-1	Federally Protected Wetlands and Waterways within the SCAG Region	3.10-10
3.10-2	Impaired Surface Water Bodies in the SCAG Region	3.10-13
3.10-3	Pollutants Associated with Transportation	3.10-53
3.11-1	Summary of Established Communities in the SCAG Region	3.11-6
3.11-2	SCAG Region General Land Use Categories	3.11-13
3.11-3	Existing Urban, Suburban, and Rural Land Use Patterns by County	3.11-13
3.11-4	Tribal Lands within the SCAG Region	3.11-21
3.11-5	Cities in the SCAG Region with Coastal Zone Jurisdiction	3.11-23
3.11-6	Potential Displacement of Existing Residential and Commercial Land Uses (in Acres)	3.11-41
3.12-1	Permitted Aggregate Resources and 50-Year Demand in the SCAG Region	3.12-5
3.13-1	Common Sound Levels and Loudness	3.13-4
3.13-2	Typical Levels of Ground-Borne Vibration	3.13-5
3.13-3	Ambient Noise Sampling Data	3.13-6
3.13-4	Major Commercial Airports within the SCAG Region	3.13-7
3.13-5	Reference Noise Levels for Various Rail Operations	3.13-10
3.13-6	Construction Equipment Noise Levels	3.13-15
3.13-7	Acceptable Noise Limit for Sensitive Land Uses	3.13-15
3.13-8	Construction Vibration Damage Criteria	3.13-21
3.13-9	Noise Levels Defining Impact for High-Speed Train Projects	3.13-22
3.13-10	Land Use Categories and Metrics for High-Speed Train Noise Impact Criteria	3.13-23
3.13-11	Community Noise Exposure	3.13-27
3.13-12	Activity Categories and Noise Abatement Criteria	3.13-28

LIST OF TABLES (continued)

4.0-2	Comparison of Alternatives to Connect SoCal	4.0-9
4.0-3	Plan Compared to No Project Alternative: Summary of Maximum Exposed Individuals Residential 30-Year Exposure Cancer Risk	4.0-16
4.0-4	Connect SoCal Compared to Existing Plans-Local Input Alternative: Summary of Maximum Exposed Individuals Residential 30-Year Exposure Cancer Risk	4.0-27
4.0-5	Connect SoCal Compared to Intensified Land Use Alternative: Summary of Maximum Exposed Individuals Residential 30-Year Exposure Cancer Risk	4.0-38

EXECUTIVE SUMMARY

In accordance with Section 15123 of the *California Environmental Quality Act (CEQA) Guidelines,*[1] this section of the Program Environmental Impact Report (PEIR) provides an overview of Connect SoCal ("Connect SoCal"; "Plan"), its potential environmental impacts and mitigation measures, and a summary of the alternatives to the proposed project evaluated in this PEIR. The summary is also required to identify areas of controversy known to the Lead Agency, including issues raised by agencies and the public, and issues to be resolved.

Connect SoCal is a long-range comprehensive plan for the region's multi-modal transportation system. Preparing the Plan is one of SCAG's primary statutory responsibilities under federal and state law. A regional transportation plan (RTP) is the mechanism used in California by both Metropolitan Planning Organizations (MPOs) and Regional Transportation Planning Agencies (RTPA) to conduct long-range (at least 20-year) planning in their regions. SCAG must adopt an RTP and update it every four years, or more frequently, if the region is to receive federal and state transportation dollars for public transit, streets/roads, and bicycle and pedestrian improvements.

In 2008, California enacted the Sustainable Communities and Climate Protection Act, also known as Senate Bill 375 (Stats. 2012, Ch. 728) (SB 375), which requires MPOs to include a Sustainable Communities Strategy (SCS) element as part of their RTP updates, with the purpose of identifying policies and strategies to reduce per capita passenger vehicle-generated GHG emissions. The SCS is required to identify the general location of land uses, residential densities, and building intensities within the region; identify areas within the region sufficient to house all the population of the region; identify areas within the region sufficient to house an eight-year projection of the regional housing need; identify a transportation network to service the regional transportation needs; gather and consider the best practically available scientific information regarding resources areas and farmland in the region; consider the state housing goals; set forth a forecasted development pattern for the region; and allow the regional transportation plan to comply with the federal Clean Air Act (CAA) of 1970 (42 USC. § 7401 *et seq.*) (Gov. Code, § 65080, subd. (b)(F)(2)(B)), of which, when integrated with the transportation network, and other transportation measures and policies will reduce the GHG from automobiles and light duty trucks to achieve, if there is a reasonable way to do so, the GHG emission reduction targets approved by the California Air Resources Board (ARB). If the SCS does not achieve the GHG emission targets set by ARB, an Alternative Planning Strategy (APS) must be developed to demonstrate how the targets could be achieved.

1 *State CEQA Guidelines*, Section 15123.

In 2012, SCAG adopted its first combined Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), a long-range plan for transportation in the region that links air quality, land use, and transportation needs. The RTP/SCS was last updated in 2016. The Plan updates the growth forecast, land use assumptions, and transportation investments that served as the foundation of both the 2012 and 2016 plans.

The Plan includes a growth forecast with population, household and employment growth anticipated to occur in the SCAG region by 2045; a transportation network including a list of transportation projects in the region; and a forecasted development pattern with land use and transportation strategies that the region could pursue over the Plan horizon. The Plan was developed to achieve targets for greenhouse (GHG) emissions reductions, consistent with SB 375 and other regional goals.

The Plan further identifies the purpose and goals, tracks trends and evaluates project performance, details financial assumptions and expenditures, and profiles key transportation investments. Please see the Draft Connect SoCal Plan and supplementary technical reports for full details, or visit SCAG's Connect SoCal Website located at: https://www.connectsocal.org/Pages/default.aspx

ES.1 BACKGROUND AND PROJECT OVERVIEW

ES.1.1 SCAG Role and Responsibilities

SCAG is one of 18 MPOs in the State of California and is comprised of the following counties: Los Angeles, Riverside, San Bernardino, Orange, Imperial and Ventura. To the north of the SCAG region are the counties of Kern and Inyo; to the east are the States of Nevada and Arizona; to the south is the County of San Diego as well as the U.S.-Mexico border; and to the west is the Pacific Ocean. The SCAG region also consists of 15 subregional entities that have been recognized by the Regional Council, SCAG's governing body, as partners in the regional policy planning process. There are 16 federally recognized tribal sovereign nations located within the SCAG region.

In addition to the federal designation as an MPO, SCAG is designated under California state law as the Multicounty Designated Transportation Planning Agency and Council of Governments (COG) for the six-county region. Founded in 1965, SCAG is a Joint Powers Authority, established as a voluntary association of local governments and agencies.

SCAG serves as the regional forum for cooperative decision making by local government elected officials and its primary responsibilities in fulfillment of federal and state requirements include the development of the Plan; the Federal Transportation Improvement Program (FTIP); the annual Overall Work Program; and transportation-related portions of local air quality management plans. SCAG's other major functions

include determining the regional transportation plans and programs are in conformity with state air quality plans; periodic preparation of a Regional Housing Needs Assessment (RHNA); and intergovernmental review of regionally significant projects. SCAG is just one part of a large body of governments and public organizations that collectively plan, construct, operate and maintain the region's transportation system. SCAG's work helps facilitate implementation, but the agency does not directly implement or construct projects.

The Regional Council is SCAG's governing body. It consists of 86 elected officials, representing cities, counties, county transportation commissions, transportation corridor agencies, tribal governments, and air districts in the region. The Regional Council has general authority to conduct the affairs of SCAG and directs the actions of the agency throughout the year. Additionally, the Regional Council implements the policy direction provided at the annual General Assembly of the membership, acts upon policy recommendations from SCAG's standing policy committees and external agencies, and appoints standing or ad-hoc subcommittees to study specific programs or issues.

SCAG provides opportunities to participate in regional planning through collaboration and participation in regional programs and dialogs. Responsible for regional policy direction and review, the primary standing committees at SCAG include; the Executive/Administration Committee; the Transportation Committee; the Community, Economic & Human Development (CEHD) Committee; the Energy & Environmental Committee; and the Legislative/Communication & Membership Committee. In addition to the standing committees, there are various subcommittees, technical advisory committees, working groups, and task forces that either report to the standing committees or provide input to SCAG staff, while other groups are established on an ad hoc basis to assist with specific projects or address specific regional policy.

ES.2 PROPOSED PROJECT

ES.2.1 Project Description

The Connect SoCal Plan is an update to SCAG's 2016 RTP/SCS, which had been adopted by SCAG's Regional Council on April 7, 2016 and subsequently last amended on September 2018. Building upon the progress made since the 2016 RTP/SCS, the Plan is a long-range visioning plan for the six county SCAG region, taking into account its transportation needs, existing and projected land use patterns, and job growth. It highlights the existing land use and transportation conditions throughout the SCAG region, and forecasts how it will meet the region's transportation needs between 2020 and 2045. The Plan identifies and prioritizes expenditures of this anticipated funding for transportation projects of all transportation modes: highways, streets and roads, transit, rail, bicycle and pedestrian, as well as aviation

ground access. It also includes a set of visions, goals, objectives, policies and performance measures developed through public and stakeholder outreach sessions across SCAG's region.

More specifically, Connect SoCal provides a strategy for accommodating projected population, household and employment growth in the SCAG region by 2045, as well as a transportation investment strategy for the region. The Plan details how the SCAG region can achieve several outcomes essential to the success of the region's long-range transportation and land use goals. The Plan:

- Describes where and how the region can accommodate a 23 percent increase in projected households and 16 percent increase in jobs between 2020 and 2045;
- Details a regional transportation investment given $633.9 billion in expected revenues from federal, state, regional and local sources over the next 25 years; and
- Complies with SB 375, the state's SCS law, which integrates land use and transportation planning and mandates both a reduction in greenhouse gas emissions from passenger vehicles (19% reduction for the SCAG region) and the provision of adequate housing for the region's 25-year projected population growth

The Plan is constrained by expected transportation revenues. The Plan identifies transportation and land use strategies to accommodate projected population, household and employment growth and improve the quality of life for existing and future residents.

ES.2.2 Local Input and Public Outreach

SCAG developed a "Bottom-Up Local Input and Envisioning Process," which assisted the agency in understanding as to what is happening at the local level – and formed the basis for projections and strategies in Connect SoCal. The local input process was approved and adopted by the SCAG Regional Council in October 2017.

SCAG held one-on-one meetings with all 197 local jurisdictions. In addition to seeking feedback on regional forecasts of population, household and employment growth, SCAG gathered data on land use, protected natural lands, farmland, flood areas and coastal inundation, regional bikeways, regional truck routes, planned major transit stops, high quality transit corridors, future transit priority areas, and other local data. In addition to the jurisdictions themselves, the data came from county assessors' offices, county transportation commissions, and state and federal partners.

Approximately 90 percent of local jurisdictions provided feedback on one or more data elements requested for local review. Collectively, these towns, cities and counties represent an estimated 94 percent

of the region's residents. SCAG staff also regularly convened a series of technical advisory groups that engaged local, state, and federal agencies in the transportation and sustainable communities planning process.

Demographic Assumptions

While growth rates are at a historic low; a gradual increase to the total population is expected. In the SCAG region, a 0.6 annual growth rate corresponds to about 114,000 new residents annually, or 3.2 million new residents between 2019 and 2045. At the county level, the region anticipates population increases of 9.1% to 35.4% for its six-county area (**Table ES-1, 2019-2045 Population, Households and Employment Projects in the SCAG Region**)

Table ES-1
2019-2045 Population, Households, and Employment Projections in the SCAG Region

County Name	Population 2019	Population 2045	Percentage Increase	Households 2019	Households 2045	Percentage Increase	Employment 2019	Employment 2045	Percentage Increase
Imperial	207,700	281,200	35%	58,000	92,500	59%	77,300	130,200	68%
Los Angeles	10,333,600	11,677, 200	13%	3,409,500	4,124,500	21%	4,826,600	5,382,200	12%
Orange	3,250,100	3,534,600	9%	1,053,500	1,153,500	10%	1,765,600	1,980,400	12%
Riverside	2,462,600	3,251,700	32%	758,300	1,086,100	43%	812,800	1,102,700	36%
San Bernardino	2,217,100	2,815,500	27%	656,500	874,800	33%	828,300	1,063,800	28%
Ventura	868,600	947,500	9%	276,100	306,400	11%	346,400	389,400	12%
SCAG Region	19,339,700	22,507, 200		6,211,900	7,638,600		8,657,138	10,048,500	

Source: SCAG 2019

Financial Assumptions

In accordance with federal fiscal constraint requirements, Connect SoCal is a financially constrained Plan. Connect SoCal identifies the amount of funding that is reasonably expected to be available to build, operate, and maintain the region's surface transportation system through the forecast horizon year of 2045.

The financially constrained Connect SoCal includes both a "traditional" core revenue forecast comprised of existing local, state, and federal sources, and more innovative but reasonably available sources of revenue to implement a program of improvements.

The financial plan's forecast of core revenue totals approximately $638.6 billion from both core and reasonably available resources. Local sources comprise 61 percent of the funding and the largest share of core revenues, followed by state sources which comprise 31 percent of revenue, federal source total 8 percent of revenue.

As shown in **Table ES-2, Connect SoCal Expenditure (in Billions)**, capital projects total $287 billion in nominal dollars. Operating and maintenance (O&M) costs total $316 billion, while debt service obligations total $35.6 billion. Transit-related costs comprise the largest share of O&M costs for the region, totaling $173.9 billion.

Table ES-2
Connect SoCal Expenditure (in Billions)

Capital Projects and Other Programs	$287.0
Arterials	$20.8
Goods Movement (including Grade Separations)	$65.7
High-Occupancy Vehicle/Express Lanes	$13.6
Mixed-Flow and Interchange Improvements	$10.3
Transportation System Management (Including ITS)	$13.7
Transit	$66.8
Passenger Rail	$53.2
Active Transportation	$17.7
Transportation Demand Management	$7.3
Other	$18.1
Operations and Maintenance	$316.0
State Highways	$68.0
Transit	$173.9
Passenger Rail	$26.6
Regionally Significant Local Streets and Roads	$47.5
Debt Service	$35.6
Cost Total	**$638.6**

Source: SCAG
Note: due to rounding, the total will not exactly match.
**Includes $4.8 billion for active transportation in addition to capital project investment level of $17.7 billion for a total of $22.5 billion for active transportation improvements*
***Includes Safety, Pooled Incentives, Mobility Equity Fund, Regional PEV Charger Program, and Others*

ES.2.3 Goals and Guiding Principles

SCAG has developed goals for Connect SoCal, which fall into four core categories: economy, mobility, environment and healthy/complete communities. The Plan lays out goals related to housing, transportation technologies, equity and resilience in order to adequately reflect the increasing importance of these topics in the region, and where possible the goals have been developed to link to potential performance measures and targets (see **Table ES-3, Connect SoCal Goals)**. The Plan's guiding policies magnifies these goals, creating a specific direction for Plan investments (see **Table ES-4 Connect SoCal Guiding Principles)**.

Table ES-3
Connect SoCal Goals

	Connect SoCal Goals
1	Encourage regional economic prosperity and global competitiveness.
2	Improve mobility, accessibility, reliability, and travel safety for people and goods.
3	Enhance the preservation, security, and resilience of the regional transportation system.
4	Increase person and goods movement and travel choices within the transportation system.
5	Reduce greenhouse gas emissions and improve air quality.
6	Support healthy and equitable communities.
7	Adapt to a changing climate and support an integrated regional development pattern and transportation network.
8	Leverage new transportation technologies and data-driven solutions that result in more efficient travel.
9	Encourage development of diverse housing types in areas that are supported by multiple transportation options.
10	Promote conservation of natural and agricultural lands and restoration of critical habitats.

Source: SCAG Connect SoCal, 2019

Table ES-4
Connect SoCal Guiding Principles

	Connect SoCal Guiding Principals
1	Base transportation investments on adopted regional performance indicators and MAP-21/FAST Act regional targets.
2	Place high priority for transportation funding in the region on projects and programs that improve mobility, accessibility, reliability and safety, and that preserve the existing transportation system.
3	Assure that land use and growth strategies recognize local input, promote sustainable transportation options, and support equitable and adaptable communities.
4	Encourage RTP/SCS investments and strategies that collectively result in reduced non-recurrent congestion and demand for single occupancy vehicle use, by leveraging new transportation technologies and expanding travel choices.
5	Encourage transportation investments that will result in improved air quality and public health, and reduced greenhouse gas emissions.
6	Monitor progress on all aspects of the Plan, including the timely implementation of projects, programs, and strategies.
7	Regionally, transportation investments should reflect best-known science regarding climate change vulnerability, in order to design for long-term resilience.

Source: SCAG Connect SoCal 2019

ES.3 PROJECT LOCATION AND SETTING

The SCAG region consists of six counties that includes Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura, and 191 cities. The total area of the SCAG region is approximately 38,000 square miles. Additionally, the SCAG region consists of 15 sub-regional entities that have been recognized by the Regional Council, SCAG's governing body, as partners in the regional policy planning process. The SCAG region is home to approximately 19 million people. This represents 5.8 percent of the 328 million people in the United States and 48 percent of California's population.[2] To the north of the SCAG region are the counties of Kern and Inyo; to the east is State of Nevada and State of Arizona; to the south is the U.S.-Mexico border; to the west is the county of San Diego; and to the northwest is the Pacific Ocean. The region includes the county with the largest land area in the nation, San Bernardino County; as well as the county with the highest population in the nation, Los Angeles County.

Transportation Network

The region's transportation network comprises more than 9,000 miles of public transit, 5,000 miles of bikeways, 135,578 lane miles of roadways, and 94 miles of express lanes. The Port of Los Angeles and Port of Long Beach are the largest container importers in the Western Hemisphere that contribute to our expansive goods movement system. The region's aviation system is one of the busiest in the world in terms of air passenger and cargo demand, with more than 110.2 million annual passengers and 3.14 million tons of cargo in 2017. Southern California features:

- 105 miles of heavy and light rail
- 534 miles of commuter rail (Metrolink)
- 9,000 miles of bus routes
- 5,075 miles of bikeways
- 135,578 total lane miles of roadways
- 94 miles of high occupancy toll (HOT) roads

Housing

As of 2018, California ranks 49th of 50 states in the number of housing units per resident. With many strong indications, high demand for housing and short supply drives up rental and home prices

2 Connect SoCal Demographics & Growth Forecast Technical Report, 2019

throughout the state. Indeed, seven of the 10 most expensive housing markets in the United States are in California.

There are many contributors to the overall housing shortfall, such as zoning, costs and fees that prevent projects from being feasible, time delays, environmental litigation, community resistance to medium and high-density projects, and lack of local funding mechanisms. Additionally, population and employment growth in metropolitan areas in California has slowed in recent years because wages cannot compensate for the high cost of housing.

ES.3.1 Land Use and Transportation Strategies

Since the Plan foresees regional growth along with transportation system improvements, it identifies strategies to increase transportation choices with a reduced dependence on automobiles and an increase growth in walkable, mixed-use communities and HQTAs. Increased choices in mobility, enhanced quality of life, and increasing sustainability practices could also lead to improved air quality in the region. Thus, the Plan focuses on land use strategies and transportation investments that would enable the SCAG region to develop into a more sustainable region.

Land Use Strategies

The land use strategies included in the Connect SoCal Plan are built upon strategies listed in the 2016 RTP/SCS and are intended to increase travel mode choices, guide future land development, and improve air quality. It also attempts to balance the region's land use choices with its transportation investments.

The Plan includes land use strategies with the committed and projected transportation investments such that they emphasize system preservation and enhancement, active transportation, and land use integration. These strategies identify how the SCAG region can implement Connect SoCal and achieve related GHG reductions. It is important to note that SCAG does not have a direct role in implementing the Sustainable Communities Strategy – neither through decisions about what type of development goes where, nor what transportation projects are ultimately built. Connect SoCal's land use strategies are as follows:

1. Focus Growth Near Destinations and Mobility Options
2. Promote Diverse Housing Choices
3. Leverage Technology Innovations
4. Support Implementation of Sustainability Policies
5. Promote a Green Region

Priority Growth Areas

Consideration of the Plan requires an understanding of several more localized geographies. Priority Growth Areas (PGAs) follow the principles of center-focused placemaking. Connect SoCal's PGAs – Job Centers, Transit Priority Areas (TPA), High Quality Transit Areas (HQTA), Neighborhood Mobility Areas (NMAs), and Livable Corridors – account for only five percent of region's total land area, but implementation of SCAG's recommended growth strategies will help these areas accommodate 76 percent of forecasted household growth and 86 percent of forecasted employment growth between 2016 and 2045. This more compact form of regional development, if fully realized, can reduce travel distances, increase mobility options, improve access to workplaces, and conserve the region's resource areas.

Transportation Strategies

Connect SoCal recognizes that the region can no longer afford to rely solely on expanding the transportation system to address the region's many changes and challenges. There is a need to use a comprehensive planning approach for a transportation system that focuses on preservation, sustainability, and productivity, as well as strategic expansion. Anticipated land use patterns as part of Connect SoCal provide a strategic opportunity to build a smart transportation system that is responsive to the region's changes and challenges. Connect SoCal includes proposed strategies for transportation investments, totaling approximately $638.6 billion (See **Table ES-2, Connect SoCal Expenditure [in billions]**). Select transportation strategies are as follows:

- System Preservation.
- ***Congestion Management Process.*** Federal regulations require the development, establishment and implementation of a CMP. Consistent with federal requirements, SCAG implements, monitors and evaluates these actions as part of Connect SoCal.
- ***Congestion Pricing.*** Connect SoCal identified three congestion pricing strategies, two of which were incorporated into the 2012 and 2016 RTP/SCS:
  - Develop a network of express lanes, that connects to existing express lanes in order to accommodate growing inter-county travel
  - Establish a mileage-based user fee to generate a funding source for aging infrastructure and construction of other travel options
  - Develop Cordon/Area Pricing which involves charging a variable or fixed fee to drive into or within a highly congested area.

- ***Transportation Demand Management.*** Connect SoCal commits $7.3 billion through 2045 to implement TDM strategies throughout the region. There are three primary goals of this program:
  - Reduce the number of SOV trips and per capita VMT through ridesourcing (which includes carpooling and vanpooling) and providing first/last mile services to and from transit
  - Redistribute or eliminate vehicle trips during peak demand periods by supporting telecommuting and alternative work schedules
  - Reduce the number of SOV trips through use of other modes such as transit, rail, bicycling, and walking, or other micro-mobility modes
- **Passenger Rail.** Connect SoCal strategies for passenger rail in the SCAG region consists of four main elements:
- **Active Transportation.** Active Transportation strategies are grouped into eight categories that address trip type as well as a range of regional priorities. Specific details on the Active Transportation Strategies highlighted below can be found in the Active Transportation Technical Report.

Transportation Safety. Connect SoCal prioritizes the safety and mobility of the region's residents, including drivers and passengers, transit riders, pedestrians, and bicyclists. SCAG's Safety strategies are largely grounded in the State's Strategic Highway Safety Plan (SHSP) that helps member agencies interested in pursuing safety initiatives and strategies at the local level. SCAG outlines detailed strategies and actions that local jurisdictions and county transportation commissions can undertake to enhance safety in our region in the transportation safety and security report.

Highway and Arterial Network. Connect SoCal emphasizes working with partner implementing agencies to prioritize projects that preserve and optimize the existing highway and arterial network. Projects include interchange improvements, auxiliary lanes, general purpose lanes, carpool lanes, toll lanes and Express/HOT lanes. The complete list of projects can be found in **Appendix 2.0, Project List.**

Goods Movement. SCAG has developed key strategies to realize a regional visor that maintains regional economic competitiveness, promotes job creation and retention, increased freight mobility and safety, and mitigating environmental impacts. Specific details of goods movement challenges and strategies can be found in the Goods Movement Technical Report. Key strategies include:

Aviation. SCAG, by definition, is primarily a regional surface transportation planning agency. Therefore, SCAG is focused on air passenger and cargo activity from the perspective of how the traffic coming and going from the airports affects the region's roads, highways, and transit systems, and how to improve

ground transportation access to the airports. On a basic level, SCAG maintains an updated list of airport ground access improvements. However, SCAG has and will continue to play a role in terms of aviation systems research, planning, and analysis, as well as encouraging collaboration and communication amongst the region's aviation stakeholders.

Emerging Technologies. SCAG recognizes that many new technologies provide consumer solutions and have made inroads in public acceptance due to advancements in smartphones, mobile banking, navigational apps and social networking. Improvements in regional mobility will therefore be derived from how technology is uses rather than from any individual technological development. Moreover, strategies to use the benefits of emerging technologies to advance Connect SoCal goals should be viewed through the lens of improving health, safety, equity and mobility outcomes.

ES.4 ALTERNATIVES TO THE PROJECT

CEQA requires an Environmental Impact Report (EIR) to describe a range of reasonable alternatives to the project or to the location of the project that could feasibly avoid or substantially lessen significant environmental impacts while attaining most of the project objectives.[3] Plan alternatives are evaluated as to how well they achieve the goals, policies, and objectives, the extent of their environmental impacts compared to the Plan, and whether or not they reduce or eliminate significant impacts caused by the Plan. These alternatives include:

Alternative 1: No Project Alternative

The No Project Alternative is required by Section 15126.6I(2) of the *CEQA Guidelines* and assumes that the Plan would not be implemented. The No Project Alternative allows decision makers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project. The No Project Alternative evaluates "what would be reasonably expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infrastructure and community services" (*CEQA Guidelines* Section 15126.6€(2)). The No Project Alternative is aligned with the Trend/Baseline Scenario[4] and includes transportation projects that are in place at the time of preparation of the Connect SoCal Plan and that are included in the first two years of the previously conforming transportation plan and/or federal transportation improvement program (FTIP). "Exempt projects" include safety projects and certain mass transit projects, transportation control measures ("TCMs") that are approved by the State Implementation Plan, and project phases that were authorized by the FHWA/FTA prior to expiration of SCAG's conformity finding for the adopted 2016 RTP/SCS.

3 CEQA Guidelines, California Code of Regulations (CCR), Title 14, Division 6, Chapter 3, § 15126.6. 2005

4 Connect SoCal – Sustainable Communities Strategy Technical Report.

These exempt projects would also be included in the No Project Alternative since they could move forward in the absence of an adopted Connect SoCal Plan.[5]

The land use strategies included in the No Project Alternative are based on the trending socioeconomic growth projection to the future (2045) updated with the same jurisdictional local input population, household and employment data as those in the Connect SoCal Plan to reflect the most recent local input growth estimates in the region.

Alternative 2: Existing Plans - Local Input Alternative

The Existing Plans - Local Input Alternative is aligned with the Existing Plans – Local Input Scenario in the Plan.[6] This alternative incorporates local general plans and land use information to reflect the Plan's population, household and employment growth estimates in the region. The Plan's transportation and land use strategies are not included in this alternative. The transportation network analyzed under this alternative are the transportation projects planned by each County Transportation Commission (CTC) in the region. In general, this alternative represents a more dispersed land use pattern as compared to Connect SoCal.

Alternative 3: Intensified Land Use Alternative

This Intensified Land Use Alternative is based off the Plan's transportation network and strategies. This alternative analyzes more aggressive densities and land use patterns than included in the Accelerated Tomorrow Scenario.[7] The land use pattern builds on the land use strategies as described in the Connect SoCal Plan and beyond. Specifically, it increases densities and intensifies land use patterns of the Plan, especially around HQTAs in an effort to maximize transit opportunities. The growth pattern associated with this alternative optimizes urban areas and suburban town centers, transit-oriented developments (TODs), HQTAs, livable corridors, and neighborhood mobility areas. It also includes a greater progressive job-housing distribution optimized for TODs and infill in HQTAs. It includes the same transportation investments as the Plan. This alternative considers the basis of the Plan with enhancements to accelerate the SB 375 GHG emissions reduction trend into 2045 and beyond, and includes related improvements for air quality, livability, public health, active transportation opportunities, and affordability.

7 Connect SoCal – Sustainable Communities Strategy Technical Report.

ES.5 AREAS OF KNOWN CONTROVERSY

A Notice of Preparation (NOP) for this PEIR was issued on January 23, 2019 by SCAG for a 30-day public review period. A total of 22 comment letters were received. The NOP and copies of each comment letter received are included in **Appendix 1.0** of the PEIR. Two scoping meetings were held on February 13, 2019. The purpose of these meetings was to provide early consultation for the public to express their concerns about the project and acquire information and make recommendations on issues to be addressed in the PEIR. In accordance with Sections 15087 and 15105 of the CEQA Guidelines, this PEIR is being circulated for a 45-day public review period. Responsible and trustee agencies and the public are invited to comment in writing on the information contained int his document. Persons and agencies commenting are encouraged to provide information that they believe is missing from the Draft PEIR and to identify where the information can be obtained. All comment letters received concerning the PEIR will be responded to in writing, and the comment letters, together with the responses to those comments, will be included in the Final PEIR.

Comments received in response to the published NOP (provided in **Appendix 1.0**) identified environmental topics that local and regional agencies and City residents recommended for analysis in the Draft EIR. These topics include:

- Biological Resources
- Vehicle Miles Traveled (VMT)
- Air Quality
- Greenhouse Gases and Climate Change
- Mitigation Measures

ES.6 ISSUES TO BE RESOLVED

The *State CEQA Guidelines* require an EIR to present issues to be resolved by the lead agency. These issues include the choice between alternatives and whether or how to mitigate potentially significant impacts. The major issues to be resolved by SCAG, as the Lead Agency for the project include the following:

- Whether the recommended mitigation measures should be adopted or modified;
- Whether additional mitigation measures need to be applied to the project; and
- Whether the project or an alternative should be approved.

ES.7 SUMMARY OF PROJECT IMPACTS

A summary of the environmental impacts associated with implementation of the proposed project, mitigation measures included to avoid or lessen the severity of potentially significant impacts, and residual impacts, is provided in **Table ES-5, Summary of Project Impacts, Mitigation Measures, and Residual Impacts**, below.

As discussed in **Chapter 1.0, Introduction**, SCAG has no concurrent authority/jurisdiction to implement mitigation related to land use plans and projects that implement the Plan. With respect to the transportation projects in the Plan, these projects are to be implemented by Caltrans, county transportation commissions, local transit agencies, and local governments (i.e., cities and counties), and not SCAG. SCAG also has no authority/jurisdiction to require these agencies to implement project-specific mitigation measures.

CEQA case law has also held that deferral of the specifics of mitigation is permissible where the lead agency commits itself to mitigation and, in the mitigation measure, either describes performance standards to be met in future mitigation or provides a menu of alternative mitigation measures to be selected from in the future (*California Native Plant Society v. City of Rancho Cordova* (2009) 172 Cal.App.4th 603 [the details of exactly how the required mitigation and its performance standards will be achieved can be deferred pending completion of a future study]; *Endangered Habitats League Inc. v. County of Orange* (2005) 131 Cal.App.4th 777, 793 [deferred mitigation acceptable when performance standards are included]; Riverwatch v. County of San Diego (1999) 76 Cal.App.4th 1428, 1448–1450 [a deferred approach may be appropriate where it is not reasonably practical or feasible to provide a more complete analysis before approval and the EIR otherwise provides adequate information of the project's impacts]; *Sacramento Old City Assn. v. City Council of Sacramento*, supra, 229 Cal.App.3d at 1028–1029 [deferral of agency's selection among several alternatives based on performance criteria was appropriate]).[8] *CEQA Guidelines* section 15126.4(a)(1)(B) codifies this concept:

> *"Formulation of mitigation should not be deferred until some future time. However, measures may specify performance standard which would mitigate the significant effect of the project and which may be accomplished in more than one specified way."*

8 Note that in litigation challenging SANDAG's adoption of its 2050 Regional Transportation Plan/Sustainable Communities Strategy, the California Court of Appeal found that "[a]n EIR may not defer the formulation of mitigation measures to a future time, but mitigation measures may specify performance standards which would mitigate the project's significant effects and may be accomplished in more than one specified way." *Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2014) 231 Cal. App. 4th 1056, 1089 (partially reversed on other grounds by *Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 3 Cal.5th 497).

Mitigation measures are subject to the same rules regarding level of detail appropriate to the EIR being prepared. In this case, the PEIR addresses a large-scale region with a variety of projects spread over more than 20 years. As such, this PEIR identifies program-wide measures for implementation by SCAG. In addition, the PEIR identifies project-level mitigation measures for lead agencies to consider, as applicable and feasible, in subsequent project-specific design, CEQA review, and decision-making processes. It is ultimately up to the lead agency to determine the appropriateness of the mitigation measure based on project-specific circumstances. As appropriate and authorized by the *CEQA Guidelines* and case law, the program-wide mitigation measures included in this PEIR are less detailed than those that would be part of a project EIR and the selection of detailed mitigation measures is properly deferred to future project-specific CEQA reviews.

The project-level mitigation measures identified by SCAG (or comparable measures) "can and should" be considered by lead agencies in project-specific environmental review documents as appropriate and feasible. This language mirrors *CEQA Guidelines* section 15091(a)(2), and it is assumed that each lead agency for specific projects would have the ability to impose and enforce these measures (i.e., that they can implement them). Lead agencies for specific projects are responsible for developing project specific mitigation measures and ensuring adherence to such mitigation measures.

While the PEIR strives to provide as much detail as possible in the mitigation measures, some flexibility must be maintained to present mitigation approaches for impacts occurring over a large geographic scope and caused by a wide variety of transportation and land use activities. CEQA case law provides that a first-tier EIR may contain generalized mitigation criteria (see, e.g., *Koster v. County of San Joaquin* (1996) 47 Cal.App.4th 29). In addition, in each resource area, the PEIR identifies mitigation measures which are performance standards-based, which lead, responsible, or trustee agencies "can and should" comply with in assessing and mitigating project-specific impacts. SCAG then identifies examples of project-level mitigation measures that may be required by lead agencies, to meet performance standards. Lead agencies may also identify other comparable measures capable of reducing impacts below the specified threshold.

For projects proposing to streamline environmental review pursuant to SB 375, SB 743, or SB 226, or for projects otherwise tiering off this PEIR, the project-level mitigation measures described in this PEIR (or comparable measures) can and should be considered and implemented by lead agencies (and project sponsors) during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require lead agencies to adopt mitigation, and it is ultimately the responsibility of the lead agency to determine and adopt project-specific mitigation as appropriate and feasible for each project.

The performance standards-based mitigation measures used in this PEIR recognize the limits of SCAG's authority; distinguish between SCAG commitments and project-level responsibilities and authorities; optimize flexibility for project implementation; and facilitate CEQA streamlining and tiering where appropriate on a project-by-project basis determined by each lead agency.[9]

[9] Note that compliance with existing regulations, such as the Uniform Building Code and California Building Code, is not necessarily considered mitigation because compliance is already required. However, such regulations do reduce environmental impacts and are identified herein where appropriate, to provide additional information on the how potential impacts are reduced. In some cases, as indicated in the PEIR, regulatory compliance is sufficient to reduce impacts to a level of less than significance. In other cases, mitigation is proposed to ensure and/or specify the means of compliance with regulations that lack specificity.

Table ES-5
Summary of Project Impacts, Mitigation Measures, and Residual Impacts

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
AESTHETICS		
Impact AES-1: Potential for the Plan to have a substantial adverse effect on a scenic vista.	*SCAG Mitigation Measures* **SMM AES-1:** SCAG shall facilitate minimizing impacts to scenic vistas through cooperation, information sharing regarding the locations of designated scenic vistas, and regional program development as part of SCAG's ongoing regional planning efforts, such as web-based planning tools for local government including REVISION, and other GIS tools and data services, including, but not limited to, Map Gallery, GIS library, and GIS applications, and direct technical assistance efforts such as sharing of associated online training materials. Caltrans and lead agencies, such as county and city planning departments, shall be consulted during this update process. *Project Level Mitigation Measures* **PMM AES-1:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to address potential aesthetic impacts to scenic vistas, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Use a palette of colors, textures, building materials that are graffiti-resistant, and/or plant materials that complement the surrounding landscape and development. b) Use contour grading to better match surrounding terrain. Contour edges of major cut-and-fill to provide a more natural looking finished profile. c) Design new corridor landscaping to respect existing natural and man-made features and to complement the dominant landscaping of the surrounding areas. d) Replace and renew landscaping along corridors with road widenings, interchange projects, and related improvements. e) Retain or replace trees bordering highways, so that clear-cutting is not evident. f) Provide new corridor landscaping that respects and provides appropriate transition to existing natural and man-made features and is complementary to the dominant landscaping or native habitats of surrounding areas. g) Reduce the visibility of construction staging areas by fencing and screening these areas with low contrast materials consistent with the surrounding environment, and by revegetating graded slopes and exposed earth surfaces at the earliest opportunity; h) Use see-through safety barrier designs (e.g. railings rather than walls)	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
Impact AES-2: Potential to substantially damage scenic resources, including but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.	*SCAG Mitigation Measures* See **SMM AES-1.** *Project Level Mitigation Measures* See **PMM AES-1.**	Significant and unavoidable
Impact AES-3: Potential to substantially degrade the existing visual character or quality of public views (public views are those that are experienced from publicly accessible vantage points). In an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality.	*SCAG Mitigation Measures* See **SMM AES-1.** *Project Level Mitigation Measures* **PMM AES-2:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to address potential aesthetic impacts that substantially degrade visual character, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Minimize contrasts in scale and massing between the projects and surrounding natural forms and development, minimize their intrusion into important viewsheds, and use contour grading to better match surrounding terrain in accordance with county and city hillside ordinances, where applicable. b) Design landscaping along highway corridors to add significant natural elements and visual interest to soften the hard-edged, linear transportation corridors. c) Require development of design guidelines for projects that make elements of proposed buildings/facilities visually compatible, or minimize visibility of changes in visual quality or character through use of hardscape and softscape solutions. Specific measures to be addressed include setback buffers, landscaping, color, texture, signage, and lighting criteria. d) Design projects consistent with design guidelines of applicable general plans. e) Require that sites are kept in a blight/nuisance-free condition. Remove blight or nuisances that compromise visual character or visual quality of project areas including graffiti abatement, trash removal, landscape management, maintenance of signage and billboards in good condition, and replace compromised native vegetation and landscape. f) Where sound walls are proposed, require sound wall construction and design methods that account for visual impacts as follows: – use transparent panels to preserve views where sound walls would block views from residences; – use landscaped earth berm or a combination wall and berm to minimize the apparent sound wall height; – construct sound walls of materials whose color and texture complements the surrounding landscape and development; g) Design sound walls to increase visual interest, reduce apparent height, and be visually compatible with the surrounding area; and landscape the sound walls with plants that screen the sound wall, preferably with either native vegetation or landscaping that complements the	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	dominant landscaping of surrounding areas.	
Impact AES-4: Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.	*SCAG Mitigation Measures* **SMM AES-2:** SCAG shall facilitate minimizing impacts on aesthetics related to new sources of light or glare through cooperation, information sharing regarding guidelines and policies, design approaches, building materials, siting, and technology, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to, Map Gallery, GIS library, and GIS applications, and direct technical assistance efforts and sharing of associated online training materials. Lead agencies, such as county and city planning departments, shall be consulted during this update process. *Project Level Mitigation Measures* **PMM AES-3:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to address potential aesthetic impacts that substantially degrade visual character, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Use lighting fixtures that are adequately shielded to a point below the light bulb and reflector and that prevent unnecessary glare onto adjacent properties. b) Restrict the operation of outdoor lighting for construction and operation activities to the hours of 7:00 a.m. to 10:00 p.m. c) Use high-pressure sodium and/or cut-off fixtures instead of typical mercury-vapor fixtures for outdoor lighting. d) Use unidirectional lighting to avoid light trespass onto adjacent properties. e) Design exterior lighting to confine illumination to the project site, and/or to areas which do not include light-sensitive uses. f) Provide structural and/or vegetative screening from light-sensitive uses. g) Shield and direct all new street and pedestrian lighting away from light-sensitive off-site uses. h) Use non-reflective glass or glass treated with a non-reflective coating for all exterior windows and glass used on building surfaces. i) Architectural lighting shall be directed onto the building surfaces and have low reflectivity to minimize glare and limit light onto adjacent properties.	Significant and unavoidable
AGRICULTURAL RESOURCES		
Impact AG-1: Potential for the Plan to convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use.	*SCAG Mitigation Measures* **SMM AG-1:** SCAG shall host a Natural & Farm Lands Conservation Working Group which will provide a forum for stakeholders to share best practices and develop recommendations for natural and agricultural land conservation throughout the region, including the development of a Natural Lands Conservation Strategy for the Connect SoCal Plan. **SMM AG-2:** SCAG shall expand on the Natural Resource Inventory Database and Conservation Framework & Assessment by incorporating strategic mapping layers to build the database and further refine the	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	priority conservation areas by (1) further investing in mapping and farmland data tracking and (2) working with County Transportation Commissions (CTCs) and SCAG's subregions to support their county-level efforts at data building. SCAG shall encourage CTCs to develop advanced mitigation programs or include them in future transportation measures by (1) funding pilot programs that encourage advance mitigation including data and replicable processes, (2) participating in state-level efforts that would support regional advanced mitigation planning in the SCAG region, and (3) supporting the inclusion of advance mitigation programs at county level transportation measures. **SMM AG-3:** SCAG shall align with funding opportunities and pilot programs to begin implementation of conservation strategies through (1) seeking planning funds, such as cap and trade auction proceeds that could help prepare for local action on acquisition and restoration, (2) supporting CTCs and other partners, and (3) continuing policy alignment with the State Wildlife Action Plan 2015 Update and its implementation. **SMM AG-4:** SCAG shall provide incentives to jurisdictions that cooperate across county lines to protect and restore natural habitat corridors, especially where corridors cross county boundaries, as detailed in the Natural & Farm Lands Technical Report strategies of Connect SoCal. SCAG will work with stakeholders to identify incentives and leverage resources that help protect habitat corridors. *Project Level Mitigation Measures* **PMM AG-1:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to address potential adverse effects on agricultural resources, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Require project sponsors to mitigate for loss of farmland by providing permanent protection of in-kind farmland in the form of easements, fees, or elimination of development rights/potential. b) Project relocation or corridor realignment to avoid Prime Farmland, Unique Farmland, or Farmland of Local or Statewide Importance. c) Maintain and expand agricultural land protections such as urban growth boundaries. d) Provide for mitigation fees to support a mitigation bank10 that invests in farmer education, agricultural infrastructure, water supply, marketing, etc. that enhance the commercial viability of retained agricultural lands. e) Minimize severance and fragmentation of agricultural land by constructing underpasses and overpasses at reasonable intervals to provide property access. f) Use berms, buffer zones, setbacks, and fencing to reduce conflicts between new development and farming uses and protect the functions of farmland.	
Impact AG-2: Potential for the Plan to conflict with existing zoning for agricultural use, or a Williamson	*SCAG Mitigation Measures* See **SMM AG-1** through **SMM AG-4.**	Significant and unavoidable

10 The California Department of Fish and Wildlife provides a definition for conservation or mitigation banks on their website (please see https://www.wildlife.ca.gov/Conservation/Planning/Banking).

Significance Threshold and Project Impacts		Mitigation Measures	Residual Impact
	Act contract.	*Project Level Mitigation Measures* See **PMM AG-1.** **PMM AG-2:** Project level mitigation measures can and should be considered by Lead Agencies as applicable and feasible. Measures to reduce substantial adverse effects on Williamson Act contracts to the maximum extent practicable, as determined appropriate by each Lead Agency, may include the following, or other comparable measures: a) Project relocation or corridor realignment to avoid lands in Williamson Act contracts. b) Establish conservation easements consistent with the recommendations of the Department of Conservation, or 20-year Farmland Security Zone contracts (Government Code Section 51296 et seq.), 10-year Williamson Act contracts (Government Code Section 51200 et seq.), or use of other conservation tools available from the California Department of Conservation Division of Land Resource Protection.	
Impact AG-3:	Potential for the Plan to conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g)).	*SCAG Mitigation Measures* See **SMM AG-1** through **SMM AG-2**. *Project Level Mitigation Measures* **PMM AG-3:** Project level mitigation measures can and should be considered by Lead Agencies as applicable and feasible. Measures to reduce substantial adverse effects, through the conversion of Farmland to maximum extent practicable, as determined appropriate by each Lead Agency, may include the following, or other comparable measures: a) Minimize construction related impacts to agricultural and forestry resources by locating materials and stationary equipment in such a way as to prevent conflict with agriculture and forestry resources.	
Impact AG-4:	Potential for the Plan to result in the loss of forest land or conversion of forest land to non-forest use.	*SCAG Mitigation Measures* See **SMM AG-1** through **SMM AG-2**. *Project Level Mitigation Measures* See **PMM AG-3**	Significant and unavoidable
Impact AG-5:	Potential for the Plan to involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.	*SCAG Mitigation Measure* See **SMM AG-1** through **SMM AG-2** and **SMM-GHG-1** through **SMM-GHG-5.** *Project Level Mitigation Measures* See **PMM AG-2** and **PMM GHG-2.** **PMM AG-4:** Project level mitigation measures can and should be considered by Lead Agencies as applicable and feasible. Measures to reduce substantial adverse effects, through the conversion of Farmland, to the maximum extent practicable, as determined appropriate by each Lead Agency, may include the following, or other comparable measures: a) Design proposed projects to minimize, to the greatest extent feasible, the loss of the highest valued agricultural land.	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	b) Redesign project features to minimize fragmenting or isolating Farmland. Where a project involves acquiring land or easements, ensure that the remaining non-project area is of a size sufficient to allow economically viable farming operations. The project proponents shall be responsible for acquiring easements, making lot line adjustments, and merging affected land parcels into units suitable for continued commercial agricultural management. c) Reconnect utilities or infrastructure that serve agricultural uses if these are disturbed by project construction. If a project temporarily or permanently cuts off roadway access or removes utility lines, irrigation features, or other infrastructure, the project proponents shall be responsible for restoring access as necessary to ensure that economically viable farming operations are not interrupted. **PMM AG-5:** Project level mitigation measures can and should be considered by Lead Agencies as applicable and feasible. Measures to reduce substantial adverse effects, through the conversion of Farmland, to the maximum extent practicable, as determined appropriate by each Lead Agency, may include the following, or other comparable measures: a) Manage project operations to minimize the introduction of invasive species or weeds that may affect agricultural production on adjacent agricultural land. Where a project has the potential to introduce sensitive species or habitats or have other spill-over effects on nearby agricultural lands, the project proponents shall be responsible for acquiring easements on nearby agricultural land and/or financially compensating for indirect effects on nearby agricultural land. Easements (e.g., flowage easements) shall be required for temporary or intermittent interruption in farming activities (e.g., because of seasonal flooding or groundwater seepage). Acquisition or compensation would be required for permanent or significant loss of economically viable operations.	
AIR QUALITY		
Impact AQ-1: Conflict with or obstruct implementation of the applicable air quality plan.	No mitigation is required.	Less than significant
Impact AQ-2: Potential to violate any air quality standard or contribute substantially to an existing or projected air quality violation.	*SCAG Mitigation Measures* **SMM-AQ-1:** SCAG shall develop the Southern California Disadvantaged Communities Planning Initiative which would provide funds to selected applicants to develop a low-cost, high-impact model which leverages SCAG's staff, data, and outreach resources to deliver context-sensitive plans in high-need, low-resourced active transportation infrastructure and frameworks. As part of the initiative, the model will be operationalized through the development of plans in six communities and refined to provide a sustainable resource for SCAG staff to partner with local agencies to develop local active transportation plans. **SMM-AQ-2:** SCAG shall continue its commitment to analyze public health outcomes as part of the Connect SoCal. As part of the public health analysis for the Plan, SCAG shall continue to analyze the plan's impacts on air quality through its Public Health Working group and continue to support policy change at the city and country level through education programs. **SMM-AQ-3:** SCAG shall continue to conduct air quality-related technical analyses on the region, specifically in vulnerable areas that are typically environmental justice areas. For example, SCAG staff conducted technical analysis of emissions impacts on populations within 500 feet of freeways and highly	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	travelled corridors in the Connect SoCal Environmental Justice Appendix. SCAG staff shall also continue to work with districts and relevant stakeholders to be informed of any updates new and/or changes to air quality issue areas through various forums like the Environmental Justice Working Group. *Project Level Mitigation Measures* **PMM-AQ-1:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to violating air quality standards. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Minimize land disturbance. b) Suspend grading and earth moving when wind gusts exceed 25 miles per hour unless the soil is wet enough to prevent dust plumes. c) Cover trucks when hauling dirt. d) Stabilize the surface of dirt piles if not removed immediately. e) Limit vehicular paths on unpaved surfaces and stabilize any temporary roads. f) Minimize unnecessary vehicular and machinery activities. g) Sweep paved streets at least once per day where there is evidence of dirt that has been carried on to the roadway. h) Revegetate disturbed land, including vehicular paths created during construction to avoid future off-road vehicular activities. i) On Caltrans projects, Caltrans Standard Specifications 10-Dust Control, 17-Watering, and 18-Dust Palliative shall be incorporated into project specifications. j) Require contractors to assemble a comprehensive inventory list (i.e., make, model, engine year, horsepower, emission rates) of all heavy-duty off-road (portable and mobile) equipment (50 horsepower and greater) that could be used an aggregate of 40 or more hours for the construction project. Prepare a plan for approval by the applicable air district demonstrating achievement of the applicable percent reduction for a CARB-approved fleet. k) Ensure that all construction equipment is properly tuned and maintained. l) Minimize idling time to 5 minutes—saves fuel and reduces emissions. m) Provide an operational water truck on-site at all times. Use watering trucks to minimize dust; watering should be sufficient to confine dust plumes to the project work areas. Sweep paved streets at least once per day where there is evidence of dirt that has been carried on to the roadway. n) Utilize existing power sources (e.g., power poles) or clean fuel generators rather than temporary power generators. o) Develop a traffic plan to minimize traffic flow interference from construction activities. The plan may include advance public notice of routing, use of public transportation, and satellite parking areas with a shuttle service. Schedule operations affecting traffic for off-peak hours. Minimize obstruction of through-traffic lanes. Provide a flag person to guide traffic properly	

Significance Threshold and Project Impacts		Mitigation Measures	Residual Impact
		and ensure safety at construction sites. p) As appropriate require that portable engines and portable engine-driven equipment units used at the project work site, with the exception of on-road and off-road motor vehicles, obtain CARB Portable Equipment Registration with the state or a local district permit. Arrange appropriate consultations with the CARB or the District to determine registration and permitting requirements prior to equipment operation at the site. q) Require projects within 500 feet of residences, hospitals, or schools to use Tier 4 equipment for all engines above 50 horsepower (hp) unless the individual project can demonstrate that Tier 4 engines would not be required to mitigate emissions below significance thresholds.	
Impact AQ-3:	Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.	*SCAG Mitigation Measures* See **SMM AQ-1, SMM AQ-2, SMM**, and **SMM AQ-3.** *Project Level Mitigation Measures* See **PMM-AQ-1.**	Significant and unavoidable
Impact AQ-4:	Expose sensitive receptors to substantial pollutant concentrations.	*SCAG Mitigation Measures* See **SMM AQ-1, SMM AQ-2, SMM**, and **SMM AQ-3.** *Project Level Mitigation Measures* See **PMM-AQ-1.**	Significant and unavoidable
Impact AQ-4:	Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.	No mitigation is required.	Less than significant
BIOLOGICAL RESOURCES			
Impact BIO-1:	Have a substantial adverse effect, either directly or through habitat modification, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or US Fish and Wildlife Service.	*SCAG Mitigation Measures* **SMM BIO-1:** SCAG shall facilitate reducing future impacts to species identified as a candidate, sensitive, or special status species and its habitats through cooperation, information sharing, and program development. SCAG shall consult with the resource agencies, such as the USFWS, NMFS, USACE, USFS, BLM, and CDFW, as well as local jurisdictions including cities and counties, to incorporate designated critical habitat, federally protected wetlands, the protection of sensitive natural communities and riparian habitats, designated open space or protected wildlife habitat, local policies and tree preservation ordinances, applicable HCPs and NCCPs, or other related planning documents into SCAG's ongoing regional planning efforts, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to, Map Gallery, GIS library, and GIS applications, and direct technical assistance efforts and sharing of associated online Training materials. Planning efforts shall be consistent with the approach outlined in the California Wildlife Action Plan. **SMM BIO-2:** SCAG shall continue to develop a regional conservation strategy in coordination with local jurisdictions and other stakeholders, including the county transportation commissions. The conservation strategy will build upon existing efforts including those at the sub-regional and local levels to identify potential priority conservation areas. SCAG shall develop new regional tools, like the Regional Data Platform and Regional Greenprint to help local jurisdictions identify areas well	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	suited for infill and redevelopment as well as critical habitat and natural lands to be preserved, including natural habitat corridors. SCAG will also collaborate with stakeholders to establish a new Regional Advanced Mitigation Program (RAMP) initiative to preserve habitat. *Project Level Mitigation Measures* **PMM BIO-1:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to threatened and endangered species. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Require project design to avoid occupied habitat, potentially suitable habitat, and designated critical habitat, wherever practicable and feasible. b) Where avoidance is determined to be infeasible, provide conservation measures to fulfill the requirements of the applicable authorization for incidental take pursuant to Section 7 or 10(a) of the federal ESA, Section 2081 of the California ESA to support issuance of an incidental take permit, and/or as identified in local or regional plans. Conservation strategies to protect the survival and recovery of federally and state-listed endangered and local special status species may include: i. Impact minimization strategies ii. Contribution of in-lieu fees for in-kind conservation and mitigation efforts iii. Use of in-kind mitigation bank credits iv. Funding of research and recovery efforts v. Habitat restoration vi. Establishment of conservation easements vii. Permanent dedication of in-kind habitat c) Design projects to avoid desert native plants protected under the California Desert Native Plants Act, salvage and relocate desert native plants, and/or pay in lieu fees to support off-site long-term conservation strategies. d) Temporary access roads and staging areas will not be located within areas containing sensitive plants, wildlife species or non-native habitat wherever feasible, so as to avoid or minimize impacts to these species e) Develop and implement a Worker Environmental Awareness Program (environmental education) to inform project workers of their responsibilities to avoid and minimize impacts on sensitive biological resources. f) Retain a qualified botanist to document the presence or absence of special status plants before project implementation. g) Appoint a qualified biologist to monitor construction activities that may occur in or adjacent to occupied sensitive species' habitat to facilitate avoidance of resources not permitted for impact. h) Appoint a qualified biologist to monitor implementation of mitigation measures.	

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	i) Schedule construction activities to avoid sensitive times for biological resources (e.g. steelhead spawning periods during the winter and spring, nesting bird season) and to avoid the rainy season when erosion and sediment transport is increased. j) Develop an invasive species control plan associated with project construction k) If construction occurs during breeding seasons in or adjacent to suitable habitat, include appropriate sound attenuation measures required for sensitive avian species and other best management practices appropriate for potential local sensitive wildlife l) Conduct pre-construction surveys to delineate occupied sensitive species' habitat to facilitate avoidance. m) Where projects are determined to be within suitable habitat and may impact listed or sensitive species that have specific field survey protocols or guidelines outlined by the USFWS, CDFW, or other local agency, conduct preconstruction surveys that follow applicable protocols and guidelines and are conducted by qualified and/or certified personnel.	
Impact BIO-2: Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service.	*SCAG Mitigation Measures* See **SMM BIO-1** and **SMM BIO-2.** *Project Level Mitigation Measures* See **PMM BIO-1**. **PMM BIO-2:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to riparian habitats and other sensitive natural communities. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Consult with the USFWS and NMFS where such state-designated sensitive or riparian habitats provide potential or occupied habitat for federally listed rare, threatened, and endangered species afforded protection pursuant to the federal ESA. b) Consult with the USFS where such state-designated sensitive or riparian habitats provide potential or occupied habitat for federally listed rare, threatened, and endangered species afforded protection pursuant to the federal ESA and any additional species afforded protection by an adopted Forest Land Management Plan or Resource Management Plan for the four national forests in the six-county area: Angeles, Cleveland, Los Padres, and San Bernardino. c) Consult with the CDFW where such state-designated sensitive or riparian habitats provide potential or occupied habitat for state-listed rare, threatened, and endangered species afforded protection pursuant to the California ESA, or Fully Protected Species afforded protection pursuant to the State Fish and Game Code. d) Consult with the CDFW pursuant to the provisions of Section 1600 of the State Fish and Game Code as they relate to Lakes and Streambeds. e) Consult with the USFWS, USFS, CDFW, and counties and cities in the SCAG region, where state-designated sensitive or riparian habitats are occupied by birds afforded protection	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	pursuant to the MBTA during the breeding season. f) Consult with the CDFW for state-designated sensitive or riparian habitats where furbearing mammals, afforded protection pursuant to the provisions of the State Fish and Game Code for fur-beaming mammals, are actively using the areas in conjunction with breeding activities. g) Require project design to avoid sensitive natural communities and riparian habitats, wherever practicable and feasible. h) Where avoidance is determined to be infeasible, develop sufficient conservation measures through coordination with local agencies and the regulatory agency (i.e., USFWS or CDFW) to protect sensitive natural communities and riparian habitats and develop appropriate compensatory mitigation, where required. i) Appoint a qualified wetland biologist to monitor construction activities that may occur in or adjacent to sensitive communities. j) Appoint a qualified wetland biologist to monitor implementation of mitigation measures. k) Schedule construction activities to avoid sensitive times for biological resources and to avoid the rainy season when erosion and sediment transport is increased. l) When construction activities require stream crossings, schedule work during dry conditions and use rubber-wheeled vehicles, when feasible. Have a qualified wetland scientist determine if potential project impacts require a Notification of Lake or Streambed Alteration to CDFW during the planning phase of projects. m) Consult with local agencies, jurisdictions, and landowners where such state-designated sensitive or riparian habitats are afforded protection pursuant an adopted regional conservation plan. n) Install fencing and/or mark sensitive habitat to be avoided during construction activities. o) Salvage and stockpile topsoil (the surface material from 6 to 12 inches deep) and perennial native plants, when recommended by the qualified wetland biologist, for use in restoring native vegetation to areas of temporary disturbance within the project area. Salvage of soils containing invasive species, seeds and/or rhizomes will be avoided as identified by the qualified wetland biologist. p) Revegetate with appropriate native vegetation following the completion of construction activities. as identified by the qualified wetland biologist. q) Complete habitat enhancement (e.g., through removal of non-native invasive wetland species and replacement with more ecologically valuable native species). r) Use Best Management Practices (BMPs) at construction sites to minimize erosion and sediment transport from the area. BMPs include encouraging growth of native vegetation in disturbed areas, using straw bales or other silt-catching devices, and using settling basins to minimize soil transport.	

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
Impact BIO-3: Have a substantial adverse effect on State or Federally Protected Wetlands (including but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption or other means.	*SCAG Mitigation Measures* See **SMM BIO-1** and **SMM BIO-2.** *Project Level Mitigation Measures* See **PMM BIO-1** and **PMM BIO-2.** **PMM BIO-3:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to wetlands. Such measures may include the following or other comparable measures identified by the Lead Agency. a) Require project design to avoid federally protected aquatic resources consistent with the provisions of Sections 404 and 401 of the CWA, wherever practicable and feasible. b) Where the lead agency has identified that a project, or other regionally significant project, has the potential to impact other wetlands or waters, such as those considered Waters Of the State of California under the State Wetland Definition and Procedures for Dischargers of Dredged or Fill Material to Waters of the State , not protected under Section 404 or 401 of the CWA, seek comparable coverage for these wetlands and waters in consultation with the SWRCB, applicable RWQCB, and CDFW. c) Where avoidance is determined to be infeasible, develop sufficient conservation measures to fulfill the requirements of the applicable authorization for impacts to federal and state protected aquatic resource to support issuance of a permit under Section 404 of the CWA as administered by the USACE. The use of an authorized Nationwide Permit or issuance of an individual permit requires the project applicant to demonstrate compliance with the USACE's Final Compensatory Mitigation Rule. The USACE reviews projects to ensure environmental impacts to aquatic resources are avoided or minimized as much as possible. Consistent with the administration's performance standard of "no net loss of wetlands" a USACE permit may require a project proponent to restore, establish, enhance or preserve other aquatic resources in order to replace those affected by the proposed project. This compensatory mitigation process seeks to replace the loss of existing aquatic resource functions and area. Project proponents required to complete mitigation are encouraged to use a watershed approach and watershed planning information. The new rule establishes performance standards, sets timeframes for decision making, and to the extent possible, establishes equivalent requirements and standards for the three sources of compensatory mitigation: – Permittee-responsible mitigation – Contribution of in-kind in-lieu fees – Use of in-kind mitigation bank credits – Where avoidance is determined to be infeasible and d) Where avoidance is determined to be infeasible and proposed projects' impacts exceed an existing Nationwide Permit (NWP) and/or California SWRCB-certified NWP, the lead agency should provide USACE and SWRCB (where applicable) an alternative analysis consistent with the Least Environmentally Damaging Practicable Alternatives in this order of priorities:	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	– Avoidance – Impact Minimization – On-site alternatives – Off-site alternatives e) Require review of construction drawings by a certified wetland delineator as part of each project-specific environmental analysis to determine whether aquatic resources will be affected and, if necessary, perform formal wetland delineation	
Impact BIO-4: Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.	*SCAG Mitigation Measures* See **SMM BIO-1** and **SMM BIO-2, SMM AG-1** through **SMM AG-4, SMM GHG-1, SMM WF-1.** **SMM BIO-3:** SCAG shall encourage and facilitate research, programs and policies to identify, protect and restore natural habitat corridors, especially where corridors cross county boundaries. Additionally, continue support for preserving wildlife corridors and wildlife crossings to minimize the impact of transportation projects on wildlife species and habitat fragmentation. *Project Level Mitigation Measures* See **PMM BIO-1** through **PMM BIO-3**. **PMM BIO-4:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to wildlife movement. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Consult with the USFS where impacts to migratory wildlife corridors may occur in an area afforded protection by an adopted Forest Land Management Plan or Resource Management Plan for the four national forests in the six-County area: Angeles, Cleveland, Los Padres, and San Bernardino. b) Consult with counties, cities, and other local organizations when impacts may occur to open space areas that have been designated as important for wildlife movement related to local ordinances or conservation plans. c) Prohibit construction activities within 500 feet of occupied breeding areas for wildlife afforded protection pursuant to Title 14 § 460 of the California Code of Regulations protecting fur-bearing mammals, during the breeding season. d) Conduct a survey to identify active raptor and other migratory nongame bird nests by a qualified biologist at least two weeks before the start of construction at project sites from February 1 through August 31. e) Prohibit construction activities with 250 feet of occupied nest of birds afforded protection pursuant to the Migratory Bird Treaty Act, during the breeding season. f) Ensure that suitable nesting sites for migratory nongame native bird species protected under the Migratory Bird Treaty Act and/or trees with unoccupied raptor nests should only be removed prior to February 1, or following the nesting season. g) When feasible and practicable, proposed projects will be designed to minimize impacts to wildlife movement and habitat connectivity and preserve existing and functional wildlife	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	corridors. h) Conduct site-specific analyses of opportunities to preserve or improve habitat linkages with areas on- and off-site. i) Long linear projects with the possibility of impacting wildlife movement should analyze habitat linkages/wildlife movement corridors on a broad scale to avoid critical narrow choke points that could reduce function of recognized movement corridor. j) Require review of construction drawings and habitat connectivity mapping by a qualified biologist to determine the risk of habitat fragmentation. k) Pursue mitigation banking to preserve habitat linkages and corridors (opportunities to purchase, maintain, and/or restore offsite habitat). l) When practicable and feasible design projects to promote wildlife corridor redundancy by including multiple connections between habitat patches. m) Evaluate the potential for installation of overpasses, underpasses, and culverts to create wildlife crossings in cases where a roadway or other transportation project may interrupt the flow of species through their habitat. Provide wildlife crossings in accordance with proven standards, such as FHWA's Critter Crossings or Ventura County Mitigation Guidelines and in consultation with wildlife corridor authorities. n) Install wildlife fencing where appropriate to minimize the probability of wildlife injury due to direct interaction between wildlife and roads or construction. o) Where avoidance is determined to be infeasible, design sufficient conservation measures through coordination with local agencies and the regulatory agency (i.e., USFWS or CDFW) and in accordance with the respective counties and cities general plans to establish plans to mitigate for the loss of fish and wildlife movement corridors and/or wildlife nursery sites. The consideration of conservation measures may include the following measures, in addition to the measures outlined in MM-BIO-1(b), where applicable: – Wildlife movement buffer zones – Corridor realignment – Appropriately spaced breaks in center barriers – Stream rerouting – Culverts – Creation of artificial movement corridors such as freeway under- or overpasses – Other comparable measures p) Where the lead agency has identified that a RTP/SCS project, or other regionally significant project, has the potential to impact other open space or nursery site areas, seek comparable coverage for these areas in consultation with the USFWS, CDFW, NMFS, or other local jurisdictions.	

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
Impact BIO-5: Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.	SCAG Mitigation Measures See **SMM BIO-1, SMM BIO-2** and **SMM BIO-3**. *Project Level Mitigation Measures* See **PMM BIO-1** through **PMM BIO-4.** **PMM BIO-5:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce conflicts with local policies and ordinances protecting biological resources . Such measures may include the following or other comparable measures identified by the Lead Agency. a) Consult with the appropriate local agency responsible for the administration of the policy or ordinance protecting biological resources. b) Prioritize retention of trees on-site consistent with local regulations. Provide adequate protection during the construction period for any trees that are to remain standing, as recommended by an International Society of Arboriculture (ISA) certified arborist. c) If specific project area trees are designated as "Protected Trees," "Landmark Trees," or "Heritage Trees," obtain approval for encroachment or removals through the appropriate entity, and develop appropriate mitigation measures at that time, to ensure that the trees are replaced. Mitigation trees shall be locally collected native species, as directed by a qualified biologist. d) Appoint an ISA certified arborist to monitor construction activities that may occur in areas with trees are designated as "Protected Trees," "Landmark Trees," or "Heritage Trees," to facilitate avoidance of resources not permitted for impact. Before the start of any clearing, excavation, construction or other work on the site, securely fence off every protected tree deemed to be potentially endangered by said site work. Keep such fences in place for duration of all such work. Clearly mark all trees to be removed. e) Establish a scheme for the removal and disposal of logs, brush, earth and other debris that will avoid injury to any protected tree. Where proposed development or other site work could encroach upon the protected perimeter of any protected tree, incorporate special measures to allow the roots to breathe and obtain water and nutrients. Minimize any excavation, cutting, filing, or compaction of the existing ground surface within the protected perimeter. Require that no change in existing ground level occur from the base of any protected tree at any time. Require that no burning or use of equipment with an open flame occur near or within the protected perimeter of any protected tree. f) Require that no storage or dumping of oil, gas, chemicals, or other substances that may be harmful to trees occur from the base of any protected trees, or any other location on the site from which such substances might enter the protected perimeter. Require that no heavy construction equipment or construction materials be operated or stored within a distance from the base of any protected trees. Require that wires, ropes, or other devices not be attached to any protected tree, except as needed for support of the tree. Require that no sign, other than a tag showing the botanical classification, be attached to any protected tree. g) Thoroughly spray the leaves of protected trees with water periodically during construction to	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	prevent buildup of dust and other pollution that would inhibit leaf transpiration, as directed by the certified arborist. h) If any damage to a protected tree should occur during or as a result of work on the site, the appropriate local agency will be immediately notified of such damage. If, such tree cannot be preserved in a healthy state, as determined by the certified arborist, require replacement of any tree removed with another tree or trees on the same site deemed adequate by the local agency to compensate for the loss of the tree that is removed. Remove all debris created as a result of any tree removal work from the property within two weeks of debris creation, and such debris shall be properly disposed of in accordance with all applicable laws, ordinances, and regulations. Design projects to avoid conflicts with local policies and ordinances protecting biological resources i) Where avoidance is determined to be infeasible, sufficient conservation measures to fulfill the requirements of the applicable policy or ordinance shall be developed, such as to support issuance of a tree removal permit. The consideration of conservation measures may include: – Avoidance strategies – Contribution of in-lieu fees – Planting of replacement trees – Re-landscaping areas with native vegetation post-construction – Other comparable measures developed in consultation with local agency and certified arborist.	
Impact BIO-6: Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.	*SCAG Mitigation Measures* **SMM BIO-1, SMM BIO-2** and **SMM BIO-3.** *Project Level Mitigation Measures* See **PMM BIO-1** through **PMM BIO-5.** **PMM BIO-6:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects on HCPs and NCCPs. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Consult with the appropriate federal, state, and/or local agency responsible for the administration of HCPs or NCCPs. b) Wherever practicable and feasible, the project shall be designed to avoid lands preserved under the conditions of an HCP or NCCP. c) Where avoidance is determined to be infeasible, sufficient conservation measures to fulfill the requirements of the HCP and/or NCCP, which would include but not be limited to applicable authorization for incidental take pursuant to Section 7 or 10(a) of the federal Endangered Species Act or Section 2081 of the California ESA, shall be developed to support issuance of an incidental take permit or any other permissions required for development within the HCP/NCCP boundaries. The consideration of additional conservation measures would include the measures outlined in SMM-BIO-2, where applicable.	Significant and unavoidable

Significance Threshold and Project Impacts		Mitigation Measures	Residual Impact
CULTURAL RESOURCES			
Impact CULT-1:	Cause a substantial adverse change in the significance of a historical resource pursuant to § 15064.5.	*SCAG Mitigation Measure* **SMM CULT-1:** Impacts to cultural resources shall be minimized through cooperation, information sharing, and SCAG's ongoing regional planning efforts such as web-based planning tools for local governments including CA LOTS, and other GIS tools and data services, including, but not limiting to, Map Gallery, GIS library, and GIS applications; and direct technical assistance efforts such as Toolbox Tuesday series and sharing of associated online Training materials. SCAG shall consult with resource agencies such as the National Park Service, Office of Historic Preservation, and Native American Heritage Commission to identify opportunities for early and effective consultation to identify archaeological sites, historical resources, and cemeteries to avoid such resources wherever practicable and feasible and reduce or mitigate for conflicts in compatible land use to the maximum extent practicable. *Project Level Mitigation Measures* **PMM CULT-1**: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to historical resources. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Pursuant to *CEQA Guidelines* Section 15064.5, conduct a record search during the project planning phase at the appropriate Information Center to determine whether the project area has been previously surveyed and whether historical resources were identified. b) During the project planning phase, retain a qualified architectural historian, defined as an individual who meets the Secretary of the Interior's (SOI) Professional Qualification Standards (PQS) in Architectural History, to conduct historic architectural surveys if a built environment resource greater than 45 years in age may be affected by the project or if recommended by the Information Center. c) Comply with Section 106 of the National Historic Preservation Act (NHPA) including, but not limited to, projects for which federal funding or approval is required for the individual project. This law requires federal agencies to evaluate the impact of their actions on resources included in or eligible for listing in the National Register. Federal agencies must coordinate with the State Historic Preservation Officer in evaluating impacts and developing mitigation. These mitigation measures may include, but are not limited to the following: – Employ design measures to avoid historical resources and undertake adaptive reuse where appropriate and feasible. If resources are to be preserved, as feasible, carry out the maintenance, repair, stabilization, rehabilitation, restoration, preservation, conservation or reconstruction in a manner consistent with the Secretary of the Interior's Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings. If resources would be impacted, impacts should be minimized to the extent feasible. – Where feasible, noise buffers/walls and/or visual buffers/landscaping should be constructed to preserve the contextual setting of significant built resources. d) If a project requires the relocation, rehabilitation, or alteration of an eligible historical resource, the Secretary of the Interior's Standards for the Treatment of Historic Properties should be used	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	to the maximum extent possible to ensure the historical significance of the resource is not impaired. The application of the standards should be overseen by an architectural historian or historic architect meeting the SOI PQS. Prior to any construction activities that may affect the historical resource, a report, meeting industry standards, should identify and specify the treatment of character-defining features and construction activities and be provided to the Lead Agency for review and approval. e) If a project would result in the demolition or significant alteration of a historical resource eligible for or listed in the National Register of Historic Places (NRHP), California Register of Historical Resources (CRHR), or local register, recordation should take the form of Historic American Buildings Survey (HABS), Historic American Engineering Record (HAER), or Historic American Landscape Survey (HALS) documentation, and should be performed by an architectural historian or historian who meets the SOI PQS. Recordation should meet the SOI Standards and Guidelines for Architectural and Engineering, which defines the products acceptable for inclusion in the HABS/HAER/HALS collection at the Library of Congress. The specific scope and details of documentation should be developed at the project level in coordination with the Lead Agency. f) During the project planning phase, obtain a qualified archaeologist, defined as one who meets the SOI PQS for archaeology, to conduct a record search at the appropriate Information Center of the California Historical Resources Information System (CHRIS) to determine whether the project area has been previously surveyed and whether resources were identified. g) Contact the NAHC to request a Sacred Lands File search and a list of relevant Native American contacts who may have additional information. h) During the project planning phase, obtain a qualified archaeologist or architectural historian (depending on applicability) to conduct archaeological and/or historic architectural surveys as recommended by the qualified professional, the Lead Agency, or the Information Center. In the event the records indicate that no previous survey has been conducted, the qualified professional or Information Center will make a recommendation on whether a survey is warranted based on the sensitivity of the project area for archaeological resources. i) If potentially significant archaeological resources are identified through survey, and impacts to these resources cannot be avoided, a Phase II Testing and Evaluation investigation should be performed by a qualified archaeologist prior to any construction-related ground-disturbing activities to determine significance. If resources determined significant or unique through Phase II testing, and avoidance is not possible, appropriate resource-specific mitigation measures should be established by the lead agency and undertaken by qualified personnel. These might include a Phase III data recovery program implemented by a qualified archaeologist and performed in accordance with the OHP's Archaeological Resource Management Reports (ARMR): Recommended Contents and Format and Guidelines for Archaeological Research Designs. Additional options can include 1) interpretative signage, or 2) educational outreach that helps inform the public of the past activities that occurred in this area. Archaeological materials collected from a significant resource should be curated with a recognized scientific or educational repository j) If a record search or archaeological assessment indicates that the project is located in an area	

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	sensitive for archaeological resources, as determined by the Lead Agency in consultation with a qualified archaeologist, retain an archaeological monitor to observe ground disturbing operations, including but not limited to grading, excavation, trenching, or removal of existing features of the subject property. The archaeological monitor should be supervised by an archaeologist meeting the SOI PQS k) Conduct construction activities and excavation to avoid cultural resources (if identified). If avoidance is not feasible, further work may be needed to determine the importance of a resource. Retain a qualified archaeologist, and/or as appropriate, a qualified architectural historian who should make recommendations regarding the work necessary to assess significance. If the cultural resource is determined to be significant under state or federal guidelines, impacts to the cultural resource will need to be mitigated. l) Stop construction activities and excavation in the area where cultural resources are found until a qualified archaeologist can determine whether these resources are significant. If the archaeologist determines that the discovery is significant, it should be curated with a recognized scientific or educational repository.	
Impact CULT-2: Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5.	*SCAG Mitigation Measure* See **SMM CULT-1.** *Project Level Mitigation Measures* See **PMM CULT-1.**	Significant and unavoidable
Impact CULT-3: Disturb human remains, including those interred outside of dedicated cemeteries.	*SCAG Mitigation Measures* See **SMM CULT-1** *Project Level Mitigation Measures* **PMM CULT-2:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to human remains. Such measures may include the following or other comparable measures identified by the Lead Agency: a) In the event of discovery or recognition of any human remains during construction or excavation activities associated with the project, in any location other than a dedicated cemetery, cease further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until the coroner of the county in which the remains are discovered has been informed and has determined that no investigation of the cause of death is required. b) If any discovered remains are of Native American origin: – Contact the County Coroner to contact the NAHC to designate a Native American Most Likely Descendant (MLD). The MLD should make a recommendation to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with appropriate dignity, the human remains and any associated grave goods. This may include obtaining a qualified archaeologist or team of archaeologists to properly excavate the human remains.	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	– If the NAHC is unable to identify a MLD, or the MLD fails to make a recommendation within 48 hours after being notified by the commission, or the landowner or his representative rejects the recommendation of the MLD and the mediation by the NAHC fails to provide measures acceptable to the landowner, obtain a culturally affiliated Native American monitor, and an archaeologist, if recommended by the Native American monitor, and rebury the Native American human remains and any associated grave goods, with appropriate dignity, on the property and in a location that is not subject to further subsurface disturbance.	
ENERGY		
Impact ENR-1: Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.	No mitigation is required	Less than significant
Impact ENR-2: Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.	No mitigation is required	Less than significant
GEOLOGY AND SOILS		
Impact GEO-1: Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving: (i) rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42; (ii) strong seismic ground shaking; (iii) seismic-related ground failure, including liquefaction; (iv) landslides.	No mitigation is required	Less than significant
Impact GEO-2: Result in substantial soil erosion or the loss of topsoil	*SCAG Mitigation Measure* **SMM-GEO-1:** SCAG shall facilitate the minimization of substantial soil erosion or loss of topsoil through cooperation, information sharing, and regional program development as part of SCAG's ongoing regional planning efforts. Such efforts shall include web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to, Map Gallery, GIS library, and GIS applications, and direct technical assistance efforts such as training series and sharing of associated online training materials. Resource agencies, such as the U.S. Geology Survey, shall be consulted during this update process. *Project Mitigation Measures* **PMM-GEO-1:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to historical resources. Such measures may include the following	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	or other comparable measures identified by the Lead Agency: a) Consistent with the CBC and local regulatory agencies with oversight of development associated with the Plan, ensure that site-specific geotechnical investigations conducted by a qualified geotechnical expert are conducted to ascertain soil types prior to preparation of project designs. These investigations can and should identify areas of potential failure and recommend remedial geotechnical measures to eliminate any problems. b) Consistent with the requirements of the State Water Resources Control Board (SWRCB) for projects over one acre in size, obtain coverage under the General Construction Activity Storm Water Permit (General Construction Permit) issued by the SWRCB and prepare a stormwater pollution prevention plan (SWPPP) and submit the plan for review and approval by the Regional Water Quality Control Board (RWQCB). At a minimum, the SWPPP should include a description of construction materials, practices, and equipment storage and maintenance; a list of pollutants likely to contact stormwater; site-specific erosion and sedimentation control practices; a list of provisions to eliminate or reduce discharge of materials to stormwater; best management practices (BMPs); and an inspection and monitoring program. c) Consistent with the requirements of the SWRCB and local regulatory agencies with oversight of development associated with the Plan, ensure that project designs provide adequate slope drainage and appropriate landscaping to minimize the occurrence of slope instability and erosion. Design features should include measures to reduce erosion caused by storm water. Road cuts should be designed to maximize the potential for revegetation. d) Consistent with the CBC and local regulatory agencies with oversight of development associated with the Plan, ensure that, prior to preparing project designs, new and abandoned wells are identified within construction areas to ensure the stability of nearby soils.	
Impact GEO-3: Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse.	No mitigation is required	Less than significant
Impact GEO-4: Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property.	No mitigation is required	Less than significant
Impact GEO-5: Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water.	No mitigation is required	Less than significant
Impact GEO-6: Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.	*SCAG Mitigation Measure* **SMM-GEO-3:** Impacts to paleontological resources shall be minimized through cooperation, information sharing, and SCAG's ongoing regional planning efforts such as web-based planning tools for local	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	governments including CA LOTS, and other GIS tools and data services, including, but not limiting to, Map Gallery, GIS library, and GIS applications; and direct technical assistance efforts such as training series and sharing of associated online training materials. SCAG shall consult with resource agencies such as the National Park Service, United States Forest Service, and Bureau of Land Management to identify opportunities for early and effective consultation to identify unique paleontological resources and unique geological features to avoid such resources wherever practicable and feasible and reduce or mitigation for conflicts in compatible land use to the maximum extent practicable. *Project Level Mitigation Measures* **PMM-GEO-1:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to paleontological resources. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Ensure compliance with the Paleontological Resources Preservation Act, the Federal Land Policy and Management Act, the Antiquities Act, Section 5097.5 of the Public Resources Code (PRC), adopted county and city general plans, and other federal, state and local regulations, as applicable and feasible, by adhering to and incorporating the performance standards and practices from the 2010 Society for Vertebrate Paleontology (SVP) standard procedures for the assessment and mitigation of adverse impacts to paleontological resources. b) Obtain review by a qualified paleontologist (e.g. who meets the SVP standards for a Principal Investigator or Project Paleontologist or the Bureau of Land Management (BLM) standards for a Principal Investigator), to determine if the project has the potential to require ground disturbance of parent material with potential to contain unique paleontological or resources, or to require the substantial alteration of a unique geologic feature. The assessment should include museum records searches, a review of geologic mapping and the scientific literature, geotechnical studies (if available), and potentially a pedestrian survey, if units with paleontological potential are present at the surface. c) Avoid exposure or displacement of parent material with potential to yield unique paleontological resources. d) Where avoidance of parent material with the potential to yield unique paleontological resources is not feasible: 1) All on-site construction personnel receive Worker Education and Awareness Program (WEAP) training prior to the commencement of excavation work to understand the regulatory framework that provides for protection of paleontological resources and become familiar with diagnostic characteristics of the materials with the potential to be encountered. 2) A qualified paleontologist prepares a Paleontological Resource Management Plan (PRMP) to guide the salvage, documentation and repository of unique paleontological resources encountered during construction. The PRMP should adhere to and incorporate the performance standards and practices from the 2010 SVP Standard procedures for the assessment and mitigation of adverse impacts to paleontological resources. If unique	

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	paleontological resources are encountered during construction, use a qualified paleontologist to oversee the implementation of the PRMP. 3) Monitor ground disturbing activities in parent material, with a moderate to high potential to yield unique paleontological resources using a qualified paleontological monitor meeting the standards of the SVP or the BLM to determine if unique paleontological resources are encountered during such activities, consistent with the specified or comparable protocols. 4) Identify where ground disturbance is proposed in a geologic unit having the potential for containing fossils and specify the need for a paleontological monitor to be present during ground disturbance in these areas. e) Avoid routes and project designs that would permanently alter unique geological features. f) Salvage and document adversely affected resources sufficient to support ongoing scientific research and education. g) Significant recovered fossils should be prepared to the point of curation, identified by qualified experts, listed in a database to facilitate analysis, and deposited in a designated paleontological curation facility. h) Following the conclusion of the paleontological monitoring, the qualified paleontologist should prepare a report stating that the paleontological monitoring requirement has been fulfilled and summarize the results of any paleontological finds. The report should be submitted to the lead CEQA and the repository curating the collected artifacts, and should document the methods and results of all work completed under the PRMP, including treatment of paleontological materials, results of specimen processing, analysis, and research, and final curation arrangements.	
GREENHOUSE GASES		
Impact GHG-1: Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.	*SCAG Mitigation Measures* **SMM GHG-1:** SCAG, in partnership with local air districts, shall continue to work with the counties and cities to adopt qualified GHG reduction plans (e.g., climate action plans [CAPs], develop GHG-reducing planning policies, and implement local climate initiatives. These reductions can be achieved through a combination of programs, that implement plans developed collaboratively, including ZNE in new construction, retrofits of existing buildings, incentivizing the development of renewable energy sources that serve both new and existing land uses, as well as measures to reduce GHG emissions form transportation sources. **SMM GHG-2:** SCAG shall encourage energy efficient design for buildings, through SCAG's Sustainable Communities Program potentially including strengthening local building codes for new construction and renovation to achieve a higher level of energy efficiency. **SMM GHG-3:** SCAG shall continue working with partners including universities, utilities, regulating agencies, the private sector and NGO's, and member agencies to support deployment of electric vehicle (EV) charging in the region. SCAG shall provide resources to member agencies and supply them with available information and data so that they can better take advantage of legislation and funding for EV charging.	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	SMM GHG-4: SCAG shall continue to pursue partnerships with SCE, municipal utilities, locally operated electricity providers and CPUC to promote energy efficient development in the SCAG region, through coordinated planning and data and information sharing activities. *Project Level Mitigation Measures:* **PMM-GHG-1:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to greenhouse gas emissions. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Integrate green building measures consistent with CALGreen (California Building Code Title 24), local building codes and other applicable laws, into project design including: i. Use energy efficient materials in building design, construction, rehabilitation, and retrofit. ii. Install energy-efficient lighting, heating, and cooling systems (cogeneration); water heaters; appliances; equipment; and control systems. iii. Reduce lighting, heating, and cooling needs by taking advantage of light-colored roofs, trees for shade, and sunlight. iv. Incorporate passive environmental control systems that account for the characteristics of the natural environment. v. Use high-efficiency lighting and cooking devices. vi. Incorporate passive solar design. vii. Use high-reflectivity building materials and multiple glazing. viii. Prohibit gas-powered landscape maintenance equipment. ix. Install electric vehicle charging stations. x. Reduce wood burning stoves or fireplaces. xi. Provide bike lanes accessibility and parking at residential developments. b) Reduce emissions resulting from projects through implementation of project features, project design, or other measures, such as those described in Appendix F of the State CEQA Guidelines. c) Include off-site measures to mitigate a project's emissions. d) Measures that consider incorporation of Best Available Control Technology (BACT) during design, construction and operation of projects to minimize GHG emissions, including but not limited to: i. Use energy and fuel-efficient vehicles and equipment; ii. Deployment of zero- and/or near zero emission technologies; iii. Use lighting systems that are energy efficient, such as LED technology; iv. Use the minimum feasible amount of GHG-emitting construction materials; v. Use cement blended with the maximum feasible amount of flash or other materials	

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	that reduce GHG emissions from cement production; vi. Incorporate design measures to reduce GHG emissions from solid waste management through encouraging solid waste recycling and reuse; vii. Incorporate design measures to reduce energy consumption and increase use of renewable energy; viii. Incorporate design measures to reduce water consumption; ix. Use lighter-colored pavement where feasible; x. Recycle construction debris to maximum extent feasible; xi. Plant shade trees in or near construction projects where feasible; and xii. Solicit bids that include concepts listed above. e) Measures that encourage transit use, carpooling, bike-share and car-share programs, active transportation, and parking strategies, including, but not limited to the following: i. Promote transit-active transportation coordinated strategies; ii. Increase bicycle carrying capacity on transit and rail vehicles; iii. Improve or increase access to transit; iv. Increase access to common goods and services, such as groceries, schools, and day care; v. Incorporate affordable housing into the project; vi. Incorporate the neighborhood electric vehicle network; vii. Orient the project toward transit, bicycle and pedestrian facilities; viii. Improve pedestrian or bicycle networks, or transit service; ix. Provide traffic calming measures; x. Provide bicycle parking; xi. Limit or eliminate park supply; xii. Unbundle parking costs; xiii. Provide parking cash-out programs; xiv. Implement or provide access to commute reduction program; f) Incorporate bicycle and pedestrian facilities into project designs, maintaining these facilities, and providing amenities incentivizing their use; and planning for and building local bicycle projects that connect with the regional network; g) Improving transit access to rail and bus routes by incentives for construction of transit facilities within developments, and/or providing dedicated shuttle service to transit stations; and h) Adopting employer trip reduction measures to reduce employee trips such as vanpool and carpool programs, providing end-of-trip facilities, and telecommuting programs including but not limited to measures that: i. Provide car-sharing, bike sharing, and ride-sharing programs;	

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	ii. Provide transit passes; iii. Shift single occupancy vehicle trips to carpooling or vanpooling, for example providing ride-matching services; iv. Provide incentives or subsidies that increase that use of modes other than single-occupancy vehicle; v. Provide on-site amenities at places of work, such as priority parking for carpools and vanpools, secure bike parking, and showers and locker rooms; vi. Provide employee transportation coordinators at employment sites; vii. Provide a guaranteed ride home service to users of non-auto modes. i) Designate a percentage of parking spaces for ride-sharing vehicles or high-occupancy vehicles, and provide adequate passenger loading and unloading for those vehicles; j) Land use siting and design measures that reduce GHG emissions, including: i. Developing on infill and brownfields sites; ii. Building compact and mixed-use developments near transit; iii. Retaining on-site mature trees and vegetation, and planting new canopy trees; iv. Measures that increase vehicle efficiency, encourage use of zero and low emissions vehicles, or reduce the carbon content of fuels, including constructing or encouraging construction of electric vehicle charging stations or neighborhood electric vehicle networks, or charging for electric bicycles; and v. Measures to reduce GHG emissions from solid waste management through encouraging solid waste recycling and reuse.	
Impact GHG-2: Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.	*SCAG Mitigation Measures* See **SMM GHG -1, SMM GHG-2, SMM GHG-3,** and **SMM GHG-4.** *Project Level Mitigation Measures* See **PMM-GHG-1.**	Significant and unavoidable
HAZARDS AND HAZARDOUS MATERIALS		
Impact HAZ-1: Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.	*SCAG Mitigation Measures* **SMM HAZ-1:** SCAG shall work with the U.S. DOT, the Office of Environmental Service Caltrans, and the private sector to continue to conduct driver safety training programs and enforce speed limits on roadways. In an effort to reduce risks associated with the transport of hazardous materials in the SCAG region, SCAG shall encourage the U.S. Department of Transportation and the California Highway Patrol to continue to enforce speed limits and existing regulations governing goods movement and hazardous materials transportation. **SMM HAZ-2:** SCAG shall notify member agencies of the importance of ensuring that construction and operation of transportation projects provide for the safe transport and disposal of hazardous waste, consistent with the provisions of HMR, 49 CFR Parts 171–180. **SMM HAZ-3:** SCAG shall coordinate with the Office of Environmental Services to identify any transportation	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	infrastructure elements within the SCAG region where risks to people and property occur at an above-average incident level, potentially warranting consideration for remedial design in future regional transportation plans (RTPs). *Project Level Mitigation Measures* **PMM HAZ-1:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to the routine transport, use, or disposal of hazardous materials, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Where the construction or operation of projects involves the transport of hazardous material, provide a written plan of proposed routes of travel demonstrating use of roadways designated for the transport of such materials. b) Specify Project requirements for interim storage and disposal of hazardous materials during construction and operation. Storage and disposal strategies must be consistent with applicable federal, state, and local statutes and regulations. Specify the appropriate procedures for interim storage and disposal of hazardous materials, anticipated to be required in support of operations and maintenance activities, in conformance with applicable federal, state, and local statutes and regulations, in the business plan for projects as applicable and appropriate. c) Submit a Hazardous Materials Business/Operations Plan for review and approval by the appropriate local agency. Once approved, keep the plan on file with the Lead Agency (or other appropriate government agency) and update, as applicable. The purpose of the Hazardous Materials Business/Operations Plan is to ensure that employees are adequately trained to handle the materials and provides information to the local fire protection agency should emergency response be required. The Hazardous Materials Business/Operations Plan should include the following: o The types of hazardous materials or chemicals stored and/or used on-site, such as petroleum fuel products, lubricants, solvents, and cleaning fluids. o The location of such hazardous materials. o An emergency response plan including employee training information. o A plan that describes the way these materials are handled, transported and disposed. d) Follow manufacturer's recommendations on use, storage, and disposal of chemical products used in construction. e) Avoid overtopping construction equipment fuel gas tanks. f) Properly contain and remove grease and oils during routine maintenance of construction equipment. g) Properly dispose of discarded containers of fuels and other chemicals. h) Prior to shipment remove the most volatile elements, including flammable natural gas liquids, as feasible. i) Identify and implement more stringent tank car safety standards.	

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	j) Improve rail transportation route analysis, and modification of routes based on that analysis. k) Use the best available inspection equipment and protocols and implement positive train control. l) Reduce train car speeds to 40 miles per hour when passing through urbanized areas of any size. m) Limit storage of crude oil tank cars in urbanized areas of any size and provide appropriate security in storage yards for all shipments. n) Notify in advance county and city emergency operations offices of all crude oil shipments, including a contact number that can provide real-time information in the event of an oil train derailment or accident. o) Report quarterly hazardous commodity flow information, including classification and characterization of materials being transported, to all first response agencies (49 Code Fed. Regs. 15.5) along the mainline rail routes used by trains carrying crude oil identified. p) Fund training and outfitting emergency response crews that includes the cost of backfilling personnel while in training. q) Undertake annual emergency responses scenario/field based training including Emergency Operations Center Training activations with local emergency response agencies.	
Impact HAZ-2: Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.	*SCAG Mitigation Measures* See **SMM HAZ-1** through **SMM HAZ-3.** *Project Level Mitigation Measures* See **PMM HAZ-1**. **PMM HAZ-2:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce hazards related to the reasonably foreseeable upsets and accidents involving the release of hazardous materials, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Removal of the most volatile elements, including flammable natural gas liquids, prior to shipment; b) More stringent tank car safety standards; c) Improved rail transportation route analysis, and modification of routes based on that analysis; d) Utilization of the best available inspection equipment and protocols, and implementation of positive train control; e) Reduced train car speeds to 40 miles per hour when passing through urbanized areas of any size; f) Limitations on storage of hazardous materials tank cars in urbanized areas of any size and provide appropriate security in storage yards for all shipments; g) Advance notification to county and city emergency operations offices of all crude oil and hazardous materials shipments, including a contact number that can provide real-time	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	information in the event of an oil train derailment or accident; h) Quarterly hazardous commodity flow information, including classification and characterization of materials being transported, to all first response agencies (49 Code Fed. Regs. 15.5) along the mainline rail routes used by trains carrying hazardous materials.	
Impact HAZ-3: Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school	*SCAG Mitigation Measures* See **SMM HAZ-1** through **SMM HAZ-3**. *Project Level Mitigation Measures* See **PMM HAZ-1** and **PMM HAZ-2**. **PMM HAZ-3:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to the release of hazardous materials within one-quarter mile of schools, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Where the construction and operation of projects involves the transport of hazardous materials, avoid transport of such materials within one-quarter mile of schools, when school is in session, wherever feasible. b) Where it is not feasible to avoid transport of hazardous materials, within one-quarter mile of schools on local streets, provide notifications of the anticipated schedule of transport of such materials.	Significant and unavoidable
Impact HAZ-4: Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment.	*SCAG Mitigation Measures* See **SMM HAZ-1** through **SMM HAZ-3**. *Project Level Mitigation Measures* **PMM HAZ-4:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to projects that are located on a site which is included on the Cortese List, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: a) For any listed sites or sites that have the potential for residual hazardous materials as a result of historic land uses, complete a Phase I Environmental Site Assessment, including a review and consideration of data from all known databases of contaminated sites, during the process of planning, environmental clearance, and construction for projects. b) Where warranted due to the known presence of contaminated materials, submit to the appropriate agency responsible for hazardous materials/wastes oversight a Phase II Environmental Site Assessment report if warranted by a Phase I report for the project site. The reports should make recommendations for remedial action, if appropriate, and be signed by a Registered Environmental Assessor, Professional Geologist, or Professional Engineer. c) Implement the recommendations provided in the Phase II Environmental Site Assessment report, where such a report was determined to be necessary for the construction or operation of the project, for remedial action.	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	d) Submit a copy of all applicable documentation required by local, state, and federal environmental regulatory agencies, including but not limited to: permit applications, Phase I and II Environmental Site Assessments, human health and ecological risk assessments, remedial action plans, risk management plans, soil management plans, and groundwater management plans. e) Conduct soil sampling and chemical analyses of samples, consistent with the protocols established by the U.S. EPA to determine the extent of potential contamination beneath all underground storage tanks (USTs), elevator shafts, clarifiers, and subsurface hydraulic lifts when on-site demolition or construction activities would potentially affect a particular development or building. f) Consult with the appropriate local, state, and federal environmental regulatory agencies to ensure sufficient minimization of risk to human health and environmental resources, both during and after construction, posed by soil contamination, groundwater contamination, or other surface hazards including, but not limited to, underground storage tanks, fuel distribution lines, waste pits and sumps. g) Obtain and submit written evidence of approval for any remedial action if required by a local, state, or federal environmental regulatory agency. h) Cease work if soil, groundwater, or other environmental medium with suspected contamination is encountered unexpectedly during construction activities (e.g., identified by odor or visual staining, or if any underground storage tanks, abandoned drums, or other hazardous materials or wastes are encountered), in the vicinity of the suspect material. Secure the area as necessary and take all appropriate measures to protect human health and the environment, including but not limited to, notification of regulatory agencies and identification of the nature and extent of contamination. Stop work in the areas affected until the measures have been implemented consistent with the guidance of the appropriate regulatory oversight authority. i) Soil generated by construction activities should be stockpiled on-site in a secure and safe manner. All contaminated soils determined to be hazardous or non-hazardous waste must be adequately profiled (sampled) prior to acceptable reuse or disposal at an appropriate off-site facility. Complete sampling and handling and transport procedures for reuse or disposal, in accordance with applicable local, state and federal laws and policies. j) Groundwater pumped from the subsurface should be contained on-site in a secure and safe manner, prior to treatment and disposal, to ensure environmental and health issues are resolved pursuant to applicable laws and policies. Utilize engineering controls, which include impermeable barriers to prohibit groundwater and vapor intrusion into the building. k) As needed and appropriate, prior to issuance of any demolition, grading, or building permit, submit for review and approval by the Lead Agency (or other appropriate government agency) written verification that the appropriate federal, state and/or local oversight authorities, including but not limited to the Regional Water Quality Control Board (RWQCB), have granted all required clearances and confirmed that the all applicable standards, regulations, and conditions have been met for previous contamination at the site.	

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	l) Develop, train, and implement appropriate worker awareness and protective measures to assure that worker and public exposure is minimized to an acceptable level and to prevent any further environmental contamination as a result of construction. m) If asbestos-containing materials (ACM) are found to be present in building materials to be removed, submit specifications signed by a certified asbestos consultant for the removal, encapsulation, or enclosure of the identified ACM in accordance with all applicable laws and regulations, including but not necessarily limited to: California Code of Regulations, Title 8; Business and Professions Code; Division 3; California Health and Safety Code Section 25915-25919.7; and other local regulations. n) Where projects include the demolitions or modification of buildings constructed prior to 1978, complete an assessment for the potential presence or lack thereof of ACM, lead based paint, and any other building materials or stored materials classified as hazardous waste by state or federal law. o) Where the remediation of lead-based paint has been determined to be required, provide specifications to the appropriate agency, signed by a certified Lead Supervisor, Project Monitor, or Project Designer for the stabilization and/or removal of the identified lead paint in accordance with all applicable laws and regulations, including but not necessarily limited to: California Occupational Safety and Health Administration's (Cal OSHA's) Construction Lead Standard, Title 8 California Code of Regulations (CCR) Section 1532.1 and Department of Health Services (DHS) Regulation 17 CCR Sections 35001–36100, as may be amended. If other materials classified as hazardous waste by state or federal law are present, the project sponsor should submit written confirmation to the appropriate local agency that all state and federal laws and regulations should be followed when profiling, handling, treating, transporting, and/or disposing of such materials.	
Impact HAZ-5: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area	*SCAG Mitigation Measures* See **SMM NOISE-1.** **SMM HAZ-5:** SCAG shall continue to collaborate with key stakeholders on regional aviation planning issues through the Aviation Technical Advisory Committee (ATAC). The ATAC is a partnership between the airports, transportation agencies and commissions, experts, and other community members. *Project Level Mitigation Measures* See **PMM NOISE-1.**	Significant and unavoidable
Impact HAZ-6: Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan	*SCAG Mitigation Measures* See **SMM HAZ-1** through **SMM HAZ-5** and **SMM TRA-5.** *Project Level Mitigation Measures* See **PMM HAZ-1** through **PMM HAZ-4** and **PMM TRA-5.** **PMM HAZ-5:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects which may impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan, as applicable and feasible. Such	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	measures may include the following or other comparable measures identified by the Lead Agency: a) Continue to coordinate locally and regionally based on ongoing review and integration of projected transportation and circulation conditions. b) Develop new methods of conveying projected and real time information to citizens using emerging electronic communication tools including social media and cellular networks; c) Continue to evaluate lifeline routes for movement of emergency supplies and evacuation.	
Impact HAZ-7: Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires.	This impact is addressed under **Section 3.20, Wildfire, Impact WF-2**. See below.	
HYDROLOGY AND WATER QUALITY		
Impact HYD-1: Potential to violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality.	*SCAG Mitigation Measure* **SMM HYD-1:** SCAG shall continue to work with local jurisdictions and water quality agencies to encourage regional-scale planning for improved water quality management and pollution prevention. Future impacts to water quality shall be avoided to the extent practical and feasible through cooperative planning, information sharing, and comprehensive pollution control measure development within the SCAG region. This cooperative planning shall occur as part of current and existing coordination, an integral part of SCAG's ongoing regional planning efforts. *Project Level Mitigation Measures* **PMM HYD-1:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects from violation of any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Complete, and have approved, a Stormwater Pollution Prevention Plan (SWPPP) prior to initiation of construction. b) Implement Best Management Practices to reduce the peak stormwater runoff from the project site to the maximum extent practicable. c) Comply with the Caltrans storm water discharge permit as applicable; and identify and implement Best Management Practices to manage site erosion, wash water runoff, and spill control. d) Complete, and have approved, a Standard Urban Stormwater Management Plan, prior to occupancy of residential or commercial structures. e) Ensure adequate capacity of the surrounding stormwater system to support stormwater runoff from new or rehabilitated structures or buildings. f) Prior to construction within an area subject to Section 404 of the Clean Water Act, obtain all required permit approvals and certifications for construction within the vicinity of a watercourse: g) Where feasible, restore or expand riparian areas such that there is no net loss of impervious	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	surface as a result of the project. h) Install structural water quality control features, such as drainage channels, detention basins, oil and grease traps, filter systems, and vegetated buffers to prevent pollution of adjacent water resources by polluted runoff where required by applicable urban storm water runoff discharge permits, on new facilities. i) Provide operational best management practices for street cleaning, litter control, and catch basin cleaning are implemented to prevent water quality degradation in compliance with applicable storm water runoff discharge permits; and ensure treatment controls are in place as early as possible, such as during the acquisition process for rights-of-way, not just later during the facilities design and construction phase. j) Comply with applicable municipal separate storm sewer system discharge permits as well as Caltrans' storm water discharge permit including long-term sediment control and drainage of roadway runoff. k) Incorporate as appropriate treatment and control features such as detention basins, infiltration strips, and porous paving, other features to control surface runoff and facilitate groundwater recharge into the design of new transportation projects early on in the process to ensure that adequate acreage and elevation contours are provided during the right-of-way acquisition process. l) Upgrade stormwater drainage facilities to accommodate any increased runoff volumes. These upgrades may include the construction of detention basins or structures that will delay peak flows and reduce flow velocities, including expansion and restoration of wetlands and riparian buffer areas. System designs shall be completed to eliminate increases in peak flow rates from current levels. m) Encourage Low Impact Development (LID) and incorporation of natural spaces that reduce, treat, infiltrate and manage stormwater runoff flows in all new developments, where practical and feasible.	
Impact HYD-2: Potential to substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin.	*SCAG Mitigation Measure* **SMM HYD-2:** SCAG shall build from existing efforts including those at the sub-regional and local level and shall continue to work with local jurisdictions and water agencies, to encourage regional-scale planning for improved stormwater management and groundwater recharge, including consideration of alternative recharge technologies and practices. Future adverse impacts may be avoided through cooperative planning, information sharing, and comprehensive implementation efforts within the SCAG region. *Project Level Mitigation Measures* **PMM HYD-2:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects from violation of any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:	Significant and unavoidable

Significance Threshold and Project Impacts		Mitigation Measures	Residual Impact
		a) Avoid designs that require continual dewatering where feasible. For projects requiring continual dewatering facilities, implement monitoring systems and long-term administrative procedures to ensure proper water management that prevents degrading of surface water and minimizes adverse impacts on groundwater for the life of the project, Construction designs shall comply with appropriate building codes and standard practices including the Uniform Building Code. b) Maximize, where practical and feasible, permeable surface area in existing urbanized areas to protect water quality, reduce flooding, allow for groundwater recharge, and preserve wildlife habitat. Minimize new impervious surfaces, including the use of in-lieu fees and off-site mitigation. c) Avoid construction and siting on groundwater recharge areas, to prevent conversion of those areas to impervious surface. d) Reduce hardscape to the extent feasible to facilitate groundwater recharge as appropriate.	
Impact HYD-3a:	Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would result in substantial erosion or siltation on- or off-site.	*SCAG Mitigation Measures* See **SMM HYD-1** and **SMM HYD-2**. **SMM HYD-3:** SCAG shall build from existing efforts including those at the sub-regional and local level and shall continue to work with local jurisdictions to encourage regional-scale planning for maintaining and/or improving existing drainage patterns. Future adverse impacts may be avoided through cooperative planning, information sharing, and comprehensive implementation efforts within the SCAG region. *Project Level Mitigation Measures* See **PMM HYD-1**.	Significant and unavoidable
Impact HYD-3b:	Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would substantially increase the rate or amount of flooding on- or off-site.	*SCAG Mitigation Measures* **See SMM HYD-1** through **SMM HYD-3.** *Project Level Mitigation Measures* See **PMM HYD-1** and **PMM HYD-2.**	Significant and unavoidable
Impact HYD-3c:	Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff.	*SCAG Mitigation Measures* **See SMM HYD-1** through **SMM HYD-3.** *Project Level Mitigation Measures* See **PMM HYD-1** and **PMM HYD-2.**	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
Impact HYD-4: In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation.	*SCAG Mitigation Measures* **SMM-HYD-4:** SCAG shall continue to work with local jurisdictions and water quality agencies to encourage flood protection and prevent development in flood hazard areas that do not have appropriate protections. This shall be accomplished through cooperation and information sharing regarding specific alignments and rights-of-way planning for RTP projects, and regional program development as part of SCAG's ongoing regional planning efforts. These include but are not limited to web-based data distribution planning tools and sustainability programs in conjunction with local governments. Such services would potentially consist of an inventory of areas located in or near a 100-year flood hazard zone or hazard areas that would potentially be affected by a failure of a levee or dam; or inundation by seiche, tsunami, or mudflow. *Project Level Mitigation Measures* **PMM-HYD-4:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures capable of avoiding or reducing the potential impacts of locating structures that would impede or redirect flood flows, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Ensure that all roadbeds for new highway and rail facilities be elevated at least one foot above the 100-year base flood elevation. Since alluvial fan flooding is not often identified on FEMA flood maps, the risk of alluvial fan flooding should be evaluated and projects should be sited to avoid alluvial fan flooding. Delineation of floodplains and alluvial fan boundaries should attempt to account for future hydrologic changes caused by global climate change.	Significant and unavoidable
Impact HYD-5: Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.	*SCAG Mitigation Measure* See **SMM HYD-2.** *Project Level Mitigation Measure* See **PMM HYD-2.**	Significant and unavoidable
LAND USE		
Impact LU-1: Potential for the Plan to physically divide an established community	*SCAG Mitigation Measures* **SMM LU-1:** SCAG shall coordinate with local County Transportation Commissions, Caltrans and other implementing agencies when siting new facilities in residential areas to facilitate minimizing future impacts of transportation projects on established communities, through cooperation, information sharing, and regional program development as part of SCAG's ongoing regional planning efforts to promote best planning practices. *Project Level Mitigation Measures* **PMM LU-1:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects that physically divide a community, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Facilitate good design for land use projects that build upon and improve existing circulation patterns	Significant and unavoidable

Significance Threshold and Project Impacts		Mitigation Measures	Residual Impact
		b) Encourage implementing agencies to orient transportation projects to minimize impacts on existing communities by: – Selecting alignments within or adjacent to existing public rights of way. – Design sections above or below-grade to maintain viable vehicular, cycling, and pedestrian connections between portions of communities where existing connections are disrupted by the transportation project. – Wherever feasible incorporate direct crossings, overcrossings, or under crossings at regular intervals for multiple modes of travel (e.g., pedestrians, bicyclists, vehicles). c) Where it has been determined that it is infeasible to avoid creating a barrier in an established community, consider other measures to reduce impacts, including but not limited to: – Alignment shifts to minimize the area affected. – Reduction of the proposed right-of-way take to minimize the overall area of impact. – Provisions for bicycle, pedestrian, and vehicle access across improved roadways.	
Impact LU-2:	Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect	*SCAG Mitigation Measures* **SMM LU-2:** SCAG shall continue to promote the Intergovernmental Review (IGR) Program as an internal and external informational tool by reviewing and monitoring all projects submitted to SCAG for review and working with local jurisdictions to ensure that submitted projects support the most currently adopted Connect SoCal Plan. SCAG shall provide comment letters on regionally significant projects to recommend additional resources to help the lead agency support or develop a projects that are consistent with the Plan, as appropriate. The IGR Mapping Tool can also be utilized by local jurisdictions to assess regional impacts. To visit the IGR Mapping tool, please go to: https://maps.scag.ca.gov/IGR/. For more information on SCAG's IGR Program, please visit: http://www.scag.ca.gov/programs/Pages/IGR.aspx. **SMM LU-3:** SCAG shall encourage cities and counties in the region to provide SCAG with electronic versions of their most recent general plan (and associated environmental document) and any updates as they are produced. **SMM LU-4:** SCAG shall continue to provide targeted technical services such as GIS and data support for cities and counties to update their general plans at least every ten years, as recommended by the Governor's Office of Planning and Research. **SMM LU-5:** SCAG shall provide technical assistance and regional leadership to encourage implementation of the Plan goals and strategies that integrate growth and land use planning with the existing and planned transportation network. *Project Level Mitigation Measures* **PMM LU-2:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the State CEQA Guidelines, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects that physically divide a community, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: a) When an inconsistency with the adopted general plan policy or land use regulation (adopted for the purpose of avoiding or mitigating an impact) is identified modify the transportation or	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	land use project to eliminate the conflict; or, determine if the environmental, social, economic, and engineering benefits of the project warrant an amendment to the general plan or land use regulation.	
MINERAL RESOURCES		
Impact MIN-1: Potential to result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state.	*SCAG Mitigation Measures* **SMM MIN-1:** SCAG shall coordinate with the Department of Conservation, California Geological Survey to maintain a database of (1) available mineral resources in the SCAG region including permitted and unpermitted aggregate resources and (2) the anticipated 50-year demand for aggregate and other mineral resources. Based on the results of this survey, SCAG shall work with local agencies on strategies to address anticipated demand, including identifying future sites that may seek permitting and working with industry experts to identify ways to encourage and increase recycling to reduce the demand for aggregate. *Project Level Mitigation Measures* **PMM MIN-1:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce the use of mineral resources that could be of value to the region, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Provide for the efficient use of known aggregate and mineral resources or locally important mineral resource recovery sites, by ensuring that the consumptive use of aggregate resources is minimized and that access to recoverable sources of aggregate is not precluded, as a result of construction, operation and maintenance of projects. b) Where avoidance is infeasible, minimize impacts to the efficient and effective use of recoverable sources of aggregate through measures that have been identified in county and city general plans, or other comparable measures such as: 1) Recycle and reuse building materials resulting from demolition, particularly aggregate resources, to the maximum extent practicable. 2) Identify and use building materials, particularly aggregate materials, resulting from demolition at other construction sites in the SCAG region, or within a reasonable hauling distance of the project site. 3) Design transportation network improvements in a manner (such as buffer zones or the use of screening) that does not preclude adjacent or nearby extraction of known mineral and aggregate resources following completion of the improvement and during long-term operations. 4) Avoid or reduce impacts on known aggregate and mineral resources and mineral resource recovery sites through the evaluation and selection of project sites and design features (e.g., buffers) that minimize impacts on land suitable for aggregate and mineral resource extraction by maintaining portions of MRZ-2 areas in open space or other general plan land use categories and zoning that allow for mining of mineral resources.	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
Impact MIN-2 Potential to result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan.	*SCAG Mitigation Measure* See **SMM MIN-1.** *Project Level Mitigation Measure* See **PMM-MIN-1.**	Significant and unavoidable
NOISE		
Impact NOISE-1: Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies.	*SCAG Mitigation Measures* **SMM-NOISE-1:** SCAG shall coordinate with CTCs and member agencies as part of SCAG's outreach and technical assistance to local governments to encourage transportation projects and projects involving residential and commercial land uses to mitigate noise and vibration or be developed in areas that are normally acceptable or conditionally acceptable, consistent with applicable guidelines (i.e, OPR, Caltrans, etc.) *Project Level Mitigation Measures* **PMM NOISE-1:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects that physically divide a community, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Install temporary noise barriers during construction. b) Include permanent noise barriers and sound-attenuating features as part of the project design. Barriers could be in the form of outdoor barriers, sound walls, buildings, or earth berms to attenuate noise at adjacent sensitive uses. c) Schedule construction activities consistent with the allowable hours pursuant to applicable general plan noise element or noise ordinance d) Post procedures and phone numbers at the construction site for notifying the Lead Agency staff, local Police Department, and construction contractor (during regular construction hours and off-hours), along with permitted construction days and hours, complaint procedures, and who to notify in the event of a problem. e) Notify neighbors and occupants within 300 feet of the project construction area at least 30 days in advance of anticipated times when noise levels are expected to exceed limits established in the noise element of the general plan or noise ordinance. f) Designate an on-site construction complaint and enforcement manager for the project. g) Ensure that construction equipment are properly maintained per manufacturers' specifications and fitted with the best available noise suppression devices (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures, and acoustically attenuating shields or shrouds silencers, wraps). All intake and exhaust ports on power equipment shall be muffled or shielded. h) Use hydraulically or electrically powered tools (e.g., jack hammers, pavement breakers, and rock drills) for project construction to avoid noise associated with compressed air exhaust from pneumatically powered tools. However, where use of pneumatic tools is	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	unavoidable, an exhaust muffler on the compressed air exhaust should be used; this muffler can lower noise levels from the exhaust by up to about 10 dBA. External jackets on the tools themselves should be used, if such jackets are commercially available, and this could achieve a further reduction of 5 dBA. Quieter procedures should be used, such as drills rather than impact equipment, whenever such procedures are available and consistent with construction procedures. i) Where feasible, design projects so that they are depressed below the grade of the existing noise-sensitive receptor, creating an effective barrier between the roadway and sensitive receptors. j) Where feasible, improve the acoustical insulation of dwelling units where setbacks and sound barriers do not provide sufficient noise reduction. k) Using rubberized asphalt or "quiet pavement" to reduce road noise for new roadway segments, roadways in which widening or other modifications require re-pavement, or normal reconstruction of roadways where re-pavement is planned l) Projects that require pile driving or other construction noise above 90 dBA in proximity to sensitive receptors, should reduce potential pier drilling, pile driving and/or other extreme noise generating construction impacts greater than 90 dBA; a set of site-specific noise attenuation measures should be completed under the supervision of a qualified acoustical consultant. m) Use land use planning measures, such as zoning, restrictions on development, site design, and buffers to ensure that future development is compatible with adjacent transportation facilities and land uses; n) Monitor the effectiveness of noise reduction measures by taking noise measurements and installing adaptive mitigation measures to achieve the standards for ambient noise levels established by the noise element of the general plan or noise ordinance. o) Use equipment and trucks with the best available noise control techniques (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures, and acoustically attenuating shields or shrouds, wherever feasible) for project construction. p) Stationary noise sources can and should be located as far from adjacent sensitive receptors as possible and they should be muffled and enclosed within temporary sheds, incorporate insulation barriers, or use other measures as determined by the Lead Agency (or other appropriate government agency) to provide equivalent noise reduction. q) Use of portable barriers in the vicinity of sensitive receptors during construction. r) Implement noise control at the receivers by temporarily improving the noise reduction capability of adjacent buildings (for instance by the use of sound blankets), and implement if such measures are feasible and would noticeably reduce noise impacts. s) Monitor the effectiveness of noise attenuation measures by taking noise measurements. t) Maximize the distance between noise-sensitive land uses and new roadway lanes, roadways, rail lines, transit centers, park-and-ride lots, and other new noise-generating facilities.	

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	u) Construct sound reducing barriers between noise sources and noise-sensitive land uses. v) Stationary noise sources can and should be located as far from adjacent sensitive receptors as possible and they should be muffled and enclosed within temporary sheds, incorporate insulation barriers, or use other measures as determined by the Lead Agency (or other appropriate government agency) to provide equivalent noise reduction. w) Use techniques such as grade separation, buffer zones, landscaped berms, dense plantings, sound walls, reduced-noise paving materials, and traffic calming measures. x) Locate transit-related passenger stations, central maintenance facilities, decentralized maintenance facilities, and electric substations away from sensitive receptors to the maximum extent feasible.	
Impact NOISE-2: Generation of excessive groundborne vibration or groundborne noise levels.	*SCAG Mitigation Measure* See **SMM-NOISE-1** *Project Level Mitigation Measures* See **PMM-NOISE-1**. **PMM-NOISE-2:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to violating air quality standards. Such measures may include the following or other comparable measures identified by the Lead Agency: a) For projects that require pile driving or other construction techniques that result in excessive vibration, such as blasting, determine the potential vibration impacts to the structural integrity of the adjacent buildings within 50 feet of pile driving locations. b) For projects that require pile driving or other construction techniques that result in excessive vibration, such as blasting, determine the threshold levels of vibration and cracking that could damage adjacent historic or other structure, and design means and construction methods to not exceed the thresholds. c) For projects where pile driving would be necessary for construction due to geological conditions, utilize quiet pile driving techniques such as predrilling the piles to the maximum feasible depth, where feasible. Predrilling pile holes will reduce the number of blows required to completely seat the pile and will concentrate the pile driving activity closer to the ground where pile driving noise can be shielded more effectively by a noise barrier/curtain. d) Restrict construction activities to permitted hours in accordance with local jurisdiction regulation. e) Properly maintain construction equipment and outfit construction equipment with the best available noise suppression devices (e.g., mufflers, silences, wraps). f) Prohibit idling of construction equipment for extended periods of time in the vicinity of sensitive receptors.	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
Impact NOISE-3: For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels.	*SCAG Mitigation Measures* See **SMM NOISE-1.** *Project Level Mitigation Measures* See **PMM NOISE-1.**	Significant and unavoidable
POPULATION AND HOUSING		
Impact POP-1: Induce substantial unplanned population growth to areas of the region either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., by extending roads and other infrastructure)	*SCAG Mitigation Measures* **SMM-POP-1:** SCAG shall promote the Sustainability Program which will provide technical assistance to local jurisdictions that support local planning and implementation of the Connect SoCal Plan. The program recognizes sustainable solutions to local growth challenges and will result in local plans that promote sustainability through the integration of transportation and land use. For more information please visit: http://sustain.scag.ca.gov/Documents/Sustainable%20Communities%20Program%20Guidelines.pdf. **SMM-POP-2:** SCAG shall provide technical assistance to local governments, transit agencies and developers within the region to build housing capacity to compete in the statewide Affordable Housing Sustainable Communities (AHSC) grants program. The AHSC program is one of the few state funding opportunities to address housing shortages within the state. For more information please visit: http://ahsc.scag.ca.gov/Pages/Home.aspx. **SMM-POP-3:** SCAG shall host summits that addresses the housing crisis and provides solutions to build more housing. Examples include the 2016 Housing Summit (http://www.scag.ca.gov/SiteAssets/HousingSummit/index.html) and the Eighth Annual Economic Summit (https://www.scag.ca.gov/calendar/Pages/8thEconomicSummit.aspx). **SMM-POP-4:** SCAG shall continue to produce the biennial Local Profile reports for all member jurisdictions in the SCAG region for the purpose of data and information sharing. The Local Profiles reports provide a variety of demographic, economic, education, housing, and transportation information that local jurisdictions can utilize like project and program planning. For more information about the most recently release 2019 Local Profiles, please visit: http://www.scag.ca.gov/DataAndTools/Pages/LocalProfiles.aspx.	Significant and unavoidable
Impact POP-2: Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere.	*SCAG Level Mitigation Measure* See **SMM-POP-4.** **SMM-POP5:** SCAG shall assist cities to identify funding and financing opportunities and potential partnerships for public infrastructure improvements for transit-oriented development and other smart growth projects. *Project Level Mitigation Measures* **PMM-POP-1:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce the displacement of existing housing, as applicable and feasible. Such measures may include the	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	following or other comparable measures identified by the Lead Agency: a) Evaluate alternate route alignments and transportation facilities that minimize the displacement of homes and businesses. Use an iterative design and impact analysis where impacts to homes or businesses are involved to minimize the potential of impacts on housing and displacement of people. b) Prioritize the use existing ROWs, wherever feasible. c) Develop a construction schedule that minimizes potential neighborhood deterioration from protracted waiting periods between right-of-way acquisition and construction. d) Review capacities of available urban infrastructure and augment capacities as needed to accommodate demand in locations where growth is desirable to the local lead Agency and encouraged by the SCS (primarily TPAs, where applicable). e) When General Plans and other local land use regulations are amended or updated, use the most recent growth projections and RHNA allocation plan.	
FIRE SERVICES		
Impact PSF-1: Result in substantial adverse physical impacts associated with the provision of new or physically altered fire protection facilities, need for new or physically altered fire protection facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios, response times, or other performance objectives.	*SCAG Mitigation Measures* See **SMM PSP-1** through **SMM PSP-4.** **SMM PSF-1:** SCAG shall assist planners, first responders, and recovery teams in a supporting role, in three key areas, before a major emergency and during the recovery period: • Provide a policy forum to help develop regional consensus and education on security policies and emergency responses. • Assist in expediting the planning and programming of transportation infrastructure repairs from major disasters. • Encourage integration of transportation security measures into transportation projects early in the project development process by leveraging SCAG's relevant plans, programs, and processes, including regional ITS architecture. An example includes SCAG's participation in the development of the Southern California Catastrophic Earthquake Preparedness Plan. **SMM PSF-2:** SCAG shall facilitate minimizing future impacts to fire protection services through information sharing regarding Fire-wise Land Management (data regarding fire-resistant vegetation, fire-resistant materials, locations where development is potentially hazardous in regard to wildfire, and management of brush and other fire risks in the immediate vicinity of development in areas with high fire threat) with county and city planning departments. *Project Mitigation Measures* See **PMM-PSP-1.**	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
POLICE SERVICES		
Impact PSP-1: Result in substantial adverse physical impacts associated with the provision of new or physically altered police facilities, need for new or physically altered police facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios, response times, or other performance objectives.	*SCAG Mitigation Measures* See **SMM PSF-1.** **SMM PSP-1:** SCAG shall facilitate minimizing future impacts to library services through cooperation, information sharing, and regional program development as part of SCAG's ongoing regional planning efforts, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to Map Gallery, GIS library, and GIS applications, and promote acceptable service ratios regarding library services. **SMM PSP-2:** SCAG shall help to enhance the region's ability to deter and respond to acts of terrorism, human-caused or natural disasters through regionally cooperative and collaborative strategies. SCAG shall work with local officials to develop regional consensus on regional transportation safety, security, and safety security policies. **SMM PSP-3:** SCAG shall help to enhance the region's ability to deter and respond to terrorist incidents, human-caused or natural disasters by strengthening relationship and coordination with transportation. This will be accomplished by the following: • SCAG shall work with local officials to develop regional consensus on regional transportation safety, security, and safety security policies. • SCAG shall encourage all SCAG elected officials are educated in NIMS. • SCAG shall work with partner agencies, federal, state and local jurisdictions to improve communications and interoperability and to find opportunities to leverage and effectively utilize transportation and public safety/security resources in support of this effort. **SMM PSP-4:** SCAG shall encourage and provide a forum for local jurisdictions to develop mutual aid agreements for essential government services during any incident recovery. *Project Mitigation Measures* **PMM PSP-1:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the State CEQA Guidelines, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects of constructing new emergency response facilities, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Coordinate with emergency response agencies to ensure that there are adequate governmental facilities to maintain acceptable service ratios, response times or other performance objectives for emergency response services and that any required additional construction of buildings is incorporated in to the project description. b) Where current levels of services at the project site are found to be inadequate, provide fair share contributions towards infrastructure improvements, as appropriate and applicable, to mitigate identified CEQA impacts. c) Project sponsors can and should develop traffic control plans for individual projects. Traffic control plans should include information on lane closures and the anticipated flow of traffic during the construction period. The basic objective of each traffic control plan (TCP) is to permit the contractor to work within the public right of way efficiently and effectively while	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	maintaining a safe, uniform flow of traffic. The construction work and the public traveling through the work zone in vehicles, bicycles or as pedestrians must be given equal consideration when developing a traffic control plan.	
SCHOOLS		
Impact PSS-1: Result in substantial adverse physical impacts associated with the provision of new or physically altered educational facilities, need for new or physically altered educational facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios, response times, or other performance objectives.	*SCAG Mitigation Measure* **SMM PSS-1:** SCAG shall facilitate minimizing future impacts to school services through cooperation, information sharing, and regional program development as part of SCAG's ongoing regional planning efforts, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to, Map Gallery, GIS library, and GIS applications, and direct technical assistance efforts to promote school planning efforts. *Project Mitigation Measure* **PMM PSS-1:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the State CEQA Guidelines, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects of constructing new or physically altered school facilities, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Where construction or expansion of school facilities is required to meet public school service ratios, require school district fees, as applicable.	Significant and unavoidable
LIBRARY SERVICES		
Impact PSL-1: Result in substantial adverse physical impacts associated with the provision of new or physically altered library facilities, need for new or physically altered library facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios, response times, or other performance objectives.	*SCAG Mitigation Measures* **SMM PSL-1** SCAG shall facilitate minimizing future impacts to library services through cooperation, information sharing, and regional program development as part of SCAG's ongoing regional planning efforts, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to Map Gallery, GIS library, and GIS applications, and promote acceptable service ratios regarding library services. *Project Mitigation Measure* **PMM PSL-1:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the State CEQA Guidelines, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects of construction of new or altered library facilities, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Where construction or expansion of library facilities is required to meet public library service ratios, require library fees, as appropriate and applicable, to mitigate identified CEQA impacts.	Significant and unavoidable
RECREATION		
Impact REC-1: Potential to increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.	*SCAG Mitigation Measure* See **SMM USWS-1.** **SMM REC-1:** SCAG shall continue the commitment to analyze public health outcomes as part of the Regional Transportation Plan/Sustainable Communities Strategy (Plan). As part of the public health analysis for the Plan, SCAG shall continue to analyze resident access to parks and recreational facilities from	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	a county level to help local jurisdictions to improve resident access to parks. SCAG shall communicate the impacts of the Plan through its Public Health Working group, and continue to support policy changes at the city and county level through educational programs. *Project Level Mitigation Measures* **PMM REC-1:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects on the use of existing neighborhood and regional parks or other recreational facilities, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Prior to the issuance of permits, where projects require the construction or expansion of recreational facilities or the payment of equivalent Quimby fees, consider increasing the accessibility to natural areas and lands for outdoor recreation from the proposed project area, in coordination with local and regional open space planning and/or responsible management agencies. b) Prior to the issuance of permits, where projects require the construction or expansion of recreational facilities or the payment of equivalent Quimby fees, encourage patterns of urban development and land use which reduce costs on infrastructure and make better use of existing facilities, using strategies such as: i. Increasing the accessibility to natural areas for outdoor recreation ii. Utilizing "green" development techniques iii. Promoting water-efficient land use and development iv. Encouraging multiple uses, such as the joint use of schools v. Including trail systems and trail segments in General Plan recreation standards	
Impact REC-2: Result in substantial adverse physical impacts associated with the provision of new or physically altered park facilities, need for new or physically altered park facilities, the construction of which could cause significant environmental impacts in order to maintain acceptable service ratios, or other performance objectives. Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.	*SCAG Mitigation Measure* See **SMM REC-1.** *Project Level Mitigation Measures* See **PMM REC-1, PMM AQ-2,** and **PMM NOISE-1.**	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
TRANSPORTATION, TRAFFIC, AND SAFETY		
Impact TRA-1: Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities.	No mitigation is required	Less than significant
Impact TRA-2: Conflict or be inconsistent with *CEQA Guidelines* section 15064.3(b).	*SCAG Mitigation Measures* **SMM TRA-1:** SCAG shall facilitate minimizing VMT and related vehicular delay by minimizing impacts to circulation and access, improve mobility, and encourage transit and Active Transportation via workshops (i.e., Mobility 21 workshop and Regional Transportation Workgroups) and web-based planning tools for local governments, forums with policy makers, and County Transportation Planning Agencies, member cities, and state partners. **SMM TRA-2:** SCAG shall identify further reduction in VMT, and fuel consumption that could be obtained through land-use strategies, additional car-sharing programs with linkage to public transportation, additional vanpools, additional bicycle sharing and parking programs, and implementation of a universal employee transit access pass (TAP) program. **SMM TRA-3:** SCAG shall initiate and facilitate an SB 743 implementation program. The grant-funded project, co-sponsored by SCAG and LADOT, seeks to provide technical and mitigation strategy development guidance to local jurisdictions in the six-county SCAG region to facilitate implementation of the VMT-based CEQA transportation impact analysis provisions of SB 743. This coordinated program of technical guidance, evaluation of options, and cooperative engagement with local communities will serve to smooth the transition to the new VMT-reducing development paradigm, helping to ensure a successful region-wide implementation of SB 743 and attainment of the associated GHG reduction goals. Some of the primary features of the scope of work include: • Evaluate the feasibility of various alternative VMT mitigation options, including local and regional VMT exchange and banking programs. • Establish CEQA nexus to reduce VMT through a VMT mitigation exchange or banking program alternative. • Substantiate the legal basis of a VMT exchange program for satisfying CEQA mitigation requirements. • Collaborate with other communities and jurisdictions to reduce VMT through implementation of a VMT mitigation exchange or bank program. • Improve the dissemination of transportation project VMT mitigation options. • Support a variety of TDM strategies for Transportation Management Organization (TMO) membership agencies. • Provide guidance to facilitate establishment of VMT mitigation exchange or bank programs throughout the region and state **SMM TRA-4:** SCAG shall continue to analyze and develop potential implementation strategies for a regional, market-based system to price or charge for auto trips during peak hours. **SMM TRA-5:** SCAG shall develop a vanpool program for SCAG employees' commute trips.	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	SMM TRA-6: SCAG shall encourage new developments to incorporate both local and regional transit measures into the project design that promote the use of alternative modes of transportation. *Project Level Mitigation Measures* **PMM-TRA-1:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to transportation-related impacts. Such measures may include the following or other comparable measures identified by the Lead Agency: • Transportation demand management (TDM) strategies should be incorporated into individual land use and transportation projects and plans, as part of the planning process. Local agencies should incorporate strategies identified in the Federal Highway Administration's publication: Integrating Demand Management into the Transportation Planning Process: A Desk Reference (August 2012) into the planning process (FHWA 2012). For example, the following strategies may be included to encourage use of transit and non-motorized modes of transportation and reduce vehicle miles traveled on the region's roadways: – include TDM mitigation requirements for new developments; – incorporate supporting infrastructure for non-motorized modes, such as, bike lanes, secure bike parking, sidewalks, and crosswalks; – provide incentives to use alternative modes and reduce driving, such as, universal transit passes, road and parking pricing; – implement parking management programs, such as parking cash-out, priority parking for carpools and vanpools; – develop TDM-specific performance measures to evaluate project-specific and system-wide performance; – incorporate TDM performance measures in the decision-making process for identifying transportation investments; – implement data collection programs for TDM to determine the effectiveness of certain strategies and to measure success over time; and – set aside funding for TDM initiatives. – The increase in per capita VMT on facilities experiencing LOS F represents a significant impact compared to existing conditions. To assess whether implementation of these specific mitigation strategies would result in measurable traffic congestion reductions, implementing actions may need to be further refined within the overall parameters of the proposed Plan and matched to local conditions in any subsequent project-level environmental analysis.	
Impact TRA-3: Substantially increase hazards due to geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).	No mitigation is required	Less than significant

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
Impact TR-4: Result in inadequate emergency access. **Impact WF-1:** Substantially impair an adopted emergency response plan or emergency evacuation plan.	*SCAG Mitigation Measures* **SMM TRA-7:** SCAG shall, in cooperation with local and state agencies, identify critical infrastructure needs necessary for: a) emergency responders to enter the region, b) evacuation of affected facilities, and c) restoration of utilities. In addition, SCAG shall establish transportation infrastructure practices that promote and enhance security. **SMM TRA-8:** SCAG shall provide the means for collaboration in planning, communication, and information sharing before, during, or after a regional emergency. This will be accomplished by the following: • SCAG shall develop and incorporate strategies and actions pertaining to response and prevention of security incidents and events as part of the on-going regional planning activities. • SCAG shall offer a regional repository of GIS data for use by local agencies in emergency planning, and response, in a standardized format. • SCAG shall enter into mutual aid agreements with other MPOs (as feasible) to provide this data, in coordination with the California OES in the event that an event disrupts SCAG's ability to function. *Project Level Mitigation Measures* **PMM TRA-2:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects which may substantially impair implementation of an adopted emergency response plan or emergency evacuation plan, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: • Prior to construction, project implementation agencies can and should ensure that all necessary local and state road and railroad encroachment permits are obtained. The project implementation agency can and should also comply with all applicable conditions of approval. As deemed necessary by the governing jurisdiction, the road encroachment permits may require the contractor to prepare a traffic control plan in accordance with professional engineering standards prior to construction. Traffic control plans can and should include the following requirements: – Identification of all roadway locations where special construction techniques (e.g., directional drilling or night construction) would be used to minimize impacts to traffic flow. – Development of circulation and detour plans to minimize impacts to local street circulation. This may include the use of signing and flagging to guide vehicles through and/or around the construction zone. – Scheduling of truck trips outside of peak morning and evening commute hours. – Limiting of lane closures during peak hours to the extent possible. – Usage of haul routes minimizing truck traffic on local roadways to the extent possible. – Inclusion of detours for bicycles and pedestrians in all areas potentially affected by project construction. – Installation of traffic control devices as specified in the California Department of	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	Transportation Manual of Traffic Controls for Construction and Maintenance Work Zones. – Development and implementation of access plans for highly sensitive land uses such as police and fire stations, transit stations, hospitals, and schools. The access plans would be developed with the facility owner or administrator. To minimize disruption of emergency vehicle access, affected jurisdictions can and should be asked to identify detours for emergency vehicles, which will then be posted by the contractor. Notify in advance the facility owner or operator of the timing, location, and duration of construction activities and the locations of detours and lane closures. – Storage of construction materials only in designated areas. – Coordination with local transit agencies for temporary relocation of routes or bus stops in work zones, as necessary. – Ensure the rapid repair of transportation infrastructure in the event of an emergency through cooperation among public agencies and by identifying critical infrastructure needs necessary for: a) emergency responders to enter the region, b) evacuation of affected facilities, and c) restoration of utilities. – Enhance emergency preparedness awareness among public agencies and with the public at large.	
TRIBAL CULTURAL RESOURCES		
Impact TCR-1: Cause a substantial adverse change in the significance of a tribal cultural resource defined in Public Resources Code section 21074 that is: a) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or b) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1.	*SCAG Mitigation Measure* **SMM TCR-1:** Impacts to tribal cultural resources shall be minimized through cooperation, information sharing, and SCAG's ongoing regional planning efforts such as web-based planning tools for local governments including CA LOTS, and other GIS tools and data services, including, but not limiting to, Map Gallery, GIS library, and GIS applications; and direct technical assistance efforts such as Toolbox Tuesday series and sharing of associated online Training materials. SCAG shall consult with the Native American Heritage Commission, as well as Native American tribes, to identify opportunities for early and effective consultation to identify tribal cultural resources to avoid such resources wherever practicable and feasible and reduce or mitigate for conflicts in compatible land use to the maximum extent practicable. *Project Level Mitigation Measures* See **PMM CULT-1.** **PMM TCR-1:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects on tribal cultural resources. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Avoidance and preservation of the resources in place, including, but not limited to, planning and construction to avoid the resources and protect the cultural and natural context, or planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria b) Treating the resource with culturally appropriate dignity taking into account the tribal cultural	Significant and unavoidable

Significance Threshold and Project Impacts		Mitigation Measures	Residual Impact
		values and meaning of the resource, including, but not limited to, the following: protecting the cultural character and integrity of the resource; protecting the traditional use of the resource; and protecting the confidentiality of the resource; c) Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places; and protecting the resource.	
SOLID WASTE			
Impact USSW-1:	Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals	*SCAG Mitigation Measures* **SMM USSW-1:** During the planning, design, and project-level CEQA review process for individual development projects, SCAG shall coordinate with waste management agencies and the appropriate local and regional jurisdictions to facilitate the development of measures and to encourage diversion of solid waste such as recycling and composting programs, as needed. This includes discouraging siting of new landfills unless all other waste reduction and prevention actions have been fully explored to minimize impacts to neighborhoods. **SMM USSW-2:** SCAG shall coordinate with waste management agencies, and the appropriate local and regional jurisdictions, measures to facilitate and encourage diversion of solid waste such as recycling and composting programs. *Project Level Mitigation Measures* **PMM USSW-2:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce the generation of solid waste, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: Integrate green building measures consistent with CALGreen (California Building Code Title 24) into project design including, but not limited to the following: a) Reuse and minimization of construction and demolition (C&D) debris and diversion of C&D waste from landfills to recycling facilities. b) Inclusion of a waste management plan that promotes maximum C&D diversion. c) Source reduction through (1) use of materials that are more durable and easier to repair and maintain, (2) design to generate less scrap material through dimensional planning, (3) increased recycled content, (4) use of reclaimed materials, and (5) use of structural materials in a dual role as finish material (e.g., stained concrete flooring, unfinished ceilings, etc.). d) Reuse of existing structure and shell in renovation projects. e) Development of indoor recycling program and space. f) Discourage the siting of new landfills unless all other waste reduction and prevention actions have been fully explored. If landfill siting or expansion is necessary, site landfills with an adequate landfill-owned, undeveloped land buffer to minimize the potential adverse impacts of the landfill in neighboring communities. g) Discourage exporting of locally generated waste outside of the SCAG region during the construction and implementation of a project. Encourage disposal within the county where the	Significant and unavoidable
Impact USSW-2:	Comply with federal, state, and local management and reduction statutes and regulations related to solid waste.		

Significance Threshold and Project Impacts		Mitigation Measures	Residual Impact
		waste originates as much as possible. Promote green technologies for long-distance transport of waste (e.g., clean engines and clean locomotives or electric rail for waste-by-rail disposal systems) and consistency with SCAQMD and Connect SoCal policies can and should be required. h) Encourage waste reduction goals and practices and look for opportunities for voluntary actions to exceed the 80 percent waste diversion target. i) Encourage the development of local markets for waste prevention, reduction, and recycling practices by supporting recycled content and green procurement policies, as well as other waste prevention, reduction and recycling practices. j) Develop ordinances that promote waste prevention and recycling activities such as: requiring waste prevention and recycling efforts at all large events and venues; implementing recycled content procurement programs; and developing opportunities to divert food waste away from landfills and toward food banks and composting facilities. k) Develop and site composting, recycling, and conversion technology facilities that have minimum environmental and health impacts. l) Integrate reuse and recycling into residential industrial, institutional and commercial projects. m) Provide education and publicity about reducing waste and available recycling services. n) Implement or expand city or county-wide recycling and composting programs for residents and businesses. This could include extending the types of recycling services offered (e.g., to include food and green waste recycling) and providing public education and publicity about recycling services.	
WASTEWATER			
Impact USWW-1:	Require or result in the relocation or construction of new or expanded wastewater treatment or storm drainage facilities, the construction or relocation of which could cause significant environmental effects.	*SCAG Mitigation Measures* **SMM USWW-1:** SCAG shall work with local jurisdictions and wastewater agencies to encourage regional-scale planning for improved wastewater and stormwater management. Future impacts to wastewater and stormwater facilities shall be avoided to the extent practical and feasible through cooperative planning, information sharing, and comprehensive pollution control measure development within the SCAG region. This cooperative planning shall occur as part of current and existing coordination, an integral part of SCAG's ongoing regional planning efforts. *Project Level Mitigation Measures* See **PMM-HYD-1.** **PMM USWW-1:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects on utilities and service systems, particularly for construction of wastewater facilities, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: • During the design and CEQA review of individual future projects, implementing agencies and projects sponsors shall determine whether sufficient wastewater capacity exists for the	Significant and unavoidable

Significance Threshold and Project Impacts		Mitigation Measures	Residual Impact
		proposed projects. There CEQA determinations must ensure that the proposed development can be served by its existing or planned treatment capacity. If adequate capacity does not exist, project sponsors shall coordinate with the relevant service provider to ensure that adequate public services and utilities could accommodate the increased demand, and if not, infrastructure improvements for the appropriate public service or utility shall be identified in each project's CEQA documentation. The relevant public service provider or utility shall be responsible for undertaking project-level review as necessary to provide CEQA clearance for new facilities.	
Impact USWW-2:	Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments.	*SCAG Mitigation Measures* See **SMM UWW-1, SMM HYD-1** through **SMM HYD-3.** *Project Level Mitigation Measures* See **PMM UWW-1.**	Significant and unavoidable
WATER SUPPLY			
Impact USWS-1:	Require or result in the relocation or construction of new or expanded water facilities, the construction or relocation of which could cause significant environmental effects.	*SCAG Mitigation Measure* **SMM USWS-1:** SCAG shall coordinate with local agencies as part of SCAG's Sustainability Program regarding the implementation of Urban Greening, Greenbelts and Community Separator land use strategies. Primary features of land use strategies address the following: • Increased trail and greenway connectivity; • Improved water quality, groundwater recharge and watershed health; • Reduce urban runoff; • Expand the urban forest; • Provision of wildlife habitat and increased biodiversity; • Expand recreation opportunities and beautification; • Preserving agrarian economies; • Restore severed wildlife corridors. *Project Level Mitigation Measures* **PMM USSW-1:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to ensure sufficient water supplies, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Reduce exterior consumptive uses of water in public areas, and should promote reductions in private homes and businesses, by shifting to drought-tolerant native landscape plantings, using weather-based irrigation systems, educating other public agencies about water use, and installing related water pricing incentives. b) Promote the availability of drought-resistant landscaping options and provide information on where these can be purchased. Use of reclaimed water especially in median landscaping and	Significant and unavoidable

Significance Threshold and Project Impacts	Mitigation Measures	Residual Impact
	hillside landscaping can and should be implemented where feasible. c) Implement water conservation best practices such as low-flow toilets, water-efficient clothes washers, water system audits, and leak detection and repair. d) For projects located in an area with existing reclaimed water conveyance infrastructure and excess reclaimed water capacity, use reclaimed water for non- potable uses, especially landscape irrigation. For projects in a location planned for future reclaimed water service, projects should install dual plumbing systems in anticipation of future use. Large developments could treat wastewater onsite to tertiary standards and use it for non-potable uses onsite.	
Impact USWS-2: Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years.	*SCAG Mitigation Measure* See **SMM USSW-1.** *Project Level Mitigation Measures* See **PMM-USWS-1.**	Significant and unavoidable
WILDFIRE		
Impact WF-2: Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire. **Impact HAZ-7:** Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires.	*SCAG Mitigation Measures* **SMM WF-1:** SCAG shall facilitate minimizing future impacts to fire protection services through information sharing regarding Fire-wise Land Management (vegetation data, fire-resistant building materials, locations where development is vulnerable to wildfire, and best practices for safe land management) with county and city planning departments. Furthermore, SCAG shall examine wildfire risk management strategies in areas where at-risk critical electrical infrastructure is located based on CPUC and CAL FIRE maps. **SMM WF-2:** SCAG, in partnership with technical experts and stakeholders shall launch or continue existing initiatives to help local cities and counties to protect Southern California communities and economies from the disruption of wildfire occurrences. Initiatives could include but not be limited to seminars that review the risk of wildfire and approaches for preparation, including strengthening of infrastructure, emergency services, emergency evacuation plans and reviewing building safety codes. **SMM WF-3:** SCAG shall develop a regional resilience program and identify specific strategies to reduce vulnerabilities from natural disasters related to land based or atmospheric hazards, climate change, wildfire and other extreme weather events. *Project Level Mitigation Measures* **PMM WF-1:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to wildfire risk, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: a) Launch fire prevention education for local cities and counties such that local fire agencies, homeowners, as well as commercial and industrial businesses are aware of potential sources of fire ignition and the related procedures to curb or lessen any activities that might initiate fire ignition.	Significant and unavoidable

Significance Threshold and Project Impacts		Mitigation Measures	Residual Impact
		b) Ensure structures in high fire risk areas are built to current state and federal standards which serve to greatly increase the chances the structure will survive a wildfire and also allow for people to shelter-in-place. c) Improve road access for emergency response and evacuation so people can evacuate safely and timely when necessary. d) Improve, and educate regarding, local emergency communications and notifications with residents and businesses. e) Enforce defensible space regulations to keep overgrown and unmanaged vegetation, accumulations of trash and other flammable material away from structures. f) Provide public education about wildfire risk and fire prevention measures, and safety procedures and practices to allow for safe evacuation and/or options to shelter-in-place	
Impact WF-3:	Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risks or that may result in temporary or ongoing impacts to the environment.	*SCAG Mitigation Measures* See **SMM-WF-1, SMM WF-2, SMM AG-4,** and **SMM BIO-3.** *Project Mitigation Measures* See **PMM HAZ-4.** **PMM WF-2:** In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to wildfire risk, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency: a) New development or infrastructure activity within very high hazard severity zones or SRAs shall be required to: **1)** Submit a fire protection plan including the designation of fire watch staff; **2)** Maintain water and other fire suppression equipment designated solely for firefighting on site for any construction and maintenance activities; **3)** Locate construction and maintenance equipment in designated "safe areas" such that they do not discharge combustible materials; and **4)** Designate trained fire watch staff during project construction to reduce risk of fire hazards.	Significant and unavoidable
Impact WF-4:	Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope stability, or drainage changes.	*SCAG Mitigation Measures* See **SMM-WF-1, SMM WF-2, SMM HYD-3, SMM GEO-1** and **SMM GEO-2.** *Project Level Mitigation Measures* See **PMM WF-1, PMM WF-2PMM HYD-1,** and **PMM HAZ-4.**	Significant and unavoidable

1.0 INTRODUCTION

The Southern California Association of Governments (SCAG) prepared this Program Environmental Impact Report (PEIR), pursuant to the California Environmental Quality Act (CEQA), for the proposed Connect SoCal ("Plan").

SCAG's jurisdiction comprises a six-county region that includes the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura, as well as 191 cities. SCAG is the Metropolitan Planning Organization (MPO) for this region, designated pursuant to Title 23, United States Code (USC) 134(d)(1), and has the primary responsibility, through its Regional Council, for consideration of Connect SoCal for approval, and thus serves as the Lead Agency under CEQA. SCAG published a Notice of Preparation (NOP) for this PEIR, pursuant to Section 21080.4 and *CEQA Guidelines* Section 15082 and 15375 on January 23, 2019.[1] Based on the analysis undertaken in the PEIR for the 2016-2040 Regional Transportation Plan and Sustainable Communities Strategies (2016 RTP/SCS),[2] SCAG determined that it is appropriate to prepare a PEIR for Connect SoCal.

The Plan is a long-range regional transportation plan that provides a vision for regional transportation investments, integrated with land use strategies, over a 20-year period. The Plan includes a land use and transportation strategy element that is shaped by the vision, goals, guiding policies, and performance measures and by the changes that the region has been facing since the adoption of the 2016 RTP/SCS. Other major components of Connect SoCal include: a list of transportation projects; a description of programs and public participation process; a description of regional growth trends that identifies future needs for travel and goods movement; a financial plan that identifies the amount of funding that is reasonably expected to be available to build, operate, and maintain the region's surface transportation system through the forecast horizon year of 2045; and a strategic plan that provides a vision for regional improvements beyond committed, available, or reasonably available funding sources. As part of the Draft Plan, SCAG has utilized a bottom-up local input and envisioning process to form the basis for the policy growth forecast (PGF). Following the guiding principles approved by SCAG's Community, Economic, and Human Development Committee, the PGF was developed to serve as the foundation for the region's policy growth scenario and land use distribution patterns, which are incorporated as part of the SCS.

---

2 Southern California Association of Governments. January 23, 2019. Certified Connect SoCal Plan PEIR. Available at: http://scagrtpscs.net/Pages/Draft2016PEIR.aspx

Although not required to do so, local jurisdictions are encouraged by SCAG to consider the proposed actions and strategies provided in Chapter 4, Sustainable Communities Strategy, of the Plan including strategies addressing land use, the transportation network, Transportation Demand Management (TDM), Transportation Systems Management (TSM) and clean vehicle technology. More information about the Plan is set forth in **Chapter 2.0, Project Description**, of this PEIR.

This PEIR fulfills the requirements of CEQA by providing a region-wide assessment of the potential significant environmental effects of implementing the projects, strategies, policies, and programs included in the Plan. As specified in Section §15168 of the *State CEQA Guidelines*, a PEIR "may be prepared on a series of actions that can be characterized as one large project and are related either: (1) geographically, (2) as logical parts of the chain of contemplated actions, (3) in connection with issuance of rules, regulations, plans or other general criteria to govern the conduct of a continuing program, or (4) as individual activities carried out under the same authorizing statutory or regulatory authority and having generally similar environmental effects which can be mitigated in similar ways." A PEIR provides a regional consideration of cumulative effects, and includes land use policy alternatives and program-wide mitigation measures that are capable of avoiding, reducing, and compensating for the potentially significant impacts of the Plan.

This PEIR provides a first-tier, programmatic environmental analysis, for a long-range, regional-scale plan document that will support local agencies in the evaluation of subsequent projects (including planning projects, transportation projects and development projects), and facilitate avoidance, reduction, and minimization of direct and indirect impacts, growth-inducing impacts, and cumulative environmental impacts. That is, although individual transportation projects are primarily (conceptually) identified in the Plan, this PEIR analyzes potential environmental impacts of both transportation projects and land use development from a regional perspective and is programmatic in nature.

Lead agencies for individual projects are responsible for determining the appropriate level of environmental review for subsequent project-level evaluation of individual projects. Consistent with the provisions of Section §15050(a) of the *State CEQA Guidelines*, the determination of the appropriate second-tier level of environmental review will be determined by the lead agency with primary discretion and decision-making authority. Where a project involves only a federal action, there will be a federal lead agency under the National Environmental Policy Act (NEPA); where there is both a federal and state/local agency action there may be individual review under NEPA and CEQA or joint federal and state/local review.

Project- and site-specific planning and implementation undertaken by each implementing agency/project proponent will depend on a number of issues, including: policies, programs, and projects adopted at the

local level; restrictions on federal, state and local transportation funds; the results of feasibility studies for particular corridors; and further environmental review of projects.

1.1 SCAG REGION AND AUTHORITY

SCAG is one of 18 MPOs in the State of California and is comprised of the following counties: Los Angeles, Riverside, San Bernardino, Orange, Imperial and Ventura. To the north of the SCAG region are the counties of Kern and Inyo; to the east are the States of Nevada and Arizona; to the south is the County of San Diego as well as the U.S.-Mexico border; and to the west is the Pacific Ocean. The SCAG region also consists of 15 subregional entities that have been recognized by the Regional Council, SCAG's governing body, as partners in the regional policy planning process. There are 16 federally recognized tribal sovereign nations located within the SCAG region.

The total area of the SCAG region is approximately 38,000 square miles. The region includes the county with the largest land area in the nation, San Bernardino County, as well as the county with the highest population in the nation, Los Angeles County. The SCAG region is home to approximately 19 million people, or 49 percent of California's population, representing the largest and most diverse region in the country. The region is home to the two largest container ports in the Western Hemisphere (Los Angeles and Long Beach), and the world's fifth busiest airport system (Los Angeles World Airports).

In addition to the federal designation as an MPO, SCAG is designated under California state law as the Multicounty Designated Transportation Planning Agency and Council of Governments (COG) for the six-county region. Founded in 1965, SCAG is a Joint Powers Authority, established as a voluntary association of local governments and agencies.

