 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - - - - - - - - - - - - - - - - -

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses URBAN Dispersion Algorithm for the SBL for    29 Source(s),
```

```
   for Total of    1 Urban Area(s):
   Urban Population =     56793.0 ;  Urban Roughness Length =  1.000 m

 **Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.
        6. Urban Roughness Length of 1.0 Meter Assumed.

 **Other Options Specified:
        ADJ_U*   - Use ADJ_U* option for SBL in AERMET
        TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  PM_10

 **Model Calculates ANNUAL Averages Only

 **This Run Includes:     29 Source(s);       1 Source Group(s); and     185
Receptor(s)

               with:      0 POINT(s), including
                          0 POINTCAP(s) and      0 POINTHOR(s)
                and:     29 VOLUME source(s)
                and:      0 AREA type source(s)
                and:      0 LINE source(s)
                and:      0 OPENPIT source(s)
                and:      0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
         Model Outputs Tables of ANNUAL Averages by Receptor
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours
```

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses URBAN Dispersion Algorithm for the SBL for    34 Source(s),
   for Total of    1 Urban Area(s):
   Urban Population =     20883.0 ;  Urban Roughness Length =  1.000 m

 **Model Uses Regulatory DEFAULT Options:
         1. Stack-tip Downwash.
         2. Model Accounts for ELEVated Terrain Effects.
         3. Use Calms Processing Routine.
         4. Use Missing Data Processing Routine.
         5. No Exponential Decay.
         6. Urban Roughness Length of 1.0 Meter Assumed.

 **Other Options Specified:
         ADJ_U*   - Use ADJ_U* option for SBL in AERMET
         TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  PM_10

 **Model Calculates ANNUAL Averages Only

 **This Run Includes:     34 Source(s);       1 Source Group(s); and     137
Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:     34 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
          Model Outputs Tables of ANNUAL Averages by Receptor
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
```

Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
m for Missing Hours
b for Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 47.00 ; Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ;
Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.5 MB of RAM.

**Input Runstream File: aermod.inp

**Output Print File: aermod.out

**Detailed Error/Message File: Segment 6, 10.err

**File for Summary of Results: Segment 6, 10.sum

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
          Model Outputs Tables of ANNUAL Averages by Receptor
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    25.20 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                ;

  ***
 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - - - - - - - - - - - - - -

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses URBAN Dispersion Algorithm for the SBL for    21 Source(s),
   for Total of    1 Urban Area(s):
   Urban Population =     24440.0 ;  Urban Roughness Length =  1.000 m

 **Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.
        6. Urban Roughness Length of 1.0 Meter Assumed.

 **Other Options Specified:
        ADJ_U*   - Use ADJ_U* option for SBL in AERMET
        CCVR_Sub - Meteorological data includes CCVR substitutions
        TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  PM_10
```

```
 **Model Calculates ANNUAL Averages Only

 **This Run Includes:     21 Source(s);       1 Source Group(s); and      69
Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:     21 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
          Model Outputs Tables of ANNUAL Averages by Receptor
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =     6.70 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                 ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.5 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

- - - - - - - - - - - - - - - - - - - - - - -

 **Model Is Setup For Calculation of Average CONCentration Values.
```

```
  --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses URBAN Dispersion Algorithm for the SBL for    34 Source(s),
   for Total of    1 Urban Area(s):
   Urban Population =     31026.0 ;  Urban Roughness Length =  1.000 m

 **Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.
        6. Urban Roughness Length of 1.0 Meter Assumed.

 **Other Options Specified:
        ADJ_U*   - Use ADJ_U* option for SBL in AERMET
        TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  PM_10

 **Model Calculates ANNUAL Averages Only

 **This Run Includes:     34 Source(s);       1 Source Group(s); and     183
Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:     34 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
         Model Outputs Tables of ANNUAL Averages by Receptor
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
```

Keyword)

 **NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours

 **Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) =   716.00 ; Decay
Coef. =   0.000   ; Rot. Angle =   0.0
                  Emission Units = GRAMS/SEC   ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =   3.5 MB of RAM.

 **Input Runstream File: aermod.inp

 **Output Print File: aermod.out

 **Detailed Error/Message File: Segment 9, RIV I-10.err

 **File for Summary of Results: Segment 9, RIV I-10.sum

                                             ***     MODEL SETUP OPTIONS SUMMARY
  ***
 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - - - - - - - - - - - - - - - -

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses URBAN Dispersion Algorithm for the SBL for    23 Source(s),
   for Total of    1 Urban Area(s):
   Urban Population =    113054.0 ;  Urban Roughness Length =  1.000 m

 **Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.
        6. Urban Roughness Length of 1.0 Meter Assumed.

 **Other Options Specified:
```

```
         ADJ_U*   - Use ADJ_U* option for SBL in AERMET
         CCVR_Sub - Meteorological data includes CCVR substitutions
         TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  PM_10

 **Model Calculates ANNUAL Averages Only

 **This Run Includes:     23 Source(s);       1 Source Group(s); and     166
Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:     23 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
         Model Outputs Tables of ANNUAL Averages by Receptor
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   420.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                                 ;
Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.5 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out
```

- - - - - - - - - - - - - - - - - - - - - - -

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses URBAN Dispersion Algorithm for the SBL for    17 Source(s),
   for Total of    1 Urban Area(s):
   Urban Population =    167836.0 ;  Urban Roughness Length =  1.000 m

 **Model Uses Regulatory DEFAULT Options:
         1. Stack-tip Downwash.
         2. Model Accounts for ELEVated Terrain Effects.
         3. Use Calms Processing Routine.
         4. Use Missing Data Processing Routine.
         5. No Exponential Decay.
         6. Urban Roughness Length of 1.0 Meter Assumed.

 **Other Options Specified:
         ADJ_U*   - Use ADJ_U* option for SBL in AERMET
         CCVR_Sub - Meteorological data includes CCVR substitutions
         TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  PM_10

 **Model Calculates ANNUAL Averages Only

 **This Run Includes:     17 Source(s);       1 Source Group(s); and      79
Receptor(s)

                with:      0 POINT(s), including
```

```
                          0 POINTCAP(s) and      0 POINTHOR(s)
                and:     17 VOLUME source(s)
                and:      0 AREA type source(s)
                and:      0 LINE source(s)
                and:      0 OPENPIT source(s)
                and:      0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
         Model Outputs Tables of ANNUAL Averages by Receptor
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    27.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.5 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   Segment 11, RIV SR-91.err

 **File for Summary of Results:   Segment 11, RIV SR-91.sum

- - - - - - - - - - - - - - - - - - - - - -

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses URBAN Dispersion Algorithm for the SBL for    26 Source(s),
   for Total of    1 Urban Area(s):
   Urban Population =    173212.0 ;  Urban Roughness Length =  1.000 m

 **Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.
        6. Urban Roughness Length of 1.0 Meter Assumed.
```

```
 **Other Options Specified:
        ADJ_U*   - Use ADJ_U* option for SBL in AERMET
        TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  PM_10

 **Model Calculates ANNUAL Averages Only

 **This Run Includes:     26 Source(s);       1 Source Group(s); and     205
Receptor(s)

               with:      0 POINT(s), including
                          0 POINTCAP(s) and      0 POINTHOR(s)
                and:     26 VOLUME source(s)
                and:      0 AREA type source(s)
                and:      0 LINE source(s)
                and:      0 OPENPIT source(s)
                and:      0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
         Model Outputs Tables of ANNUAL Averages by Receptor
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   853.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.5 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out
```

- - - - - - - - - - - - - - - - - - - - -

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses URBAN Dispersion Algorithm for the SBL for    23 Source(s),
   for Total of    1 Urban Area(s):
   Urban Population =    122265.0 ;  Urban Roughness Length =  1.000 m

 **Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.
        6. Urban Roughness Length of 1.0 Meter Assumed.

 **Other Options Specified:
        ADJ_U*   - Use ADJ_U* option for SBL in AERMET
        TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.
```

```
 **The User Specified a Pollutant Type of:  PM_10

 **Model Calculates ANNUAL Averages Only

 **This Run Includes:     23 Source(s);       1 Source Group(s); and     164
Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:     23 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
          Model Outputs Tables of ANNUAL Averages by Receptor
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   853.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.5 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   Segment 13, SB I-15 VIC.err

 **File for Summary of Results:   Segment 13, SB I-15 VIC.sum
```

                                          ***     MODEL SETUP OPTIONS SUMMARY
  ***
 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - - - - - - - - - - - - - - -

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses URBAN Dispersion Algorithm for the SBL for    28 Source(s),
   for Total of    1 Urban Area(s):
   Urban Population =    173212.0 ;  Urban Roughness Length =  1.000 m

 **Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
```

```
         3. Use Calms Processing Routine.
         4. Use Missing Data Processing Routine.
         5. No Exponential Decay.
         6. Urban Roughness Length of 1.0 Meter Assumed.

 **Other Options Specified:
         ADJ_U*   - Use ADJ_U* option for SBL in AERMET
         TEMP_Sub - Meteorological data includes TEMP substitutions

 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  PM_10

 **Model Calculates ANNUAL Averages Only

 **This Run Includes:     28 Source(s);       1 Source Group(s); and     173
Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:     28 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
          Model Outputs Tables of ANNUAL Averages by Receptor
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =   379.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                 ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3
```

                                          ***     MODEL SETUP OPTIONS SUMMARY
  ***
 - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
- - - - - - - - - - - - - - - - - - - - - -

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses URBAN Dispersion Algorithm for the SBL for    34 Source(s),
   for Total of    1 Urban Area(s):
   Urban Population =    109067.0 ;  Urban Roughness Length =  1.000 m

 **Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.
        6. Urban Roughness Length of 1.0 Meter Assumed.

 **Other Options Specified:
        CCVR_Sub - Meteorological data includes CCVR substitutions
        TEMP_Sub - Meteorological data includes TEMP substitutions
```

```
 **Model Assumes No FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  PM_10

 **Model Calculates ANNUAL Averages Only

 **This Run Includes:     34 Source(s);       1 Source Group(s); and     158
Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:     34 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  14134

 **Output Options Selected:
          Model Outputs Tables of ANNUAL Averages by Receptor
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    11.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                  Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.5 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   Segment 15, VEN US-101 SB.err
```

*** MODEL SETUP OPTIONS SUMMARY ***

- - - -

```
                and:      0 OPENPIT source(s)
                and:      0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  14134

 **Output Options Selected:
          Model Outputs Tables of ANNUAL Averages by Receptor
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    21.00 ;  Decay
Coef. =    0.000     ;  Rot. Angle =     0.0
                 Emission Units = GRAMS/SEC                                ;
Emission Rate Unit Factor =   0.10000E+07
                 Output Units   = MICROGRAMS/M**3

 **Approximate Storage Requirements of Model =      3.5 MB of RAM.

 **Input Runstream File:          aermod.inp

 **Output Print File:             aermod.out

 **Detailed Error/Message File:   Segment 16, VEN US-101 TO.err

 **File for Summary of Results:   Segment 16, VEN US-101 TO.sum

INTRODUCTION

The Southern California Association of Governments (SCAG) is the lead California Environmental Quality Act (CEQA) agency for the proposed 2020–2045 Regional Transportation Plan and Sustainable Communities Strategy (2020 RTP/SCS or, the Plan). As the lead agency, SCAG has committed to prepare a Program Environmental Impact Report (PEIR) for the 2020 RTP/SCS.

SCAG is a federally designated Metropolitan Planning Organization (MPO) under Title 23, United States Code (USC.) 134(d)(1). The SCAG region consists of six counties (Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura) and 191 cities. The 2020 RTP/SCS is a regional planning document updated every four years for the SCAG region. The 2020 RTP/SCS will outline the region's goals and policies for meeting current and future mobility needs and provide a foundation for transportation decisions by local, regional and state officials that are ultimately aimed at achieving a coordinated and balanced transportation system. The 2020 RTP/SCS will also identify the region's transportation needs and issues, recommended actions, programs, and a list of projects to address the needs consistent with adopted regional policies and goals, and document the financial resources needed to implement the 2020 RTP/SCS. It is important to note that SCAG does not implement individual projects in the RTP, as they will be implemented by local and state jurisdictions, and other agencies. SCAG has already initiated the development of the 2020 RTP/SCS and is working closely with county transportation commission (CTCs) to compile a regional transportation project list that will build upon the list identified in the 2016 RTP/SCS [1].

This report describes the current biological resources within the region and evaluates the significance of the changes in biological resources that would result from implementation of the proposed 2020 RTP/SCS. In addition, this report provides a framework of mitigation measures for subsequent, site-specific environmental review documents prepared by lead agencies to reduce identified impacts. Information sources utilized in this discussion include the U.S. Fish and Wildlife Service (USFWS), the California Native Plant Society (CNPS), the California Natural Diversity Database (CNDDB), and the California Department of Fish and Wildlife (CDFW).

REGULATORY FRAMEWORK

Federal

Federal Endangered Species Act

The USFWS, under the auspices of the Federal Endangered Species Act of 1973 (ESA), manages and protects species listed as Endangered or Threatened. The USFWS can issue a permit for incidental "take" of listed species that can result from otherwise lawful activities. Take, under the federal definition, means to harass, harm (including habitat modification), pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to engage in any such conduct. The permitting process is used to determine if a project would

1 Southern California Association of Governments. 2016. 2016-2040 RTP/SCS. April. Available at: http://scagrtpscs.net/Documents/2016/final/f2016RTPSCS.pdf, accessed July 12, 2019.

jeopardize the continued existence of listed species and the mitigation measures that would be required to avoid or minimize impacts to listed species. Procedures for obtaining a permit for incidental take are set forth in Section 7 (for federal properties or where federal actions are involved) and Section 10 (for non-federal actions) of the ESA.

Candidate species do not have the full protection of the ESA; however, the USFWS advises applicants that candidate species could be elevated to listed species at any time.

The USFWS administers the ESA, which designates critical habitat for endangered species. This enables USFWS to carry out its mission to conserve, protect, and enhance the nation's fish and wildlife and their habitats for the continuing benefit of people. Critical habitat areas cannot be disturbed without permission from the USFWS and other federal agencies, depending on land ownership. The USFWS also manages a system of land and waters for the conservation of wildlife and associated ecosystems. These National Wildlife Refuges are primarily managed for the preservation and protection of unique or important resources and ecosystems.

Section 10 of Rivers and Harbors Appropriation Act of 1899

Authorization from the U.S. Army Corps of Engineers (USACE) must be obtained for construction of a structure in or over, or alteration (e.g., dredge or fill) of, any navigable water of the U.S., pursuant to Section 10 of the Rivers and Harbors Appropriation Act of 1899 (33 USC 401, 403, 407). Authorization is also needed for structures built near navigable water if they would affect the course, location, condition, or capacity of the water body, as through re-channelization, disposal of fill, and so forth. Geographic jurisdiction includes those waters subject to ebb and flow of the tide.

Migratory Bird Treaty Act of 1918 (MBTA)

The MBTA (16 USC §§ 703–712) makes it unlawful to pursue, capture, kill, or possess any migratory bird or part, nest, or egg of any such bird listed in wildlife protection treaties between the United States, Great Britain, Mexico, Japan, and the countries of the former Soviet Union. Similar to the federal ESA, the MBTA authorizes the Secretary of the Interior to issue permits for incidental take.

Fish and Wildlife Coordination Act (FWCA), 1956

The objective of the FWCA of 1956 (16 USC 661–666c) is to protect fish and wildlife when federal actions result in the control or modification of a natural stream or body of water. Under the FWCA, Federal agencies shall consider the effect that water-related projects would have on fish and wildlife resources, prevent loss or damage and develop and improve fish and wildlife resources. The FWCA requires consultation with USFWS and state fish and wildlife agencies to develop measures to protect, develop and improve fish and wildlife resources.

Section 404 of the Federal Clean Water Act (CWA)

Section 404 of the federal CWA (33 USC 1251), which is administered by the USACE, regulates the discharge of dredged and fill material into waters of the United States. USACE has established a series of nationwide permits that authorize certain activities in waters of the United States, provided that a proposed activity can demonstrate compliance with standard conditions. In general, USACE requires an individual permit for an activity that will affect an area equal to or in excess of 0.3 acre of waters of the United States. Projects that result in impacts to less than 0.3 acre of waters of the United States can normally be conducted pursuant to one of the nationwide permits, if consistent with the standard permit

conditions. USACE also has regional conditions which may apply to these nationwide permits depending upon the resources present, e.g., anadromous fish use. USACE also has discretionary authority to require an Environmental Impact Statement for projects that result in impacts to an area between 0.1 and 0.3 acre. Use of any nationwide permit is contingent on the activities having no impacts to endangered species.

Section 401 of the Federal CWA (1972)

Section 401 of the federal CWA (33 USC 1251) is administered by the State Water Resources Control Board (SWRCB) and the Regional Water Quality Control Boards (RWQCBs). Section 401 requires that prior to any federal permit or license, any activity, including river or stream crossings during road, pipeline, or transmission line construction, which may result in discharges into waters of the United States, must be certified by the applicable RWQCB. The SWRCB has conditionally certified 14 nationwide permits and denied 38 without prejudice. This certification ensures that the proposed activity does not violate federal water quality standards. The SCAG region lies within the jurisdiction of five RWQCBs:

- Colorado River Basin
- Lahontan
- Los Angeles
- Santa Ana
- San Diego

Marine Mammal Protection Act of 1972 (MMPA)

The MMPA (16 USC 31) protects all marine mammals, including cetaceans (whales, dolphins, and porpoises), otarids (seals and sea lions), phocids (true seals), odobenids (walruses; *Odobenus rosmarus*), sirenians (manatees and dugongs), sea otters (*Enhydra lutra*), and polar bears (*Ursus maritimus*) within the waters of the United States. The MMPA prohibits the "take" of marine mammals without a permit, with certain exceptions. The definition of "take" under the MMPA is consistent with that of the federal ESA. The MMPA is managed by the federal government. The National Marine Fisheries Service is responsible for managing cetaceans, otariids, and phocids. The USFWS is responsible for managing odobenids, sirenians, sea otters, and polar bears.

Marine Protection, Research, and Sanctuaries Act of 1972 (MPRSA)

The MPRSA (Public Law 92-532), also known as the Ocean Dumping Act, prohibits the dumping of material into the ocean that would unreasonably degrade or endanger human health or the marine environment. Ocean dumping cannot occur unless a permit is issued under the MPRSA. In the case of dredged material, the decision to issue a permit is made by the USACE, using the U.S. Environmental Protection Agency's (EPA) environmental criteria and subject to EPA's concurrence.

Emergency Wetlands Resources Act of 1986 (EWRA)

The objective of the EWRA (16 USC 3901–3932), dated November 10, 1986, is to promote the conservation of wetlands and help fulfill obligations contained in various migratory bird treaties. Under the EWRA, the USFWS must provide leadership and take action to:

- Intensify cooperative efforts to manage and conserve wetlands

- Intensify efforts to protect wetlands

Bald and Golden Eagle Protection Act (BGEPA)

The purpose of the federal BGEPA (16 USC 668–668c, as amended) that is administered by the USFWS protects bald (*Haliaeetus leucocephalus*) and golden eagles (*Aquila chrysaetos*), their nests, eggs, and parts.[2] The BGEPA states that no person shall take, possess, sell, purchase, barter, offer for sale, purchase or barter, transport, export, or import any bald or golden eagle alive or dead, or any part, nest, or egg without a valid permit to do so. The BGEPA prohibits the "take" of bald and golden eagles unless pursuant to regulations. Take is defined by the BGEPA as an action "to pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, molest, or disturb."

In addition to immediate impacts, this definition covers impacts that result from human-caused alterations initiated around a previously used nest site during a time when eagles were not present. Permits are issued to Native Americans to possess eagle feathers for religious purposes, and salvaged eagle carcasses can be sent to the National Eagle Repository in Colorado, where they are redistributed to Native Americans. Although the bald eagle was removed from the Endangered Species List in June 2007, it is still federally protected under the BGEPA and MBTA described above. In addition, the *National Bald Eagle Management Guidelines* were published in conjunction with delisting by the USFWS in May 2007 to provide provisions to continue to protect bald eagles from harmful actions and impacts.

Under the BGEPA, a final rule was published in May 2008 in the *Federal Register* that proposed authorization for take of bald eagles for those with existing authorization under the federal ESA where the bald eagle is covered in an HCP or the golden eagle is covered as a non-listed species.[3] The final rule also established a new permit category to provide expedited permits to entities authorized to take bald eagles through Section 7 Incidental Take Permits.

Wetlands – Executive Order Number 11990

Executive Order (EO) 11990 was issued in May 1977, as a furtherance of the National Environmental Policy Act (NEPA) providing protection of wetlands. Pursuant to the EO, all new construction should be designed to the greatest extent possible to avoid long- and short-term adverse impacts that would lead to the destruction or the modification of wetlands, in order to preserve and enhance the natural and beneficial values of wetlands. The procedures require the determination of whether or not the proposed project will be in or will affect wetlands. If so, a wetlands assessment must be prepared that describes the alternatives considered. Federal agencies, such as the Federal Highway Administration (FHWA), cannot undertake or provide assistance for new construction located in wetlands unless the head of the agency finds that: (1) there is no practicable alternative to the construction and (2) the proposed project includes all practicable measures to minimize harm.

2 U.S. Fish and Wildlife Service (USFWS). 2007. National Bald Eagle Management Guidelines. May. Available at: https://www.fws.gov/southdakotafieldoffice/NationalBaldEagleManagementGuidelines.pdf, accessed January 23, 2019.

3 Federal Register. 2008. Notices. 73(98): 29075–84. May.

Invasive Species – Executive Order Number 13112

This EO was signed by President Clinton on February 3, 1999. It serves to prevent activities that may promote the introduction and spread of invasive species. The order states that federal agencies whose actions

"may affect the status of invasive species shall … use relevant programs and authorities to … prevent the introduction of invasive species … detect and respond rapidly to and control populations of such species in a cost-effective and environmentally sound manner…monitor invasive species populations accurately and reliably … provide for restoration of native species and habitat conditions in ecosystems that have been invaded."

In order to implement EO 13112, the FHWA has established guidance to prevent the introduction and spread, and promote the control, of invasive plant species on highway rights-of-way. Under EO 13112, federal agencies are prohibited from authorizing, funding, or carrying out actions that are likely to promote or result in the introduction or spread of invasive species unless all feasible measures to minimize the impacts have been analyzed and considered.

National Environmental Policy Act

NEPA is implemented by regulations (40 Code of Federal Regulations [CFR] § 1500 *et seq*.), which require careful consideration of the harmful effects of federal actions or plans, including projects that receive federal funds, if they may have a significant adverse effect on the environment. NEPA mandates that all federal agencies carry out their regulations, policies, and programs in accordance with NEPA's policies of environmental protection. NEPA encourages the protection of all aspects of the environment and requires federal agencies to utilize a systematic, interdisciplinary approach to agency decision-making that will ensure the integrated use of natural sciences such as geology. While NEPA compliance is not required for the Plan, NEPA compliance will be required for transportation improvement projects that will be financed using federal funds. Some development projects (such as low-income housing) also use federal funds and are subject to NEPA. The regulations also require projects requiring NEPA review to seek to avoid or minimize adverse effects of proposed actions, and restore and enhance environmental quality as much as possible.

The Council on Environmental Quality (CEQ) oversees NEPA, and the EPA carries out administrative aspects of the NEPA process. NEPA mandates that the federal government shall give appropriate consideration to potential adverse environmental impacts of their major actions, including impacts to biological resources.

State

Section 1600 of the State Fish and Game Code, Lake or Streambed Alteration

All diversions, obstructions, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake in California are subject to the regulatory authority of the CDFW pursuant to Sections 1600 through 1603 of the California Fish and Game Code (FGC) and require preparation of a Streambed Alteration Agreement. Pursuant to 14 CCR § 1.72, a stream is defined as a "body of water that flows at least periodically, or intermittently, through a bed or channel having banks and supporting fish or other aquatic life. This includes watercourses having a surface or subsurface flow that supports or has supported

riparian vegetation." Altered or artificial waterways valuable to fish and wildlife are subject to CDFW jurisdiction. CDFW also has jurisdiction over dry washes that carry water ephemerally during storm events.

Section 2080 of the State Fish and Game Code, California Endangered Species Act (California ESA)

The California ESA prohibits the take of listed species except as otherwise provided in state law. Unlike the federal ESA, the California ESA applies the take prohibitions to species petitioned for listing (state candidates). State lead agencies are required to consult with the CDFW to ensure that any actions undertaken by the lead agency are not likely to jeopardize the continued existence of any state-listed species or result in destruction or degradation of required habitat. CDFW is authorized to enter into Memoranda of Understanding (MOUs) with individuals, public agencies, universities, zoological gardens, and scientific or educational institutions to import, export, take, or possess listed species for scientific, educational, or management purposes.

Pursuant to Section 2081 of the California FGC, the CDFW may authorize individuals or public agencies to import, export, take, or possess, any state-listed endangered, threatened, or candidate species. These otherwise prohibited acts may be authorized through permits or MOUs if:

- The take is incidental to an otherwise lawful activity.
- The impacts of the authorized take are minimized and fully mitigated.
- The permit is consistent with any regulations adopted pursuant to any recovery plan for the species.
- The applicant ensures adequate funding to implement the measures required by CDFW.

CDFW shall make this determination based on available scientific information and shall include consideration of the ability of the species to survive and reproduce.

Sections 2800 through 2840 of the State Fish and Game Code, Natural Community Conservation Planning Act

Section 2800 through 2840 of the State Fish and Game Code provides a mechanism to conserve natural communities on an ecosystem level while accommodating compatible land use. Specifically, it is used to provide comprehensive management and conservation of multiple wildlife species and the natural communities in which they occur.

Sections 3503 and 3503.5 of the State Fish and Game Code, Resident and Migratory Birds

Sections 3503 and 3503.5 of the State Fish and Game Code provide regulatory protection to resident and migratory birds and all birds of prey within the State of California, including the regulation of the taking of nests and eggs, unless otherwise provided for by the State Fish and Game Code. Specifically, it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, or destroy the nest or eggs of any bird of prey, except as otherwise provided.

Sections 3511, 4700, 5050, and 5515 of the State Fish and Game Code, Fully Protected Species

The classification of fully protected was the state's initial effort to identify and provide additional protection to those animals that were rare or faced possible extinction. Lists were created for fish, amphibians and reptiles, birds, and mammals. Most of the species on these lists have subsequently been listed under the state and/or federal ESA. Sections 3511, 4700, 5050 and 5515 of the Fish and Game Code state that fully protected species (birds, mammals, fish, reptiles, amphibians) or parts thereof may not be taken or possessed at any time and no licenses or permits may be issued for their take except for collecting these species for necessary scientific research and relocation of the bird species for the protection of livestock.

Title 14, § 460 of the California Code of Regulations

The regulations of take of furbearing mammals are established within the California Code of Regulations (CCR), Title 14, Division 1 (Subdivision 2), Chapter 5. Take is prohibited for several furbearing mammals under Title 14, § 460 of the CCR, including, but not limited to, desert kit fox (*Vulpes macrotis arsipus*) and red fox (*Vulpes vulpes*). Title 14 § 460 is supported by Sections 200, 202, 203, and 4009.5 of the State FGC.

California Porter-Cologne Water Quality Control Act (1969, amended 2019)

Pursuant to the California Porter-Cologne Water Quality Control Act (California Water Code, Division 7), the State Water Resources Control Board is granted ultimate authority over water quality policy for the State of California. The RWQCBs oversee water quality at the local and regional levels, and regulate pollutant and nuisance discharges into waters of the state. Waters of the state are defined as any surface water or groundwater, including saline waters, within the boundaries of the state. Before allowing discharges that may affect the quality of waters of the state, a Report of Waste Discharge must be filed with the RWQCB.

California Wild and Scenic Rivers Act (1972)

The objective of the California Wild and Scenic Rivers Act of 1972 (Public Resources Code [PRC] 5093.50) is the preservation of certain rivers, together with their immediate environments, which possess extraordinary scenic, recreational, fishery, or wildlife values. The Act provides permanent protection for some of the state's most outstanding free flowing rivers and prohibits actions such as the construction of dams or other harmful instream activities, except to serve local needs.

California Coastal Act (1976, amended 2019)

Through the California Coastal Act (PRC Division 20), the California Coastal Commission has unusually broad authority to regulate development in the Coastal Zone. A permit is required for any project that might change the intensity of land use in the Coastal Zone including projects that would require a building or grading permit from the city or county, major vegetation clearing, or subdividing. The coastal zone generally extends three miles seaward and about 1,000 yards inland. However, important and generally undeveloped areas where there can be considerable impact on the coastline from inland development, the coastal zone extends to a maximum of five miles inland from mean high tide line. In developed urban areas, the coastal zone extends substantially less than 1,000 yards inland.

California Native Plant Protection Act (1977)

The California Native Plant Protection Act (Fish and Game Code Section 1900–1913) includes measures to preserve, protect, and enhance rare and endangered native plants. The list of native plants afforded protection pursuant to the Native Plant Protection Act includes those listed as rare and endangered under the California ESA. The Native Plant Protection Act provides limitations by stating "no person will import into this State, or take, possess, or sell within this State" any rare or endangered native plant, except in compliance with provisions of the act. Individual landowners are required to notify the CDFW at least 10 days in advance of changing land uses to allow the CDFW to salvage any rare or endangered native plant material.

California Desert Native Plant Act (1981)

The main purpose of the Desert Native Plant Act (Food and Agriculture Code Division 23) is to preserve and enhance desert native plants by protecting certain species from unlawful harvesting on both public and privately-owned lands. The list of desert native plants afforded protection pursuant to the Desert Native Plant Act includes species within the Mojave Desert portions of Los Angeles, San Bernardino, and Riverside Counties. The Desert Native Plant Act provides limitations that no person will harvest, transport, or be in possession of certain native desert plants without authorization (i.e., valid permit or wood receipt). Authorization for take of native desert plants can be obtained through the sheriff or commissioner of the county where harvesting will occur and is subject to county-designated fees.

Natural Community Conservation Planning Act of 1991, as Amended

The Natural Community Conservation Planning Act of 1991 (NCCP), as amended in 2003 (Fish and Game Code Section 2800-2835) established the Natural Community Conservation Planning program for the protection and perpetuation of the state's biological diversity. The CDFW established the program in order to conserve natural communities at the ecosystem level while accommodating compatible land use. An NCCP plan identifies and provides for the regional or area-wide protection of plants, animals, and their habitats, while allowing compatible and appropriate economic activity. The CDFW provides support, direction, and guidance to participants in order to ensure that NCCP plans are consistent with the state ESA.

State Senate Concurrent Resolution No. 17 – Relative to Oak Woodlands

The State Senate Concurrent Resolution No. 17, filed with the Secretary of State on September 1, 1989, states that any state agencies having land use planning duties and responsibilities shall assess the effects of their land use decisions or actions within any oak woodlands containing blue oak (*Quercus douglasii*), Engelmann oak (*Q. engelmannii*), valley oak (*Q. lobata*), or coast live oak (*Q. agrifolia*). The State Senate defines "oak woodland" as a five-acre circular area containing five or more oak trees per acre. This resolution requires that state agencies must preserve and protect native oak woodlands to the maximum extent feasible or provide for replacement plantings where blue, Engelmann, valley, or coast live oak are removed from oak woodlands.

State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State