SCAG serves as the regional forum for cooperative decision making by local government elected officials and its primary responsibilities in fulfillment of federal and state requirements include the development of the Plan; the Federal Transportation Improvement Program (FTIP); the annual Overall Work Program; and transportation-related portions of local air quality management plans. SCAG's other major functions include determining the regional transportation plans and programs are in conformity with state air quality plans; periodic preparation of a Regional Housing Needs Assessment (RHNA); and intergovernmental review of regionally significant projects. SCAG is just one part of a large body of governments and public organizations that collectively plan, construct, operate and maintain the region's transportation system. SCAG's work helps facilitate implementation, but the agency does not directly implement or construct projects.

The Regional Council is SCAG's governing body. It consists of 86 elected officials, representing cities, counties, county transportation commissions, transportation corridor agencies, tribal governments, and

air districts in the region. The Regional Council has general authority to conduct the affairs of SCAG and directs the actions of the agency throughout the year. Additionally, the Regional Council implements the policy direction provided at the annual General Assembly of the membership, acts upon policy recommendations from SCAG's standing policy committees and external agencies, and appoints standing or ad-hoc subcommittees to study specific programs or issues.

1.1.1 Regional Cooperation and Subregions

SCAG places great importance on local input in the regional planning process and, therefore, seeks feedback from local elected officials and their staff through the subregional organizations that have been recognized by the Regional Council as partners in the regional policy planning process. The subregional organizations represent various parts of the SCAG region that have identified themselves as having common interests and concerns. The subregions vary according to geographical size, number of local member jurisdictions, staffing, decision-making structure, and legal status.

SCAG provides opportunities to participate in regional planning through collaboration and participation in regional programs and dialogs. Responsible for regional policy direction and review, standing committees at SCAG include the Executive/Administration Committee, the Transportation Committee, the Community, Economic & Human Development Committee, the Energy & Environmental Committee, and Legislative/Communication & Membership Committee. In addition to the standing committees, there are various subcommittees, technical advisory committees, working groups, and task forces that report to the standing committees, while other groups are established on an ad hoc basis to assist with specific projects or address specific regional policy.

1.1.2 Regional Transportation Plan / Sustainable Communities Strategy

Regional Transportation Plan and Federal Transportation Improvement Plan

As a metropolitan planning organization – the largest in the nation – SCAG is responsible for developing long-range transportation plans and sustainability strategies for the region. The centerpiece of that planning work is the Regional Transportation Plan / Sustainable Communities Strategy (RTP/SCS) that contains both the federally required RTP and the state-required SCS (discussed below). The 2020–2045 RTP/SCS is referred to as Connect SoCal.

In accordance with federal and state transportation planning laws, SCAG is required to adopt and update a long-range RTP every four years. The RTP is used to guide the development of the Federal Transportation Improvement Plan (FTIP) as well as other transportation programming documents and plans. The RTP outlines the region's goals and policies for meeting current and future mobility needs,

providing a foundation for transportation decisions by local, regional, and state officials that are ultimately aimed at achieving a coordinated and balanced transportation system. The RTP must include, among other things: the identification of transportation facilities such as major roadways, transit, intermodal facilities and connectors that function as an integrated metropolitan system over at least a 20 year forecast period; a financial plan demonstrating how the RTP can be implemented with "reasonably available" resources and additional financial approaches; strategies to improve existing facilities and relieve vehicular congestion and maximize the safety and mobility of people and goods; and environmental mitigation activities.

Transportation investments in the SCAG region that receive funding for which federal approval is required must be consistent with the Plan and must be included in SCAG's FTIP when funded. The FTIP covers six years and is updated biennially on an even-year cycle. It represents the immediate, near-term commitments of the Plan. SCAG does not implement individual projects in the Plan, as these projects will be implemented by local and state jurisdictions, and other agencies. In order to continue receiving funding for which federal approval is required, the SCAG region must have an RTP with an approved transportation conformity determination in accordance with federal air quality requirements, approved by the federal government by June 2020. **Section 2.0, Project Description**, provides additional detail on Connect SoCal.

Moving Ahead for Progress in the 21st Century Act

With the passage of the 'Moving Ahead for Progress in the 21st Century' (MAP-21) federal transportation authorization legislation in 2012, transportation system performance planning and monitoring also became a federal mandate.[3] This commitment to a national performance management and reporting system was further solidified with the passage of the subsequent federal transportation authorization package (the 'FAST Act') in 2015. Starting with the 1998 Regional Transportation Plan, SCAG has been using quantitative performance measures to evaluate how well the RTP may achieve the regional goals established in the Plan.

Further, MAP-21 continues to require, as under prior planning law, that "a long-range transportation plan shall include a discussion of the types of potential environmental mitigation activities and potential areas to carry out these activities, including activities that may have the greatest potential to restore and maintain the environmental functions affected by the plan" (23 USC § 134(i)(2)(B)).[4] Consultation and

---

3 U.S. Department of Transportation. *MAP-21 – Moving Ahead for Progress in the 21st Century*. Available online at: https://www.fhwa.dot.gov/map21/, accessed August 23, 2019.

4 Federal Highway Administration. *Title 23, U.S.C.* Available online at: https://www.fhwa.dot.gov/map21/docs/title23usc.pdf, accessed August 23, 2019.

public outreach activities have been undertaken in conjunction with the Plan and PEIR development processes. SCAG is coordinating efforts to comply with MAP-21 planning requirements with efforts undertaken through the CEQA outreach process. As such, the Plan has placed emphasis on these planning requirements, including those that prescribe coordinated planning and consideration of environmental resources.

Section 65080 of the California Government Code

SCAG is also required to prepare an RTP pursuant to Section 65080 of the California Government Code. The state requirements largely mirror the federal requirements and require each transportation planning agency in urban areas to adopt and submit an updated RTP to the California Transportation Commission (CTC) and the California Department of Transportation (Caltrans) every four years. To ensure a degree of statewide consistency in the development of RTPs, the CTC under Government Code Section 14522 prepared RTP Guidelines. The adopted guidelines include a requirement for program level performance measures, which include objective criteria that reflect the goals and objectives of the RTP. In addition, the initial years of the plan must be consistent with the FTIP.[5]

Sustainable Communities and Climate Protection Act of 2008

State planning law further requires, pursuant to the Sustainable Communities and Climate Protection Act of 2008, Senate Bill (SB) 375 (Chapter 728, Statutes of 2008) that an RTP include an SCS component to reduce greenhouse gas (GHG) emissions from passenger vehicles (automobiles and light-duty trucks). SB 375 is part of California's overall strategy to reach GHG emissions reduction goals required by Assembly Bill (AB) 32, by promoting integrated transportation planning with the goal of creating more sustainable communities. [6]

Pursuant to SB 375, the SCS prepared by SCAG is required to meet reduction targets for greenhouse gas (GHG) emissions by 8 percent per capita by 2020 and 19 percent per capita by 2035 compared to 2005, as set by the California Air Resources Board (CARB). The most recent targets were established by CARB in October 2018.[7]

According to Section 65080(b)(2)(B) of the California Government Code, the SCS must:[8]

---

5 California Legislative Information. *Chapter 2.5 Transportation Planning and Programming [65080-65086.5].*

6 California Legislative Information. 2008. *Senate Bill No. 375, Chapter 728*.

7 California Air Resources Board. Available online at: https://ww2.arb.ca.gov/our-work/programs/sustainable-communities-program/regional-plan-targets

8 California Legislative Information. *Chapter 2.5 Transportation Planning and Programming [65080-65086.5].*

- Identify existing land use.
- Identify areas to accommodate long-term housing needs.
- Identify areas to accommodate an eight-year projection of regional housing needs.
- Identify transportation needs and the planned transportation network.
- Consider resource areas and farmland.
- Consider state housing goals and objectives.
- Set forth a forecasted growth and development pattern.
- Comply with federal law for developing an RTP.

The Plan outlines SCAG's plan for attaining the GHG emissions reductions targets set forth by CARB, by integrating the transportation network and land use strategies with forecasted land use pattern that responds to projected growth, housing needs and changing demographics, and transportation demands.

In addition, SCAG is required to submit to CARB the SCS (along with associated required modeling), developed as part of the Plan for the purpose of determining whether the GHG emissions reduction targets have been met. Furthermore, the Act specifically states that the SCS developed as part of the RTP cannot dictate local General Plan policies. Rather, the Act is intended to provide a regional policy foundation that local government may build upon if they so choose and generally includes the quantitative growth projections from each city and county in the region going forward. Qualifying projects that meet criteria established by SB 375 and are consistent with the SCS are eligible for streamlined environmental review under CEQA.[9]

SB 32 (Statutes of 2016, Chapter 249), extended the state's GHG reduction target under AB 32, requiring achievement of a 40 percent reduction from 1990 levels of GHG emissions by 2030, as initially directed by Executive Order B-30-15. In California's 2017 Climate Change Scoping Plan (2017 Scoping Plan), CARB, the state agency tasked with furthering the state toward its long-term GHG reduction targets, provides the framework for the state to achieve its 2030 target as mandated by SB 32. These statewide efforts extend to achieve the state's target of achieving an 80 percent reduction from 1990 levels by 2050 as established by Executive Order S-3-05. CARB identifies passenger vehicle-sourced GHGs as a sector where notable reductions are required, which can be partially achieved through implementation of the land use and transportation strategies in RTP/SCSs.

9 CEQA streamlining provisions are also available for eligible projects meeting the criteria established by Senate Bill 226, *CEQA Guidelines* Section 15183.3 (Streamlining for Infill Projects) and for eligible projects meeting the criteria established by Senate Bill 743 (Steinberg, 2013), Public Resources Code Section 21155.4 (Exemptions).

National Environmental Policy Act

Adoption of the Plan is solely at the discretion of SCAG's Regional Council and does not require approval by any federal agency, therefore it not subject to NEPA (Public Law 91-190).[10] However, SCAG recognizes that lead agencies that pursue construction and operation of the transportation projects that are included in the Plan may seek federal funding; federal permits; federal approvals; or authorization to cross over lands administered by an agency of the federal government that would constitute a federal action, thus triggering the procedural provisions of NEPA. Therefore, SCAG has chosen to include a statement of purpose and need (see **Chapter 2.0, Project Description**) to enable proponents of individual projects included in the Plan to use this PEIR in full or in a part to serve as a functional equivalent environmental review, as appropriate, for individual projects that may involve a subsequent federal action triggering the procedural provisions of NEPA. Activities that constitute a federal action, include but are not limited to use of federal funds, right-of-way permits on federal lands, federal leases, and discretionary permits issued by federal agencies. To the extent that the proposed action is adequately characterized, analyzed, and sufficient mitigation measures have been considered to avoid or reduce the anticipated adverse direct, indirect and cumulative effects of the proposed federal action.

Revisions to the State CEQA Guidelines

On December 28, 2018, the updated *CEQA Guidelines* were approved by the Office of Administrative Law. The revisions to the *CEQA Guidelines* apply to the CEQA process (*CEQA Guidelines*, § 15007, subd. (b).) The proposed updates include analyzing transportation impacts pursuant to Senate Bill 743, proposed updates to the analysis of greenhouse gas emissions, new checklist questions for wildfire and energy, and revised Section 15126.2(a) in response to the California Supreme Court's decision in *California Building Industry Association v. Bay Area Air Quality Management District* (2015) 62 Cal.4th 369.[11] For the purposes of this analysis, the Connect SoCal Plan PEIR utilizes the updated *CEQA Guidelines* Appendix G Checklist.

1.2 PURPOSE AND SCOPE OF THE ENVIRONMENTAL IMPACT REPORT

SCAG has prepared this PEIR to fulfill the basic purposes of CEQA,[12] which are:

- To disclose to the decision-makers and the public significant environmental effects of the proposed activities.

---

10 U.S. Fish and Wildlife Services. *The National Environmental Policy of 1969*. Available online at: https://www.fws.gov/r9esnepa/RelatedLegislativeAuthorities/nepa1969.PDF, accessed August 23, 2019.

11 Governor's Office of Planning and Research. *Current CEQA Guidelines Update*. Available online at: http://opr.ca.gov/ceqa/updates/guidelines/, accessed July 7, 2019.

12 *CEQA Guidelines* § 15002.

- To identify ways to avoid or reduce environmental damage.
- To prevent environmental damage by requiring implementation of feasible alternatives or mitigation measures.
- To disclose to the public reasons for agency approvals of projects with significant environmental effects.
- To foster interagency coordination in the review of projects.
- To enhance public participation in the planning process.

Although the PEIR neither controls nor anticipates the ultimate decision of approval on the Plan, SCAG (and other agencies that rely on this PEIR) must consider the information in this PEIR and make findings concerning each potentially significant impact, as identified.

1.2.1 Programmatic Level of Analysis

The focus of the environmental analysis in the PEIR is on regional-scale impacts (which are inherently cumulative impacts as the analysis of the Plan includes a multitude of potential individual projects in the region) of implementation of the Plan and the alternatives. The long-range planning horizon of more than 20 years necessitates that many of the projects included in the Plan (and the alternatives) are identified at the conceptual level. This document addresses environmental impacts to the level that they can be assessed without undue speculation (*CEQA Guidelines* § 15145).[13] This PEIR acknowledges this uncertainty and incorporates these realities into the methodology to evaluate the environmental effects of the Plan, given its long-term planning horizon.

The degree of specificity in an EIR corresponds to the degree of specificity of the underlying activity being evaluated (*CEQA Guidelines* §15146).[14] Also, the adequacy of an EIR is determined in terms of what is reasonably feasible, in light of factors such as the magnitude of the project at issue, the severity of its likely environmental impacts, and the geographic scope of the project (*CEQA Guidelines* §§15151,[15] 15204(a)[16]). The activity being evaluated in this PEIR is the long-term RTP including the SCS. This PEIR strives to provide as much quantitative detail as feasible regarding the regional environmental impacts of the Plan. Not all impacts can be feasibly and/or accurately quantitatively analyzed at a regional level and/or up to the year 2045.

---

13 CEQA. *Article 10. Considerations in Preparing EIRs and Negative Declarations*..

14 Ibid.

15 Ibid.

16 CEQA. *Article 13. Review and Evaluation of EIRs and Negative Declarations*.

The geographic scope, consisting of over 38,000 square miles, and complexity represented by the diverse needs of six counties, 15 subregional areas, 191 cities, and 16 federally recognized tribes[17] that comprise the SCAG region, that are addressed by the Plan, played an important role in determining the appropriate level of detail to include in this PEIR.

Potential significant environmental effects of the Plan were identified by employing multiple analytical methods, including 1) spatial analysis, 2) transportation, noise, land use and air quality modeling and 3) other quantitative, ordinal, and qualitative techniques. Spatial analysis using geographic information systems (GIS) was employed to evaluate the potential effects of the major transportation projects on resource categories such as land use and biological and water resources. Transportation, noise, and air quality simulation models were used to estimate the transportation, noise, and air quality impacts. Transportation projects, anticipated growth distribution pattern, and policies and strategies of the Plan and alternatives were incorporated into the modeling analysis and the socioeconomic projections.

1.2.2 Limitations on the Scope of Analysis

While this PEIR analyzes potential impacts from the Plan utilizing all available sources of data and models, SCAG recognizes that there are limitations on the scope of analysis for the PEIR. For example, assessing the effects of global climate change impacts from regional GHG emissions is well beyond the scale of any other types of impacts considered under CEQA, such as regional conditions relating to air basins, streams or watersheds, or localized conditions such as cultural and biological resources. The global consequences of regional GHG emissions are also dependent on a wide range of factors such as the willingness of federal, state, regional and local governments in the United States and worldwide to adopt or implement meaningful measures to reduce their own GHG emissions; the development and deployment of technologies that reduce GHG emissions; and the many factors that affect the pricing and availability of fuels that result in GHG emissions such as global conflict and taxes. On the other end of the CEQA analytical spectrum, many CEQA thresholds in most topical areas relate to localized environmental conditions and Plan impacts, such as:

- Aesthetics (e.g., degradation of existing visual character of the site and/or creation of new sources of light or glare that affect day or nighttime views)

- Air quality (e.g., localized air toxic pollutant effects from construction)

---

17 *Indian Entities Recognized by and Eligible to Receive Services from the United States Bureau of Indian Affairs*. Updated 02/01/2019. Available at: https://www.federalregister.gov/d/2019-00897, accessed September 13, 2019.

- Biological Resources (e.g., conflict with local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance)
- Cultural Resources (e.g., impacts to individual historical resources)
- Energy (e.g. inefficient use of energy)
- Geology and Soils (e.g., exacerbating, or making soil conditions more unstable)
- Hazards and Hazardous Materials (e.g., exacerbating existing hazards)
- Hydrology and Water quality (e.g., provide substantial additional sources of polluted runoff)
- Land use (e.g., conflict with adopted land use plans such as General Plans and zoning codes)
- Mineral Resources (e.g. loss of known mineral resources)
- Noise (e.g., cause a substantial permanent or temporary increase in ambient noise above preexisting levels)
- Population and Housing (e.g., induce substantial population growth in an area, or displace substantial numbers of people and/or housing units)
- Public Services (e.g., cause a need for new or physically altered physical facilities to maintain acceptable service ratios for recreational parks, schools, and other public services, the construction of which could cause impacts)
- Recreation (e.g., result in an increase in the use of existing neighborhood and regional parks resulting in a need for new parks, the construction of which could cause impacts)
- Transportation and Traffic (e.g., conflict with applicable plans or standards for roadway effective performance metrics or conflict with a congestion management plan designed to achieve effective traffic flow)
- Tribal Cultural Resources (e.g. cause substantial adverse change in the significance of a tribal cultural resources)
- Utilities and Service Systems (e.g., require the construction of facilities, the construction of which would cause significant impacts)
- Wildfire (e.g. expose people to wildfire risk)

These and other examples of CEQA thresholds are aimed at protecting the local environment in which projects occur. At the regional scale of the Plan and in this PEIR, it is difficult to identify with specificity any of these impacts. Nonetheless, each impact category is carefully analyzed in light of Plan components, both land use and transportation, to determine the potential for significance.

1.3 BASELINE FOR DETERMINING SIGNIFICANCE AND THRESHOLDS OF SIGNIFICANCE

The PEIR must identify significant impacts that would be expected to result from implementation of the Plan. Significant impacts are defined as a "substantial or potentially substantial, adverse change in the environment" (Public Resources Code § 21068).[18] Significant impacts must be determined by applying explicit significance criteria to compare the future Plan conditions to the existing environmental setting (*CEQA Guidelines* § 15126.2(a)).[19] The existing setting is described in detail in each resource section of Section 3.0 of this document, and represents the most recent, reliable, and representative data to describe current regional conditions at the time of publication of the NOP for the PEIR, January 23, 2019. In most instances, the most recent available data was for 2018 or 2019. For population, land use and related modeling analyses (air quality, transportation and noise), base year information is collected every four years as part of the Plan. The base year for the Plan is 2016. For purposes of the PEIR, 2019 data has been estimated based on an interpolation of 2016 to 2045 projections. Available data that differs from this generalized explanation and used to determine existing conditions is specified in each resource section in Section 3.0 of this document.

CEQA gives the lead agency the responsibility to determine whether an adverse environmental effect identified in an EIR should be classified as "significant" or "less than significant" (*CEQA Guidelines* §15064(b)). Under Section 15064(b), "the significance of an activity may vary with the setting" and, as a result, an inflexible definition of what constitutes a significant effect is not always possible.[20] The lead agency has discretion to set its own significance criteria, which requires the lead agency to make a policy judgment about how to distinguish impacts which are adverse, but significant, from impacts which are adverse, but not significant (*Eureka Citizens for Responsible Gov't v. City of Eureka* [2007] 147 Cal.App.4th 357). A lead agency may select a standard of significance based on its judgment about an appropriate standard of significance (*Sierra Club v. City of Orange* (2008) 163 Cal.App.4th 523, 541). The standards of significance used in an EIR may also rely upon policies adopted and implemented by the lead agency (*Mira Mar Mobile Community v. City of Oceanside* (2004) 119 Cal.App.4th 477). The criteria for determining

significance are included in each resource section in **Section 3.0, Environmental Impact Analysis and Mitigation Measures,** of this PEIR.

1.4 CONSIDERATION OF EFFECTS OF REGIONAL POPULATION GROWTH AND PATTERN OF GROWTH

It is important to emphasize that the urbanization in the SCAG region will increase substantially by 2045, with or without implementation of the Plan. The CEQA required environmental baseline of current conditions means that the impact assessment for many of the resource categories is cumulative in nature. Specifically, the analysis assumes all the changes in land use and transportation within the region are attributed to the Plan. This is due to the fact that at the regional scale, it is difficult to parse out the effects of the Plan as compared to effects that would occur without the Plan (although this information is provided in the alternatives analysis as well as some of the sections of the PEIR). Therefore, it is important to provide a meaningful perspective on the effects of implementing the Plan. As required by CEQA, **Section 3.0** of this document provides a direct comparison for each resource category between the expected future conditions with the Plan and the baseline conditions. The comparative analysis of the expected future conditions with the Plan and if no Plan were adopted (the No Project Alternative) is included in some resource analyses and in **Section 4.0, Alternatives**, of this PEIR.

Analysis of the growth distribution pattern in Section 3 (and alternate growth distribution patterns in Section 4) includes an analysis of the anticipated land use development necessary to accommodate the forecasted population, housing and employment growth. However, because locations, densities, orientation timing, and other site-sensitive factors related to development are not specified in the Plan, SCAG cannot reliably quantify the impacts from such anticipated development. In addition, a number of external factors (including energy and water efficiency requirements, air emission standards, etc.) affect the analyses. Without an understanding of how these parameters will change the analysis assumes conservative existing known factors. SCAG can therefore programmatically analyze impacts and provide mitigation measures to address them based on reasonable assumptions regarding transportation projects and growth and conservative assumptions regarding parameters that affect impacts.

1.5 CONNECT SOCAL PLAN AND ALTERNATIVES TO THE PLAN

When considering whether or not the range of alternatives to be evaluated in an EIR is adequate, several principles apply. The "discussion of alternatives need not be exhaustive," and the requirement to discuss alternatives is "subject to a construction of reasonableness" (*Residents Ad Hoc Stadium Committee v. Board*

of Trustees (1979) 89 Cal.App.3d 274, 286). "An EIR need not consider every conceivable alternative to a project" (*CEQA Guidelines* §15126.6(a)).[21]

Under CEQA, perfection is not the standard governing a lead agency's proposed range of project alternatives. Rather, in preparing an EIR, a lead agency must make an objective, good faith effort to provide information permitting a reasonable choice of alternatives that would feasibly attain most of the basic objectives of the project, while avoiding or substantially lessening the project's significant adverse environmental impacts (*California Oak Foundation v. Regents of University of California* (2010) 188 Cal.App. 4th 227, 275-276).

CEQA Guidelines Section 15126.6(d)[22] requires an EIR to include sufficient information about each alternative in order to allow meaningful evaluation, analysis, and comparison with the proposed project. They suggest the use of a matrix displaying each alternative's significant environmental effects to summarize the comparison (see Section 4.0). When a large-scale program contains multiple, interrelated objectives, an alternative that does not meet all of those objectives may be excluded from detailed analysis (see *In re Bay-Delta Programmatic Environmental Impact Report Coordinated Proceedings* (2008) 43 Cal. 4th 1143, 1162–1168). An EIR must discuss alternatives to a project in its entirety but is not required to discuss alternatives to each particular component of a project (see *California Oak Foundation v. Regents of University of California* (2010) 188 Cal.App. 4th 227, 276–277). CEQA does not require an EIR to consider multiple variations on the alternatives analyzed. "What is required is the production of information sufficient to permit a reasonable choice of alternatives so far as environmental aspects are concerned" (*Village Laguna of Laguna Beach, Inc. v. 21 Board of Supervisors of Orange County* (1982) 134 Cal.App.3d 1022).

The Plan and each alternative maintain a constant total for population, households, and jobs for the region in 2045. The year 2045 growth projections for each alternative differ only in the distribution of growth.

The following alternatives are described and analyzed in **Chapter 4.0, Alternatives**:

- *No Project Alternative*- The No Project Alternative is required by Section 15126.6(e)(2) of the CEQA Guidelines and assumes that the Plan would not be implemented. The No Project Alternative considers continued implementation of the goals and polices of the adopted 2016 RTP/SCS. The No Project Alternative includes only those transportation projects that are in the first two years of the

21 CEQA. *Article 9. Contents of Environmental Impact Reports*. Available online at: http://resources.ca.gov/ceqa/guidelines/art9.html, accessed August 23, 2019.

22 Ibid.

previously conforming FTIP (i.e., 2018). The growth scenario included in the No Project Alternative, and all alternatives, includes the same regional totals for population, housing and employment.

- *Existing Plans-Local Input Alternative* - The Existing Plans-Local Input Alternative incorporates jurisdictional general plans and land use information to reflect the Plan's population, household and employment growth estimates and land use development patterns in the region. This alternative includes policies and strategies in the 2016 RTP/SCS to the extent that they have been incorporated into local jurisdictional plans. This alternative does not include additional land use strategies described in the Plan that go beyond current local policy. This alternative includes projects planned by each County Transportation Commission (CTC).

- *Intensified Land Use Alternative* - The Intensified Land Use Alternative is based on the Plan's transportation network and strategies. This alternative analyzes more aggressive densities and land use patterns than included in the Accelerated Tomorrow Scenario. The land use pattern builds on the land use strategies as described in the Connect SoCal Plan and beyond. Specifically, it increases densities and intensifies land use patterns of the Plan, especially around HQTAs to maximize transit opportunities. The growth pattern associated with this alternative optimizes urban areas and suburban town centers, transit-oriented developments (TODs), HQTAs, livable corridors, and neighborhood mobility areas. It also includes a greater progressive job-housing distribution optimized for TODs and infill in HQTAs.

1.6 MITIGATION MEASURES

1.6.1 General Description and Legal Requirements

CEQA requires that SCAG identify all feasible mitigation measures in the PEIR that will avoid or substantially lessen the significant environmental effects of the project.[23,24,25]. CEQA, however, does not require a lead agency to undertake identified mitigation measures, even if those measures are necessary to address a project's significant environmental effects, if the agency finds that the measures "are within the responsibility and jurisdiction of another public agency and have been, or can and should be, adopted by that other agency"[26] *City of Marina v. Bd. of Trustees of the Calif. State Univ.* (2006) 39 Cal.4th 341, 366; see also *Smart Rail v. Exposition Metro Line Construction Authority* (2013) 57 Cal.4th 439). Under these circumstances, the lead agency may find that the measures "can and should" be implemented by the

23 California Legislative Information, *Chapter 1. Policy [21000-21006].*

24 California Legislative Information. *Chapter 2.6. General [21080-21098].*

25 CEQA. *Article 9. Contents of Environmental Impact Reports.*

26 California Legislative Information. *Chapter 2.6. General [21080-21098].*

other agency or agencies said to have exclusive responsibility/jurisdiction over the measures (*City of Marina*, 39 Cal.4th at 366). As the *CEQA Guidelines* explain, the "finding in subsection (a)(2) shall not be made if the agency making the finding has concurrent jurisdiction with another agency to deal with identified feasible mitigation measures or alternatives."[27]

Furthermore, SB 375 specifically provides that nothing in an SCS supersedes the land use authority of cities and counties, and that cities and counties are not required to change their land use policies and regulations, including their general plans, to be consistent with the SCS or an alternative planning strategy.[28] Moreover, cities and counties have plenary authority to regulate land use through their police powers granted by the California Constitution, art. XI, §7, and under several statutes, including the local planning law,[29] the zoning law,[30] and the Subdivision Map Act.[31] As such, SCAG has no concurrent authority/jurisdiction to implement mitigation related to land use plans and projects that implement the Plan. With respect to the transportation projects in the Plan, these projects are to be implemented by Caltrans, county transportation commissions, local transit agencies, and local governments (i.e., cities and counties), and not SCAG. SCAG also has no authority/jurisdiction to require these agencies to implement project-specific mitigation measures.

CEQA case law has also held that deferral of the specifics of mitigation is permissible where the lead agency commits itself to mitigation and, in the mitigation measure, either describes performance standards to be met in future mitigation or provides a menu of alternative mitigation measures to be selected from in the future (*California Native Plant Society v. City of Rancho Cordova* (2009) 172 Cal.App.4th 603 [the details of exactly how the required mitigation and its performance standards will be achieved can be deferred pending completion of a future study]; *Endangered Habitats League Inc. v. County of Orange* (2005) 131 Cal.App.4th 777, 793 [deferred mitigation acceptable when performance standards are included]; Riverwatch v. County of San Diego (1999) 76 Cal.App.4th 1428, 1448–1450 [a deferred approach may be appropriate where it is not reasonably practical or feasible to provide a more complete analysis before approval and the EIR otherwise provides adequate information of the project's impacts]; *Sacramento Old City Assn. v. City Council of Sacramento*, supra, 229 Cal.App.3d at 1028–1029 [deferral of

27 CEQA. *Article 7. EIR Process*.

28 California Legislative Information. *Public Resources Code – PRC, Division 13. Environmental Quality, Chapter 2.5. Definitions [21060-21074]*.

31 California Legislative Information. *Division 2 Subdivisions 66410-66499.38*.

agency's selection among several alternatives based on performance criteria was appropriate]).[32] *CEQA Guidelines* section 15126.4(a)(1)(B) codifies this concept:

> *"Formulation of mitigation should not be deferred until some future time. However, measures may specify performance standard which would mitigate the significant effect of the project and which may be accomplished in more than one specified way."*

Mitigation measures are subject to the same rules regarding level of detail appropriate to the EIR being prepared. In this case, the PEIR addresses a large-scale region with a variety of projects spread over more than 20 years. As such, this PEIR identifies program-wide measures for implementation by SCAG. In addition, the PEIR identifies project-level mitigation measures for lead agencies to consider, as applicable and feasible, in subsequent project-specific design, CEQA review, and decision-making processes. It is ultimately up to the lead agency to determine the appropriateness of the mitigation measure based on project-specific circumstances. As appropriate and authorized by the *CEQA Guidelines* and case law, the program-wide mitigation measures included in this PEIR are less detailed than those that would be part of a project EIR and the selection of detailed mitigation measures is properly deferred to future project-specific CEQA reviews.

The project-level mitigation measures identified by SCAG (or comparable measures) "can and should" be considered by lead agencies in project-specific environmental review documents as appropriate and feasible. This language mirrors *CEQA Guidelines* section 15091(a)(2), and it is assumed that each lead agency for specific projects would have the ability to impose and enforce these measures (i.e., that they can implement them). Lead agencies for specific projects are responsible for developing project specific mitigation measures and ensuring adherence to such mitigation measures.

While the PEIR strives to provide as much detail as possible in the mitigation measures, some flexibility must be maintained to present mitigation approaches for impacts occurring over a large geographic scope and caused by a wide variety of transportation and land use activities. CEQA case law provides that a first-tier EIR may contain generalized mitigation criteria (see, e.g., *Koster v. County of San Joaquin* (1996) 47 Cal.App.4th 29). In addition, in each resource area, the PEIR identifies mitigation measures which are performance standards-based, which lead, responsible, or trustee agencies "can and should" comply with in assessing and mitigating project-specific impacts. SCAG then identifies examples of project-level mitigation measures that may be required by lead agencies, to meet performance standards. Lead

---

32 Note that in litigation challenging SANDAG's adoption of its 2050 Regional Transportation Plan/Sustainable Communities Strategy, the California Court of Appeal found that "[a]n EIR may not defer the formulation of mitigation measures to a future time, but mitigation measures may specify performance standards which would mitigate the project's significant effects and may be accomplished in more than one specified way." *Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2014) 231 Cal. App. 4th 1056, 1089 (partially reversed on other grounds by *Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 3 Cal.5th 497).

agencies may also identify other comparable measures capable of reducing impacts below the specified threshold.

For projects proposing to streamline environmental review pursuant to SB 375, SB 743, or SB 226, or for projects otherwise tiering off this PEIR, the project-level mitigation measures described in this PEIR (or comparable measures) can and should be considered and implemented by lead agencies (and project sponsors) during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require lead agencies to adopt mitigation, and it is ultimately the responsibility of the lead agency to determine and adopt project-specific mitigation as appropriate and feasible for each project.

The performance standards-based mitigation measures used in this PEIR recognize the limits of SCAG's authority; distinguish between SCAG commitments and project-level responsibilities and authorities; optimize flexibility for project implementation; and facilitate CEQA streamlining and tiering where appropriate on a project-by-project basis determined by each lead agency.[33]

1.6.2 Transportation Project Mitigation

SCAG's role is to prioritize and facilitate transportation projects consistent with federal and state transportation planning law. For individual transportation projects included in the Plan, SCAG has no authority to approve or implement such projects. In general, individual transportation projects in the Plan will be implemented by Caltrans, CTCs, local transit agencies, local governments or other public agencies.[34] These agencies routinely implement the types of mitigation measures identified in this PEIR during project design, CEQA review, and/or project construction. The example measures directed at lead agencies included in this PEIR are intended to be permissive and not mandatory. This PEIR has made a preliminary determination that it is feasible to reduce impacts in many cases and that there is more than one specified way to accomplish this through mitigation. However, lead agencies retain the discretion to

---

[33] Note that compliance with existing regulations, such as the Uniform Building Code and California Building Code, is not necessarily considered mitigation because compliance is already required. However, such regulations do reduce environmental impacts and are identified herein where appropriate, to provide additional information on the how potential impacts are reduced. In some cases, as indicated in the PEIR, regulatory compliance is sufficient to reduce impacts to a level of less than significance. In other cases, mitigation is proposed to ensure and/or specify the means of compliance with regulations that lack specificity.

[34] In this document, lead agencies for transportation projects are also referred to as project-implementing agencies as they are responsible for carrying out (reviewing, approving, constructing, and/or operating) transportation projects included in the Project List (See **Appendix 2.0, Plan Project List**) to the Draft Plan. Individual projects that are anticipated to occur pursuant to the Plan consist of planning projects (general plans, specific plans, climate action plans, etc.), development projects including Transit Priority Projects (TPPs) and other similar projects, and transportation projects. Lead agencies for such projects are usually local governments and project sponsors are responsible for constructing and operating local development projects.

determine which mitigation measures are most applicable to each individual project and whether they are feasible under location-specific circumstances.

1.6.3 Land Use Planning and Development Project Mitigation

As discussed above, SCAG has no authority to approve or implement local land use projects resulting from land use strategies in the Plan. SB 375 specifically provides that nothing in SB 375 supersedes the land use authority of cities and counties. In addition, cities and counties are not required to change their current or future land use plans and policies, including general plans, to be consistent with an RTP/SCS (Government Code §65080(b)(2)(K)).[35] Generally, local governments are the lead agencies responsible for mitigation of the impacts of land use plans and development projects that implement the Plan, and SCAG has no concurrent authority to mitigate the impacts of land use plans and development projects. Local governments routinely implement the types of mitigation measures identified in this PEIR during project design, CEQA review, and/or project construction. This PEIR has made a preliminary determination it is feasible to meet reduce impacts with mitigation measures and that there are more than one specified way to accomplish this.

1.7 PUBLIC PARTICIPATION AND CONSULTATION FOR THE PLAN

The Plan was developed with input from the public in accordance with the adopted Public Participation Plan. SCAG recognizes the need for early engagement during the development of the RTP/SCS. For members of the public, SCAG conducted 28 open house workshops on the Plan between June and July 2019.[36] These goals of these events was to share the purpose of Connect SoCal, introduce and provide information on policies and strategies under consideration, describe the performance outcomes of the different policy choices and receive input from participants. Scenarios were developed to help facilitate discussion during the development of the Draft Plan and to evaluate how each scenario would perform in terms of meeting the goals and guiding policies of the Plan and other performance metrics. SCAG also broadened its participation activities in the development of the Plan to engage a more extensive group of stakeholders in its planning and programming processes. SCAG held five public workshops on environmental justice for the Plan.

The Draft Plan was released by the Regional Council for a 70-day public comment and review period, while the Draft PEIR will undergo a 45-day public comment and review period. SCAG plans to engage in additional public participation activities during the 70-day public review and comment period on the

---

35 California Legislative Information. *Public Resources Code – PRC, Division 13. Environmental Quality, Chapter 2.5. Definitions [21060-21074].*

36 Southern California Association of Governments, Public Participation and Consultation Report, November 2019

Draft Plan and the 45-day public review and comment period on the Draft PEIR. The public review and comment period for the Plan commenced on November 14, 2019 and will close on January 24, 2020. The public review and comment period will commence on December 9, 2019, and close on January 24, 2020. To help further inform local, state and federal agencies, and other interested agencies, organizations, and individuals ("Interested Parties") about the elements of the Draft Plan, SCAG has posted announcements and videos on its website, blog sites, and its social networking pages (Facebook, Twitter); prepared factsheets and other outreach materials in English, Spanish, Chinese, Korean and Vietnamese; and placed ads and public announcements in 12 newspapers, including the ethnic press.

During public review and comment period for the Draft Plan, SCAG will hold public workshops related to the Plan and a separate workshop on the PEIR. Although the informational workshops will be targeted towards public officials and agency representatives, they will be open to the public, and time will be allowed for public comment. SCAG will also conduct additional outreach activities, as appropriate, to the business community, ethnic groups, Native American tribes, and other stakeholders during the public review period, as needed.

With the release of the Draft Plan, SCAG will make available the interactive Plan website that provides for easy navigation through the various sections of the Plan and allows visitors to submit comments through the online form. In addition to the online forum, SCAG will continue to accept public input through mailings, and at public workshops.

Comments received during the public review period of the Draft Plan will be considered and included along with SCAG's responses to comments in the Final Plan document.

1.8 PUBLIC PARTICIPATION AND CONSULTATION FOR THE PEIR

Pursuant to Public Resources Code Section § 21080.4 and *CEQA Guidelines* §§ 15082 and 15375, the NOP for the Draft Plan was released on January 23, 2019, and circulated for a 30-day comment period ending February 22, 2019. SCAG hosted two scoping meetings on February 13, 2019 at 3:00 pm to 5:00 pm, and at 6:30 pm to 8:00 pm. The meetings were convened in the SCAG's main office in Los Angeles, with videoconferencing available at SCAG regional offices in Imperial, Orange, Riverside, and San Bernardino Counties. Videoconferencing was made available at two additional locations in the Cities of Palm Desert (Coachella Valley Association of Governments) and Palmdale. SCAG received 25 comment letters in response to the NOP. The scope and content of the PEIR were developed in light of the comments received in response to the NOP.

The NOP was sent to the State Clearinghouse on January 23, 2019; posted with the County Clerks for the six counties in the SCAG region; and distributed to various federal, state, regional and local government

agencies, and other interested agencies, organizations, and individuals. The NOP was made available on SCAG's website at https://www.connectsocal.org/Documents/PEIR/NOP-PEIR-ConnectSoCal.pdf. The NOP was published in 12 newspapers, including the Los Angeles Times, and additional newspapers that address the large geographic reach and diverse population within the SCAG region:

- Desert Sun
- Imperial Valley
- La Opinion
- Los Angeles Sentinel
- Los Angeles Times
- Nguoi Viet
- Press Enterprise
- San Bernardino County Sun
- The Korean Times
- The OC Register
- Ventura County Star
- World Journal (Chinese Daily News)

The NOP was circulated primarily using electronic mail to over 500 interested parties, including representatives of Native American tribes. The NOP was mailed directly to approximately 100 interested parties, including federal, state, regional and local agencies, organizations and major libraries in the region using the U.S. Postal Service certified mail service. The NOP was also posted at the following locations:

SCAG Main Office
900 Wilshire Boulevard, 17th Floor,
Los Angeles, CA 90017

SCAG Riverside County Regional Office
3403 10th Street, Suite 805
Riverside, CA 92501

SCAG Imperial County Regional Office
1503 N. Imperial Avenue, Suite 104
El Centro, CA 92243

SCAG San Bernardino County Regional Office
1170 West 3rd Street, Suite 140
San Bernardino, CA 92410

SCAG Orange County Regional Office
600 South Main Street, Suite 741
Orange, CA 92868

The NOP provided notification of the two public scoping meetings for interested parties to receive information on the Plan and the related CEQA process as well as providing an opportunity for the submittal of comments both by mail and electronically. **Appendix 1.0** of the PEIR includes a copy of the NOP and written comments received in responses to the NOP.

Written comments on this Draft PEIR should be transmitted during the 45-day public review and comment period (January 24, 5:00 p.m.) to the following address:

SCAG Main Office
Attn: Mr. Roland Ok
900 Wilshire Boulevard, 16th Floor
Los Angeles, CA 90017

Comments may also be submitted electronically to 2020PEIR@scag.ca.gov

Formal written responses will be prepared and incorporated into the Final PEIR for the Plan to address written comments submitted on the Draft PEIR.

Written comments provided by the interested parties will be evaluated. Written responses will be prepared for comments received during the comment period. Upon completion of the evaluation, a Final PEIR will be prepared and provided to the SCAG Regional Council for consideration for certification of compliance with CEQA, and for review and consideration as part of the decision-making process undertaken by the Regional Council for the Plan.

1.9 CEQA STREAMLINING

The CEQA process is often viewed as cumbersome and costly, particularly if the environmental reviews and project approvals are litigated. In order to minimize such delays and to streamline the CEQA environmental review process, the California Legislature signed into law, Senate Bill (SB) 375, SB 226, and SB 743. These laws provide for streamlined review of residential and mixed-use projects consistent with the SCS; modified review and analysis, through an expedited Sustainable Communities Environmental Assessment (SCEA), for Transit Priority Projects (TPPs) that are consistent with the SCS; and a complete CEQA exemption for TPPs that are consistent with the SCS and meet a specific list of other requirements. Infill and transit-oriented development projects at the local levels in particular, can proceed faster through the entitlement and environmental processes by relying on regional project CEQA approvals. Having a certified RTP/SCS PEIR allows for "tiering" for subsequent, individual projects. A regionally adopted EIR such as this PEIR, as a first-tier document, could lead to negative declarations (NDs),

mitigated negative declarations (MNDs), or even statutory or categorical exemptions for subsequent second-tier environmental documents.

1.9.1 Sustainability Communities and Climate Protection Act of 2008 (SB 375) (Steinberg, 2008)

The Sustainable Communities and Climate Protection Act of 2008 amends CEQA to add Chapter 4.2 Implementation of the Sustainable Communities Strategy, which allows a CEQA exemption for Sustainable Community Projects, as well as streamlined CEQA analysis for Transit Priority Projects (TPPs) and certain residential or mixed-use projects.[37]

The purpose of the SCS is to develop strategies to meet the GHG emission reduction targets for the region, and qualifying projects that are consistent with the SCS will help meet this goal. Furthermore, because the potential impacts of the SCS are analyzed in this PEIR, the qualifying projects may take advantage of the CEQA streamlining provisions contained in SB 375. The intent of the CEQA streamlining provisions is not to undercut or circumvent CEQA requirements, but rather to reduce documentation and redundancy and to provide an incentive to support residential and transportation projects that are consistent with a larger effort to reduce GHG emissions.

The following is a summary of the CEQA streamlining provisions in SB 375. For the purpose of determining consistency for CEQA streamlining, lead agencies such as local jurisdictions have the sole discretion in determining a local project's consistency with the Plan.

A Transit Priority Project (TPP) is eligible for four types of CEQA relief: (1) Sustainable Communities Project CEQA Exemption, (2) Sustainable Communities Environmental Assessment, (3) a streamlined EIR, or (4) traffic mitigation measures. Different types of CEQA relief are associated with different criteria that are to be met.

As a threshold matter, to qualify as a TPP, a project must be consistent with the general land use designation, density, building intensity and applicable policies in an SCS accepted by the State Air Resources Board. The TPP must also meet four standards:

- Be at least 50 percent residential use based on area.
- Contain at least 20 dwelling units/acre.
- Have a floor area ratio for the commercial portion of the project at 0.75, if the project contains between 26 percent and 50 percent nonresidential uses.

---

37 California Legislative Information. *Senate Bill No. 375*.

- Be within 0.5 mile of a major transit stop[38] or high-quality transit corridor[39] included in the RTP.

Sustainable Communities Project Exemption

The Sustainable Communities Project (SCP) Exemption is a TPP, which is consistent with the SCS and meets nine criteria for eligibility for use of the exemption:[40]

- The project and approved projects can be served by utilities, and project will pay applicable in-lieu or development fees.
- Does not include wildlife habitat of significant value or protected species.
- Is not contaminated (site is not on Cortese list).
- Site is subject to preliminary endangerment assessment regarding potential exposure to health hazards from nearby activities. Any hazards are to be mitigated to less than significant.
- Would not significantly affect an historic resource.
- The site is not subject to wildland fire hazard, unusually high risk of fire/explosion from materials on adjacent properties, health hazard, seismic risk, landslide, or flood plain.
- The site is not located on developed open space.
- The project would be 15 percent more efficient than Title 24, and landscaping would use 25 percent less water than the regional average household.

In addition, the project must meet seven additional parameters related to size, siting, and protection of affordable housing:

- The site is not more than 8 acres.
- The project does not contain more than 200 units.
- The project does not result in the net loss of affordable housing.

---

38 Defined as a site containing an existing rail transit station, a ferry terminal served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods.

39 Defined as a corridor with fixed route bus service with 15-minute service intervals during peak commute hours.

40 California Legislative Information. *Senate Bill No. 375*.

- No single level building that exceeds 75,000 square feet.
- Applicable mitigation, performance standards, criteria from prior EIRs will be incorporated in to the TPP.
- The project would not conflict with nearby operating industrial use.
- The project is located within 0.5 mile of rail transit station or ferry terminal included in RTP, or within 0.25 mile of a high-quality transit corridor.

The project must provide at least one of three specified community benefits:

- At least 20 percent of the housing will be for moderate income or 10 percent rented to low income, or not less than 5 percent rented to very low income, and developer provides commitment to ensure continued availability to these income groups for the period.
- Developer pays in-lieu fees pursuant to local ordinance to result in an equivalent number of units that would otherwise be required in a) above.
- Project provides public open space 5 acres/1,000 residents.

After a public hearing where a legislative body finds that a TPP meets all the requirements, a project can be declared to be an SCP and can be exempted from CEQA.

Sustainable Communities Environmental Assessment

A TPP that does not meet the Sustainable Communities Project Exemption may nevertheless qualify for a Sustainable Communities Environmental Assessment (SCEA) if the project incorporates all feasible mitigation measures, performance standards, or criteria set forth in prior applicable certified environmental impact reports (including the Plan PEIR) (Pub. Res. Code § 21155.2(b)).[41] An SCEA is comparable to a negative declaration since the lead agency must find that all potentially significant impacts of a project have been identified, adequately analyzed, and mitigated to a level of insignificance. However, unlike a negative declaration, the SCEA need not consider the cumulative effects of the project that have been adequately addressed and mitigated in prior EIRs. Also, growth-inducing impacts are not required to be referenced, described or addressed. Additionally, project specific or cumulative impacts from cars and light duty truck trips on global warming or the regional transportation network need not be referenced, described or discussed.

41 California Legislative Information. *Chapter 4.2. Implementation of the Sustainable Communities Strategy [21155-21155.4].*

The SCEA will be circulated for 30 days, comments will be considered, and then the SCEA may be approved after a public hearing provided impacts are mitigated. The SCEA will be reviewed under the substantial evidence standard, which means a court will uphold an agency's decision if there is substantial evidence in light of the whole record to support its action. This is different from the normal CEQA fair argument standard, which is less deferential and states that an EIR must be prepared when after examining the entire record, there is substantial evidence to support a fair argument that the project may have a significant effect on the environment. The substantial evidence standard makes it more difficult for a petitioner to challenge an SCEA.

Transit Priority Project Streamlined Environmental Impact Report

Instead of an SCEA, a lead agency may choose to perform a streamlined EIR. If, after conducting an Initial Study (IS), the lead agency determines that an EIR is required, it only need address potentially significant impacts. Where a cumulative effect has been adequately addressed and mitigated in a previous EIR (such as the Plan EIR), that cumulative effect shall not be treated as cumulatively considerable.

The EIR is not required to analyze off-site alternatives to the TPP or discuss a reduced residential density alternative to address the effects of car and light duty truck trips generated by the project. Furthermore, the EIR is not required to include an analysis of growth inducing impacts or any project specific or cumulative impacts from cars and light duty trucks trips generated by the project on global warming or the regional transportation network. The IS must identify any cumulative effects that have been adequately addressed and mitigated in prior applicable certified EIRs and these cumulative effects are not to be treated as cumulatively considerable in the EIR.

Traffic Mitigation Measures

After a public hearing, a legislative body or local jurisdiction may adopt traffic mitigation measures that apply to TPPs (such measures must be updated as necessary every five years), including requirements for the installation of traffic control improvements, street or road improvements, and contributions to road improvement or transit funds, transit passes for future residents, or other measures that will avoid or mitigate traffic impacts of TPPs. If such measures are adopted by a local jurisdiction, no additional traffic mitigation are required for TPPs (measures addressing public health and bicycle safety may still be imposed).

Other CEQA Streamlining within SB 375

SB 375 also provides for general CEQA streamlining for residential and mixed-use residential projects as well as TPPs. Pursuant to Section 21159.28 of the Public Resources Code, projects that meet the following requirements can be subject to streamlined CEQA review:[42]

- A residential or mixed-use residential project (or a TPP) consistent with the designation, density, building intensity, and applicable policies specified for the project area in an accepted SCS (a residential or mixed-use residential project is a project where at least 75 percent of the total building square footage of the project consists of residential use or a project that is a transit priority project).
- Incorporates the mitigation measures required by an applicable prior environmental document.
- If a project meets these requirements, any exemptions, negative declarations, mitigated negative declarations, SCEA, EIR or addenda prepared for the projects shall not be required to reference describe, or discuss two areas that are normally required:
  - Growth inducing impacts.
  - Any project specific or cumulative impacts from cars and light-duty truck trips generated by the project on global warming or the regional transportation network.

1.9.2 CEQA Streamlining for Infill Projects (SB 226) (Simitian, 2011)

The CEQA Streamlining for Infill Projects (SB 226) sets forth a streamlined review process for infill.[43] SB 226 defines "infill project" as a project that (a) consists of one or a combination of the following uses: residential, retail/commercial (where no more than one-half of the project area is used for parking), transit station, school and public office building; and (b) is located within an urban area, and is either on a site that has been previously developed, or on a vacant site where at least 75 percent of the perimeter of the site adjoins (or is separated only by an improved public right-of-way from) parcels that are developed with qualified urban uses.

SB 226 allows limited CEQA review for certain infill projects through a process that resembles "tiering" of EIRs under CEQA. Tiering refers to environmental review of sequential actions, where general matters and environmental effects are examined in a broad EIR for a decision such as adoption of a policy, plan, program, or ordinance, and subsequent narrower or site-specific EIRs are prepared that incorporate by

42 California Legislative Information. 2002. *Article 6. Special Review of Housing Projects [21159.20-21159.28].*

43 *Senate Bill No. 226*.

reference the prior EIR and concentrate on environmental effects that can be mitigated or that were not analyzed in the prior EIR. In such instances, the later narrow EIR "tiers" off the prior broad EIR.

SB 226 provides that if an EIR was certified for the enactment or amendment of a city or county general plan, community plan specific plan, or zoning code, CEQA review for approval of a qualifying SB 226 infill project is limited to (a) environmental effects that are specific to the project or project site and were not addressed as significant effects in the prior EIR, or (b) substantial new information showing that environmental effects will be more significant than described in the prior EIR. A lead agency's determination pursuant to new statutory provisions authorizing SB 226 limited CEQA review must be supported by substantial evidence.

Limited CEQA review under SB 226 is available for an infill project located within an MPO region if the project (a) is consistent with the general use designation, density, building intensity and applicable policies specified for the project area in the SCS, and (b) satisfies all applicable statewide performance standards contained in the Implementation Guidelines. However, SB 226 does not specify which agency is responsible for determining whether the project is consistent with relevant SCS policies. As stated above, SB 375 expressly states that an SCS does not regulate the use of land, and that nothing in an SCS shall be interpreted as superseding the exercise of the land use authority of cities and counties within the region (CA Gov't Code § 65080(b)(2)(K)).[44] Moreover, SB 375 does not require consistency between the SCS and city or county general plan, community plan, specific plan, or local zoning ordinance. As such, for purpose of determining consistency for CEQA streamlining, lead agencies such as local jurisdictions have the sole discretion in determining a local project's consistency with the 2020 RTP/SCS.

1.9.3 Transit-Oriented Infill Projects (SB 743) (Steinberg, 2013)

SB 743 (Steinberg) was signed into law by Governor Jerry Brown on September 27, 2013, and provides opportunities for CEQA streamlining to facilitate transit-oriented development (TOD), which is to update the *CEQA Guidelines* to include the vehicle miles traveled (VMT)–based transportation impact metric. Prior to SB 743, CEQA transportation impacts were assessed through "Level of Service" (LOS) analysis, which focused exclusively on motor vehicle delay. SB 743 seeks to encourage development of mixed-use, transit-oriented infill projects by: (1) establishing new CEQA exemptions for transit-oriented developments located in Transit Priority Areas that are consistent with an adopted Specific Plan; (2) eliminating the requirement to evaluate aesthetic and parking impacts in those targeted development

44 California Legislative Information. *Public Resources Code – PRC, Division 13. Environmental Quality, Chapter 2.5. Definitions [21060-21074].*

areas; and (3) directing the OPR to develop an alternative metric to evaluate transportation-related impacts under CEQA. [45]

SB 743 exempts from CEQA, residential, employment center, or mixed-use development projects, including any subdivision, or any zoning, change that meets all of the following criteria:

1) The project is proposed within a transit priority area.

2) The project is undertaken to implement and is consistent with a specific plan for which an environmental impact report has been certified.

3) The project is consistent with the general use designation, density, building intensity, and applicable policies specified for the project area in either a sustainable communities strategy or an alternative planning strategy accepted by the State Air Resources Board.[46]

The exemption cannot be applied if a project would cause new or worse significant environmental impacts compared to what was analyzed in the environmental impact report for the specific plan. In that case, supplemental environmental review must be prepared.

Furthermore, "[a]esthetic and parking impacts of a residential, mixed-use residential, or employment center project on an infill site within a transit priority area shall not be considered significant impacts on the environment."[47] However, the exemption for aesthetic impacts does not include impacts to historic or cultural resources. Local governments retain their ability to regulate a project's transportation, aesthetics, and parking impacts outside of the CEQA process pursuant to local design review ordinances or other discretionary powers.

A Transit Priority Area (TPA) is an area that is located within one-half mile of an existing or planned major transit stop. A "major transit stop" refers to a site containing an existing rail transit station or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods. To qualify as a TPA, a planned major transit stop needs to be scheduled for completion within the planning horizon included in the adopted FTIP or RTP. A TPA is a subset of the High Quality Transit Areas (HQTA) described in the Plan, excluding the one-half-mile buffer area along the high-quality transit corridors (which are corridors with fixed route bus service with service intervals no longer than 15 minutes during peak commute hours).

---

45 California Legislative Information. 2013. *Senate Bill No. 743*.

46 See Pub. Res. Code § 21155.4.

47 Pub. Res. Code § 21099(d).

For infill development, including TOD, SB 743 provides a rationale for the development of a new metric to evaluate CEQA transportation impacts, as the previous LOS practice focused only on motor vehicle delay, which often penalized infill and active transportation projects. SB 743 established that the new transportation impact analysis methodology should appropriately balance the needs of congestion management with statewide goals related to transit-oriented mixed-use infill development, promotion of public health through active transportation, and reduction of GHG emissions. These principles complement the goals and policies of the SCAG Plan outlined in Section 2.0, Project Description, of this PEIR.

While SB 743 did not include the substantive specifics of the new CEQA transportation impact analysis methodology, it directed the OPR to develop guidance for establishing an alternative metric for evaluating the transportation impact of projects located within TPAs to replace LOS analysis. The criteria provided by SB 743 for selecting an alternative methodology was that it must serve to promote reduction of GHG emissions, stimulate development of multimodal transportation networks, and encourage a diversity of land uses. OPR also provided the option to extend application of the alternative metric for evaluating CEQA transportation impacts to locations outside of TPAs.

The updated *CEQA Guidelines* were approved by the Office of Administrative Law and the California Natural Resources Agency on December 28, 2018.[48] The *CEQA Guidelines* update package included changes to the Guidelines section implementing Senate Bill 743 (§ 15064.3).[49] OPR has also developed a Technical Advisory on Evaluating Transportation Impacts in CEQA which contains OPR's technical recommendations regarding assessment of VMT, thresholds of significance, and mitigation measures.[50]

The revised *CEQA Guidelines* state that vehicle level of service (LOS) and similar measures related to delay shall not be used as the sole basis for determining the significance of transportation impacts, and that as of July 1, 2020, this requirement shall apply statewide, but that until that date, lead agencies may elect to rely on VMT rather than LOS to analyze transportation impacts. (Although CEQA was updated as of January 1, 2019 to specify that VMT is the most appropriate basis for determining significance of transportation impacts.[51]) It should be noted that SCAG has traditionally undertaken VMT analysis as this metric is more-appropriate for a regional-scale document. While LOS analysis is useful in determining the efficiency of local intersections, it is not a useful tool in determining the efficiency of an

51 *CEQA Guidelines* § 15064.3

entire system such as the RTP. For these reasons, VMT is the most appropriate tool to understand overall performance of the regional transportation network.

To aid in SB 743 implementation, the following state guidance has been published:

- Technical Advisory on Evaluating Transportation Impacts in CEQA;[52]
- The 2017 Scoping Plan-Identified VMT Reductions and Relationship to State Climate Goals;[53] and
- Local Development – Intergovernmental Review Program Interim Guidance, Implementing Caltrans Strategic Management Plan 2015-2020 Consistent with SB 743.[54]

Discussion of the Plan's relationship to these documents is provided in **Section 3.8 Greenhouse Gas Emissions** and **Section 3.17 Transportation, Traffic and Safety.**

1.9.4 Streamlining Greenhouse Gas Analyses

OPR has published guidance with respect to how to evaluate climate change as a whole, including analysis of transportation impacts (including consideration of SB 743) and how to evaluate different types of projects including transportation projects and land use plans, is provided in the following document:

- CEQA and Climate Change Advisory, Discussion Draft (OPR, December 2018).

This document summarizes relevant regulations and discusses different approaches (both quantitative and qualitative) to analyzing different types of projects. The document further discusses how the analysis of GHG for individual projects may be streamlined through the preparation of greenhouse gas emission reduction plans such as climate action plans. The document suggests that emissions from individual projects may best be analyzed and mitigated at the programmatic level in community or regional-level plans, policies, or measures focused on reduction of GHG emissions.[55]

1.9.5 Summary

As provided above, there are multiple streamlining options for local jurisdictions. SCAG's intent with this PEIR is to allow maximum flexibility and utility in the streamlining process. For these reasons, SCAG is

not proposing any specific means of streamlining from this PEIR. Rather, each jurisdiction can use the methods that best fit within their planning framework. As described in the mitigation measures section above, it is the intent of SCAG to allow project sponsors to use mitigation measures identified or comparable measures (as determined by the project sponsor/local jurisdiction). SCAG encourages project sponsors to streamline documents using any of the methods described above and to use this PEIR as a means to do so.

1.10 ORGANIZATION OF THE PEIR

This document is organized into seven chapters, plus an Executive Summary.

Executive Summary: The Executive Summary contains an introduction, project summary, and a summary of the expected environmental impacts resulting from implementation of the Plan and the measures recommended to mitigate those impacts. The summary also includes a comparison of the expected environmental effects of each alternative to the Plan, as well as the areas of controversy, including issues raised by agencies and the public. Additionally, the Executive Summary includes issues to be resolved, including the choice among alternatives, and whether or how to mitigate the significant effects.

Chapter 1.0: Introduction. This section provides an overall introduction to the PEIR, the CEQA process, and the PEIR analytical approach. It describes the SCAG region and authority, purpose and scope of the PEIR; the characterization of baseline conditions; summary of the environmental review and public outreach process; provisions for CEQA for streamlining opportunities; consideration of the potential subsequent, currently unspecified, review pursuant to NEPA, if applicable; acknowledgement of pending approved and potential changes to the regulatory framework that may affect environmental review at the second tier of analysis; and an overview of the contents of the PEIR.

Chapter 2.0: Project Description. Consistent with the provision of Section § 15124 of the *State CEQA Guidelines*, this section provides the location and boundaries of the Plan; states the plan's objectives; contains a general description of the technical, economic, and environmental characteristics of the Plan; and includes a statement briefly describing the intended uses of the PEIR. Although federal environmental review is not required, a discussion of purpose and need for the Plan is also included along with the CEQA-required project objectives.

Chapter 3.0: Environmental Setting, Impacts and Mitigation Measures. This section identifies the environmental setting for the Plan and provides a programmatic analysis of the Plan for the region. The following resource categories are analyzed in this section: Aesthetics; Agriculture and Forestry Resources; Air Quality; Biological Resources; Cultural Resources; Energy; Geology and Soils; Greenhouse Gas

Emissions; Hazards and Hazardous Materials; Hydrology and Water Quality, Land Use and Planning; Mineral Resources; Noise; Population/Housing; Public Services; Recreation; Transportation; Tribal Cultural Resources; Utilities and Service Systems; Wildfire and cumulative impacts. For each of these resource categories, the analysis addresses: Regulatory Framework, Existing Conditions, Methodology, Thresholds of Significance, Impact Analysis, Cumulative Impacts, Mitigation Measures, and Level of Significance after Mitigation. As required by CEQA, the determination of impacts is based on a comparison of the future Plan conditions to the existing conditions (*CEQA Guidelines* § 15126(a)). This section includes figures that geographically depict spatial and quantitative data.

Chapter 4.0: Alternatives. This section describes a range of reasonable alternatives to the Plan, which would feasibly attain most of the basic objectives of the Plan but would avoid or substantially lessen any of the significant effects of the Plan at a programmatic and region-wide level. It includes a comparison of the Plan to the No Project Alternative, the Intensified Land Use Alternative, and the Local Input Alternative. The Alternatives are evaluated and compared to the Plan for the resource categories evaluated in **Chapter 3.0**.

Chapter 5.0: Other CEQA Considerations. This section identifies the significant unavoidable environmental effects, significant irreversible environmental effects, growth inducing impacts, and irreversible damage from environmental accidents of the Plan.

Chapter 6.0: Persons and Sources Consulted. This section lists the contributors to the preparation of this PEIR and the reference material used.

Chapter 7.0: Glossary. This section includes the acronyms used in the document.

Appendices. The Draft PEIR appendices include:

- **Appendix 1.0:** Notice of Preparation and Comments on Notice of Preparation
- **Appendix 2.0:** Plan Project List
- **Appendix 3.3:** Health Risk Assessment Technical Report
- **Appendix 3.4:** Biological Resources Technical Report
- **Appendix 3.5:** Cultural Resources Technical Report
- **Appendix 3.7** Paleontological Resources Technical Report
- **Appendix 3.13:** Aviation Noise Technical Report

2.0 PROJECT DESCRIPTION

Consistent with the provisions of Section 15124 of the State California Environmental Quality Act (CEQA) Guidelines, this section provides information regarding the Program Environmental Impact Report (PEIR) for the 2020- 2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), the Connect SoCal Plan ("Connect SoCal" or "Plan"), including the Plan's location, objectives and characteristics. Connect SoCal has been prepared to comply with metropolitan planning laws, 23 U.S.C.A. Section 134 et seq. and California Government Code 65080 et seq., which require the preparation of a regional transportation plan that offers policy guidance for projects within SCAG's jurisdiction.

2.1 INTRODUCTION

Connect SoCal is a long-range comprehensive plan for the region's multi-modal transportation system. Preparing the Plan is one of SCAG's primary statutory responsibilities under federal and state law. A regional transportation plan (RTP) is the mechanism used in California by both Metropolitan Planning Organizations (MPOs) and Regional Transportation Planning Agencies (RTPA) to conduct long-range (at least 20-year) planning in their regions. SCAG must adopt an RTP and update it every four years, or more frequently, if the region is to receive federal and state transportation dollars for public transit, streets/roads, and bicycle and pedestrian improvements.

In 2008, California enacted the Sustainable Communities and Climate Protection Act, also known as Senate Bill 375 (Stats. 2012, Ch. 728) (SB 375), which requires MPOs to include a Sustainable Communities Strategy (SCS) element as part of their RTP updates, with the purpose of identifying policies and strategies to reduce per capita passenger vehicle-generated GHG emissions. The SCS is required to identify the general location of land uses, residential densities, and building intensities within the region; identify areas within the region sufficient to house all the population of the region; identify areas within the region sufficient to house an eight-year projection of the regional housing need; identify a transportation network to service the regional transportation needs; gather and consider the best practically available scientific information regarding resources areas and farmland in the region; consider the state housing goals; set forth a forecasted development pattern for the region; and allow the regional transportation plan to comply with the federal Clean Air Act (CAA) of 1970 (42 USC. § 7401 *et seq.*) (Gov. Code, § 65080, subd. (b)(F)(2)(B)), of which, when integrated with the transportation network, and other transportation measures and policies will reduce the GHG from automobiles and light duty trucks to achieve, if there is a reasonable way to do so, the GHG emission reduction targets approved by the California Air Resources Board (ARB). If the SCS does not achieve the GHG emission targets set by ARB,

an Alternative Planning Strategy (APS) must be developed to demonstrate how the targets could be achieved.

In 2012, SCAG adopted its first combined Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS), a long-range plan for transportation in the region that links air quality, land use, and transportation needs. The RTP/SCS was last updated in 2016. The proposed Plan updates the growth forecast, land use assumptions, and transportation investments that served as the foundation of both the 2012 and 2016 plans.

The Plan includes a growth forecast with population, household and employment growth anticipated to occur in the SCAG region by 2045; a transportation network including a list of transportation projects in the region; and a forecasted development pattern with land use and transportation strategies that the region could pursue over the Plan horizon. The Plan was developed to achieve targets for greenhouse (GHG) emissions reductions, consistent with SB 375 and other regional goals.

The Plan further identifies the purpose and goals, tracks trends and evaluates project performance, details financial assumptions and expenditures, and profiles key transportation investments. Please see the Draft Connect SoCal Plan and supplementary technical reports for full details, or visit SCAG's Connect SoCal Website located at: https://www.connectsocal.org/Pages/default.aspx

This section describes the regional setting, growth forecasts and regulatory framework that provide the context for the Plan. The background information is followed by a description of the Plan, including the Plan's purpose, objectives and key components.

2.2 REGIONAL LOCATION AND GENERAL SETTING

2.2.1 Regional Location

The SCAG region consists of six counties that includes Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura, and 191 cities (**Figure 2.0-1, SCAG Region**). The total area of the SCAG region is approximately 38,000 square miles. Additionally, the SCAG region consists of 15 sub-regional entities that have been recognized by the Regional Council, SCAG's governing body, as partners in the regional policy planning process (**Figure 2.0-2, SCAG Subregions**). The SCAG region is home to approximately 19 million people. This represents 5.8 percent of the 328 million people in the United States and 48 percent of California's population.[1] To the north of the SCAG region are the counties of Kern and Inyo; to the east is State of Nevada and State of Arizona; to the south is the U.S.-Mexico border; to the west and south is the

1 Connect SoCal Demographics & Growth Report, 2019

county of San Diego; and to the northwest is the Pacific Ocean. The region includes the county with the largest land area in the nation, San Bernardino County; as well as the county with the highest population in the nation, Los Angeles County.

Imperial County. Imperial County covers an area of 4,482 square miles. El Centro is the city with the highest population level in the county, with approximately 46,248 people. Overall, the county has 190,266 residents.[2]

Los Angeles County. Los Angeles County covers an area of 4,751 square miles. Los Angeles is the city with the highest population level in the county, with approximately 4,040,079 people. Overall, the county has 10,253,716 residents.[3]

Orange County. Orange County covers an area of 948 square miles. Anaheim is the city with the highest population level in the county, with approximately 359,339 people. Overall, the county has 3,222,498 residents.[4]

Riverside County. Riverside County covers an area of 7,303 square miles. Riverside is the city with the highest population level in the county, with approximately 328,101 people. Overall, the county has 2,440,124 residents.[5]

San Bernardino County. San Bernardino County covers an area of 20,105 square miles. San Bernardino is the city with the highest population level in the county, with approximately 219,233 people. Overall, the county has 2,192,203 residents.[6]

Ventura County. Ventura County covers an area of 2,208 square miles. Oxnard is the city with the highest population level in the county, with approximately 209,879 people. Overall, the county has 856,598 residents.[7]

7 SCAG 2019 Local Profile Ventura County https://www.scag.ca.gov/Documents/VenturaCountyLP.pdf

2.2.2 General Setting

Transportation Network

The region's transportation network comprises more than 9,000 miles of public transit, 5,000 miles of bikeways, 135,578 lane miles of roadways, and 94 miles of express lanes (see **Figure 2.0-3, Existing Transit Network, 2018; Figure 2.0-4, Existing Arterial System, 2016; Figure 2.0-5, Existing Regional Goods Movement System;** and **Figure 2.0-6, Major Airports in SCAG Region**). The Port of Los Angeles and Port of Long Beach are the largest container importers in the Western Hemisphere that contribute to our expansive goods movement system. The region's aviation system is one of the busiest in the world in terms of air passenger and cargo demand, with more than 110.2 million annual passengers and 3.14 million tons of cargo in 2017. Southern California features:

- 105 miles of heavy and light rail
- 534 miles of commuter rail (Metrolink)
- 9,000 miles of bus routes
- 5,075 miles of bikeways
- 135,578 total lane miles of roadways
- 94 miles of high occupancy toll (HOT) roads

Open Space and Natural Lands

The six counties within the SCAG region contain nearly 23 million acres of "open space" combined. These lands include the region's national forests, state parks, military installations, other public lands, and various private holdings. Much of the open space in the region has been left in its natural state, however many non-native species have transformed what was once native habitat. As of 2018, about half of California has been mapped and classified according to this standard; much of southern California has not yet been classified. Barriers to wildlife movement exist throughout the SCAG region, including large areas of urban development and multilane freeways that cut off regional movement for migratory and resident species alike. These barriers can affect all species from large mammals to small insects and can lead to significant degradation of ecosystem function and plant community composition.

A Habitat Conservation Plan (HCP) is a planning document required as part of an application for an incidental take permit. HCPs describe the anticipated effects of the proposed taking, how the impacts will be minimized and mitigated, and how the HCP is to be funded. A Natural Community Conservation Plan (NCCP) is defined by CDFW as a plan for the conservation of natural communities that identifies

and provides for the regional or area-wide protection and perpetuation of plants, animals, and their habitats. More than 20 million acres of open space within the SCAG region is currently protected under an HCP or NCCP, or will be protected by a future HCP or NCCP that is currently in its planning stages. Data from CDFW and USFWS show 27 plans with durations of 16–80 years providing conservation efforts nearly three million acres in the SCAG region. As a group, these plans provide protection for multiple species by conserving habitats, identifying locations for future mitigation efforts, providing conservation guidance and practices, and preserving important wildlife linkages.[8]

Housing

As of 2018, California ranks 49th of 50 states in the number of housing units per resident. With many strong indications, high demand for housing and short supply drives up rental and home prices throughout the state. Indeed, seven of the 10 most expensive housing markets in the United States are in California.

There are many contributors to the overall housing shortfall, such as zoning, costs and fees that prevent projects from being feasible, time delays, environmental litigation, community resistance to medium and high-density projects, and lack of local funding mechanisms. **Figure 2.0-7, Existing Land Use**, highlights SCAG's existing land use as of 2016. Additionally, population and employment growth in metropolitan areas in California has slowed in recent years because wages cannot compensate for the high cost of housing.

2.3 PROJECT BACKGROUND

The Plan was developed in accordance with applicable metropolitan planning requirements. The following discussion provides an overview of SCAG (responsible and lead agency) as well as the federal and state requirements associated with the preparation of an RTP and SCS.

Founded in 1965, SCAG is a federally designated Metropolitan Planning Organization (MPO) under Title 23, United States Code (USC) 134(d)(1),[9] for the six-county region. SCAG is designated under California state law as a Council of Governments (COG) and a Regional Transportation Planning Agency (RTPA) for the six-county region. SCAG is a Joint Powers Authority, established as a voluntary association of local governments and agencies.

---

8 SWCA Environmental Consultants, Biological Resources Report for the 2020-2045 RTP/SCS. October 2019

9 Federal Highway Administration. 2012. *Title 23, United States Code*. Available online at: https://www.fhwa.dot.gov/map21/docs/title23usc.pdf, accessed August 21, 2019.

As stated previously, SCAG develops long-range regional transportation plans including sustainable communities strategy and growth forecast components, regional transportation improvement programs, regional housing needs allocations (RHNA) and assists in the development of the South Coast Air Quality Management Plans. In 1992, SCAG expanded its governing body, the Executive Committee, to a 70-member Regional Council to help accommodate new responsibilities mandated by the federal and state governments, as well as to provide more broad-based representation of Southern California's cities and counties. With its expanded membership structure, SCAG created regional districts to provide for more diverse representation. The districts were formed with the intent to serve equal populations and communities of interest. Currently, the Regional Council consists of 86 members.

In addition to the six counties and 191 cities that make up SCAG's region, there are six County Transportation Commissions that hold the primary responsibility for programming and implementing transportation projects, programs and services in their respective counties. Additionally, SCAG Bylaws provide for representation of Native American tribes and Air Districts in the region on the Regional Council and Policy Committees.

2.3.1 Federal and State Requirements

Fixing America's Surface Transportation (FAST) and Moving Ahead for Progress in the 21st Century Act

Under the FAST (Fixing America's Surface Transportation [Public Law 114-94]) Act and MAP-21 (Moving Ahead for Progress in the 21st Century Act [Public Law 112-141]), the U.S. Department of Transportation (USDOT) requires that metropolitan planning organizations, such as SCAG, prepare long-range RTPs and update them every four years if they are in areas designated as "nonattainment" or "maintenance" for federal air quality standards. Prior to enactment of MAP-21, the primary federal requirements regarding RTPs were included in the metropolitan transportation planning rules—Title 23 CFR Part 450 and 49 CFR Part 613. The FAST Act and MAP-21 make a number of changes to the statutes that underpin these regulations. Key federal requirements for long-range plans include the following:

- RTPs must be developed through an open and inclusive process that ensures public input; seeks out and considers the needs of those traditionally under served by existing transportation systems; and consults with resource agencies to ensure potential problems are discovered early in the RTP planning process;

- RTPs must be developed for a period of not less than 20 years into the future; RTPs must reflect the most recent assumptions for population, travel, land use, congestion, employment, and economic activity;

- RTPs must have a financially constrained element, transportation revenue assumptions must be reasonable, and the long-range financial estimate must take into account construction-related inflation costs;

- RTPs must include a description of the performance measures and performance targets used in assessing the performance of the transportation system;

- RTPs must include a system performance report evaluating the condition and performance of the system with respect to performance targets adopted by the state that detail progress over time;

- RTPs may include multiple scenarios for consideration and evaluation relative to the state performance targets as well as locally developed measures;

- RTPs must conform to the applicable federal air quality plan, called the State Implementation Plan (SIP) for ozone and other pollutants for which an area is not in attainment; and

- RTPs must consider planning factors and strategies in the local context.

Regional Transportation Plan Requirements

An RTP outlines the region's goals and strategies for meeting current and future mobility needs, providing a foundation for transportation planning and funding decisions by local, regional, and state officials that are ultimately aimed at achieving a coordinated and balanced transportation system. In addition, an RTP identifies the region's transportation needs, sets forth actions, programs, and a plan of projects to address the needs consistent with adopted regional strategies and goals, and documents the financial resources needed to implement the RTP. The process for development of the RTP takes into account all modes of transportation, accompanied by a continuing, cooperative, and comprehensive planning approach that is performance driven and outcome-based, consistent with the provisions of MAP-21 and the FAST Act.

The RTP must also comply with Section 65080 of the California Government Code. The state requirements largely mirror the federal requirements and require each transportation-planning agency in urban areas to adopt and submit an updated RTP to the California Transportation Commission (CTC) and the California Department of Transportation (Caltrans) every four years. To ensure a degree of statewide consistency in the development of RTPs, the CTC, pursuant to Government Code Section 14522, adopted RTP Guidelines. The RTP Guidelines include a requirement for program-level performance measures, which include objective criteria that reflect the goals and objectives of the RTP. The RTP Guidelines are intended to assist MPOs with development of their RTPs to be consistent with

federal and state planning requirements. An RTP is used to guide the development of the Federal Transportation Improvement Program (FTIP), a federally mandated four-year program of all regionally important surface transportation projects and all projects that will receive federal funding, as well as other transportation programming documents and plans. Connect SoCal follows the 2017 RTP Guidelines, which were adopted on January 18, 2017.

Sustainable Communities Strategy Requirements

Pursuant to the Sustainable Communities and Climate Protection Act of 2008 (Senate Bill (SB 375), the SCS is a required component of the RTP. SB 375 directs the California Air Resources Board to set regional targets for reducing GHG emissions. The law establishes a "bottom up" approach to ensure that cities and counties are involved in the development of regional plans to achieve those targets. SB 375 requires that an MPO prepare and adopt an SCS that sets forth a forecasted regional development pattern that reduces GHG emissions associated with the land use and transportation network, measures, and policies. SB 375 is part of California's overall strategy to reach GHG emissions reduction goals as set forth by Assembly Bill (AB) 32, Senate Bill (SB) 32, and Executive Orders S-03-05 and B-30-15. According to Section 65080(b)(2)(B) of the California Government Code (CGC), the SCS must:

- Identify existing land uses;
- Identify areas to house long-term population growth;
- Identify areas to accommodate an eight-year projection of regional housing needs;
- Identify transportation needs and the planned transportation network;
- Consider resource areas and farmland;
- Consider state housing goals and objectives;
- Set forth an integrated forecasted development pattern and transportation network that will reduce GHG emissions; and
- Comply with the federal Clean Air Act requirements for developing an RTP.

2.4 PURPOSE AND NEED FOR ACTION

Transportation projects for which federal approval is required must be listed in the RTP/SCS and FTIP. Such projects must comply with National Environmental Policy Act (NEPA), which requires the preparation of a statement of purpose and need in conjunction with environmental documents.[10]

10 Electronic Code of Federal Regulations. 2019. *§1502.13 Purpose and need.*

Although adoption of the Plan is not subject to NEPA, SCAG has included this statement of purpose and need to enable project proponents to discuss the purpose and need for their individual projects relative to the Plan.

The SCAG Regional Council has the responsibility for consideration of the Plan with substantial input from its member jurisdictions, agencies, and stakeholders. Since the Plan includes transportation improvements that may involve a federal action (such as the use of federal funds, right-of-way, permits and or leases), the requirement for environmental review under NEPA as set forth in 40 CFR Section 1502.13 may be triggered at the time that project-level design is initiated. Therefore, where determined appropriate by a Lead Agency undertaking a site or project-specific federal action evaluated in this PEIR at the programmatic-level of detail, this statement of purpose and need may be incorporated by reference in site- or project-specific NEPA documents as provided in 40 CFR § 1502.21.[11]

The purpose of the Plan is to provide a clear, long-term vision of the regional transportation goals, policies, objectives, strategies, and investments along with the land use strategies for the SCAG region while at the same time providing strategies to meet greenhouse gas emissions reduction and air quality conformity requirements. The necessity for the Plan is driven by the need to plan for the region's changing socioeconomic, transportation, financial, technological, and environmental conditions. The Plan is also necessary to plan for improvements to the aging regional transportation system and to preserve its long-term viability in light of projected demographic growth.

2.5 PROJECT DESCRIPTION

The Connect SoCal Plan is an update to SCAG's 2016 RTP/SCS, which had been adopted by SCAG's Regional Council on April 7, 2016, and last amended in September 2018. Building upon the progress made since the 2016 RTP/SCS, Connect SoCal is a long-range visioning plan for the six-county SCAG region, taking into account its transportation needs, existing and projected land use patterns, and job growth. It highlights the existing land use and transportation conditions throughout the SCAG region, and forecasts how it will meet the region's transportation needs between 2020 and 2045. The Plan identifies and prioritizes expenditures of this anticipated funding for transportation projects of all transportation modes: highways, streets and roads, transit, rail, bicycle and pedestrian, as well as aviation ground access. It also includes a set of visions, goals, objectives, policies and performance measures developed through public and stakeholder outreach sessions across SCAG's region.

More specifically, Connect SoCal includes strategies for accommodating projected population, household and employment growth in the SCAG region by 2045 as well as a transportation investment strategy for

11 Electronic Code of Federal Regulations. 2019. *§1502.21 Incorporation by reference*.

the region. The Plan details how the SCAG region can achieve several outcomes essential to the success of the region's long-range transportation and land use goals. The Plan:

- Describes where and how the region can accommodate a 23 percent increase in projected households and 16 percent increase in jobs between 2020 and 2045;
- Details a regional transportation investment given $633.9 billion in expected revenues from federal, state, regional and local sources over the next 25 years; and
- Complies with SB 375, the state's SCS law, which integrates land use and transportation planning and mandates both a reduction in greenhouse gas emissions from passenger vehicles (19% reduction for the SCAG region) and the provision of adequate housing for the region's 25-year projected population growth.

The Plan is constrained by expected transportation revenues, and identifies transportation and land use strategies to accommodate projected population, household and employment growth and improve the quality of life for existing and future residents.

2.5.1 Local Input and Public Outreach

Local Input Process: The most recent RTP/SCS for the SCAG region was adopted by SCAG in April 2016. State law requires that it is updated every four years. Connect SoCal is an update that builds upon the growth patterns and strategies developed in the 2016 RTP/SCS but with updated planning assumptions that incorporate key economic, demographic and financial trends from the last four years.

SCAG developed a "Bottom-Up Local Input and Envisioning Process," which assisted the agency in understanding as to what is happening at the local level – and formed the basis for projections and strategies in Connect SoCal. The local input process was approved and adopted by the SCAG Regional Council in October 2017.

SCAG held one-on-one meetings with all 197 local jurisdictions. In addition to seeking feedback on regional forecasts of population, household and employment growth, SCAG gathered data on land use, protected natural lands, farmland, flood areas and coastal inundation, regional bikeways, regional truck routes, planned major transit stops, high quality transit corridors, future transit priority areas, and other local data. In addition to the jurisdictions themselves, the data came from county assessors' offices, county transportation commissions, and state and federal partners.

Approximately 90 percent of local jurisdictions provided feedback on one or more data elements requested for local review. Collectively, these towns, cities and counties represent an estimated 94 percent

of the region's residents. SCAG staff also regularly convened a series of technical advisory groups that engaged local, state, and federal agencies in the transportation and sustainable communities planning process.

Coordination with County Transportation Commissions: SCAG worked closely with each of the six county transportation commissions (CTCs) throughout 2018 to update the list of major local transportation projects that were listed in the 2016 RTP/SCS. Each CTC in turn worked with their partner transportation agencies (including transit providers, rail operators, marine port and airport authorities and Caltrans District offices) to finalize a list of county-priority projects to submit to SCAG. This effort culminated in a comprehensive update to the capital list of projects, which numbers in the thousands. SCAG worked collaboratively with key stakeholders to identify additional regional projects that are intended to address challenges that are regional in nature.

Topic Specific Working Groups: SCAG has regularly convened topic-specific working groups, which bring together regional stakeholders to discuss the Plan's development and provide technical expertise. There were seven formal Regional Planning Working Groups, including Active Transportation, Environmental Justice, New Mobility, Natural Lands Conservation, Public Health, Sustainable Communities, and Transportation Safety. Additionally, SCAG convened an Emerging Technologies Committee (ETC). The ETC was formed to identify technological and societal trends (e.g. mobility as a service; zero emissions, automated and connected vehicles; smart cities and ITS; and the future of work) that may fundamentally alter the use of the region's transportation system and land use patterns. Emerging technology is a topic of intense speculation and interest at the regional planning level. Numerous popular press and academic articles have advanced the argument that the transportation sector is currently experiencing a period of changing transportation that has not been seen since the first decades of the previous century. Like that period, changes are now predominantly driven by private sector companies. In addition, the companies driving these changes are doing so through disruptive business models.

Outreach to Community Based Organizations: SCAG conducted a grassroots outreach initiative to engage diverse constituencies across Southern California. SCAG collaborated with 18 community-based organizations (CBOs) from across the region. These organizations assisted with workshop and survey outreach as well as hosting local gatherings for community members to provide input on Connect SoCal.

Survey Input: SCAG used an online platform, Neighborland, to host a survey to solicit input from Southern California residents about perspectives and priorities for various land use and transportation strategies. The survey included both multiple choice and open-ended questions. In total, more than 4,000

responses were collected from a broad sample of residents. The survey was made accessible via SCAG's Connect SoCal Website, at workshops, through CBOs and outreach.

Public Workshops: SCAG sought feedback from residents throughout the region through public engagement initiatives that featured 28 public workshops, an extensive advertisement campaign, a telephone town hall meeting and a widely distributed online survey. Public workshop attendees were asked to review four potential growth scenarios, each with a unique set of strategies. These included enhancing job centers, prioritizing connecting people to more transportation options, protecting natural lands and farmland areas, and planning for our region's future resiliency from natural disasters. More than 600 participants attended the 28 open-house workshops that took place between June and July 2019.

Public Meetings: Connect SoCal was developed through a four-year planning process involving policy discussions with local elected leaders who serve on SCAG's governing body, the Regional Council, and Policy Committees, which include the Energy and Environment Committee (EEC), Transportation Committee (TC) and the Community, Economic and Human Development Committee. Elected officials serving on these committees consist of representatives from county transportation commissions, tribal governments, as well as towns, cities and counties throughout the six-county region. The various components of Connect SoCal were reviewed by SCAG's Regional Council and policy committees in a series of public meetings.

Business Stakeholders: SCAG consulted with its business advisory group, the Global Land Use & Economic (GLUE) Council which formed in April 2009, to advise SCAG staff on the economic implications of the agency's planning activities and to better engage key public and private stakeholders. Membership of the GLUE Council consists of key business and organizational leaders from both the private and public sectors and serves as a resource for SCAG in reviewing regional plans and policy proposals. Over the past year, SCAG staff presented to the GLUE Council key components of Connect SoCal, and they have provided insight on the business, economic and job creation impact of the Plan.

Native American Consultation: In addition to board and committee representation, SCAG reached out to tribal governments during the Connect SoCal development process and conducted a workshop dedicated to Tribal Governments on May 28, 2019.

Pursuant to the *State CEQA Guidelines* and Assembly Bill 52 (Public Resources Code Sections 21080.3.1 and 21080.3.2), SCAG initiated consultation by letter on January 23, 2019 with tribal parties with respect to the PEIR for Connect SoCal to solicit input on how the plan may affect tribal cultural resources and to explore opportunities to avoid or mitigate significant adverse effects**.**

In summary, as a result of robust outreach, SCAG received 12,000 unique comments during the pre-draft phase of Connect SoCal.

2.5.2 Scenario Planning

To develop Connect SoCal, SCAG developed five unique scenarios (including Trend/Baseline) to illustrate alternative representations of the region in 2045. More specifically, each scenario was designed to explore and convey the impact of where the region would grow; to what extent the growth be focused within existing cities and towns, and how it would grow – the shape and style of the neighborhoods and transportation systems that would shape growth over the period. Descriptions of the five scenarios are as follows:

1. **Trend/Baseline:** This scenario reflects current land use trends carried forward into the future

2. **Existing Plan – Local Input:** This scenario reflects the land use and growth patterns as submitted to SCAG to envision the region in 2045. For transportation, projects planned by each CTC would occur throughout the region.

3. **Networked Destinations:** This scenario assumes that growth occurs near transit stops and new jobs locate in areas with easy access to frequent bus or rail service. Growth was prioritized in Transit Priority Areas (TPA), Livable Corridors, High Quality Transit Areas, (HQTA) and Neighborhood Mobility Areas (NMA).

4. **Dynamic Centers:** This scenario assumes that growth occurs near existing job centers, transit stations and in walkable neighborhoods, where homes, jobs, shops and services are accessible without a car. Growth was prioritized in Job Centers, TPAs, NMAs, Livable Corridors and HQTAs.

5. **Accelerated Tomorrow (Unconstrained):** This scenario assumes that funding is available to invest in expanded bus and rail networks, and there is additional revenue to make existing transit service faster and more reliable. Additionally, new investments would occur in public infrastructure, which focus on active transportation and facilitate connections between transit, jobs, homes and local destinations. Growth was prioritized in TPAs, Livable Corridors, Job Centers, HQTAs and NMAs.

Planning Assumptions

Planning assumptions related to the development of the Plan include, demographic, economic, and financial considerations. A description of these assumptions is as follows:

Demographic Assumptions

On a national level, population growth has slowed, with the US Census Bureau projecting a decrease in national annual growth rate from about 0.75 percent in 2016 to approximately 0.40 percent by the 2040s. In the SCAG region, growth is similarly slowing down, from about 0.85 percent in 2020 to about 0.45 percent by 2045.

While growth rates are at a historic low; a gradual increase to the total population is expected. In the SCAG region, a 0.6 annual growth rate corresponds to about 114,000 new residents annually, or 3.2 million new residents between 2019 and 2045. At the county level, the region anticipates population increases of 9.1% to 35.4% for its six-county area (**Table 2.0-1, 2019-2045 Population, Households and Employment Projects in the SCAG Region**)

Table 2.0-1
2019-2045 Population, Households, and Employment Projections in the SCAG Region

County Name	Population 2019	Population 2045	Percentage Increase	Households 2019	Households 2045	Percentage Increase	Employment 2019	Employment 2045	Percentage Increase
Imperial	207,700	281,200	35%	58,000	92,500	59%	77,300	130,200	68%
Los Angeles	10,333,600	11,677, 200	13%	3,409,500	4,124,500	21%	4,826,600	5,382,200	12%
Orange	3,250,100	3,534,600	9%	1,053,500	1,153,500	10%	1,765,600	1,980,400	12%
Riverside	2,462,600	3,251,700	32%	758,300	1,086,100	43%	812,800	1,102,700	36%
San Bernardino	2,217,100	2,815,500	27%	656,500	874,800	33%	828,300	1,063,800	28%
Ventura	868,600	947,500	9%	276,100	306,400	11%	346,400	389,400	12%
SCAG Region	19,339,700	22,507, 200		6,211,900	7,638,600		8,657,138	10,048,500	

Source: SCAG 2019

As growth rates are declining, the population is also aging. From 2000 to 2016, the region's median age increased from 32.3 to 35.8. By 2045, this number is expected to reach 39.7.

From 2010 to 2019, an additional 1,288,228 people moved to Southern California. Los Angeles County had the largest share of population growth among the six counties in the SCAG region during this period, adding an additional 514,935 new residents (approximately 42 percent of the region's increase in population). Riverside County followed with the next largest share and experienced an increase of 272,951 new residents (nearly 22 percent of the region's increase in population).

Economic Assumptions

The distribution of income and wealth in Southern California has been changing gradually. Median incomes have increased in the SCAG region since the depths of economic recession of 2007 to 2009, but when adjusted for inflation, the median household income in the SCAG region is below what it was in 1989.

The region has experienced job growth since 2010, gaining 1.3 million jobs and cresting the pre-recession high of 8.1 million jobs reached in 2007. Meanwhile unemployment has dropped from a high of 12.4 percent in 2010 to 4.3 percent in 2018. However, an estimate of potential impacts of automation on regional employment by 2045 suggests that construction, repair, transportation, food preparation, sales, social services and office support occupations have the highest likelihood of automation/displacement. Today these industries together employ more than 3 million workers region wide.

Planning for more housing and jobs near transit was a strategy incorporated in SCAG's first SCS in 2012 and carried forward in the 2016 RTP/SCS with a focus on areas well served by transit. Between 2008 and 2016, nearly 50 percent of household growth and 44 percent of employment growth occurred within high-quality transit areas (i.e., the half mile surround rail transit stops or bus stops/corridors that have peak headways of 15 minutes or less) (**Table 2.0-2, Recent Growth Trends in SCAG Growth Priority Areas**). **Figure 2.0-8, SCAG Growth Priority Areas,** shows the location of these areas in the region. Between 2008 and 2016, less than six percent of household growth and less than five percent of employment growth occurred in open space areas.

Table 2.0-2
Recent Growth Trends in SCAG Growth Priority Areas

	Land Area		Share of Total Growth (2008-2016)		
	Acres	Percent	Population	Households	Employment
SCAG Region Total	24,717,287				
Growth Priority Areas Total	1,320,772	5.3%	64.4%	68.0%	77.3%
High-Quality Transit Areas (HQTA)[1]	616,668	2.5%	44.3%	49.9%	44.2%
Transit Priority Areas (TPA)[1]	208,252	0.8%	19.8%	28.0%	19.1%
Specific Plans	592,819	2.4%	20.9%	21.8%	26.6%
Specific Plan / TPA[2]	56,212	0.2%	7.1%	7.7%	8.9%
Job Centers	202,186	0.8%	13.8%	20.8%	28.1%
Neighborhood Mobility Areas	248,916	1.0%	23.6%	31.6%	24.0%
Livable Corridors[3]	552,023	2.2%	38.0%	43.9%	49.9%
Constraint Areas Total[4]	**18,840,937**	**76.2%**	**4.6%**	**5.9%**	**4.8%**
Open Space[5]	15,078,003	61.0%	2.7%	3.7%	1.1%
Farmland[6]	2,593,038	10.5%	4.9%	5.6%	1.9%
Flood Hazard Areas[7]	1,313,531	5.3%	18.0%	13.5%	17.2%
High Risk of Wildfire[8]	4,401,328	17.8%	11.0%	11.2%	14.8%

1. *Extracted from draft 2045 plan year data of the Connect SoCal, 2020-2045 RTP/SCS*
2. *Overlaps between specific plan boundaries and the 2045 Transit Priority Areas (TPA)*
3. *Using 0.5 mile buffers from the Livable Corridors*
4. *Including open space, military installations, and tribal lands*
5. *Including the California Protected Areas Database (CPAD) and the California Conservation Easement Database (CCED). Please note CPAD does not include: military lands used primarily for military purposes, tribal lands, private golf courses, and public lands not intended for open space.*
6. *Including Prime Farmland, Farmland of Statewide Importance, Unique Farmland, Farmland of Local Importance and Grazing lands*
7. *Including the 100-year (1% annual chance of occurring) and 500-year (0.2% annual chance of occurring) flood zones*
8. *Including 'High' and 'Very High' wildfire hazard classifications*

Financial Assumptions

In accordance with federal fiscal constraint requirements, Connect SoCal is a financially constrained Plan. Connect SoCal identifies the amount of funding that is reasonably expected to be available to build, operate, and maintain the region's surface transportation system through the forecast horizon year of 2045.

The financially constrained Connect SoCal includes both a "traditional" core revenue forecast comprised of existing local, state, and federal sources, and more innovative but reasonably available sources of revenue to implement a program of improvements.

The financial plan's forecast of core revenue totals approximately $638.6 billion from both core and reasonably available resources. Local sources comprise 61 percent of the funding and the largest share of core revenues, followed by state sources which comprise 31 percent of revenue, federal sources comprise 8 percent of revenue.

As shown in **Table 2.0-3**, capital projects total $287 billion in nominal dollars. Operating and maintenance (O&M) costs total $316 billion, while debt service obligations total $35.6 billion. Transit-related costs comprise the largest share of O&M costs for the region, totaling $173.9 billion.

Table 2.0-3
Connect SoCal Expenditure (in Billions)

Capital Projects and Other Programs	$287.0
Arterials	$20.8
Goods Movement (including Grade Separations)	$65.7
High-Occupancy Vehicle/Express Lanes	$13.6
Mixed-Flow and Interchange Improvements	$10.3
Transportation System Management (Including ITS)	$13.7
Transit	$66.8
Passenger Rail	$53.2
Active Transportation	$17.7
Transportation Demand Management	$7.3
Other	$18.1
Operations and Maintenance	$316.0
State Highways	$68.0
Transit	$173.9
Passenger Rail	$26.6
Regionally Significant Local Streets and Roads	$47.5
Debt Service	$35.6
Cost Total	**$638.6**

Source: SCAG
Note: due to rounding, the total will not exactly match.
**Includes $4.8 billion for active transportation in addition to capital project investment level of $17.7 billion for a total of $22.5 billion for active transportation improvements*
***Includes Safety, Pooled Incentives, Mobility Equity Fund, Regional PEV Charger Program, and Others*

Table 2.0-4
Connect SoCal Revenue Sources

Local	Sales Tax	$210.1
	– Local Option Sales Tax Measures	$172.6
	– Transportation Development Act (TDA)—Local Transportation Fund	$37.6
	Transit Farebox Revenue	$27.3
	Highway Tolls (in core revenue forecast)	$32.7
	Mitigation Fees	$2.5
	Other Local Sources	$30.2
	Local Total	$302.8
State	State Transportation Improvement Program (STIP)	$5.6
	– Regional Transportation Improvement Program (RTIP)	$4.2
	– Interregional Transportation Improvement Program (ITIP)	$1.4
	State Highway Operation and Protection Plan (SHOPP)	$63.0
	Highway Users Tax Account (HUTA)	$36.7
	Road Maintenance and Rehabilitation Account (RMRA)	$24.3
	State Transit Assistance Fund (STA)	$14.2
	Cap-and-Trade Auction Proceeds	$2.2
	Other State Sources	$9.2
	State Total	$155.4
Federal	Federal Transit	$25.0
	– Federal Transit Formula	$19.0
	– Federal Transit Non-Formula	$6.0
	Federal Highway & Other	$16.1
	– Congestion Mitigation and Air Quality (CMAQ)	$5.3
	– Surface Transportation Block Grant (STBG)	$7.5
	– Other Federal Sources	$3.3
	Federal Total	$41.1
New	Federal Gas Excise Tax Adjustment	$2.7
	Mileage-Based User Fee (Replacement)	$42.7
	TIFIA/RRIF Credit Assistance; Bond Proceeds	$2.2
	Private Equity	$6.3
	Local Road Charge Program	$77.8
	Enhanced Infrastructure Financing District	$3.0
	TNC Fee	$4.7
	New Revenue Total	**$139.4**
	Revenue Total	**$638.6**

Modeling

The CTC 2017 RTP Guidelines recommend that the largest metropolitan areas should build formal microeconomic land use models to analyze and evaluate proposed changes in land use, economic, and transportation system. SCAG uses Regional Travel Demand Model/Activity Based Model (ABM) and Scenario Planning Model (SPM) as an integrated model framework to evaluate the relationship of transportation and land use. This allows for analysis of how transportation projects affect the surrounding land use pattern, as well as how changes to household and employment locations affect transportation demand, and ultimately affect GHG emissions.

Regional Travel Demand Model / Activity Based Model (ABM)

SCAG is the primary agency responsible for the development and maintenance of travel demand forecasting models for the SCAG region. SCAG has been developing and improving these travel demand forecasting models since 1967. SCAG's Modeling Task Force, consisting of modeling technical peers from the various county and state agencies and private firms, meets every other month at SCAG to discuss regionally significant modeling projects and modeling issues, including the development, maintenance, and application of SCAG's Regional Travel Demand Model as well as the travel demand models used by other stakeholder agencies.

SCAG's Regional Travel Demand Model is an activity-based model that meets or exceeds the state of the practice. The Model meets all the requirements of the Transportation Conformity Rule, specifically 40 CFR 93.122(b)). The results from the Regional Travel Demand Model are input to the ARB's Emission Factors (EMFAC 2014) model for calculating regional emissions.

SCAG's regional transportation modeling area covers the entire SCAG region, including the Counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. This modeling area is divided into 11,267 Transportation Analysis Zones (TAZs) with an additional 40 external cordon stations, 12 airport nodes, and 31 port nodes for the Ports of Los Angeles and Long Beach. A comprehensive model validation was also performed to ensure the model properly replicates base-year (2016) travel conditions, which is the base year for Connect SoCal.

Scenario Planning Model (SPM)

SCAG's Scenario Planning Model (SPM) is a data management, land use planning and modeling tool built on the open source version of UrbanFootprint platform (UF 1.5), which was originally developed by Calthorpe Analytics in partnership with SCAG and other California Public Agencies. UF1.5 is available and free for public use, downloadable from California Strategic Growth Council's website. SPM enables

the creation and organization of local and regional data, plan and policies, facilitates scenario creation and editing and estimates a wide range of potential benefits resulting from alternative transportation and land use strategies.

SPM has been deployed as two separate web services: Data Management (DM) tool and Scenario Development and Analysis (SD) tool. SPM-DM provides a common data framework within which local planning efforts can be easily integrated and synched with regional plans. Using a variety of data management and review options, the user (local jurisdictions) can explore data, export attributes and edit configured layers. SPM-DM was released in November 2018 to all 197 local jurisdictions in the SCAG region in support of SCAG's local input and envisioning process for the Connect SoCal. To assist cities and counties in using the tool, a total of 21 hands-on training sessions in a classroom setting have been provided throughout the region. SPM-SD includes a suite of tools and analytic engines that facilitate scenario creation and editing with advanced analytic capabilities and allow meaningful comparison across different land use and transportation options. Starting with the 2016 RTP/SCS, SPM-SD has been used in providing directional and order-of-magnitude impacts of local land use and policy decisions that would assist in the development of regional plans and associated scenario analysis.

2.5.3 Goals and Guiding Principles

SCAG developed goals for Connect SoCal, which fall into four core categories: economy, mobility, environment and healthy/complete communities. The Plan lays out goals related to housing, transportation technologies, equity and resilience in order to adequately reflect the increasing importance of these topics in the region, and where possible the goals have been developed to link to potential performance measures and targets (see **Table 2.0-5**). The Plan's guiding policies magnify these goals, creating a specific direction for Plan investments (see **Table 2.0-6**).

Table 2.0-5
Connect SoCal Goals

	Connect SoCal Goals
1	Encourage regional economic prosperity and global competitiveness.
2	Improve mobility, accessibility, reliability, and travel safety for people and goods.
3	Enhance the preservation, security, and resilience of the regional transportation system.
4	Increase person and goods movement and travel choices within the transportation system.
5	Reduce greenhouse gas emissions and improve air quality.
6	Support healthy and equitable communities.
7	Adapt to a changing climate and support an integrated regional development pattern and transportation network.
8	Leverage new transportation technologies and data-driven solutions that result in more efficient travel.
9	Encourage development of diverse housing types in areas that are supported by multiple transportation options.
10	Promote conservation of natural and agricultural lands and restoration of critical habitats.

Source: SCAG

Table 2.0-6
Connect SoCal Guiding Principles

	Connect SoCal Guiding Principals
1	Base transportation investments on adopted regional performance indicators and MAP-21/FAST Act regional targets.
2	Place high priority for transportation funding in the region on projects and programs that improve mobility, accessibility, reliability and safety, and that preserve the existing transportation system.
3	Assure that land use and growth strategies recognize local input, promote sustainable transportation options, and support equitable and adaptable communities.
4	Encourage RTP/SCS investments and strategies that collectively result in reduced non-recurrent congestion and demand for single occupancy vehicle use, by leveraging new transportation technologies and expanding travel choices.
5	Encourage transportation investments that will result in improved air quality and public health, and reduced greenhouse gas emissions.
6	Monitor progress on all aspects of the Plan, including the timely implementation of projects, programs, and strategies.
7	Regionally, transportation investments should reflect best-known science regarding climate change vulnerability, in order to design for long-term resilience.

Source: SCAG

2.5.4 Performance Measures

Federal policy also requires that SCAG set performance measures and targets in Connect SoCal. As required under MAP-21, in 2016 and 2017 the FHWA issued national performance measures and guidelines for use in the setting of statewide and regional performance targets. The FHWA rule-making process established a four-year performance target setting and reporting cycle, with a two-year mid-term

progress evaluation point. SCAG coordinated closely with Caltrans in the establishment of specific performance targets for the state and for our region in the various transportation performance areas established under MAP-21. These targets provide quantifiable objectives to achieve each measure during the performance period.

The Plan has a number of performance measures that are closely tied to its vision, goals and guiding policies. These ensure that the implementation of the Plan moves the SCAG region closer to achieving these vision, goals and policies. Plan performance is measured under eight categories as shown in **Table 2.0-7, Connect SoCal Performance Measures**. These performance measures are built upon but updated from those developed for the 2016 RTP/SCS to ensure that there is consistency when tracking and assessing the region's performance and whether this is meeting and exceeding federal and state requirements. It is also intended to help quantify regional goals, estimate potential impacts of proposed investments, and evaluate progress over time. Recognizing that the proposed land use and transportation strategies are expected to have impacts beyond those that are exclusively transportation-related, the health outcome was first introduced in the 2012 RTP/SCS and was also addressed in the 2016 RTP/SCS. These health-related measures are tied with the proposed transportation investments in transit, and transportation, more walkable communities, and land use strategies, which focus new housing and employment in the region's High-Quality Transit Areas (HQTAs), livable corridors and neighborhood mobility areas.

As stated previously, the Plan is constrained by expected transportation revenues, household and employment growth. The Plan creates a list of transportation projects that are eligible for future funding but does not program funds to specific transportation projects (**See Appendix 2.0, Plan Project List)**. While the Plan identifies transportation and land use strategies that accommodate expected growth and improve the quality of life for existing and future residents, it does not change local land use policies. Individual jurisdictions retain all local land use authority.

Table 2.0-7
Connect SoCal Performance Measures

Outcome	Performance Measures	Connect SoCal Goals
Location Efficiency	Share of regional household growth occurring in HQTAs	7, 9
	Share of regional employment growth occurring in HQTAs	1, 7
	Land consumption	7, 10
	VMT per capita	2, 5
	Average distance traveled for work and non-work trips	2, 5
	Percent of trips less than 3 miles	2, 5
	Work trip length distribution	2, 5
Mobility and Accessibility	Person delay per capita	2, 4
	Person hours of delay by facility type (mixed flow/ HOV/arterials)	2, 4
	Truck delay by facility type (highways/arterials)	1, 4
	Travel time distribution by mode	2, 8
	Transit mode share	4, 7
	Mean commute time	2, 8
Safety and Health	Collision fatality rate	2, 6
	Collision serious injury rate	2, 6
	Air pollution-related health measures	5, 6
	Physical activity-related health measures	6, 7
	Mode share for walking and biking	6, 7
Environmental Quality	Greenhouse gas (GHG) emissions reduction	5, 6
	Criteria pollutant emissions	5, 6
	Non-SOV mode share	2, 4
Economic Opportunity	New jobs supported by improved economic competitiveness	1, 4
	New jobs supported by transportation system investments	1, 3
Investment Effectiveness	Transportation system investment benefit/cost ratio	1, 3
Transportation System Sustainability	Cost per capita to preserve multimodal transportation system in current state of good repair	1, 3
	Interstate highway pavement condition	1, 3
	Non-interstate National Highway System pavement condition	1, 3
	National Highway System bridge condition	1, 3
Environmental Justice	Environmental Justice Performance Measures	6, 9

2.5.5 Connect SoCal Document Framework

The Plan discusses how the SCAG region could grow over the next 25 years (to year 2045) and identifies transportation and land use strategies to enable a more sustainable, equitable, and economically vibrant future. The document updates the region's previous RTP/SCS, adopted in 2016. The document is organized into seven chapters as follows:

0. Making Connections – an introduction to the Plan.

1. About the Plan – a description of the Plan including goals and guiding principles and description of how the Plan was developed as well as identification of the laws that guide the Plan.

2. SoCal Today – identification of major trends, population and demographic changes, regional growth, a description of the transportation system (and mode choices), identification of farmland lost and at-risk, discussion of transportation safety, discussion of public health, discussion of access and mobility, funding, planning for disruption and moving towards solutions.

3. A Path to Greater Access, Mobility and Sustainability – a description of the proposed transportation strategies and sustainable communities strategies

4. Paying Our Way Forward – a description of how the transportation projects are anticipated to be financed.

5. Measuring Our Progress – identification of how the performance of the Plan is measured.

6. Looking Ahead – a summary of the challenges that lie ahead.

The Plan also includes the following supplemental technical reports:

- Active Transportation
- Aviation and Airport Ground Access
- Congestion Management (including a TDM Toolbox of Strategies)
- Demographics and Growth Forecast
- Economic and Job Creation Analysis
- Emerging Technologies
- Environmental Justice

- Goods Movement
- Highways and Arterials
- Natural and Farm Lands Conservation
- Passenger Rail
- Performance Measures
- Project List
- Public Health
- Public Participation and Consultation
- Sustainable Communities Strategy
- Transit
- Transportation Conformity Analysis
- Transportation Finance
- Transportation, Safety and Security

2.5.6 Land Use and Transportation Strategies

Since the Plan foresees regional growth along with transportation system improvements, it identifies land use and transportation strategies aimed at increasing transportation choices with a reduced dependence on automobiles and an increase growth in walkable, mixed-use communities and HQTAs. Increased choices in mobility, enhanced quality of life, and increasing sustainability practices could also lead to improved air quality in the region.

Land Use Strategies

The land use strategies included in the Connect SoCal Plan are built upon strategies listed in the 2016 RTP/SCS and are intended to increase travel mode choices, guide future land development, and improve air quality. It also attempts to balance the region's land use choices with its transportation investments.

The Plan includes land use strategies with the committed and projected transportation investments such that they emphasize system preservation and enhancement, active transportation, and land use integration. These strategies identify how the SCAG region can implement Connect SoCal and achieve related GHG reductions. It is important to note that SCAG does not have a direct role in implementing

the Sustainable Communities Strategy – neither through decisions about what type of development goes where, nor what transportation projects are ultimately built. Connect SoCal's land use strategies are as follows:

1. Focus Growth Near Destinations and Mobility Options

- Emphasize land use patterns that facilitate multimodal access to work, educational and other destinations
- Focus on jobs/housing balance to reduce commute times and distances and expand job opportunities near transit and along center-focused main streets
- Plan for growth near transit investments and support implementation of first/last mile strategies
- Promote the redevelopment of underperforming retail developments and other outmoded nonresidential uses
- Prioritize infill and redevelopment of underutilized land to accommodate new growth, increase amenities and connectivity in existing neighborhoods
- Encourage design and transportation options that reduce the reliance on and number of solo car trips (this could include mixed uses or locating and orienting close to existing destinations)
- Identify ways to "right size" parking requirements and promote alternative parking strategies (e.g. shared parking or smart parking)

2. Promote Diverse Housing Choices

- Preserve and rehabilitate affordable housing and prevent displacement
- Identify opportunities for new workforce and affordable housing development
- Create incentives and reduce regulatory barriers for building context-sensitive accessory dwelling units to increase housing supply
- Provide support to local jurisdictions to streamline and lessen barriers to housing development that supports reduction of greenhouse gas emissions

3. Leverage Technology Innovations

- Promote low emission technologies such as neighborhood electric vehicles, shared rides hailing, car sharing, bike sharing and scooters by providing supportive and safe infrastructure such as dedicated lanes, charging and parking/drop-off space

- Improve access to services through technology- such as telework and telemedicine as well as commuter incentives such as a "mobility wallet", an app-based system for storing transit and other multi-modal payments

- Identify ways to incorporate "micro-power grids" in communities, for example solar energy, hydrogen fuel cell power storage and power generation

4. Support Implementation of Sustainability Policies

- Pursue funding opportunities to support local sustainable development implementation projects that reduce greenhouse gas emissions

- Support statewide legislation that reduces barriers to new construction and that incentivizes development near transit corridors and stations

- Support cities in the establishment of Enhanced Infrastructure Financing Districts (EIFDs), Community Revitalization and Investment Authorities (CRIAs), or other tax increment or value capture tools to finance sustainable infrastructure and development projects

- Work with local jurisdictions/communities to identify opportunities and assess barriers to implement sustainability strategies

- Enhance partnerships with other planning organizations to promote resources and best practices in the SCAG region

- Continue to support long range planning efforts by local jurisdictions

- Provide educational opportunities to local decisions makers and staff on new tools, best practices and policies related to implementing the Sustainable Communities Strategy

5. Promote a Green Region

- Support development of local climate adaptation and hazard mitigation plans, as well as project implementation that improves community resiliency to climate change and natural hazards

- Support local policies for renewable energy production, reduction of urban heat islands and carbon sequestration
- Integrate local food production into the regional landscape
- Promote more resource efficient development focused on conservation, recycling and reclamation
- Preserve, enhance and restore regional wildlife connectivity
- Reduce consumption of resource areas, including agricultural land
- Identify ways to improve access to public park space

Priority Growth Areas

Consideration of the Plan requires an understanding of several more localized geographies. Priority Growth Areas (PGAs) follow the principles of center-focused placemaking. Connect SoCal's PGAs – Job Centers, Transit Priority Areas (TPA), HQTA, NMAs, and Livable Corridors – account for only five percent of region's total land area, but implementation of SCAG's recommended growth strategies will help these areas accommodate 76 percent of forecasted household growth and 86 percent of forecasted employment growth by 2045. This more compact form of regional development, if fully realized, can reduce travel distances, increase mobility options, improve access to workplaces, and conserve the region's resource areas.

Job Centers: Job centers are where regional strategies that support economic prosperity are identified. Job centers represent areas that have a significantly higher employment density than surrounding areas. Employment growth and residential growth are prioritized in job centers to leverage existing density and infrastructure. SCAG has identified 70+ job centers in the region (see **Figure 2.0-9, SCAG Region Proposed Job Centers**).

Transit Priority Areas: TPAs are PGAs that are within one half mile of existing or planned 'major' transit stops in the region (See **Figure 2.0-10, Transit Priority Areas**). A 'major' transit stop is defined as a site containing an existing or planned rail transit station, a ferry terminal served by either a bus or rail, transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods. Although TPAs comprise less than one percent of Southern California's land area, around 35 percent of new households are projected to occur within these transit rich areas.

High Quality Transit Areas: HQTAs are corridor-focused PGAs within one half mile of an existing or

planned fixed guideway transit stop or a bus transit corridor where buses pick up passengers at a frequency of every 15 minutes (or less) during peak commuting hours. HQTAs represent less than three percent of the region's acreage but are projected to accommodate nearly 55 percent of new households between 2016 and 2045. (See **Figure 2.0-11, High-Quality Transit Areas throughout the SCAG Region in 2045**) Infrastructure investments that support walkable, compact communities that integrate land use and transportation planning for a better-functioning built environment are essential within HQTAs. Active transportation and new developments should respond to the existing physical conditions of the surrounding area. Sensitively designed TODs can preserve existing development patterns and neighborhood character while providing a balance of modal and housing choices.

Neighborhood Mobility Areas: NMAs focus on creating, improving, restoring and enhancing safe and convenient connections to schools, shopping, services, places of worship, parks, greenways and other destinations (See **Figure 2.0-12, Neighborhood Mobility Areas**). NMAs are PGAs with robust residential to non-residential land use connections, high roadway intersection densities and low-to-moderate traffic speeds. NMAs can encourage safer, multimodal, short trips in existing and planned neighborhoods and reduce reliance on single occupancy vehicles. NMAs support the principles of center focused placemaking. Fundamental to neighborhood scale mobility in urban, suburban and rural settings is encouraging "walkability," active transportation and short, shared vehicular trips on a connected network through increased density, mixed land uses, neighborhood design, enhanced destination accessibility and reduced distance to transit. From 2016 to 2045, nearly 33 percent of new households are projected to be in NMAs. Although 38 percent of all trips made in the SCAG region are three miles or less, more than 78 percent of these short trips are made by driving.

Livable Corridors. Livable corridors are arterial roadways where jurisdictions may plan for a combination of the following elements: high-quality bus frequency; higher density residential and employment at key intersections; and increased active transportation through dedicated bikeways. Most Livable Corridors would be located within HQTAs (**See Figure 2.0-13, Livable Corridors**).

Transportation Strategies

Connect SoCal recognizes that the region can no longer afford to rely solely on expanding the transportation system to address the region's many changes and challenges. There is a need to use a comprehensive planning approach for a transportation system that focuses on preservation, sustainability, and productivity, as well as strategic expansion. Anticipated land use patterns as part of Connect SoCal provide a strategic opportunity to build a smart transportation system that is responsive to the region's changes and challenges. Connect SoCal includes proposed strategies for transportation

investments, totaling approximately $638.6 billion (See **Table 2.0-3, Connect SoCal Expenditure [in billions]**). Proposed transportation strategies are as follows:

System Preservation. A top priority is to maintain and preserve the transportation infrastructure through a "Fix it First" principle. Anticipated funding provided by Senate Bill 1 offers an opportunity to strategically reinvest in the transportation network to realize an improvement in the conditions of the existing system. A key strategy for system preservation is to include preventative maintenance of roadways as part of project costs and work plans. The timeframe to perform preventative maintenance can be days, while construction of a new roadway can take years, causing more increased inconvenience and congestion on the network as residents use alternate routes not built for such demand. Connect SoCal allocates approximately $68 billion over the plan period to ensure a well maintained and resilient system for generations to come.

Manage Congestion. Connect SoCal also seeks to optimize the existing transportation system to meet increased demand levels through the use of innovative strategies that leverage the existing transportation infrastructure. Physical solutions can include reversible lanes and policy solutions can include congestion pricing concept along with other solutions. Congestion strategies may include but are not limited to the following:

- ***Congestion Management Process.*** The Congestion Management Process (CMP) aims to provide effective management of the regional transportation system through monitoring and maintenance, demand reduction, analysis of local land use decisions, operational management strategies and strategic capacity enhancements. Federal regulations require the development, establishment and implementation of a CMP. Consistent with federal requirements, SCAG implements, monitors and evaluates these actions as part of Connect SoCal. These eight actions are as follows:
  - Develop Regional Objectives for Congestion Management
  - Define CMP Network
  - Develop Multimodal Performance
  - Collect Data/Monitor System Performance
  - Analyze Congestion Problems and Needs
  - Identify and Assess Strategies
  - Program and Implement Strategies
  - Evaluate Strategy Effectiveness

- ***Congestion Pricing.*** Connect SoCal identified three congestion pricing strategies, two of which were incorporated into the 2012 and 2016 RTP/SCS:

  - Develop a network of express lanes, that connects to existing express lanes in order to accommodate growing inter-county travel

  - Establish a mileage-based user fee to generate a funding source for aging infrastructure and construction of other travel options

  - Develop Cordon/Area Pricing which involves charging a variable or fixed fee to drive into or within a highly congested area.

- ***Transportation Demand Management.*** Transportation Demand Management (TDM) is a set of strategies that aims to reduce the demand for roadway travel, particularly from single-occupancy Vehicles (SOVs). TDM investments can reduce congestion and shift trips from SOVs to other modes in ways that often cost significantly less than roadway or transit capital expansion projects. TDM strategies add transportation choices that improve sustainability, public health and the quality of life by reducing congestion, air pollution and greenhouse gas emissions. When transit ridership, carpooling, biking and walking increase, the efficiency of the entire transportation system improves, bringing many benefits to the region. These benefits can justify relatively modest public expenditures on effectively implemented TDM programs. Connect SoCal commits $7.3 billion through 2045 to implement TDM strategies throughout the region. There are three primary goals of this program:

  - Reduce the number of SOV trips and per capita VMT through ridesourcing (which includes carpooling and vanpooling) and providing first/last mile services to and from transit

  - Redistribute or eliminate vehicle trips during peak demand periods by supporting telecommuting and alternative work schedules

  - Reduce the number of SOV trips through use of other modes such as transit, rail, bicycling, and walking, or other micro-mobility modes

Automated Vehicle Technology and Car to Car Communication Systems. Automated/Connected Vehicle technologies cover a range of advancements that allow vehicles to operate without drivers and coordinate with other vehicles. This includes on-board sensing capabilities, data integration and vehicle to vehicle communication.

Transit. Since 1991, the region has spent more than $77 billion on transit (in 2016 dollars). This trend is expected to continue, as the combined costs for transit capital projects and operations and maintenance

(O&M) total nearly half of the investments in Connect SoCal. The Plan includes significant investment across all transit modes, with $66.8 billion toward transit capital projects and $173.9 billion for transit O&M. **Table 2.0-8, Selected Transit Capital Projects,** displays selected major transit capital projects included in Connect SoCal, while the map in **Figure 2.0-14, 2045 Plan Transit Network** and **Figure 2.0-15 Major Rail Projects,** display the 2045 Plan transit and rail network.

Table 2.0-8
Selected Transit Capital Projects

County	Project
Los Angeles	Airport Metro Connector
Los Angeles	BRT Connector – Orange/Red Line to Gold Line
Los Angeles	Crenshaw/LAX Transit Corridor
Los Angeles	Historic Los Angeles Streetcar
Los Angeles	East San Fernando Valley Transit Corridor
Los Angeles	Gold Line Extension Phase 2 to South El Monte
Los Angeles	Gold Line Foothill Extension – Azusa to Claremont
Los Angeles	Green Line Extension to Torrance
Los Angeles	LAX Automated People Mover
Los Angeles	North San Fernando Valley Transit Corridor
Los Angeles	Orange Line BRT Improvements
Los Angeles	Purple Line Westside Subway Extension to La Cienga, Century City, Westwood
Los Angeles	Regional Connector
Los Angeles	Sepulveda Pass Transit Corridor (Phase 2)
Los Angeles	Vermont Transit Corridor
Los Angeles	West Santa Ana Branch Transit Corridor
Los Angeles	Green Line Extension to Norwalk/Santa Fe Springs Metrolink Station
Los Angeles	Red Line Extension to Hollywood Burbank Airport
Los Angeles	Slauson Light Rail – Crenshaw/LAX Transit Corridor to Blue Line
Orange	OC Streetcar
Orange	OC Transit Vision
Riverside	Rapid Commuter Corridor From Parris To San Jacinto
Riverside	RapidLink Service – Riverside, Moreno Valley, Perris
Riverside	Coachella Valley BRT
San Bernardino	Foothill/San Bernardino BRT
San Bernardino	Gold Line Extension to Montclair
San Bernardino	Passenger Rail Service from San Bernardino Metrolink to Ontario Airport
San Bernardino	Redlands Passenger Rail
San Bernardino	West Valley Connector Phase I

Source: SCAG Connect SoCal 2019

Micro-Transit. Micro-transit is more flexible than traditional bus service in that it either uses dynamic routing, smaller vehicles or on-demand service that allows greater efficiency and convenience. Some micro-transit services exist in Southern California. The vast majority of transit riders could benefit from micro-transit.

Passenger Rail. Connect SoCal strategies for passenger rail in the SCAG region consists of four main elements:

- **Grow Ridership:** Although ridership on commuter and intercity rail services has steadily grown over the last two decades, there is still tremendous potential to significantly increase ridership in the region.

- **Provide More Frequent and New Services:** Providing more frequent rail service will attract new riders to passenger rail. Currently, commuter rail service in Southern California is much less frequent than commuter rail services elsewhere in the nation. There are also several unserved passenger rail markets that would greatly benefit from the establishment of new rail service.

- **Improve Connectivity:** While progress has been made in connecting passenger rail services to other existing transit in our region, more needs to be done to coordinate schedules and connections. Also, more progress must be made in first/last mile connections to rail stations, and station area planning and transit-oriented development (TOD).

- **Secure Funding:** New funding opportunities have been created since the 2016 RTP/SCS, such as the first dedicated source for rail operations at the state level. However, passenger rail funding in the region is still incremental in nature and to grow ridership via increased service levels, more long-term state and federal financing needs to be identified.

Active Transportation. Increasing the number of people walking and bicycling and decreasing the number of people driving will improve health outcomes and reduce greenhouse gas emissions in the region. Connect SoCal is expected to increase the number of people making active transportation trips by more than two million, increasing the mode share from 8.3 percent in 2016 to 10.4 percent in 2045. In order to achieve these outcomes, investments will be required to implement a variety of strategies.

Strategies to achieve Connect SoCal goals related to active transportation address planning, policy making and implementation for both short and regional trips. Additionally, they are designed to improve environmental justice outcomes and enhance the safety and comfort of people walking and bicycling. Many of these strategies should be implemented concurrently, as improvements to short trips, for example, do not preclude strategies to improve safety or address environmental justice, and vice versa.

Active Transportation strategies are grouped into eight categories that address trip type as well as a range of regional priorities. Specific details on the Active Transportation Strategies highlighted below can be found in the Active Transportation Technical Report.

- Environmental Justice
- Short Trips
- Regional Trips
- Planning, Data Collection and Technology
- Micro-mobility
- Complete Streets
- Engagement
- Safety

Transportation Safety. Connect SoCal prioritizes the safety and mobility of the region's residents, including drivers and passengers, transit riders, pedestrians, and bicyclists. SCAG's Safety strategies are largely grounded in the State's Strategic Highway Safety Plan (SHSP) that helps member agencies interested in pursuing safety initiatives and strategies at the local level. SCAG outlines detailed strategies and actions that local jurisdictions and county transportation commissions can undertake to enhance safety in our region in the transportation safety and security report. The strategies are based on the SHSP and include:

- Reduce aggressive driving and speeding
- Improve safety for aging populations
- Improve bicyclist safety
- Improve commercial vehicles safety
- Ensure drivers are licensed
- Improve emergency response services
- Improve research and data collection
- Reduce impaired driving fatalities
- Reduce distracted driving

- Improve safety at intersections
- Reduce the occurrence of lane departure fatalities
- Improve motorcycle safety
- Improve occupant protection by increased use of seat belts and child safety seats
- Improve pedestrian safety
- Improve work zone safety
- Improve safety for young drivers

Highway and Arterial Network. Connect SoCal emphasizes working with partner implementing agencies to prioritize projects that preserve and optimize the existing highway and arterial network. A sample of major committed projects included in Connect SoCal are highlighted in **Figure 2.0-16, Major Highway Projects, Figure 2.0-17, Major HOV Projects**, and **Table 2.0-9, Sample Major Highway Projects Committed by the Counties.** Projects include interchange improvements, auxiliary lanes, general purpose lanes, carpool lanes, toll lanes and Express/HOT lanes. The complete list of projects can be found in the **Appendix 2.0, Plan Project List.** The Highway and Arterial improvements in Connect SoCal are guided by the following framework and guiding principles:

- Protect and preserve what we have first, supporting 'Fix it First' principle, including the consideration of life cycle costs beyond construction
- Support continued system preservation funding and augment as necessary
- Focus on achieving maximum productivity through strategic investments in system management and demand management
- Focus on adding capacity primarily (but not exclusively) to:
  - Close gaps in the system
  - Improve access where needed
- Support policies and system improvements that will encourage the seamless operation of our roadway network from a user perspective
- Assure that any new roadway capacity project is developed with consideration and incorporation of congestion management strategies, including demand management measures, operational improvements, transit and ITS, where feasible

- Focus on addressing non-recurring congestion with new technology
- Support 'complete street' opportunities where feasible and practical

Table 2.0-9
Sample Major Highway Projects Committed by the Counties

	County	Route	Description	Completion Year	Project Cost ($1,000's)
Mixed-Flow Lanes	Imperial	SR-111	Widen and improve to six-lane freeway with interchanges at Heber, McCabe, and Jasper and overpass at Chick Rd.	2030	$999,136
	Los Angeles	SR-57/SR-60	Improve the SR-57/SR-60 interchange.	2028	$300,000
	Orange	SR-55	Add one mixed-flow lane in each direction and fix chokepoints from I-405 to I-5 and add one auxiliary lane in each direction between select on/off ramps and operational improvements through project limits.	2023	$327,363
	Orange	SR-91	Add eastbound mixed-flow lane from SR-57 to SR-55, add one westbound mixed- flow lane from Kraemer to State College, improve interchanges and merging from Lakeview to Raymond, and auxiliary lanes in certain segments.	2030	$456,190
	Orange	I-405	Add one mixed-flow lane in each direction from I-5 to SR-55.	2034	$190,000
	Orange	I-405	Add one mixed-flow lane in each direction, convert existing HOV lane to HOT lane, add one additional HOT lane in each direction from SR-73 to I-605.	2026	$1,900,000
	Ventura	SR-118	Add one lane each direction from RT-23 to Tapo Canyon Rd.	2031	$216,463
Express Lanes	Los Angeles	I-405	Add I-405 ExpressLanes from I-105 to I-110.	2028	$71,560
	Los Angeles	I-405	Add -405 ExpressLanes from I-110 to LA/Orange Country Line.	2028	$110,390
	Los Angeles	I-405	Add I-105 Express Lane from I-405 to I-605	2029	$228,500
	Los Angeles	I-405	Sepulveda Pass Transit Corridor (Ph 1) with Express Lanes.	2026	$310,500
	Los Angeles	I-10	Add I-10 ExpressLanes from I-605 to LA/San Bernardino County Line.	2028	$196,840
	Los Angeles	I-405	Add I-405 ExpressLanes from I-10 to I-105.	2028	$70,880
	Los Angeles	I-605	I-605 ExpressLanes from I-105 to Orange County Line.	2031	$100,850
	Riverside	I-15	Add two Express Lanes in each direction from Cajalco Rd to SR-74. Also add one southbound auxiliary lane from Cajalco Rd to Weirick Rd.	2028	$544,000
	San Bernardino	I-15	Add two Express Lanes in each direction from I-215 to US-395	2040	$687,994
	San Bernardino	I-15	Add one Express Lane in each direction from US-395 to High Desert Corridor (Segment 5)	2045	$194,662

	County	Route	Description	Completion Year	Project Cost ($1,000's)
HOV Lanes	Los Angeles	SR-14	Add 1 HOV lane each direction from Ave. P-8 to Ave. L	2027	$120,000
	Los Angeles	RT-71	Add one HOV lane and one mixed-flow lane from Rt-10 to SB County Line.	2028	$326,392
	Riverside	I-15	Add one HOV lane in each direction from SR-74 to I-15/I-215 interchange.	2039	$375,664
	San Bernardino	I-210	Add one HOV lane in each direction from I-215 to I-10.	2045	$178,780
	San Bernardino	I-215	Add one HOV lane in each direction from SR-210 to I-15.	2035	$249,151
	Ventura	US-101	Add one HOV lane in each direction from LA/VEN County Line to SR-33.	2040	$700,000

Source: SCAG Arterials Report, 2019

Regional Express Lane Network. The regional express lane network included in Connect SoCal builds on the success of the I-10 and I-110 Express Lanes in Los Angeles County and the recent extension of the SR-91 Express Lanes between Orange and Riverside Counties. Additional efforts underway include planned express lanes on the 1-105 in Los Angeles County, the I-15 in Riverside County, the I-15 and the I-10 in San Bernardino County and the I-405 in Orange County and Los Angeles County. **Figure 2.0-18, Planned Regional Express Lane Network,** display the segments in the proposed regional express lane network.

Goods Movement. SCAG has developed key strategies to realize a regional vison that maintains regional economic competitiveness, promotes job creation and retention, increased freight mobility and safety, and mitigating environmental impacts. Specific details of goods movement challenges and strategies can be found in the Goods Movement Technical Report. Key strategies include:

- **Infrastructure Investments to Improve Freight Mobility.** Capturing the benefits that accompany goods movement means ensuring that regional businesses have access to and increased mobility on key goods movement corridors and networks. Improving efficiency on the transportation system will help contain rising costs of goods and services that often pass on to consumers. Connect SoCal identifies a significant number of infrastructure investments to assure that the region continues to be the leading trade gateway in the U.S. It does this by supporting physical improvements in marine terminals, highways, intermodal terminals, railroad mainlines, access routes, airports and international land border crossings that make up the goods movement network.

- **Last-Mile Freight.** Last-mile delivery represents the final leg for goods to customers. These deliveries happen in complex environments, including high-density regional locations, and they involve sophisticated interactions among physical infrastructure, and often compete for limited public space

with other modes. Ensuring that freight is properly included in policy considerations and street design necessitates tailored and nuanced strategies involving multidisciplinary approaches as identified in Connect SoCal.

- **Workforce Development.** Changing supply chains, automation and new technologies, and increasingly competitive wages from other sectors, will place growing pressure on goods movement related businesses to find qualified workers without raising costs and reduce the availability of jobs that have traditionally provided well-paying jobs to lower-skilled workers. Connect SoCal supports regional programs that raise awareness of the issue, reposition the image of goods movement jobs to reflect career mobility, promote increased participation by younger workers, and improve access for workers.

- **Truck Bottleneck Relief Strategy.** Connect SoCal identifies 48 truck bottlenecks in the region and allocates an estimated $5 billion toward strategies that relieve them, such as:
  - Ramp metering
  - Extending merging lanes
  - Improving ramps and interchanges
  - Adding auxiliary lanes

- **Industrial Warehouse & Distribution Centers.** SCAG will continue efforts to provide the most updated data on industrial warehouse building square footage and conduct further analyses to better reflect changes in industrial land uses, truck industry service types, and equipment usage for truck terminals due to e-commerce. This includes consideration of new area sub-category classifications such as seaport and air cargo terminals, and rail intermodal and classification yards. By further understanding industrial facilities, SCAG will be more equipped to explore strategies that support the effective integration between goods movement needs and regional land use patterns.

- **Goods Movement Environmental Strategy.** Connect SoCal proposes an environmental strategy to address the air quality impacts of goods movement, while also allowing for the efficient and safe movement of goods throughout the region. A critical component of this strategy is the integration of advanced technologies that have benefits such as air quality improvements, energy security, and economic growth opportunities. Connect SoCal articulates a process to accelerate the development and deployment of effective technologies, along with key action steps, to help the region reduce dangerous pollutants as much as possible. While this plan focuses on getting cleaner vehicles on the road quickly, this must be done with full life-cycle consideration of production, use and disposal

impacts. This plan reaffirms zero and near-zero emission technologies as a priority, describes progress to date, and outlines a framework and key action steps to reach that goal.

Aviation. SCAG, by definition, is primarily a regional surface transportation planning agency. Therefore, SCAG is focused on air passenger and cargo activity from the perspective of how the traffic coming and going from the airports affects the region's roads, highways, and transit systems, and how to improve ground transportation access to the airports. On a basic level, SCAG maintains an updated list of airport ground access improvements. However, SCAG has and will continue to play a role in terms of aviation systems research, planning, and analysis, as well as encouraging collaboration and communication amongst the region's aviation stakeholders. SCAGs aviation strategies include but are not limited to:

- Work with airports and transportation agencies on airport ground access projects
- Effective analysis and planning
- Ongoing communication and collaboration between airports, transportation agencies and other government agencies.

Emerging Technologies. SCAG recognizes that many new technologies provide consumer solutions and have made inroads in public acceptance due to advancements in smartphones, mobile banking, navigational apps and social networking. Improvements in regional mobility will therefore be derived from how technology is used rather than from any individual technological development. Moreover, strategies to use the benefits of emerging technologies to advance Connect SoCal goals should be viewed through the lens of improving health, safety, equity and mobility outcomes.

2.5.7 Public Health

The role of transportation and land use decisions on public health outcomes has been increasingly recognized by health advocates, planners, and transportation providers. Improving air quality has a direct impact on public health outcomes. Public health in the SCAG region is influenced by the Plan's impact on the area's air emissions levels and the exposure of the population to those emissions, as well as the opportunities for physical activities and recreation uses. The transportation and land use strategies included in the Plan are expected to improve public health outcomes across the region and to improve the quality of life for SCAG area residents. Thus, the Plan highlights many of the benefits for improving health outcomes and present opportunities to ensure that future projects equitably benefit all population groups in the region. Proposed transportation and land use strategies such as first mile/last mile improvements, regional bikeways and Safe Routes to School programs, are anticipated to increase the number of short trips and result in increased physical activity benefits. Including health-related measures

as part of the Plan therefore helps build an ongoing monitoring of the Plan's performance on public health.

Public health analysis under the Plan focuses on providing up to date public health data to support this analysis. Thus, the Plan has developed a framework to promote health and prolong life among the region's population by enhancing the social determinants or the circumstances in which people are born, grow up, live, work, play, and age. Economic opportunity, government policies, and the built environment play a role influencing public health outcomes, so are social determinants of health, including social and community environment, health and health care, neighborhood and built environment, education, and economic stability. The Plan, therefore, proposes seven focus areas that align with its goals to improving public health. These include access to essential destinations, air quality, climate resiliency, economic wellbeing, physical activity, housing, and transportation safety.

2.6 INTENDED USES OF THE PEIR

In compliance with the CEQA (Pub. Resources Code, Section 21000 et seq.), this PEIR describes the potential environmental impacts of the Plan. This PEIR is designed to fully inform SCAG's Regional Council, as well as responsible agencies, trustee agencies, interested agencies/organizations and persons, and the general public of the potential environmental effects of the proposed project and identified alternatives. SCAG is the Lead Agency for environmental review of this PEIR and intends to use this PEIR as part of its review and approval of the Plan.

While individual transportation projects are included in the Plan, this PEIR is programmatic in nature and the analysis considers impacts that would reasonably be expected in conjunction with the transportation investments and land use development patterns envisioned as part of the Plan; the potential for significant and unavoidable impacts after the consideration of feasible mitigation measures; and a range of feasible alternatives. Project-level analysis will be prepared by implementing agencies, serving as a lead agency under CEQA, with the authority and principal responsibility for approving or carrying out the individual projects. These agencies include the six counties and 191 cities in the region. Other project implementing agencies may include public transit providers, other public agencies such as air districts, Native American tribes, colleges and university transportation providers, and Caltrans among others.

It is the intent of SCAG that lead agencies and others use the information contained within the PEIR in order to "tier" subsequent environmental documentation of projects in the region. Such projects may include:

- transportation projects consistent with the SCS;

- planning projects consistent with the SCS (e.g., General Plans, Specific Plans, etc.); and
- development projects including residential, mixed-use, employment center and transit priority projects consistent with the SCS.

As described in more detail in **Chapter 1.0, Introduction**, for projects that may be eligible for CEQA streamlining, applicable mitigation measures from this PEIR can and should be incorporated into those projects as feasible and appropriate.

List of Permits or Other Approvals Required to Implement the Project

In order to implement the Plan, after certification of the PEIR, it must be approved by SCAG's Regional Council. Then, Connect SoCal requires a conformity determination under the CAA section 176(c). The Federal Highway Administration (FHWA) and the Federal Transit Administration (FTA) make the final determination of conformity on the Regional Transportation Plan elements. A FHWA/FTA air quality conformity determination for transportation (Conformity) is required for the Plan pursuant to the Environmental Protection Agency's (EPA) Transportation Conformity Rule, 40 CFR Parts 51 and 93, and the United States Department of Transportation's Final Rule on Statewide and Metropolitan Planning, 23 CFR Part 450. The conformity analysis that is submitted must indicate that all air quality conformity requirements have been met. Based on review by FHWA and FTA, and after consultation with the EPA Region 9 office, FHWA/FTA will make a finding that the Plan conforms to the applicable State Implementation Plan in accordance with the provisions of 40 CFR Parts 51 and 93.

Furthermore, under SB 375, the Plan is subject to review and approval by the California Air Resources Board (CARB). Specifically, the SCS component will be reviewed by CARB to determine whether the adopted SCS, if implemented, would meet the region's 2035 19 percent per capita greenhouse gas reduction target.

List of Environmental Review and Consultation Requirements

Federal consultation requirements include: 1) a process involving the MPO, state and local air quality planning agencies, state and local transportation agencies, the U.S. EPA, and the U.S. Department of Transportation; and 2) a proactive public involvement process that provides opportunity for public review and comment by, at a minimum, providing reasonable public access to technical and policy information considered by the agency.

SB 375 requires consultation with stakeholders, including affordable housing advocates, transportation advocates, neighborhood and community groups, environmental advocates, homebuilder

representatives, broad-based business organization, landowners, commercial property interests, homeowners associations, congestion management agencies, transportation agencies, local agency formation commission, and members of city councils and boards of supervisors.

3.0 ENVIRONMENTAL IMPACT ANALYSIS AND MITIGATION MEASURES

3.0.1 ENVIRONMENTAL IMPACT ANALYSIS

This section of the Program Environmental Impact Report (PEIR) evaluates the potential of the Plan to result in significant impacts to the environment. This section provides a full scope of environmental analysis in conformance with the California Environmental Quality Act Guidelines (*State CEQA Guidelines*).

As a result of the detailed evaluation contained in this PEIR, it has been determined that the Plan would result in potentially significant impacts to Aesthetics; Agriculture and Forestry Resources; Air Quality; Biological Resources; Cultural Resources; Geology and Soils, Greenhouse Gas Emissions; Hazards and Hazardous Materials; Hydrology and Water Quality; Land Use and Planning; Mineral Resources; Noise; Population and Housing, Public Services; Recreation; Transportation, Traffic, and Safety; Tribal Cultural Resources, Utilities and Service Systems and Wildfire. Although mitigation measures have been proposed for all of the above issue areas that would reduce the potentially significant impacts to the maximum extent practicable, impacts would remain significant and unavoidable, even with the implementation of mitigation measures.

Each section provides the regulatory framework, existing conditions, thresholds of significance, impact analysis, mitigation measures for significant impacts, and level of significance after mitigation. The applicable federal, state, regional, county, and local statutes and regulations that govern individual environmental resources that must be considered by SCAG in the decision-making process are included in the regulatory framework described for each environmental resource. The existing conditions portion of the analysis has been prepared in accordance with the *State CEQA Guidelines* and includes a description of the environment in the Plan area. The existing conditions are described based on literature review, archived resources, and agency coordination. Significance thresholds were established in accordance with Appendix G of the *State CEQA Guidelines*. The level of significance after mitigation was evaluated in accordance with the thresholds of significance and the effectiveness of the proposed mitigation measures to reduce potentially significant impacts to below the significance threshold. The impact analysis contained in this environmental document is based on the implementation of Connect SoCal as described in **Chapter 2.0, Project Description**.

3.0.2 MITIGATION MEASURES

The PEIR addresses a large-scale region with a variety of projects spread over more than 20 years. As such, this PEIR identifies regional-level mitigation measures to be implemented by SCAG over the lifetime of the Plan as well as project-level mitigation measures for lead agencies to consider, as applicable and feasible, in subsequent project-specific design, CEQA review, and decision-making processes. As described in more detail in **Chapter 1.0, Introduction**, it is ultimately up to the lead agency to determine the appropriateness of the mitigation measures based on project-specific circumstances. As appropriate and authorized by the *CEQA Guidelines* and case law, the mitigation measures to be implemented by SCAG in this PEIR are less detailed than those that would be part of a project EIR and the more detailed project-level, performance standards-based mitigation measures are properly deferred to future project-specific CEQA reviews.

Since SCAG has no authority to require specific mitigation measures at the project level, and lead or responsible agencies have the discretion to determine which mitigation measures are applicable and feasible based on the location-specific circumstances, identification of programmatic mitigation measures fulfill SCAG's responsibility, that may be considered (among others) for implementation by lead, responsible, or trustee agencies in the region as applicable and feasible.

The mitigation measures presented in this PEIR recognize the limits of SCAG's authority; distinguish between SCAG commitments and project-level responsibilities and authorities; optimize flexibility for project implementation; and facilitate CEQA streamlining and tiering where appropriate on a project-by-project basis determined by each lead agency.

3.1 AESTHETICS

This section of the Program Environmental Impact Report (PEIR) describes the existing visual characteristics within the SCAG region, identifies the regulatory framework with respect to laws and regulations that address aesthetic resources, and analyzes the significance of the potential impacts in visual character that could result from development of the Connect SoCal Plan ("Connect SoCal"; "Plan"). In addition, this PEIR provides regional-scale mitigation measures, as well as project-level mitigation measures to be considered by lead agencies for subsequent, site-specific environmental review to reduce identified impacts as appropriate and feasible.

3.1.1 ENVIRONMENTAL SETTING

3.1.1.1 Definitions

To provide context for the analysis presented below, a discussion of general definitions is necessary. Terms discussed include "viewsheds" and "visual quality," both key factors in addressing impacts to aesthetics and views. The environmental setting also generally describes regionally significant resources and lists the designated scenic highways, byways, and vista points.

The aesthetic value of an area is a measure of its visual character and quality, combined with the viewer response to the area. The scenic quality component can best be described as the overall impression that an individual viewer retains after driving though, walking though, or flying over an area. Viewer response is a combination of viewer exposure and viewer sensitivity. Viewer exposure is a function of the number of viewers, the number of views seen, the distance of the viewers, and the viewing duration. Viewer sensitivity relates to the extent of the public's concern for particular viewsheds.

Terms and criteria used in the assessment of visual resources are described below.

Degree of visibility: The extent to which transportation improvements and/or anticipated development can be seen. This refers to a large extent on route alignment and configuration (i.e., elevated, at grade, depressed, or underground) of the transportation improvement and location, height/bulk, construction materials (reflectivity, color) of development. Generally, elevated grade transportation investments have a more substantial impact on aesthetics and views. The taller a development, in general, the greater the potential for impact.

Glare: Perceived glare is the unwanted and potentially objectionable sensation as observed by a person looking directly into the light source (e.g., the sun, the sun's reflection, automobile headlights, or other light fixtures). Reflective surfaces on existing buildings, car windshields, etc., can expose people and

property to varying levels of glare. Glare is typically a daytime condition where the sun reflects off a particular building, while lighting effects often occur when new nighttime sources of lighting are introduced into an area.

Scale: The size and proportion, and of transportation improvements and development in relation to the massing of the structures and buildings in surrounding area.

Scenic Resources: Significant visual resources identified by local planning documents that can be maintained and enhanced to promote a positive image in the community, such as natural open spaces, topographic formations, and landscapes that contribute to a high level of visual quality. Natural landforms and landscapes are often established as scenic resources, such as lakes, rivers and streams, mountain meadows, and oak woodlands. However, scenic resources can also include man-made open spaces and the built environment, such as parks, trails, nature preserves, sculpture gardens, and similar features.

State-designated Scenic Highway: The State Scenic Highway Program was created in 1963 to protect and enhance the natural scenic beauty of California highways and adjacent corridors through special conservation treatment, a highway may be designated scenic depending upon how much of the natural landscape can be seen by travelers, the scenic quality of the landscape, and the extent to which development intrudes upon the traveler's enjoyment of the view.[1]

Viewshed: A viewshed is a geographic area composed of land, water, biotic and/or cultural elements seen from one or more viewpoints and has inherent scenic qualities and/or aesthetic value as determined by those who view it. A viewshed's extent can be limited by a number of intervening elements, including trees and other vegetation, built structures, or topography such as hills and mountains.

Visual Quality: Visual quality refers to the character of the landscape, which generally gives visual value to a setting.[2,3] Various jurisdictions, within the County such as cities, the county, and federal or regional agencies, provide guidelines regarding the preservation and enhancement of visual quality in their plans

---

1 Los Angeles County Department of Regional Planning. 1965. *Regional Recreation Areas Plan*. Available at: http://planning.lacounty.gov/assets/upl/project/gp_web80-regional-recreation-areas-plan.pdf, accessed August 20, 2019.

2 US DOT, Federal Highway Administration. *Guidelines for the Visual Impact Assessments of Highway Projects*. Available at: https://www.environment.fhwa.dot.gov/env_topics/other_topics/VIA_Guidelines_for_Highway_Projects.pdf, accessed October 2018.

3 The term "visual quality" is used synonymously with "scenic quality" in this document.

or regulations.[4] An example of such guidance is the Caltrans Scenic Highway Visual Quality Program Intrusion Examples, which are presented in **Table 3.1-1, Caltrans Scenic Highways Program: Examples of Visual Quality Intrusions**. As that table illustrates, a given visual element may be considered desirable or undesirable, depending on design, location, use, and other considerations. Because of the size and diversity of the SCAG region, it is not possible or appropriate to apply uniform standards to all areas within the region.

Table 3.1-1
Caltrans Scenic Highways Program: Examples of Visual Quality Intrusions

Land Use Type	Minor Intrusion	Moderate Intrusion	Major Intrusion
Buildings: Residential, Commercial, Industrial Development	Widely dispersed buildings. Natural landscape dominates. Wide setbacks and buildings screened from roadway. Exterior colors and materials are compatible with environment. Buildings have cultural or historical significance.	Increased number of buildings but are complementary to the landscape. Smaller setbacks and lack of roadway screening. Buildings do not degrade or obstruct scenic view.	Dense and continuous development. Highly reflective surfaces. Buildings poorly maintained. Visible blight. Development along ridgelines. Buildings degrade or obstruct scenic view.
Unsightly Land Uses: Dumps, Quarries, Concrete Plants, Tank Farms, Auto Dismantling	Screened from view so that facility is not visible from the highway.	Not screened from view and visible but programmed/funded for removal and site restoration.	Not screened from view and visible by motorists. Will not be removed or modified. Scenic view is degraded.
Strip Malls		Neat and well landscaped. Blend with surroundings	Not harmonious with surroundings. Poorly maintained or vacant. Blighted, Development degrades or obstructs scenic view.
Parking Lots	Screened from view so that vehicles and pavement are not visible from the highway	Neat and well landscaped. Blend with surroundings	Not screened or landscaped. Scenic view is degraded.
Off-Site Advertising Structures			Billboards degrade or obstruct scenic view
Noise Barriers		Noise barriers are well landscaped and complement the natural landscape. Noise barriers do not degrade or obstruct views.	Noise barriers obstruct scenic view.
Power Lines	Not easily visible from road.	Visible, but compatible with surroundings	Poles and lines dominate view. Scenic view is degraded.
Agriculture: Structures, Equipment, Crops	Blends in and complements scenic view. Indicative of regional culture.	Not in harmony with surroundings. Competes with natural landscape for visual dominance.	Incompatible with and dominates natural landscape. Structures equipment or crops degrade scenic view.
Exotic Vegetation	Used as screening and landscaping. Blends in and complements scenic view.	Competes with native vegetation for visual dominance.	Incompatible with and dominates natural landscape. Structures equipment or crops degrade scenic view.

4 California cities and counties are not required to include visual quality elements in their General Plans, although many do. However, the General Plans are required to include a Conservation Element, which includes resources such as waterways and forests that frequently are also scenic resources.

Land Use Type	Minor Intrusion	Moderate Intrusion	Major Intrusion
Clearcutting		Tress bordering highway remains so that clearcutting is not evident.	Clearcutting or deforestation is evident. Scenic view is degraded.
Erosion	Minor soil erosion.	Slopes beginning to erode. Not stabilized.	Large slope failures and no vegetation. Scenic view is degraded.
Grading	Grading blends with adjacent landforms and topography.	Some changes, but restoration is taking place.	Extensive cut and fill. Scarred hillsides and landscape. Canyons filled in. Scenic view is degraded.
Road Design	Blends in and complements scenic view. Roadway structures are suitable for location and compatible with surroundings.	Cut and fill is visible but has vegetative cover.	

Source: Caltrans. Scenic Highways Program, 1996.

Scenic resources can include natural open spaces, topographic formations, landscapes, and manmade features. Many people associate natural landforms and landscapes with scenic resources, such as woodlands, lakes, rivers, streams, mountains, habitat, and agricultural lands. Scenic resources can also include urban open spaces and the built environment. Examples of these would include urban parks, trails, and nature centers, archaeological and historical resources, and man-made structures like buildings and bridges with unique architectural features. Tall buildings may also provide excellent views of scenic resources beyond the urban core. Typically, jurisdictions identify designated scenic resources, or some similar classification system, to identify priority scenic resources. These designated scenic resources are the focus of this chapter.

In urban areas, roadway rights-of-way comprise 20 to 30 percent of the total land area. As a result, transportation systems have a major influence on human perception of the visual environment. As most vehicular movement occurs along transportation corridors, their placement largely determines what parts of the area will be seen. Even for people not using the transportation system at a particular time, or who never use certain modes of travel, transportation systems are usually a dominant element of the visual environment. Air quality and visibility affect view sheds and visual quality. In the SCAG region, under certain weather conditions, pollutant emissions combined with poor natural ventilation in the air basin result in degraded visibility. Of particular note is photochemical smog and airborne particulates, finely divided solids or liquids, such as soot, dust, aerosols, and mists that absorb sunlight, producing haze and reducing visibility.

It is useful to think of scenic resources in terms of "typical views" seen throughout the SCAG region because scenic resources are rarely encountered in isolation. A typical view may include several types of scenic resources, including both natural and man-made elements. The typical views seen within the

SCAG region are outlined in the following paragraphs. It is important to distinguish between public and private views. Private views are views seen from privately owned land and are typically viewed by individual viewers, including views from private residences.

Public views are those experienced by the collective public. These include views of significant landscape features such as San Gorgonio Mountain or the Salton Sea, as seen from public viewing spaces, not privately owned properties. The analysis below addresses public views and not private views, since obstruction of private views is not generally regarded as a significant environmental impact. (See *Citizens for Responsible and Open Government v. City of Grand Terrace* (2008) 160 Cal.App.4th 1323, 1337-38; *Mira Mar Mobile Community v. City of Oceanside* (2004) 119 Cal.App.4th 477, 492-93). California Environmental Quality Act (CEQA) (Pub. Resources Code, § 21000 *et seq*.) case law has established that in general protection of public views is emphasized. For example, in *Association for Protection etc. Values v. City of Ukiah* (1991) 2 Cal. App. 4th 720 [3 Cal. Rptr.2d 488] the court determined that:

> *We must differentiate between adverse impacts upon particular persons and adverse impacts upon the environment of persons in general. As recognized by the court in Topanga Beach Renters Assn. v. Department of General Services (1976) 58 Cal.App.3d 188 [129 Cal.Rptr. 739]: '[A]ll government activity has some direct or indirect adverse effect on some persons. The issue is not whether [the project] will adversely affect particular persons but whether [the project] will adversely affect the environment of persons in general.'*

Therefore, this analysis considers only public views in analyzing the visual impacts of implementing the Plan.

3.1.1.2 Existing Conditions

This section characterizes the baseline conditions for scenic vistas, scenic resources within scenic highway corridors, visual character and quality, sources of light and glare and other scenic resources afforded protection pursuant to county and city general plans. The SCAG region ranges in character from urban centers, to rural agricultural lands, to natural woodlands, to mountains and canyons, to lakes and waterways, to beaches and the Pacific Ocean.

The visual quality and character of the SCAG region is a function of the dramatic physical environment, ringed by two mountain ranges, the peninsular and transverse ranges; two deserts, the Mojave and Colorado; sandy beaches and marine terraces along the approximately 150-mile western margin of the SCAG region where the land meets the Pacific Ocean; and the Channel Islands that parallel the coastline. The highway and transportation system in the SCAG region provides a wide variety of opportunities for enjoying the Southern California scenery and travelling to some of the state's most popular destinations.

Geomorphic Regions

The six-county SCAG region is comprised of six of California's geomorphic regions: the Basin and Range province, the Coast Ranges, Colorado Desert province, the Mojave Desert, the Peninsular Ranges, and the Transverse Ranges. The geomorphic provinces and the valuable aesthetic resources they contain are described below.[5]

Basin and Range Province

The SCAG portion of the Basin and Range province lies within San Bernardino County. The province represents the westernmost part of the Great Basin and is characterized by interior drainage with lakes and playas, and abrupt changes in elevation.

Coast Ranges

Within the SCAG region, Coast Ranges are located in the counties of Ventura and Los Angeles. The Ranges are north-west trending mountain ranges, rising between 2,000 and 6,000 feet above sea level, and the valleys associated with them. The SCAG portion of the Coast Ranges is subparallel to the Rift Valley of the San Andreas Fault and is composed of granitic rock.

Colorado Desert Province

San Bernardino, Imperial, and Riverside counties are home to the Colorado Desert province within the SCAG region. The basin lies approximately 245 feet below sea level and contains the Salton Sea, California's largest lake. The landscape is dry and barren and is characterized by the ancient beach lines and silt deposits of extinct Lake Cahuilla.

The Mojave Desert

The Mojave province within the SCAG region is located in Imperial, Los Angeles, Riverside, and San Bernardino counties. As the name suggests, it is composed of broad desert plains but also isolated mountain ranges. The interior region lies between the Garlock Fault and the San Andreas Fault and has enclosed drainage and various playas.

---

5 American Geosciences Institute. *California's Geomorphic Provinces*. Available at: www.americangeosciences.org/sites/default/files/earthcomm-edg-ca-c1a6q2r1.doc, accessed October 19, 2018.

Peninsular Ranges

The Peninsular Ranges make up a large portion of the SCAG region and are prevalent in Imperial, Los Angeles, Orange, Riverside, and San Bernardino counties. The series of ranges is similar to the Coast Ranges but is characterized by granitic rock intruding metamorphic rock. The province is bound to the east by the Colorado Desert and includes the Los Angeles Basin, Santa Catalina, Santa Barbara, and San Clemente and San Nicolas islands.

Transverse Ranges

The Transverse Ranges are located in Los Angeles, Riverside, San Bernardino, and Ventura counties of the SCAG region. The series of mountain ranges and valleys trend east-west and are bordered by the Santa Cruz Islands to the west and the San Bernardino Mountains to the east. The ranges are characterized by oil-rich sedimentary rock and include the San Gabriel, Tehachapi, Santa Monica, and Santa Susana Mountains. The province also contains the Los Padres, Angeles, and San Bernardino national forests.

Visual Character and Quality

Natural features include land and water resources such as parks and open areas, wilderness areas, beaches, and natural water resources. Man-made lakes are included as elements of the visual environment that have been constructed to resemble natural features. The loss of natural aesthetic features, reduction of vistas, or the introduction of contrasting urban features may diminish the value of natural resources in the region. Views of the coast from locations in Ventura, Los Angeles and Orange Counties are considered valuable visual resources.[6,7,8] Views of various mountain ranges are also widely prevalent throughout the region. Rivers, streams, creeks, lakes, and reservoirs located in the region may also be visually significant. Features of the built environment that may also have visual significance include individual or groups of structures that are distinctive due to their aesthetic, historical, social, or cultural significance or characteristics. Examples of the built environment that may be visually significant

7 Orange County Public Works OC Development Services. 2012. *Orange County General Plan. Chapter VI Resources Element.* Available online at: http://ocplanning.net/civicax/filebank/blobdload.aspx?blobid=40235, accessed March 19, 2019.

8 Ventura County. 2011. *Ventura County General Plan: Resources Appendix*. June. Available online at: https://docs.vcrma.org/images/pdf/planning/plans/General-Plan-Resources-Appendix.pdf, accessed March 19, 2019.

include bridges or overpasses, architecturally appealing buildings or groups of buildings, landscaped freeways, and a location where a historic event occurred.

In the approximately 38,000 square mile SCAG region, there are approximately 1,352 square miles of urban land use, 1,299 square miles of a suburban land use, and 35,145 square miles of rural land use.[9] The counties of Imperial, Riverside, San Bernardino, and Ventura are comprised of more than 90 percent rural land uses, with approximately 73.8 percent of land in Los Angeles County characterized by rural land uses and approximately 52.1 percent of land in Orange County characterized by rural land uses. (**Table 3.1-2, Urban, Suburban, and Rural Land Use Patterns by County; Figure 3.1-1, Land Use Pattern in SCAG Region**).

Table 3.1-2
Urban, Suburban, and Rural Land Use Patterns by County

County	Urban Land Use Pattern (Square Miles)	Percent Urban Land of Overall Area	Suburban Land Use Pattern (Square Miles)	Percent Suburban Land of Overall Area	Rural Land Use Pattern (Square Miles)	Percent Rural Land of Overall Area
Imperial	77.8	1.8	34.6	0.8	4,327.0	97.5
Los Angeles	465.6	12.3	522.8	13.8	2,789.8	73.8
Orange	144.9	20.6	191.9	27.3	366.0	52.1
Riverside	82.2	4.5	85.1	4.7	1,647.5	90.8
San Bernardino	348.9	1.8	234.5	1.2	19,348.1	97.1
Ventura	233.2	3.3	230.8	3.2	6,667.2	93.5
SCAG region	**1,352.5**	**3.6**	**1,299.8**	**3.4**	**35,145.8**	**93.0**

Note: Portions of each County have not been categorized, which means that percentages may not add up to 100 percent.
Source: SCAG Existing Land Uses (03/2017). Land use patterns have been interpreted from the following existing land use categories:

- ***Urban**: multi-family residential, general office, commercial and services, facilities, education, industrial, transportation/communications/utilities, mixed commercial and industrial, and under construction.*
- ***Suburban** : single-family residential, mobile homes and trailer parks, mixed residential, and mixed residential and commercial*
- ***Rural**: rural residential, military installations, open space and recreation, agriculture, vacant, water, undevelopable, and unknown*

Most existing urban development is found along the coastal plains of Los Angeles, Orange, and Ventura Counties, as well as in adjoining valleys that extend inland from the coastal areas. Urban development also has moved into the inland valleys such as the Antelope, San Bernardino, Yucca, Moreno, Hemet–San Jacinto, Coachella, and Imperial Valleys. Downtown Los Angeles is the largest urbanized center within the SCAG region. Other high-density urbanized areas include other centers within the City of Los Angeles (Century City, Hollywood, Warner Center), as well as the downtown areas of other cities

9 SCAG, 2019 Modeling SPM output September 13, 2019

including the cities of Long Beach, Burbank, Glendale, Pasadena, and Pomona in Los Angeles County; Riverside in Riverside County; San Bernardino in San Bernardino County; Santa Ana, Anaheim, and Irvine in Orange County; Oxnard and Ventura in Ventura County; and El Centro in Imperial County. The urban form is limited by national forests, mountains, and the coast. The majority of medium- and high-density housing in the region is found in the urban core of the region, in Downtown Los Angeles, East Los Angeles, and the "West Side" of Los Angeles.

Several beach communities, such as the Cities of Santa Monica, Manhattan Beach, Hermosa Beach, Redondo Beach, Huntington Beach, and Newport Beach, have high density areas close to the ocean. Surrounding suburbs are predominantly low-density housing tracts typically interspersed with low-scale commercial corridors. Low-density housing, with interspersed low-density commercial areas expands west into Ventura County, east through southeast Los Angeles County, throughout much of Orange County, and through the western Inland Empire. The resort communities and cities of the Coachella Valley in Riverside County also are built primarily on a low-density scale. The developing land on the urban fringe, such as the Antelope Valley of Los Angeles County and the Victorville-Hesperia area, Lucerne Valley, and Yucca Valley of San Bernardino County, also are primarily low-density residential. The Imperial Valley in Imperial County is primarily an agricultural region with a growing, yet still regionally small, population that lives in primarily low-density developments. According to the California Department of Conservation, there are approximately 2.6 million acres of agricultural lands in the SCAG region: approximately 1.12 million acres of farmland and approximately 1.48 million acres of grazing land/rangeland (see **Section 3.2, Agriculture and Forestry Resources**).

Visual Resources

The loss of natural aesthetic features, reduction of vistas, or the introduction of contrasting urban features may diminish the value of natural resources in the region. Natural features include land and open spaces such as park and open space areas, mountain areas, and natural water sources. Included, as natural features, are elements of the visual environment, which have been constructed to resemble natural features, such as man-made lakes.

Views of the various mountain ranges from locations in the region are considered valuable visual resources, as are views of the coast from locations in Ventura, Los Angeles, and Orange counties.[10,11,12]

---

10 Los Angeles County Department of Regional Planning. Adopted October 2015. *Los Angeles County General Plan. Chapter 9: Conservation and Natural Resources Element. Section VII. Scenic Resources.* Available at: http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan-ch9.pdf, accessed October 19, 2018.

11 Orange County Public Works OC Development Services. July 2014. *Orange County General Plan. Chapter VI Resources Element*. Available at: http://ocplanning.net/civicax/filebank/blobdload.aspx?blobid=40235, accessed October 19, 2018.

Other natural features that may contain visual significance include the numerous rivers, streams, creeks, lakes, and reservoirs located within the region. Features of the built environment that may have visual significance include individual or groups of structures that are distinctive due to their aesthetic, historical, social, or cultural significance or characteristics. Examples of the visually significant built environment may include bridges or overpasses, architecturally appealing buildings or groups of buildings, landscaped freeways, or a location where an historic event occurred.

Scenic Vistas

There are nine Caltrans-designated vista points in the SCAG region (**Table 3.1-3, Caltrans Designated Vista Points**).

Table 3.1-3
Caltrans Designated Vista Points

County	Name	Route	Post Mile
Los Angeles	Lamont Odett	14	57.8
Riverside	Coachella Valley	74	87.6
Riverside	Indian Hill Road	243	13.8
San Bernardino	Bear Valley Dam	18	44.2
San Bernardino	Donald S. Wieman	18	21.4
San Bernardino	Eyes of the World	38	14.2
San Bernardino	Mill Creek	38	10.7
San Bernardino	Silverwood Lake	138	3.6
San Bernardino	Silverwood Lake 2	138	3.6

Source: Department of Transportation. 2015. Caltrans GIS Data- California Vista Points. August. Available online at: http://www.dot.ca.gov/hq/tsip/gis/datalibrary/Metadata/Vista.html, accessed March 19, 2019.

There are no county-designated Vista Points within the county general plans for Imperial, Orange, Riverside, San Bernardino, or Ventura Counties; however, these general plans emphasize protection of scenic vistas from scenic routes/drives/highways and identify scenic resources and landmarks for which the scenic background and natural resources of the area should be preserved. Los Angeles County has designated scenic vistas within the Santa Monica Mountains Local Coastal Program.[13]

12 Ventura County. June 2011. *Ventura County General Plan: Resources Appendix*. Available at: http://www.ventura.org/rma/planning/pdf/plans/General-Plan-Resources-Appendix-6-28-11.pdf, accessed October 19, 2018.

Scenic Resources within Scenic Highway Corridors

There are two National Scenic Byways, two BLM Back Country Byways, and three National Forest Scenic Byways in the SCAG region:

- National Scenic Byways
  - Arroyo Seco Historic Parkway – Route 110 (9.5 miles) (Los Angeles County) [14]
  - Parker Dam Road (11 miles) (San Bernardino County)[15]
- State Scenic Byways
  - Twentynine Palms Highway- Route 62 (9 miles) (Riverside County)[16]
  - Ramona Expressway (24 miles) (Riverside County)[17]
  - Route 74 (68 miles) (Riverside County)[18]
- BLM Scenic Areas and Back Country Byways
  - Bradshaw Trail Back Country Byway (67 miles) (Riverside County, Imperial County)[19]
  - Wild Horse Canyon Scenic Backcountry Byway (11 miles) (San Bernardino County)[20]
- National Forest Scenic Byways
  - Angeles Crest Scenic Byway (Route 2)[21]

- Rim of the World Scenic Byway (107 miles) (San Bernardino County)[22]
- Palms to Pines Scenic Byway (67 miles) (Riverside County)[23]

Portions of eight State Routes in the SCAG region have been designated by Caltrans as State Scenic Highways (**Table 3.1-4, Officially Designated State Scenic Highways,** and **Figure 3.1-2, State Designated and Eligible Scenic Highways and Vista Points**).

Table 3.1-4
Officially Designated State Scenic Highways

Route	County	Location	Miles
2	Los Angeles	From 2.7 miles north of State Route 210 (at La Canada) to San Bernardino County Line	55.1
27	Los Angeles	Topanga Canyon State Scenic Highway	2.5
33	Ventura	From 6.4 miles north of SR-150 to Santa Barbara County Line	39.9
38	San Bernardino	From 0.1 mile east of South Fork Campground to 2.9 miles south of SR-18 at State Line	15.7
62	Riverside	From SR-10 north to the San Bernardino County Line	9.2
74	Riverside	From western boundary of the San Bernardino National Forest to SR-111 in Palm Desert	47.7
91	Orange	From SR-55 to eastern city limit of Anaheim	4.2
243	Riverside	From SR-74 to the Banning City limit	28.2

As of 2015, there are 5,045 state agency bridges on the California State Highway system and 3,699 local agency bridges that are located within the SCAG region, eight of which are listed on the National Register of Historic Places (NRHP), 80 of which are eligible for NRHP, five of which are potentially eligible for NRHP, 286 for which the historical significance has not been determined, and 8,365 of which are not eligible for NRHP (**Table 3.1-7, Historical Significance of State and Local Agency Bridges**).[24]

Transportation Facilities

As noted above in **Tables 3.1-3** through **3.1-6**, many public views in the SCAG region are from arterial and freeway routes and the freeways themselves are a visual component of the landscape. The location of roadways largely determines which parts of the region will be seen, with some roadways gaining notoriety from the views they provide, such as the Pacific Coast Highway, which runs along the entire coastal side of the SCAG region. Elements of the transportation infrastructure, including roadways, airports, railroads, and seaports are a component of the visual character of the urban environment. A discussion of these components is provided below.

Freeways, Highways, and Roadways

In urban areas, roadway rights-of-way make up approximately 20 to 30 percent of the total land area. Because most vehicular movement occurs along transportation corridors, their placement largely determines what parts of the SCAG region will be seen by persons traveling in the area. In the SCAG region, arterials and freeways constitute a major component of the existing visual environment. The visual character of freeways themselves depends on the scale at which observers view them. Above and from a distance, freeway traffic forms a compelling contribution to the scenery, whether by lights moving at night or by the changing visual character of daytime traffic. From below and at close range, freeways (including associated sound walls and safety railings) are often barriers to views of near and distant scenery. Arterials and freeways make up a major component of the existing visual environment of the region. Arterials in the SCAG region offer a variety of visual experiences from the uncrowded, narrow winding roads in mountain areas to the high-volume urban streets in the densely populated areas of Los Angeles and Orange Counties. Many arterials have been built connecting urban concentrations with natural areas with key scenic resources. Examples include:

- The Pacific Coast Highway 1 (PCH) traverses the entire coastal side of the SCAG region. Proceeding northward, PCH enters the region at Dana Point in Orange County and follows the shoreline of the Pacific Ocean, illuminating its beaches and rugged cliffs, through Los Angeles and Ventura Counties, where it continues on to Northern California.[25]

- The 50-mile Santa Monica Mulholland Scenic Corridor runs westward from the Hollywood Freeway (U.S. 101), winding its way through the Santa Monica Mountains to Leo Carrillo State Beach in Malibu.[26]

- The 15-mile Palos Verdes Scenic Drive begins at Palos Verdes Estates and goes to Point Fermin Park in the community of San Pedro. The cliff-top section of the road offers many scenic views.

In addition, county and local roads in foothill and mountain areas also afford panoramic views throughout the region. Examples of areas with these types of views include:

- Los Angeles County: Santa Monica Mountains, San Gabriel Mountains, Verdugo Mountains, Santa Susana Mountains (also in Ventura County), San Jose Hills, Puente Hills

- Orange County: San Joaquin Hills, Anaheim Hills, and Santa Ana Mountains

26 Mountains Recreation & Conservation Authority. *Mulholland Scenic Parkway and Corridor*. Accessed online at: https://mrca.ca.gov/parks/park-listing/mulholland-scenic-parkway-and-corridor/, accessed August 20, 2019.

- Riverside County: San Jacinto Mountains
- San Bernardino County: Chino Hills and San Bernardino Mountains
- Ventura County: Simi Hills, Santa Susana Mountains, Santa Monica Mountains

Mountainous portions of Imperial County are not generally accessible from county roads. Large areas in the Chocolate Mountains are owned by the military and are not accessible to civilians.

Trains

Passenger rail operations (i.e., Amtrak, Metrolink, Metro) occupy existing railroad tracks and right-of-way areas and generally limited in terms of routes and overall passengers served. Except in predominantly residential areas, the view of passenger trains (at-grade or elevated guideways) is not generally considered visually offensive to most viewers. Conversely, passenger rail operations afford riders a variety of views. In Ventura County, for example, Amtrak provides scenic views of the coastline and adjacent mountains. Because of their prevalence in the urban core at relatively low elevations, passenger rail operations in the SCAG region provide accessible views of scenic resources comparable to those associated with freeways, highways, and roadways.

Freight railroads and associated rail yards are often considered to have a negative aesthetic effect in many urban communities. This perception is largely due to graffiti associated with rail cars and rail yards, unsightly building facilities, and viewshed blockage. Additional factors include building scale and utilitarian architectural style, visual intrusiveness on surrounding land uses, and community context (i.e., predominately industrial vs. residential uses). Negative opinions are particularly acute within adjacent residential communities. Views of freight railroads (i.e., rail cars) and rail yard facilities are largely limited, due, in part, to topography, security fencing, and limits on operation within urban communities. However, some facilities are visible from adjacent roadways, along freeways, highways, railroad right-of-ways, and hillside areas. Rail yard facilities within the SCAG region are predominately located within industrial core areas and include the Port of Los Angeles, Long Beach, East Los Angeles, Hobart, City of Industry (Los Angeles County), West Colton, and Burlington Northern/Santa Fe (BNSF) (San Bernardino County). Additional freight facilities are also located in less densely populated areas such as Barstow and Yermo (San Bernardino County).

Airports

The SCAG region includes numerous airports serving both commercial and private airplane flights. Major commercial airports in the region include Los Angeles International Airport (LAX), Palmdale Airport, Long Beach Airport, and Burbank Airport in Los Angeles County; John Wayne Airport in

Orange County; Ontario International Airport, San Bernardino International Airport, and Southern California Logistics Airport in San Bernardino County; and Palm Springs International Airport and March Inland Port in Riverside County. From an aesthetic resources standpoint, the proximity of aviation facilities to residential areas is considered to have a negative impact due to the industrial nature of aviation facilities and their attraction of related industrial uses including warehousing and freight-based businesses. Direct views of aviation operations at airports, views of takeoffs and landings, and the prevalence of trucks and vehicular congestion near aviation facilities all contribute to the perceived negative aesthetic effects of airports on residential areas. Although some people enjoy watching planes take off and land.

Within the SCAG region, proximal views of takeoffs and landings of large commercial aircraft occur near all major commercial airports. Proximal, but temporary, passing views of aviation facilities and airport operations are also prevalent from highways and major arterials serving these facilities. Near LAX, residents of Inglewood, El Segundo, Playa del Rey, and Westchester are exposed to these types of views. Residential areas in Palmdale, Lancaster, and unincorporated Los Angeles County are proximal to flights at the Palmdale facility. Long Beach and Signal Hill residents have views of takeoffs and landings at the Long Beach Airport. Residents in Tustin, Newport Beach, Irvine, and Costa Mesa are located in proximity to the John Wayne Airport. Residential and resort housing is located close to the Palm Springs Airport. Moreno Valley and Riverside residents have the closest views of flights from March Inland Port. Residential areas in San Bernardino, Colton, and Redlands have views of flights at the San Bernardino International Airport. Ontario residents have the closest views of flights from the Ontario International Airport. Victorville residents have the closest views of flights from the Southern California Logistics Airport.

To a lesser degree, similar conditions are experienced near general aviation facilities throughout the region, although air traffic is considerably less than at commercial aviation facilities. In general, there is a great deal less air traffic and therefore less population exposed to this traffic at general aviation facilities than near commercial facilities. However, several general aviation facilities (e.g., Santa Monica, Hawthorne, Van Nuys) are located near urban residential areas.

Ports

The adjacent shipping ports of Los Angeles and Long Beach represent the major shipping location in the SCAG region and also one of the most important shipping locations in the United States. Smaller ports include Port Hueneme in Ventura County, Redondo Beach Harbor in Los Angeles County, and Dana Point Harbor in Orange County. Proximity to rail and air transport facilities increases the utility and importance of these ports. Because of security and safety concerns, ports generally block public access to

the waterfront within the port, limiting visual access as well. However, provisions of the California Coastal Act provide for public access to the coast elsewhere in the SCAG region.

Port facilities in Los Angeles and Long Beach offer views of container terminals, cranes, other types of loading equipment, and ships carrying cargo in and out of the ports. Operations in the Port of Los Angeles are visible in portions of the San Pedro area (City of Los Angeles). Port facilities in Long Beach are widely visible from downtown Long Beach, portions of West Long Beach, and along the shoreline south of downtown. Port of Long Beach facilities are also visible from two of the city's major tourist attractions along Queensway Bay: the Queen Mary and the Aquarium of the Pacific.

Light and Glare

The more urbanized areas of the SCAG region tend to produce high levels of nighttime light, daytime glare from reflective materials such as glass building facades and wide stretches of asphalt roads, and shadows on adjacent outdoor land uses from tall buildings and structures (**Table 3.1-8, Existing Sources of Nighttime Light in SCAG Region**). Suburban areas tend to produce high levels of nighttime light and daytime glare but lower levels of shadows on shade-sensitive uses due to lower building heights. Rural areas tend to produce low levels of nighttime light; low to moderate levels of daytime glare, as agricultural structures and paved roads produce some glare; and very low levels of shadows from taller structures due to the distance between structures.

Some communities are becoming more sensitive to sources of nighttime lighting and are adopting dark sky ordinances to encourage lower level lighting in order to facilitate enjoyment of the nighttime sky (as well as avoiding impacting local observatories), avoid impacts to wildlife and natural areas, encourage energy savings (e.g., City of Malibu[27] and County of Los Angeles[28]).

28 County of Los Angeles, http://planning.lacounty.gov/view/rural_outdoor_lighting_district_ordinance/, accessed March 20, 2019

Table 3.1-8
Existing Sources of Nighttime Light in SCAG Region

County	Approximate Percentage of Light and Dark Sky Area at Night	Characterization of Nighttime Light Levels
Imperial	5% light; 95% dark	Very low throughout most of county, with brightly lit areas in the urbanized southern portion of the County adjacent to the City of Mexicali, scattered in the locations of larger communities, and in the city of El Centro.
Los Angeles	50% light; 50% dark	High levels of nighttime light in the urbanized southern half of the county including the cities of Long Beach, Los Angeles, and Pomona. The cities of Santa Clarita, Palmdale and Lancaster are also brightly lit areas within the county. The darker areas include the Santa Monica Mountains, Los Padres National Forest, Angeles National Forest, and the rural desert communities in the northern portion of the county.
Orange	80% light; 20% dark	High levels of nighttime light in the county, with two darker areas: the mountains northwest of Laguna Beach and Cleveland National Forest on the eastern side of the county.
Riverside	15% light; 85% dark	Very low throughout most of county, with brightly lit areas in the urbanized western portion of the county including the city of Riverside, scattered in the locations of larger communities, and in the cities of Palm Springs and Temecula.
San Bernardino	5% light; 95% dark	Very low throughout most of county, with brightly lit areas in the urbanized southwestern portion of the county, scattered in the locations of larger communities, and in the city of Victorville.
Ventura	25% light; 75% dark	Very low throughout most of county, with brightly lit areas in the urbanized southern portion of the county, scattered in the locations of larger communities, and in the cities of Oxnard and Thousand Oaks. The darker area includes the Los Padres National Forest.

3.1.2 REGULATORY FRAMEWORK

3.1.2.1 Federal

Section 4(f) of the U.S. Department of Transportation Act

Section 4(f) refers to the original section within the U.S. Department of Transportation Act of 1966 that provided for consideration of park and recreation lands, wildlife and waterfowl refuges, and historic sites during transportation project development.[29] The law, now codified in 49 U.S. Code (USC) §303[30] and 23

29 Federal Transit Administration. *Section 4(f) of the Department of Transportation Act*. Accessed online at: https://www.transit.dot.gov/regulations-and-guidance/environmental-programs/section-4f-department-transportation-act, accessed August 23, 2019.

30 Government Publishing Office. *49 U.S.C. 303 – Policy on lands, wildlife and waterfowl refuges, and historic sites*. Accessed online at: https://www.govinfo.gov/app/details/USCODE-2009-title49/USCODE-2009-title49-subtitleI-chap3-subchapI-sec303, accessed August 23, 2019.

USC §138,[31] applies only to the U.S. Department of Transportation (U.S. DOT) and is implemented by the Federal Highway Administration (FHWA) and the Federal Transit Administration (FTA) through 23 Code of Federal Regulations (CFR) 774. Section 4(f) only applies if the project has a federal nexus (i.e., requires a federal permit or receives federal funds).[32]

In August 2005, Section 6009(a) of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU; 23 CFR 774) amended existing Section 4(f) at both Title 49 USC Section 303 and Title 23 USC Section 138 to simplify the process and approval of projects that have only *de minimis* impacts on lands impacted by Section 4(f).[33] Under the revised provisions, once the U.S. DOT determines that a transportation use of Section 4(f) property results in a de minimis impact, analysis of avoidance alternatives are not required and the Section 4(f) evaluation process is complete. Section 6009 also required the U.S. DOT to issue regulations that clarify the factors to be considered and the standards to be applied when determining if an alternative for avoiding the use of a Section 4(f) property is feasible and prudent. On March 12, 2008, the FHWA issued a Final Rule on Section 4(f), which clarified the 4(f) approval process, simplified its regulatory requirements, and moved the Section 4(f) regulation to 23 CFR 774.

Intermodal Transportation Efficiency Act, Federal Highway Administration (FHWA) National Scenic Byways Program

The FHWA National Scenic Byways Program, which was established in Title 23, Section 162 of the USC under the Intermodal Transportation Efficiency Act of 1991, is a grassroots collaborative effort that designates selected highways as "All American Roads" (a roadway that is a destination unto itself). "America's Byways" or "National Scenic Byway" is a roadway that possesses outstanding qualities that exemplify regional characteristics.[34]

Bureau of Land Management (BLM) Scenic Areas and Back Country Byways

The BLM designates some of its holdings as Scenic Areas and some roadways in remote areas as Back Country Byways. The BLM Back Country Byways Program was established in 1989 and is a component of the National Scenic Byways Program.[35] The counties of Imperial, Riverside, and San Bernardino in the SCAG region include land with such BLM designations.

United States Forest Service (USFS) National Forest Scenic Byways Program

The USDA also has a National Scenic Byways Program, independent from the BLM program, which was established in 1995 under the Intermodal Transportation Efficiency Act of 1991 to indicate roadways of scenic importance that pass through national forests.[36] The SCAG region includes Forest Service Scenic Byways in the counties of Los Angeles, Riverside, San Bernardino, and Ventura.

National Trails System Act

The National Trails System Act (Public Law 90-543) was established by Congress in 1968 to establish a network of scenic, historic, and recreational trails.[37] The Act defined four categories of national trails: recreation trails, scenic trails, historic trails, and connecting or side trails. Trails within park, forest, and other recreation areas administered by the Secretary of the Interior or the Secretary of Agriculture or in other federally administered areas may be established and designated as "National Recreation Trails" by the appropriate Secretary. Since the National Trails System Act was enacted, the list of qualifying national scenic trails and national historic trails has grown from the initial two trails (the Application National Scenic Trail and Pacific Crest National Scenic Trail) to the current list, which includes 11 national scenic trails and 19 historic trails. The Pacific Crest National Scenic Trail passes through Los Angeles County, Riverside County, and San Bernardino County in the SCAG region.

National Forests Land Management Plans

Each of the four Southern California national forests (Cleveland National Forest, Los Angeles National Forest, San Bernardino National Forest, and Los Padres National Forest) is included in the Southern California National Forests Vision. The Southern California National Forests Vision (forest plans) has

created individual land management plans for each of the four Southern California national forests. The plans include a section for design criteria and a map of scenic integrity objectives for each national forest to guide the management of the land and its resources for the next 10 to 15 years.[38]

3.1.2.2 State

California Department of Transportation (Caltrans) California Scenic Highways Program

The California Scenic Highways Program was created in 1963 under Senate Bill 1467, which added Sections 260 through 263 to the Streets and Highways Code, to preserve and protect scenic highway corridors from change that would reduce the aesthetic value of lands adjacent to highways.[39,40] To be included in the state program, the highways proposed for designation must meet Caltrans' eligibility requirements and have visual merit. County highways and roads that meet the Caltrans Scenic Highways Program standards may also be officially designated. (See also discussion above in the Environmental Setting for an identification of the current state scenic and eligible highways.)

The state laws governing the Scenic Highway Program are provided in the California Streets and Highways Code, Sections 260 through 263.[41] The State Scenic Highway System includes a list of highways that have been designated by Caltrans as scenic highways or are eligible for designation as scenic highways. These highways are designated in Section 263 of the Streets and Highways Code. Scenic highway designation can offer the following benefits:

- Protection of the scenic values of an area;
- Enhancement of community identity and pride, encouraging citizen commitment to preserving community values;
- Preservation of scenic resources to enhance land values and make the area more attractive; and
- Promotion of local tourism that is consistent with the community's scenic values.

41 California Legislative Information. *Article 2.5. State Scenic Highways [260-284].*

A scenic corridor is the land generally adjacent to and visible from the highway and is identified by using a motorist's line of vision. A reasonable boundary is selected when the view extends to the distant horizon. Caltrans outlines the following minimum requirements for scenic corridor protection (Section 261 of the Streets and Highways Code): (1) regulation of land use and intensity (density) of development, (2) detailed land and site planning, (3) control of outdoor advertising, (4) careful attention to and control of earthmoving and landscaping, and (5) the design and appearance of structures and equipment. Caltrans defines non-compliance for a Corridor Protection Program as a program that: (1) no longer complies with the five legislatively required elements under Section 261 of the Street and Highways Code, (2) no longer affords protection because required elements have been amended or changed, or (3) no longer is being enforced by the local governing body.

California Building Energy Efficiency Standards: 2013 Title 24, Part 6 (California Energy Code)

The California Energy Code (Title 24, Section 6) was created as part of the California Building Standards Code (Title 24 of the California Code of Regulations) by the California Building Standards Commission in 1978 to establish statewide building energy efficiency standards to reduce California's energy consumption.[42] California's Building Energy Efficiency Standards are updated on an approximately three-year cycle; the 2016 Standards went into effect on January 1, 2017. These standards include mandatory requirements for efficiency and design of lighting control devices and mandatory requirements for indoor and outdoor lighting systems in residential and non-residential buildings, and hotel or motel buildings.

Senate Bill 743

Changes to CEQA pursuant to new state law, Senate Bill No. 743 (Stats. 2013, ch. 386) (SB 743), require the Governor's Office of Planning and Research (OPR) to develop a new approach to analyzing transportation impacts under the California Environmental Quality Act and create a new exemption for certain projects that are consistent with an adopted specific plan. The exemption applies if the project is a) within a transit priority area, b) consistent with a specific plan for which an EIR has been certified, and c) consistent with an SCS. SB 743 further provides that aesthetic and parking impacts of a project shall not be considered significant impacts on the environment if the project is 1) a residential, mixed-use residential, or employment center project, and 2) located on an infill site within a transit priority area. The exemption for aesthetic impacts does not include impacts to historic or cultural resources. Local

42 California Building Standards Commission. 2015. About Us Available at: http://www.bsc.ca.gov/abt_bsc.aspx, accessed November 20, 2018.

governments retain their ability to regulate a project's transportation, aesthetics, and parking impacts outside of the CEQA process pursuant to local design review ordinances or other discretionary powers.[43]

3.1.2.3 Local

The SCAG region spans six counties and 191 cities, all of which have general plans containing policies related to scenic resources **(Table 3.1-9, Summary of County and City General Plan Policies and Ordinances in the SCAG Region)**. Additional plans and ordinances at the master plan level, city level, and specific plan level may also apply within the SCAG region.

Table 3.1-9
Summary of County and City General Plan Policies and Ordinances in the SCAG Region

County	County and City Policies and Ordinances
Imperial	**Scenic Vistas:** None designated in County or cities **Scenic Highways:** Circulation and Scenic Highways Element in the Imperial County General Plan[1] **Visual Character/Quality:** Conservation/Open Space Element of the Imperial County General Plan and City General Plans, Imperial County Code of Ordinances Chapters 12.44 Wildlife Protection and 12.48 Wild Flowers and Trees **Light and Glare:** No County-level ordinances, some cities have General Plan policies or Ordinances[2] **Shade and Shadow:** No County-adopted standards
Los Angeles	**Scenic Vistas:** Designated Public Viewing Areas within Santa Monica Mountains Local Coastal Program,[3] some cities have designated scenic views within City General Plans **Scenic Highways:** Conservation and Open Space Element of the Los Angeles County General Plan, some cities have designated scenic highways in Conservation and Open Space Elements and Transportation Elements of City General Plans **Visual Character/Quality:** Conservation and Open Space Element of the Los Angeles County General Plan and City General Plans; County and City Tree and Landscaping Ordinances **Light and Glare:** 2012 Los Angeles County Rural Outdoor Lighting District Ordinance and some City dark sky ordinances **Shade and Shadow:** The City of Los Angeles has established shade and shadow effect guidelines that are referenced by other cities in Los Angeles and Orange Counties in evaluation of impacts[4]
Orange	**Scenic Vistas:** None designated **Scenic Highways:** Transportation Element of the Orange County General Plan, some cities have designated scenic highways identified in General Plans **Visual Character/Quality:** Resources Element of the Orange County General Plan and City General Plans **Light and Glare:** County-level ordinances under review,[5] some cities have General Plan policies or ordinances **Shade and Shadow:** No County-adopted standards. The City of Los Angeles has established shade and shadow effect guidelines that are referenced by other cities in Los Angeles and Orange Counties in evaluation of impacts[6]
Riverside	**Scenic Vistas:** None designated **Scenic Highways:** Multipurpose Open Space Element of the County of Riverside General Plan, some cities have designated scenic highways identified in General Plans **Visual Character/Quality:** Riverside County Ordinance No. 559 Regulating the Removal of Trees, Multipurpose Open Space Element of the County of Riverside General Plan,[7] and City General Plans **Light and Glare:** 1988 Riverside County Ordinance No. 655, some cities have General Plan policies or Ordinances[2] **Shade and Shadow:** No County-adopted standards

3.1.3 ENVIRONMENTAL IMPACTS

3.1.3.1 Thresholds of Significance

For the purposes of this PEIR, SCAG has determined that adoption and/or implementation of the Plan could result in significant adverse impacts to visual resources, if the Plan would result in any of the following:

- Have a substantial adverse effect on a scenic vista;
- Substantially damage scenic resources, including but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway;
- Substantially degrade the existing visual character or quality of public views (public views are those that are experienced from publicly accessible vantage points). In an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality; or

- Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.

3.1.3.2 Methodology

To assess potential impacts to aesthetics adjacent to transportation corridors, a geographic information system (GIS) was used to analyze major highway, transit, and freight rail projects in the Plan.[44] The GIS analysis determined that transportation projects included in the Plan could affect scenic vistas, scenic highway corridors, visual character, nighttime light and daytime glare levels in the SCAG region. Indirect impacts were evaluated based on land use pattern assumptions that protected lands would remain protected and strategies intended to shift new growth away from wildlife habitat areas and concentrate growth in existing urbanized areas or opportunity areas such as high-quality transit areas (HQTAs) (near transit projects), livable corridors, and neighborhood mobility areas that are well served by transit and are conducive to higher-density housing and walkable, mixed-use communities in the future.

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743, or SB 226 (as described in Section 1.0 Introduction), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.1.3.4 Impacts and Mitigation Measures

Impact AES-1 Potential for the Plan to have a substantial adverse effect on a scenic vista.

Significant and Unavoidable Impacts - Mitigation required.

Implementation of transportation projects contained in the Plan and development projects anticipated to occur under the Plan may result in the conversion of open space or vacant lands to new uses. Areas potentially affected include designated open space visible from USFS, Caltrans, county, and city designated scenic vistas.

---

44 Major Transportation Projects include but are not limited to projects that involve ground disturbing activities and projects outside of existing rights-of-way such as projects that require new rights-of-way, adding traffic lanes, and grade separation.

Implementation of transportation projects contained in the Plan and development projects anticipated to occur under the Plan could result in both short-term and long-term visual impacts by blocking views from Scenic Byways or Caltrans, county, and/or city designated scenic vista points. For purposes of this PEIR, public views (i.e., from look-outs, roadways, parks, and other public places) are analyzed for visual impacts. High scenic integrity is a USFS management objective for conditions where human activities are not visually evident and the valued (desired) landscape character "appears" intact or unaltered.[45]

Construction of new transportation facilities, expansion of existing facilities, potential development, or growth in previously undisturbed sites could block or impede views of scenic resources in a given area. For example, construction of highways, connectors, interchanges, goods movement roadway facilities, and sound walls could block or impede views of mountains, oceans, or rivers. Similarly, construction of development projects in existing urbanized areas have the potential to have the same effects, as many valued visual resources are located within urban areas.. Effects from anticipated growth would result in new development constructed in existing urbanized areas where views of a scenic resources are blocked. This could occur as a result of increased density in HQTAs or other areas with views of scenic elements such as the San Bernardino, Santa Monica, or San Gabriel Mountains.

Construction impacts, although short-term, could also result in views blocked by construction equipment and scaffolding. Removal of landscaping, temporary route changes, temporary signage, exposed excavation activities and slope faces with contrasting soil colors, and construction staging areas could also block views. Use of Best Management Practices (BMPs) during construction such as locating construction staging areas in less visible locations (given other environmental considerations such as avoiding sensitive habitat, etc.), fencing and/or screening staging areas, and revegetation of exposed slopes at the earliest possible opportunity would minimize impacts. However, even with these typical practices, short-term visual impacts would often be unavoidable.

Development in floodplains, wetlands, wooded areas, coastal bluffs, lagoons, reservoirs, regional parks, recreational areas, agricultural lands, or in areas that include steep slopes or scenic vistas has the potential to adversely impact the region's visual resources by blocking such scenic vistas. Specifically, several transportation projects included in the Plan would have the potential to create a significant visual impact, such as highway projects involving noise barriers that can block views; construction that involves cut and fill within the viewshed of Caltrans, county, or city designated scenic vistas; or construction of tall structures in urban areas that obstruct views (see **Figure 2.0-15, Major Highway Projects**, **Figure 2.0-17, Major HOV Projects**; and **Figure 2.0-18, Major Rail Projects**, in **Section 2.0, Project Description**).

[45] United States Department of Agriculture, Forest Service (USFS). September 2005. Land Management Plan, Part 3: Design Criteria for Southern California National Forests. Available at: http://www.fs.usda.gov/Internet/FSE_DOCUMENTS/stelprdb5166878.pdf

Additionally, grade separated facilities for rail or buses, goods movement roadway facilities, and widened roads with high-occupancy vehicle (HOV) and high-occupancy toll (HOT) lanes and connectors could also result in visual impacts if they block or impede vistas of surrounding scenic resources during and after construction.

Highway widening projects such as SR-74 in Riverside County and I-10 in San Bernardino County and the SR-57/SR-60 Interchange improvement in Los Angeles County also have the potential to impact visual resources. Creation of aerial structures over the top of existing transportation features, such as connectors, has a very high potential to create visual impacts to panoramic views, views of significant landscape features, or landforms.

Several transit projects, if implemented, would affect the region's visual environment. As discussed above, the Plan includes transportation projects involving both new facilities and modifications to existing facilities. The Plan includes 19 major transit capital projects. New light rail transit projects in Los Angeles County, such as the Crenshaw LAX Corridor, or the West Valley Connector in San Bernardino could affect views, especially if all or parts of these lines are elevated. Many of the transit projects included in the Plan, if implemented, would be located in existing urbanized areas and new growth opportunity areas that would block views of historic resources. A few transportation projects, such as the Regional Connector, would tunnel underground and not affect scenic vistas.

Goods movement highway facilities, such as HOT and toll lanes in Orange County, are examples of transportation projects that would obstruct scenic views. Adding new goods movement highway facilities may require construction of new roadway facilities and acquisition of right-of-way property that would result in the loss of vegetation along these routes and changes in topography of the given area depending on the route alignment. Elevated highway and roadway facilities would block views of the San Gabriel Mountains, Whittier Hills, Puente Hills, San Bernardino Mountains, and Jurupa Mountains, depending on the alignment chosen.

Construction of transportation projects and facilities that involve modifications such as widening or upgrading existing roadways and safety improvements would generally not significantly impact the visual environment. These modification projects would most likely occur within existing highway and roadway facilities, although they could require acquisition of right-of-way property. Such changes likely would not block or impede views of scenic resources or views from designated scenic vistas beyond existing conditions.

Modifications to existing transportation projects consist of improvements to existing highways, HOV lanes, HOT lanes, toll lanes, arterials, interchanges, bridges and grade crossings, sound wall retrofitting,

and improvements to transit rail and bus services. Impacts from transportation modification projects would generally be less substantial than those created by new transportation projects. These improvements would occur on existing facilities and are not assumed to be designed at a higher elevation and therefore would not be expected to block views of scenic resources. The Plan also includes active transportation projects such as regional greenway networks, regional and local bikeway networks, coastal trails access, and safe routes to school. In many cases, such projects would not only improve access to scenic parts of the region, such as coastal areas, but would also add visual improvements to the region through landscaping, lighting, and sustainable or a complete street approach to design resulting in beneficial impacts.

However, due to the large number of transportation projects encompassed by the Plan, it is expected that new and expanded highway and roadway facilities, new and expanded transit projects, and new and expanded goods movement projects, or other facilities would result in significant impacts to scenic vistas in the region. Similarly, development patterns that may occur if the land use strategies are implemented under the Plan have the potential to impact scenic vistas by obstructing views. Therefore, the Plan would result in a significant impact to scenic vistas and mitigation is required.

Mitigation Measures

SCAG Mitigation Measures

SMM AES-1: SCAG shall facilitate minimizing impacts to scenic vistas through cooperation, information sharing regarding the locations of designated scenic vistas, and regional program development as part of SCAG's ongoing regional planning efforts, such as web-based planning tools for local government including REVISION, and other GIS tools and data services, including, but not limited to, Map Gallery, GIS library, and GIS applications, and direct technical assistance efforts such as sharing of associated online training materials. Caltrans and lead agencies, such as county and city planning departments, shall be consulted during this update process.

Project Level Mitigation Measures

PMM AES-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to address potential aesthetic impacts to scenic vistas, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

a) Use a palette of colors, textures, building materials that are graffiti-resistant, and/or plant materials that complement the surrounding landscape and development.

b) Use contour grading to better match surrounding terrain. Contour edges of major cut-and-fill to provide a more natural looking finished profile.

c) Design new corridor landscaping to respect existing natural and man-made features and to complement the dominant landscaping of the surrounding areas.

d) Replace and renew landscaping along corridors with road widenings, interchange projects, and related improvements.

e) Retain or replace trees bordering highways, so that clear-cutting is not evident.

f) Provide new corridor landscaping that respects and provides appropriate transition to existing natural and man-made features and is complementary to the dominant landscaping or native habitats of surrounding areas.

g) Reduce the visibility of construction staging areas by fencing and screening these areas with low contrast materials consistent with the surrounding environment, and by revegetating graded slopes and exposed earth surfaces at the earliest opportunity;

h) Use see-through safety barrier designs (e.g. railings rather than walls)

Level of Significance after Mitigation

As previously discussed, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts on scenic vistas could be significant and unavoidable even with implementation of mitigation.

Impact AES-2 **Potential to substantially damage scenic resources, including but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.**

Significant and Unavoidable Impacts - Mitigation Required.

The Caltrans State Scenic Highway Program was created by the State Legislature in 1963 to preserve and protect scenic highway corridors from change that would diminish the aesthetic value of lands adjacent to highways. The state laws governing the Scenic Highway Program are provided in the California Streets and Highways Code, Section 260.

The State Scenic Highway System includes a list of highways that have been designated by Caltrans as scenic highways or are eligible for designation as scenic highways. These highways are designated in Section 263 of the Streets and Highways Code. Scenic highway designation can offer the following benefits:

- Protection of the scenic values of an area;
- Enhancement of community identity and pride, encouraging citizen commitment to preserving community values;
- Preservation of scenic resources to enhance land values and make the area more attractive; and
- Promotion of local tourism that is consistent with the community's scenic values.

A scenic corridor is the land generally adjacent to and visible from the highway and is identified by using a motorist's line of vision. A reasonable boundary is selected when the view extends to the distant horizon. Caltrans outlines the following minimum requirements for scenic corridor protection: regulation of land use and density of development; detailed land and site planning; control of outdoor advertising; careful attention to, and control of, earthmoving and landscaping; and careful attention to design and appearance of structures and equipment.

The transportation projects considered in the Plan do not include projects that would require the acquisition or development of previously undisturbed vacant land, including designated open space that is visible from Officially Designated State Scenic Highways. The Plan does not include transportation projects within the immediate vicinity of any Officially Designated State Scenic Highways, or Officially Designated County Scenic Highways. Major highway projects within the immediate vicinity of roadways eligible for State Scenic Highway designation include:

- HOV Lanes (I-5, US-101, I-15)
- Express Lanes (I-15, I-10)
- Mixed Lane Flow Projects (SR-118)

At SR-74, the construction of a new freeway segment that will connect to the eligible scenic highway near Warren Road may require attention to and control of earthmoving and landscaping in accordance with Section 261 of the Streets and Highways Code.

If a project is proposed in a scenic corridor, that project would be required to comply with applicable rules and regulations governing the protection of that area as a scenic resource. As most of the transportation projects in the Plan are minor modifications or maintenance within the region's urban areas, most scenic routes would not be affected.

While there are no restrictions on scenic highway projects, local agencies and Caltrans must work together to coordinate projects and ensure the protection of the scenic value to the greatest extent possible. For example, state law (Section 320 of the California Public Utilities Code) requires the undergrounding of all visible electricity distribution lines within 1,000 feet of a scenic highway.[46] In some cases, local governments have their own land use and site planning regulations to project scenic values along a given corridor.

Additionally, the Plan includes the land use strategies that encourage more compact growth development patterns in the region and aim to shift growth away from wildlife habitat areas toward existing urbanized areas with transportation infrastructure in place and opportunity areas that are conducive to more mixed-use and higher-density housing in the future. Several HQTAs extend along scenic highways and, as such, would have the potential to impact scenic highways or vistas. Impacts would occur if anticipated development were to detract or diminish the elements that contribute to the scenic nature of the highway, such as a modern office building or retail center located along such a highway that could be incongruous with the surrounding scenic nature if not properly shielded from view.

The general location of Plan transportation projects in urban areas and anticipated new growth and development focused within HQTAs avoids the potential to substantially damage scenic resources within state-designated scenic highways. HQTAs would be located near two State-designated scenic highways that are already developed: at the northeastern end of the portion of SR-74 in Riverside County, which is characterized by single-family residences and commercial development in the City of Palm Desert, and on the northern side of the western portion of SR-91 in Orange County, which is characterized by single-family residences, commercial and industrial development, the Santa Ana River Lake, Anaheim Lake, and a few parks (see **Figure 2.0-11, High-Quality Transit Areas Throughout the SCAG Region in 2045**; see **Figure 3.1-2, Land Use Patten in the SCAG Region**). HQTAs would not be located near the State-

46 California Department of Transportation. October 2008. *Scenic Highway Guidelines.* Available at: http://www.dot.ca.gov/hq/LandArch/16_livability/scenic_highways/guidelines/scenic_hwy_guidelines_04-12-2012.pdf

designated scenic highways that are characterized by rural uses and open space, such as Angeles Crest Highway (Sr-2), which is located within the Angeles National Forest that precludes future development, or State Route 243, which is predominantly located within the San Bernardino National Forest. As these HQTAs in proximity to State-designated scenic highways are already developed, the land use strategies considered in the Plan would not be expected to substantially damage scenic resources within an officially designated State scenic highway. Implementation of the Plan's land use strategies would not be expected to substantially damage historic buildings within these scenic highway corridors because, although a small portion of the single-family residences were constructed in the 1950s, the majority of development in Palm Desert along SR-74 occurred more recently in the 1970s, 1980s, and 1990s; similarly, although the area was developed for agricultural use in the 1940s and 1950s, the majority of single-family residential, commercial, and industrial development to the north of SR-91 occurred in the 1970s, 1980s, 1990s.[47]

The Plan would also have the potential to impact rock outcroppings or other scenic elements such as historic resources within eligible state scenic highways. As discussed above, many of the transportation projects and the HQTAs are in areas with designated scenic resources including historic buildings and scenic rock outcroppings. Therefore, there is potential for the Plan to affect these resources. As such, impacts would be significant and unavoidable, and mitigation measures are required.

Mitigation Measures

SCAG Mitigation Measures

See **SMM AES-1**.

Project Level Mitigation Measures

See **PMM AES-1**.

Level of Significance after Mitigation

As previously discussed, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and

47 Nationwide Environmental Title Research, LLC. Accessed 23 November 2015. Historic Aerials. Available at: http://www.historicaerials.com/

feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts to scenic resources could be significant and unavoidable even with implementation of mitigation.

Impact AES-3 **Potential to substantially degrade the existing visual character or quality of public views (public views are those that are experienced from publicly accessible vantage points). In an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality.**

Significant and Unavoidable Impacts - Mitigation required.

Implementation of transportation projects contained in the Plan and development anticipated to occur under the Plan has the potential to degrade the visual character of project sites, constituting a significant impact. The SCAG region is comprised of approximately 38,000 square miles, many of which are in their natural state or are primarily rural. Transportation projects outside of the urban core would add visual elements of urban character to these areas. Some transportation projects are planned in rural parts of the region. Transportation projects that require new construction as well as projects that require modification would add visual elements of urban character to these rural areas. Proposed enhancements to existing transportation facilities and construction of new highways, roadways, and other transit facilities, as well as new development or densification of residential, commercial, and similar land uses would create adverse visual impacts by adding visual elements of urban character to existing rural or open spaces. This would occur where new alignments or road widening pass through primarily rural, agricultural, and/or open space areas, and the contrast would potentially result in a significant impact to visual quality (e.g., road widening, transit or rail projects). The Plan includes transportation projects that would intersect with the Pacific Crest National Scenic Trail in Los Angeles, San Bernardino, and Riverside Counties (i.e., mixed lane flow projects, HOT Lanes), which would affect the visual character of the scenic trail at these locations.

The Plan also includes transportation strategies such as TDM and emphasis on complete streets. While these strategies have the potential to change the visual character of an existing community, for example, by adding bike lanes to an existing roadway, some changes, such as bus rapid transit have the potential to have adverse impacts.

As described in **Section 3.14, Population, Housing, and Employment**, the land use strategies included in the Plan would focus new growth in existing urbanized areas and opportunity areas like HQTAs that are supported by existing transportation facilities and are conducive to walkable and/or transit-oriented land

patterns. The Plan includes transportation projects and land use strategies that have the potential to affect the patterns of new growth in the region. As discussed in **Section 3.14**, the total SCAG region population is expected to increase by approximately 3.6 million people by 2045. Additionally, the land use strategies included in the Plan assume a significant increase in small-lot, single- and multi-family housing that is expected to mainly occur in infill and mix use locations near transit infrastructure (HQTAs and transit priority areas [TPAs]). However, the Plan estimates a conversion of approximately 41,546 acres of greenfields to developed land, which would ultimately result in the conversion of some areas to a more urban character

The Plan focuses most new housing and job growth in HQTAs and other opportunity areas in existing main streets, downtowns, and commercial corridors. This strategy supports and complements the proposed transportation network that emphasizes system preservation, active transportation, and transportation demand management measures. However, the densification of uses, even in existing urbanized areas, would result in changes to the overall visual character. Increased urbanization through taller buildings or more compact development would have a similar effect by changing the low-scale nature of a neighborhood.

In urbanized areas, roadways and ancillary improvements such as sound walls included in the Plan would also result in adverse visual impacts depending on the scale of improvements and location of sensitive viewers, which includes users of scenic routes, gathering places, rest areas and vista points, and residents who live near scenic resources. Highway widening and the construction of HOV/HOT and managed lanes and park-and-ride lots may result in some loss of existing freeway landscaping. Although these activities generally occur in urbanized environments, these actions would have an adverse effect on visual quality, depending upon nearby sensitive viewers.

Significant impacts would also occur if proposed alignments or transportation facilities require large cut-and-fill slopes or noise barriers, whether in previously undeveloped areas or in already developed urban areas. Careful alignment and design, conformance with local grading ordinances, and installation of landscaping to ensure compatibility with surrounding development would be expected to reduce visual impacts to below the level of significance at the project level.

Grade separated facilities, due to elevation and scale, could have a substantial adverse visual impact on surrounding land uses during and after construction. The elevation and scale of the proposed grade separated facilities could create a significant contrast with the overall visual character of the existing landscape setting. However, the degree of the impact would be dependent on the scale of the project itself with some projects resulting in minimal if any visual impact. Transportation projects that involve the

widening or upgrading of existing roadways can be designed to complement the existing system and, therefore, would involve lesser changes to the visual character of the existing landscape setting.

Transit centers and park-and-ride lots would be constructed primarily within the heavily urbanized portions of the SCAG region and consequently affect a large number of viewers. Transit centers would be expected to be dominant visual elements due to their fixed structures, including terminals, service facilities, and lighted parking lots. While these facilities would become integrated with the urban setting over time, their initial effect would result in a change in visual quality. Elevated and at-grade transit facilities such as the Gold Line Extension have the greatest potential to change the visual character of an area, while underground rail facilities such as the Metro Regional Connector and the Purple Line Extension would have fewer impacts.

Nonetheless, transportation projects and strategies, and the land use strategies in the Plan have the potential to result in changes to the visual character of existing landscapes or natural areas. As such, impacts would be significant and mitigation measures are required.

Mitigation Measures

SCAG Mitigation Measures

See **SMM AES-1.**

Project Level Mitigation Measures

PMM AES-2: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to address potential aesthetic impacts that substantially degrade visual character, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

a) Minimize contrasts in scale and massing between the projects and surrounding natural forms and development, minimize their intrusion into important viewsheds, and use contour grading to better match surrounding terrain in accordance with county and city hillside ordinances, where applicable.

b) Design landscaping along highway corridors to add significant natural elements and visual interest to soften the hard-edged, linear transportation corridors.

c) Require development of design guidelines for projects that make elements of proposed buildings/facilities visually compatible or minimize visibility of changes in visual quality or character through use of hardscape and softscape solutions. Specific measures to be addressed include setback buffers, landscaping, color, texture, signage, and lighting criteria.

d) Design projects consistent with design guidelines of applicable general plans.

e) Require that sites are kept in a blight/nuisance-free condition. Remove blight or nuisances that compromise visual character or visual quality of project areas including graffiti abatement, trash removal, landscape management, maintenance of signage and billboards in good condition, and replace compromised native vegetation and landscape.

f) Where sound walls are proposed, require sound wall construction and design methods that account for visual impacts as follows:

- use transparent panels to preserve views where sound walls would block views from residences;
- use landscaped earth berm or a combination wall and berm to minimize the apparent sound wall height;
- construct sound walls of materials whose color and texture complements the surrounding landscape and development;

g) Design sound walls to increase visual interest, reduce apparent height, and be visually compatible with the surrounding area; and landscape the sound walls with plants that screen the sound wall, preferably with either native vegetation or landscaping that complements the dominant landscaping of surrounding areas.

Level of Significance after Mitigation

As previously discussed, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail,

including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts to visual character could be significant and unavoidable even with implementation of mitigation.

Impact AES-4 **Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.**

Significant and Unavoidable Impacts – Mitigation Required.

Implementation of transportation projects contained in the Plan and development anticipated to occur under the Plan has the potential to create new substantial sources of light or glare, constituting a significant impact. Light and glare effects often occur in urban areas. Glare is typically a daytime condition where the sun reflects off a particular building, while lighting effects often occur when new nighttime sources of lighting are introduced into an area. Both of these conditions would occur as a result of the Plan, which includes transportation projects that would introduce nighttime sources of lighting as well as anticipated development, buildings, and vehicles that would produce sources of glare. Anticipated sources of light and glare as a result of the transportation projects in the Plan include nighttime construction lights, security lighting, and operation lighting such as vehicles, buildings, parking lots, and walkways. The land use strategies in the Plan encourage compact development and development in HQTAs with existing high levels of nighttime light. Similarly, many transportation projects would be located in urban areas. However, some major transportation projects could occur in areas that currently have low levels of nighttime light. The proposed transportation projects included in the Plan would have the potential to create a new source of substantial light or glare which would adversely affect day or nighttime views in jurisdictions where there are no ordinances protecting night skies. Impacts would be significant and unavoidable and mitigation is required.

Mitigation Measures

SCAG Mitigation Measures

SMM AES-2: SCAG shall facilitate minimizing impacts on aesthetics related to new sources of light or glare through cooperation, information sharing regarding guidelines and policies, design approaches, building materials, siting, and technology, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to, Map Gallery, GIS library, and GIS applications, and direct technical assistance efforts and sharing of associated online training materials. Lead agencies, such as county and city planning departments, shall be consulted during this update process.

Project Level Mitigation Measures

PMM AES-3: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to address potential aesthetic impacts that substantially degrade visual character, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

a) Use lighting fixtures that are adequately shielded to a point below the light bulb and reflector and that prevent unnecessary glare onto adjacent properties.

b) Restrict the operation of outdoor lighting for construction and operation activities to the hours of 7:00 a.m. to 10:00 p.m.

c) Use high pressure sodium and/or cut-off fixtures instead of typical mercury-vapor fixtures for outdoor lighting.

d) Use unidirectional lighting to avoid light trespass onto adjacent properties.

e) Design exterior lighting to confine illumination to the project site, and/or to areas which do not include light-sensitive uses.

f) Provide structural and/or vegetative screening from light-sensitive uses.

g) Shield and direct all new street and pedestrian lighting away from light-sensitive off-site uses.

h) Use non-reflective glass or glass treated with a non-reflective coating for all exterior windows and glass used on building surfaces.

i) Architectural lighting shall be directed onto the building surfaces and have low reflectivity to minimize glare and limit light onto adjacent properties.

Level of Significance after Mitigation

As previously discussed, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts to light or glare could be significant and unavoidable even with implementation of mitigation.

3.2 AGRICULTURE AND FORESTRY

This section of the Program Environmental Impact Report (PEIR) describes the existing agricultural and forestry resources within the SCAG region, identifies the regulatory framework with respect to laws and regulations that affect agriculture and forestry resources, and analyzes the significance of the potential impacts to agricultural and forestry resources that could result from development of the Connect SoCal Plan ("Connect SoCal"; "Plan"). In addition, this PEIR provides regional-scale mitigation measures as well as project level mitigation measures to be considered by lead agencies for subsequent, site-specific environmental review to reduce identified impacts as appropriate and feasible.

3.2.1 ENVIRONMENTAL SETTING

3.2.1.1 Definitions

Types of farmlands, as well as other terms pertinent to the discussion of agricultural resources, are defined below.

Farmland: §21060.1(a) of CEQA (Public Resources Code §§21000-21177) delineates the consideration of agricultural land to include "prime farmland, farmland of statewide importance, or unique farmland, as defined by the United States Department of Agriculture (USDA) land inventory and monitoring criteria, as modified for California," and is herein collectively referred to as "Farmland." The following are categories mapped by the CDC:[1]

Prime Farmland: Farmland that has the best combination of physical and chemical features able to sustain long-term agricultural production. This land has the soil quality, growing season, and moisture supply needed to produce sustained high yields. Land must have been used for irrigated agricultural production at some time during the four years prior to the mapping date.

Farmland of Statewide Importance: Farmland similar to Prime Farmland but with minor shortcomings, such as greater slopes or less ability to store soil moisture. Land must have been used for irrigated agricultural production at some time during the four years prior to the mapping date.

Unique Farmland: Farmland of lesser quality soils used for the production of the state's leading agricultural crops. This land is usually irrigated but may include non-irrigated orchards or vineyards as

1 California Department of Conservation, Division of Land Resource Protection. 2004. *A Guide to the Farmland Mapping and Monitoring Program*. Available at: http://www.conservation.ca.gov/dlrp/fmmp/Documents/fmmp_guide_2004.pdf, accessed October 25, 2018.

found in some climatic zones in California. Land must have been cropped at some time during the four years prior to the mapping date.

Farmland of Local Importance: Land of importance to the local agricultural economy as determined by each county's board of supervisors and a local advisory committee.

Grazing Land: Land on which the existing vegetation is suited to the grazing of livestock. This category was developed in cooperation with the California Cattlemen's Association, University of California Cooperative Extension, and other groups interested in the extent of grazing activities. The minimum mapping unit for Grazing Land is 40 acres.

Urban and Built-Up Land: Land occupied by structures with a building density of at least one unit to 1.5 acres, or approximately six structures to a 10-acre parcel. This land is used for residential, industrial, commercial, institutional, public administrative purposes, railroad and other transportation yards, cemeteries, airports, golf courses, sanitary landfills, sewage treatment, water control structures, and other developed purposes.

Other Land: Land not included in any other mapping category. Common examples include low density rural developments; brush, timber, wetland, and riparian areas not suitable for livestock grazing; confined livestock, poultry or aquaculture facilities; strip mines and borrow pits; and water bodies smaller than 40 acres. Vacant and non-agricultural land surrounded on all sides by urban development and greater than 40 acres is mapped as Other Land.

Forest: §12220(g) of CEQA defines forest land as "land that can support 10-percent native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits."

Timberland: Public Resources Code §4526 defines Timberland as "land, other than land owned by the federal government and land designated by the board as experimental forest land, which is available for, and capable of, growing a crop of trees of a commercial species used to produce lumber and other forest products, including Christmas trees."

Timberland Production Zone: California Government Code Section 51104(g) defines a Timberland Production Zone (TPZ) as "an area which has been zoned pursuant to Section 51112 or 51113 and is devoted to and used for growing and harvesting timber, or for growing and harvesting timber and compatible uses, as defined in subdivision (h). With respect to general plans of cities and counties, 'timberland preserve zone' means 'timberland production zone.'"

3.2.1.2 Existing Conditions

This section characterizes the baseline conditions for Important Farmland, agricultural use, Williamson Act contracts, forest land, and timberland, including Timberland Production zones.

Agricultural Lands

California ranked first among the 50 states in 2017 in terms of net farm income at $17.7 billion.[2] Agricultural and related products are also one of California's largest exports to the rest of the world. The SCAG region maintains over 2.6 million acres of agricultural land, with over 100,000 parcels of land designated as farmland.[3] For purposes of this analysis and in accordance with SB 375, "farmland" means farmland that is outside all existing city spheres of influence or city limits as of January 1, 2008, and is one of the following:

- Classified as Prime or Unique Farmland or Farmland of Statewide Importance.
- Farmland classified by a local agency in its general plan that meets or exceeds the standards for Prime or Unique Farmland or Farmland of Statewide Importance.[4]

Agricultural areas in the region provide benefits like flood control, groundwater recharge, energy production, and employment opportunities. The California Department of Conservation maps farmland throughout California under the Farmland Mapping and Monitoring Program (FMMP).[5] The FMMP emphasizes Important Farmland, which is comprised of four subcategories: Prime Farmland, Farmland of Statewide Importance, Unique Farmland, and Farmland of Local Importance, as defined above.

Table 3.2-1, SCAG Region by Land Use Category (2016)[6] breaks down the acres of agricultural lands, urban and built up land, other land, and water area by county within the SCAG region. San Bernardino County contains the most agricultural land by far, with farms and grazing lands making up over 60 percent of total inventoried area. Riverside and Imperial counties also contain substantial amounts of agricultural land, with farm and/or grazing lands comprising approximately half of the total acreage in each county. Orange County and Los Angeles County have the least amount of agricultural lands in the

Source: California Department of Conservation, Farmland Mapping and Monitoring, 2016.

Agricultural lands in the SCAG region represent a declining trend, with the exception of Ventura County that increased marginally from 2014-2016. The conversion of irrigated farmland to urban land[7,8] is primarily due to urbanization. Non-irrigated and other land that was converted to urban land were primarily due to the construction of new homes, commercial and industrial buildings and groundwater recharge or water control ponds.[9]

Table 3.2-2, Important Farmland within the SCAG Region (2016),[10] shows the breakdown of Important Farmland in the SCAG region. Nearly 17 percent of the area inventoried by the FMMP classifies as Important Farmland.

7 Urban Land includes residential, industrial, recreational, infrastructure and institutional uses.

8 Irrigated Farmland includes most irrigated crops grown in California. When combined with soil data, these farmed areas become the Important Farmland (IFL) categories of Prime Farmland, Farmland of Statewide Importance & Unique Farmland. Because of the nature of the IFL definitions, some irrigated uses, such as irrigated pastures or nurseries, may not be eligible for all three IFL categories.

9 Non-irrigated land uses include grazing areas, land used for dryland crop farming, and formerly irrigated land that has been left idle for three or more update cycles.

10 2016 is the most recently available data as of August 2019

Table 3.2-2
Important Farmland within the SCAG Region (2016)

County	Farmland Designation (Acres)					
	Prime Farmland	Farmland of Statewide Importance	Unique Farmland	Farmland of Local Importance	Important Farmland Total	Percent of Total Area Inventoried

Source: California Department of Conservation, Division of Land Resource Protection, 2016.
Notes:
(1) Figures are generated from the GIS data. Files dating from 1990-2016.

As shown above, in **Table 3.2-2**, Imperial County contains the most Prime Farmland and Farmland of Statewide Importance, due to a favorable climate, productive soils, and irrigation water from the All-American Canal. The County produced approximately $2.1 billion in agricultural crops and commodities in 2016. Major crops grown in Imperial County include vegetables, melons, and fruit and nut crops. Although Imperial County does not contain state-designated Important Grazing Land, cattle are the County's number one commodity, and livestock produced approximately $400 million (19 percent) of the county's agricultural income in 2016.[11] **Figure 3.2-1, Farmland in the SCAG Region**, displays the regional distribution of Important Farmlands within the SCAG region.

As shown in **Table 3.2-3, SCAG Region Average Annual Acreage Change (1984-2016)**, the SCAG region lost an average of 9,148 acres of farmland per year of Important Farmland from 1984 to 2016.[12]

Los Angeles County is the most urbanized county in the SCAG region and contains only 2.4 percent of Important Farmland. Despite this, the County reaped over $135 million from agricultural commodities in 2017 (the most recent data available). Nursery products are the number one commodity in Los Angeles County, followed by vegetable crops, and field crops.[13]

Orange County was once a rural community that relied primarily on its agricultural economy that included oranges, apricots, and walnuts. Similar to Los Angeles County, Orange County has become heavily urbanized and now contains the lowest acreage of Important Farmland of any county in the SCAG region. Despite this, Orange County produced $114 million from agricultural crops and commodities, the majority of which was generated by nursery crops, as well as tree fruit and berry crops.[14]

Riverside County contains the most Unique Farmland and Farmland of Local Importance within the region, due to its soil quality, moisture, and growing season that sustain high value crops. In 2016,

13 Los Angeles County. 2018. *2017 Los Angeles County Crop and Livestock Report*. Available online at: http://file.lacounty.gov/SDSInter/acwm/1052741_2017FINALCROPREPORT.pdf, accessed July 29, 2019

14 Orange County. 2017. *Orange County 2016 Annual Crop Report.* Available online at: http://www.ocagcomm.com/documents/2016OrangeCountyCropReport.pdf, accessed March 19, 2019.

Riverside County grossed approximately $1.3 billion from agricultural production, down 2 percent from 2015. Major crops in Riverside County include summer squash, okra, eggplant, and melon.[15]

San Bernardino, despite having the most agricultural land in the SCAG region, has almost the least amount of Important Farmland, second only to Orange County. This is due to the massive amount of Grazing Land that constitutes most of the agricultural land in San Bernardino County. In 2017, the County's gross value of agricultural production totaled approximately $465 million. Milk is the number one commodity and the meat from cattle and calves is the number two commodity for the County.[16]

Ventura County has some of the most productive Prime and Unique Farmlands in the nation. Over 21 percent of inventoried land in the County is designated as Important Farmland and in 2016, the County generated $2.1 billion from agricultural commodities. Strawberries and lemons are the top crops in the County, followed by nursery stock, celery, and raspberries.[17]

Forestry Resources

Forest lands within the SCAG region include the Angeles National Forest (Los Angeles and San Bernardino counties), San Bernardino National Forest (San Bernardino and Riverside counties), Los Padres National Forest (Los Angeles and Ventura County), and the Cleveland National Forest (Orange County and Riverside County), as well as forest lands within the open space zones of Imperial and Los Angeles counties (**Figure 3.2-2, Forest Lands in SCAG Region)**.

Within the SCAG region, forests growing at higher elevations (approximately 3,000 feet and above) are dominated by conifers. Montane conifer forests are often comprised of white fir and sugar pine, while mountain juniper and lodgepole pine thrive on open slopes and flats, respectively. Interior and Canyon live oak is also found in areas of higher elevation, as are big cone-fir trees, and Coulter, ponderosa and Jeffrey pines. The San Bernardino Mountains maintain the highest elevation forests in the region, which are dominated by limber pine.

Forests and woodlands in lower elevations of the SCAG region are largely oak-dominated, supporting Engelmann and valley oak. Lower woodlands also consist of a mix of Coulter pine, canyon live oak, black

17 Ventura County. 2016. 2016 Crop and Livestock Report. Available online at: http://vcportal.ventura.org/AgComm/docs/crop-reports/Ag%20Crop%20Report%202016%2001-08-18%20lr.pdf, accessed March 19, 2019.

oak, ponderosa pine, and Jeffrey pine, as well as understory grasses and herbs, most of which are non-native. Coast live oak woodland forms along coastal slopes and is often found associated with California walnut. In the vicinity of Sierra Peak in Orange County is the Tecate cypress forest, which thrives on low-fertility soils. The fire-adapted conifer species is listed by the California Native Plant Society and the forest is considered a special-status natural community by the California Natural Diversity Database (CNDDB).[18]

The California Department of Fish and Wildlife (CDFW) recognizes valley oak woodland, Engelmann oak woodland, and California walnut woodland as sensitive woodland communities in the SCAG region. These communities as well as others have declined dramatically due to urban and agricultural development over the past 100 years. Wildfires have also negatively affected forests and woodlands, many of which can be attributed to humans. It is estimated that 4,150 human-caused fires have burned approximately 296,281 acres of Southern California between 2000 and 2017.[19] Fire management and protection professionals now face longer fire seasons, bigger fires, and more acres burned on average each year, and more extreme fire behavior as climate change intensifies fire conditions.

Timberland

"Timberland" means privately or publicly owned land which is devoted to and used for growing and harvesting timber, or for growing and harvesting timber and compatible uses, and which is capable of growing an average annual volume of wood fiber of at least 15 cubic feet per acre. "Timber" means trees of any species maintained for eventual harvest for forest products purposes, whether planted or of natural growth, standing or down, on privately or publicly owned land, including Christmas trees, but does not mean nursery stock. Timber is permitted in the A-2 and A-3 agricultural zones in Imperial County, the Open Space zone in Los Angeles County with a Conditional Use Permit (CUP), and the Open Space Overlay in San Bernardino County with a CUP. Riverside County permits timberland production within the R-R (rural residential) zone and W-2 (controlled development areas) zone if a CUP has been obtained. Some counties designate areas of timberland as Timberland Preserves. These areas zoned as Timberland Production Zones (TPZs) are restricted in use to the production of timber for at least ten years. There is no TPZ land in the SCAG region.[20]

3.2.2 REGULATORY FRAMEWORK

3.2.2.1 Federal

United States Forest Service (USFS) National Forest Management Act of 1976

The USFS manages approximately 2.3 million acres of national forests in the SCAG region, which is subject to the National Forest Management Act of 1976 (Public Law 94-588),[21] a federal law that governs the administration of national forests. There are four national forests in the SCAG region, each of which is managed in accordance with a Forest Management Plan: the Angeles National Forest,[22] San Bernardino National Forest,[23] Los Padres National Forest,[24] and Cleveland National Forest.[25]

Farmland Protection Policy Act of 1981 (FPPA)

Congress passed the Agriculture and Food Act of 1981 (Public Law 97-98)[26] containing the FPPA subtitle I of Title XV, Section 1539-1549. Pursuant to the FPPA of 1981 Sections 1539–1549, the Secretary of Agriculture is directed to establish and carry out a program to "minimize the extent to which federal programs contribute to the unnecessary and irreversible conversion of farmland to nonagricultural uses, and to the extent practicable, will be compatible with state, unit of local government, and private programs and policies to protect farmland" (7 U.S. Code [USC] 4201–4209 & 7 USC 658).[27] Projects are subject to FPPA requirements if they may irreversibly convert farmland (directly or indirectly) to nonagricultural use and are completed by a federal agency or with assistance from a federal agency. The purpose of the FPPA to minimize the impacts federal programs have on the unnecessary and irreversible

conversion of farmland to nonagricultural uses. It ensures that to the extent possible, federal programs are administered to be compatible with state, local units of government, and private programs and policies to protect farmland. Federal agencies are required to develop and review their policies and procedures to implement the FPPA every two years. The FPPA does not authorize the federal government to regulate the use of private or nonfederal land or, in any way, affect the property rights of owners. For the purpose of FPPA, farmland includes Prime Farmland, Unique Farmland, and Land of Statewide or Local Importance. Farmland subject to FPPA requirements does not have to be currently used for cropland. It can be forest land, pastureland, cropland, or other land, but not water or urban built-up land.

Federal Farm and Ranchland Protection Program

The Federal Farm and Ranchland Protection Program (FRPP) is a voluntary easement purchase program that helps farmers and ranchers keep their land in agriculture.[28] Pursuant to Sections 1539-1549 of the Farmland Protection Policy Act (FPPA) of 1981 Sections, the Secretary of Agriculture is directed to establish and carry out a program to "minimize the extent to which federal programs contribute to the unnecessary and irreversible conversion of farmland to nonagricultural uses, and to the extent practicable, will be compatible with state, unit of local government, and private programs and policies to protect farmland." (7 USC 4201-4209 & 7 USC 658). The program provides matching funds to state, tribal, or local governments and nongovernmental organizations with existing farmland protection programs to purchase conservation easements or other interests in land.

The FRPP is re-authorized in the Farm Security and Rural Investment Act of 2002 (Farm Bill).[29] The NRCS manages the program. Technical Committee, awards funds to qualified entities to conduct their farmland protection programs. Although a minimum of 30 years is required for conservation easements, priority is given to applications with perpetual easements.

Federal Forest Legacy Program

The Forest Legacy Program (FLP) (16 USC § 2103c)[30] was part of the 1990 Federal Farm Bill.[31] The purpose of the FLP is to protect environmentally important forestland under private ownership from

conversion to non-forest uses, such as residential or commercial development. The FLP promotes the use of voluntary conservation easements on these properties. Landowners who wish to participate may sell or transfer particular rights, such as the right to develop the property or to allow public access, while retaining ownership of the property and the right to use it in any way consistent with the terms of the easement. The agency or organization holding the easement is responsible for managing the rights it acquires and for monitoring compliance by the landowner. Forest management activities, including timber harvesting, hunting, fishing, and hiking are encouraged, provided they are consistent with the program's purpose.

Agricultural Improvement Act of 2018

The Agricultural Improvement Act of 2018, or 2018 Farm Bill, which was signed on December 20, 2018 (and will remain in effect through 2023), builds upon and continues to implement many of the crucial programs that serve agricultural producers. The US Department of Agriculture is charged with implementing the bill, which reauthorized previous programs in the 2014 Farm Bill to serve producers now while they seek public input for future programs.[32] The 2018 Farm Bill continued funding for major programs but did include some changes to Natural Resources Conservation Programs such as expanding support to producers who address significant natural resources concerns through adoption of conservation practices and activities.[33] All major conservation programs are continued, although some have been modified.

Federal Environmental Quality Incentives Program (EQIP)

The Environmental Quality Incentives Program (EQIP) is a voluntary program that provides financial and technical assistance through contracts up to 10 years in length to farmers and ranchers who face threats to soil, water, air, and related natural resources on their land. These contracts provide financial assistance to help plan and implement conservation practices that address natural resource concerns and for opportunities to improve soil, water, plant, animal, air and related resources on agricultural land and non-industrial private forestland. In addition, another purpose of EQIP is to help producers meet federal, State, Tribal and local environmental regulations.

3.2.2.2 State

The California Land Conservation Act (Williamson Act)

The California Land Conservation Act (Williamson Act) of 1965 was enacted by the California State Legislature in 1965 to encourage the preservation of agricultural lands.[34] The California Department of Conservation administers the Williamson Act, for the conservation of farmland and other resource-oriented laws. The Williamson Act program permits property tax adjustments for landowners who contract with a city or county to keep their land in agricultural production or approved open space uses for at least 10 years. Lands covered by Williamson Act contracts are assessed on the basis of their agricultural value instead of their potential market value under nonagricultural uses. In return for the preferential tax rate, the landowner is required to contractually agree to not develop the land for a period of at least 10 years.[35]

Williamson Act contracts are renewed annually for 10 years unless a party to the contract files for non-renewal.[36] The filing of a non-renewal application by a landowner ends the automatic annual extension of a contract and starts a nine-year phase-out of the contract. During the phase-out period, the land remains restricted to agricultural and open-space uses, but property taxes gradually return to levels associated with the market value of the land.[37] At the end of the nine-year non-renewal process, the contract expires, and the owner's uses of the land are restricted only by applicable local zoning.

The Williamson Act defines compatible use of contracted lands as any use determined by the county or city administering the preserve to be compatible with the agricultural, recreational, or open-space use of land within the preserve and subject to contract.[38] However, uses deemed compatible by a county or city government must be consistent with the principles of compatibility set forth in Government Code section 51231, 51238, or 51238.1.[39]

38 Gov. Code, § 51201[e].

39 California Legislative Information. *ARTICLE 1. General Provisions [51200-51207].*

Within the SCAG region, Imperial, Los Angeles, Riverside, San Bernardino and Ventura counties have land under a Williamson Act contract, although Santa Catalina Island is the only contracted area in Los Angeles County. Orange County no longer has any land under a Williamson Act contract.[40]

Open Space Subvention Act

The Open Space Subvention Act (OSSA) of 1972 (Gov. Code, § 16140 *et seq.*) was enacted on January 1, 1972 to provide for the partial replacement of local property tax revenue foregone as a result of participation in the Williamson Act and other enforceable open space restriction programs. Participating local governments receive annual payment on the basis of the quantity (number of acres), quality (soil type and agricultural productivity), and, for Farmland Security Zone contracts, location (proximity to a city) of land enrolled under eligible, enforceable open space restrictions.[41]

The Right to Farm Act of 1981

The Right to Farm Act of 1981 (Civ. Code, § 3482.5) is designed to protect commercial agricultural operations from nuisance complaints that may arise when an agricultural operation is conducting business in a "manner consistent with proper and accepted customs." The code specifies that established operations that have been in business for three or more years that were not nuisances at the time they began shall not be considered a nuisance as a result of new land use.[42]

Farmland Security Zone Act

The Farmland Security Zone Act (California Government Code Sections 51296–51297.4) is similar to the Williamson Act and was passed by the California State Legislature in 1999 to ensure that long-term farmland preservation is part of public policy.[43] Farmland Security Zone Act contracts are sometimes referred to as "Super Williamson Act Contracts." Under the provisions of this act, a landowner already under a Williamson Act contract can apply for Farmland Security Zone status by entering into a contract with the county. Farmland Security Zone classification automatically renews each year for an additional 20 years. In return for a further 35 percent reduction in the taxable value of land and growing improvements (in addition to Williamson Act tax benefits), the owner of the property promises not to

develop the property into non-agricultural uses. Currently, Ventura County is the only county in the SCAG region with lands designated as Farmland Security Zones.

The Cortese-Knox-Hertzberg Local Government Reorganization Act of 2000

The Cortese-Knox-Hertzberg Local Government Reorganization Act (Cortese-Knox-Hertzberg Act) of 2000 (Gov. Code, § 56000 *et seq*.) established procedures for local government changes of organization, including city incorporations, annexations to a city or special district, and city and special district consolidations. This act requires that development or use of land for other than open space shall be guided away from existing prime agricultural lands in open space use toward areas containing nonprime agricultural lands, unless that action would not promote that planned, orderly, efficient development of an area.[44]

California Farmland Conservancy Program Act

The California Farmland Conservancy Program Act of 2010 (Pub. Resources Code, § 10200 *et seq.*), also known as Sen. Bill No. 1142 (Stats. 2010, ch. 323) (SB 1142), established the California Farmland Conservancy Program (CFCP), which provides grants for agricultural conservation easements.[45] An agricultural conservation easement aims to maintain agricultural land in active production by removing the development pressures from the land. Such an easement prohibits practices that would damage or interfere with the agricultural use of the land. Because the easement is a restriction on the deed of the property, the easement remains in effect even when the land changes ownership. Agricultural conservation easements are created specifically to support agriculture and prevent development on the subject parcels. While other benefits may accrue because the land is not developed (scenic and habitat values, for example), the primary use of the land is agricultural. Easements funded by the CFCP must be of a size and nature suitable for viable commercial agriculture.

The Forest Practice Act

The California Department of Forestry and Fire Protection (CALFIRE) enforces the laws that regulate logging on privately-owned lands in California. The Forest Practice Act was enacted in 1973 to ensure that logging is done in a manner that will preserve and protect fish, wildlife, forests and streams. CALFIRE reviews and approves plans for timber harvesting on private lands. In addition, through its

responsibility for fighting wildland fires, the CDF plays a role in planning development in forested areas.[46]

California Department of Conservation (CDC) Farmland Mapping and Monitoring Program (FMMP)

The FMMP was established in 1982 to assess the location, quality, and quantity of agricultural lands in the State of California and conversion of these lands over time.[47] The goal of the FMMP is to provide consistent and impartial data to decision makers for use in planning for the future of California's agricultural land resources.[48] The CDC applies the Natural Resources Conservation Service (NRCS) soil classifications to identify agricultural lands, and these agricultural designations are used in planning for the present and future of California's agricultural land resources. The CDC has a minimum mapping unit of 10 acres, with parcels that are smaller than 10 acres being absorbed into the surrounding classifications. The following are categories mapped by the CDC: Prime Farmland, Farmland of Statewide Importance, Unique Farmland, Farmland of Local Importance, Grazing Land, Urban and Built Up Land, and Other Land.[49]

California Farmland Conservancy Program (CFCP)

The CFCP seeks to encourage the long-term, private stewardship of agricultural lands through the voluntary use of agricultural conservation easements. The CFCP provides grant funding for projects which use and support agricultural conservation easements for protection of agricultural lands. The CFCP has funded more than 58,000 acres of easement projects in California, in more than a dozen counties between 1996 and 2016.[50,51] CFCP has also funded a number of planning grants, including some

with regional or statewide value. CFCP did not award any new grants for planning and policy projects in the SCAG region between 1996 and 2016.[52]

California Forest Legacy

Similar to the Federal Forest Legacy Program, the California Forest Legacy Act of 2007 (Pub. Resources Code, § 12220(G)) is a program of the California Department of Forestry and Fire Protection (CAL FIRE) to promote conservation easements in environmentally sensitive forest areas. Money to fund the Program is obtained from gifts, donations, federal grants and loans, other appropriate funding sources, and from the sale of bonds pursuant to Proposition 12, the Safe Neighborhood Parks, Clean Water, Clean Air, and Coastal Protection Bond Act (The Villaraigosa-Kelley Act) of 2000 (Pub. Resources Code, div. 5, ch. 1.692). This act defines "forest land" as "land that can support 10-percent native tree cover of any species, including hardwoods, under natural conditions and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits."[53]

3.2.2.3 Local

General Plans

The SCAG region spans six counties, each of which has a general plan containing policies related to protection of agriculture and typically forestry resources:

- **Imperial County:** Agricultural Element[54] (no policies for forestry resources)
- **Los Angeles County:** Chapter 9: Conservation and Natural Resources Element[55]
- **Orange County:** Chapter VI. Resources Element[56]
- **Riverside County:** Chapter 5: Multipurpose Open Space Element[57]

- **San Bernardino County:** Chapter V. Conservation Element[58]
- **Ventura County:** Resources Appendix[59]

Additional plans and ordinances at the master plan level, city-level, and specific plan level may also apply within the SCAG region.

Zoning

City and county zoning codes provide the set of detailed requirements that implement general plan policies at the level of the individual parcel. Zoning codes present standards for different uses and identifies which uses are allowed in the various zoning districts of the jurisdiction, including zones for agricultural use and timberland production. Since 1971, state law has required the city or county zoning code to be consistent with the jurisdiction's general plan. The purpose of agricultural zoning is to protect farmland and farming activities from incompatible non-farm uses.

Land Conservation Trust

A land trust is a nonprofit organization that, as all or part of its mission, actively works to conserve land by undertaking or assisting in land or conservation easement acquisition, or by its stewardship of such land or easements. A land conservation trust is another type of organization devoted to protecting open space, agricultural lands, wildlife habitats, and natural resource lands. There are approximately 80 established trusts in California, 14 of which are located at least partially within the SCAG region.[60] Local and regional land trusts, organized as charitable organizations under federal tax laws, are directly involved in conserving land for its natural, recreational, scenic, historical, and productive values. Local governments and special districts, either on their own or working with land trusts and conservancies, can acquire fee title to agricultural and open space lands or purchase development rights to preserve rural and agricultural areas, watersheds, or critical habitat, or to create public parks and recreational areas.

Regional Conservation Plans

Local agencies throughout the region have worked together to form Regional Conservation Plans (RCPs). These plans recognize that important habitats do not routinely line up with jurisdictional borders, so designation of conservation lands can span multiple jurisdictions. Additionally, RCPs efficiently address mitigation mandates from the California Environmental Quality Act (CEQA) by anticipating transportation projects and "banking" potentially threatened endangered-species habitats. The following are adopted major conservation plans made up of multiple jurisdictions within SCAG's boundaries; The Coachella Valley Multiple Species Habitat Conservation Plan (MSHCP), the Western Riverside MSHCP, the Orange County Transportation Authority Measure M2 Natural Communities Conservation Plan/Habitat Conservation Plan (NCCP/HCP), and the Orange County Central Coastal NCCP/HCP.

The following RCPs are in the planning phase, although conservation and restoration efforts for most of them are well underway; City of Rancho Palos Verdes NCCP/HCP, Imperial Irrigation District NCCP/HCP, Town of Apple Valley MSHCP/NCCP, and the San Bernardino County Regional Conservation Investment Strategy (RCIS).

Local Agency Formation Commissions

The Local Agency Formation Commission (LAFCO) is the agency that has the responsibility to create orderly local government boundaries, with the goal of encouraging "planned, well-ordered, efficient urban development patterns," the preservation of open-space lands, and the discouragement of urban sprawl. While LAFCO has no direct land use authority, its actions determine which local government will be responsible for planning new areas. LAFCO addresses a wide range of boundary actions, including creation of spheres of influence for cities, adjustments to boundaries of special districts, annexations, incorporations, detachments of areas from cities, and dissolution of cities.

Mitigation Bank or Conservation Bank

A conservation or mitigation bank is privately or publicly owned land managed for its natural resource values. In exchange for permanently protecting, managing, and monitoring the land, the bank sponsor is allowed to sell or transfer habitat credits to permittees who need to satisfy legal requirements and compensate for the environmental impacts of developmental projects.

A privately-owned conservation or mitigation bank is a free-market enterprise that:

- Offers landowners economic incentives to protect natural resources; Saves permittees time and money by providing them with the certainty of pre-approved compensation lands;

- Consolidates small, fragmented wetland mitigation projects into large contiguous sites that have much higher wildlife habitat values;
- Provides for long-term protection and management of habitat.

A publicly owned conservation or mitigation bank:

- Offers the sponsoring public agency advance mitigation for large projects or multiple years of operations and maintenance.[61]

3.2.3 ENVIRONMENTAL IMPACTS

3.2.3.1 Thresholds of Significance

In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland.[62] In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board.

For the purposes of this PEIR, SCAG has determined that adoption and/or implementation of Connect SoCal could result in significant adverse impacts to agricultural and forestry resources, if the Plan would result in any of the following:

- Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use;
- Conflict with existing zoning for agricultural use, or a Williamson Act contract;

61 *See e.g.*, Bunn, David; Lubell, Mark; Johnson, Christine. 2013. *Reforms could boost conservation banking by landowners*. Available at: http://calag.ucanr.edu/Archive/?article=ca.v067n02p86, accessed August 15, 2019.

62 California Department of Conservation. 2019. *Land Evaluation & Site Assessment (LESA) Model*. Available at: https://www.conservation.ca.gov/dlrp/Pages/qh_lesa.aspx, accessed August 15, 2019.

- Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)),[63] timberland (as defined by Public Resources Code section 4526),[64] or timberland zoned Timberland Production (as defined by Government Code section 51104(g));[65]

- Result in the loss of forest land or conversion of forest land to non-forest use;

- Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.

3.2.3.2 Methodology

The methodology for determining the significance of agricultural, timberland, and forest impacts compares the existing conditions to conditions in 2045 with the Connect SoCal Plan, as required by *State CEQA Guidelines* Section 15126.2(a). The known agricultural, timberland, and forest resources located within the region were evaluated using the criteria set forth by the California Department of Conservation and the *State CEQA Guidelines*. The analysis was limited to state-recognized agricultural, timberland, and forest resources. In general, the potential to impact agricultural, timber, and forest resources varies by the development area type (or location of transportation improvement).

Impacts are assessed in terms of changes to both land use and transportation infrastructure using data from the six counties within the SCAG region and SCAG forecasts related to projected population, housing, and employment growth. The methodology for determining the significance of these impacts applies the significance criteria above to the future (2045) land use pattern and transportation network. The development of new transportation facilities may affect agricultural, timber and forest resources, through both direct and indirect effects, including traversing agricultural, timberland, and forest lands. SCAG used a 500-foot buffer for transportation projects and land use development to represent where impacts could occur with respect to mapped resources such as agricultural lands.

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743, or SB 226 (as described in **Section 1.0, Introduction**), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific

63 California Legislative Information. *Article 3. Definitions [12220-12220.].*

64 California Legislative Information. *Article 2. Definitions [4521-4529.5].*

65 California Legislative Information. *Article 1. General Provisions [51100-51104].*

environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.2.3.3 Impacts and Mitigation Measures

Impact AG-1 **Potential for the Plan to convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use.**

Significant and Unavoidable Impacts - Mitigation Required.

Implementation of transportation projects as well as growth anticipated under the Plan would have the potential to convert the following to non-agricultural use: Prime Farmland, Farmland of Statewide Importance, Unique Farmland and Farmland of Local Importance. Farmland may be located within 500-feet of the transportation projects and anticipated land use development in the Plan, which would result in the conversion of lands and constitute a significant impact (**Table 3.2-4, Estimated Maximum Direct Potential Loss of Important Agricultural Land**). Based on this scenario, approximately 15,903 acres, or 0.06 percent, of combined existing Important Farmland and Grazing Land would be directly converted to non-agricultural use as a result of the transportation projects and strategies included in the Plan.

Implementation of the transportation projects and strategies considered in the Connect SoCal Plan could result in long-term impacts to farmland by adding transportation projects to parts of the region in use as agricultural lands or through development on agricultural lands, which are interspersed throughout urban areas and are also located in less developed portions of the counties. Where there would be new transportation facilities constructed outside of the region's urbanized areas, undisturbed/vacant land could be utilized for transportation purposes. Transportation projects that are most likely to result in significant impacts to agricultural lands include highway expansion, highway widening projects, and potential connectors. Other transportation projects such as roadway improvements, toll road improvements and connections, grade separated facilities for busways, goods movement roadway facilities, high speed rail and commuter rail projects, and regional express lane network improvements in areas that currently serve as agricultural could also result in significant impacts, requiring mitigation measures.

Table 3.2-4
Estimated Maximum Direct Potential Loss of Important Agricultural Land

County	Important Farmland (Acres)				Subtotal of Important Farmland (Acres)	Grazing Land (Acres)	Total Important Agricultural Land (Acres)	Percent Potentially Lost by County
	Prime Farmland	Farmland of Statewide Importance	Unique Farmland	Farmland of Local Importance				
Imperial	262	202	0	102	566	0	566	0.02%
Los Angeles	78	69	4	110	260	3,390	3,650	0.14%

Totals	**1,217**	**1,189**	**285**	**3,809**	**6,499**	**9,404**	**15,903**	**0.06%**

Source: California Department of Conservation, Division of Land Resource Protection, 2016

The Plan includes policies and strategies to help protect natural and farmlands and reduce overall land consumption. The Plan includes policies such as encouraging regional conservation planning, improving natural corridor connectivity, and expanding data sharing among agencies. The Plan also promotes a more compact growth pattern, which would help preserve agricultural lands. While the Plan includes the land use strategies that would focus new growth in the region's urbanized areas (primarily HQTAs), development anticipated to accommodate population growth could result in the consumption of agricultural lands, which would constitute a significant impact requiring mitigation measures.

Mitigation Measures

SCAG Mitigation Measures

SMM AG-1: SCAG shall host a Natural & Farm Lands Conservation Working Group which will provide a forum for stakeholders to share best practices and develop recommendations for natural and agricultural land conservation throughout the region, including the development of a Natural Lands Conservation Strategy for the Connect SoCal Plan.

SMM AG-2: SCAG shall expand on the Natural Resource Inventory Database and Conservation Framework & Assessment by incorporating strategic mapping layers to build the database and further refine the priority conservation areas by (1) further investing in

mapping and farmland data tracking and (2) working with County Transportation Commissions (CTCs) and SCAG's subregions to support their county-level efforts at data building. SCAG shall encourage CTCs to develop advanced mitigation programs or include them in future transportation measures by (1) funding pilot programs that encourage advance mitigation including data and replicable processes, (2) participating in state-level efforts that would support regional advanced mitigation planning in the SCAG region, and (3) supporting the inclusion of advance mitigation programs at county level transportation measures.

SMM AG-3: SCAG shall align with funding opportunities and pilot programs to begin implementation of conservation strategies through (1) seeking planning funds, such as cap and trade auction proceeds that could help prepare for local action on acquisition and restoration, (2) supporting CTCs and other partners, and (3) continuing policy alignment with the State Wildlife Action Plan 2015 Update and its implementation.

SMM AG-4: SCAG shall provide incentives to jurisdictions that cooperate across county lines to protect and restore natural habitat corridors, especially where corridors cross county boundaries, as detailed in the Natural & Farm Lands Appendix strategies of Connect SoCal. SCAG will work with stakeholders to identify incentives and leverage resources that help protect habitat corridors.

Project Level Mitigation Measures

PMM AG-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to address potential adverse effects on agricultural resources, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

a) Require project sponsors to mitigate for loss of farmland by providing permanent protection of in-kind farmland in the form of easements, fees, or elimination of development rights/potential.

b) Project relocation or corridor realignment to avoid Prime Farmland, Unique Farmland, or Farmland of Local or Statewide Importance.

c) Maintain and expand agricultural land protections such as urban growth boundaries.

d) Provide for mitigation fees to support a mitigation bank[66] that invests in farmer education, agricultural infrastructure, water supply, marketing, etc. that enhance the commercial viability of retained agricultural lands.

e) Minimize severance and fragmentation of agricultural land by constructing underpasses and overpasses at reasonable intervals to provide property access.

f) Use berms, buffer zones, setbacks, and fencing to reduce conflicts between new development and farming uses and protect the functions of farmland.

Level of Significance after Mitigation

As previously discussed, regulations and policies would reduce each of the impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and lack of project-specific detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to conversion of farmlands could be significant and unavoidable even with implementation of mitigation.

Impact AG-2 Potential for the Plan to conflict with existing zoning for agricultural use, or a Williamson Act contract.

Significant and Unavoidable- Mitigation Required.

Implementation of the transportation projects and growth anticipated under the Plan would have the potential to conflict with land managed pursuant to Williamson Act contracts constituting a significant impact. Prime Agricultural Land in Riverside County, Mixed Enrollment Agricultural Land in Ventura County, and Non-Renewal land in Imperial and Riverside counties under a Williamson Act contract are located within the 500-foot construction radius of the transportation projects in the Plan. Thus, there is a potential for the Plan to result in significant impacts to lands managed under Williamson Act contracts.

Implementation of the transportation projects included in the Plan could also directly affect existing zoning for agricultural use. Land zoned for agricultural use within Imperial, Orange, Riverside, San

66 The California Department of Fish and Wildlife provides a definition for conservation or mitigation banks on their website (please see https://www.wildlife.ca.gov/Conservation/Planning/Banking).

Bernardino, and Ventura Counties is located within 500 feet of projects in the Plan. While the land use strategies in the Plan are intended to encourage growth in urbanized areas, some growth would occur in areas that would potentially conflict with existing zoning for agricultural use or Williamson Act contracts which constitutes a significant impact requiring mitigation measures.

Mitigation Measures

SCAG Mitigation Measures

See **SMM AG-1** through **SMM AG-4.**

Project Level Mitigation Measures

See **PMM AG-1.**

PMM AG-2: Project level mitigation measures can and should be considered by Lead Agencies as applicable and feasible. Measures to reduce substantial adverse effects on Williamson Act contracts to the maximum extent practicable, as determined appropriate by each Lead Agency, may include the following, or other comparable measures:

a) Project relocation or corridor realignment to avoid lands in Williamson Act contracts.

b) Establish conservation easements consistent with the recommendations of the Department of Conservation, or 20-year Farmland Security Zone contracts (Government Code Section 51296 et seq.), 10-year Williamson Act contracts (Government Code Section 51200 et seq.), or use of other conservation tools available from the California Department of Conservation Division of Land Resource Protection.

Level of Significance after Mitigation

As previously discussed, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and lack of project-specific detail, including project locations, and SCAG's lack of authority to impose project-level mitigation measures,

this PEIR finds impacts related to conflicts with existing agricultural zoning and Williamson Act contract lands could be significant and unavoidable even with implementation of mitigation..

Impact AG-3 **Potential for the Plan to conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g)).**

Significant and Unavoidable – Mitigation Required.

Implementation of the transportation projects and anticipated growth under the Plan has the potential to conflict with existing zoning for forest land, timberland, or timberland zoned Timberland Production. Within the SCAG region, forest industries are permitted in open space zones in Imperial County and Ventura County, while national forest lands are protected from future development. Two of the transportation projects included in the Plan would cross through the SCAG region's national forests. Although there are very few existing trees along the I-15 freeway within the San Bernardino National Forest (predominantly characterized by shrubland adjacent to the freeway, with trees in riparian areas), roadway widening associated with HOV lanes has the potential to affect existing lands zoned as forest land. Similarly, the preferred alignment for HSR is currently expected to be along the SR 14 and would continue underground through Angeles National Forest, preserving the wilderness and the forest at ground surface along the route.[67] However, it is possible the alignments could change or that in areas where projects intersect with forest lands impacts could occur. These projects would likely require a Forest Management Plan amendment regarding the preservation of scenic integrity objectives which would reduce potential impacts, however, impacts may not be reduced to below a level of significance. Therefore, impacts related to forest land are considered significant requiring consideration of mitigation measures.

The harvesting of timberland is only permitted in two agricultural zones in Imperial County, in the open space zone in Los Angeles County only if a Conditional Use Permit (CUP) has been obtained, in the rural residential zone and controlled development areas in Riverside County only if a CUP has been obtained, in the open space zone in San Bernardino County, and only Christmas tree farms are permitted in the Timberland Preserve zone in Ventura County. Although implementation of the transportation projects considered in the Plan could result in long-term impacts to land zoned for timberland use, timberland harvesting does not currently occur in the SCAG region. Therefore, the Plan would result in no impact to

67 Vartabedian, Ralph, Sept 19, 2018. https://www.latimes.com/local/california/la-me-high-speed-rail-palmdale-burbank-20180919-story.html

timberland. Furthermore, there would also be no impact to Timberland Production Zones, as none have been established in the six-county SCAG region. As described above, impacts to forestry would be significant and unavoidable. Mitigation measures are required.

Mitigation Measures

SCAG Mitigation Measures

See **SMM AG-1** through **SMM AG-2**.

Project Level Mitigation Measures

PMM AG-3: Project level mitigation measures can and should be considered by Lead Agencies as applicable and feasible. Measures to reduce substantial adverse effects, through the conversion of Farmland to maximum extent practicable, as determined appropriate by each Lead Agency, may include the following, or other comparable measures:

a) Minimize construction related impacts to agricultural and forestry resources by locating materials and stationary equipment in such a way as to prevent conflict with agriculture and forestry resources**.**

Impact AG-4 Potential for the Plan to result in the loss of forest land or conversion of forest land to non-forest use.

Significant and Unavoidable - Mitigation Required.

Implementation of transportation projects and anticipated growth under the Plan would result in significant impacts with regards to the loss of forest land or conversion of forest land to non-forest use. Forestry resources within the SCAG region are primarily concentrated in the four national forests in the SCAG region, which are protected from future development. However, small patches of forest land and sensitive woodland communities near the wildland-urban interface are not protected. Despite land use strategies included in the Plan aim to concentrate future development in the region's urbanized areas, existing suburban town centers, and walkable, mixed-use communities (primarily the HQTAs), some of the new transportation facilities would inevitably be constructed outside of such areas. Additionally, development associated with new urban uses could also be located on forest land, resulting in the conversion of small patches of forest land to non-forest use.

Transportation projects that are most likely to result in minor impacts to forest lands include highway expansion, highway widening projects, and potential connectors. Other transportation projects such as

roadway improvements, toll road improvements and connections, grade separated facilities for busways, goods movement roadway facilities, high speed rail and commuter rail projects, and high-occupancy vehicle (HOV) / high-occupancy toll (HOT) connectors in areas that are currently forest land could also result in minor impacts. As mentioned in AG-3 above, two projects in the Plan have the potential to result in the conversion of forestry resources. As such, impacts related to forestry would be significant and mitigation measures are required. As described above, impacts to forestry would be significant and unavoidable. Mitigation measures are required.

Mitigation Measures

SCAG Mitigation Measures

See SMM AG-1 through **SMM AG-2**.

Project Level Mitigation Measures

See **PMM AG-3.**

Impact AG-5 **Potential for the Plan to involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use.**

Significant and Unavoidable Impact – Mitigation Required.

Implementation of transportation projects and anticipated growth under the Plan would result in significant impacts with regards to the conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use.

Although the Plan would include the land use strategies that focus new anticipated development in the region's urbanized areas, some new development is anticipated to occur in agricultural areas on forest land outside the national forests (where forest land is protected from future development), and/or near the wildland-urban interface. As described under Impact AG-1, the Plan would potentially directly impact up to 0.06 percent of combined existing Important Farmland and Grazing Land in the SCAG region based on a 500 foot buffer, which could indirectly result in the conversion of additional farmland or forest land as a result of increased development due to transit and/or passenger rail projects included in the Plan. Furthermore, implementation of the Plan would result in the conversion of approximately 6,499 acres of Important Farmland (15,903 acres of total agricultural lands). Lands that remain agricultural but located adjacent to urban uses, may feel pressure to develop, as nearby land values increase or as nuisances from urban development spread to agricultural lands. In addition, urban uses,

especially newly urbanized areas, can lead to pressure on adjacent farms to change their farming practices (to reduce noise, decrease spraying of fertilizers and pesticides, etc.).

Forestry resources are concentrated in the four national forests in the SCAG region, which are protected from future development. However, as discussed in Connect SoCal, climate change associated with greenhouse gas emissions would be expected to contribute to the loss of agricultural and forest land caused by increased drought conditions and wildfires.[68] As climate change studies suggest that Southern California will continue to experience more extreme weather scenarios, including longer and hotter heat waves that would increase the threat of wildfire in parts of the SCAG region already prone to wildfires, forested areas in the region are expected to experience greater threats from wildfires as conditions grow drier and hotter.[69] Agricultural areas in Southern California are "moderately" vulnerable to climate change (i.e., loss of winter chill hours, increased invasive pests, changes to plant and pest interactions, and increased plant and animal diseases in agriculture have the potential to result in the loss of agricultural land).[70] As described in **Section 3.8, Greenhouse Gases Emissions**, the proposed project could result in a significant impact with respect to greenhouse gas emissions (GHGs) and GHGs are considered a primary cause of global climate change. However, the relationship between development in any given region or country and measurable changes in forest land is not possible to determine and is therefore considered too speculative to be analyzed any further in this environmental document.

As previously mentioned, implementation of the Plan would convert a total of 15,903 acres from agricultural land to urban land use. A range of local conservation plans, habitat conservation agencies and state/federal park designated areas provide protection for a significant amount of natural and farm land in the SCAG region. However, a substantial amount of land on the urban and suburban fringe is vulnerable to development if not within the boundaries of protected lands and face additional development pressure as adjacent lands are converted. Therefore, transportation projects and development projects anticipated to occur under Connect SoCal could have the potential to cause other changes in the existing environment that could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use, constituting a significant impact requiring the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measures

See **SMM AG-1** through **SMM AG-2** and **SMM-GHG-1** through **SMM-GHG-5.**

Project Level Mitigation Measures

See **PMM AG-2** through **PMM AG-3** and **PMM GHG-2.**

PMM AG-4: Project level mitigation measures can and should be considered by Lead Agencies as applicable and feasible. Measures to reduce substantial adverse effects, through the conversion of Farmland, to the maximum extent practicable, as determined appropriate by each Lead Agency, may include the following, or other comparable measures:

a) Design proposed projects to minimize, to the greatest extent feasible, the loss of the highest valued agricultural land.

b) Redesign project features to minimize fragmenting or isolating Farmland. Where a project involves acquiring land or easements, ensure that the remaining non-project area is of a size sufficient to allow economically viable farming operations. The project proponents shall be responsible for acquiring easements, making lot line adjustments, and merging affected land parcels into units suitable for continued commercial agricultural management.

c) Reconnect utilities or infrastructure that serve agricultural uses if these are disturbed by project construction. If a project temporarily or permanently cuts off roadway access or removes utility lines, irrigation features, or other infrastructure, the project proponents shall be responsible for restoring access as necessary to ensure that economically viable farming operations are not interrupted.

PMM AG-5: Project level mitigation measures can and should be considered by Lead Agencies as applicable and feasible. Measures to reduce substantial adverse effects, through the conversion of Farmland, to the maximum extent practicable, as determined appropriate by each Lead Agency, may include the following, or other comparable measures:

a) Manage project operations to minimize the introduction of invasive species or weeds that may affect agricultural production on adjacent agricultural land.

Where a project has the potential to introduce sensitive species or habitats or have other spill-over effects on nearby agricultural lands, the project proponents shall be responsible for acquiring easements on nearby agricultural land and/or financially compensating for indirect effects on nearby agricultural land. Easements (e.g., flowage easements) shall be required for temporary or intermittent interruption in farming activities (e.g., because of seasonal flooding or groundwater seepage). Acquisition or compensation would be required for permanent or significant loss of economically viable operations.

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and lack of project-specific detail, including project locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to conversion of farmland or forest land could be significant and unavoidable even with implementation of mitigation.

3.3 AIR QUALITY

This section of the Program Environmental Impact Report (PEIR) describes air quality within the SCAG region, identifies the regulatory framework with respect to laws and regulations that affect air quality, and analyzes the potential impacts of the Connect SoCal Plan ("Connect SoCal"; "Plan"). In addition, this PEIR provides regional-scale mitigation measures as well as project-level mitigation measures to be considered by lead agencies for subsequent, site-specific environmental review to reduce identified impacts as appropriate and feasible.

3.3.1 DEFINITIONS

Air Dispersion*:* Air dispersion is defined as how air pollutants travel through ambient air. Toxic Air Contaminants/Mobile Source Air Toxics (TACs/MSATs) impact those located closest to the emission sources more than those located further away. A California law passed in 2003 (Public Resources Code Section 21151.8) prohibits the siting of a school within 500 feet of a freeway unless "the school district determines, through analysis based on appropriate air dispersion modeling, that the air quality at the proposed site is such that neither short-term nor long-term exposure poses significant health risks to pupils." The U.S. EPA has issued a number of regulations that will dramatically decrease MSATs through cleaner fuels and cleaner engines.

Concentrations: The amount of pollutant material per volumetric unit of air, measured in parts per million (ppm) or micrograms per cubic meter ($\mu g/m^3$). The following discussion identifies the pollutants included in this analysis.

Criteria Pollutants: Criteria air pollutants are defined as pollutants for which the federal and State governments have established ambient air quality standards for outdoor concentrations. The federal and State standards have been set at levels above which concentrations could be harmful to human health and welfare. These standards are designed to protect the most sensitive persons from illness or discomfort. Pollutants of concern include carbon monoxide (CO), ozone (O_3), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), particulate matter 2.5 microns or less in diameter (PM2.5), particulate matter ten microns or less in diameter (PM10), and lead (Pb). These pollutants are discussed below. [1]

- Carbon Monoxide (CO) is a colorless and odorless gas formed by the incomplete combustion of fossil fuels. It is emitted primarily from motor vehicles, power plants, refineries, industrial boilers, ships, aircraft, and trains. In urban areas, automobile exhaust accounts for the majority of emissions. CO is a non-reactive air pollutant that dissipates relatively quickly, so ambient concentrations generally

[1] U.S. Environmental Protection Agency. *NAAQS*. Available online at: https://www.epa.gov/criteria-air-pollutants/naaqs-table, accessed November 6, 2019.

follow the spatial and temporal distributions of vehicular traffic. Concentrations are influenced by local meteorological conditions; primarily wind speed, topography, and atmospheric stability. CO from motor vehicle exhaust can become locally concentrated when surface-based temperature inversions are combined with calm atmospheric conditions, a typical situation at dusk in urban areas between November and February. Inversions are an atmospheric condition in which a layer of warm air traps cooler air near the surface of the earth, preventing the normal rising of surface air. The highest concentrations occur during the colder months of the year when inversion conditions are more frequent. CO is a health concern because it competes with oxygen, often replacing it in the blood and reducing the blood's ability to transport oxygen to vital organs. Excess CO exposure can lead to dizziness, fatigue, and impair central nervous system functions.[2]

- Ozone (O_3) is a colorless gas that is formed in the atmosphere when reactive organic gases (ROG) and nitrogen oxides (NO_X) react in the presence of ultraviolet sunlight. O_3 is not a primary pollutant; rather, it is a secondary pollutant formed by complex interactions of two pollutants directly emitted into the atmosphere. The primary sources of ROG and NO_X, the components of O_3, are automobile exhaust and industrial sources. Meteorology and terrain play major roles in O_3 formation. Ideal conditions occur during summer and early autumn, on days with low wind speeds or stagnant air, warm temperatures, and cloudless skies. The greatest source of smog-producing gases is the automobile. Short-term exposure (lasting for a few hours) to O_3 at levels typically observed in Southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes.[3]

- Nitrogen Dioxide (NO_2) like O_3, is not directly emitted into the atmosphere but is formed by an atmospheric chemical reaction between nitric oxide (NO) and atmospheric oxygen. NO and NO_2 are collectively referred to as NO_X and are major contributors to O_3 formation. NO_2 also contributes to the formation of PM10. High concentrations of NO_2 can cause breathing difficulties and result in a brownish-red cast to the atmosphere with reduced visibility. There is some indication of a

2 U.S. Environmental Protection Agency. *Basic Information about Carbon Monoxide (CO) Outdoor Air Pollution*. Available online at: https://www.epa.gov/co-pollution/basic-information-about-carbon-monoxide-co-outdoor-air-pollution#What is CO, accessed November 6, 2019.

3 U.S. Environmental Protection Agency. *Ground-level Ozone Basics*. Available online at: https://www.epa.gov/ground-level-ozone-pollution/ground-level-ozone-basics#wwh, accessed November 6, 2019.

relationship between NO_2 and chronic pulmonary fibrosis. Some increase of bronchitis in children (2-3 years old) has been observed at concentrations below 0.3 parts per million (ppm).[4]

- Sulfur Dioxide (SO_2) is a colorless, pungent gas formed primarily by the combustion of sulfur-containing fossil fuels. Main sources of SO_2 are coal and oil used in power plants and industries. Generally, the highest levels of SO_2 are found near large industrial complexes. In recent years, SO_2 concentrations have been reduced by the increasingly stringent controls placed on stationary source emissions of SO_2 and limits on the sulfur content of fuels. SO_2 is an irritant gas that attacks the throat and lungs. It can cause acute respiratory symptoms and diminished ventilator function in children. SO_2 can also yellow plant leaves and erode iron and steel.[5]

- Particulate Matter (PM) consists of small liquid and solid particles floating in the air, including smoke, soot, dust, salts, acids, and metals and can form when gases emitted from industries and motor vehicles undergo chemical reactions in the atmosphere. Fine particulate matter, or PM2.5, is roughly 1/28 the diameter of a human hair and results from fuel combustion (e.g. motor vehicles, power generation, industrial facilities), residential fireplaces, and wood stoves. In addition, PM2.5 can be formed in the atmosphere from gases such as SO_2, NO_X, and VOC. Inhalable particulate matter, or PM10, is about 1/7 the thickness of a human hair. Major sources of PM10 include crushing or grinding operations; dust stirred up by vehicles traveling on roads; wood burning stoves and fireplaces; dust from construction, landfills, and agriculture; wildfires and brush/waste burning; industrial sources; windblown dust from open lands; and atmospheric chemical and photochemical reactions.

  PM2.5 and PM10 pose a greater health risk than larger-size particles. When inhaled, they can penetrate the human respiratory system's natural defenses and damage the respiratory tract. PM2.5 and PM10 can increase the number and severity of asthma attacks, cause or aggravate bronchitis and other lung diseases, and reduce the body's ability to fight infections. Very small particles of substances, such as lead, sulfates, and nitrates can cause lung damage directly. These substances can be absorbed into the blood stream and cause damage elsewhere in the body. These substances can transport absorbed gases, such as chlorides or ammonium, into the lungs and cause injury. Whereas PM10 tends to collect in the upper portion of the respiratory system, PM2.5 is so tiny that it can

penetrate deeper into the lungs and damage lung tissues. Suspended particulates also damage and discolor surfaces on which they settle, as well as produce haze and reduce regional visibility.[6]

- Lead (Pb) in the atmosphere occurs as particulate matter. Sources of lead include leaded gasoline; the manufacturers of batteries, paint, ink, ceramics, and ammunition; and secondary lead smelters. Prior to 1978, mobile emissions were the primary source of atmospheric lead. Between 1978 and 1987, the phase-out of leaded gasoline reduced the overall inventory of airborne lead by nearly 95 percent. With the phase-out of leaded gasoline, secondary lead smelters, battery recycling, and manufacturing facilities have become lead-emission sources of greater concern.

  Prolonged exposure to atmospheric lead poses a serious threat to human health. Health effects associated with exposure to lead include gastrointestinal disturbances, anemia, kidney disease, and in severe cases, neuromuscular and neurological dysfunction. Of particular concern are low-level lead exposures during infancy and childhood. Such exposures are associated with decrements in neurobehavioral performance, including intelligence quotient performance, psychomotor performance, reaction time, and growth. [7]

- Toxic Air Contaminants (TAC) are airborne pollutants that may increase a person's risk of developing cancer or other serious health effects. TACs include more than 700 chemical compounds that are identified by State and federal agencies based on a review of available scientific evidence. In California, TACs are identified through a two-step process established in 1983 that includes risk identification and risk management.[8]

Diesel Particulate Matter (DPM)*:* According to the California Air Resources Board (CARB), most toxic air emissions are from motor vehicles and the particulate matter from the exhaust of diesel-fueled engines.[9] In 1998, the OEHHA completed a comprehensive health assessment of diesel exhaust. This assessment formed the basis for a decision by the CARB to formally identify particles in diesel exhaust as a TAC that may pose a threat to human health.[10]

10 Office of Environmental Health Hazard Assessment. Accessed 8 September 2015. *Health Effects of Diesel Exhaust*. Available at: http://oehha.ca.gov/public_info/facts/dieselfacts.html

DPM is part of a complex mixture that makes up diesel exhaust. Diesel exhaust is commonly found throughout the environment and is estimated by EPA's National Scale Assessment to contribute to the human health risk in New England. Diesel exhaust is composed of two phases, either gas or particle, and both phases contribute to the risk. The gas phase is composed of many of the urban hazardous air pollutants, such as acetaldehyde, acrolein, benzene, 1,3-butadiene, formaldehyde, and polycyclic aromatic hydrocarbons. The particle phase also has many different types of particles that can be classified by size or composition. The size of diesel particulates that are of greatest health concern are those that are in the categories of fine, and ultra-fine particles. The composition of these fine and ultrafine particles may be composed of elemental carbon with absorbed compounds such as organic compounds, sulfate, nitrate, metals, and other trace elements. Diesel exhaust is emitted from a broad range of diesel engines: the on-road diesel engines of trucks, buses, and cars and the off-road diesel engines that include locomotives, marine vessels, and heavy-duty equipment.[11] People living and working in urban and industrial areas are more likely to be exposed to this pollutant. Those spending time on or near roads and freeways, truck loading and unloading operations, operating diesel-powered machinery, or working near diesel equipment face exposure to higher levels of diesel exhaust and face higher health risks.[12]

The most common exposure pathway is breathing the air that contains the DPM. The fine and ultrafine particles are respirable, which means that they can avoid many of the human respiratory system defense mechanisms and enter deeply into the lung. In the National Scale Assessment, there are several steps used to characterize public health risks. For diesel particulate matter, not all of the steps could be completed but a qualitative assessment was provided that provided modeling estimates of population exposures. The estimated population exposure concentrations for diesel particulate matter were the highest exposure concentrations in all of the New England states. EPA has medium confidence in the overall NATA estimate for diesel particulate exposure based on the emissions and exposure modeling. Exposure to DPM comes from both on road and off-road engine exhaust that is either directly emitted from the engines or aged through lingering in the atmosphere.[13]

Diesel exhaust causes health effects from both short-term or acute exposures and also long-term chronic exposures, such as repeated occupational exposures. The type and severity of health effects depends upon several factors including the amount of chemical you are exposed to and the length of time you are

exposed. Individuals also react differently to different levels of exposure. There is limited information on exposure to just diesel particulate matter but there is enough evidence to indicate that inhalation exposure to diesel exhaust causes acute and chronic health effects.[14]

Acute exposure to diesel exhaust may cause irritation to the eyes, nose, throat, and lungs and some neurological effects such as lightheadedness. Acute exposure may also elicit a cough or nausea as well as exacerbate asthma. Chronic exposure in experimental animal inhalation studies have shown a range of dose-dependent lung inflammation and cellular changes in the lung, and there are also diesel exhaust immunological effects. Based upon human and laboratory studies, there is considerable evidence that diesel exhaust is a likely carcinogen. Human epidemiological studies demonstrate an association between diesel exhaust exposure and increased lung cancer rates in occupational settings.[15] The elderly and people with emphysema, asthma, and chronic heart and lung disease are especially sensitive to fine-particle pollution. Numerous studies have linked elevated particle levels in the air to increased hospital admissions, emergency room visits, asthma attacks and premature deaths among those suffering from respiratory problems. Because children's lungs and respiratory systems are still developing, they are also more susceptible than healthy adults to fine particles. Exposure to fine particles is associated with increased frequency of childhood illnesses and can also reduce lung function in children. For the average Californian, 70 percent of cancer risk from breathing toxic air pollutants stem from diesel exhaust particles.[16]

EPA's National Scale Assessment uses several types of health hazard information to provide a quantitative "threshold of concern" or a health benchmark concentration at which it is expected that no adverse health effects occur at exposures to that level. Health effects information on carcinogenic, short- and long term non-carcinogenic end points are used to establish selective protective health levels to compare to the modeled exposures levels. The exposure response data in human studies are considered too uncertain to develop a carcinogenic unit risk for EPA's use. There is a Reference Concentration (RFC) that is used as a health benchmark protective of chronic noncarcinogenic health effects, but it is for diesel exhaust and not specifically set for DPM, which is what was modeled in NATA. The RFC for diesel

exhaust, which includes DPM is 5 μg/m^3. This value is similar to the National Ambient Air Quality Standard established for fine particulate matter, which is 15 μ/m^3.[17]

Emissions: The quantity of pollutants released into the air, measured in pounds per day (ppd) or tons per day (tpd).

GHG Greenhouse Gases – Components of the atmosphere that contribute to the greenhouse effect. The principal greenhouse gases that enter the atmosphere because of human activities are carbon dioxide, methane, nitrous oxide, and fluorinated gases.

Visibility*:* With the exception of Lake County, which is designated in attainment, all of the air districts in California are currently designated as unclassified with respect to the California Ambient Air Quality Standards (CAAQS) for visibility reducing particles. (A pollutant is designated unclassified if the data are incomplete and do not support a designation of attainment or nonattainment.)

Since deterioration of visibility is one of the most obvious manifestations of air pollution and plays a major role in the public's perception of air quality, the state of California has adopted a standard for visibility or visual range. Until 1989, the standard was based on visibility estimates made by human observers. The standard was changed to require measurement of visual range using instruments that measure light scattering and absorption by suspended particles. The visibility standard is based on the distance that atmospheric conditions allow a person to see at a given time and location. Visibility reduction from air pollution is often due to the presence of sulfur and nitrogen oxides, as well as particulate matter. Visibility degradation occurs when visibility reducing particles are produced in sufficient amounts such that the extinction coefficient is greater than 0.23 inverse kilometers (to reduce the visual range to less than 10 miles) at relative humidity less than 70 percent, 8-hour average (from 10:00 a.m. to 6:00 p.m.) according to the state standard.

3.3.2 ENVIRONMENTAL SETTING

The SCAG region encompasses a population exceeding 19 million persons in an area of more than 38,000 square miles within the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura.

Air quality in the four air basins in the SCAG region—South Coast Air Basin (SCAB), Mojave Desert Air Basin (MDAB), Salton Sea Air Basin (SSAB), and South Central Coast Air Basin (SCCAB) (Ventura

---

17 U.S. Environmental Protection Agency. 24 April 2014. *Diesel Particulate Matter*. April 24, 2014. Available at: http://www.epa.gov/region1/eco/airtox/diesel.html

County portion)—is a function of the topography, climate, population, and land use. While improved from the 1970s, Southern California consistently ranks as some of the worst air quality in the nation. The American Lung Association's *State of the Air Report 2018*, ranks the Los Angeles-Long Beach metropolitan area as seventh worst in the nation for people at risk for 24-hour PM2.5, fourth worst for annual PM2.5, and worst for most ozone-polluted cities.[18]

Topography, Climate, and Meteorology

The SCAG region has a greatly varied topography from lakes to mountains, valleys, hills, basins, and urban areas. The topography and meteorological conditions define the climate of the region because air quality is a function of the rate and location of pollutant emissions. Atmospheric conditions such as wind speed, wind direction, and air temperature gradients, along with local topography, influence the movement and dispersal of pollutants and thereby provide the link between air pollutant emissions and air quality. Southern California has strong temperature inversions in the lower atmosphere that can trap pollutants near the surface. Meteorology affects air quality trends that may mask emission reduction benefits. Meteorology also affects different pollutants differently. Warm and sunny weather, which is typical of Southern California, leads to higher ozone days because sunlight aids the chemical reactions that form ozone. On the other hand, windy weather will spread primary particulate matter from direct emissions leading to high PM concentrations in the air. Secondary PM, including particulate nitrates and sulfates, is more prevalent in the air during cold, calm, and humid weather conditions. Rain and wind reduce PM concentration in the air.[19] The local topography and climate conditions are described in greater detail specific to each air basin as listed below. These air basins are geographically defined because the travel of air pollution can be trapped by natural barriers like mountains unless the prevailing winds are powerful enough to disperse it to other areas.[20]

South Coast Air Basin (SCAB)

The SCAB incorporates approximately 12,000 square miles, consisting of Orange County and the urbanized areas of San Bernardino, Riverside, and Los Angeles Counties. In May 1996, the boundaries of the SCAB were changed by CARB to include the Beaumont-Banning area. The distinctive climate of the

20 South Coast Air Quality Management District. *Southern California Air Basins.* Available online at: http://www.aqmd.gov/docs/default-source/default-document-library/map-of-jurisdiction.pdf, accessed March 25, 2019.

SCAB is determined by its terrain and geographic location. The SCAB is a coastal plain with connecting broad valleys and low hills, bounded by the Pacific Ocean to the southwest and high mountains around the rest of its perimeter. The general region lies in the semi-permanent high-pressure zone of the eastern Pacific, resulting in a mild climate tempered by cool sea breezes with light average wind speeds. The usually mild climatological pattern is interrupted occasionally by periods of extremely hot weather, winter storms, or Santa Ana winds.[21]

The vertical dispersion of air pollutants in the SCAB is hampered by the presence of persistent temperature inversions. High-pressure systems, such as the semi-permanent high-pressure zone in which the SCAB is located, are characterized by an upper layer of dry air that warms as it descends, restricting the mobility of cooler marine-influenced air near the ground surface, and resulting in the formation of subsidence inversions. Such inversions restrict the vertical dispersion of air pollutants released into the marine layer and, together with strong sunlight, can produce worst-case conditions for the formation of photochemical smog. The basin-wide occurrence of inversions at 3,500 feet above sea level or less averages 191 days per year.[22]

The atmospheric pollution potential of an area is largely dependent on winds, atmospheric stability, solar radiation, and terrain. The combination of low wind speeds and low inversions produces the greatest concentration of air pollutants. On days without inversions, or on days of winds averaging over 15 miles per hour, smog potential is greatly reduced.[23]

Mojave Desert Air Basin (MDAB)

The MDAB encompasses approximately 21,480 square miles and includes the desert portions of San Bernardino County, Palo Verde Valley, Palmdale, and Lancaster in the Antelope Valley. The MDAB is bordered by the SCAB and the Riverside County line to the south, Kern County line to the west, the Arizona and Nevada borders to the north and east, and the eastern portion of Riverside County to the southeast.[24] The Kern County portion of MDAB is not in the SCAG region.

The MDAB is an assemblage of mountain ranges interspersed with long broad valleys that often contain dry lakes.[25] Many of the lower mountains that dot the vast terrain rise from 1,000 to 4,000 feet above the

valley floor. Prevailing winds in the MDAB are out of the west and southwest. These prevailing winds are due to the proximity of the MDAB to coastal and central regions and the blocking nature of the Sierra Nevada Mountains to the north; air masses pushed onshore in Southern California by differential heating are channeled through the MDAB. The MDAB is separated from the Southern California coastal and central California valley regions by mountains (highest elevation approximately 10,000 feet), whose passes form the main channels for these air masses. The Antelope Valley is bordered in the northwest by the Tehachapi Mountains, separated from the Sierra Nevada in the north by the Tehachapi Pass (3,800 feet elevation). The Antelope Valley is bordered in the south by the San Gabriel Mountains, bisected by Soledad Canyon (3,300 feet). The Mojave Desert is bordered in the southwest by the San Bernardino Mountains, separated from the San Gabriel Mountains by the Cajon Pass (4,200 feet). A lesser channel lies between the San Bernardino Mountains and the Little San Bernardino Mountains (the Morongo Valley).

The Palo Verde Valley portion of the Mojave Desert lies in the low desert, at the eastern end of a series of valleys (notably the Coachella Valley) whose primary channel is the San Gorgonio Pass (2,300 feet) between the San Bernardino and San Jacinto Mountains.

During the summer, the MDAB is generally influenced by a Pacific subtropical high cell that sits off the coast, inhibiting cloud formation and encouraging daytime solar heating. The MDAB is rarely influenced by cold air masses moving south from Canada and Alaska, as these frontal systems are weak and diffuse by the time the reach the desert. Most desert moisture arrives from infrequent warm, moist, and unstable air masses from the south. The MDAB averages between 3 and 7 inches of precipitation per year (from 16 to 30 days with at least 0.01 inch of precipitation).[26] The MDAB is classified as a dry-hot desert climate, with portions classified as dry-very hot desert, to indicate at least three months have maximum average temperatures over 100.4 degrees Fahrenheit (°F).

Salton Sea Air Basin (SSAB)

The SSAB includes Imperial County and the desert portion of Riverside County between the SCAB and the MDAB (known as the Coachella Valley). Imperial County extends over 4,284 square miles in the southeastern corner of California, bordering on Mexico to the south, Riverside County to the north, San Diego County on the west, and the State of Arizona on the east. The Salton Trough runs northwest to southeast through the center of Imperial County and extends into Mexico. The elevation in Imperial

26 County of Riverside. 2015. *County of Riverside General Plan Air Quality Element*. Available online at: https://planning.rctlma.org/Portals/14/genplan/general_plan_2018/elements/Ch09_AQE_071718.pdf, accessed March 25, 2019.

County ranges from about 230 feet below sea level at the Salton Sea in the north to more than 2,800 feet on the mountain summits to the east.[27]

Climatic conditions in the SSAB are governed by the large-scale sinking and warming of air in the semi-permanent subtropical high-pressure center of the Pacific Ocean. The high-pressure ridge blocks out most mid-latitude storms except in the winter when the high is weakest and farthest south. The coastal mountains prevent the intrusion of any cool, damp marine air found in California coastal environs. Because of the weakened storms and the orographic barrier, the SSAB experiences clear skies, very low humidity, extremely hot summers, mild winters, and little rainfall. The flat terrain of the valley and the strong temperature differentials created by intense solar heating produce moderate winds and deep thermal convection.[28]

The combination of subsiding air, protective mountains, and distance from the ocean severely limits precipitation. Rainfall is highly variable, with heavy precipitation occurring from single storms followed by periods of dry air. Humidity is typically low throughout the year, ranging from 28 percent in summer to 52 percent in winter.[29]

The wind in Imperial County follows two general patterns. Prevailing winds are from the west-northwest through southwest. Also evident is a secondary flow maximum from the southeast. The prevailing winds from the west and northwest occur seasonally from fall through spring and are known to be from the Los Angeles area. Imperial County experiences periods of extremely high wind speeds. Wind speeds can exceed 31 miles per hour, and this occurs primarily during April and May. However, wind speeds of less than 6.8 miles per hour account for more than half of the observed wind measurements.[30]

South Central Coast Air Basin (SCCAB)

The SCAG region includes the Ventura County portion of the SCCAB. Ventura County is made up of coastal mountain ranges, the coastal shore, the coastal plain, and several inland valleys.[31] The northern half of the county (Los Padres National Forest) is extremely mountainous with altitudes up to 8,800 feet. Consequently, the climate in the northern half of the county varies a great deal depending on elevation.

31 Ventura County Air Pollution Control District. 2017. *Final 2016 Ventura County Air Quality Management Plan*. Available online at: http://www.vcapcd.org/pubs/Planning/AQMP/2016/Final/Final-2016-Ventura-County-AQMP.pdf, accessed September 6, 2019.

Therefore, the climatological and meteorological description presented for Ventura County focuses on the southern half of the county where violations of federal and state ozone standards occur. In the winter, low-pressure systems originating in the northern Pacific Ocean bring clouds, rain, and wind into Ventura County.

The average annual temperature in the coastal and inland valleys of the southern half of Ventura County ranges from the upper 50s at the coast (Point Mugu) to the mid-60s in Simi Valley. The difference between the maximum and minimum temperatures becomes greater as the distance increases from the coast. The average minimum and maximum temperatures at Point Mugu are 50°F and 60°F, respectively, while at the inland location of Simi Valley, the averages are 52°F and 77°F. The smaller range of temperatures at Point Mugu demonstrates the moderating influence of the ocean on air temperature. The ocean's ability to warm and cool the air while its temperature remains relatively unchanged produces the moderating effect. Inland area temperatures are more prone to rapid fluctuations. Almost all rainfall in Ventura County falls during the winter and early spring (November through April). Summer rainfall is normally restricted to scattered thundershowers in lower elevations and somewhat heavier activity in the mountains. Humidity levels vary throughout the County. The range of humidity is primarily influenced by proximity to the ocean. Although the County's climate is semiarid, average humidity levels are relatively high due to the marine influence. Coastal areas are more humid than inland areas during typical fair weather. The reverse is true during stormy periods. The lowest humidity levels are recorded during Santa Ana wind conditions.

Ventura County winds are dominated by a diurnal land-sea breeze cycle. The land-sea breeze regime is broken only by occasional winter storms and infrequent strong northeasterly Santa Ana wind flows. Since the sea breeze is stronger than the land breeze, the net wind flow during the day is from west to east. Under light land-sea breeze regimes, recirculation of pollutants can occur as emissions move westward during morning hours, and eastward during the afternoon. This can cause a buildup of pollutants over several days.

The vertical dispersion of air pollutants in Ventura County is limited by the presence of persistent temperature inversions. Approximately 60 percent of all inversions measured at Point Mugu are surface based, with most occurring during the morning hours.

Regional Air Quality

In Southern California, the American Lung Association consistently gives counties within the SCAG region failing grades in the amount of ozone and particulate pollution in the air. The American Lung Association has assigned grades to each of the Counties in the SCAG region for 2018 (**Table 3.3-1,**

American Lung Association Report Card for SCAG Region). Grades were calculated from a weighted average based on the total number of days in each air quality index level. The weighted average was derived by counting the number of days in each unhealthful range in each year (2014–2016), multiplying the total in each range by the assigned standard weights, and calculating the average. All six counties in the SCAG region received a failing grade for ozone, which means there were a significant number of unhealthy air days relative to the ozone standard. For ozone, an "F" grade was set to generally correlate with the number of unhealthy air days that would place a county in nonattainment for the ozone standard. For short-term particle pollution, fewer unhealthy air days are required for an F than for nonattainment under the PM2.5 standard. For PM2.5, the national standard allows 2 percent of days in a three-year period to exceed 35 μg/m3, which is roughly 21 unhealthy days in three years, but the American Lung Association uses a more restrictive 1 percent or 99th percentile limit to protect the public from short term spikes in pollution.

Particle Pollution

In December 2009, the U.S. EPA linked fine particle pollution (PM2.5) to public health impacts. The U.S. EPA determined that fine particle pollution could cause early death, cardiovascular harm, respiratory harm, cancer, and reproductive and developmental harm. In the short term, particle pollution reduces lung function and increases lung tissue inflammation in young, healthy adults. Short-term exposure increases emergency room visits for patients with acute respiratory illnesses, increases number of heart attacks, increases school absenteeism, increases hospitalization of children with asthma, and can even result in deaths on days of high levels of particle pollution.[32] Asthma in the SCAG region ranges from 32

[32] American Lung Association. 2018. *State of the Air 2018*. Available online at: https://www.lung.org/assets/documents/healthy-air/state-of-the-air/sota-2018-full.pdf, accessed March 25, 2019.

to 89 per 10,000 people (**Table 3.3-2, Population-Weighted Asthma Rate per 10,000**). Asthma rates are a good indicator of population sensitivity to environmental stressors because asthma is both caused by and exacerbated by pollutants.

Table 3.3-2

SCAG region	**49**

Source: CalEnviroScreen3.0 - age-adjusted rate of emergency department (ED) visits for asthma per 10,000 (2018 Update).

In 2014, the World Health Organization's International Agency for Research on Cancer linked long-term exposure to particle pollution to increased risk of developing lung cancer.[33] Other studies have shown long-term particle pollution exposure increases hospitalization of children with asthma living near busy roads with heavy truck traffic, reduces lung function in children and teenagers, damages small airways of the lungs, increases risk of death from cardiovascular disease, and increases risk of lower birth weight and infant mortality.[34]

Particle pollution particularly has a detrimental effect on sensitive populations including children, elderly, and those with respiratory or cardiovascular illnesses. In March 2015, the Office of Environmental Health Hazard Assessment (OEHHA) amended their Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments to consider the impact of age, breathing rates, and exposure levels into their cancer risk calculation methodology.[35]

Particulate matter pollution is anticipated to increase due to climate change, which can lead to worsening asthma symptoms, chronic obstructive pulmonary disease (COPD), and respiratory infections associated

to premature mortality. Increasing temperatures due to climate change are also anticipated to lead to an increase in wildfires across California. Wildfires are a significant source of smoke and particulate matter exposure. The risk from fires persists even after a wildfire is extinguished because particulate matter from fire ash can be picked up by the winds.[36]

Figure 3.3-1, Annual Average Concentration of PM2.5, shows the average annual exposure to PM2.5 in the SCAG region for years 2012 to 2014. South Los Angeles County, northeast Orange County, southwest San Bernardino County, and northwest Riverside County experienced the highest average annual exposure to PM2.5. The metropolitan area by El Centro and Calexico in Imperial County also show high average annual exposure to PM2.5. Average concentrations in these high exposure areas range from 10.1 to 14.6 micrograms of PM2.5 per cubic meter of air. This is below the federal 15 μg/m3 standard, but above the state standard of 12 μg/m3.

Ozone

Ozone is formed when sunlight reacts with NO_x, VOCs, and/or CO. These compounds are typically found in vehicle exhaust but can also be released into the atmosphere from other sources like chemical solvents, power plants, gas stations, paints, and refineries. In February 2013, the U.S. EPA published the "Integrated Science Assessment for Ozone and Related Photochemical Oxidants." The report concluded that ozone pollution causes respiratory harm, is likely to cause early death and cardiovascular harm, may cause harm to the central nervous system, and may cause reproductive and developmental harm.[37] High levels of ozone can result in premature death and stroke, acute breathing problems like shortness of breath, wheezing, and coughing, asthma attacks, increase in risk of respiratory infection, increase susceptibility to pulmonary inflammation, and increase in hospitalization and emergency room visits for those with asthma, chronic obstructive pulmonary disease, cardiovascular disease and lung disease. Long term ozone exposure is connected to higher risk of death from respiratory diseases, higher risk of hospitalization for children with asthma especially those that are also low income, higher risk of developing asthma, lower birth weight and decreased lung function in newborns.[38] Similar to particle pollution, ozone has a detrimental effect on sensitive populations including children, elderly, and those with respiratory or cardiovascular illnesses.

Figure 3.3-2, Maximum 8-Hour Ozone Concentrations (ppm), shows the average daily O_3 exposure in the SCAG region that is in excess of the national 8-hour standard (0.070 ppm) in the SCAG region for years 2012 to 2014. Although the region largely experiences average daily ozone exposure exceeding the

36 Southern California Association of Governments. 2019. *Public Health Draft Technical Report*.

37 Ibid.

38 Ibid.

federal standard, the highest concentration of ozone exposure can be seen mostly in southwest San Bernardino and northwest Riverside Counties, and also in northwest Los Angeles County.

Sensitive Receptors

There are many sensitive receptors located throughout the SCAG region. Some persons, such as those with respiratory illnesses or impaired lung function due to other illnesses, people with cardiovascular diseases or diabetes, the elderly over 65 years of age, and children under 14 years of age, can be particularly sensitive to emissions of criteria pollutants. These are the populations most at risk to poor air quality. Facilities and structures where sensitive people live or spend considerable amounts of time are known as sensitive receptors. Land uses identified by SCAQMD in the CEQA Air Quality Handbook to be sensitive receptors include residences, schools, playgrounds, childcare centers, athletic facilities, long-term health care facilities, rehabilitation centers, convalescent centers, and retirement homes.

Attainment Status

NAAQS

The federal CAA sets NAAQS for the main criteria air pollutants: NO_x, VOC, PM2.5, PM10, SO_x, CO, and lead. Attainment and nonattainment of the NAAQS is variable throughout the counties within the SCAG region (**Table 3.3-3, 2019 Nonattainment in Counties in the SCAG Region for All Criteria Pollutants by County by NAAQS**).

CAAQS

CAAQS are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations. California has set standards for certain pollutants, such as particulate matter and ozone, which are more protective of public health than respective federal standards. California has also set standards for some pollutants that are not addressed by federal standards such as visibility reducing particles and vinyl chloride (**Table 3.3-4, CAAQS Area Designations**).

The SCAG region is encompassed by CARB's air quality monitoring program. The air monitoring stations collect ambient level measurements for criteria pollutants. The data generated are used to define the nature and severity of pollution in California; determine which areas of California are in attainment or non-attainment; identify pollution trends in the state; support agricultural burn forecasting; and develop air models and emission inventories.[39] There are 64 active air monitoring stations in the SCAG region: nine in Imperial County, 15 in Los Angeles County, five in Orange County, 15 in Riverside County, 14 in the San Bernardino County, and six in Ventura County. These monitoring stations are shown in **Figure 3.3-3, Air Quality Basins and Monitoring Stations**.[40]

Health Risk Assessment

The Health Risk Assessment (HRA) (**Appendix 3.3**) assesses the potential carcinogenic risk to persons potentially exposed to harmful diesel exhaust emissions near freeways within the SCAG region. Using EMFAC2014, exhaust diesel particulate matter (DPM, modeled as PM2.5 and PM10) is modeled because DPM has carcinogenic health effects. Cancer risk is used as a proxy for overall health effects in this

assessment. Discussed in more detail in **Appendix 3.3** and **Chapter 4.0, Alternatives**, of this PEIR, the model simulates five conditions: existing conditions, 2045 No Project, 2045 under Connect SoCal, and 2045 under project alternatives (Local Input, Intensified Land Use) alternative scenarios containing variations on land use and transportation projects and strategies. Comparison between the existing conditions and the Plan is described in **Section 3.3.4, Environmental Impacts.**

Emissions and cancer risk are evaluated along 16 transportation corridors. The corridors were determined in prior RTP/SCS PEIRs primarily based on highest traffic volumes, highest heavy duty diesel truck volumes (HDDT) as well as proximity to sensitive receptors. Quantitative modeling of the entire length of each freeway corridor (some of which extend more than 90 miles) is impractical and therefore representative high-volume segments were selected.

For this analysis, 16 transportation segments (previously evaluated in the 2016 RTP/SCS PEIR) were evaluated. By selecting the same 16 segments as evaluated in 2016, it affords an opportunity to view progress since the adoption of the 2016 RTP/SCS. Eight of the sixteen segments were also previously evaluated in the 2012 RTP/SCS. When selecting the additional eight segments for analysis in 2016, SCAG ranked potential transportation segments by the volume of HDDT traffic. Segments were then ranked again based on the density of sensitive receptors. Using these rankings, one segment was chosen in each county and an additional two segments in Los Angeles and Riverside Counties were chosen based on heavy-duty diesel traffic. These sixteen segments were then quantitatively modeled for increased cancer risk (see **Table 3.3.-16, Summary Maximum Exposed Individual Residential 30-Year Exposure Cancer Risk**).

HDDT comprise the majority of DPM emissions. An AERMOD dispersion model was used to calculate the anticipated DPM concentrations at identified receptors out to 1,000 meters away from each freeway segment. Risk calculations were undertaken for worker, residential, and school sensitive receptors. **Table 3.3-17, Summary Maximum Exposed Individual Residential 30-year Exposure Cancer Risk** presents a summary of the cancer risk per million exposed persons for each of the six scenarios and 16 freeway segments. The HRA (see **Appendix 3.3**) also includes a discussion comparing the health risk calculations at each segment under Connect SoCal as well as the plans from the 2012 RTP/SCS and 2016 RTP/SCS.

Ambient Air Quality

The five air districts in the SCAG region each monitor air quality conditions in their region. The characterization of the ambient air quality in relation to criteria pollutants was based on peak readings of criteria pollutants in the SCAG air basins (**Table 3.3-6, Peak Criteria Pollutants Readings for the SCAG Region Air Basins**). The data shows that O_3, PM2.5, and PM10 readings consistently exceeded the standards in each of the air basins.

3.3.3 REGULATORY FRAMEWORK

3.3.3.1 Federal

Federal Clean Air Act

Congress passed the first major Clean Air Act (CAA) in 1970 (42 U.S. Code [USC] Sections 7401 et seq.). This Act gives the EPA broad responsibility for regulating motor vehicle emissions from many sources of air pollution from mobile to stationary sources. Pursuant to the CAA, the EPA is authorized to regulate air emissions from mobile sources like heavy-duty trucks, agricultural and construction equipment, locomotives, lawn and garden equipment, and marine engines; and stationary sources such as power plants, industrial plants, and other facilities. The CAA sets National Ambient Air Quality Standards (NAAQS) for the six most common air pollutants to protect public health and public welfare. These pollutants include particulate matter, ozone, carbon monoxide, sulfur oxides, nitrogen oxides, and lead. For each pollutant, the EPA designates an area as attainment for meeting the standard or nonattainment for not meeting the standard. A maintenance designation entails an area that was previously designated as nonattainment but is currently designated as attainment. The CAA directs states to develop state implementation plans (SIPs), applicable to appropriate industrial sources in the state, in order to achieve these standards.[41]

CAA Section 112(f) and 112(d): National Emission Standards for Hazardous Air Pollutants (NESHAPs)

Section 112 of the CAA addresses emissions of hazardous air pollutants. Prior to 1990, CAA established a risk-based program under which only a few standards were developed. The 1990 CAAA revised Section 112 to first require issuance of technology-based standards for major sources and certain area sources. "Major sources" are defined as a stationary source or group of stationary sources that emit or have the potential to emit 10 tons per year or more of a hazardous air pollutant or 25 tons per year or more of a combination of hazardous air pollutants. An "area source" is any stationary source that is not a major source.[42]

For major sources, Section 112 requires that EPA establish emission standards that require the maximum degree of reduction in emissions of hazardous air pollutants. These emission standards are commonly referred to as "maximum achievable control technology" or MACT standards. Eight years after the technology-based MACT standards are issued for a source category, EPA is required to review those

41 U.S. Environmental Protection Agency. *Summary of the Clean Air Act 42 U.S.C. §7401 et seq. (1970).* Available online at: https://www.epa.gov/laws-regulations/summary-clean-air-act, accessed August 23, 2019.

42 Ibid.

standards to determine whether any residual risk exists for that source category and, if necessary, revise the standards to address such risk.[43]

The Risk and Technology Review (RTR) is a combined effort to evaluate both risk and technology as required by the CAA after the application of MACT standards. Section 112(f) of the CAA requires EPA to complete a report to Congress that includes a discussion of methods the EPA would use to evaluate the risks remaining after the application of MACT standards. These are known as residual risks. EPA published the Residual Risk Report to Congress (PDF) in March 1999. Section 112(f)(2) directs EPA to conduct risk assessments on each source category subject to MACT standards, and to determine if additional standards are needed to reduce residual risks. Section 112(d)(6) of the CAA requires EPA to review and revise the MACT standards, as necessary, taking into account developments in practices, processes and control technologies.[44]

National Ambient Air Quality Standards (NAAQS)

The federal CAA required the U.S EPA to establish NAAQS. The NAAQS set primary standards and secondary standards for specific air pollutants**.** Primary standards define limits for the intention of protecting public health, which include sensitive populations such as asthmatics, children, and the elderly. Secondary Standards define limits to protect public welfare to include protection against decreased visibility, damage to animals, crops, vegetation, and buildings. A summary of the federal ambient air quality standards is shown in **Table 3.3-7, National Ambient Air Quality Standards**.

43 Ibid.

44 Ibid.

Table 3.3-7
National Ambient Air Quality Standards

Pollutant		Primary/Secondary	Averaging Time	Level
Carbon Monoxide		Primary	8 hours	9 ppm
			1 hour	35 ppm
Lead		Primary and secondary	Rolling 3-month average	0.15 μg/m^3
Nitrogen dioxide		Primary	1 hour	100 ppb
		Primary and secondary	Annual	0.053 ppm
Ozone		Primary and secondary	8 hours	0.070 ppm
Particulate Matter	PM2.5	Primary	Annual	12 μg/m^3
		Secondary	Annual	15 μg/m^3
		Primary and secondary	24 hours	35 μg/m^3
	PM10	Primary and secondary	24 hours	150 μg/m^3
Sulfur dioxide		Primary	1 hour	75 ppb
		Secondary	3 hours	0.5 ppm

State Implementation Plan (SIP)/ Air Quality Management Plans (AQMPs)

A SIP is required by the EPA to ensure compliance with the NAAQS. States must develop a general plan to maintain air quality in areas of attainment and a specific plan to improve air quality for areas of nonattainment. SIPs are a compilation of new and previously submitted plans, programs (such as monitoring, modeling, permitting, etc.), district rules, state regulations, and federal controls. The SIP verifies that the state has a proper air quality management program that adheres to or strives to reach the most up to date emissions requirements.[45] The 1990 amendments to the federal CAA set deadlines for attainment based on the severity of an area's air pollution problem. In adherence to CAA Section 172, states must adopt additional regulatory programs for nonattainment areas.[46] Particularly in California, the SIP not only complies with NAAQS, but also the more stringent CAAQS.