The SWRCB adopted procedures as an amendment to the Water Quality Control Plan for Ocean Waters of California and the Water Quality Control Plan for Inland Surface Waters, Enclosed Bays, and Estuaries of California to establish a statewide wetland definition and procedures for discharges on April 2, 2019. The procedures consist of four major elements: 1) a wetland definition; 2) a framework for determining if a feature that meets the wetland definition is a water of the state; 3) wetland delineation procedures; and 4) procedures for the submittal, review and approval of applications for Water Quality Certifications and Waste Discharge Requirements for dredge or fill activities. In accordance with EO W-59-93, the procedures ensure that the SWRCB's regulation of dredge or fill activities will be conducted in a manner "to ensure no overall net loss and long-term net gain in the quantity, quality, and permanence of wetlands acreage and values.

State Wildlife Action Plan (SWAP)

Congress created the State and Tribal Wildlife Grants (STWG) program in 2000, recognizing the need to fund programs for the conservation of wildlife diversity.4 Congress mandated each state and territory to develop a SWAP by 2005 that provided a comprehensive wildlife conservation strategy to continue receiving federal funds through the STWG program. California's first SWAP was completed by the California Department of Fish and Game (now the CDFW) and approved by the USFWS in 2005. California's SWAP 2005 identified and targeted Species of Greatest Conservation Need (SGCN) and the critical habitats on which they depend. The STWG program requires SWAP updates at least every 10 years. CDFW has recently prepared SWAP 2015, which is the first comprehensive update of SWAP 2005.5 Currently under USFWS review for approval, the SWAP 2015 focuses on conservation of the wildlife resources of the nation's most biologically diverse state using an approach that is in harmony with both a growing human population and the need for resilience in the face of a changing climate. Employing an ecosystem approach to conserve and manage diverse habitats and species, SWAP 2015 provides a blueprint for actions necessary to address the highest priorities for conserving California's aquatic, marine, and terrestrial resources.

Local

In addition to federal and state regulations described above, general plans and municipal codes of counties and cities in the SCAG region may include conservation elements that identify biological resources, including mature trees and locally important species that are afforded special consideration.

County General Plans and Ordinances

Per state general plan guidelines, a county's general plan is required to contain a conservation element as well as an open space element. These elements are generally where discussions regarding biological resources can be found. Each county's general plan varies in level of detail and necessary measures to

4 U.S. Fish & Wildlife Services. Accessed 29 October 2015. State Wildlife Grant Program – Overview. Available at: http://wsfrprograms.fws.gov/Subpages/GrantPrograms/SWG/SWG.htm, accessed January 10, 2019.

5 California Department of Fish and Wildlife. 2015. California State Wildlife Action Plan 2015 Update: A Conservation Legacy for Californians. Available at: https://www.wildlife.ca.gov/SWAP/Final, accessed January 10, 2019.

preserve biological resources. The counties within the SCAG area may each have individual codes or ordinances protecting biological resources. A commonly occurring ordinance is a native tree protection or oak tree protection ordinance. These codes and ordinances generally have a limited scope, in this case the removal of specific tree species, which are afforded some level of protection.

IMPERIAL COUNTY

The Imperial County Code of Ordinances has established two codes related to biological resources (Chapter 12.44, Wildlife Protection, and Chapter 12.48 Wild Flowers and Trees). The Conservation and Open Space Element of the Imperial County General Plan has established one goal and two policies related to biological resources.6 The County's two codes, one goal, and two supporting policies relevant to the SCAG projects provide protection to wildlife, wild flowers and trees, as well as preservation of native plant communities and best restoration practices.

LOS ANGELES COUNTY

The Conservation and Natural Resources Element of the Los Angeles County General Plan 2035 Update has established two goals and 13 policies related to biological resources. Ten of the 13 policies are relevant to the SCAG projects.7 The two goals and eight supporting policies that apply to SCAG activities provide protection to natural habitats, special status species, sensitive plant communities, wildlife corridors, watersheds and other sensitive biological resources. They also act to discourage development in natural or biologically sensitive areas. In addition, the Los Angeles County Code of Ordinances has established an ordinance to protect native oak trees.

Los Angeles County has designated several areas containing sensitive biological resources as Significant Ecological Areas (SEAs). SEAs are areas that warrant special management because they contain biotic resources that are considered to be rare or unique; are critical to the maintenance of wildlife; represent relatively undisturbed areas of Los Angeles County Habitat Types; or serve as linkages. Any development within SEAs is subject to the discretion and policies of the Significant Ecological Areas Technical Advisory Committee (SEATAC).

ORANGE COUNTY

The Resources Element of the Orange County General Plan has established one goal and one policy related to biological resources.8 The one goal and one supporting policy relevant to SCAG projects provide protection to wildlife, plants, and vegetation communities.

RIVERSIDE COUNTY

The Riverside County Code of Ordinances has established one ordinance related to biological resources (No. 559, Section 1). The Open Space and Conservation Element of the Riverside County General Plan has established two objectives and eight policies related to biological resources.9 The one ordinance, two goals, and eight supporting policies relevant to the SCAG projects provide protection to native trees, native plant communities, critical habitat, sensitive habitats, sensitive species, and wildlife corridors. They also ensure continued participation and compliance with the County's Multi-Species Habitat Conservation Program (MSHCP) and the San Bernardino kangaroo rat (*Dipodomys merriami parvus*) Habitat Conservation Plan (HCP).

SAN BERNARDINO COUNTY

The San Bernardino County Development Code has established one code related to biological resources (Chapter 88.01.010(c)). The Conservation Element of the San Bernardino County General Plan has established one goal and six policies related to biological resources.10 The one code, two goals, and six supporting policies relevant to SCAG projects provide protection to native species, sensitive species and sensitive plant communities. They also warrant coordination with the appropriate resource management agencies and interested groups to maintain the County's biological resources.

VENTURA COUNTY

The Ventura County Code of Ordinances has established one ordinance related to biological resources. The Resources Element of the Ventura County General Plan has established one goal and two policies related to biological resources.[11] The one code, one goal, and six supporting policies relevant to SCAG projects provide protection to native trees, sensitive species, sensitive habitats, wildlife corridors, and locally important species/communities.

City General Plan and Ordinances

In accordance with Sections 6530(c) and (d) of the California Government Code, like the six counties in the SCAG region, all cities are required to have a conservation element and an open space element, as mandatory elements of their general plans. The conservation element provides goals and polices related to conservation, development, and utilization of natural resources including water and its hydraulic force, forests, soils, rivers and other waters, harbors, fisheries, wildlife, minerals, and other natural resources. One of the six required aspects of the open space element is for planning, conservation and management of open space for the preservation of natural resources, including habitat for fish and wildlife species; areas required for ecologic and other scientific study purposes; rivers, streams, bays and estuaries; and coastal beaches, lakeshores, banks of rivers and streams, and watershed lands. In addition, many of the

cities have ordinances related to protection, conservation and management of natural habitats, and associated plant and animal resources.

EXISTING CONDITIONS

Environmental Setting

The SCAG region encompasses an area of varied topography and diverse ecosystems. An ecosystem is the dynamic complex of plant and animal communities and their associated non-living environment. The region covers over 38,000 square miles across six counties, encompassing two mountain ranges, two deserts, and approximately 150 miles of coastline, with elevations ranging from -266 to more than 11,500 feet above mean seal level (msl). Due to the remarkable variation in the region's topography, climate, and landforms, the biological communities within the area are exceptionally diverse and call for a broad approach to their description.

The SCAG region primarily encompasses five United States Department of Agriculture (USDA) regionally defined Ecological Sections.12 These include:

Southern California Coast Section. This ecological region is bound to the west by the Pacific Ocean. This section has coastal terraces and low elevation ranges with alluvial lowlands. Plant communities are generally comprised of coastal sagebrush, sagebrush, chaparral, and western hardwood communities. This ecological region occurs in Ventura, Los Angeles and Orange Counties and a small portion of extreme southwestern Riverside County.

Southern California Mountain and Valley Section. Located generally immediately east of the Southern California Coast Section, this region has a landscape of moderate elevation and narrow ranges primarily vegetated with chaparral, chaparral-mountain scrub, western hardwoods, pine, and fir-spruce communities. This ecological section is present in every SCAG county.

Mojave Desert Section. Located primarily within the northeast portion of the SCAG region, this ecological section consists of short mountain ranges, basins, playas and dunes. Much of this ecological region is vegetated with creosote bush scrub and desert scrub, with pinyon-juniper and other communities within the large array of elevations within this wide section. The Mojave Desert comprises a large portion of San Bernardino County, and smaller portions of Los Angeles and Riverside Counties.

Colorado Desert Section. This area is largely a plain comprised of alluvial deposits associated with the Salton Sea in Imperial and Riverside Counties. Native vegetation is sparse creosote bush scrub and desert scrub communities, with a high concentration of agricultural lands.

Sonoran Desert Section. This area consists of desert plain interspersed with small low elevation mountain ranges primarily vegetated with creosote bush scrub and desert scrub plant communities. This section covers a large portion of eastern Imperial and Riverside Counties and the southeastern portion of San Bernardino County.

12 Descriptions of "Ecological Subregions: Sections of the Conterminous United States. 2017. General Technical Report WO-76B. United States Department of Agriculture, Forest Service. Available at: http://www.edc.uri.edu/atmt-dss/report_forecast/landscape_dynamics/SectionDescriptions.pdf. Accessed July 8, 2019.

Definitions

Definitions of terms used in the regulatory framework, characterization of baseline conditions, and impact analysis for biological resources are provided.

Critical Habitat: A designated area defined by the United States Fish and Wildlife Services (USFWS) as being important for the survival of species listed pursuant to the federal ESA. The USFWS evaluates the collection of the environmental conditions (i.e., plant communities, range, elevation, food source, etc.) essential to the continued conservation and preservation of each species listed as federally threatened and endangered.

Federally Listed Species: Species provided with special legal protection under the federal ESA. A federally listed endangered species is a species that is in danger of extinction throughout all or a significant portion of its range. A federally threatened species is one likely to become endangered in the absence of special protection or management efforts provided by the listing. A candidate species is one that is proposed by the federal government for listing as endangered or threatened.

Federal Wetlands: Defined by the USACE and the EPA as: "Those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas."13

Habitat Conservation Plans (HCPs): Required by the USFWS as part of an application for an "incidental take" permit for species listed pursuant to the federal ESA. HCPs describe the anticipated effects of the proposed taking, how the impacts will be minimized and mitigated, and how the HCP is to be funded.

Locally Important Species: Species that are not monitored by the resource agencies, but monitored by private organizations or local municipal governments. For the purposes of this EIR, locally important species include those plant species recognized by the California Native Plant Society (CNPS), a private organization dedicated to the conservation of native plants, as well as those recognized by the Audubon Society.

Natural Community Conservation Plan : Defined by CDFW as a plan for the conservation of natural communities that identifies and provides for the regional or area-wide protection and perpetuation of plants, animals, and their habitats.

Nursery Site: Considered habitat in which native wildlife may establish nests, maternity roosts, dens, or otherwise engage in breeding and/or the rearing of offspring.

Sensitive Plant Community: A native plant community listed on CDFW Natural Communities List as being rare within California or threatened by human actions.

Special Status Species: Species that have been afforded special recognition by federal, state, and/or local resource agencies or jurisdictions, or recognized resource conservation organizations. Special status wildlife species include those that are federally or state-listed as endangered, threatened, or candidate species pursuant to the federal ESA, the California ESA, or other regulations enforced by a federal or

13 U.S. Army Corps of Engineers. 1987. *Corps of Engineers Wetland Delineation Manual*. Vicksburg, MS.

state agency; or those species considered by the scientific community to be rare. For the purposes of this analysis, special status species include listed, sensitive, and locally important species.

Species of Special Concern (SSC): Species, subspecies, or distinct population of an animal (bird, mammal, fish, reptile, and amphibian) native to California that currently satisfies one or more of the following criteria: (a) is extirpated from the state or, in the case of birds, in its primary seasonal or breeding role; (b) is listed as federally, but not state-, threatened or endangered; (c) meets the state definition of threatened or endangered but has not formally been listed; (d) is experiencing, or formerly experienced, serious (noncyclical) population declines or range retractions (not reversed) that, if continued or resumed, could qualify it for state-threatened or endangered status; (e) has naturally small populations exhibiting high susceptibility to risk from any factor(s), that if realized, could lead to declines that would qualify it for statethreatened or endangered status.

State-designated Sensitive Species: Species that are not listed by the state government as endangered, threatened, or candidate species but are categorized by the state as a species of special concern or fully protected species. A California species of special concern is defined by CDFW as being a wildlife species that has declining population levels, a limited range, and/or continuing threats that have made it vulnerable to extinction.

State-Listed Species: Species provided special legal protection under the California ESA. A state-listed endangered species is a species that is in danger of extinction throughout all or a significant portion of its range. A state-listed threatened species is one likely to become endangered in the absence of special protection or management efforts provided by the listing. A candidate species is one that is proposed by the federal or state government for listing as endangered or threatened.

State Streams: Defined by the California Fish and Game Code. A stream is defined as a body of water that flows at least periodically, or intermittently, through a bed or channel having banks and supporting fish or other aquatic life.

State Wetlands: Defined by the SWRCB as an area that, under normal circumstances, (1) has continuous or recurrent saturation of the upper substrate caused by groundwater, or shallow surface water, or both; (2) the duration of such saturation is sufficient to cause anaerobic conditions in the upper substrate; and (3) the area's vegetation is dominated by hydrophytes or the area lacks vegetation.

Waters of the United States: Surface waters such as navigable waters and their tributaries, all interstate waters and their tributaries, natural lakes, all wetlands adjacent to other waters, and all impoundments of these waters. On April 21, 2014, the EPA proposed to refine the definition of waters of the United States to include all tributaries of traditional navigable waters, interstate waters, territorial seas, and impoundments of such tributaries; wetlands adjacent to the foregoing; and waters other than wetlands that are adjacent to other jurisdictional waters.14

Wildlife Movement Corridors: Characterized as areas of habitat that are used by wildlife for the purpose of moving between locations.

14 Federal Register. 2014. Proposed Rules. 79(76). April. Available online at: http://www.gpo.gov/fdsys/pkg/FR-2014-04-21/pdf/2014-07142.pdf, accessed March 19, 2019.

Special - Status Species and Critical Habitat

Special-status species are generally defined as: (1) species listed as a candidate, threatened, or endangered under the federal or state ESA; (2) species considered rare or endangered under the CEQA; (3) plants considered "Rare, Threatened, or Endangered in California" by CNPS (Lists 1B and 2); (4) animal listed as "species of special concern" by the state; and (5) animals fully protected in California FGC.

Critical habitat is a specific geographic area(s) that is essential for the conservation of a threatened or endangered species and that may require special management and protection. Critical habitat is designated by the USFWS under the federal ESA and cannot be disturbed without permission from the USFWS and other federal agencies, depending on land ownership. The listing process for individual species may include designation of critical habitat. Critical habitat may include an area that is not currently occupied by the species but that may be needed for its recovery.

The following discussion is based on a background search of special-status species that are documented in the CNDDB, the CNPS Inventory of Rare and Endangered Plants, and the USFWS Endangered and Threatened species list. The background search was regional in scope and focused on the documented occurrences within the boundaries of the SCAG region. There are 63 federally or state-listed wildlife and 72 listed plant species with historical records located within the six counties of the SCAG region as well as over 5.5 million acres of designated critical habitat (Table 1).

Table 1. Summary of Special-Status Species and Designated Critical Habitat in the SCAG Region

County	Number Federally and State-Listed Wildlife Species	Number Federally and State-Listed Plant Species	Acres of Critical Habitat
Imperial	19	4	423,065
Los Angeles	37	30	108,574
Orange	22	11	27,833
Riverside	34	21	938,789
San Bernardino	32	24	3,673,963
Ventura	28	19	358,793
Entire SCAG Region	63	72	5,530,964

Source: California Department of Fish and Wildlife. 2019. Rarefind 5: A Database Application for the Use of the California Department of Fish and Game Natural Diversity Data Base. Sacramento, CA.

Every county within the SCAG region contains USFWS-designated critical habitat for listed species (Figure 1). Critical habitat for 46 of these ferally listed species has been established within the SCAG region (Table 2). San Bernardino, the largest county in the country, contains nearly 3,700,000 acres of designated critical habitat, or over 66% of the lands designated in the SCAG region. Both San Bernardino and Riverside each have designated habitat for 22 species, the most of any SCAG counties. Over 86% (4,685,378 acres) of all the Critical Habitat in the region is for desert tortoise (*Gopherus agassizii*) and this species represents the largest designated critical habitat in the four of the six SCAG counties in which it is present (San Bernardino, Riverside, Los Angeles, and Imperial Counties). Coastal California gnatcatcher (*Polioptila californica californica*) has the largest critical habitat in Orange County (with 19,000 acres, or nearly 67% of the designated lands in the County). California Condor (*Gymnogyps californianus*) has nearly 180,000 acres designated in Ventra County, or almost 50% of all critical habitat designated in the County. Each county has Designated Critical Habitat for a wide variety of species (including plants, amphibians, fish, reptiles, insects, crustaceans, birds, and mammals) and each county has a wide diversity of natural communities to support these species.

State and Federally Listed Species

A search of relevant literature and databases for the six counties of the SCAG region was performed to develop a list of federally and state-listed species that could potentially occur in the SCAG region (Table 3; Figure 2) Literature and database records reviewed were:

- CNDDB (RareFind 5): administered by CDFW; Biogeographical Data Branch inventories the status and locations of rare plants, animals, and natural communities in California.
- CNPS online electronic Inventory of Rare and Endangered Vascular Plants of California
- Calflora, Information on wild California plants for conservation, education, and appreciation. http://www.calflora.org/.
- information about birds. http://ebird.org.

There are 135 listed species recorded in the region. These included federally listed threatened and endangered and state-listed threatened, endangered or rare species. Although only the third largest County in the region, Los Angeles had the greatest number of listed species with 70. The smallest County, Orange, had the lowest number of species with 34.

Figure 2. State and Federally Listed Species in the SCAG Region

Table 3. Federally and State Listed Species Reported in the SCAG Region.

Scientific Name	Common Name	Status	Counties Where Reported	Designated Critical Habitat (Acres)
Plants				
Acanthoscyphus parishii var. goodmanian	Cushenbury oxytheca	FE, CRPR: 1B.1	SB	ND
Acmispon argophyllus var. adsurgens	San Clemente Island bird's-foot trefoil	SE, CRPR: 1B.1	LA	ND
Acmispon dendroideus var. traskiae	San Clemente Island lotus	FT, SE, CRPR: 1B.3	LA	ND
Allium munzii	Munz's onion	FE, ST, CRPR: 1B.1	RIV	98
Ambrosia pumila	San Diego ambrosia	FE, CRPR: 1B.1	RIV	307
Arenaria paludicola	Marsh sandwort	FE, SE ,CRPR: 1B.1	LA, RIV, SB	ND
Astragalus albens	Cushenbury milk-vetch	FE, CRPR: 1B.1	SB	4,370
Astragalus brauntonii	Braunton's milk-vetch	FE, CRPR: 1B.1	LA, VEN, OR	3298
Astragalus jaegerianus	Lane Mountain milk-vetch	FE, CRPR: 1B.1	SB	14167
Astragalus lentiginosus var. coachellae	Coachella Valley milk-vetch	FE, CRPR: 1B.2	RIV	9671
Astragalus magdalenae var. peirsonii	Peirson's milk-vetch	FT, SE, CRPR: 1B.2	IMP	12105
Astragalus pyncnostachyus var. lanosissimus	Ventura Marsh milk-vetch	FE, SE, CRPR: 1B.1	LA, OR, VEN	220
Astragalus tener var. titi	Coastal dunes milk-vetch	FE, SE, CRPR: 1B.1	LA	ND
Astragalus traskiae	Trask's milkvetch	SR, CRPR: 1B.2	VEN	ND
Astragalus tricarinatus	Triple-ribbed milk vetch	FE, CRPR: 1B.2	RIV, SB	ND
Atriplex coronata var. notatior	San Jacinto valley crownscale	FE, CRPR: 1B.1	RIV	ND
Berberis nevinii	Nevin's barberry	FE, SE, CRPR: 1B.1	LA, RIV, SB	5.3
Berberis pinnata ssp. insularis	Island barberry	FE, SE, CRPR: 1B.2	VEN	ND
Boechera hoffmannii	Hoffmann's rockcress	FE, CRPR: 1B.1	VEN	ND
Brodiaea filifolia	Thread-leaved brodiaea		LA, OR, RIV, SB	2799
Castilleja cinerea	Ash-gray paintbrush	FT, CRPR: 1B.2	SB	1767
Castilleja gleasoni	Mt. Gleason paintbrush	SR, CRPR: 1B.2	LA	ND
Castilleja grisea	San Clemente Island paintbrush	FT, SE, CRPR: 1B.3	LA	ND
Ceanothus ophiochilus	Vail Lake ceanothus	FT, SE, CRPR: 1B.1	RIV	200
Cercocarpus traskiae	Catalina Island mountain-mohagany	FE, SE, CRPR: 1B.1	LA	ND
Chloropyron maritimum ssp. Maritimum	Salt marsh bird's-beak	FE, SE, CRPR: 1B.2	LA, OR, RIV, SB, VEN	ND
Chorizanthe parryi var. fernandina	San Fernando Valley spineflower	FPT, SE, CRPR: 1B.1	LA, OR, VEN	ND
Crocanthemum greenei	Island rush-rose	FT, CRPR: 1B.2	LA	ND
Croton wigginsii	Wiggins' croton	SR, CRPR: 2B.2	IMP	ND

Scientific Name	Common Name	Status	Counties Where Reported	Designated Critical Habitat (Acres)
Deinandra minthornii	Santa Susana tarplant	SR, CRPR: 1B.2	LA, VEN	ND
Deinandra mohavensis	Mojave tarplant	SE, CRPR: 1B.3	RIV, SB	ND
Delphinium hesperium ssp. Cuyamacae	Cuyamaca larkspur	SR, CRPR: 1B.2	RIV	ND
Delphinium variegatum ssp. Kinkiense	San Clemente Island larkspur	FE, SE, CRPR: 1B.1	LA	ND
Dithyrea maritima	Beach spectaclepod	ST, CRPR: 1B.1	LA, VEN	ND
Dodecahema leptoceras	Slender-horned spineflower	FE, SE, CRPR: 1B.1	LA, RIV, SB	ND
Dudleya cymosa ssp. Agourensis	Agoura Hills dudleya	FT, CRPR: 1B.2	LA, VEN	ND
Dudleya cymosa ssp. Marcescens	Marcescent dudleya	FT, SR, CRPR: 1B.2	LA, VEN	ND
Dudleya cymosa ssp. Ovatifolia	Santa Monica dudleya	FT, CRPR: 1B.1	LA	ND
Dudleya parva	Conejo dudleya	FT, CRPR: 1B.2	VEN	ND
Dudleya stolonifera	Laguna Beach dudleya	FT, ST, CRPR: 1B.1	OR	ND
Dudleya verityi	Verity''s dudleya	FT, CRPR: 1B.1	VEN	ND
Eremalche parryi ssp. Kernensis	Kern mallow	FE, CRPR: 1B.22	VEN	ND
Eremogone ursina	Big Bear Valley sandwort	FT, CRPR: 1B.2	SB	1411
Eriastrum densifolium ssp. Sanctorum	Santa Ana River woollystar	FE, SE, CRPR: 1B.1	OR, RIV, SB	ND
Erigeron parishii	Parish's daisy	FT, CRPR: 1B.1	RIV, SB	4,420