AQMPs are required to ensure compliance with the state and federal requirements. AQMPs contain scientific information and use analytical tools to demonstrate a pathway towards achieving attainment for the criteria air pollutants. Within the SCAG region, five air districts—SCAQMD, Mojave Desert Air

45 U.S. Environmental Protection Agency. *Basic Information about Air Quality SIPs*. Available online at: https://www.epa.gov/sips/basic-information-air-quality-sips, accessed August 23, 2019.

46 U.S. Environmental Protection Agency. *The Clean Air Act – Highlights of the 1990 Amendments*. Available online at: https://www.epa.gov/sites/production/files/2015-11/documents/the_clean_air_act_-_highlights_of_the_1990_amendments.pdf, accessed August 23, 2019.

Quality Management District (MDAQMD), Imperial County Air Pollution Control District (ICAPCD), Antelope Valley Air Quality Management District (AVAQMD), and the Ventura County Air Pollution Control District (VCAPCD)—are responsible for developing the AQMPs.[47] The approval process begins when the regional air districts submit their AQMPs to the CARB. CARB is the lead agency and responsible agency for submitting the SIP to the EPA. CARB forwards SIP revisions to the EPA for approval and publication in the Federal Register. The Code of Federal Regulations Title 40, Chapter I, Part 52, Subpart F, Section 52.220, lists all of the items included in the California SIP.[48]

Transportation Conformity

Transportation conformity is required under federal CAA Section 176(c) to ensure that federally supported highway and transit project activities are consistent with ("conform to") the purpose and requirements of the SIP. Conformity currently applies to areas that are designated nonattainment, and those redesignated to attainment after 1990 ("maintenance areas" with plans developed under CAA Section 175A) for the following transportation-related criteria pollutants: ozone, particulate matter (PM2.5 and PM10), CO, and NO_2. Conformity to the purpose of the SIP means that transportation activities will not cause new air quality violations, worsen existing violations, or delay timely attainment of the relevant NAAQS. The transportation conformity regulation is found in 40 CFR Part 93. Conformity requires reporting on the timely implementation of Transportation Control Measures (TCMs) in ozone nonattainment areas designated as serious or worse, thus reinforcing the link between AQMP/SIPs and the transportation planning process. TCMs are expected to be given funding priority and to be implemented on schedule, and in the case of any delays, any obstacles to implementation have been or are being overcome. In the SCAG region, there are two areas for which the ozone SIPs contain TCMs: SCAB and the Ventura County portion of SCCAB. (It is noted that the Ventura County SIP does not claim emission reduction credits from TCM projects. They have been included to assist transportation and air quality agencies to identify projects that have the potential of reducing vehicle emissions, vehicle trips, and vehicle miles traveled.)[49]

Federal CAA Rules

The mobile and stationary sources of emissions are subject to different rules and regulations. For the mobile sources, the rules apply to cars, trucks, buses, recreational vehicles, engines, generators, farm and construction machines, lawn and garden equipment, marine engines, and locomotives. In addition, the compositions of fuels used to operate mobile sources are regulated to help reduce harmful emissions. For stationary resources including factories and chemical plants, pollution control equipment are installed to meet specific emission limits set under the CAA. The New Source Review (NSR) and Prevention of Significant Deterioration (PSD) require large industrial operators such as coal-fired power, acid, glass, and cement plants and petroleum refineries to make modifications to existing facilities or install new controls resulted in emissions of pollutants on new facilities to reduce degradation and harm against public health. EPA works with its federal partners through CAA to ensure compliance with rules through active monitoring and to make sure that the regulated community obeys environmental laws/regulations through on-site inspections and record reviews that lead to enforcement in order to meet environmental regulatory requirements.[50]

Clean Air Act Waiver for California's GHG Emission Standards for New Motor Vehicles

Due to the unique topography and rapid population increase within the Los Angeles basin, federal standards may not be effective enough to meet clean air standards, therefore the state was granted the ability to create stricter standards than set by the CAA. Utilizing the ability to set stricter emission standards, California was granted a waiver of the CAA in July 2009 so that the state may set its own vehicle emission standards for new motor vehicles in order to reduce GHG and ozone emissions.[51] In 2018, the Trump administration announced that the government would ease the federal vehicle fuel standards. As a response, and as a result of the autonomy provided by this waiver, California along with four major antimanufacturing companies pledged to produce vehicle fleets averaging approximately 50 miles per gallon (mpg) by 2026.

On September 19, 2019, under the Safer, Affordable, Fuel-Efficient (SAFE) Vehicles Rule, the U.S. Department of Transportation's National Highway Traffic Safety Administration (NHSTA) and the U.S. EPA issued the final "One National Program Rule." The rule states that federal law preempts state and local laws regarding tailpipe GHG emissions standards, zero emissions vehicle mandates, and fuel

economy for automobiles and light duty trucks. The rule revokes California's Clean Air Act waiver and preempts California's Advanced Clean Car Regulations and may potentially impact SCAG's Connect SoCal and transportation projects in the SCAG region.[52, 53] On September 20, 2019, a lawsuit was filed by California and a coalition of 22 other states, and the cities of Los Angeles, New York and Washington, D.C., in the United States District Court for the District of Columbia (Case 1:19-cv-02826) challenging the SAFE Rule and arguing that EPA lacks the legal authority to withdraw the California waiver. At the time of this PEIR, it is unclear whether the SAFE Rule will remain in place.[54]

Mobile Source Air Toxics (MSAT) Modeling and Programs

MOVES2014. In 2010, the EPA released the emission model, the Motor Vehicle Emissions Simulator (MOVES). On February 8, 2011, EPA issued guidance on "Using the MOVES and Emission Factors (EMFAC) Models in NEPA Evaluation" that recommended a two-year grace period be applied to project-level emissions analysis for NEPA purposes. At the end of this grace period, that is, beginning December 20, 2012, Lead Agencies should use MOVES to conduct emissions analysis for NEPA purposes. To prepare for this transition, FHWA is updating the September 2009 Interim Guidance to incorporate the analysis conducted using MOVES. Based on FHWA's analysis using MOVES2010 diesel particulate matter (diesel PM) has become the dominant MSAT of concern. MOVES2014, the latest version of MOVES, was released in October 2014, and incorporates the Tier 3 Rule and other EPA rulemakings since the last MOVES release.

The U.S. EPA has adopted several mobile source emission control programs such as:[55]

Control of Hazardous Air Pollutants from Mobile Sources. In February 2007, EPA finalized this rule to reduce hazardous air pollutants from mobile sources. The rule limits the benzene content of gasoline and reduces toxic emissions from passenger vehicles and gas cans. EPA estimates that in 2030 this rule would

54 If the SAFE Rule remains in place, the state and region would have to develop other means of achieving the NAAQS.

55 U.S. Environmental Protection Agency. *Mobile Source Pollution and Related Health Effects.* Available online at: https://www.epa.gov/mobile-source-pollution, accessed November 12, 2018.

reduce total emissions of mobile source air toxics by 330,000 tons and VOC emissions (precursors to ozone and PM2.5) by over 1 million tons.[56]

Heavy-Duty Onboard Diagnostic Rule (74 FR 8310). In February 2009, the EPA published a final rule, requiring that these advanced emissions control systems be monitored for malfunctions via an onboard diagnostic system (OBD), similar to those systems that have been required on passenger cars since the mid-1990s. This final rule will require manufacturers to install OBD systems that monitor the functioning of emission control components and alert the vehicle operator to any detected need for emission related repair.[57]

Small SI and Marine SI Engine Rule (73 FR 25098). Published October 2008, these exhaust emission standards applied starting in 2010 for new marine spark-ignition (SI) engines, including first-time EPA standards for sterndrive and inboard engines. The exhaust emission standards applied starting in 2011 and 2012 for different sizes of new land based, spark-ignition engines at or below 19 kilowatts (kW). These small engines are used primarily in lawn and garden applications. Estimated annual nationwide reductions are anticipated to be 604,000 tons of volatile organic hydrocarbon emissions, 132,200 tons of NO_x emissions, and 5,500 tons of directly emitted particulate matter (PM2.5) emissions.[58]

Locomotive and Commercial Marine Rule (66 FR 5002). Published May 2008, the controls apply to all types of locomotives, including line-haul, switch, and passenger, and all types of marine diesel engines below 30 liters per cylinder displacement, including commercial and recreational, propulsion and auxiliary. The near-term program, which started in 2009, includes new emission limits for existing locomotives and marine diesel engines that apply when they are remanufactured, and take effect as soon as certified remanufacture systems are available. The long-term emissions standards for newly built locomotives and marine diesel engines are based on the application of high-efficiency catalytic after-

treatment technology. These standards take effect in 2015 for locomotives and in 2014 for marine diesel engines.[59]

Clean Air Nonroad Diesel Rule (65 FR 6698). Published June 2004, this comprehensive national program regulates nonroad diesel engines and diesel fuel as a system. New engine standards took effect in the 2008 model year, phasing in over a number of years. These standards are based on the use of advanced exhaust emission control devices.[60]

Heavy-duty Engine and Vehicle Standards and Highway Diesel Fuel Sulfur Control Requirements (66 FR 5002). Published January 2001, the EPA established a comprehensive national control program to regulate the heavy-duty vehicle and its fuel as a single system. As part of this program, new emission standards took effect in model year 2007, and apply to heavy-duty highway engines and vehicles. These standards are based on the use of high-efficiency catalytic exhaust emission control devices or comparably effective advanced technologies.[61]

New Source Performance Standards (NSPS) for Stationary Engines. Nonroad diesel engines are used in excavators and other construction equipment, farm tractors and other agricultural equipment, heavy forklifts, airport ground service equipment, and utility equipment such as generators, pumps, and compressors.[62] EPA has adopted multiple tiers of emission standards, including reducing emissions from nonroad diesel engines by integrating engine and fuel controls as a system. To meet these Tier 4 emission standards, engine manufacturers will produce new engines with advanced emission control technologies.[63]

3.3.3.2 State

California Clean Air Act of 1988

The California CAA of 1988 (Chapter 1568, Statutes of 1988) requires all air pollution control districts in the state to aim to achieve and maintain state ambient air quality standards for ozone, carbon monoxide, and nitrogen dioxide by the earliest practicable date and to develop plans and regulations specifying how the districts will meet this goal. There are no planning requirements for the state PM10 standard. The CARB, which became part of the California Environmental Protection Agency (Cal/EPA) in 1991, is responsible for meeting state requirements of the federal CAA, administrating the California CAA, and establishing the CAAQS. The California CAA, amended in 1992, requires all AQMDs in the state to achieve and maintain the CAAQS. The CAAQS are generally stricter than national standards for the same pollutants, but there is no penalty for nonattainment. California has also established state standards for sulfates, hydrogen sulfide, vinyl chloride, and visibility-reducing particles, for which there are no national standards.[64]

California Ambient Air Quality Standards

The federal CAA permits states to adopt additional or more protective air quality standards if needed. California has set standards for certain pollutants, such as particulate matter and ozone, which are more protective of public health than respective federal standards. California has also set standards for some pollutants that are not addressed by federal standards.[65] The state standards for ambient air quality are summarized in **Table 3.3-8, California Ambient Air Quality Standards**.

Table 3.3-8
California Ambient Air Quality Standards

Pollutant		Averaging Time	Level
Carbon monoxide		8 hours	9 ppm
		1 hour	20 ppm
Lead		30-day average	1.5 μg/m^3
Nitrogen dioxide		1 hour	0.180 ppm
		Annual	0.030 ppm
Ozone		8 hours	0.070 ppm
		1 hour	0.09 ppm
Particulate matter	PM2.5	Annual	12 μg/m^3
	PM10	24 hours	50 μg/m^3
		Annual	20 μg/m^3
Sulfur dioxide		1 hour	0.25 ppm
		24 hours	0.04 ppm
Sulfates		24 hours	25 μg/m^3
Hydrogen sulfide		1 hour	0.03 ppm
Vinyl chloride		24 hours	0.01 ppm

California Health and Safety Code

Under the California Health and Safety Code, Division 26 (Air Resources), the ARB is authorized to adopt regulations to protect public health and the environment through the reduction of TACs and other air pollutants with adverse health effects. ARB has promulgated several mobile and stationary source airborne toxic control measures (ATCMs) pursuant to this authority. For instance, effective as of July 2003, ARB approved an ATCM that limits school bus idling and idling at or near schools to only when necessary for safety or operational concerns (13 CCR Chapter 10 Section 2480). This ATCM is intended to reduce diesel PM and other TACs and air pollutants from heavy-duty motor vehicle exhaust. It applies to school buses, transit buses, school activity buses, youth buses, general public paratransit vehicles, and other commercial motor vehicles. This ATCM focuses on reducing public exposure to diesel PM and other TACs, particularly for children riding in and playing near school buses and other commercial motor vehicles, who are disproportionately exposed to pollutants from these sources.[66] In addition, effective February 2005, the ARB approved an ATCM to limit the idling of diesel-fueled commercial

66 CARB. *Amended Regulation: Airborne Toxic Control Measure to Limit School Bus Idling at Schools*. Available online at: https://ww3.arb.ca.gov/toxics/sbidling/sbvidling.pdf, accessed August 23, 2019.

motor vehicles with gross vehicular weight ratings of greater than 10,000 pounds, regardless of the state or country in which the vehicle is registered (13 CCR Chapter 10 Section 2485).[67]

Toxic Air Contaminant Identification and Control Act

The Toxic Air Contaminant Identification and Control Act (Assembly Bill [AB] 1807, Chapter 1047, Statutes of 1983) created the California Air Toxics Program in 1983. It established a two-step process of risk identification and risk management to address potential health effects associated with public exposure to toxic substances in the air. In the risk identification step, CARB and the OEHHA determine if a substance should be formally identified, or "listed," as a TAC in California. Since inception of the program, a number of such substances have been identified and listed. In 1993, legislative amendments were enacted for the program to identify the 189 federal hazardous air pollutants (HAPs) as TACs.

In the risk management step, CARB reviews emission sources of an identified TAC to determine whether regulatory action is needed to reduce the risk. Based on results of that review, CARB has promulgated a number of airborne toxic control measures (ATCMs), both for mobile and stationary sources. In 2004, CARB adopted an ATCM to limit heavy-duty diesel motor vehicle idling in order to reduce public exposure to diesel PM and other TACs. The measure applies to diesel-fueled commercial vehicles with gross vehicle weight ratings greater than 10,000 pounds that are licensed to operate on highways, regardless of where they are registered. This measure does not allow diesel-fueled commercial vehicles to idle for more than 5 minutes at any given time. These diesel-related measures are critical in reducing the statewide cancer risk and creating healthier communities.[68]

CARB Air Toxics "Hot Spots" Information and Assessment Act of 1987

The California Air Toxics Program is supplemented by the Air Toxics "Hot Spots" program, which became law (AB 2588, Statutes of 1987) in 1987. In 1992, the AB 2588 program was amended by Senate Bill 1731 to require facilities that pose a significant health risk to the community to perform a risk reduction audit and reduce their emissions through implementation of a risk management plan. Under this program, which is required under the Air Toxics "Hot Spots" Information and Assessment Act (Section 44363 of the California Health and Safety Code), facilities are required to report their air toxics emissions, assess health risks, and notify nearby residents and workers of significant risks when present.[69] In March 2015, the OEHHA adopted "The Air Toxics Hot Spots Program Guidance Manual for Preparation of

69 Ibid.

Health Risk Assessments" in accordance with the Health and Safety Code, Section 44300. The Final Guidance Manual incorporates the scientific basis from three earlier developed Technical Support Documents to assess risk from exposure to facility emissions. The 2015 OEHHA Final Guidance has key changes including greater age sensitivity in particular for children, decreased exposure durations, and higher breathing rate profiles. Because cancer risk could be up to three times greater using this new guidance, it may result in greater mitigation requirements, more agency backlog, and increased difficulty in getting air permits. Regardless of the change in calculation methodology, actual emissions and cancer risk within South Coast Air Basin has declined by more than 50 percent since 2005. [70]

The CARB provides a computer program, the Hot Spots Analysis and Reporting Program (HARP), to assist in a coherent and consistent preparation of an HRA. HARP2, an update to HARP, was released in March 2015. HARP2 has a more refined risk characterization in HRA and CEQA documents and incorporates the 2015 OEHHA Final Guidance. [71]

Multiple Air Toxics Exposure Study (MATES-IV)

To date, the most comprehensive study of air toxics in the South Coast Air Basin (SCAB) is the Multiple Air Toxics Exposure Study (MATES-IV), conducted by Southern California Air Quality Management District (SCAQMD) in 2015. MATES combines monitoring of ambient air toxics, emissions inventories, and computer modeling to estimate the cancer risk from air pollution. The monitoring program measured over 30 air pollutants, including both gases and particulates. SCAQMD's MATES IV found that the average cancer risk from air pollution across the region declined from 1,194 in 1 million during MATES III in 2005 to 418 in 1 million in 2012–2013 using similar methods of analysis. The risk reduction follows a trend of declining toxic emissions in the region since the first MATES study was conducted in 1987. MATES IV found that mobile sources are responsible for 90 percent of the risk.[72]

The SCAQMD proposes the MATES V study as a follow up to the MATES IV study. The purpose of MATES V fixed monitoring is to characterize long-term regional air toxics levels in residential and

commercial areas. The MATES V study proposes to study air toxics for a one-year period at ten fixed sites beginning in January 2019.[73]

Senate Bill 656 (Chapter 738, Statues of 2003)

In 2003, the Legislature enacted Senate Bill (SB) 656 (Chapter 738, Statutes of 2003), codified as Health and Safety Code Section 39614, to reduce public exposure to PM10 and PM2.5. SB 656 required ARB, in consultation with local air pollution control and air quality management districts (air districts), to develop and adopt, by January 1, 2005, a list of the most readily available, feasible, and cost-effective control measures that could be employed by ARB and the air districts to reduce PM10 and PM2.5 (collectively referred to as PM).[74]

The legislation established a process for achieving near-term reductions in PM throughout California ahead of federally required deadlines for PM2.5, and provided new direction on PM reductions in those areas not subject to federal requirements for PM. Measures adopted as part of SB 656 complement and support those required for federal PM2.5 attainment plans, as well as for State ozone plans. This ensures continuing focus on PM reduction and progress towards attaining California's more health protective standards. This list of air district control measures was adopted by the ARB on November 18, 2004. ARB also developed a list of State PM control measures for mobile and stationary sources, including measures planned for adoption as part of ARB's Diesel Risk Reduction Plan. The lists are at the following web site: http://www.arb.ca.gov/pm/pmmeasures/pmmeasures.htm.

California Air Resources Board Mobile Source Programs

Emission Reduction Plan for Ports and Goods Movement

The CARB approved the 2006 Emission Reduction Plan for Ports and Goods Movement in California. The Plan is an essential component of California's effort to reduce community exposure to air pollution and to meet new federal air quality standards for ozone and fine particulate matter (PM2.5). The plan's goals are to:[75]

1. Reduce total statewide international and domestic goods movement emissions to the greatest extent possible and at least back to 2001 levels by year 2010.

---

73 South Coast Air Quality Management District. *MATES V Multiple Air Toxics Exposure Study*. Available online at: http://www.aqmd.gov/home/air-quality/air-quality-studies/health-studies/mates-v, accessed September 30, 2019.

75 California Air Resources Board. 2006.. *Emission Reduction Plan for Ports Goods Movement in California*. April. Available online at: https://www.arb.ca.gov/planning/gmerp/plan/final_plan.pdf, accessed November 19, 2018.

2. Reduce the statewide diesel PM health risk from international and domestic goods movement 85 percent by year 2020.

3. Reduce NO_x emissions from international goods movement in the South Coast 30 percent from projected year 2015 levels, and 50 percent from projected year 2020 levels based on preliminary targets for attaining federal air quality standards.

4. Apply the emission reduction strategies for ports and goods movement statewide to aid all regions in attaining air quality standards.

5. Make every feasible effort to reduce localized risk in communities adjacent to goods movement facilities as expeditiously as possible.

Goods Movement Emission Reduction Program

In June 2015, CARB released the Proposition 1B: Goods Movement Emission Reduction Program Final 2015 Guidelines for Implementation. This program is designed to reduce diesel exhaust emissions from trucks, locomotives, ships, harbor craft, and cargo handling equipment. The guidelines shall include, at a minimum, all of the following: [76]

- An application process for funds, and any limits on administration costs.
- Requirements that local agencies identify the useful life of the project and project delivery milestones as part of the application process.
- Criteria for selection of local and State agency projects and equipment projects.
- Requirements for match funding.
- The method by which ARB will consider the air basin's status in achieving State and federal air quality standards.
- Requirements that grant agreements between ARB and local agencies, and interagency agreements with other State agencies, identify project milestones, and remedies for failure to meet project milestones.

---

76 California Air Resources Board. 2015. *Proposition 1B: Goods Movement Emission Reduction Program 2015 Guidelines for Implementation.* June. Available online at: https://ww3.arb.ca.gov/bonds/gmbond/docs/prop_1b_goods_movement_2015_program_guidelines_for_implementation.pdf, accessed August 23, 2019.

- Accountability and auditing requirements, including provisions for Program reviews or fiscal audits of project expenditures and outcomes.

ARB Staff shall evaluate the progress of the Program and any changes needed to improve its effectiveness, plus advances in technology and updated equipment costs that create a need to revise the list of equipment project options. These guidelines are designed and intended to effectuate the provisions of SB 88, AB 201, and AB 892.[77]

CARB Small Off-road Engine (SORE) Exhaust Emission Standards

SORE engines include off-road spark-ignition engines that produce 19 kW gross power or less (less than 25 horsepower), including lawn and garden, industrial, logging, airport ground support, and commercial utility equipment; golf carts; and specialty vehicles. These emission standards apply to HC, NO_x, CO, and PM emissions with increasingly stricter standards from 1995 to 2013.[78]

CARB Off-road Compression-Ignition Diesel Engine Exhaust Emission Standards

These engines include new compression-ignition engines (a.k.a. diesel engines) that are found in a wide variety of off-road applications such as farming, construction, and industrial. Some familiar examples include tractors, excavators, dozers, scrapers, portable generators, transport refrigeration units (TRUs), irrigation pumps, welders, compressors, scrubbers, and sweepers. This category, however, does not include locomotives, commercial marine vessels, marine engines over 37 kW, or recreational vehicles.[79]

CARB On-Road Heavy-Duty Diesel Vehicles (In-Use) Regulation

This regulation requires diesel trucks and buses that operate in California to be upgraded to reduce emissions. Newer heavier trucks and buses must meet PM filter requirements beginning January 1, 2012. Lighter and older heavier trucks must be replaced starting January 1, 2015. By January 1, 2023, nearly all trucks and buses will need to have 2010 model year engines or equivalent. The regulation applies to nearly all privately and federally owned diesel fueled trucks and buses and to privately and publicly owned school buses with a gross vehicle weight rating (GVWR) greater than 14,000 pounds. In 2014, to void the flexibility options provided in the 2014 amendments to the Truck and Bus regulation, John R.

Lawson Rock and Oil of Fresno and the California Trucking Association sued the California Air Resources Board. On January 31, 2018 the court ruled to void the 2014 amendments.[80]

CARB Smartway/Phase I Heavy Duty Vehicle Greenhouse Gas Regulation

This regulation applies to GHG emissions from heavy-duty trucks and engines sold in California. It establishes GHG emissions limits on truck and engine manufacturers and harmonizes with the recently adopted U.S. EPA rule for new trucks and engines nationally. Existing heavy-duty vehicle regulations in California include engine criteria emission standards, tractor-trailer GHG requirements to implement SmartWay strategies (i.e., the Heavy-Duty Tractor-Trailer Greenhouse Gas Regulation), and in-use fleet retrofit requirements such as the Truck and Bus Regulation.[81] Executive Order (EO) B-32-15 and Sustainable Freight Action Plan

On July 17, 2015, Governor Brown issued Executive Order B-32-15, which directs the Secretary of the California State Transportation Agency, the Secretary of Cal/EPA, and the Secretary of the Natural Resources Agency to lead other relevant state departments in developing an integrated action plan that will improve freight efficiency, transition to zero-emission technologies, and increase competitiveness of California's freight system. The plan is informed by existing state agency strategies, including the California Freight Mobility Plan, Sustainable Freight Pathways to Zero and Near-Zero Emissions, and the Integrated Energy Policy Report.[82]

The Action Plan is intended to integrate investments, policies, and programs across several State agencies to help realize a singular vision for California's freight transport system. This integrated approach will serve to coordinate State agency priorities and timing on actions to influence freight transportation and energy infrastructure, vehicle and equipment technologies, and facility and operations efficiency, rather than the traditional and separate planning efforts for transportation, environment, and energy. The Action Plan includes recommendations on:[83]

- A long-term 2050 Vision and Guiding Principles for California's future freight transport system
- Targets for 2030 to guide the State toward meeting the Vision

- Opportunities to leverage State freight transport system investments
- Actions to initiate over the next five years to make progress towards the Targets and the Vision
- Pilot projects to achieve on-the-ground progress in the near-term
- Additional concepts for further exploration and development, if viable

Diesel Risk Reduction Plan

In August 1998, the ARB identified particulate emissions from diesel-fueled engines (diesel PM) as toxic air contaminants, based on data linking diesel PM emissions to increased risks of lung cancer and respiratory disease. Following the identification process, the ARB was required to determine if there was a need for further control, which led to creation of the Diesel Advisory Committee to assist in the development of a risk management guidance document and risk reduction plan. In September 2000, the ARB adopted the Diesel Risk Reduction Plan, which recommends control measures to reduce the risks associated with diesel PM and achieve a goal of 75 percent diesel PM reduction by 2010 and 85 percent by 2020.[84]

Specific statewide regulations designed to further reduce diesel PM emissions from diesel-fueled engines and vehicles will be evaluated and developed. The goal of these regulations is to make diesel engines as clean as possible by establishing state-of-the-art technology requirements or emission standards to reduce diesel PM emissions.

California Wellness Plan (2014)

The California Department of Public Health published a statewide Wellness Plan in 2014. The Plan acknowledges that many factors contribute to an individual's health. These factors include the physical environment (housing, neighborhood, healthy food access and environment), educational attainment and employment, economic status, social support, social norms and attitudes, culture, literacy, race/ethnicity. The physical environment is also an indicator of exposure to toxins and transportation where individuals are affected on a daily basis by the air quality of their surroundings.[85]

CARB Air Quality and Land Use Handbook

In April 2005, the California Air Resources Board published the Air Quality and Land Use Handbook as a informational and advisory guide for evaluating and reducing air pollution impacts associated with new projects that go through the land use decision-making process. Studies have shown that diesel exhaust and other cancer-causing chemicals emitted from cars and trucks are responsible for much of the overall cancer risk from airborne toxics in California. Reducing diesel particulate emissions is one of CARB's highest public health priorities and the focus of a comprehensive statewide control program that is reducing diesel PM emissions each year. This document highlights the potential health impacts associated with proximity to air pollution sources so planners explicitly consider this issue in planning processes. The Air Quality and Land Use Handbook includes advisories on where to site new sensitive land uses. Regarding freeways and high-traffic roads, CARB states, "[A]void siting new sensitive land uses within 500 feet of a freeway urban roads with 100,000 vehicles/day, or rural roads with 50,000 vehicles/day."[86]

3.3.3.3 Local

The SCAG region is comprised of four air basins and five air districts. The four air basins are SCAB, MDAB, SSAB, and the Ventura County portion of SCCAB. The five air districts are MDAQMD, AVAQMD, VCAPCD, SCAQMD, and ICAPCD.

MDAQMD Federal 75 ppb Ozone Attainment Plan (Western Mojave Desert Nonattainment Area)

The Western Mojave Desert nonattainment area (as defined in 40 CFR 81.305) was designated nonattainment for the NAAQS for ozone by USEPA effective on July 20, 2012. The MDAQMD has experienced ambient ozone concentrations in excess of the 8-hour ozone NAAQS. This plan (1) demonstrates that the MDAQMD will meet the primary required Federal ozone planning milestone, attainment of the 75 ppb 8-hour ozone NAAQS, by July 2027; (2) presents the progress the MDAQMD will make towards meeting all required ozone planning milestones; and (3) discusses the 2015 70 ppb 8-hour ozone NAAQS, preparatory to an expected non-attainment designation for the new NAAQS.[87]

AVAQMD Federal 75 ppb Ozone Attainment Plan (2017)

The AVAQMD has adopted a single attainment plan for ozone. The AVAQMD Federal 8-hour Ozone Attainment Plan, adopted in March 2017, demonstrates that the AVAQMD will meet the primary required federal ozone planning milestones by June 2027, presents the progress the AVAQMD will make towards meeting all required ozone planning milestones, and discusses the 75 part per million 8-hour ozone NAAQS.[88]

VCAPCD Air Quality Management Plan

The 2016 Ventura County Air Quality Management Plan (AQMP) presents Ventura County's: 1) strategy to attain the 2008 federal 8-hour ozone standard; 2) attainment demonstration for the federal 8-hour ozone standard; and, 3) reasonable further progress demonstration for the federal 8-hour ozone standard.[89]

SCAQMD 2016 Air Quality Management Plan (AQMP)

The 2016 AQMP seeks to achieve multiple goals in partnership with other entities promoting reductions in criteria pollutant, greenhouse gases, and toxic risk, as well as efficiencies in energy use, transportation, and goods movement. The 2016 AQMP includes the integrated strategies and measures needed to meet the National Ambient Air Quality Standards (NAAQS). SCAQMD recently approved on March 3, 2017 the 2016 AQMP that demonstrates attainment of the 1-hr and 8-hr ozone NAAQS as well as the latest 24-hr and annual PM2.5 standards.[90]

ICAPCD Air Plans

At a public meeting held on May 25, 2018, CARB approved the Imperial County 2018 Annual PM2.5 State Implementation Plan (SIP). At a public meeting held on November 13, 2018, the Imperial County 2018 Redesignation Request and Maintenance Plan for PM10. SIPs in the region are utilized to demonstrate

that the County is in attainment of previous PM goals, as well as to set new emissions reduction guidelines, goals, and methodologies.[91]

Fugitive Dust Regulations: SCAQMD, AVAQMD, and MDAQMD Rule 403; VCAPCD Rule 55, Fugitive Dust; ICAPCD Rule 800, ICAPCD Rule 801

The SCAQMD, AVAQMD, and MDAQMD have adopted Rule 403, Fugitive Dust, which requires the implementation of best available fugitive dust control measures during construction and operational activities capable of generating fugitive dust emissions from on-site earth-moving activities, construction/demolition activities, and mobile equipment traveling on paved and unpaved roads.[92] Similarly, VCAPCD has adopted Rule 55, Fugitive Dust,[93] and ICAPCD has adopted Rule 800, General Requirements for Control of Fine Particulate Matter (PM10),[94] and Rule 801, Construction and Earthmoving Activities, to reduce fugitive dust.[95]

SCAQMD, AVAQMD Rule 1401;[96] [97] MDAQMD Rule 1320;[98] VCAPCD Rule 36;[99] ICAPCD Rule 207[100] and SCAQMD, AVAQMD Rule 1402;[101,102] MDAQMD Rule 1520;[103] VCAPCD Rule 73;[104] ICAPCD Rule 403[105]

The SCAQMD has adopted two rules for TACs to limit cancer and non-cancer health risks from facilities located within its jurisdiction. Rule 1401, New Source Review of Toxic Air Contaminants, regulates new or modified facilities; and Rule 1402, Control of Toxic Air Contaminants from Existing Sources, regulates facilities that are already in operation. Rule 1402 incorporates requirements of the AB 2588 program, including implementation of risk reduction plans for significant risk facilities. In 2015, SCAQMD revised Rule 1401 and 1402 to include more equipment types and industry categories. Under the revised Rule 1401, no permit would be issued for new and modified equipment unless the cancer risk is less than ten in a million using Toxics Best Available Control Technology (TBACT) or less than one in a million without TBACT or if near a school. For Rule 1402, existing facilities under AB 2588 must reduce facility-wide risk if maximum individual cancer risk is greater than 25 in a million. AVAQMD, MDAQMD, VCAPCD, and ICAPCD have adopted similar rules to limit health risks from toxic air contaminants from new, modified, and existing sources.

3.3.4 ENVIRONMENTAL IMPACTS

3.3.4.1 Thresholds of Significance

The impacts related to air quality from the proposed project would be considered significant if they would exceed the following significance criteria, in accordance with Appendix G of the *State CEQA Guidelines*:

- Conflict with or obstruct implementation of the applicable air quality plan;
- Violate any air quality standard or contribute substantially to an existing or projected air quality violation;
- Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard;
- Expose sensitive receptors to substantial pollutant concentrations; or
- Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

Air Quality Thresholds for Criteria Air Pollutants

As previously discussed, the SCAG region is located within the SCAQMD, VCAPCD, MDAQMD, AVAPCD, and ICAPCD. Per *CEQA Guidelines* §15064.7 each air district is encouraged to develop and publish significance thresholds that the agency can use in the determination of the significance of environmental effects. Each of the air district's significance thresholds are discussed below.[106] These thresholds are generally recommended by each air district to be used to determine if further discussion of air quality impacts is needed in an environmental document. If emissions of criteria pollutants are below these levels, then air quality impacts are generally considered to be less than significant.

South Coast Air Quality Management District Thresholds

SCAQMD prepared air quality significance thresholds to compare the mass daily emissions in pounds per day (lbs/day) from construction and operation for NOx, VOC, PM10, PM2.5, SOx, CO, and Lead.

106 CEQA Guidelines §15064.7.

SCAQMD's thresholds are summarized in **Table 3.3-9, SCAQMD Air Quality Significance Thresholds**.[107]

Table 3.3-9
SCAQMD Air Quality Significance Thresholds

Pollutant	Construction (lbs/day)	Operation (lbs/day)
NOx	100	55
VOC	75	55
PM10	150	150
PM2.5	55	55
Sox	150	150
CO	550	550
Lead	3	3

Ventura County Air Pollution Control District Thresholds

VCAPCD published the Ventura County Air Quality Assessment Guidelines in October 2003 that include the District's recommended significance thresholds. According to the Guidelines, operational ROG and NOx emissions have a threshold of 5 pounds per day in the Ojai Planning Area and 25 pounds per day in the remainder of Ventura County.[108] For all other criteria air pollutants, the District uses the ambient air quality standards as thresholds.[109]

Mojave Desert Air Quality Management District Thresholds

MDAQMD published the *MDAQMD CEQA and Federal Conformity Guidelines* in August 2016 that includes the District's recommended air quality significance thresholds for CO, NOx, VOC, SOx, PM10, PM2.5, Hydrogen Sulfide (H_2S), and Lead in mass daily and annual emissions. The MDAQMD and

108 The City of Simi Valley, within the VCAPCD, uses a threshold of 13.7 tons/year for ROG and NOx emissions.

109 Ventura County Air Pollution Control District. 2003. *Ventura County Air Quality Assessment Guidelines*. Available online at: http://www.vcapcd.org/pubs/Planning/VCAQGuidelines.pdf, accessed October 2, 2019.

AVAPCD have set the same annual and daily thresholds, which are summarized in **Table 3.3-10, MDAQMD and AVAPCD Air Quality Significance Thresholds**.[110]

Antelope Valley Air Pollution Control District Thresholds

AVAPCD published the *AVAPCD CEQA and Federal Conformity Guidelines* in August 2016 that includes the District's recommended air quality significance thresholds for CO, NOx, VOC, SOx, PM10, PM2.5, Hydrogen Sulfide (H_2S), and Lead in mass daily and annual emissions.[111] **Table 3.3-10** summarizes the air quality thresholds for both the AVAPCD and MDAQMD, as their annual and daily thresholds are the same.

Table 3.3-10
MDAQMD and AVAPCD Air Quality Significance Thresholds

Pollutant	Annual Threshold (tons)	Daily Threshold (pounds)
CO	100	548
NOx	25	137
VOC	25	137
Sox	25	137
PM10	15	82
PM2.5	12	65
H_2S	10	54
Lead	0.6	3

Air Quality Threshold for Toxic Air Contaminants

TACs are hazardous air pollutants that may reasonably cause cancer, development effects, or other serious or irreversible acute or chronic health effects in humans. In the analysis below, DPM, a type of TAC, is evaluated to determine the cancer risk posed to sensitive groups in the SCAG region. The SCAQMD,[114] VCAPCD,[115] MDAQMD,[116] and AVAPCD[117] have all recommended a significance threshold of 10 in one million.[118] As a result, if an individual's probability of contracting cancer over

113 Imperial County Air Pollution Control District. 2017. *CEQA Air Quality Handbook*. Available online at: https://www.co.imperial.ca.us/AirPollution/PlanningDocs/CEQAHandbk.pdf, accessed October 2, 2019.

118 IPAPCD does not have a quantified cancer risk threshold, instead individual projects that meet Tier II would be required to prepare a health risk assessment which should be prepared in consultation of APAPCD staff.

their lifetime **increases** by 10 or more chances in one million **as a result of a project's emissions**, the project would have a significant impact.[119]

3.3.4.2 Methodology

This section describes the air quality in the SCAG region, discusses the potential impacts of Connect SoCal on air quality, identifies mitigation measures for potential impacts, and evaluates residual impacts in accordance with Appendix G of the *CEQA Guidelines*. Air quality within the SCAG region was evaluated at a programmatic level of detail, in relation to the Air Quality Management Plans for the five air quality districts and the general plans of the six counties and 191 cities within the SCAG region, a review of published and unpublished literature germane to the SCAG region, as well as a review of SCAG's 2016 RTP/SCS PEIR.[120] This analysis focuses on air pollution from on-road motor vehicles in two perspectives: daily emissions and pollutant concentrations. The analysis is based upon air quality modeling, performed by SCAG, using EMFAC2014.[121] Air quality modeling that produces criteria pollutant emissions for the SCAG region and by county is based on SCAG's transportation modeling and network built for the existing conditions and the Plan.

The methodology for determining the significance of air quality impacts compares existing conditions to the expected future air quality with the Plan, as required in CEQA Section 15126.2(a). The criteria above were applied to compare current conditions to the 2045 Plan conditions.

Analysis of the potential air quality impacts of the Plan was conducted based on SCAG's Regional Travel Demand Model, evaluation of relevant AQMPs/SIPs, and a mobile-source health risk analysis (HRA) (**Appendix 3.3**) to determine whether or not there will be a significant impact. The analysis of cancer risk was evaluated using the United States Environmental Protection Agency (U.S. EPA) AERMOD dispersion model and the Hot Spots Analysis and Reporting Program Version 2 (HARP2) Risk Assessment Standalone Tool (RAST) model, consistent with the guidance provided by the California Office of Environmental Health Hazard Assessment (OEHHA) for Human Health Risk Assessment (HRA) based on DPM emission estimates from CARB's EMFAC2014 model. EMFAC2014 was developed

---

119 *See e.g.*, SCAQMD Air Quality Significance Thresholds, http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf, accessed November 11, 2019.

120 Southern California Association of Governments. 2016. *Final Program Environmental Report for the 2016-2040 Regional Transportation Plan/Sustainable Communities Strategy.* Available online at: http://scagrtpscs.net/Pages/FINAL2016PEIR.aspx, accessed March 25, 2019.

121 EMFAC 2014 model was the most recent, EPA-approved version at the time SCAG released the Conformity Assumptions for this analysis (EMFAC2017 had not been approved). Additionally, EMFAC2017 had not been approved at the time of releasing the NOP. On August 15, 2019, EPA approved EMFAC2017 for use; however, EPA provided a two-year grace period in which SCAG is not required to use EMFAC2017. The grace period runs through August 16, 2021.

in order to estimate emissions from mobile sources and includes County-specific data, such as fleet mix in order to estimate criteria air pollutants. See **Appendix 3.3, Health Risk Assessment Technical Report,** for more detail.

In *California Building Industry Association (CBIA) vs. Bay Area Air Quality Management District (BAAQMD)*, the California Supreme Court ruled that agencies subject to CEQA generally are not required to analyze the impact of existing environmental conditions on a project's future users or residents unless the proposed project risks exacerbating those environmental hazards or conditions that already exist.[122] Therefore, emissions from the existing transportation network, including freeways, are generally not considered impacts under CEQA unless the project exacerbates the existing environmental conditions.[123] Since Connect SoCal includes transportation projects, including freeway improvements, that could occur within 500 feet of sensitive receptors (thereby exacerbating an existing condition), this section analyses the risk posed from existing freeways on sensitive receptors.

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743, or SB 226 (as described in **Chapter 1.0, Introduction**), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.3.4.3 Impacts and Mitigation Measures

Impact AQ-1 Conflict with or obstruct implementation of the applicable air quality plan.

Less than Significant Impact.

---

122 See *Cal. Building Industry Assn. v. Bay Area Air Quality Management District* (2015) 62 Cal.4th 369; see also *Cal. Building Industry Assn. v. Bay Area Air Quality Management District* (2016) 2 Cal.App.5th 1067.

123 Note that as discussed in **Section 3.15.3, Public Services – Schools**, CEQA review of school construction generally does require an evaluation of the effects of existing air quality exposure on pupils, and to the extent the health risk is unacceptable, the school would not be built. CEQA also provides limited protection and requires analysis of impacts of the existing environment on certain housing development projects exercising exemptions under Pub. Res. Code §§ 21159.21(f), (h), 21159.22(a), (b)(3), 21159.23 (a)(2)(A), 21159.24(a)(1), (3), and 21155.1(a)(4, (6).

Connect SoCal would result in a less than significant impact to air quality related to the potential to conflict with or obstruct implementation of the adopted SIPs/AQMPs/Attainment Plans in the SCAG region because the projected long-term emissions are in alignment with the local SIPs/AQMPs as demonstrated in the transportation conformity analysis, found in the Conformity Technical Report for the Plan.[124] The emissions resulting from the Plan are within the applicable emissions budgets as stated in the SIPs/AQMPs for each nonattainment or maintenance area for all milestone, attainment, and planning horizon years.

As described in the Regulatory Framework, when a region is in nonattainment for any of the six criteria air pollutants relative to the NAAQs, the federal CAA requires states to develop SIPs to achieve the federal standard. The AQMPs are required as part of the SIP. Within the SCAG region, the 8-hour federal ozone standard is designated as nonattainment for all six counties. San Bernardino, Riverside, Orange, Los Angeles, and Imperial Counties are all designated as nonattainment for PM2.5. Additionally, San Bernardino, Riverside, and Imperial Counties are designated as nonattainment for PM10. As a result, all the SIPs in the SCAG region focus on reducing ozone emissions and may also focus on particulate matter pollution. The following air quality plans are applicable to Connect SoCal: 2016 SCAQMD Air Quality Management Plan (AQMP), AVAQMD Federal 75 ppb Ozone Attainment Plan (2017), MDAQMD Federal 75 ppb Ozone Attainment Plan (2017), 2016 Ventura County Air Quality Management Plan, and Imperial County 2018 Annual PM2.5 State Implementation Plan.

The goals of the air quality management plans and attainment plans are to establish a strategy for achieving the standards by a set date by listing all feasible control measures, including transportation control measures. These control measures help advance the attainment date and are financially, economically, and socially feasible. As standards become more stringent over time, achieving the standards becomes a moving target that the air quality districts, and air-related plans must continue to chase. At this current snapshot of time (2019), the Plan would not conflict with the existing air-related plans since it will align with feasible Transportation Control Measures (TCMs). SCAG coordinates with air districts in the region to ensure that air quality management plans (and air pollution control plans) are consistent and comprehensively address air pollution from all sources (as appropriate) in the SCAG region. For example, the 2016 SCAQMD AQMP was developed in alignment with the 2016 RTP/SCS, incorporating the latest scientific, technological, and regulatory information and planning assumptions as of January 17, 2017.[125]

---

124 Southern California Association of Governments. 2019. *Transportation Conformity Analysis Draft Technical Report*.

125 SCAQMD. 2015. *2016 AQMP Updates Coordination with SCAG & CARB*. Available online at: http://www.aqmd.gov/docs/default-source/Agendas/STMPR-Advisory-Group/stmpr_073015_5.pdf, accessed October 29, 2019.

Connect SoCal includes new transportation projects and refined land use strategies compared to the 2016 RTP/SCS. With respect to achieving emission reductions, Connect SoCal would further reduce emissions compared to the 2019 RTP/SCS as it has a greater emphasis on compact development, additional transportation projects and strategies including more integrated strategies for active transportation, additional investments for transit and passenger rail, and a greater emphasis improving the public health and ensuring the quality of life (as discussed in **Chapter 2.0, Project Description**). This is evident by the Plan's transportation project types that allocate funding and planning efforts on trail access, regional greenway network, regional and local bikeway network, and pedestrian improvements by using a "complete street" approach; transit (rail, bus) improvements and new facilities; rideshare/vanpool programs; high-occupancy vehicle (HOV) lanes; traffic calming and signal improvements; and streetscape/landscape projects. Implementation of transportation projects (See **Appendix 2.0, Plan Project List**) would reduce emissions in both mobile and stationary sources by increasing density and reducing VMT per capita (See **Section 3.8, Greenhouse Gas Emissions** for additional discussion on VMT per capita reduction). Additionally, land use strategies proposed in the Plan seek to balance the region's strategic transportation investments and land use choices and are coordinated with the committed and projected transportation investments in the region that emphasize system preservation and enhancement, active transportation, and land use integration. These efforts are in alignment with the attainment plans and air quality management plans' goals to reduce emissions of pollutants in nonattainment areas. Therefore, the Plan is expected to have a less than significant impact as it would not conflict with or obstruct implementation of applicable air quality plans, and the consideration of mitigation measures is not warranted.

The determination of significance under CEQA is based on the comparison to existing conditions, as required. The following comparison to the No Project scenario is provided here for informational purposes to understand the effects of the Plan as compared to a scenario where the Plan is not implemented. Under a No Project scenario, investments in VMT reduction projects and infill and compact land use strategies would not occur to the same degree as the Plan. This scenario would result in increased emissions of ozone precursors and particulate matter and likely would not meet Conformity or the AQMPs target emission reductions.

Impact AQ-2 **Potential to violate any air quality standard or contribute substantially to an existing or projected air quality violation.**

Significant and Unavoidable – Mitigation Required.

At the regional level, criteria pollutant emissions would be mostly reduced compared to existing conditions and the region would meet air quality standards. In 2045, when compared to existing

conditions, on-road mobile-source PM2.5 would increase in Imperial, Riverside, and San Bernardino Counties and mobile-source PM10 would increase in Imperial, Orange, Riverside, and San Bernardino Counties due to increasing traffic. On-road mobile-source particulate matter emissions would remain the same or decrease from existing conditions in the other counties. Within the SCAB (which is likely indicative of the region as a whole), SCAQMD indicates that total pollutant emissions are being reduced through at least 2031, except for small increases in SOx and PM2.5.

Construction Emissions

Over the lifetime of the Plan, various transportation and development projects would be constructed. These construction activities would result in ongoing emissions of air pollutants including ROG, NO_x, PM10, PM2.5, and fugitive dust. Emissions associated with each individual project are generally short-term and are limited to the project construction phase. The sources associated with these emissions include construction equipment, employee and vendor vehicles, demolition, grading and other ground-disturbing activities, application of paint and other coatings, paving, and others. Typically, larger projects are associated with larger emissions during construction.

While construction of each individual project is temporary and limited in nature, emissions from individual construction projects have the potential to exceed localized and daily thresholds. As stated above, the five air districts in the SCAG region have set mass daily or annual construction and/or operational emissions thresholds. Furthermore, all the air districts in the SCAG region have relevant fugitive dust rules that apply to construction activities. While these thresholds are to be applied to individual construction projects, the air districts do not provide a threshold for use with regional planning documents such as the RTP/SCS. However, SCAQMD does account for estimated construction emissions from off-road construction equipment within the 2016 AQMP. As demonstrated in the 2016 AQMP, and discussed below, total regional emissions of criteria pollutants including from construction sources would generally decline through at least 2031 with the exception of small increases in PM2.5 and SOx. In addition, at the individual project level there is the potential for local exceedances.

Operational Emissions

As noted in **Chapter 2.0, Project Description**, as part of the process for developing Connect SoCal, SCAG is responsible for ensuring that mobile source on-road emissions meet NAAQS and CAAQS for the SCAG region, as well as SB 375 GHG targets. The air quality management and air pollution control districts are responsible for addressing all other sources of air pollution in the SCAG region (stationary sources, construction equipment, airplanes, trains and ships) and ensuring that standards are met.

On-road mobile-source emissions evaluated in Connect SoCal by SCAG include passenger vehicles, light-duty trucks, medium trucks and heavy-duty trucks. CARB identifies emissions standards for these

sources. Off-road vehicles generally refer to construction equipment. In the AQMP, off-road vehicles refer to locomotives, ocean going vessels, off-highway recreational vehicles, cargo handling equipment, farm equipment, and aircraft. CARB is responsible for implementing the AQMP with respect to emissions standards for construction equipment sold within the state. The U.S. EPA implements the AQMP with respect to regulating airplanes, trains, and ships emissions.

As mentioned above, air quality management and air pollution control districts are responsible for addressing air pollution from stationary sources, construction equipment, airplanes, trains, and ships within the SCAG region. These air quality and air pollution control districts include SCAQMD, MDAQMD, VCAPCD, AVAPCD, and ICAPCD. The SCAQMD includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties.[126] Therefore, SCAQMD's 2016 AQMP's analysis of the emissions resulting from stationary sources, construction equipment, airplanes, trains, and ships is discussed below as a proxy for these emissions throughout the entire SCAG region.

In addition to on-road mobile sources provided by SCAG, SCAQMD's 2016 AQMP provides emission estimates for stationary, and off-road mobile sources from 2019 to 2031, see **Table 3.3-12, 2016 AQMP Forecast of Annual Average Total Emissions in SCAB Through 2031**. Stationary sources include both point and area sources. Point stationary sources include permitted facilities, such as power plants and refineries, with one or more emission sources. Area stationary sources include small emission sources, such as residential water heaters, architectural coatings, consumer products, and smaller permitted sources. Off-road mobile sources include construction equipment, locomotives, ocean-going vessels, aircraft, cargo handling equipment, and farm equipment. SCAQMD does not forecast out to 2045, but the general trend of most pollutants decreasing is not expected to change.

As shown in **Table 3.3-12**, in the SCAB region total VOC, NOx, and CO emissions are anticipated to decrease between 2019 to 2031. Comparing emission estimates from 2019 to 2031, SOx, and PM2.5 emissions are expected to increase by 1 ton/day each. Increases in SOx and PM2.5 are expected to occur due to increases in population and activity that will outpace the emissions reductions expected to occur from newer and cleaner equipment and vehicles. VOC and NOx emissions are expected to decrease due to existing regulations, such as on- and off-road equipment regulations and vehicle emissions standards.[127]

The 2016 AQMP identifies the top ten source categories for VOC, NOx, SOx, and PM2.5 for the years 2012, 2019, 2022, 2023, 2025, and 2031. Review of these data demonstrates that in 2019, passenger cars, light-duty trucks, and medium duty trucks are anticipated to be the top ten contributors of VOC emissions in the SCAG region. By 2031, VOC emissions from on-road mobile sources are anticipated to substantially decrease due to more stringent on-road standards and only passenger cars and light-duty trucks are anticipated to be within the top ten contributors to VOC emissions. Throughout the entire AQMP planning year, heavy-duty trucks, off-road construction equipment, and ships and commercial boats will be the top contributors of NOx emissions, although the emission rates will decline over the years. Regarding SOx emissions, ships and commercial boats and aircrafts are the highest contributors in the SCAB region and are anticipated to fluctuate over the AQMP planning years. Finally, heavy-duty diesel trucks, light duty trucks, and passenger cars are the only mobile-sources in the top ton polluters for PM2.5 emissions in the SCAB region. From 2019 to 2031, passenger car and light duty trucks PM2.5 emissions remain constant while the heavy-duty PM2.5 emissions continuously decrease.[128]

Other air basins in the SCAG region include the South Central Coast Air Basin (SCCAB), Salton Sea Air Basin (SSAB), and the Mojave Desert Air Basin (MDAB). As demonstrated in **Table 3.3-4**, similar to SCAB, all three air basins are in nonattainment for ozone and PM10. The SCCAB and portions are the SSAB are also in nonattainment for PM2.5. Each of these air basins has an AQMP to plan the basin's

128 SCAQMD. 2017. *Final 2016 Air Quality Management Plan*. Available online at: http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/final2016aqmp.pdf?sfvrsn=15, accessed October 29, 2019.

attainment status pursuant to the federal CAA Amendment. P to address nonattainment of ozone in the southwestern desert portion of the basin.[129]

On-Road Mobile Source Emissions

Under Connect SoCal, mobile-source air emissions were estimated for 2045 with the Plan and compared to the existing conditions (2019). The calculated emissions were compiled for ROG, NO_x, CO, PM10, PM2.5, and SO_x for each county in the SCAG region. The only pollutants expected to increase with implementation of Connect SoCal are PM10 annual emissions in Imperial, Orange, Riverside, and San Bernardino Counties as well as PM2.5 in Imperial, Riverside, and San Bernardino Counties. Annual PM10 and PM2.5 emissions in the remaining counties, and annual SOx emissions in every county will decrease or not change from the existing emissions to 2045. ROG, NOx, and CO emissions in every county are expected to decrease with implementation of the Plan (**Table 3.3-13, On-Road Mobile-Source Criteria Air Pollutant Emission by County – Existing Conditions [2019] vs Plan [2045]**).

As shown in **Table 3.3-13**, the Plan will mostly reduce emissions from existing conditions (2019). In part, the reduction is due to vehicle emissions reductions required by federal and states rules and policies (see 3.3.2 Regulatory Framework). In 2045, when compared to existing conditions, on-road mobile-source PM2.5 would increase in Imperial, Riverside, and San Bernardino Counties and mobile-source PM10 would increase in Imperial, Orange, Riverside, and San Bernardino Counties due to increasing vehicle miles travelled. Mobile-source particulate matter emissions would remain the same or decrease from existing conditions in the other counties. Particulate matter is generated by tires on roadways and therefore, unlike other pollutants that can be regulated through tailpipe emission controls, particulate matter is difficult to address without simply reducing VMT.

The Plan includes transportation projects and strategies aimed at reducing the VMT across the region. One result of these investments is a decline in per capita VMT compared to existing conditions (although total VMT would increase). As further discussed in **Section 3.17, Transportation, Traffic and Safety**, total VMT is expected in increase between 2019 and 2045 in all counties, however per capita VMT would increase only in Imperial County. At the regional level, on-road mobile source emissions would generally decrease (with the exception of small increases in PM10 and PM2.5 in some counties) and per capita VMT would decrease. However, it is possible that individual projects, particularly development projects that generate many vehicle trips (i.e., high VMT) would result in localized air quality impacts.

Table 3.3-13
On-Road Mobile-Source Criteria Air Pollutant Emissions by County – Existing Condition (2019) vs Plan (2045)

County		(Tons/day)								
		ROG	ROG	NOx	NOx	NOx	CO	PM10	PM2.5	SOx
		Summer	Annual	Summer	Annual	Winter	Winter	Annual	Annual	Annual
Imperial	Existing	3	3	6	7	7	19	0.5	0.2	0.0
	Plan	2	2	4	4	4	17	0.7	0.3	0.1
	Difference	-1	-1	-2	-2	-3	-3	0.3	0.1	0.0
Los Angeles	Existing	52	50	88	95	93	397	14.2	6.3	1.1
	Plan	22	21	33	35	34	145	14.2	5.8	0.8
	Difference	-30	-29	-55	-60	-59	-252	0.0	-0.5	-0.3
Orange	Existing	15	15	22	23	23	111	4.7	2.1	0.3
	Plan	7	7	7	8	7	45	4.7	1.9	0.2
	Difference	-8	-8	-14	-16	-15	-66	0.1	-0.1	-0.1
Riverside	Existing	14	12	32	34	34	87	3.9	1.7	0.3
	Plan	7	6	12	13	13	39	4.7	1.9	0.3
	Difference	-7	-6	-20	-21	-21	-48	0.9	0.2	0.0
San Bernardino	Existing	16	14	38	40	39	99	4.1	1.8	0.3
	Plan	7	6	18	19	18	42	5.2	2.1	0.3
	Difference	-8	-7	-20	-21	-21	-57	1.2	0.3	0.0
Ventura	Existing	4	4	6	7	7	30	1.1	0.5	0.1
	Plan	1	1	2	2	2	10	1.1	0.5	0.1
	Difference	-3	-3	-4	-5	-5	-20	0.0	0.0	0.0

As shown in **Table 3.17-15, Population and VMT (2019 and 2045),** VMT per capita under the Plan would be less than existing conditions. As shown in **Table 3.17-14, Total VMT 2019 and 2045**, total VMT would be less under the Plan than the No Project. Therefore, emissions will be less with the Plan as compared to No Project.

Off-Road Mobile Sources

According to the SCAQMD 2016 AQMP, when compared to the 2012 AQMP, mobile-source emissions from airplane, train, and ship transportation sources have decreased VOC, NOx, CO, and PM2.5 emissions in the SCAB region and will continue to decrease to 2031,[130] see **Table 3.3-14, AQMP Forecast of Annual Average Off-Road Mobile Emissions in SCAB.**

130 SCAG acknowledges that AQMD, nor the other air districts in the region, has not identified emissions beyond 2031. However, due to the overall downward trajectory and the substantial state requirements, it is assumed that emissions will continue to decline through 2045.

Table 3.3-14
AQMP Forecast of Annual Average Off-Road Mobile Emissions in SCAB

Year	Tons/Day						Summer Planning	
	VOC	NOx	CO	SOx	PM2.5	NH_3	VOC	NOx
2019	79	124	697	5	6	0	98	133

As shown in **Table 3.3-14,** emissions from off-road mobile VOC, NOx, CO, and PM2.5 emissions within the SCAB region are anticipated to decrease. SO_x emissions from off-road mobile are anticipated to increase and NH_3 emissions will remain constant (near zero level).

Stationary Sources

According to the SCAQMD 2016 AQMP, when compared to the 2012 AQMP, stationary-source emissions from NOx will decrease in the SCAB region by approximately 17%. All other pollutants from stationary sources are anticipated to increase by 2031, see **Table 3.3-15, AQMP Forecast of Annual Average Off-Road Mobile Emissions in SCAB.**

As shown in **Table 3.3-15**, stationary source emissions from all criteria air pollutants, except NOx, are anticipated to increase when 2019 conditions are compared to 2031.

Table 3.3-15
AQMP Forecast of Annual Average Stationary Source Emissions in SCAB

Wildfire

SCAQMD accounts for most sources of pollutants in their AQMP. However, in recent years wildfires have added substantial amounts of pollutants to the SCAB that are unaccounted for in the AQMP. According to the U.S. EPA's Exceptional Events Rule, wildfires are not to be considered for NAAQS attainment status.[131]

However, wildfire emissions are likely to result in significant air quality and health impacts in the future. According to SCAG's Public Health Draft Technical Report, wildfires are going to become more prevalent as climate change leads to drier, hotter conditions in Southern California. The SCAQMD and MDAQMD include information regarding active wildfires, resulting air quality impacts, and the health risks of wildfires on their websites.[132,133]

Summary

Total emissions in the SCAB region (as indicated in 2016 AQMP) and likely across the SCAG region are expected to generally decline through at least 2031 except for small increases in PM 2.5 and SOx (**Table**

131 Federal Register. *Treatment of Data Influenced by Exceptional Events*. Available online at: https://www.epa.gov/sites/production/files/2016-09/documents/exceptional_events_rule_revisions_2060-as02_final.pdf, accessed November 6, 2019.

132 SCAQMD. *Wildfire Smoke & Ash Health & Safety Tips*. Available online at: http://www.aqmd.gov/home/air-quality/wildfire-health-info-smoke-tips, accessed November 6, 2019.

133 MDAQMD. *Wildfires*. Available online at: http://mdaqmd.ca.gov/air-quality/wildfires, accessed November 6, 2019.

3.3-12). SCAG is responsible for assessing on-road mobile source emissions through 2045. In general, in 2045, when compared to existing conditions, on-road mobile-source PM2.5 would increase in Imperial, Riverside, and San Bernardino Counties and mobile-source PM10 would increase in Imperial, Orange, Riverside, and San Bernardino Counties due to increasing traffic (see **Table 3.3-13**).

While the SCAG region may see an increase in PM2.5, PM10 and SOx emissions, the SCAQMD, AVAPCD, ICAPCD, and MDAQMD have not established regional thresholds to determine significance. The air districts within the SCAG region have only established project-level thresholds (see **Table 3.3-9, Table 3.3-10,** and **Table 3.3-11**). Therefore, individual projects must compare anticipated project emissions to the thresholds for the air district within which they are located in order to determine significance on the project-level. Because mobile source emissions of PM10 and PM2.5 will increase (PM10 would increase in Imperial, Orange, Riverside, and San Bernardino Counties and PM2.5 would increase in Imperial, Riverside, and San Bernardino Counties), largely as a result of increased total VMT, and SOx would increase in the region at least through 2031, the Plan could contribute to an air quality violation. Further, there is the potential for individual projects to exceed local standards during construction and/or operation for several pollutants. Therefore, this impact is considered to be significant.

Health Implications

In accordance with the *Sierra Club v. County of Fresno* (i.e., *Friant Ranch*) decision, when air quality impacts are found to be significant, the health implications of the significant emissions should be disclosed. Modeling and analyzing health consequences requires a substantial amount of data. A detailed health risk assessment of on-road mobile-source emissions was undertaken for the Plan (see discussion of Impact AQ-4 below).

The main health concerns associated with PM10 and PM2.5 include worsening of symptoms in sensitive patients with respiratory disease and excess seasonal declines in pulmonary function, especially in children. This can include an increase in the number and severity of asthma attacks, cause or aggravate bronchitis and other lung diseases, and reduce the body's ability to fight infections. Very small particles of substances, such as lead, sulfates, and nitrates can cause lung damage directly. These substances can be absorbed into the blood stream and cause damage elsewhere in the body. These substances can transport absorbed gases, such as chlorides or ammonium, into the lungs and cause injury. Whereas PM10 tends to collect in the upper portion of the respiratory system, PM2.5 is much smaller and it can penetrate deeper into the lungs and damage lung tissues. Suspended particulates also damage and discolor surfaces on which they settle, as well as produce haze and reduce regional visibility. **Table 3.3-6, Peak Criteria Pollutants Readings for the SCAG Region Air Basins,** above indicates that the applicable PM10 and

PM2.5 State standards were exceeded multiple times between 2016 and 2018. The Plan's increase in PM10 and PM2.5 emissions could worsen the health concerns listed above or result in Air Quality Index values that are unhealthy for sensitive groups and other populations. On unhealthy days, persons are recommended to avoid both prolonged and heavy-exertion outdoor activities.[134]

As noted earlier, NOx and ROG are ozone precursors and the SCAG region is currently in nonattainment for PM2.5, PM10, and ozone under NAAQS and CAAQS. The main health concern regarding exposure to ground-level ozone is its effects on the respiratory system, particularly on lung function. Several factors influence these health impacts, including the concentration of ground-level ozone in the atmosphere, the duration of exposure, the average volume of air breathed per minute, the length of intervals between short-term exposures; and the sensitivity of the person to the exposure.[135,136]

The SCAQMD, in its amicus brief to the California Supreme Court in *Friant Ranch*, stated that from a scientific standpoint, it takes a large amount of additional precursor emissions to cause a modeled increase in ambient ozone levels over an entire air basin, and provided evidence from its 2012 AQMP that showed that if the daily emissions of NOx and ROG were reduced in amounts of 432 and 187 tons per day respectively, the ozone concentrations at SCAQMD's monitoring site would go down by only 9 parts per billion as compared to ozone readings without these ROG and NOx reductions.[137] For all these reasons, it is difficult to estimate the change in ozone concentrations that would result from the decrease in ozone precursors (ROG and NOx). **Table 3.3-12, 2016 AQMP Forecast of Annual Average Total Emissions in SCAB Through 2031,** demonstrates there will be overall decreases in ROG and NOx from mobile and stationary sources in the SCAB region. Therefore, it can be assumed that the total amount of ozone would also decrease, however the exact amount cannot be accurately quantified.

Both ozone and particulate matter are known to have negative public health impacts especially for sensitive populations, like children, the elderly, and those with respiratory or cardiovascular health problems. Therefore, the potential for Connect SoCal to adversely affect public health was evaluated using cancer risk from diesel particulate matter as a proxy for respiratory health (see **Appendix 3.3**)

Similarly, the analysis acknowledges applicable California legislation and initiatives to improve public health, particularly respiratory health in light of *Research Results on Land Use, Transportation, and Community Design:*[138]

- Residents in walkable neighborhoods are more likely to meet physical activity guidelines. Public transit users are more likely to meet Surgeon General recommendations for physical activity. Greater health benefits can be achieved by increasing the amount (duration, frequency, or intensity) of physical activity.

Connect SoCal plans to increase active transportation in communities, as these projects provide opportunities for physical activity, which has been shown to improve chronic disease rates. [139] Consistent with the environmental justice analysis in Connect SoCal, this PEIR considers the potential benefits and impacts on sensitive receptors including low-income and minority populations located in the vicinity of transportation facilities (e.g., the potential to increase or decrease diesel particulate emissions).

ROG and NOx emissions contribute to the development of ozone; therefore, reductions of ROG and NOx emissions would also lead to a reduction in ozone. Excess NOx emissions can also lead to increases in physician and emergency room visits as well as hospitalization and more school days missed by school-aged children living in the air basin. Implementation of Connect SoCal, when compared to existing conditions, would decrease on-road mobile-source ROG and NOx emissions. (**Table 3.3-13, On-Road Mobile-Source Criteria Air Pollutant Emissions by County – Existing Conditions [2019] vs Plan [2045]**). Additionally, within the SCAB area NOx emissions are anticipated to decrease through at least 2031 from off-road vehicle and stationary sources (**Table 3.3-14, AQMP Forecast of Annual Average Off Road Mobile Emissions in SCAB,** and **Table 3.3-15 AQMP, Forecast of Annual Average Stationary Source Emissions in SCAB**). Through at least 2031, ROG emissions are expected to decrease from off-road vehicle emissions (**Table 3.3-14, AQMP Forecast of Annual Average Off Road Mobile Emissions in SCAB**) but will increase from stationary sources (**Table 3.3-15, AQMP Forecast of Annual Average Stationary Source Emissions in SCAB**). Overall, the total ROG and NOx emissions from on-road, off-road vehicle, and stationary sources are expected to decrease in the SCAB area through at least 2031 (**Table 3.3-12, 2016 AQMP Forecast of Annual Average Total Emissions in SCAB Through 2031**).SCAB was re-designated as in attainment of federal standards for CO in June 2017 and the last exceedance of state standards within the region for CO was in 2015. CO presents a significant health risk as it can interfere with oxygen transport within the body. Compared to existing conditions, mobile-source CO

138 Active Living Research. 2011. *Research Results on Land Use, Transportation, and Community Design.* Available online at: http://activelivingresearch.org/land-use-transportation-and-community-design-research-summary-slides, accessed March 25, 2019.

139 Southern California Association of Governments. 2019. *Active Transportation Technical Report*.

emissions in the future with implementation of Connect SoCal would decrease between now and 2045 despite increasing traffic, as a result of stringent emissions controls. (**Table 3.3-13, On-Road Mobile-Source Criteria Air Pollutant Emissions by County – Existing Condition [2019] vs Plan [2045]**).

In recent years, SO_2 concentrations have been reduced by the increasingly stringent controls placed on stationary source emissions of SO_2 and limits on the sulfur content of fuels. SO_2 is an irritant gas that attacks the throat and lungs. It can cause acute respiratory symptoms and diminished ventilator function in children. SO_2 can also yellow plant leaves and erode iron and steel. Compared to existing conditions, mobile-source SO_x emissions would not change substantially despite increasing traffic (**Table 3.3-13, On-Road Mobile-Source Criteria Air Pollutant Emissions by County – Existing Conditions [2019] vs Plan [2045]**). Most of the counties within the SCAG region are emitting negligible amounts of on-road mobile-source SO_x; however, the AQMP does indicate that SOx (primarily from ship-related emissions) are expected to increase slightly at least through 2031 (see **Table 3.3-12, 2016 AQMP Forecast of Annual Average Total Emissions in SCAB Through 2031**).[140]

The 2016 AQMP undertook a detailed evaluation of health effects associated with the 2016 AQMP (which considers all sources of pollutants). That evaluation is contained within Appendix I of the Final 2016 AQMP (and is hereby incorporated by reference). It concludes the following:

> *A large body of scientific evidence shows that the adverse impacts of air pollution on human and animal health are clear. A considerable number of population-based and laboratory studies have established a link between air pollution and increased morbidity and, in some instances, premature mortality. Importantly, the health effects of air pollution extend beyond respiratory effects, and there is substantial evidence that air pollution (including particulate matter and ozone) exposures cause cardiovascular morbidity and mortality. Some air pollutants, such as diesel PM, lead, and several other air toxics, have been linked to increased cancer risk. Health studies have also identified populations who may be more susceptible to the adverse effects of air pollution, such as children, older adults, low SES communities, people with certain pre-existing health conditions, and people with certain genetic factors. Understanding the impacts of air pollution on these more susceptible populations can help inform policies that better protect public health, for example, in setting standards for criteria air pollutants, and in the development of methods to evaluate air toxics health risks. Continued research on the effects of specific PM constituents and ultrafine particles will be important in furthering the understanding of how these pollutants affect human health.*

140 Los Angeles County is estimated to emit approximately 1-ton SOx annually under existing conditions and will continue to emit 1-ton annually in 2040 with implementation of the Plan.

As the scientific methods for the study of air pollution health effects have progressed over the past decades, adverse effects have been shown to occur at lower levels of exposure. For some pollutants, no clear thresholds for effects have been demonstrated. The new findings have, in turn, led to the revision and lowering of National Ambient Air Quality Standards (NAAQS) which, in the judgment of the Administrator of the U.S. EPA, are necessary to protect public health. Chapter 8 of the draft 2016 AQMP provides an overview of the extensive, multi-year, public process involved in setting federal air quality standards. Assessments of the scientific evidence from health studies is an important part of the process, and has helped inform revisions to the federal air pollution standards. Figures [included in the AQMP] are meant to convey some of the historical context to recent revisions to the NAAQS for ozone and for particulate matter, with regard to key developments in the understanding of the health effects of these pollutants.

Mitigation Measures

SCAG Mitigation Measures

SMM-AQ-1: SCAG shall develop the Southern California Disadvantaged Communities Planning Initiative which would provide funds to selected applicants to develop a low-cost, high-impact model which leverages SCAG's staff, data, and outreach resources to deliver context-sensitive plans in high-need, low-resourced active transportation infrastructure and frameworks. As part of the initiative, the model will be operationalized through the development of plans in six communities and refined to provide a sustainable resource for SCAG staff partner with local agencies to develop local active transportation plans.

SMM-AQ-2: SCAG shall continue its commitment to analyze public health outcomes as part of Connect SoCal. As part of the public health analysis for the Plan, SCAG shall continue to analyze the Plan's impacts on air quality through its Public Health Working group and continue to support policy change at the city and country level through education programs.

SMM-AQ-3: SCAG shall continue to conduct air quality-related technical analyses on the region, specifically in vulnerable areas that are typically environmental justice areas. For example, SCAG staff conducted technical analysis of emissions impacts on populations within 500 feet of freeways and highly travelled corridors in the Connect SoCal Environmental Justice Appendix. SCAG staff shall also continue to work with districts and relevant stakeholders to be informed of any updates new and/or changes to air quality issue areas through various forums like the Environmental Justice Working Group.

Project Level Mitigation Measures

PMM-AQ-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to violating air quality standards. Such measures may include the following or other comparable measures identified by the Lead Agency:

a) Minimize land disturbance.

b) Suspend grading and earth moving when wind gusts exceed 25 miles per hour unless the soil is wet enough to prevent dust plumes.

c) Cover trucks when hauling dirt.

d) Stabilize the surface of dirt piles if not removed immediately.

e) Limit vehicular paths on unpaved surfaces and stabilize any temporary roads.

f) Minimize unnecessary vehicular and machinery activities.

g) Sweep paved streets at least once per day where there is evidence of dirt that has been carried on to the roadway.

h) Revegetate disturbed land, including vehicular paths created during construction to avoid future off-road vehicular activities.

i) On Caltrans projects, Caltrans Standard Specifications 10-Dust Control, 17-Watering, and 18-Dust Palliative shall be incorporated into project specifications.

j) Require contractors to assemble a comprehensive inventory list (i.e., make, model, engine year, horsepower, emission rates) of all heavy-duty off-road (portable and mobile) equipment (50 horsepower and greater) that could be used an aggregate of 40 or more hours for the construction project. Prepare a plan for approval by the applicable air district demonstrating achievement of the applicable percent reduction for a CARB-approved fleet.

k) Ensure that all construction equipment is properly tuned and maintained.

l) Minimize idling time to 5 minutes—saves fuel and reduces emissions.

m) Provide an operational water truck on-site at all times. Use watering trucks to minimize dust; watering should be sufficient to confine dust plumes to the project work areas. Sweep paved streets at least once per day where there is evidence of dirt that has been carried on to the roadway.

n) Utilize existing power sources (e.g., power poles) or clean fuel generators rather than temporary power generators.

o) Develop a traffic plan to minimize traffic flow interference from construction activities. The plan may include advance public notice of routing, use of public transportation, and satellite parking areas with a shuttle service. Schedule operations affecting traffic for off-peak hours. Minimize obstruction of through-traffic lanes. Provide a flag person to guide traffic properly and ensure safety at construction sites.

p) As appropriate require that portable engines and portable engine-driven equipment units used at the project work site, with the exception of on-road and off-road motor vehicles, obtain CARB Portable Equipment Registration with the state or a local district permit. Arrange appropriate consultations with the CARB or the District to determine registration and permitting requirements prior to equipment operation at the site.

q) Require projects within 500 feet of residences, hospitals, or schools to use Tier 4 equipment for all engines above 50 horsepower (hp) unless the individual project can demonstrate that Tier 4 engines would not be required to mitigate emissions below significance thresholds.

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce each of the impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of anticipated regional increases in certain criteria pollutant emissions and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to violating air quality standards or contributing substantially to an existing or projected air quality violation could be significant and unavoidable even with implementation of mitigation.

Impact AQ-3 **Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard.**

Significant and Unavoidable Impact – Mitigation Required.

The analysis of the Plan is essentially a cumulative analysis of air quality impacts resulting from the growth within the SCAG region. At the regional level, projects that are considered cumulative to and similar to the Plan are other regional-scale projects, e.g., other RTPs/SCSs for adjacent jurisdictions and AQMPs. The air quality analysis focuses on emissions associated with mobile sources as that is the primary responsibility of the RTP; the AQMP addresses stationary sources as well as airplane, trains, ship and construction emissions. The AQMP's emissions estimates from mobile-sources, including on-road as well as airplane, trains, and ships and stationary sources are summarized in **Impact AQ-2.**

In 2045, when compared to existing conditions, on-road mobile-source PM2.5 would increase in Imperial, Riverside, and San Bernardino Counties and mobile-source PM10 would increase in Imperial, Orange, Riverside, and San Bernardino Counties due to increasing traffic. Mobile-source particulate matter emissions would remain the same or decrease from existing conditions for all other pollutants (see **Table 3.3-13, On-Road Mobile-Source Criteria Air Pollutant Emissions by County – Existing Conditions [2019] vs Plan [2045]**).

The state of California is made up of 18 MPO's. SCAG's jurisdiction makes up the majority of the Southern California region and is surrounded by three other MPO's including San Diego Association of Government (SANDAG) to the south, Kern Council of Governments (KCOG) north of Ventura and Los Angeles Counties, and Santa Barbara County Association of Governments (SBCAG) north of Ventura County.[141,142] Each of these MPO's prepared a RTP/SCS to develop transportation and land use strategies within their region. SANDAG's 2050 RTP/SCS EIR concluded that on-road vehicle emissions would decrease for CO, ROG, and NOx pollutants from 2010 to 2050, with minimal increases of 0.23 and 0.15 tons/year for PM10 and PM2.5, respectively. The San Diego Air Pollution Control District (SDAPCD) maintains air plans for ozone and CO for the San Diego Air Basin (SDAB). [143] Therefore, the growth in the San Diego region under the SANDAG's plan would not increase emissions for which the area is in non-attainment.

---

141 The area north of San Bernardino County is a non-MPO, rural area.

142 Institute for Local Government. *California's 18 Metropolitan Planning Organizations*. Available online at: https://www.ca-ilg.org/post/californias-18-metropolitan-planning-organizations, accessed October 29, 2019.

143 San Diego Association of Governments. 2011. *SANDAG 2050 RTP/SCS EIR, 4.3 Air Quality*. Available online at: https://www.sandag.org/uploads/2050RTP/EIR43.pdf, accessed October 29, 2019.

KCOG's 2018 RTP PEIR similarly concluded that by 2042, implementation of the RTP would reduce ROG, NOx, and CO emissions, however PM10 and PM2.5 emissions would increase. The KCOG's PEIR determines that these increases in particulate matter are likely due to the increases in VMT which would increase roadway, brake, and tire particulate matter dust. The KCOG region includes the Eastern Kern Air Pollution Control District (EKAPCD) and the San Joaquin Valley Air Pollution Control District (SJVAPCD). The SJVAPCD is in non-attainment for federal and state ozone and PM2.5 as well as state PM10 standards. The Eastern Kern Air Pollution Control District is in a moderate nonattainment area for the national, state 8-Hour, and state 1-Hour ozone standard. Growth in the KCOG region would result in decreases in ozone precursors but result in slight increases in particulate matter for which SJVAPCD is in non-attainment for.[144]

Finally, the SBCAG 2040 RTP/SCS's (called Fast Forward 2040) Final Supplemental EIR concluded that daily ROC, NOx, and PM10 emissions would decrease within the SBCAG region from 2014 to 2040, therefore resulting in a less than significant impact. Santa Barbara County is in non-attainment for state 8-hour ozone and state PM10 standards, therefore, SBCAG would reduce pollutants for which the area is in non-attainment. [145]

Pursuant to the U.S. EPA's Transportation Conformity Regulations, the regional emissions tests are met if plan emissions are within the applicable emissions budgets for each nonattainment or maintenance area for all milestone, attainment, and planning horizon years and, if no emissions budgets have been established, if Plan emissions are less than the no-build emissions or the base-year emissions. The emissions budgets that were established in the AQMPs/SIPs in the SCAG region and have been approved by the U.S. EPA function as the applicable emission budgets for the conformity analysis for the respective nonattainment and maintenance areas. Federal conformity regulations also require the regional emissions analysis to be based on the Latest Planning Assumptions that include the latest vehicle data (fleet, age, activity) and latest socioeconomic growth forecast. A conformity determination must be made for each nonattainment and maintenance area in the region. In addition to the regional emissions analysis, the Plan is also required to pass (1) the timely implementation of the Transportation Control Measures (TCM) test, (2) the Financial Constraint test, and (3) the Interagency Consultation and Public Involvement test. The regional emissions analysis serves as a reasonable analysis of cumulative air

144 Kern Council of Governments. 2018. *2018 Regional Transportation Plan Program Environmental Impact Report*. Available online at: https://www.kerncog.org/wp-content/uploads/2018/05/2018-Public-Draft-PEIR.pdf, accessed October 29, 2019.

145 Santa Barbara County Association of Governments. 2017. *Fast Forward 2040 Regional Transportation Plan & Sustainable Communities Strategy Final Supplemental EIR.* Available online at: http://www.sbcag.org/uploads/2/4/5/4/24540302/ff2040_seir.pdf, accessed December 2, 2019.

quality impacts of the Plan. Connect SoCal meets the regional emissions tests for each nonattainment and maintenance area and for all milestone, attainment, and planning horizon years.

The Plan will meet the targets and emissions reduction milestones for on-road mobile-source emissions set in each of the AQMPs/SIPs within the SCAG region and are in compliance with federal conformity requirements. Additionally, implementation of the Plan will reduce on-road mobile criteria air pollutants and thus reduce the overall health effects to the surrounding community. Total emissions within the SCAB region, which makes up a large portion of the SCAG area, are expected to decrease as well through 2031 according to the 2016 AQMP with the exception of increases in PM2.5 and SOx. In addition, the Plan would decrease all criteria air pollutant emissions, except for small increases in PM2.5 in Imperial, Riverside, and San Bernardino Counties and PM10 in Imperial, Orange, Riverside, and San Bernardino Counties. Reductions in ROG, NOx, and CO are consistent with the RTP/SCS for the SANDAG, KCOG, and SBCAG planning areas. The KCOG and SANDAG region are also anticipated to result in increases in particulate matter in the future. However, because emissions would increase in some counties (PM10 would increase in Imperial, Orange, Riverside, and San Bernardino Counties and PM2.5 would increase in Imperial, Riverside, and San Bernardino Counties), largely as a result of increased total VMT, and SOx would increase in the region at least through 2031, the SCAG region would add to emissions of neighboring MPO's. Moreover, as discussed in AQ-2, individual project emissions may result in significant construction and/or operational emissions as compared to thresholds of significance identified by each air district. Therefore, the Plan could contribute to cumulative impacts from adjacent MPO's and therefore this impact is considered significant, and mitigation is required.

See discussion above in **Impact AQ-2** regarding health effects.

Mitigation Measures

SCAG Mitigation Measures

See **SMM AQ-1, SMM AQ-2, SMM**, and **SMM AQ-3.**

Project Level Mitigation Measures

See **PMM-AQ-1.**

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce each of the impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures

consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the anticipated regional increase in certain criteria pollutant emissions and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment could be significant and unavoidable even with implementation of mitigation.

Impact AQ-4 Expose sensitive receptors to substantial pollutant concentrations.

Significant and Unavoidable Impact – Mitigation Required.

Construction-Related Emissions

Over the lifetime of the Plan numerous transportation projects and land use development projects would be implemented. The construction of these projects could expose sensitive receptors to substantial pollutant concentrations. The greatest potential for exposure to substantial pollutant concentrations and TAC emissions during construction of both transportation projects and anticipated development, would be DPM emissions associated with heavy-duty equipment operations and truck traffic during construction activities. According to the SCAQMD methodology, health effects from carcinogenic air toxics are described in terms of individual cancer risk. "Individual Cancer Risk" is the likelihood that a person continuously exposed to concentrations of TACs over a 70-year lifetime will contract cancer based on the use of standard risk assessment methodology. SCAQMD, VCAPCD, MDAQMD, and AVAPCD has stated that the incremental cancer risk should not exceed an incremental increase of 10 excess cancer cases per million, and the chronic and acute non-carcinogenic risks should not exceed a calculated Hazard Index (HI) value of 1.0.

The California Office of Environmental Health Hazard Assessment (OEHHA) published a guidance manual in 2015 to assist the preparation of health risk assessments (HRA) for carcinogenic and non-carcinogenic exposures to air toxics in accordance with the Air Toxics Hot Spots Information and Assessment Act.[146] The 2015 OEHHA HRA guidelines provide methodologies for assessing various types of environmental exposures to toxic contaminants, including inhalation exposures. The 2015 OEHHA HRA guidance relied upon a comprehensive review of the most up-to-date scientific literature to formulate the recommended exposure estimation methodologies. The OEHHA guidance acknowledges that children are especially susceptible to the effects of toxic air contaminant exposure, and incorporated age sensitivity factors (ASFs) and age-specific daily breathing rates (DBRs) to account for

[146] OEHHA, *Guidance Manual for Preparation of Health Risk Assessments*, February 2015.

the differences in sensitivity to carcinogens during early life exposure. OEHHA recommends a default ASF of 10 for the age range between the third trimester of pregnancy through two years, and an ASF of three for ages two through 15 years.

As a conservative measure to characterize maximum potential exposures of sensitive receptors to carcinogenic risks, residential exposures are assumed to begin in the third trimester and exposures of children at schools is anticipated to begin at the lowest educational grade level. The OEHHA guidance provides recommended DBR values that are specific to the age of the receptor and the type of activity in which the receptor would be engaged during exposure, which are evaluated on a case-by-case basis. Air districts in the SCAG region (including SCAQMD) have not adopted guidelines to implement the 2015 OEHHA HRA guidelines for construction and indicated it is currently considering how to implement the guidelines. Only one air district -- the San Joaquin Valley Air Pollution Control District – appears to have adopted guidelines to implement the 2015 OEHHA HRA guidelines. BAAQMD is undergoing a process to implement guidelines as well.

The specific size and location of future construction activity within the SCAG region is not known, and therefore many variables related to characterizing potential exposures to air toxics during construction activities could not be determined, such as proximity to the emissions sources and duration of exposure. Connect SoCal's Project List (See **Appendix 2.0**) includes transportation projects through 2045, however a construction health risk analysis would be speculative given the lack of a construction location and construction activities. However, it is reasonable to assume that some level of construction activity would occur adjacent to sensitive receptors (e.g., residences and schools). The significant construction emissions identified above, could result in adverse health effects to sensitive receptors. As such, it is likely that intense construction activities (e.g., from development projects that involve a high volume of haul trucks) would exceed the health risk significance thresholds due to equipment and truck exhaust emissions. This is considered a significant impact related to substantial pollutant concentrations during construction activities.

On-Road Mobile-Source Emissions

Mobile source (heavy-duty truck) diesel emissions, specifically DPM, are the primary source of health concern in most urban areas in the SCAG region. Mobile DPM emissions in the SCAG region are anticipated to decrease as compared to existing conditions. Additionally, from 2019 to 2031, passenger and light daily truck PM2.5 is expected to remain constant, while heavy-duty PM2.5 emissions

continuously decrease.[147] As a result, existing sensitive receptors would be exposed to lower concentrations of TACs in the future. Sensitive receptors include residences, schools, medical facilities, senior centers, nursing homes, and similar uses. CARB recommends that local governments avoid locating new sensitive land uses within 500 feet of freeways as discussed in the Regulatory Framework above (see **Section 3.3.1**). Consistent with CARB recommendations, it is anticipated that local governments would limit growth within 500 feet of freeways and/or address potential health concerns through appropriate design requirements. For example, in the City of Los Angeles, all new mechanically ventilated buildings located within 1,000 feet of freeways are required to install air filtration media that provides a Minimum Efficiency Reporting Value (MERV) of 13.[148] In addition, properties within 1,000 feet of freeways are subject to an advisory notice regarding adverse health impacts resulting from chronic exposure to vehicle exhaust and particulate matter. The notice indicates that all applicants filing for a discretionary action within 1,000 feet of a freeway must adhere to design guidelines regarding freeway proximity, including a) avoiding locating sensitive uses such as schools, day-care facilities and senior centers; b) locate occupied open space away from freeway sources; c) prioritize non-habitable spaces (e.g. parking) nearest the freeway; and d) screen the site with substantial vegetation and or wall/barrier.[149] The City of Los Angeles also has numerous general plan policies related to air emissions and health. The City has also announced the City of Los Angeles Green New Deal, which includes goals that would reduce on-road mobile-source emissions (see **Section 3.6, Energy**).

Nonetheless, new sensitive receptors are likely to be developed within 500 feet of freeways and lanes may be added to freeways that result in widenings that bring freeway lanes in closer proximity to existing sensitive receptors. To assess the public health risks associated with emissions from major roadways, an HRA was prepared for Connect SoCal and is included in **Appendix 3.3**. An HRA evaluating the cancer risk from the transportation emissions in the SCAG region provides estimated cancer risk to the most impacted sensitive groups from a large sector of pollutants (transportation). An evaluation of the total emissions to sensitive receptors is not feasible because detailed data regarding all other sources of emissions is not available for 2045; see the discussion of the 2016 AQMP health effects appendix in **Impact AQ-2**.

According to the SCAQMD's most recent 2016 AQMP, which summarized the MATES IV study, the SCAQMD region has a population weighted cancer risk of 897 per million (2012-20136) for both

147 SCAQMD. 2017. *Final 2016 Air Quality Management Plan*. Available online at: http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/2016-air-quality-management-plan/final-2016-aqmp/final2016aqmp.pdf?sfvrsn=15, accessed October 29, 2019.

148 See Los Angeles Municipal Code § 99.04.504.6.

stationary and mobile sources. [150] It should be noted that the MATES IV study evaluated the risk from June 2012 through June 2013 and the results of the MATES IV study resulted in a 70% decrease in diesel emissions and a 50% decrease in cancer risk compared to the MATES III study that evaluated the risk from 2004 to 2006.[151] According to the MATES-IV study, the highest concentration of DPM was simulated to occur at the Ports of Los Angeles and Long Beach. [152] Since the MATES-IV study monitoring (2012-2013), California has mandated measures to reduce diesel exhaust at the ports. For example, in 2014 California requires that 50% of fleet calls must use shore power instead of running diesel-fueled auxiliary on-bard engines while at berth. Shore power is estimated to cut air pollution from ships at berth by 95 percent. The percentage of fleet calls using shore power increases to 70% in 2017 and 80% in 2020.[153] Therefore, it can be assumed that the MATES V study, which is currently underway, will also find a significant decrease in the weighted cancer risk since it is based on 2018 monitoring data.[154]According to CARB, DPM emissions account for approximately 70% of the known cancer risk related to air toxics in California. Major sources of diesel emissions include ships, trains, and heavy-duty trucks, especially for residents living near ports, railyards, and heavily traveled roadways.[155]

The Connect SoCal HRA evaluates potential carcinogenic health risks from emissions of DPM from motor vehicles on major freeways and transportation corridors. CARB has previously evaluated the risks posed to residential receptors near the Ports of Los Angeles and Long Beach and railyards across the SCAG region, including the four railyards in the City of Commerce, the Union Pacific Railyard in the City of Industry, Union Pacific Los Angeles Transportation Center (LATC) Railyard, and Union Pacific Mira Loma Railyard. According to CARB, port activities (including ship hoteling, cargo handling, and on-port trucking) would result in a cancer risk of over 10 in a million to approximately 1.98 million people, with

the nearest receptors exceeding 500 in one million cancer risks.[156] The Commerce railyards (Union Pacific Commerce Railyard, BNSF Hobart Railyard, BNSF Mechanical Sheila Railyard, and BNSF Commerce Eastern Railyard) will expose approximately 1.29 million people to a cancer risk greater than 10 in a million over a 76,000-acrea area.[157] Additionally the City of Industry, LATC, and Mira Loma Railyards are estimated to expose approximately 91,000 residents over 8,300-acres in Industry, 147,000 residents over 9,400-acres in LA, and 7,900 people over 3,000-acres in Mira Loma, respectively, to risks equal or greater to 10 in a million.[158,159,160] The Connect SoCal HRA evaluates a remaining major source of DPM emissions, highly traveled roadways.

DPM emissions have been associated with acute and chronic health effects, such as the worsening of heart and lung diseases. Elevated levels of ambient particulate matter have also been identified as one of many aggravating factors for childhood asthma. At levels above the federal and state ambient air quality standards, PM10 and PM2.5 emissions are a health concern. PM2.5 is believed to have greater negative health effects because the smaller particles can penetrate to the deepest parts of the lungs. Diesel exhaust from heavy duty trucks emits a mixture of gaseous and solid air pollutants, the solid pollutants make up DPM. Approximately 90% of DPM emissions are less than 1 μm, thus the majority of DPM emissions are a subset of PM2.5 and are small enough to be inhaled into the lungs.[161]

The HRA quantitatively analyzed the potential to expose people to increased cancer and other health risks, based on using the potential for increased cancer risk from diesel particulate matter from heavy-duty diesel trucks traveling on major freeways. Cancer risk is used as a proxy for general respiratory health. Only motor vehicle emissions on freeways were quantitatively evaluated because emissions from

other transportation corridors are much less than emissions on major freeways. Additionally, stationary sources were not evaluated as there was insufficient data available to model the health risk posed from these sources.

The HRA shows substantial reductions in DPM and associated health risks (see discussion below). In the future under Plan (and No Plan) conditions, as a result of stringent emission controls, DPM and health risk would be reduced substantially as compared to existing conditions.

Implementation of the Plan would result in new transportation projects being developed near existing sensitive receptors or locating new receptors near transportation projects. Sensitive receptors would continue to be exposed to DPM as a result of the Plan. However, as shown in **Table 3.3-16**, cancer risk would decrease considerably in the future, and local jurisdictions are requiring more robust air filtration and other ways of reducing exposure to existing sources of pollutants in particular in proximity to freeways (see above discussion regarding the City of Los Angeles).

The declines in cancer risk across all freeway segments is the result of continued decreases in per-vehicle mile fleet emissions projected to occur due to continued emission control technology improvements in new vehicles.

The methodology for selection of the HRA segments is discussed above (based on vehicle volumes). Emissions of DPM from each segment were calculated using the SCAG Transportation Demand Model VMT data for 2019 and projections for 2045. The potential cancer risk for residences were evaluated for a 30-year exposure, 9-year exposure and 70-year exposure periods, assuming continuous exposure over those time periods (i.e. 24 hours a day, 7 days a week). SCAG VMT data was provided for heavy duty vehicles and light/medium duty vehicles. The most current version of CARB mobile source emissions model (EMFAC2014) was used to obtain emissions factors of PM10 in diesel-fueled vehicles, which were assumed equal to DPM emission factors.[162]

The potential health risk of emissions from a representative 1-mile long portion of each freeway segment were evaluated with CARB-approved AERMOD dispersion model (Version 18081) and meteorological data obtained from South Coast, Mojave Desert, Imperial, and Ventura Air District monitoring sites. The calculated DPM concentration was then used to calculate the potential carcinogenic risk using the most current OEHHA 2015 guidelines.

---

[162] EMFAC 2014 model was the most recent, EPA-approved version at the time SCAG released the Conformity Assumptions for this analysis (i.e., EMFAC2017 had not yet been approved). Additionally, EMFAC2017 had not yet been approved at the time of releasing the NOP. On August 15, 2019, EPA approved EMFAC2017 for use; however, EPA provided a two-year grace period in which SACOG is not required to use EMFAC2017. The grace period runs through August 16, 2021.

To analyze potential cancer risk with respect to DPM, the threshold of 10 in one million identified above is considered. A 30-year exposure cancer risk was used in the analysis below per OEHHA guidance. As stated above, a 9-year and 70-year health risk analysis was also conducted. OEHHA recommends that a cancer risk for a range of residency times be calculated to coincide with the U.S. EPA's estimates of the average (9 years), high-end estimates (30-years) of residence time, and a lifetime residency (70 years). According to OEHHA, the 30-year exposure duration should be used to determine the risk characterization and recommends a 9-year and 70-year cancer risk be included as a supplemental analysis.[163] The 9-year and 70-year cancer risk estimates are provided in **Appendix 3.3, Health Risk Assessment Technical Report**.

As shown on **Table 3.3-16, Summary Maximum Exposed Individual Residential 30-Year Exposure Cancer Risk** (also see **Appendix 3.3**), the maximum 30-year exposure to residential cancer risk for each transportation segment is significantly reduced when compared to existing conditions. While the daily VMT would rise in every county under the Plan (even though per capita VMT is expected to decrease), see **Table 3.8-11** in **Section 3.8, Greenhouse Gases**, the maximum potential cancer risk would be on average 87 percent less than existing conditions. This is due to the dramatic reductions in emissions that are expected to result from federal and state regulations that require reduced tail pipe emissions from on-road heavy-duty diesel trucks (HDDT). It is important to note that despite the reduction in cancer risk compared to existing conditions, the Plan would still result in exposing sensitive receptors to substantial pollutant concentrations, however such emissions would be substantially less than under existing conditions. As shown on **Table 3.3-16** emissions under the Plan, on all segments, would decrease substantially. Due to the significant reduction in DPM emissions and associated health risk, overall risk is reduced and therefore, impacts are considered less than significant.

Table 3.3-16
Summary Maximum Exposed Individual Residential 30-Year Exposure Cancer Risk

Segment No.	Transportation Segment	County/Region	Existing Conditions	2045 No Project	2045 Connect SoCal
1	IMP I-8	Imperial / El Centro	24.5	14.2	14.5
2	IMP SR-78	Imperial / Westmoreland	64.6	37.1	18.9
3	LA I-110	Los Angeles / Carson	69.4	24.8	23.5
4	LA I-710	Los Angeles / Compton	63.8	31.2	30.9
5	LA SR-60 DB	Los Angeles / Diamond Bar	106.6	31.1	29.7
6	LA SR-60 SEM	Los Angeles / South El Monte	64.4	18.4	16.9
7	ORA I-5	Orange / Orange	24.8	5.36	5.49
8	ORA I-405	Orange / Seal Beach	43.3	12.2	11.8
9	RIV I-10	Riverside / Banning	10.5	4.97	4.83
10	RIV I-15	Riverside / Temecula	16.7	9.65	9.52
11	RIV SR-91	Riverside / Corona	22.6	8.4	8.41
12	SB I-15 ONT	San Bernardino / Ontario	40.4	10.4	10.5
13	SB I-15 VIC	San Bernardino / Victorville	109.9	40.6	41.3
14	SB SR-60	San Bernardino / Ontario	71.9	19.1	18.8
15	VEN US-101 SB	Ventura / San Buenaventura	21.2	4.93	4.85
16	VEN US-101 TO	Ventura / Thousand Oaks	102.5	19.6	21.9

Note: Cancer Risk Threshold is an increase of 10 per 1 million from the Plan.
Source: Health Risk Assessment (Appendix 3.3).

As demonstrated in **Table 3.3-16**, six of the transportation segments under the No Project scenario would have lower cancer risk than under the Plan. This is likely due to changes in the land use growth pattern and the ratio of light/medium vehicle versus heavy-duty truck travel expected under the Plan versus a No Plan. For example, Segment 12 is in Ontario on the I-15, under the Plan the segment would experience a decrease in VMT from light and medium duty cars of over 100,000 as compared to the No Project, however heavy-duty truck traffic is expected to increase by approximately 7,400 daily trips under the Plan as compared to the No Project scenario. Since the majority of DPM emissions and the associated health risk results from heavy-duty vehicles, the health risk would be greater in this segment under the Plan. The health risk under the Plan is anticipated to be less in most segments as compared to the No Project scenario. The total health risk in analyzed segments under the Plan (268.7 in one million) would

be less than the No Project (290.71 in one million). Additionally, the total health (268.7 in one million) risk under the Plan would be less than under existing conditions (857.1 in one million).

In addition to mobile-source emissions, multiple social, economic, and lifestyle factors could contribute to the detriment of the region's public health. Built upon the public health emphasis of previous Plans, Connect SoCal emphasizes public health.

As indicated in the Connect SoCal Public Health Technical Report, poor air quality can also impact non-cancer related health problems including asthma. Additionally, climate change can lead to increased wildfires and smoke, which in turn degrades the air quality in the region. Increases in PM2.5 from wildfires leads to increased hospital visits and mortality.[164] This risk persists even after a wildfire is extinguished because particulate matter from fire ash can be picked up by winds. SCAG has evaluated social detriments including the community context, availability of health care, neighborhood and surrounding built environment, education, and economic health to see how these factors shape public health. With nearly half of U.S. adults living with a chronic disease, SCAG recognizes improving public health is vital to the community. The Surgeon General promotes increasing physical activity as one strategy to improve public health.[165]

SCAG's responsibility as it relates to air quality is to focus on mobile source emissions. Air districts, such as the SCAQMD are responsible for overseeing air quality in the region for stationary sources. As stated above, the SCAQMD prepares an AQMP in order to ensure the area reaches attainment for ozone and particulate matter. According to the SCAQMD, 25% of the SCAB area's ozone-forming air pollutant comes from stationary sources and 75% comes from mobile-source emissions.[166] Therefore, while air districts have more authority in reducing stationary source pollution by creating rules and thresholds within their jurisdictions as well as have more authority in project-level analysis, air quality management districts must work closely with MPO's, such as SCAG, in order to ensure reductions in mobile-source air emissions. For example, SCAQMD's most recent 2016 AQMP includes a discussion of the health risk in the SCAB region as a result of both stationary and mobile source emissions based on the MATES IV model, which included on-road mobile source information obtained from SCAG.[167] As indicated above, the weighted cancer risk from all sources from 2012-2013 is approximately 897 in one million, which is

---

167 SCAQMD. 2015. *Mates IV*. Available online at: http://www.aqmd.gov/docs/default-source/air-quality/air-toxic-studies/mates-iv/mates-iv-final-draft-report-4-1-15.pdf?sfvrsn=7, accessed November 5, 2019.

likely lower in 2019.[168] The MATES IV study goes onto say that the areas of highest risk include those near the ports, Central Los Angeles, and along transportation corridors.[169]

While implementation of the Plan would increase total VMT from 2019 to 2045 (see **Table 3.8-11, Population and VMT (2019 and 2045)**), there is a growing support for increasing active transportation throughout the communities in the region. These changes can only be met if there is also a change in the built environment that enable people to walk safely in their communities. Proposed land use strategies and transportation investments, such as provision of additional investments in active transportation networks including first mile/last mile improvements, Safe Routes to School projects, and regional bikeways infrastructure are expected to increase the number of short trips, reduce per capita VMT and improve physical activity outcomes. The statewide Affordable Housing and Sustainable Communities (AHSC) program, as noted in the Plan, would improve air quality and reduce greenhouse gas emissions by funding housing and transportation improvements that support infill and compact development thereby reducing VMT.[170] Land use strategies within Connect SoCal also focuses development in HQTAs.

Connect SoCal includes regional strategies that would contribute to improving public health by reducing VMT (as well as encouraging increased healthy activities). As discussed in **Section 2.0, Project Description,** these strategies include, increased transportation investments in active transportation opportunities and facilities, transit and passenger rail use, and land use strategies that create more opportunities for walking and biking or other physics activities. The Plan projects total VMT would increase from 2019, but VMT per capita would decrease.

Summary

Connect SoCal would provide strategies to improve public health and develop walkable and transit friendly communities. The cancer risk adjacent to freeways would be significantly reduced when compared to existing conditions. The Plan would not exacerbate the health risk compared to existing conditions and therefore the impact of on-road emissions is less than significant.

As discussed above, construction activity would occur adjacent to sensitive receptors. The significant construction emissions identified in AQ-2, could result in an adverse health effects to sensitive receptors.

170 Southern California Association of Governments. 2019. *Connect SoCal*.

As such, it is likely that extended intense construction activities (e.g., from development projects that involve a high volume of haul trucks) would exceed the health risk significance thresholds due to equipment and truck exhaust emissions. This is considered a significant impact related to substantial pollutant concentrations during construction activities. Mitigation is required.

Mitigation Measures

SCAG Mitigation Measures

See **SMM AQ-1, SMM AQ-2, SMM**, and **SMM AQ-3.**

Project Level Mitigation Measures

See PMM-AQ-1.

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce each of the impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the anticipated construction emissions, the regional nature of the analysis and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to air emission impacts on sensitive receptors during construction could be significant and unavoidable even with implementation of mitigation.

Impact AQ-4 Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

Less than Significant Impact.

Connect SoCal would result in a less than significant impact to air quality in relation to exposing a substantial number of people to objectionable odors. Odor sources within the SCAG region, such as wastewater treatment facilities, landfills, and agricultural operations, are controlled by county and city odor ordinances and air district rules that prohibit nuisance odors and identify enforcement measures to reduce odor impacts to nearby receptors. These ordinances and rules are enforced by the air pollution control districts and local law enforcements. For example, SCAQMD, MDAQMD, and AVAQMD Rule 113; VPAPCD Rule 74.2; and ICAPCD Rules 101 and 424, *Architectural Coatings*, limit the amount of

volatile organic compounds from architectural coatings and solvents to further reduce the potential for odiferous emissions. SCAQMD also provides rules to establish odor management practices and requirements from solid waste transfer stations, material recovery facilities, and rendering facilities in Rule 410, *Odors from Transfer Stations and Material Recovery Facilities*, [171] and Rule 415, *Odors from Rendering Facilities*.[172] Additionally, SCAQMD and MDAQMD's Rule 402; [173, 174] VCAPCD's Rule 51; [175] and IPAPCD's Rule 407[176] *Nuisance* establishes that no person shall discharge any source of air contaminants that may cause harm or nuisance to the public. In order to hold any facility accountable for nuisance rules, the air quality management districts allow the public to report any air quality problems within the district including odor complaints.[177] As such, the Plan would be required to adhere to these rules and implementation of the Plan would not be expected to result in substantial odor emissions or affect a substantial number of people when compared to existing conditions. Therefore, the impact would be less than significant, and the consideration of mitigation measures is not warranted.

Construction

Construction of transportation projects and anticipated development under the Plan have the potential to cause an increase in construction activities in the region. Activities associated with the operation of construction equipment, diesel, the application of asphalt, the application of architectural coatings and other interior and exterior finished, and roofing may produce discernible odors typical of most construction sites. As stated above, SCAQMD, MDAQMD, and AVAQMD Rule 113; VPAPCD Rule 74.2; and ICAPCD Rules 101 and 424, *Architectural Coatings*, limit the amount of volatile organic compounds from architectural coatings and solvents to further reduce the potential for odiferous emissions. Although these odors could be a source of nuisance to adjacent uses, odors from construction at any individual site

176 ICAPCD. 1999. *Rule 407 Nuisances*. Available online at: https://ww3.arb.ca.gov/drdb/imp/curhtml/r407.pdf, accessed November 15, 2019.

177 South Coast Air Quality Management District. 2019. *Odor Complaints and Nuisance Violations*. Available online at: http://www.aqmd.gov/home/news-events/community-investigations/sunshine-canyon-landfill/odor-complaints, accessed October 30, 2019.

is temporary and intermittent in nature. Construction-related emissions also decrease with distance from individual project sites and quickly dissipate.

In accordance with federal and state regulations, diesel emissions from heavy duty trucks are projected to decrease with the Plan (see the HRA in **Appendix 3.3**), and construction activities associated with the Plan would adhere to CARB's guidelines regarding proximity to sensitive receptors. As such, construction resulting from the Plan would result in less than significant odor impacts.

Land Use Development Projects

The development projects anticipated to occur under the Plan would have the potential to result in nuisance odors. There are certain industries and activities that tend to result in odor complaints. According to the SCAQMD *CEQA Air Quality Handbook*, land uses and industrial operations that are associated with odor complaints include agricultural uses, wastewater treatment plants, food processing plants, chemical plants, composting, refineries, landfills, dairies and fiberglass molding. Any and all of these uses/activities could occur somewhere in the SCAG region under the Plan.

However, development projects would be required to comply with applicable odor regulations, such as SCAQMD, MDAQMD, and AVAQMD Rule 113; VPAPCD Rule 74.2; and ICAPCD Rules 101 and 424, *Architectural Coatings* and SCAQMD and MDAQMD Rule 402; VPAPCD Rule 51; and ICAPCD Rule 407 *Nuisance*. The air quality management districts use similar *Nuisance* rules which state:

> *A person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort, repose, health or safety of any such persons to the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.*[178, 179, 180, 181]

Therefore, most development projects would be required to comply with rules prohibiting nuisance to the public, including odors. The level of exposure and number of receptors affected from potential odor can only be determined through project-level analysis once facility designs of individual projects are

available. Therefore, odor impacts related to development would be analyzed at the individual project level. However, since development projects are required to comply with applicable odor regulations, land use development would not be expected to result in substantial odor emissions or affect a substantial number of people when compared to existing conditions, the impact would be less than significant, and the consideration of mitigation measures is not warranted.

Transportation Improvements

Connect SoCal includes the implementation of transportation projects (see **Appendix 2.0, Project List**) with the aim of reducing overall emissions in both mobile and stationary sources by increasing density and reducing VMT. Some transportation projects that involve roadway expansions or realignments could result in the transfer of vehicle emissions and/or could result in odor emissions sources being located closer to receptors. For example, Connect SoCal includes a transportation project to widen Harbor Boulevard in Orange County by one lane in each direction from Warner Avenue to 17th Street. Extending the street will bring vehicles and the associated exhaust emissions and odors closer to existing receptors along the roadway. In addition, some projects (e.g., rail stations) could result in localized traffic congestion that could incrementally add to odor concentrations. However, the SCAQMD does not indicate that transportation projects are associated with odor complaints. Similar to development projects, transportation projects would be required to comply with applicable odor regulations, such as the SCAQMD and MDAQMD's Rule 402; VCAPCD's Rule 51; and ICAPCD's Rule 407 *Nuisance*. Transportation projects would not be expected to result in substantial odor emissions or affect a substantial number of people when compared to existing conditions. Therefore, the impact would be less than significant, and the consideration of mitigation measures is not warranted.

3.4 BIOLOGICAL RESOURCES

This section of the Program Environmental Impact Report (PEIR) describes biological resources in the SCAG region, identifies the regulatory framework with respect to laws and regulations that govern biological resources, and analyzes the potential impacts of the Connect SoCal Plan ("Connect SoCal"; "Plan"). In addition, this PEIR table provides regional-scale mitigation measures as well as project-level mitigation measures to be considered by lead agencies for subsequent, site-specific environmental review to reduce identified impacts as appropriate and feasible.

3.4.1 ENVIRONMENTAL SETTING

The SCAG region encompasses an area of varied topography and diverse ecosystems.[1] The region covers over 38,000 square miles across six counties, encompassing two mountain ranges, two deserts, and approximately 150 miles of coastline, with elevations ranging from 0 to 10,000 feet above mean seal level (msl). Due to the remarkable variation in the region's topography, climate, and landforms, the biological communities within the area are exceptionally diverse and call for a broad approach to their description.

The SCAG region primarily encompasses the following five United States Department of Agriculture (USDA) regionally defined Ecological Sections.[2]

Southern California Coast Section. This ecological region is bound to the west by the Pacific Ocean. This section has coastal terraces and low elevation ranges with alluvial lowlands. Plant communities are generally comprised of coastal sagebrush, sagebrush, chaparral, and western hardwood communities. This ecological region occurs in Ventura, Los Angeles and Orange Counties and a small portion of extreme southwestern Riverside County.

Southern California Mountain and Valley Section. Located generally east of the Southern California Coast Section, this region has a landscape of moderate elevation and narrow ranges primarily vegetated with chaparral, chaparral-mountain scrub, western hardwoods, pine, and fir-spruce communities. This ecological section is present in every SCAG county.

Mojave Desert Section. Located primarily within the northeast portion of the SCAG region, this ecological section consists of short mountain ranges, basins, playas and dunes. Much of this ecological

---

1 An ecosystem is the dynamic complex of plant and animal communities and their associated non-living environment.

2 Descriptions of "Ecological Subregions: Sections of the Conterminous United States. 2017. General Technical Report WO- 76B. United States Department of Agriculture, Forest Service. Available at: http://www.edc.uri.edu/ATMT-DSS/report_forecast/landscape_dynamics/SectionDescriptions.pdf, accessed August 26, 2019.

region is vegetated with creosote bush scrub and desert scrub, with pinyon-juniper and other communities within the large array of elevations within this wide section. The Mojave Desert comprises a large portion of San Bernardino County, and smaller portions of Los Angeles and Riverside Counties.

Colorado Desert Section. This area is largely a plain comprised of alluvial deposits associated with the Salton Sea in Imperial and Riverside Counties. Native vegetation is sparse creosote bush scrub and desert scrub communities, with a high concentration of agricultural lands.

Sonoran Desert Section. This area consists of desert plain interspersed with small low elevation mountain ranges primarily vegetated with creosote bush scrub and desert scrub plant communities. This section covers a large portion of eastern Imperial and Riverside Counties and the southeastern portion of San Bernardino County.

3.4.1.1 Definitions

Definitions of terms used in this section are provided.

Critical Habitat: A designated area defined by the USFWS as being important for the survival of species listed pursuant to the federal Endangered Species Act (ESA). The USFWS evaluates the collection of the environmental conditions (i.e., plant communities, range, elevation, food source, etc.) essential to the continued conservation and preservation of each species listed as federally threatened and endangered.

Federally Designated Sensitive Species: Species that are not listed by the federal government as endangered, threatened, or candidate species but are categorized by the federal government as a federal species of concern. Federal species of concern is a term-of-art that describes a taxon (organism or group of organisms) whose conservation status may be of concern to the USFWS but does not have official status. In addition, federally designated sensitive species include those that are designated as such by the Bureau of Land Management (BLM) and U.S. Forest Service (USFS) on lands that fall under their jurisdiction.

Federally Listed Species: Species provided with special legal protection under the federal ESA. A federally listed endangered species is a species that is in danger of extinction throughout all or a significant portion of its range. A federally threatened species is one likely to become endangered in the absence of special protection or management efforts provided by the listing. A candidate species is one that is proposed by the federal government for listing as endangered or threatened.

Federal Wetlands: Defined by the U.S. Army Corps of Engineers (USACE) and the U.S. Environmental Protection Agency (EPA) as: "Those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a

prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas."[3]

Greenfield: Also known as "raw land," land that is privately owned, lacks urban services, has not been previously developed, and is located at the fringe of existing urban areas.

Habitat Conservation Plans (HCPs): Required by the USFWS as part of an application for an "incidental take" permit for species listed pursuant to the federal ESA. HCPs describe the anticipated effects of the proposed taking, how the impacts will be minimized and mitigated, and how the HCP is to be funded.

Locally Important Species: Species that are not monitored by the resource agencies but monitored by private organizations or local municipal governments. For the purposes of this PEIR, locally important species include those plant species recognized by the California Native Plant Society (CNPS), a private organization dedicated to the conservation of native plants, as well as those recognized by the Audubon Society.

Natural Community Conservation Plan (NCCP): Defined by CDFW as a plan for the conservation of natural communities that identifies and provides for the regional or areawide protection and perpetuation of plants, animals, and their habitats.[4]

Nursery Site: Considered habitat in which native wildlife may establish nests, maternity roosts, dens, or otherwise engage in breeding and/or the rearing of offspring.

Sensitive Plant Community: A native plant community listed on CDFW Natural Communities List as being rare within California or threatened by human actions.

Special Status Species: Species that have been afforded special recognition by federal, state, and/or local resource agencies or jurisdictions, or recognized resource conservation organizations. Special status wildlife species include: (1) species listed as a candidate, threatened, or endangered under the federal or state Endangered Species Act; (2) species considered rare or endangered under the California Environmental Quality Act; (3) plants considered "Rare, Threatened, or Endangered in California" by the California Native Plant Society (Lists 1B and 2); (4) animal listed as "species of special concern" by the state; and (5) animals fully protected in California by the Fish and Game Code.

3 U.S. Army Corps of Engineers. 1987. *Corps of Engineers Wetland Delineation Manual*. Vicksburg, MS. Available online at: http://www.cpe.rutgers.edu/Wetlands/1987-Army-Corps-Wetlands-Delineation-Manual.pdf, accessed August 26, 2019.

4 California Department of Fish and Wildlife. *Natural Community Conservation Planning (NCCP)*. Available online at: https://www.wildlife.ca.gov/Conservation/Planning/NCCP, accessed August 26, 2019.

Species of Special Concern (SSC): Species, subspecies, or distinct population of an animal (bird, mammal, fish, reptile, and amphibian) native to California that currently satisfies one or more of the following criteria: (a) is extirpated from the state or, in the case of birds, in its primary seasonal or breeding role; (b) is listed as federally-, but not state-, threatened or endangered; (c) meets the state definition of threatened or endangered but has not formally been listed; (d) is experiencing, or formerly experienced, serious (noncyclical) population declines or range retractions (not reversed) that, if continued or resumed, could qualify it for state threatened or endangered status; (e) has naturally small populations exhibiting high susceptibility to risk from any factor(s), that if realized, could lead to declines that would qualify it for state threatened or endangered status.

State-designated Sensitive Species: Species that are not listed by the state government as endangered, threatened, or candidate species but are categorized by the state as a species of special concern or fully protected species. A California species of special concern is defined by the California Department of Fish and Wildlife (CDFW) as being a wildlife species that has declining population levels, a limited range, and/or continuing threats that have made it vulnerable to extinction.

State-Listed Species: Species provided special legal protection under the California ESA. A state-listed endangered species is a species that is in danger of extinction throughout all or a significant portion of its range. A state-listed threatened species is one likely to become endangered in the absence of special protection or management efforts provided by the listing. A candidate species is one that is proposed by the federal or state government for listing as endangered or threatened.

State Wetlands/Streams: Defined by the California Fish and Game Code. A *stream* is defined as a body of water that flows at least periodically, or intermittently, through a bed or channel having banks and supporting fish or other aquatic life. *Wetlands* are defined as areas having riparian vegetation, without regard to wetland vegetation, soils, or hydrology. Defined by the SWRCB it is area that, under normal circumstances, (1) has continuous or recurrent saturation of the upper substrate caused by groundwater, or shallow surface water, or both; (2) the duration of such saturation is sufficient to cause anaerobic conditions in the upper substrate; and (3) the area's vegetation is dominated by hydrophytes or the area lacks vegetation.

Waters of the United States: Surface waters such as navigable waters and their tributaries, all interstate waters and their tributaries, natural lakes, all wetlands adjacent to other waters, and all impoundments of these waters. On April 21, 2014, the U.S. EPA proposed to refine the definition of waters of the United States to include all tributaries of traditional navigable waters, interstate waters, territorial seas, and

impoundments of such tributaries; wetlands adjacent to the foregoing; and waters other than wetlands that are adjacent to other jurisdictional waters.[5]

Wildlife Movement Corridors: Characterized as areas of habitat that are used by wildlife for the purpose of moving between locations.

3.4.1.2 Special-Status Species and Critical Habitat

Special-status species are generally defined as: (1) species listed as a candidate, threatened, or endangered under the federal or state Endangered Species Act; (2) species considered rare or endangered under the California Environmental Quality Act; (3) plants considered "Rare, Threatened, or Endangered in California" by the California Native Plant Society (Lists 1B and 2); (4) animal listed as "species of special concern" by the state; and (5) animals fully protected in California by the Fish and Game Code.

Critical habitat is a specific geographic area that is essential for the conservation of a threatened or endangered species and that may require special management and protection. Critical habitat is designated by the USFWS under the Federal Endangered Species Act (FESA) and cannot be disturbed without permission from the USFWS and other federal agencies, depending on land ownership. The listing process for individual species may include designation of critical habitat. Critical habitat may include an area that is not currently occupied by the species but that will be needed for its recovery. [6]

The following discussion is based on a background search of special-status species that are documented in the CNDDB,[7] the California Native Plant Society's (CNPS) Inventory of Rare and Endangered Plants,[8] and the US Fish and Wildlife Service's (USFWS) Endangered and Threatened species list.[9] The background search was regional in scope and focused on the documented occurrences within the boundaries of the SCAG region.

As described in **Table 3.4-1, Summary of Special-Status Species and Designated Critical Habitat in the SCAG Region,** below, there are 63 federally or state-listed wildlife species and 72 plant species with

historical records located within the six counties of the SCAG region as well as nearly 5.5 million acres of designated critical habitat. **Table 3.4-1, Summary of Special-Status Species and Designated Critical Habitat in the SCAG Region,** provides further detail on the state- and federally- listed plant and animal species, as well as their affiliated critical habitat, within the SCAG region.

Table 3.4-1
Summary of Special-Status Species and Designated Critical Habitat in the SCAG Region

County	Number Federally and State-Listed Wildlife Species	Number Federally and State-Listed Plant Species	Acres of Critical Habitat
Imperial	19	4	423,065
Los Angeles	37	30	108,574
Orange	22	11	27,833
Riverside	34	21	938,789
San Bernardino	32	24	3,673,963
Ventura	28	19	358,793
Entire SCAG Region	63	72	5,530,964

Source: California Department of Fish and Wildlife. 2019. Rarefind 5: A Database Application for the Use of the California Department of Fish and Game Natural Diversity Data Base. Sacramento, CA.

Every county within the SCAG region contains USFWS-designated critical habitat for listed species (**Figure 3.4-1, Designated Critical Habitat in the SCAG Region**). Critical habitat for 46 of these federally listed species has been established within the SCAG region (see **Appendix 3.4**). San Bernardino, the largest county in the country, contains nearly 3,700,000 acres of designated critical habitat, or over 66% of the lands designated in the SCAG region. Both San Bernardino and Riverside each have designated habitat for 22 federally-listed species, the most of any SCAG counties. More than 86 percent (4,685,378 acres) of all the critical habitat in the region is for desert tortoise (Gopherus agassizii) and this species represents the largest designated critical habitat in the four of the six SCAG counties in which it is present (San Bernardino, Riverside, Los Angeles, and Imperial Counties). Coastal California gnatcatcher (Polioptila californica californica) has the largest critical habitat in Orange County (with 19,000 acres, or nearly 67 percent of the designated lands in the County). California Condor (Gymnogyps californianus) has nearly 180,000 acres designated in Ventra County, or almost 50 percent of all critical habitat designated in the County. Each county has designated critical habitat for a wide variety of species (including plants, amphibians, fish, reptiles, insects, crustaceans, birds, and mammals) and each county has a wide diversity of natural communities to support these species.

State and Federally Listed Species

A search of relevant literature and databases for the six counties of the SCAG region was performed to develop a list of 135 listed species and biological resources that could potentially occur in the SCAG region, as shown in **Table 3.4-2, Federally and State Listed Species Reported in the SCAG Region**.[10] These included federally listed threatened and endangered and state-listed threatened, endangered or rare species. Although only the third largest county in the region, Los Angeles had the greatest number of listed species with 67. Imperial County had the fewest species listed with 23.

Table 3.4-2
Federally and State Listed Species Reported in the SCAG Region

Scientific Names	Common Name	Status	Counties Where Reported	Designated Critical Habitat (Acres)
Plants				
Acanthoscyphus parishii var. goodmanian	Cushenbury oxytheca	FE, CRPR: 1B.1	SB	ND
Acmispon argophyllus var. adsurgens	San Clemente Island bird's-foot trefoil	SE, CRPR: 1B.1	LA	ND
Acmispon dendroideus var. traskiae	San Clemente Island lotus	FT, SE, CRPR: 1B.3	LA	ND
Allium munzii	Munz's onion	FE, ST, CRPR: 1B.1	RIV	98
Ambrosia pumila	San Diego ambrosia	FE, CRPR: 1B.1	RIV	307
Arenaria paludicola	Marsh sandwort	FE, SE, CRPR: 1B.1	LA, RIV, SB	ND
Astragalus albens	Cushenbury milk-vetch	FE, CRPR: 1B.1	SB	4,370
Astragalus brauntonii	Braunton's milk-vetch	FE, CRPR: 1B.1	LA, VEN, OR	3298
Astragalus jaegerianus	Lane Mountain milk-vetch	FE, CRPR: 1B.1	SB	14167
Astragalus lentiginosus var. coachellae	Coachella Valley milk-vetch	FE, CRPR: 1B.2	RIV	9671
Astragalus magdalenae var. peirsonii	Peirson's milk-vetch	FT, SE, CRPR: 1B.2	IMP	12105
Astragalus pyncnostachyus var. lanosissimus	Ventura Marsh milk-vetch	FE, SE, CRPR: 1B.1	LA, OR, VEN	220
Astragalus tener var. titi	Coastal dunes milk-vetch	FE, SE, CRPR: 1B.1	LA	ND
Astragalus traskiae	Trask's milkvetch	SR, CRPR: 1B.2	VEN	ND
Astragalus tricarinatus	Triple-ribbed milk vetch	FE, CRPR: 1B.2	RIV, SB	ND
Atriplex coronata var. notatior	San Jacinto valley crownscale	FE, CRPR: 1B.1	RIV	ND

Sensitive Wildlife Species

A query of the CNDDB was performed to develop a list of sensitive wildlife species recognized by the CDFW as California Species of Special Concern, or species that are tracked by the CNDDB that could potentially occur in the SCAG region. In addition to the federally and State-listed wildlife species described above, there are 233 sensitive wildlife species with historic records located within the SCAG region (**Table 3.4-3, Sensitive Wildlife Species Reported in the SCAG Region,** and **Figure 3.4-2, Sensitive Wildlife Species Reported in the SCAG Region**).[11]

Of these 233 sensitive wildlife species, Riverside and San Bernardino Counties had the highest diversity of species observed (both with more than 21 percent of the total recorded for the SCAG region), followed closely by Los Angeles County (with more than 20 percent of the wildlife recorded), and then Imperial, Orange, and Ventura Counties (with a range of 12–13 percent of the recorded observations).

Table 3.4-3
Sensitive Wildlife Species Reported in the SCAG Region

Scientific Name	Common Name	Status	Counties Reported
Crustaceans			
Linderiella santarosae	Santa Rosa Plateau fairy shrimp	CSA	RIV
Mollusks			
Assiminea infima	Badwater snail	CSA	SB

Xerospermophilus tereticaudus chlorus	Palm Springs round-tailed ground squirrel	SSC	RIV

Note:
SSC = California Species of Special Concern; CFP = California Fully Protected; CSA = California Special Animal; SB = San Bernardino County; LA = Los Angeles County; RIV = Riverside County; VEN = Ventura County; OR = Orange County; IMP = Imperial County.*
** California Special Animal (CSA) is a general term that refers to all of the taxa the CNDDB is interested in tracking, regardless of their legal or protection status. The Department of Fish and Wildlife considers the taxa on this list to be those of greatest conservation need. For those species with statuses identified by USFWS and/or CDFW, the status is noted. Those species included on the list due to identification by other governmental agencies and/or non-governmental conservation organizations are listed as CSA.*

Rare and Locally Important Plants

Rare plants and plants of local importance are recorded by the CNDDB and the CNPS Rare Plan Inventory. In addition to the federally and state-listed plant species described above, there are 449 locally important plant species with historic records located within the SCAG region as shown in **Table 3.4-4, Rare and Locally Important Plants Reported in the SCAG Region**. As described below, the greatest number, representing more than 36 percent of 449 species recorded, were found in San Bernardino County, with 20 percent in Los Angeles and Riverside Counties, and less than 10 percent in Orange, Imperial and Ventura Counties.

Table 3.4-4
Rare and Locally Important Plants Reported in the SCAG Region

Scientific Name	Common Name	Status	Counties Where Reported
Abronia villosa var. aurita	chaparral sand-verbena	1B.1	IMP, OR, RIV, SB
Abutilon parvulum	dwarf abutilon	2B.3	SB
Acanthoscyphus parishii var. abramsii	Abrams' oxytheca	1B.2	VEN
Acanthoscyphus parishii var. cienegensis	Cienega Seca oxytheca	1B.3	SB
Acleisanthes longiflora	angel trumpets	2B.3	RIV
Acleisanthes nevadensis	desert wing-fruit	2B.1	SB
Acmispon argyraeus var. multicaulis	scrub lotus	1B.3	SB

Scientific Name	Common Name	Status	Counties Where Reported
Acmispon argyraeus var. notitius	Providence Mountains lotus	1B.3	SB
Acmispon haydonii	pygmy lotus	1B.3	IMP, RIV
Ageratina herbacea	desert ageratina	2B.3	SB
Aliciella ripleyi	Ripley's aliciella	2B.3	SB
Aliciella triodon	coyote gilia	2B.2	SB
Allium atrorubens var. atrorubens	Great Basin onion	2B.3	SB
Allium howellii var. clokeyi	Mt. Pinos onion	1B.3	LA, SB, VEN
Allium marvinii	Yucaipa onion	1B.2	RIV, SB
Allium nevadense	Nevada onion	2B.3	SB
Almutaster pauciflorus	alkali marsh aster	2B.2	RIV, SB
Ambrosia monogyra	singlewhorl burrobrush	2B.2	RIV, SB
Androstephium breviflorum	small-flowered androstephium	2B.2	RIV, SB
Anomobryum julaceum	slender silver moss	4.2	LA
Antennaria marginata	white-margined everlasting	2B.3	SB
Aphanisma blitoides	aphanisma	1B.2	LA, OR, VEN
Arctomecon merriamii	white bear poppy	2B.2	SB
Arctostaphylos catalinae	Santa Catalina Island manzanita	1B.2	LA
Arctostaphylos glandulosa ssp. gabrielensis	San Gabriel manzanita	1B.2	LA, SB
Arctostaphylos rainbowensis	Rainbow manzanita	1B.1	RIV
Arenaria lanuginosa var. saxosa	rock sandwort	2B.3	SB
Argyrochosma limitanea ssp. limitanea	southwestern false cloak-fern	2B.1	SB
Asclepias nyctaginifolia	Mojave milkweed	2B.1	SB
Astragalus allochrous var. playanus	playa milk-vetch	2B.2	SB
Astragalus bernardinus	San Bernardino milk-vetch	1B.2	RIV, SB
Astragalus cimae var. cimae	Cima milk-vetch	1B.2	SB
Astragalus didymocarpus var. milesianus	Miles' milk-vetch	1B.2	VEN
Astragalus hornii var. hornii	Horn's milk-vetch	1B.1	SB
Astragalus insularis var. harwoodii	Harwood's milk-vetch	2B.2	IMP, RIV, SB
Astragalus lentiginosus var. antonius	San Antonio milk-vetch	1B.3	LA, SB
Astragalus lentiginosus var. sierrae	Big Bear Valley milk-vetch	1B.2	SB
Astragalus leucolobus	Big Bear Valley woollypod	1B.2	LA, RIV, SB
Astragalus nevinii	San Clemente Island milk-vetch	1B.2	LA
Astragalus pachypus var. jaegeri	Jaeger's milk-vetch	1B.1	RIV

Scientific Name	Common Name	Status	Counties Where Reported
Astragalus preussii var. laxiflorus	Lancaster milk-vetch	1B.1	LA, RIV
Astragalus preussii var. preussii	Preuss' milk-vetch	2B.1	SB
Astragalus sabulonum	gravel milk-vetch	2B.2	IMP, RIV
Astragalus tidestromii	Tidestrom's milk-vetch	2B.2	SB
Astrolepis cochisensis ssp. cochisensis	scaly cloak fern	2B.3	SB
Atriplex coulteri	Coulter's saltbush	1B.2	LA, OR, SB, VEN
Atriplex pacifica	south coast saltscale	1B.2	LA, OR, VEN
Atriplex parishii	Parish's brittlescale	1B.1	LA, OR, RIV, SB
Atriplex serenana var. davidsonii	Davidson's saltscale	1B.2	LA, OR, RIV, VEN
Ayenia compacta	California ayenia	2B.3	IMP, RIV, SB
Baccharis malibuensis	Malibu baccharis	1B.1	LA, OR, VEN
Bahia neomexicana	many-flowered bahia	2B.3	SB
Berberis fremontii	Fremont barberry	2B.3	SB
Berberis harrisoniana	Kofa Mountain barberry	1B.2	SB
Bergerocactus emoryi	golden-spined cereus	2B.2	LA
Blepharidachne kingii	King's eyelash grass	2B.3	SB
Boechera dispar	pinyon rockcress	2B.3	RIV, SB
Boechera johnstonii	Johnston's rockcress	1B.2	RIV
Boechera lincolnensis	Lincoln rockcress	2B.3	RIV, SB
Boechera parishii	Parish's rockcress	1B.2	SB
Boechera peirsonii	San Bernardino rockcress	1B.2	SB
Boechera shockleyi	Shockley's rockcress	2B.2	SB
Botrychium ascendens	upswept moonwort	2B.3	SB
Botrychium crenulatum	scalloped moonwort	2B.2	LA, SB
Bouteloua trifida	three-awned grama	2B.3	SB
Brodiaea kinkiensis	San Clemente Island brodiaea	1B.2	LA
Brodiaea orcuttii	Orcutt's brodiaea	1B.1	RIV
Brodiaea santarosae	Santa Rosa Basalt brodiaea	1B.2	RIV
Bursera microphylla	little-leaf elephant tree	2B.3	IMP, RIV
Calliandra eriophylla	pink fairy-duster	2B.3	IMP, RIV
Calochortus clavatus var. gracilis	slender mariposa-lily	1B.2	LA, VEN
Calochortus fimbriatus	late-flowered mariposa-lily	1B.3	LA, VEN

Scientific Name	Common Name	Status	Counties Where Reported
Calochortus palmeri var. munzii	San Jacinto mariposa-lily	1B.2	RIV
Calochortus palmeri var. palmeri	Palmer's mariposa-lily	1B.2	LA, RIV, SB, VEN
Calochortus plummerae	Plummer's mariposa-lily	4.2	LA, OR, RIV, SB, VEN
Calochortus striatus	alkali mariposa-lily	1B.2	LA, SB
Calochortus weedii var. intermedius	intermediate mariposa-lily	1B.2	LA, OR, RIV, SB
Calyptridium pygmaeum	pygmy pussypaws	1B.2	SB
Calystegia felix	lucky morning-glory	1B.1	LA, RIV, SB
Calystegia peirsonii	Peirson's morning-glory	4.2	LA
Camissoniopsis guadalupensis ssp. clementina	San Clemente Island evening-primrose	1B.2	LA
Canbya candida	white pygmy-poppy	4.2	LA, SB
Carex comosa	bristly sedge	2B.1	SB
Carex occidentalis	western sedge	2B.3	LA, RIV, SB
Carnegiea gigantea	saguaro	2B.2	IMP, SB
Castela emoryi	Emory's crucifixion-thorn	2B.2	IMP, RIV, SB
Castilleja hololeuca	island white-felted paintbrush	1B.2	VEN
Castilleja lasiorhyncha	San Bernardino Mountains owl's-clover	1B.2	RIV, SB
Caulanthus lemmonii	Lemmon's jewelflower	1B.2	VEN
Caulanthus simulans	Payson's jewelflower	4.2	RIV
Centromadia parryi ssp. australis	southern tarplant	1B.1	LA, OR, VEN
Centromadia pungens ssp. laevis	smooth tarplant	1B.1	LA, RIV, SB
Chaenactis carphoclinia var. peirsonii	Peirson's pincushion	1B.3	IMP
Chaenactis glabriuscula var. orcuttiana	Orcutt's pincushion	1B.1	LA, OR, VEN
Chaenactis parishii	Parish's chaenactis	1B.3	RIV
Chenopodium littoreum	coastal goosefoot	1B.2	LA
Chloropyron tecopense	Tecopa bird's-beak	1B.2	SB
Chorizanthe blakleyi	Blakley's spineflower	1B.3	VEN
Chorizanthe parryi var. parryi	Parry's spineflower	1B.1	LA, RIV, SB
Chorizanthe polygonoides var. longispina	long-spined spineflower	1B.2	OR, RIV
Chorizanthe xanti var. leucotheca	white-bracted spineflower	1B.2	RIV, SB
Chylismia arenaria	sand evening-primrose	2B.2	IMP, RIV, SB
Cirsium arizonicum var. tenuisectum	desert mountain thistle	1B.2	SB

Scientific Name	Common Name	Status	Counties Where Reported
Cirsium occidentale var. compactum	compact cobwebby thistle	1B.2	LA
Cladium californicum	California saw-grass	2B.2	LA, RIV, SB
Clarkia xantiana ssp. parviflora	Kern Canyon clarkia	4.2	LA
Claytonia lanceolata var. peirsonii	Peirson's spring beauty	3.1	SB
Clinopodium chandleri	San Miguel savory	1B.2	OR, RIV
Colubrina californica	Las Animas colubrina	2B.3	IMP, RIV
Comarostaphylis diversifolia ssp. diversifolia	summer holly	1B.2	OR
Constancea nevinii	Nevin's woolly sunflower	1B.3	LA
Cordylanthus parviflorus	small-flowered bird's-beak	2B.3	SB
Coryphantha alversonii	Alverson's foxtail cactus	4.3	RIV, SB
Coryphantha chlorantha	desert pincushion	2B.1	SB
Coryphantha vivipara var. rosea	viviparous foxtail cactus	2B.2	SB
Crossosoma californicum	Catalina crossosoma	1B.2	LA
Cryptantha clokeyi	Clokey's cryptantha	1B.2	LA, SB
Cryptantha traskiae	Trask's cryptantha	1B.1	LA, VEN
Cryptantha wigginsii	Wiggins' cryptantha	1B.2	LA, RIV
Cuscuta obtusiflora var. glandulosa	Peruvian dodder	2B.2	LA, SB
Cylindropuntia munzii	Munz's cholla	1B.3	IMP, RIV
Cymopterus deserticola	desert cymopterus	1B.2	LA, SB
Cymopterus gilmanii	Gilman's cymopterus	2B.3	SB
Cymopterus multinervatus	purple-nerve cymopterus	2B.2	RIV, SB
Delphinium parryi ssp. blochmaniae	dune larkspur	1B.2	VEN
Delphinium scaposum	bare-stem larkspur	2B.3	SB
Delphinium umbraculorum	umbrella larkspur	1B.3	VEN
Delphinium variegatum ssp. thornei	Thorne's royal larkspur	1B.1	LA
Dendromecon harfordii var. rhamnoides	south island bush-poppy	3.1	LA
Dieteria canescens var. ziegleri	Ziegler's aster	1B.2	RIV
Digitaria californica var. californica	Arizona cottontop	2B.3	IMP, SB
Diplacus mohavensis	Mojave monkeyflower	1B.2	SB
Diplacus traskiae	Santa Catalina Island monkeyflower	1A	LA
Dissanthelium californicum	California dissanthelium	1B.2	LA

Scientific Name	Common Name	Status	Counties Where Reported
Ditaxis claryana	glandular ditaxis	2B.2	IMP, RIV, SB
Ditaxis serrata var. californica	California ditaxis	3.2	RIV
Draba saxosa	Southern California rock draba	1B.3	RIV
Drymocallis cuneifolia var. cuneifolia	wedgeleaf woodbeauty	1B.1	SB
Drymocallis cuneifolia var. ewanii	Ewan's woodbeauty	1B.3	LA
Dryopteris filix-mas	male fern	2B.3	SB
Dudleya abramsii ssp. affinis	San Bernardino Mountains dudleya	1B.2	SB
Dudleya blochmaniae ssp. blochmaniae	Blochman's dudleya	1B.1	LA, OR, VEN
Dudleya cymosa ssp. crebrifolia	San Gabriel River dudleya	1B.2	LA
Dudleya densiflora	San Gabriel Mountains dudleya	1B.1	LA
Dudleya multicaulis	many-stemmed dudleya	1B.2	LA, OR, RIV, SB
Dudleya virens ssp. hassei	Catalina Island dudleya	1B.2	LA
Dudleya virens ssp. insularis	island green dudleya	1B.2	LA, VEN
Dudleya virens ssp. virens	bright green dudleya	1B.2	LA
Dudleya viscida	sticky dudleya	1B.2	OR, RIV
Echinocereus engelmannii var. howei	Howe's hedgehog cactus	1B.1	SB
Elymus salina	Salina Pass wild-rye	2B.3	SB
Enneapogon desvauxii	nine-awned pappus grass	2B.2	SB
Eremogone congesta var. charlestonensis	Charleston sandwort	1B.3	SB
Eremothera boothii ssp. boothii	Booth's evening-primrose	2B.3	RIV, SB
Eremothera boothii ssp. intermedia	Booth's hairy evening-primrose	2B.3	SB
Eriastrum harwoodii	Harwood's eriastrum	1B.2	IMP, RIV, SB
Eriastrum rosamondense	Rosamond eriastrum	1B.1	LA
Erigeron oxyphyllus	wand-like fleabane daisy	2B.3	SB
Erigeron uncialis var. uncialis	limestone daisy	1B.2	SB
Erigeron utahensis	Utah daisy	2B.3	SB
Eriodictyon angustifolium	narrow-leaved yerba santa	2B.3	SB
Eriogonum bifurcatum	forked buckwheat	1B.2	SB
Eriogonum contiguum	Reveal's buckwheat	2B.3	SB
Eriogonum evanidum	vanishing wild buckwheat	1B.1	RIV, SB
Eriogonum giganteum var. formosum	San Clemente Island buckwheat	1B.2	LA

Scientific Name	Common Name	Status	Counties Where Reported
Eriogonum kennedyi var. alpigenum	southern alpine buckwheat	1B.3	LA, SB, VEN
Eriogonum microthecum var. johnstonii	Johnston's buckwheat	1B.3	LA, SB
Eriogonum microthecum var. lacus- ursi	Bear Lake buckwheat	1B.1	SB
Eriogonum umbellatum var. juniporinum	juniper sulphur-flowered buckwheat	2B.3	SB

Riparian and State Sensitive Plant Communities

The six counties within the SCAG region contain nearly 23 million acres of "open space" combined. These vacant lands include the region's national forests, state parks, military installations, other public lands, and various private holdings. Much of the open space in the region has been left in its natural state, however many non-native species have transformed what was once native habitat. The CNDDB identifies approximately 318,000 acres as containing state-sensitive plant communities, those identified as critically imperiled, or vulnerable to extirpation. In addition, approximately 190,700 acres of riparian habitats have been included in the database. Riparian habitats in the SCAG region may fall under the jurisdiction of the CDFW and improvements within or in the vicinity of these habitats would require compliance with Section 1600 of the State FGC under which a Lake or Streambed Alteration Agreement would need to be obtained prior to the alteration of a state jurisdictional area.

Historically, special-status natural communities have been recorded by the CNDDB, which reported 45 special-status natural communities within the SCAG region, as shown in **Table 3.4-5, Riparian Habitat and State Sensitive Plant Communities Reported in the SCAG Region**. Unfortunately, this CNDDB information was last recorded in 1993, as the Natural Heritage Division of the CDFW is currently in the process of classifying and mapping vegetation in the state. Although there is no current comprehensive picture of state-sensitive plant communities and riparian habitat, it is highly likely that such communities exist within the SCAG region. Therefore, it is important that individual projects consider sensitive communities and carefully examine project sites on a case-by-case basis.

Table 3.4-5
Riparian Habitat and State Sensitive Plant Communities Reported in the SCAG Region

Community Name	State Sensitivity Rank	Counties Where Reported	Acres Reported in SCAG Region

Community Name	State Sensitivity Rank	Counties Where Reported	Acres Reported in SCAG Region
Southern Riparian Scrub	S3.2	LA, OR, RIV, SB, VEN	11,378
Southern Sycamore Alder Riparian Woodland	S4	LA, OR, RIV, SB, VEN	61,959
Southern Willow Scrub	S2.1	LA, OR, RIV, SB, VEN	5,697
Stabilized and Partially Stabilized Desert Dunes	S3.2	IMP	2,233
Transmontane Alkali Marsh	S2.1	IMP, SB	243
Valley Needlegrass Grassland	S3.1	LA, OR, RIV, VEN	16,806
Valley Oak Woodland	S2.1	LA, VEN	12,400
Walnut Forest	S1.1	LA, VEN	402
Wildflower Field	S2.2	LA	6,592

Note:
S1 Critically Imperiled — Critically imperiled in the state because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state.
S2 Imperiled — Imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state.
S3 Vulnerable — Vulnerable in the state due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation.
*S4Apparently Secure — Uncommon but not rare; some cause for long-term concern due to declines or other factors SNR **Unranked** — State conservation status not yet assessed.*
SB = San Bernardino County; LA = Los Angeles County; RIV = Riverside County; VEN = Ventura County; OR = Orange County; IMP = Imperial County.

Since 1993 CDFW and CNPS, have been classifying vegetation types using the new state standards, as outlined in the Manual of California Vegetation, updated in the second edition of the Manual.[12] These new state standards are being utilized in the classification of Sensitive Natural Communities throughout California that are currently being evaluated using NatureServe's Heritage Methodology, the same system used to assign state rarity ranks for sensitive plant communities in the CNDDB.[13] Natural Communities with ranks of S1-S3 are considered Sensitive Natural Communities that should be addressed during the CEQA process.

As of 2018, about half of California has been mapped and classified according to this standard; much of southern California has not yet been classified. **Table 3.4-6** provides the Vegetation Classification and Mapping Program's current list of vegetation Alliances with State Rarity Ranks of S1-S3 that occur within the USDA Ecological Sections (Southern California Coast, Southern California Mountains and Valleys, Mojave Desert, Colorado Desert, Sonoran Desert) found in the SCAG region. Some of these sections

overlap portions of counties outside of the SCAG region (primarily portions of San Diego and Santa Barbara Counties). Although this data is incomplete, it is highly likely that these or additional Sensitive Natural Communities may occur in the footprint of future projects in the SCAG region. Therefore, it is important that individual projects evaluate Sensitive Natural Communities in their analyses.

Table 3.4-6
Sensitive Natural Communities within the SCAG Region

Alliance Scientific Name	Common Name	State Rarity
Abies concolor Dry	Dry White Fir forest	S3
Abronia latifolia - Ambrosia chamissonis	Dune mat	S3
Achnatherum hymenoides	Indian rice grass grassland	S1.2
Achnatherum speciosum	Desert needlegrass grassland	S2.2
Adenostoma fasciculatum - Salvia apiana	Chamise - white sage chaparral	S3
Agave deserti	Desert agave scrub	S3.2
Allenrolfea occidentalis	Iodine bush scrub	S3.2
Alopecurus geniculatus	Water foxtail meadows	S3?
Amphipappus fremontii - Salvia funerea	Fremont's chaffbush - woolly sage scrub	S3
Anemopsis californica - Helianthus nuttallii - Solidago spectabilis	Yerba mansa - Nuttall's sunflower - Nevada goldenrod alkaline wet meadows	S2
Arbutus menziesii	Madrone forest	S3.2
Arctostaphylos (crustacea, tomentosa)	Brittle leaf - woolly leaf manzanita chaparral	S3
Arctostaphylos pungens - Arctostaphylos pringlei	Pointleaf manzanita - pink-bract manzanita chaparral	S3
Arctostaphylos (purissima, rudis)	Burton Mesa chaparral	S1.2
Argentina egedii	Pacific silverweed marshes	S2
Aristida purpurea	Purple three-awn meadows	S3?
Artemisia nova	Black sagebrush scrub	S3.2
Artemisia rothrockii	Rothrockâ€™s sagebrush	S3
Arthrocnemum subterminale	Parishâ€™s glasswort patches	S2
Atriplex parryi	Parry's saltbush scrub	S3
Baccharis emoryi - Baccharis sergiloides	Emory's and Broom baccharis scrub	S3
Betula occidentalis	Water birch thicket	S2.2
Bolboschoenus maritimus	Salt marsh bulrush marshes	S3
Bromus carinatus - Elymus glaucus	California brome - blue wildrye prairie	S3
Bursera microphylla	Elephant tree stands	S1.2
Calocedrus decurrens	Incense cedar forest	S3.2
Carex douglasii	Douglasâ€™ sedge meadows	S2?
Carex heteroneura	Different-nerve sedge patches	S3?
Carex integra	Small-fruited sedge meadows	S2?

Alliance Scientific Name	Common Name	State Rarity
Carex luzulina	Woodland sedge fens	S2?
Carex (pansa, praegracilis)	Sand dune sedge swaths	S3?
Carnegiea gigantea - Parkinsonia microphylla - Prosopis velutina	Saguaro - foothill palo verde - velvet mesquite desert scrub	S2.2
Castela emoryi	Crucifixion thorn stands	S1.1
Ceanothus greggii	Cup leaf ceanothus chaparral	S3
Ceanothus (oliganthus, tomentosus)	Hairy leaf - woolly leaf ceanothus chaparral	S3
Ceanothus papillosus	Wart leaf ceanothus chaparral	S3
Ceanothus verrucosus	Wart-stemmed ceanothus chaparral	S2
Centromadia (pungens)	Tar plant fields	S2
Chilopsis linearis - Psorothamnus spinosus	Desert-willow - smoketree wash woodland	S3
Chrysolepis sempervirens	Bush chinquapin chaparral	S3.3
Coreopsis gigantea	Giant coreopsis scrub	S3
Cressa truxillensis - Distichlis spicata	Alkali weed - salt grass playas and sinks	S2
Cylindropuntia bigelovii	Teddy bear cholla patches	S3
Deinandra clementina - Eriogonum giganteum	Island tar plant - Saint Catherine's lace scrub	S2
Deinandra fasciculata	Clustered tarweed fields	S2
Dicoria canescens - Abronia villosa - Panicum urvilleanum	Mojave-Sonoran desert dunes	S3.2
Diplacus aurantiacus	Bush monkeyflower scrub	S3?
Dudleya greenei - Dudleya spp. Succulent Scrub	Greene's live-forever - live-forever species succulent scrub	S1
Encelia (actonii, virginensis) - Viguiera reticulata	Acton's and Virgin River brittle brush - net-veined goldeneye scrub	S3
Encelia californica - Eriogonum cinereum	California brittle bush - Ashy buckwheat scrub	S3
Ephedra funerea	Death Valley joint fir scrub	S3
Ericameria palmeri	Palmerâ€™s goldenbush scrub	S3?
Ericameria paniculata	Black-stem rabbitbrush scrub	S3
Eriodictyon crassifolium	Thick leaf yerba santa scrub	S3
Eriogonum arborescens - Eriogonum grande	Island Buckwheat scrub	S3
Eriogonum wrightii - Eriogonum heermannii - Buddleja utahensis	Wright's buckwheat - Heermann's buckwheat - Utah butterfly- bush scrub	S3
Fallugia paradoxa	Apache plume scrub	S3
Frankenia salina	Alkali heath marsh	S3
Grindelia (camporum, stricta)	Gum plant patches	S2
Gutierrezia sarothrae - Gutierrezia microcephala	Snakeweed scrub	S3
Hazardia squarrosa	Sawtooth golden bush scrub	S3
Hesperocyparis forbesii	Tecate cypress stands	S2.2
Hesperocyparis sargentii	Sargent cypress woodland	S3.2
Hesperocyparis stephensonii	Cuyamaca cypress stands	S1

Alliance Scientific Name	Common Name	State Rarity
Hordeum brachyantherum	Meadow barley patches	S2
Isocoma menziesii	Menzies's golden bush scrub	S3
Juglans californica	California walnut groves	S3.2
Juncus (oxymeris, xiphioides)	Iris-leaf rush seeps	S2?
Juniperus osteosperma	Utah juniper woodland	S3.2
Keckiella antirrhinoides	Bush penstemon scrub	S3
Koeberlinia spinosa	Crown-of-thorns stands	S1.1
Krascheninnikovia lanata	Winterfat scrubland	S3
Lepidospartum squamatum	Scale broom scrub	S3
Leymus cinereus - Leymus triticoides	Ashy ryegrass - creeping ryegrass turfs	S3
Leymus condensatus	Giant wild rye grassland	S3
Leymus mollis	Sea lyme grass patches	S2
Lupinus chamissonis - Ericameria ericoides	Silver dune lupine - mock heather scrub	S3
Lycium californicum	California desert-thorn scrub	S3
Menodora spinescens	Spiny menodora scrub	S3
Monolopia (lanceolata) - Coreopsis (calliopsidea)	Monolopia - leafy-stemmed tickseed fields	S3
Muhlenbergia rigens	Deer grass beds	S2?
Nolina (bigelovii, parryi)	Nolina scrub	S2.2
Opuntia littoralis - Opuntia oricola - Cylindropuntia prolifera	Coast prickly pear scrub	S3
Pinus edulis	Two-needle pinyon stands	S2?
Pinus flexilis	Limber pine woodland	S3.2
Pinus muricata - Pinus radiata	Bishop pine - Monterey pine forest	S3.2
Pinus quadrifolia	Parry pinyon woodland	S2
Pinus torreyana	Torrey pine woodland	S1.2
Platanus racemosa	California sycamore woodlands	S3
Pleuraphis jamesii	James's galleta shrub-steppe	S2.2
Pleuraphis rigida	Big galleta shrub-steppe	S2.2
Pluchea sericea	Arrow weed thickets	S3.3
Poa secunda	Curly blue grass grassland	S3?
Populus fremontii	Fremont cottonwood forest	S3.2
Populus tremuloides	Aspen groves	S3.2
Populus trichocarpa	Black cottonwood forest	S3
Prosopis glandulosa - Prosopis velutina - Prosopis pubescens	Mesquite thickets	S3
Prunus fremontii	Desert apricot scrub	S3
Prunus virginiana	Choke cherry thickets	S2?
Pseudotsuga macrocarpa	Bigcone Douglas fir forest	S3.2
Purshia stansburiana	Stansbury cliff rose scrub	S3.2
Purshia tridentata	Bitter brush scrub	S3

Alliance Scientific Name	Common Name	State Rarity
Quercus chrysolepis (shrub)	Canyon live oak chaparral	S3
Quercus dumosa - Quercus pacifica	Coastal sage and Island scrub oak chaparral	S3
Quercus engelmannii	Engelmann oak woodland	S3
Quercus lobata	Valley oak woodland	S3
Quercus palmeri	Palmer oak chaparral	S2?
Quercus tomentella - Lyonothamnus floribundus	Island live oak - Catalina ironwood woodland	S3
Quercus turbinella	Sonoran live oak scrub	S1.3
Rhus integrifolia	Lemonade berry scrub	S3
Rhus trilobata - Crataegus rivularis - Forestiera pubescens	Basket bush - river hawthorn - desert olive patches	S3.2?
Ribes quercetorum	Oak gooseberry thickets	S2?
Rosa californica	California rose briar patches	S3
Ruppia (cirrhosa, maritima)	Ditch-grass or widgeon-grass mats	S2
Salix gooddingii	Black willow thickets	S3
Salix laevigata	Red willow thickets	S3
Salix lucida	Shining willow groves	S3.2
Salvia apiana	White sage scrub	S3
Sambucus nigra	Blue elderberry stands	S3
Sarcocornia pacifica (Salicornia depressa)	Pickleweed mats	S3
Schoenoplectus (acutus, californicus)	Hardstem and California bulrush marshes	S3
Schoenoplectus americanus	American bulrush marsh	S3.2
Selaginella bigelovii	Bushy spikemoss mats	S3
Sesuvium verrucosum	Western sea-purslane marshes	S2.2?
Simmondsia chinensis	Jojoba scrub	S3?
Spartina foliosa	California cordgrass marsh	S3.2
Sporobolus airoides - Muhlenbergia asperifolia - Spartina gracilis	Alkali sacaton - scratchgrass - alkali cordgrass alkaline wet meadow	S2
Stuckenia (pectinata) - Potamogeton spp.	Pondweed mats	S3?
Suaeda moquinii	Bush seepweed scrub	S3
Tetracoccus hallii	Hallâ€™s shrubby-spurge patches	S1.1
Umbellularia californica	California bay forest	S3
Venegasia carpesioides	Canyon sunflower scrub	S3
Vitis arizonica - Vitis girdiana	Wild grape shrubland	S3
Washingtonia filifera	California fan palm oasis	S3.2
Xylococcus bicolor	Mission manzanita chaparral	S3

Alliance Scientific Name	Common Name	State Rarity
Yucca brevifolia	Joshua tree woodland	S3.2
Ziziphus obtusifolia	Graythorn patches	S2?

S1 Critically Imperiled — Critically imperiled in the state because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state.
S2 Imperiled — Imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state.
S3 Vulnerable — Vulnerable in the state due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation.
Entries marked with "?" indicate reliminary or more information required

Federally Protected Wetlands and Waterways

Current National Wetlands Inventory maps[14] and USGS National Hydrography Dataset of surface waters (rivers, streams, ephemeral streams, canals, lakes, ponds, and other hydrologic features) for the SCAG region were reviewed to identify the extent of potential wetlands and waterways subject to protection under Section 404 of the CWA and coastal areas subject to Section 10 of the Rivers and Harbors Act. Wetlands and waterways potentially subject to the jurisdiction of the USACE, CDFW, and RWQCB's were determined to be present within each of the six counties in the SCAG region (**Table 3.4-7, Federally Protected Wetlands and Waterways Reported in the SCAG Region,** and **Table 3.4-8, Federally Protected Surface Water Features in the SCAG Region**).

Table 3.4-7

Wildlife Movement Corridors

Wildlife movement corridors, or habitat linkages, are generally defined as connections between habitat patches that allow for physical and genetic exchange between otherwise isolated animal populations. Such linkages may serve a local purpose, such as providing a linkage between foraging and denning areas, or they may be regional in nature. Some habitat linkages may serve as migration corridors, wherein animals periodically move away from an area and then subsequently return. Others may be important as dispersal corridors for young animals. A group of habitat linkages in an area can form a wildlife corridor network.[15]

The presence of viable and sustainable wildlife corridor networks may also be critical to the survival of some species as habitat conditions and landscapes are altered due to climate change. Across the SCAG region's diverse habitat types, many native plant species are at risk because of from climate change effects.[16] These effects include rising sea levels, increased temperatures, decreased water availability and/or altered precipitation patterns, and invasive species infestations. Special status species are most susceptible to climate change due to their small population sizes and, often, specific suitable habitat conditions required for survival. These impacts on plants change ecosystems and the wildlife they support. Maintaining existing connected habitat linkages and establishing new wildlife crossings in is essential to the survival of California's diverse native species and unique ecosystems in the face of a

15 Ventura County Resource Management Agency (VCRMA). 2018. Habitat Connectivity and Wildlife Movement Corridors. Available online at: https://vcrma.org/habitat-connectivity-and-wildlife-movement-corridors, accessed January 15, 2019.

16 Native Plants and Climate Change. 2019. California Deprtmnt of Fish and Wildlfe. Available at: https://www.wildlife.ca.gov/Conservation/Plants/Climate

changing climate. As habitat conditions change in response to altered climate conditions, wildlife require an increased diversity of opportunities for movement and migration to a wide variety of landscapes. [17]

The California Department of Transportation (Caltrans) and CDFW commissioned the California Essential Habitat Connectivity Project to assess essential habitat connectivity across the state.[18] As shown in **Figure 3.4-3, Essential Habitat Connectivity within the SCAG Region,**[19] a large portion of the SCAG region includes many natural landscape blocks, accounting for nearly 12 million acres that support high native wildlife biodiversity with a significant wildlife connectivity network (**Figure 3.4-3**; **Table 3.4-9, Natural Landscape Blocks by County in the SCAG Region**).[20] These large and intact blocks are connected by over 4.5 million acres of corridors that are highly (Class 4 and 5) permeable (i.e., beneficial) to wildlife movement (**Table 3.4-10**). A large portion of these landscape blocks and essential connectivity areas are spread through eastern Imperial, Riverside, and San Bernardino Counties. Ventura County has the relatively largest proportion of landscape blocks and essential connectivity areas by county acreage. Large portions of the mountainous parts of Los Angeles County provide a critical linkage between habitat blocks from Riverside and Imperial County to the east and Ventura County to the west. Orange County has limited essential connectivity habitat and habitat blocks, located mostly in the eastern end of the county, but these provide connectivity to San Diego County to the south.

Table 3.4-9
Natural Landscape Blocks by County in the SCAG Region

County	Area (acres)

Barriers to wildlife movement exist throughout the SCAG region, including large areas of urban development and multilane freeways that cut off regional movement for migratory and resident species alike. These barriers can affect all species from large mammals to small insects and can lead to significant degradation of ecosystem function and plant community composition. Conservation, protection, and enhancement of these intact Natural Landscape Blocks and Essential Connectivity Areas should be considered in project development to maintain or improve the viability of wildlife movement networks' and natural community stability.

A notable example of wildlife corridor enhancement is the wildlife crossing planned through the State Route 101 Freeway at Liberty Canyon Road in Agoura Hills. The development of the Liberty Canyon Wildlife Crossing will help facilitate mountain lion and other terrestrial wildlife movement through a major regional freeway, opening a corridor and reducing the risk of motor vehicle collisions with wildlife. Managed by California Department of Transportation (Caltrans), the Liberty Canyon Wildlife Crossing is a regional partnership with many public and private entities, including the City of Agoura Hills, City of Thousand Oaks, Mountains Recreation and Conservation Authority, the Santa Monica Mountains Conservancy, the National Park Service, and the Resource Conservation District of the Santa Monica Mountains. This project is planned to break ground in 2021 and be completed in 2023[21]. The crossing will cross ten lanes of US Highway 101 and an access road, with an estimated 200-foot long by 165-foot wide structure that will rank as the largest wildlife crossing in the world. This crossing will reconnect currently fragmented ecosystems for the benefit of mountain lions and other wildlife.

21 National Wildlife Federation/SaveLACougers. 2019. Available online at: https://savelacougars.org/ accessed November 22, 2019.

In addition to these essential corridors, major rivers, creeks, and streams often serve as nursery sites for fish, amphibian, and invertebrate species. These important features can facilitate movement between landscape blocks. Over 182,000 acres of these riparian wildlife connections have been mapped in the SCAG region (see **Table 3.4-11** and **Figure 3.4-3**).

Habitat Conservation Plans and Natural Community Conservation Plans

A Habitat Conservation Plan (HCP) is a planning document required as part of an application for an incidental take permit. HCPs describe the anticipated effects of the proposed taking, how the impacts will be minimized and mitigated, and how the HCP is to be funded. A Natural Community Conservation Plan (NCCP) is defined by CDFW as a plan for the conservation of natural communities that identifies and provides for the regional or area-wide protection and perpetuation of plants, animals, and their habitats. As described by **Table 3.4-12, HCPs and NCCPs in the SCAG Region**, below, more than 20 million acres of open space within the SCAG region are currently protected under an HCP or NCCP, or will be protected by a future HCP or NCCP that is currently in its planning stages. Data from CDFW and USFWS show 27 plans with durations of 16–80 years providing conservation efforts nearly three million acres in the SCAG region. As a group, these plans provide protection for multiple species by conserving habitats, identifying locations for future mitigation efforts, providing conservation guidance and practices, and preserving important wildlife linkages.

3.4.2 REGULATORY FRAMEWORK

3.4.2.1 Federal

Federal Endangered Species Act

The USFWS, under the auspices of the Federal Endangered Species Act of 1973 (FESA), manages and protects species listed as Endangered or Threatened. The USFWS can issue a permit for incidental "take" of listed species that can result from otherwise lawful activities. Take, under the federal definition, means to harass, harm (including habitat modification), pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to engage in any such conduct. The permitting process is used to determine if a project would jeopardize the continued existence of listed species and the mitigation measures that would be required to avoid or minimize impacts to listed species. Procedures for obtaining a permit for incidental take are set forth in Section 7 (for federal properties or where federal actions are involved) and Section 10 (for non-federal actions) of the FESA.[22] Candidate species do not have the full protection of the FESA; however, the USFWS advises applicants that candidate species could be elevated to listed species at any time.

USFWS administers the FESA, which designates critical habitat for endangered species. This enables USFWS to carry out its mission to conserve, protect, and enhance the nation's fish and wildlife and their habitats for the continuing benefit of people. Critical habitat areas cannot be disturbed without permission from the USFWS and other federal agencies, depending on land ownership. The USFWS also manages a system of land and waters for the conservation of wildlife and associated ecosystems. These National Wildlife Refuges are primarily managed for the preservation and protection of unique or important resources and ecosystems.

Section 10 of Rivers and Harbors Appropriation Act of 1899

Authorization from the USACOE must be obtained for construction of a structure in or over any navigable water of the U.S., pursuant to Section 10 of the Rivers and Harbors Appropriation Act of 1899 (33 United States Code [USC] §§ 401, 403, 407). Authorization is also needed for structures built near

22 U.S. Fish and Wildlife Service. 1973. *Endangered Species Act of 1973*. Available online at: https://www.fws.gov/endangered/esa-library/pdf/ESAall.pdf, accessed August 26, 2019.

navigable water if they would affect the course, location, condition, or capacity of the water body, as through re-channelization, disposal of fill, and so forth. [23]

Migratory Bird Treaty Act of 1918 (MBTA)

The MBTA (16 USC §§ 703–712) makes it unlawful to pursue, capture, kill, or possess any migratory bird or part, nest, or egg of any such bird listed in wildlife protection treaties between the United States, Great Britain, Mexico, Japan, and the countries of the former Soviet Union. Similar to the federal ESA, the MBTA authorizes the Secretary of the Interior to issue permits for incidental take.[24]

Fish and Wildlife Coordination Act, 1956

The objective of the Fish and Wildlife Coordination Act of 1956 (FWCA; 16 USC §§ 661–666c) is to protect fish and wildlife when federal actions result in the control or modification of a natural stream or body of water. Under the FWCA, Federal agencies shall consider the effect that water-related projects would have on fish and wildlife resources, prevent loss or damage and develop and improve fish and wildlife resources. The FWCA requires consultation with USFWS and state fish and wildlife agencies to develop measures to protect, develop and improve fish and wildlife resources.[25]

Section 401 of the Federal Clean Water Act (CWA) (1972)

Section 401 of the federal CWA (33 USC § 1251) is administered by the State Water Resources Control Board and the Regional Water Quality Control Boards (RWQCBs). Section 401 requires that prior to any federal permit or license, any activity, including river or stream crossings during road, pipeline, or transmission line construction, which may result in discharges into waters of the United States, must be certified by the applicable RWQCB. This certification ensures that the proposed activity does not violate federal water quality standards.[26] The SCAG region lies within the jurisdiction of five RWQCBs:

- Colorado River Basin

- San Diego

Section 404 of the Federal CWA

Section 404 of the federal CWA (33 USC § 1251), which is administered by the USACOE, regulates the discharge of dredged and fill material into waters of the United States. USACOE has established a series of nationwide permits that authorize certain activities in waters of the United States, provided that a proposed activity can demonstrate compliance with standard conditions. In general, USACOE requires an individual permit for an activity that will affect an area equal to or in excess of 0.3 acre of waters of the United States. Projects that result in impacts to less than 0.3 acre of waters of the United States can normally be conducted pursuant to one of the nationwide permits, if consistent with the standard permit conditions. USACOE also has discretionary authority to require an Environmental Impact Statement for projects that result in impacts to an area between 0.1 and 0.3 acre. Use of any nationwide permit is contingent on the activities having no impacts to endangered species.[27]

Marine Mammal Protection Act of 1972 (MMPA)

The MMPA (16 USC § 31) protects all marine mammals, including cetaceans (whales, dolphins, and porpoises), pinnipeds (seals and sea lions), sirenians (manatees and dugongs), sea otters, and polar bears within the waters of the United States. The MMPA prohibits the "take" of marine mammals without a permit, with certain exceptions. The definition of "take" under the MMPA is consistent with that of the federal ESA. The MMPA is managed by the federal government. The National Marine Fisheries Service is responsible for managing cetaceans, otariids, and phocids. The USFWS is responsible for managing odobenids, sirenians, otters, and polar bears. [28]

Marine Protection, Research, and Sanctuaries Act of 1972 (MPRSA)

The MPRSA (Public Law 92-532), also known as the Ocean Dumping Act, prohibits the dumping of material into the ocean that would unreasonably degrade or endanger human health or the marine

environment. Ocean dumping cannot occur unless a permit is issued under the MPRSA. In the case of dredged material, the decision to issue a permit is made by the USACOE, using EPA's environmental criteria and subject to EPA's concurrence. [29]

Emergency Wetlands Resources Act of 1986 (EWRA)

The objective of the EWRA (16 USC §§ 3901–3932), dated November 10, 1986, is to promote the conservation of wetlands and help fulfill obligations contained in various migratory bird treaties. Under the EWRA, the USFWS must provide leadership and take action to: [30]

- Intensify cooperative efforts to manage and conserve wetlands
- Intensify efforts to protect wetlands

Bald and Golden Eagle Protection Act (BGEPA)

The purpose of the federal BGEPA (16 USC §§ 668–668c, as amended) that is administered by the USFWS protects bald and golden eagles, their nests, eggs, and parts.[31] The BGEPA states that no person shall take, possess, sell, purchase, barter, offer for sale, purchase or barter, transport, export, or import any bald or golden eagle alive or dead, or any part, nest, or egg without a valid permit to do so. The BGEPA prohibits the "take" of bald and golden eagles unless pursuant to regulations. *Take* is defined by the BGEPA as an action "to pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, molest, or disturb."

In addition to immediate impacts, this definition covers impacts that result from human-caused alterations initiated around a previously used nest site during a time when eagles were not present. Permits are issued to Native Americans to possess eagle feathers for religious purposes, and salvaged eagle carcasses can be sent to the National Eagle Repository in Colorado, where they are redistributed to Native Americans. Although the bald eagle was removed from the Endangered Species List in June 2007, it is still federally protected under the BGEPA and MBTA described above. In addition, the *National Bald Eagle Management Guidelines* were published in conjunction with delisting by the USFWS in May 2007 to provide provisions to continue to protect bald eagles from harmful actions and impacts.

Under the BGEPA, a final rule was published in May 2008 in the *Federal Register* that proposed authorization for take of bald eagles for those with existing authorization under the federal ESA where the bald eagle is covered in an HCP or the golden eagle is covered as a non-listed species.[32] The final rule also established a new permit category to provide expedited permits to entities authorized to take bald eagles through Section 7 Incidental Take Permits.

Wetlands – Executive Order Number 11990

Executive Order (EO) 11990 was issued in May 1977, as a furtherance of the National Environmental Policy Act (NEPA) providing protection of wetlands. Pursuant to the EO, all new construction should be designed to the greatest extent possible to avoid long- and short-term adverse impacts that would lead to the destruction or the modification of wetlands, in order to preserve and enhance the natural and beneficial values of wetlands. Federal agencies, such as the Federal Highway Administration (FHWA), cannot undertake or provide assistance for new construction located in wetlands unless the head of the agency finds that: (1) there is no practicable alternative to the construction and (2) the proposed project includes all practicable measures to minimize harm.[33]

Invasive Species – Executive Order Number 13112

This EO was signed by President Clinton on February 3, 1999. It serves to prevent activities that may promote the introduction and spread of invasive species. The order states that federal agencies whose actions "may affect the status of invasive species shall … use relevant programs and authorities to … prevent the introduction of invasive species … detect and respond rapidly to and control populations of such species in a cost-effective and environmentally sound manner…monitor invasive species populations accurately and reliably … provide for restoration of native species and habitat conditions in ecosystems that have been invaded." In order to implement EO 13112, the FHWA has established guidance to prevent the introduction and spread, and promote the control, of invasive plant species on highway rights-of-way. Under EO 13112, federal agencies are prohibited from authorizing, funding, or carrying out actions that are likely to promote or result in the introduction or spread of invasive species unless all feasible measures to minimize the impacts have been analyzed and considered.[34]

National Environmental Policy Act

The National Environmental Policy Act (NEPA) is implemented by regulations included in the Code of Federal Regulations (40 CFR § 1500 *et seq*.), which require careful consideration of the harmful effects of federal actions or plans, including projects that receive federal funds, if they may have a significant adverse effect on the environment. NEPA mandates that all federal agencies carry out their regulations, policies, and programs in accordance with NEPA's policies of environmental protection. NEPA encourages the protection of all aspects of the environment and requires federal agencies to utilize a systematic, interdisciplinary approach to agency decision-making that will ensure the integrated use of natural sciences such as geology. While NEPA compliance is not required for the Plan, NEPA compliance will be required for transportation improvement projects that will be financed using federal funds. Some development projects (such as low-income housing) also use federal funds and are subject to NEPA. The regulations also require projects requiring NEPA review to seek to avoid or minimize adverse effects of proposed actions, and restore and enhance environmental quality as much as possible.

The Council on Environmental Quality (CEQ) oversees NEPA, and the US EPA carries out administrative aspects of the NEPA process. NEPA mandates that the federal government shall give appropriate consideration to potential adverse environmental impacts of their major actions, including impacts to biological resources.[35]

3.4.2.2 State

Section 1600 of the State Fish and Game Code, Lake or Streambed Alteration

All diversions, obstructions, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake in California are subject to the regulatory authority of the CDFW pursuant to Sections 1600 through 1603 of the Code and require preparation of a Streambed Alteration Agreement. Pursuant to the Code, a stream is defined as a body of water that flows at least periodically, or intermittently, through a bed or channel having banks and supporting fish or other aquatic life. Based on this definition, a watercourse with surface or subsurface flows that support or have supported riparian vegetation is a stream and is subject to CDFW jurisdiction. Altered or artificial waterways valuable to fish and wildlife are subject to CDFW jurisdiction. CDFW also has jurisdiction over dry washes that carry water ephemerally during storm events. [36]

Section 2080 of the State Fish and Game Code, California Endangered Species Act (California ESA)

The California ESA prohibits the take of listed species except as otherwise provided in state law. Unlike the federal ESA, the California ESA applies the take prohibitions to species petitioned for listing (state candidates). State lead agencies are required to consult with the CDFW to ensure that any actions undertaken by the lead agency are not likely to jeopardize the continued existence of any state-listed species or result in destruction or degradation of required habitat. CDFW is authorized to enter into Memoranda of Understanding (MOUs) with individuals, public agencies, universities, zoological gardens, and scientific or educational institutions to import, export, take, or possess listed species for scientific, educational, or management purposes.[37]

Pursuant to Section 2081 of the Code, the CDFW may authorize individuals or public agencies to import, export, take, or possess, any state-listed endangered, threatened, or candidate species. These otherwise prohibited acts may be authorized through permits or MOUs if:[38]

- The take is incidental to an otherwise lawful activity.
- The impacts of the authorized take are minimized and fully mitigated.
- The permit is consistent with any regulations adopted pursuant to any recovery plan for the species.
- The applicant ensures adequate funding to implement the measures required by CDFW.

CDFW shall make this determination based on available scientific information and shall include consideration of the ability of the species to survive and reproduce.

Sections 2800 through 2840 of the State Fish and Game Code, Natural Community Conservation Planning Act

Section 2800 through 2840 of the State Fish and Game Code provides a mechanism to conserve natural communities on an ecosystem level while accommodating compatible land use. Specifically, it is used to provide comprehensive management and conservation of multiple wildlife species and the natural communities in which they occur.[39]

---

37 California Department of Fish and Wildlife. *California's Endangered Species Act Listing Process*. Available online at: http://www.dfg.ca.gov/wildlife/nongame/t_e_spp/list_proced.html, accessed August 26, 2019.

39 California Legislative Information. *Article 3. Taking, Importation, Exportation, or Sale [2080-2085].*

The Natural Community Conservation Planning Act of 1991, as amended in 2003 established the Natural Community Conservation Planning program for the protection and perpetuation of the state's biological diversity. The CDFW established the program in order to conserve natural communities at the ecosystem level while accommodating compatible land use. An NCCP identifies and provides for the regional or area-wide protection of plants, animals, and their habitats, while allowing compatible and appropriate economic activity. The CDFW provides support, direction, and guidance to participants in order to ensure that NCCPs are consistent with the state ESA.

Sections 3503 and 3503.5 of the State Fish and Game Code, Resident and Migratory Birds

Sections 3503 and 3503.5 of the State Fish and Game Code provide regulatory protection to resident and migratory birds and all birds of prey within the State of California, including the regulation of the taking of nests and eggs, unless otherwise provided for by the State Fish and Game Code. Specifically, it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, or destroy the nest or eggs of any bird of prey, except as otherwise provided.[40,41]

Sections 3511, 4700, 5050, and 5515 of the State Fish and Game Code, Fully Protected Species

The classification of Fully Protected was the state's initial effort to identify and provide additional protection to those animals that were rare or faced possible extinction. Lists were created for fish, amphibians and reptiles, birds, and mammals. Most of the species on these lists have subsequently been listed under the state and/or federal Endangered Species Acts. Sections 3511, 4700, 5050 and 5515 of the Fish and Game Code state that Fully Protected species (birds, mammals, fish, reptiles, amphibians) or parts thereof may not be taken or possessed at any time and no licenses or permits may be issued for their take except for collecting these species for necessary scientific research and relocation of the bird species for the protection of livestock.[42,43,44,45]

Title 14, § 460 of the California Code of Regulations

The regulations of take of furbearing mammals are established within the California Code of Regulations (CCR), Title 14, Division 1 (Subdivision 2), Chapter 5. Take is prohibited for several furbearing mammals under Title 14, § 460 of the CCR, including, but not limited to, desert kit fox (*Vulpes macrotis arsipus*) and red fox (*Vulpes vulpes*).[46] Title 14 § 460 is supported by Sections 200, 202, 203, and 4009.5 of the State Fish and Game Code.[47,48]

California Porter-Cologne Water Quality Control Act (1969)

Pursuant to the California Porter-Cologne Water Quality Control Act (California Water Code, Division 7), the State Water Resources Control Board is granted ultimate authority over water quality policy for the State of California. The nine regional boards, the RWQCBs, oversee water quality at the local and regional levels, and regulate pollutant and nuisance discharges into waters of the state. Waters of the state are defined as any surface water or groundwater, including saline waters, within the boundaries of the state. Before allowing discharges that may affect the quality of waters of the state, a Report of Waste Discharge must be filed with the RWQCB.[49]

California Wild and Scenic Rivers Act (1972)

The objective of the California Wild and Scenic Rivers Act of 1972 (Public Resources Code [PRC] § 5093.50) is the preservation of certain rivers which possess extraordinary scenic, reaction, fishery, or wildlife values. The Act provides permanent protection for some of the state's most outstanding free flowing rivers and prohibits actions such as the construction of dams or other harmful instream activities, except to serve local needs.[50]

California Coastal Act (1976)

Through the California Coastal Act (PRC Division 20), the California Coastal Commission has unusually broad authority to regulate development in the Coastal Zone. A permit is required for any project that might change the intensity of land use in the Coastal Zone including projects that would require a building or grading permit from the city or county, major vegetation clearing, or subdividing. The coastal

zone generally extends three miles seaward and about 1,000 yards inland. In particularly important and generally undeveloped areas where there can be considerable impact on the coastline from inland development, the coastal zone extends to a maximum of five miles inland from mean high tide line. In developed urban areas, the coastal zone extends substantially less than 1,000 yards inland.[51]

California Native Plant Protection Act (1977)

The Native Plant Protection Act (Fish and Game Code Section 1900–1913) includes measures to preserve, protect, and enhance rare and endangered native plants. The list of native plants afforded protection pursuant to the Native Plant Protection Act includes those listed as rare and endangered under the California ESA. The Native Plant Protection Act provides limitations by stating "no person will import into this State, or take, possess, or sell within this State" any rare or endangered native plant, except in compliance with provisions of the act. Individual landowners are required to notify the CDFW at least 10 days in advance of changing land uses to allow the CDFW to salvage any rare or endangered native plant material.[52]

California Desert Native Plant Act (1981)

The main purpose of the Desert Native Plant Act (Food and Agriculture Code Division 23) is to preserve and enhance desert native plants by protecting certain species from unlawful harvesting on both public and privately owned lands. The list of desert native plants afforded protection pursuant to the Desert Native Plant Act includes species within the Mojave Desert portions of Los Angeles, San Bernardino, and Riverside Counties. The Desert Native Plant Act provides limitations that no person will harvest, transport, or possession of certain native desert plants without authorization (i.e., valid permit or wood receipt). Authorization for take of native desert plants can be obtained through the sheriff or commissioner of the county where harvesting will occur and subject to county designated fees.[53]

Natural Community Conservation Planning Act of 1991, as Amended

The Natural Community Conservation Planning Act of 1991, as amended in 2003 (Fish and Game Code Section 2800-2835) established the Natural Community Conservation Planning program for the protection and perpetuation of the state's biological diversity. The CDFW established the program in order to conserve natural communities at the ecosystem level while accommodating compatible land use. An NCCP identifies and provides for the regional or area-wide protection of plants, animals, and their

habitats, while allowing compatible and appropriate economic activity. The CDFW provides support, direction, and guidance to participants in order to ensure that NCCPs are consistent with the state ESA.[54]

State Senate Concurrent Resolution No. 17 – Relative to Oak Woodlands

The State Senate Concurrent Resolution No. 17, filed with the Secretary of State on September 1, 1989, states that any state agencies having land use planning duties and responsibilities shall assess the effects of their land use decisions or actions within any oak woodlands containing blue oak (*Quercus douglasii*), Engelmann oak (*Q. engelmannii*), valley oak (*Q. lobata*), or coast live oak (*Q. agrifolia*). The State Senate defines "oak woodland" as a five-acre circular area containing five or more oak trees per acre. This resolution requires that state agencies must preserve and protect native oak woodlands to the maximum extent feasible or provide for replacement plantings where blue, Engelmann, valley, or coast live oak are removed from oak woodlands.

State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State

The SWRCB adopted procedures as an amendment to the Water Quality Control Plan for Ocean Waters of California and the Water Quality Control Plan for Inland Surface Waters, Enclosed Bays, and Estuaries of California to establish a statewide wetland definition and procedures for discharges on April 2, 2019.[55]

The procedures consist of four major elements: 1) a wetland definition; 2) a framework for determining if a feature that meets the wetland definition is a water of the state; 3) wetland delineation procedures; and 4) procedures for the submittal, review and approval of applications for Water Quality Certifications and Waste Discharge Requirements for dredge or fill activities. In accordance with EO W-59-93, the procedures ensure that the SWRCB's regulation of dredge or fill activities will be conducted in a manner "to ensure no overall net loss and long-term net gain in the quantity, quality, and permanence of wetlands acreage and values.

State Wildlife Action Plan (SWAP)

Congress created the State and Tribal Wildlife Grants (SWG) program in 2000, recognizing the need to fund programs for the conversation of wildlife diversity.[56] Congress mandated each state and territory to develop a SWAP by 2005 that provided a comprehensive wildlife conservation strategy to continue receiving federal funds through the SWG program. California's first SWAP was completed by the California Department of Fish and Game (now the CDFW) and approved by the U.S. Fish and Wildlife Services (USFWS) in 2005. California's SWAP 2005 identified and targeted Species of Greatest Conservation Need (SGCN) and the critical habitats on which they depend. The SWG program requires SWAP updates at least every 10 years. CDFW has recenty prepared SWAP 2015, which is the first comprehensive update of SWAP 2005.[57] Currently under USFWS review for approval, the SWAP 2015 focuses on conservation of the wildlife resources of the nation's most biologically diverse state using an approach that is in harmony with a growing human population and the need for resilience in the face of a changing climate. Employing an ecosystem approach to conserve and manage diverse habitats and species, SWAP 2015 provides a blueprint for actions necessary to address the highest priorities for conserving California's aquatic, marine, and terrestrial resources.

Assembly Bill 2087

This bill establishes a pilot project for the Regional Conservation Investment Strategy (RCIS) program that encourages public agencies to develop regional conservation planning documents to help local native species populations by protecting, restoring, creating, and reconnecting their habitats. No more than eight regional strategies could be approved prior to January1, 2020, the date the program sunsets.

Senate Bill 103

This bill changes Assembly Bill 2087 by: 1) removing the January 1, 2020 "sunset" provision; and 2) allowing a RCIS to be exempt from the "cap" (i.e., the limit of eight RCISs that may be approved by CDFW) if a state water or transportation infrastructure agency requests approval of the RCIS.

3.4.2.3 Local

In addition to federal, state, and county regulations described above, general plans and municipal codes

56 U.S. Fish & Wildlife Services. Accessed 29 October 2015. State Wildlife Grant Program – Overview. Available at: http://wsfrprograms.fws.gov/Subpages/GrantPrograms/SWG/SWG.htm, accessed January 10, 2019.

57 California Department of Fish and Wildlife. 2015. California State Wildlife Action Plan 2015 Update: A Conservation Legacy for Californians. Available at: https://www.wildlife.ca.gov/SWAP/Final, accessed January 10, 2019.

of counties and cities in the SCAG region may include conservation elements that identify biological resources, including mature trees and locally important species that are afforded special consideration.

County General Plans and Ordinances

Per state general plan guidelines, county's general plan is required to contain a conservation element as well as an open space element. These elements are generally where discussions regarding biological resources can be found. Each county's general plan varies in level of detail and necessary measures to preserve biological resources. The counties within the SCAG area may each have individual codes or ordinances protecting biological resources. A commonly occurring ordinance is a native tree protection or oak tree protection ordinance. These codes and ordinances generally have a limited scope, in this case the removal of specific tree species, which are afforded some level of protection.

Imperial County

The Imperial County Code of Ordinances has established two codes related to biological resources (Chapter 12.44, Wildlife Protection, and Chapter 12.48 Wild Flowers and Trees). The Conservation and Open Space Element of the Imperial County General Plan has established one goal and two policies related to biological resources.[58] The County's two codes, one goal and two supporting policies relevant to the SCAG projects provide protection to wildlife, wild flowers and trees as well as preservation of native plant communities and best restoration practices.

Los Angeles County

The Conservation and Natural Resources Element of the Los Angeles County General Plan 2035 Update has established two goals and 13 policies related to biological resources. Ten of the 13 policies are relevant to the SCAG projects.[59] The two goals and eight supporting policies that apply to SCAG activities provide protection to natural habitats, special status species, sensitive plant communities, wildlife corridors, watersheds and other sensitive biological resources. They also act to discourage development in natural or biologically sensitive areas. In addition, the Los Angeles County Code of Ordinances has established an ordinance to protect native oak trees.

Los Angeles County has designated several areas containing sensitive biological resources as Significant Ecological Areas (SEAs). SEAs are areas that warrant special management because they contain biotic resources that are considered to be rare or unique; are critical to the maintenance of wildlife; represent relatively undisturbed areas of Los Angeles County Habitat Types; or serve as linkages. Any development within SEAs is subject to the discretion and policies of the Significant Ecological Areas Technical Advisory Committee (SEATAC).

Orange County

The Resources Element of the Orange County General Plan has established one goal and one policy related to biological resources.[60] The one goal and one supporting policy relevant to SCAG projects provide protection to wildlife, plants and vegetation communities.

Riverside County

The Riverside County Code of Ordinances has established one ordinance related to biological resources (No. 559, Section 1). The Open Space and Conservation Element of the Riverside County General Plan has established two objectives and eight policies related to biological resources.[61] The one ordinance, two goals, and eight supporting policies relevant to the SCAG projects provide protection to native trees, native plant communities, critical habitat, sensitive habitats, sensitive species and wildlife corridors. They also ensure continued participation and compliance with the County's Multi-Species HCP Program and the San Bernardino kangaroo rat HCP.

San Bernardino County

The San Bernardino County Development Code has established one code related to biological resources (Chapter 88.01.010(c)). The Conservation Element of the San Bernardino County General Plan has established one goal and six policies related to biological resources.[62] The one code, two goals, and six supporting policies relevant to SCAG projects provide protection to native species, sensitive species and

sensitive plant communities. They also warrant coordination with the appropriate resource management agencies and interested groups to maintain the County's biological resources.

Ventura County

The Ventura County Code of Ordinances has established one ordinance related to biological resources. The Resources Element of the Ventura County General Plan has established one goal and two policies related to biological resources.[63] The one code, one goal and six supporting policies relevant to SCAG projects provide protection to native trees, sensitive species, sensitive habitats, wildlife corridors and locally important species/communities.

City General Plan and Ordinances

In accordance with Sections 6530(c) and (d) of the California Government Code, like the six counties in the SCAG region, all cities are required to have a conservation element and an open space element, as mandatory elements of their general plans. The conservation element provides goals and polices related to conservation, development, and utilization of natural resources including water and its hydraulic force, forests, soils, rivers and other waters, harbors, fisheries, wildlife, minerals, and other natural resources. One of the six required aspects of the open space element is for planning, conservation and management of open space for the preservation of natural resources, including habitat for fish and wildlife species; areas required for ecologic and other scientific study purposes; rivers, streams, bays and estuaries; and coastal beaches, lakeshores, banks of rivers and streams, and watershed lands. In addition, many of the cities have ordinances related to protection, conservation and management of natural habitats, and associated plant and animal resources.

Regional Conservation Investment Strategies

The RCIS Program encourages public agencies to develop regional conservation planning documents to help local native species populations by protecting, restoring, creating, and reconnecting their habitats. [64] The RCIS was created when the Governor signed Assembly Bill 2087 (2016) to initiate the pilot program (Program). The Program went into effect on January 1, 2017, as amended by Senate Bill 103 (2017), and is

63 Ventura County Planning and Development Services. 2016. *Ventura County General Plan: Goals, Policies And Programs.* P. 16. Available at: https://docs.vcrma.org/images/pdf/planning/plans/Goals-Policies-and-Programs.pdf, accessed January 10, 2019.

64 Energy and Environmental Consulting and California Department of Fish and Wildlife. 2019. Regional Conservation Investment Strategies. Available at: https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=134963&inline

administered by CDFW's Habitat Conservation Planning Branch. [65]. The goal of the RCIS is to achieve regional conservation outcomes through investments in conservation and mitigation that support regional conservation priorities. Public agencies and other entities can protect natural resources in their regions, for their ecological values and for the ecosystem services they provide to their communities. This is a non-regulatory and voluntary program.

The Program consists of regional conservation assessments (RCAs), RCISs, and mitigation credit agreements (MCAs):

- RCA's are a non-regulatory and non-binding conservation assessments that provide an analysis of species, ecosystems, protected areas, and habitat linkages. This information is intended to support the development/determination of long-term conservation priorities and to support the development of RCISs.
- RCIS include conservation and habitat enhancement strategies that advance the conservation of native species, habitat. These plans also provide nonbinding and voluntary guidance for the prioritization of conservation priorities, investments in ecological resource conservation sources, or identification of locations for compensatory mitigation.

- MCAs are mitigation credit agreements developed, in coordination with CDFW, to implement the conservation or habitat enhancement actions identified in an approved RCIS. These credits may be used as compensatory mitigation for impacts under CEQA, CESA, and the Lake and Streambed Alteration Program.

In the SCAG region there are two RCIS's currently in development: the Antelope Valley RCIS in northeastern Los Angeles County and the San Bernardino County RCIS in Southwestern San Bernardino County. These two draft plans are in process but may be finalized sometime after 2020. The Antelope Valley RCIS proponent is the Desert and Mountain Conservation Authority and the San Bernardino County RCIS proponent is the San Bernardino County Transportation Authority. Although these, nor any other plans, have been finalized in the region, RCIS should be considered as part of the mitigation strategy for transportation projects in the region.

3.4.3 ENVIRONMENTAL IMPACTS

3.4.3.1 Thresholds of Significance

In accordance with Appendix G of the *State CEQA Guidelines*, the Plan would have a significant impact related to biological resources if it would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, and regulations or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service.
- Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.
- Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites.
- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.
- Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State Habitat Conservation Plan.

3.4.3.2 Methodology

Impacts to biological resources were evaluated in accordance with Appendix G of the 2019 *CEQA Guidelines*. Biological resources within the SCAG region were evaluated at a programmatic level of detail, in relation to the General Plans of the six counties and the 191 cities within the SCAG region; and a review of related literature germane to the SCAG region.

The impact assessment for biological resources focuses on the potentially significant direct effects of the Plan on biological resources within the SCAG region. To assess potential impacts to biological resources, existing geographic information system (GIS) spatial data for natural resources, as summarized in the

existing biological resource analysis were overlain with GIS data of major transportation projects proposed in the Plan.[66] The analysis considers the 2045 Plan conditions compared to existing conditions (generally 2019). This analysis includes major highway, rail, and transit projects to identify potential impacts near biological resources in each county that have the potential to result in significant direct impact to special status species or their habitats; have the potential to result in conversion of state-designated sensitive habitats, including those habitats afforded protection pursuant to Sections 401 and 404 of the Federal Clean Water Act, and/or Section 1600 of the State Fish and Game Code; or have the potential to disrupt migratory corridors, nursery sites, or lands designated for long-term regional conservation of species.

Using GIS spatial data, potential regional-level adverse effects were identified by adding a 500-foot buffer to major transportation projects included in the Plan and overlaying project impacts within each county in the SCAG region to identify intersections between transportation projects and known locations of biological resources, including natural vegetation, wetlands and water resources, special status species and communities, and natural lands. The analysis also includes a review of adopted HCPs NCCPs and RCIPs to identify potential conflicts with their provisions. The 500-foot buffer was added to account for any potential direct or indirect impacts that may occur to biological resources during construction and operation. The methodology for determining the significance of these impacts compares the future Plan conditions to baseline conditions.

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743, or SB 226 (as described in Section 1.0 Introduction), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.4.3.3 Impacts and Mitigation Measures

Impact BIO-1 **Have a substantial adverse effect, either directly or through habitat modification, on any species identified as a candidate, sensitive, or special**

66 Southern California Association of Governments GIS Data. 2019. Major_Highway_Project_PEIR_082119.gdb, DraftRTP_2045Plan_Transit, and a2040_Urban_Rail_New.

status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or US Fish and Wildlife Service.

Significant and Unavoidable Impact – Mitigation Required.

Implementation of transportation projects identified in the Plan and development projects anticipated to occur under the Plan would affect biological resources. Direct impacts that could occur during construction of some projects include direct loss of sensitive plant and/or wildlife species resulting from injury, death, or disturbance of these species. Direct impacts may also occur through direct habitat loss and fragmentation during construction, displacement of sensitive species due to construction noise or during operation, accidental introduction of non-native plants by construction equipment or during maintenance and general operation, introduction of new lighting sources, and dust and noise during construction and operation.

Implementation of any new transportation projects or land use strategies in or adjacent to natural habitats would also increase the risk and frequency of fires that could degrade the function and value of habitats supporting sensitive species (impacts from wildfires are further discussed in **Section 3.20, Wildfire**). Further, indirect impacts could result from general development related to growth that is expected to occur with the Plan. Indirect impacts could also occur as a result of transportation projects if suitable habitat was encroached upon to the extent that it could no longer support sensitive species. Indirect impacts may include edge effects resulting from habitat fragmentation which can alter habitat structure and composition as well as negatively impact predator-prey dynamics.

Expected significant impacts include: direct loss of natural resource lands; disturbance and removal of natural vegetation used by sensitive species; barriers to wildlife movement, habitat fragmentation, and the associated decrease in habitat quality; litter, trampling, light pollution and road noise in previously undisturbed natural areas; increased noise levels related to construction and/or increased traffic volumes; temporal loss of habitat during construction; expansion of public access into previously remote lands; displacement of riparian and wetland habitat; incursion of invasive plants and animals spreading from new transportation corridors; siltation of streams and other water bodies during construction; and the loss of open space that provides habitat for native species.

Impacts to sensitive species may be further exaceberated by the effects of climate change.[67] Special status species are most susceptible to climate change due to their small population sizes and, often, specific suitable habitat conditions required for their survival. The combination of project impacts and climate

67 Native Plants and Climate Change. 2019. California Deprtmnt of Fish and Wildlfe. Available at: https://www.wildlife.ca.gov/Conservation/Plants/Climate

change can further reduce available habitat, reduce movement opportunities for wildlife, provide new corridors for invasive species infestations, and increase the risk of fires in open space to the detriment of special status species.

Regional land use and transportation strategies set forth in the Plan focus new growth in HQTAs, existing suburban town centers, and more walkable, mixed-use communities. The Plan recognizes that as population continues to grow, there is increasing pressure on natural lands. One of the goals of the Plan (See **Chapter 2.0, Project Description**) is to promote conservation of natural and agricultural lands and restoration of critical habitats. The land use mix for the Plan assumes that 60 percent of new housing and 73 percent of new jobs will be in Growth Priority Areas and therefore would be directed away from sensitive habitat. The Plan also aims to preserve, enhance, and restore regional wildlife connectivity through strategies that encourage compact urban development. SCAG's Sustainable Communities Program supports planning in local jurisdiction to advance the regional growth vision. In addition, SCAG new regional data tools, like the Regional Data Platform and Greenprint, would help local jurisdictions identify areas well suited for infill and redevelopment as well as critical habitat and lands with sensitive natural resources to be preserved.

The Plan also includes urban greening strategies. Urban Greening is a multi–benefit land use strategy that improves the relationship between the built and natural environment. Greening can support reduction in greenhouse gas emissions by sequestering carbon and reduce vehicle miles traveled by making the environment more appealing for people who are bicycling and walking. Benefits within urban, suburban and rural settings include:

- Improved traffic calming and safety;
- Increased active transportation
- Cooler street surfaces and communities
- Increased trail and greenway connectivity
- Improved water quality, groundwater recharge and watershed health
- Reduced urban runoff
- Reduced energy consumption and costs
- Expanded urban forest
- Provision of wildlife habitat and increased biodiversity
- Expanded recreation opportunities and beautification.

The Plan also includes greenbelts and community separators to serve as contiguous areas that support land conservation. Creating a sustainable, "green" region requires that the built environment and natural resource areas coexist in a well–balanced land use pattern that encourages mutual co–benefits. The quality and range of conservation, natural and agricultural areas present in the region can be reinforced and enhanced by a range of regional and local tools. Paired with an emphasis on compact development, Connect SoCal's conservation strategies promote the economic and ecological benefits of preserving natural areas and farmlands, while also maximizing their potential for greenhouse gas reduction. New housing and employment development is emphasized in Growth Priority Areas, such as Job Centers, TPAs, HQTAs and NMAs, and away from natural and farm lands on the edges of urban and suburban areas, to incentivize infill development and the concentration of varied land uses. This emphasis on concentrated, compact growth makes it easier to travel shorter distances, which reduces per–capita greenhouse gas emissions. In addition, natural areas and farmlands have the capacity to absorb and store atmospheric carbon dioxide, preventing additional contributions of GHG emissions. Natural lands conservation has the co-benefit of protecting communities from major hazards caused or exacerbated by climate change, such as wildfires and flooding.

Overall, these strategies support redirecting growth away from high value habitat areas to existing urbanized areas which would support the conservation of natural habitats capable of sustaining listed and sensitive species by including land use strategies.

Across the SCAG region there are records of and/or habitat for 63 federally or state-listed wildlife species and 72 federally or state-listed plant species, 233 sensitive wildlife species, 449 rare and locally important plant species, and over 5.5 million acres of designated critical habitat for 46 federally listed species. The development of transportation improvement projects, particularly projects involving large-scale ground disturbance during construction such as grade separation projects, mixed flow lane projects, and rail projects, within the SCAG region may result in significant impacts to these species and their habitats. For example, major transportation improvement projects in San Bernardino County are anticipated to cross known habitat for the federally threatened desert tortoise, and major transportation improvement projects in Los Angeles, Orange, Riverside, and Ventura counties are anticipated to cross critical habitat for the coastal California gnatcatcher (**Table 3.4-13, Acres of Critical Habitat For Listed Species Potentially Within 500 Feet of Connect SoCal Transportation Projects**).

Designated critical habitat contains known suitable habitat for federally listed species and typically is an indicator of suitable habitat for state- and/or non-listed sensitive species. More than 16,000 acres of critical habitat for 23 of the 26 species covered in the SCAG region are present within 500 feet of major project areas.

Of the 72 listed plant species with records in the SCAG region, 34 species, with nearly 1,500 recorded occurrences, have CNDDB records that exist within 500 feet of major transportation projects included in the Plan (**Table 3.4-14, Records of Listed Plan Species within 500 Feet of Connect SoCal Projects**).

Of the 63 listed wildlife species with records in the SCAG region, 41 species, with nearly 6,600 occurrences, have CNDDB records that exist within 500 feet of major transportation projects included in the Plan (**Table 3.4-15**). In addition to these listed species, impacts to rare, locally important, and sensitive plant and wildlife species would be expected to occur throughout the SCAG region where suitable habitat is present.

While implementation of land use and transportation strategies may guide development toward areas that are already disturbed through the emphasis on compact development and the strategies listed above, some new transportation projects are still anticipated in areas where sensitive species are located. The level of impact to threatened and/or endangered species, fully protected and sensitive species, locally important species, or associated critical habitat will vary on a project-by-project basis. For example, grade separation projects or rail projects located in areas containing natural, previously undisturbed vegetation are anticipated to have a greater impact on threatened and/or endangered species, fully protected and sensitive species, locally important species, or associated critical habitat than a traffic signal synchronization or lane-restriping project located in an urban environment.

This analysis of impacts of the Plan to sensitive plant and wildlife species and their habitats and designated critical habitat is at the programmatic level, and conservatively assumes that species with critical habitat and/or CNDDB records in a given area may be present in that area. However, the CNDDB record is also incomplete and may not show all sensitive species present in a given area and project specific surveys may be required. The level of impact of subsequent projects would be subject to verification at the project-level of environmental review pursuant to CEQA. All projects within the SCAG region would be subject to the provisions of the Federal and State ESAs, as well as Sections 1900–1913, 3511, 4150, 4700, 5050, 5515 of the State Fish and Game Code and Sections 80071–80075 of the State Food and Agriculture Code.

Impacts to threatened and/or endangered species, fully protected and sensitive species, locally important species, or associated critical habitat resulting from transportation improvement projects included in the Plan would be significant, requiring the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measures

SMM BIO-1: SCAG shall facilitate reducing future impacts to species identified as a candidate, sensitive, or special status species and its habitats through cooperation, information sharing, and program development. SCAG shall consult with the resource agencies, such as the USFWS, NMFS, USACE, USFS, BLM, and CDFW, as well as local jurisdictions including cities and counties, to incorporate designated critical habitat, federally protected wetlands, the protection of sensitive natural communities and riparian habitats, designated open space or protected wildlife habitat, local policies and tree preservation ordinances, applicable HCPs and NCCPs, or other related planning documents into SCAG's ongoing regional planning efforts, such as web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to, Map Gallery, GIS library, and GIS applications, and direct technical assistance efforts and sharing of associated online Training materials. Planning efforts shall be consistent with the approach outlined in the California Wildlife Action Plan.

SMM BIO-2: SCAG shall continue to develop a regional conservation strategy in coordination with local jurisdictions and other stakeholders, including the county transportation commissions. The conservation strategy will build upon existing efforts including those at the sub-regional and local levels to identify potential priority conservation areas. SCAG shall develop new regional tools, like the Regional Data Platform and Regional Greenprint to help local jurisdictions identify areas well suited for infill and redevelopment as well as critical habitat and natural lands to be preserved, including natural habitat corridors. SCAG will also collaborate with stakeholders to establish a new Regional Advanced Mitigation Program (RAMP) initiative to preserve habitat.

Project Level Mitigation Measures

PMM BIO-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to threatened and endangered species. Such measures may include the following or other comparable measures identified by the Lead Agency:

a) Require project design to avoid occupied habitat, potentially suitable habitat, and designated critical habitat, wherever practicable and feasible.

b) Where avoidance is determined to be infeasible, provide conservation measures to fulfill the requirements of the applicable authorization for incidental take pursuant to Section 7 or 10(a) of the federal ESA, Section 2081 of the California ESA to support issuance of an incidental take permit, and/or as identified in local or regional plans. Conservation strategies to protect the survival and recovery of federally and state-listed endangered and local special status species may include:

   i. Impact minimization strategies

   ii. Contribution of in-lieu fees for in-kind conservation and mitigation efforts

   iii. Use of in-kind mitigation bank credits

   iv. Funding of research and recovery efforts

   v. Habitat restoration

   vi. Establishment of conservation easements

   vii. Permanent dedication of in-kind habitat

c) Design projects to avoid desert native plants protected under the California Desert Native Plants Act, salvage and relocate desert native plants, and/or pay in lieu fees to support off-site long-term conservation strategies.

d) Temporary access roads and staging areas will not be located within areas containing sensitive plants, wildlife species or non-native habitat wherever feasible, so as to avoid or minimize impacts to these species

e) Develop and implement a Worker Environmental Awareness Program (environmental education) to inform project workers of their responsibilities to avoid and minimize impacts on sensitive biological resources.

f) Retain a qualified botanist to document the presence or absence of special status plants before project implementation.

g) Appoint a qualified biologist to monitor construction activities that may occur in or adjacent to occupied sensitive species' habitat to facilitate avoidance of resources not permitted for impact.

h) Appoint a qualified biologist to monitor implementation of mitigation measures.

i) Schedule construction activities to avoid sensitive times for biological resources (e.g. steelhead spawning periods during the winter and spring, nesting bird season) and to avoid the rainy season when erosion and sediment transport is increased.

j) Develop an invasive species control plan associated with project construction

k) If construction occurs during breeding seasons in or adjacent to suitable habitat, include appropriate sound attenuation measures required for sensitive avian species and other best management practices appropriate for potential local sensitive wildlife

l) Conduct pre-construction surveys to delineate occupied sensitive species' habitat to facilitate avoidance.

m) Where projects are determined to be within suitable habitat and may impact listed or sensitive species that have specific field survey protocols or guidelines outlined by the USFWS, CDFW, or other local agency, conduct preconstruction surveys that follow applicable protocols and guidelines and are conducted by qualified and/or certified personnel.

Level of Significance after Mitigation

As previously discussed, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts on sensitive species could be significant and unavoidable even with implementation of mitigation.

Impact BIO-2 **Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service.**

Significant and Unavoidable Impact – Mitigation Required.

Implementation of transportation projects identified in the Plan and development projects anticipated to occur under the Plan would have a substantial adverse effect on riparian habitats and other sensitive natural communities. Land use and transportation strategies in the Plan seek to minimize the conversion of natural landscapes that may contain sensitive plant communities or riparian habitats by focusing new growth in HQTAs, Growth Priority Areas, and more walkable, mixed-use communities. Some jurisdictions in the region have taken steps toward planning comprehensively for conserving natural lands and farmlands, while also meeting demands for growth. Proposed natural lands conservation strategies described in the Plan are built upon the conservation framework and complements an infill-based approach. While implementation of land use strategies may guide development projects toward areas that are already developed, some projects are still anticipated in areas where riparian habitats or other sensitive natural communities are located.

The level of impacts to riparian habitats and sensitive natural communities as a result of the Plan will differ on a project-by-project basis. For example, projects that have the potential to cross waterways or require conversion of natural open space to infrastructure, such as transit or rail projects, highway segment projects, land use development in open space areas, or have the potential to convert state-designated habitats including riparian habitats, would have the potential to have significant impacts on sensitive plant communities and riparian habitats. As described above, the Plan includes greenbelts and community separators to support land conservation and allow the built environment and natural resource areas to coexist. Transportation projects that are contained within the alignments of existing transportation corridors, such as bike lane projects and traffic demand management measures, as well as land use development within existing urbanized areas would generally not be expected to have significant impacts on sensitive plant communities and riparian habitats.

Of the nearly 23 million acres of open space in the SCAG region, 318,000 acres are currently identified by the CNDDB as containing state-sensitive plant communities, including 190,700 acres of riparian habitats. Riparian habitats in the SCAG region may fall under the jurisdiction of the CDFW. It is important to note that mapping of sensitive habitats and sensitive natural communities within the region is incomplete and the likelihood of additional state-sensitive plant communities and riparian habitat to exist within the six-county region is high. Therefore, due to large-scale ground disturbance, including grade separation

projects, mixed flow lane projects, and rail projects, and large residential subdivisions within the SCAG region, the Plan may result in significant impacts to these riparian habitats and sensitive plant communities.

It is also estimated that the Plan will result in the direct consumption of 41,546 acres of greenfield. Natural open space areas have a high potential to contain sensitive plant communities and riparian habitats, and projects constructed in these areas would require individual field analysis at the project-level to determine the level of impacts.

Impacts to CNDDB documented sensitive plant communities and CDFW documented sensitive natural communities and riparian habitats within 500 feet of major transportation projects included in the Plan would occur within each county in the SCAG region (**Table 3.4-16, Acres of Sensitive and Riparian Habitats within 500 Feet of Connect SoCal Major Transportation Projects**). It is anticipated that impacts to sensitive and riparian habitats would occur in areas beyond those identified by the CNDDB and CDFW. Of the more than 80,000 linear miles of blueline features in the SCAG region, 4,466 miles have the potential to be adversely affected within 500 feet of major transportation projects included in the Plan (**Table 3.4-17, Blueline Streams and Rivers within 500 Feet of Connect SoCal Major Transportation Projects**). These blueline features have the potential to contain riparian habitat.

Impacts associated with the conversion of sensitive and riparian habitats would include direct loss and fragmentation of sensitive communities and riparian habitats as projects are developed, temporal loss of habitat in temporary work areas, alteration of hydrology supporting these habitats, and the possible introduction of non-native plants that would degrade existing communities during construction, operation, and maintenance. Further, indirect impacts resulting from the development of transportation projects could include growth induced development of associated infrastructure to support population growth within surrounding areas which may impact sensitive plant communities and riparian habitats through the disturbance and removal of vegetation, alterations to supporting watersheds or changes (addition or removal) of up-stream water sources.

This analysis of impacts of the Plan to sensitive plant communities and riparian habitats is at the programmatic level, and conservatively assumes that all natural open space areas have the potential to contain sensitive plant communities and all waterways have the potential to contain riparian habitat. However, the existing data record is also incomplete and much more sensitive habitat is likely present in the region and project specific surveys may be required. The level of impact of subsequent projects would be subject to verification at the project-level of environmental review pursuant to CEQA. All projects within the SCAG region would be subject to the provisions of Section 1600 of the State Fish and Game Code in which a Lake or Streambed Alteration Agreement would need to be obtained prior to the alteration of a state jurisdictional area.

Therefore, the Plan would result in significant impacts to state-designated riparian and other sensitive plant communities, including areas subject to Section 1600 of the State Fish and Game Code, requiring the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measures

See **SMM BIO-1** and **SMM BIO-2.**

Project Level Mitigation Measures

See **PMM BIO-1.**

PMM BIO-2: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to riparian habitats and other sensitive natural communities. Such measures may include the following or other comparable measures identified by the Lead Agency:

a) Consult with the USFWS and NMFS where such state-designated sensitive or riparian habitats provide potential or occupied habitat for federally listed rare, threatened, and endangered species afforded protection pursuant to the federal ESA.

b) Consult with the USFS where such state-designated sensitive or riparian habitats provide potential or occupied habitat for federally listed rare, threatened, and endangered species afforded protection pursuant to the federal ESA and any additional species afforded protection by an adopted Forest Land Management Plan or Resource Management Plan for the four national forests in the six-county area: Angeles, Cleveland, Los Padres, and San Bernardino.

c) Consult with the CDFW where such state-designated sensitive or riparian habitats provide potential or occupied habitat for state-listed rare, threatened, and endangered species afforded protection pursuant to the California ESA, or Fully Protected Species afforded protection pursuant to the State Fish and Game Code.

d) Consult with the CDFW pursuant to the provisions of Section 1600 of the State Fish and Game Code as they relate to Lakes and Streambeds.

e) Consult with the USFWS, USFS, CDFW, and counties and cities in the SCAG region, where state-designated sensitive or riparian habitats are occupied by birds afforded protection pursuant to the MBTA during the breeding season.

f) Consult with the CDFW for state-designated sensitive or riparian habitats where furbearing mammals, afforded protection pursuant to the provisions of the State Fish and Game Code for fur-beaming mammals, are actively using the areas in conjunction with breeding activities.

g) Require project design to avoid sensitive natural communities and riparian habitats, wherever practicable and feasible.

h) Where avoidance is determined to be infeasible, develop sufficient conservation measures through coordination with local agencies and the regulatory agency (i.e., USFWS or CDFW) to protect sensitive natural communities and riparian habitats and develop appropriate compensatory mitigation, where required.

i) Appoint a qualified wetland biologist to monitor construction activities that may occur in or adjacent to sensitive communities.

j) Appoint a qualified wetland biologist to monitor implementation of mitigation measures.

k) Schedule construction activities to avoid sensitive times for biological resources and to avoid the rainy season when erosion and sediment transport is increased.

l) When construction activities require stream crossings, schedule work during dry conditions and use rubber-wheeled vehicles, when feasible. Have a qualified wetland scientist determine if potential project impacts require a Notification of Lake or Streambed Alteration to CDFW during the planning phase of projects.

m) Consult with local agencies, jurisdictions, and landowners where such state-designated sensitive or riparian habitats are afforded protection pursuant an adopted regional conservation plan.

n) Install fencing and/or mark sensitive habitat to be avoided during construction activities.

o) Salvage and stockpile topsoil (the surface material from 6 to 12 inches deep) and perennial native plants, when recommended by the qualified wetland biologist, for use in restoring native vegetation to areas of temporary disturbance within the project area. Salvage of soils containing invasive species, seeds and/or rhizomes will be avoided as identified by the qualified wetland biologist.

p) Revegetate with appropriate native vegetation following the completion of construction activities. as identified by the qualified wetland biologist.

q) Complete habitat enhancement (e.g., through removal of non-native invasive wetland species and replacement with more ecologically valuable native species).

r) Use Best Management Practices (BMPs) at construction sites to minimize erosion and sediment transport from the area. BMPs include encouraging growth of native vegetation in disturbed areas, using straw bales or other silt-catching devices, and using settling basins to minimize soil transport.

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts on riparian habitats could be significant and unavoidable even with implementation of mitigation.

Impact BIO-3 **Have a substantial adverse effect on State or Federally Protected Wetlands (including but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption or other means.**

Significant and Unavoidable Impact – Mitigation Required.

Implementation of transportation projects identified in the Plan and development projects anticipated to occur under the Plan would have a substantial adverse effect on wetlands. Transportation and land use strategies in the Plan (e.g., compact growth, TSM, etc.) seek to minimize impacts to federally protected wetlands and Waters of the United States as defined by Section 404 of the Clean Water by focusing new growth in HQTAs, Growth Priority Areas, and more walkable, mixed-use communities. Impacts would occur where dredge or fill would be required within wetlands or other waters of the United States, particularly where projects need to cross drainages where a clearspan to avoid impacts is infeasible. There is potential for comparable significant impacts in areas subject to Section 10 of the Rivers and Harbors Act. The level of impacts to federally protected wetlands and Waters of the United States would

vary on a project-by-project basis. For example, grade separation projects or transit/rail projects located in areas containing coastal habitats or close to the terminal locations of major rivers or stream systems, where the width of the stream is often largest would be anticipated to have a greater impact on federally protected wetlands and waters of the United States than those located in the upstream portion of the watershed, near the headwaters where drainages are typically more numerous and narrower.

More than 800,000 acres of federally protected wetlands and waterways potentially subject to the jurisdiction of the USACE were identified by the National Wetlands Inventory to be present in the SCAG region. In addition, the SCAG region includes more than 80,000 linear miles of USGS blueline drainages that may contain waters of the United States.

While land use development projects may be focused in areas that are already developed as reflected under the Plan, some new projects are still anticipated in areas where wetlands are located.

Potential impacts to wetlands and waters of the United States within 500 feet of major transportation projects included in the Plan exist within all six counties in the SCAG region, ranging from 700 acres potentially affected in Imperial County to 5,000 acres potentially affected in Los Angeles County (**Table 3.4-18, Acres of Federally Protected Wetlands and Waterways within 500 Feet of Connect SoCal Major Transportation Projects**).

Potential impacts include disruption of streams and wetlands as new projects are developed, and dredge and fill activities associated with development, operation, and maintenance. All projects within the SCAG region would be subject to the provisions of Section 404 of the Federal CWA. Dredge or fill in waters of the United States is subject to the regulatory authority of the USACE pursuant to Section 404 of the Federal CWA.

Therefore, the Plan would result in significant impacts to federally protected wetlands and Waters of the United States, requiring the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measures

See **SMM BIO-1** and **SMM BIO-2.**

Project Level Mitigation Measures

See **PMM BIO-1** and **PMM BIO-2.**

PMM BIO-3: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to wetlands. Such measures may include the following or other comparable measures identified by the Lead Agency.

a) Require project design to avoid federally protected aquatic resources consistent with the provisions of Sections 404 and 401 of the CWA, wherever practicable and feasible.

b) Where the lead agency has identified that a project, or other regionally significant project, has the potential to impact other wetlands or waters, such as those considered Waters Of the State of California under the *State Wetland Definition and Procedures for Dischargers of Dredged or Fill Material to Waters of the State* , not protected under Section 404 or 401 of the CWA, seek comparable coverage for these wetlands and waters in consultation with the SWRCB, applicable RWQCB, and CDFW.

c) Where avoidance is determined to be infeasible, develop sufficient conservation measures to fulfill the requirements of the applicable authorization for impacts to federal and state protected aquatic resource to support issuance of a permit under Section 404 of the CWA as administered by the USACE. The use of an authorized Nationwide Permit or issuance of an individual permit requires the project applicant to demonstrate compliance with the USACE's Final Compensatory Mitigation Rule. The USACE reviews projects to ensure environmental impacts to aquatic resources are avoided or minimized as much as possible. Consistent with the administration's performance standard of "no net loss of wetlands" a USACE permit may require a project proponent to restore, establish, enhance or preserve other aquatic resources in order to replace those affected by the proposed project. This compensatory mitigation process seeks to replace the loss of existing aquatic resource functions and

area. Project proponents required to complete mitigation are encouraged to use a watershed approach and watershed planning information. The new rule establishes performance standards, sets timeframes for decision making, and to the extent possible, establishes equivalent requirements and standards for the three sources of compensatory mitigation:

- Permittee-responsible mitigation
- Contribution of in-kind in-lieu fees
- Use of in-kind mitigation bank credits
- Where avoidance is determined to be infeasible and

d) Where avoidance is determined to be infeasible and proposed projects' impacts exceed an existing Nationwide Permit (NWP) and/or California SWRCB-certified NWP, the lead agency should provide USACE and SWRCB (where applicable) an alternative analysis consistent with the Least Environmentally Damaging Practicable Alternatives in this order of priorities:

- Avoidance
- Impact Minimization
- On-site alternatives
- Off-site alternatives

e) Require review of construction drawings by a certified wetland delineator as part of each project-specific environmental analysis to determine whether aquatic resources will be affected and, if necessary, perform formal wetland delineation

Level of Significance after Mitigation

As previously discussed, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this EIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level

mitigation measures, this PEIR finds impacts on wetlands could be significant and unavoidable even with implementation of mitigation..

Impact BIO-4 **Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.**

Significant and Unavoidable Impact – Mitigation Required.

Implementation of transportation projects identified in the Plan and development projects anticipated to occur under the Plan would interfere substantially with the movement of native resident or migratory fish, or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites directly, as a result of habitat conversion to accommodate transportation projects and growth under the Plan, or indirectly through interruption of movement or migratory corridors caused by construction and operation of infrastructure for transportation projects and adjacent projects that may result from improved transportation access. The Plan would result in the direct consumption of 41,546 greenfield acres and the degradation of approximately 15,800 acres of bird habitat.[68] Indicators of wildlife movement are present across the SCAG region. More than 18 million acres of natural open space in the region can be characterized as having the potential to be suitable for, or aid in, wildlife movement. Furthermore, many bird species breed and are expected to nest within the entire SCAG region, including urban areas. Within that open space is nearly 12 million acres of habitat blocks that support native wildlife biodiversity and a significant wildlife connectivity network. These large, intact blocks are connected by more than 4.5 million acres of corridors that are classified as highly beneficial to wildlife movement.

Potential impacts exist for 16,167 acres of intact natural landscape blocks and 18,716 acres of associated major riparian connectors found within 500 feet of major transportation projects included in the Plan (**Table 3.4-20, Areas Used for Wildlife Movement Areas Potentially Affected by Connect SoCal Major Transportation Projects by County**).

Projects, particularly projects involving large-scale ground disturbance during construction such as grade separation projects, mixed flow lane projects, and rail projects, as well as large-scale land use development could result in significant impacts to the wildlife movement corridors and native wildlife nursery sites. Some projects may also have the potential to cross areas that currently support medium to high permeability to wildlife movement in Ventura, Los Angeles, San Bernardino, Riverside and Imperial Counties.

68 SCAG Scenario Planning Model Output, October 2019

These impacts include habitat removal and fragmentation that would disrupt wildlife corridor functionality as new projects are developed, and introduction of lighting and noise during construction and operation that may interrupt wildlife movement and disturb nursery and nesting sites. Construction, operation and maintenance of transportation and development projects across or adjacent to existing wildlife corridors could introduce new barriers to wildlife movement or increase the impact of barriers to wildlife movement by widening the barriers and thus narrowing the corridor. The linear nature of transportation projects increases the potential extent and significance of this effect. Additionally, an increase in wildlife-roadway conflicts as a result of development could increase wildlife injury and fatalities.

One of the goals of the Plan is to preserve, enhance, and restore regional wildlife connectivity through strategies that encourage compact urban development. SCAG is also developing a Regional Greenprint, a strategic web-based conservation tool to help cities, counties and transportation agencies make better land use and transportation infrastructure decisions and to conserve natural and farmlands, which has a focus on maintaining habitat connectivity. In addition, the Plan's natural lands strategies will improve natural corridor connectivity by encouraging and facilitating research, programs and policies that

identify, protect and restore natural habitat corridors, especially where corridors cross county boundaries.

Projects will be encouraged to create wildlife crossings and corridors in cases where transportation or other related projects may interrupt the flow of wildlife or otherwise cause habitat fragmentation. An example project in the SCAG region, scheduled for ground-breaking in the early 2020's, is the Liberty Canyon Wildlife Crossing proposed for the 101 Freeway in the City of Agoura Hills. This project is the first of its kind in California. The crossing will cross ten lanes of US Highway 101 and an access road, with an estimated 200-foot long by 165-foot wide structure to facilitate mountain lion and other wildlife movement across currently fragmented habitat regions. [69]

Indirect impacts to migratory corridors and nursery sites would occur when the functionality of a corridor is degraded after construction of the transportation project. The development of transportation projects through migratory corridors and/or construction on existing transportation facilities that serve as barriers through wildlife corridors would result in an increase in human disturbances locally including an increase in traffic, noise, and lighting. New projects through or adjacent to open space or natural areas could also increase the risk and frequency of wildland fires that would further degrade ecosystem functions that support diverse wildlife populations and corridor function. These projects may also impact pollinator populations or behavior that could further impact local plant community stability and function and degrade existing habitat or the permeability of corridors. Further, indirect impacts resulting from demographic growth associated with these projects may impact wildlife corridors and nursery sites.

Potential impacts from transportation projects and the related changes to land use and development that these projects facilitate may be heightened due to climate change. The changing climate is altering local ecosystems, causing increased stress on wildlife from changes in plant communities and their structure, decreasing pollinator populations, altering precipitation patterns, and many other factors that increase the risk of extinction for wildlife[70,71] In addition, the changing climate often results in conditions favorable to invasive species that further reduces the ecosystem functions necessary to support wildlife populations. Transportation corridors can act as conduits for invasive species and their adjacency to vehicle traffic can increase wildfire risk, further degrading communities and reducing wildlife corridor value. Therefore, the conversion of existing native nursery habitat and potential wildlife movement areas

---

resulting from the Plan would result in a significant impact, requiring the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measures

See **SMM BIO-1** and **SMM BIO-2, SMM AG-1** through **SMM AG-4, SMM GHG-1, SMM WF-1.**

SMM BIO-3: SCAG shall encourage and facilitate research, programs and policies to identify, protect and restore natural habitat corridors, especially where corridors cross county boundaries. Additionally, continue support for preserving wildlife corridors and wildlife crossings to minimize the impact of transportation projects on wildlife species and habitat fragmentation.

Project Level Mitigation Measures

See **PMM BIO-1** through **PMM BIO-3.**

PMM BIO-4: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to wildlife movement. Such measures may include the following or other comparable measures identified by the Lead Agency:

a) Consult with the USFS where impacts to migratory wildlife corridors may occur in an area afforded protection by an adopted Forest Land Management Plan or Resource Management Plan for the four national forests in the six-County area: Angeles, Cleveland, Los Padres, and San Bernardino.

b) Consult with counties, cities, and other local organizations when impacts may occur to open space areas that have been designated as important for wildlife movement related to local ordinances or conservation plans.

c) Prohibit construction activities within 500 feet of occupied breeding areas for wildlife afforded protection pursuant to Title 14 § 460 of the California Code of Regulations protecting fur-bearing mammals, during the breeding season.

d) Conduct a survey to identify active raptor and other migratory nongame bird nests by a qualified biologist at least two weeks before the start of construction at project sites from February 1 through August 31.

e) Prohibit construction activities with 250 feet of occupied nest of birds afforded protection pursuant to the Migratory Bird Treaty Act, during the breeding season.

f) Ensure that suitable nesting sites for migratory nongame native bird species protected under the Migratory Bird Treaty Act and/or trees with unoccupied raptor nests should only be removed prior to February 1, or following the nesting season.

g) When feasible and practicable, proposed projects will be designed to minimize impacts to wildlife movement and habitat connectivity and preserve existing and functional wildlife corridors.

h) Conduct site-specific analyses of opportunities to preserve or improve habitat linkages with areas on- and off-site.

i) Long linear projects with the possibility of impacting wildlife movement should analyze habitat linkages/wildlife movement corridors on a broad scale to avoid critical narrow choke points that could reduce function of recognized movement corridor.

j) Require review of construction drawings and habitat connectivity mapping by a qualified biologist to determine the risk of habitat fragmentation.

k) Pursue mitigation banking to preserve habitat linkages and corridors (opportunities to purchase, maintain, and/or restore offsite habitat).

l) When practicable and feasible design projects to promote wildlife corridor redundancy by including multiple connections between habitat patches.

m) Evaluate the potential for installation of overpasses, underpasses, and culverts to create wildlife crossings in cases where a roadway or other transportation project may interrupt the flow of species through their habitat. Provide wildlife crossings in accordance with proven standards, such as FHWA's Critter Crossings or Ventura County Mitigation Guidelines and in consultation with wildlife corridor authorities.

n) Install wildlife fencing where appropriate to minimize the probability of wildlife injury due to direct interaction between wildlife and roads or construction.

o) Where avoidance is determined to be infeasible, design sufficient conservation measures through coordination with local agencies and the regulatory agency (i.e., USFWS or CDFW) and in accordance with the respective counties and cities general plans to establish plans to mitigate for the loss of fish and wildlife movement corridors and/or wildlife nursery sites. The consideration of conservation measures may include the following measures, in addition to the measures outlined in **MM-BIO-1(b),** where applicable:

   - Wildlife movement buffer zones
   - Corridor realignment
   - Appropriately spaced breaks in center barriers
   - Stream rerouting
   - Culverts
   - Creation of artificial movement corridors such as freeway under- or overpasses
   - Other comparable measures

p) Where the lead agency has identified that a RTP/SCS project, or other regionally significant project, has the potential to impact other open space or nursery site areas, seek comparable coverage for these areas in consultation with the USFWS, CDFW, NMFS, or other local jurisdictions.

Level of Significance after Mitigation

As previously discussed, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level

mitigation measures, this PEIR finds impacts on wildlife movement could be significant and unavoidable even with implementation of mitigation..

Impact BIO-5 **Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.**

Significant and Unavoidable Impact – Mitigation Required.

Implementation of transportation projects as well as land use and transportation strategies identified in the Plan have the potential to conflict with local policies and ordinances related to biological resources. Conflicts may arise when projects included in the Plan, or growth that occurs as a result of the Plan, involve the disturbance or removal of trees or other vegetation protected under city or county ordinances.

Strategies in the Plan focus growth in urban areas such as HQTAs, suburban town centers, and walkable communities. This type of compact development consumes less land and, therefore, results in less habitat loss and fewer conflicts with local policies or ordinances protecting biological resources. Nonetheless, impacts are expected to occur because many natural land areas near the edge of existing urbanized areas are vulnerable to development pressure, and transportation projects aimed to improve accessibility might require expansion in existing urbanized areas, or facilitate growth into urbanizing areas. Many urban areas have local ordinances to protect trees, as such the potential for conflicts with tree preservation policies exists not just in undeveloped area but can often occur in urban areas. As infill development increases, there may be pressure to develop on sites with protected trees. Similarly, as density increases, there may be pressure to develop more of a site, whereas previously a development project maybe could have been planned around protected trees. Although many tree preservation ordinances require planting of new trees (i.e., at one to one or greater ratios) to replace the removed trees, smaller infill sites do not always have sufficient space to accommodate more or larger trees. As such, impacts could occur.

Except for Orange County, each county within the SCAG region has ordinances regulating the removal of native trees and plants. Impacts within 500 feet of major transportation projects included in the Plan occur in unincorporated areas of all six counties that would be subject to the jurisdiction of the individual county general plans and ordinances (**Table 3.4-21, Unincorporated Areas Subject to County General Plans Potentially Affected by the Connect SoCal Major Transportation Projects**). Any conversion of land from open space or removal of protected trees or vegetation in these areas has the potential to conflict with local plans and ordinances. Applicable policies to protect biological resources are articulated in general plans for each county as well as the 191 cities. Many of the general plans in the SCAG region have additional provisions for protection of mature native and landscape trees and requirements for revegetion of landscaped areas using native plants. Each project would be subject to, and have the

potential to conflict with, the policies and ordinances applicable to the local government with jurisdiction over the project location. As discussed in **Section 3.2, Agriculture and Forestry**, major transportation projects included in the Plan would occur within, and may result in impacts to, the Angeles National Forest and the San Bernardino National Forest and may conflict with the provisions of the Angeles Forest Plan and the San Bernardino National Forest Land Management Plan, respectively.

Table 3.4-21
Unincorporated Areas Subject to County General Plans Potentially Affected by the Connect SoCal Major Transportation Projects.

County	Acres within Unincorporated County Boundaries Subject to County General Plans, Policies, and Ordinances
Imperial	598
Los Angeles	10,578
Orange	217
Riverside	6,909
San Bernardino	4,018
Ventura	377
Total	**22,697**

Source:
LAFCO City Boundaries, 2016 and County Boundaries 2016
Note: These data were reviewed by local jurisdictions and reflect each jurisdiction's input

The level of impact related to conflicts with local policies and ordinances protecting biological resources will vary on a project-by-project basis. For example, grade separation projects, rail projects or land use development located in areas with a high density of native trees protected by a local tree protection ordinance would be anticipated to have greater conflicts with local policies and ordinances protecting biological resources than a traffic signal synchronization or lane-restriping project located in an urban environment.

The Plan would have the potential to result in significant impacts related to conflicts with local policies and ordinances protecting biological resources, requiring the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measures

See **SMM BIO-1, SMM BIO-2** and **SMM BIO-3.**

Project Level Mitigation Measures

See PMM BIO-1 through **PMM BIO-4.**

PMM BIO-5: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce conflicts with local policies and ordinances protecting biological resources . Such measures may include the following or other comparable measures identified by the Lead Agency.

a) Consult with the appropriate local agency responsible for the administration of the policy or ordinance protecting biological resources.

b) Prioritize retention of trees on-site consistent with local regulations. Provide adequate protection during the construction period for any trees that are to remain standing, as recommended by an International Society of Arboriculture (ISA) certified arborist.

c) If specific project area trees are designated as "Protected Trees," "Landmark Trees," or "Heritage Trees," obtain approval for encroachment or removals through the appropriate entity, and develop appropriate mitigation measures at that time, to ensure that the trees are replaced. Mitigation trees shall be locally collected native species, as directed by a qualified biologist.

d) Appoint an ISA certified arborist to monitor construction activities that may occur in areas with trees are designated as "Protected Trees," "Landmark Trees," or "Heritage Trees," to facilitate avoidance of resources not permitted for impact. Before the start of any clearing, excavation, construction or other work on the site, securely fence off every protected tree deemed to be potentially endangered by said site work. Keep such fences in place for duration of all such work. Clearly mark all trees to be removed.

e) Establish a scheme for the removal and disposal of logs, brush, earth and other debris that will avoid injury to any protected tree. Where proposed development or other site work could encroach upon the protected perimeter of any protected tree, incorporate special measures to allow the roots to breathe and obtain water and nutrients. Minimize any excavation, cutting, filing, or compaction of the existing ground surface within the protected perimeter. Require that no change in existing ground level occur from the base of any protected tree at any time. Require that no burning or use of equipment with an open flame occur near or within the protected perimeter of any protected tree.

f) Require that no storage or dumping of oil, gas, chemicals, or other substances that may be harmful to trees occur from the base of any protected trees, or any other location on the site from which such substances might enter the protected perimeter. Require that no heavy construction equipment or construction materials be operated or stored within a distance from the base of any protected trees. Require that wires, ropes, or other devices not be attached to any protected tree, except as needed for support of the tree. Require that no sign, other than a tag showing the botanical classification, be attached to any protected tree.

g) Thoroughly spray the leaves of protected trees with water periodically during construction to prevent buildup of dust and other pollution that would inhibit leaf transpiration, as directed by the certified arborist.

h) If any damage to a protected tree should occur during or as a result of work on the site, the appropriate local agency will be immediately notified of such damage. If, such tree cannot be preserved in a healthy state, as determined by the certified arborist, require replacement of any tree removed with another tree or trees on the same site deemed adequate by the local agency to compensate for the loss of the tree that is removed. Remove all debris created as a result of any tree removal work from the property within two weeks of debris creation, and such debris shall be properly disposed of in accordance with all applicable laws, ordinances, and regulations. Design projects to avoid conflicts with local policies and ordinances protecting biological resources

i) Where avoidance is determined to be infeasible, sufficient conservation measures to fulfill the requirements of the applicable policy or ordinance shall be developed, such

as to support issuance of a tree removal permit. The consideration of conservation measures may include:

- Avoidance strategies
- Contribution of in-lieu fees
- Planting of replacement trees
- Re-landscaping areas with native vegetation post-construction
- Other comparable measures developed in consultation with local agency and certified arborist.

Level of Significance after Mitigation

As previously discussed, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis, the number of transportation projects and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts arising out of conflicts with local policies and ordinances protecting biological resources could be significant and unavoidable even with implementation of mitigation..

Impact BIO-6 **Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.**

Significant and Unavoidable Impact – Mitigation Required.

Implementation of transportation projects identified in the Plan and development projects anticipated to occur under the Plan would have a potential to result in conflicts with the provisions of applicable adopted HCPs and NCCPs because some planned major transportation projects and development projects may occur in or adjacent to lands protected under these plans, constituting a significant impact. Regional land use strategies identified in the Plan seek to reduce conflicts with the provisions of adopted HCPs and NCCPs by focusing new growth in existing urban areas, suburban town centers, and urban areas which are conducive to more compact, densified, infill and mixed-used development. Additionally,

land use strategies aim to preserve natural habitat areas and support redirecting growth away from high value habitat areas to these urbanized areas.

Major transportation projects included in the Plan have the potential to impact land within 13 HCPs/NCCPs in the SCAG region for which GIS data was publically available (**Table 3.4-22, HCP's and NCCP's Potentially Affected by the Connect SoCal Major Transportation Projects**).

Implementation of Plan projects within areas of adopted HCPs and NCCPs may result in significant impacts. Potential impacts include direct impacts to lands protected under these HCPs and NCCPs as

well as potential direct and indirect impacts to plant and animal species and their habitats and connectivity of these habitats afforded protection under these HCPs and NCCPs through conversion of habitat, introduction of invasive species, habitat fragmentation, increased noise, introduction of lighting and noise during construction and operation. At least four HCPs and NCCPs located within the SCAG region contain known provisions for the construction of transportation projects as part of plan-covered activities, acknowledging that such projects normally constitute significant impacts, and specifying the requirement for mitigation measures. These HCP/NCCPs (Coachella Valley MSHCP, Orange County Transportation Authority NCCP/HCP, West Mojave HCP, and Western Riverside County MSHCP) include considerations for the development of transportation projects as part of plan-covered activities and would be significantly impacted by transportation projects included in the Plan. Therefore, implementation of the Plan could result in significant impacts related to conflicts with the provisions of four adopted HCPs and NCCPs applicable to the SCAG region, and may conflict with other plans, requiring the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measures

Project Level Mitigation Measures

See **PMM BIO-1** through **PMM BIO-5.**

PMM BIO-6: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects on HCPs and NCCPs. Such measures may include the following or other comparable measures identified by the Lead Agency:

a) Consult with the appropriate federal, state, and/or local agency responsible for the administration of HCPs or NCCPs.

b) Wherever practicable and feasible, the project shall be designed to avoid lands preserved under the conditions of an HCP or NCCP.

c) Where avoidance is determined to be infeasible, sufficient conservation measures to fulfill the requirements of the HCP and/or NCCP, which would include but not be limited to applicable authorization for incidental take pursuant to Section 7 or 10(a) of the federal Endangered Species Act or Section 2081 of the California ESA, shall be

developed to support issuance of an incidental take permit or any other permissions required for development within the HCP/NCCP boundaries. The consideration of additional conservation measures would include the measures outlined in SMM-BIO-2, where applicable.

Level of Significance after Mitigation

As previously discussed, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts on HCPs and NCCPs could be significant and unavoidable even with implementation of mitigation..

3.5 CULTURAL RESOURCES

This section of the Program Environmental Impact Report (PEIR) describes the existing cultural resources within the SCAG region, identifies the regulatory framework with respect to laws and regulations that govern cultural resources, and analyzes the potential impacts of the Connect SoCal Plan ("Connect SoCal"; "Plan"). In addition, this PEIR provides regional-scale mitigation measures as well as project-level mitigation measures to be considered by lead agencies for subsequent, site-specific environmental review to reduce identified impacts as appropriate and feasible.

Tribal Cultural Resources are addressed in **Section 3.18, Tribal Cultural Resources**.

3.5.1 ENVIRONMENTAL SETTING

3.5.1.1 Definitions

Definitions of terms used in the regulatory framework, characterization of baseline conditions, and impact analysis for cultural resources are provided.

AD: The term Anno Domini (AD or A.D.) is used to label calendar years and is intended to be in relation to the beginning of the life of Jesus as a reference date.

Alluvium: An unconsolidated accumulation of stream-deposited sediments, including sands, silts, clays or gravels.

Archaeological site: Defined by the National Register of Historic Places (NRHP) as the place or places where the remnants of a past culture survive in a physical context that allows for the interpretation of these remains. Archaeological remains usually take the form of artifacts (e.g., fragments of tools, vestiges of utilitarian, or non-utilitarian objects), features (e.g., remnants of walls, cooking hearths, or midden deposits), and ecological evidence (e.g., pollen remaining from plants that were in the area when the activities occurred). The Office of Historic Preservation (OHP) defines an archaeological "site" as consisting of three or more related resources discovered in one locality. In the event of archaeological discovery, the resources are collected, documented, and curated at an educational institution, such as a school or a museum. These can include prehistoric (pre-European contact), historic (post-contact), or combination thereof.

BCE: The term BCE is the abbreviation for Before the Common Era, and is used to label calendar years, prior to the demarcation of AD.

BP: "Before present," which is defined as before 1950 and is used by archaeologists in conjunction with the commonly used term, AD.

Cretaceous: An interval of time relating to, or denoting the last period of the Mesozoic era, between the Jurassic and Tertiary periods.

CE: The term Common Era (CE) is an alternative naming of the calendar era AD.

Formation: A laterally continuous rock unit with a distinctive set of characteristics that make it possible to recognize and map from one outcrop or well to another. The basic rock unit of stratigraphy.

Holocene: An interval of time relating to, or denoting the present epoch, which is the second epoch in the Quaternary period, including the time period from approximately 11,000 years ago to the present.

Historic period: The period that begins with the arrival of the first nonnative population and thus varies by area. In 1769, Gaspar de Portolá became the first European to enter the San Fernando Valley, initiating the historic period in the SCAG region.

Historical resource: Defined by CEQA as any object, building, structure, site (including archaeological sites), area, place, record, or manuscript that is listed in, or is eligible for listing in, the California Register of Historical Resources (CRHR); officially designated or recognized as historically significant by a local government pursuant to a local initiative or resolution; or identified as significant in a historic resource survey conducted in accordance with the requirements of the CRHR statute (PRC Section 5024.1(g)). Properties listed in, or determined eligible for listing in, the NRHP are automatically listed in the CRHR and are therefore historical resources under CEQA.

Isolate: An isolated artifact or small group of artifacts that appear to reflect a single event, loci, or activity. It may lack identifiable context but has the potential to add important information about a region, culture, or person. Isolates are not considered under CEQA to be significant and, thus, do not require avoidance or mitigation under CEQA. All isolates located during the field effort, however, are recorded, and the data are transmitted to the appropriate California Historical Resources Information System (CHRIS) Information Center.

Miocene: An interval of time relating to or denoting the fourth epoch of the Tertiary period, between the Oligocene and Pliocene epochs, from approximately 23 to 5.5 million years ago.

Native American sacred site: An area that has been, and often continues to be, of religious significance to Native American peoples, such as an area where religious ceremonies are practiced or an area that is

central to their origins as a people. They also include areas where Native Americans gather plants for food, medicinal, or economic purposes.

Oligocene: An interval of time relating to or denoting the third epoch of the Tertiary period, between the Eocene and Miocene epochs, from approximately 34 to 23 million years ago.

Outcrop: A rock formation that is visible on earth's surface.

Paleocene: An interval of time, relating to, or denoting the earliest epoch of the Tertiary period, between the Cretaceous period and the Eocene epoch.

Phase I archaeological resources survey: A literature review (background research), consultation with the NAHC, and fieldwork. Fieldwork consists of a physical inspection of the cultural resources survey area, generally through pedestrian surveys, or by other means when appropriate. The purpose of the Phase I survey is to identify the cultural resources known or likely to be present in the initiative's impact area and in the immediate vicinity.

Phase II archaeological investigation: Consisting of testing and evaluation, is conducted when the results of a Phase I investigation indicate the presence of potentially significant cultural resources. Phase II investigations are intended to evaluate the historical significance of historic and prehistoric archaeological sites and require a comprehensive and detailed scope of work, a research design, and fieldwork. Surface and subsurface testing is conducted during Phase II investigations to collect the data necessary to establish historical significance of archaeological sites.

Phase III data recovery: Implemented on those archaeological sites that are determined to be significant as a result of the Phase II investigations and that cannot feasibly be avoided or preserved with initiative implementation. Phase III efforts typically involve the collection of data intended to answer scientific or research questions that have been formulated during Phase II testing and formalized by a comprehensive Phase III research design. Most commonly, Phase III data collections are implemented on sites determined to be significant as a means of mitigating the effects of an initiative through salvage, recordation, and archiving of scientific data associated with the site.

Pleistocene: An interval of time, relating to or denoting the first epoch of the Quaternary period, between the Pliocene and Holocene epochs, from approximately 2.6 million years ago to 11,000 years ago.

Pliocene: An interval of time, relating to or denoting the last epoch of the Tertiary period, between the Miocene and Pleistocene epochs, from approximately 5.5 to 2.6 million years ago.

Plutonic igneous rocks: Igneous rocks that have crystallized beneath the earth's surface.

Prehistoric period: The era prior to AD 1769. The later part of the prehistoric period (post–AD 1542) is also characterized as the protohistoric period in some areas, which marks a transitional period during which native populations began to be influenced by European presence resulting in gradual changes to their lifeways.

Quaternary: The most recent Period in geological time; includes the Pleistocene and Holocene Epochs.

Secretary of the Interior' Standards and Guidelines: The Standards are a series of concepts about maintaining, repairing, and replacing historic materials, as well as designing new additions or making alterations. The Guidelines offer general design and technical recommendations to assist in applying the Standards to a specific property. Together, they provide a framework and guidance for decision-making about work or changes to a historic property. The Standards and Guidelines can be applied to historic properties of all types, materials, construction, sizes, and use. They include both the exterior and the interior and extend to a property's landscape features, site, environment, as well as related new construction. Federal agencies use the Standards and Guidelines in carrying out their historic preservation responsibilities. State and local officials use them in reviewing both federal and nonfederal rehabilitation proposals. Historic district and planning commissions across the country use the Standards and Guidelines to guide their design review processes. The Standards offer four distinct approaches to the treatment of historic properties—preservation, rehabilitation, restoration, and reconstruction with Guidelines for each. The Standards for the Treatment of Historic Properties are regulatory for all grant-in-aid projects assisted through the national Historic Preservation Fund. The Standards for Rehabilitation, codified in 36 CFR 67, are regulatory for the review of rehabilitation work in the Historic Preservation Tax Incentives program. The Guidelines are advisory, not regulatory.

Unique Archeological Resource: Pursuant to Section 21083.2 of the PRC, a unique archaeological resource includes artifacts or sites that meet any one or all the following criteria:[1]

- It has made a significant contribution to the broad patterns of local or regional history or the cultural heritage of California or the United States;
- It is associated with the lives of persons important to California's past;
- It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; and/or
- It has yielded, or may be likely to yield, information important to the prehistory or history of California.

3.5.2 EXISTING CONDITIONS

3.5.2.1. Cultural Context

A brief context statement is provided below. The cultural context is organized by three broad temporal-cultural periods: Prehistoric, Protohistoric, and Historic. The Prehistoric and Historic periods are further divided into chronological sequences. The Prehistoric period is discussed in terms of four "horizons" that were established in the mid-twentieth century and continue to be developed by archaeologists. The Prehistoric and Protohistoric periods are intended to reflect Native American history prior to Spanish presence in the SCAG region (Prehistoric period) and shortly after (Protohistoric period). The Prehistoric horizons are based primarily on archaeological data, whereas information from the Protohistoric period also includes oral history and historical records. The divisions within the Historic period are based strictly on the years of Spanish, Mexican, and American government administration. As a result, the Protohistoric period has some overlap with the Spanish period, the former being affiliated exclusively with Native Americans, the latter with Europeans or other non-Native Americans.

Prehistoric

In the last several decades, researchers have devised numerous prehistoric chronological sequences to aid in understanding cultural changes in southern California. Building on early studies and focusing on data synthesis, Wallace (1955, 1978) developed a prehistoric chronology for the southern California coastal region that is still widely used today and is applicable to near-coastal and many inland areas. Four horizons are presented in Wallace's prehistoric sequence: Early Man, Milling Stone, Intermediate, and Late Prehistoric. The summary of prehistoric chronological sequences for southern California coastal and near-coastal areas presented below is a composite of information in Wallace (1955) and Warren (1968), as well as more recent studies using radiocarbon dates obtained by researchers in the last three decades, including Koerper and Drover (1983).

Horizon I: Early Man (ca. 10,000–6,000 BC)

The earliest accepted dates for archaeological sites on the southern California coast are from two of the northern Channel Islands, located off the coast of Santa Barbara. On San Miguel Island, Daisy Cave clearly establishes the presence of people in this area approximately 10,000 years ago (Erlandson 1991:105). On Santa Rosa Island, human remains have been dated from the Arlington Springs site to approximately 13,000 years ago (Johnson et al. 2002). Present-day Orange and San Diego counties contain several sites dating from 9,000 to 10,000 years ago (Byrd and Raab 2007:219; Macko 1998:41; Mason and Peterson 1994:55–57; Sawyer and Koerper 2006). Although the dating of these finds remains controversial, several sets of human remains from the Los Angeles Basin (e.g., "Los Angeles Man," "La Brea Woman,"

and the Haverty skeletons) apparently date to the Middle Holocene, if not earlier (Brooks et al. 1990; Erlandson et al. 2007:54).

Recent data from Horizon I sites indicate that the economy was a diverse mixture of hunting and gathering, with a major emphasis on aquatic resources in many coastal areas (e.g., Jones et al. 2002), and a greater emphasis on large-game hunting inland.

Horizon II: Milling Stone (6,000–3,000 BC)

Set during a drier climatic regime than the previous horizon, the Milling Stone horizon is characterized by subsistence strategies centered on collecting plant foods and small animals. The importance of the seed processing is apparent in the dominance of stone grinding implements in contemporary archaeological assemblages, namely milling stones (metates) and handstones (manos). Recent research indicates that Milling Stone horizon food procurement strategies varied in both time and space, reflecting divergent responses to variable coastal and inland environmental conditions (Byrd and Raab 2007:220).

Horizon III: Intermediate (3,000 BC–AD 500)

The Intermediate horizon is characterized by a shift toward a hunting and maritime subsistence strategy, along with a wider use of plant foods. An increasing variety and abundance of fish, land mammal, and sea mammal remains are found in sites from this horizon along the California coast. Related chipped stone tools suitable for hunting are more abundant and diversified, and shell fishhooks became part of the toolkit during this period. Mortars and pestles became more common during this period, gradually replacing manos and metates as the dominant milling equipment and signaling a shift away from the processing and consuming of hard seed resources to the increasing importance of the acorn (e.g., Glassow et al. 1988).

Horizon IV: late Prehistoric (AD 500–Historic Contact)

In the Late Prehistoric horizon, there was an increase in the use of plant food resources in addition to an increase in land and sea mammal hunting. There was a concomitant increase in the diversity and complexity of material culture during the Late Prehistoric horizon, demonstrated by more classes of artifacts. The recovery of a greater number of small, finely chipped projectile points suggests increased use of the bow and arrow rather than the atlatl (spear thrower) and dart for hunting. Steatite cooking vessels and containers are also present in sites from this time, and there is an increased presence of smaller bone and shell circular fishhooks; perforated stones; arrow shaft straighteners made of steatite; a variety of bone tools; and personal ornaments such as beads made from shell, bone, and stone. There was also an increased use of asphalt for waterproofing and as an adhesive.

By AD 1000, fired clay smoking pipes and ceramic vessels were being used at some sites (Drover 1971, 1975; Meighan 1954; Warren and True 1961). The scarcity of pottery in coastal and near-coastal sites implies that ceramic technology was not well developed in that area, or that occupants were trading with neighboring groups to the south and east for ceramics. The lack of widespread pottery manufacture is usually attributed to the high quality of tightly woven and watertight basketry that functioned in the same capacity as ceramic vessels.

During this period, there was an increase in population size accompanied by the advent of larger, more permanent villages (Wallace 1955:223). Large populations and, in places, high population densities are characteristic, with some coastal and near-coastal settlements containing as many as 1,500 people. Many of the larger settlements were permanent villages in which people resided year-round. The populations of these villages may have also increased seasonally.

In Warren's (1968) cultural ecological scheme, the period between AD 500 and European contact, which occurred as early as 1542, is divided into three regional patterns: Chumash (Santa Barbara and Ventura counties), Takic/Numic (Los Angeles, Orange, and western Riverside counties), and Yuman (San Diego County). The seemingly abrupt introduction of cremation, pottery, and small triangular arrow points in parts of modern-day Los Angeles, Orange, and western Riverside counties at the beginning of the Late Prehistoric period is thought to be the result of a Takic migration to the coast from inland desert regions. Modern Gabrielino, Juaneño, and Luiseño people in this region are considered the descendants of the Uto-Aztecan, Takic-speaking populations that settled along the California coast in this period.

Protohistoric

The Protohistoric period does not have a clear chronological timeline but may be defined by the boundaries of 500 to approximately 1600. Although early Spanish explorers and mission fathers recorded information on the local Native American populations, professional anthropological studies did not begin until the end of the 19th century after most of the Indian groups had been decimated by genocide, mixed with other Indigenous groups, were assimilated by Spanish, Mexican, and American cultures, or were forced to relocated to reservations.

The SCAG region once was the home to at least 11 distinct Native American groups. These include the Cahuilla, Chumash, Gabrielino, Halchidhoma, Kitanemuk, Luiseno, Mohave, Quechan, Serrano, Southern Paiute, Tataviam, and Tipai. The territorial boundaries of the Native Americans who were residing in Southern California at the time of first European contact do not coincide with today's political boundaries. Moreover, many tribal boundaries overlapped, and most groups migrated within their general boundaries throughout the years.

Between 1851 and 1852 federal agents, negotiated 18 treaties that included 139 tribes, to establish reservation lands across almost a third of California. The treaties were not ratified by Congress, and as a rule, Congress no longer negotiated with American Indians from 1871. However, the federal government continued the policy of forced migration and established a number of reservations in Southern California between 1875 and 1891. In all 17 reservations were established within the SCAG region, within Imperial, Riverside, and San Bernardino Counties. Riverside County holds the most, including Chemehuevi, Fort Mojave, Torres, Cabazon, Augustine, Santa Rosa, Ramona, Pechanga, Soboba, Agua Caliente, Mission Creek, and Morongo. Within Imperial County are the Martinez, Fort Yuma, and Colorado River reservations. The two reservations in San Bernardino County are the San Manuel and Twentynine Palms reservations. No reservations were established in Los Angeles, Ventura, or Orange Counties as it was believed that the local Native American groups in those counties had become extinct.

Historic

Post-contact history for the state of California is generally divided into three periods: the Spanish period (1769–1822), the Mexican period (1822–1848), and the American period (1848–present). Although there were brief visits by Spanish, Russian, and British explorers from 1529 to 1769, the Spanish period in California began with the establishment of Mission San Diego de Alcalá, the first of 21 missions constructed between 1769 and 1823. Independence from Spain marks the beginning of the Mexican period, and the signing of the Treaty of Guadalupe Hidalgo in 1848, ending the Mexican-American War, signals the beginning of the American period, when California became a territory of the United States.

Spanish Period (1769–1821)

Spanish explorers made numerous expeditions into California between the mid-1500s and mid-1700s. In the process of delivering supplies to another expedition, Hernando de Alarcon followed the Colorado River in 1950 and reached what is now Andrade in Imperial County. Two years later, in search of the legendary Northwest Passage, Juan Rodríquez Cabríllo stopped in 1542 at present-day San Diego Bay. With his crew, Cabríllo explored the shorelines of present Catalina Island as well as San Pedro and Santa Monica Bays. Much of the present California and Oregon coastline was mapped and recorded in the next half-century by Spanish naval officer Sebastián Vizcaíno. Vizcaíno's crew also landed on Santa Catalina Island and at San Pedro and Santa Monica Bays, giving each location its long-standing name. The Spanish crown laid claim to California based on the surveys conducted by Cabríllo and Vizcaíno (Bancroft 1886:96–99; Gumprecht 2001:35).

More than 200 years passed before Spain began the colonization and inland exploration of Alta California. With the renewed interest into the area by other European nations, such as Britain, France,

and Russia, who all sent expeditions into the area, Spain officially moved to settle the territory. The 1769 overland expedition by Captain Gaspar de Portolá marks the beginning of California's Historic period, occurring just after the King of Spain installed the Franciscan Order to direct religious and colonization matters in assigned territories of the Americas. With a band of 64 soldiers, missionaries, Baja (lower) California Native Americans, and Mexican civilians, Portolá established the Presidio of San Diego, a fortified military outpost, as the first Spanish settlement in Alta California. In July 1769, while Portolá was exploring Southern California, Franciscan Fr. Junípero Serra founded Mission San Diego de Alcalá at Presidio Hill, the first of the 21 missions that would be established in Alta California by the Spanish and the Franciscan Order between 1769 and 1823.

These missions were part of the Spanish plan that included the settlement of three pueblos and four presidios, that would provide Spain control over Alta California. While one of the pueblos, Branciforte would fail, the other aspects of this plan would be successful.

Mexican Period (1822–1848)

A major emphasis during the Spanish period in California was the construction of missions and associated presidios to integrate the Native American population into Christianity and communal enterprise. Incentives were also provided to bring settlers to pueblos or towns, but just three pueblos were established during the Spanish period, only two of which were successful and remain as California cities (San José and Los Angeles). Several factors kept growth within Alta California to a minimum, including the threat of foreign invasion, political dissatisfaction, and unrest among the indigenous population. After more than a decade of intermittent rebellion and warfare, New Spain (Mexico and the California territory) won independence from Spain in 1821. In 1822, the Mexican legislative body in California ended isolationist policies designed to protect the Spanish monopoly on trade, and decreed California ports open to foreign merchants.

Extensive land grants were established in the interior during the Mexican period, in part to increase the population inland from the more settled coastal areas where the Spanish had first concentrated their colonization efforts. The secularization of the missions following Mexico's independence from Spain resulted in the subdivision of former mission lands and establishment of many additional ranchos.

During the supremacy of the ranchos (1834–1848), landowners largely focused on the cattle industry and devoted large tracts to grazing. Cattle hides became a primary southern California export, providing a commodity to trade for goods from the east and other areas in the United States and Mexico. The number of nonnative inhabitants increased during this period because of the influx of explorers, trappers, and ranchers associated with the land grants. Many newcomers were Americans that had traveled west and

married into landed families. The rising California population contributed to the introduction and rise of diseases foreign to the Native American population, who had no associated immunities.

An attempted northern California revolt in 1946, was quickly stopped, but the American Navy arrived soon after, and on January 13, 1847, Governor Pio Pico and Commander Jose Maria Flores officially surrender to US Captain John C. Freemont. The Treaty of Guadalupe Hidalgo in 1848 was the end of Mexican rule in California.

American Period (1848–Present)

The Mexican–American War officially ended with the Treaty of Guadalupe Hidalgo in 1848, which resulted in the annexation of California and much of the present-day southwest, ushering California into its American period. While gold was first found by Francisco Lopez in 1842 within Placerita Canyon, it wasn't until James Marshall's gold find in 1948 that the Gold Rush began, drastically changing California.

California officially became a state with the Compromise of 1850, which also designated Utah and New Mexico (with present-day Arizona) as U.S. territories. With Statehood and the population boom, legal battles over the land rights of the rancho's were prevalent. By the time American courts decided upon each case, many of the ranches had already be lost by their original Mexican landowners, through deceit, debt, or marriage.

With the huge influx of people seeking gold, the cattle industry flourished as cattle were no longer desired mainly for their hides, but also as a source of meat and other goods. During the 1850s cattle boom, rancho vaqueros drove large herds from southern to northern California to feed that region's burgeoning mining and commercial boom. Cattle were at first driven along major trails or roads such as the Gila Trail or Southern Overland Trail, then were transported by trains when available. The cattle boom ended for southern California as neighbor states and territories drove herds to northern California at reduced prices. Operation of the huge ranchos became increasingly difficult, and droughts severely reduced their productivity (Cleland 1941). With that, many of the rancho lands were transformed to agricultural fields.

The connection of California to the rest of the United States by rail in the 1970s resulted in another population boom, as well as a land boom. Towns began to be established along rail lines, and with them additional mineral deposits were identified and mined. These mining camps existed for only short periods of time before being abandoned.

3.5.2.2. Existing Conditions

This section characterizes the existing conditions related to cultural resources in the SCAG region, which encompasses an area of more than 38,000 square miles within the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. The discussion of cultural resources includes archaeological resources associated with various time periods, as well as non-archaeological resources such as buildings, structures, and other elements of the historical built environment.

Historical and Archeological Resources

Historical resources are defined in Section 15064.5(a) of the *State CEQA Guidelines* and are evaluated according to the provisions of Section 15126.4 of the *State CEQA Guidelines*. Furthermore, AB 52 requires that CEQA lead agencies consider the effects of projects on tribal cultural resources. Such resources may be underrepresented in the record and archival information available in the information centers, existing in developed areas of a community, where development occurred prior to enactment of CEQA.

Archaeological resources consist of the physical remains of past human activity, and the occupation of Southern California by humans for thousands of years has created innumerable such resources. If an archeological resource is determined to be a historical resource as defined in Section 15064.5(a) of the *State CEQA Guidelines*, it is evaluated in light of the provisions of Section 15126.4 of the *State CEQA Guidelines*. If the resource is not a historical resource but meets the definition of a unique archeological resource as established in Section 21083.2 of the PRC, the site is required to be treated in accordance with the provisions of Section 21083.2 of the PRC. For projects that are subject to the provisions of AB 52 (i.e., when a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report are prepared), consideration must include archeological resources that are determined to be tribal cultural resources. Such resources may be underrepresented in the record and archival information available in the information centers, as they may be present in existing developed areas, developed prior to enactment of CEQA.

As of July 2019, over 109,000 archaeological resource locations have been identified in the SCAG region (**Table 3.5-1, Archeological Resources Listed in the California Historical Resources Information System [CHRIS]**). In order to protect these archaeological sites, and the artifacts contained within their boundaries, from scavenging and looting, their locations are confidential. Under state law, detailed information about these sites, especially their location, is considered confidential.

Table 3.5-1
Archeological Resources Listed in the California Historical Resources Information System (CHRIS)

County	Archeological Resources	Archeological Resources Listed in CHRIS
Imperial*	12,398	16,500 (approx.)
Los Angeles	4,886	18,599
Orange	1,775	5,498
Riverside**	20,200 (approx..)	28,612
San Bernardino	8,236	36,924
Ventura	1,864	3,226
SCAG Region Total	**49,359**	**109,359**

Source:
SWCA Environmental Consultants, Inc. (2019).
** The SCIC database is currently being revised and the count of total resources is an approximation based on current listings. The number of resources with archaeological components is taken from the 2016 General Plan, Open Space & Conservation Element. The total number of resources was approximated by SCIC staff and provided to SWCA via email on July 1, 2019.*
*** The EIC database is not currently configured to distinguish historic-period archaeological resources from non-archaeological historic resources (i.e., buildings, structures, etc.). Instead, the EIC provided tallies of resources with components dating to the respective periods as follows: 13,993 Prehistoric archaeological sites; 1 Protohistoric archaeological site; 15,313 Historic period cultural resources (archaeological sites and historic resources); 202 sites of unknown cultural or temporal affiliation. Because an individual resource may have components that fall into multiple periods, the sum of all resources listed for each period is greater than the total number of resources. The total number of archaeological sites was estimated for Riverside County to allow for comparison with other counties across the SCAG region. This was done for Riverside County by taking the 13,994 archaeological sites listed as Prehistoric and Protohistoric (because these resources can only be archaeological sites) and adding an estimated fraction of those listed as Historic and Unknown Period, which could consist of historic resources (i.e., non-archaeological). The estimate provided here assumes 40 percent of those resources listed as Historic or Unknown Period have archaeological components that are not multi-component resources (and already tallied as Prehistoric or Protohistoric).*

Due to the proprietary nature of archaeological information, the exact location of most of these locales cannot be discussed. However, some of the sites have been made public in county, regional, state, and federal parks, or listed on public registers:

- The site of the Puvunga India Village (NR) Los Angeles County
- Vasquez Rocks (NR) Los Angeles County
- Black Star Canyon Indian Village Site (CHL-217) Orange County
- Fairview Indian Site (NR) Orange County
- Desert Intaglios (CHL-101) Riverside County
- Site of the Indian Village of Pochea (CHL-104) Riverside County
- Carved Rock (CHL-187) Riverside County
- Painted Rock (CHL-190) Riverside County
- The Hemet Maze (CHL-557) Riverside County
- The Calico "Early Man" Site San Bernardino County
- Anacapa Island Archaeological District (NR) Ventura County

The SCAG region was occupied during both the prehistoric and protohistoric periods; therefore, archaeological sites are widespread and numerous. Rock outcrops, river and stream drainages, and coastal strips were often prime locations for Native American village sites or processing camps. These locations now include highly urbanized locations, such as cities, and undeveloped areas of the high desert. Often archaeological sites are covered by three feet or more of topsoil; however, it is possible that construction may not disturb the surface soils by more than a foot or two, thereby protecting remains even after an area has been fully urbanized. In 1998, a large undisturbed Native American burial ground, dating from the Protohistoric Period, was exposed during construction at the ARCO Refinery in Los Angeles. The refinery had been there for 75 years, yet the burial level was located under three to five feet of flood deposits from the nearby Los Angeles River.[2]

There are numerous historical resources that have been listed or determined eligible for listing in the National Register of Historic Places and/or the California Register of Historical Resources. These historical sites are generally open to the public. Additionally, registries are maintained by counties, cities, and local historical societies within the SCAG region. There are more than 85,000 listings in the NRHP, of which 1,123 are located in the SCAG region **(Table 3.5-2, National Register of Historic Places Properties within the SCAG Region).** A complete listing is provided in **Appendix 3.5**, **Cultural Resources Technical Report**.

The State of California keeps a record of districts, places, sites, and buildings determined to hold historic or prehistoric significance. Two registers, administered by the California OHP and the SHRC, are part of the California Department of Parks and Recreation. There are over 1,000 listings in the register of CHL, of which 226 are located in the SCAG region (**Table 3.5-4, California Historical Landmarks within the SCAG Region**), and with the CPHI, there are 850 listings, of which 284 are located in the SCAG region (**Table 3.5-5, California Points of Historical Interest within the SCAG Region**).

Historic places are also recorded and can be identified in county, city, and local registers. These resources are also under various ordinances specific to the county, city, or locality. City and county registers may also be maintained by various county and city commissions. Examples of these types of organizations include the Riverside County Historical Commission, the Santa Ana Historic Resources Commission, and the Santa Monica Landmarks Commission. Local groups have also created registries within their area of interest, generally at the community level. An example of such local registers is the Ontario Heritage, a local non-profit organization that aims to protect the historic and cultural resources of Ontario, California. Furthermore, several local cities and counties maintain historic districts. Projects within the borders of these districts are often subject to additional conditions and review by planning staff and historic commissions. A full detailing of these resources is located in **Appendix 3.5** (Tables C-1 through C-4) and (Table D-1).

Human Remains

Human remains in the SCAG region occur within the nearly 200 formal cemeteries in the six-county area and those interred outside of formal cemeteries. In the SCAG region, there are many circumstances in which human remains outside formal cemeteries could be encountered. In additional to existing formal cemeteries, many cemeteries have been relocated. While the goal of such relocation projects is to repatriate human remains to a new location, there have been instances where human remains have been encountered at the original location of a relocated cemetery during subsequent ground-disturbing activities. There is also a potential to find human remains that are the result of foul play. There are also burial features associated with historic settlements and other indigenous people. Burial features can range in complexity from a simple isolated inhumation (burial or cremation) to more elaborate interments containing numerous bodies. These features may represent specially designated interment areas or

remnants of larger archaeological sites. Burial associations can include shell beads and ornaments as well as ground and polished stone artifacts. In some areas, human burials are expected to be found in raised earthen mounds. Native American groups within the SCAG region varied in their burial practices with respect to interment and cremation.

3.5.3 REGULATORY FRAMEWORK

3.5.3.1 Federal

Antiquities Act of 1906

The Antiquities Act of 1906 (16 U.S. Code [USC] 431–433), which aimed to protect important historic and archaeological sites, initiated historic preservation legislation. It established a system of permits for conducting archaeological studies on federal land, as well as setting penalties for noncompliance. This permit process controls the disturbances that may be caused to archaeological sites.[3] New permits are currently issued under the Archaeological Resources Protection Act (ARPA) of 1979. The purpose of ARPA is to enhance preservation and protection of archaeological resources on public and Native American lands.[4]

Historic Sites Act of 1935

The Historic Sites Act (16 USC 461–467) became law on August 21, 1935, and declared that it is national policy to "Preserve for public use historic sites, buildings, and objects of national significance."[5] The National Historic Preservation Act (NHPA) expanded the scope to include important state and local resources. Provisions of NHPA established the National Register maintained by the National Park Service, advisory councils on Historic Preservation, State Historic Preservation Offices, and grants-in-aid programs. Section 106 of the NHPA requires all federal agencies to consult the Advisory Council before continuing any activity affecting a property listed on or eligible for listing on the National Register.[6] The

Advisory Council has developed regulations for Section 106 to encourage coordination of agency cultural resource compliance requirements (Executive Order 11593).[7]

United States Department of Transportation Act of 1966 (Section 4[f])

Section 4(f) of the United States Department of Transportation (USDOT) Act of 1966 affords special protection to public recreational lands and facilities, including: local parks and school facilities that are open and available to the general public for recreational purposes; significant cultural resources; historical resources; and natural wildlife refuges. Federally funded transportation improvement projects are prohibited from the encroachment (direct or constructive use, or a take) of Section 4(f) lands unless it can be demonstrated that no feasible and prudent alternative exists.[8]

National Register of Historic Places (National Register)

The National Register recognizes properties that are significant at the national, state, and/or local levels. Although administered by the National Park Service, the federal regulations explicitly provide that National Register listing of private property "does not prohibit under federal law or regulation any actions which may otherwise be taken by the property owner with respect to the property." Listing in the National Register assists in preservation of historic properties through: recognition that a property is of significance to the nation, the state, or the community; consideration in the planning for federal or federally-assisted projects; eligibility for federal tax benefits; consideration in the decision to issue a surface coal mining permit; and qualification for federal assistance for historic preservation, when funds are available. In addition, for projects that receive federal funding, a clearance process must be completed in accordance with Section 106 of the NHPA. Furthermore, state and local regulations may apply to properties listed in the National Register.[9]

The criteria for listing in the National Register follow the standards for determining if properties, sites, districts, structures, or landscapes of potential significance are eligible for nomination. In addition to meeting any or all of the following criteria, properties nominated must also possess integrity of location,

design, setting, feeling, workmanship, association, and materials that[10] a property is eligible for the NRHP if it is significant under one or more of the following criteria:

Criterion A: It is associated with events that have made a significant contribution to the broad patterns of our history;

Criterion B: It is associated with the lives of persons who are significant in our past;

Criterion C: It embodies the distinctive characteristics of a type, period, or method of construction, or represents the work of a master, or possesses high artistic values, or represents a significant and distinguishable entity whose components may lack individual distinction; and/or

Criterion D: It has yielded, or may be likely to yield, information important in prehistory or history.

Ordinarily cemeteries, birthplaces, or graves of historic figures, properties owned by religious institutions or used for religious purposes, structures that have been moved from their original locations, reconstructed historic buildings, and properties that are primarily commemorative in nature, are not considered eligible for the NRHP, unless they satisfy certain conditions. In general, a resource must be 50 years of age to be considered for the NRHP, unless it satisfies a standard of exceptional importance.

In addition to meeting these criteria, a property must retain historic integrity, which is defined in National Register Bulletin 15 as the "ability of a property to convey its significance" (NPS 1990). In order to assess integrity, the NPS recognizes seven aspects or qualities that, considered together, define historic integrity. To retain integrity, a property must possess several, if not all, of these seven qualities, which are defined in the following manner in National Register Bulletin 15:

Location: the place where the historic property was constructed or the place where the historic event occurred;

Design: the combination of elements that create the form, plan, space, structure, and style of a property;

Setting: the physical environment of a historic property;

Materials: the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.

Workmanship: the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory;

---

10 Ibid.

Feeling: a property's expression of the aesthetic or historic sense of a particular period of time;

Association: the direct link between an important historic event or person and a historic property.

Procedures for listing a property in the NRHP are outlined in Procedures for State, Tribal, and Local Government Historic Preservation Programs (36 CFR 61) and in Determinations of Eligibility for Inclusion in the National Register (36 CFR 63). The Secretary of the Interior's Professional Qualifications Standards for who is allowed to conduct cultural resources studies and evaluations are outlined in 36 CFR 61.

Procedures for artifact curation are noted in Curation of Federally Owned and Administered Archeological Collections (36 CFR 79) for artifacts recovered under the authority of the Antiquities Act (16 USC 431- 433), the Reservoir Salvage Act (16 USC 469-469c), Section 110 of the NHPA (16 USC 470h-2), or the ARPA (16 USC 470aa-mm).

National Landmarks Program

36 CFR 65 identifies and designates NHLs and encourages the long-range preservation of nationally significant properties that illustrate or commemorate the history and prehistory of the United States. The NPS administers the National Historic Landmarks Program on behalf of the Secretary of the Interior. Properties designated as NHLs are listed in the NRHP upon designation. All NHLs are NRHP Properties but not all NRHP Properties are NHLs. The criteria for designation as an NHL are similar to those for inclusion in the NRHP but are more stringent and have a greater emphasis on national significance. The Landmark Program Criterion 3, which does not have a counterpart in the NRHP regulations, applies to a resource that represents some great idea or ideal of the American people. Agencies should, to the maximum extent possible, minimize harm to NHLs affected by undertakings.

Archeology and Historic Preservation: Secretary of the Interior Standards and Guidelines

As established by 36 CFR 67, one recognized method for generally avoiding adverse effects to historic properties is following the Secretary of the Interior's Standards for Rehabilitation & Illustrated Guidelines for Rehabilitating Historic Buildings (Secretary's Standards). Created under Sections 101(f), (g), and (h), and Section 110 of the amended NHPA of 1966, the Secretary's Standards offer guidelines and approaches for preserving, maintaining, repairing, and replacing historical materials and features, as well as designing additions or making alterations. Guidance is also provided for new construction adjacent to historic properties, in order to avoid adverse impacts to neighboring properties through a change in setting and feeling. In this way, the Secretary's Standards outline common-sense approaches that allow

for the retention of and/or sensitive changes to the distinctive materials and features that lend a historical resource its significance. These standards and guidelines are not regulatory in nature, nor do they set of interpret policy. Instead that serve as technical advice regarding archaeological and historic preservation procedures.

State CEQA Guidelines Section 15126.4(b)(1) states that a project determined to conform with the Secretary's Standards can generally be considered to be a project that will not cause material impairment to a historical resource. Nonconformance with the Secretary's Standards, however, does not uniformly result in material impairment to a historical resource, and some projects that do not comply with the Secretary's Standards do not cause a significant adverse impact. Project elements must be studied on a case-by-case basis, depending upon the resource and the reasons for its significance. However, projects that comply with the Secretary's Standards benefit from a regulatory presumption that they would have a less-than-significant adverse impact on historic resources.

National Historic Preservation Act of 1966 (NHPA)

The NHPA, as amended (54 U.S.C. section 470 *et seq*.), established guidelines to "preserve important historic, cultural, and natural aspects of our national heritage, and to maintain, wherever possible, an environment that supports diversity and a variety of individual choice." The NHPA includes requirements (Section 106) which pertain to all projects that are funded, permitted, or approved by any federal agency and which have the potential to affect cultural resources. Under the Section 106 consultation process (36 CFR section 800 *et seq*.), federal agencies taking such actions are required to consult with the Advisory Council on Historic Preservation (ACHP), State Historic Preservation Officer (SHPO), local agencies, and Indian tribes, and avoid or mitigate adverse effects on National Register-listed or -eligible properties. Provisions of NHPA establish a National Register of Historic Places (National Register); see above for details.[11]

Archaeological and Historic Preservation Act of 1974

Passed and signed into law in 1974, The Archaeological and Historic Preservation Act of 1974 (AHPA), 16 USC Section 469 *et seq*.) amended and expanded the Reservoir Salvage Act of 1960. The AHPA as amended requires that federal agencies provide for the preservation of historical and archaeological data (including relics and specimens) which might otherwise be irreparably lost or destroyed as the result of

11 National Park Service. *National Historic Preservation Act of 1966 as amended through 1992*. Available online at: https://www.nps.gov/history/local-law/nhpa1966.htm, accessed August 27, 2019.

any alteration of the terrain caused by any federal construction project or federally-licensed activity or program.[12]

Archaeological Resources Protection Act of 1979

The ARPA (16 USC Section 470aa *et seq*.) applies when a project may involve archaeological resources located on federal or tribal land. ARPA requires that a permit be obtained before excavation of an archaeological resource on such land can take place.[13]

American Indian Religious Freedom Act

AIRFA establishes U.S. policy to protect and preserve American Indian, Eskimo, Aleut, and Native Hawaiian freedom to believe, express, and exercise traditional religions and ways. This includes access to religious sites and the freedom to worship through ceremonial and traditional rites. Federal agencies must determine if policy and procedure changes are needed to protect such rights and freedoms. The act is aligned with the First Amendment guarantee of religious freedom. It is not implemented with regulations.

Native American Graves Protection and Repatriation Act of 1990

The Native American Graves Protection and Repatriation Act (NAGPRA) of 1990 (25 USC 3001 et seq.) protects human remains, funerary objects, sacred objects, and items of cultural patrimony of indigenous peoples on federal lands. NAGPRA stipulates priorities for assigning ownership or control of such cultural items excavated or discovered on federal or tribal lands, or in the possession and control of an agency that has received federal funding.

NAGPRA also provides for the repatriation of human remains and associated items previously collected from federal lands and in the possession or control of a federal agency or federally funded repository. Implementing regulations are codified in 43 CFR Part 10. In addition to defining procedures for dealing with previously collected human remains and associated items, these regulations outline procedures for negotiating plans of action or comprehensive agreements for treatment of human remains and associated items encountered in intentional excavations, or inadvertent discoveries on federal or tribal lands.

---

12 National Park Service. *Archeological and Historic Preservation Act as Amended*. Available online at: https://www.nps.gov/history/local-law/FHPL_ArchHistPres.pdf, accessed August 27, 2019.

13 National Park Service. *The Archaeological Resources Protection Act of 1979 (ARPA)*. Available online at: https://www.nps.gov/archeology/tools/Laws/ARPA.htm, accessed August 27, 2019.

This regulation (last amended March 21, 2007) provides a Plan of Action (POA) for NAGPRA. To prevent work stoppages that last 30 days each time cultural items (as defined by NAGPRA) are encountered, it allows the responsible federal agency to create a POA to follow if these cultural items (as defined by NAGPRA) are encountered. POAs require consultation with the *appropriate Indian tribe or Native Hawaiian organization with respect to tribal lands, if known or readily ascertainable, and, in the case of lands that have been selected by an Alaska Native Corporation or group organized pursuant to the Alaska Native Claims Settlement Act of 1971[43 USC 1601 et seq.], the appropriate corporation or group (25 USC 3002d).*

3.5.3.2 State

California Implementation of Federally and State-Mandated Historic Preservation Program

The California OHP is responsible for administering federally and state mandated historic preservation programs to further the identification, evaluation, registration and protection of California's irreplaceable archaeological and historical resources under the direction of the State Historic Preservation Officer (SHPO), a gubernatorial appointee, and the State Historical Resources Commission.

OHP's responsibilities include:

- Identifying, evaluating, and registering historic properties;
- Ensuring compliance with federal and state regulatory obligations;
- Encouraging the adoption of economic incentives programs designed to benefit property owners; and
- Encouraging economic revitalization by promoting a historic preservation ethic through preservation education and public awareness and, most significantly, by demonstrating leadership and stewardship for historic preservation in California.

OHP reviews and comments on thousands of federally sponsored projects annually pursuant to Section 106 of the National Historic Preservation Act and state programs and projects pursuant to Sections 5024 and 5024.5 of the Public Resources Code (PRC). OHP also reviews and comments on local government and state projects pursuant to CEQA.

The purpose of OHP's project review program is to promote the preservation of California's heritage resources by ensuring that projects and programs carried out or sponsored by federal and state agencies comply with federal and state historic preservation laws and that projects are planned in ways that avoid any adverse effects to heritage resources. If adverse effects cannot be avoided, the OHP assists Lead Agencies in developing measures to minimize or mitigate such effects.

OHP administers the NRHP, the CRHR, the CHL, and the CPHI programs. Each program has different eligibility criteria and procedural requirements; all register nominations must be submitted to the Commission for review and approval.[14]

California Register of Historical Resources (California Register)

Created in 1992 and implemented in 1998, the CRHR is "an authoritative guide in California to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (PRC Sections 21083.2 and 21084.1). Certain properties, including those listed in or formally determined eligible for listing in the NRHP and CHL numbered 770 and higher, are automatically included in the CRHR.

Other properties recognized under the CPHI program, identified as significant in historical resources surveys, or designated by local landmarks programs may be nominated for inclusion in the CRHR. According to PRC Section 5024.1(c), a resource, either an individual property or a contributor to a historic district, may be listed in the CRHR if the State Historical Resources Commission determines that it meets one or more of the following criteria, which are modeled on NRHP criteria:

Criterion 1: It is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.

Criterion 2: It is associated with the lives of persons important in our past.

Criterion 3: It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.

Criterion 4: It has yielded, or may be likely to yield, information important in history or prehistory.

Resources nominated to the CRHR must retain enough of their historic character or appearance to convey the reasons for their significance. Resources whose historic integrity does not meet NRHP criteria may still be eligible for listing in the CRHR.

14 Office of Historic Preservation. *About the Office of Historic Preservation*. Available online at: http://ohp.parks.ca.gov/?page_id=27961, accessed August 27, 2019.

California Historical Landmarks

CHL are sites, buildings, features, or events that are of statewide significance and have anthropological, cultural, military, political, architectural, economic, scientific or technical, religious, experimental, or other value. The specific standards now in use were first applied in the designation of Landmark #770. CHL #770 and above are automatically listed in the CRHR.

To be designated as a CHL, a resource must meet at least one of the criteria listed below; have the approval of the property owner(s); be recommended by the State Historical Resources Commission; and be officially designated by the Director of California State Parks.

Criteria for Designation. To be eligible for designation as a Landmark, a resource must meet at least one of the following criteria:

- The first, last, only, or most significant of its type in the state or within a large geographic region (Northern, Central, or Southern California).
- Associated with an individual or group having a profound influence on the history of California.
- A prototype of, or an outstanding example of, a period, style, architectural movement or construction or is one of the more notable works or the best surviving work in a region of a pioneer architect, designer or master builder.

Effects of Designation:

- Limited protection: Environmental review may be required under CEQA if property is threatened by a project. Contact your local planning agency for more information.
- Local assessor may enter into contract with property owner for property tax reduction (Mills Act).
- Local building inspector must grant code alternative provided under State Historic Building Code. Registration will be recorded on the property deed.
- Automatic listing in CRHR.
- Bronze plaque at site (underwritten by local sponsor) ordered through OHP; highway directional sign available through local Department of Transportation (Caltrans) district office.

California Points of Historical Interest

If a site is primarily of local interest, it may meet the criteria for the CPHI program. California Points of Historical Interest are sites, buildings, features, or events that are of local (city or county) significance and have anthropological, cultural, military, political, architectural, economic, scientific or technical, religious, experimental, or other value. Points of Historical Interest designated after December 1997 and

recommended by the State Historical Resources Commission are also listed in the California Register. No historical resource may be designated as both a Landmark and a Point. If a Point is subsequently granted status as a Landmark, the Point designation will be retired.

Criteria for Designation. To be eligible for designation as a Point of Historical Interest, a resource must meet at least one of the following criteria:

- The first, last, only, or most significant of its type within the local geographic region (City or County).
- Associated with an individual or group having a profound influence on the history of the local area.
- A prototype of, or an outstanding example of, a period, style, architectural movement or construction or is one of the more notable works or the best surviving work in the local region of a pioneer architect, designer or master builder.

Effects of Designation.

- Limited protection: Environmental review may be required under CEQA if property is threatened by a project. Contact your local planning agency for more information.
- Local assessor may enter into contract with property owner for property tax reduction (Mills Act).
- Local building inspector must grant code alternative provided under State Historic Building Code.
- Registration is recorded on property deed.
- A small enamel directional sign (no text) available through local Caltrans district office.
- Owner may place his or her own marker at the site.

California Public Resources Code, Sections 5097.5, 5097.9, 5097.98–99, and 50907.9

Section 5097.5 of the Public Resources Code defines as a misdemeanor the unauthorized disturbance or removal of archaeological, historical, or paleontological resources located on public lands. This Section also prohibits the knowing destruction of objects of antiquity without a permit (expressed permission) on public lands, and provides for criminal sanctions. In 1987, the Code was amended to require consultation with the California Native American Heritage Commission whenever Native American graves are found. It also established that violations for taking or possessing remains or artifacts are felonies.[15]

---

15 California Legislative Information. *Chapter 1.7. Archaeological, Paleontological, and Historic Sites [5097-5097.7], Section 5097.5*. Available online at: http://leginfo.legislature.ca.gov/faces/codes_displaySection.xhtml?lawCode=PRC&sectionNum=5097.5, accessed August 27, 2019.

Public Resources Code Section 5097.9 establishes the California Native American Heritage Commission to make recommendations to encourage private property owners to protect and preserve sacred places in a natural state and to allow appropriate access to Native Americans for ceremonial or spiritual activities. The Commission is authorized to assist Native Americans in obtaining appropriate access to sacred places on public lands, and to aid state agencies in any negotiations with federal agencies for the protection of Native American sacred places on federally-administered lands in California.[16]

Public Resources Code sections 5097.98 through 5097.99 require that the Governor's California Native American Heritage Commission be consulted whenever Native American graves are found. According to these sections, it is illegal to take or possess remains or artifacts taken from Native American graves; however, it does not apply to materials taken before 1984. Violations occurring after January 1, 1988 are felonies.[17,18]

Public Resources Code Section 50907.9 (Section 7050 of the Health and Safety Code) authorizes the Native American Heritage Commission (NAHC) to regulate Native American concerns regarding the excavation and disposition of Native American cultural resources. Among its duties, the Commission is authorized to resolve disputes relating to the treatment and disposition of Native American human remains and items associated with burials. Upon notification of the discovery of human remains by a county coroner, the Commission notifies the Native American group or individual most likely descended from the deceased. PRC 5097.98(b) requires that landowners ensure that the immediate vicinity (according to generally accepted cultural or archaeological standards of practices) are not damaged or disturbed by further development until the landowner has discussed and conferred with most likely descendants.[19]

California Coastal Act

The California Coastal Act (CCA; PRC Sections 30000 et seq.) was enacted in 1976, four years after the Coastal Commission was created by Proposition 20. It requires the implementation of reasonable mitigations measures to protect archaeological resources as identified by the SHPO when development would adversely impact such resources. [20]

California Health and Safety Code, Section 7050 and Sections 18950 through 18961

Consistent with the provisions of Section 50907.9 of the PRC, Section 7050 of the Health and Safety Code HSC) authorizes the Native American Heritage Commission (NAHC) to regulate Native American concerns regarding the excavation and disposition of Native American cultural resources. Among its duties, the Commission is authorized to resolve disputes relating to the treatment and disposition of Native American human remains and items associated with burials. Upon notification of the discovery of human remains by a county coroner, the Commission notifies the Native American group or individual most likely descended from the deceased.[21]

The State Historic Building Code (HSC; Sections 18950–18961) provide alternative building regulations and building standards for the rehabilitation, preservation, restoration (including related reconstruction), or relocation of buildings or structures designated as historic buildings. Such alternative building standards and building regulations are intended to facilitate the restoration or change of occupancy so as to preserve their original or restored architectural elements and features, to encourage energy conservation and a cost-effective approach to preservation, and to provide for the safety of the building occupants.[22]

California Penal Code Section 622 – Destruction of Historical Properties

Penal Code Section 622 establishes that the willful injury, disfiguration, defacement, or destruction of any object, thing, or site, of archaeological or historical interest or value, as a misdemeanor. This applies to

resources situated on both private and public land. Furthermore, Section 622.5 sets the applicable penalties for any such damage or removal of cultural resources. [23]

Senate Bill 18 – Traditional Tribal Cultural Places

Signed into law in 2004, Senate Bill (SB) 18 requires that cities and counties notify and consult with California Native American tribes about proposed local land use planning decisions for the purpose of protecting traditional tribal cultural sites. Cities and counties must provide general and specific plan amendment proposals to California Native American tribes that the NAHC has identified as having traditional lands located within the city's boundaries. If requested by the Native American tribes, the city must also conduct consultations with the tribes prior to adopting or amending their general and specific plans.

Assembly Bill 52

Assembly Bill 52 of 2014 (AB 52) amended PRC Section 5097.94 and added PRC Sections 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2, and 21084.3.

AB 52 formalizes the lead agency–tribal consultation process, requiring the lead agency to initiate consultation with California Native American groups that are traditionally and culturally affiliated with the project, including tribes that may not be federally recognized. Lead agencies are required to begin consultation prior to the release of a negative declaration, mitigated negative declaration, or environmental impact report.

Section 4 of AB 52 adds Sections 21074(a) and (b) to the PRC, which address tribal cultural resources and cultural landscapes. Section 21074(a) defines tribal cultural resources as one of the following:

1) Sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are either of the following:

   A. Included or determined to be eligible for inclusion in the CRHR.

   B. Included in a local register of historical resources as defined in subdivision (k) of Section 5020.1.

2) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Section 5024.1. In applying the criteria

---

23 California Legislative Information. *Title 14. Malicious Mischief [594-625c], Section 622 ½.* Available online at: https://leginfo.legislature.ca.gov/faces/codes_displaySection.xhtml?lawCode=PEN&sectionNum=622½, accessed August 27, 2019.

set forth in subdivision (c) of Section 5024.1 for the purposes of this paragraph, the lead agency shall consider the significance of the resource to a California Native American tribe.

Section 1(a)(9) of AB 52 establishes that "a substantial adverse change to a tribal cultural resource has a significant effect on the environment." Effects on tribal cultural resources should be considered under CEQA. Section 6 of AB 52 adds Section 21080.3.2 to the PRC, which states that parties may propose mitigation measures "capable of avoiding or substantially lessening potential significant impacts to a tribal cultural resource or alternatives that would avoid significant impacts to a tribal cultural resource." Further, if a California Native American tribe requests consultation regarding project alternatives, mitigation measures, or significant effects to tribal cultural resources, the consultation shall include those topics (PRC Section 21080.3.2[a]). The environmental document and the mitigation monitoring and reporting program (where applicable) shall include any mitigation measures that are adopted (PRC Section 21082.3[a]).

Executive Order B-10-11

Executive Order B-10-11 establishes the states policy regarding Native American groups, including the recognition of their sovereign rights, and the states desire that all agencies subject to executive control is to encourage the communication and consultation with California Native tribes. Furthermore, in order to implement this policy, it created the position of Governor's Tribal Advisor as part of the Office of the Governor of California. This position was established to serve as the direct link between the Governor's Office and the numerous tribal governments regarding matters of policy, including legislation and regulation.

3.5.3.3 Local

County General Plans

In addition to federal and state regulations, cities and counties in the SCAG region may also provide regulatory protection and advisement regarding cultural resources (**Table 3.5-6, County Policies and Ordinances Relevant to the SCAG Region**). California law requires that a general plan include seven elements (land use, open space, conservation, housing, circulation, noise, and safety). Many jurisdictions incorporate policies related to cultural and historical resources into the conservation element. Other jurisdictions choose to prepare a separate (optional) element dealing with cultural and/or historic preservation issues. Many jurisdictions also prepare ordinances addressing cultural resources and historic preservation.

Table 3.5-6
County Policies and Ordinances Relevant to the SCAG Region

County	County Policies and Ordinances
Imperial	Conservation and Open Space Element of General Plan **Policy Numbers:** Only one policy, Section IV.B.2 **Policies Specific to Archaeological Resources:** Yes, brief **Policies Specific to Paleontological Resources:** No **Policies Specific to Historic Resources:** No
Los Angeles	Chapter 9: Conservation and Natural Resources Element of General Plan **Policy Numbers:** C/NR 14.1 – C/NR 14.6 **Policies Specific to Archaeological Resources:** Yes, very brief **Policies Specific to Paleontological Resources:** Yes, very brief **Policies Specific to Historic Resources:** Yes, very brief
Orange	Chapter VI: Resources Element of General Plan **Policy Numbers:** Goals 1, 2 and 3, each with multiple policy numbers **Policies Specific to Archaeological Resources:** Yes, extensive **Policies Specific to Paleontological Resources:** Yes, extensive **Policies Specific to Historic Resources:** Yes, extensive
Riverside	Chapter 5: Multipurpose Open Space Element of General Plan **Policy Numbers:** 19.1 – 19.9 **Policies Specific to Archaeological Resources:** Yes, brief **Policies Specific to Paleontological Resources:** Yes, brief **Policies Specific to Historic Resources:** Yes
San Bernardino	Conservation Element (Subchapter C2) of General Plan **Policy Numbers:** CO 3.1 – CO 3.5 **Policies Specific to Archaeological Resources:** No – together with historic resources, extensive **Policies Specific to Paleontological Resources:** Yes, extensive **Policies Specific to Historic Resources:** No – together with archaeological resources, extensive
Ventura	Chapter 1: Resources (Subchapter 1.8) of General Plan **Policy Numbers:** 1 – 6 **Policies Specific to Archaeological Resources:** Yes, Policies 1-3 **Policies Specific to Paleontological Resources:** Yes, Policies 4 & 5 **Policies Specific to Historic Resources:** Yes, Policy 6

City General Plans and Ordinances

In accordance with Sections 65560 (g) and (i) of the California Government Code, like the six counties in the SCAG region, all cities are required to have a conservation element and an open space element, as mandatory elements of their general plans.[24] Many city general plans have provisions for historic

[24] California Legislative Information. *Article 10.5. Open-Space Lands [65560-65570], Section 65560.* Available online at: https://leginfo.legislature.ca.gov/faces/codes_displaySection.xhtml?lawCode=GOV&sectionNum=65560, accessed August 27, 2019.

districts and protection of locally important cultural resources that may or may not meet the criteria for eligibility for listing in the NRHP or CRHR.

3.5.4 THRESHOLDS OF SIGNIFICANCE

In accordance with Appendix G of the *State CEQA Guidelines*, the Plan would have a significant impact related to cultural resources if it would:

- Cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5;
- Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5; and/or
- Disturb any human remains, including those interred outside of dedicated cemeteries.

3.5.5 METHODOLOGY

Cultural Resources have been evaluated in accordance with Appendix G of the *State CEQA Guidelines*. Cultural resources within the SCAG region were evaluated at a programmatic level of detail, in relation to the general plans of the six counties and 191 cities within the SCAG region.

The methodology for determining the significance of cultural impacts compares the existing conditions to the future (2045) Connect SoCal conditions, as required by *CEQA Guidelines* Section 15126.2(a). The known historical, and archaeological resources located within the SCAG region were evaluated using the criteria set forth by the OHP, the California Register of Historic Resources, and the *State CEQA Guidelines*. The research analysis for archeological and historic was limited to state and federally recognized resources and landmarks, consistent with the definitions provided in Section 15064.5 of the *State CEQA Guidelines*.

All of the counties within the SCAG region are rich with fossil-bearing sedimentary formations and have been documented to contain historic and archaeological sites. All areas within the region have the potential for yielding yet undiscovered paleontological and archaeological resources. The development of new transportation facilities may affect archaeological resources, primarily through the disturbance of buried resources. Frequently, these resources are previously unidentified.

Nearly 50,000 archaeological resources have been identified in the SCAG region (see **Table 3.5-1**). Each of these sites is documented at an Archaeological Information Center, which holds location information on archaeological sites for each region in California. These known resources are limited to areas that have subject to various levels of research or investigation. Areas that have been subject to pedestrian surveys

or sub-surface explorations represent only a fraction of the total area with the potential to yield such resources. Therefore, the analysis focuses on the potential for major transportation projects to necessitate ground-disturbing activities in areas where significant archeological resources have been previously recorded or require work in sediments that have not been previously investigated.

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743, or SB 226 (as described in **Section 1.0 Introduction**), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.5.6 IMPACT ANALYSIS

Impact 3.5-1 **Cause a substantial adverse change in the significance of a historical resource pursuant to § 15064.5.**

Significant and Unavoidable Impacts – Mitigation Required.

The Plan has the potential to effect more than 1,000 historical resources in the SCAG region, including the 1,123 sites listed in the NRHP (**Table 3.5-2** and **Appendix 3.5)**; 29 sites listed in the NHL (**Table 3.5-3** and **Appendix 3.5**); 226 sites listed in the CHL (**Table 3.5-4** and **Appendix 3.5)**; and 284 listed in the CPHI (**Table 3.5-5** and **Appendix 3.5**). In addition to historical sites that have been recognized in federal and state lists, there is the potential for the Plan to affect unrecognized historical resources (structures that exist whose historic value has not previously been assessed or documented). In more remote areas, or areas not previously subject to any type of survey, structures of historic importance may not be currently listed on state or federal registers. In urban areas some jurisdictions have not undertaken a detailed inventory of potential resources. In addition, over time, additional resources become eligible to be identified as historic. Therefore, potential exists for the Plan to affect unrecognized historical resources throughout the region.

In instances where buildings 50 years or older are located on or adjacent to a project site, it is important to evaluate these structures, in accordance with professional standards, as potential historical resources, to determine if they meet the criteria that would make them eligible for the NRHP or the CRHR. In general, it is recommended that, depending on circumstances, for new construction, the evaluation of the

potential for indirect and direct impacts to historical resources should extend 1,000 feet from new construction. However, the geography and circumstance of each site will affect the appropriate means and protocols for evaluation.

Projects that would have the potential to cause an impact to historical resources include transportation projects that entail the development of new lanes, tracks, arterials, or interchanges that may require the acquisition of new right-of-ways, as well as development projects influenced by the land use strategies in the Plan. Such projects may result in direct demolition of historical resources or more indirect impacts such as changing the aesthetic context of the resource and/or increasing levels of corrosive air contaminants that affect historical features, and/or project construction activity that can result in vibrations that damage to fragile buildings.

Transportation projects proposed in existing "rights of way," such as high-occupancy vehicle (HOV) lanes, high- occupancy toll (HOT) lanes, bus rapid transit (BRT) and goods movement capacity enhancement projects, mixed flow lanes, and "right of way" maintenance (such as pot-hole repair) would have a limited potential to result in an impact to historic resources because they result in changes to existing facilities within an existing impact footprint. In circumstances where widening would occur, there would be greater potential for impacts, for example, by changing the view of a resource.

The Plan includes regional land use and transportation strategies that if implemented, may focus new growth in urbanized areas such as HQTAs,. These include an expanded transit network, including multiple Metro Rail extensions and the first urban rail services in Orange County (OC Streetcar) and San Bernardino County (Redlands Rail/Arrow). New bus rapid transit and rapid bus routes will be implemented across Los Angeles, Orange, Riverside and San Bernardino Counties. On the land use side, the Plan includes the Regional Housing Supportive Infrastructure Initiatives that will help make it quicker and easier for local jurisdictions to plan and produce needed housing by implementing tax increment finance districts. Many urbanized areas are older urban or suburban town centers where structures of architectural or historical significance are likely to be located. Changes in visual character of a neighborhood both through increases in density and through the addition of new transportation infrastructure (such as elevated transit platforms) could alter the significance of a historical resource. Further, as development is focused in urban areas, there may be pressure to redevelop existing historical resources (or eligible resources) that may be of lower density than new development. Redevelopment of historic properties could result in significant impacts to historical resources.

In summary, construction of transportation projects and development projects anticipated to occur under the Plan could impact the physical and aesthetic integrity of historic buildings and communities. These effects would constitute a significant impact, requiring the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measure

SMM CULT-1: Impacts to cultural resources shall be minimized through cooperation, information sharing, and SCAG's ongoing regional planning efforts such as web-based planning tools for local governments including CA LOTS, and other GIS tools and data services, including, but not limiting to, Map Gallery, GIS library, and GIS applications; and direct technical assistance efforts such as Toolbox Tuesday series and sharing of associated online Training materials. SCAG shall consult with resource agencies such as the National Park Service, Office of Historic Preservation, and Native American Heritage Commission to identify opportunities for early and effective consultation to identify archaeological sites, historical resources, and cemeteries to avoid such resources wherever practicable and feasible and reduce or mitigate for conflicts in compatible land use to the maximum extent practicable.

Project Level Mitigation Measures

PMM CULT-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to historical resources. Such measures may include the following or other comparable measures identified by the Lead Agency:

a. Pursuant to *CEQA Guidelines* Section 15064.5, conduct a record search during the project planning phase at the appropriate Information Center to determine whether the project area has been previously surveyed and whether historical resources were identified.

b. During the project planning phase, retain a qualified architectural historian, defined as an individual who meets the Secretary of the Interior's (SOI) Professional Qualification Standards (PQS) in Architectural History, to conduct historic architectural surveys if a built environment resource greater than 45 years in age may be affected by the project or if recommended by the Information Center.

c. Comply with Section 106 of the National Historic Preservation Act (NHPA) including, but not limited to, projects for which federal funding or approval is required for the individual project. This law requires federal agencies to evaluate the

impact of their actions on resources included in or eligible for listing in the National Register. Federal agencies must coordinate with the State Historic Preservation Officer in evaluating impacts and developing mitigation. These mitigation measures may include, but are not limited to the following:

- Employ design measures to avoid historical resources and undertake adaptive reuse where appropriate and feasible. If resources are to be preserved, as feasible, carry out the maintenance, repair, stabilization, rehabilitation, restoration, preservation, conservation or reconstruction in a manner consistent with the Secretary of the Interior's Guidelines for Preserving, Rehabilitating, Restoring, and Reconstructing Historic Buildings. If resources would be impacted, impacts should be minimized to the extent feasible.

- Where feasible, noise buffers/walls and/or visual buffers/landscaping should be constructed to preserve the contextual setting of significant built resources.

d. If a project requires the relocation, rehabilitation, or alteration of an eligible historical resource, the Secretary of the Interior's Standards for the Treatment of Historic Properties should be used to the maximum extent possible to ensure the historical significance of the resource is not impaired. The application of the standards should be overseen by an architectural historian or historic architect meeting the SOI PQS. Prior to any construction activities that may affect the historical resource, a report, meeting industry standards, should identify and specify the treatment of character-defining features and construction activities and be provided to the Lead Agency for review and approval.

e. If a project would result in the demolition or significant alteration of a historical resource eligible for or listed in the National Register of Historic Places (NRHP), California Register of Historical Resources (CRHR), or local register, recordation should take the form of Historic American Buildings Survey (HABS), Historic American Engineering Record (HAER), or Historic American Landscape Survey (HALS) documentation, and should be performed by an architectural historian or historian who meets the SOI PQS. Recordation should meet the SOI Standards and Guidelines for Architectural and Engineering, which defines the products acceptable for inclusion in the HABS/HAER/HALS collection at the Library of Congress. The specific scope and details of documentation should be developed at the project level in coordination with the Lead Agency.

f. During the project planning phase, obtain a qualified archaeologist, defined as one who meets the SOI PQS for archaeology, to conduct a record search at the appropriate Information Center of the California Historical Resources Information System (CHRIS) to determine whether the project area has been previously surveyed and whether resources were identified.

g. Contact the NAHC to request a Sacred Lands File search and a list of relevant Native American contacts who may have additional information.

h. During the project planning phase, obtain a qualified archaeologist or architectural historian (depending on applicability) to conduct archaeological and/or historic architectural surveys as recommended by the qualified professional, the Lead Agency, or the Information Center. In the event the records indicate that no previous survey has been conducted, the qualified professional or Information Center will make a recommendation on whether a survey is warranted based on the sensitivity of the project area for archaeological resources.

i. If potentially significant archaeological resources are identified through survey, and impacts to these resources cannot be avoided, a Phase II Testing and Evaluation investigation should be performed by a qualified archaeologist prior to any construction-related ground-disturbing activities to determine significance. If resources determined significant or unique through Phase II testing, and avoidance is not possible, appropriate resource-specific mitigation measures should be established by the lead agency and undertaken by qualified personnel. These might include a Phase III data recovery program implemented by a qualified archaeologist and performed in accordance with the OHP's Archaeological Resource Management Reports (ARMR): Recommended Contents and Format and Guidelines for Archaeological Research Designs. Additional options can include 1) interpretative signage, or 2) educational outreach that helps inform the public of the past activities that occurred in this area. Archaeological materials collected from a significant resource should be curated with a recognized scientific or educational repository

j. If a record search or archaeological assessment indicates that the project is located in an area sensitive for archaeological resources, as determined by the Lead Agency in consultation with a qualified archaeologist, retain an archaeological monitor to observe ground disturbing operations, including but not limited to grading, excavation, trenching, or removal of existing features of the subject property. The

archaeological monitor should be supervised by an archaeologist meeting the SOI PQS

k. Conduct construction activities and excavation to avoid cultural resources (if identified). If avoidance is not feasible, further work may be needed to determine the importance of a resource. Retain a qualified archaeologist, and/or as appropriate, a qualified architectural historian who should make recommendations regarding the work necessary to assess significance. If the cultural resource is determined to be significant under state or federal guidelines, impacts to the cultural resource will need to be mitigated.

l. Stop construction activities and excavation in the area where cultural resources are found until a qualified archaeologist can determine whether these resources are significant. If the archaeologist determines that the discovery is significant, it should be curated with a recognized scientific or educational repository.

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce each of the impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and lack of project-specific detail, including project locations and the location of existing historical resources, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to substantial adverse changes in the significance of historical resources could be significant and unavoidable even with implementation of mitigation.

Impact 3.5-2 **Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5.**

Significant and Unavoidable Impacts – Mitigation Required.

Transportation projects and anticipated growth under the Plan have the potential to cause a substantial adverse change in the significance of archaeological resources in the SCAG region, pursuant to *CEQA Guidelines* Section 15064.5, constituting a significant impact.

The OHP defines an archaeological "site" as consisting of three or more related resources discovered in one locality. In the event of archaeological discovery, the resources are collected, documented, and curated at an educational institution, such as a school or a museum. Transportation projects considered in the Plan have the potential to impact the nearly 100,000 archaeological resources in the SCAG region **(Table 3.5-1)**. Many of the more than 100,000 archeological resources may also constitute tribal cultural resources (see **Section 3.18, Tribal Cultural Resources**) and be designated a Native American sacred site. In addition to the archeological sites that have been recognized and listed in federal and state lists, there are many unrecognized archaeological resources. Unrecognized archeological resources are those that have not previously been assessed or documented.