Eriogonum crocatum	Conejo buckwheat	SR, CRPR: 1B.2	VEN	ND
Eriogonum grande var. timorum	San Nicolas Island buckwheat	SE, CRPR: 1B.1	VEN	ND
Eriogonum kennedyi var. austromontanum	Southern Mountain buckwheat	FT, CRPR: 1B.2	SB	ND
Eriogonum ovalifolium var. vineum	Cushenbury buckwheat	FE, CRPR: 1B.1	SB	6,950
Eriogonum thornei	Thorne's buckwheat	SE, CRPR: 1B.2	SB	ND
Eryngium aristulatum var. parishii	San Diego button celery	FE, SE, CRPR: 1B.1	IMP, RIV, LA, OR	ND
Galium angustifolium ssp. Borregoense	Borrego bedstraw	SR, CRPR: 1B.3	IMP	ND
Galium catalinense ssp. Acrispum	San Clemente Island bedstraw	SE, CRPR: 1B.3	LA	ND
Helianthus niveus ssp. Tephrodes	Algodones Dune's sunflower	SE, CRPR: 1B.2	IMP	ND
Ivesia callida	Tahquitz ivesia	SR, CRPR: 1B.3	RIV	ND
Lithophragma maximum	San Clemente Island woodland star	FE, SE, CRPR: 1B.1	LA	ND
Malacothamnus clementinus	San Clemente Island bush mallow	FE, SE, CRPR: 1B.1	LA	ND
Malacothrix squalida	Island malacothrix	FE, CRPR: 1B.1	VEN	ND
Nasturtium gambelii	Gambel's water cress	FE, ST, CRPR: 1B.1	LA, OR, SB	ND
Navarretia fossalis	Spreading navarretia	FT, CRPR: 1B.1	LA, RIV	6,519

Scientific Name	Common Name	Status	Counties Where Reported	Designated Critical Habitat (Acres)
Orcuttia californica	California orcutt grass	FE, SE, CRPR: 1B.1	LA, RIV, VEN, OR	ND
Packera ganderi	Gander's ragwort	SR, CRPR: 1B.2	RIV	ND
Pentachaeta lyonii	Lyon's pentachaeta	FE, SE, CRPR: 1B.1	LA, VEN	3,580
Physaria kingii ssp. Bernardina	San Bernardino Mountains bladderpod	FE, CRPR: 1B.1	SB	1,026
Poa atropurpurea	San Bernardino blue grass	FE, CRPR: 1B.2	SB	1,415
Sibara filifolia	Santa Cruz Island rock cress	FE, CRPR: 1B.1	LA	ND
Sidalcea hickmanii ssp. parishii	Parish's checkerbloom	SR, CRPR: 1B.2	SB	ND
Sidalcea pedata	Bird-foot checkerbloom	FE, SE, CRPR: 1B.1	SB	ND
Taraxacum californicum	California dandelion	FE, CRPR: 1B.1	SB	1,955
Thelypodium stenopetalum	Slender-petaled thelypodium	FE, SE, CRPR: 1B.1	SB	ND
Verbesina dissita	Big-leaved crownbeard	FT, ST, CRPR: 1B.1	OR	ND
Crustaceans				
Branchinecta conservation	Conservancy fairy shrimp	FE	VEN	46,430
Branchinecta lynchi	Vernal pool fairy shrimp	FT	LA, RIV	46,430
Branchinecta sandiegonensis	San Diego fairy shrimp	FE	RIV, OR	200
Streptocephalus woottoni	Riverside fairy shrimp	FE	LA, OR, RIV	2,050
Insects				
Dinacoma caseyi	Casey's June beetle	FE	RIV	594
Euphilotes battoides allyni	El Segundo blue butterfly	FE	LA	
Euphydryas editha quino	Quino checkerspot butterfly	FE	SB, LA, RIV, OR	22,023
Euproserpinus euterpe	Kern primrose sphinx moth	FT	VEN	ND
Glaucopsyche lygdamus palosverdesensis	Palos Verdes blue butterfly	FE	LA	91
Rhaphiomidas terminatus abdominalis	Delhi sands flower-loving fly	FE	RIV, SB	ND
Fish				
Catostomus santaanae	Santa Ana sucker	FT	LA, VEN, OR, RIV, SB	9,360
Cyprinodon macularius	Desert pupfish	FE, SE	IMP, RIV	ND
Eucyclogobius newberryi	Tidewater goby	FE	LA, OR, VEN	448
Gasterosteus aculeatus williamsoni	Unarmored threespine stickleback	FE, SE	LA, VEN, SB	ND
Gila elegans	Bonytail	FE, SE	IMP, SB	10,113
Oncorhynchus mykiss irideus	Southern steelhead – southern California DPS	FE	LA, OC, VEN, RIV	292
Ptychocheilus lucius	Colorado pikeminnow	FE,SE	IMP, SB	ND
Siphateles bicolor mohavensis	Mohave tui chub	FE,SE	SB, LA	ND
Xyrauchen texanus	Razorback sucker	FE,SE	IMP, RIV, SB	9,166

Scientific Name	Common Name	Status	Counties Where Reported	Designated Critical Habitat (Acres)
Amphibians				
Anaxyrus californicus	Arroyo toad	FE	LA, VEN, OR, RIV, SB	30,800
Batrachoseps major aridus	Desert slender salamander	FE, SE	RIV	ND
Rana boylii	Foothill yellow-legged frog	SCT	VEN, LA, SB	
Rana draytonii	California red-legged frog	FT	LA, RIV, SB, VEN	33,279
Rana muscosa	Southern mountain yellow-legged frog	FE, SE	LA, SB, RIV	8,280
Reptiles				
Charina umbratica	Southern rubber boa	ST	VEN, RIV, SB	ND
Chelonia mydas	Green turtle	FT	LA, OR	ND
Coleonyx switaki	Barefoot gecko	ST	IMP	ND
Gambelia sila	Blunt-nosed leopard lizard	FE, SE	VEN	ND
Gopherus agassizii	Desert tortoise	FT, ST	IMP, SB, LA, RIV	4,685,740
Uma inornata	Coachella Valley fringe-toed lizard	FT, SE	RIV	11,790
Birds				
Agelaius tricolor	Tricolored blackbird	ST	LA, OR, RIV, SB, VEN	ND
Artemisiospiza belli clementeae	San Clemente sage sparrow	FT	LA	ND
Buteo swainsoni	Swainson's hawk	ST	LA, OR, RIV, SB	ND
Charadrius alexandrinus nivosus	Western snowy plover	FT	IMP, LA, OR, RIV, SB, VEN	1,400
Coccyzus americanus occidentalis	Western yellow-billed cuckoo	FT, SE	IMP, LA, RIV, SB, VEN, OR	39,015
Colaptes chrysoides	Gilded flicker	SE	IMP, RIV, SB	ND
Empidonax traillii extimus	Southwestern willow flycatcher	FE, SE	IMP, LA, OR, RIV, SB, VEN	24,980
Gymnogyps californianus	California condor	FE, SE	VEN, LA	187,558
Haliaeetus leucocephalus	Bald eagle	SE	IMP, LA, OR, RIV, SB	ND
Lanius ludovicianus mearnsi	San Clemente loggerhead shrike	FE	LA	ND
Laterallus jamaicensis coturniculus	California black rail	ST	IMP, LA, OR, RIV, SB, VEN	ND
Melanerpes uropygialis	Gila woodpecker	SE	IMP, RIV, SB	ND
Micrathene whitneyi	Elf owl	SE	IMP, RIV, SB	ND
Passerculus sandwichensis beldingi	Belding's savannah sparrow	SE	LA, OR, VEN	ND
Polioptila californica californica	Coastal California gnatcatcher	FT	LA, VEN, OR, RIV, SB	120,891
Rallus obsoletus levipes	Light-footed Ridegway's clapper rail	FE, SE	OR, VEN	ND
Rallus obsoletus yumanensis	Yuma clapper rail	FE, ST	IMP, RIV, SB	ND

Scientific Name	Common Name	Status	Counties Where Reported	Designated Critical Habitat (Acres)
Riparia riparia	Bank swallow	ST	LA, OR, VEN	ND
Sterna antillarum browni	California least tern	FE, SE	LA, OR, VEN	ND
Synthliboramphus scrippsi	Scripps's murrelet	FC, ST	LA	ND

Vireo bellii pusillus	Least Bell's vireo	FE, SE	IMP, LA, OR, VEN, RIV, SB	14,300
Mammals				
Ammospermophilus nelsoni	Nelson's antelope squirrel	ST	LA, VEN	ND
Arctocephalus townsendi	Guadalupe fur-seal	FT, ST	VEN	ND
Canis lupus	Gray wolf	FE, SE	SB	ND
Dipodomys merriami parvus	San Bernardino kangaroo rat	FE	LA, RIV, SB	33,290
Dipodomys stephensi	Stephen's kangaroo rat	FE, ST	RIV, SB	ND
Enhydra lutris nereis	Southern sea otter	FT	VEN	ND
Ovis canadensis nelson pop. 2	Peninsular bighorn sheep DPS	FE, ST	IMP, RIV	115,845
Perognathus longimembris pacificus	Pacific pocket mouse	FE	LA, OR	ND
Urocyon littoralis catalinae	Santa Catalina Island fox	FT, ST	LA	ND
Urocyon littoralis clementae	San Clemente Island fox	ST	LA	ND
Urocyon littoralis dickeyi	San Nicolas Island fox	ST	VEN	ND
Xerospermophilus mohavensis	Mohave ground squirrel	ST	LA, SB	ND

NOTE:

California Native Plant Society: California Rare Plant Rank (CRPR) 1B = Plants Rare, Threatened, or Endangered in California and Elsewhere; FC = Federal Candidate; FE = Federal Endangered; FT = Federal Threatened; SE = State Endangered; FPT = Fedreal Proposed Threatened; SR = State Rare; SCT= State Candidate Threatened; SB = San Bernardino County; LA = Los Angeles County; RIV = Riverside County; VEN = Ventura County; OR = Orange County; IMP = Imperial County; ND = none designated.

Sensitive Wildlife Species

A query of the CNDDB was performed to develop a list of sensitive wildlife species recognized by the CDFW as California SSC, or species that are tracked by the CNDDB that could potentially occur in the SCAG region. In addition to the federally and state-listed wildlife species described above, there are 233 sensitive wildlife species with historic records located within the SCAG region (Table 4; Figure 3).15 Of these sensitive wildlife species, Riverside and San Bernardino Counties had the highest diversity of species observed (both with over 21% of the total recorded for the SCAG region), followed closely by Los Angeles County (with over 20% of the wildlife recorded), and then Imperial, Orange, and Ventura Counties (with a range of 12–13% of the recorded observations).

Carolella busckana	Busck's gallmoth	CSA	LA, RIV, SB
Ceratochrysis bradleyi	Bradley's cuckoo wasp	CSA	RIV
Ceratochrysis longimala	Desert cuckoo wasp	CSA	RIV, VEN
Cicindela gabbii	western tidal-flat tiger beetle	CSA	LA, OR
Cicindela hirticollis gravida	sandy beach tiger beetle	CSA	LA, OR, VEN
Cicindela latesignata latesignata	western beach tiger beetle	CSA	LA, OR
Cicindela senilis frosti	senile tiger beetle	CSA	LA, OR, RIV, VEN
Cicindela tranquebarica viridissima	greenest tiger beetle	CSA	RIV
Coelus globosus	globose dune beetle	CSA	LA, OR, VEN
Danaus plexippus pop. 1	monarch - California overwintering population	CSA	LA, OR, VEN
Diplectrona californica	California diplectronan caddisfly	CSA	LA, SB
Euchloe hyantis andrewsi	Andrew's marble butterfly	CSA	SB
Eucosma hennei	Henne's eucosman moth	CSA	LA
Glaresis arenata	Kelso Dunes scarab glaresis beetle	CSA	SB
Halictus harmonius	haromonius halictid bee	CSA	RIV, SB
Hedychridium argenteum	Riverside cuckoo wasp	CSA	RIV
Hydroporus simplex	simple hydroporus diving beetle	CSA	SB
Lepismadora algodones	Algodones sand jewel beetle	CSA	IMP
Macrobaenetes kelsoensis	Kelso giant sand treader cricket	CSA	SB
Macrobaenetes valgum	Coachella giant sand treader cricket	CSA	RIV
Melitta californica	California mellitid bee	CSA	IMP, RIV
Miloderes nelsoni	Nelson's miloderes weevil	CSA	SB
Minymischa ventura	Ventura cuckoo wasp	CSA	VEN
Oliarces clara	cheeseweed owlfly (cheeseweed moth lacewing)	CSA	IMP, RIV, SB
Onychobaris langei	Lange's El Segundo Dune weevil	CSA	LA

Scientific Name	Common Name	Status	Counties Reported
Panoquina errans	wandering (=saltmarsh) skipper	CSA	LA, OR, VEN
Paranomada californica	California cuckoo bee	CSA	SB
Parnopes borregoensis	Borrego parnopes cuckoo wasp	CSA	SB
Pelocoris shoshone	Amargosa naucorid bug	CSA	SB
Plebejus saepiolus aureolus	San Gabriel Mountains blue butterfly	CSA	LA, SB
Plebulina emigdionis	San Emigdio blue butterfly	CSA	LA, SB
Polyphylla erratica	Death Valley June beetle	CSA	SB
Pseudocotalpa andrewsi	Andrew's dune scarab beetle	CSA	IMP
Psychomastax deserticola	desert monkey grasshopper	CSA	SB
Rhaphiomidas terminatus terminatus	El Segundo flower-loving fly	CSA	LA
Rhopalolemma robertsi	Roberts' rhopalolemma bee	CSA	RIV, SB
Stenopelmatus cahuilaensis	Coachella Valley jerusalem cricket	CSA	RIV
Trigonoscuta brunnotesselata	brown tassel trigonoscuta weevil	CSA	SB
Trigonoscuta dorothea dorothea	Dorothy's El Segundo Dune weevil	CSA	LA, OR
Trimerotropis occidentiloides	Santa Monica grasshopper	CSA	LA, VEN
Euproserpinus euterpe	Kern primrose sphinx moth	CSA	VEN
Fish			
Catostomus latipinnis	flannelmouth sucker	CSA	SB
Cyprinodon nevadensis amargosae	Amargosa pupfish	SSC	SB
Cyprinodon nevadensis nevadensis	Saratoga Springs pupfish	SSC	SB
Gila orcuttii	arroyo chub	SSC	LA, OR, RIV, SB, VEN
Rhinichthys osculus ssp. 1	Amargosa Canyon speckled dace	SSC	SB
Rhinichthys osculus ssp. 3	Santa Ana speckled dace	SSC	LA, OR, RIV, SB
Amphibians			
Rana boylii	foothill yellow-legged frog	SSC	LA, SB, VEN
Batrachoseps gabrieli	San Gabriel slender salamander	CSA	LA, SB
Batrachoseps pacificus	Channel Islands slender salamander	CSA	VEN
Ensatina eschscholtzii croceater	yellow-blotched salamander	CSA	LA
Ensatina eschscholtzii klauberi	large-blotched salamander	CSA	LA, RIV, SB
Incilius alvarius	Sonoran desert toad	SSC	IMP, SB
Lithobates pipiens	northern leopard frog	SSC	IMP, OR, RIV
Lithobates yavapaiensis	lowland leopard frog	SSC	IMP, RIV
Scaphiopus couchii	Couch's spadefoot	SSC	IMP, RIV

Scientific Name	Common Name	Status		Counties Reported
Spea hammondii	western spadefoot		SSC	LA, OR, RIV, SB, VEN
Taricha torosa	Coast Range newt		SSC	LA, OR, RIV, VEN, SB
Reptiles				
Anniella pulchra	northern California legless lizard		SSC	LA, VEN
Anniella sp.	California legless lizard		SSC	LA, VEN
Anniella stebbinsi	southern California legless lizard		SSC	LA, OR, RIV, SB, VEN
Arizona elegans occidentalis	California glossy snake		SSC	IMP, LA, OR, RIV, SB, VEN
Aspidoscelis hyperythra	orange-throated whiptail		CSA	OR, RIV, SB
Aspidoscelis tigris stejnegeri	coastal whiptail		SSC	LA, OR, RIV, SB, VEN
Coleonyx variegatus abbotti	San Diego banded gecko		SSC	RIV, SB
Crotalus ruber	red-diamond rattlesnake		SSC	IMP, LA, OR, RIV, SB

NOTE:

SSC = California Species of Special Concern; CFP = California Fully Protected; CSA* = California Special Animal; SB = San Bernardino County; LA = Los Angeles County; RIV = Riverside County; VEN = Ventura County; OR = Orange County; IMP = Imperial County. * California Special Animal (CSA) is a general term that refers to all of the taxa the CNDDB is interested in tracking, regardless of their legal or protection status. The Department of Fish and Wildlife considers the taxa on this list to be those of greatest conservation need. For those species with statuses identified by USFWS and/or CDFW, the status is noted. Those species included on the list due to identification by other governmental agencies and/or non-governmental conservation organizations are listed as CSA.

SOURCE:

California Department of Fish and Wildlife. 2019. Rarefind 5: A Database Application for the Use of the California Department of Fish and Game Natural Diversity Data Base. Sacramento, CA.

Rare and Locally Important Plants

A search of the CNDDB and the CNPS Rare Plant Inventory was performed to develop a list of rare and locally important plants that could potentially occur in the SCAG region. In addition to the federally and state-listed plant species described above, there are 449 locally important plant species with historic records located within the SCAG region as shown in (Table 5, Figure 4).

The greatest number, representing over 36% of 449 species recorded, where found in San Bernardino County, with 20% in Los Angeles and Riverside Counties, and less than 10% of the diversity in Orange, Imperial and Ventura Counties.

Table 5. Rare and Locally Important Plants Reported in the SCAG Region

Scientific Name	Common Name	Status	Counties Where Reported
Abronia villosa var. aurita	chaparral sand-verbena	1B.1	IMP, OR, RIV, SB

Scientific Name	Common Name	Status	Counties Where Reported
Abutilon parvulum	dwarf abutilon	2B.3	SB
Acanthoscyphus parishii var. abramsii	Abrams' oxytheca	1B.2	VEN
Acanthoscyphus parishii var. cienegensis	Cienega Seca oxytheca	1B.3	SB
Acleisanthes longiflora	angel trumpets	2B.3	RIV
Acleisanthes nevadensis	desert wing-fruit	2B.1	SB
Acmispon argyraeus var. multicaulis	scrub lotus	1B.3	SB
Acmispon argyraeus var. notitius	Providence Mountains lotus	1B.3	SB
Acmispon haydonii	pygmy lotus	1B.3	IMP, RIV
Ageratina herbacea	desert ageratina	2B.3	SB
Aliciella ripleyi	Ripley's aliciella	2B.3	SB
Aliciella triodon	coyote gilia	2B.2	SB
Allium atrorubens var. atrorubens	Great Basin onion	2B.3	SB
Allium howellii var. clokeyi	Mt. Pinos onion	1B.3	LA, SB, VEN
Allium marvinii	Yucaipa onion	1B.2	RIV, SB
Allium nevadense	Nevada onion	2B.3	SB
Almutaster pauciflorus	alkali marsh aster	2B.2	RIV, SB

Figure 4. Rare and Locally Important Plants Reported in the SCAG Region

Riparian and State Sensitive Plant Communities

The six counties within the SCAG region contain nearly 23 million acres of open space (Figure 5). These vacant lands include the region's national forests, state parks, military installations, other public lands, and various private holdings. Much of the open space in the region has been left in its natural state, however many non-native species have transformed what was once native habitat. The CNDDB identifies approximately 318,000 acres as containing state-sensitive plant communities, those identified as critically imperiled, or vulnerable to extirpation. In addition, approximately 190,700 acres of riparian habitats have been included in the database. Riparian habitats in the SCAG region may fall under the jurisdiction of the CDFW and improvements within or in the vicinity of these habitats would require compliance with Section 1600 of the State FGC under which a Lake or Streambed Alteration Agreement would need to be obtained prior to the alteration of a state jurisdictional area.16

The CNDDB reported 45 special-status natural communities within the SCAG region (Table 6; Figure 6), however, this information was last recorded in 1993 and provides an incomplete picture of sensitive habitats in the SCAG region. Although there is no current comprehensive picture of state-sensitive plant communities and riparian habitat, it is highly likely that additional communities exist within the SCAG region. Therefore, it is important that individual projects consider sensitive communities and carefully examine project sites on a case-by-case basis.

Table 6. Riparian Habitat and State Sensitive Plant Communities Reported in the SCAG Region

Community Name	State Sensitivity Rank	Counties Where Reported	Acres Reported in SCAG Region	Type
Active Desert Dunes	S2.2	IMP	2,233.43	Dune
Alkali Seep	S2.1	SB	4.90	Herbaceous

Southern Willow Scrub	S2.1	LA, OR, RIV, SB, VEN	5,697.12	Riparian
Stabilized and Partially Stabilized Desert Dunes	S3.2	IMP	2,233.43	Dune
Transmontane Alkali Marsh	S2.1	IMP, SB	243.06	Marsh
Valley Needlegrass Grassland	S3.1	LA, OR, RIV, VEN	16,805.86	Herbaceous
Valley Oak Woodland	S2.1	LA, VEN	12,399.50	Woodland
Walnut Forest	S1.1	LA, VEN	401.94	Forest
Wildflower Field	S2.2	LA	6,592.07	Herbaceous

Note:
S1 Critically Imperiled — Critically imperiled in the state because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state.
S2 Imperiled — Imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state.
S3 **Vulnerable** — Vulnerable in the state due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation.
S4Apparently Secure — Uncommon but not rare; some cause for long-term concern due to declines or other factors
SNR **Unranked** — State conservation status not yet assessed.
SB = San Bernardino County; LA = Los Angeles County; RIV = Riverside County; VEN = Ventura County; OR = Orange County; IMP = Imperial County.

Figure 5. Land Use Reported in the SCAG Region

Figure 6. Riparian Habitat and State Sensitive Plant Communities Reported in the SCAG Region

Since 1993 CDFW and CNPS, have been classifying vegetation types using the new state standards, as outlined in the Manual of California Vegetation, updated in the second edition of the Manual17. These new state standards are being utilized in the classification of Sensitive Natural Communities throughout California that are currently being evaluated using NatureServe's Heritage Methodology, the same system used to assign state rarity ranks for sensitive plant communities in the CNDDB18. Natural Communities with ranks of S1-S3 are considered Sensitive Natural Communities that should be addressed during the CEQA process.

As of 2018, about half of California has been mapped and classified according to this standard; much of southern California has not yet been classified. Table 7 provides the Vegetation Classification and Mapping Program's current list of vegetation Alliances with State Rarity Ranks of S1-S3 that occur within the USDA Ecological Sections (Southern California Coast, Southern California Mountains and Valleys, Mojave Desert, Colorado Desert, Sonoran Desert) found in the SCAG region. Some of these sections overlap portions of counties outside of the SCAG Region (primarily portions of San Diego and Santa Barbara Counties). Although this data is incomplete, it is highly likely that these or additional Sensitive Natural Communities may occur in the footprint of future projects in the SCAG region. Therefore, it is important that individual projects evaluate Sensitive Natural Communities in their analyses.

Table 7. Sensitive Natural Communities Within The SCAG Region

Alliance Scientific name	Common name	State rarity
Abies concolor Dry	Dry White Fir forest	S3
Abronia latifolia - Ambrosia chamissonis	Dune mat	S3
Achnatherum hymenoides	Indian rice grass grassland	S1.2
Achnatherum speciosum	Desert needlegrass grassland	S2.2
Adenostoma fasciculatum - Salvia apiana	Chamise - white sage chaparral	S3
Agave deserti	Desert agave scrub	S3.2
Allenrolfea occidentalis	Iodine bush scrub	S3.2
Alopecurus geniculatus	Water foxtail meadows	S3?
Amphipappus fremontii - Salvia funerea	Fremont's chaffbush - woolly sage scrub	S3
Anemopsis californica - Helianthus nuttallii - Solidago spectabilis	Yerba mansa - Nuttall's sunflower - Nevada goldenrod alkaline wet meadows	S2
Arbutus menziesii	Madrone forest	S3.2
Arctostaphylos (crustacea, tomentosa)	Brittle leaf - woolly leaf manzanita chaparral	S3
Arctostaphylos pungens - Arctostaphylos pringlei	Pointleaf manzanita - pink-bract manzanita chaparral	S3
Arctostaphylos (purissima, rudis)	Burton Mesa chaparral	S1.2
Argentina egedii	Pacific silverweed marshes	S2
Aristida purpurea	Purple three-awn meadows	S3?

Alliance Scientific name	Common name	State rarity
Artemisia nova	Black sagebrush scrub	S3.2
Artemisia rothrockii	Rothrockâ€™s sagebrush	S3
Arthrocnemum subterminale	Parishâ€™s glasswort patches	S2
Atriplex parryi	Parry's saltbush scrub	S3
Baccharis emoryi - Baccharis sergiloides	Emory's and Broom baccharis scrub	S3
Betula occidentalis	Water birch thicket	S2.2
Bolboschoenus maritimus	Salt marsh bulrush marshes	S3
Bromus carinatus - Elymus glaucus	California brome - blue wildrye prairie	S3
Bursera microphylla	Elephant tree stands	S1.2
Calocedrus decurrens	Incense cedar forest	S3.2
Carex douglasii	Douglasâ€™ sedge meadows	S2?
Carex heteroneura	Different-nerve sedge patches	S3?
Carex integra	Small-fruited sedge meadows	S2?
Carex luzulina	Woodland sedge fens	S2?
Carex (pansa, praegracilis)	Sand dune sedge swaths	S3?
Carnegiea gigantea - Parkinsonia microphylla - Prosopis velutina	Saguaro - foothill palo verde - velvet mesquite desert scrub	S2.2
Castela emoryi	Crucifixion thorn stands	S1.1
Ceanothus greggii	Cup leaf ceanothus chaparral	S3
Ceanothus (oliganthus, tomentosus)	Hairy leaf - woolly leaf ceanothus chaparral	S3
Ceanothus papillosus	Wart leaf ceanothus chaparral	S3
Ceanothus verrucosus	Wart-stemmed ceanothus chaparral	S2
Centromadia (pungens)	Tar plant fields	S2
Chilopsis linearis - Psorothamnus spinosus	Desert-willow - smoketree wash woodland	S3
Chrysolepis sempervirens	Bush chinquapin chaparral	S3.3
Coreopsis gigantea	Giant coreopsis scrub	S3
Cressa truxillensis - Distichlis spicata	Alkali weed - salt grass playas and sinks	S2
Cylindropuntia bigelovii	Teddy bear cholla patches	S3
Deinandra clementina - Eriogonum giganteum	Island tar plant - Saint Catherine's lace scrub	S2
Deinandra fasciculata	Clustered tarweed fields	S2
Dicoria canescens - Abronia villosa - Panicum urvilleanum	Mojave-Sonoran desert dunes	S3.2
Diplacus aurantiacus	Bush monkeyflower scrub	S3?
Dudleya greenei - Dudleya spp. Succulent Scrub	Greene's live-forever - live-forever species succulent scrub	S1
Encelia (actonii, virginensis) - Viguiera reticulata	Acton's and Virgin River brittle brush - net-veined goldeneye scrub	S3
Encelia californica - Eriogonum cinereum	California brittle bush - Ashy buckwheat scrub	S3
Ephedra funerea	Death Valley joint fir scrub	S3
Ericameria palmeri	Palmerâ€™s goldenbush scrub	S3?

Alliance Scientific name	Common name	State rarity
Ericameria paniculata	Black-stem rabbitbrush scrub	S3
Eriodictyon crassifolium	Thick leaf yerba santa scrub	S3
Eriogonum arborescens - Eriogonum grande	Island Buckwheat scrub	S3
Eriogonum wrightii - Eriogonum heermannii - Buddleja utahensis	Wright's buckwheat - Heermann's buckwheat - Utah butterfly-bush scrub	S3
Fallugia paradoxa	Apache plume scrub	S3
Frankenia salina	Alkali heath marsh	S3
Grindelia (camporum, stricta)	Gum plant patches	S2
Gutierrezia sarothrae - Gutierrezia microcephala	Snakeweed scrub	S3
Hazardia squarrosa	Sawtooth golden bush scrub	S3
Hesperocyparis forbesii	Tecate cypress stands	S2.2
Hesperocyparis sargentii	Sargent cypress woodland	S3.2
Hesperocyparis stephensonii	Cuyamaca cypress stands	S1
Hordeum brachyantherum	Meadow barley patches	S2
Isocoma menziesii	Menzies's golden bush scrub	S3
Juglans californica	California walnut groves	S3.2
Juncus (oxymeris, xiphioides)	Iris-leaf rush seeps	S2?
Juniperus osteosperma	Utah juniper woodland	S3.2
Keckiella antirrhinoides	Bush penstemon scrub	S3
Koeberlinia spinosa	Crown-of-thorns stands	S1.1
Krascheninnikovia lanata	Winterfat scrubland	S3
Lepidospartum squamatum	Scale broom scrub	S3
Leymus cinereus - Leymus triticoides	Ashy ryegrass - creeping ryegrass turfs	S3
Leymus condensatus	Giant wild rye grassland	S3
Leymus mollis	Sea lyme grass patches	S2
Lupinus chamissonis - Ericameria ericoides	Silver dune lupine - mock heather scrub	S3
Lycium californicum	California desert-thorn scrub	S3
Menodora spinescens	Spiny menodora scrub	S3
Monolopia (lanceolata) - Coreopsis (calliopsidea)	Monolopia - leafy-stemmed tickseed fields	S3
Muhlenbergia rigens	Deer grass beds	S2?
Nolina (bigelovii, parryi)	Nolina scrub	S2.2
Opuntia littoralis - Opuntia oricola - Cylindropuntia prolifera	Coast prickly pear scrub	S3
Pinus edulis	Two-needle pinyon stands	S2?
Pinus flexilis	Limber pine woodland	S3.2
Pinus muricata - Pinus radiata	Bishop pine - Monterey pine forest	S3.2
Pinus quadrifolia	Parry pinyon woodland	S2
Pinus torreyana	Torrey pine woodland	S1.2
Platanus racemosa	California sycamore woodlands	S3

Alliance Scientific name	Common name	State rarity
Pleuraphis jamesii	James's galleta shrub-steppe	S2.2
Pleuraphis rigida	Big galleta shrub-steppe	S2.2
Pluchea sericea	Arrow weed thickets	S3.3
Poa secunda	Curly blue grass grassland	S3?
Populus fremontii	Fremont cottonwood forest	S3.2
Populus tremuloides	Aspen groves	S3.2
Populus trichocarpa	Black cottonwood forest	S3
Prosopis glandulosa - Prosopis velutina - Prosopis pubescens	Mesquite thickets	S3
Prunus fremontii	Desert apricot scrub	S3
Prunus virginiana	Choke cherry thickets	S2?
Pseudotsuga macrocarpa	Bigcone Douglas fir forest	S3.2
Purshia stansburiana	Stansbury cliff rose scrub	S3.2
Purshia tridentata	Bitter brush scrub	S3
Quercus chrysolepis (shrub)	Canyon live oak chaparral	S3
Quercus dumosa - Quercus pacifica	Coastal sage and Island scrub oak chaparral	S3
Quercus engelmannii	Engelmann oak woodland	S3
Quercus lobata	Valley oak woodland	S3
Quercus palmeri	Palmer oak chaparral	S2?
Quercus tomentella - Lyonothamnus floribundus	Island live oak - Catalina ironwood woodland	S3
Quercus turbinella	Sonoran live oak scrub	S1.3
Rhus integrifolia	Lemonade berry scrub	S3
Rhus trilobata - Crataegus rivularis - Forestiera pubescens	Basket bush - river hawthorn - desert olive patches	S3.2?
Ribes quercetorum	Oak gooseberry thickets	S2?
Rosa californica	California rose briar patches	S3
Ruppia (cirrhosa, maritima)	Ditch-grass or widgeon-grass mats	S2
Salix gooddingii	Black willow thickets	S3
Salix laevigata	Red willow thickets	S3
Salix lucida	Shining willow groves	S3.2
Salvia apiana	White sage scrub	S3
Sambucus nigra	Blue elderberry stands	S3
Sarcocornia pacifica (Salicornia depressa)	Pickleweed mats	S3
Schoenoplectus (acutus, californicus)	Hardstem and California bulrush marshes	S3
Schoenoplectus americanus	American bulrush marsh	S3.2
Selaginella bigelovii	Bushy spikemoss mats	S3