Construction of any new transportation facilities has the potential to impact archaeological resources by changing the context of the resource or directly through disturbing previously undisturbed resources. Changes to existing transportation facilities such as improvements and modifications to existing rights-of-way, such as HOV lanes, HOT lanes, bus-ways and capacity enhancement facilities, mixed flow lanes, other transportation facilities and right-of-way maintenance, would have less potential to impact archaeological resources because these project locations have previously been disturbed. However, it is possible for archaeological resources to be present within or immediately adjacent to disturbed sediments. Activities to increase roadway capacity such as the construction of additional lanes would potentially impact archaeological resources, if it would entail grading, trenching, excavation, and/or soil removal in an area not previously disturbed.

The Connect SoCal Plan also includes land use strategies that focus new growth in urbanized areas that are generally developed and therefore subject to varying levels of disturbance. In most cases the potential for discovering buried archeological resources in previously disturbed areas is low, as any resources that may have existed have likely been either removed or destroyed during previous excavations. Nonetheless, it is possible that some development pursuant to the land use strategies included in the Plan could be expected to occur on previously undisturbed sites. It is also possible that disturbance of archaeological resources could occur where such resource are buried and may not be visible at the ground surface, and in some instances are located below recent development. In such an instance, the potential to disturb previously undiscovered archeological resources would result in similar types of impacts to those described above for transportation facilities and would constitute a significant impact requiring the consideration of mitigation measures.

Construction and implementation of transportation projects contained in the Plan, as well as anticipated growth and land use development have the potential to expose and/or displace archeological resources, constituting a potentially significant impact requiring the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measure

See **SMM CULT-1.**

Project Level Mitigation Measures

See **PMM CULT-1.**

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce each of the impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and lack of project-specific detail, including project locations and the locations of undiscovered archeological resources, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to substantial adverse changes in the significance of archaeological resources could be significant and unavoidable even with implementation of mitigation.

Impact 3.5-3 Disturb human remains, including those interred outside of dedicated cemeteries.

Significant and Unavoidable Impacts – Mitigation Required.

Construction and implementation of transportation projects included in the Connect SoCal Plan would not be expected to disturb human remains within areas being operated as existing formal cemeteries. However, the Plan includes transportation projects that have the potential to disturb human remains interred outside of formal cemeteries or those interred in Native American sacred sites, constituting a significant impact.

Humans have occupied the six-county SCAG region for at least 10,000 years. Although it is not always possible to predict where human remains may occur outside of formal burials, it is possible that excavation and construction activities, regardless of depth, may yield human remains that may not be interred in marked, formal burials. Earthmoving activities for transportation projects would generally be

within 150 feet on either side of any project and could result in a significant impact relative to the discovery of human remains.

Development that focuses new growth in urbanized areas while preserving natural lands may have a potential to encounter human remains as well. The transportation projects and anticipated growth under the Plan would result in 41,546 acres of greenfield land consumed. Although 60 percent of jobs and 73 percent of housing units would be in Growth Priority Areas under the Plan, 16 percent of the new housing would be in a standard suburban pattern that could disturb previously undisturbed resources. Under CEQA, human remains are protected under the definition of archaeological materials as being "any evidence of human activity." Human remains are also protected under NAGPRA, which was enacted to provide protection to Native American graves, as well as culturally affiliated items, associated funerary objects, unassociated funerary objects, sacred objects, and objects of cultural patrimony.

Transportation projects and anticipated growth under the Plan could take place in previously undisturbed or areas with only little previous disturbance, and excavation and soil removal of any kind, irrespective of depth, has the potential to encounter human remains, implementation of the Plan has the potential to disturb previously undiscovered human remains. While existing law strictly governs the procedures to address such remains, due to the volume of transportation projects and growth anticipated to occur under the Plan, it is possible that significant impacts could occur thus requiring the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measure

See **SMM CULT-1.**

Project Level Mitigation Measures

PMM CULT-2: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to human remains. Such measures may include the following or other comparable measures identified by the Lead Agency:.

a. In the event of discovery or recognition of any human remains during construction or excavation activities associated with the project, in any location other than a dedicated cemetery, cease further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until the coroner of the

county in which the remains are discovered has been informed and has determined that no investigation of the cause of death is required.

b. If any discovered remains are of Native American origin:

- Contact the County Coroner to contact the NAHC to designate a Native American Most Likely Descendant (MLD). The MLD should make a recommendation to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with appropriate dignity, the human remains and any associated grave goods. This may include obtaining a qualified archaeologist or team of archaeologists to properly excavate the human remains.

- If the NAHC is unable to identify a MLD, or the MLD fails to make a recommendation within 48 hours after being notified by the commission, or the landowner or his representative rejects the recommendation of the MLD and the mediation by the NAHC fails to provide measures acceptable to the landowner, obtain a culturally affiliated Native American monitor, and an archaeologist, if recommended by the Native American monitor, and rebury the Native American human remains and any associated grave goods, with appropriate dignity, on the property and in a location that is not subject to further subsurface disturbance.

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce each of the impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and lack of project-specific detail, including project locations and the location of undiscovered human remains, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts could be significant and unavoidable even with implementation of mitigation.

3.6 ENERGY

This section of the Program Environmental Impact Report (PEIR) describes the existing conditions related to energy in the SCAG region, identified the regulatory framework with respect to laws and regulations that address energy, and analyzes the significance of the potential energy impacts that could occur from development of the Connect SoCal Plan ("Connect SoCal" or "Plan"). In addition, this PEIR provides regional-scale mitigation measures, as well as project-level mitigation measures to be considered by lead agencies for subsequent, site-specific environmental review to reduce identified impacts as appropriate and feasible.

3.6.1 ENVIRONMENTAL SETTING

3.6.1.1 Definitions

Terms and criteria used in the assessment of energy are described below.

Natural Gas: Natural gas is a naturally occurring hydrocarbon mixture consisting primarily of methane and formed when layers of decomposing carbon material is exposed to intense heat under the Earth's surface over millions of years.

Petroleum: Petroleum is a naturally occurring liquid mixture of hydrocarbons found in geological formations beneath earth's surface and is refined into various types of fuels including gasoline, kerosene, and diesel oil.

Renewable energy: Renewable energy is a form of energy that is collected from renewable resources which are naturally replenishes on a human timescale such as sunlight, wind, rain, tides, waves, and geothermal heat. Renewable energy often provides energy for electricity generation, air and water heating/cooling, transportation, and off-grid energy services.

Acre-Feet: Unit of volume used to reference large-scale water resources, such as reservoirs, aqueducts, canals, and river flows. One acre-foot is equivalent to approximately 326,000 gallons or enough water to cover an acre of land by one foot.

British Thermal Units (Btu): The amount of heat required to raise the temperature of one pound of water by one-degree Fahrenheit.

Therms: Unit of heat equivalent to 100,000 Btu.

Watt: Unit of power equivalent to one joule per second, corresponding to the power in an electric circuit.

Watt-hour: Unit of energy equivalent to one watt of power expended for one hour of time.

3.6.1.2 Energy Supply

Electricity

Electricity produced within California in 2017 was from natural gas (43 percent), renewable resources (30 percent), large hydroelectric (18 percent), nuclear (9 percent), and coal (<1 percent). California uses energy generated in-state and imports electricity from the Southwest or Pacific Northwest of the United States. The State's electric generation mix, based on in-state generation and out-of-state purchases in 2017 was comprised of natural gas (34 percent), renewable resources (29 percent), large hydroelectric (15 percent), coal (4 percent), nuclear (9 percent), and additional unspecific sources of power (9 percent)[1]. In 2017, the total electrical system power generated was 292,039 GWh, which is up about 0.5 percent from 2016's total system electric generation of 290,567 GWh.[2] This results in a per capita electricity use of approximately 7.38 MWh/person/year.[3]

Natural Gas

In 2018, the total natural gas usage across California was 12,638.16 million therms. The six counties making up the SCAG region used approximately 4,600 million therms in 2018, approximately 36% of the state's total usage for the year.[4]

Natural gas production across the country increased with technological advances in horizontal drilling and hydraulic fracking. However, in Southern California, natural gas production has steadily declined. In 2016, Governor Jerry Brown declared a state of emergency in Porter Ranch due to a natural gas leak that sickened people and forced the relocation of approximately 7,000 homes and several schools.[5, 6] In 2018,

it was announced that NRG Energy would close three natural gas plants in Southern California, including: Etiwanda in Rancho Cucamonga, Ormond Beach in Oxnard, and Ellwood in Goleta.[7]

Petroleum Based Fuel

In 2015, 15.1 billion gallons of gasoline (non-diesel) were sold statewide.[8] In 2015, California also reported a total of 29,830,797 registered on-road vehicles, including light-duty cars (54 percent), light-duty trucks (43 percent), and medium and heavy-duty trucks (3.3 percent).[9] In 2015, refineries in the state of California sold approximately 4,341 thousand gallons of gasoline a day, steadily decreasing since peaking at selling 8,452.8 thousand gallons per day in 2006.[10] However, in 2017 and 2018, refinery sales increased to 4,369.6 thousand gallons a day and 4,455.9 thousand gallons per day, respectively.[11]

Nuclear Power

After closure of the San Onofre Nuclear Generating Station (SONGS) in 2012, California has one operating nuclear power plant, Diablo Canyon. Diablo Canyon is located near San Luis Obispo and can generate approximately 2,160 megawatts (MW). The operating license expires in 2024 and Pacific Gas and Electric (PG&E), the owners of the plant, would be required to apply for a new permit in order to extend the license to 2044.[12]

Hydroelectric Power

California has 270 hydroelectric facilities with an installed capacity of 14,009 megawatts (MW). The amount of hydroelectricity varies each year due to snowmelt runoff and rainfall. From 1983 to 2018, the annual average hydroelectric generation was 271.8 GWh. Within the SCAG region, Imperial, Orange, Los

Angeles, Riverside, San Bernardino, Riverside, and Ventura have a combined hydroelectric capacity of 2,596.2 MW.[13]

Renewable Energy

Renewable energy includes biomass, geothermal plants, small hydroelectric (under 30 MW), solar, and wind. In 2018, California produced 63,028 GWh of electricity in renewable energy, 43% of which was solar.[14] California is on the trajectory to meet the goal of 33% renewable energy by 2020 and is working towards achieving 50% renewable energy by 2030.[15] The 2019 Building Energy Efficiency Standards go into effect on January 1, 2020 and will require most new residences to install solar panels which will decrease demand on electrical suppliers.[16]

3.6.1.3 Energy and Water

Water and energy are dependent on one another as water is essential in the production of electricity and electricity is required to pump, treat, and heat water.

In electricity generation, water is essential to hydropower (although hydro power does not result in consumption of water), thermoelectric power plants, as well as oil and gas extraction. In order to decrease thermoelectric power production's reliance on water many coastal power plants are changing from "once-through cooling" methods to "closed-cycle wet cooling" or "dry cooling" in order to reuse water. Moreover, the state's shift toward producing electricity from more renewables will decrease water use as few renewables require water.

California's water system requires electricity and accounts for approximately 20% of the state's total electrical consumption. While California's agricultural sector uses almost four times as much water as cities, cities use most of the water-related energy. Water heating makes up 90% of water-energy use and the pumping, conveying, and treating of water and wastewater make up the remaining 10%. As California moves to increase water efficiency, many measures will in turn reduce energy requirements. As discussed in **Section 3.19.3, Water Supply**, Southern California is increasing local water supply

through investments in desalination and water recycling. While both processes are energy intensive, they would replace a portion of the water being pumped from Northern California, creating an overall decrease in the energy required.[17]

3.6.2 REGULATORY FRAMEWORK

3.6.2.1 Federal

Energy Policy and Conservation Act of 1975

The Energy Policy and Conservation Act of 1975 (EPCA; Public Law 94–163, 89 Stat. 871, enacted December 22, 1975) was enacted for the purpose of serving the nation's energy demands and promoting conservation methods when feasibly obtainable.

The EPCA was amended to:

- Grant specific authority to the President to fulfill obligations of the U.S. under the international energy program;
- Provide for the creation of a Strategic Petroleum Reserve capable of reducing the impact of severe energy supply interruptions;
- Conserve energy supplies through energy conservation programs, and the regulation of certain energy uses;
- Provide for improved energy efficiency of motor vehicles, major appliances, and certain other consumer products;
- Provide a means for verification of energy data to assure the reliability of energy data; and
- Conserve water by improving the water efficiency of certain plumbing products and appliances.[18]

National Energy Act of 1978

In response to the energy crisis in the 1970s, Congress passed the National Energy Act of 1978 (NEA) to establish energy efficiency programs, tax incentives, tax disincentives, energy conservation programs, alternative fuel programs, and regulatory and market-based initiatives.[19] It includes five statutes:

18 US Legal, Inc. *Energy Policy and Conservation*. Available online at: http://energylaw.uslegal.com/energy-policy-and-conservation/, accessed December 13, 2018.

- Public Utility Regulatory Policies Act (PURPA) (Public Law 95–617)
- Energy Tax Act (Public Law 95–618)
- National Energy Conservation Policy Act (NECPA) (Public Law 95–619)
- Power Plant and Industrial Fuel Use Act (Public Law 95–620)
- Natural Gas Policy Act (Public Law 95–621)

Of the five statutes, one, PURPA, is relevant to the consideration of the Plan and is therefore discussed in detail below.

Public Utility Regulatory Policies Act of 1978 (PURPA)

PURPA was passed in response to the unstable energy climate of the late 1970s. PURPA sought to promote conservation of electric energy. Additionally, PURPA created a new class of nonutility generators, small power producers, from which, along with qualified cogenerators, utilities are required to buy power.

PURPA was in part intended to augment electric utility generation with more efficiently produced electricity and to provide equitable rates to electric consumers. Utility companies are required to buy all electricity from "Qfs" (qualifying facilities) at avoided cost (avoided costs are the incremental savings associated with not having to produce additional units of electricity). PURPA expanded participation of nonutility generators in the electricity market, and demonstrated that electricity from nonutility generators could successfully be integrated with a utility's own supply. PURPA requires utilities to buy whatever power is produced by Qfs (usually cogeneration or renewable energy). Utilities want these provisions repealed, critics argue that it will decrease competition and impede development of the renewable energy industry. The Fuel Use Act (FUA) of 1978 (repealed in 1987) also helped Qfs become established. Under FUA, utilities were not allowed to use natural gas to fuel new generating technologies but Qfs which were by definition not utilities, were able to take advantage of abundant natural gas and abundant new technologies (such as combined cycle). The technologies lowered the financial threshold for entrance into the electricity generation business as well as shortened the lead time for constructing new plants.[20]

20 *Public Utility Regulatory Policies Act of 1978*. Available online at: https://www.usbr.gov/power/legislation/purpa.pdf, accessed August 28, 2019.

Energy Policy Act of 1992

The Energy Policy Act (Public Law 102-486; abbreviated as EPACT92) is a United States government act. It was passed by Congress and set goals, created mandates, and amended utility laws to increase clean energy use and improve overall energy efficiency in the United States. EPACT92 established regulations requiring certain federal, state, and alternative fuel provider fleets to build an inventory of alternative fuel vehicles. It was amended several times in the Energy Conservation and Reauthorization Act of 1998 and in 2005 via the Energy Policy Act in 2005, which emphasized alternative fuel use and infrastructure development.[21]

Energy Policy Act of 2005

On August 8, 2005, President George W. Bush signed the National Energy Policy Act of 2005 (Public Law 109-58) into law. This comprehensive energy legislation contains several electricity-related provisions that aim to:

- Help ensure that consumers receive electricity over a dependable, modern infrastructure;
- Remove outdated obstacles to investment in electricity transmission lines;
- Make electric reliability standards mandatory instead of optional; and
- Give Federal officials the authority to site new power lines in DOE-designated national corridors in certain limited circumstances.

The Renewable Fuel Standard (RFS) program was created under the Energy Policy Act (EPAct) of 2005 and established the first renewable fuel volume mandate in the United States. The program regulations were developed in collaboration with refiners, renewable fuel producers, and many other stakeholders. As required under EPAct, the original RFS program (RFS1) required 7.5 billion gallons of renewable fuel to be blended into gasoline by 2012.[22]

Energy Independence and Security Act of 2007

The Energy Independence and Security Act (EISA; Public Law 110-140) was signed into law by President George W. Bush on December 19, 2007. The Act's goal is to achieve energy security in the United States by increasing renewable fuel production, improving energy efficiency and performance, protecting

21 U.S. Department of Energy, Alternative Fuels Data Center. Key Federal Legislation. Available online at: http://www.afdc.energy.gov/laws/key_legislation, accessed December 13, 2018.

22 Government Publishing Office. *Energy Policy Act of 2005*. Available online at: https://www.govinfo.gov/content/pkg/PLAW-109publ58/pdf/PLAW-109publ58.pdf, accessed August 28, 2019.

consumers, improving vehicle fuel economy, and promoting research on greenhouse gas capture and storage. Under the EISA, the RFS program (RFS2) was expanded in several key ways:

- EISA expanded the RFS program to include diesel, in addition to gasoline.
- EISA increased the volume of renewable fuel required to be blended into transportation fuel from 9 billion gallons in 2008 to 36 billion gallons by 2022.
- EISA established new categories of renewable fuel, and set separate volume requirements for each one.
- EISA required EPA to apply lifecycle greenhouse gas performance threshold standards to ensure that each category of renewable fuel emits fewer greenhouse gases than the petroleum fuel it replaces.

RFS2 lays the foundation for achieving significant reductions of greenhouse gas emissions from the use of renewable fuels, for reducing imported petroleum, and encouraging the development and expansion of our nation's renewable fuels sector.

The EISA also includes a variety of new standards for lighting and for residential and commercial appliance equipment. The equipment includes residential refrigerators, freezers, refrigerator-freezers, metal halide lamps, and commercial walk-in coolers and freezers. [23]

Moving Ahead for Progress in the 21st Century

MAP-21 (Public Law 112-141) is the nation's surface transportation program and extended the provisions for fiscal year (FY) 12 with new provisions for FY 13. MAP-21 funded surface transportation programs at over $105 billion for FY 2013 and FY 2014. It was intended to create a streamlined, performance-based, and multimodal program to address challenges facing the U.S. transportation system. These challenges include improving safety, maintaining infrastructure condition, reducing traffic congestion, improving efficiency of the system and freight movement, protecting the environment, and reducing delays in project delivery. MAP-21 addresses economic growth, accessibility, social equity, energy security and public health by setting transparent performance benchmarks.[24]

After MAP-21 funding ended in FY 2014, President Obama issued the Fixing America's Surface Transportation Act (Fast Act) that largely maintains the MAP-21 program structure and funding shares and will continue to be implemented by the Federal Motor Carrier Safety Administration.[25,26]

Heavy-Duty National Program

The Heavy-Duty National Program was adopted on August 9, 2011, to establish the first fuel efficiency requirements for medium- and heavy-duty vehicles beginning with the model year 2014.[27]

Final Rule: Phase 2 Greenhouse Gas Emissions Standards and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles

In June 2015, the U.S. Environmental Protection Agency (EPA) and the Department of Transportation's National Highway Traffic Safety Administration (NHTSA) jointly proposed a national program that established the next phase of greenhouse gas (GHG) emissions and fuel efficiency standards for medium- and heavy-duty vehicles. The Phase 2 program significantly reduces carbon emissions and improves the fuel efficiency of heavy-duty vehicles, helping to address the challenges of global climate change and energy security. In October 2016, the final rule was published, and anticipates saving the heavy duty vehicle industry billions of dollars' worth of fuel, reducing the cost of transporting goods, cutting fuel consumption, and reducing GHG emissions by 1 billion metric tons. Fuel consumption of tractor trailers alone is anticipated to decrease by 24 percent. The Phase 2 standards, which begin in the model year 2021 (model year 2018 for trailers and 2021 for NHTSA's trailer standards) and culminate in standards for model year 2027, are the product of a comprehensive assessment of existing and advanced technologies and extensive stakeholder outreach.[28]

Executive Order 13514, Federal Leadership in Environmental, Energy, and Economic Performance

Executive Order (EO) 13514 was signed by President Obama on October 5, 2009. It expands on the energy reduction and environmental performance requirements for federal agencies identified in EO 13423, Strengthening Federal Environmental, Energy, and Transportation Management. The goals of EO 13514 are as follows:

- Reduce petroleum consumption by 2% per year through FY2020 (applies to agencies with fleets of more than 20 vehicles) (Baseline FY2005).
- Reduce by 2% annually:
  - Potable water intensity by FY2020 (26% total reduction) (Baseline FY2007).
  - Industrial, landscaping, and agricultural water intensity by FY2020 (20% total reduction) (Baseline FY2010).
- Achieve 50% or higher diversion rate:
  - Non-hazardous solid waste by FY2015.
  - Construction and demolition materials and debris by FY2015.
- Ensure at least 15% of existing buildings and leases (>5,000 gross square feet) meet the Guiding Principles by FY2015, with continued progress towards 100%.
- Ensure 95% of all new contracts, including non-exempt contract modifications, require products and services that are energy-efficient, water-efficient, bio-based, environmentally preferable, non-ozone depleting, contain recycled-content, non-toxic or less-toxic alternatives.[29]

Executive Order 13693, Planning for Federal Sustainability in the Next Decade

EO 13693 was signed by President Obama on March 19, 2015 and revoked EO 13514. The goal of EO 13693 is to maintain federal leadership in sustainability and GHG emissions reductions. EO 13693 promotes building energy conservation, efficiency, and management by reducing agency building energy intensity measured in British thermal units per gross square foot by 2.5 percent annually through the end

[29] The White House President Barack Obama. 2009. *Executive Order 13514 Focused on Federal Leadership in Environmental, Energy, and Economic Performance*. Available online at: https://obamawhitehouse.archives.gov/the-press-office/president-obama-signs-executive-order-focused-federal-leadership-environmental-ener, accessed August 28, 2019.

of FY 2025, relative to the baseline of the agency's building energy use in FY 2015 and taking into account agency progress to date. EO 13693 also sets agency water use efficiency standards and management practices as well as mandates a fleet-wide per-mile GHG emissions reduction from agency fleet vehicles.[30]

Executive Order 13834, Efficient Federal Operations

President Trump issued EO 13834 on May 17, 2018 which revokes EO 13693. EO 13834 confirms that it is US policy that Federal agencies meet energy and environmental performance statutory requirements in order to increase efficiency, optimize performance, eliminate unnecessary use of resources, and protect the environment and includes the following goals for the agencies:

- Achieve and maintain annual reductions in building energy use and implement energy efficiency measure that reduce costs;
- Meet statutory requirements relating to the consumption of renewable energy and electricity;
- Reduce potable and non-potable water consumption, and comply with stormwater management requirements;
- Utilize performance contracting to achieve energy, water, building modernization, and infrastructure goals;
- Ensure that new construction and major renovation conform to applicable building energy efficiency requirements and sustainable design principles; consider building efficiency when renewing or entering into leases; implement space utilization and optimization practices; and annually assess and report on building conformance to sustainability metrics;
- Implement waste prevention and recycling measures and comply with all Federal requirements with regard to solid, hazardous, and toxic waste management and disposal;
- Acquire, use, and dispose of products and services, including electronics, in accordance with statutory mandates for purchasing preference, Federal Acquisition Regulation requirements, and other applicable Federal procurement policies; and

30 Government Publishing Office. 2015. *Planning for Federal Sustainability in the Next Decade*. Available online at: https://www.govinfo.gov/content/pkg/CFR-2016-title3-vol1/pdf/CFR-2016-title3-vol1-eo13693.pdf, accessed August 28, 2019.

- Track and report on energy management activities, performance improvements, cost reductions, greenhouse gas emissions, energy and water savings, and other appropriate performance measures.[31]

Clean Air Act Waiver for California's GHG Emission Standards for New Motor Vehicles

Due to the unique topography and rapid population increase within the Los Angeles basin, federal standards may not be effective enough to meet clean air standards, therefore the state was granted the ability to create stricter standards than set by the CAA. Utilizing the ability to set stricter emission standards, California was granted a waiver of the CAA in July 2009 so that the state may set its own vehicle emission standards for new motor vehicles in order to reduce GHG and ozone emissions.[32] In 2018, the Trump administration announced that the government would ease the federal vehicle fuel standards. As a response, and as a result of the autonomy provided by this waiver, California along with four major antimanufacturing companies pledged to produce vehicle fleets averaging approximately 50 miles per gallon (mpg) by 2026.

On September 19, 2019, under the Safer, Affordable, Fuel-Efficient (SAFE) Vehicles Rule, the U.S. Department of Transportation's National Highway Traffic Safety Administration (NHSTA) and the U.S. EPA issued the final "One National Program Rule." The rule states that federal law preempts state and local laws regarding tailpipe GHG emissions standards, zero emissions vehicle mandates, and fuel economy for automobiles and light duty trucks. The rule revokes California's Clean Air Act waiver and preempts California's Advanced Clean Car Regulations and may potentially impact SCAG's Connect SoCal and transportation projects in the SCAG region.[33, 34]On September 20, 2019, California, a coalition of 22 other states, and the cities of Los Angeles, New York and Washington, D.C., filed a lawsuit in the United States District Court for the District of Columbia (Case 1:19-cv-02826) challenging the SAFE Rule

and arguing that EPA lacks the legal authority to withdraw the California waiver. As such, at the time of this PEIR, it is unclear whether the SAFE Rule will remain in place.[35]

Code of Federal Regulations Chapter 40, Parts 1039, 1065, and 1068

The Code of Federal Regulations established tiered emissions standards for construction equipment in order to phase in cleaner burning equipment that will reduce NOx and particulate matter emissions from exhaust. After 2014, all construction equipment manufactured in the US is required to meet the highest tier of emission standards, Tier 4. The U.S. EPA oversees the implementation of these regulations.[36]

3.6.2.2 State

Assembly Bill 2076, Reducing Dependence on Petroleum

The California Energy Commission (CEC) and California Air Resources Board (CARB) are directed by law, AB 2076 (2000), to develop and adopt recommendations for reducing dependence on petroleum. A performance-based goal is to reduce petroleum consumption to 15 percent below 2003 demand by 2020. The options include the following:[37]

Mid-Term Options (could be fully implemented in the 2010–2020 timeframe):

- Double fuel efficiency of current model light duty vehicles to 40 miles/gallon; and
- Use natural gas-derived Fischer-Tropsch fuel as a 33 percent blending agent in diesel.

Long-Term Options:

- Introduce fuel cell light duty vehicles in 2012, increasing to 10 percent of new vehicle sales by 2020, and 20 percent by 2030.

---

35 If the SAFE Rule remains in place, the State and region would have to develop other means of achieving the NAAQS.

36 U.S. EPA. 2018. *Regulations for Emissions from Heavy Equipment with Compression-Ignition (Diesel) Engines*. Available online at: https://www.epa.gov/regulations-emissions-vehicles-and-engines/regulations-emissions-heavy-equipment-compression, accessed September 26, 2019.

37 State of California Air Resources Board. 2003. *Notice of Public Meeting to Consider Adoption of Recommendations to Reduce California's Dependence on Petroleum*. Available online at: https://ww3.arb.ca.gov/regact/petdeprpt.htm, accessed August 28, 2019.

Recommendations include:[38]

- The Governor and Legislature should adopt the recommended statewide goal of reducing demand for on-road gasoline and diesel to 15 percent below the 2003 demand level by 2020 and maintaining that level for the foreseeable future;

- The Governor and Legislature should work with the California delegation and other states to establish national fuel economy standards that double the fuel efficiency of new cars, light trucks and SUVs; and

- The Governor and Legislature should establish a goal to increase the use of non-petroleum fuels to 20 percent of on-road fuel consumption by 2020 and 30 percent by 2030.

Since this bill was passed, California has set stricter standards for many of the goals laid out in AB 2076. For example, in January 2018, Governor Jerry Brown issued Executive Order B-48-18 that guarantees $2.5 billion dollars to help Californian's buy electric vehicles and expand a network of charging stations in order to have 5 million electric cards on the road by 2030.[39] Moreover, as stated above, see **Section 3.6.2.1, Federal Regulations**, California worked with four major automotive manufacturers to announce that the state would have a fleet of vehicles averaging approximately 50 mpg by 2026.[40]

Warren-Alquist Act

The Warren-Alquist Act was passed in 1974 in order to establish the California Energy Commission to respond to the energy crisis in the early 1970's and to address the state's unsustainable growing demand for energy resources. The Energy Commission's Chief Counsel's Office publishes updated versions of the Warren-Alquist Act every two years. The most recent version was approved in February 2019.[41]

Senate Bill 1368, Greenhouse Gas Emissions Performance Standard for Major Power Plant Investments

SB 1368 was passed in September 2006 and requires the CEC to develop and adopt by regulation a GHG emissions performance standard for long-term procurement of electricity by local publicly owned utilities.[42]

Assembly Bill 32: Global Warming Solutions Act

Governor Arnold Schwarzenegger signed AB 32 (Global Warming Solutions Act) into law on September 27, 2006, requiring that the CARB reduce GHG emissions by 25 percent by 2020. In the interim, CARB will begin to measure the GHG emissions of the industries it determines to be significant emitters. The bill also provides the governor the ability to invoke a safety valve and suspend the emissions caps for up to one year in the case of an emergency or significant economic harm. Pursuant to AB 32, CARB must adopt regulations to achieve the maximum technologically feasible and cost-effective GHG emissions reductions. The full implementation of AB 32 will help mitigate risks associated with climate change, while improving energy efficiency, expanding the use of renewable energy resources, cleaner transportation, and reducing waste.

AB 32 requires CARB to develop a Scoping Plan which lays out California's strategy for meeting the goals. The Scoping Plan must be updated every five years. In December 2008, CARB approved the initial Scoping Plan, which included a suite of measures to sharply cut GHG emissions. The most recent Climate Change Scoping Plan Update was published in January 2017 and highlights California's progress toward meeting the near-term 2020 GHG emissions reduction goals, highlights the latest climate change science, and provides direction on how to achieve long-term emission reduction goal described in EO S-3-05. As energy is one of the state's largest contributors to GHG emissions, efforts to reduce energy-related emissions are a key component of the Scoping Plan. The actions outlined in the Update also support California's efforts to build a state-of-the-art energy generation, supply and distribution system that is clean, affordable and reliable. A core element of the Update is the effort to reduce greenhouse gas emissions, specifically through low carbon energy, waste and water management, and sustainable agriculture, transportation and industry. [43]

---

42 California Legislative Information. *Senate Bill No. 1368*.

43 California Legislative Information. *Assembly Bill No. 32*.

Senate Bill 32 (SB 32) and Assembly Bill 197 (AB 197)

On September 8, 2016, California signed into law Senate Bill 32 (SB 32), which adds Section 38566 to the Health and Safety Code and requires a commitment to reducing statewide GHG emissions by 2020 to 1990 levels and by 2030 to 40 percent less than 1990 levels.[44] SB 32 was passed with companion legislation AB 197 Chapter 250, Statutes of 2016), which provides greater legislative oversight of CARB's GHG regulatory programs, requires CARB to account for the social costs of GHG emissions, and establishes a legislative preference for direct reductions of GHG emissions.[45]

Assembly Bill 1007, Alternative Fuels Plan

The Alternative Fuels Plan adopted in 2007 by the State Energy Resources Conservation and Development Commission and the State Air Resources Board as required under state law, AB 1007, recommends that the governor set targets on a gasoline gallon equivalent basis for use of 10 different alternative motor fuels in the on-road and off-road sectors by nine percent by 2012, which has been achieved, and 11 percent by 2017 and 26 percent by 2022. These targets do not apply to air, rail or marine fuel uses. These goals will require a dramatic expansion in the use of such fuels as electricity, compressed natural gas, hydrogen, renewable diesel, bio-diesel and ethanol in motor vehicles.

Also built into the Alternative Fuels Plan, is a multi-part strategy to develop hybrid and electric vehicle technologies; build the infrastructure to deliver the alternative fuels; increase the blending of more biofuels into gasoline and diesel; improve the fuel efficiency of vehicles; and reduce vehicle miles traveled by California motorists with more effective land use planning.[46]

Assembly Bill 758 Energy: Energy Audit

New state law promulgated under AB 758 mandates the California Energy Commission (CEC) to develop a comprehensive energy efficiency program for existing buildings. This bill will be implemented in three phases. In phase I, during the American Recovery and Reinvestment Act of 2009 (ARRA) implementation period (2010–2012), the CEC used ARRA funds to do state and local upgrade programs, workforce training, financing, and an outreach campaign. The CEC published the Comprehensive Energy Efficiency Program for Existing Buildings Scoping Report and adopted the AB 758 Action Plan. Phase II will focus on implementing the roadmap necessary for foundational No Regrets Strategies to take hold and Voluntary Pathways to scale to achieve energy efficiency goals, partnerships, and market development.

---

44 California Legislative Information. 2016. *Senate Bill 32.*

45 California Legislative Information. 2016. *Assembly Bill 197*. 2019.

46 California Legislative Information. *Assembly Bill No. 1007*..

Phase III will develop and institute Mandatory Approaches that will move energy efficiency practices into the mainstream. Transformation and maturation of the energy efficiency marketplace will require the formation of partnerships and cooperation among all stakeholders.[47]

On December 14, 2016, the CEC published the updated version of the Existing Buildings Energy Efficiency Action Plan. The Plan provides a 10-year roadmap to activate market forces and transform California's existing residential, commercial, and public building stock into high-performing and energy-efficient buildings. The results of this effort will be accelerated growth of energy efficiency markets, more effective targeting and delivery of building upgrade services, improved quality of occupant and investor decisions, and vastly improved performance of California's buildings. Equally important, this effort will deliver substantial energy savings and greenhouse gas emissions reductions, contributing to the collective goal of reducing the impacts of climate change while improving the resilience of the state's built environment and economy.[48]

Assembly Bill 1493 (2009) / Advanced Clean Cars Program

The Advanced Clean Cars Program under AB 1493 (referred to as Pavley I), requires the California Air Resources Board (CARB) to develop and adopt standards for vehicle manufacturers to reduce GHG emissions coming from passenger vehicles and light-duty trucks at a "maximum feasible and cost effective reduction" by January 1, 2005. Pavley I took effect for model years starting in 2009 to 2016 and Pavley II, which is now referred to as "LEV (Low Emission Vehicle) III GHG" will cover 2017 to 2025.[49]

In January 2012, CARB adopted the Advanced Clean Cars program to extend AB 1493 through model years 2017 to 2025. This program will promote all types of clean fuel technologies such as plug-in hybrids, battery electric vehicles, compressed natural gas (CNG) vehicles, and hydrogen powered vehicles while reducing smog and saving consumers' money in fuel costs. By 2025, when the rules will be fully implemented:

- New automobiles will emit 34 percent fewer global warming gases and 75 percent fewer smog-forming emissions.

47 California Energy Commission. 2012. *Comprehensive Energy Efficiency Program for Existing Buildings Scoping Report*. August. Available online at: http://www.aiacc.org/wp-content/uploads/2013/05/Comp-Ener-Efficiency-Programs-CEC-400-2012-01511.pdf, accessed August 28, 2019.

48 California Energy Commission. 2016. *2016 Existing Buildings Energy Efficiency Plan Update December 2016*.

49 California Air Resources Board. 2017. *Clean Car Standards – Pavley, Assembly Bill 1493*. January. Available online at: http://www.arb.ca.gov/cc/ccms/ccms.htm, accessed December 14, 2018.

- Environmentally superior cars will be available across the range of models, from compacts, to SUVs, pickups and minivans.

- Consumer savings on fuel costs will average $6,000 over the life of the car. The savings more than offsets the average $1,900 increase in vehicle price for the ultra-clean, high-efficiency technology.[50]

Heavy-Duty (Tractor-Trailer) Greenhouse Gas Regulation

In December 2008, CARB adopted a new regulation aimed at reducing GHG emissions by improving the fuel efficiency of heavy-duty tractors pulling 53-foot or longer trailers. Increases in fuel efficiency were achieved through improvements in the aerodynamics of the tractor and trailer as well as the use of low rolling resistance tires. The rule went into effect in 2010 and by the end of 2020 is anticipated to have reduced diesel fuel consumption by 500 million gallons in California and 3.3 billion gallons nationwide.[51]

Senate Bill 2 Renewable Portfolio Standard

California's Renewable Portfolios Standard (RPS), under Senate Bill (SB) 2 of 2011, sets a procurement goal for electricity retail sellers including investor-owned utilities, electric service providers, and community choice aggregators to 33 percent renewable energy sources by 2020. The RPS has three compliance periods: Period 1 (2011–2013), Period 2 (2014–2016), and Period 3 (2017–2020) as intermediate targets before full compliance in 2020. The CEC is responsible for designating electrical generation facilities as renewable energy sources and enforcing RPS.[52]

Part 11 of the California Code of Regulations: Green Building Code

The California Green Building Standards Code, which is Part 11 of the California Code of Regulations, is commonly referred to as the CALGreen Code. The 2008 edition, the first edition of the CALGreen Code, contained only voluntary standards. The 2010 CALGreen Code is a code with mandatory requirements for state-regulated buildings and structures throughout California beginning on January 1, 2011. The code

51 CARB. 2013. *Heavy-Duty (Tractor-Trailer) Greenhouse Gas Regulation*. Available online at: https://ww3.arb.ca.gov/cc/hdghg/hdghg.htm, accessed September 26, 2019.

52 California Public Utilities Commission. *California Renewables Portfolio Standard*. Available online at: http://www.cpuc.ca.gov/PUC/energy/Renewables/, accessed December 14, 2018.

requires building commissioning, which is a process for the verification that all building systems, such as heating and cooling equipment and lighting systems, are functioning at their maximum efficiency.[53]

California Building Energy Efficiency Standards: 2013 Title 24, Part 6 (California Energy Code)

The Code California Energy Code (Title 24, Section 6) was created as part of the California Building Standards Code (Title 24 of the California Code of Regulations) by the California Building Standards Commission in 1978 to establish statewide building energy efficiency standards to reduce California's energy consumption.[54] These standards include provisions applicable to all buildings, residential and nonresidential, which describe requirements for documentation and certificates that the building meets the standards.[55] These provisions include mandatory requirements for efficiency and design of the following types of systems, equipment, and appliances:

- Air conditioning systems
- Heat pumps
- Water chillers
- Gas- and oil-fired boilers
- Cooling equipment
- Water heaters and equipment
- Pool and spa heaters and equipment
- Gas-fired equipment including furnaces and stoves/ovens
- Windows and exterior doors
- Joints and other building structure openings ("envelope")
- Insulation and cool roofs
- Lighting control devices

---

53 CARB. 2018. *Green Building Standards Code*. Available online at: https://ww3.arb.ca.gov/cc/greenbuildings/standards.htm, accessed August 28, 2019.

54 California Energy Commission. 2013 Building Energy Efficiency Standards. Available online at: https://www.energy.ca.gov/title24/2013standards/, accessed December 14, 2018.

55 Ibid.

The standards include additional mandatory requirements for space conditioning (cooling and heating), water heating, and indoor and outdoor lighting systems and equipment in non-residential, high-rise residential, and hotel or motel buildings. Mandatory requirements for low-rise residential buildings cover indoor and outdoor lighting, fireplaces, space cooling and heating equipment (including ducts and fans), and insulation of the structure, foundation, and water piping. In addition to the mandatory requirements, the standards call for further energy efficiency that can be provided through a choice between performance and prescriptive compliance approaches. Separate sections apply to low-rise residential and to non-residential, high-rise residential, and hotel or motel buildings. In buildings designed for mixed use (e.g., commercial and residential), each section must meet the standards applicable to that type of occupancy.

The performance approach set forth under these standards provides for the calculation of an energy budget for each building and allows flexibility in building systems and features to meet the budget. The energy budget addresses space-conditioning (cooling and heating), lighting, and water heating. Compliance with the budget is determined by the use of a CEC-approved computer software energy model. The alternative prescriptive standards require demonstrating compliance with specific minimum efficiency for components of the building such as building envelope insulation R-values, fenestration (areas, U-factor and solar heat gain coefficients of windows and doors) and heating and cooling, water heating and lighting system design requirements. These requirements vary depending on the building's location in the state's 16 climate zones.

California's Building Energy Efficiency Standards are updated on an approximately three-year cycle as technology and methods have evolved. As a result of new law under AB 970, passed in the fall of 2000 in response to the state's electricity crisis, an emergency update of the standards went into effect in June 2001. The CEC then initiated an immediate follow-on proceeding to consider and adopt updated standards that could not be completed during the emergency proceeding. The 2013 Standards went into effect July 1, 2014. The 2016 Standards went into effect on January 1, 2017, and the 2019 Standards go into effect on January 1, 2020 and will continue to improve upon the current Standards for new construction of, and additions and alterations to, residential and nonresidential buildings.[56]

The 2013 Standards focus on several key areas to improve the energy efficiency of newly constructed buildings and additions and alterations to existing buildings, and include requirements that will enable both demand reductions during critical peak periods and future solar electric and thermal system installations.

---

56 California Energy Commission. 2019. *2019 Building Energy Efficiency Standards*. Available online at: https://www.energy.ca.gov/programs-and-topics/programs/building-energy-efficiency-standards/2019-building-energy-efficiency, accessed August 28, 2019.

California Solar Initiative

On January 12, 2006, the California Public Utilities Commission (CPUC) approved the California Solar Initiative (CSI; R.04-03-017), which provides $2.9 billion in incentives between 2007 and 2017. The CPUC oversaw a $2.5 billion program for commercial and existing residential customers, funded through revenues and collected from gas and electric utility distribution rates. Furthermore, the CEC managed $350 million targeted for new residential building construction, utilizing funds already allocated to the CEC to foster renewable projects between 2007 and 2011.

On March 2, 2006, the CPUC opened a proceeding to develop rules and procedures for the California Solar Initiative and to continue consideration of policies for the development of cost-effective, clean, and reliable distributed generation. On August 21, 2006, the governor signed SB 1, which directed the CPUC and the CEC to implement the CSI program consistent with specific requirements and budget limits set forth in the legislation, and directed the CPUC and the CEC to create 3,000 megawatts of new, solar-produced electricity by 2017. In 2017 alone, customers installed 1,262 MW of solar capacity.[57]

California's 2019 Building Energy Efficiency Standards

In December 2018, the California Building Standards Commission gave the final approval to a solar PV requirement mandating all new buildings under three stories tall be equipped with solar systems. The standards officially take effect on January 1, 2020 and include solar installation, battery storage, and improved energy savings through high-performance walls, attics, and windows.[58]

California Cap and Trade Program

CARB adopted the California Cap and Trade Program final regulations on October 20, 2011. An amended regulation was adopted on September 12, 2012, with the first auction for GHG allowances on November 14, 2012. The cap and trade program is a market- based mechanism to reduce GHG emissions in a cost-effective and economically efficient manner. California is the first multi-sector cap and trade program in North America following the northeast Regional Greenhouse Gas Initiative (RGGI) and the European Union Emission Trading Scheme (EU-ETS). It sets a GHG emissions limit that will decrease by 2 percent each year until 2015 and then 3 percent from 2015 to 2020 to achieve the goals set forth in AB 32. The

program initially applied to large electric power plants and large industrial plants, and, in 2015, expanded to include fuel distributors.[59]

CARB's 2017 Update to Climate Change Scoping Plan (November 2017)

CARB's Climate Change Scoping Plan, which functions as a roadmap to achieve the California GHG reductions required by AB 32 and SB 32 through subsequently enacted regulations, is discussed in detail in 3.6, *Greenhouse Gases*. On December 14, 2017, CARB approved the final version of *California's 2017 Climate Change Scoping Plan* (2017 Scoping Plan Update), which outlines the proposed framework of action for achieving California's new SB 32 2030 GHG target: a 40 percent reduction in GHG emissions by 2030 relative to 1990 levels. The 2017 Scoping Plan Update identifies key sectors of the implementation strategy, which includes improvements in low carbon energy, industry, transportation sustainability, natural and working lands, waste management, and water. The Scoping Plan references a 2013 study by the CEC that shows 12 percent of the total energy used in the state is related to water, with 10 percent associated with water-related end uses (e.g., heating, cooling, pressurizing, and industrial processes) and 2 percent associated with energy used by water and wastewater systems (e.g., pump, convey, treat). These figures indicate that the greatest potential for water-related energy savings resides with water end users, while water agencies have a role in improving end-user water conservation and in reducing the energy intensity of their portfolios. SB 350 and other regulations are expected to decarbonize the electricity sector over time, which will in turn reduce the consumption of fossil-fuel-based energy to produce water.[60]

Executive Order S-06-06

Governor Arnold Schwarzenegger signed EO S-06-06 into law on April 25, 2006, which requires the state to meet the following targets regarding bioenergy production and use:[61]

- The state produce a minimum of 20 percent of its biofuel within California by 2010, 40 percent by 2020, and 75 percent by 2050; and

- The state meet a 20 percent target within the established state goals for renewable generation for 2010 and 2020.

Executive Order S-01-07

Governor Schwarzenegger signed EO S-01-07 into law on January 18, 2007, which establishes a statewide goal to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020.[62]

Low Carbon Fuel Standard

Pursuant to EO S-01-07 and AB 32 (discussed in **Section 3.8, Greenhouse Gas**), the California Air Resources Board (CARB) developed the Low Carbon Fuel Standard in order to encourage the use of cleaner low-carbon fuels in California, encourage the production of those cleaner fuels, and therefore, reduce greenhouse gas (GHG) emissions. The program is based on the principle that each fuel has "life cycle" GHG emissions which includes the production, transportation, and consumption of a given fuel. Each fuel is assigned a carbon intensity score, which is then compared to a declining carbon intensity benchmark for each year. Low carbon fuels below the benchmark generate credits, while fuels above the CI benchmark generate deficits. Credits and deficits are denominated in metric tons of GHG emissions. Providers of transportation fuels must demonstrate that the mix of fuels they supply for use in California meets the LCFS carbon intensity standards, or benchmarks, for each annual compliance period. A deficit generator meets its compliance obligation by ensuring that the amount of credits it earns or otherwise acquires from another party is equal to, or greater than, the deficits it has incurred.[63]

Executive Order B-18-12

Governor Edmund G. Brown, Jr., signed EO B-18-12 into law on April 25, 2012, which directs state agencies to reduce their grid-based energy purchases by at least 20 percent by 2018, as compared to a 2003 baseline. Pursuant to EO B-18-12, all new state buildings and major renovations beginning design after 2025 shall be constructed as Zero Net Energy facilities with an interim target for 50 percent of new facilities beginning design after 2020 to be Zero Net Energy. State agencies shall also take measures toward achieving Zero Net Energy for 50 percent of the square footage of existing state-owned building area by 2025. Further, the following measures relevant to energy are required:[64]

---

62 Office of the Governor. 2007. *Executive Order S-01-07*. Available online at: https://ww3.arb.ca.gov/fuels/lcfs/eos0107.pdf, accessed November 1, 2019.

64 California Climate Change. *Executive Order B-18-12*. Available online at: https://www.climatechange.ca.gov/climate_action_team/documents/Executive_Order_B-18-12.pdf, accessed August 28, 2019.

- Any proposed new or major renovation of state buildings larger than 10,000 square feet shall use clean, on-site power generation, such as solar photovoltaic, solar thermal and wind power generation, and clean back-up power supplies, if economically feasible;

- New or major renovated state buildings and build-to-suit leases larger than 10,000 square feet shall obtain LEED "Silver" certification or higher, using the applicable version of LEED;

- New and existing buildings shall incorporate building commissioning to facilitate improved and efficient building operation; and

- State agencies shall identify and pursue opportunities to provide electric vehicle charging stations, and accommodate future charging infrastructure demand, at employee parking facilities in new and existing buildings.

Executive Order B-48-18

On January 26, 2018, Governor Edmund G. Brown, Jr. signed EO-48-18 to boost the use of zero-emission vehicles (ZEVs), electric vehicle charging infrastructure, and hydrogen refueling infrastructure in California. The order will implement the Governor's target of 5 million ZEVs on the road by 2030 and 250,000 vehicle charging stations and 200 hydrogen refueling stations by 2025.[65]

Executive Order B-30-15

EO B-30-15 reiterates a 2050 GHG emissions target of 80 percent below 1990 levels and sets a new interim target of 40 percent below 1990 levels by 2030. It further orders in relevant part: [66]

- CARB to update the Scoping Plan to express the 2030 target in terms of million metric tons of carbon dioxide equivalent;

- CARB to update every three years the state's climate adaptation strategy;

- "State agencies shall take climate change into account in their planning and investment decisions, and employ full life-cycle cost accounting to evaluate and compare infrastructure investments and alternatives;"

66 Office of Governor Edmund G. Brown Jr., *Governor Brown Establishes Most Ambitious Greenhouse Gas Reduction Target in North America*. Available online at: https://www.ca.gov/archive/gov39/2015/04/29/news18938/, accessed August 28, 2019.

- "State agencies' planning and investment shall be guided by the following principles:
  - Priority should be given to actions that both build climate preparedness and reduce greenhouse gas emissions;
  - Where possible, flexible and adaptive approaches should be taken to prepare for uncertain climate impacts;
  - Actions should protect the state's most vulnerable populations; and
  - Natural infrastructure solutions should be prioritized; and
- OPR to establish a technical advisory group to help state agencies incorporate climate change impacts into planning and investment decisions.

Executive Order N-19-19

On September 20, 2019, Governor Newsom issued Executive Order N-19-19 which requires the redoubling of the state's "efforts to reduce greenhouse gas emissions and mitigate the impacts of climate change while building a sustainable, inclusive economy." EO N-19-19 requires the Department of Finance to create a Climate Investment Framework with a strategy to align the state's $700 billion investment portfolio towards industries and sectors that contribute to the reduction of carbon emissions and increased resilience to the impacts of climate change. The State Transportation Agency shall leverage over $5 billion in annual state transportation spending to reduce fuel consumption and GHG emissions associated with the transportation sector. The Department of General Services shall reduce the state government's GHG footprint. Finally, the California Air Resources Board (CARB) shall develop new criteria for the clean vehicle incentive programs, propose new strategies to increase demand for zero emission vehicles, and consider strengthening existing or adopting new transportation-GHG reduction regulations in order to meet California's goal of five million zero emissions vehicle sales by 2030.[67]

Senate Bill 375 (SB 375)

SB 375, adopted in 2008, builds on AB 32, SB 375 (Chapter 728, Statutes of 2008) seeks to coordinate land use planning, housing planning, regional transportation planning, and GHG reductions. SB 375 addresses that reductions can be made through energy conservation and amended Government Code 65583 to

[67] Adaptation Clearinghouse. 2019. *State of California Executive Order N-19-19*. Available online at: https://www.adaptationclearinghouse.org/resources/state-of-california-executive-order-n-19-19.html, accessed October 29, 2019.

ensure the housing element of a sustainable communities strategy provide a proper analysis of energy conservation.[68] See **Section 3.8, Greenhouse Gas,** for further discussion of SB 375.

Senate Bill 350 (SB 350)

SB 350 was approved by Governor Brown on October 7, 2015. SB 350 does the following: (1) increases the standards of the California RPS program by requiring that the amount of electricity generated and sold to retail customers per year from eligible renewable energy resources be increased to 50 percent by December 31, 2030; (2) requires the State Energy Resources Conservation and Development Commission to establish annual targets for statewide energy efficiency savings and demand reduction that will achieve a cumulative doubling of statewide energy efficiency savings in electricity and natural gas final end uses of retail customers by January 1, 2030; (3) provides for the evolution of the Independent System Operator (ISO) into a regional organization; and (4) requires the state to reimburse local agencies and school districts for certain costs mandated by the state through procedures established by statutory provisions. Among other objectives, the Legislature intends to double the energy efficiency savings in electricity and natural gas end uses of retail customers through energy efficiency and conservation.[69]

Senate Bill 100 (SB 100)

Under SB 350, the state of California committed to reaching 50% renewable energy by December 31, 2030. SB 100, also known as "The 100 Percent Clean Energy Act of 2018," revises the goals of SB 350 in order to achieve 50% renewable resources target by December 31, 2026 and achieve a 60% target by December 31, 2030 in order to plan for 100 percent of total retail sales of electricity in California to come from eligible renewable energy and zero-carbon resources by December 31, 2045. The transition to renewable energy resources is intended to provide the following benefits to California:[70]

- Displacing fossil fuel consumption within the state.
- Adding new electrical generating facilities in the transmission network within the West Electricity Coordinating Council (WECC).
- Reducing air pollution, particularly criteria air pollutant emissions and toxic air contaminants, in the state.

---

68 California Legislative Information. 2008. *Senate Bill 375*.

69 California Legislative Information. *Senate Bill No. 350*.

70 California Legislative Information. *Senate Bill No. 100*.

- Meeting the state's climate change goals by reducing emissions of greenhouse gases associated with electrical generation.
- Promoting stable retail rates for electric service.
- Meeting the state's need for a diversified and balanced energy generation portfolio.
- Assisting with meeting the state's resource adequacy requirements.
- Contributing to the safe and reliable operation of the electrical grid, including providing predictable electrical supply, voltage support, lower line losses, and congestion relief.
- Implementing the state's transmission and land use planning activities related to development of eligible renewable energy resources.

3.6.2.3 Regional

Many of the cities and counties within the region address energy in their general plans. Sections devoted to energy or utilities discuss the current state of energy procurement and utilization within specific jurisdictions and the local plans to improve current methods and move towards cleaner, renewable energy sources.

Clean Cities Program

The U.S. Department of Energy's Clean Cities Program promotes voluntary, locally based government/industry partnerships for the purpose of expanding the use of alternatives to gasoline and diesel fuel by accelerating the deployment of alternative fuel vehicles (AFVs) and building a local AFV refueling infrastructure. The mission of the Clean Cities Program is to advance the nation's economic, environmental and energy security by supporting local decisions to adopt practices that contribute to the reduction of petroleum consumption. The Clean Cities Program carries out this mission through a network of more than 80 volunteer coalitions, which develop public/private partnerships to promote alternative fuels and vehicles, fuel blends, fuel economy, hybrid vehicles, and idle reduction.[71]

The Southern California/SCAG Clean Cities Coalition was first designated by the U.S. Department of Energy on March 1, 1996. SCAG directly administers the SCAG Clean Cities Program. This coalition supports government and industry partnerships to expand alternative fuel vehicles and infrastructure throughout the SCAG region.

---

71 U.S. Department of Energy. *Clean Cities Coalition Network*. Available online at: https://cleancities.energy.gov/about/, accessed August 28, 2019.

SCAG Future Communities Framework

The Future Communities Framework was developed to improve data collection, analysis, and application across Southern California. New technologies are critical to policy-making and planning decisions and the Framework presents SCAG with strategic recommendations for addressing big data and new technologies and the potential adoption of innovative policies. Advanced efficiency and innovation are especially critical when considering energy generation and utilization, as the state transitions to a clean energy future. The Framework outlines the potential for SCAG to increase outreach and data sharing with agencies within the region on climate adaptation, environmental, and energy data.

Los Angeles Countywide Sustainability Plan

The Los Angeles Countywide Sustainability Plan, also named OurCounty, is a regional sustainability plan for Los Angeles focused around the following goals:

- **Goal 1**: Resilient and healthy community environments where residents thrive in place;
- **Goal 2:** Buildings and infrastructure that support human health and resilience;
- **Goal 3:** Equitable and sustainable land use and development without displacement;
- **Goal 4:** A prosperous LA County that provides opportunities for all residents and businesses and supports the transition to a green economy;
- **Goal 5:** Thriving ecosystems, habitats, and biodiversity;
- **Goal 6:** Accessible parks, beaches, recreational waters, public lands, and public spaces that create opportunities for respite, recreation, ecological discovery, and cultural activities;
- **Goal 7:** A fossil fuel-free LA County;
- **Goal 8:** A convenient, safe, clean, and affordable transportation system that enhances mobility while reducing car dependency;
- **Goal 9:** Sustainable production and consumption of resources;
- **Goal 10:** A sustainable and just food system that enhances access to affordable, local, and healthy food;

- **Goal 11:** Inclusive, transparent, and accountable governance that facilitates participation in sustainability efforts, especially by disempowered communities;

- **Goal 12:** A commitment to realize OurCounty sustainable goals through creative, equitable, and coordinated funding and partnerships.[72]

3.6.2.4 Local

Many cities within the SCAG region have established green plans or climate action plans (CAPs) that include goals and policies to reduce energy use and the associated emissions to meet AB 32 and SB 32 climate goals. Major cities within the SCAG region that have prepared plans that will reduce energy use include Los Angeles and Riverside, these plans are discussed below.

Los Angeles Green New Deal

In April 2019, Mayor Eric Garcetti announced Los Angeles' Green New Deal to set goals for the city's sustainable future. Los Angeles' Green New Deal commits to uphold the Paris Climate Agreement (see **Section 3.8, Greenhouse Gases**), deliver environment justice through an inclusive green economy, planning to ensure every City resident has the ability to join the green economy, and a determination to lead by example within City government. The goals and targets of the Green New Deal include:

- Building a zero-carbon electricity grid – reaching an accelerated goal of 80% renewable energy supply by 2036 as Los Angeles leads California toward 100% renewable by 2045.

- Creating a Jobs Cabinet to bring city, labor, educations, and business leaders together to support our effort to create 300,000 green jobs by 2035 and 400,000 by 2050.

- Mandating that all new municipally owned building and major renovations be all-electric, effective immediately, and that every building in Los Angeles – from skyscrapers to single-family homes – become emissions free by 2050.

- Achieving a zero-waste future by phasing out Styrofoam by 2021, ending the use of plastic straws and single-use takeout containers by 2028, and no longer sending any trash to landfills by 2050.

- Recycling 100% of our wastewater by 2035; sourcing 70% of our water locally – a significant increase from our existing pathway; and nearly tripling the maximum amount of stormwater captured.

---

72 County of Los Angeles. *Los Angeles Countywide Sustainability Plan*. Available online at: https://ourcountyla.org/wp-content/uploads/2019/07/OurCounty-Final-Plan.pdf, accessed September 12, 2019.

- Planting and maintaining at least 90,000 trees – which will provide 61 million square feet of shade – citywide by 2021 and increasing tree canopy in low-income, severely heat impacted areas by at least 50% by 2028.

The Green New Deal aims to reach a 50% reduction in GHG emissions by 2025 and reach net neutrality by 2050. The Green New Deal builds upon the City's Sustainable City pLAn, in which the City met or exceeded 90% of the City's long-term goals on time or early, resulting in a reduction of GHG emissions by 11% in a single year and creating more than 35,000 green jobs.[73]

City of Riverside Green Action Plan

The City of Riverside's Green Action Plan aims to reduce the City's environmental impact by increasing the City's renewable energy production and reduce the City's GHG emissions, waste, and water consumption. Regarding energy, the Green Action Plan includes goals to install at least 20 megawatts (MW) of photovoltaic systems by 2020, reduce the City's peak electrical load demand by 10%, and meet 33% of electricity demand from renewable sources by 2050.[74]

3.6.3 ENVIRONMENTAL IMPACTS

3.6.3.1 Thresholds of Significance

For purposes of this PEIR, SCAG has determined that adoption of implementation of the Plan could result in significant adverse impacts regarding energy if the Plan would result in any of the following:

- Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation;
- Conflict with or obstruct a state or local plan for renewable energy or energy efficiency

3.6.3.2 Methodology

This section includes a discussion of the potential energy impacts of the proposed policies, programs, and projects included in the Plan, with particular emphasis on avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy, identifies mitigation measures for the impacts, and evaluates the

73 City of Los Angeles. 2019. *Mayor Garcetti Launches L.A.'s Green New Deal*. Available online at: https://www.lamayor.org/mayor-garcetti-launches-la%E2%80%99s-green-new-deal, accessed September 12, 2019.

74 City of Riverside. 2012. *Green Action Plan*. Available online at: https://www.riversideca.gov/utilities/greenriverside/pdf/Green_Action_Plan%202012.pdf, accessed September 12, 2019.

residual impacts. Energy resources, including non-renewable energy consumption, residential and commercial building energy consumption, water-related energy consumption, and transportation related fuel consumption, were evaluated in accordance with Appendix G of the 2019 California Environmental Quality Act (CEQA) Guidelines. In addition, Appendix F, which generally provides direction on how an EIR can address energy and outlines how projects can demonstrate energy conservation was used to guide the analysis.

Estimated energy consumption in the Plan horizon year of 2045 is expected to represent the most conservative (i.e., highest energy consumption of any year in the Plan) because population and employment are projected to be higher in 2045 than in any earlier year, and future conservation efforts may not be fully quantified at this time. Building energy and water consumption were estimated for future horizon year 2045 using SCAGs Urban Footprint Scenario Planning Model (SPM).[75] The SPM is a web-based scenario development, modeling, and data organization tool developed to facilitate informed and collaborative regional planning. Built on open source software platforms, the SPM includes a suite of tools and analytical engines that help to illustrate planning and policy growth scenarios and to estimate and compare, in relatives, potential benefits and effects among scenarios in transportation, environment, fiscal, public health, and community. Moreover, the SPM provides a common data framework within which local planning efforts can be easily integrated and synced with regional plans.

SPM calculates greenhouse gas (GHG) emissions associated with building energy use as a function of energy use and GHG emission rates for electricity generation and natural gas combustion. To correspond with residential and commercial building energy emissions as determined by CARB GHG Inventory, SPM uses a baseline CO_2e emission rate derived by dividing California's total emissions attributed to electric power generation in 2016 by total electricity consumption in that year. Future electricity emissions rates are calculated based on projected resource mix that meets the California Renewables Portfolio Standard (RPS) goal of 50% renewable sources by 2030 and remains unchanged thereafter. Emissions from on-site natural gas combustion are assumed to remain constant at the CPUC-approved baseline rate, which already represents a high level of efficiency.

Water-related energy use and greenhouse gas (GHG) emissions refer to those resulting from two main water-related energy use categories: a) system use, including the transport and treatment of residential water consumed; and b) end uses, including all uses of water that occur within homes (e.g., water heating). SPM calculates energy use and emissions for water system uses only. The per-gallon energy use factors associated with the system uses were estimated by the CEC in a 2005 report, *California's Water-*

75 Southern California Association of Governments. Accessed 30 October 2015. *Scenario Planning Model*. Available at: http://sp.scag.ca.gov/Pages/About.aspx

Energy Relationship, and a 2006 refinement of the report's original factors. The GHG emission rates per kilowatt-hour of water-related electricity use are assumed to be the same as building energy use.

Energy resources within the SCAG region were evaluated at a programmatic level of detail, in relation to the General Plans of six counties and 191 cities within the SCAG region; data available from the U.S. Energy Information Administration (EIA) for California;[76] and review of related literature germane to the SCAG region.

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743, or SB 226 (as described in **Chapter 1.0, Introduction**), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.6.3.3 Impacts and Mitigation Measures

Impact ENR-1 **Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.**

Less than Significant Impact.

Implementation of transportation projects and the land use strategies reflected in the Plan, is not expected to result in wasteful, inefficient, or unnecessary energy consumption. The Plan includes many transportation projects (e.g., bikeway and pedestrian projects, rail projects, transit projects, Transportation System Management [TSM] and Transportation Demand Management [TDM] projects, etc.) that would improve the availability of alternative transportation modes and help reduce VMT, congestion and resultant air pollutants in the SCAG region as compared to a future without Plan implementation (see **Table 3.17-11, Major Transit Capital Projects**; **Table 3.17-12, Daily Transit Boarding**; and **Table 3.17-14, Total VMT 2019 and 2045 by County**). As shown in **Table 2.0-3, Connect SoCal Expenditure (in Billions)**, SCAG has programmed more than $17 billion in active transportation

76 U.S. Energy Information Administration. 2018. *State Profile and Energy Estimates: California.* Available online at: http://www.eia.gov/state/?sid=ca, accessed December 18, 2018.

projects. Beyond reductions in VMT, many of the Plan's transportation projects promote the use and generation of renewable energy reducing the need for fossil fuel energy. For example, the Plan includes the purchase of 170 solar-powered bus information signs in Los Angeles as well upgrades to a Los Angeles Metro maintenance facility with up-to-date date solar panels and a battery storage system.[77] The Plan's transportation projects are integrated with the land use strategies that promote HQTAs, livable corridors, and neighborhood mobility areas. The Plan would result in a reduction of per capita VMT, combined with federal and state policies that require reductions in fossil fuel consumption (see S-06-06 and EO B-48-18), and increased renewable energy use and availability (see EO B-18-12), and increased building efficiency (EO 13834). Therefore, overall energy use would not be wasteful or inefficient.

Construction

Transportation Projects

Construction of transportation projects would result in short-term consumption of energy resulting from the use of construction equipment and processes. In addition, roadway and transit construction materials, such as asphalt, concrete, surface treatments, steel, rail ballast, as well as building materials, require energy to be produced, and would likely be used in projects that involve new construction or replacement of older materials.

Construction of individual transportation projects within the SCAG region as a result of the Plan would use energy resources, such as petroleum fuel to operate off-road construction equipment. The EPA set Tier 4 construction engine standards in order to reduce NOx and particulate matter emissions, however, Tier 4 standards also provide greater energy efficiency and productivity.[78] Construction also requires heavy duty truck trips for vendor trips or to remove grading and demolition debris from individual sites. In order to address greenhouse gas emissions from these heavy-duty trucks, the California Air Resources Board (CARB) set regulations in 2008 to increase the fuel efficiency of heavy-duty trucks through improving the trailer aerodynamics and using low rolling resistance tires (see **Section 3.6.2.2**). This policy is expected to have reduced diesel fuel consumption in heavy duty trucks by 500 million gallons in California from 2010 to 2020.[79] Additionally, in an effort to reduce diesel particulate matter (DPM), NOx, and other criteria air pollutant emissions from vehicles, CARB issued the Truck and Bus Regulation in 2008. The regulation requires nearly all trucks and buses to have 2010 or newer model year engines by

January 1, 2023.[80]

Land Use Development

Similar to transportation projects, construction of development projects would result in short-term consumption of energy resulting from the use of construction equipment. The California Green Building Standards Code (CALGreen Code)[81] includes specific requirements related to recycling, construction materials and energy efficiency standards, which would apply to construction of land use projects, which would help to minimize waste and energy consumption.

Similar to transportation projects, construction of development projects would use energy resources, such as petroleum fuel to operate off-road construction equipment. As noted above, EPA Tier 4 construction engine standards provide greater energy efficiency and productivity.[82]

Growth under the Plan

The SCAG region is anticipated to grow by approximately 3.2 million people over the lifetime of the Plan. Due to increases in per capita petroleum fuel and energy consumption through rising utility prices and efficiency improvements, residential and building energy consumption is expected to decrease. A discussion of residential energy use, building energy use, petroleum usage, and energy and water-related energy consumption with the Plan is provided below:

Daily operation of the regional transportation system uses energy in the form of fuel consumed by propulsion of passenger vehicles (see discussion below) as well as other forms of transportation (buses, planes, ships, and trains). The Plan's transportation projects are not only aimed at reducing VMT (see **Table 13.17-14, Total VMT 2019 and 2045**), the Plan also invests in the expansion of critical highways and road improvements which would increase vehicle capacity, and overall efficiency of the transportation network. Increases in motor vehicle trips are primarily a combined function of population and employment growth. Population growth and growth in VMT would occur within the region regardless of whether the Plan is implemented, but under the Plan more efficient use of the transportation system is

82 Diesel Technology Forum. *About Clean Diesel Construction*. Available online at: https://www.dieselforum.org/about-clean-diesel/construction, accessed September 18, 2019.

anticipated resulting in a lower VMT per capita. The Plan would result in greater availability of public transit and other alternative modes of transportation, such as complete streets and active transportation, that would facilitate a more energy efficient region. The reduction in overall congestion resulting from these service level improvements would reduce fuel consumption and promote fuel efficiency (see analysis of fuel consumption below with respect to anticipated development). New transportation facilities that require energy for operation, such as signal lighting, roadway or parking lot lighting and electronic equipment will increase energy demand. New landscaping irrigation of transportation projects also incrementally increases energy demand through water pumping and treatment. In addition, statewide policies targeted at improving the fuel efficiencies of on-road vehicle petroleum fuel consumption by light, medium , and heavy-duty vehicles are anticipated to result in decreased petroleum use by 2045 (see **Table 3.6-4, SCAG Region Estimated Transportation Fuel Consumption**).

Land Use Development

Residential Energy Use

Growth under the Plan would increase residential energy consumption due to the increase in total households by 2045. It is expected that the SCAG region would add approximately 1.4 million households from 2019 to 2045. The residential energy consumption per household is expected to decline from 56 million British thermal unit (Btu) in 2019 to 44 million Btu in 2045 with implementation of the Plan (**Table 3.6-1, Residential Energy Use and Cost per Household**). Additionally, the Plan includes land use strategies intended to increase sustainable and energy efficient residential development (compact development is more energy efficient). As a result, it is projected that the Plan would result in a 21 percent reduction in per household energy consumption and an estimated 23 percent reduction in residential electricity consumption per household (**Table 3.6-1**). Due to the reductions in per household energy and electricity consumption, the overall energy consumption is expected by decrease by approximately 3 percent.

Table 3.6-1
Residential Energy Use and Cost per Household

	2019	No Project 2045	Plan 2045	% Difference from 2019 to Plan
Residential energy use per household (Btu in millions)	56	45	44	-21%
Residential electricity use per household (kWh)	6,877	5,400	5,270	-23%
Number of households	6,212,000	7,722,000	7,722,000	24%
Residential energy use (Btu in trillions)	350	347	338	-3.4%
Residential energy cost (in billions)	$9.30	$15.60	$15.20	63%

Note: Btu = British thermal unit; kWh = kilowatt-hour
Source: SCAG Modeling, 2019.

Residential energy costs are expected to increase from $9.3 billion in 2019 to $15.2 billion in 2045 across the SCAG region. This represents an approximately $479 increase in household energy costs from 2019 to 2045 (**Table 3.6-2, Residential Energy and Water Cost per Household**). Increased energy costs, despite lower energy use, can be explained by increasing electricity and natural gas per unit costs. **Table 3.6-2** shows there would be an estimated 25 percent increase in household cost compared to the 2019 base year. The total utility cost per household, including both energy and water cost is expected to increase by $498 from 2019 to 2045. Water costs are anticipated to decrease, but do not proportionally decrease as much as energy costs increase.

Table 3.6-2
Residential Energy and Water Cost per Household

	(2019)	2045 No Project	2045 Plan	% Difference from 2019 to Plan
Residential energy cost per household	$1,494	$2,020	$1,973	32%
Residential water cost per household	$403	$409	$392	-3%
Total utilities (energy + water) cost per household	**$1,897**	**$2,429**	**$2,365**	**25%**

Source:
SCAG scenario planning modeling, 2019.
Impact Sciences, 2019

Although the total population is expected to increase by 16 percent over the lifetime of the Plan, the overall energy use is expected to decrease with large increases in per household energy and electricity

efficiency. These increases in efficiency are due in part to California building regulations. For example, by 2020, California will require every new home to be equipped with solar power,[83], [84] therefore all new single family homes and multifamily homes up to three stories in height, constructed over the duration of the Plan will have solar panels. Additionally, the Plan includes strategies to promote transit oriented development, which tends to be more energy efficient as it moves more people per mile. Further, many transit agencies use natural gas, electricity, or other clean energy for their fleet. Finally, increases in energy cost will drive down demand. As such, residential energy use would not be wasteful.

Building Energy Consumption

By 2045, the SCAG region is expected to add approximately 3.2 million people. Due to population growth and the associated development, building energy consumption is projected to increase. The Plan encourages compact land use patterns with a focus on urban infill growth and walkable, mixed-use communities. Mixed-use, walkable, and urban infill development combined with transportation investments that increase active transportation opportunities and improved facilities would be expected to accommodate more growth in more energy-efficient housing types. Examples of energy efficient housing types include townhomes, apartments, and smaller single-family homes, as well as more compact commercial building types. Overall, development under the Plan would result in an increase in total building energy consumption, however, buildings will be more energy efficient in 2045 (**Table 3.6-3, Building Energy Consumption—Residential and Commercial**). Total residential and commercial building energy consumption (electricity and natural gas) is expected to decrease by 2 percent under the Plan (**Table 3.6-3**). The residential sector would use less energy in the future (3 percent decrease); the commercial sector would use the same amount of energy in the future. Since total building energy would decrease under the Plan, the Plan would not result in the wasteful or inefficient use of energy.

---

83 The New York Times. *California Will Require Solar Power for New Homes*. Available online at: https://www.nytimes.com/2018/05/09/business/energy-environment/california-solar-power.html, accessed September 12, 2019.

84 California Energy Commission. 2019. *2019 Building Energy Efficiency Standards for Residential and Nonresidential Buildings*. See Section 110.10. Available online at: https://ww2.energy.ca.gov/2018publications/CEC-400-2018-020/CEC-400-2018-020-CMF.pdf, accessed November 1, 2011.

Table 3.6-3
Building Energy Consumption – Residential and Commercial

	Base Year (2019)	No Plan (2045)	Plan (2045)	% Difference from Base Year
Residential electricity consumed (GWh)	42,722	41,701	40,692	-5%
Residential natural gas consumed (therms in billions)	2	2	2	0%
Residential energy consumed (Btu in trillions)	350	347	338	-3%
Commercial electricity consumed (GWh)	49,881	53,161	50,309	1%
Commercial natural gas consumed (therms in billions)	0.5	0.5	0.5	0%
Commercial energy consumed (Btu in trillions)	221	231	221	0%
Total energy consumed (Btu in trillions)	**571**	**578**	**559**	-2%

Note: GWh = gigawatt-hour; Btu = British thermal unit.
Source: SCAG Scenario Planning Modeling, 2019.

As shown above, total building energy consumed in the SCAG region over the lifetime of the Plan is anticipated to decrease by 2%. According to SCAG, the population in 2019 is approximately 19.3 million people, result in a per capita building energy use 29.5 million Btu/person. The population is estimated to reach 22.5 million people by 2045, resulting in a 2045 per capita building energy use of 24.8 million Btu/person. Therefore, per capita building energy use will decrease by 4.7 million Btu/person. As a result, building energy efficiency will increase.

Petroleum Fuel

Petroleum fuel consumption is associated with energy consumed by cars and other light duty vehicles as a result of people traveling between the various land uses. Fuel consumption is expected to decrease by 19.4 percent from 8.3 billion gallons in 2019 to the projected 6.7 billion gallons in 2045 (**Table 3.6-4, SCAG Region Estimated Transportation Fuel Consumption**).

Table 3.6-4
SCAG Region Estimated Transportation Fuel Consumption

	Fuel Consumed		Percentage Reduction
	Billion Gallons per Year	**Thousand Gallons per Day**	**Compared to 2019**
2019	8.3	22,865	—
2045 No Project	6.9	18,869	-17.5%
2045 Plan	6.7	18,437	-19.4%

Source: SCAG Transportation Modeling, 2019.

As the SCAG region gains employment and population, total VMT will increase (see **Table 3.17-14, Total VMT 2019 and 2045 by County)**. Proposed transportation investments and the land use strategies that encourage carpooling, increase transit use and active transportation opportunities, and promote more walkable and mixed-use communities would help reduce VMT and would reduce per capita VMT but reductions would not be enough to offset total VMT increases. Total VMT would increase in 2045 compared to existing (see **Table 3.17-14**). Despite an increase in total VMT, total fuel consumption would be reduced through improved fuel economy and increased efficiency in the overall network (measured as total hours of delay) (see **Table 3.17-17, Total Daily Vehicle Hours of Delay**), and more alternative fuel and zero emissions vehicle types on the road. In accordance with EO B-48-18, five million ZEV's are expected to be on California roadways in 2030. Additionally, CARB's fuel efficiency regulations have reduced diesel fuel consumption in heavy-duty trucks by 500 million gallons in California from 2010 to 2020 through improvements in tractor and trailer aerodynamics, which would reduce fuel consumption during both the construction and operation of a project.[85] Therefore, the use of petroleum would not be wasteful or inefficient.

Energy and Water-Related Energy Use

Increasing water efficiencies are anticipated to result in a decrease in residential water use in the future. Overall residential and commercial water use in the region is anticipated to decrease by 5 percent. As a result of increasing energy efficiencies and decreases in total water use, water-related energy use would not be wasteful or inefficient and therefore the impact would be less than significant.

As shown in **Table 3.6-5, Water Use—Residential and Commercial**, the majority of water use reductions are expected from the residential sector, which is anticipated to reduce water use over the lifetime of the Plan by approximately 14% (combined indoor and outdoor). Reductions in the residential sector are

85 California Air Resources Board. 2013. *Heavy-Duty (Tractor-Trailer) Greenhouse Gas Regulation*. Available online at: https://ww3.arb.ca.gov/cc/hdghg/hdghg.htm, accessed September 18, 2019.

anticipated to result from policies implemented as a result of the 2012-2015 drought. Most of the anticipated residential water use reductions would come from the reduction in urban landscaping water, which makes up roughly half of all urban water use.[86] Larger reductions are seen in the outdoor water use compared with the indoor water use for both residential and commercial. This is aligned with potential higher density, multi-family and attached single-family development (which tends to consume less water for outdoor, landscaping uses, compared to lower density development with larger lot sizes) expected from implementation of the Plan's land use strategies that encourage more compact development in existing urbanized areas and opportunity areas.

Table 3.6-5
Water Use – Residential and Commercial

	2019	2045 No Project	2045 Plan	% Difference from 2019
Indoor residential water use (AF)	1,200,854	1,152,888	1,121,335	-7%
Outdoor residential water use (AF)	973,387	829,561	791,901	-19%
Residential water use (AF)	**2,174,241**	**1,982,449**	**1,913,236**	**-12%**
Indoor commercial water use (AF)	708,821	856,138	868,901	23%
Outdoor commercial water use (AF)	390,535	351,650	340,534	-13%
Commercial water use (AF)	**1,099,356**	**1,207,788**	**1,209,434**	**10%**
Total water use (AF)	**3,273,597**	**3,190,237**	**3,122,670**	**-5%**

Note: AF = acre-feet.
Source: SCAG scenario planning modeling, 2019.

As shown above, total water use in the SCAG region by 2045 is anticipated to decrease by 5%. Indoor residential, outdoor residential, and outdoor commercial are anticipated to decrease in water use; however, indoor commercial water use is anticipated to increase by 23% over the lifetime of the Plan. The commercial sector includes offices, hospitals, hotels, restaurants, educational facilities, and industrial land uses. The large increase in water use may be in part to the additional commercial uses that will be required for a population increase of 3.2 million people.

86 PPIC Water Policy Center. 2019. *Just the Facts: Water Use in California*. Available online at: https://cwc.ca.gov/-/media/CWC-Website/Files/Documents/2019/06_June/June2019_Item_12_Attach_2_PPICFactSheets.pdf?la=en&hash=E233EA870DFB826F235B258177849300179E1B64, accessed September 12, 2019.

As noted above, water use is closely tied to the electricity required to transport, distribute, and treat water.[87] Water- related electricity use is expected to decrease from 13,040 gigawatt-hours (GWh) to 12,544 GWh in 2045 with the Plan, which represents a 4 percent decrease in electricity (**Table 3.6-6, Water-Related Energy Use**).

Table 3.6-6
Water-Related Energy Use

	2019	2045 No Project	2045 Plan	% Difference from Baseline
Water-related electricity use (GWh)	13,040	12,672	12,544	-4%

Note: GWh = gigawatt-hour.
Water related energy use does not include heating of water
Source: SCAG scenario planning modeling, 2019.

As demonstrated in the table above, the total water-related electricity use is expected to decrease by 4% over the lifetime of the Plan. Based on data provided by SCAG, the per capita water-electricity use is 674 kWh/person for the existing condition. In a 2045 per capita water-related electricity use is expected to be 557 kWh/person. Therefore, the per capita water-related electricity use will decrease by 117 kWh/person. As a result, water-related electricity use efficiency will increase.

As demonstrated above, fuel consumption, total building energy use, and water related energy use are expected to decrease over the lifetime of the Plan. Water-related electricity use efficiency is also anticipated to decrease over the lifetime of the Plan. However, as stated above, the per capita building energy use efficiency is anticipated to increase by 4.7 million Btu/person.

In summary, construction energy use is anticipated to be more efficient (and less wasteful) in the future as Tier 4 construction equipment combined with CARB regulations for reducing fuel use in heavy-duty diesel trucks used for hauling construction materials are implemented. Additionally, the transportation projects combined with transportation and land use strategies will encourage compact (more efficient) land use and more efficient, less energy intensive transportation (transit, bike, walk) which will result in a lower VMT per capita. Therefore, the Plan would not result in wasteful or inefficient use of energy and this impact is less than significant.

87 The SCAG region has several desalination projects proposed or under development within the SCAG region, and desal plants are highly energy intensive. However, such projects diversify water supply portfolios and provide for greater reliability. Therefore, if water production relies on a desalination plants in the future, the water-related energy use could increase.

Impact ENR-2 **Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.**

Less than Significant Impact.

As discussed above, the Plan would result in a decrease in per capita energy use and would not result in energy used in an unnecessary or wasteful manner. The Plan would not result in the inefficient, wasteful, or unnecessary consumption of energy if it is consistent with existing relevant energy conservation policies. Accordingly, inconsistencies between the Plan and adopted plans and policies related to energy conservation have not been identified. The discussion below further examines consistency with adopted plans and policies related to energy conservation.

The 1974 Warren-Alquist Act established the California Energy Resource Conservation and Development Commission, now known as the California Energy Commission (CEC), and established a State policy to reduce wasteful, uneconomical and unnecessary uses of energy. Based on the data above, and explained in the conclusion below, the Plan would not result in wasteful, inefficient, or unnecessary use of energy. Therefore, the Plan is consistent with the Warren-Alquist Act policies.

Senate Bill (SB) 1078 as accelerated by SB 350, establishes a renewable portfolio standard for electricity supply, and requires that retail sellers of electricity, including investor-owned utilities and community choice aggregators, provide 33 percent of their supply from renewable sources by 2020. In addition, the 2017 Integrated Energy Policy Report (IEPR) includes a set of strategies to address California's future energy needs. Key topics covered in the report include electricity resource and supply plans; electricity and natural gas demand forecasts; natural gas outlooks; transportation energy demand forecasts; energy efficiency savings; integrated resource planning; a barriers study; climate adaptation and resilience; renewable gas; distributed energy resources; strategic transmission investment plans; and existing power plan reliability issues The proposed Plan would not conflict with these policies. Refer to **Section 3.8, Greenhouse Gas Emissions**, for a discussion of greenhouse gas emissions reductions related to the Plan.

In addition, many Plan projects promote energy efficiency as they support implementation of the 2010 Clean Air Plan transportation control measures including transportation demand management, transportation system management, commuter and public transit; rail, bike and pedestrian programs, among others.

Development under the Plan would be required to be consistent with applicable regulations and policies including the LA County Sustainability Plan, the LA Green New Deal, as well as the Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura County General Plans. These plans encourage the use of renewable energy, energy conservation and energy efficiency techniques in all new building

design, orientation and construction and support of alternative transportation and fuels. As described above, the Plan includes TDM intended to improve the efficiency and effectiveness of the transportation system, reducing fuel consumption, transit and other alternative modes of transportation, such as new pedestrian and bicycle facilities and promotes mixed use and infill development. In summary, implementation of the Plan would not result in wasteful or inefficient energy consumption within the region and is generally consistent with applicable policies regarding energy conservation and renewable energy. Therefore, impacts would be less than significant.

3.7 GEOLOGY AND SOILS

This section of the Program Environmental Impact Report (PEIR) describes the geological characteristics of the SCAG region, identifies the regulatory framework with respect to laws and regulations that govern geology and soils, and analyzes the significance of the potential impacts that could result from development of the Connect SoCal Plan ("Connect SoCal"; "Plan"). In addition, this PEIR provides regional-scale mitigation measures as well as project-level mitigation measures to be considered by lead agencies for subsequent, site-specific environmental review to reduce identified impacts as appropriate and feasible. Information regarding paleontological resources was largely obtained from the Paleontological Resources Report prepared by SWCA and included as Appendix 3.7 of this PEIR.

3.7.1 ENVIRONMENTAL SETTING

3.7.1.1 Definitions

Alluvium: An unconsolidated accumulation of stream deposited sediments, including sands, silts, clays or gravels.

Extrusive Igneous Rocks: Rocks that crystallize from molten magma on earth's surface.

Fault: A fracture or fracture zone in rock along which movement has occurred.

Formation: A laterally continuous rock unit with a distinctive set of characteristics that make it possible to recognize and map from one outcrop or well to another. The basic rock unit of stratigraphy.

Holocene: An interval of time relating to, or denoting the present epoch, which is the second epoch in the Quaternary period, from approximately 11,000 years ago to the present time.

Liquefaction: The process by which water-saturated sandy soil materials lose strength and become susceptible to failure during strong ground shaking in an earthquake. The shaking causes the pore-water pressure in the soil to increase, thus transforming the soil from a stable solid to a more liquid form.

Oligocene: An interval of time relating to, or denoting the third epoch of the Tertiary period, between the Eocene and Miocene epochs, from approximately 34 to 23 million years ago.

Outcrop: A rock formation that is visible on earth's surface.

Paleozoic: An interval of time relating to, or denoting the era between the Precambrian eon and the Mesozoic era.

Pleistocene: An interval of time relating to, or denoting the first epoch of the Quaternary period, between the Pliocene and Holocene epochs, from approximately 2.6 million years ago to 11,000 years ago.

Pliocene: An interval of time relating to, or denoting the last epoch of the Tertiary period, between the Miocene and Pleistocene epochs, from approximately 5.5 to 2.6 million years ago.

Plutonic Igneous Rocks: Igneous rocks that have crystallized beneath the earth's surface.

Pore water pressure: Refers to the pressure of groundwater held within a soil or rock, in gaps between particles (pores).

Quaternary: The most recent period in geological time; includes the Pleistocene and Holocene Epochs.

Unique geologic feature: An important and irreplaceable geological formation. Such features may have scientific and/or cultural values.

Unique paleontological resource: A fossil that meets one or more of the following criteria:

- It provides information on the evolutionary relationships and developmental trends among organisms, living or extinct.
- It provides data useful in determining the age(s) of the rock unit or sedimentary stratum, including data important in determining the depositional history of the region and the timing of geologic events therein.
- It provides data regarding the development of biological communities or interaction between plant and animal communities.
- It demonstrates unusual or spectacular circumstances in the history of life.
- The fossils are in short supply and/or in danger of being depleted or destroyed by the elements, vandalism, or commercial exploitation, and are not found in other geographic locations.

3.7.1.2 Existing Conditions

The geology and soils of the SCAG region were defined by major forces that continue to shape the physical environment, including mountain building, faulting, erosion, deposition, and volcanic activity. These events occur both gradually and in potentially catastrophic episodes. The region that is now Southern California slowly "assembled" over a billion years from older materials recycled through the lithosphere (Earth's crust and mantle) or accumulated from precipitation and biological activity in the

oceans, or carried in as ash and dust in the atmosphere.[1] Tectonic forces and volcanism built up the landscape, and sediments eroded and deposited along the margin of the North American continent, later to be uplifted and recycled over again. Much of the continental crust that is now southern California was derived or recycled from crust that formed beneath the Pacific Ocean region and later subducted or accreted onto the margin of the North American continent.[2]

Geologic hazards are natural geologic events that can endanger human lives and threaten property. Potential geologic hazards include rupture of a known earthquake fault, seismic ground shaking, seismic ground failure including liquefaction, and landslides. Other hazards in relation to geology and soils include soil erosion or loss of topsoil, and development of structures and buildings in locations with geologic units or soils that are unstable or expansive soils. Similarly, not all areas within the SCAG region are served by sewer systems or have soils that are capable of adequately supporting septic tanks or alternative waste water disposal systems.

The SCAG region extends primarily over four[3] California geomorphic provinces: the Mojave Desert, the Transverse Ranges, the Peninsular Ranges, and the Colorado Desert.[4] These provinces are naturally defined geologic regions that display a distinct landscape or landform (**Figure 3.7-1, Geomorphic Provinces**).

Mojave Desert

The Mojave Desert geomorphic province occupies approximately 25,000 square miles. It is a broad interior region of isolated mountain ranges separated by expanses of desert. There are two important fault trends that control topography a prominent northwest-southeast trend and a secondary east-west trend. The Mojave province is wedged in a sharp angle between the Garlock Fault to the north (southern boundary Sierra Nevada) and the San Andreas Fault to the west (where it bends east from its northwest trend). The Nevada state line defines its eastern boundary, and the San Bernardino/Riverside county line defines its southern boundary. Portions of Los Angeles and San Bernardino Counties lie within this province.

3 A small sliver of the northwest corner of San Bernardino County is located in the Basin and Range province, and a small area in northern Ventura County is located in the Southern Coastal Ranges province.

4 California Geological Survey. 2002. *California Geomorphic Provinces*. Available online at: https://www.conservation.ca.gov/cgs/Documents/Note_36.pdf, accessed June 12, 2019.

Erosional features such as broad alluvial basins that receive non-marine sediments from the adjacent uplands dominate the Mojave Desert region. Numerous playas, or ephemeral lakebeds within internal drainage basins, also characterize the region. Throughout this province, small hills—some the remnants of ancient mountainous topography—rise above the valleys that are surrounded by younger alluvial sediments. The highest elevation approaches 4,000 feet above mean sea level (MSL), and most valleys lie between 2,000 to 4,000 feet above MSL.

Transverse Ranges

The Transverse Ranges are an east-west trending series of steep mountain ranges and broad alluvial valleys that extends approximately 320 miles from Point Arguello in the west to the Little San Bernardino Mountains in the east. The east-west structure of the Transverse Ranges is oblique to the normal northwest trend of coastal California, hence the name "Transverse." This geomorphic province includes Ventura County and portions of Los Angeles, San Bernardino, and Riverside Counties. It also extends offshore to include San Miguel, Santa Rosa, and Santa Cruz islands.

There is intense north-south compression squeezing the Transverse Ranges and resulting in the prominent basins and ranges found in this province, including the Ventura Basin and the San Gabriel and San Bernardino Mountains. This is one of the most rapidly rising regions on earth. Several active faults, such as the San Andreas Fault Zone, are located in the Transverse Ranges. Other faults in the province include the Santa Clara River Valley Fault, the San Gabriel Fault Zone, the Santa Cruz Island Faults, the Santa Rosa Island Faults, and the Soledad Faults. This province is one of the most geologically diverse in California, containing a wide variety of bedrock types and structures. California's highest peaks south of the central Sierra Nevada and the only Paleozoic rocks in the coastal mountains in the United States are found here. Because of the great lithological diversity, the province is further subdivided into eight subprovinces, each displaying its own geologic signature. Broad alleviated valleys, narrow stream canyons, and prominent faults separate these subprovinces.

Peninsular Ranges

The Peninsular Ranges province consists of a series of ranges separated by northwest trending valleys, subparallel to faults branching from the San Andreas Fault. This province is bounded on the northwest by the Transverse Ranges, on the east by the Colorado Desert, and extends south, encompassing the Los Angeles Basin and terminating 775 miles south of the United States–Mexico border.

The Peninsular Ranges includes the southern portion of Los Angeles County, the southwest corner of San Bernardino County, all of Orange County, and the San Jacinto Mountains and the Coachella Valley in the central portion of Riverside County. The ranges are composed of a series of northwest-southeast trending

mountains that are separated by several active faults, including the San Jacinto and Elsinore Fault zones. The Peninsular Ranges is one of the largest geologic units in western North America. Its highest elevations are found in the San Jacinto-Santa Rosa Mountains, with San Jacinto Peak reaching 10,805 feet above MSL. The orientation and shape of the Peninsular Ranges is similar to the Sierra Nevada, in that the west slope is gradual and the eastern face is steep and abrupt. Drainage from the province is typically by the San Diego, San Dieguito, San Luis Rey, and Santa Margarita Rivers.

Colorado Desert (Salton Trough)

The Colorado Desert geomorphic province (also referred to as the Salton Trough) is a depressed block between active branches of alluvium-covered San Andreas Fault with the southern extension of the Mojave Desert province in the east. Its roughly triangular shape is bounded to the east by the Chocolate Mountains, to the west by the Peninsular Ranges, and extends south into Mexico. The area is a low-lying, barren desert basin dominated by the Salton Sea. This province includes a large portion of Imperial County and a small portion of central Riverside County. The Colorado Desert is divided into two main valleys: the deep Imperial Valley to the south and the narrower and shallower Coachella Valley to the north. A good portion of both valleys lie below sea level with the lowest elevation found in the Salton Basin at 235 feet below MSL. The area is characterized by the ancient beach lines and silt deposits of extinct Lake Cahuilla. Geologic features include playas separated by sand dunes and the occurrence of seismic and a seismic subsidence due to the San Andreas Fault system.

Paleontological Setting

Given the diversity of geologic units found in the SCAG region, the paleontology is equally diverse, and, in some areas, fossils are quite abundant. A detailed analysis of the paleontological sensitivity of each geologic formation in the SCAG region is beyond the scope of this analysis and should be the subject of project-specific paleontological assessments (see recommendations below). The SVP (2010) defines fossils as being over 5,000 years in age, while the BLM (2009, 2016) generally considers fossils to be Pleistocene in age or older (11,700 years in age). Therefore, sediments younger than middle or early Holocene are too young to preserve fossil resources and have low (SVP) or PFYC 2 (BLM) paleontological sensitivity. Other types of geologic units with low sensitivity are moderately metamorphosed rocks, as the heat and pressure associated with metamorphism is likely to destroy fossils. High grade metamorphic rocks, as well as igneous rocks, have no paleontological sensitivity.

Some generalizations about the primary types of fossil bearing rocks can be made, based on the 1:750,000 scale geologic mapping by Jennings et al. (2010), as discussed below.

Cenozoic Marine Deposits

Cenozoic marine deposits date from the Paleocene to the Pliocene and were deposited on the ancient seafloor. These geologic formations are well known for being highly fossiliferous in southern California and may preserve a wide variety of marine fauna: invertebrates such as mollusks, crustaceans, echinoderms, and others; marine vertebrates such as shark and other fish, whales, seals, sea lions, and others; and even terrestrial vertebrates such as horse, camel, bison, and others that washed out to sea and where buried in the near-shore marine deposits.

These deposits are particularly common at the surface in the Transverse Ranges in Ventura County, where Eocene and Miocene units are prevalent, coastal Orange County, central Imperial County as scattered outcrops around the Salton Sea, and central Los Angeles County. In the subsurface, these deposits are likely to be encountered underlying the younger surficial alluvium across large parts of the Los Angeles and San Bernardino basins.

Some of these units with the highest paleontological sensitivity (BLM PFYC class 4 or 5, SVP high potential) are discussed below:

Shallow Marine Deposits. Shallow marine deposits such as the San Pedro Sand and the Palos Verdes Sand have a strong record of preserving Pleistocene-aged marine and terrestrial fossils. The San Pedro Sand has yielded a diverse fauna of nearshore marine invertebrates such as crabs, snails, bivalves, gastropods, and echinoids and vertebrates such as sharks, bony fish, amphibians, reptiles, birds, whales, antelopes, mammoth, dire wolves, rodents, and bison. These units are common along coastal southern California, including Ventura, Los Angeles, and Orange Counties in the SCAG region. Many abundant fossil localities have been collected from excavations in San Pedro around the Port of Los Angeles, where the setting is very similar to that of the program area, with artificial fill covering old marine deposits. These deposits have yielded thousands of specimens of marine invertebrates that are significant for reconstructing changes in shallow marine ecosystems as the climate has changed since the Pleistocene.[5]

Fernando Formation. The Fernando Formation dates to the Pliocene and consists of marine siltstone, sandstone, pebbly sandstone, and conglomerate. The Fernando is common in the Transverse Ranges, particularly in Los Angeles County, where it is found extensively in the subsurface throughout the Los Angeles Basin. The lower part of the Fernando Formation consists of a pebble-cobble conglomerate in a sandstone matrix that fines upwards into a coarse sandstone and then a silty sandstone. The upper Fernando Formation consists of coarse-grained sandstone with conglomerate lenses. The Fernando

5 SWCA Environmental Consultants. 2019. *Draft Paleontological Resources Technical Report for the 2020-2045 Regional Transportation Plan and Sustainable Communities Strategy for the Southern California Association of Governments*.

Formation has an extensive record of preserving scientifically significant fossils, including invertebrates such as mollusks, echinoids, and bryozoans, fish, squid, and a number of unidentified megafossils.[6]

Bouse Formation. The Bouse Formation spans the early Pliocene to the late Miocene and has been interpreted to represent either a marine estuarian or lacustrine depositional environment. The Bouse Formation is found in the Mojave Desert Geomorphic Province and consists of calcareous clay, silt, and sand. Abundant common invertebrate fossils such as gastropods, ostracodes, barnacles, and foraminifera, as well as fish and plants are known from the Bouse Formation.[7]

Puente Formation. The Puente Formation, often synonymous with the Modelo Formation, consists of marine sandstone, siltstone, and shale that dates from the early Pliocene to the Miocene. The Puente Formation has a history of preserving both invertebrate and vertebrate marine fossils, such as cephalopods, crustaceans, fishes, and other marine and terrestrial vertebrates. The Puente Formation is common in the Peninsular Ranges and Transverse Ranges provinces.[8]

Monterey Formation. The Monterey Formation records the filling of a deep basin formed by tectonism along the California margin and constitutes one of the major elements of California geology and can range up to several thousands of feet thick. The Monterey ranges in age from the Pliocene to middle Miocene and can be found throughout the basins of the Peninsular Ranges and Transverse Ranges provinces in the subsurface. The Monterey has yielded a diverse fauna consisting of some mollusks and common fish skeletons, and remains of larger marine macrofauna such as whales and the giant extinct Desmostylus, as well as birds, crocodiles and rare land organisms such as horse and land plants.[9]

Vaqueros Formation. The Vaqueros Formation consists of predominately limey sandstone interbedded with siltstone and shale deposited in an offshore basin. The Vaqueros Formation is common in the Peninsular Ranges and Transverse Ranges provinces and dates from the early Miocene to the late Eocene. Common fossils in the Vaqueros include marine invertebrates such as barnacles, ostreids, pectinids and marine ichnofossils, as well as terrestrial vertebrates and marine megafauna.[10]

10 Ibid.

Cenozoic Terrestrial Deposits

Cenozoic terrestrial deposits date from the Paleocene to the Pleistocene and were deposited in terrestrial environments as alluvial sediments, fluvial sediments, and lacustrine deposits. These geologic formations are well known for being highly fossiliferous in southern California and may preserve a wide variety of terrestrial fauna: invertebrates such as mollusks; plants; and abundant terrestrial vertebrates such as horse, camel, bison, and others.

These deposits are particularly common at the surface in the Mojave and Colorado Desert provinces but are found scattered across the entire SCAG region. Some of these units with the highest paleontological sensitivity (BLM PFYC class 4 or 5, SVP high potential) are discussed below.

Pleistocene Alluvium. Pleistocene alluvium consists of sand, silt, and gravel deposited in terrestrial environments as the result of erosion of surrounding highlands and dates to the Pleistocene (11,000–2.58 ma). Pleistocene sediments have a rich fossil history in southern California.[11]

The most common Pleistocene terrestrial mammal fossils include the bones of mammoth, horse, bison, camel, and small mammals, but other taxa, including lion, cheetah, wolf, antelope, peccary, mastodon, capybara, and giant ground sloth, have been reported, as well as birds, amphibians, and reptiles such as frogs, salamanders, snakes, and turtles. In addition to illuminating the striking differences between Southern California in the Pleistocene and today, this abundant fossil record has been vital in studies of extinction, ecology, and climate change.[12]

An excellent example of the striking abundance and diversity of these Pleistocene sediments comes from Riverside County, just south of San Bernardino County, where nearly 100,000 identifiable fossil specimens representing 105 vertebrate, invertebrate, and plant species were collected from more than 2,000 individual localities during the construction of the dam at Diamond Valley Lake and are now housed at the Western Science Center in Hemet, California. This site represents the second largest late Pleistocene fossil assemblage known from the American Southwest after the La Brea Tar Pits in Los Angeles. Other Ice Age fossils have been found throughout the inland valleys and the Mojave Desert.[13]

Manix Formation. The Manix Formation consists of around 40 m of lacustrine, fluvial, and alluvial sediments deposited in and around the Middle to late Pleistocene Lake Manix. This formation occurs to the east of Barstow in the Mojave Desert. The lacustrine and fluvial deposits in this formation have

11 Ibid.

12 Ibid.

13 Ibid.

yielded a diverse fauna, preserving invertebrates such as mollusks and ostracods as well as aquatic and terrestrial vertebrates such as fish, birds, and numerous Ice Age mammals.[14]

San Timoteo Formation. The San Timoteo Formation dates from the Pleistocene to the Pliocene and consists of stream-deposited alluvial sediments that are made up of detritus eroded from the San Bernardino Mountains in the Mojave Desert and southeastern Transverse Ranges provinces. A number of significant fossil deposits have been discovered in the San Timoteo. The construction of the El Casco Substation in San Timoteo Canyon between September 2009 and January 2011 produced numerous fossils, including riparian and aquatic plants, insects, slugs and snails, fish, tortoise, lizards, snakes, small mammals, birds, a giant camel, a llama, two ground sloths, and two different types of saber tooth cats. The Shutt Ranch fauna is a collection of hundreds of significant fossils belonging to 37 species of small mammals, as well as larger macrofauna such as sloth, camel, deer, horse, and others, found in the San Timoteo beds. The scientific literature records a rich fossil history from this unit that includes fossils of more than 30 plant taxa and over forty animal taxa, including camels, deer, sloth, elephants, bears, rabbits, and rodents. This fauna has been the subject of study for almost 100 years.[15]

Avawatz Formation. The Avawatz Formation consists of four members: conglomerate, siltstone and sandstone, breccias, and sandstone, siltstone, and tuff deposited in alluvial fans, floodplains, and lakes, spanning a period of around 40 Ma, during the late Miocene. The Avawatz Formation is found in the Avawatz Mountains in the Mojave Desert province. The Avawatz preserves a typical Miocene mammalian fauna of early ancestors of horses and camels, as well as abundant rodents and some reptiles. In addition, the Avawatz is known for preserving exceptional fossil trackways from dozens of different types of animals, including birds, camels, and cats. Trackways are significant fossil resources, and provide valuable information on not only foot morphology, but also how an animal moved and potentially whether it was part of a herd. The Raymond M. Alf Museum in Claremont, California, has more than 100 fossil trackways collected from the Avawatz in San Bernardino County.[16]

Topanga Group. The Topanga Group is predominantly composed of sandstone but also some siltstone, breccia, and shale. Formations within the Topanga Group are common across the basins of the Peninsular Ranges and Transverse Ranges provinces. The Topanga is interpreted to represent wave-dominated coastal deposits grading into river-dominated deltaic deposits and fluvial deposits in the upper parts of the formation. The Topanga Formation dates to the middle Miocene, around 20 to 16 Ma. Fossils from the Topanga Formation include numerous invertebrate and vertebrate remains from both

14 Ibid.

15 Ibid.

16 Ibid.

marine and terrestrial settings, including sharks, bony fishes, birds, whales, dolphins, and land mammals.[17]

Barstow Formation. The Barstow Formation is composed of fluvial and lacustrine sediments interbedded with air-fall tuff beds deposited in lakes from around 14.8 to 19.3 ma. This formation crops out across the Mojave Desert province. The fossil mammal fauna of the Barstow is so abundant it has been used to define a biostratigraphic portion of the middle Miocene called the Barstovian North American Land Mammal Age. The University of California, Berkeley, conducted extensive excavations of the mammal fossils shortly after they were first discovered in the Mud Hills. The most common fossils from the Barstow Formation include early ancestors of horses, antelope, and camels, as well as small mammals such as mice and rabbits, with birds, fish, invertebrates, reptiles, and early ancestors of canines and elephants less common but well represented. In addition to the vertebrate fauna, an extensive record of exceptionally preserved small organisms, such as insects and arthropods, are known from the Barstow. These fossils have been extensively studied and reported on in the scientific literature, leading to a better understanding of the early evolution of many modern animals ranging from horses and camels to insects, as well as paleoecology.[18]

Earthquake Faults

The SCAG region is seismically active. In the past 100 years, several earthquakes of magnitude 5.0 or larger have been reported on the active San Andreas, San Jacinto, Elsinore, and Newport-Inglewood fault systems. These four fault systems are concentrated in the western portion of the SCAG region, running in a northwest to southeast direction. The San Andreas Fault lies furthest to the east, extending just above the northern border of Ventura County and the San Gabriel Mountains, eventually terminating at the Salton Sea. As a result, significant earthquake hazards exist in the region.[19] Injury to people and damage to structures during earthquakes can be caused by actual surface rupture along an active fault, by ground shaking from a nearby or distant fault, liquefaction, or dam failure. In Southern California, the last earthquake exceeding Richter magnitude 8.0 occurred in 1857. Much more frequent are smaller temblors, like the relatively moderate (but still exceedingly damaging) 1971 San Fernando and 1994 Northridge

17 Ibid.

18 Ibid.

19 It should be noted that new faults continue to reveal themselves, such as in the case of the Ridgecrest quake of 2019, and the potential seismic threats posed by these faults also continue to be reevaluated on the basis of new geologic information and analysis.

earthquakes, both classified as magnitude 6.7 earthquakes.[20] In July 2019, a magnitude 7.1 earthquake struck on a previously unnamed fault system near Ridgecrest in San Bernardino County. Two foreshocks of 5.4 and 6.1 preceded the larger 7.1 earthquake.

A fault is a fracture in the crust of the earth along which there has been displacement of the sides relative to one another parallel to the fracture. Most faults are the result of repeated displacements over a long period of time. Numerous active and potentially active faults have been mapped in the region (**Table 3.7-1, Characteristics of Major Faults in the SCAG Region,** and **Figure 3.7-2, Alquist-Priolo Zones and Areas of Probabilistic Ground Acceleration**). The SCAG region contains lateral strike slip faults similar to the San Andreas and various identified and hidden blind thrust faults. A fault trace is the surface expression of a particular fault. Buried or blind thrust faults are thought to underlie much of the SCAG region. These "buried" faults do not exhibit readily identifiable traces on the earth's surface and are typically at considerable depth within the underlying geologic formation. Although these faults typically do not offset surface deposits, they can generate substantial ground shaking. The California Geological Survey (CGS) defines active faults as those that have exhibited evidence of displacement during Holocene (10,000 years ago to present) period. Potentially active faults are defined as faults that have exhibited evidence of displacement during the Pleistocene period (10,000 years to 1.8 million years ago). Class A faults have slip rates greater than 5 millimeters per year (mm/yr) and generally have substantial historic seismic data available, while Class B faults have slip rates smaller than 5 mm/yr and, as a rule, historic seismic data on which to develop reliable recurrence intervals of large events is lacking.[21]

Table 3.7-1
Characteristics of Major Faults in the SCAG Region

Fault	Counties	Recency	Slip-Rate (mm/yr)	Max. Moment
		Class A Faults		
San Andreas	Los Angeles San Bernardino Riverside Imperial	Historic Late Quaternary Latest Quaternary	24.0–34.0	7.2–7.5

20 The human and economic damage caused by earthquakes tends to increase with time, as more and more people and property come to occupy more and more of the land, thus cumulatively increasing the exposure of human habitation to seismic hazard. The 1994 Northridge earthquake, though hardly the most severe experienced by Southern California, was deemed the most expensive, in terms of its economic cost and its damage to human property. The California Office of Emergency Services claimed a $15 billion total damage estimate.

Note:
Recency of fault movement: Refers to the time period when the fault is believed to have last moved. The age is expressed in terms of the Geologic Time Scale. Generally, the older the activity on a fault, the less likely it is that the fault will produce an earthquake in the near future. For assessing earthquake hazard, usually only faults active in the Late Quaternary or more recently are considered. These include the following three non-overlapping time periods: Historic: Refers to the period for which written records are available (approximately the past 150 years).
Latest Quaternary: Refers to a period of time between the present and 15,000 years before present. Faults of this age are commonly considered active.
Late Quaternary: Refers to the time period between the present and approximately 130,000 years before the present.
Where no recency data are given, no determination has been made.
The Maximum Moment Magnitude is an estimate of the size of a characteristic earthquake capable of occurring on a particular fault. Moment magnitude is related to the physical size of a fault rupture and movement across a fault. Richter magnitude scale reflects the maximum amplitude of a particular type of seismic wave. Moment magnitude provides a physically meaningful measure of the size of a faulting event [CGS, 2002b]. Richter magnitude estimations can be generally higher than moment magnitude estimations.

Seismic Hazards

Movements on the previously identified faults would likely cause future earthquakes in the SCAG region. Earthquakes can originate in areas where potential seismic energy has built up along a fault over time, but has not yet been released in the form of an earthquake. Studies supported by the National Earthquake Hazards Reduction Program enable scientists to evaluate the hazard level in different areas. In Southern California, scientists estimate that the probability of a magnitude 7.0 or greater earthquake by the year 2045 is 75 percent.[22]

22 United States Geological Survey, *Uniform California Earthquake Rupture Forecast, Version 3*, March 2015.

The four major hazards generally associated with earthquakes are ground shaking, surface fault rupture (ground displacement), liquefaction ground failures, and settlement. A detailed discussion of these types of hazards is found below.

Ground Shaking

Ground shaking may affect areas hundreds of miles distant from the earthquake's epicenter. Historic earthquakes have caused strong ground shaking and damage in many areas of the SCAG region. The composition of underlying soils in areas located relatively distant from faults can intensify ground shaking. Areas that are underlain by bedrock tend to experience less ground shaking than those underlain by unconsolidated sediments such as artificial fill.

Earthquakes on the various and potentially active fault systems are expected to produce a wide range of ground shaking intensities in the SCAG region **(Figure 3.7-2, Alquist-Priolo Zones and Potential Areas of Probabilistic Ground Acceleration)**. The estimated maximum moment magnitudes represent characteristic earthquakes on particular faults.[23] While the magnitude is a measure of the energy released in an earthquake, intensity is a measure of the ground shaking effects at a particular location. Shaking intensity can vary depending on the overall magnitude, distance to the fault, focus of earthquake energy, and characteristics of geologic media. Generally, intensities are highest at the fault and decrease with distance from the fault.

Surface Fault Rupture

The surface expression of earthquake fault rupture typically occurs in the immediate vicinity of the originating fault. The magnitude and nature of the rupture may vary across different faults, or even along different segments of the same fault. Rupture of the surface during earthquake events is generally limited to the narrow strip of land immediately adjacent to the fault on which the event is occurring. Surface ruptures associated with the 1992 Landers earthquake in San Bernardino County extended for a length of 50 miles, with displacements varying from 1 inch to 20 feet.

The law requires the State Geologist to establish regulatory zones (known as Earthquake Fault Zones) around the surface traces of active faults, and to issue appropriate maps. Numerous active and potentially active earthquake faults are mapped throughout the SCAG region **(Figure 3.7-2).** Detailed maps are distributed to all affected cities, counties, and state agencies for their use in planning new or

---

23 Moment magnitude is related to the physical size of a fault rupture and movement across a fault. Richter magnitude scale reflects the maximum amplitude of a particular type of seismic wave. Moment magnitude provides a physically meaningful measure of the size of a faulting event. See Table 4.6-1 for the moment magnitudes associated with particular faults.

renewed construction. Local agencies must regulate most development projects within the zones, including all land divisions and most structures intended for human habitation. Fault surface rupture almost always follows preexisting faults, which are zones of weakness. Rupture may occur suddenly during an earthquake, or slowly in the form of fault creep. Sudden displacements are more damaging to structures because they are accompanied by ground shaking. Fault creep is the slow rupture of the earth's crust. Not all earthquakes result in surface rupture (e.g., the 1994 Northridge earthquake). Potentially active faults have demonstrated movement within Pleistocene period (approximately 1.6 million years ago). According to the CDMG, active and potentially active faults must be considered as potential sources of fault rupture.

Liquefaction and Ground Failure

Liquefaction has been responsible for ground failures during almost all of California's large earthquakes. The depth to groundwater can control the potential for liquefaction; the shallower the groundwater, the higher the potential for liquefaction. Earthquake-induced liquefaction most often occurs in low-lying areas with soils or sediments composed of unconsolidated, saturated, clay-free sands and silts, but can also occur in dry, granular soils, or saturated soils with some clay content. Within the SCAG region, liquefaction potential is a function of the potential level of ground shaking at a given location and depends on the geologic material at that location **(Figure 3.7-3, Areas of Potential Liquefaction).** Structural failure often occurs as sediments liquefy and cannot support structures that are built on them. Alluvial valleys and coastal regions are particularly susceptible to liquefaction. These areas can include but are not limited to flood plains and former wetlands such as Marina Del Rey, Playa Del Rey and areas near the Los Angeles River, the Santa Monica Bay, and Los Alamitos Bay in Los Angeles County, Areas in the vicinity the Santa Clara River, and Calluguas Creek outlets to the ocean in Ventura County. Additionally, there are areas in northern Los Angeles County that are susceptible to liquefaction as a result of existing geological conditions **(Figure 3.7-3).** Unconsolidated alluvial deposits in desert region deposits are rarely saturated because of the depth to the water table, and are thus, less susceptible to liquefaction than unconsolidated alluvium adjacent to stream channels.

Earthquake-Induced Subsidence

Settlement of the ground surface can be accelerated and accentuated by earthquakes. During an earthquake, settlement can occur as a result of the relatively rapid compaction and settling of subsurface materials (particularly loose, non-compacted, and variable sandy sediments) due to the rearrangement of soil particles during prolonged ground shaking. Settlement can occur both uniformly and differentially (i.e., where adjoining areas settle at different rates). Within the SCAG region, artificial fills, unconsolidated alluvial sediments, slope washes, and areas with improperly engineered construction-fills

typically underlie areas susceptible to this type of settlement. The July 2019 M7.1 Ridgecrest Earthquake and its preceding M6.4 and M5.4 foreshocks were felt across much of Southern California and into parts of Arizona, Nevada, and the San Francisco Bay Area. The M7.1 mainshock was the strongest earthquake to occur in the state in nearly 20 years. Although mobile homes, chimneys, and gas lines suffered damage, no major subsidence or landslide incidents were reported as a result of this earthquake.

Seismically Induced Landslides

Strong ground shaking during earthquake events can generate landslides and slumps in uplands or coastal regions near the causative fault. Seismically induced land sliding has typically been found to occur within 75 miles of the epicenter of a magnitude 6.5 earthquake. Seismically induced landslides would be most likely to occur in areas that have previously experienced landslides or slumps, in areas of steep slopes, or in saturated hillside areas. Areas of the SCAG region are susceptible to seismically induced land sliding because of the abundance of active faults in the region and the existing landslide hazards (**Figure 3.7-4 Areas of Potential Landslides**). Specifically, areas with high susceptibility to earthquake-induced landslides are concentrated along mountain ranges in the SCAG region: Santa Ana Mountains, San Gabriel Mountains, Santa Susanna Mountains, Santa Monica Mountains, Sulphur Mountain, San Jacinto Mountains, and the San Bernardino Mountains.

Earthquake-Induced Inundation and Tsunamis

Because the West Coast of the United States is seismically active, California is subject to flood hazard from tectonic activity capable of generating submarine earthquakes, volcanic eruptions, and landslides. Considering its proximity to the Pacific Ocean, the inundation by tsunamis (seismic sea waves) or seiches (oscillating waves in enclosed water bodies) can occur along the California coast in the event of significant earthquake. The SCAG region consists of approximately 150 miles of coastline. The coastline of SCAG region has been mapped as being in a location potentially subject to tsunamis and the existing tsunami warning system (**Figure 3.7-5, Areas Susceptible to Tsunamis**).[24] Additionally, several large water impoundments in the SCAG region also have the potential to induce seiche inundation. For purposes of a relative comparison, an earthquake with its epicenter in Alaska and with a magnitude of 8.5 (Richter scale) generated a seismically induced sea wave with a maximum wave height of 11 feet in the Monterey Harbor, on the central coast of California north of the SCAG region. The most recent historical tsunami to affect the coast of the SCAG region was in 2012, when a magnitude 7.5 earthquake

24 California State Department of Conservation. *California Official Tsunami Inundation Maps*. Available online at: https://www.conservation.ca.gov/cgs/tsunami/maps#Interactive, accessed June 24, 2019.

struck the Queen Charlotte Islands of the west coast of Canada. A resulting tsunami was 0.08 meter or 0.26 foot and occurred in Santa Monica.[25]

Soils and Geologic Materials

Soils within the SCAG region are classified by distinguishing characteristics and are arranged within soil associations.[26] Soils throughout the region differ in origin, composition, and slope development. Individual soil characteristics are important in determining the suitability of the soil for agricultural use or urbanized development. The formation of surficial soil depends on the topography, climate, biology, local vegetation, and the material on which the soil profile is developed. Although many soils in the SCAG region are suitable for agricultural uses, each soil type may have properties that could limit its uses and represent an agricultural or development hazard.[27] These limitations are listed and discussed below. **Figure 3.7-6, General Soil Types**, shows the general location of soil types contained within the SCAG region.

Erosion

Soil erosion is a natural ongoing process that transports, erodes, and displaces soil particles through a transport mechanism such as flowing water or wind. In addition, erosion results from manmade activity when soil coverings are stripped leaving the underlying soil exposed to the elements. Erosion is the physical detachment and movement of soil materials through natural processes or human activities. The determination of soil erosion potential is a complex process generally applied to site specific areas using the soil erodibility K factor index. The K factor combines the detachability of soil, runoff potential of the soil, and transportability of the sediment eroded from the soil into one measure for soil erodibility. The K factor is just one element of the RUSLE (Revised Universal Soil Loss Equation), which is used by government agencies to make erosion predictions for regulatory and conservation planning uses.

Determining areas of potential erosion is made more complex due to the substantial geomorphic diversity in the SCAG region. Generally, there is a high potential for erosion in mountainous areas and areas along the margins of mountainous areas, where there is a high intensity of rainfall and where the soils are considered erosive. Clay soils typically have low erodibility because the soil particles are

26 Soil Association: A mapping unit consisting of a group of defined and taxonomic soil units occurring together in an individual and characteristic pattern over a geographic region.

27 U.S. Department of Agriculture, Soil Conservation Service. 1970. Soil Survey of Ventura Area, California. Washington, DC.

resistant to detachment. Soils having a high silt content are the most erosive as the particles are easily detached, tend to crust, and produce high rates of runoff.[28]

Soil

Three soil factors are strongly associated with soil erosion potential: texture, compactness, and structure. Of these, texture plays the most dominant role. Intermediate textured soil types, such as silt, tend to be most erodible, whereas clay and particles coarser than sand are more resistant to erosion. Slopes influence the rate and amount of runoff, and in turn influence erosion. Loose texture and steep slopes primarily result in high wind erosion potential in soils. Data on Soil Erodibility (K factor) from the State Water Resources Control Board indicates there are areas within the SCAG region with both moderate (K factor 0.25–0.45) and high susceptibility (K factor > 0.45) of erosion. In Ventura County, most of the Santa Monica Mountains and Topatopa Mountains are characterized by soils that are moderately susceptible to erosion. In Los Angeles County, most soils within the urbanized areas south of the San Gabriel Mountains are moderately susceptible to erosion. These soils continue southeast into Orange County where almost all of the land area is covered by soils moderately susceptible to erosion. In San Bernardino County, the majority of soils are not moderately or highly susceptible, however several pockets of moderately erodible soils exist throughout the county, particularly surrounding the Ivanpah and Piute Mountains and Lanfair and Ivanpah Valleys; one small area of highly erodible soil exists in the northeast corner of the county within the Mesquite Valley. Riverside County also features both moderately and highly susceptible erodible soils that are mainly concentrated in the western portion of the county immediately adjacent to the east and west of the Lakeview Mountains. Finally, Imperial County is covered by moderately erodible soils on its west side, surrounding the Salton Sea and extending south.[29]

Erosion caused by wind is most severe in arid regions where sandy or loamy sediments are not covered by vegetation and exposed to severe wind conditions, such as the eastern portions of San Bernardino, Riverside, and Imperial Counties. Human intervention can accelerate the natural erosion process. For instance, typical consequences of development increase erosion potential due to the removal of vegetative cover and reduction of overall permeable area. These activities can lead to increased water runoff rates and concentrated flows that have greater potential to erode exposed soils. The effects of excessive erosion range from nuisance problems that require additional maintenance, such as increased siltation in storm drains, to instances of more severe damage where water courses are down-cut and gullies develop. These

29 California State Water Resources Control Board. RUSLE K Values. Available online at: https://www.waterboards.ca.gov/water_issues/programs/stormwater/docs/constpermits/guidance/k_factor_map.pdf, accessed June 24, 2019.

processes can eventually undermine adjacent structures or topography. Human activities that disturb soils in arid regions also increase wind erosion potential. Many of the desert areas in the SCAG region are susceptible to blowing sand, a severe form of wind erosion that damages property and accumulates soil on roadways. The majority of the soils in the SCAG region exhibit moderate to high erosion potential, which can be compounded by development. **Figure 3.7-7, Soils with Moderate to High Erosion Potential**, shows the general location of soils within the SCAG region that exhibit moderate to high erosion potential.

Coastal

Coastal erosion is a natural process that is typically the most visible during storm events. Beach sand is replenished by sediment loads in rivers and gentler waves after storm events or during summer months. Erosion rates of 1 inch per year are considered moderate. However, depending on the severity and duration of storm events and the degree of human intervention with natural coastline or riverine processes, coastal erosion can proceed at considerable rates, resulting in rapid visible coastline recession. In areas of extreme coastal erosion, such as the cities of Rancho Palos Verdes and Malibu, slopes have been undercut by waves during storm events, causing slope failure and resulting in property damage and risks to human health and safety. The coastal regions of Los Angeles, Orange, and Ventura Counties are susceptible to wave erosion hazards.

The Pacific Ocean borders the Peninsular Ranges province and the Transverse Ranges Province on the west. Nearly all the sea cliffs along the coast display some sign of coastal erosion. Coastal retreat is attributable to various processes, including undercutting from wave action, weathering and erosion of rocks and cliffs, emergence of groundwater at the cliff face, rain-wash, and land sliding. Additionally, these naturally occurring forces can be assisted by human activity such as coastal road construction, channelization of surface water flows, or development on marine terraces.

Expansive Soils

Expansive soils possess a "shrink-swell" behavior. Shrink-swell is the cyclic change in volume (expansion and contraction) that occurs in fine-grained clay sediments from the process of wetting and drying. Structural damage may result over a long period of time, usually the result of inadequate soil and foundation engineering or the placement of structures directly on expansive soils. Typically, soils that exhibit expansive characteristics comprise the upper 5 feet of the surface. The effects of expansive soils could damage foundations of aboveground structures, paved roads and streets, and concrete slabs. Expansion and contraction of soils, depending on the season and the amount of surface water infiltration,

could exert enough pressure on structures to result in cracking, settlement, and uplift. Locations of expansive soils are site-specific and can generally be remedied through standard engineering practices.

Unstable Soil Conditions

Settlement

Loose, soft soil material comprised of sand, silt and clay, if not properly engineered, has the potential to settle after a building is placed on the surface. Settlement of the loose soils generally occurs slowly but over time can amount to more than most structures can tolerate. Building settlement could lead to structural damage such as cracked foundations and misaligned or cracked walls and windows. Settlement problems are site-specific and can generally be remedied through standard engineering applications.

Land Subsidence

Land subsidence is caused by a variety of agricultural, municipal or mining practices that contribute to the loss of support materials within a geologic formation. Agricultural practices can cause oxidation and subsequent compaction and settlement of organic clay soils or hydro-compaction allowing land elevations to lower or sink. Agricultural and municipal practices can result in the overdraft of a groundwater aquifer thereby causing aquifer settlement. Groundwater overdraft occurs when groundwater pumping from a subsurface water-bearing zone (aquifer) exceeds the rate of aquifer replenishment. The extraction of mineral or oil resources can also result in subsidence from removal of supporting layers in the geologic formation. Substantial subsidence occurs in the SCAG region due to groundwater extraction and subsequent lowering of the groundwater surface, typically beneath a confining clay stratum. Land subsidence can also result from persistent and prolonged drought. Prolonged drought can also exacerbate the above causes of subsidence as in the case of groundwater extraction for agricultural purposes. As there is less surface water available, more groundwater is extracted, thus increasing the potential for subsidence.[30]

The impact of subsidence could include lowering of the land surfaces, increased potential for flooding, potential disturbance or damage to transportation infrastructure, buried pipelines and associated structures, and damage to structures designed with minimal tolerance for settlement. Historic occurrences of land subsidence due to groundwater extraction are reported in the SCAG region within

[30] U.S. Geological Survey. n.d. Areas of Land Subsidence in California. Available online at: http://ca.water.usgs.gov/land_subsidence/california-subsidence-areas.html, accessed July 23, 2019.

Antelope Valley, Coachella Valley, and the Mojave River Basin Area. With groundwater level declines as high as 300 feet in some areas, subsidence has caused permanent damage to many of these landscapes.[31]

Landslides

Landslides are the rapid downslope movement of a mass of material that moves as a unit and carries with it all the loose material above bedrock. Landslides occur more frequently on steep slopes or after periods of heavy rain due to the additional weight of water and its lubricating qualities. The material in the slope and external processes such as climate, topography, slope geometry, and human activity can render a slope unstable and eventually initiate slope movements and failures. Changes in slope material such as improperly engineered fill slopes can alter water movement and lead to chemical and physical changes within the slope. Unfavorable fracture or joint orientation and density may develop as a rock material responds to reduced weight or strain relief, resulting in a decreased ability of the rock material to resist movement. Removing the lower portion (the toe) decreases or eliminates the support that opposes lateral motion in a slope. This can occur by man-made activity such as excavations for road-cuts located along a hillside. Oversteepening a slope by removing material can also reduce its lateral support. Placement of buildings on slopes can increase the amount of stress that is applied to a potential failure surface. Shaking during an earthquake may lead materials in a slope to lose some cohesion, cause liquefaction, or change pore water pressures. Landslide-susceptible areas within the SCAG region are those with low-strength soil material on hilly topography, for example, the Portuguese Bend and Point Fermin areas of the Palos Verdes Peninsula, and the Blackhawk slide area on the north slope of the San Bernardino Mountains. Factors that decrease resistance to movement in a slope include pore-water pressure, material changes, and structure.

Soils Capable of Supporting Septic Tanks or Alternative Waste Water Disposal Systems

The California State Water Resources Control Board has specific guidelines and requirements with regard to soil suitability for septic tanks and alternative waste water disposal systems in their publication 3.2C-Construction Practices – Onsite Wastewater Treatment Systems (OWTS).[32] Soils with poorly or excessively drained soils are generally not suitable for septic tanks or alternative waste water disposal

32 California State Water Resources Control Board. 3.2C – Construction Practices – Onsite Wastewater Treatment Systems (OWTS). Available online at: https://www.waterboards.ca.gov/water_issues/programs/nps/encyclopedia/3_2c_const_owts.html, accessed June 24, 2019.

systems.[33] According to the U.S. Environmental Protection Agency, it is recommended that onsite wastewater disposal systems incorporate native soil knowledge into system design to prevent groundwater contamination and ensure long-term performance. Most often, a percolation test is performed to assess the infiltration rate and soil texture, both of which determine the site suitability for a waste water disposal system. As it is difficult to assess site suitability without on-site testing, suitability in the SCAG region would be determined on a per project basis according to all local, regional, and state requirements.[34]

3.7.2 REGULATORY FRAMEWORK

3.7.2.1 Federal

Earthquake Hazards Reduction Act

The Earthquake Hazards Reduction Act of 1977 (Public Law 95-124) established the National Earthquake Hazards Reduction Program which is coordinated through the Federal Emergency Management Agency (FEMA), the U.S. Geological Survey (USGS), the National Science Foundation, and the National Institute of Standards and Technology. The purpose of the Program is to establish measures for earthquake hazards reduction and promote the adoption of earthquake hazards reduction measures by federal, state, and local governments; national standards and model code organizations; architects and engineers; building owners; and others with a role in planning and constructing buildings, structures, and lifelines through (1) grants, contracts, cooperative agreements, and technical assistance; (2) development of standards, guidelines, and voluntary consensus codes for earthquake hazards reduction for buildings, structures, and lifelines; and (3) development and maintenance of a repository of information, including technical data, on seismic risk and hazards reduction. The Program is intended to improve the understanding of earthquakes and their effects on communities, buildings, structures, and lifelines through interdisciplinary research that involves engineering, natural sciences, and social, economic, and decisions sciences.

Disaster Mitigation Act (2000)

The federal Disaster Mitigation Act (DMA; Public Law 106-390) provides the legal basis for FEMA mitigation planning requirements for state, local, and Indian Tribal governments as a condition of mitigation grant assistance. DMA 2000 amended the Robert T. Stafford Disaster Relief and Emergency

---

33 Ibid.

34 U.S. Environmental Protection Agency. Website. Available at: http://water.epa.gov/aboutow/owm/upload/2004_07_07_septics_septic_2002_osdm_all.pdf, accessed July 22, 2019.

Assistance Act by repealing the previous mitigation planning provisions and replacing them with a new set of requirements that emphasize the need for state, local, and Indian Tribal entities to closely coordinate mitigation planning and implementation efforts. The requirement for a state mitigation plan is continued as a condition of disaster assistance, adding incentives for increased coordination and integration of mitigation activities at the state level through the establishment of requirements for two different levels of state plans. DMA 2000 also established a new requirement for local mitigation plans and authorized up to 7 percent of Hazard Mitigation Grand Program funds available to a state for development of state, local, and Indian Tribal mitigation plans.

Clean Water Act Section 402

Section 402 of the Clean Water Act (33 U.S. Code Section 1251 et seq.) establishes a framework for regulating municipal and industrial stormwater discharges under the National Pollutant Discharge Elimination System (NPDES) program. The NPDES program controls water pollution by regulating point sources that discharge pollutants, including rock, sand, dirt, and agricultural, industrial, and municipal waste, into waters of the United States. The Environmental Protection Agency has delegated to the State Water Resources Control Board the authority for the NPDES program in California, which is implemented by the State's nine Regional Water Quality Control Boards. Under the NPDES Phase II Rule, construction activity disturbing 1 or more acres must obtain coverage under the State's General Permit for Discharges of Storm Water Associated with Construction Activity (General Construction Permit). As described further in **Section 3.10, Hydrology and Water Quality,** the Construction General Permit requires that applicants develop and implement a Stormwater Pollution Prevention Plan (SWPPP), which specifies best management practices (BMPs) that reduce pollution in stormwater discharges to the Best Available Technology Economically Achievable/Best Conventional Pollutant Control Technology standards and perform inspections and maintenance of all BMPs.

U.S. Geological Survey Landslide Hazard Program

The USGS Landslide Hazard Program provides information on landslide hazards including information on current landslides, landslide reporting, real time monitoring of landslide areas, mapping of landslides through the National Landslide Hazards Map, local landslide information, landslide education, and research.

3.7.2.2 State

Alquist-Priolo Earthquake Fault Zoning Act (Alquist-Priolo Act)

The Alquist-Priolo Act (California Code of Regulations, Section 3603(f)) provides policies and criteria to assist cities, counties, and state agencies in the development of structures for human occupancy across the trace of active faults. The Alquist-Priolo Act was intended to provide the citizens of the state with increased safety and to minimize the loss of life during and immediately following earthquakes by facilitating seismic retrofitting to strengthen buildings, including historical buildings, against ground shaking.

Alquist-Priolo Special Study Zones

The Alquist-Priolo Act requires that special geologic studies be conducted to locate and assess any active fault traces in and around known active fault areas prior to development of structures for human occupancy. This state law was a direct result of the 1971 San Fernando Earthquake, which was associated with extensive surface fault ruptures that damaged numerous homes, commercial buildings, and other structures. The Alquist-Priolo Act's main purpose is to prevent the construction of buildings used for human occupancy on the surface trace of active faults. This Act addresses only the hazard of surface fault rupture and is not directed toward other earthquake hazards.

Seismic Hazards Mapping Act

The Seismic Hazards Mapping Act of 1990 (Public Resources Code, Chapter 7.8, Sections 2690–2699.6) addresses non-surface fault rupture earthquake hazards, including liquefaction and seismically induced landslides. The purpose of the Act is to protect the public from the effects of strong ground shaking, liquefaction, landslides, or other ground failure, and other hazards caused by earthquakes. The program and actions mandated by the Seismic Hazards Mapping Act closely resemble those of the Alquist-Priolo Act.

In addition to the Seismic Hazards Mapping Act, the CGS provides guidelines (Guidelines for Evaluating and Mitigating Seismic Hazards in California) for evaluating seismic hazards other than surface fault rupture, and for mitigation measures as required by PRC Section 2695(a). The most current guidelines are provided in Special Publication 117A of 2008.

California Building Code

The California Building Code (CBC) is a compilation of building standards codified in the California Code of Regulations, Title 24, Part 2. The provisions of the CBC apply to the construction, alteration,

movement, replacement, location, and demolition of every building or structure in California. The CBC is published on a triennial basis, and supplements and errata can be issued throughout the cycle. The 2016 edition of the CBC became effective on January 1, 2017, and is based on the 2015 International Building Code (IBC) of the International Code Council, with California amendments. The 2016 CBC incorporates the latest seismic design standards for structural loads and materials, as well as provisions from the National Earthquake Hazards Reduction Program to mitigate losses from an earthquake.

CBC standards are based on the following:

- Building standards that have been adopted by state agencies without change from a national model code such as the IBC;
- Building standards based on a national model code that have been changed to address conditions specific to California; and
- Building standards authorized by the California legislature but not covered by the national model code.

The CBC includes provisions for demolition and construction, as well as regulations regarding building foundations and soil types to protect people and property from hazards associated with falling debris or construction processes. Seismic standards within the CBC are among the strictest in the world due to California's susceptibility to earthquakes and other seismic events.

California Department of Transportation (Caltrans) Regulations

Caltrans' jurisdiction includes rights-of-way (ROWs) of state and interstate routes within California. Any work within the ROW of a federal or state transportation corridor is subject to Caltrans' regulations governing allowable actions and modifications to the ROW. Caltrans issues permits to encroach on land within their jurisdiction to ensure encroachment is compatible with the primary uses of the State Highway System, to ensure safety, and to protect the state's investment in the highway facility. The encroachment permit requirement applies to persons, corporations, cities, counties, utilities, and other government agencies. A permit is required for specific activities including opening or excavating a state highway for any purpose, constructing, or maintaining road approaches or connections, grading within rights-of-way on any state highway, or planting or tampering with vegetation growing along any state highway. The encroachment permit application requirements relating to geology, seismicity and soils include information on road cuts, excavation size, engineering and grading cross-sections, hydraulic calculations, and mineral resources approved under Surface Mining Area Reclamation Act (SMARA).

Caltrans Seismic Design Criteria

Caltrans Seismic Design Criteria was initiated through the recognition that past earthquakes in California have shown the vulnerability of some older structures, designed with non-ductile design standards to earthquake-induced force sand deformations. As a result, Caltrans initiated an extensive seismic retrofit program to strengthen the state's inventory of bridges to ensure satisfactory performance during anticipated future earthquakes. Caltrans has funded an extensive research program as well as developed design procedures that have furthered the state of practice of earthquake bridge engineering. The Seismic Design Criteria (SDC) are an encyclopedia of new and currently practiced seismic design and analysis methodologies for the design of new bridges in California. The SDC adopts a performance-based approach specifying minimum levels of structural system performance, component performance, analysis, and design practices for ordinary standard bridges. Bridges with non-standard features or operational requirements above and beyond the ordinary standard bridge may require a greater degree of attention than specified by the SDC.

Southern California Catastrophic Earthquake Preparedness Plan

The Southern California Catastrophic Earthquake Preparedness Plan, based on the California Geological Survey and USGS's ShakeOut Scenario of 2008, was released in 2010 and examines the initial impacts, inventories resources, cares for those wounded and homeless, and develops a long-term recovery process. The process of Long-Term Regional Recovery (LTRR) provides a mechanism for coordinating federal support to state, tribal, regional, and local governments, nongovernmental organizations (NGOs), and the private sector to enable recovery from long-term consequences of extraordinary disasters. The LTRR process accomplishes this by identifying and facilitating the availability and use of recovery funding sources and providing technical assistance (such as impact analysis) for recovery and recovery planning support. "Long term" refers to the need to reestablish a healthy, functioning region that would sustain itself over time. Long-term recovery is not debris removal and restoration of utilities, which are considered immediate or short-term recovery actions. The LTRR's three main focus areas are housing, infrastructure (including transportation), and economic development.

3.7.2.3 Local

County and City General Plans

A safety element is required in county and city general plans for the protection of the community from any unreasonable risks associated with the effects of seismically induced surface rupture, ground shaking, ground failure, tsunami, seiche, and dam failure; slope instability leading to mudslides and landslides; subsidence; liquefaction; and other seismic hazards identified in Division 2 of the Public

Resources Code, and other geologic hazards known to the legislative body. The safety element shall include mapping of known seismic and other geologic hazards (Government Code Section 65302 (g)). **Table 3.7-1** and **Figure 3.7-2** above show the potentially active faults in the SCAG region. As part of the safety element, county and city governments typically identify goals, objectives, and implementing actions to minimize the loss of life, property damage, and disruption of goods and services from man-made and natural disasters including floods, fires, non-seismic geologic hazards, and earthquakes. County and City governments may provide policies and develop ordinances to ensure acceptable protection of people and structures from risks associated with these hazards. Ordinances may include those addressing unreinforced masonry construction, erosion, or grading.

3.7.3 ENVIRONMENTAL IMPACTS

3.7.3.1 Thresholds of Significance

For the purposes of this PEIR, SCAG has determined that adoption and/or implementation of the Plan could result in significant adverse impacts related to geology and soils if the Plan would result in any of the following:

- Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:

    (i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.

    (ii) Strong seismic ground shaking.

    (iii) Seismic-related ground failure, including liquefaction.

    (iv) Landslides.

- Result in substantial soil erosion or the loss of topsoil.

- Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse.

- Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property.

- Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water.

- Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

3.7.3.2 Methodology

This section evaluates hazards to people or property from geology and soils, identifies mitigation measures for the impacts, and evaluates the residual impacts. The potential for hazards to people and property from geology and soils was evaluated in accordance with Appendix G of the 2019 State California Environmental Quality Act (CEQA) Guidelines. Geology and soils within the SCAG region were evaluated at the programmatic level of detail, in relation to the general plans of the six counties and the 191 cities within the SCAG region, review of general information characterizing geology and soils from the Dibblee Maps and maps of Alquist-Priolo zones and mapping of seismic zones and movement that has occurred along mapped earthquake faults and review of published and unpublished literature germane to the SCAG region.. The methodology for determining the significance of potential risk to people and property in relation hazards posed by geology and soils compares the existing conditions to the future 2045 conditions under the Plan, as required by *CEQA Guidelines* Section 15126.2(a).

To assess potential impacts to residences and businesses adjacent to transportation corridors, geographic information systems (GIS) was used to assess seismic and geologic impacts by overlaying data in GIS format on the location of areas known to pose seismic or geologic hazards in the SCAG region. Specifically, the Major Transportation Projects[35] and urban development patterns from the land use strategies included in the Plan were plotted on maps that identify potential hazards, such as known faults, high ground acceleration areas, areas exhibiting landslide potential, and areas with highly erodible soils in the SCAG region. A 500-foot-wide buffer was created along transportation project segments to identify potential seismic and geologic hazards and to determine whether such hazards could impact transportation projects included in the Plan. **Table 3.7-2, Potential Geologic Hazards Impacts from the Plan**, and **Figure 3.7-8, Connect SoCal Projects in Relation to Geologic Hazards**, show the results of this analysis.

[35] Major Transportation Projects include but are not limited to projects that involve ground disturbing activities and projects outside of existing rights-of-way such as projects that require new rights-of-way, adding traffic lanes, and grade separation.

Table 3.7-2
Potential Geologic Hazards Impacts from the Plan

County	Potential Liquefaction (acres)	Potential Earthquake Induced Landslides (acres)
Imperial	n/a	N/a
Los Angeles	14,343.88	736.34
Orange	4,197.14	152.85
Riverside	46.02	6.16
San Bernardino	0.15	
Ventura	2591.39	106.51
Total SCAG Area	**21,179**	**1,002**

Source: SCAG GIS analysis and data, 2019
Note: data for Imperial County is not available

In 2015, the California Supreme Court in *California Building Industry Association v. Bay Area Air Quality Management District (CBIA v. BAAQMD* (2015) 62 Cal.4th 369), held that CEQA generally does not require a lead agency to consider the impacts of existing environmental conditions on the future residents or users of a project. However, if a project risks exacerbating preexisting environmental hazards or conditions, the lead agency is required to analyze the impact of that exacerbated condition on the environment, which may include future residents and users within the project area. Generally, transportation and land use projects under the Plan would not exacerbate existing environmental hazards related to geological and soil conditions, nonetheless, consistent with past practice, information is presented on geologic hazards at the regional level that may be of use to local jurisdictions or other readers of the Plan or PEIR.

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743, or SB 226 (as described in **Section 1.0, Introduction**), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.7.3.3 Impacts and Mitigation Measures

Impact GEO-1 **Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving: (i) rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42; (ii) strong seismic ground shaking; (iii) seismic-related ground failure, including liquefaction; (iv) landslides.**

Less than Significant Impact.

Connect SoCal identifies new transit and rail routes, expansion highway routes and other facilities, all of which are subject to seismic events to some degree (See **Table 3.7-1**). Seismic events can damage transportation infrastructure and urban development through surface rupture, ground shaking, liquefaction, and landslides. As illustrated in **Table 3.7-1**, numerous active faults are known to exist in the SCAG region that could potentially generate seismic events capable of significantly affecting existing structures and transportation projects analyzed in the Plan. Also, as described in the existing setting, it is expected there are unknown faults that could also significantly damage transportation infrastructure or the built environment. The plan contains transportation projects that would be located in areas prone to landslide, liquefaction and/or erosion. Indirect impacts could also promote additional delays and breaks in service while repairs are made. The potential for transportation projects and anticipated development projects to be significantly affected by liquefaction would be higher in areas exhibiting shallow groundwater levels and unconsolidated soils such as fill material, some alluvial soils, and coastal sands. As shown in **Table 3.7-2**, **Potential Geologic Hazards Impacts from the Plan,** approximately 21,000 acres of land are within 500 feet of Plan transportation projects. Potential hazards associated with liquefaction would be addressed through site-specific geotechnical studies required by local jurisdictions in accordance with standard industry practices and state-provided guidance, such as CGS Special Publication 117A, which specifically address liquefaction.

The land use strategies would have the potential to direct more growth into existing urban centers, walkable mixed-use communities, transit-oriented development, and other areas well-served by transit such as high-quality transit areas (HQTAs). Increased density could increase the number of people and structures exposed to potential fault rupture at a given location. For example, if a fault were to rupture adjacent to an urban center more people would be affected than if fault rupture were to occur in a remote area of the region with few people (as was the case with the Ridgecrest earthquake). Strength of a

particular earthquake and proximity to the fault would also be factors in how many people are affected by an earthquake.

Implementation of the Plan would result in projects exposed to both direct and indirect effects of seismic activities compared to existing conditions. However, the Plan would neither cause nor exacerbate existing geologic hazards, including the likelihood of fault rupture. This condition exists throughout the SCAG region as it is a seismically active area.

Transportation projects would be in proximity to known faults, increases in population would also result in people being located near known faults. Potential direct impacts from surface rupture and severe ground shaking could cause catastrophic damage to transportation infrastructure, including overpasses and underground structures. Indirect impacts from seismic events could damage ancillary transportation facilities such as port facilities, traffic control equipment, and train stations. With regard to land use development, seismic activity can cause damage to existing structures designed due to substandard construction. Further, as noted above, earthquakes can occur within previously undetected fault zones. For example, the July 2019 Ridgecrest earthquakes occurred within previously undetected fault zones and caused an excess of $100 million in damages.[36] A catastrophic earthquake on the San Andreas Fault would have the potential to cause 1,800 fatalities, displace 9 million people, and cause more than $200 billion in damages.[37]

The Alquist-Priolo Act prohibits the location of structures for human occupancy across active faults. Local jurisdictions require a surface fault rupture hazard investigation for any development project that would be located within an Alquist-Priolo Earthquake Fault Zone. This is to ensure that proposed development would not be located astride an active fault. In addition, the CBC contains numerous regulations designed to address seismic hazards.

New or seismically retrofitted structures designed with current state of the art engineering knowledge and compliance with local or state building codes (California Building Code, Uniform Building Code[38]) also reduce potential damage to structures and minimize the seismic impacts to the public. For example, the City of Los Angeles has issued mandatory retrofitting notices to owners of soft-story buildings under

38 California Building Standards Commission. 2016. *2016 California Building Standards Code*. Available online at: https://www.dgs.ca.gov/BSC/Codes, accessed May 21, 2019.

Ordinance 183893 and 184081. As of October 2019, approximately 82 percent of property owners receiving notices have submitted plans to retrofit or provide proof of a past retrofit.[39]

As discussed above, implementation of the Plan would not exacerbate existing geologic hazards including fault rupture because the SCAG region is a seismically active area, and this condition exists throughout the region. Furthermore, there are numerous regulations in place to reduce such risks to any planned development or transportation project, and therefore, the potential impacts of the Plan with regard to fault rupture are less than significant. No mitigation measures are necessary.

Impact GEO-2 Result in substantial soil erosion or the loss of topsoil.

Significant and Unavoidable Impact – Mitigation Required.

Implementation of transportation projects included in the Plan as well as growth under the Plan, particularly projects involving large-scale ground disturbance during construction such as grade separation projects, mixed flow lane projects, and rail projects may result in significant impacts from soil erosion or the loss of topsoil. In addition, urban development patterns encouraged by the land use strategies that direct more growth into existing urban areas, walkable mixed-use communities, and areas well-served by transit such as HQTAs could also result in soil erosion or loss of topsoil constituting a significant impact.

Soil erosion and its subsequent loss are the result of the actions of water and wind. The likelihood of erosion is higher with an increase in slope, the narrowing of runoff channels, and the removal of groundcover such as vegetation. Human activities associated with development such as grading, particularly on slopes, increase the risk for erosion in affected areas. Erosion also increases the risks of dust storms which can degrade air quality.

Several transportation projects included in the Plan would involve major construction of new facilities that may involve rail lines, highway segments, or other urban development patterns that would be within previously undisturbed areas which may result in soil erosion and the loss of topsoil. Some transportation projects and anticipated development projects may also require significant earthwork including cuts into hillsides, which could become unstable over time, increasing long-term erosion potential. Strategies that encourage denser development could also contribute to loss of topsoil through construction of underground parking garages.

39 City of Los Angeles. *Soft Story Retrofit Program.* Available online at: http://www.ladbs.org/services/core-services/plan-check-permit/plan-check-permit-special-assistance/mandatory-retrofit-programs/soft-story-retrofit-program, accessed October 23, 2019.

Improvements and modifications to existing rights-of-way, such as HOV lanes, HOT lanes, new busways and capacity enhancement facilities, mixed flow lanes, and ROW maintenance, would have less potential to impact topsoil because these project locations have previously been disturbed. However, road cuts could expose soils to erosion over the life of the project, creating potential landslide and falling rock hazards. Engineered roadways could be undercut over time by storm water drainage and wind erosion. Some areas would be more susceptible to erosion than others due to the naturally occurring soils with high erosion potential.

Figure 3.7-8, Connect SoCal Projects in Relation to Geologic Hazards, shows the location of projects identified in the Plan in relation areas with soils subject to moderate and high potential for soil erosion.

Notwithstanding natural soil types, engineered soils can also erode due to poor construction methods and design features or lack of maintenance. Transportation projects included in the Plan are in areas susceptible to geologic hazards including high soil erodibility. Construction of additional lanes on freeways, other transportation facilities or development could also potentially result in the loss of topsoil, through grading, trenching, excavation, and/or soil removal.

The Plan includes coordinated and integrated regional strategies for transportation investments and land use growth that aim to focus more development in urbanized areas such as HQTAs, livable corridors, neighborhood mobility areas, and walkable, mixed- used communities. This focus on compact development would not be expected to result in an increase in slope instability as much of the anticipated development would be in already developed areas served by transit and other existing infrastructure. However, some of the anticipated development could require earthwork or otherwise result in soil erosion or slope failure, thus creating a significant impact.

Throughout California, the Regional Water Quality Control Boards (RWQCB) set erosion control standards because one of the major effects of grading is sedimentation of receiving waters. These control standards are administered via the NPDES permit process for storm drainage discharge. One of the requirements of this permit is the implementation of nonpoint source control of stormwater runoff through the application of Best Management Practices (BMPs). A Storm Water Pollution Prevention Plan (SWPPP) is required by the RWQCB to describe the BMPs that would control both the quality and amount of stormwater runoff on a project site. Erosion and sedimentation issues are addressed more fully in **Section 3.10, Hydrology and Water Quality**. Transportation projects and development that would occur under the Plan would be required to comply with this process.

Because projects would be required to comply with existing state and local jurisdiction permitting, regulatory, and grading processes as well as the application of BMPs, impacts may be reduced. However,

given the large number of projects in the Plan and wide variety of project conditions including soil types and slopes, this impact is considered significant.

Mitigation Measures

SCAG Mitigation Measure

SMM-GEO-1: SCAG shall facilitate the minimization of substantial soil erosion or loss of topsoil through cooperation, information sharing, and regional program development as part of SCAG's ongoing regional planning efforts. Such efforts shall include web-based planning tools for local government including CA LOTS, and other GIS tools and data services, including, but not limited to, Map Gallery, GIS library, and GIS applications, and direct technical assistance efforts such as training series and sharing of associated online training materials. Resource agencies, such as the U.S. Geology Survey, shall be consulted during this update process.

Project Mitigation Measures

PMM-GEO-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to historical resources. Such measures may include the following or other comparable measures identified by the Lead Agency:

a) Consistent with the CBC and local regulatory agencies with oversight of development associated with the Plan, ensure that site-specific geotechnical investigations conducted by a qualified geotechnical expert are conducted to ascertain soil types prior to preparation of project designs. These investigations can and should identify areas of potential failure and recommend remedial geotechnical measures to eliminate any problems.

b) Consistent with the requirements of the State Water Resources Control Board (SWRCB) for projects over one acre in size, obtain coverage under the General Construction Activity Storm Water Permit (General Construction Permit) issued by the SWRCB and prepare a stormwater pollution prevention plan (SWPPP) and submit the plan for review and approval by the Regional Water Quality Control Board (RWQCB). At a minimum, the SWPPP should include a description of construction materials, practices, and equipment storage and maintenance; a list of

pollutants likely to contact stormwater; site-specific erosion and sedimentation control practices; a list of provisions to eliminate or reduce discharge of materials to stormwater; best management practices (BMPs); and an inspection and monitoring program.

c) Consistent with the requirements of the SWRCB and local regulatory agencies with oversight of development associated with the Plan, ensure that project designs provide adequate slope drainage and appropriate landscaping to minimize the occurrence of slope instability and erosion. Design features should include measures to reduce erosion caused by storm water. Road cuts should be designed to maximize the potential for revegetation.

d) Consistent with the CBC and local regulatory agencies with oversight of development associated with the Plan, ensure that, prior to preparing project designs, new and abandoned wells are identified within construction areas to ensure the stability of nearby soils.

Level of Significance after Mitigation

As previously discussed, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the lack of project specific-detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to erosion could be significant and unavoidable even with implementation of mitigation.

Impact GEO-3 **Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse.**

Less than Significant Impact.

Lateral spreading is a phenomenon where large blocks of intact soil move downslope in a rapid fluid-like flow movement. This is usually associated with liquefaction events. The mass moves towards an

unconfined area, such as downslope on slopes as small as one degree. Lateral spreading often occurs along riverbanks, where soft soils are often present, as well as in other areas prone to liquefaction.

Subsidence has historically occurred within the SCAG region due to groundwater overdraft and petroleum extraction. **Table 3.7-2, Potential Geologic Hazards Impacts from the Plan,** shows the acres of land within each County (except Imperial) where transportation projects in the Plan intersect with areas prone to liquefaction and earthquake-induced landslides. **Figure 3.7-8, Connect SoCal Projects in Relation to Geologic Hazards,** shows the location of the Plan transportation projects in relation to these areas. Unconsolidated soils containing petroleum or groundwater often compress when the liquids are removed causing the surface elevation to decrease. Improperly abandoned oil wells or underground hard rock mining can also cause localized subsidence. Areas of historic subsidence within the SCAG region exist in the Santa Clara River Valley and in the historic oil and gas fields of Los Angeles County including the Baldwin Hills, Long Beach, Pomona Chino, Puente Hills, and Antelope Valley areas. Subsidence has also occurred in the Coachella Valley and Murrieta/Temecula areas in Riverside County, Troy Lake, Lucerne Lake, Lucerne Valley, Harper Dry Lake, and Fort Irwin in San Bernardino County, the Santa Ana basin in Orange County, and the Oxnard Plan and Santa Clarita Calleguas Basin in Ventura County. The Port of Long Beach has also experienced subsidence due to the placement of fill along the original coastline.[40] Subsidence can also occur in areas with unconsolidated soils that have not historically shown elevation changes.

Slope failure results in landslides and mudslides from unstable soils or geologic units. As discussed above, construction of transportation projects and development included in the Plan, may require substantial earthwork and road cuts, increasing the potential for slope failure.

Section 1613 of the CBC states that projects located in liquefaction zones shall incorporate seismic design features into both grading and construction plans. Any on-site grading and site preparation activities must comply with the CBC, described above, which addresses grading and excavations. The requirements laid out therein are considered minimum standards for the design and construction of buildings, particularly for those located on soils that are unstable or that have the potential to be unstable. Additionally, local jurisdictions require that the recommendations contained within the geotechnical report to be implemented by the individual project applicant.

---

40 State of California Department of Water Resources. 2014. *Summary of Recent, Historical, and Estimated Potential for Future Land Subsidence in California*. Available online at: https://water.ca.gov/LegacyFiles/groundwater/docs/Summary_of_Recent_Historical_Potential_Subsidence_in_CA_Final_with_Appendix.pdf, accessed May 21, 2019.

Hazards associated with unstable soils or geologic units are dependent on site-specific conditions, as well as the specific nature of the individual project proposed. However, implementation of transportation projects and development projects anticipated to occur under the Plan would not be expected to exacerbate existing conditions with respect to geologic units and existing soils. With adherence to grading permit and building code requirements, including seismic design criteria as required by the CBC, transportation projects and anticipated development projects would be designed to minimize potential risks related to unstable soils and geologic units. Therefore, the potential for landslide, lateral spreading, subsidence, liquefaction, or other collapse impacts related to the implementation of transportation projects and anticipated development projects under the Plan, is considered less than significant and no mitigation is required.

Impact GEO-4 **Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property.**

Less than Significant Impact.

Development of transportation projects, particularly projects involving large-scale ground disturbance during construction such as grade separation projects, mixed flow lane projects, and rail projects, and compact development strategies, may expose people and structures to risks where located on expansive soils. Soils with high percentages of clay can expand when wet, causing structural damage to surface improvements. These clay soils can occur in localized areas throughout the SCAG region, making it necessary to survey project areas extensively prior to construction. Expansive soils are generally removed during foundation work to avoid structural damage. The Plan assumes 60 percent of the new residential growth and 73 percent of new employment growth would occur within Growth Priority Areas, where expansive soils may have already been removed. However, expansive soils may remain in many parts of the SCAG region.

Transportation projects and anticipated development under the Plan would not be expected to exacerbate existing conditions with respect to expansive soils. Expansive soil conditions would be addressed through the integration of geotechnical information in the design process for development projects to determine whether a site is suitable for a project. Industry practice and state-provided guidance would minimize risk associated with geologic hazards. Compliance with CBC requirements as well as adherence to local building codes and ordinances would reduce hazards relating to expansive soils, and as such, impacts remain less than significant.

Impact GEO-5 **Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water.**

Less than Significant Impact.

The Plan includes transportation investments and the regional land use strategies that are intended to produce more dense development in well-served transit areas. These land use strategies encourage compact development in HQTAs, and more walkable, mixed-use communities to accommodate the anticipated growth of 3.2 million people by 2045. The Plan does not encourage or anticipate residential development in areas where sewers are not available for the disposal of wastewater or where densities would not support the provision of sanitary sewers. the Plan's transportation projects would not require septic tanks or alternative wastewater disposal systems. Moreover, the Growth Priority Areas are well served by sanitary sewer systems. To the extent septic tanks and alternative wastewater disposal systems may be required in more rural areas, septic tanks and alternative wastewater disposal systems are heavily regulated at the state, regional, and local level. Local jurisdictions also have general plans that contain policies and implementation measures, including BMPs relevant to the use of septic tanks or alternative water disposal system. County environmental health departments regulate septic tanks through measures such as requiring a Sewage Disposal Permit for construction, reconstruction, repair, or abandonment of septic tanks. Therefore, impacts from having soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater would be less than significant, and no mitigation measures are required.

Impact GEO-6 **Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.**

Significant and Unavoidable Impacts - Mitigation Required.

As discussed in the environmental setting section of this chapter, geologic units considered sensitive for paleontological resources are widespread in the Plan area. These units, such as the shallow marine deposits, such as the San Pedro Sans and the Palos Verdes Sand may yield marine and terrestrial fossils. These units are common along coastal southern California, including Ventura, Los Angeles, and Orange Counties in the SCAG region. Many abundant fossil localities have been collected from excavations in San Pedro around the Port of Los Angeles, where the setting is very similar to that of the program area, with artificial fill covering old marine deposits. These deposits have yielded thousands of specimens of marine invertebrates that are significant for reconstructing changes in shallow marine ecosystems.

Potential impacts to paleontological resources would be more likely to occur from ground-disturbing activities associated with transportation projects and development projects anticipated to occur under the Plan rather than during ongoing operations. Direct permanent impacts to paleontological resources as a result of the Plan may result from ground disturbance associated with construction. Ground-disturbing activities such as excavation for building foundations and bridges, trenching for utility lines, tunneling, and grading, could damage or destroy sensitive paleontological resources on or near the surface or at depth. Construction in previously undisturbed areas and deep excavation activities would have the greatest probability to impact intact buried paleontological resources. The potential for direct impacts to paleontological resources may be comparatively less for improvements to existing facilities and modifications to existing rights-of-way since these areas have been previously disturbed. However, any construction in geologic units sensitive for paleontological resources could result in potentially significant damage to or destruction of unique paleontological resources.

Direct permanent impacts may arise if paleontological resources cannot be completely avoided by project design. Substantial damage to or destruction of significant paleontological resources would represent a significant impact. Excavation of the sediments and any significant fossils could destroy or degrade the condition of the fossils; additionally, the nature of project excavation would cause any fossils to be removed from their stratigraphic context, thereby reducing the scientific usefulness of the fossil. The extensive distribution and presence of rock units below the ground surface that may contain significant fossilized remains makes it difficult to predict the location of paleontological resources during the project planning phase, and thus increases the likelihood of inadvertent discovery of significant paleontological resources during construction and ground-disturbing activities.

Therefore, the potential direct impacts on paleontological resources related to implementation of transportation projects and development projects anticipated to occur under the Plan, could result in substantial alteration or removal of a significant paleontological resource from construction activities, and is considered significant.

Mitigation Measures

SCAG Mitigation Measure

SMM-GEO-3: Impacts to paleontological resources shall be minimized through cooperation, information sharing, and SCAG's ongoing regional planning efforts such as web-based planning tools for local governments including CA LOTS, and other GIS tools and data services, including, but not limiting to, Map Gallery, GIS library, and GIS applications; and direct technical assistance efforts such as training series and sharing of associated

online training materials. SCAG shall consult with resource agencies such as the National Park Service, United States Forest Service, and Bureau of Land Management to identify opportunities for early and effective consultation to identify unique paleontological resources and unique geological features to avoid such resources wherever practicable and feasible and reduce or mitigation for conflicts in compatible land use to the maximum extent practicable.

Project Level Mitigation Measures

PMM-GEO-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to paleontological resources. Such measures may include the following or other comparable measures identified by the Lead Agency:

a) Ensure compliance with the Paleontological Resources Preservation Act, the Federal Land Policy and Management Act, the Antiquities Act, Section 5097.5 of the Public Resources Code (PRC), adopted county and city general plans, and other federal, state and local regulations, as applicable and feasible, by adhering to and incorporating the performance standards and practices from the 2010 Society for Vertebrate Paleontology (SVP) standard procedures for the assessment and mitigation of adverse impacts to paleontological resources.

b) Obtain review by a qualified paleontologist (e.g. who meets the SVP standards for a Principal Investigator or Project Paleontologist or the Bureau of Land Management (BLM) standards for a Principal Investigator), to determine if the project has the potential to require ground disturbance of parent material with potential to contain unique paleontological or resources, or to require the substantial alteration of a unique geologic feature. The assessment should include museum records searches, a review of geologic mapping and the scientific literature, geotechnical studies (if available), and potentially a pedestrian survey, if units with paleontological potential are present at the surface.

c) Avoid exposure or displacement of parent material with potential to yield unique paleontological resources.

d) Where avoidance of parent material with the potential to yield unique paleontological resources is not feasible:

1) All on-site construction personnel receive Worker Education and Awareness Program (WEAP) training prior to the commencement of excavation work to understand the regulatory framework that provides for protection of paleontological resources and become familiar with diagnostic characteristics of the materials with the potential to be encountered.

2) A qualified paleontologist prepares a Paleontological Resource Management Plan (PRMP) to guide the salvage, documentation and repository of unique paleontological resources encountered during construction. The PRMP should adhere to and incorporate the performance standards and practices from the 2010 SVP Standard procedures for the assessment and mitigation of adverse impacts to paleontological resources. If unique paleontological resources are encountered during construction, use a qualified paleontologist to oversee the implementation of the PRMP.

3) Monitor ground disturbing activities in parent material, with a moderate to high potential to yield unique paleontological resources using a qualified paleontological monitor meeting the standards of the SVP or the BLM to determine if unique paleontological resources are encountered during such activities, consistent with the specified or comparable protocols.

4) Identify where ground disturbance is proposed in a geologic unit having the potential for containing fossils and specify the need for a paleontological monitor to be present during ground disturbance in these areas.

e) Avoid routes and project designs that would permanently alter unique geological features.

f) Salvage and document adversely affected resources sufficient to support ongoing scientific research and education.

g) Significant recovered fossils should be prepared to the point of curation, identified by qualified experts, listed in a database to facilitate analysis, and deposited in a designated paleontological curation facility.

h) Following the conclusion of the paleontological monitoring, the qualified paleontologist should prepare a report stating that the paleontological monitoring requirement has been fulfilled and summarize the results of any paleontological

finds. The report should be submitted to the lead CEQA and the repository curating the collected artifacts, and should document the methods and results of all work completed under the PRMP, including treatment of paleontological materials, results of specimen processing, analysis, and research, and final curation arrangements.

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce each of the impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this PEIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and lack of project-specific detail, including project components and locations, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts to paleontological resources could be significant and unavoidable even with implementation of mitigation.

3.8 GREENHOUSE GASES

This section of the Program Environmental Impact Report (PEIR) describes greenhouse gas emissions in the SCAG region, identifies the regulatory framework with respect to laws and regulations that govern greenhouse gas emissions, and evaluates the significance of the potential impacts related to greenhouse gas emissions that could result from development of the Connect SoCal Plan ("Connect SoCal"; "Plan"). In addition, this PEIR provides regional-scale mitigation measures, as well as project-level mitigation measures to be considered by lead agencies for subsequent, site-specific environmental review to reduce identified impacts as appropriate and feasible.

3.8.1 ENVIRONMENTAL SETTING

Gases that trap heat in the atmosphere are often called greenhouse gases (GHGs), comparable to a greenhouse, which captures and traps radiant energy. GHGs are emitted by natural processes and human activities. The accumulation of GHGs in the atmosphere regulates the Earth's temperature. Global warming is the observed increase in average temperature of the Earth's surface and atmosphere. The primary cause of global warming is an increase of GHGs in the atmosphere. The six major GHGs are carbon dioxide (CO_2), methane (CH_4), nitrous oxide (NO_2), sulfur hexafluoride (SF_6), hydrofluorocarbons (HFCs), and perfluorocarbon (PFCs). The GHGs absorb longwave radiant energy emitted by the Earth, which warms the atmosphere. The GHGs also emit longwave radiation both upward to space and back down toward the surface of the Earth. The downward part of this longwave radiation emitted by the atmosphere is known as the "greenhouse effect." Emissions from human activities such as fossil fuel combustion for electricity production and vehicles have elevated the concentration of these gases in the atmosphere.[1]

3.8.1.1 Definitions

Terms and criteria used in the assessment of GHGs are described below.

Greenhouse Gases (GHGs): GHGs are those compounds in the earth's atmosphere that play a critical role in determining the earth's surface temperature. Specifically, these gases allow high-frequency solar radiation to enter the earth's atmosphere but retain the low-frequency energy, which is radiated back from the earth to space, resulting in a warming of the atmosphere. This phenomenon is known as the greenhouse effect. Increased concentrations of GHGs in the earth's atmosphere are thought to be linked

1 South Coast Air Quality Management District. 2017. *Final Environmental Impact Report 2016 Air Quality Management Plan*. Available online at: http://www.aqmd.gov/docs/default-source/ceqa/documents/aqmd-projects/2016/2016aqmpfpeir.pdf?sfvrsn=10, accessed March 25, 2019.

to global climate change, such as rising surface temperatures, melting icebergs and snowpack, rising sea levels, and the increasing frequency and magnitude of severe weather.

Climate Change: Climate change is the variation of earth's climate over time, whether due to natural variability or as a result of human activities. Scientists have concluded that human activities are contributing to global climate change by adding large amounts of heat-trapping gases, (i.e., GHGs), to the atmosphere.

Global Warming Potential (GWP): Metric used to describe how much heat a molecule of a GHG absorbs relative to a molecule of carbon dioxide (CO_2) over a given period of time (20, 100, and 500 years). CO_2 has a GWP of 1.

$MTCO_{2e}$: Metric ton of CO_2e.

$MMTCO_{2e}$: Million metric tons of CO_2e.

Carbon Dioxide (CO_2): Enters the atmosphere through the burning of fossil fuels (oil, natural gas, and coal), solid waste, trees and wood products, and respiration, and as a result of other chemical reactions (e.g., manufacture of cement). Carbon dioxide is removed from the atmosphere (sequestered) when it is absorbed by plants as part of the biological carbon cycle.

Carbon Dioxide-Equivalent (CO_{2e}): The standard unit to measure the amount of GHGs in terms of the amount of CO_2 that would cause the same amount of warming. CO_{2e} is based on the GWP ratios between the various GHGs relative to CO_2.

Methane (CH_4): Emitted during the production and transport of coal, natural gas, and oil. Methane emissions also result from livestock and other agricultural practices and from the decay of organic waste in municipal landfills and water treatment facilities.

Nitrous oxide (NO_2): Emitted during agricultural and industrial activities as well as during combustion of fossil fuels and solid waste.

Chlorofluorocarbons (CFCs): One of a class of fluorinated gases with a high GWP, CFCs are GHGs covered under the 1987 Montreal Protocol and used for refrigeration, air conditioning, packaging, insulation, solvents, or aerosol propellants. Since they are not destroyed in the lower atmosphere (troposphere, stratosphere), CFCs drift into the upper atmosphere where, given suitable conditions, they break down ozone.

Fluorinated Gases: Synthetic, strong GHGs that are emitted from a variety of industrial processes. Fluorinated gases are sometimes used as substitutes for ozone-depleting substances. These gases are typically emitted in smaller quantities, but they are potent GHGs, sometimes referred to as high GWP gases.

Hydrofluorocarbons (HFCs): One of a class of fluorinated gases with a high GWP, HFCs contain only hydrogen, fluorine, and carbon atoms. They were introduced as alternatives to ozone-depleting substances to serve many industrial, commercial, and personal needs. HFCs are emitted as by-products of industrial processes and are also used in manufacturing. They do not significantly deplete the stratospheric ozone layer, but they are strong GHGs.

Hydrochlorofluorocarbons (HCFCs): One of a class of fluorinated gases with a high GWP, HCFCs contain hydrogen, fluorine, chlorine, and carbon atoms. Although ozone-depleting substances, they are less potent at destroying stratospheric ozone than CFCs. They have been introduced as temporary replacements for CFCs and are GHGs.

Sulfur Hexafluoride (SF_6): One of a class of fluorinated gases with a high GWP, SF_6 is a colorless gas soluble in alcohol and ether, slightly soluble in water. SF_6 is a strong GHG used primarily in electrical transmission and distribution systems as an insulator.

Perfluorocarbons (PFCs): One of a class of fluorinated gases with a high GWP, PFCs, are a group of human-made chemicals composed of carbon and fluorine only. These chemicals (predominantly perfluoromethane [CF_4] and perfluoroethane [C_2F_6]) were introduced as alternatives, along with HFCs, to the ozone-depleting substances. In addition, PFCs are emitted as by-products of industrial processes and are also used in manufacturing. PFCs do not harm the stratospheric ozone layer, but they have a high global warming potential.

Global Warming Potential of Various GHGs: GHGs include CO_2, CH_4, O_3, water vapor, NO_2, HFCs, PFCs, and SF_6. Carbon dioxide is the most abundant GHG. Other GHGs are less abundant but have higher global warming potential than CO_2. (**Table 3.8-1, Greenhouse Gases and Their Relative Warming Potential Compared to CO_2**).

Table 3.8-1
Greenhouse Gases and Their Relative Global Warming Potential Compared to CO_2

GHG	Atmospheric Lifetime (years)	Global Warming Potential Relative to CO_2[a]
Carbon Dioxide (CO_2)	50 to 100	1
Methane (CH_4)[b]	12 (±3)	25
Nitrous Oxide	120	298
Hydrofluorocarbons:		
HFC-23	264	14,800
HFC-32	5.6	675
HFC-125	32.6	3,500
HFC-134a	14.6	1,100
HFC-143a	48.3	1,430
HFC-152a	1.5	124
HFC-227ea	36.5	3,220
HFC-236fa	209	9,810
HFC-43-10mee	17.1	1,640
Perfluoromethane: CF_4	50,000	7,390
Perfluoroethane: C_2F_6	10,000	12,200
Perfluorobutane: C_4F_{10}	2,600	8,860
Perfluoro-2-methylpentane: C_6F_{14}	3,200	9,300
Sulfur Hexaflouride (SF_6)	3,200	22,800

Note:
Based on 100-Year Time Horizon of the Global Warming Potential (GWP) of the air pollutant relative to CO_2.
The methane GWP includes the direct effects and those indirect effects due to the production of tropospheric ozone and stratospheric water vapor. The indirect effect due to the production of CO_2 is not included.
Source:
Intergovernmental Panel on Climate Change (IPCC), Fourth Assessment Report (AR4). 4 April 2014. Emission factors for greenhouse gas inventories. Available at: http://www.epa.gov/climateleadership/documents/emission-factors.pdf

Thus, emissions of other GHGs are frequently expressed in the equivalent mass of CO_2, denoted as CO_2e. GHGs are the result of natural and anthropogenic activities. Forest fires, decomposition, industrial processes, landfills, and consumption of fossil fuels for power generation, transportation, heating, and cooking are the primary sources of GHG emissions.

Understanding of the fundamental processes responsible for global climate change has improved over the past decade, and the predictive capabilities are advancing. However, there remain significant scientific uncertainties, for example, in estimating current and future emissions and the appropriate assumptions, predictions of local effects of climate change, occurrence of extreme weather events, effects of aerosols, changes in clouds, shifts in the intensity and distribution of precipitation, rate of sea ice melting, and changes in oceanic circulation. Due to the complexity of the earth's climate system, the

uncertainty in its description and in the prediction of changes may never be completely eliminated. Because of these uncertainties, there continues to be significant debate over the extent to which increased concentrations of GHGs have caused or will cause climate change and over the appropriate actions to limit and/or respond to climate change.

3.8.1.2 Existing Conditions

Global climate change refers to any significant change in climate measurements, such as temperature, precipitation, or wind, lasting for an extended period (i.e., decades or longer).[2] GHGs are any gas that absorbs infrared radiation in the atmosphere[3] and are the result of both natural and human-influenced activities. Forest fires; decomposition; industrial processes; landfills; and consumption of fossil fuels for power generation, transportation, heating, and cooling are the primary sources of GHG emissions. Without human intervention, the earth maintains an approximate balance between the emission of GHGs into the atmosphere and the storage of GHGs in oceans and terrestrial ecosystems. Increased combustion of fossil fuels (e.g., gasoline, diesel, coal, etc.), have contributed to the rapid increase in atmospheric levels of GHGs over the last 150 years. In 1850, the world emitted approximately 4.75 billion tons of CO_2 and in 2017, the world emitted approximately 1.54 trillion tons of CO_2.[4]

The primary effect of rising global concentrations of atmospheric GHG levels has been a rise in the average global land and ocean temperature of approximately one degree Celsius above pre-industrial levels. Warming greater than the global annual average is being experienced in many land regions, including two to three times higher in the Arctic. Estimated global warming is currently increasing at 0.2 degrees Celsius per decade due to past and ongoing emissions. The International Panel on Climate Change (IPCC) has determined that pathways limiting global warming to 1.5 degrees Celsius require emissions to decline by about 45 percent from 2010 levels by 2030, reaching net zero by 2050. Warming forecasts and related emission pathways presented by the IPCC do not account for self-reinforcing climate feedback loops. These feedback loops include, but are not limited to: loss of sea ice, which reflects heat back into the atmosphere rather than the ocean, causing further melting; the melting of permafrost, which would release new methane emissions into the atmosphere; and the cooling effects of sulfate

pollution in the atmosphere, the loss of which would lead to additional warming.[5] Adverse impacts from global climate change worldwide and in California may include, but not be limited to:

- Declining sea ice and mountain snowpack levels, thereby increasing sea levels and sea surface evaporation rates with a corresponding increase in tropospheric water vapor due to the atmosphere's ability to hold more water vapor at higher temperatures.[6]

- Since the early 1970s, glacier mass loss and ocean thermal expansion from warming together explain about 75% of the observed global mean sea level rise. Over the period 1993 to 2010, global mean sea level rise is consistent with the sum of the observed contributions from ocean thermal expansion due to warming from changes in glaciers, Greenland ice sheet, Antarctic ice sheet, and land water storage.[7] Sea level in California has risen approximately 7 inches from 1900 to 2005, according to the National Climate Assessment.[8]

- Changing weather patterns, including changes to precipitation, ocean acidification and warming, and wind patterns.[9]

- Declining Sierra snowpack levels, which account for approximately half of the surface water storage in California, by 70 percent to as much as 90 percent over the next 100 years.[10]

- Increasing the number of days conducive to ozone formation by 25 to 85 percent (depending on the future temperature scenario) in high ozone areas located in the Southern California area and the San Joaquin Valley by the end of the 21st century.[11]

- Migrating of species to suitable habitats.

- Reducing of crop yields in the agricultural sector.

- Increasing the potential for erosion of California's coastlines and seawater intrusion into the Sacramento Delta and associated levee systems due to the rise in sea level.[12]

- Decreasing cold temperature extremes, increasing warm temperature extremes, increasing extreme high sea levels, and increasing number of heavy precipitation events in a number of regions.[13]
- Increasing frequency and severity of climate-related extremes including heat waves, droughts, floods, cyclones, and wildfires.[14]

The impacts of climate change have been documented by the Office of Environmental Health Hazard Assessment (OEHHA), which includes the following changes that are already occurring:[15,16]

- A recorded increase in annual average temperatures as well as increases in daily minimum and maximum temperatures.
- An increase in the occurrence of extreme events, including wildfire and heat waves.
- A reduction in spring runoff volumes, as a result of declining snowpack.
- A decrease in winter chill hours, necessary for the production of high-value fruit and nut crops.
- Changes in the timing and location of species sightings, including migration upslope of flora and fauna, and earlier appearance of Central Valley butterflies.

A recent aerial survey by the U.S. Forest Service determined that 18 million trees died in California in 2018, which brings the total of dead trees across California from 2010 to 147 million trees over 9.7 million acres. Since 2016, federal, state, and local bodies have removed approximately 1.5 million dead trees that posed the highest hazards to life and property, however, the amount of dead trees across the state presents an increasing wildfire risk.[17] The U.S. Forest Service National Insect and Disease Forest Assessment, found that due to projected climate changes from 2013-2027, the number of acres at risk of losing forest and woodlands will increase and the number of tree deaths will likely increase from already

highly destructive pests, such as the mountain pine beetle.[18] This would further exacerbate the fire hazard posed from dead trees.

In the last decade, California has experienced five of the state's 10 largest wildfires and seven of its 10 most destructive fires in its history. Over the past five decades, summertime forest fires have increased in size by roughly 800 percent. Though no single wildfire can be attributed solely to climate change, evidence shows that the increase in average temperatures statewide is creating conditions more prone to wildfires.[19] Southern California has warmed about three degrees Fahrenheit in the last century, and every additional increment of warming speeds up evaporation, dries out soil and vegetation, and increases the amount of fuel available for a wildfire.[20] In 2018, wildfires in California released approximately 68 million tons of carbon dioxide, or about 15 percent of the State's annual emissions.[21] Studies suggest that greenhouse gas emissions from wildfires create a positive feedback loop, wherein the emissions warm the planet further, leading to more wildfires and more emissions.

The warming climate also causes sea level rise by warming the oceans which causes water to expand, and by melting land ice which transfers water to the ocean. Sea level rise is expected to magnify the adverse impact of any storm surge and high waves on the California coast. As temperatures warm and GHG concentrations increase, more carbon dioxide dissolves in the ocean, making it more acidic. More acidic ocean water affects a wide variety of marine species, including species that people rely on for food.[22]

While more intense dry periods are anticipated under warmer conditions, increased extreme wet conditions are also expected to increase due to more frequent warm, wet atmospheric river events and a higher proportion of precipitation falling as rain instead of snow. In recent years, atmospheric rivers have also been recognized as the cause of the large majority of major floods in rivers all along the U.S. West

Coast and as the source of up to 50 percent of all precipitation in California.[23] These extreme precipitation events, together with the rising snowline, often cause devastating floods in major river basins (e.g., California's Russian River). Looking ahead, the frequency and severity of atmospheric rivers on the U.S. West Coast will increase due to higher atmospheric water vapor that occurs with rising temperature, leading to more frequent flooding.[24,25]

As GHG emissions continue to accumulate and climate disruption grows, such destructive events will become more frequent. Several recent studies project increased precipitation within hurricanes over ocean regions.[26,27] The primary physical mechanism for this increase is higher water vapor in the warmer atmosphere, which enhances moisture convergence in a storm for a given circulation strength. Hurricanes are responsible for many of the most extreme precipitation events; such events are likely to become more extreme. Anthropogenic warming by the end of the 21st century will likely cause tropical cyclones globally to become more intense on average. This change implies an even larger increase in the destructive potential per storm, assuming no changes in storm size.[28,29] Thus, the historical record, which once set our expectations for the traditional range of weather and other natural events, is an increasingly unreliable predictor of the conditions we will face in the future. Consequently, the best available science must drive effective climate policy.[30]

California is committed to further supporting new research on ways to mitigate climate change and how to understand its ongoing and projected impacts. California's Fourth Climate Change Assessment and Indicators of Change Report will further update our understanding of the many impacts from climate

change in a way that directly informs State agencies' efforts to safeguard the State's people, economy, and environment.[31,32]

The State is also taking steps to make the State more resilient to ongoing and projected climate impacts as laid out by the Safeguarding California Plan.[33] The Safeguarding California Plan was updated in 2018 to present new policy recommendations and provide a roadmap of all the actions and next steps that state government is taking to adapt to the ongoing and inevitable effects of climate change. California's continuing efforts are vital steps toward minimizing the impact of GHG emissions and a three-pronged approach of reducing emissions, preparing for impacts, and conducting cutting-edge research can serve as a model for action.[34]

Scientific understanding of the fundamental processes responsible for global climate change has improved over the past decade, and predictive capabilities are advancing. However, there remain significant scientific uncertainties, for example, in predictions of local effects of climate change; occurrence of extreme weather events; and effects of aerosols, changes in clouds, shifts in the intensity and distribution of precipitation, and changes in oceanic circulation. In addition, it may not be possible to link specific development projects to future specific climate change impacts, though estimating project-specific emissions and contributions is possible.

Sources of GHG Emissions

Global

Worldwide anthropogenic GHG emissions for industrialized nations (referred to as Annex I) and developing nations (referred to as Non-Annex I) are tracked through the year 2014. The sum of the top five GHG producing nations (plus the European Union) totaled approximately 29,600 million metric tons of CO_2 equivalents ($MMTCO_2e$).[35,36] It should be noted that global emissions inventory data are not all

from the same year and may vary depending on the source of the emissions inventory data.[37] The top five countries and the European Union accounted for approximately 55 percent of the total global GHG emissions according to the most recently available data (see **Table 3.8-2, Top Five GHG Producer Countries and the European Union [Annual]**). The GHG emissions in more recent years may differ from the inventories presented in **Table 3.8-2**; however, the data is representative of currently available global inventory data.

Table 3.8-2
Top Five GHG Producer Countries and the European Union (Annual)

Emitting Countries	2014 GHG Emissions ($MMTCO_2e$)
China	12,000
United States	6,300
European Union (EU), 27 Member States	3,600
India	3,200
Indonesia	2,500
Russia	2,000

National

As noted in **Table 3.8-2**, the US was the number two producer of global GHG emissions in 2014. The primary GHG emitted by human activities in the US was CO_2, representing approximately 82 percent of total GHG emissions. Carbon dioxide from fossil fuel combustion, the largest source of GHG emissions, accounted for approximately 76 percent of US GHG emissions. In 2016, carbon dioxide emissions from

36 The CO_2 equivalent emissions commonly are expressed as "million metric tons of carbon dioxide equivalent ($MMTCO_2E$)." The carbon dioxide equivalent for a gas is derived by multiplying the tons of the gas by the associated GWP, such that $MMTCO_2E$ = (million metric tons of a GHG) x (GWP of the GHG). For example, the GWP for methane is 21. This means that the emission of one million metric tons of methane is equivalent to the emission of 21 million metric tons of CO_2.

37 The global emissions are the sum of Annex I and non-Annex I countries, without counting Land-Use, Land-Use Change and Forestry (LULUCF). For countries without 2005 data, the United Nations Framework Convention on Climate Change (UNFCCC) data for the most recent year were used. United Nations Framework Convention on Climate Change. *Annex I Parties – GHG total without LULUCF.* and *Flexible GHG Data Queries* with selections for total GHG emissions excluding LULUCF/LUCF, all years, and Annex I and non-Annex I countries. Available online at: https://unfccc.int/process-and-meetings/transparency-and-reporting/greenhouse-gas-data/ghg-data-unfccc/ghg-data-from-unfccc . n.d., accessed March 25, 2019.

the transportation sector accounted for approximately 64% of all GHG emissions from fossil fuel combustion.[38,]

State of California

The California Air Resources Board (CARB) compiles GHG inventories for the State of California. Based on the 2017 GHG inventory data (i.e., the latest year for which data are available), California emitted 424.1 $MMTCO_2e$ including emissions resulting from imported electrical power in 2017.[39] Based on the GHG inventories compiled by the World Resources Institute, California's total statewide GHG emissions rank second in the U.S. (Texas is the highest emitter of GHG). [40]

The primary contributors to GHG emissions in California are transportation, electric power production from both in-state and out-of-state sources, industry, agriculture and forestry, and other sources, which include commercial and residential activities.[41] **Table 3.8-3, GHG Emissions in California (2000 and 2017)**, provides a summary of GHG emissions reported in California in 2000 and 2017 by categories defined by the United Nations Intergovernmental Panel on Climate Change (IPCC).

Table 3.8-3
GHG Emissions in California (2000 and 2017)

Source:
[1] *California Air Resources Board, "California Greenhouse Gas 2000-2017 Inventory by IPCC Category - Summary," https://ww3.arb.ca.gov/cc/inventory/data/tables/ghg_inventory_ipcc_sum_2000-17.pdf.*

As demonstrated in **Table 3.8-3**, California's 2017 GHG emissions are lower than 2000 levels. In 2007, California statewide GHG emissions peaked at 490.9 MMT CO_2e/year, since that time emissions have been following a declining trend. In 2017, emissions from routine emitting activities statewide were 66.8 million metric tons of CO_2e ($MMTCO_2e$) lower than peak GHG levels in 2007.[42]

Cap and Trade Program

The state-wide cap and trade expenditure plan allocated $832 million dollars towards programs that will help reduce GHG emissions, with set-asides for projects benefiting disadvantaged communities. The expenditure plan funds three main investment categories: (1) sustainable communities & clean transportation; (2) energy efficiency & clean energy; and (3) natural resources & waste diversion.[43]

42 California Air Resources Board. 2019. *California Greenhouse Gas 2000-2017 Inventory by IPCC Category – Summary.* June. Available online at: https://ww3.arb.ca.gov/cc/inventory/data/tables/ghg_inventory_ipcc_sum_2000-17.pdf, accessed August 13, 2019.

43 Southern California Association of Governments. 2015. *The Greenhouse Gas Reduction Fund.* Available online at: http://www.scag.ca.gov/programs/Pages/GGRFExpenditurePlan.aspx?opentab=2, accessed March 25, 2019.

The Affordable Housing & Sustainable Communities (AHSC) Program is a statewide competitive program that provides grants and loans for affordable housing, infill development, transit-oriented development and related infrastructure. The Strategic Growth Council (SGC) and Department of Housing and Community Development (HCD) administer the program, including project evaluation and the approval of funding awards.[44] 19 projects in the SCAG region were awarded funding for Round Three of the AHSC Program. The 19 projects totaled approximately $258 million, exhausting the available budget for Round Three projects. The Fiscal Year (FY) 2019–2020 Cap and Trade Expenditure Plan proposes $1.4 billion to support programs that sequester GHG emissions, enhance the state' resiliency to climate change, benefit disadvantaged communities most impacted by climate change, and expand the state's workforce skill base in industries and occupations that anchor the carbon-neutral economy.[45] The Greenhouse Gas Reduction Fund (GGRF) is expected to be $2.1 billion in FY 2019–2020.[46] The program is in its fourth round with a current Notice of Funding Available of approximately $395 million.[47]

SCAG Region

The most recent GHG emissions data by sector for the SCAG region is from 2012. Similar to the 2013 U.S. and California GHG emission profiles, transportation, industrial, and electricity are the three largest contributors to GHG emissions. Total SCAG emissions in 2020 were estimated to be 216 $MMTCO_{2e}$. Transportation emissions are most prevalent relative to all other sectors in California and specifically in the SCAG region. Transportation emissions accounted for approximately 38 percent of total emissions in the SCAG region, compared to 26 percent of total emissions in the United States in 2008.[48]

Fossil fuel carbon dioxide emissions ($FFCO_2$) for 2011 were calculated across the Los Angeles megacity, which includes Los Angeles, Orange, Riverside, Santa Barbara, and Ventura Counties. The total $FFCO_2$ emissions were calculated to be approximately 48.06±5.3 megatons of carbon dioxide per year

48 Final Southern California Association of Governments. 2012. *Regional Greenhouse Gas Inventory and Reference Case Projections, 1990-2035*. Available online at: http://sustain.scag.ca.gov/Sustainability%20Portal%20Document%20Library/05-30-12_SCAG_Revised_IF%20Report_Final.pdf, accessed October 2, 2019.

($MtCO_2$/yr), or 53.4±5.9 MMT CO_2e/year, with transportation emissions accounting for approximately 50.4% of these emissions [49]. Los Angeles County contributed approximately 55% of the total $FFCO_2$ emissions, followed by San Bernardino, Orange, Riverside, and Ventura Counties. These results are consistent with SCAG estimates of GHG emissions for 2016 (see **Table 3.8-4, Greenhouse Gas Emissions from Transportation by County,** in **Section 3.8.3.3, Impacts and Mitigation Measures**). It should be noted that the 2011 $FFCO_2$ estimates does not include Imperial County, however, according to **Table 3.8-7**, in 2016 Imperial County only contributed approximately 1.7% of the regional total transportation GHG emissions. Therefore, these results are representative of the SCAG region.[50]

Goods Movement

As discussed in **Section 3.17, Transportation Traffic and Safety**, goods movement includes trucking, rail freight, air cargo, marine cargo, and both domestic and international freight, the latter entering the country via the seaports, airports, and the international border with Mexico. Additionally, many cargo movements are intermodal, for example, sea to truck, sea to rail, air to truck, or truck to rail. The goods movement system includes not only highways, railroads, sea lanes, and airways, but also intermodal terminals, truck terminals, railyards, warehousing, freight consolidation/de-consolidation terminals, freight forwarding, package express, customs inspection stations, truck stops, and truck queuing areas.

SCAG plans for goods movement are consistent with executive orders from the governor that directs MPOs to integrate climate change policies to support the State's effort to reduce per capita GHG emissions and combat the effects of climate change. California Executive Order S-3-05 (June 1, 2005 - Schwarzenegger) called for a coordinated approach to address the detrimental air quality effects of greenhouse gases (GHGs).[51] More recently, California Executive Order B-16-12 supports the rapid commercialization of zero emission vehicles sets a 2050 GHG emissions reduction goal for the transportation sector to achieve 80 percent less emissions than 1990 levels. Executive Order B-32-15 works toward achieving GHG reduction targets with the California Sustainable Freight Action Plan, an integrated plan that establishes clear targets to improve freight efficiency, transition to zero-emission technologies and increase competitiveness of California's freight system. In addition, Executive Order B-30-15 established an interim statewide GHG emission reduction target to reduce GHG emissions to 40

percent below 1990 levels by 2030 to ensure California meets its target of reducing GHG emissions to 80 percent below 1990 levels by 2050.

Public Health

The changing climate's effect on temperature, air quality, wildfires, droughts, and the spread of diseases will threaten the health and wellbeing of everyone in the SCAG region. Climate change threatens the water supply, food security, air quality and shelter and leads to more extreme heat days, drought, and sea level rise.

Extreme heat days are days in which the temperature exceeds the 98th percentile of maximum temperature for a given location. Extreme weather conditions, particularly extreme heat days results in adverse outcomes for human health. Heat-induced illnesses include heat stroke, heat exhaustion, dehydration, and premature death from cardiovascular or respiratory disease. The effects of extreme heat days is further exacerbated by the urban heat island effects, which is caused by dense urban areas that have more buildings, pavement, and dark surfaces with less greenery and green spaces.

As a result of extreme heat days there may be longer and more severe droughts. Extreme heat can lead to excessive drying of soil and vegetation as well as melting of California's Sierra Nevada snowpack.

Climate change can also lead to sea level rise. Orange County has the greatest risk for inundation within the SCAG region, with 3.6 percent of the population in an inundation zone. Los Angeles and Ventura Counties have 1.6% and 0.17%, respectively, of their county population living within inundation zones. Sea level rise can lead to flooding in these areas and can create important health consequences such as contaminating drinking water or respiratory issues from mold in flood-damaged homes.

Ongoing GHG Emission Reduction and Adaption Strategies in the SCAG Region

Climate change affects natural and human systems globally. Climate mitigation strategies include reducing or sequestering GHG emissions, while climate adaptation is preparing for the unavoidable impacts from climate change. Climate mitigation strategies include, but are not limited to:[52]

- Promoting energy efficiency in buildings
- Using low carbon electricity
- Transitioning to high efficiency heating and cooling systems

---

52 Energy + Environmental Economics. 2015. *Summary of the California State Agencies' PATHWAYS Project: Long-Term Greenhouse Gas Reduction Scenarios*. Available online at: https://ww3.arb.ca.gov/html/fact_sheets/e3_2030scenarios.pdf , accessed March 25, 2019.

- Using low carbon and alternative fuels
- Incorporating zero emission or hybrid vehicles
- Incorporating healthy community planning (active transportation)
- Increasing urban density
- Reducing automobile dependence
- Increasing transit options
- Integrating renewable energy
- Improving waste management

Climate adaptation solutions would be long term and require a shift in thinking on how communities are designed. Adaptation strategies include, but are not limited to:[53]

- Using scarce water more efficiently
- Adapting building codes to future climate conditions and extreme weather events
- Building flood defenses and raising the levels of levees
- Developing drought tolerant crops
- Implementing urban tree planting and reforestation
- Setting aside land corridors for species migration
- Increasing collaboration on climate preparedness strategies among public agencies

Multiple jurisdictions in the SCAG region have taken action to address climate change. After assessing the climate vulnerabilities distinct to their community, these jurisdictions formulate a plan to move forward to minimize the impacts of these vulnerabilities. These actions take the form of climate action plans, general plan policies, GHG reduction plans, sustainability plans, and ordinances.[54] SCAG has undertaken several planning efforts including studying adaptation strategies and assisting jurisdictions in developing Climate Action Plans.

SCAG presents annual Sustainability Awards to recognize exemplary planning projects that support the core principles of mobility, livability, prosperity, and sustainability.

Past Sustainability Award winners include:

2018:

- City of Long Beach – 2017 Bicycle Master Plan, Communities of Excellence in Nutrition, Physical Activity and Obesity Prevention (CX3) & Willow Springs Wetland Restoration Project
- City of Cathedral City & SCRAP Gallery – Cycle Cathedral City Bicycle Outreach and Education Program
- City of San Fernando – Corridors Specific Plan
- Cities of Arcadia, Azusa, Duarte, Irwindale, Monrovia, San Marino, South Pasadena and LA Metro – 626 Golden Streets
- City of Rancho Cucamonga – Rancho Cucamonga Sustainable Community Action Plan
- City of Perris – Live Well Perris
- City of Hermosa Beach – PLAN Hermosa

2017:

- Transportation Corridor Agencies (TCA) – Foothill South Settlement Agreement
- UCLA Department of Transportation – UCLA BruinBikeSmart
- City of San Bernardino – Waterman + Baseline Neighborhood Specific Plan
- Imperial County Transportation Commission (ICTC) – Pedestrian and Bicycle Transportation Access Study for the California/Baja California Land Ports of Entry
- Los Angeles County Department of Parks and Recreation – Los Angeles County Master Plan for Sustainable Parks and Recreation: Phase 1
- City of Lynwood – Lynwood Safe and Healthy Communities Element
- City of Long Beach – Midtown Specific Plan

3.8.2 REGULATORY FRAMEWORK

3.8.2.1 International

Intergovernmental Panel on Climate Change

The World Meteorological Organization (WMO) and United Nations Environmental Program (UNEP) established the IPCC in 1988. The goal of the IPCC is to evaluate the risk of climate change caused by human activities. Rather than performing research or monitoring climate, the IPCC relies on peer-reviewed and published scientific literature to make its assessment. While not a regulatory body, the IPCC assesses information (i.e., scientific literature) regarding human-induced climate change and the impacts of human-induced climate change and recommends options to policy makers for the adaptation and mitigation of climate change. The IPCC reports its evaluations in special reports called assessment reports. The latest assessment report (i.e., Fifth Assessment Report, consisting of three working group reports and a synthesis report based on the first three reports) was published in 2013. In its 2013 report, the IPCC stated that global temperature increases since 1951 were extremely likely attributable to man-made activities (greater than 95 percent certainty).[55] The IPCC anticipates the release of the Sixth Assessment Report in 2022.[56]

Paris Accord

The most recent international climate change agreement was adopted at the United Nations Framework Convention on Climate Change in Paris in December 2015 (the "Paris Accord").[57] In the Paris Accord, the United States set its intended nationally determined contribution to reduce its GHG emissions by 26 to 28 percent below its 2005 level in 2025 and to make best efforts to reduce its emissions by 28 percent. These targets were set with the goal of limiting global temperature rise to below 2 degrees Celsius and getting to the 80 percent emission reduction by 2050.

57 United Nations, Paris Agreement. 2015. *Paris Agreement.* Available online at: http://unfccc.int/files/essential_background/convention/application/pdf/english_paris_agreement.pdf, accessed April 17, 2018

However, in June 2017, the U.S. announced its intent to withdraw from the Paris Accord.[58] The earliest effective date of a withdrawal by the U.S. is November 2020.

In an effort to reach the goals set by the Paris Accord, over 9,000 cities and local governments from 132 countries across the world formed the Global Covenant of Mayors (GCoM) with the goal of collectively reducing 1.3 billion tons of CO_2 emissions per year by 2030.[59] 158 cities within the United States have joined GCoM despite the federal government announcing its intent to withdraw from the Paris Accord. Many of these cities are in the SCAG region, including Los Angeles, Lancaster, Long Beach, Manhattan Beach, Santa Monica, West Hollywood, and Palm Springs.[60]

3.8.2.2 Federal

Global Change Research Act (1990)

In 1990, Congress passed and the President signed Public Law 101-606, the Global Change Research Act.[61] The purpose of the legislation was: "…to require the establishment of a United States Global Change Research Program aimed at understanding and responding to global change, including the cumulative effects of human activities and natural processes on the environment, to promote discussions towards international protocols in global change research, and for other purposes." To that end, the Global Change Research Information Office was established in 1991 to serve as a clearinghouse of information. The Act requires a report to Congress every four years on the environmental, economic, health and safety consequences of climate change; however, the first and only one of these reports to date, the National Assessment on Climate Change, was not published until 2000. In February 2004, operational responsibility for GCRIO shifted to the U.S. Climate Change Science Program.

Supreme Court Ruling

The US Supreme Court ruled in *Massachusetts v. Environmental Protection Agency, 127 S.Ct. 1438 (2007)*, that carbon dioxide and other greenhouse gases are pollutants under the Federal Clean Air Act (CCA),

which the US Environmental Protection Agency (USEPA) must regulate if it determines they pose an endangerment to public health or welfare.

US EPA Endangerment Finding

On December 7, 2009, the US EPA Administrator signed two distinct findings regarding GHGs under section 202(a) of the Clean Air Act (42 USC Section 7521):[62]

- Endangerment Finding: The Administrator finds that the current and projected concentrations of the six key well-mixed GHGs (carbon dioxide, methane, nitrous oxide, hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride) in the atmosphere threaten the public health and welfare of current and future generations.

- Cause or Contribute Finding: The Administrator finds that the combined emissions of these well-mixed GHGs from new motor vehicles and new motor vehicle engines contribute to the GHG pollution that threatens public health and welfare.

Energy Policy Act of 1992 (EPAct)

The Energy Policy Act of 1992 (EPAct)[63] was passed to reduce the country's dependence on foreign petroleum and improve air quality. EPAct includes several parts intended to build an inventory of alternative fuel vehicles (AFVs) in large, centrally fueled fleets in metropolitan areas. EPAct requires certain federal, state, and local government and private fleets to purchase a percentage of light duty AFVs capable of running on alternative fuels each year. In addition, financial incentives are also included in EPAct. Federal tax deductions will be allowed for businesses and individuals to cover the incremental cost of AFVs. States are also required by the act to consider a variety of incentive programs to help promote AFVs.

Energy Policy Act of 2005

The Energy Policy Act of 2005[64] provides renewed and expanded tax credits for electricity generated by qualified energy sources, such as landfill gas; provides bond financing, tax incentives, grants, and loan

guarantees for clean renewable energy and rural community electrification; and establishes a federal purchase requirement for renewable energy.

Energy Independence and Security Act

The Energy Independence and Security Act of 2007[65] includes several key provisions that will increase energy efficiency and the availability of renewable energy, which will reduce greenhouse gas emissions as a result. First, the Act sets a Renewable Fuel Standard that requires fuel producers to use at least 36 billion gallons of biofuel by 2022. Second, it increased Corporate Average Fuel Economy (CAFE) Standards to require a minimum average fuel economy of 35 miles per gallon for the combined fleet of cars and light trucks by 2020. Third, the adopted bill includes a variety of new standards for lighting and for residential and commercial appliance equipment. The equipment includes residential refrigerators, freezers, refrigerator-freezers, metal halide lamps, and commercial walk-in coolers and freezers.

EPA Reporting Rule

The US Environmental Protection Agency (USEPA) adopted a mandatory GHG reporting rule in September 2009.[66] The rule would require suppliers of fossil fuels or entities that emit industrial greenhouse gases, manufacturers of vehicles and engines, and facilities that emit 25,000 metric tons or more per year of GHG emissions to submit annual reports to the USEPA beginning in 2011 (covering the 2010 calendar year emission). Vehicle and engine manufacturers were required to begin reporting GHG emissions for model year 2011.

Fuel Economy Standards

On September 15, 2009, the National Highway Traffic Safety Administration (NHTSA) and EPA announced a proposed joint rule that would explicitly tie fuel economy to GHG emissions reductions requirements. The proposed new Corporate Average Fuel Economy (CAFE) Standards[67] would cover automobiles for model years 2012 through 2016 and would require passenger cars and light trucks to meet a combined, per mile, carbon dioxide emissions level. It was estimated that by 2016, this GHG

emissions limit could equate to an overall light-duty vehicle fleet average fuel economy of as much as 35.5 miles per gallon. The proposed standards would require model year 2016 vehicles to meet an estimated combined average emission level of 250 grams of carbon dioxide per mile under EPA's GHG program.

On November 16, 2011, EPA and NHTSA issued a joint proposal to extend the national program of harmonized GHG and fuel economy standards to model year (MY) 2017 through 2025 passenger vehicles. In August 2012, President Obama finalized standards that will increase fuel economy to the equivalent of 54.5 mpg for cars and light-duty trucks by MY 2025.

On January 12, 2017, EPA Administrator Gina McCarthy signed her determination to maintain the GHG emissions standards for model year MY 2022-2025 vehicles. Her final determination found that automakers are well positioned to meet the standards at lower costs than previously estimated.[68]

On March 15, 2017, the new EPA Administrator Scott Pruitt and Department of Transportation Secretary Elaine Chao announced that EPA intended to reconsider the final determination, issued on January 12, 2017, that recommended no change to the greenhouse gas standards for light duty vehicles for model years 2022- 2025.[69]

On April 2, 2018, the Administrator signed the Mid-term Evaluation Final Determination which finds that the model year 2022-2025 greenhouse gas standards are not appropriate in light of the record before EPA and, therefore, should be revised.[70]

On September 19, 2019, under the Safer, Affordable, Fuel-Efficient (SAFE) Vehicles Rule, the U.S. Department of Transportation's National Highway Traffic Safety Administration (NHSTA) and the U.S. EPA issued the final "One National Program Rule." The rule states that federal law preempts state and local laws regarding tailpipe GHG emissions standards, zero emissions vehicle mandates, and fuel economy for automobiles and light duty trucks. The rule revokes California's Clean Air Act waiver and

70 Ibid.

preempts California's Advanced Clean Car Regulations and may potentially impact SCAG's Connect SoCal and transportation projects in the SCAG region.[71, 72]

On September 20, 2019, a lawsuit was filed by California and a coalition of 22 other states, and the cities of Los Angeles, New York and Washington, D.C., in the United States District Court for the District of Columbia (Case 1:19-cv-02826) challenging the SAFE Rule and arguing that EPA lacks the legal authority to withdraw the California waiver. As such, at the time of this PEIR, it is unclear whether the SAFE Rule will remain in place.[73]

Heavy-Duty Vehicle Program

In May 2010, President Barack Obama issued a Presidential Memorandum Regarding Fuel Efficiency Standards requesting that USEPA and National Highway Traffic Safety Administration (NHTSA) take additional coordinated steps to produce a new generation of clean vehicles.[74] In response, USEPA and NHTSA adopted regulations governing Medium- and Heavy-Duty Greenhouse Gas Emissions and Fuel Efficiency (title 40, Code of Federal Regulations, Chapter I) on September 15, 2011 (most recently amended on August 16, 2013) to establish the first fuel efficiency requirements for medium- and heavy-duty vehicles beginning with the model year 2014 through model year 2018. On February 18, 2014, the President directed EPA and NHTSA to set the next round of fuel efficiency standards for Medium- and heavy-duty vehicles (beyond model year 2018) that will build on the existing standards to further reduce fuel consumption through the application of advanced cost-effective technologies and continue to improve the efficiency of moving goods across the United States. In October 2016, US EPA and NHTSA adopted Phase 2 GHG and fuel efficiency standards for medium- and heavy-duty engines and vehicles.[75]

Clean Power Plan

In 2015, US EPA published the Clean Power Plan (80 Fed. Reg. 64661, October 23, 2015).[76] The Clean Power Plan sets achievable standards to reduce CO_2 emissions by 32 percent from 2005 levels by 2030. This Plan establishes final emissions guidelines for states to follow in developing plans to reduce GHG emissions from existing fossil fuel-fired electric generating units (EGUs). Specifically, US EPA is establishing: (1) CO_2 emission performance rates representing the best system of emission reduction (BSER) for two subcategories of existing fossil-fuel-fired EGUs, fossil-fuel-fired electric utility steam generating units and stationary combustion turbines; (2) state-specific CO_2 goals reflecting the CO_2 emission performance rates; and (3) guidelines for the development, submittal and implementation of state plans that establish emission standards or other measures to implement the CO_2 emission performance rates, which may be accomplished by meeting the state goals. This final rule would continue progress already under way in the United States to reduce CO_2 emissions from the utility power sector. On February 9, 2016, the Supreme Court (Order No. 15A773) stayed implementation of the Clean Power Plan pending judicial review. As directed by Executive Order on Energy Independence,[77] the U.S. EPA officially repealed the Clean Power Plan in June 2019 and issued the final Affordable Clean Energy rule in its place.[78]

Affordable Clean Energy Rule

The U.S. EPA issued the Affordable Clean Energy (ACE) rule on June 19, 2019, in order to replace the Clean Power Plan. The ACE rule establishes emissions guidelines for states to use when developing plans to limit carbon dioxide at coal-fired power plants. Specifically, the ACE rule aims at improving the heat rate as the best system of emissions reductions for carbon dioxide at coal-fired power plants and these improvements can be made at individual facilities. States will have three years to submit plans. The EPA estimates that the ACE rules will result in a reduction of CO_2 emissions from the electricity sector by as much as 35% below 2005 levels by 2030.[79]

Federal Highway Administration's Climate Change and Extreme Weather Vulnerability Assessment Framework

Published in December 2012, the Climate Change and Extreme Weather Vulnerability Assessment Framework is a guidance document for transportation agencies to assess their vulnerability to climate change and extreme weather events. Objectives for a vulnerability assessment may include siting new assets in areas less vulnerable to climate change, educating staff regarding overall climate risks to the agency's transportation system, or informing the development of adaption strategies. Based on these objectives, an agency can then select and characterize relevant assets and identify climate variables for study. The vulnerability assessment is an iterative process; information gathered on assets may inform climate information needs and vice versa.[80]

Executive Order on Energy Independence

On March 28, 2017, President Donald Trump signed Executive Order 13783, "Promoting Energy Independence and Economic Growth," which calls for:[81]

- Review of the Clean Power Plan
- Review of the 2016 Oil and Gas New Source Performance Standards for New, Reconstructed, and Modified Sources
- Review of the Standards of Performance for GHG Emissions from New, Modified, and Reconstructed Stationary Sources: Electric Generating Units
- Withdrawal of Proposed Rules: Federal Plan Requirements for GHG Emissions From Electric Utility Generating Units Constructed on or Before January 8, 2014; Model Trading Rules; Amendments to Framework Regulations; and Clean Energy Incentive Program Design Details

3.8.2.3 State

Coastal Act

The California Coastal Act of 1976 directs the California Coastal Commission (Coastal Commission) to protect and enhance the State's coastal resources.[82] The Coastal Commission has planning, regulatory, and permitting authority over all development within the coastal zone, whose landward boundary varies with location. The Act governs coastal hazards for new development, mandating that it minimize risks to life and property in areas of high flood. New development must be located such that it will not be subject to erosion or stability hazard over the course of its design life, and construction of protective devices (e.g., seawalls, revetment) that substantially alter natural land forms along bluffs and cliffs are not permitted (Section 30253).

The Coastal Commission's mandate extends to climate change, including sea level rise; however, the agency is currently assessing how best to address sea level rise and other challenges resulting from climate change. The Coastal Commission partners with local governments to form Local Coastal Programs (LCPs), transferring the power to regulate development within the coastal zone to cities and counties. Within the Bay Area, all of San Mateo, San Francisco, Marin, and Sonoma counties, along with the cities of Daly City, Pacifica and Half Moon Bay have certified LCPs. Any changes in the Coastal Commission's policies and/or regulations with respect to sea level rise may ultimately require revisions to LCPs.

Senate Bill 1078 (SB 1078), Senate Bill 107 (SB 107), Executive Order (EO) S-14-08, Executive Order S-21-09 (Renewables Portfolio Standard), and Senate Bill 100 (SB 100)

On September 12, 2002, Governor Gray Davis signed SB 1078 (Chapter 516, Statutes of 2002) requiring California to generate 20 percent of its electricity from renewable energy by 2017.[83] SB 107 (Chapter 464, Statutes of 2006), signed by the Governor on September 26, 2006 changed the due date for this goal from 2017 to 2010.[84] On November 17, 2008, Governor Arnold Schwarzenegger signed Executive Order S-14-08, which established a Renewables Portfolio Standard goal for California requiring that all retail sellers of electricity serve 33 percent of their load with renewable energy by 2020.[85] Increased use of renewable energy sources will decrease California's reliance on fossil fuels, reducing emissions of GHGs from the

energy sector. In April 2011, SB X1-2 required that all electricity retailers adopt the new RPS goals providing 20 percent renewable sources by the end of 2013, 25 percent by the end of 2016, and 33 percent by the end of 2020.[86] SB 350 of 2015 (Chapter 547, Statutes of 2015) increased the renewable portfolio standard to 50 percent by the year 2030.[87]

Executive Order S-21-09 directs CARB to adopt regulations to increase California's Renewables Portfolio Standard (RPS) to 33 percent by 2020.[88] The target was signed into law as SB 2 by Governor Brown in April 2011. This builds upon SB 1078 (2002), which established the California RPS program, requiring 20 percent renewable energy by 2017, and SB 107 (2006), which advanced the 20 percent deadline to 2010. In September 2018, SB 100 was approved by Governor Brown. SB 100 requires an updated goal of 60% renewable energy resources by the year 2030, and 100% zero-carbon energy by the year 2045.[89]

Assembly Bill 1493 (AB 1493) (Pavley Regulations) - Vehicular Emissions Greenhouse Gas Emission Standards

In September 2002, AB 1493 (Chapter 200, Statutes of 2002) (referred to as Pavley I)[90] was enacted, requiring the development and adoption of regulations to achieve "the maximum feasible reduction of greenhouse gases" emitted by noncommercial passenger vehicles, light-duty trucks, and other vehicles used primarily for personal transportation in the state by January 1, 2005. Pavley I took effect for model years starting in 2009 to 2016 and Pavley II, which is now referred to as "LEV (Low Emission Vehicle) III GHG" will cover 2017 to 2025 (13 Cal. Code Regs. Section 1900 *et seq.*).[91] Fleet average emission standards were to reach a 22 percent reduction by 2012 and 30 percent by 2016.

Assembly Bill 32 (AB 32) and CARB Scoping Plan

The State of California has implemented numerous laws targeting GHG emissions. Chief among these is the California Global Warming Solutions Act of 2006 (Assembly Bill [AB] 32) (Health & Safety Code Section 38500 et seq.).[92] AB 32 represents the first enforceable statewide program to limit GHG emissions from all major sectors with penalties for noncompliance. Like EO S-3-05, AB 32 requires the State of

92 Assembly Bill 32. 2006.

California to reduce its emissions to 1990 levels by 2020. The Act establishes key deadlines for certain actions the state must take in order to achieve the reduction target. The first action under AB 32 resulted in California Air Resources Board's (CARB) adoption of a report listing three specific early action GHG reduction measures on June 21, 2007. On October 25, 2007, CARB approved an additional six early action GHG reduction measures under AB 32.[93]

As required under AB 32, on December 6, 2007, CARB approved the 1990 GHG emissions inventory, thereby establishing the emissions limit for 2020. The 2020 emissions limit was set at 427 $MMTCO_{2e}$, since updated to 431 $MMTCO_2e$.[94] The inventory indicated that in 1990, transportation, with 35 percent of the state's total emissions, was the largest single sector generating carbon dioxide; followed by industrial emissions, 24 percent; imported electricity, 14 percent; in-state electricity generation, 11 percent; residential use, 7 percent; agriculture, 5 percent; and commercial uses, 3 percent (figures are based on the 1990 inventory). AB 32 does not require individual sectors to meet their individual 1990 GHG emissions inventory; the total statewide emissions are required to meet the 1990 target by 2020.

In addition to the 1990 emissions inventory, CARB also adopted regulations requiring the mandatory reporting of GHG emissions for large facilities on December 6, 2007 (17 Cal. Code Regs. Section 95100 *et seq.*).[95] The mandatory reporting regulations require annual reporting from the largest facilities in the state, which account for approximately 94 percent of GHG emissions from industrial and commercial stationary sources in California. About 800 separate sources fall under the new reporting rules and include electricity generating facilities, electricity retail providers and power marketers, oil refineries, hydrogen plants, cement plants, cogeneration facilities, and industrial sources that emit over 25,000 tons of CO_2 each year from on-site stationary combustion sources. Affected facilities began tracking their emissions in 2008, and reported them beginning in 2009, with a phase-in process to allowed facilities to develop reporting systems and train personnel in data collection. Emissions for 2008 could be based on best available emission data. Beginning in 2010, however, emissions reporting requirements became more rigorous and are subject to third-party verification. Verification will take place annually or every three years, depending on the type of facility.

93 CARB. *Early Action Items*. Available online at: https://ww3.arb.ca.gov/cc/ccea/ccea.htm, accessed April 17, 2018.

94 CARB. 2017. *California 1990 Greenhouse Gas Emissions Level and 2020 Limit*. Available online at: https://www.arb.ca.gov/cc/inventory/1990level/1990level.htm, accessed April 18, 2017.

95 CARB. 2007. *Notice of Public Availability of Modified Text: Public Hearing to Consider Adoption of a Regulation for the Mandatory Reporting of Greenhouse Gas Emissions*. Available online at: https://ww3.arb.ca.gov/regact/2007/ghg2007/15daynotice.pdf, accessed August 21, 2019.

In December 2008, CARB adopted a *Climate Change Scoping Plan*[96] indicating how emission reductions will be achieved from significant sources of GHGs via regulations, market mechanism, and other actions. The *Climate Change Scoping Plan* identifies 18 recommended strategies the state should implement to achieve AB 32.

CARB's initial Scoping Plan contains the main strategies California would implement to reduce the projected 2020 Business-as-Usual (BAU) emissions to 1990 levels, as required by AB 32. These strategies are intended to reduce CO_2e[97] emissions by 174 million metric tons (MT), or approximately 30 percent, from the State's projected 2020 emissions level of 596 million $MTCO_{2e}$ (MMTCO2e) under a BAU[98] scenario. This reduction of 42 million $MTCO_{2e}$, or almost 10 percent from 2002 to 2004 average emissions, would be required despite the population and economic growth forecast through 2020.

CARB's initial Scoping Plan calculates 2020 BAU emissions as those expected to occur in the absence of any GHG reduction measures. The 2020 BAU emissions estimate was derived by projecting emissions from a past baseline year using growth factors specific to each of the different economic sectors (e.g., transportation, electrical power, commercial and residential, industrial). CARB used 3-year average emissions, by sector, for 2009 to 2011 to forecast emissions to 2020. The measures described in CARB's Scoping Plan are intended to reduce the projected 2020 BAU to 1990 levels, as required by AB 32.[99]

On December 14, 2017, CARB approved the final version of *California's 2017 Climate Change Scoping Plan* (2017 Scoping Plan Update – discussed in more detail below), which outlines the proposed framework of action for achieving the SB 32 2030 GHG target of 40 percent reduction in GHG emissions relative to 1990 levels.[100] See further discussion below.

---

96 CARB. 2013. *Initial AB 32 Climate Change Scoping Plan* Document. Available online at: https://www.arb.ca.gov/cc/scopingplan/document/scopingplandocument.htm, accessed April 17, 2018.

97 Carbon dioxide equivalent (CO_2e) – A metric measure used to compare the emissions from various greenhouse gases based upon their global warming potential.

98 "Business-as-Usual" refers to emissions expected to occur in the absence of any GHG reduction measure (California Environmental Protection Agency Air Resources Board Website, http://www.arb.ca.gov/cc/inventory/data/bau.htm, Accessed June 1, 2016). Note that there is significant controversy as to what BAU means. In determining the GHG 2020 limit, CARB used the above as the "definition."

99 The First Update to California's Climate Change Scoping Plan was developed by CARB in collaboration with the CAT and reflects the input and expertise of a range of state and local government agencies. The 2014 Scoping Plan Update lays the foundation for establishing a broad framework for continued emission reductions beyond 2020.

100 CARB. 2017. *California's 2017 Climate Change Scoping Plan*. Available online at: https://ww3.arb.ca.gov/cc/scopingplan/scoping_plan_2017.pdf, accessed August 14, 2019.

Senate Bill 1 (SB 1)

SB 1 (2006) (Chapter 132, Statutes of 2006) set a goal to install 3,000 megawatts of new solar capacity by 2017, moving the state toward a cleaner energy future and helping lower the cost of solar systems for consumers.[101] The "Million Solar Roofs" Program is a ratepayer-financed incentive program aimed at transforming the market for rooftop solar systems by driving down costs over time. It provides up to $3.3 billion in financial incentives that decline over time.

Assembly Bill 811 (AB 811)

AB 811 (2008) (Chapter 159, Statutes of 2008) authorizes California cities and counties to designate districts within which willing property owners may enter into contractual assessments to finance the installation of renewable energy generation and energy efficiency improvements that are permanently fixed to the property.[102] These financing arrangements would allow property owners to finance renewable generation and energy efficiency improvements through low-interest loans that would be repaid as an item on the property owner's property tax bill.

SB 1383-Short Lived Climate Pollutants

Short-lived climate pollutants (SLCP) SLCPs include black carbon (soot), methane, and fluorinated gases (F-gases). SB 1383 of 2016 (Chapter 395, Statutes of 2016) sets forth legislative direction for control of SLCPs.[103] It requires CARB, no later than January 1, 2018, to approve and begin implementing its SLCP strategy to achieve the following reductions in emissions by 2030 compared to 2013 levels: methane by 40 percent, hydrofluorocarbons by 40 percent, and black carbon (non-forest) by 50 percent. The bill also specifies targets for reducing organic waste in landfills. SB 1383 also requires CARB to adopt regulations to be implemented on or after January 1, 2024 specific to the dairy and livestock industry, requiring a 40 percent reduction in methane emissions below 2013 levels by 2030, if certain conditions are met. Lastly, the bill requires CalRecycle to adopt regulations to take effect on or after January 1, 2022 to achieve specified targets for reducing organic waste in landfills.

Senate Bill 375 (SB 375)

SB 375, adopted in 2008, builds on AB 32, SB 375 (Chapter 728, Statutes of 2008)[104] seeks to coordinate land use planning, housing planning, regional transportation planning, and GHG reductions. By

coordinating these efforts, it is envisioned that vehicle congestion and travel can be reduced resulting in a corresponding reduction in emissions. SB 375 directed CARB to set regional targets to reduce emissions; regional transportation plans are required to identify how they will meet these targets.

SB 375 has three major components:

- Using the regional transportation planning process to achieve reductions in emissions consistent with AB 32's goals.
- Offering California Environmental Quality Act (CEQA) incentives to encourage projects that are consistent with a regional plan that achieves emissions reductions.
- Coordinating the Regional Housing Needs Assessment (RHNA) process with the regional transportation process while maintaining local authority over land use decisions.

A Sustainable Communities Strategy (SCS) is a required component of the RTP. The SCS is a land use pattern for the region which, in combination with transportation policies and programs, strives to reduce emissions and helps meet CARB's targets for the region. An alternative planning strategy (APS) must be prepared if the SCS is unable to reduce emissions and achieve the emissions reduction targets established by CARB.

Certain transportation planning and programming activities must be consistent with the SCS; however, SB 375 expressly provides that the SCS does not regulate the use of land, and further provides that local land use plans and policies (e.g., general plans) are not required to be consistent with either the RTP or SCS. For the 2016 RTP/SCS cycle, CARB set reduction targets for the SCAG region at 8 percent for 2020 and 19 percent for 2035. This was an update to the previous 2035 target of 13 percent.[105]

The 2018 Progress Report for SB 375 was written to assess progress made toward meeting GHG reduction targets and to include data-supported metrics for strategies utilized to meet those targets. It found that California is not on track to meet GHG reductions expected under SB 375, largely due to the fact that statewide passenger vehicle travel per capita is increasing. While California has hit its 2020 climate target ahead of schedule due to strong performance in the energy sector, meeting future targets will require a greater contribution from the transportation sector. Despite increases in fuel efficiency and decreases in the carbon content of fuel, transportation emissions have grown due to the high cost of housing, forcing residents to drive longer distances between the places they need to go.

The 2018 Progress Report also found that these growth patterns reinforce racial and economic injustices by disproportionately burdening low-income residents, who pay the highest proportion of their wages

105 CARB Updated Targets March 2018 https://ww3.arb.ca.gov/cc/sb375/sb375old.htm

for housing and commuting. These residents also often live in communities with the most health impacts from lack of active transportation infrastructure and transportation pollution. Overall, CARB finds that structural changes at all levels of government are still necessary to meet climate goals and ancillary benefits.[106]

Senate Bill 743

SB 743 (Steinberg) was signed into law by Governor Jerry Brown on September 27, 2013, and encourages development of mixed-use, transit-oriented infill projects by: (1) establishing new CEQA exemptions for transit-oriented developments located in Transit Priority Areas (TPAs) that are consistent with an adopted Specific Plan; (2) eliminating the requirement to evaluate aesthetic and parking impacts in those targeted development areas; and (3) directing the OPR to develop an alternative metric to evaluate transportation-related impacts under CEQA. [107, 108]

SB 743 directed OPR to identify appropriate criteria for the evaluation of transportation impacts. OPR selected VMT as the preferred transportation impact metric and applied their discretion to require its use statewide. Vehicle level of service (LOS) and similar measures related to delay are not identified as appropriate metrics for determining the significance of transportation impacts under CEQA although they may still be appropriate for evaluation of projects as part of the planning process. The SB 743 guidance indicates that each jurisdiction throughout the state has until July 1, 2020, to adopt VMT as the metric for evaluation of transportation impacts, but until that date, lead agencies may elect to use VMT and/or LOS to analyze transportation impacts (although CEQA has already been revised to indicate VMT as the appropriate metric for evaluation of transportation impacts).

With respect to identifying what represents an appropriate threshold of significance for VMT impacts, the California Air Resources Board (CARB) published the *2017 Scoping Plan-Identified VMT Reductions and Relationship to State Climate Goals* (CARB Report) which includes non-binding technical information on what level of statewide VMT reduction, in the judgment of CARB staff, would promote achievement of statewide GHG emission reduction targets. [109] CARB asserts that the currently adopted SCSs throughout the state "would achieve in aggregate, a nearly 18 percent reduction in statewide per capita on-road light-duty transportation-related GHG emissions relative to 2005 by 2035, if those SCSs were successfully

---

107 California Legislative Information. 2013. *Senate Bill No. 743*.

108 For a further discussion of SB 743, see Section 3.17 *Transportation, Traffic and Safety*.

109 California Air Resources Board. *CARB 2017 Scoping Plan-Identified VMT Reductions and Relationship to State Climate Goals* (Jan. 2019). Available online at: https://ww2.arb.ca.gov/sites/default/files/2019-01/2017_sp_vmt_reductions_jan19.pdf, accessed October 24, 2019.

implemented." However, in order to meet the state goals, the full reduction needed is a 25 percent reduction in statewide per capita on-road light-duty transportation-related GHG emissions, however, CARB has "determined that those targets would be infeasible for MPOs to achieve with currently available resources."

The CARB Report is based on modeling that incorporates cleaner technologies and fuels (CTF) assumptions consistent with the 2017 Scoping Plan Update and the 2016 Mobile Source Strategy (as discussed below) and provides an "alternate assessment tool for jurisdictions that choose to use them to complete analyses directed by the CEQA Guidelines." The CARB Report finds that:

> *Certain land use development projects located in areas that would produce rates of **total** VMT per capita that are approximately 14.3 percent lower than existing conditions, or rates of **light-duty** VMT per capita that are approximately 16.8 percent lower than existing conditions (either lower than the regional average or other appropriate planning context) could be, by virtue of their location and land use context, interpreted to be consistent with the transportation assumptions embedded in the 2017 Scoping Plan and with 2050 State climate goals. (Emphasis in original).*[110]

However, CARB notes that the modeling used for the CTF forecast identifies ratios of total statewide VMT to population and that the suggested per capita reductions are not household generated VMT and that values are not directly comparable to output from a local or regional travel demand model.

The *Technical Advisory on Evaluating Transportation Impacts in CEQA* (OPR Technical Advisory) also provides non-binding recommendations regarding assessment of VMT, thresholds of significance, and mitigation measures. [111] OPR cites to the CARB Report to reiterate that "consistency with RTP/SCSs does not necessarily lead to a less-than-significant VMT impact."[112] OPR finds:

> *Based on OPR's extensive review of the applicable research, and in light of an assessment by the California Air Resources Board quantifying the need for VMT reduction in order to meet the State's long-term climate goals, OPR recommends that a per capita [residential] or per employee [office] VMT that is fifteen percent below that of existing development may be a reasonable threshold.*[113]

As discussed in more detail in **Section 3.17 Transportation, Traffic and Safety**, for roadway capacity projects, OPR also recommends developing a project-level threshold based on VMT levels required to

achieve legally mandated GHG emission reduction targets as set forth in the CARB Scoping Plan and 2016 Mobile Source Strategy. OPR generally recommends a threshold of 15 percent below existing VMT per capita for residential and office with a no net increase for retail projects. OPR asserts that "land use projects, residential projects, office and retail projects tend to have the greatest influence on VMT" and suggests that lead agencies with more specific location information may develop their own more specific thresholds.

Executive Order (EO) S-3-05

On June 1, 2005, EO S-3-05 set the following GHG emission reduction goals: reduce GHG emissions to 2000 levels by 2010; reduce GHG emissions to 1990 levels by 2020; and reduce GHG emissions to 80 percent below 1990 levels by 2050.[114, 115] EO S-3-05 also calls for the Secretary of California Environmental Protection Agency (Cal/EPA) to be responsible for coordination of state agencies and progress reporting.

In response to the Executive Order, the Secretary of the Cal/EPA created the Climate Action Team (CAT).[116] California's CAT originated as a coordinating council organized by the Secretary for Environmental Protection. It included the Secretaries of the Natural Resources Agency, and the Department of Food and Agriculture, and the Chairs of the Air Resources Board, Energy Commission, and Public Utilities Commission. The original council was an informal collaboration between the agencies to develop potential mechanisms for reductions in GHG emissions in the state. The council was given formal recognition in Executive Order S-3-05 and became the CAT.

The original mandate for the CAT was to develop proposed measures to meet the emission reduction targets set forth in the executive order. The CAT has since expanded and currently has members from 18 state agencies and departments.

---

114 While EO S-3-05 sets a goal that Statewide GHG emissions be reduced to 80 percent below 1990 levels by 2050, the EO does not constitute a "plan" for GHG reduction, and no State plan has been adopted to achieve the 2050 goal.

115 Office of the Governor, Arnold Schwarzenegger. 2005. *Executive Order S-3-05.*

116 State of California. *Climate Action Team & Climate Action Initiative*. Available online at: https://www.climatechange.ca.gov/climate_action_team/, accessed on August 14, 2019.

The CAT is responsible for preparing reports that summarize the state's progress in reducing GHG emissions. The most recent CAT Report was published in December 2010.[117] The CAT Report discusses mitigation and adaptation strategies, state research programs, policy development, and future efforts.

Executive Order (EO) S-1-07, the Low Carbon Fuel Standard

On January 18, 2007, EO S-1-07 was issued establishing a statewide goal to reduce at least 10 percent in the carbon intensity of California's transportation fuels by 2020.[118] Regulatory proceedings and implementation of the Low Carbon Fuel Standard have been directed to the California Air Resources Board (ARB). The Low Carbon Fuel Standard has been identified by ARB as a discrete early action item in the *Climate Change Scoping Plan*.[119] CARB expects the Low Carbon Fuel Standard to achieve the minimum 10 percent reduction goal; however, many of the early action items outlined in the *Climate Change Scoping Plan* work in tandem with one another. To avoid the potential for double-counting emission reductions associated with AB 1493 (see previous discussion), the *Climate Change Scoping Plan* has modified the aggregate reduction expected from the Low Carbon Fuel Standard to 9.1 percent.

Executive Order S-13-08

Executive Order S-13-08, signed on November 14, 2008, directs California to develop methods for adapting to climate change impacts through preparation of a statewide plan.[120] In response to this order, the California Natural Resources Agency coordinated with 10 state agencies, multiple scientists, a consulting team, and stakeholders to develop the first statewide, multi-sector adaptation strategy in the country. The resulting report, *2009 California Climate Adaptation Strategy*[121,122] summarizes the best-known science to assess the vulnerability of the state to climate change impacts and outlines possible solutions that can be implemented within and across state agencies to promote resiliency. This strategy is the first step in an evolving process to reduce California's vulnerability to climate change impacts.

121 California Natural Resources Agency. 2009. *2009 California Climate Adaption Strategy.*

122 This report has been updated twice, once in 2014, and once in 2018 to reflect current adaption strategies and incorporate a "Climate Justice" chapter highlighting how equity is woven throughout the entire plan.

Adaptation refers to efforts that prepare the state to respond to the impacts of climate change – adjustments in natural or human systems to actual or expected climate changes to minimize harm or take advantage of beneficial opportunities. California's ability to manage its climate risks through adaptation depends on a number of critical factors. These include its baseline and projected economic resources, technology, infrastructure, institutional support and effective governance, public awareness, access to the best available scientific information, sustainably managed natural resources, and equity in access to these resources.

Executive Order B-16-2012

In March 23, 2012, Governor Brown issued Executive Order B-16-2012 to encourage zero-emission vehicles (ZEVs) and related infrastructure.[123] It orders CARB, CEC, CPUC, and other relevant agencies to work with the Plug-in Electric Vehicle Collaborative and the California Fuel Cell Partnership to establish benchmarks concerning ZEVs. By 2020, the state's ZEV infrastructure should support up to one million vehicles. By 2025, Executive Order B-16-2012 aims to put over 1.5 million ZEVs on California roads and displace at least 1.5 billion gallons of petroleum. The Executive Order also directs state government to begin purchasing ZEVs. In 2015, 10 percent of state departments' light-duty fleet purchases must be ZEVs, climbing to 25 percent of light-duty fleet purchases by 2020. Executive Order B-16-2012 sets a target for 2050 to reduce GHG emissions in the transportation sector by 80 percent below 1990 levels.

Executive Order N-19-19

On September 20, 2019, Governor Newsom issued Executive Order N-19-19 which requires the redoubling of the state's "efforts to reduce greenhouse gas emissions and mitigate the impacts of climate change while building a sustainable, inclusive economy." EO N-19-19 requires the Department of Finance to create a Climate Investment Framework with a strategy to align the state's $700 billion investment portfolio towards industries and sectors that contribute to the reduction of carbon emissions and increased resilience to the impacts of climate change. The State Transportation Agency shall leverage over $5 billion in annual state transportation spending to reduce fuel consumption and GHG emissions associated with the transportation sector. The Department of General Services shall reduce the state government's GHG footprint. Finally, the California Air Resources Board (CARB) shall develop new criteria for the clean vehicle incentive programs, propose new strategies to increase demand for zero

123 State of California. 2012. *Executive Order B-16-2012*. Available online at: https://www.ca.gov/archive/gov39/2012/03/23/news17472/index.html, accessed on August 14, 2019.

emission vehicles, and consider strengthening existing or adopting new transportation-GHG reduction regulations in order to meet California's goal of five million zero emissions vehicle sales by 2030.[124]

California Cap-and-Trade Program

Authorized by the California Global Warming Solutions Act of 2006 (AB 32), the Cap-and-Trade Program is a core strategy that California is using to meet its statewide GHG reduction targets for 2020 and 2030, and ultimately achieve an 80 percent reduction from 1990 levels by 2050. Pursuant to its authority under AB 32, CARB has designed and adopted a California Cap-and-Trade Program to reduce GHG emissions from major sources (deemed "covered entities") by setting a firm cap on statewide GHG emissions and employing market mechanisms to achieve AB 32's emission-reduction mandate of returning to 1990 levels of emissions by 2020 (17 CCR Sections 95800 to 96023).

In September 2012, CARB adopted a California Cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms, which established the cap-and-trade program to manage GHG emissions, for California. The cap-and-trade program is a market-based approach wherein the government determines an overall emission target, or "cap," for a particular set of facilities. The cap is the total amount of emissions that all of the facilities can produce. Tradable emissions allowances totaling the overall emissions cap are distributed by auction or given out amongst the particular set of facilities. The emissions allowances can be traded amongst the facilities.

Under the Cap-and-Trade Program, an overall limit is established for GHG emissions from capped sectors (e.g., electricity generation, petroleum refining, cement production, and large industrial facilities that emit more than 25,000 metric tons CO_2e per year) and declines over time, and facilities subject to the cap-and-trade permits to emit GHGs. The statewide cap for GHG emissions from the capped sectors commenced in 2013 and declines over time, achieving GHG emission reductions throughout the program's duration (see generally 17 CCR Sections 95811, 95812). On July 17, 2017, the California Legislature passed Assembly Bill 398, extending the Cap-and-Trade Program through 2030.

The cap-and-trade regulation provides a firm cap, helping to ensure that the 2020 and 2030 statewide emission limits will not be exceeded. An inherent feature of the Cap-and-Trade Program is that it does not direct GHG emissions reductions in any discrete location or by any particular source. Rather, GHG emissions reductions are ensured on a state-wide basis.

---

124 Adaptation Clearinghouse. 2019. *State of California Executive Order N-19-19*. Available online at: https://www.adaptationclearinghouse.org/resources/state-of-california-executive-order-n-19-19.html, accessed October 29, 2019.

Senate Bill 32 (SB 32) and AB 197

On September 8, 2016, California signed into law Senate Bill 32 (SB 32), which adds Section 38566 to the Health and Safety Code and requires a commitment to reducing statewide GHG emissions by 2020 to 1990 levels and by 2030 to 40 percent less than 1990 levels. SB 32 was passed with companion legislation AB 197 Chapter 250, Statutes of 2016), which provides greater legislative oversight of CARB's GHG regulatory programs, requires CARB to account for the social costs of GHG emissions, and establishes a legislative preference for direct reductions of GHG emissions.

CARB's 2017 Scoping Plan Update

In December 2017, CARB adopted California's 2017 Climate Change Scoping Plan (2017 Scoping Plan Update), which outlines the proposed framework of action for achieving California's SB 32 2030 GHG target: a 40 percent reduction in GHG emissions by 2030 relative to 1990 levels. The 2030 target is intended to ensure that California remains on track to achieve the goal set forth by Executive Order B-30-15 to reduce statewide GHG emissions by 2050 to 80 percent below 1990 levels.

The 2017 Scoping Plan Update identifies key sectors of the implementation strategy, which includes improvements in low carbon energy, industry, transportation sustainability, natural and working lands, waste management, and water. Through a combination of data synthesis and modeling, CARB determined that the target statewide 2030 emissions limit is 260 $MMTCO_2e$, and that further commitments will need to be made to achieve an additional reduction of 50 $MMTCO_2e$ beyond current policies and programs. Key elements of the 2017 Update include a proposed 20 percent reduction in GHG emissions from refineries and an expansion of the Cap-and-Trade program to meet the aggressive 2030 GHG emissions goal and ensure achievement of the 2050 limit set forth by E.O. B-30-15.

For the transportations sector, the 2017 Update indicates that while most of the GHG reductions will come from technologies and low carbon fuels, a reduction in the growth of vehicle miles traveled (VMT) is also needed. The 2017 Update indicates that stronger SB 375 GHG reduction targets will enable the State to make significant progress toward this goal, but alone will not provide all of the VMT growth reductions that will be needed. It notes that there is a gap between what SB 375 can provide and what is needed to meet the State's 2030 and 2050 goals. The 2017 Update recommends that local governments consider policies to reduce VMT, including: land use and community design that reduces VMT; transit-oriented development; street design policies that prioritize transit, biking, and walking; and increasing low carbon mobility choices, including improved access to viable and affordable public transportation and active transportation opportunities.

California Environmental Quality Act Guidelines Amendments

California Senate Bill (SB) 97 (Chapter 185, Statutes of 2007) required the Governor's Office of Planning and Research (OPR) to develop California Environmental Quality Act (CEQA) Guidelines "for the mitigation of greenhouse gas emissions or the effects of greenhouse gas emissions." The *CEQA Guidelines* amendments provide guidance to public agencies regarding the analysis and mitigation of the effects of GHG emissions in CEQA documents. The significance of GHG emissions are specifically addressed in *State CEQA Guidelines* Section 15064.4. Section 15064.4 calls for a lead agency to make a "good-faith effort" to "describe, calculate or estimate" GHG emissions in CEQA environmental documents. Section 15064.4 further states that the analysis of GHG impacts should include consideration of (1) the extent to which the project may increase or reduce GHG emissions; (2) whether the project emissions would exceed a locally applicable threshold of significance; and (3) the extent to which the project would comply with "regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions." The guidelines also state that a project's incremental contribution to a cumulative effect is not cumulatively considerable if the project will comply with the requirements in a previously approved plan or mitigation program (including plans or regulations for the reduction of GHG emissions) that provides specific requirements that will avoid or substantially lessen the cumulative problem within the geographic area in which the project is located (*State CEQA Guidelines* Section 15064(h)(3)).

2016 Mobile Source Strategy

On May 16, 2016, the Air Resources Board (ARB or Board) released the updated Mobile Source Strategy that demonstrates how the State can simultaneously meet air quality standards, achieve greenhouse gas emission reduction targets, decrease health risk from transportation emissions, and reduce petroleum consumption over the next fifteen years. The Mobile Source Strategy aims to deliver environmental and public health benefits as well as updates to transportation infrastructure, enhancements of systemwide efficiency, and clean growth in the mobile sector. The estimated benefits of the strategy in reducing emissions from mobile sources includes an 80 percent reduction of smog-forming emissions and a 45 percent reduction in diesel particulate matter from today's levels in the South Coast. CARB estimates statewide, the Mobile Source Strategy would also result in a 45 percent reduction in greenhouse gas emissions, and a 50 percent reduction in the consumption of petroleum-based fuels.

Discussion Draft of CEQA and Climate Change Advisory

In December 2018, OPR published updated guidance with respect to how to evaluate climate change as a whole, including analysis of transportation impacts (including consideration of SB 743) and how to

evaluate different types of projects including transportation projects and land use plans. This document summarizes relevant regulations and discusses different approaches (both quantitative and qualitative) to analyzing different types of projects. The document further discusses how the analysis of GHG for individual projects may be streamlined through the preparation of greenhouse gas emission reduction plans such as climate action plans. The document suggests that emissions from individual projects may best be analyzed and mitigated at the programmatic level in regional-level documents focused on GHG emissions such as climate action plans. [125]

Caltrans Guidance on Incorporating Sea Level Rise

Pursuant to EO S-13-08 and the California Sea Level Rise Interim Guidance Document,[126] in May 2011 Caltrans released guidance on incorporating sea level rise into planning and decision making with respect to transportation projects. Caltrans' guidance recommends first determining if sea level should be incorporated into project planning, based on the project location and level of risk. A screening process with ten criteria guides the assessment of whether to incorporate sea level rise: design life, redundancy/alternative route(s), anticipated travel delays, evacuations/emergencies, traveler safety, expenditure of public funds, scope of project, effect on non-state highways, and environmental constraints. If the screening determines that sea level rise should be incorporated into project planning, the next step is to estimate the degree of potential impact and assess alternatives for preventing, mitigating and/or absorbing the impact. Caltrans uses the statewide sea level rise estimates presented in the California Sea Level Rise Interim Guidance Document for different years (2030 through 2100) to determine target sea level rise values; Caltrans directs projects with a life that extends to 2030 or earlier not to assume impacts from sea level rise. Having identified target sea level rise values for a project, Caltrans then lays out steps for implementation, including conducting more technical studies of inundation and subsidence and determining any adverse effects on facility functions and operations (e.g., from erosion, exposure to salt water), necessary adaptation measures, and the costs of mitigation.

California Department of Public Health Guidance on Integrating Public Health into Climate Action Planning

In February of 2012, the California Department of Public Health released a guidance document, *Climate Action for Health: Integrating Public Health into Climate Action Planning*.[127] This document introduces key health connections to climate change mitigation strategies, and suggestions for where these fit into a local climate action plan or general plan. The guidance document also provides a number of examples of strategies taken from actual climate action plans that integrate public health objectives, with policy efforts to improve community health and reduce GHG emissions. The information provided is advisory, voluntary, and educational. The document includes specific policy recommendations for transportation and land use planning, including incorporation of green space and tree canopy to mitigate urban heat islands, and healthy siting of housing, schools and health care facilities to avoid major air quality impacts.

California's Energy Efficiency Standards for Residential and Nonresidential Buildings

California established statewide building energy standards following legislative action. The legislation required the standards to:

- Be cost effective;
- Be based on the building life cycle; and
- Include both prescriptive and performance-based approaches.

The standards have been periodically updated as technology and design have evolved. Generally, the standards are updated every three years. As a result of AB 970, passed in the fall of 2000 in response to the state's electricity crisis, an emergency update of the Standards went into effect in June 2001.[128] The Commission then initiated an immediate follow-on proceeding to consider and adopt updated Standards that could not be completed during the emergency proceeding. The 2005 Building Energy Efficiency Standards were adopted in November 2003, took effect October 1, 2005.[129] The latest amendments were made in June 2015 and went into effect on January 1, 2017.

129 California Energy Commission. 2005. *2005 Building Energy Efficiency Standards for Residential and Nonresidential Buildings.* Available online at: https://ww2.energy.ca.gov/2006publications/CEC-400-2006-015/CEC-400-2006-015.PDF, accessed August 14, 2019.

Title 24 of the California Code of Regulations comprises the state Building Standards Code.[130] Part 6 of Title 24 is the California Energy Code, which includes the building energy efficiency standards. The standards include provisions applicable to all buildings, residential and non-residential, which describe requirements for documentation and certificates that the building meets the standards. These provisions include mandatory requirements for efficiency and design of the following types of systems, equipment, and appliances:

- Air conditioning systems
- Heat pumps
- Water chillers
- Gas- and oil-fired boilers
- Cooling equipment
- Water heaters and equipment
- Pool and spa heaters and equipment
- Gas-fired equipment including furnaces and stoves/ovens
- Windows and exterior doors
- Joints and other building structure openings (envelope)
- Insulation and cool roofs
- Lighting control devices.

The standards include additional mandatory requirements for space conditioning (cooling and heating), water heating and indoor and outdoor lighting systems and equipment in non-residential, high-rise residential, and hotel or motel buildings.

130 California Energy Commission. 2019. *Building Energy Efficiency Standards – Title 24.* Available online at: https://www.energy.ca.gov/programs-and-topics/programs/building-energy-efficiency-standards, accessed August 14, 2019.

In May 2018, the California Energy Commission voted unanimously, 5-0, to recommend energy efficiency standards to be added to state building regulations later in 2018, effecting all construction after Jan. 1, 2020.[131] The rules will make California the first state in the nation to require solar panels on new homes.

California Green Building Standards Code (2016), California Code of Regulations Title 24, Part 11

California's green building code, referred to as "CalGreen," was developed to provide a consistent approach to green building within the State.[132] Taking effect in January 2016, the most recent version of the Code lays out the minimum requirements for newly constructed residential and nonresidential buildings to reduce GHG emissions through improved efficiency and process improvements. It also includes voluntary tiers to further encourage building practices that improve public health, safety and general welfare by promoting the use of building concepts which minimize the building's impact on the environment and promote a more sustainable design. Local jurisdictions are required to adopt the CalGreen provisions. CalGreen is complimentary with California Energy Code, Title 24, Part 6, which continues to regulate energy efficiency in buildings.

Caltrans Strategic Management Plan, 2015 - 2020

The most recent Caltrans Strategic Management Plan[133] redefines the Caltrans mission statement and provides a vision statement. The Caltrans mission statement is: *Provide a safe, sustainable, integrated, and efficient transportation system to enhance California's economy and livability*. The Caltrans vision is: *A performance-driven, transparent, and account- able organization that values its people, resources, and partners and meets new challenges through leadership, innovation, and teamwork.* The document identifies five goals: 1) Safety and Health, 2) Stewardship and Efficiency, 3) Sustainability, Livability and Economy, 4) System Performance, and 5 Organizational Excellence. The document identifies numerous performance measures and targets including the following target with respect to Sustainability, Livability and Economy: to increase non-auto modes (triple bicycles, double pedestrian and double transit (2010 – 12 California Household Travel survey is the baseline), achieve a 15 percent reduction in per capita VMT (3 percent per year) reported by each District relative to 2010 by 2020, 85 percent reduction in diesel

particulate matter (relative to 2000), 80 percent reduction in NOx in the South Coast Air Basin by 2023 (from 2010).[134]

Local Development – Intergovernmental Review Program Interim Guidance, Implementing Caltrans Strategic Management Plan 2015 – 2020 Consistent with SB 743[135]

Caltrans developed this guidance for Caltrans use in providing comments to local jurisdictions through the Intergovernmental Review process. This guidance document supports the implementation of the Strategic Management Plan including achieving the identified targets.

3.8.2.4 Regional and Local

SCAG Sustainability Planning Grant Program

Formerly known as the Compass Blueprint Grant Program, SCAG's Sustainability Program works actively with Southern California communities and stakeholders to create a dynamic regional growth vision based on the principles of mobility, livability, prosperity, and sustainability. The program's work focuses on implementing the region's Sustainable Communities Strategy, the state-mandated plan for reducing GHG emissions from cars and light trucks through integrated transportation, land use, housing and environmental planning.[136]

South Coast Air Quality Management District (SCAQMD) Policy on Global Warming and Stratospheric Ozone Depletion

SCAQMD adopted a "Policy on Global Warming and Stratospheric Ozone Depletion" on April 6, 1990. The policy commits the SCAQMD to consider global impacts in rulemaking and in drafting revisions to the Air Quality Management Plan. In March 1992, the SCAQMD Governing Board reaffirmed this policy and adopted amendments to the policy. [137]

---

134 This document does not provide a detailed comparison to these targets because year 2000 and year 2010 comparable data is not available, and Caltrans VMT data for districts in the SCAG region is not available.

SCAQMD Draft Guidance Regarding Interim CEQA GHG Significance Thresholds

SCAQMD released draft guidance regarding interim CEQA GHG significance thresholds. In its October 2008 document, the SCAQMD proposed the use of a percent emission reduction target (e.g., 30 percent) to determine significance for commercial/residential projects that emit greater than 3,000 metric tons per year. On December 5, 2008, the SCAQMD Governing Board adopted the staff proposal for an interim GHG significance threshold for stationary source/industrial projects where the SCAQMD is lead agency.[138] However, SCAQMD has yet to adopt a GHG significance threshold for land use development projects (e.g., residential/commercial projects) and has formed a GHG Significance Threshold Working Group to further evaluate potential GHG significance thresholds.[139]

The CEQA GHG Significance Threshold Working Group met several times in 2008 to provide guidance to local lead agencies on determining significance for GHG emissions in their CEQA documents. Members of the working group included various stakeholder groups from state agencies, OPR, CARB, Attorney's General Office, local agencies, city and county planning departments, utilities, industry groups, and both environmental and professional organizations. The purpose of the working group was to solicit comments from the stakeholders as SCAQMD developed interim GHG significance thresholds to achieve a 90 percent GHG emission capture rate.[140] The Working Group discussed methodologies for determining project significance including categorical exemptions, consistency with regional GHG budgets in approved plans, a numerical threshold, performance standards, and emissions offsets.

The draft tier thresholds recommended by the SCAQMD Working Group were designed to meet reduction requirements from AB 32. Since the development of the draft tier thresholds, California passed SB 32 in order to reduce state GHG emissions to 40% below 1990 levels by 2030 (see **Section 3.8.2.3**). These recommended thresholds are over a decade old and were not designed to meet the stricter 2030 reduction requirements, as a result these thresholds are outdated and were not utilized in this analysis.

Counties

Los Angeles County

The Los Angeles County Office of Sustainability[141] was created within the Internal Services Department by the Board of Supervisors in October 2009 to respond to legislation, regulation, and policy related to Climate Change and serve as a central hub to coordinate Energy Efficiency, Conservation and Sustainability Programs within the County, its facilities, and the region. The County Office of Sustainability develops and implements programs that impact and benefit the constituents of Los Angeles County, such as the Energy Upgrade California in Los Angeles County energy efficiency home improvement and rebate program, countywide Environmental Service Centers, the SolarMap LACounty.gov and Green.LACounty.gov websites, and the Los Angeles Regional Collaborative for Climate Action and Sustainability. In addition, the County Office of Sustainability is the lead in coordinating and implementing Energy and Environmental policy programs and activities by all County departments.

As of March 2015, Los Angeles County Board of Supervisors approved the first Community Climate Action Plan (CCAP). The CCAP provides a roadmap to reduce GHGs in Los Angeles County by 11 percent by 2020. This target can be achieved through cool roofs, solar, tree canopies, and more active transportation and public transit use. The County of Los Angeles Department of Regional Planning will implement the CCAP and work to develop climate adaptation strategies beyond 2020.[142]

In August 2019, the Los Angeles County Board of Supervisors adopted the OurCounty regional sustainability plan. It outlines what local governments and stakeholders can do to enhance community well-being while reducing damage to the natural environment and adapting to climate change, with a particular focus on communities disproportionately burdened by environmental pollution. OurCounty is organized around 12 goals that will guide policy toward resiliency, equity, parks, renewable energy, reducing car dependency, and more. Its most ambitious goal includes reaching complete carbon neutrality by 2050 by completely phasing out fossil fuels countywide.[143]

Orange County

In early 2010, a joint committee with equal representation from the Orange County Council of Governments (COG) and the Orange County Transportation Authority (OCTA) was formed to develop the Orange County Sustainable Communities Strategy (SCS).[144] The Orange County COG/OCTA SCS Joint Working Committee led overall efforts to develop a subregional Orange County SCS to meet the requirements of SB 375 and the mutual agreements with SCAG with a plan that all local jurisdictions in Orange County could support. As a result of this collaborative effort, the Orange County SCS was adopted unanimously by the OCTA and Orange County COG Boards of Directors in June of 2011. Orange County SCS utilizes the transportation system along with land use and Best Management Practices strategies to help the County to achieve the state-mandated emissions reduction targets.

Riverside County

In July 2018, Riverside County created a Climate Action Plan to establish a clear path to sustainability and GHG reduction. The Plan establishes a 2020 reduction goal of 15% to 2008 emissions in order to be consistent with AB 32.[145]

In September 2014, Western Riverside Council of Governments (WRCOG) published the Subregional Climate Action Plan. The major goals of the Climate Action Plan are to create local jobs, promote healthier communities, achieve energy self-sufficiency, enhance social equity, reduce emissions, improve air quality, protect natural systems, and save money. WRCOG aims to reduce GHG emissions to 15 percent below 2010 levels by 2020, and 49 percent below 2010 levels by 2035.[146]

San Bernardino County

In March 2014, San Bernardino County released the final version of the San Bernardino County Greenhouse Gas Reduction Plan and Final EIR to be certified by the SANBAG Board of Directors. The plan initiated the compilation of an updated inventory of GHG emissions across the County as well as an evaluation of measures that could be adopted on a City-level to reduce emissions. The plan is in

accordance with AB 32 and other regional and general plans and provides a baseline of information for jurisdictions addressing greenhouse gas emissions.[147]

Ventura County

In April 2010, the County of Ventura General Services Agency (GSA) released an Energy Action Plan to minimize energy intensities in GSA-maintained buildings, improve operational energy and water efficiencies, reduce energy and water use, pursue LEED and Energy Star certifications, and educate GSA employees. As of April 2012, the County of Ventura released a Climate Protection Plan to reduce GHG emissions by 15 percent by 2020. The six action areas include climate protection leadership, countywide responsibility, facilities, vehicle (fleet) operations, employee commute, and expanded sustainability goals.[148]

Imperial County

In October 2018, Imperial County announced the development of a Climate Action Plan in order to identify GHG emissions and reduction strategies in the Imperial Valley region.

Cities

In 2016, the Governor's Office of Planning and Research (OPR) prepared a list of plans and initiatives adopted by California jurisdictions, including jurisdictions in the SCAG region, to address climate change.[149] The list showed that about 20 percent of the local jurisdictions had either completed local climate action plans or had efforts underway. Some cities in the SCAG region have also addressed climate change and GHG policies in their planning and permitting programs. As part of its Sustainability Program, SCAG has provided funding assistance for such local GHG emissions inventory efforts and local climate action plans. Jurisdictions within the SCAG region that have undertaken plans and initiatives addressing climate change are shown in **Table 3.8-4, California Jurisdictions Addressing Climate Change in the SCAG Region (2019).**

Los Angeles Green New Deal

In April 2019, Mayor Eric Garcetti released a refreshed version of the City's 2015 Sustainable City Plan. The Green New Deal calls for reaching 100 percent renewable electricity by 2045, creating 300,000 green jobs by 2035, and reducing overall greenhouse gas emissions to 50 percent of 1990 levels by 2025.[150]

3.8.3 ENVIRONMENTAL IMPACTS

3.8.3.1 Thresholds of Significance

The impacts related to GHG emissions resulting from the implementation of the proposed project would be considered significant if they would exceed the following significance criteria, in accordance with Appendix G of the *State CEQA Guidelines*:

- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.
- Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

As discussed in **Section 3.17, Transportation, Traffic and Safety,** CARB and OPR have recommended project-level VMT thresholds of significance in their guidance documents for use in evaluating traffic impacts in CEQA documents. These thresholds are intended to meet statewide GHG emissions targets through VMT reductions from the transportation sector. Both CARB and OPR acknowledge that MPO's are tasked with meeting SB 375 GHG emissions targets, and while CARB has determined that meeting these targets will not be sufficient to attain state climate goals, more can be done at the project level. At the project level, lead agencies may consider CARB, OPR and other recommended thresholds of significance and determine which ones are appropriate and feasible for an individual project. The discussion of GHG impacts below considers the potential for the region as a whole to meet the CARB and OPR targets.

3.8.3.2 Methodology

GHG emissions and climate change were evaluated in accordance with Appendix G the 2019 *CEQA Guidelines*. GHG emissions and climate change within the SCAG region were evaluated at a programmatic level of detail, in relation to the general plans of the six counties and the 191 cities within the SCAG region; a review of related literature germane to the SCAG region.

CEQA Guidelines Section 15064.4 states that, when making a determination with respect to the significance of a project's GHG emissions, a lead agency shall have discretion to determine whether to: (1) Use a model or methodology to quantify greenhouse gas emissions resulting from a project, and which model or methodology to use; and/or (2) Rely on a qualitative analysis or performance-based standards. Section 15064.4 also states that a lead agency should consider the following factors when assessing the significance of the impact of GHG emissions on the environment: (1) The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting;

(2) Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project; and (3) The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions.

The methodology for determining the significance of GHG emissions includes the use of SCAG's 2019 Scenario Planning Model (SPM) and transportation modeling in order to estimate GHG emissions from energy, water, and transportation. GHG emissions and transportation data were projected to 2045 using SCAG's Regional Travel Demand Model and ARB's EMFAC2014 emissions model. Estimates of energy and water use are based on current demand factors and emission rates associated with current power generation operations and water supply.

Analysis of the potential GHG impacts of Connect SoCal was conducted based on regional-level modeling of mobile-source emissions and gross estimates of stationary source emissions. It is anticipated that increasingly stringent regulations, changes in technology combined with future conservation (as a result of increased pressure to conserve and increased prices) will result in a reduced demand for all types of energy, including mobile and stationary sources (as well as reduced demand for water and associated energy requirements). As energy providers and other sectors respond to SB 32 and CARB's 2017 Scoping Plan, emission rates associated with energy use are anticipated to decrease. However, in order to present a conservative analysis and without knowledge of future regulations, technologies or market drivers, only modest reductions in demand are assumed. While the analysis considers regulations, programs, and policies currently in place, there is substantial uncertainty in projecting emissions for future horizon years. Additionally, it is important to note that GHG impacts are generally cumulative in nature, and unlike the localized air quality impacts, they have broader (i.e., statewide, national, and global) implications. *See Center for Biology Diversity v. Dept. of Fish & Wildlife*, 62 Cal.4th 204, 220 (2015) (Characterizing the state's GHG emissions as a "cumulative problem.").

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743, or SB 226 (as described in **Section 1.0 Introduction**), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.8.3.3 Impacts and Mitigation Measures

Impact GHG-1 **Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment.**

Significant and Unavoidable- Mitigation Required.

Pursuant to Appendix G of the *CEQA Guidelines*, a significant GHG impact would occur if the Plan would generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment. While transportation sector (specifically on road source) GHG emissions resulting from implementation of the Plan are anticipated to decrease compared to existing conditions and compared to No Project conditions, they are not anticipated to be reduced sufficiently to meet the GHG emissions reduction targets established for California (as discussed in **Impact GHG-2**). Moreover, while the Plan will meet the SB 375 GHG reduction targets set by CARB for SCAG, CARB has indicated that achievement of such regional targets is insufficient for the transportation sector to meet the state's overall GHG reduction goals. As such, GHG emissions from the Plan may have a significant impact on the environment.

Connect SoCal Projects and Strategies and Associated GHG Emissions -- Overview

Connect SoCal includes transportation projects which promote increased public transit ridership, connect public transit lines, increase active transportation opportunities and facilities, and manage traffic congestion. A complete list of SCAG's transportation projects is provided in **Appendix 2.0, Project List**. The region is anticipated to experience substantial increases in population, households, and jobs by 2045 (see **Section 2.0, Project Description**, and **Section 3.14, Population and Housing**). Connect SoCal also includes the land use strategies that seek to balance that the region's land use choices and transportation investments. This means Connect SoCal focuses new growth and development in existing urbanized settings and opportunity areas such as high-quality transit corridors (HQTAs) and incorporates strategies to increase walking, biking or other forms of active transportation, in fact 48% of housing units are expected to be within HQTAs in 2045 compared to 38% under existing conditions.

Changes in technology are anticipated to complement transportation projects and land use strategies in further reducing GHG emissions. The location-based land use strategies, street design policies, and pricing and system management policies would reduce GHG emissions. Integration of changing technologies with proposed strategies would enhance the effects of the strategies. For example, in order to support an increase in alternative fuel vehicles, SCAG's multi-tier approach includes encouraging electric vehicle (EV) charging at public fast charging locations, workplaces, and multi-family housing

(land use strategy), encouraging curbside EV charging stations and parking (street design policy), and providing rebates for charging stations and EVs (pricing and system management policy).

A complete list of emerging technologies and SCAG's associated land use, street design, and pricing and system management policies is included in the **Connect SoCal's - Emerging Technologies Technical Report**. Because of the anticipated increase in compact and higher density development, less energy (e.g., multi-family housing units are insulated by each other and, therefore, require less heating and cooling as compared to single family units) and less water (e.g., multi-family units have less landscaping requiring irrigation as compared to single-family units) is expected to be used and would contribute to the reduction in GHG emissions (see **Table 3.6-1, Residential Energy Use and Cost per Household,** and **Table 3.6-3, Building Energy Consumption – Residential and Commercial,** in **Section 3.6, Energy**).

GHG emissions result from direct and indirect sources. Direct emissions in the transportation sector derive from fuel combustion in vehicles (i.e., automobiles, trucks, trains, buses, planes, ships, and trains) and natural gas combustion from stationary sources. Indirect sources include off-site emissions occurring as a result of electricity from stationary sources. Indirect sources include off-site emissions occurring as a result of electricity, water consumption and solid waste. On road transportation emissions include fuel consumption from passenger vehicles, heavy-duty trucks, buses, and other motor vehicles. Transportation accounts for the greatest proportion of GHG emissions on a regional and state level. As part of Connect SoCal, transportation network improvements would be included, and more compact, infill, walkable, and mixed-use development strategies to accommodate new region's growth would be encouraged to accommodate increases in population, housing, employment, and travel demand. Additionally, Connect SoCal includes improvements to the active transportation network as well as passenger and rail in order to decrease fuel emissions.

Transportation Emissions

In order to assess the impacts of direct emissions as a result of Connect SoCal, the transportation emissions from on-road (light and medium duty vehicles, heavy duty vehicles, and buses) and other sources transportation (rail, aviation, and ocean-going vessels) were evaluated in **Table 3.8-5, Greenhouse Gas Emissions from All On-Road Vehicles in the SCAG Region,** and **Table 3.8-6, Greenhouse Gas Emissions from Other Transportation Sources in the SCAG Region**. **Table 3.8-7, Greenhouse Gas Emissions from All On-Road Vehicles and Other Transportation Sources in the SCAG Region,** provides a summary of **Tables 3.8-5** and **3.8-6** to demonstrate that the SCAG region will decrease mobile-source GHG emissions by approximately 12 percent from 2019 to 2045.

Between 2019 and 2045, GHG emission from on-road mobile sources and other transportation sources, inclusive of light and medium duty vehicles and heavy-duty trucks, would decrease by approximately 12 percent (on road only would decrease by approximately 17 percent). The largest decreases would occur in the most populous counties -- Los Angeles, Orange, and Ventura Counties (**Table 3.8-8, Greenhouse Gas Emissions All On-Road and Other Transportation Sources by County [CO_2]**). As shown in **Table 3.8-8**, transportation GHG emissions in Imperial and San Bernardino Counties are expected to increase between 2019 and 2045.

Total GHG Emissions in SCAG Region

In order to get a better estimate of total GHG emissions, emissions from other major sectors (energy and water consumption) in addition to transportation are considered in the analysis below.

As previously stated, Connect SoCal focuses growth in existing urban regions and opportunity areas, where transit and infrastructure are already in place. Locating new growth near bikeways, greenways, and transit would increase active transportation options and the use of other transit modes (public

transit, carpooling), thereby reducing number of vehicle trips and trip lengths and associated emissions. The land use strategies included in the Plan would encourage higher density development in existing urban cores and opportunity areas which would encourage more multi-family and/or mixed-use projects, via vertical development, instead of the traditional single-family home development. Compact development and utilization of conservation strategies (i.e. exceed Title 24 building codes, LEED certification), would reduce energy and water consumption.

GHG emissions for building energy were calculated in SCAG's Scenario Planning Model (SPM) a factor of 11.66 pounds (lb) CO_{2e}/therm for natural gas and 0.74 CO_{2e}/kilowatt-hour (kWh) for electricity were used to estimate 2019 and 2045 emissions). Indoor and outdoor water-related energy[151] assumed factors of 13,040 kWh/MG and 12,544 kWh/MG, respectively for 2019 and 2045. Water related energy includes the electricity used in the transport, treatment, and distribution of water. However, the analysis below does not account for changing sources of emissions that would reduce GHG emissions per kilowatt hour, nor does it account for improved technology that would reduce consumption of energy. The below analysis also does not account for reductions in water demand as a result of conservation. The analysis presented in **Table 3.8-9, Greenhouse Gas Emissions for the SCAG Region from Three Primary Sources (CO2e) (Million Metric Tons per Year)** illustrates how a more compact growth pattern can reduce GHG emissions. It does not account for technological and other reductions that are anticipated to substantially reduce emissions compared to what is shown in **Table 3.8-9.**

As shown in **Table 3.8-9, Greenhouse Gas Emissions for the SCAG Region from Three Primary Sources (CO2e) (Million Metric Tons per Year)**, the total GHG emissions from transportation, building and water-related energy are anticipated to decrease by 15.9 percent with Connect SoCal in 2045 compared to existing (2019) conditions. These three sectors account for approximately 70 percent of the total GHG emissions in the SCAG region. Additionally, as compared to 2045 No Project, GHG emissions from the three primary sources are anticipated to be approximately 10.8% lower under Connect SoCal. Compared to 2005, GHG emissions from the three primary sources are estimated to be 25.9% less than in 2005.

It is important to note that the Plan is not responsible for addressing sectors beyond transportation, including building energy and water-related energy consumption. In addition, even with respect to transportation sources, the Plan has no control over the fuels used by vehicles in the region or the types of vehicles used. As outlined in CARB's 2016 Mobile Source Strategy, changes to fuel type and types of vehicles are anticipated to result in additional substantial reductions in GHG from the transportation

[151] Water related energy includes the electricity used in the transport, treatment, and distribution of water.

sector. Note that the analysis above does not include emissions from construction equipment, agricultural operations, industrial processes, wildfires, and other unique sources.

Table 3.8-9

/d/ 2012 RTP/SCS PEIR
The Scenario Planning Model provides estimates of energy and water consumption; it is a scenario planning tool used for developing scenarios for the Plan during the scenario planning process to compare relative differences among scenarios and does not account for emissions reductions from cleaner fuels and technologies in the future.
The estimates of GHG emissions in this table do not include the following sources: construction, solid waste, aircraft, ships/watercraft, trains, agriculture, wildfires, industrial process or other sources.
Source: SCAG Modeling, 2019.

Construction Emissions

The construction of transportation and development projects requires use of vehicles and equipment that consume fuel and emit GHGs for construction activities (worker commutes and materials transport emissions are accounted for within the on-road emissions analysis above). Earth-moving equipment is often necessary to construct new transportation and development projects. Equipment includes graders, scrapers, backhoes, jackhammers, front-end loaders, generators, water trucks, and dump trucks. Construction-related GHG emissions for each individual project are temporary and last only for the duration of construction of that project, but on a regional scale construction is an on-going source of GHG emissions. Quantification of short-term construction related GHG emissions is generally based on the size of each project, the equipment used and the construction schedule. Such detailed information is not available on a regional scale. Construction emission estimates are not reasonably foreseeable because the nature of construction activity is so variable. The 2016 RTP/SCS PEIR notes that construction emissions are relatively minor -- typically accounting for less than 0.3 percent of total regional emissions.

Industrial, Agricultural and Other Sources

It is important to note that the Plan is primarily a transportation plan with land use strategies. SCAG currently does not collect information regarding industrial, agricultural and other sources, rather these sources of emissions are addressed by air quality management districts as part of the preparation of air quality management plans. The SCAQMD's 2016 AQMP uses an integrated approach in order to reduce criteria air pollutants, toxic pollutants, and GHG emissions. A large portion of GHG and air pollutant emissions come from the transportation and energy sectors. Industrial facilities consume approximately 10% of energy in the SCAB region, therefore contributing to a significant portion of GHG emissions. The SCAQMD's 2016 AQMP proposes to modernize industrial facilities, promotes equipment electrification, and incorporating newer technologies such as smart girds and solar panels to reduce the reliance on fossil fuel without generating more emissions from electricity use.152

Wildfires

In 2018, more than 1.8 million acres of California land burned in wildfires. The Woolsey Fire in November 2018 burned approximately 96,949 acres and 1,643 structures in Ventura and Los Angeles Counties, representing the largest fire of that year within the SCAG region.[153] At the same time, California's most destructive fire, the Camp Fire, in Butte County destroyed 18,804 structures. California's 2018 wildfires emitted approximately 45.5 $MMTCO_2e$, which represents about 11 percent of California's total GHG emissions that year.[154] Estimating GHG emissions from wildfires is highly unpredictable and beyond the scope of this PEIR. However, it is likely that wildfires and their associated emissions will continue to be a substantial source of emissions in future years as climate change leads to a longer and more intense fire season.[155]

Summary

In summary, while GHG emissions are anticipated to decrease compared to existing conditions and compared to No Project conditions, based on the analysis above they are not anticipated to be reduced sufficiently to meet the GHG emissions reduction targets established for California (see Regulatory

Framework and discussion of Impact GHG-2 below), and therefore the GHG emissions resulting directly and indirectly from the Plan may result in significant and unavoidable impacts. However, as noted in the discussion above, the analyses of GHG emissions sources presented herein, even for transportation, do not fully take into account changes to fuels and technology that are expected to substantially reduce emissions compared to what is presented here. Nonetheless, this impact is considered significant requiring the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measures

SMM GHG-1: SCAG, in partnership with local air districts, shall continue to work with the counties and cities to adopt qualified GHG reduction plans (e.g., climate action plans [CAPs], develop GHG-reducing planning policies, and implement local climate initiatives. These reductions can be achieved through a combination of programs, that implement plans developed collaboratively, including ZNE in new construction, retrofits of existing buildings, incentivizing the development of renewable energy sources that serve both new and existing land uses, as well as measures to reduce GHG emissions form transportation sources.

SMM GHG-2: SCAG shall encourage energy efficient design for buildings, through SCAG's Sustainable Communities Program potentially including strengthening local building codes for new construction and renovation to achieve a higher level of energy efficiency.

SMM GHG-3: SCAG shall continue working with partners including universities, utilities, regulating agencies, the private sector and NGO's, and member agencies to support deployment of electric vehicle (EV) charging in the region. SCAG shall provide resources to member agencies and supply them with available information and data so that they can better take advantage of legislation and funding for EV charging.

SMM GHG-4: SCAG shall continue to pursue partnerships with SCE, municipal utilities, locally operated electricity providers and CPUC to promote energy efficient development in the SCAG region, through coordinated planning and data and information sharing activities.

Project Level Mitigation Measures

PMM-GHG-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation

measures to reduce substantial adverse effects related to greenhouse gas emissions. Such measures may include the following or other comparable measures identified by the Lead Agency:

a) Integrate green building measures consistent with CALGreen (California Building Code Title 24), local building codes and other applicable laws, into project design including:

   i) Use energy efficient materials in building design, construction, rehabilitation, and retrofit.

   ii) Install energy-efficient lighting, heating, and cooling systems (cogeneration); water heaters; appliances; equipment; and control systems.

   iii) Reduce lighting, heating, and cooling needs by taking advantage of light-colored roofs, trees for shade, and sunlight.

   iv) Incorporate passive environmental control systems that account for the characteristics of the natural environment.

   v) Use high-efficiency lighting and cooking devices.

   vi) Incorporate passive solar design.

   vii) Use high-reflectivity building materials and multiple glazing.

   viii) Prohibit gas-powered landscape maintenance equipment.

   ix) Install electric vehicle charging stations.

   x) Reduce wood burning stoves or fireplaces.

   xi) Provide bike lanes accessibility and parking at residential developments.

b) Reduce emissions resulting from projects through implementation of project features, project design, or other measures, such as those described in Appendix F of the *State CEQA Guidelines*.

c) Include off-site measures to mitigate a project's emissions.

d) Measures that consider incorporation of Best Available Control Technology (BACT) during design, construction and operation of projects to minimize GHG emissions, including but not limited to:

   i) Use energy and fuel-efficient vehicles and equipment;

   ii) Deployment of zero- and/or near zero emission technologies;

   iii) Use lighting systems that are energy efficient, such as LED technology;

   iv) Use the minimum feasible amount of GHG-emitting construction materials;

   v) Use cement blended with the maximum feasible amount of flash or other materials that reduce GHG emissions from cement production;

   vi) Incorporate design measures to reduce GHG emissions from solid waste management through encouraging solid waste recycling and reuse;

   vii) Incorporate design measures to reduce energy consumption and increase use of renewable energy;

   viii) Incorporate design measures to reduce water consumption;

   ix) Use lighter-colored pavement where feasible;

   x) Recycle construction debris to maximum extent feasible;

   xi) Plant shade trees in or near construction projects where feasible; and

   xii) Solicit bids that include concepts listed above.

e) Measures that encourage transit use, carpooling, bike-share and car-share programs, active transportation, and parking strategies, including, but not limited to the following:

   i) Promote transit-active transportation coordinated strategies;

   ii) Increase bicycle carrying capacity on transit and rail vehicles;

iii) Improve or increase access to transit;

iv) Increase access to common goods and services, such as groceries, schools, and day care;

v) Incorporate affordable housing into the project;

vi) Incorporate the neighborhood electric vehicle network;

vii) Orient the project toward transit, bicycle and pedestrian facilities;

viii) Improve pedestrian or bicycle networks, or transit service;

ix) Provide traffic calming measures;

x) Provide bicycle parking;

xi) Limit or eliminate park supply;

xii) Unbundle parking costs;

xiii) Provide parking cash-out programs;

xiv) Implement or provide access to commute reduction program;

f) Incorporate bicycle and pedestrian facilities into project designs, maintaining these facilities, and providing amenities incentivizing their use; and planning for and building local bicycle projects that connect with the regional network;

g) Improving transit access to rail and bus routes by incentives for construction of transit facilities within developments, and/or providing dedicated shuttle service to transit stations; and

h) Adopting employer trip reduction measures to reduce employee trips such as vanpool and carpool programs, providing end-of-trip facilities, and telecommuting programs including but not limited to measures that:

i) Provide car-sharing, bike sharing, and ride-sharing programs;

ii) Provide transit passes;

iii) Shift single occupancy vehicle trips to carpooling or vanpooling, for example providing ride-matching services;

iv) Provide incentives or subsidies that increase that use of modes other than single-occupancy vehicle;

v) Provide on-site amenities at places of work, such as priority parking for carpools and vanpools, secure bike parking, and showers and locker rooms;

vi) Provide employee transportation coordinators at employment sites;

vii) Provide a guaranteed ride home service to users of non-auto modes.

i) Designate a percentage of parking spaces for ride-sharing vehicles or high-occupancy vehicles, and provide adequate passenger loading and unloading for those vehicles;

j) Land use siting and design measures that reduce GHG emissions, including:

i) Developing on infill and brownfields sites;

ii) Building compact and mixed-use developments near transit;

iii) Retaining on-site mature trees and vegetation, and planting new canopy trees;

iv) Measures that increase vehicle efficiency, encourage use of zero and low emissions vehicles, or reduce the carbon content of fuels, including constructing or encouraging construction of electric vehicle charging stations or neighborhood electric vehicle networks, or charging for electric bicycles; and

v) Measures to reduce GHG emissions from solid waste management through encouraging solid waste recycling and reuse.

Level of Significance after Mitigation

As discussed above, regulations and polices would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing

regulations and policies. Therefore, this EIR identifies project-level mitigation measures consistent with applicable regulations and polices designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis and the difficulty in quantifying the effectiveness of the mitigation measures identified above, and SCAG's lack of authority to implement project-level mitigation measures, this PEIR finds impacts related to greenhouse gas emissions to be significant and unavoidable.

Impact GHG-2 Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

Significant and Unavoidable – Mitigation Required.

Pursuant to Appendix G of the *CEQA Guidelines*, a significant GHG impact is identified if the Plan could conflict with applicable GHG reduction plans, policies, or regulations. Transportation projects and anticipated development under the Plan would be subject to complying with SB 375, SB 743, AB 32, and SB 32. SB 375 requires MPO's to meet per capita emission reductions by 2020 and 2035 as compared to the base year of 2005. AB 32 and SB 32 are statewide reduction goals aimed at reducing emissions to 1990 levels by 2020 and reducing emissions to 40% below 1990 levels by 2030, respectively. The Plan will meet the reduction goals set forth in SB 375, as discussed below. However, CARB has indicated that achievement of the SB 375 goals is insufficient for the transportation sector to meet the state's overall GHG reduction goals. In addition, without additional information as to how other sectors (energy, water-related energy and other sources of emissions) would reduce emissions to meet targets, the Plan would not be consistent with AB 32 and SB 32. As a result, the impact would be significant and unavoidable.

Compliance with SB 375

As described in the Regulatory Framework, SB 375 requires CARB to develop regional GHG emission reduction targets for cars and light-duty trucks for 2020 and 2035 (compared to 2005 emissions) for each of the state MPOs on a per capita basis. Each MPO is required to prepare an SCS as part of the RTP in order to meet these GHG emissions reduction targets by aligning transportation, land use, and housing strategies with respect to SB 375. For SCAG, the targets are to reduce per capita GHG emissions by 8 percent below 2005 levels by 2020 and 19 percent below 2005 levels by 2035. Determining the per capita CO_2 emissions requires modeling vehicle miles traveled (VMT) by passenger vehicles and light trucks that emit CO_2 and dividing the number by the total population.

SCAG estimates that the per capita 2005 emissions from cars and light-duty trucks as 23.8 pounds of CO_2 per person per day (**Table 3.8-10, SB 375 Analysis**).

Table 3.8-10
SB 375 Analysis

	2005 (Baseline)	2020 (Plan)	2035 (Plan)
Resident population (per 1,000)	17,161	19,194	21,110
CO2 emissions (per 1,000 tons)	204.0/a/	204.5/b/	198.6/b/
Per capita emissions (pounds/day)	23.8	21.3	18.8
% difference from Plan (2020) to Baseline (2005)			–8%
% difference from Plan (2035) to Baseline (2005)			–19%/c/

Note:
/a/ Based on EMFAC2007
/b/Based on EMFAC2014 and SCAG modeling, 2019.
/c/ Includes off-model adjustments for 2035 and 2045
Source: SCAG modeling, 2019.
http://www.scag.ca.gov/committees/CommitteeDocLibrary/jointRCPC110515fullagn.pdf

As shown in **Table 3.8-10, SB 375 Analysis**, per capita CO_2 emissions from cars and light-duty trucks (only) are calculated at 21.3 pounds per day in 2020 with the Plan. The result of the Plan is an 8 percent decrease in per capita CO_2 emissions from 2005 to 2020. The percent decrease would achieve the 8 percent emissions reduction target by 2020 for the region set by SB 375. By 2035, Connect SoCal projects 18.8 pounds per day for per capita CO_2 emissions from cars and light-duty trucks (only). This represents an approximately 19 percent decrease in per capita CO_2 emissions from 2005 to 2035. This 19 percent decrease would achieve the 19 percent emissions reduction target set by CARB for 2035. CARB has not set per capita GHG emission reduction targets for passenger vehicles for the Plan's horizon year (2045). However, due to the projects and policies proposed by SCAG to reduce GHG emissions through transit improvements, traffic congestion management, emerging technology, and active transportation, the Plan's GHG emission reduction trajectory is expected to meet more aggressive GHG emission reductions by 2045. Additional reduction strategies are provided in the SCS and include congestion pricing, mileage-based user fees, and co-working at strategic locations.

By meeting the SB 375 targets for 2020 and 2035, as well as providing strategies and policies to further reduce per capita GHG emissions into 2045, the Plan would be in compliance with SB 375 with respect to meeting CARB targets.

SB 743 and VMT Guidance

As also discussed in **Section 3.17, Transportation, Traffic, and Safety**, in January 2019, CARB identified guidance with respect to necessary VMT reductions to meet state climate goals.[156] That guidance indicates that population in the state is anticipated to grow by 24 percent as compared to 2015, and that in order to meet the state's 2050 climate goal, the increase in total cumulative statewide daily VMT should not be more than 6.5 percent as compared to 2015. This corresponds to a reduction of 14.3 percent in per capita total daily VMT as compared to 2015 (from 24.6 VMT per capita in 2015 to about 21 VMT per capita in 2050) and 16.8 percent decrease in per capita daily VMT for light-duty vehicles (from 22.2 VMT per capita in 2015 to about 18.5 VMT per capita in 2050). CARB notes that the modeling used for the Cleaner Technology and Fuels (CTF) forecast identifies ratios of total statewide VMT to population and that the suggested per capita reductions are not household generated VMT and that values are not directly comparable to output from a local or regional travel demand model. Given that the CARB guidance is not intended to be directly compared to regional travel demand model outputs, VMT from SCAG's model should not be compared to these guidance numbers for purposes of determining consistency with SB 743 and associated CARB guidance. However, for purposes of general comparison and information, **Table 3.8-11, Population and Daily VMT (2019 and 2045),** presents information related to population, daily VMT and VMT per capita for the years 2019 and 2045.

Table 3.8-11
Population and VMT (2019 and 2045)

	2019	2045	2045 vs 2019
Total Population	19,339,700	22,507,200	14.1%
Total VMT	460,153,316	517,631,374	11.1%
VMT Per Capita Light Duty Vehicles	22.09	20.67	-6.4%
VMT Per Capita All Vehicles	23.79	22.89	-3.8%

Source: SCAG modeling, 2019.

OPR and Caltrans have also provided guidance on recommended VMT thresholds at the project level which are discussed in **Section 3.17, Transportation, Traffic, and Safety**. According to OPR, VMT is the preferred transportation impact metric in CEQA documents. OPR developed the *Technical Advisory on Evaluating Transportation Impacts in CEQA* (OPR Technical Advisory) which provides non-binding recommendations regarding assessment of VMT, thresholds of significance, and mitigation measures.

156 California Air Resources Board, January 2019 https://ww2.arb.ca.gov/sites/default/files/2019-01/2017_sp_vmt_reductions_jan19.pdf

OPR recommends that a per capita (residential) or per employee (office) VMT that is 15% below that of existing development may be a reasonable threshold.[157] In addition, as discussed above, Caltrans prepared their *Strategic Management Plan 2015-2020*, which set a target of 15% reduction in per capita VMT relative to 2010 levels by 2020.[158]

Compliance with AB 32 and SB 32

As noted in **Section 3.8.2, Regulatory Framework**, AB 32 requires the state to reduce GHG emissions to 1990 levels by 2020. SB 32 was created to further reduce GHG emissions and requires the state to reduce GHG emissions to 40 percent below 1990 levels by 2030. In order to ensure the state reaches these goals, CARB was ordered to prepare an updated Scoping Plan. In November 2017, CARB released the 2017 Scoping Plan as a framework to meet the 2030 reduction requirements. The Scoping Plan is designed to shift California's economy away from fossil fuels to more sustainable options that deliver economic growth, job development, and environmental benefits. Key programs that are part of the Scoping Plan include Cap-and-Trade regulation, the Low Carbon Fuel Standard, cleaner cars, trucks and freight travel, renewable energy, and reduce methane emissions from agricultural and other wastes.[159]

The 2017 Scoping Plan is designed to reduce statewide GHG emissions across different economic sectors, including: energy, transportation, industry, water, waste management, agriculture, and natural and working lands. As discussed above, under the Plan, per capita mobile source GHG emissions from cars and light-duty trucks would be reduced by approximately 8 percent by 2020 and 19 percent by 2035 which meets (for 2035) the SB 375 reduction targets.

In 2045 under the Plan, GHG emissions from the three primary sources -- transportation, energy, and water-related energy are all anticipated to decrease as compared to existing conditions (see **Table 3.8-9, Greenhouse Gas Emissions for the SCAG Region from Three Primary Sources [CO2e])**.

Transportation Sources -- Cars and Light-Duty Vehicles

In November of 2018, CARB released its 2018 California's Sustainable Communities and Climate Protection Act Progress Report.[160] The report recognizes the importance of realizing and measuring the benefits identified through the SB 375 planning work. Key findings of the report include that while positive gains have been made to improve the alignment of transportation, land use, and housing policies with state goals, the data suggest that more is necessary for climate success.

CARB indicates their regional 2035 GHG emissions reduction targets under SB 375 are not adequate to fully meet the goals of the 2017 Scoping Plan for the cars and light-duty trucks. Collectively, CARB determined that if the state's 18 MPOs' all met the SB 375 GHG cars and light-duty trucks emission reduction targets set by CARB in 2018, a 19 percent reduction in per capita VMT (from cars and light-duty trucks) would be achieved by 2035. In the target re-setting report, CARB expressed that to meet the statewide reduction goals set forth by SB 32 and the 2017 Scoping Plan, the state would need to reduce per capita GHG emissions from cars and light-duty trucks by 25 percent by 2035, resulting in a 6 percent gap between the 19 percent emissions reductions targets set for the regions (averaged for the 18 MPOs and compared to a baseline year of 2005).[161] Therefore, even with meeting CARBs SB 375 GHG emissions reduction targets, a 6 percent gap compared to the state's 25 percent reduction need remains.

As CARB notes, "[a]n RTP/SCS that meets the applicable SB 375 targets alone will not produce the GHG emissions reductions necessary to meet state climate goals in 2030 nor in 2050."[162] CARB has also noted that greater reductions in VMT will be required to make up the 6 percent gap in GHG. Further, according to the 2018 Sustainable Communities Progress Report, "California – at the state, regional, and local levels – has not yet gone far enough in making the systemic and structural changes to how we build and invest in communities that are needed to meet state climate goals." It will take collaboration among all these levels of government to identify the additional VMT reductions needed to achieve the state's climate goals because MPOs do not have the land use authority or resources to meet challenge alone.

OPR and CARB have both provided recommendations for reducing VMT reductions at the project level which could be a means to close the gap between GHG reductions achieved through SCS implementation

---

161 CARB. 2017. *Final Staff Report Proposed Update to the SB 375 Greenhouse Gas Emission Reduction Targets*. Available online at: https://ww3.arb.ca.gov/cc/sb375/final_staff_proposal_sb375_target_update_october_2017.pdf?_ga=2.217174102.1993336916.1570127197-1229197864.1566229390, accessed October 4, 2019.

162 Ibid.

and the GHG reductions necessary to meet the state's GHG reduction goals. For example, OPR has provided a recommended threshold of 15 percent VMT reduction at the project level.[163] CARB also recommends project specific VMT reduction thresholds of 16.8 percent reduction from baseline for light-duty vehicle VMT (i.e., passenger cars and light trucks) or a 14.3 percent reduction for total VMT (i.e., all vehicles).[164] As GHG reductions from the transportation sector become more difficult to achieve, it is also possible that Cap-and-Trade could be a viable method of capturing transportation emissions and reducing them through market-based carbon trading.[165] Such an expansion of that program is speculative at the time of writing this PEIR, however.

Given the state's emphasis on VMT reduction as the only feasible way to achieve additional GHG reductions needed from cars and light-duty trucks, and in recognition of the climate change benefits that occur from reduced VMT resulting in reductions in GHGs, the projected land use pattern proposed under the Plan supports HQTAs. However, SCAG lacks the land use authority to enforce specific land uses. Implementation of the projected land use pattern under the Plan is within the purview of local agencies. As described in **Section 2.0, Project Description**, in order to incentivize implementation, SCAG has established several programs that support transit-oriented development in the region. For example: promoting congestion pricing, implementing complete streets strategies, and improving connectivity between existing transit systems.

In sum, while overall, California has hit its 2020 climate target ahead of schedule due to advances in the energy sector, the transportation sector has not seen the same gains and is still approximately 40 percent of the state's emissions. Emissions from the transportation sector have continued to rise despite increases in fuel economy and decreases in the carbon content of fuel.[166]

164 California Air Resources Board 2017 Scoping Plan-Identified VMT Reductions and Relationship to State Climate Goals, January 2019.

165 In June 2015, fuels (gasoline, diesel, and natural gas) were covered under the Cap-and-Trade programs, which would require fuel suppliers to reduce GHG emissions by supplying low carbon fuels or purchase allowances to cover the GHG emissions produced when conventional petroleum- based fuel is burned. Therefore, a program is already in place within the Cap-and-Trade program to reduce GHG emissions from the transportation section. (See: CARB. *California's Cap and Trade Program: Fuel Facts*. Available online at: https://ww3.arb.ca.gov/cc/capandtrade/guidance/facts_fuels_under_the_cap.pdf, accessed October 23, 2019.)

166 CARB. 2017. *Final Staff Report Proposed Update to the SB 375 Greenhouse Gas Emission Reduction Targets*. Other Emission Sources

GHG emissions from sectors other than cars and light-duty trucks are anticipated to be reduced in future years due to the implementation of statewide regulations and policy directed at reducing emissions (see **Table 3.8-8, Greenhouse Gas Emissions All On-Road and Other Transportation Sources by County (CO2e)**). For example, emissions from agriculture and the solid waste sector may be reduced through regulatory requirements of SB 1383, which requires a 50 percent reduction in the level of statewide disposal of organic waste compared to 2014 levels by 2020 and a 75 percent reduction by 2025. SB 100, the 100 Percent Clean Energy Act of 2018 also requires that the state's electricity sector achieve carbon neutrality by 2045 with benchmark targets of 50 percent renewable energy by 2026 and 60 percent by 2030. However, while these reductions are expected, implementation of statewide regulations is beyond the scope of SCAG's authority.

The 2017 Scoping Plan recognizes that 2030 serves as a benchmark year in the state's long-term climate change goals; however, the 2017 Scoping Plan guides the state only to the 2030 goal. Moreover, given that the 2050 target of achieving an 80 percent reduction from 1990 GHG levels has not yet been codified in legislation (although established by Executive Order S-3-05), the 2017 Scoping Plan does not provide a framework to achieve emissions targets beyond 2030. Nonetheless, given the identified gap between SCAG's 19 percent reduction target and the state's 25 percent reduction target for 2030, it is anticipated that such a gap would remain when looking toward 2050.

Implementation of development projects with the Plan would be subject to Title 24 Building Code requirements, including the California Energy Code and the mandatory requirements of the CalGreen Code. Future development would also be required to undergo environmental review that would evaluate the potential for climate change impacts to occur. It is likely that in cases where climate change impacts are identified, appropriate and feasible mitigation would be applied to reduce GHG emissions including on- and off-site GHG reduction measures (e.g., low-flow water appliance, energy-efficient home appliances, landscaping limits), investments in local or regional programs to reduce GHGs (e.g., electrified school bus programs, home refurbishment rebate programs), and the purchase of carbon offsets through programs verified by third party such as the Climate Action Reserve.

Table 3.8-9, Greenhouse Gas Emissions for the SCAG Region from Three Primary Sources, provides a comparison of estimated emissions for three primary sources for the years 2005, 2019 and 2045. When 1990 data is not available, 15 percent below 2005 may be used as an estimate of 1990.[167] Therefore

[167] CARB. 2014. *First Update to the Climate Change Scoping Plan*. Available online at: https://ww3.arb.ca.gov/cc/scopingplan/2013_update/first_update_climate_change_scoping_plan.pdf, accessed November 4, 2019.

estimated 1990 emissions for three primary sources of emissions in the SCAG region is 15 percent less than 131.92 MMT or 112.13. 2045 total emissions these sources are estimated at 97.8 MMT or about 13 percent less than estimated 1990 emissions. Therefore 2045 emissions for the SCAG region (as estimated by currently available emissions and consumption factors that do not take into account GHG reduction requirements) would not meet 2030 emission targets and would not be on track to meet 2050 emission targets.

Summary

The Plan has demonstrated that it will meet and exceed CARB's targets for greenhouse gas emissions from light duty passenger vehicles for 2020 and 2035, respectively. By meeting the SB 375 targets, the Plan has technically contributed its share (in the transportation sector), towards meeting the AB 32, SB 32, and the Scoping Plan targets. As discussed above, GHG impacts are generally cumulative in nature and have broader (i.e. statewide, national, and global) implications. Also, CARB has indicated that even if all MPOs meet their regional SB 375 GHG targets, the state would not be able to meet the statewide GHG reduction goals of AB 32, SB 32, and the Scoping Plan. As recognized by CARB, MPO's do not have land use authority to implement additional VMT reductions. Furthermore, SCAG has no control or authority over the other key sectors (e.g., energy, industry, water, waste and agriculture) in meeting the AB 32, SB 32, and Scoping Plan targets. Assuming existing available emission factors, GHG emissions in the SCAG region are not on-track to achieve targets identified in AB 32, SB 32 and the Scoping Plan resulting in a significant and unavoidable impact. Mitigation is required.

Mitigation Measures

SCAG Mitigation Measures

See **SMM GHG -1, SMM GHG-2, SMM GHG-3,** and **SMM GHG-4.**

Project Level Mitigation Measures

See **PMM-GHG-1.**

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this EIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and

feasible. However, because of the regional nature of the analysis, the estimated GHG emissions from the three primary sources, the difficulty in quantifying both future emission and water and energy consumption factors and the effectiveness of the mitigation measures identified above, and SCAG's lack of authority to implement project-level mitigation measures, this PEIR finds impacts related to greenhouse gas emissions and potential conflicts with applicable plans, policies and regulations to be significant and unavoidable.

3.9 HAZARDS AND HAZARDOUS MATERIALS

3.9.1 ENVIRONMENTAL SETTING

This section of the Program Environmental Impact Report (PEIR) describes the hazards and hazardous materials in the SCAG region, identifies the regulatory framework with respect to laws and regulations that govern hazards and hazardous materials, and analyzes the significance of the potential impacts from hazards and hazardous materials that could result from development of the Connect SoCal Plan ("Connect SoCal"; "Plan"). In addition, this PEIR provides regional-scale mitigation measures as well as project-level mitigation measures to be considered by lead agencies for subsequent, site-specific environmental review to reduce identified impacts as appropriate and feasible. **Section 3.17, Transportation, Traffic, and Safety,** also addresses emergency response and evacuation plans**.**

3.9.1.1 Definitions

Definitions of terms used in the regulatory framework, characterization of baseline conditions, and impact analysis for hazards and hazardous materials are provided.

Hazard versus Risk. Workers' health and general public health are potentially at risk whenever hazardous materials have been used or where there could be an exposure to such materials. Inherent in the setting and analyses presented in this section are the concepts of the "hazard" of these materials and the "risk" they pose to human health. Exposure to some chemical substances may harm internal organs or systems in the human body, ranging from temporary effects to permanent disability, or death. Hazardous materials that result in adverse effects are generally considered "toxic." Other chemical materials, however, may be corrosive, or react with other substances to form other hazardous materials, but they are not considered toxic because organs or systems are not affected. Because toxic materials can result in adverse health effects, they are considered hazardous materials, but not all hazardous materials are necessarily "toxic." For purposes of the information and analyses presented in this section, the terms hazardous substances or hazardous materials are used interchangeably and include materials that are considered toxic.

The risk to human health is determined by the probability of exposure to a hazardous material and the severity of harm such exposure would pose. That is to say, the likelihood and means of exposure, in addition to the inherent toxicity of a material, are used to determine the degree of risk to human health. For example, a high probability of exposure to a low toxicity chemical would not necessarily pose an unacceptable human health or ecological risk, whereas a low probability of exposure to a very high toxicity chemical might. Various regulatory agencies, such as the U.S. Environmental Protection

Agency (USEPA), California Environmental Protection Agency's (Cal/EPA), State Water Resources Control Board (SWRCB), Cal/EPA Department of Toxic Substances Control (DTSC), and state and federal Occupational Safety and Health Administration (OSHA) are responsible for developing and/or enforcing risk-based standards to protect the public and the environment.

Hazardous Material: The term "hazardous material" can have varying definitions depending on the regulatory programs. For the purposes of this PEIR, the term refers to both hazardous materials and hazardous wastes. The California Health and Safety Code Section 25501(n)(1)[1] defines hazardous material as follows:

> *Hazardous material means any material that because of its quantity, concentrations, or physical or chemical characteristics, poses a significant present or potential hazard to human health and safety or to the environment if released into the workplace or the environment. Hazardous materials include but are not limited to hazardous substances, hazardous waste, and any material which a handler or the administering agency has a reasonable basis for believing would be injurious to the health and safety of persons or harmful to the environment if released into the workplace or the environment.*

Soil and groundwater can become contaminated by hazardous material released in a variety of ways, including permitted or illicit use and accidental or intentional disposal or spillage. Before the 1980s, most land disposal of chemicals was unregulated, resulting in numerous industrial properties and public landfills becoming dumping grounds for unwanted chemicals. In general, the largest and most contaminated of these sites became federal Superfund (see definition below) sites in the early 1980s, so named for their eligibility to receive cleanup money from a federal fund established for that purpose under the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA).[2] Sites are added to the National Priorities List (NPL) following a hazard ranking system.[3] The U.S. EPA maintains a list of federal Superfund sites, as well as a more extensive list of all sites with potential to be listed as contaminated, this list is maintained in the Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS).[4]

Numerous smaller properties also have been designated as contaminated sites. Often, these are gas station sites, where leaking underground storage tanks were upgraded under a federal requirement in the late 1980s. Another category of sites, which may have some overlap with the types already mentioned, is brownfields sites. Brownfields sites are those areas that were previously used for industrial purposes or certain commercial uses. The land may be contaminated by low concentrations of hazardous waste or pollution, and has the potential to be reused once it is cleaned up. Both the U.S. EPA and DTSC maintain lists of known brownfield sites.[5,6] These sites are often difficult to inventory due to their owners' reluctance to publicly label their property as potentially contaminated. In California, numerous regulatory barriers have blocked effective reuse of brownfields sites, including uncertainty as to cleanup levels and ultimate cleanup cost. Senate Bill (SB) 32, adopted in 2001, establishes a locally based program to help speed the cleanup and reuse of brownfields sites.[7]

Hazardous Waste: A "hazardous waste" is a waste that poses substantial or potential threats to public health or the environment. Hazardous wastes are defined under the Resource Conservation and Recovery Act (RCRA)[8] as exhibiting one or more of the characteristics identified below:

Toxic Substances: Toxic substances may cause short-term or long-lasting health effects, ranging from temporary effects to permanent disability, or even death. For example, such substances can cause disorientation, acute allergic reactions, asphyxiation, skin irritation, or other adverse health effects if human exposure exceeds certain levels. The level depends on the substances involved and is chemical-specific. Carcinogens (substances that can cause cancer) are a special class of toxic substances. Examples of toxic substances include benzene (a component of gasoline and a suspected carcinogen) and methylene chloride (a common laboratory solvent and a suspected carcinogen).

Ignitable Substances: Ignitable substances are hazardous because of their ability to burn. Gasoline, hexane, and natural gas are examples of ignitable substances.

Corrosive Materials: Corrosive materials can cause severe burns. Corrosives include strong acids and bases such as sodium hydroxide (lye) or sulfuric acid (battery acid).

Certified Unified Program Agencies: California Unified Program Agencies (CUPA) implement the hazardous waste and material standard including petroleum storage, areas plans for hazardous material emergencies, California Accidental Release Prevention (CalARP) Program, hazardous materials release response plans and inventories, hazardous material management plan and inventory statements, onsite waste treatment program, and underground storage tank program.[9] The CalARP program was implemented on 1997 to prevent accidental releases of substances that can cause serious harm to the public and the environment, to minimize the damage if releases do occur, and to satisfy community right-to-know laws. This is accomplished by requiring businesses that handled regulated substance above a threshold to develop a risk management plan with safety information, operating procedures, and training requirements, compliance audits, and other incident investigation measures to reduce accidental release potential.[10]

Contaminated Sites: A site at which hazardous substances occur at concentration above background levels and where assessment indicates it poses, or is likely to pose, an immediate or long-term hazard to human health or the environment. DTSC maintains a database of properties in California where hazardous substances were released, see **Section 3.9.1.2, Properties Included on a List of Hazardous Materials Sites Pursuant to Government Code Section 65962.5**.

Federal Emergency Management Agency (FEMA): FEMA coordinates the federal government's role in preparing for, preventing, mitigating the effects of, responding to, and recovering from all domestic disasters, whether natural or man-made, including acts of terror, see **Section 3.9.2.1, Federal Regulations**.[11]

Reactive Materials: Reactive materials may cause explosions or generate toxic gases. Explosives, pure sodium or potassium metals (which react violently with water), and cyanides are examples of reactive materials.

Radioactive Materials: Materials that emit radiation resulting from changes in the nuclei of atoms of the element.

By definition, EPA determined that some specific wastes are hazardous when they exhibit the characteristics of ignitability, reactivity, corrosivity, and toxicity. Once a site is determined hazardous, CERCLA provides a mechanism and assign liabilities for cleanup of the sites. The actions may involve short-term measures taken to address releases, long-term actions to permanently and significantly reduce the risk of release of hazardous substances, and a preliminary assessment/site inspection then a remedial investigation/feasibility study.

Spill Cleanup Site: Facilities with aboveground oil storage facilities greater than 1,320 gallons of oil and/or with total aggregate capacity of completely buried storage tanks greater than 42,000 gallons of oil are subjected to Spill Prevention Control and Countermeasure (SPCC) rules. These facilities need to be regulated to prevent discharge of oil into navigable waters or adjoining shorelines. Owners of a facility develop a response plan to prepare and respond to oil discharge or threats of discharge during drilling, producing, gathering, storing, processing, refining, transferring, distributing, using, or consuming oil. The U.S. EPA is the lead federal response agency for providing cleanup of oil spills to prevent, prepare for, and respond to spills that occur in and around inland waters of the U.S.[12]

State Response System: The State of California's response system is represented by the Department of Fish and Wildlife (CDFW), Office of Oil Spill Prevention and Response (OSPR), local government, and the U.S. Coast Guard. Section 8670.7 of the California Government Code establishes that the Administrator of OSPR has the primary state authority to direct removal, abatement, response, containment, and cleanup efforts with regard to all aspects of any oil spill in the marine waters of the state.[13]

Superfund Sites: Superfund sites generally refer to contaminated sites that have been designated by EPA on the National Priorities List (NPL) that are eligible for funding from the trust fund (the "Superfund") established by EPA for cleaning up abandoned or uncontrolled hazardous waste sites pursuant to CERCLA. CERCLA was enacted in the wake of the discovery of toxic waste dumps such as Love Canal and Times Beach in the 1970s. It allows the U.S. EPA to clean up such sites and to compel responsible parties to perform cleanups or reimburse the government for EPA-led cleanups.

13 California Legislative Information. 1990. *ARTICLE 10. Environmental Enhancement Fun [8670.70-8670.73].*

Voluntary Cleanup Program (VCP): The VCP is a program administered by DTSC, and was introduced as a streamlined program to protect human health, clean up the environment and get property back to productive use. Corporations, real estate developers, local and state agencies entering into Voluntary Cleanup Program agreements are able to restore properties quickly and efficiently, rather than having their projects compete for DTSC's limited resources with other low-priority hazardous waste sites. State voluntary cleanup programs have played a major role in cleaning up brownfields since the 1990s. Through a nonbinding memorandum of agreement, the U.S. EPA partnered with the state to provide resource and coordination of Superfund sites to meet Resource Conservation and Recovery Act (RCRA) liabilities and provide corrective actions to provide "one cleanup" approaches. Selection of sites eligible for VCPs are provided under EPA's March 2003 guidance that exclude sites from "eligible response site" when not meeting regional determinations under Section 101(41)(C)(i) of CERCLA.[14]

Asbestos Containing Materials (ACMs). Asbestos is a naturally occurring fibrous material that was widely used in structures built between 1945 and 1978 for its fireproofing and insulating properties. ACMs were banned by USEPA between the early 1970s and 1991 under the authority of the federal CAA and TSCA as exposure to ACMs increases the risk of developing lung disease and cancers. Common ACMs include vinyl flooring and associated mastic, wallboard and associate joint compound, plaster, stucco, acoustic ceiling spray, ceiling tiles, heating system components, and roofing materials. Commercial/industrial structures are affected by asbestos regulations if damage occurs or if remodeling, renovation, or demolition activities disturb ACMs. Since many of the structures within the SCAG Region were constructed before 1978, there is a potential for the presence of ACMs to exist in a wide variety of building materials within the SCAG Region.