Sesuvium verrucosum	Western sea-purslane marshes	S2.2?
Simmondsia chinensis	Jojoba scrub	S3?
Spartina foliosa	California cordgrass marsh	S3.2
Sporobolus airoides - Muhlenbergia asperifolia - Spartina gracilis	Alkali sacaton - scratchgrass - alkali cordgrass alkaline wet meadow	S2

Alliance Scientific name	Common name	State rarity
Stuckenia (pectinata) - Potamogeton spp.	Pondweed mats	S3?
Suaeda moquinii	Bush seepweed scrub	S3
Tetracoccus hallii	Hallâ€™s shrubby-spurge patches	S1.1
Umbellularia californica	California bay forest	S3
Venegasia carpesioides	Canyon sunflower scrub	S3
Vitis arizonica - Vitis girdiana	Wild grape shrubland	S3
Washingtonia filifera	California fan palm oasis	S3.2
Xylococcus bicolor	Mission manzanita chaparral	S3
Yucca brevifolia	Joshua tree woodland	S3.2
Ziziphus obtusifolia	Graythorn patches	S2?

S1 Critically Imperiled — Critically imperiled in the state because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state.

S2 Imperiled — Imperiled in the state because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state.

S3 Vulnerable — Vulnerable in the state due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation.

Entries marked with ? indicate reliminary or more information required

Federally Protected Wetlands and Waterways

Current National Wetlands Inventory19 maps and U.S. Geological Service (USGS) blue-line drainage data for the six-county SCAG region were reviewed for potential wetlands and waterways subject to protection under Section 404 of the CWA and coastal areas subject to Section 10 of the Rivers and Harbors Act. Wetlands and waterways potentially subject to the jurisdiction of the USACE were determined to be present within each of the six counties in the SCAG region (Table 8; Table 9). The analysis of federally protected wetlands and waterways in this section is based on existing data; individual projects within the SCAG region would be required to complete a formal jurisdictional delineation pursuant to USACE Corps requirements.

Wildlife Movement Corridors

Wildlife movement corridors, or habitat linkages, are generally defined as connections between habitat patches that allow for physical and genetic exchange between otherwise isolated animal populations. Such linkages may serve a local purpose, such as providing a linkage between foraging and denning areas, or they may be regional in nature providing migratory paths from the ocean to the mountains. Some habitat linkages may serve as migration corridors, wherein animals periodically move away from an area and then subsequently return. Others may be important as dispersal corridors for young animals. A group of habitat linkages in an area can form a wildlife corridor network.20 The presence of viable and sustainable wildlife corridor networks may also be critical to the survival of some species as habitat conditions and landscapes are altered due to climate change.

The California Department of Transportation (Caltrans) and CDFW commissioned the California Essential Habitat Connectivity Project to assess essential habitat connectivity across the state and show, at a course scale, large areas that are important to maintaining wildlife movement and ecological

20 Ventura County Resource Management Agency (VCRMA). 2018. Habitat Connectivity and Wildlife Movement Corridors. Available online at: https://vcrma.org/habitat-connectivity-and-wildlife-movement-corridors, accessed January 15, 2019.

function.21. A large portion of the SCAG region includes many natural landscape blocks, accounting for nearly 12 million acres that support high native wildlife biodiversity with a significant wildlife connectivity network (Figure 7; Table 10) 22. These large and intact blocks are connected by over 4.5 million acres of corridors that are highly (Class 4 and 5) permeable (i.e., beneficial) to wildlife movement (Table 11). A large portion of these landscape blocks and essential connectivity areas are spread through eastern Imperial, Riverside, and San Bernardino Counties. Ventura County has the relatively largest proportion of landscape blocks and essential connectivity areas by county acreage. Large portions of the mountainous parts of Los Angeles County provide a critical linkage between habitat blocks from Riverside and Imperial County to the east and Ventura County to the west. Orange County has limited essential connectivity habitat and habitat blocks, located mostly in the eastern end of the county, but these provide connectivity to San Diego County to the south.

Figure 7. Essential Habitat Connectivity and Natural Landscape Blocks within the SCAG Region

Barriers to wildlife movement exist throughout the SCAG region, including large areas of urban development and multilane freeways that cut off regional movement for migratory and resident species alike. These barriers can affect all species from large mammals to small insects and can lead to significant degradation of ecosystem function and plant community composition. Conservation, protection, and enhancement of these intact Natural Landscape Blocks and Essential Connectivity Areas should be considered in project development to maintain or improve the viability of wildlife movement networks' and natural community stability. A notable example of wildlife corridor enhancement is the wildlife crossing planned through the State Route 101 Freeway at Liberty Canyon Road in Agoura Hills. The development of this crossing will help facilitate mountain lion and other terrestrial wildlife movement through a major regional freeway, opening a corridor and reducing the risk of motor vehicle collisions with wildlife.

In addition to these essential cooridors, major rivers, creeks, and streams often serve as nursery sites for fish, amphibian, and invertebrate species. These important features can facilitate movement between landscape blocks. Over 182,000 acres of these riparian wildlife connections have been mapped in the SCAG region (Table 12; see Figure 7).

Table 12. Potential Riparian Connections in the SCAG Region

Habitat Conservation Plans and Natural Community Conservation Plans

An HCP is a planning document that is required as part of an application for an incidental take permit. HCPs describe the anticipated effects of the proposed taking, how the impacts will be minimized and mitigated, and how the HCP is to be funded. An NCCP is defined by CDFW as a plan for the conservation of natural communities that identifies and provides for the regional or area-wide protection and perpetuation of plants, animals, and their habitats. The HCPs and NCCPs in the SCAG region range from county, multi-county or municipality-wide natural resource planning efforts, to land-owner specific plans (Table 13). Data from CDFW and USFWS show 26 plans with durations of 16–80 years providing conservation efforts over nearly three million acres in the SCAG region. As a group, these plans provide protection for multiple species by conserving habitats, identifying locations for future mitigation efforts, providing conservation guidance and practices, and preserving important wildlife linkages.

Regional Conservation Investment Strategies/Local Conservation Plans

The Regional Conservation Investment Strategy (RCIS) Program encourages public agencies to develop regional conservation planning documents to help local native species populations by protecting,

restoring, creating, and reconnecting their habitats23 The goal of the RCIS is to achieve regional conservation outcomes through investments in conservation and mitigation that support regional conservation priorities. Public agencies and other entities can protect natural resources in their regions, for their ecological values and for the ecosystem services they provide to their communities. This is a non-regulatory and voluntary program.

RCIS include conservation and habitat enhancement strategies that advance the conservation of native species, habitat. These plans also provide nonbinding and voluntary guidance for the prioritization of conservation priorities, investments in ecological resource conservation sources, or identification of locations for compensatory mitigation.

In the SCAG region there are two RCIS's currently in development: The Antelope Valley RCIS in northeastern Los Angeles County and the San Bernardino County RCIS in Southwestern San Bernardino County. These two draft plans are in process, but may be finalized sometime after 2020. The Antelope Valley RCIS proponent is the Desert and Mountain Conservation Authority and the San Bernardino County RCIS proponent is the San Bernardino County Transportation Authority. Although these, nor any other plans been finalized in the region, RCIS be considered as part of the mitigation strategy for transportation projects in the region.

Local Policies and Ordinances

The SCAG region spans six counties and 191 cities, each of which has a General Plan with policies related to biological resources. The State of California General Plan Guidelines dictate that all cities and counties in the state of California are required to include conservation and open-space elements within their general plans. With the exception of Orange County, each county within the SCAG region has ordinances regulating the removal of native trees and plants (Table 14).

23 Regional Conservation Investment Strategies Program. 2018. California Department of Fish and Game, Sacramento, CA. Available online at: https://www.wildlife.ca.gov/conservation/planning/regional-conservation, accessed June 28, 2019.

In addition to the county regulations for the six counties described above, General Plans and municipal codes of each of the 191 individual cities in the SCAG region include Conservation Elements that identify biological resources, including mature trees and locally important species that are afforded special consideration. Conservation elements of city plans and municipal codes may also include requirements for permits and mitigation in the planning process for sensitive biological resources such as listed, sensitive or candidate species, riparian or State-sensitive natural communities, wetlands or waters of the United States, and wildlife corridors and native nursery sites. Any project within the SCAG region would need to demonstrate compliance with conservation elements of applicable city and county general plans.

INTRODUCTION

The Southern California Association of Governments (SCAG) is the lead California Environmental Quality Act (CEQA) agency for the proposed 2020-2045 Regional Transportation Plan and Sustainable Communities Strategy (2020 RTP/SCS, Connect SoCal or the Plan). As the lead agency, SCAG has determined to prepare a Program Environmental Impact Report (PEIR) for the 2020 RTP/SCS.

SCAG is a federally designated Metropolitan Planning Organization (MPO) under Title 23, United States Code (USC) 134(d)(1). The SCAG region consists of six counties (Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura counties) and 191 cities (Figure 1). The 2020 RTP/SCS is a regional planning document updated every four years for the SCAG region. The 2020 RTP/SCS will outline the region's goals and policies for meeting current and future mobility needs, provide a foundation for transportation decisions by local, regional and state officials that are ultimately aimed at achieving a coordinated and balanced transportation system. The 2020 RTP/SCS will also identify the region's transportation needs and issues, recommended actions, programs, and a list of projects to address the needs consistent with adopted regional policies and goals, and document the financial resources needed to implement the 2020 RTP/SCS. It is important to note that SCAG does not implement individual projects in the RTP, as they will be implemented by local and state jurisdictions, and other agencies. SCAG has already initiated the development of the 2020 RTP/SCS and is working closely with county transportation commissions (CTCs) to compile a regional transportation project list that will build upon the list identified in the 2016 RTP/SCS (SCAG 2016). This report builds on the analysis and reproduces sections from the 2016 PEIR where appropriate.

In accordance with California Government Code §65080(b)(2)(B), the 2020 RTP/SCS will include a SCS, which details land use, housing and transportation strategies to reduce greenhouse gas (GHG) emissions from passenger vehicles (automobiles and light-duty trucks). SCAG's SCS is required to meet reduction targets for GHG emissions of 8 percent per capita by 2020 and 19 percent per capita by 2035 compared with 2005 emission levels, as set by the California Air Resources Board (ARB).

This report describes the current cultural resources within the region and evaluates the significance of the changes in cultural resources that would result from implementation of the proposed 2020 RTP/SCS. In addition, this report provides a framework of mitigation measures for subsequent, site-specific environmental review documents prepared by lead agencies to reduce identified impacts. Information sources utilized in this discussion include the Native American Heritage Commission (NAHC), National Park Service (NPS), California Office of Historic Preservation (OHP), and three of the OHP's Information Centers (ICs): Eastern Information Center (EIC), South Coastal Information Center (SCIC), South Central Coastal Information Center (SCCIC). Specific datasets utilized to characterize the existing conditions include the Sacred Lands File (SLF), National Historic Landmarks (NHLs), National Register of Historic Places (NRHP), California Historical Landmarks (CHLs), California Register of Historical Resources (CRHR), California Points of Historical Interest (CPHI), and the California Historical Resources Information System (CHRIS).

REGULATORY SETTING

Federal

Antiquities Act of 1906

The Antiquities Act of 1906 was the first federal law to provide protection of historic and prehistoric resources located on federal land. This act prohibited destruction of antiquities on public land. It prohibited any excavation located on public land without permission of the appropriate Department Secretary. The Antiquities Act authorized the Secretaries of the Interior, Agriculture, and Army to grant permission to reputable institutions to conduct research (including excavation) to increase knowledge and the permanent preservation of antiquities in public museums. This act authorized the President to declare areas of federal lands as national monuments. Preservation of American Antiquities (43 Code of Federal Regulations [CFR] 3) implements the Antiquities Act. The Archaeological Resources Protection Act (ARPA) of 1979 clarified some of the mandates of the Antiquities Act and supersedes some portions of it. Criminal Acts and Penalties related to archaeological resources incorporated into ARPA, as was the requirement for a permit for the removal or destruction of Antiquities.

Historic Sites Act of 1935

The Historic Sites Act of 1935 established the national policy of preserving historic sites, buildings, and objects for public use. The implementation of this act established the Historic American Building Survey (HABS). This act gave the Secretary of the Interior the authority to preserve data on historic sites and to acquire and preserve archaeological and historic resources on federal land. The act provides for *the preservation of historic American sites, buildings, objects, and antiquities of national significance*. It refers to sites of *national significance* but was established as a public law and a code before the NHPA and NRHP defined *national significance* further.

U.S. Department of Transportation Act of 1966 (Section 4[f])

Section 4(f) of the U.S. Department of Transportation (USDOT) Act of 1966 prohibits the FTA and other USDOT agencies from using land from publicly owned parks, recreation areas (including recreational trails), wildlife and water fowl refuges, or public and private historic properties, unless there is no feasible and prudent alternative to that use and the action includes all possible planning to minimize harm to the property resulting from such a use.

National Historic Preservation Act of 1966

Section 106 of the NHPA states that federal agencies with direct or indirect jurisdiction over federally funded, assisted, or licensed undertakings must take into account the effect of the undertaking on any historic property that is included in or eligible for inclusion in the NRHP, and that the ACHP must be afforded an opportunity to comment, through a process outlined in the ACHP regulations, in 36 CFR 800, on such undertakings. The Section 106 process involves identification of significant historic resources within an "area of potential effect; determination if the undertaking will cause an adverse effect on historic resources; and resolution of those adverse effects through execution of a Memorandum of Agreement. In addition to the ACHP, interested members of the public, including individuals, organizations, and agencies (such as the OHP) are provided with opportunities to participate in the process.

NATIONAL REGISTER OF HISTORIC PLACES

The NRHP was established by the NHPA of 1966 as "an authoritative guide to be used by Federal, State, and local governments, private groups and citizens to identify the Nation's cultural resources and to indicate what properties should be considered for protection from destruction or impairment" (36 CFR 60.2). The NRHP recognizes properties that are significant at the national, state, and local levels. To be eligible for listing in the NRHP, a resource must be significant in American history, architecture, archaeology, engineering, or culture. Districts, sites, buildings, structures, and objects of potential significance must also possess integrity of location, design, setting, materials, workmanship, feeling, and association. A property is eligible for the NRHP if it is significant under one or more of the following criteria:

- **Criterion A:** It is associated with events that have made a significant contribution to the broad patterns of our history;
- **Criterion B:** It is associated with the lives of persons who are significant in our past;
- **Criterion C:** It embodies the distinctive characteristics of a type, period, or method of construction, or represents the work of a master, or possesses high artistic values, or represents a significant and distinguishable entity whose components may lack individual distinction; and/or
- **Criterion D:** It has yielded, or may be likely to yield, information important in prehistory or history.

Ordinarily cemeteries, birthplaces, or graves of historic figures, properties owned by religious institutions or used for religious purposes, structures that have been moved from their original locations, reconstructed historic buildings, and properties that are primarily commemorative in nature, are not considered eligible for the NRHP, unless they satisfy certain conditions. In general, a resource must be 50 years of age to be considered for the NRHP, unless it satisfies a standard of exceptional importance.

In addition to meeting these criteria, a property must retain historic integrity, which is defined in National Register Bulletin 15 as the "ability of a property to convey its significance" (NPS 1990). In order to assess integrity, the NPS recognizes seven aspects or qualities that, considered together, define historic integrity. To retain integrity, a property must possess several, if not all, of these seven qualities, which are defined in the following manner in National Register Bulletin 15:

1. **Location:** the place where the historic property was constructed or the place where the historic event occurred;
2. **Design:** the combination of elements that create the form, plan, space, structure, and style of a property;
3. **Setting:** the physical environment of a historic property;
4. **Materials:** the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.
5. **Workmanship:** the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory;
6. **Feeling:** a property's expression of the aesthetic or historic sense of a particular period of time;
7. **Association:** the direct link between an important historic event or person and a historic property.

Procedures for listing a property in the NRHP are outlined in Procedures for State, Tribal, and Local Government Historic Preservation Programs (36 CFR 61) and in Determinations of Eligibility for Inclusion in the National Register (36 CFR 63). The Secretary of the Interior's Professional Qualifications Standards for who is allowed to conduct cultural resources studies and evaluations are outlined in 36 CFR 61.

Procedures for artifact curation are noted in Curation of Federally Owned and Administered Archeological Collections (36 CFR 79) for artifacts recovered under the authority of the Antiquities Act (16 USC 431- 433), the Reservoir Salvage Act (16 USC 469-469c), Section 110 of the NHPA (16 USC 470h-2), or the ARPA (16 USC 470aa-mm).

NATIONAL LANDMARKS PROGRAM

36 CFR 65 identifies and designates NHLs and encourages the long-range preservation of nationally significant properties that illustrate or commemorate the history and prehistory of the United States. The NPS administers the National Historic Landmarks Program on behalf of the Secretary of the Interior. Properties designated as NHLs are listed in the NRHP upon designation. All NHLs are NRHP Properties but not all NRHP Properties are NHLs. The criteria for designation as an NHL are similar to those for inclusion in the NRHP but are more stringent and have a greater emphasis on national significance. The Landmark Program Criterion 3, which does not have a counterpart in the NRHP regulations, applies to a resource that represents some *great idea or ideal of the American people*. Agencies should *to the maximum extent possible...minimize harm* to NHLs affected by undertakings.

Archeology and Historic Preservation: Secretary of the Interior Standards and Guidelines

As established by 36 CFR 67, one recognized method for generally avoiding adverse effects to historic properties is following the Secretary of the *Interior's Standards for Rehabilitation & Illustrated Guidelines for Rehabilitating Historic Buildings (Secretary's Standards)*. Created under Sections 101(f), (g), and (h), and Section 110 of the amended NHPA of 1966, the *Secretary's Standards* offer guidelines and approaches for preserving, maintaining, repairing, and replacing historical materials and features, as well as designing additions or making alterations. Guidance is also provided for new construction adjacent to historic properties, in order to avoid adverse impacts to neighboring properties through a change in setting and feeling. In this way, the *Secretary's Standards* outline common-sense approaches that allow for the retention of and/or sensitive changes to the distinctive materials and features that lend a historical resource its significance. These standards and guidelines are not regulatory in nature, nor do they set of interpret policy. Instead that serve as technical advice regarding archaeological and historic preservation procedures.

State CEQA Guidelines Section 15126.4(b)(1) states that a project determined to conform with the *Secretary's Standards* can generally be considered to be a project that will not cause material impairment to a historical resource. Nonconformance with the *Secretary's Standards,* however, does not uniformly result in material impairment to a historical resource, and some projects that do not comply with the *Secretary's Standards* do not cause a significant adverse impact. Project elements must be studied on a case-by-case basis, depending upon the resource and the reasons for its significance. However, projects that comply with the *Secretary's Standards* benefit from a regulatory presumption that they would have a less-than-significant adverse impact on historic resources.

Archaeological and Historic Preservation Act of 1974

The Archeological and Historic Preservation Act (AHPA) of 1974 augments requirements of the Historic Sites Act by requiring *the preservation of historical and archeological data (including relics and specimens)* that may be lost or destroyed by federal construction projects or federally licensed or assisted programs. This act requires data to be preserved even if a site is not preserved. It encourages in situ preservation but supports data recovery efforts for significant historic properties.

Archaeological Resources Protection Act of 1979

ARPA establishes that excavating, removing, damaging, altering, or defacing any archaeological resource more than 100 years of age, on public or American Indian lands, unless authorized by a permit, is a felony. This act was established to preserve and protect archaeological resources located on public and American Indian lands. Excavation or removal permits must be granted by the appropriate federal agency/land manager to qualified investigators, if the proposed work is anticipated to contribute to archaeological knowledge and is of public interest. Work on Indian lands requires separate American Indian approval. All materials recovered from public land are the property and responsibility of the United States. Collection of archaeological items from public lands is prosecuted as theft of government property. It prohibits the sale, purchase, exchange, transportation, receipt, or offering of any archaeological resource obtained in violation of any regulation or permit under the act or under any federal, state, or local law.

American Indian Religious Freedom Act

AIRFA establishes U.S. policy to protect and preserve American Indian, Eskimo, Aleut, and Native Hawaiian freedom to believe, express, and exercise traditional religions and ways. This includes access to religious sites and the freedom to worship through ceremonial and traditional rites. Federal agencies must determine if policy and procedure changes are needed to protect such rights and freedoms. The act is aligned with the First Amendment guarantee of religious freedom. It is not implemented with regulations.

Native American Graves Protection and Repatriation Act of 1990

The Native American Graves Protection and Repatriation Act (NAGPRA) of 1990 (25 USC 3001 et seq.) protects human remains, funerary objects, sacred objects, and items of cultural patrimony of indigenous peoples on federal lands. NAGPRA stipulates priorities for assigning ownership or control of such cultural items excavated or discovered on federal or tribal lands, or in the possession and control of an agency that has received federal funding.

NAGPRA also provides for the repatriation of human remains and associated items previously collected from federal lands and in the possession or control of a federal agency or federally funded repository. Implementing regulations are codified in 43 CFR Part 10. In addition to defining procedures for dealing with previously collected human remains and associated items, these regulations outline procedures for negotiating plans of action or comprehensive agreements for treatment of human remains and associated items encountered in intentional excavations, or inadvertent discoveries on federal or tribal lands.

This regulation (last amended March 21, 2007) provides a Plan of Action (POA) for NAGPRA. To prevent work stoppages that last 30 days each time cultural items (as defined by NAGPRA) are encountered, it allows the responsible federal agency to create a POA to follow if these cultural items (as defined by NAGPRA) are encountered. POAs require consultation with the *appropriate Indian tribe or Native Hawaiian organization with respect to tribal lands, if known or readily ascertainable, and, in the case of lands that have been selected by an Alaska Native Corporation or group organized pursuant to*

the Alaska Native Claims Settlement Act of 1971[43 USC 1601 et seq.], the appropriate corporation or group (25 USC 3002d).

State

California Implementation of Federally and State-Mandated Historic Preservation Program

The California OHP is responsible for administering federally and state mandated historic preservation programs to further the identification, evaluation, registration and protection of California's irreplaceable archaeological and historical resources under the direction of the State Historic Preservation Officer (SHPO), a gubernatorial appointee, and the State Historical Resources Commission.

OHP's responsibilities include:

- Identifying, evaluating, and registering historic properties;
- Ensuring compliance with federal and state regulatory obligations;
- Encouraging the adoption of economic incentives programs designed to benefit property owners; and
- Encouraging economic revitalization by promoting a historic preservation ethic through preservation education and public awareness and, most significantly, by demonstrating leadership and stewardship for historic preservation in California.

OHP reviews and comments on thousands of federally sponsored projects annually pursuant to Section 106 of the National Historic Preservation Act and state programs and projects pursuant to Sections 5024 and 5024.5 of the Public Resources Code (PRC). OHP also reviews and comments on local government and state projects pursuant to CEQA.

The purpose of OHP's project review program is to promote the preservation of California's heritage resources by ensuring that projects and programs carried out or sponsored by federal and state agencies comply with federal and state historic preservation laws and that projects are planned in ways that avoid any adverse effects to heritage resources. If adverse effects cannot be avoided, the OHP assists Lead Agencies in developing measures to minimize or mitigate such effects.

OHP administers the NRHP, the CRHR, the CHL, and the CPHI programs. Each program has different eligibility criteria and procedural requirements; all register nominations must be submitted to the Commission for review and approval.

NATIONAL REGISTER OF HISTORIC PLACES

Applications to nominate California properties to the NRHP are submitted to OHP for review and approval by the State Historic Resources Commission (SHRC). Authorized under the NHPA, the National Register is part of a national program to coordinate and support public and private efforts to identify, evaluate, and protect historic and archeological resources. The National Register is administered by the NPS, which is part of the U.S. Department of the Interior. Prior to forwarding Nomination Packages for consideration for the National Register, OHP must review the package and make a determination that it conforms to the guidelines published by NPS Bulletin 16A. If approved by the SHRC, the nomination is sent to the State Historic Preservation Officer for nomination to the National Register.

CALIFORNIA REGISTER OF HISTORICAL RESOURCES

Created in 1992 and implemented in 1998, the CRHR is "an authoritative guide in California to be used by state and local agencies, private groups, and citizens to identify the state's historical resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse change" (PRC Sections 21083.2 and 21084.1). Certain properties, including those listed in or formally determined eligible for listing in the NRHP and CHL numbered 770 and higher, are automatically included in the CRHR.

Other properties recognized under the CPHI program, identified as significant in historical resources surveys, or designated by local landmarks programs may be nominated for inclusion in the CRHR. According to PRC Section 5024.1(c), a resource, either an individual property or a contributor to a historic district, may be listed in the CRHR if the State Historical Resources Commission determines that it meets one or more of the following criteria, which are modeled on NRHP criteria:

- **Criterion 1:** It is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
- **Criterion 2:** It is associated with the lives of persons important in our past.
- **Criterion 3:** It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
- **Criterion 4:** It has yielded, or may be likely to yield, information important in history or prehistory.

Resources nominated to the CRHR must retain enough of their historic character or appearance to convey the reasons for their significance. Resources whose historic integrity does not meet NRHP criteria may still be eligible for listing in the CRHR.

CALIFORNIA HISTORICAL LANDMARKS

CHL are sites, buildings, features, or events that are of statewide significance and have anthropological, cultural, military, political, architectural, economic, scientific or technical, religious, experimental, or other value. The specific standards now in use were first applied in the designation of Landmark #770. CHL #770 and above are automatically listed in the CRHR.

To be designated as a CHL, a resource must meet at least one of the criteria listed below; have the approval of the property owner(s); be recommended by the State Historical Resources Commission; and be officially designated by the Director of California State Parks.

Criteria for Designation. To be eligible for designation as a Landmark, a resource must meet at least one of the following criteria:

- The first, last, only, or most significant of its type in the state or within a large geographic region (Northern, Central, or Southern California).
- Associated with an individual or group having a profound influence on the history of California.
- A prototype of, or an outstanding example of, a period, style, architectural movement or construction or is one of the more notable works or the best surviving work in a region of a pioneer architect, designer or master builder.

Effects of Designation:

- Limited protection: Environmental review may be required under CEQA if property is threatened by a project. Contact your local planning agency for more information.
- Local assessor may enter into contract with property owner for property tax reduction (Mills Act).
- Local building inspector must grant code alternative provided under State Historic Building Code. Registration will be recorded on the property deed.
- Automatic listing in CRHR.
- Bronze plaque at site (underwritten by local sponsor) ordered through OHP; highway directional sign available through local Department of Transportation (Caltrans) district office.

CALIFORNIA POINTS OF HISTORICAL INTEREST

If a site is primarily of local interest, it may meet the criteria for the CPHI program. California Points of Historical Interest are sites, buildings, features, or events that are of local (city or county) significance and have anthropological, cultural, military, political, architectural, economic, scientific or technical, religious, experimental, or other value. Points of Historical Interest designated after December 1997 and recommended by the State Historical Resources Commission are also listed in the California Register. No historical resource may be designated as both a Landmark and a Point. If a Point is subsequently granted status as a Landmark, the Point designation will be retired.

Criteria for Designation. To be eligible for designation as a Point of Historical Interest, a resource must meet at least one of the following criteria:

- The first, last, only, or most significant of its type within the local geographic region (City or County).
- Associated with an individual or group having a profound influence on the history of the local area.
- A prototype of, or an outstanding example of, a period, style, architectural movement or construction or is one of the more notable works or the best surviving work in the local region of a pioneer architect, designer or master builder.

Effects of Designation.

- Limited protection: Environmental review may be required under CEQA if property is threatened by a project. Contact your local planning agency for more information.
- Local assessor may enter into contract with property owner for property tax reduction (Mills Act).
- Local building inspector must grant code alternative provided under State Historic Building Code.
- Registration is recorded on property deed.
- A small enamel directional sign (no text) available through local Caltrans district office.
- Owner may place his or her own marker at the site.

California Environmental Quality Act

CEQA requires a lead agency to analyze whether historic and/or archaeological resources may be adversely affected by a proposed project. Under CEQA, a "project that may cause a substantial adverse change in the significance of a historic resource is a project that may have a significant effect on the

environment" (PRC Section 21084.1). Answering this question is a two-part process: first, the determination must be made as to whether the proposed project involves cultural resources. Second, if cultural resources are present, the proposed project must be analyzed for a potential "substantial adverse change in the significance" of the resource.

California Coastal Act

The California Coastal Act (CCA; PRC Sections 30000 et seq.) was enacted in 1976, four years after the Coastal Commission was created by Proposition 20. It requires the implementation of reasonable mitigations measures to protect archaeological resources as identified by the SHPO when development would adversely impact such resources.

California Health and Safety Code, Section 7050 and Sections 18950 through 18961

Section 7050 of the California Health and Safety Code, pursuant to Section 50907.9 of the PRC, empowers the NAHC to regulate Native American concerns regarding the excavation, treatment, and disposition of Native American cultural resources. These duties include, when applicable, the authorization to resolve disputes relating to the treatment and disposition of Native American human remains and such items as are associated with burials. Section 7050 requires the county coroner, if they have determined that the remains are not subject to their authority and recognizes or believes them to be those of a Native American, to contact the NAHC. Upon this notification of discovery, the NAHC notifies the Native American group or individual most likely descended (MLD) from the deceased.

California Penal Code Section 622 – Destruction of Historical Properties

Penal Code Section 622 establishes that the willful injury, disfiguration, defacement, or destruction of any object, thing, or site, of archaeological or historical interest or value, as a misdemeanor. This applies to resources situated on both private and public land. Furthermore, Section 622.5 sets the applicable penalties for any such damage or removal of cultural resources.

California Public Resources Code, Sections 5024, 5024.5, 5025, 5028, 5097.5, 5097.9, and 5097.98-99

In an effort to establish a state program to preserve historical resources, the California State Legislature enacted the California PRC sections 5024 and 5024.5. These sections require that all state agencies take actions to ensure the preservation of state-owned historical resources under their jurisdictions. This includes evaluation of resources for NRHP and CHL eligibility, maintain an up to date inventory of all eligible and listed resources to these registries, and managing resources so as to retain their historical characteristics.

Section 5025 of the California PRC established the need for state repositories dedicated to the preservation and restoration of artifacts related to the history of aviation within California and the United States. This included the designation of a state aviation museum.

Section 5028 of the PRC specifies that no structure that is listed on the NRHP, on the California Register of Historical Places, or on any local public register of historic places, and that has been damaged due to a natural disaster, including, but not limited to, an earthquake, fire, or flood, may be demolished, destroyed, or significantly altered, except for restoration to preserve or enhance its historical values, unless the

structure presents an imminent threat to the public of bodily harm or of damage to adjacent property, or unless the OHP determines, that the structure may be demolished, destroyed, or significantly altered.

PRC section 5097.5 defines the unauthorized disturbance or removal of archaeological, historical, or paleontological resources, situated on public land, as a misdemeanor. In addition, this section of the PRC prohibits the willful and knowing destruction of object of antiquity, without a permit, on public land, and creates criminal sanctions of such violations. It was amended in 1987 to require consultation with the California NAHC whenever Native American Graves are found, and to designate that the removal or possessions of remains or artifacts are felonies, punishable by law.

Section 5097.9 created the California NAHC with the purpose of making recommendations that can encourage private property owners to protect and preserve sacred places in a natural state and allow Native Americans appropriate access for ceremonial or spiritual practices. As part of their duties, the Commission is authorized to assist tribal members in obtaining similar access to sacred sites that are situated on public lands, as well as to assist State agencies in negotiations with federal agencies related to the protection of Native American sacred places located on federally administered lands within the borders of California.

PRC Sections 5097.98 through 5097.99 requires that the California NAHC must be consulted upon the discovery and identification of and Native American graves. Furthermore, these sections established that it is illegal to take or possess remains or artifacts taken from Native American graves after 1984. In addition, any violations of these sections that occur after January 1, 1988, are considered felonies, punishable by law.

Senate Bill 18 – Traditional Tribal Cultural Places

Signed into law in 2004, Senate Bill (SB) 18 requires that cities and counties notify and consult with California Native American tribes about proposed local land use planning decisions for the purpose of protecting traditional tribal cultural sites. Cities and counties must provide general and specific plan amendment proposals to California Native American tribes that the NAHC has identified as having traditional lands located within the city's boundaries. If requested by the Native American tribes, the city must also conduct consultations with the tribes prior to adopting or amending their general and specific plans.

Assembly Bill 52

Assembly Bill 52 of 2014 (AB 52) amended PRC Section 5097.94 and added PRC Sections 21073, 21074, 21080.3.1, 21080.3.2, 21082.3, 21083.09, 21084.2, and 21084.3.

AB 52 formalizes the lead agency–tribal consultation process, requiring the lead agency to initiate consultation with California Native American groups that are traditionally and culturally affiliated with the project, including tribes that may not be federally recognized. Lead agencies are required to begin consultation prior to the release of a negative declaration, mitigated negative declaration, or environmental impact report.

Section 4 of AB 52 adds Sections 21074(a) and (b) to the PRC, which address tribal cultural resources and cultural landscapes. Section 21074(a) defines tribal cultural resources as one of the following:

1) Sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are either of the following:
   A. Included or determined to be eligible for inclusion in the CRHR.

B. Included in a local register of historical resources as defined in subdivision (k) of Section 5020.1.

2) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Section 5024.1. In applying the criteria set forth in subdivision (c) of Section 5024.1 for the purposes of this paragraph, the lead agency shall consider the significance of the resource to a California Native American tribe.

Section 1(a)(9) of AB 52 establishes that "a substantial adverse change to a tribal cultural resource has a significant effect on the environment." Effects on tribal cultural resources should be considered under CEQA. Section 6 of AB 52 adds Section 21080.3.2 to the PRC, which states that parties may propose mitigation measures "capable of avoiding or substantially lessening potential significant impacts to a tribal cultural resource or alternatives that would avoid significant impacts to a tribal cultural resource." Further, if a California Native American tribe requests consultation regarding project alternatives, mitigation measures, or significant effects to tribal cultural resources, the consultation shall include those topics (PRC Section 21080.3.2[a]). The environmental document and the mitigation monitoring and reporting program (where applicable) shall include any mitigation measures that are adopted (PRC Section 21082.3[a]).

Executive Order B-10-11

Executive Order B-10-11 establishes the states policy regarding Native American groups, including the recognition of their sovereign rights, and the states desire that all agencies subject to executive control is to encourage the communication and consultation with California Native tribes. Furthermore, in order to implement this policy, it created the position of Governor's Tribal Advisor as part of the Office of the Governor of California. This position was established to serve as the direct link between the Governor's Office and the numerous tribal governments regarding matters of policy, including legislation and regulation.

Local

County General Plans

In addition to federal and state regulations, cities and counties in the SCAG region may also provide regulatory protection and advisement regarding cultural resources (Table 1). California law requires that a general plan include seven elements (land use, open space, conservation, housing, circulation, noise, and safety). Many jurisdictions incorporate policies related to cultural and historical resources into the conservation element. Other jurisdictions choose to prepare a separate (optional) element dealing with cultural and/or historic preservation issues. Many jurisdictions also prepare ordinances addressing cultural resources and historic preservation.

Table 1. County Policies and Ordinances Relevant to the SCAG Region

County	County Policies and Ordinances
Imperial	Conservation and Open Space Element of General Plan Policy Numbers: One Policy, Section IV.B. Policies Specific to Archaeological Resources: No Policies Specific to Historic Resources: No

County	County Policies and Ordinances
Los Angeles	Chapter 9: Conservation and Natural Resources Element of General Plan Policy Numbers: C/NR 14.1 – C/NR 14.6 Policies Specific to Archaeological Resources: Yes, brief Polices Specific to Historic Resources: Yes, brief
Orange	Chapter Vi: Resources Element Policy Numbers: Goals 1.1 – 3.4 with multiple objectives and policies Policies Specific to Archaeological Resources: Yes, extensive Polices Specific to Historic Resources: Yes, extensive
Riverside	Chapter 5: Multipurpose Open Space Element of General Plan Policy Numbers: OS 19.1 – 19.10 Policies Specific to Archaeological Resources: Yes; OS 19.2-19.4 Polices Specific to Historic Resources: Yes; OS 19.5 – 19.7
San Bernardino	Cultural Resources Element of General Plan Policy Numbers: CR-1 – CR-2 Policies Specific to Archaeological Resources: Yes; CR-1.1, CR-2.3 Policies Specific to Historic Resources: Yes; CR-2.1, CR-2.2
Ventura	Chapter 1: Resources (Subchapter 1.8) of General Plan Policy Numbers: Goals 1.8.1.1-2, 1.8.2.1-6, and 1.8.3.1-3 Policies Specific to Archaeological Resources: Yes, Policy 1.8.2.4 Policies Specific to Historic Resources: Yes, Policy 1.8.2.6

City General Plans and Ordinances

In accordance with Sections 6530(c) and (d) of the California Government Code, like the six counties in the SCAG region, all cities are required to have a conservation element and an open space element, as mandatory elements of their general plans. Many city general plans have provisions for historic districts and protection of locally important cultural resources that may or may not meet the criteria for eligibility for listing in the NRHP or CRHR.

CULTURAL CONTEXT

A brief context statement is provided below. The cultural context is organized by three broad temporal-cultural periods: Prehistoric, Protohistoric, and Historic. The Prehistoric and Historic periods are further divided into chronological sequences. The Prehistoric period is discussed in terms of four "horizons" that were established in the mid-twentieth century and continue to be developed by archaeologists. The Prehistoric and Protohistoric periods are intended to reflect Native American history prior to Spanish presence in the SCAG region (Prehistoric period) and shortly after (Protohistoric period). The Prehistoric horizons are based primarily on archaeological data, whereas information from the Protohistoric period also includes oral history and historical records. The divisions within the Historic period are based strictly on the years of Spanish, Mexican, and American government administration. As a result, the Protohistoric period has some overlap with the Spanish period, the former being affiliated exclusively with Native Americans, the latter with Europeans or other non-Native Americans.

Prehistoric

In the last several decades, researchers have devised numerous prehistoric chronological sequences to aid in understanding cultural changes in southern California. Building on early studies and focusing on data

synthesis, Wallace (1955, 1978) developed a prehistoric chronology for the southern California coastal region that is still widely used today and is applicable to near-coastal and many inland areas. Four horizons are presented in Wallace's prehistoric sequence: Early Man, Milling Stone, Intermediate, and Late Prehistoric. The summary of prehistoric chronological sequences for southern California coastal and near-coastal areas presented below is a composite of information in Wallace (1955) and Warren (1968), as well as more recent studies using radiocarbon dates obtained by researchers in the last three decades, including Koerper and Drover (1983).

Horizon I: Early Man (ca. 10,000–6,000 BC)

The earliest accepted dates for archaeological sites on the southern California coast are from two of the northern Channel Islands, located off the coast of Santa Barbara. On San Miguel Island, Daisy Cave clearly establishes the presence of people in this area approximately 10,000 years ago (Erlandson 1991:105). On Santa Rosa Island, human remains have been dated from the Arlington Springs site to approximately 13,000 years ago (Johnson et al. 2002). Present-day Orange and San Diego counties contain several sites dating from 9,000 to 10,000 years ago (Byrd and Raab 2007:219; Macko 1998:41; Mason and Peterson 1994:55–57; Sawyer and Koerper 2006). Although the dating of these finds remains controversial, several sets of human remains from the Los Angeles Basin (e.g., "Los Angeles Man," "La Brea Woman," and the Haverty skeletons) apparently date to the Middle Holocene, if not earlier (Brooks et al. 1990; Erlandson et al. 2007:54).

Recent data from Horizon I sites indicate that the economy was a diverse mixture of hunting and gathering, with a major emphasis on aquatic resources in many coastal areas (e.g., Jones et al. 2002), and a greater emphasis on large-game hunting inland.

Horizon II: Milling Stone (6,000–3,000 BC)

Set during a drier climatic regime than the previous horizon, the Milling Stone horizon is characterized by subsistence strategies centered on collecting plant foods and small animals. The importance of the seed processing is apparent in the dominance of stone grinding implements in contemporary archaeological assemblages, namely milling stones (metates) and handstones (manos). Recent research indicates that Milling Stone horizon food procurement strategies varied in both time and space, reflecting divergent responses to variable coastal and inland environmental conditions (Byrd and Raab 2007:220).

Horizon III: Intermediate (3,000 BC–AD 500)

The Intermediate horizon is characterized by a shift toward a hunting and maritime subsistence strategy, along with a wider use of plant foods. An increasing variety and abundance of fish, land mammal, and sea mammal remains are found in sites from this horizon along the California coast. Related chipped stone tools suitable for hunting are more abundant and diversified, and shell fishhooks became part of the toolkit during this period. Mortars and pestles became more common during this period, gradually replacing manos and metates as the dominant milling equipment and signaling a shift away from the processing and consuming of hard seed resources to the increasing importance of the acorn (e.g., Glassow et al. 1988).

Horizon IV: late Prehistoric (AD 500–Historic Contact)

In the Late Prehistoric horizon, there was an increase in the use of plant food resources in addition to an increase in land and sea mammal hunting. There was a concomitant increase in the diversity and complexity of material culture during the Late Prehistoric horizon, demonstrated by more classes of artifacts. The recovery of a greater number of small, finely chipped projectile points suggests increased