Lead and Lead-Based Paint (LBP). Lead is a naturally occurring metallic element. Because of its toxic properties, lead is regulated as a hazardous material. Excessive exposure to lead can result in the accumulation of lead in the blood, soft tissues, and bones. Children are particularly susceptible to potential lead-related health problems, because it is easily absorbed into developing systems and organs. Among its numerous uses and sources, lead can be found in paint, water pipes, solder in plumbing systems, and in soils around buildings and structures painted with LBP. LBP was primarily used during the same time period as ACMs. Commercial/industrial structures are affected by lead-based paint regulations if the paint is in a deteriorated condition or if remodeling, renovation, or demolition activities disturb LBP surfaces. Since many of the structures within the SCAG Region were constructed before

14 California Environmental Protection Agency. *Guidance on Regional Determination Regarding Eligible Response Sites.* Available at: http://www2.epa.gov/enforcement/guidance-regional-determinations-regarding-eligible-response-sites, accessed September 11, 2015.

1978, there is potential for structures in the SCAG region to contain paints and coatings with detectable or elevated concentrations of lead.

Polychlorinated Biphenyls (PCBs). PCBs are mixtures of up to 209 individual chlorinated compounds. There are no known natural sources of PCBs. PCBs have been used as coolants and lubricants in transformers, capacitors, and other electrical equipment because they do not burn easily and are good insulators. The manufacture of PCBs was stopped in the United States in 1977 because of evidence that they build up in the environment and can cause cancers and other harmful health effects, including to the immune system, reproductive system, nervous system, and endocrine system. Products made before 1977 that may contain PCBs include old fluorescent lighting fixtures and electrical devices containing PCB capacitors, and old microscope and hydraulic oils.

3.9.1.2 Properties Included on a List of Hazardous Materials Sites Pursuant to Government Code Section 65962.5

The DTSC maintained a database, known as CalSites, which contained information on properties in California where hazardous substances were released, or where the potential for a release existed.[15] In 2006, DTSC launched its brownfields site database, EnviroStor, which replaced the CalSites database. EnviroStor includes identification of formerly contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites (**Table 3.9-1, Number of Cleanup Sites by County**).[16] The DTSC also tracks and monitors hazardous materials through the HazNet list and Cortese List, while the Cal EPA, State Water Resources Control Board (SWRCB), and the California Integrated Waste Management Board monitor potential solid waste hazards, Leaking Underground Storage Tanks, and potential clean-up sites.

3.9.1.3 Underground Storage Tanks (USTs)[17]

A UST system is a tank and any underground piping connected to the tank that has at least 10 percent of its combined volume underground. Federal UST regulations apply only to underground tanks and piping storing either petroleum or certain hazardous substances. When the UST program began, there were approximately 2.1 million regulated tanks in the United States. Today, there are far fewer regulated tanks, since many substandard UST systems have been closed. Nearly all USTs at these sites contain petroleum. These sites include marketers who sell gasoline to the public (such as service stations and convenience stores) and nonmarketers who use tanks solely for their own needs (such as fleet service operators and local governments). The U.S. EPA estimates about 10,000 tanks hold hazardous substances covered by the UST regulations.

The greatest potential hazard from a leaking underground storage tank (LUST) is that the petroleum or other hazardous substance can seep into the soil and contaminate groundwater, the source of drinking water for nearly half of all Americans (although not such a high percentage in the SCAG region). A LUST can present other health and environmental risks, including the potential for fire and explosion. Until the mid-1980s, most USTs were made of bare steel, which is likely to corrode over time and allow UST contents to leak into the environment. Faulty installation or inadequate operating and maintenance procedures also can cause USTs to release their contents into the environment. There are nearly 15,000

17 U.S. Environmental Protection Agency. 2018. *Underground Storage Tanks (USTs).* Available online at: http://www.epa.gov/OUST/overview.htm, accessed February 8, 2019.

LUSTs in the SCAG region, with over half in Los Angeles County, and the least number, by an order of magnitude, in Imperial County (**Table 3.9-2, Leaking Underground Storage Tank Cleanup Sites**).

Table 3.9-2
Leaking Underground Storage Tank Cleanup Sites

County	Leaking Underground Storage Tank (LUST)
Imperial	235

3.9.1.4 Routine Transport, Use, or Disposal of Hazardous Materials

There are several risks associated with the transportation-related use of hazardous materials in the SCAG region. Actual transport of hazardous materials via truck, rail, and other modes involves a degree of risk of accident and release. The use of hazardous materials and the generation of hazardous waste in the construction and maintenance of the transportation system are other avenues for risk or exposure. Finally, the past disposal of hazardous materials in a manner that creates residual contamination of soil or water can be a source of risk when such sites are disturbed in the course of future transportation projects or associated development. Each of these avenues is discussed below.

Hazardous materials move through the SCAG region by a variety of modes: truck, rail, air, ship, and pipeline. According to the Office of Hazardous Materials Safety (OHMS) in the U.S. Department of Transportation (U.S. DOT), hazardous materials shipments can be regarded as equivalent to deliveries, but any given shipment may involve one or more movements, or trip segments, that may occur by different modes. For instance, a shipment might involve initial pickup by truck (one movement), a transfer to rail (a second movement), and a final delivery by truck again (for a total of three movements). Each movement of hazardous materials implies a degree of risk, depending on the material being moved, the mode of transport, and numerous other factors.[18]

18 U.S. Department of Transportation. *Office of Hazardous Material Safety*. Available online at: https://www.phmsa.dot.gov/about-phmsa/offices/office-hazardous-materials-safety, accessed August 19, 2019.

There are 20 hazardous material treatment storage and disposal facilities in the SCAG region (**Table 3.9-3, Hazardous Material Treatment Storage and Disposal Facilities in the SCAG Region**).

3.9.1.5 Release of Hazardous Materials in the Environment

Hazardous materials may be released into the environment in a variety of ways, including permitted or illicit use and accidental or intentional disposal or spillage. Before the 1980s, most land disposal of chemicals was unregulated, resulting in numerous industrial properties and public landfills becoming the recipients of authorized and unauthorized hazardous materials. In general, the largest and most contaminated of these sites became federal Superfund sites in the early 1980s, so named for their eligibility to receive cleanup money from a federal fund established for that purpose under CERCLA. Sites are added to the NPL following a hazard ranking system. The U.S. EPA maintains this list of federal Superfund sites, as well as a more extensive list of all sites with potential to be listed known as CERCLIS. 16 of the 29 superfund sites on the National Priorities List in the SCAG region were in the process of being cleaned up during the period of preparation of this PEIR:[19]

- Barstow Marine Corps Logistics Base, Barstow
- Cooper Drum Co., South Gate

Numerous smaller properties also have been designated as contaminated sites. Often, these are gas station sites, where leaking underground storage tanks were upgraded under a federal requirement in the late 1980s. Another category of sites, which may have some overlap with the types already mentioned, are brownfields sites. Brownfields sites are those areas that were previously used for industrial purposes or certain commercial uses. The land may be contaminated by low concentrations of hazardous waste or pollution, and has the potential to be reused once it is cleaned up. Both the U.S. EPA and DTSC maintain lists of known brownfield sites. These sites are often difficult to inventory due to their owners' reluctance to publicly label their property as potentially contaminated. In California, numerous regulatory barriers have blocked effective reuse of brownfields sites, including uncertainty as to cleanup levels and ultimate cleanup cost.

Radioactive Materials

San Onofre Nuclear Generating Station

Although there are no nuclear power stations within the SCAG region, the retired San Onofre Nuclear Generating Station (SONGS) is located just south of Orange County near San Clemente, in the northwestern corner of San Diego County and is jointly owned by SCE, San Diego Gas & Electric, and the City of Riverside.[20] SONGS went offline in January 2012 and was ordered by the Nuclear Regulatory Commission to stay offline while tubing wear issues were investigated. Subsequently, plant owners announced in June 2013 that remaining Units 2 and 3 would be permanently retired. Since the decision to retire the facility, SCE has initiated the process of providing for final repository of radioactive materials from SONGS. Spent fuel storage from SONGS poses a risk to the SCAG region if cracks develop in the thin steel canisters that will store the waste, and radioactive waste material is released into the environment. In 2015, SCE provided an update to the public, stating that all nuclear fuel would be transferred into dry cask storage and will remain on-site until the federal government develops a program to dispose of the waste. [21] On October 17, 2019 the California Coastal Commission approved a coastal development permit allowing dismantlement of plant structures and decontamination of the site.[22]

Hazardous Emissions within One-Quarter Mile of a School Site

As described in **Section 4.15.3, Public Services-Schools**, there are nearly 5,000 public and private schools in the SCAG region ranging from K–12 through the California State University and University of California university systems. Over half of the K–12 schools and community colleges are located in Los Angeles County, and the least number of the K–12 schools and community colleges are located in Imperial County, with comparable statistics for private schools, with Los Angeles County having 42 percent of the private K–12 schools. The California Education Code 17213(b)[23] has minimum standards to minimize the potential for hazardous emissions within one-quarter mile of a school site:

- The property line of the school site, even if it is operated pursuant to a joint use agreement, shall be sited as specified distances from the edge of respective power line easements:
  - 1,100 feet for 50-133 kV line
  - 2,150 feet for 220-230 kV line
  - 3,350 feet for 500-550 kV line
- If the proposed site is within 1,500 feet of a railroad track easement, a safety study shall be done by a competent professional trained in assessing cargo manifests, frequency, speed, and schedule of railroad traffic, grade, curves, type and condition of track need for sound or safety barriers, need for pedestrian and vehicle safeguards at railroad crossings, presence of high pressure gas lines near the tracks that could rupture in the event of a derailment, preparation of an evacuation plan. In addition to the analysis, possible and reasonable mitigation measures must be identified.
- The site shall not be located near an above-ground water or fuel storage tank or within 1,500 feet of the easement of an above ground or underground pipeline that can pose a safety hazard as determined by a risk analysis study, conducted by a competent professional, which may include certification from a local public utility commission.
- Existing or proposed zoning of the surrounding properties shall be compatible with schools in that it would not pose a potential health or safety risk to students or staff in accordance with Education Code Section 17213 and Government Code Section 65402 and available studies of traffic surrounding the site.
- The district is required to consider environmental factor of light, wind, noise, aesthetics, and air pollution in its site selection process.

---

23 California Legislative Information. 1996. *ARTICLE 1. General Provisions [17210-17224].*

- If the proposed site is on or within 2,000 feet of a significant disposal of hazardous waste, the school district shall contact the Department of Toxic Substance Control for a determination of whether the property should be considered a Hazardous Waste Property or Border Zone Property.

Properties Located within Two Miles of a Public, Public Use, or Private Airport

There are 57 public and private airports in the SCAG region, including 12 major airports (**Figure 3.9-1, Airports in the SCAG Region**).[24]

Goods Movement

Goods movement generally refers to the movement of raw, semi-finished, and finished materials and products used by businesses and residents across the transportation system. These goods move in myriad ways and through complex systems, often using multiple modes of transportation (e.g., ships, trucks, trains, planes, etc.). Products can be produced within the U.S. or another country, and make their way to a business, retail store, or directly to consumers versus traditional purchases by consumers at physical retail outlets. The efficient movement of these goods are critical to maintain a strong economy and ensure improvements in the quality of life of regional residents.

Goods movement supports industries and activities that provide jobs, tax revenue, and resources that bolster innovation, creativity, and access to local and world markets through trade. This movement depends directly on the infrastructure that comprises the transportation network such as highways, rail lines, ports, and networks of warehousing and other distribution facilities. Maintaining and improving existing infrastructure, and expanding infrastructure capacity where appropriate, is key to ensuring the competitiveness of a growing economy. However, goods movement also has negative impacts and externalities. Growing trade and increased volumes of goods moving across the transportation system have contributed to greater congestion, safety concerns, harmful emissions of dangerous pollutants, wear-and-tear on roadways and impacts on local neighborhoods. As the Metropolitan Planning Organization (MPO) for the region, SCAG has adopted a vision for the region's goods movement system.

Federal law (23 U.S.C. §§ 134-135) mandates that MPOs encourage and promote the safe and efficient management, operation, and development of surface transportation systems that will serve the mobility needs of people and freight and foster economic growth and development within and between States and urbanized areas. Specifically, MPOs should consider projects and strategies that will increase the

accessibility and mobility of people and for freight and enhance the integration and connectivity of the transportation system, across and between modes, for people and freight.[25]

At the state level, MPOS are required to perform regional transportation planning to prepare and provide for the region's mobility in a fiscally and environmentally responsible manner, consistent with the needs, preferences, and sensibilities of the community. This coincides with California Government Code 65041.1 (Cal Civ. Code § 65041.1) and identifies planning considerations for freight that are consistent with federal requirements.

Emergency Response Plan / Emergency Evacuation Plan

California updated its State of California Multi-Hazard Mitigation Plan in 2018.[26] The state is required to adopt a federally approved State Multi-Hazard Mitigation Plan to be eligible for certain disaster assistance and mitigation funding. The State Multi-Hazard Mitigation Plan is an evaluation of the hazards California faces and the strategies, goals, and activities the state will pursue to address these hazards. It:

- Documents statewide hazard mitigation planning in California,
- Describes strategies and priorities for future mitigation activities,
- Facilitates the integration of local and tribal hazard mitigation planning activities into statewide efforts, and
- Meets state and federal statutory and regulatory requirements.

All six SCAG counties and a number of cities within the SCAG region have completed Hazard Mitigation Plans, although Ventura County is currently in the process of updating its documents. California Emergency Management Agency (Cal EMA) dictates that these plans must be updated every three years.[27] **See Section 3.20, Wildlife,** for an additional discussion of emergency response plans and emergency evacuation plans.

3.9.2 REGULATORY FRAMEWORK

3.9.2.1 Federal

Occupational Safety and Health Act of 1970

The Occupational Safety and Health Act (29 Code of Federal Regulations [CFR] Parts 70 to 2400), which is implemented by the Federal Occupational Safety and Health Administration (OSHA), contains provisions with respect to hazardous materials handling. Federal OSHA requirements, as set forth in 29 CFR Section 1910 et seq., are designed to promote worker safety, worker training, and a worker's right–to-know. In California, OSHA has delegated the authority to administer OSHA regulations to the State of California.[28]

Hazardous Materials Transportation Act of 1975

The Hazardous Materials Transportation Act (Title 49 U.S. Code [USC] Sections 5101–5127) is the principal federal law regulating the transportation of hazardous materials. Its purpose is to "protect against the risks to life, property, and the environment that are inherent in the transportation of hazardous material in intrastate, interstate, and foreign commerce" under the authority of the U.S. Secretary of Transportation.

Regulations implementing the Hazardous Materials Transportation Act of 1975 specify additional requirements and regulations with respect to the transport of hazardous materials. For example, the Act requires that every employee who transports hazardous materials receive training to recognize and identify hazardous materials and become familiar with hazardous materials requirements. Drivers are also required to be trained in function and commodity specific requirements.[29]

Hazardous Materials Transportation Act (HMTA)

Enacted in 1975, the HMTA (49 USC 51, Sections 5101 et seq.) is the principal federal law regulating the transportation of hazardous materials. Its purpose is to "protect against the risks to life, property, and the

environment that are inherent in the transportation of hazardous material in intrastate, interstate, and foreign commerce" under the authority of the U.S. Secretary of Transportation.[30]

Response Conservation and Recovery Act (RCRA)

The RCRA of 1976 (42 USC 2) was the first major federal act regulating the potential health and environmental problems associated with hazardous and nonhazardous solid waste. RCRA and the implementation regulations developed by the U.S. EPA provide the general framework for the national hazardous and nonhazardous waste management systems. This framework includes the determination of whether hazardous wastes are being generated, techniques for tracking wastes to eventual disposal, and the design and permitting of hazardous waste management facilities.[31]

RCRA amendments enacted in 1984 and 1986 began the process of eliminating land disposal as the principal hazardous waste disposal method. Hazardous waste regulations promulgated in 1991 address site selection, design, construction, operation, monitoring, corrective action, and closure of disposal facilities. Additional regulations addressing solid waste issues are contained in 40 CFR, Part 258.[32]

Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA)

CERCLA (1980; 42 USC Sections 1906 et seq.), also known as the Superfund Act, outlines the potential liability related to the cleanup of hazardous substances; available defenses to such liability; appropriate inquiry into site status under Superfund, which is the federal government's program to clean up the nation's uncontrolled hazardous waste sites; statutory definitions of hazardous substances and petroleum products; and the petroleum product exclusion under CERCLA. CERCLA provides broad federal authority to respond directly to releases or threatened releases of hazardous substances that may endanger public health or the environment. CERCLA establishes requirements concerning closed and abandoned hazardous waste sites, provides for liability of persons responsible for releases of hazardous waste at these sites, and establishes a trust fund to provide for cleanup when no responsible party can be identified. CERCLA also establishes the National Contingency Plan (NCP), which provides guidelines and procedures necessary to respond to releases and threatened releases of hazardous

substances.[33] The SCAG region lies within U.S. Environmental Protection Agency (EPA) Region 9, which has the responsibility for designation and oversight of Superfund sites on the National Priorities List. There are 33 Superfund sites on the National Priorities List in the SCAG region.[34]

Emergency Planning and Community Right-to-Know Act (EPCRA)

The EPCRA of 1986 (42 USC 116, Sections 9601 et seq.) was created to help communities plan for emergencies involving hazardous substances. EPCRA requires hazardous chemical emergency planning by federal, state, and local governments; Native American tribes; and industry. It also requires industry to report on the storage, use, and releases of hazardous chemicals to federal, state, and local governments.[35]

Superfund Amendment and Reauthorization Act (SARA), Title III

SARA, Title III, of 1986 is the Emergency Planning and Community Right-to-Know Act (40 CFR Parts 350– 372). Facilities are required to report the following items on U.S. EPA Form R, the Toxic Chemical Release Inventory Reporting Form: facility identification, off-site locations where toxic chemicals are transferred in wastes, chemical-specific information, and supplemental information.

Form R requires a facility to list the hazardous substances that are handled on-site and to account for the total aggregate releases of listed toxic chemicals for the calendar year. Releases to the environment include emissions to the air, discharges to surface water, and on-site releases to land and underground injection wells.[36]

Robert T. Stafford Disaster Relief and Emergency Assistance Act, as Amended, and Related Authorities

The Robert T. Stafford Disaster Relief and Emergency Assistance Act (Public Law 100-707), signed into law on November 23, 1988, amended the Disaster Relief Act of 1974 (Public Law 93-288). The Stafford Act

constitutes the statutory authority for most federal disaster response activities especially as they pertain to FEMA and FEMA programs.[37]

Disaster Mitigation Act (DMA) of 2000

DMA 2000 (Public Law 106-390) provides the legal basis for FEMA mitigation planning requirements for state, local and Indian Tribal governments as a condition of mitigation grant assistance. DMA 2000 amended the Robert T. Stafford Disaster Relief and Emergency Assistance Act by repealing the previous mitigation planning provisions and replacing them with a new set of requirements that emphasize the need for state, local, and Indian Tribal entities to closely coordinate mitigation planning and implementation efforts. The requirement for a state mitigation plan is continued as a condition of disaster assistance, adding incentives for increased coordination and integration of mitigation activities at the state level through the establishment of requirements for two different levels of state plans. DMA 2000 also established a new requirement for local mitigation plans and authorized up to 7 percent of HMGP funds available to a state for development of state, local, and Indian Tribal mitigation plans.[38]

Pipeline and Hazardous Materials Safety Administration Hazardous Materials Regulations

PHMSA is the federal regulator for the movement of hazardous materials by rail. Regulations cover product classification, operating rules, and tank car standards.[39]

Code of Federal Regulations, Title 14, Part 77

FAA's primary role is to promote aviation safety and control the use of airspace. Public use airports that are subject to the FAA's grant assurances must comply with specific FAA design criteria, standards, and regulations. Land use safety compatibility guidance from the FAA is limited to the immediate vicinity of the runway, the runway protection zones at each end of the runway, and the protection of navigable airspace. The FAA enforces safety standards and investigates and corrects violations, as appropriate.

Title 14, Part 77 of the CFR, *Safe Efficient Use and Preservation of the Navigable Airspace,* establishes the federal review process for determining whether proposed development activities in the vicinity of an airport have the potential to result in a hazard to air navigation. 14 CFR Part 77 identifies criteria that

---

38 FEMA. 2000. *Disaster Mitigation Act of 2000*. Available online at: https://www.fema.gov/media-library/assets/documents/4596, accessed August 19, 2019.

39 U.S. Department of Transportation. *Pipeline and Hazardous Materials Safety Administration*. Available online at: https://www.phmsa.dot.gov/, accessed August 19, 2019.

govern which projects require notice to be filed with the FAA, as well as identifying standards for determining whether a proposed project would represent an obstruction "that may affect safe and efficient use of navigable airspace and the operation of planned or existing air navigation and communication facilities." Objects that are identified as obstructions based on these standards are presumed to be hazards until an aeronautical study conducted by the FAA determines otherwise.

14 CFR Part 77.9, *Construction or Alteration Requiring Notice*, indicates that notice must be filed with the FAA for any construction or alteration of objects within 20,000 feet of a public use airport runway when the height of the objects exceeds (i.e., is taller than) an imaginary surface with a 100:1 (1 foot upward per 100 feet horizontally) slope from the nearest point of the nearest runway. This requirement applies when the airport has at least one runway that exceeds 3,200 feet in length; for shorter runways, the notification surface has a50:1 slope and extends 10,000 feet from the runway. For heliports, the notification surface has a 25:1 slope and extends 5,000 feet from the helicopter takeoff and landing area, commonly referred to as final approach and takeoff area. The notification requirements apply to all public-use airports, military airports, and heliports. When FAA notification is required, it must be provided using FAA Form 7460-1, Notice of Proposed Construction or Alteration.[40]

Title 40 - Protection of Environment, Chapter I - Environmental Protection Agency (Continued) CFR Part 68 - Chemical Accident Prevention Provisions

This part sets forth the list of regulated substances and thresholds, the petition process for adding or removing substances to the list of regulated substances, the requirements for owners or operators of stationary sources concerning the prevention of accidental releases, and the state accidental release prevention programs approved under Section 112(r).[41]

International Fire Code

The International Fire Code (IFC), created by the International Code Council, is the primary means for authorizing and enforcing procedures and mechanisms to ensure the safe handling and storage of any substance that may pose a threat to public health and safety. The IFC regulates the use, handling, and storage requirements for hazardous materials at fixed facilities. The IFC and the International Building Code use a hazard classification system to determine what protective measures are required for fire and life safety. These measures may include construction standards, separations from property lines, and

---

specialized equipment. To ensure that these safety measures are met, the IFC employs a permit system based on hazard classification. The IFC is updated every 3 years, and is the basis for the California Fire Code (CFC; also updated triennially). Local jurisdictions then adopt the CFC, in some cases with local amendments.[42]

Presidential Policy Directive 8: National Preparedness

The National Response Framework (NRF) is an essential component of the National Preparedness System mandated in Presidential Policy Directive 8: National Preparedness (PPD-8). PPD-8 is aimed at strengthening the security and resilience of the United States through systematic preparation for the threats that pose the greatest risk to the security of the Nation. PPD-8 defines five mission areas—Prevention, Protection, Mitigation, Response, and Recovery—and mandates the development of a series of policy and planning documents to explain and guide the Nation's collective approach to ensuring and enhancing national preparedness. The NRF presents the guiding principles that enable all response partners to prepare for and provide a unified national response to disasters and emergencies. It establishes a comprehensive, national, all-hazards approach to domestic incident response. The National Response Plan was replaced by the NRF effective March 22, 2008 and updated most recently in June 2016.

The NRF defines the principles, roles, and structures that organize response protocols as a nation. The NRF:

- Describes how communities, tribes, states, the federal government, private-sectors, and nongovernmental partners work together to coordinate national response;
- Describes specific authorities and best practices for managing incidents; and
- Builds upon the National Incident Management System (NIMS), which provides a consistent template for managing incidents.[43]

Federal Response Plan

The Federal Response Plan of 1999 is a signed agreement among 27 federal departments and agencies, including the American Red Cross, that (1) provides the mechanism for coordinating delivery of federal assistance and resources to augment efforts of state and local governments overwhelmed by a major disaster or emergency; (2) supports implementation of the Robert T. Stafford Disaster Relief and Emergency Act, as well as individual agency statutory authorities; and (3) supplements other federal

emergency operations plans developed to address specific hazards. The Federal Response Plan is implemented in anticipation of a significant event likely to result in a need for federal assistance or in response to an actual event requiring federal assistance under a Presidential declaration of a major disaster or emergency.[44]

Federal Railroad Administration Office of Railroad Safety

FRA's Office of Railroad Safety promotes and regulates safety throughout the Nation's railroad industry.[45] The regional offices enforce compliance with regulations related to hazardous materials, motive power equipment, operating practices, signal and train control, and tracks. California is in Region 7, which is headquartered in Sacramento, California.

Federal Emergency Management Agency (FEMA)

FEMA's mission is to reduce the loss of life and property and protect communities nationwide from all hazards, including natural disasters, acts of terrorism, and other man-made disasters. FEMA leads and supports the nation in a risk-based, comprehensive emergency management system of preparedness, protection, response, recovery and mitigation.

In March 2003, the Federal Emergency Management Agency (FEMA) became a department of the U.S. Department of Homeland Security (DHS), pursuant to 44 CFR, Chapter 1 Part 201. The primary mission of FEMA is to reduce the loss of life and property and protect the nation from all hazards, including natural disasters, acts of terrorism, and other human-made disasters, by leading and supporting the nation in a risk-based, comprehensive emergency management system of preparedness, protection, response, recovery, and mitigation. SCAG is under the jurisdiction of FEMA Region 9, which covers Arizona, California, Hawaii, Nevada, Guam, American Samoa, Commonwealth of Northern Mariana Islands, Republic of Marshall Islands, Federated State of Micronesia, and more than 150 sovereign tribal entities. In Southern California, FEMA Region 9 specifically plans for hazards such as major earthquakes and wildfires. A catastrophic earthquake could result in 1,800 fatalities, 9 million people displaced, and $200 billion in losses.[46]

National Fire Plan

The Department of the Interior's National Fire Plan is intended to ensure an appropriate federal response to severe wildland fires, reduce fire impacts to rural communities, and ensure sufficient firefighting capacity in the future.[47] The Rural Fire Assistance program is funded to enhance the fire protection capabilities of rural fire districts and safe and effective fire suppression in the wildland/urban interface. The program promotes close coordination among local, state, tribal, and federal firefighting resources by conducting training, equipment purchase, and prevention activities on a cost-shared basis.[48]

3.9.2.2 State

Hazardous Waste Control Law of 1972

The Hazardous Waste Control Act (Health and Safety Code Sections 25100 et seq.) created the state hazardous waste management program, which is similar to but more stringent than the federal RCRA program.[49] The Act is implemented by regulations contained in Title 26 of the California Code of Regulations (CCR), which describes the following required aspects for the proper management of hazardous waste: identification and classification; generation and transportation; design and permitting of recycling, treatment, storage, and disposal facilities; treatment standards; operation of facilities and staff training; and closure of facilities and liability requirements. These regulations list more than 800 materials that may be hazardous and establish criteria for identifying, packaging, and disposing of such waste. Under the Hazardous Waste Control Act and Title 26, the generator of hazardous waste must complete a manifest that accompanies the waste from generator to transporter to the ultimate disposal location. Copies of the manifest must be filed with DTSC.

Hazardous Materials Release Response Plans and Inventory Law of 1985

The Hazardous Materials Release Response Plans and Inventory Law of 1985 (Business Plan Act; HSC Division 20 Chapter 6.95 [25500–25547.8]) governs hazardous materials handling, reporting requirements, and local agency surveillance programs.[50]

Lempert-Keene-Seastrand Oil Spill Prevention and Response Act

The Lempert-Keene-Seastrand Oil Spill Prevention and Response Act of 1990 granted the Office of Spill Prevention and Response (OSPR) the authority to direct prevention, removal, abatement, response, containment, and cleanup efforts with regard to all aspects of any oil spill in marine waters of California. OSPR implements the California Oil Spill Contingency Plan, consistent with the National Contingency Plan, which pays special attention to marine oil spills and impacts to environmentally- and ecologically-sensitive areas. In 2014, the OSPR program was expanded to cover all statewide surface waters at risk of oil spills from any source, including pipelines and the increasing shipments of oil transported by railroads.[51]

California Disaster Assistance Act (CDAA)

The California Disaster Assistance Act (CDAA; CCR Title 19, Chapter 6) authorizes the Director of the California Governor's Office of Emergency Services (Cal OES) to administer a disaster assistance program that provides financial assistance from the state for costs incurred by local governments as a result of a disaster event. Funding for the repair, restoration, or replacement of public real property damaged or destroyed by a disaster is made available when the Director concurs with a local emergency proclamation requesting state disaster assistance.[52]

Office of Emergency Services

The Office of Emergency Services (OES) is an agency responsible for overseeing and coordinating emergency preparedness, response, recovery and homeland security activities, in cooperation with fire and law and other enforcement agencies. Each county within the SCAG region has an OES which is responsible for coordinating and maintaining resources necessary for first responders to protect the community. In addition to maintaining a Material Safety Data Sheets (MSDS), notifications to the OES must be made when there is a hazardous material incident or spill that may require clean-up. OES is responsible for preparing, and gathering information on incident, participate in offering guidance to residents and communities affected by incident, coordinating with FEMA, state, and county/city agencies for other needed resource, and implement a reduction of risk program to prevent future accidents causing physical and natural or human casualties.

52 California Office of Emergency Services. 2019. *California Disaster Assistance Act (CDAA).* Available online at: https://www.caloes.ca.gov/cal-oes-divisions/recovery/public-assistance/california-disaster-assistance-act, accessed August 19, 2019.

The Cal OES mission statement is "Protect lives and property, build capabilities, and support our communities for a resilient California." Cal OES goals include:

- **Goal 1:** Anticipate and enhance prevention and detection capabilities to protect our State from all hazards and threats.
- **Goal 2:** Strengthen California's ability to plan, prepare for, and provide resources to mitigate the impacts of disasters, emergencies, crimes, and terrorist events.
- **Goal 3:** Effectively respond to and recover from both human-caused and natural disasters.
- **Goal 4:** Enhance the administration and delivery of all state and federal funding, and maintain fiscal and program integrity.
- **Goal 5:** Develop a united and innovative workforce that is trained, experienced, knowledgeable, and ready to adapt and respond.
- **Goal 6:** Strengthen capabilities in public safety communication services and technology enhancements.[53]

Local Community Rail Security Act

The Local Community Rail Security Act of 2006 (Public Utilities Code Sections 7665-7667) requires all rail operators to provide security risk assessments to CPUC, the Director of Homeland Security, and the Catastrophic Event Memorandum Account that describe the following:

- Location and function of each rail facility
- Types of cargo stored at or typically moved through the facility
- Hazardous cargo stored at or moved through the facility
- Frequency of hazardous movements or storage
- A description of sabotage-terrorism countermeasures
- Employee training programs
- Emergency response procedures

- Emergency response communication protocols[54]

California State Aeronautics Act

The purpose of the California State Aeronautics Act pursuant to Public Utilities Code Section 21001 et seq. "is to further and protect the public interest in aeronautics and aeronautical progress" through encouraging the development of private flying and air transportation, promoting safety in aeronautics, effecting uniformity in laws and regulations relating to aeronautics, providing cooperation with federal authorities, protecting residents from unreasonable levels of aircraft noise, and promoting the development of a stable regional air carrier system. The California Department of Transportation (Caltrans), Division of Aeronautics, administers much of this statute.[55]

Hazardous Substances Account Act (State Superfund) (HSC Sections 25300–25301)

Chapter 6.8 of the California Health and Safety Code requires the DTSC to include "the largest manageable number" of potentially responsible parties (PRPs) in any cleanup order that applies to a multiple PRP site after considering certain factors, including the adequacy of the evidence of each PRP's liability, the financial viability of each PRP, and the degree to which each PRP contributed to the release of hazardous substances at the site.[56]

California Emergency Services Act (Assembly Bill (AB) 38 (Chapter 372)

AB 38 combined the Office of Homeland Security and the Office of Emergency Services into Cal EMA. Under AB 38 Cal EMA was responsible for overseeing and coordinating emergency preparedness, response, recovery, and homeland security activities in the state.[57] In 2013, under the Governor's reorganization plan #2, Cal EMA was eliminated and restored to the Governor's Office, renaming it the California Governor's Office of Emergency Services (Cal OES). [58]

Hazardous Materials Release Cleanup (Assembly Bill (AB) 440 Chapter 588)

AB 440 Chapter 588, passed into law in 2013, authorizes a local agency to take clean up action similar to that under the Polanco Redevelopment Act that the local agency determines is necessary, consistent with other state and federal laws, to remedy or remove a release of hazardous substances within the

boundaries of the local agency. AB 440 allows the local agency to designate another agency, in lieu of the department or the regional board, to review and approve a cleanup plan and to oversee the cleanup of hazardous material from a hazardous material release site, under certain conditions. It also provides immunity to the local agency as long as the action is in accordance with a cleanup plan prepared by a qualified independent contractor, and approved by the department, a regional board, or the designated agency, and the cleanup is undertaken and properly completed. Finally, AB 440 authorizes the local agency to recover cleanup costs from the responsible party.[59]

Asbestos Regulations

In 1990, ARB issued an Airborne Toxic Control Measure (ATCM), which prohibited the use of serpentine aggregate for surfacing if the asbestos content was 5 percent or more.[60] In July 2000, ARB adopted amendments to the existing ATCM prohibiting the use or application of serpentine, serpentine-bearing materials and asbestos-containing ultramafic rock for covering unpaved surfaces unless it has been tested using an approved asbestos bulk test method and determined to have an asbestos content that is less than 0.25 percent.[61] In July 2001, ARB adopted a new ATCM for construction, grading, quarrying, and surface mining operations in areas with serpentine or ultramafic rocks.[62] These regulations are codified in Title 17, Section 93105 of the CCR. The regulations require preparation and implementation of an Asbestos Dust Mitigation Plan for construction or grading activities on sites greater than 1 acre in size with known Naturally Occurring Asbestos (NOA) soils. The air districts enforce this regulation.[63]

In October 2000, the Governor's Office of Planning and Research (OPR) issued a memorandum providing guidance to lead agencies in analyzing the impacts of NOA on the environment through the California Environmental Quality Act (CEQA) review process.[64] In November 2000, the California Department of Real Estate added a section to subdivision forms that includes questions related to NOA on property

proposed for development.[65] In 2004, as part of its school-site review program, the DTSC's School Property Evaluation and Cleanup Division released interim guidance on evaluating NOA at school sites.[66]

In addition, HSC Section 19827.5 prohibits the issuance of demolition permits by local and State agencies for any building or structure that has not submitted all required asbestos notifications to the US EPA, pursuant to Part 61 of Title 40 of the Code of Federal Regulations.[67]

California Occupational Safety and Health Administration (Cal/OSHA) Regulations. Cal/OSHA sets forth regulations for the disturbance of Asbestos Containing Construction Materials (ACCMs) including removal operations for all types of ACCMs. Cal/OSHA requires contractors and employers that remove ACCMs to be registered and consultants and technicians who conduct sampling and/or removal to be certified. In addition, the agency has developed standards for general industry and the construction industry hazardous waste operations and emergency response. Cal/OSHA ensures that employers must have controls to reduce and monitor exposure levels of hazardous materials, an informational program describing any exposure during operations and the inspection of drums and containers prior to removal or opening. Decontamination procedures and emergency response plans must be in place before employees begin working in hazardous waste operations.[68]

California Code of Regulations (CCR) Title 8 Section 1529. This section of the CCR regulates asbestos exposure for work identified in Section 1502, including demolition or salvage of structures where asbestos is present; removal or encapsulation of materials containing asbestos; construction, alteration, repair, maintenance, or renovation of structures, substrates, or portions thereof, that contain asbestos, installation of products containing asbestos; asbestos spill/emergency cleanup; transportation, disposal, storage, containment of and housekeeping activities involving asbestos or products containing asbestos, on the site or location at which construction activities are performed; and excavation that may involve exposure to asbestos as a natural constituent which is not related to asbestos mining and milling activities.[69]

SCAQMD Rule 1403. The Clean Air Act regulates asbestos as a hazardous air pollutant, which subjects it to regulation by South Coast Air Quality Management District (SCAQMD) under its Rule 1403. OSHA also regulates asbestos as a potential worker safety hazard. These rules and regulations prohibit emissions of asbestos from demolition or construction activities, require medical examinations and monitoring of employees engaged in activities that could disturb asbestos fibers, and require notice to federal and local government agencies prior to renovation or demolition activities that could disturb asbestos.[70]

Lead Regulations

Because of its toxic properties, lead is regulated as a hazardous material. Lead is also regulated as a toxic air contaminant. State-certified contractors must perform inspection, testing, and removal (abatement) of lead-containing building materials in compliance with applicable health and safety and hazardous materials regulations, including those outlined in Title 17 of the CCR.

CCR Title 8 Section 1532.1. This section of the CCR applies to all construction work where employees could be occupationally exposed to lead, including demolition or salvage of structures where lead or materials containing lead are present; removal or encapsulation of materials containing lead; new construction, alteration, repair, or renovation of structures, substrates, or portions thereof, that contain lead or materials containing lead; installation of products containing lead; lead contamination/emergency clean-up; transportation, disposal, storage, or containment of lead or materials containing lead on the site or location at which construction activities are performed; and maintenance operations associated with construction activities. This section sets a maximum exposure limit; requires an assessment to determine whether employees may be exposed to lead; requires employees to create a compliance program to ensure that employee exposure to lead are at or below the permissible exposure limit to the extent feasible; and requires that employees with exposure to lead are provided with respiratory protection, protective work clothing and equipment.[71]

Other state laws that address lead include:

- Hazardous Waste Control Law
- Safe Drinking Water and Toxic Enforcement Act of 1986 (Proposition 65)

California Accidental Release Prevention Program

The California Accidental Release Prevention Program (CalARP; CCR Title 19, Division 2, Chapter 4.5) was implemented on January 1, 1997, and replaced the California Risk Management and Prevention Program (RMPP). The CalARP program encompasses both the federal "Risk Management Program," established in the Code of Federal Regulations, Title 40, Part 68, and the State of California program, in accordance with the Title 19 of the California Code of Regulations, Division 2, Chapter 4.5.[72]

The main objective of the CalARP program is to prevent accidental releases of those substances determined to potentially pose the greatest risk of immediate harm to the public and the environment, and to minimize the consequences if releases do occur. These substances are called regulated substances and include both flammable and toxic hazardous materials listed on the Federal Regulated Substances for Accidental Release Prevention and on the State of California Regulated Substances lists. Businesses that handle regulated substances in industrial processes above threshold quantity levels are subject to CalARP program requirements.

The CalARP program requires businesses to have planning activities that are intended to minimize the possibility of an accidental release by encouraging engineering and administrative controls. It is further intended to mitigate the consequences of an accidental release, by requiring owners or operators of facilities to develop and implement an accident prevention program.

California Human Health Screening Levels

The California Human Health Screening Levels (CHHSLs) were developed as a tool to assist in the evaluation of contaminated sites for potential adverse threats to human health. Preparation of the CHHSLS was required by the California Land Environmental Restoration and Reuse Act of 2001. The CHHSLs were developed by OEHHA, an agency under the umbrella of Cal/EPA, and are contained in its report entitled *Human-Exposure- Based Screening Numbers Developed to Aid Estimation of Cleanup Costs for*

72 California Office of Emergency Services. 2019. *California Accidental Release Prevention*. Available online at: https://www.caloes.ca.gov/cal-oes-divisions/fire-rescue/hazardous-materials/California-Accidental-Release-Prevention, accessed August 19, 2019.

Contaminated Soil1.[73] The thresholds of concern used to develop the CHHSLs are an excess lifetime cancer risk of one in 1 million and a hazard quotient of 1.0 for non-cancer health effects. The CHHSLs were developed using standard exposure assumptions and chemical toxicity values published by EPA and Cal/EPA. The CHHSLs can be used to screen sites for potential human health concerns where releases of hazardous chemicals to soils have occurred. Under most circumstances, the presence of a chemical in soil, soil gas, or indoor air at concentrations below the corresponding CHHSLs can be assumed to not pose a significant health risk to people who may live (residential CHHSLs) or work (commercial/ industrial CHHSLs) at the site.[74]

California Fire Code (CFC)

The CFC is Chapter 9 of CCR Title 24. It is the primary means for authorizing and enforcing procedures and mechanisms to ensure the safe handling and storage of any substance that may pose a threat to public health and safety. The CFC regulates the use, handling, and storage requirements for hazardous materials at fixed facilities. The CFC and the California Building Code use a hazard classification system to determine what protective measures are required to protect fire and life safety. These measures may include construction standards, separations from property lines, and specialized equipment. To ensure that these safety measures are met, the CFC employs a permit system based on hazard classification. The CFC is updated every three years.[75]

2017 State of California Emergency Plan

The 2017 State of California Emergency Plan, also referred to as the State Emergency Plan (SEP), addresses the state's response to extraordinary emergency situations associated with natural disasters or human-caused emergencies. The California Emergency Services Act provides the basic authorities for conducting emergency operations following the proclamation of emergencies by appropriate local officials and/or the Governor. The provisions of this act are further reflected and expanded upon by local emergency ordinances. In accordance with this act, the SEP describes the methods for carrying out emergency operations, the process for rendering mutual aid, the emergency services of governmental agencies, how resources are mobilized, how the public will be informed and the process to ensure

73 Office of Environmental Health Hazard Assessment. 2005. *Human-Esposure-Based* Screening Numbers Developed to Aid Estimation of Cleanup Costs for Contaminated Soil. Available online at: https://oehha.ca.gov/media/downloads/crnr/screenreport010405.pdf, accessed September 4, 2019.

74 Office of Environmental Health Hazard Assessment. 2019. *California Human Health Screening Levels*. Available online at: https://oehha.ca.gov/risk-assessment/california-human-health-screening-levels-chhsls, accessed August 19, 2019.

75 International Code Council. 2019. *2019 California Fire Code, Title 24, Part 9*. Available online at: https://codes.iccsafe.org/content/chapter/15600/, accessed August 19, 2019.

continuity of government during an emergency or disaster. The SEP emphasizes mitigation programs to reduce the vulnerabilities to disaster and preparedness activities to ensure the capabilities and resources are available for an effective response. To assist communities and governments to recover from the disaster, the SEP outlines programs that establish a consistent, statewide framework to enable state, local, tribal governments, federal government and the private sector to work together to mitigate, prepare for, respond to and recover from the effects of emergencies regardless of cause, size, location, or complexity.[76]

2018 State Hazard Mitigation Plan (SHMP)

Approved by FEMA in September 2018, as an Enhanced State Mitigation Plan, the 2018 SHMP update continues to build upon California's commitment to reduce or eliminate the impacts of disasters caused by natural, technological, accidental, and adversarial/human-caused hazards, and further identifies and documents progress made in hazard mitigation efforts, new or revised state and federal statutes and regulations, and emerging hazard conditions and risks that affect the State of California. Resilience depends on the whole community and is a shared responsibility for all levels of government, private and nonprofit sectors, and individuals.[77]

3.9.2.3 Local

Certified Unified Program Agencies (Senate Bill 1082)

Californians are protected from hazardous waste and materials by a unified program that ensures consistency throughout the state in regards to administrative requirements, permits, inspections, and enforcements. The goal of the CUPA is to create a more cohesive, effective, and efficient program. Under the CUPA, application and required submission forms are standardized and consolidated, inspections are combined where possible, annual fees for each program element are merged into a single fee system, and enforcement procedures are made more consistent. The program elements consolidated under the CUPA are:

- Hazardous waste generator and onsite hazardous waste treatment programs (a.k.a. Tiered permitting);
- Aboveground petroleum storage tank spill prevention control and countermeasure plan (SPCC);

76 California Emergency Management Agency. 2017. *State of California Emergency Plan 2017*. Available online at: https://www.caloes.ca.gov/cal-oes-divisions/planning-preparedness/state-of-california-emergency-plan-emergency-support-functions, accessed September 16, 2019.

77 California's Office of Emergency Services. 2018. *2018 California State Hazard Mitigation Plan*. Available online at: https://www.caloes.ca.gov/cal-oes-divisions/hazard-mitigation/hazard-mitigation-planning/state-hazard-mitigation-plan, accessed August 19, 2019.

- Hazardous materials release response plans and inventory program (a.k.a. hazardous materials disclosure or community-right-to-know)
- California Accidental Release Prevention Program (Cal ARP);
- Underground storage tank program (UST); and
- Uniform fire code plans and inventory requirements.

CalEPA oversees the program, and certifies 83 local government agencies, including 37 in the SCAG region. Local agencies administering one or more of the six program elements have the option to either apply for CUPA status within the CalEPA or retain their programs by becoming a participating agency under another CUPA's jurisdiction. Some examples of the agencies that are participating under the CUPA are fire departments, environmental and health branches, Department of Toxic Substances Controls within city and municipal governments.[78]

County General Plans and Other County-wide Planning

In addition to federal and state requirements, general plans and municipal codes of counties and cities in the SCAG region may include safety elements that goals and policies related protecting people and property from risks from hazards and hazardous materials.

Los Angeles County General Plan

The Safety Element of the Los Angeles County General Plan 2035 Update, in conjunction with the AllHazard Mitigation Plan prepared by the Chief Executive Office, Office of Emergency Management (CEO OEM), sets strategies for natural and man-made hazards in Los Angeles County. The All-Hazard Mitigation Plan, which has been approved by FEMA and the California Emergency Management Agency (CalEMA), includes a compilation of known and projected hazards in Los Angeles County.[79,80]

Los Angeles County Operational Area Emergency Response Plan (ERP)

The County of Los Angeles developed the ERP to ensure the most effective allocation of resources for the maximum benefit and protection of the public in time of emergency. The ERP does not address normal

79 Los Angeles County Department of Regional Planning. 2015. *Los Angeles County General Plan*. Available online at: http://planning.lacounty.gov/assets/upl/project/gp_final-general-plan.pdf, accessed August 19, 2019.

80 County of Los Angeles, Chief Executive Office – Office of Emergency Management. 2014. All-Hazard Mitigation Plan. Available online at: https://ceo.lacounty.gov/wp-content/uploads/OEM/hazmitgplan.pdf, accessed September 4, 2019.

day-to-day emergencies or the well-established and routine procedures used in coping with them. Instead, the operational concepts reflected in this plan focus on potential large-scale disasters like extraordinary emergency situations associated with natural and man-made disasters and technological incidents which can generate unique situations requiring an unusual or extraordinary emergency response. The purpose of the plan is to incorporate and coordinate all the facilities and personnel of County government, along with the jurisdictional resources of the cities and special districts within the County, into an efficient Operational Area organization capable of responding to any emergency using a Standard Emergency Management System, mutual aid and other appropriate response procedures. The goal of the plan is to take effective life-safety measures and reduce property loss, provide for the rapid resumption of impacted businesses and community services, and provide accurate documentation and records required for cost-recovery.[81]

San Bernardino County General Plan

The San Bernardino County General Plan contains an entire element regarding household hazardous waste, which includes reduction implementation programs.[82] The Safety Element was amended in 2014 with goals such as the County providing a Hazard Mitigation Plan which will become part of the Safety Element.[83]

Imperial County General Plan

The Land Use Planning and Public Safety and Emergency Preparedness Elements of the Imperial County General Plan have established goals related to protection of public health and safety for consideration in the land use planning process. The specified goals and objectives are intended to minimize potential hazards to public health and safety, and prevent the loss of life and damage to properties, and rely heavily on ensuring conformance with established applicable state codes. The General Plan has specific goals related protecting the public from exposure to hazardous materials and wastes, by discouraging the transport of hazardous materials/waste near or through residential areas and critical facilities, measures to minimize the possibility of hazardous materials/waste spills, land use planning policies to discourage incompatible development adjacent to sites and facilities for the production, storage, disposal, and transport of hazardous materials/waste as identified in the County General Plan and other regulations,

and an established objective of adopting and ordinances, policies, and guidelines that assure the safety of Imperial County ground and surface waters from toxic or hazardous materials and wastes.[84]

Orange County General Plan

The Safety Element of the Orange County General Plan provides for the protection of people and property from risks associated with hazards and hazardous materials through the implementation of mitigation measures as outlined in the California Emergency Plan, the California Master Mutual Aid Agreement, the Orange County Emergency Plan, the Orange County Operational Area Plan, S.O.N.G.S. Plan, County of Orange and Orange County Fire Authority Hazard Mitigation Plan, and other emergency management plans. The Safety Element of the Orange County General Plan focuses primarily upon the County's planned response to extraordinary emergency situations associated with natural disasters, technological incidents, intentional acts of terrorism and nuclear protection operations. To reduce the County's susceptibility and vulnerability to extraordinary emergency situations, the Safety Element recommends continued emphasis is placed on several coordinated efforts:

- Mitigation
- Emergency planning
- Training of full-time, auxiliary, and reserve personnel
- Public awareness and education; and assuring the adequacy and availability of sufficient resources to cope with such emergencies[85]

In November 2015, the Board of Supervisors adopted a new County of Orange and Orange County Fire Authority Hazard Mitigation Plan (HMP) in compliance with federal and state regulations.[86]

Ventura County General Plan

The Safety Element of the Ventura County General Plan contains specific goals to minimize the risk of loss of life, injury, serious illness, damage to property, and economic and social dislocations resulting from the use, transport, treatment and disposal of hazardous materials and hazardous wastes. Additionally specific goals are identified to locate potentially hazardous facilities and operations in areas

that would not expose the public to a significant risk of injury, loss of life, or property damage. The plan identifies five policies and 13 programs related to the management of hazards and hazardous materials.[87]

City General Plans

The SCAG region spans six counties and 191 cities, each of which has a general plan containing policies related to hazards and hazardous materials. Additional plans and ordinances at the master plan level, city-level, and specific plan level may also apply within the SCAG region, such as the City of Los Angeles Local Hazard Mitigation Plan. The Local Hazard Mitigation Plan meets the planning requirements of FEMA's Community Rating System.[88] Furthermore, fire departments and other agencies in the SCAG region have a variety of local laws that regulate reporting, storage, handling, and transporting hazardous substances and materials. See **Section 3.20, Wildfire,** for an additional discussion on hazards in relation to wildland fires.

3.9.3 ENVIRONMENTAL IMPACTS

3.9.3.1 Thresholds of Significance

For the purposes of this PEIR, SCAG has determined the Plan could result in significant impacts related to hazards and hazardous materials, if the Plan would result in any of the following:

- Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials;
- Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment;
- Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school;
- Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment;
- For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area; or

---

88 City of Los Angeles Emergency Management Department. 2018. *Local Hazard Mitigation Plan*. Available online at: https://emergency.lacity.org/sites/g/files/wph496/f/2018_LA_HMP_Final_2018-11-30.pdf, accessed September 4, 2019.

- Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan; or

- Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires (this criterion is addressed in **Section 3.20, Wildfire**, **Impact WF-2**).

3.9.3.2 Methodology

The potential for implementation of the Plan to expose people or property to risk from hazards or hazardous materials was evaluated in accordance with Appendix G of the 2019 *State California Environmental Quality Act (CEQA) Guidelines*, and at the programmatic level of detail, in relation to the general plans of the six counties and the 191 cities within the SCAG region, a query of government data bases, and a review of related literature germane to the SCAG region.

The frequency and location of hazardous material shipments are an indicator of potential risk. The impact of hazardous materials transportation through the SCAG region can be assessed by examining the Plan's effect on shipments of hazardous materials. To assess potential hazards to sensitive receptors adjacent to transportation corridors, geographic information systems (GIS) analysis was used to identify where major highway, rail, and transit projects included in the Plan would be within 150 feet of 2045 residential land uses. Major projects considered in the Plan since the 2016 RTP/SCS was adopted include additional highway projects, high-occupancy vehicle (HOV) projects, mixed flow projects, and toll projects.

The methodology for determining the significance of hazardous material impacts compares the existing conditions (2019) to the future 2045 conditions under the Plan, as required in CEQA Section 15126.2(a). Implementation of the Plan would affect the transportation and handling of hazardous materials in the SCAG region by improving and increasing transportation routes in proximity to sensitive receptors such as educational and residential uses. The potential for risk related to the transport of hazardous materials was assessed by evaluating the locations of proposed transportation projects in relation to the surrounding uses, as well as potential significant impacts related to the risk of accidental releases of hazardous materials due to an increase in the transportation of hazardous materials and the potential for such releases to reach schools, and communities adjacent to transportation facilities included in the Plan.

In 2015, the California Supreme Court in *CBIA v. BAAQMD*, held that CEQA generally does not require a lead agency to consider the impacts of the existing environment on the future residents or users of a project. However, if a project exacerbates a condition in the existing environment, the lead agency is required to analyze the impact of that exacerbated condition on future residents and users of a project, as well as other impacted individuals. The following discussion presents a programmatic, regional

evaluation of potential impacts of transportation projects, land use strategies, and development projects anticipated to occur under the Plan on increased risk of exposure to hazardous materials.[89]

The mitigation measures in the PEIR are divided into two categories: SCAG mitigation and project-level mitigation measures. SCAG mitigation measures shall be implemented by SCAG over the lifetime of the Plan. For projects proposing to streamline environmental review pursuant to SB 375, SB 743 or SB 226 (as described in Section 1.0 Introduction), or for projects otherwise tiering off this PEIR, the project-level mitigation measures described below (or comparable measures) can and should be considered and implemented by Lead Agencies and Project Sponsors during the subsequent, project- or site-specific environmental reviews for transportation and development projects as applicable and feasible. However, SCAG cannot require implementing agencies to adopt mitigation, and it is ultimately the responsibility of the implementing agency to determine and adopt project-specific mitigation.

3.9.3.3 Impacts and Mitigation Measures

Impact HAZ-1 **Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials.**

Significant and Unavoidable Impact- Mitigation Required.

The transportation, use, and/or disposal of hazardous materials are subject to numerous laws, regulations, and health and safety standards set forth by federal, state, and local authorities that regulate the proper handling of such materials and their containers. These include the EPA, OSHA, U.S. DOT, and the Food and Drug Administration (FDA) for the federal government. State agencies, including the Cal/EPA, have parallel and, in some cases, more stringent rules governing the use of hazardous materials. U.S. DOT requires that hazardous waste inventories (which are used to ensure that hazardous wastes are strictly monitored and tracked from the point of generation through ultimate disposal) be maintained. To operate in California, all hazardous waste transporters must be registered with the DTSC. Unless specifically exempted, hazardous waste transporters must comply with the California Highway Patrol Regulations, the California State Fire Marshal Regulations, and the U.S. DOT regulations.

The Connect SoCal Plan includes transportation projects and land use strategies, that may create a significant hazard to the public or the environment through the transportation, use, and/or disposal of

89 Note that as discussed in **Section 3.15.3 Public Services – Schools**, CEQA review of school construction generally does require an evaluation of the effects of existing air quality exposure on pupils, and to the extent the health risk is unacceptable, the school would not be built. CEQA also provides limited protection and requires analysis of impacts of the existing environment on certain housing development projects exercising exemptions under Pub. Res. Code § 21096.

hazardous materials, constituting a significant impact. Goods movement activities can facilitate the movement of hazardous materials throughout the transportation network. Proposed freight rail enhancements and other goods movement capacity enhancements identified in the Plan could result in increased or new transport of hazardous materials or wastes. In addition, construction and maintenance of these projects would result in use of equipment that contains or uses routine hazardous materials (e.g., diesel-fuel, paint and cleaning solutions), and the transportation of excavated soil and/or groundwater containing contaminants from previously contaminated areas. Port traffic (and associated goods movement in the region) is anticipated to triple over the lifetime of the Plan. Container traffic for the San Pedro Bay Ports is anticipated to increase from approximately 17.6 million Twenty-foot Equivalent Units (TEUs) in 2018 to a projected 34 million TEUs in 2040. The fraction of containers that include hazardous materials is not known, but if it is assumed that it remains constant, transport of hazardous materials would be expected to triple along with other container traffic. In addition to container traffic, hazardous materials are transported via company trucks (for example gas companies transport gasoline, diesel and other flammable substances) and various industrial users transport materials for their businesses (raw materials and waste products).

Reducing conflicts between goods movement and people movement is critical to realize a safer system for users. In 2016, there were nearly 3,700 truck-involved accidents[90] in the SCAG region, an increase of 22.8 percent versus 2012, and more than 130 of them resulted in fatalities.[91] A greater separation of passenger and goods movement is envisioned in the Plan to make the system safer for all users.

Regional goods movement strategies should also mitigate neighborhood and community impacts to the maximum extent possible by selecting the least intrusive alignments for new facilities, seeking shared-use corridors (e.g., rail and truck, transportation and utility), and separating modal system conflicts. The California Air Resources Board (CARB) plans to release a freight handbook in early 2020 that will offer communities recommendations on mitigation from freight facilities. This is consistent with the Plan which offers an aggressive program of technology research, development, and demonstration aimed at zero emission truck and rail technologies as major elements of the vision.

The construction and maintenance of transportation projects and development projects anticipated to occur under the Plan would potentially involve the use of hazardous materials such as fuels, solvents, paints, and other architectural coatings. The use and storage of these materials is regulated by local fire departments, Certified Unified Program Agencies (CUPAs), and the Cal OSHA. Materials remaining after

90 Another 245 resulted in severe injuries and more than 1,000 others had other visible injuries.

91 With the exception of 2015, the number of fatalities in truck involved collisions has increased annually since 2012. However, the ratio of overall fatalities to truck-involved collisions has remained between 3.6 percent to 3.8 percent for each year besides 2014 (4.1 percent).

project construction can likely be reused on other projects. For materials that cannot be or are not reused, disposal would be regulated by DTSC under state and federal hazardous waste regulations. Additionally, increased transport and handling of hazardous materials particularly by goods movement facilities could result in increased risk of accidental releases reaching neighborhoods and communities adjacent to the transportation facilities).

To accommodate the region's new growth (3.2 million more people by 2045), the Connect SoCal Plan's land use strategies encourage growth adjacent to transit and transportation facilities in order to reduce trips and trip lengths. However, with increasing growth adjacent to such transportation facilities, there would be greater potential risk for exposure of people and property to hazardous materials from the routine transport, use, and disposal of hazardous materials. While the transport, use, and disposal of hazardous materials is heavily regulated as discussed above, and transportation projects and development projects would be required to comply with all existing applicable regulations, due to the volume of transportation projects and large amount of growth anticipated to occur under the Plan, it is possible that significant impacts could occur thus requiring the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measures

SMM HAZ-1: SCAG shall work with the U.S. DOT, the Office of Environmental Service Caltrans, and the private sector to continue to conduct driver safety training programs and enforce speed limits on roadways. In an effort to reduce risks associated with the transport of hazardous materials in the SCAG region, SCAG shall encourage the U.S. Department of Transportation and the California Highway Patrol to continue to enforce speed limits and existing regulations governing goods movement and hazardous materials transportation.

SMM HAZ-2: SCAG shall notify member agencies of the importance of ensuring that construction and operation of transportation projects provide for the safe transport and disposal of hazardous waste, consistent with the provisions of HMR, 49 CFR Parts 171–180.

SMM HAZ-3: SCAG shall coordinate with the Office of Environmental Services to identify any transportation infrastructure elements within the SCAG region where risks to people and property occur at an above-average incident level, potentially warranting consideration for remedial design in future regional transportation plans (RTPs).

Project Level Mitigation Measures

PMM HAZ-1: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to the routine transport, use, or disposal of hazardous materials, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

a) Where the construction or operation of projects involves the transport of hazardous material, provide a written plan of proposed routes of travel demonstrating use of roadways designated for the transport of such materials.

b) Specify Project requirements for interim storage and disposal of hazardous materials during construction and operation. Storage and disposal strategies must be consistent with applicable federal, state, and local statutes and regulations. Specify the appropriate procedures for interim storage and disposal of hazardous materials, anticipated to be required in support of operations and maintenance activities, in conformance with applicable federal, state, and local statutes and regulations, in the business plan for projects as applicable and appropriate.

c) Submit a Hazardous Materials Business/Operations Plan for review and approval by the appropriate local agency. Once approved, keep the plan on file with the Lead Agency (or other appropriate government agency) and update, as applicable. The purpose of the Hazardous Materials Business/Operations Plan is to ensure that employees are adequately trained to handle the materials and provides information to the local fire protection agency should emergency response be required. The Hazardous Materials Business/Operations Plan should include the following:

- The types of hazardous materials or chemicals stored and/or used on-site, such as petroleum fuel products, lubricants, solvents, and cleaning fluids.
- The location of such hazardous materials.
- An emergency response plan including employee training information.

- A plan that describes the way these materials are handled, transported and disposed.

d) Follow manufacturer's recommendations on use, storage, and disposal of chemical products used in construction.

e) Avoid overtopping construction equipment fuel gas tanks.

f) Properly contain and remove grease and oils during routine maintenance of construction equipment.

g) Properly dispose of discarded containers of fuels and other chemicals.

h) Prior to shipment remove the most volatile elements, including flammable natural gas liquids, as feasible.

i) Identify and implement more stringent tank car safety standards.

j) Improve rail transportation route analysis, and modification of routes based on that analysis.

k) Use the best available inspection equipment and protocols and implement positive train control.

l) Reduce train car speeds to 40 miles per hour when passing through urbanized areas of any size.

m) Limit storage of crude oil tank cars in urbanized areas of any size and provide appropriate security in storage yards for all shipments.

n) Notify in advance county and city emergency operations offices of all crude oil shipments, including a contact number that can provide real-time information in the event of an oil train derailment or accident.

o) Report quarterly hazardous commodity flow information, including classification and characterization of materials being transported, to all first response agencies (49 Code Fed. Regs. 15.5) along the mainline rail routes used by trains carrying crude oil identified.

p) Fund training and outfitting emergency response crews that includes the cost of backfilling personnel while in training.

q) Undertake annual emergency responses scenario/field based training including Emergency Operations Center Training activations with local emergency response agencies.

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this EIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis, the volume of transportation projects and amount of growth under the Plan, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to routine use, transport or disposal of hazardous waste to be significant and unavoidable.

Impact HAZ-2 **Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.**

Significant and Unavoidable Impact – Mitigation Required.

Implementation of transportation projects included in the Connect SoCal Plan would result in significant impacts by facilitating the movement of goods, including hazardous materials, through the SCAG region. The Plan's land use strategies may guide regional growth, including industrial types of uses that could generate hazardous materials. The region's highway and arterial system covers over 73,000 lane miles and serves more than 63 million trips daily.[92] As a result of anticipated growth that is projected to occur within cities and counties under the Plan in the next 25 years, it is anticipated that there would be a substantial increase in vehicle miles traveled (VMT) by trucks, a common mode of hazardous materials transport, as Plan transportation improvements close critical gaps in the highway network. In addition, freight rail enhancements, truck mobility improvements, intermodal facilities, and other goods movement capacity enhancements are included in the Plan, including new and expanded railyards, additional main line railroad tracks, improved and modernized port terminals and critical bottleneck

92 Southern California Association of Governments. 2019. Highways and Arterials Draft Technical Report.

relief projects on major freeways. Specifically, the Plan proposes to expand near-dock rail and double the capacity of the Intermodal Transfer Container Facility. In order to improve on-road transportation, the Plan has identified 42 heavy duty truck bottlenecks in the region and proposes the Bottleneck Relief Strategy and freight corridors to alleviate truck congestion. Moreover, near the San Pedro Port and the Port of Hueneme, many modernization and new on-road transportation projects have been proposed and are included in the Connect SoCal's Goods Movement Report.[93]

Transportation of goods, in general, and hazardous materials, in particular, can thus be expected to increase substantially with implementation of the transportation projects included in the Plan. It is estimated that daily regional heavy-duty truck vehicle hours of delay (VHD) within the SCAG region would increase from 113,192 in 2019 to 177,459 in 2045, which is an approximately 56 percent increase. Further, the Plan estimates a 300 percent increase in vehicle hours of delay at rail-highway grade crossings in the region by 2045. The past several Plan updates including this one, incorporate dedicated truck lane facilities. These facilities would be aligned to connect freight intensive locations such as the ports, warehousing/distribution center locations and manufacturing locations. They would have fewer ingress/egress locations than typical urban interstates have to smooth the flow of goods in the region. Additional transportation strategies and projects included in the Plan would generally improve transportation safety, thus reducing the likelihood of hazardous material transportation incidents.

Plan projects, including rail-to-rail grade separations, rail operations safety improvements, truck mobility improvements such as truck-only freight corridors, and grade separations of streets and highways from rail lines, could be expected to reduce the level of risk posed by hazardous materials transport by separating freight transportation from other traffic types and reducing the risk of collisions. Such improvements to the transportation system may provide an incentive for even greater goods shipment through the SCAG region, potentially offsetting this benefit. The imposition of tolls or fees for dedicated truck lane facilities may induce the transfer of some freight, including hazardous materials, to rail rather than truck. Federal statistics show that hazardous materials incidents are much less common by rail than on highways. Since most hazardous materials are transported by truck, the majority of incidents related to the movement of hazardous materials occur on highways or in truck terminals. A very small share of hazardous materials transportation incidents are the result of a vehicular crash or derailment (referred to as "accident related"). While 1.5 percent of the incidents in 2016 were accident related, they accounted for

93 See 2020 RTP/SCS Goods Movement Technical Report.

64.3 percent of all property damage. Highway had the highest share of incidents at 90.4 percent but accounted for 60.9 percent of all property damage.[94]

Even with Plan transportation improvements, there remains the potential for significant impacts related to reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment from implementation of transportation projects and development anticipated to occur under the Plan, requiring the consideration of mitigation measures.

Mitigation Measures

SCAG Mitigation Measures

See **SMM HAZ-1** through **SMM HAZ-3.**

Project Level Mitigation Measures

See **PMM HAZ-1.**

PMM HAZ-2: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce hazards related to the reasonably foreseeable upsets and accidents involving the release of hazardous materials, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

Require implementation of safety standards regarding transport of hazardous materials, including but not limited to the following:

a) Removal of the most volatile elements, including flammable natural gas liquids, prior to shipment;

b) More stringent tank car safety standards;

c) Improved rail transportation route analysis, and modification of routes based on that analysis;

d) Utilization of the best available inspection equipment and protocols, and implementation of positive train control;

94 U.S. Department of Transportation, Bureau of Transportation Statistics. 2017. *Freight Facts and Figures*. Available online at: https://rosap.ntl.bts.gov/view/dot/34923, accessed September 5, 2019.

e) Reduced train car speeds to 40 miles per hour when passing through urbanized areas of any size;

f) Limitations on storage of hazardous materials tank cars in urbanized areas of any size and provide appropriate security in storage yards for all shipments;

g) Advance notification to county and city emergency operations offices of all crude oil and hazardous materials shipments, including a contact number that can provide real-time information in the event of an oil train derailment or accident;

h) Quarterly hazardous commodity flow information, including classification and characterization of materials being transported, to all first response agencies (49 Code Fed. Regs. 15.5) along the mainline rail routes used by trains carrying hazardous materials.

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this EIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis, the increased truck volumes and increases in passenger and freight rail traffic as a result of implementation of the Plan, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to foreseeable accident conditions resulting in the release of hazardous materials to be significant and unavoidable.

Impact HAZ-3 **Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.**

Significant and Unavoidable Impact - Mitigation Required.

Implementation of the transportation projects in the Plan and growth from the Plan could result in significant impacts with regard to emitting hazardous emission or handling of hazardous or acutely hazardous materials, substance, or waste within one-quarter mile of an existing or proposed school. Transportation and development projects may result in the use, transport and/or storage of hazardous materials. Using SCAG's GIS data, the Plan's network of transportation projects was overlaid on the

region to determine the potential for effects related to hazardous materials emissions to impact schools. Results of the GIS analysis show that under the Plan, approximately 36 existing kindergarten through 12th-grade schools are within a one-quarter mile buffer of the transportation projects included in the Plan (see **Table 3.9-4, School, Hospitals, and Nursing Homes within One-Quarter Mile of Connect SoCal Transportation Projects**).

Increased transport of hazardous materials carried on existing roadways could affect adjacent land uses including along existing facilities within one-quarter mile of schools if there were to be a release or incident during transportation. Changes in air toxics and potential impacts on sensitive receptors (including schools) is discussed in **Section 3.3, Air Quality**. In general, the transport, use, and storage of hazardous materials is heavily regulated as described in the regulatory framework section above, to ensure that hazardous materials do not pose a significant risk to nearby receptors including schools.

However, due to the number of transportation projects and more dense, compact urban development encouraged by land use strategies in the Plan, there would be the potential for significant impacts related to the emission of hazardous materials or the handling of hazardous or acutely hazardous materials, substances, or wastes within one-quarter mile of an existing or proposed school, requiring mitigation measures.

Table 3.9-4
School, Hospitals, and Nursing Homes within One-Quarter Mile of Connect SoCal Transportation Projects

Mode	Connect SoCal Plan
Colleges	66
Hospitals	117
K-12 Schools	36
Nursing Homes	17
Senior Centers	20
Urgent Care Centers	5

Note: The above figures account for all types of colleges, hospitals, k-12 schools, nursing homes, senior centers, and urgent care centers.

Mitigation Measures

SCAG Mitigation Measures

See **SMM HAZ-1** through **SMM HAZ-3**.

Project Level Mitigation Measures

See **PMM HAZ-1 and PMM HAZ-2.**

PMM HAZ-3: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to the release of hazardous materials within one-quarter mile of schools, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

a) Where the construction and operation of projects involves the transport of hazardous materials, avoid transport of such materials within one-quarter mile of schools, when school is in session, wherever feasible.

b) Where it is not feasible to avoid transport of hazardous materials, within one-quarter mile of schools on local streets, provide notifications of the anticipated schedule of transport of such materials.

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this EIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis, the volume of transportation projects, the more dense and compact urban development resulting from the land use strategies in the Plan, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to release of hazardous materials within one-quarter mile of schools to be significant and unavoidable.

Impact HAZ-4 **Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment.**

Significant and Unavoidable - Mitigation Required.

Transportation projects and development projects anticipated to occur under the Plan may have the potential to be located on a site which is included on a list of hazardous materials sites compiled pursuant

to Government Code Section 65962.5 (the Cortese List). The Plan includes transportation system improvements to close critical gaps in the transportation network that currently hinder access to certain parts of the region. Construction related to these transportation projects and anticipated development could involve construction on or adjacent to sites that are contaminated (buildings and/or soil and/or groundwater) due to past use or disposal of hazardous materials. Federal, state, and local laws regulate the remediation of these sites, and it is likely that the majority of contaminated sites have been identified or are easily identifiable from existing information. Given the intensity of past use of land, there are a substantial number of contaminated sites on the Cortese List in the SCAG region (See **Table 3.9-1)**. In urban as well as rural areas, many projects, both transportation and development, would likely need to address at least the potential for contamination. Because of the large number of contaminated sites and the risk associated with encountering and cleaning up of these sites, this impact could be significant.

The land use strategies included in the Plan as well as transportation strategies and investments that are intended to increase mobility and improve accessibility would potentially influence population distribution, resulting in a potentially significant impact related to disturbance of contaminated sites by new urban development, most of which would be in existing urban areas. The land use strategies included in the Plan generally aim to direct future population growth toward high-quality transit areas (HQTAs) in close proximity to transit. Consequently, the redevelopment and reuse of urban infill lands as well as urban opportunity areas that are currently underutilized may become more common as the region grows.

Because Connect SoCal may cause transportation projects and development to be located on sites which are included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5, the Plan would have the potential to create a significant hazard to the public or the environment, requiring mitigation measures.

Mitigation Measures

SCAG Mitigation Measures

See **SMM HAZ-1** through **SMM HAZ-3.**

Project Level Mitigation Measures

PMM HAZ-4: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects related to projects that are located on a site

which is included on the Cortese List, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

a) For any listed sites or sites that have the potential for residual hazardous materials as a result of historic land uses, complete a Phase I Environmental Site Assessment, including a review and consideration of data from all known databases of contaminated sites, during the process of planning, environmental clearance, and construction for projects.

b) Where warranted due to the known presence of contaminated materials, submit to the appropriate agency responsible for hazardous materials/wastes oversight a Phase II Environmental Site Assessment report if warranted by a Phase I report for the project site. The reports should make recommendations for remedial action, if appropriate, and be signed by a Registered Environmental Assessor, Professional Geologist, or Professional Engineer.

c) Implement the recommendations provided in the Phase II Environmental Site Assessment report, where such a report was determined to be necessary for the construction or operation of the project, for remedial action.

d) Submit a copy of all applicable documentation required by local, state, and federal environmental regulatory agencies, including but not limited to: permit applications, Phase I and II Environmental Site Assessments, human health and ecological risk assessments, remedial action plans, risk management plans, soil management plans, and groundwater management plans.

e) Conduct soil sampling and chemical analyses of samples, consistent with the protocols established by the U.S. EPA to determine the extent of potential contamination beneath all underground storage tanks (USTs), elevator shafts, clarifiers, and subsurface hydraulic lifts when on-site demolition or construction activities would potentially affect a particular development or building.

f) Consult with the appropriate local, state, and federal environmental regulatory agencies to ensure sufficient minimization of risk to human health and environmental resources, both during and after construction, posed by soil contamination, groundwater contamination, or other surface hazards including, but not limited to, underground storage tanks, fuel distribution lines, waste pits and sumps.

g) Obtain and submit written evidence of approval for any remedial action if required by a local, state, or federal environmental regulatory agency.

h) Cease work if soil, groundwater, or other environmental medium with suspected contamination is encountered unexpectedly during construction activities (e.g., identified by odor or visual staining, or if any underground storage tanks, abandoned drums, or other hazardous materials or wastes are encountered), in the vicinity of the suspect material. Secure the area as necessary and take all appropriate measures to protect human health and the environment, including but not limited to, notification of regulatory agencies and identification of the nature and extent of contamination. Stop work in the areas affected until the measures have been implemented consistent with the guidance of the appropriate regulatory oversight authority.

i) Soil generated by construction activities should be stockpiled on-site in a secure and safe manner. All contaminated soils determined to be hazardous or non-hazardous waste must be adequately profiled (sampled) prior to acceptable reuse or disposal at an appropriate off-site facility. Complete sampling and handling and transport procedures for reuse or disposal, in accordance with applicable local, state and federal laws and policies.

j) Groundwater pumped from the subsurface should be contained on-site in a secure and safe manner, prior to treatment and disposal, to ensure environmental and health issues are resolved pursuant to applicable laws and policies. Utilize engineering controls, which include impermeable barriers to prohibit groundwater and vapor intrusion into the building.

k) As needed and appropriate, prior to issuance of any demolition, grading, or building permit, submit for review and approval by the Lead Agency (or other appropriate government agency) written verification that the appropriate federal, state and/or local oversight authorities, including but not limited to the Regional Water Quality Control Board (RWQCB), have granted all required clearances and confirmed that the all applicable standards, regulations, and conditions have been met for previous contamination at the site.

l) Develop, train, and implement appropriate worker awareness and protective measures to assure that worker and public exposure is minimized to an

acceptable level and to prevent any further environmental contamination as a result of construction.

m) If asbestos-containing materials (ACM) are found to be present in building materials to be removed, submit specifications signed by a certified asbestos consultant for the removal, encapsulation, or enclosure of the identified ACM in accordance with all applicable laws and regulations, including but not necessarily limited to: California Code of Regulations, Title 8; Business and Professions Code; Division 3; California Health and Safety Code Section 25915-25919.7; and other local regulations.

n) Where projects include the demolitions or modification of buildings constructed prior to 1978, complete an assessment for the potential presence or lack thereof of ACM, lead based paint, and any other building materials or stored materials classified as hazardous waste by state or federal law.

o) Where the remediation of lead-based paint has been determined to be required, provide specifications to the appropriate agency, signed by a certified Lead Supervisor, Project Monitor, or Project Designer for the stabilization and/or removal of the identified lead paint in accordance with all applicable laws and regulations, including but not necessarily limited to: California Occupational Safety and Health Administration's (Cal OSHA's) Construction Lead Standard, Title 8 California Code of Regulations (CCR) Section 1532.1 and Department of Health Services (DHS) Regulation 17 CCR Sections 35001–36100, as may be amended. If other materials classified as hazardous waste by state or federal law are present, the project sponsor should submit written confirmation to the appropriate local agency that all state and federal laws and regulations should be followed when profiling, handling, treating, transporting, and/or disposing of such materials.

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this EIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and

feasible. However, because of the regional nature of the analysis, the number of contaminated sites on the Cortese List in the region, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to being located on a hazardous materials site to be significant and unavoidable.

Impact HAZ-5 **For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area.**

Significant and Unavoidable – Mitigation Required.

The Plan would not in itself result in a safety hazard; however, increased population growth that would occur by 2045 would result in increased air traffic in major commercial airports in Southern California. Air travel in the SCAG region continues to grow. The 2020 Plan's regional air passenger demand forecast is 197.14 million annual passengers (MAP) in 2045, and the Plan's air cargo demand is approximately 7.77 million tons in 2045. The MAP forecast is higher than the previously adopted 2016 RTP/SCS's number of 136.2 MAP adopted for 2040, and the air cargo demand is similarly higher than what was adopted in the previously adopted 2016 RTP/SCS (approximately 3.78 million metric tons in 2040). Aircraft operations are not anticipated to grow as fast as passenger growth, but are still expected to grow -- from 3.7 million in 2017 to 4.58 million in 2045,[95]

There are 57 public and private airports in the SCAG region, including 12 major airports serving the region **(Figure 3.9-1).** The Plan's land use strategies generally aim to focus growth in HQTAs and transit priority areas (TPAs) in locations away from airport clear zones and accident potential zones. Encouraging and distributing new growth in HQTAs and TPAs is expected to decrease the number of Southern California residents' proximity to airports and potential for safety risks and hazards associated with air traffic.

In addition, most major public airports are required to implement an Airport Land Use Compatibility Plan which regulates safety and land use in adjacent areas. As explained in the Connect SoCal Aviation and Airport Ground Access Technical Report,[96] existing law mandates the creation of an ALUCP to coordinate planning for areas that surround public use airports. The ALUCP protects the public by minimizing their exposure to excessive noise[97] and safety hazards within these areas. See **Section 3.13**

---

95 Southern California Association of Governments. 2019. *Aviation and Airport Ground Access Draft Technical Report*.

96 Southern California Association of Governments. 2019. *Aviation and Airport Ground Access Draft Technical Report*.

97 Noise impacts related to airports/aircraft are specifically discussed in **Section 3.13, Noise.**

Noise, Impact NOI-3 for a further discussion noise impacts from airports/aircrafts**.** However, it is conservatively assumed sensitive receptors may experience a greater risk to hazard impacts than at present in the vicinity of airports resulting in significant impacts.

Mitigation Measures

SCAG Mitigation Measures

SMM NOISE-1

SMM HAZ-5: SCAG shall continue to collaborate with key stakeholders on regional aviation planning issues through the Aviation Technical Advisory Committee (ATAC). The ATAC is a partnership between the airports, transportation agencies and commissions, experts, and other community members.

Project Level Mitigation Measures

PMM NOISE-1

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this EIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to safety hazards and excessive noise in proximity to airports to be significant and unavoidable.

Impact HAZ-6 Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.

Significant and Unavoidable - Mitigation Required.

The Plan would result in significant impacts in regards to impairing implementation of or physically interfering with an adopted emergency response plan or emergency evacuation plan. SCAG does not have a direct role as first response or emergency management, however SCAG can facilitate policy forums to help develop regional consensus and education on security policies and emergency responses,

assist in expediting the planning and programming of transportation infrastructure repairs after any major disasters, and leverage projects and planning functions that benefit transportation security efforts and emergency services.

Section 3.15, Public Services Fire, addresses the potential for the Plan to result in substantial physical impacts associated with the construction of new or physically alter fire stations that would be required to maintain acceptable service ratios and response time for fire protective services. Additionally, the county general plans include Safety Elements that discuss critical infrastructure systems and services to assure adequate circulation, communications, and transportation services. Depending upon the timing, location, and duration of construction activities from transportation projects included in the Plan, traffic and/or road closures in grade crossings, arterials, interchanges, and auxiliary lanes, could delay emergency vehicle response times or otherwise disrupt delivery of emergency response services. By closing off one or more lanes of a roadway during project construction, emergency routes could be impaired. The closure of these lanes could potentially cause traffic delays and ultimately prevent access to calls for service. **Section 3.20 Wildfire**, discusses the county general plans and specific policies or goals within each to minimize the potential for personal risk and property damage from natural or manmade disasters. For example, the Ventura County General Plan includes a policy that requires "new residential subdivisions to provide not less than two means of access for emergency vehicles and resident evacuation."[98]

Goals, objectives, and policies of the Safety Elements of local general plans and other plans such as the Los Angeles County Operational Area Emergency Response Plan (ERP)[99] provide guidance during unique situations requiring an unusual or extraordinary emergency response. In Los Angeles County, the most populous county in the SCAG region, implementation of the ERP would incorporate and coordinate all the facilities and personnel of County government, along with the jurisdictional resources of the cities and special districts within the County, into an efficient Operational Area organization capable of responding to any emergency using a Standard Emergency Management System,[100] mutual aid and other appropriate response procedures.

100 California Office of Emergency Services. 2019. *Standardized Emergency Management System*. Available online at: https://www.caloes.ca.gov/cal-oes-divisions/planning-preparedness/standardized-emergency-management-system, accessed October 24, 2019.

Cities generally provide procedures for coordination among neighboring City agencies and other jurisdictions to provide mutual assistance in the event of an emergency or natural disaster and establishment of disaster recovery programs. Compliance with these policies and plans would minimize potential interference with the City and County emergency response plans from construction and operational activities resulting from implementing the Plan.

Larger cities (such as the City of Los Angeles, the largest city in the SCAG region) have an Emergency Operations Organization (EOO).[101] The City of Los Angeles EOO implements the goals and policies of the City's Safety Element. The Safety Element outlines the scope of the EOO's on-going efforts to use experiences and new information to improve the City's hazard program. The City of Los Angeles EOO Master Plan and individual agency Emergency Response Plans set forth procedures for City personnel to follow in the event of an emergency situation stemming from natural disasters, technological incidents and nuclear defense operations, and other unforeseeable disasters or crises. The City of Los Angeles Department of Transportation and LAFD are responsible for ensuring that future development does not impair or physically interfere with an adopted emergency response or evacuation plan.

The Plan's land use strategies generally aim to focus new growth in areas well-served by transit, and HQTAs including livable corridors, that allow residents to be closer to jobs and recreational and active transportation amenities and opportunities, to increase mobility and accessibility, and to shift growth away from high value habitat areas. Thus, if the Plan's land use strategies are implemented, population density in urbanized areas would increase which may improve emergency response by eliminating the need to travel to more rural and dispersed locations in the region. Alternatively, large concentrations of people could also cause adverse effects related to implementation of emergency plans because the increased population may overburden adopted evacuation routes and other emergency response resources during emergency conditions.

The proposed transportation projects would generally increase mobility and circulation capacity and may therefore have the potential to improve response times for police, fire and emergency service providers. However, despite the efforts of the land use strategies and transportation projects included in the Plan, congestion would likely increase in existing and new urban development, like HQTAs, and existing communities in cities and counties in the SCAG region, which could adversely affect emergency access.

As part of standard development procedures in most cities, plans are submitted for review and approval to ensure all new development has adequate emergency access and escape routes (clearly marked and delineated) in compliance with existing regulations. The Plan would not introduce any features that

---

101 City of Los Angeles. *Emergency Operations Organization*. Available online at: https://emergency.lacity.org/eoo, accessed October 24, 2019.

would preclude implementation of or alter these policies or procedures in any way, or impair implementation of, or physically interfere with the SEP or the ERP (and similar county-wide plans).

While the Plan would increase hours of delay at the regional level, there is no direct relationship between increased travel delay and emergency response times as California State law requires that drivers yield the right-of-way to emergency vehicles and remain stopped until the emergency vehicles have passed. The impact on response times and overall fire service is not proportional to increasing traffic (see **Section 3.17, Transportation, Traffic and Safety,** of this PEIR, for additional discussion about how the Plan would affect traffic). Generally, multi-lane arterial roadways allow emergency vehicles to travel at higher speeds and permit other traffic to maneuver out of the path of the emergency vehicle. On congested roadways, multi-lane arterial roadways with continuous center left-turn lanes facilitate emergency access when the thru lanes experience delays. Nonetheless, the potential exists for the Plan to interfere with emergency response plans, mitigation is required.

Mitigation Measures

SCAG Mitigation Measures

See **SMM HAZ-1** through **SMM HAZ-5 and SMM TRA-5.**

Project Level Mitigation Measures

See **PMM HAZ-1** through **PMM HAZ-4 and PMM TRA-5**.

PMM HAZ-5: In accordance with provisions of sections 15091(a)(2) and 15126.4(a)(1)(B) of the *State CEQA Guidelines*, a Lead Agency for a project can and should consider mitigation measures to reduce substantial adverse effects which may impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan, as applicable and feasible. Such measures may include the following or other comparable measures identified by the Lead Agency:

a) Continue to coordinate locally and regionally based on ongoing review and integration of projected transportation and circulation conditions.

b) Develop new methods of conveying projected and real time information to citizens using emerging electronic communication tools including social media and cellular networks;

c) Continue to evaluate lifeline routes for movement of emergency supplies and evacuation.

Level of Significance after Mitigation

As discussed above, regulations and policies would reduce impacts but given the regional scale of the analysis in this PEIR, it is not possible to determine if all impacts would be fully mitigated by existing regulations and policies. Therefore, this EIR identifies project-level mitigation measures consistent with applicable regulations and policies designed to reduce impacts. Lead Agencies may choose to include project-level mitigation measures in environmental documents as they determine to be appropriate and feasible. However, because of the regional nature of the analysis, the Plan's potential to result in increased congestion, and SCAG's lack of authority to impose project-level mitigation measures, this PEIR finds impacts related to emergency response to be significant and unavoidable.

Impact HAZ-7 **Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires.**

This question is addressed in **Section 3.20, Wildfire**, **Impact WF-2**.

3.10 HYDROLOGY AND WATER QUALITY

This section of the Program Environmental Impact Report (PEIR) describes the existing hydrology and water quality conditions within the SCAG region, identifies the regulatory framework with respect to laws and regulations that affect hydrology and water quality, and analyzes the potential impacts of the Connect SoCal Plan (Connect SoCal"; "Plan") to affect water quality, result in substantial siltation or erosion or flooding due to the alteration of drainage patterns, and deplete groundwater supplies or interfere with groundwater recharge. In addition, this PEIR provides regional-scale mitigation measures, as well as project-level mitigation measures for subsequent, site-specific environmental review to reduce identified impacts as appropriate and feasible.

3.10.1 ENVIRONMENTAL SETTING

3.10.1.1 Definitions

Definitions of terms used in the regulatory framework, characterization of baseline conditions, and impact analysis for hydrology and water quality are provided.

Best Management Practices (BMPs): For purposes of this PEIR, A BMP is any program, technology, process, siting criteria, operating method, measure, or device that controls, prevents, removes, or reduces storm water pollution. Generally, BMPs focus on water quality problems caused by increased impervious surfaces from land development. BMPs are designed to reduce stormwater volume, peak flows, and/or nonpoint source pollution through evapotranspiration, infiltration, detention, and filtration or biological and chemical actions.

Ephemeral Drainages: An ephemeral stream or drainage has flowing water only during, and for a short duration after, precipitation events in a typical year. Ephemeral stream beds are located above the water table year-round. Groundwater is not a source of water for the stream. Runoff from rainfall is the primary source of water for stream flow.

Hydrologic Unit Code (HUC): The United States is divided and sub-divided into successively smaller hydrologic units which are classified into four levels: regions, sub-regions, accounting units, and cataloging units. The hydrologic units are arranged or nested within each other, from the largest geographic area (regions) to the smallest geographic area (cataloging units). Each hydrologic unit is identified by a unique hydrologic unit code (HUC) consisting of two to eight digits based on the four levels of classification in the hydrologic unit system.

1. The first level of classification divides the United States into 21 major geographic areas, or regions. These geographic areas contain either the drainage area of a major river, such as the Missouri region, or the combined drainage areas of a series of rivers, such as the California region.

2. The second level of classification divides the 21 regions into 221 subregions. A subregion includes the area drained by a river system, a reach of a river and its tributaries in that reach, a closed basin(s), or a group of streams forming a coastal drainage area.

3. The third level of classification subdivides many of the subregions into accounting units. These 378 hydrologic accounting units are nested within, or can be equivalent to the subregions.

4. The fourth level of classification is the cataloging unit, the smallest element in the hierarchy of hydrologic units. A cataloging unit is a geographic area representing part or all of a surface drainage basin, a combination of drainage basins, or a distinct hydrologic feature. There are 2,264 Cataloging Units in the country.

Impaired Waters: Under section 303(d) of the Clean Water Act, states, territories, and authorized tribes are required to develop lists of impaired waters. These are waters that are too polluted or otherwise degraded to meet the water quality standards of the jurisdiction. The law requires that these jurisdictions establish priority rankings for waters on the lists and develop Total Maximum Daily Loads (TMDLs) for these waters.

Mudflow: Mudflows result from the downslope movement of soil and/or rock under the influence of gravity.

National Flood Insurance Program (NFIP): The National Flood Insurance Program aims to reduce the impact of flooding on private and public structures. It does so by providing affordable insurance to property owners, renters and businesses and by encouraging communities to adopt and enforce floodplain management regulations.

Non-Point Source Runoff: Runoff that occurs on surfaces before reaching a channel is also called a nonpoint source. If a nonpoint source contains man-made contaminants, the runoff is called nonpoint source pollution. A land area which produces runoff that drains to a common point is called a drainage basin. When runoff flows along the ground, it can pick up soil contaminants including, but not limited to, petroleum, pesticides, or fertilizers that become discharge or nonpoint source pollution.

Perennial Stream: A perennial stream has flowing water year-round during a typical year. The water table is located above the stream bed for most of the year. Groundwater is the primary source of water for stream flow. Runoff from rainfall is a supplemental source of water for stream flow.

Runoff: Runoff is the water flow that occurs when the soil is infiltrated to full capacity and excess water from rain, meltwater, or other sources flows over the land. This is a major component of the water cycle, and the primary agent in water erosion. In addition to causing water erosion and pollution, surface runoff in urban areas is a primary cause of urban flooding, which can result in property damage, damp and mold in basements, and street flooding.

Regional Water Quality Control Board: As a result of the Porter-Cologne Act, nine RWQCBs were established that exercise rulemaking and regulatory activities by basin. Each RWQCB conducts a broad range of activities to protect ground and surface water resources within their respective jurisdictions. Six of the nine RWQCBs (either wholly or in part) have jurisdiction that includes portions of the SCAG region as shown in **Figure 3.10-1, Regional Water Quality Control Boards:**

- *Region 3—Central Coast RWQCB.* The Central Coast RWQCB jurisdiction includes Santa Clara (south of Morgan Hill), San Mateo (southern portion), Santa Cruz, San Benito, Monterey, Kern (small portions), San Luis Obispo, Santa Barbara, Ventura (northern portion) counties.
- *Region 4—Los Angeles RWQCB.* The Los Angeles RWQCB jurisdiction includes the coastal watersheds of Los Angeles and Ventura Counties, along with very small portions of Kern and Santa Barbara Counties.
- *Region 6—Lahontan RWQCB.* The jurisdiction of the Lahontan RWQCB extends from the Oregon border to the northern Mojave Desert and includes all of California east of the Sierra Nevada crest, including San Bernardino County and northeastern Los Angeles County.
- *Region 7—Colorado River RWQCB.* The Colorado River RWQCB jurisdiction includes Imperial, San Bernardino, Riverside, and San Diego counties.
- *Region 8—Santa Ana RWQCB.* The Santa Ana RWQCB jurisdiction includes Orange, Riverside, and San Bernardino counties.
- *Region 9—San Diego RWQCB.* The San Diego RWQCB includes San Diego, Imperial, and Riverside counties.

Seiche: A seiche is an oscillation of a body of water in an enclosed or semi-enclosed basin, such as a reservoir, harbor, lake, or storage tank.

Storm Water Pollution Prevention Plan (SWPPP): A plan created by constructors to show their plans for sediment and erosion control. Typically, these plans are part of an overall design that details procedures to be followed during various phases of construction. This is required by a federal regulation governing stormwater runoff from active construction sites that are more than one acre in area.

Total Maximum Daily Loads (TMDL): A TMDL is a calculation of the maximum amount of a pollutant that a water body can receive and still safely meet water quality standards.

Tsunami: A tsunami is a great sea wave produced by a significant undersea disturbance.

Waters of the United States: the definition of "waters of the United States" are regulatory definitions of "waters of the United States" are those portions of 33 CFR part 328 and 40 CFR parts 110, 112, 116, 117, 122, 230, 232, 300, 302, and 401 as they existed immediately prior to the 2015 Rule's amendments (see discussion below in Regulatory Background). For example, pursuant to 40 CFR 230.3(s), the term "waters of the United States" means:

1. All waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;

2. All interstate waters including interstate wetlands;

3. All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds, the use, degradation or destruction of which could affect interstate or foreign commerce including any such waters:

    a. Which are or could be used by interstate or foreign travelers for recreational or other purposes; or

    b. From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or

    c. Which are used or could be used for industrial purposes by industries in interstate commerce;

4. All impoundments of waters otherwise defined as waters of the United States under this definition;

5. Tributaries of waters identified in paragraphs (s)(1) through (4) of this section;

6. The territorial sea;

7. Wetlands adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs (s)(1) through (6) of this section; waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA (other than cooling ponds as defined in 40 CFR 423.11(m) which also meet the criteria of this definition) are not waters of the United States.

3.10.1.2 Hydrologic Regions

The Department of Water Resources (DWR) has divided the state into ten hydrologic regions, corresponding to the state's major water drainage basins. The SCAG region is divided into four hydrologic regions: Central Coast, Colorado River, South Coast, and South Lahotan. The hydrologic regions are described below.[1]

Central Coast

The Central Coast Hydrologic Region runs along California's central coast, stretching from Santa Cruz County down to Santa Barbara County and the northwest corner of Ventura County. Due to the thriving agriculture and viticulture business in the area, the region is the most groundwater-dependent hydrologic region in California. Approximately 80 percent of water demands in the region are met via groundwater extraction. Additional water is supplemented from the State Water Project (SWP) and the Central Valley Project. Due to the extent of groundwater extraction, the Central Coast faces challenges such as groundwater basin overdraft, seawater intrusion, and water quality degradation.[2]

Colorado River

The Colorado River Hydrologic Region covers approximately 13 million acres of southeast California. Imperial County, and large parts of Riverside and San Bernardino counties are within this hydrologic region. It is the most arid hydrologic region in California, with less than an average of six inches of precipitation falling annually. Groundwater aquifers are a vital water resource for communities in the area, as is the Colorado River, which serves as the main tributary of the region. Overdraft and leaking underground storage tanks pose legitimate issues to water availability and quality in the region.[3]

2 Department of Water Resources. *California Water Update 2018: Central Coast Hydrologic Region Report*. October. Available online at: cwpcom@water.ca.gov, accessed August 27, 2019.

3 Ibid

South Coast

The South Coast Hydrologic Region is comprised of approximately 6.8 million acres in the southwestern portion of the state. The region is bounded to the south by Mexico and the Pacific Ocean to the west. Most of the region falls within SCAG's jurisdiction, including parts of Ventura, Orange, Los Angeles, Riverside, and San Bernardino counties. Approximately 50 percent of the population of California lives within this region and as such, it maintains the highest population density of any hydrologic region. Groundwater provides about 25 percent of water demand in the region, which contains 56 delineated groundwater basins.[4]

South Lahontan

The South Lahontan Hydrologic Region covers over 21 million acres of eastern California. The region contains the highest (Mount Whitney) and lowest (Death Valley) surface elevations of the state and the contiguous U.S. Annual precipitation is approximately eight inches and a significant amount of water rights in the region belong to the Los Angeles Department of Water and Power (LADWP). SCAG counties within the South Lahontan Hydrologic Region include San Bernardino and Los Angeles. The 223-mile long Los Angeles Aqueduct is the region's major water development feature. The aqueduct system provides large quantities of power and water to the region, though 41 percent of water supply is provided by groundwater.[5]

3.10.1.3 Regional Water Quality Control Boards

The four hydrologic regions in the SCAG region are managed by six Regional Water Quality Control Boards (RWQCBs): The Central Coast, Los Angeles, Lahontan, Colorado River, Santa Ana and the San Diego RWQCB. The purpose of the RWQCBs is to manage and improve water supplies within the region, by addressing groundwater pumping, water quality protection and restoration, and sharing information between water boards across the state. Each board has seven part-time board members, appointed by the Governor, who make critical decisions including setting water quality standards, issuing permits, and determining and enforcing compliance. Furthermore, each RWQCB completes, reviews, and updates a Basin Plan, designed specifically to each region's climate and topography. Basin Plans are designed to preserve and enhance water quality, as well as protect the beneficial uses of all regional waters. Each Basin Plan designates beneficial uses, sets protection goals to comply with the state's anti-degradation policy, and describes protection programs. By incorporating all applicable water rules and regulations, the Basin Plans serve as a resource for agencies involved with water, wastewater, discharge,

4 Ibid

5 Ibid

environmental permitting, and resource management, as well as the public interested in local water quality issues.

3.10.1.4 Surface Hydrology

Surface water hydrology refers to surface water systems, including watersheds, floodplains, rivers, streams, lakes, and reservoirs.

Watersheds

Watersheds refer to areas of land, or a basin, in which all waterways drain to one specific outlet, or body of water, such as a river, lake, ocean, or wetland. Watersheds have topographical divisions such as ridges, hills, or mountains. All precipitation that falls within a given watershed, or basin, eventually drains into the same body of water. As shown in **Figure 3.10-2, Watersheds in the SCAG Region**, there are 19 watersheds in the SCAG region: the Aliso-San Onofre Watershed, Antelope-Fremont Valleys Watershed, Ballona Creek Watershed, Calleguas Creek Watershed, Imperial Reservoir Watershed, Los Angeles River Watershed, Lower Colorado Watershed, Malibu Creek Watershed, Mojave Watershed, Newport Bay Watershed, Salton Sea Watershed, Santa Ana River Watershed, Santa Clara River Watershed, San Gabriel River Watershed, San Jacinto Watershed, Santa Monica Bay Watershed, Seal Beach-Westminster Watershed, Southern Mojave Watershed, Ventura River Watershed.[6]

Watersheds are an essential part of the landscape, ecological composition, economy, and life, especially in Southern California and the SCAG region where arid conditions place great emphasis on the necessity of water. Unfortunately, water resources in the SCAG region have been degraded by a multitude of factors. Agricultural run-off, mining operations, loss of habitat, illegal dumping, and eutrophication are just some of the causes of impaired water quality. As climate change affects precipitation patterns and drought conditions become more severe, water resources must be carefully managed to ensure their protection. In particular, groundwater pumping must be performed with caution so as to prevent saltwater intrusion or permanent aquifer subsidence.

Drainages

Despite its primarily arid climate, the SCAG region has a variety of surface water resources, such as creeks, rivers, lakes, and reservoirs. Due to the dry climate of the region, many rivers and creeks are intermittent or ephemeral, drying up in the summer or flowing only in reaction to precipitation. Annual

6 USGS. 2018. *Watershed Boundary Dataset.* Available online at: https://www.usgs.gov/core-science-systems/ngp/national-hydrography/watershed-boundary-dataset?qt-science_support_page_related_con=4#qt-science_support_page_related_con, accessed January 10, 2019.

rainfall amounts vary depending on elevation and proximity to the coast. Some waterways in the region, like the Los Angeles River, maintain a perennial flow due to agricultural irrigation and urban landscape watering.

Most waterways in California have been diverted for agricultural and economic purposes. Within the SCAG region, surface waters such as Los Angeles River, San Gabriel River, and the San Jacinto River have been dammed, redirected, and paved for human uses and as flood control measures. The Salton Seas is a man-made inland sea that resulted from the diversion of the Colorado River around 1905. The drainage reservoir serves Imperial County and would dry up without agricultural runoff flows.[7] Other major natural surface waters like the Ventura River, Santa Clara River, Santa Ana River, and portions of the Santa Margarita River maintain more natural conditions and flows and support aquatic species and natural habitats. All surface water drainages suffer from water quality impacts such as overuse, erosion, and illegal dumping.

Lakes and Reservoirs

Most lakes in southern California have been generated by humans, through manual digging and/or the damming of rivers across the state. Lakes and reservoirs serve as important habitat as well as recreational purposes; however, the most vital uses include agricultural irrigation, flood control, and drinking water, all of which are imperative to life in the semi-arid climate. Major lakes in the SCAG region include Big Bear Lake, Lake Arrowhead, Lake Casitas, Diamond Valley Lake, and the Salton Sea.

Big Bear Lake and Lake Arrowhead are located in San Bernardino County and were created via the damming of rivers. Big Bear Lake was created in 1884 and has no tributary inflow, replenishing itself solely by snowmelt. The dam at Lake Arrowhead was completed in 1922 and the lake is still used for recreation and potable water. Damming also created Lake Casitas in Ventura County[8] and the Salton Sea, which is one of the saltiest bodies of water on earth due to evaporation and agricultural runoff.[9] Diamond Valley Lake is the newest and largest reservoir in Southern California, holding 800,000 acre-feet (af) of water. While the lake is situated in Riverside County, it is connected to the State Water Project

(SWP) and serves as an important resource for potable water and hydroelectric power throughout the SCAG region.[10]

Coastal Waters

Three counties in the SCAG region border the Pacific Ocean and contain coastal waters such as bays, estuaries, beaches, and open ocean. Santa Monica Bay comprises a large portion of the region's open coastal waters and important harbors include the Los Angeles/Long Beach Harbor complex and Port Hueneme. Important estuaries, providing unique and critical habitat for wildlife, include coastal lagoons and wetlands. Unfortunately, coastal wetlands are negatively impacted by run-off, discharges, oil spills, dredging, illegal dumping, and natural oil seeps.[11]

Federally Protected Wetlands and Waterways

Under Section 404 of the Clean Water Act (CWA)[12] and Section 10 of the Rivers and Harbors Act,[13] some wetlands and waterways are federally protected by the U.S. Army Corps of Engineers (USACE). Parties must obtain special permits for discharging dredged or fill materials or pollutants into designated waters, intensifying protections for such wetlands and waterways. Designated wetlands and waterways in the SCAG region are identified in **Table 3.10-1, Federally Protected Wetlands and Waterways within the SCAG Region**, below.

3.10.1.5 Groundwater Hydrology

Groundwater accounts for most of the local fresh water within the SCAG region. The Central Coast and South Lahontan watersheds most heavily rely on groundwater for urban and agricultural use, although all four watersheds are dependent upon it. Drought conditions in recent years have led to groundwater overdraft and associated subsidence, in which the groundwater basin collapses with dirt and renders it unusable. Improved groundwater management and water reduction measures, as well as wet weather conditions, have assisted in lessening groundwater overdraft, however, it is still a major concern within the SCAG region and across the state, as climate change leads to more severe and volatile weather patterns and the population of the area continues to expand.[14]

3.10.1.6 Water Quality

Point and non-point source pollution are different forms of pollution which can damage surface water and are regulated at the federal and local level. Point source pollution refers to contaminants that enter a watershed, usually through a specific location such as a pipe. The source must be documented and the flow from the source is subject to a discharge permits issued by a Regional Water Quality Control Board. Examples of point source pollution are discharges from sewage treatment plants and industrial facilities. Because point sources are much easier to regulate than non-point sources, they were the initial focus of the 1972 CWA. Regulation of point sources since then has dramatically improved the water quality of rivers and streams throughout the country.

In contrast to point source pollution, non-point source pollution, also known as "pollution runoff," is diffuse. Non-point pollution comes from areas (such as contaminated runoff from urban areas) and is significantly influenced by land uses. A driveway or the road in front of a house may be a source of pollution if spilled oil, leaves, pet waste, or other contaminants are washed into a storm drain. Non-point source pollution is now considered a major water quality problem in the United States.

The problem of non-point source pollution, specifically runoff pollution is especially acute in urbanized areas where a combination of impermeable surfaces, landscape irrigation, highway runoff, and illicit dumping increase the pollutant loads in stormwater. The California State Water Quality Control Board (SWQCB) has identified the following pollutants found in urban runoff as being of concern:

- **Sediment.** Excessive sediment loads in streams can interfere with photosynthesis, aquatic life respiration, growth, and reproduction.

---

14 United States Geological Survey. (USGS). 2018. California Water Data. Available online at: https://ca.water.usgs.gov/data/, accessed January 8, 2019.

- **Nutrients.** Nitrogen and phosphorus can result in eutrophication of receiving waters (excessive or accelerated growth of vegetation or algae), reducing oxygen levels available for other species.
- **Bacteria and viruses.** Pathogens introduced to receiving waters from animal excrement in the watershed and by septic systems can restrict water contact activities.
- **Oxygen demanding substances.** Substances such as lawn clippings, animal excrement, and litter can reduce dissolved oxygen levels as they decompose.
- **Oil and grease.** Hydrocarbons from automobiles are toxic to some aquatic life.
- **Metals.** Lead, zinc, cadmium, and copper are heavy metals commonly found in stormwater. Other metals introduced by automobiles include chromium, iron, nickel, and manganese. These metals can enter waterways through storm drains along with sediment, or as atmospheric deposition.
- **Toxic pollutants.** Pesticides, phenols, and polynuclear aromatic hydrocarbons (PAHs) are toxic organic chemicals found in stormwater.
- **Floatables.** Trash in waterways increases metals and toxic pollutant loads in addition to undesirable aesthetic impacts.

EPA lists impaired and threatened waters under CWA Section 303(d).[15] The state then identifies the pollutant causing the impairment and develops rules and guidelines towards its improvement. There are more than 200 impacted waterways and water bodies within the SCAG region (**Table 3.10-2, Impaired Surface Water Bodies in the SCAG Region**).[16] Poor water management and overuse in Southern California has led to problems with salinity, Polychlorinated biphenyls (PCBs), pathogens and bacteria, overwhelming nutrients, lead, sulfates, uranium, and disinfection biproducts (DBPs).

Table 3.10-2
Impaired Surface Water Bodies in the SCAG Region

Pollutant	Impaired Water Body
Central Coast	
Boron	Cuyama River (above Twitchell Reservoir)
	Rincon Creek
Colorado River Basin	
Chlordane	Alamo River
	Imperial Valley Drains
DDT (Dichlorodiphenyltrichloroethane)	Coachella Valley Storm Water Channel
	Palo Verde Outfall Drain and Lagoon
Selenium	Colorado River (Imperial Reservoir to California-Mexico Border)
Toxaphene	New River (Imperial County)
Lahontan	
Arsenic	Amargosa River (Upper Canyon to Willow Creek confluence)
Fluoride	Mojave River (Mojave Forks Reservoir outlet to Upper Narrows)
	Mojave River (Upper Narrows to Lower Narrows)
Nitrate	Sheep Creek
Total Dissolved Solids	Crab Creek
	Holcomb Creek
Los Angeles	
Algae	Lindero Creek Reach 1
	Lindero Creek Reach 2 (Above Lake)
	Medea Creek Reach 1 (Lake to Confl. with Lindero)
	Medea Creek Reach 2 (Abv Confl. with Lindero)
	Ventura River Estuary
	Ventura River Reach 1 and 2 (Estuary to Weldon Canyon)
Ammonia	Calleguas Creek Reach 2 (estuary to Potrero Rd- was Calleguas Creek Reaches 1 and 2 on 1998 303d list)
	Calleguas Creek Reach 3 (Potrero Road upstream to confluence with Conejo Creek on 1998 303d list)
	Calleguas Creek Reach 6 (was Arroyo Las Posas Reaches 1 and 2 on 1998 303d list)
	Calleguas Creek Reach 7 (was Arroyo Simi Reaches 1 and 2 on 1998 303d list)
	Calleguas Creek Reach 9B (was part of Conejo Creek Reaches 1 and 2 on 1998 303d list)
	Calleguas Creek Reach 10 (Conejo Creek (Hill Canyon)-was part of Conejo Crk Reaches 2 & 3, and lower Conejo Crk/Arroyo Conejo N Fk on 1998 303d list)
	Calleguas Creek Reach 11 (Arroyo Santa Rosa, was part of Conejo Creek Reach 3 on 1998 303d list)
	Calleguas Creek Reach 12 (was Conejo Creek/Arroyo Conejo North Fork on 1998 303d list)
	Calleguas Creek Reach 13 (Conejo Creek South Fork, was Conejo Cr Reach 4 and part of Reach 3 on 1998 303d list)
	Coyote Creek
	Dominguez Channel (lined portion above Vermont Ave)

Pollutant	Impaired Water Body
	Los Angeles River Reach 1 (Estuary to Carson Street)
	Los Angeles River Reach 2 (Carson to Figueroa Street)
	Los Angeles River Reach 3 (Figueroa St. to Riverside Dr.)
	Los Angeles River Reach 4 (Sepulveda Dr. to Sepulveda Dam)
	Los Angeles River Reach 5 (within Sepulveda Basin)
	San Jose Creek Reach 1 (SG Confluence to Temple St.)
	Santa Clara River Reach 3 (Freeman Diversion to A Street)
	Sepulveda Canyon
	Tujunga Wash (LA River to Hansen Dam)
Beach Closures	Robert H. Meyer Memorial Beach
Benthic-Macroinvertebrate Bioassessments	Arroyo Seco Reach 1 (LA River to West Holly Ave.)
	Compton Creek
	Las Virgenes Creek
	Malibu Creek
	Triunfo Canyon Creek Reach 2
	Walnut Creek Wash (Drains from Puddingstone Res)
Bis(2ethylhexyl)phthalate (DEHP)	Sawpit Creek
Boron	Calleguas Creek Reach 8 (was Tapo Canyon Reach 1)
	Fox Barranca (tributary to Calleguas Creek Reach 6)
	Santa Clara River Reach 11 (Piru Creek, from confluence with Santa Clara River Reach 4 to gaging station below Santa Felicia Dam)
Cadmium	Ballona Creek Estuary
Cadmium (sediment)	Ballona Creek
ChemA (tissue)	Calleguas Creek Reach 5 (was Beardsley Channel on 1998 303d list)
	Calleguas Creek Reach 9A (was lower part of Conejo Creek Reach 1 on 1998 303d list)
	Duck Pond Agricultural Drains/Mugu Drain/Oxnard Drain No 2
	Rio De Santa Clara/Oxnard Drain No. 3
Chloride	Piru Creek (from gaging station below Santa Felicia Dam to headwaters)
	Santa Clara River Reach 5 (Blue Cut gaging station to West Pier Hwy 99 Bridge) (was named Santa Clara River Reach 7 on 2002 303(d) list)
	Santa Clara River Reach 6 (W Pier Hwy 99 to Bouquet Cyn Rd) (was named Santa Clara River Reach 8 on 2002 303(d) list)
	Sespe Creek (from 500 ft below confluence with Little Sespe Cr to headwaters)
Chlorpyrifos (tissue)	Calleguas Creek Reach 4 (was Revolon Slough Main Branch: Mugu Lagoon to Central Avenue on 1998 303d list)
Coliform Bacteria	Arroyo Seco Reach 2 (West Holly Ave to Devils Gate Dam)
	Bell Creek
	Big Rock Beach
	Dan Blocker Memorial (Coral) Beach
	Las Flores Beach
	Leo Carillo Beach (South of County Line)
	Long Point Beach
	Los Angeles River Reach 6 (Above Sepulveda Flood Control Basin)
	Malibu Lagoon Beach (Surfrider)
	Palo Comado Creek

Pollutant	Impaired Water Body
	Redondo Beach
	Rio Hondo Reach 1 (Confl. LA River to Snt Ana Fwy)
	Rio Hondo Reach 2 (At Spreading Grounds)
	San Gabriel River Reach 1 (Estuary to Firestone)
	San Gabriel River Reach 2 (Firestone to Whittier Narrows Dam
	San Jose Creek Reach 2 (Temple to I-10 at White Ave.)
	Santa Clara River Reach 7 (Bouquet Canyon Rd to above Lang Gaging Station) (was named Santa Clara River Reach 9 on 2002 303(d) list)
	Stokes Creek
	Topanga Beach
	Torrance Beach
	Torrance Carson Channel
	Verdugo Wash Reach 1 (LA River to Verdugo Rd.)
	Wilmington Drain
Copper	Aliso Canyon Wash
	Burbank Western Channel
	San Gabriel River Estuary
DDT (Dichlorodiphenyltrichloroethane)	Amarillo Beach
	Bluff Cove Beach
	Cabrillo Beach (Outer)
	Carbon Beach
	Castlerock Beach
	Escondido Beach
	Flat Rock Point Beach Area
	Inspiration Point Beach
	La Costa Beach
	Las Tunas Beach
	Malaga Cove Beach
	Malibu Beach
	Nicholas Canyon Beach
	Paradise Cove Beach
	Point Dume Beach
	Point Fermin Park Beach
	Portuguese Bend Beach
	Puerco Beach
	Royal Palms Beach
	Sea Level Beach
	Trancas Beach (Broad Beach)
	Ventura Marina Jetties
	Whites Point Beach
	Zuma Beach (Westward Beach)
DDT (sediment)	Abalone Cove Beach
Fecal Coliform	Canada Larga (Ventura River Watershed)
	Dry Canyon Creek

Pollutant	Impaired Water Body
	McCoy Canyon Creek
Fish Barriers (Fish Passage)	Matilija Creek Reach 1 (Jct. With N. Fork to Reservoir)
	Matilija Creek Reach 2 (Above Reservoir)
Indicator Bacteria	Artesia-Norwalk Drain
	Avalon Beach
	Bull Creek
	Channel Islands Harbor Beach
	Coyote Creek, North Fork
	Dockweiler Beach
	Hermosa Beach
	Hobie Beach (Channel Islands Harbor)
	Long Beach City Beach
	Lunada Bay Beach
	Manhattan Beach
	Marina del Rey Harbor Beach
	Ormond Beach
	Peninsula Beach
	Point Vicente Beach
	Promenade Park Beach
	Puente Creek
	Resort Point Beach
	Rincon Beach
	San Antonio Creek (Tributary to Ventura River Reach 4)
	San Buenaventura Beach
	San Gabriel River Reach 3 (Whittier Narrows to Ramona)
	Santa Monica Beach
	Santa Monica Canyon
	Surfers Point at Seaside
	Venice Beach
	Ventura River Reach 3 (Weldon Canyon to Confl. w/ Coyote Cr)
	Will Rogers Beach
Invasive Species	Solstice Canyon Creek
Lead	Monrovia Canyon Creek
	Topanga Canyon Creek
	Triunfo Canyon Creek Reach 1
Nitrate and Nitrite	Brown Barranca/Long Canyon
	Mint Canyon Creek Reach 1 (Confl to Rowler Cyn)
	Torrey Canyon Creek
	Wheeler Canyon/Todd Barranca
Pathogens	Palo Verde Shoreline Park Beach
Pumping	Ventura River Reach 4 (Coyote Creek to Camino Cielo Rd)
Sulfates	Hopper Creek
	Pole Creek (trib to Santa Clara River Reach 3)

Pollutant	Impaired Water Body
Toxicity	Santa Clara River Reach 1 (Estuary to Hwy 101 Bridge)
Trash	San Gabriel River, East Fork
	Verdugo Wash Reach 2 (Above Verdugo Road)
San Diego	
Benzo[b]fluoranthene	English Canyon
Cadmium	Prima Deshecha Creek
Chloride	Oso Creek (at Mission Viejo Golf Course)
Chlorpyrifos	Long Canyon Creek (tributary to Murrieta Creek)
	Murrieta Creek
	Redhawk Channel
	Santa Gertrudis Creek Temecula Creek
	Warm Springs Creek (Riverside County) Long Canyon Creek (tributary to Murrieta Creek)
	Murrieta Creek
DDE (Dichlorodiphenyldichloroethylene)	San Juan Creek
Diazinon	Arroyo Trabuco Creek
Enterococcus	Pacific Ocean Shoreline, Aliso HSA, at Aliso Beach - middle
	Pacific Ocean Shoreline, Aliso HSA, at Aliso Creek mouth
	Pacific Ocean Shoreline, Lower San Juan HSA, at North Beach Creek
	Pacific Ocean Shoreline, Lower San Juan HSA, at South Doheny State Park Campground
	Pacific Ocean Shoreline, San Clemente HA, at San Clemente City Beach at Pier
	Pacific Ocean Shoreline, San Clemente HA, at South Capistrano County Beach
Indicator Bacteria	Aliso Creek
	Pacific Ocean Shoreline, Dana Point HSA, at Aliso Beach at West Street
Iron	De Luz Creek
Phosphorus	Santa Margarita River (Upper)
	Segunda Deshecha Creek
Sediment Toxicity	Laguna Canyon Channel
Selenium	Moro Canyon Creek
	Oso Creek (lower)
Total Coliform	Pacific Ocean Shoreline, Dana Point HSA, at Salt Creek outlet at Monarch Beach
	Pacific Ocean Shoreline, Laguna Beach HSA, at Main Beach
Santa Ana	
Ammonia (Unionized)	Bolsa Chica Channel
	Borrego Creek (from Irvine Blvd to San Diego Creek Reach 2)
	East Garden Grove Wintersburg Channel
	Serrano Creek
Cadmium	Cucamonga Creek Reach 1 (Valley Reach)
	Rathbone (Rathbun) Creek
	Santa Ana River Reach 6
Chemical oxygen demand (COD)	Chino Creek Reach 1B (Mill Creek confl to start of concrete lined channel)
Coliform Bacteria	Chino Creek Reach 2 (Beginning of concrete channel to confl w San Antonio Creek)

Pollutant	Impaired Water Body
Copper	Bolsa Chica State Beach
	Santa Ana River, Reach 3
DDT (Dichlorodiphenyltrichloroethane)	Balboa Beach
	Peters Canyon Channel
Enterococcus	Newport Slough
	Seal Beach
Fecal Coliform	Buck Gully Creek
	Los Trancos Creek (Crystal Cove Creek)
	San Diego Creek Reach 1
Indicator Bacteria	Goldenstar Creek
	Morning Canyon Creek
	San Diego Creek Reach 2
	Santa Ana Delhi Channel
	Santa Ana River, Reach 2
	Temescal Creek, Reach 6 (Elsinore Groundwater sub basin boundary to Lake Elsinore Outlet)
Nutrients	Chino Creek Reach 1A (Santa Ana River R5 confl to just downstream of confl with Mill Creek)
	Grout Creek
	Mill Creek (Prado Area)
	Summit Creek
Pathogens	Knickerbocker Creek
	Lytle Creek
	Mill Creek Reach 1
	Mill Creek Reach 2
	Mountain Home Creek
	Mountain Home Creek, East Fork
	Santa Ana River, Reach 4
	Silverado Creek
PCBs (Polychlorinated biphenyls)	Huntington Beach State Park
pH	Cucamonga Creek Reach 2 (Mountain Reach)
	San Antonio Creek
	Temescal Creek, Reach 1
Salinity/TDS/Chlorides	Santiago Creek, Reach 4

Source: State Water Resources Control Board. 2016. 2016 303(d) List of Impaired Waterbodies. Available at: http://www.waterboards.ca.gov/water_issues/programs/tmdl/integrated2010.shtml, accessed September 3, 2019.

Land Use and Water Quality

Buildings, roads, sidewalks, parking lots, and other impervious surfaces define the urban landscape. Impervious surfaces also alter the natural hydrology and prevent the infiltration of water into the ground. Impervious surfaces change the flow of stormwater over the landscape. In underdeveloped

areas, vegetation holds down soil, slows the flow of stormwater over land, and filters out some pollutants by both slowing the flow of the water and trapping some pollutants in the root system. Additionally, some stormwater filters through the soil, replenishing underground aquifers. As land is converted to other uses such as commercial or residential development, many of these natural processes are eliminated as vegetation is cleared and soil is paved over. As more impervious surface coverage is added to the landscape, more stormwater flows faster off the land. The greater volume of stormwater increases the possibility of flooding, and the high flow rates of stormwater do not allow for pollutants to settle out, meaning that more pollution gets concentrated in the stormwater runoff. Research on urban stream protection has found that stream degradation occurs when a watershed reaches relatively low levels of imperviousness—in the range of 10 to 20 percent. Water quality degradation can occur when impervious surface coverage in a watershed surpasses 10 percent.[17] Fish habitat, spawning, and diversity suffer when imperviousness is greater than 10 to 12 percent. Wetland plants and amphibian populations diminish when impervious surfaces are greater than 10 percent. Generally, the higher the percentage of impervious surface, the greater the degradation in stream water quality.[18] Based on this research, streams can be considered stressed in watersheds when the impervious coverage exceeds 10 to 15 percent. The link between impervious surfaces and degraded water quality points to the need for careful comparisons between dispersed and compact development strategies. On a regional or watershed level, greater overall water quality protection is achieved through more concentrated or clustered development. Concentrated development protects the watershed by leaving a larger percentage of it in its natural condition.

Waste Discharge Requirements

If the operation or discharges from a property or business affects California's surface, coastal, or groundwater, it would normally be required to obtain a permit to discharge waste from the appropriate RWQCB. Discharges of pollutants into surface waters require a federal NPDES permit application with the appropriate RWQCB.[19] For other types of discharges, such as those affecting groundwater or in a diffused manner (e.g., erosion from soil disturbance or waste discharges to land) a report of waste

19 U.S. Environmental Protection Act. *NPDES Permit Basics*. Available online at: https://www.epa.gov/npdes/npdes-permit-basics, accessed August 27, 2019.

discharge must be filed with the appropriate RWQCB in order to obtain Waste Discharge Requirements (WDRs).

For specific situations, the RWQCB may waive the requirement to obtain a WDR for discharges to land or may determine that a proposed discharge can be permitted more effectively through enrollment in a general NPDES permit or general WDR.

RWQCBs in the SCAG region have identified a typical list of activities that affect water, but the list is by no means inclusive of all situations:

- Discharge of process wastewater not discharging to a sewer (factories, cooling water, etc.)
- Confined Animal facilities (dairies, feedlots, etc.)
- Waste containments (landfills, waste ponds, etc.)
- Construction sites
- Boatyards and shipyards
- Discharges of pumped groundwater and cleanups (underground tank cleanups, dewatering, spills)
- Material handling areas draining to storm drains
- Sewage treatment facilities
- Filling of wetlands
- Dredging, filling, and disposal of dredge wastes
- Commercial activities not discharging to a sewer (e.g., factory wastewater, storm drain)
- Waste discharges to land

3.10.1.7 Hazards

Floodplains and Flooding

Flooding generally occurs when soil and vegetation cannot absorb excess rainwater or snowmelt, and water runs off the land in quantities that cannot be carried in stream channels or kept in natural ponds or man-made reservoirs. Periodic floods occur naturally on many rivers, forming areas known as floodplains. These river floods usually result from heavy rain, sometimes combined with melting snow, which causes the rivers to overflow their banks. A flood that rises and falls rapidly with little or no

advance warning is called a flash flood. Flash floods usually result from intense rainfall over a relatively small area.

Flooding occurs occasionally on streets and roads in urbanized areas where storm waters are diverted into manmade or artificial drainage systems. In urbanized areas with significant area of impervious surfaces, storm water is not able to permeate and percolate into the soil, and is diverted into a storm drainage system. In some areas, these drainage systems are occasionally overloaded with storm water drainage, or the drains become clogged with leaves and other debris, thereby impeding storm water drainage onto transportation facilities (i.e., roadways). The ability of the storm drainage system to accommodate water flows is also largely based on ground permeability and infrastructure capacity. In metropolitan areas, agencies responsible for maintaining and upgrading drainage facilities to accommodate volume are local cities and the counties.

Principal impacts of flooding include damage to permanent structures, relocation of non-stationary objects, loss of human life, and damage to infrastructure and soil conditions. After the initial damage from floodwaters, standing water often creates a secondary level of destruction, by ruining crops, further undermining and damaging infrastructure, and contaminating water wells. Debris flows are another hazard associated with flooding, when heavy soils and rocks slide down into a valley, threatening the infrastructure below.

100-Year Floodplain

The 100-Year floodplain denotes an area that has a one percent chance of being inundated during any particular 12-month period. The risk of this area being flooded in any century is one percent but statistically the risk is almost 40 percent in any 50-year period. Floodplain zones are determined FEMA and used to create Flood Insurance Rate Maps (FIRMs).[20] These tools assist communities in mitigating flood hazards through land use planning. FEMA also outlines specific regulations for any construction located within a 100-year floodplain, whether residential, commercial, or industrial. Each watershed in the SCAG region has associated 100-year flood plain, with Imperial County containing the most land designated as being in the floodplain.

Seiche

A seiche is an oscillation of a body of water in an enclosed or semi enclosed basin, such as a reservoir, harbor, lake, or storage tank. Many examples of seiches can be found in Southern California, where water

20 FEMA. *Flood Insurance Rate Map (FIRM)*. Available online at: https://www.fema.gov/flood-insurance-rate-map-firm, accessed August 27, 2019.

reservoirs have been constructed or developed by damming rivers. The seiches serve as a means of flood control and a holding tank for drinking and agricultural water. Examples of enclosed water bodies in the SCAG region include Big Bear Lake, Pyramid Lake, and the Salton Sea.

Tsunami

Tsunamis are massive waves triggered by large earthquakes along fault lines near the ocean. Tsunamis have potential to crash and flood areas much further inland than regular ocean waves. Such inundation can cause severe damage to local infrastructure and even loss of life. The three coastal counties of Los Angeles, Orange, and Ventura contain more than 25,000 acres that are susceptible to tsunamis within the SCAG region.[21]

Mudflow

Mudflows and landslides are also generated by ground-shaking seismic events. In areas with steep slopes or hillsides, mud and other debris can be triggered by an earthquake miles away and cause significant damage to infrastructure and life below. Many areas of the SCAG region are susceptible to landslides and mudflows due the abundance of active faults and existing mudflow hazards. Landslides are discussed in further detail in **Section 3.7, Geology and Soils.**

Coastal Flooding and Sea Level Rise

During the winter months (generally November to February), offshore storms occurring over the Pacific Ocean, combined with high tides and strong winds, have the potential to result in wave run-up. In addition, as discussed above, seismically-induced waves (i.e. as the result of a tsunami event) may occur on occasion, having the potential to cause coastal flooding. Further, a short- or long-duration increase in sea level during a period of extreme precipitation and runoff may result in the potential for coastal flooding. Wave run-up along the coastal areas may also contribute to coastal flooding and erosion.

Rising sea levels will increase the potential for coastal flooding, and the issue of sea-level rise is important in land use planning and hazard analysis in coastal areas. California Executive Order S-13-08, signed by the governor on November 14, 2008, specifies that all state agencies planning construction projects in areas that are vulnerable to future sea-level rise must consider a range of scenarios for 2050 and 2100 to assess project vulnerability, and, to the extent feasible, must reduce expected risks and increase resiliency with respect to sea-level rise. Before 2050, differences in sea-level rise projections under different emissions scenarios are minor but they diverge significantly past midcentury. After 2050, sea-level rise

21 California Department of Conservation (DOC). 2018. *California Official Tsunami Inundation Maps*. Available online at: https://www.conservation.ca.gov/cgs/geohazards/tsunami/maps#County, accessed January 8, 2019.

projections increasingly depend on the trajectory of greenhouse gas emissions. For example, under certain scenarios, rapid ice sheet loss on Antarctica could drive rates of sea-level rise in California above 50 mm/year (2 inches/year) by the end of the century, leading to potential sea-level rise exceeding 10 feet. This rate of sea-level rise would be about 30-40 times faster than the sea-level rise experienced over the last century.[22]

The Intergovernmental Panel on Climate Change (IPCC) has indicated that globally, sea level rose at an average annual rate of approximately 1.5 millimeters from 1901 to 1990 and at an average annual rate of approximately 3.2 millimeters from 1993 to 2010 (IPCC 2013). By year 2100, sea levels may rise up to 55 inches (1.4-meter), causing a 45 percent increase in land in Los Angeles County to become more vulnerable to the 100-year flood event. Based on mapping completed by the Pacific Institute, much of the Pacific Coast could be subject to flooding associated with a 100-year flood event with a sea-level rise of 55 inches.

3.10.2 REGULATORY FRAMEWORK

3.10.2.1 Federal Regulations

Rivers and Harbors Appropriation Act of 1899, Section 10

Authorization from the USACOE must be obtained for construction of a structure in or over any navigable water of the U.S., pursuant to Section 10 of the Rivers and Harbors Appropriation Act of 1899 (33 U.S. Code [USC] 403). Authorization is also needed for structures built near navigable water if they would affect the course, location, condition, or capacity of the water body, as through re-channelization, disposal of fill, and so forth.[23]

Wild and Scenic Rivers Act of 1968 (WSRA)

The objective of the WSRA (Public Law 90–542), dated October 2, 1968, is the preservation of certain rivers with outstanding natural, cultural, and recreational values in a free-flowing condition. The WSRA provides permanent protection for some of the country's most outstanding free flowing rivers and

23 U.S. Environmental Protection Agency. 2019. *Section 10 of the Rivers and Harbors Appropriation Act of 1899.* Available online at: https://www.epa.gov/cwa-404/section-10-rivers-and-harbors-appropriation-act-1899, accessed August 27, 2019.

prohibits federal support for actions such as the construction of dams or other harmful instream activities.[24]

Clean Water Act of 1972, as amended (CWA)

Congress enacted the Clean Water Act (CWA), originally enacted as the Federal Water Pollution Control Act (FWPCA; Public Law 92–500) in 1948, but took on its modern form when completely rewritten in 1972 in an act entitled the Federal Water Pollution Control Act Amendments of 1972, now commonly known as the Clean Water Act.[25] Major changes have subsequently been introduced via amendatory legislation including the Clean Water Act of 1977 and the Water Quality Act of 1987.

The CWA is the primary federal law governing water pollution. Its objective is to restore and maintain the chemical, physical, and biological integrity of the nation's waters by preventing point and nonpoint pollution sources, providing assistance to publicly owned treatment works for the improvement of wastewater treatment, and maintaining the integrity of wetlands. It is one of the first and most influential modern environmental laws in the U.S. As with many other major federal environmental statutes, it is administered by EPA, in coordination with state governments. Its implementing regulations are codified at 40 C.F.R. Subchapters D, N, and O (Parts 100-140, 401-471, and 501-503).

Section 303(d)

Section 303(d) of the Federal CWA requires the SWRCB to list impaired water bodies and determine TMDLs of pollutants, sediments, or other stressors that are contributing excessively to these impaired waters.[26]

Section 401 – Water Quality Certification

Section 401 establishes the basic structure for regulating discharges of pollutants into the waters of the U.S. and regulating quality standards for surface waters. Under the CWA, EPA has implemented pollution control programs such as setting wastewater standards for industries and surface waters.[27]

Section 402

Section 402 establishes the National Pollutant Discharge Elimination System (NPDES) permit process. In California, NPDES permitting authority is delegated to, and administered by the nine RWQCBs. Pursuant to Section 402, a discharge of any pollutant from a point source into navigable waters, are prohibited unless an NPDES permit is obtained. Point sources are discrete conveyances such as pipes or manmade ditches. Individual homes that are connected to a municipal system, use a septic system, or do not have a surface discharge do not need an NPDES permit; however, industrial, municipal, and other facilities must obtain permits if their discharges go directly to surface waters.[28]

Section 402(p) establishes that, stormwater permits are required for stormwater discharges from a municipal separate storm sewer system (MS4) serving a population of 100,000 or more. Municipal separate storm sewer means a conveyance or system of conveyances (including roads with drainage systems, municipal streets, catch basins, curbs, gutter, ditch, man-made channels or storm drain) owned or operated by a state, city, town, borough, county, parish, district, association, or other public body (created by or pursuant to state law) having jurisdiction over disposal of sewage, industrial wastes, stormwater, or other wastes, including special districts under state law such as a sewer district, flood control district or drainage district, or similar entity, or a tribe or an authorized tribal organization, or a designated and approved management agency under section 208 of the CWA that discharges to waters of the United States (40 CFR 122.26(b)(8)).

Section 404 – Discharge of Dredge or Fill Material

Section 404 of the federal CWA is administered and enforced by the U.S. Army Corps of Engineers (USACOE). Section 404 of the CWA established a program to regulate the discharge of dredged and fill material into waters of the United States, including wetlands. USACOE administers the day-to-day program, including the determination of eligibility of projects for use of Categorical Exclusions and Nationwide Permits, and review and consideration of individual permit decisions and jurisdictional determinations. USACOE also develops policy and guidance; and enforces Section 404 provisions.[29]

29 U.S. Environmental Protection Agency. *Overview of Clean Water Act Section 404.* Available online at: https://www.epa.gov/cwa-404/overview-clean-water-act-section-404, accessed August 27, 2019.

Executive Order 11990 - Protection of Wetlands

This executive order is an overall wetlands policy for all agencies managing federal lands, sponsoring federal projects, or providing federal funds to state or local projects. This executive order requires that when a construction project involves wetlands, a finding must be made by the federal agency that there is no practicable alternative to such construction, and that the proposed action includes all practicable measures to minimize impacts to wetlands resulting from such use.[30]

Pollution Prevention Act of 1990

The Pollution Prevention Act (42 USC §13101 et seq.) focused on reducing the amount of pollution through cost-effective changes in production, operation, and raw materials. The Act focuses on source reduction which reduces the release of hazardous substances through practices that increase efficiency in energy, water, or other natural resources.[31]

Antidegradation Policy

The Antidegradation Policy under U.S. EPA's Water Quality Standards Regulations (48 F.R. 51400, 40 CFR 131.12, November 8, 1983), requires states and tribes to establish a three-tiered antidegradation program to prevent a decrease in water quality standards.

- Tier 1—Maintains and protects existing uses and water quality conditions that support such uses. Tier 1 is applicable to all surface waters.
- Tier 2—Maintains and protects "high quality" waters where existing conditions are better than necessary to support "fishable/swimmable" waters. Water quality can be lowered in such waters but not to the point at which it would interfere with existing or designed uses.
- Tier 3—Maintains and protects water quality in outstanding national resource waters (ONRWs). Water quality cannot be lowered in such waters except for certain temporary changes.

30 U.S. Environmental Protection Agency. 2019. *Protection of Wetlands (Executive Order 11990).* Available online at: https://www.epa.gov/cwa-404/protection-wetlands-executive-order-11990, accessed August 27, 2019.

31 U.S. Environmental Protection Agency. 2017. *Pollution Prevention Act of 1990*. Available online at: https://www.epa.gov/p2/pollution-prevention-act-1990, accessed August 27, 2019.

Antidegradation was explicitly incorporated into the federal CWA through 1987 amendments, codified in section 303(d)(4)(B), requiring satisfaction of antidegradation requirements before making certain changes in NPDES permits.[32]

Definition of Waters of the United States (WOTUS)

On June 29, 2015, EPA and USACOE jointly published a final WOTUS Rule (40 CFR Parts 110, 112, 116, et al. and 33 CFR Part 328) for determining the extent to which wetlands and other water features are protected under the CWA.

Following publication of the 2015 WOTUS Rule, 31 states, and 53 non-state parties, including environmental groups and groups representing farming, recreational, forestry, and other interests, filed complaints and petitions for review in multiple federal district and appellate courts challenging the 2015 Rule. On February 28, 2017, the President of the United States issued Executive Order 13778 directing EPA and the Department of the Army to review and rescind or revise the 2015 Clean Water Rule. On October 22, 2019, EPA and the Department of the Army published a final rule to repeal the 2015 Rule and recodify the regulation that was in place prior to issuance of the 2015 Rule. This final rule will become effective on December 23, 2019.[33]

National Flood Insurance Act

The U.S. Congress passed the National Flood Insurance Act in 1968 and the Flood Disaster Protection Act in 1973 to restrict certain types of development on floodplains and to provide for a NFIP. The purpose of these acts is to reduce the need for large, publicly funded flood control structures and disaster relief. The NFIP is a federal program administered by the Flood Insurance Administration of FEMA. It enables individuals who have property (a building or its contents) within the 100-year floodplain to purchase insurance against flood losses. FEMA works with the states and local communities to identify flood hazard areas and publishes a flood hazard boundary map of those areas. Floodplain mapping is an ongoing process and flood maps must be regularly updated for both major rivers and tributaries as land uses and development patterns change.[34]

Executive Order 11988, Flood Plain Management

The objective of Presidential Executive Order 11988, dated May 24, 1977, is the avoidance of, to the extent possible, long- and short-term adverse impacts associated with the occupancy and modification of the base floodplain (100-year floodplain) and the avoidance of direct and indirect support of development in the base floodplain wherever there is a practicable alternative. Under the Executive Order, the USACOE must provide leadership and take action to:[35]

- Avoid development in the base floodplain unless it is the only practicable alternative
- Reduce the hazard and risk associated with floods
- Minimize the impact of floods to human safety, health, and welfare
- Restore and preserve the natural and beneficial values of the base floodplain

California Toxics Rule

On May 18, 2000, USEPA promulgated numeric water quality criteria for priority toxic pollutants and other provisions for water quality standards to be applied to waters within California. USEPA promulgated this rule based on the USEPA Administrator's determination that the numeric criteria are necessary in California to protect human health and the environment. The rule fills a gap in California water quality standards that was created in 1994 when a state court overturned the state's water quality control plans containing water quality criteria for priority toxic pollutants. Thus, the state of California has been without numeric water quality criteria (which is required by the CWA) for many priority toxic pollutants, necessitating this action by USEPA. These federal criteria are legally applicable in the state of California for inland surface waters, enclosed bays, and estuaries for all purposes and programs under the CWA. USEPA and the SWRCB have the authority to enforce these standards, which are incorporated into the NPDES permits that regulate existing discharges in California.

3.10.2.2 State

Porter Cologne Water Quality Control Act

The Porter-Cologne Act is the principal law governing water quality regulation in California. It establishes a comprehensive program to protect water quality and the beneficial uses of water. The Porter-Cologne Act applies to surface waters, wetlands, and ground water and to both point and

[35] U.S. Fish and Wildlife Service. *Executive Order 11988 Flood plain Management*. Available online at: https://www.fws.gov/r9esnepa/NEPA_Handbook/EO_11988.pdf, accessed August 27, 2019.

nonpoint sources of pollution. Pursuant to the Porter-Cologne Act (California Water Code section 13000 et seq.), the policy of the State is as follows:

- That the quality of all the waters of the State shall be protected;
- That all activities and factors affecting the quality of water shall be regulated to attain the highest water quality within reason; and
- That the State must be prepared to exercise its full power and jurisdiction to protect the quality of water in the State from degradation.

The Porter-Cologne Act established nine Regional Water Boards (based on hydrogeologic barriers) and the State Water Board, which are charged with implementing its provisions and which have primary responsibility for protecting water quality in California. The State Water Board provides program guidance and oversight, allocates funds, and reviews Regional Water Boards decisions. In addition, the State Water Board allocates rights to the use of surface water. The Regional Water Boards have primary responsibility for individual permitting, inspection, and enforcement actions within each of nine hydrologic regions. The State Water Board and Regional Water Boards have numerous NPS-related responsibilities, including monitoring and assessment, planning, financial assistance, and management.

The Regional Water Boards regulate discharges under the Porter-Cologne Act primarily through issuance of NPDES permits and waste discharge requirements (WDRs for point and nonpoint source discharges. Anyone discharging or proposing to discharge materials that could affect water quality (other than to a community sanitary sewer system regulated by an NPDES permit) must file a report of waste discharge.

The Porter-Cologne Act also implements many provisions of the Clean Water Act, such as NPDES permitting program. Section 401 of the Clean Water Act gives the State Water Board the authority to review any proposed federally permitted or federally licensed activity that may impact water quality and to certify, condition, or deny the activity if it does not comply with State water quality standards.

The Porter-Cologne Act also requires adoption of water quality control plans (Basin plans) that contain the guiding policies of water pollution management in California. A number of statewide water quality control plans have been adopted by the State Water Board. In addition, regional water quality control plans (basin plans) have been adopted by each of the Regional Water Boards and get updated as necessary and practical. These plans identify the existing and potential beneficial uses of waters of the State and establish water quality objectives to protect these uses. The basin plans also contain implementation, surveillance, and monitoring plans. Statewide and regional water quality control plans include enforceable prohibitions against certain types of discharges, including those that may pertain to nonpoint sources. Portions of water quality control plans, the water quality objectives and beneficial use

designations, are subject to review by U.S.EPA, when approved they become water quality standards under the Clean Water Act.

Sustainable Groundwater Management Act (SGMA)

On September 16, 2014 Governor Edmund G. Brown Jr. signed a three-bill package known as the Sustainable Groundwater Management Act. The legislation allows local agencies to customize groundwater sustainability plans to their regional economic and environmental needs. SGMA creates a framework for sustainable, local groundwater management for the first time in California history.

The three bills that make up SGMA are Assembly Bill (AB) 1739 by Assembly Member Roger Dickinson, Senate Bill (SB) 1319, and SB 1168 by Senator Fran Pavley. [36]

In September 2015, Governor Brown signed SB 13, by Senator Fran Pavley. The Bill makes various technical, clarifying changes to SGMA including requirements for groundwater sustainability agency formation, the process for State Water Board intervention if no responsible agency is specified for a basin, guidelines for high- and medium-priority basins, and participation of mutual water companies in a groundwater sustainability agency. [37]

Cobey-Alquist Floodplain Management Act

The Cobey-Alquist Floodplain Management Act (California Water Code 8400-8415) and Executive Order B-39-77 support the NFIP. The Act encourages local governments to plan, adopt, and enforce land use regulations for floodplain management, to protect people and property from flooding hazards. The Act also identifies requirements that jurisdictions must meet to receive State financial assistance for flood control.[38] Executive Order B-39-77 requires state agency compliance with good floodplain management practices.[39]

California Coastal Act

The California Coastal Act (Public Resources Code § 30000 et seq.), dealing with coastal development and its impacts to public access, is the primary law that governs decisions of the California Coastal

Commission (CCC). Chapter 3 of the California Coastal Act contains Coastal Resources Planning and Management Policies. Policies include protection of certain water oriented recreational activities (Section 30220); minimizing the adverse effects of wastewater discharge, controlling runoff and preventing depletion of ground water supplies (Section 30231); and water supply and flood control through channelization, dams, or other substantial alternations (Section 30236).[40]

State Water Resources Control Board Water Rights (SWRCB) Program

The SWRCB is responsible for administering water rights in California. It has several water rights programs including a compliance monitoring program, drought year information resources, water availability analysis, water use reports program and water quality certification. The water availability analysis program is required by the California Water Code which requires sufficient information for applications submitted to the SWRCB to demonstrate a reasonable likelihood that appropriated water is available for appropriation. The water use reports program is responsible for water use reports for water right holders and sets measurement methods for the reports.[41]

Lake or Streambed Alteration Program

The California Department of Fish and Wildlife (CDFW) is responsible for conserving, protecting, and managing California's fish, wildlife, and native plant resources. To meet this responsibility, Section 1600 of the California Fish and Game Code requires an entity to notify CDFW of any proposed activity that may substantially modify a river, stream, or lake. Notification is required by any person, business, state, or local government agency or public utility that proposes an activity that will:[42]

- Substantially divert or obstruct the natural flow of any river, stream or lake;
- Substantially change or use any material from the bed, channel, or bank of, any river, stream, or lake; or
- Deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake.

The notification requirement applies to any work undertaken in or near a river, stream, or lake that flows at least intermittently through a bed or channel. This includes ephemeral streams, desert washes, and

42 California Legislative Information. *Chapter 6. Fish and Wildlife Protection and Conservation [1600-1617].*

watercourses with a subsurface flow. It may also apply to work undertaken within the flood plain of a body of water. If CDFW determines that the activity may substantially adversely affect fish and wildlife resources, a Lake or Streambed Alteration Agreement will be prepared. In August 2005, the California Fish and Game Commission policy regarding wetlands resources stated that "it is the policy of the Fish and Game Commission to seek to provide for the protection, preservation, restoration, enhancement and expansion of wetland habitat in California" and to "strongly discourage development in or conversion of wetlands."[43] As a result, although the Commission has no independent statutory permitting authority related to wetlands, the policy underscores that the Commission does not support wetland development proposals unless "project mitigation assures there will be 'no net loss' of either wetland habitat values or acreage" and "prefers mitigation which would achieve expansion of wetland acreage and enhancement of wetland habitat values." The Agreement includes reasonable conditions necessary to protect those resources and must comply with CEQA.

Statement of Policy with Respect to Maintaining High Quality Waters in California

California's antidegradation policy, formally known as the Statement of Policy with Respect to Maintaining High Quality Waters in California (SWRCB Resolution No. 68-16), restricts degradation of surface and ground waters. It protects waters where existing quality is higher than necessary for the protection of beneficial uses. Any actions with the potential to adversely affect water quality must 1) be consistent with maximum benefit to the people of the state, 2) not unreasonably affect present and anticipated beneficial use of the water, and 3) not result in water quality less than that prescribed in water quality plans and policies.[44] Any actions that can adversely affect surface waters are also subject to the federal antidegradation policy (40 CFR Section 131.12) developed under the CWA.

NPDES General Permits

Construction General Permit

The California Construction Stormwater Permit (Construction General Permit) 1 (also, known as Industrial General Permit), adopted by the SWRCB, regulates construction activities that include clearing, grading, and excavation resulting in soil disturbance of at least one acre of total land area. The Construction General Permit authorizes the discharge of stormwater to surface waters from construction activities. It prohibits the discharge of materials other than stormwater and authorized non-stormwater

---

43 California Fish and Game Commission. *Miscellaneous Policies: Wetlands Resources*.

44 State Water Resources Control Board. *Resolution No. 68-16 Statement of Policy with Respect to Maintaining High Quality of Waters in California*. Available online at: https://www.waterboards.ca.gov/board_decisions/adopted_orders/resolutions/1968/rs68_016.pdf, accessed August 27, 2019.

discharges and all discharges that contain a hazardous substance in excess of reportable quantities established in Title 40, Sections 117.3 or 302.4 of the CFR, unless a separate NPDES permit has been issued to regulate those discharges. The Construction General Permit requires that all developers of land where construction activities will occur over more than 1 acre do the following:

- Complete a risk assessment to determine pollution prevention requirements pursuant to the three risk levels established in the General Permit;
- Eliminate or reduce non-stormwater discharges to storm sewer systems and other waters of the US;
- Develop and implement a SWPPP, which specifies BMPs that will reduce pollution in stormwater discharges to the Best Available Technology Economically Achievable/ Best Conventional Pollutant Control Technology standards; and
- Perform inspections and maintenance of all BMPs.

To obtain coverage under the NPDES Construction General Permit, the Legally Responsible Person must electronically file all permit registration documents with the SWRCB before the start of construction. Permit registration documents must include:

- Notice of Intent,
- Risk Assessment,
- Site Map,
- SWPPP,
- Annual Fee, and
- Signed Certification Statement.

Typical BMPs contained in SWPPPs are designed to minimize erosion during construction, stabilize construction areas, control sediment, control pollutants from construction materials, and address post construction runoff quantity (volume) and quality (treatment). The SWPPP must also include a discussion of the program to inspect and maintain all BMPs.[45]

[45] State Water Resources Control Board. *Construction General Permit Fact Sheet*. Available online at: https://www.waterboards.ca.gov/water_issues/programs/stormwater/docs/constpermits/wqo_2009_0009_complete.pdf, accessed August 27, 2019.

Industrial General Permit

The Statewide General Permit for Storm Water Discharges Associated with Industrial Activities, Order 2014-0057-DWQ (Industrial General Permit or IGP) implements the federally required storm water regulations in California for storm water associated with industrial activities discharging to waters of the United States.[46]

Municipal Stormwater Program

The Municipal Storm Water Program regulates storm water discharges from municipal separate storm sewer systems (MS4s) throughout California. Pursuant to the Federal Water Pollution Control Act (Clean Water Act) section 402(p), storm water permits are required for discharges from an MS4 serving a population of 100,000 or more. The Municipal Storm Water Program manages the Phase I Permit Program (serving municipalities over 100,000 people), the Phase II Permit Program (for municipalities less than 100,000), and the Statewide Storm Water Permit for the State of California Department of Transportation (Caltrans).[47]

Caltrans is responsible for the design, construction, management, and maintenance of the State highway system, including freeways, bridges, tunnels, Caltrans' facilities, and related properties, and is subject to the permitting requirements of CWA Section 402(p). Caltrans' discharges consist of storm water and non-storm water discharges from state-owned rights-of-way.

Before July 1999, discharges from Caltrans' MS4 were regulated by individual NPDES permits issued by the RWQCBs. On July 15, 1999, the SWRCB issued a statewide permit (Order No. 99-06-DWQ) that regulated all discharges from Caltrans MS4s, maintenance facilities, and construction activities.[48] On September 19, 2012, Caltrans' permit was reissued (Order No. 2012-0011-DWQ), and it became effective on July 1, 2013.[49]

49 California State Water Resources Control Board. *Order No. 2012-0011-DWQ NPDES No. CAS000003 National Pollutant Discharge Elimination System (NPDES) Statewide Storm Water Permit Waste Discharge Requirements (WDRS) for State of California Department of Transportation*. Available online at: https://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2012/wqo2012_0011_dwq.pdf, accessed August 27, 2019.

The Caltrans permit requires development of a program for communication with local agencies, and coordination with other MS4 programs where those programs overlap geographically with Caltrans facilities. As part of the permit, Caltrans is required to create and annually update a Stormwater Management Plan (SWMP) that is used to outline the regulation of pollutant discharge caused by current and future construction and maintenance activities. SWMP requirements apply to discharges from Caltrans stormwater conveyances, including catch basins and drain inlets, curbs, gutters, ditches, channels, and storm drains. The SWMP applies to discharges consisting of stormwater and non-stormwater resulting from the following:

- maintenance and operation of state-owned highways, freeways, and roads;
- maintenance facilities;
- other facilities with activities that have the potential for discharging pollutants;
- permanent discharges from subsurface dewatering;
- temporary dewatering; and
- construction activities.

Caltrans' Storm Water Management Plan (SWMP) describes the procedures and practices used to reduce or eliminate the discharge of pollutants to storm drainage systems and receiving waters. The SWMP was most recently updated in July of 2016.[50]

California Green Building Standards Code

Chapters 4 and 5 of the California Green Building Standards Code (CalGreen) include mandatory measures for residential and nonresidential development, respectively. Section 4.106.2 requires residential projects that disturb less than 1 acre and are not part of a larger common plan of development, manage stormwater drainage during construction through use of on-site retention basins, filtration systems where stormwater is conveyed to a public drainage system, and/or compliance with a stormwater management ordinance. Section 5.106.1 requires newly constructed nonresidential projects and additions of less than one acre to prevent the pollution of stormwater runoff because of construction

50 Caltrans. 2016. *Statewide Stormwater Management Plan*. Available online at: https://www.waterboards.ca.gov/water_issues/programs/stormwater/docs/caltrans/swmp/swmp_approved.pdf, accessed August 27, 2019.

through compliance with a local ordinance or implementing BMPs that address soil loss and good housekeeping to manage equipment, materials, and wastes.[51]

California Fish and Game Code

The California Department of Fish and Wildlife (CDFW) is responsible for conserving, protecting, and managing California's fish, wildlife, and native plant resources. To meet this responsibility, the Fish and Game Code (Section 1602) requires an entity to notify CDFW of any proposed activity that may substantially modify a river, stream, or lake. Notification is required by any person, business, state or local government agency, or public utility that proposes an activity that will:

- substantially divert or obstruct the natural flow of any river, stream or lake;
- substantially change or use any material from the bed, channel, or bank of, any river, stream, or lake; or
- deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake.

The notification requirement applies to any work undertaken in or near a river, stream, or lake that flows at least intermittently through a bed or channel. This includes ephemeral streams, desert washes, and watercourses with a subsurface flow. It may also apply to work undertaken within the flood plain of a body of water.[52]

California Ocean Plan