use of the bow and arrow rather than the atlatl (spear thrower) and dart for hunting. Steatite cooking vessels and containers are also present in sites from this time, and there is an increased presence of smaller bone and shell circular fishhooks; perforated stones; arrow shaft straighteners made of steatite; a variety of bone tools; and personal ornaments such as beads made from shell, bone, and stone. There was also an increased use of asphalt for waterproofing and as an adhesive.

By AD 1000, fired clay smoking pipes and ceramic vessels were being used at some sites (Drover 1971, 1975; Meighan 1954; Warren and True 1961). The scarcity of pottery in coastal and near-coastal sites implies that ceramic technology was not well developed in that area, or that occupants were trading with neighboring groups to the south and east for ceramics. The lack of widespread pottery manufacture is usually attributed to the high quality of tightly woven and watertight basketry that functioned in the same capacity as ceramic vessels.

During this period, there was an increase in population size accompanied by the advent of larger, more permanent villages (Wallace 1955:223). Large populations and, in places, high population densities are characteristic, with some coastal and near-coastal settlements containing as many as 1,500 people. Many of the larger settlements were permanent villages in which people resided year-round. The populations of these villages may have also increased seasonally.

In Warren's (1968) cultural ecological scheme, the period between AD 500 and European contact, which occurred as early as 1542, is divided into three regional patterns: Chumash (Santa Barbara and Ventura counties), Takic/Numic (Los Angeles, Orange, and western Riverside counties), and Yuman (San Diego County). The seemingly abrupt introduction of cremation, pottery, and small triangular arrow points in parts of modern-day Los Angeles, Orange, and western Riverside counties at the beginning of the Late Prehistoric period is thought to be the result of a Takic migration to the coast from inland desert regions. Modern Gabrielino, Juaneño, and Luiseño people in this region are considered the descendants of the Uto-Aztecan, Takic-speaking populations that settled along the California coast in this period.

Protohistoric

The Protohistoric period does not have a clear chronological timeline but may be defined by the boundaries of 500 to approximately 1600. Although early Spanish explorers and mission fathers recorded information on the local Native American populations, professional anthropological studies did not begin until the end of the 19th century after most of the Indian groups had been decimated by genocide, mixed with other Indigenous groups, were assimilated by Spanish, Mexican, and American cultures, or were forced to relocated to reservations.

The SCAG region once was the home to at least 11 distinct Native American groups. These include the Cahuilla, Chumash, Gabrielino, Halchidhoma, Kitanemuk, Luiseno, Mohave, Quechan, Serrano, Southern Paiute, Tataviam, and Tipai. The territorial boundaries of the Native Americans who were residing in Southern California at the time of first European contact do not coincide with today's political boundaries. Moreover, many tribal boundaries overlapped, and most groups migrated within their general boundaries throughout the years.

Between 1851 and 1852 federal agents, negotiated 18 treaties that included 139 tribes, to establish reservation lands across almost a third of California. The treaties were not ratified by Congress, and as a rule, Congress no longer negotiated with American Indians from 1871. However, the federal government continued the policy of forced migration and established a number of reservations in Southern California between 1875 and 1891. In all 17 reservations were established within the SCAG region, within Imperial, Riverside, and San Bernardino Counties. Riverside County holds the most, including Chemehuevi, Fort Mojave, Torres, Cabazon, Augustine, Santa Rosa, Ramona, Pechanga, Soboba, Agua Caliente, Mission

Creek, and Morongo. Within Imperial County are the Martinez, Fort Yuma, and Colorado River reservations. The two reservations in San Bernardino County are the San Manuel and Twentynine Palms reservations. No reservations were established in Los Angeles, Ventura, or Orange Counties as it was believed that the local Native American groups in those counties had become extinct.

Historic

Post-contact history for the state of California is generally divided into three periods: the Spanish period (1769–1822), the Mexican period (1822–1848), and the American period (1848–present). Although there were brief visits by Spanish, Russian, and British explorers from 1529 to 1769, the Spanish period in California began with the establishment of Mission San Diego de Alcalá, the first of 21 missions constructed between 1769 and 1823. Independence from Spain marks the beginning of the Mexican period, and the signing of the Treaty of Guadalupe Hidalgo in 1848, ending the Mexican-American War, signals the beginning of the American period, when California became a territory of the United States.

Spanish Period (1769–1821)

Spanish explorers made numerous expeditions into California between the mid-1500s and mid-1700s. In the process of delivering supplies to another expedition, Hernando de Alarcon followed the Colorado River in 1950 and reached what is now Andrade in Imperial County. Two years later, in search of the legendary Northwest Passage, Juan Rodríquez Cabríllo stopped in 1542 at present-day San Diego Bay. With his crew, Cabríllo explored the shorelines of present Catalina Island as well as San Pedro and Santa Monica Bays. Much of the present California and Oregon coastline was mapped and recorded in the next half-century by Spanish naval officer Sebastián Vizcaíno. Vizcaíno's crew also landed on Santa Catalina Island and at San Pedro and Santa Monica Bays, giving each location its long-standing name. The Spanish crown laid claim to California based on the surveys conducted by Cabríllo and Vizcaíno (Bancroft 1886:96–99; Gumprecht 2001:35).

More than 200 years passed before Spain began the colonization and inland exploration of Alta California. With the renewed interest into the area by other European nations, such as Britain, France, and Russia, who all sent expeditions into the area, Spain officially moved to settle the territory. The 1769 overland expedition by Captain Gaspar de Portolá marks the beginning of California's Historic period, occurring just after the King of Spain installed the Franciscan Order to direct religious and colonization matters in assigned territories of the Americas. With a band of 64 soldiers, missionaries, Baja (lower) California Native Americans, and Mexican civilians, Portolá established the Presidio of San Diego, a fortified military outpost, as the first Spanish settlement in Alta California. In July 1769, while Portolá was exploring Southern California, Franciscan Fr. Junípero Serra founded Mission San Diego de Alcalá at Presidio Hill, the first of the 21 missions that would be established in Alta California by the Spanish and the Franciscan Order between 1769 and 1823.

These missions were part of the Spanish plan that included the settlement of three pueblos and four presidios, that would provide Spain control over Alta California. While one of the pueblos, Branciforte would fail, the other aspects of this plan would be successful.

Mexican Period (1822–1848)

A major emphasis during the Spanish period in California was the construction of missions and associated presidios to integrate the Native American population into Christianity and communal enterprise. Incentives were also provided to bring settlers to pueblos or towns, but just three pueblos were established during the Spanish period, only two of which were successful and remain as California cities (San José

and Los Angeles). Several factors kept growth within Alta California to a minimum, including the threat of foreign invasion, political dissatisfaction, and unrest among the indigenous population. After more than a decade of intermittent rebellion and warfare, New Spain (Mexico and the California territory) won independence from Spain in 1821. In 1822, the Mexican legislative body in California ended isolationist policies designed to protect the Spanish monopoly on trade, and decreed California ports open to foreign merchants.

Extensive land grants were established in the interior during the Mexican period, in part to increase the population inland from the more settled coastal areas where the Spanish had first concentrated their colonization efforts. The secularization of the missions following Mexico's independence from Spain resulted in the subdivision of former mission lands and establishment of many additional ranchos.

During the supremacy of the ranchos (1834–1848), landowners largely focused on the cattle industry and devoted large tracts to grazing. Cattle hides became a primary southern California export, providing a commodity to trade for goods from the east and other areas in the United States and Mexico. The number of nonnative inhabitants increased during this period because of the influx of explorers, trappers, and ranchers associated with the land grants. Many newcomers were Americans that had traveled west and married into landed families. The rising California population contributed to the introduction and rise of diseases foreign to the Native American population, who had no associated immunities.

An attempted northern California revolt in 1946, was quickly stopped, but the American Navy arrived soon after, and on January 13, 1847, Governor Pio Pico and Commander Jose Maria Flores officially surrender to US Captain John C. Freemont. The Treaty of Guadalupe Hidalgo in 1848 was the end of Mexican rule in California.

American Period (1848–Present)

The Mexican–American War officially ended with the Treaty of Guadalupe Hidalgo in 1848, which resulted in the annexation of California and much of the present-day southwest, ushering California into its American period. While gold was first found by Francisco Lopez in 1842 within Placerita Canyon, it wasn't until James Marshall's gold find in 1948 that the Gold Rush began, drastically changing California.

California officially became a state with the Compromise of 1850, which also designated Utah and New Mexico (with present-day Arizona) as U.S. territories. With Statehood and the population boom, legal battles over the land rights of the rancho's were prevalent. By the time American courts decided upon each case, many of the ranches had already be lost by their original Mexican landowners, through deceit, debt, or marriage.

With the huge influx of people seeking gold, the cattle industry flourished as cattle were no longer desired mainly for their hides, but also as a source of meat and other goods. During the 1850s cattle boom, rancho vaqueros drove large herds from southern to northern California to feed that region's burgeoning mining and commercial boom. Cattle were at first driven along major trails or roads such as the Gila Trail or Southern Overland Trail, then were transported by trains when available. The cattle boom ended for southern California as neighbor states and territories drove herds to northern California at reduced prices. Operation of the huge ranchos became increasingly difficult, and droughts severely reduced their productivity (Cleland 1941). With that, many of the rancho lands were transformed to agricultural fields.

The connection of California to the rest of the United States by rail in the 1970s resulted in another population boom, as well as a land boom. Towns began to be established along rail lines, and with them

additional mineral deposits were identified and mined. These mining camps existed for only short periods of time before being abandoned.

EXISTING CONDITIONS

This section characterizes the existing conditions related to cultural resources in the SCAG region, which encompasses an area of more than 38,000 square miles within the counties of Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura. The baseline conditions in the SCAG region are described for 1) cultural resources, 2) Native American sacred sites, and 3) cemeteries. The discussion of cultural resources includes archaeological resources associated with various time periods, as well as non-archaeological resources such as buildings, structures, and other elements of the historical built environment.

Cultural Resources

Historical resources are defined in Section 15064.5(a) of the State CEQA Guidelines and are evaluated according to the provisions of Section 15126.4 of the State CEQA Guidelines. Furthermore, AB 52 requires that CEQA lead agencies consider the effects of projects on tribal cultural resources. Such resources may be underrepresented in the record and archival information available in the information centers, existing in developed areas of a community, where development occurred prior to enactment of CEQA.

Archaeological resources consist of the physical remains of past human activity, and the occupation of Southern California by humans for thousands of years has created innumerable such resources. If an archeological resource is determined to be a historical resource as defined in Section 15064.5(a) of the State CEQA Guidelines, it is evaluated in light of the provisions of Section 15126.4 of the State CEQA Guidelines. If the resource is not a historical resource but meets the definition of a unique archeological resource as established in Section 21083.2 of the PRC, the site is required to be treated in accordance with the provisions of Section 21083.2 of the PRC. For project that are subject to the provisions of AB 52 (i.e., when a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report are prepared), consideration must include archeological resources that are determined to be tribal cultural resources. Such resources may be underrepresented in the record and archival information available in the information centers, as they may be present in existing developed areas, developed prior to enactment of CEQA.

As of July 2019, over 109,000 archaeological resource locations have been identified in the SCAG region (Table 2). In order to protect these archaeological sites, and the artifacts contained within their boundaries, from scavenging and looting, their locations are confidential. Under state law, detailed information about these sites, especially their location, is considered confidential.

There are numerous historical resources that have been listed or determined eligible for listing in the NRHP and/or the CRHR. These historical sites are generally open to the public. Additional registries are maintained by counties, cities, and local historical societies within the SCAG region, that may include sites not listed or determined eligible by the NRHP or CRHR.

Table 2. Archaeological Resources Listed in the CHRIS

County	Archaeological Resources	Total Resources (Archaeological and Historic Resources)
Imperial*	12,398	16,500 (approx.)
Los Angeles	4,886	18,599
Orange	1,775	5,498
Riverside**	20,200 (approx.)	28,612
San Bernardino	8,236	36,924
Ventura	1,864	3,226
Total	**49,359**	**109,359**

Source: SWCA Environmental Consultants, Inc (2019)

* The SCIC database is currently being revised and the count of total resources is an approximation based on current listings. The number of resources with archaeological components is taken from the 2016 General Plan, Open Space & Conservation Element. The total number of resources was approximated by SCIC staff and provided to SWCA via email on July 1, 2019.

** The EIC database is not currently configured to distinguish historic-period archaeological resources from non-archaeological historic resources (i.e., buildings, structures, etc.). Instead, the EIC provided tallies of resources with components dating to the respective periods as follows: 13,993 Prehistoric archaeological sites; 1 Protohistoric archaeological site; 15,313 Historic period cultural resources (archaeological sites and historic resources); 202 sites of unknown cultural or temporal affiliation. Because an individual resource may have components that fall into multiple periods, the sum of all resources listed for each period is greater than the total number of resources. The total number of archaeological sites was estimated for Riverside County to allow for comparison with other counties across the SCAG region. This was done for Riverside County by taking the 13,994 archaeological sites listed as Prehistoric and Protohistoric (because these resources can only be archaeological sites) and adding an estimated fraction of those listed as Historic and Unknown Period, which could consist of historic resources (i.e., non-archaeological). The estimate provided here assumes 40 percent of those resources listed as Historic or Unknown Period have archaeological components that are not multi-component resources (and already tallied as Prehistoric or Protohistoric).

Federal Registers

In order to coordinate and support efforts, both public and private, to identify, evaluate, and protect historic and archaeological resources, the federal government created the NRHP, as part of the NHPA of 1996. This register serves as the official list of buildings, structures, objects, sites, and districts deemed by the federal government as worthy of preservation, as determined by evaluations along uniform criteria. There are currently over 85,000 listings in NRHP, of which 1,123 are located in the SCAG region (Table 3). A complete list of these resources is located in Appendix A, Table A-1.

Table 3. National Register of Historic Places Properties within SCAG Region

County	Listed	Approved	Accepted	Eligible	Total
Imperial	10	0	0	13	23
Los Angeles	564	2	1	142	709
Orange	124	0	0	17	141

Ventura	37	0	0	16	53
Grand Total	**891**	**2**	**1**	**229**	**1123**

Source: NPS (accessed 7/1/2019)

Also recognized by the federal government are NHLs. These are districts, sites, buildings, structures, and objects that the Secretary of the Interior has determined to be significant to the nation's history and culture or illustrate events or places that were important contributions to the historical development of the

United States. There are currently over 2,500 listings in the NHL Database of which 29 are located in the SCAG region (Table 4). A full accounting of these landmarks is located within Appendix B, Table B-1.

State Registers

The State of California keeps a record of districts, places, sites, and buildings determined to hold historic or prehistoric significance. Two registers, administered by the California OHP and the SHRC, are part of the California Department of Parks and Recreation. There are over 1,000 listings in the register of CHL, of which 226 are located in the SCAG region (Table 5), and with the CPHI, there are 850 listings, of which 284 are located in the SCAG region (Table 6).

Historic places are also recorded and can be identified in county, city, and local registers. These resources are also under various ordinances specific to the county, city, or locality. City and county registers may also be maintained by various county and city commissions. Examples of these types of organizations include the Riverside County Historical Commission, the Santa Ana Historic Resources Commission, and the Santa Monica Landmarks Commission. Local groups have also created registries within their area of interest, generally at the community level. An example of such local registers is the Ontario Heritage, a local non-profit organization that aims to protect the historic and cultural resources of Ontario, California. Furthermore, several local cities and counties maintain historic districts. Projects within the borders of these districts are often subject to additional conditions and review by planning staff and historic commissions. A full detailing of these resources is located in Appendix C (Tables C-1 through C-4) and Appendix D (Table D-1).

Native American Sacred Sites

Within the SCAG region there are 16 federally recognized tribes (84 FR 1200) with lands administered as federal Indian reservations, also known as pueblos, rancherias, missions, villages, communities, etc. (Bureau of Indian Affairs 2019):

- Agua Caliente Band of Cahuilla Indians
- Augustine Band of Mission Indians
- Cabazon Band of Mission Indians
- Cahuilla Band of Indians
- Chemehuevi Indian Tribe
- Colorado River Indian Tribe
- Fort Mojave
- Morongo Band of Mission Indians
- Quechan Indian Tribe
- Pechanga Band of Luiseño Indians
- Ramona Band of Cahuilla Mission Indians
- San Manuel Band of Mission Indians
- Santa Rosa Band of Cahuilla Indians
- Soboba Band of Luiseno Indians
- Torres-Martinez Desert Cahuilla Indians

- Twenty-Nine Palms Band of Mission Indians

Recognizing that tribal groups may have expertise with regard to their tribal history and practices that others may not, AB 52 requires lead agencies to provide notice to all tribal groups that are traditionally, culturally, and historically affiliated with the geographic area of a proposed project if they have requested such notice. Some of these groups are not federally recognized, have had their federal recognition revoked, or are in the processes of requesting federal recognition. The NAHC maintains the list of tribes that are traditionally and culturally affiliated within a specified geographic area. Below is a list of tribes on the NAHC's AB 52 notification list within the SCAG region, including the federally recognized groups listed above:

- Agua Caliente Band of Cahuilla Indians
- Augustine Band of Cahuilla Indians
- Barbareño/Ventureno Band of Mission Indians
- Big Pine Paiute Tribe of the Owens Valley
- Cabazon Band of Mission Indians
- Cahuilla Band of Indians
- Campo Band of Digueño Mission Indians
- Chemehuevi Indian Tribe
- Coastal Band of the Chumash Nation
- Colorado River Indian Tries of the Colorado River Indian Reservation
- Ewiiaapaayp Band of Kumeyaay Indians
- Fernandeño Tataviam Band of Mission Indians
- Fort Mojave Indian Tribe
- Gabrieleño Band of Mission Indians–Kizh Nation
- Gabrieleno/Tongva San Gabriel Band of Mission Indians
- Gabrielino Tongva Indians of California Tribal Council
- Gabrielino/Tongva Nation
- Gabrielino-Tongva Tribe
- Jamul Indian Village
- Juaneño Band of Mission Indians, Acjachemen Nation
- Kern Valley Indian Community
- Kitanemuk & Yowlumne Tejon Indians
- Kwaaymii Laguna Band of Mission Indians
- La Jolla Band of Luiseño Indians
- La Posta Band of Digueño Mission Indians
- Los Coyotes Band of Cahuilla and Cupeno Indians

- Manzanita Band of Kumeyaay Nation
- Morongo Band of Mission Indians
- Pala Band of Mission Indians
- Pauma Band of Luiseno Indians
- Pechanga Band of Luiseño Indians
- Quechan Tribe of the Fort Yuma Indian Reservation
- Ramona Band of Cahuilla
- Rincon Band of Luiseño Indians
- San Luis Obispo County Chumash Council
- San Luis Rey Band of Mission Indians
- San Manuel Band of Mission Indians
- San Pasqual Band of Diegueño Mission Indians
- Santa Rosa Band of Cahuilla Indians
- Santa Ynez Band of Chumash Indians
- Serrano Nation of Mission Indians
- Soboba Band of Luiseno Indians
- Sycuan Band of the Kumeyaay Nation
- Torres-Martinez Desert Cahuilla Indians
- Twenty-Nine Palms Band of Mission Indians
- Viejas Band of Kumeyaay Indians

Native American sacred sites reflect the evolution of the Southern California landscape, reflecting the rich cultural heritage of Native American cultures that predate and continued beyond European contact. Native American sacred sites may be related to a range of topics, including origins of the universe, the shifting of tectonic plates, and an evolving array of plants and animals that give Southern California its unique features today. Some sites are associated with the migration of humans into the region, where they settled, and how they lived. These sites document the view of Native American cultures of their own history and way of life.

SWCA contacted the NAHC on behalf of SCAG on December 5, 2018 to request a Sacred Lands File Search and CEQA Tribal Consultation List under AB 52. The NAHC responded in a letter dated December 18, 2018 and indicated that the SLF search yielded positive results; the letter also included a list of 61 contacts for tribal consultation. SCAG sent letters to all 61 of these contacts via certified mail on January 8, 2019. SCAG's letter described the 2020 RTP/SCS and PEIR, and invited tribal parties to consult under AB 52. On behalf of SCAG, SWCA subsequently followed up by email on March 13, 2019 with those contacts who had not responded. In total, seven parties responded to SCAG's outreach effort. Two of these, the Pala Band of Mission Indians and the Big Pine Paiute Tribe of the Owens Valley, declined consultation. Five parties – the Agua Caliente Band of Cahuilla Indians, the Fernandeño Band of Mission Indians, the Gabrieleno Band of Mission Indians – Kizh Nation, the Juaneño Band of Mission Indians Acjachemen Nation, and the San Manuel Band of Mission Indians – requested consultation and additional details, including the cultural resources technical study, once completed. SCAG replied to the

five parties who requested consultation and provided a timeline for the cultural resources technical study, which it anticipates sharing in late 2019. In the meantime, SCAG invited the interested tribes to attend project scoping meetings. AB 52 tribal consultation is ongoing at the time of this draft report.

The NAHC is charged with identifying, cataloging, and protecting Native American cultural resources and sacred sites, which is maintained as the SLF. An SLF search for the SCAG region was requested by SWCA and provided by the NAHC on July 5, 2019. The results identified a count of the total number of SLF listings within each county (Table 7). The nature and precise location of these resources is confidential.

Table 7. Sacred Lands Recorded by the NAHC in the SCAG Region Listed by County

County	Sacred Lands
Imperial	84
Los Angeles	38
Orange	45
Riverside	123
San Bernardino	61
Ventura	12
Grand Total	363

Human Remains

Human remains in the SCAG region occur within the nearly 200 formal cemeteries in the six-county area and those interred outside of formal cemeteries (Table 8).

Table 8. Formal Cemeteries in the SCAG Region Listed by County

County	Number of Formal Cemeteries
Imperial	8
Los Angeles	85
Orange	20
Riverside	27
San Bernardino	32
Ventura	15
Grand Total	**187**

Source: SCAG data, 2010.

In the SCAG region, there are many circumstances in which human remains outside formal cemeteries could be encountered. In additional to existing formal cemeteries, many cemeteries have been relocated. While the goal of such relocation projects is to repatriate human remains to a new location, there have been instances where human remains have been encountered at the original location of a relocated cemetery during subsequent ground-disturbing activities. There is also a potential to find human remains that are the result of foul play. There are also burial features associated with historic settlements and other indigenous people. Burial features can range in complexity from a simple isolated inhumation (burial or

cremation) to more elaborate interments containing numerous bodies. These features may represent specially designated interment areas or remnants of larger archaeological sites. Burial associations can include shell beads and ornaments as well as ground and polished stone artifacts. In some areas, human burials are expected to be found in raised earthen mounds. Native American groups within the SCAG region varied in their burial practices with respect to interment and cremation.

SWCA Project No. 049443

October 2019

Keywords: Paleontological resources; Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura Counties, California

ABSTRACT/EXECUTIVE SUMMARY

Purpose and Scope: In support of the Southern California Association of Governments (SCAG) 2020–2045 Regional Transportation Plan and Sustainable Communities Strategy (2020 RTP/SCS, Connect SoCal or the Plan), Impact Sciences retained SWCA Environmental Consultants (SWCA) to summarize the existing conditions of paleontological resources within the study area, evaluate potential impacts that could occur to these resources because of the Plan, and to provide mitigation measures for potential impacts.

The SCAG region consists of six counties (Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura) and 191 cities. The 2020 RTP/SCS is a regional planning document updated every four years for the SCAG region. The 2020 RTP/SCS will outline the region's goals and policies for meeting current and future mobility needs, provide a foundation for transportation decisions by local, regional and state officials that are ultimately aimed at achieving a coordinated and balanced transportation system. The 2020 RTP/SCS will also identify the region's transportation needs and issues, recommended actions, programs, and a list of projects to address the needs consistent with adopted regional policies and goals, and document the financial resources needed to implement the 2020 RTP/SCS. It is important to note that SCAG does not implement individual projects in the RTP, as they will be implemented by local and state jurisdictions, and other agencies. SCAG has already initiated the development of the 2020 RTP/SCS and is working closely with county transportation commission to compile a regional transportation project list that will build upon the list identified in the 2016 RTP/SCS.

The following paleontological resources assessment was prepared under contract to Impact Sciences in order to characterize existing conditions in regard to the potential for paleontological resources in the six county area. This report compiles an extensive survey of geologic mapping and the scientific literature of paleontological discoveries in southern California. The assessment was conducted according to the methods and standards defined by the Society of Vertebrate Paleontology (1995, 2010) and the Bureau of Land Management (2009, 2016) and is consistent with laws, ordinances, and regulations pertaining to paleontological resources such as the California Environmental Quality Act (Appendix G) and the National Environmental Protection Act.

Dates of Investigation: This report was completed in July 2019.

Findings of the Investigation: The review of geologic mapping and scientific literature indicates southern California, including the six counties included in the SCAG region, has a rich history of fossil discoveries and a strong potential for future findings. Paleontological sensitivity varies across the region: igneous and high-grade metamorphic units have no paleontological sensitivity, whereas sedimentary units range from low to high sensitivities. Growth and development will inevitably lead to impacts on paleontological resources, but with the implementation of planning and mitigation measures, impacts to paleontological resources can be managed and minimized. Recommendations are provided for avoiding impacts to fossil resources during project planning and implementation.

Disposition of Data: Copies of this report will be retained by SWCA and submitted to Impact Sciences and SCAG.

INTRODUCTION

In support of the Southern California Association of Governments (SCAG) 2020–2045 Regional Transportation Plan and Sustainable Communities Strategy (2020 RTP/SCS, Connect SoCal or the Plan), Impact Sciences retained SWCA Environmental Consultants (SWCA) to summarize the existing conditions of paleontological resources within the study area, evaluate potential impacts that could occur to these resources because of the Plan, and to provide mitigation measures for potential impacts.

SCAG is the lead California Environmental Quality Act (CEQA) agency for the proposed 2020 RTP/SCS. As the lead agency, SCAG has determined to prepare a Program Environmental Impact Report for the 2020 RTP/SCS.

SCAG is a federally designated Metropolitan Planning Organization (MPO) under Title 23, United States Code (USC) 134(d)(1). The SCAG region consists of six counties (Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura Counties) and 191 cities. The 2020 RTP/SCS is a regional planning document updated every 4 years for the SCAG region. The 2020 RTP/SCS will outline the region's goals and policies for meeting current and future mobility needs, provide a foundation for transportation decisions by local, regional and state officials that are ultimately aimed at achieving a coordinated and balanced transportation system. The 2020 RTP/SCS will also identify the region's transportation needs and issues, recommended actions, programs, and a list of projects to address the needs consistent with adopted regional policies and goals, and document the financial resources needed to implement the 2020 RTP/SCS. It is important to note that SCAG does not implement individual projects in the RTP, as they will be implemented by local and state jurisdictions, and other agencies. SCAG has already initiated the development of the 2020 RTP/SCS and is working closely with county transportation commissions to compile a regional transportation project list that will build upon the list identified in the 2016 RTP/SCS.

The following paleontological resources assessment was prepared for Impact Sciences, in support of the Program Environmental Impact Report, in order to characterize existing conditions in regard to the potential for paleontological resources in the six county area. This report compiles an extensive survey of geologic mapping and the scientific literature of paleontological discoveries in southern California. The assessment was conducted according to the methods and standards defined by the Society of Vertebrate Paleontology (SVP) (1995, 2010) and the Bureau of Land Management (BLM) (BLM 2009, 2016) and is consistent with laws, ordnances, and regulations pertaining to paleontological resources such as the CEQA (Appendix G) and the National Environmental Protection Act of 1969 (NEPA).

SWCA relied upon three main sources of data to conduct this paleontological assessment: 1) geologic mapping, 2) scientific literature, and 3) online records publicly available from the University of California Museum of Paleontology (UCMP) and the San Diego Natural History Museum (SDNHM). Due to the large size of the SCAG region, it is not feasible to analyze every geologic formation within the area. Rather, this analysis focuses on the broad geologic regions, referred to as geomorphological provinces, as commonly recognized in the paleontological community and summarized by Norris and Webb (1990), among others. For each region, the types of geologic units known for preserving paleontological resources are discussed.

SWCA used the paleontological assessment conducted here to develop a series of recommendations for the development of appropriate mitigation measures for potential projects within the SCAG region. Implementation of these recommendations will ensure CEQA and NEPA compliance and reduce the impacts to fossil resources to less than significant.

SWCA Senior Paleontologist Alyssa Bell, Ph.D. served as Principal Investigator and conducted the research and authored this report. SWCA Senior Paleontologist Russell Shapiro, Ph.D. reviewed this report for quality assurance/quality control. Heather Gibson, Ph.D., Registered Professional Archaeologist, served as project manager for SWCA's technical studies. Copies of the report will be retained SWCA and submitted to Impact Sciences and SCAG.

PROJECT DESCRIPTION

SCAG is the lead CEQA agency for the proposed 2020 RTP/SCS. SCAG is a federally designated Metropolitan Planning Organization under Title 23, USC 134(d)(1). The SCAG region consists of six counties (Imperial, Los Angeles, Orange, Riverside, San Bernardino, and Ventura) and 191 cities (Figure 1). The 2020 RTP/SCS is a regional planning document updated every four years for the SCAG region. The 2020 RTP/SCS will outline the region's goals and policies for meeting current and future mobility needs, provide a foundation for transportation decisions by local, regional and state officials that are ultimately aimed at achieving a coordinated and balanced transportation system. The 2020 RTP/SCS will also identify the region's transportation needs and issues, recommended actions, programs, and a list of projects to address the needs consistent with adopted regional policies and goals, and document the financial resources needed to implement the 2020 RTP/SCS. It is important to note that SCAG does not implement individual projects in the RTP, as they will be implemented by local and state jurisdictions and other agencies. SCAG has already initiated the development of the 2020 RTP/SCS and is working closely with county transportation commissions to compile a regional transportation project list that will build upon the list identified in the 2016 RTP/SCS.

In accordance with California Government Code 65080(b)(2)(B), the 2020 RTP/SCS will include a SCS, which details land use, housing and transportation strategies to reduce greenhouse gas emissions from passenger vehicles (automobiles and light-duty trucks). SCAG's SCS is required to meet reduction targets for greenhouse gas emissions of 8 percent per capita by 2020 and 19 percent per capita by 2035, as compared to 2005 emission levels, as set by the California Air Resources Board.

Figure 1. SCAG region.

REGULATORY SETTING

Paleontological resources are limited, nonrenewable resources of scientific, cultural, and educational value and are afforded protection under federal and state laws and regulations. This study satisfies project requirements in accordance with both federal and state regulations. This analysis also complies with guidelines and significance criteria specified by the SVP (1995, 2010).

Federal Regulations

Antiquities Act of 1906

The Antiquities Act of 1906 (16 USC 431–433) states, in part,

> That any person who shall appropriate, excavate, injure or destroy any historic or prehistoric ruin or monument, or any object of antiquity, situated on lands owned or controlled by the Government of the United States, without the permission of the Secretary of the Department of the Government having jurisdiction over the lands on which said antiquities are situated, shall upon conviction, be fined in a sum of not more than five hundred dollars or be imprisoned for a period of not more than ninety days, or shall suffer both fine and imprisonment, in the discretion of the court.

Although there is no specific mention of natural or paleontological resources in the Act itself, or in the Act's uniform rules and regulations (Title 43 Part 3, Code of Federal Regulations [43 CFR 3]), the term "objects of antiquity" has been interpreted to include fossils by the National Park Service (NPS), BLM, U.S. Forest Service (USFS), and other federal agencies. Permits to collect fossils on lands administered by federal agencies are authorized under this Act. However, due to the large gray areas left open to interpretation due to the imprecision of the wording, agencies are hesitant to interpret this act as governing paleontological resources.

The National Environmental Policy Act of 1969

NEPA, as amended (Public Law [PL] 91-190, 42 USC 4321–4347, January 1 1970, as amended by PL 94-52, July 3 1975, PL 94-83, August 9 1975, and PL 97-258 4(b), Sept. 13 1982) recognizes the continuing responsibility of the federal government to "preserve important historic, cultural, and natural aspects of our national heritage…" (Sec. 101 [42 USC 4321]). With the passage of the Paleontological Resources Preservation Act (PRPA), paleontological resources are considered a significant resource and it is therefore now standard practice to include paleontological resources in NEPA studies in all instances where there is a possible impact.

Federal Land Policy and Management Act of 1976

The Federal Land Policy and Management Act (FLPMA) of 1976 (43 USC 1712(c), 1732(b)); Section 2 of the Federal Land Management and Policy Act of 1962 [30 USC 611]; Subpart 3631.0 et seq.), *Federal Register* Vol. 47, No. 159, pg. 35914 (1982) do not refer specifically to fossils. However, "significant fossils" are understood and recognized in policy as scientific resources. Permits, which authorize the collection of significant fossils for scientific purposes, are issued under the authority of FLPMA. Under FLPMA, federal agencies are charged to

- manage public lands in a manner that protects the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, archaeological, and water resources, and, where

appropriate, preserve and protect certain public lands in their natural condition (Section 102 (a)(8)(11));

- periodically inventory public lands so that the data can be used to make informed land-use decisions (Section 102(a)(2)); and

- regulate the use and development of public lands and resources through easements, licenses, and permits (Section 302(b)).

Paleontological Resources Preservation, Omnibus Public Lands Act of 2009

The Paleontological Resources Preservation Act was enacted as a result of the passage of the Omnibus Public Lands Act of 2009 (PL 111-011, Title VI, Subtitle D), which directs the Secretaries of the U.S. Department of the Interior (USDI) and U.S. Department of Agriculture to manage and protect paleontological resources on federal land using "scientific principles and expertise." To formulate a consistent paleontological resources management framework, PRPA incorporates most of the recommendations from the report of the Secretary of the Interior titled *Assessment of Fossil Management on Federal and Indian Lands* (USDI 2000). In passing the PRPA, Congress officially recognized the scientific importance of paleontological resources on some federal lands by declaring that fossils from these lands are federal property that must be preserved and protected. PRPA codifies existing policies of the BLM, NPS, USFS, Bureau of Reclamation, and U.S. Fish and Wildlife Service, and provides the following:

- uniform criminal and civil penalties for illegal sale and transport, and theft and vandalism of fossils from federal lands;

- uniform minimum requirements for paleontological resource-use permit issuance (terms, conditions, and qualifications of applicants);

- uniform definitions for "paleontological resources" and "casual collecting;" and

- uniform requirements for curation of federal fossils in approved repositories.

State Regulations

California Environmental Quality Act

CEQA is the principal statute governing environmental review of projects occurring in the state and is codified at Public Resources Code (PRC) Section 21000 et seq. CEQA requires lead agencies to determine if a proposed project would have a significant effect on the environment, including significant effects on paleontological resources. Guidelines for the Implementation of CEQA, as amended March 29 1999 (California Code of Regulations [CCR], Title 14, Chapter 3, Section 15000 et seq.), define procedures, types of activities, persons, and public agencies required to comply with CEQA, and include as one of the questions to be answered in the Environmental Checklist (14 CCR Section 15023, Appendix G, Section 14, Part a) the following: "Will the proposed project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?"

Public Resources Code Sections 5097.5

Requirements for paleontological resource management are included in the PRC Section 5097.5 , which states the following:

> No person shall knowingly and willfully excavate upon, or remove, destroy, injure or deface any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over such lands. Violation of this section is a misdemeanor.

These statutes prohibit the removal, without permission, of any paleontological site or feature from lands under the jurisdiction of the state or any city, county, district, authority, or public corporation, or any agency thereof. As a result, local agencies are required to comply with PRC Section 5097.5 for their own activities, including construction and maintenance, as well as for permit actions (e.g., encroachment permits) undertaken by others. PRC Section 5097.5 also establishes the removal of paleontological resources as a misdemeanor and requires reasonable mitigation of adverse impacts to paleontological resources from developments on public (state, county, city, and district) lands.

Local Regulations

Imperial County

The Imperial County General Plan does not address paleontological resources.

Los Angeles County

The Los Angeles County General Plan (Los Angeles County 2015) addresses paleontological resources in Section 8 of Chapter 9: Conservation and Natural Resources Element. This section identifies six policies for the protection of historic, cultural, and paleontological resources, of which Policies 1, 2, 5 and 6 pertain to paleontological resources:

> **Policy C/NR 14.1**: Mitigate all impacts from new development on or adjacent to historic, cultural, and paleontological resources to the greatest extent feasible.
>
> **Policy C/NR 14.2**: Support an inter-jurisdictional collaborative system that protects and enhances historic, cultural, and paleontological resources.
>
> **Policy C/NR 14.5**: Promote public awareness of historic, cultural, and paleontological resources.
>
> **Policy C/NR 14.6**: Ensure proper notification and recovery processes are carried out for development on or near historic, cultural, and paleontological resources.

Orange County

The Orange County General Plan includes paleontological resources in the cultural resources' management program (Orange County 2005:Chapter VI). Goal 2 states, "to encourage through a resource

management effort the preservation of the county's cultural and historic heritage," (Orange County 2005:VI-123) and identifies the following objectives to preserve paleontological resources:

> **Objective 2.2**: Take all reasonable and proper steps to achieve the preservation of archaeological and paleontological remains, or their recovery and analysis to preserve cultural, scientific, and educational values.

Specifically, the General Plan identifies the following three policies to guide the management of paleontological resources:

1. To identify paleontological resources through literature and records research and surface surveys.
2. To monitor and salvage paleontological resources during the grading of a project.
3. To preserve paleontological resources by maintaining them in an undisturbed condition.

Riverside County

Paleontological resources are addressed in the Multipurpose Open Space Element (Chapter 5) of the Riverside County General Plan (Riverside County 2015). The following policies provide direction for paleontological resources:

> **Open Space Policy 19.6** – Whenever existing information indicates that a site proposed for development has high paleontological sensitivity… a paleontological resource impact mitigation program (PRIMP) shall be filed with the County Geologist prior to site grading. The PRIMP shall specify the steps to be taken to mitigate impacts to paleontological resources.
>
> **Open Space Policy 19.7** – Whenever existing information indicates that a site proposed for development has low paleontological sensitivity… no direct mitigation is required unless a fossil is encountered during site development. Should a fossil be encountered, the County Geologist shall be notified, and a paleontologist shall be retained by the project proponent. The paleontologist shall document the extent and potential significance of the paleontological resources on the site and establish appropriate mitigation measures for further site development.
>
> **Open Space Policy 19.8** – Whenever existing information indicates that a site proposed for development has undetermined paleontological sensitivity… a report shall be filed with the County Geologist documenting the extent and potential significance of the paleontological resources on site and identifying mitigation measures for the fossil and for impacts to significant paleontological resources prior to approval of that department.
>
> **Open Space Policy 19.9** – Whenever paleontological resources are found, the County Geologist shall direct them to a facility within Riverside County for their curation, including the Western Science Center in the city of Hemet.

San Bernardino County

The Conservation Element of the San Bernardino County General Plan (San Bernardino County 2007: Chapter 5) identifies paleontological resources as part of the heritage of San Bernardino County. Goal

CO3 states, "the County will preserve and promote its historic and prehistoric cultural heritage," and identifies the following policies to preserve paleontological resources:

> **Policy CO 3.4, program 4**: In areas of potential but unknown sensitivity, field surveys prior to grading will be required to establish the need for paleontologic monitoring.
>
> **Policy CO 3.4, program 5**: Projects requiring grading plans that are located in areas of known fossil occurrences, or demonstrated in a field survey to have fossils present, will have all rough grading (cuts greater than 3 feet) monitored by trained paleontologic crews working under the direction of a qualified professional, so that fossils exposed during grading can be recovered and preserved. Fossils include large and small vertebrate fossils, the latter recovered by screen washing of bulk samples.
>
> **Policy CO 3.4, program 6**: A report of findings with an itemized accession inventory will be prepared as evidence that monitoring has been successfully completed. A preliminary report will be submitted and approved prior to granting of building permits, and a final report will be submitted and approved prior to granting of occupancy permits. The adequacy of paleontologic reports will be determined in consultation with the Curator of Earth Science, San Bernardino County Museum.

Ventura County

The Ventura County General Plan addresses paleontological resources in Section 1.8: Paleontological and Cultural Resources (Ventura County 2019). The Plan identifies two goals, six policies, and three programs for the protection of paleontological resources, of which the following apply to paleontological resources:

> **1.8.1 Goals**
>
> 1. Identify, inventory, preserve and protect the paleontological and cultural resources of Ventura County (including archaeological, historical and Native American resources) for their scientific, educational and cultural value.
>
> 2. Enhance cooperation with cities, special districts, other appropriate organizations, and private landowners in acknowledging and preserving the County's paleontological and cultural resources.
>
> **1.8.2 Policies**
>
> 1. Discretionary developments shall be assessed for potential paleontological and cultural resource impacts, except when exempt from such requirements by CEQA. Such assessments shall be incorporated into a Countywide paleontological and cultural resource data base.
>
> 2. Discretionary development shall be designed or re-designed to avoid potential impacts to significant paleontological or cultural resources whenever possible. Unavoidable impacts, whenever possible, shall be reduced to a less than significant level and/or shall be mitigated by extracting maximum recoverable data. Determinations of impacts, significance and mitigation shall be made by qualified archaeological (in consultation with recognized local Native American groups), historical or paleontological consultants, depending on the type of resource in question.
>
> 3. Mitigation of significant impacts on cultural or paleontological resources shall follow the Guidelines of the State Office of Historic Preservation, the State Native American Heritage

Commission, and shall be performed in consultation with professionals in their respective areas of expertise

1.8.3 Programs

2. The Planning Division will continue to compile and retain a list of qualified archaeological, historical, and paleontological consultants to provide additional information to complete Initial Studies and Environmental Analyses.

EXISTING CONDITIONS

Methods

The following section presents an overview of the methodology used to identify the potential for paleontological resources within the SCAG region. This report is based on a desktop review of available scientific literature, geologic maps, and online museum records searches from the UCMP and SDNHM.

Professional Standards

Both the SVP (1995, 2010) and the BLM (2009, 2016) have established standard guidelines that outline professional protocols and practices for conducting paleontological resource assessments and surveys, monitoring and mitigation, data and fossil recovery, sampling procedures, and specimen preparation, identification, analysis, and curation. Most practicing professional vertebrate paleontologists adhere closely to the SVP's assessment, mitigation, and monitoring requirements, as specifically provided in its standard guidelines. Most state regulatory agencies with paleontological laws, ordinances, regulations, and standards accept and use the professional standards set forth by the SVP to meet the requirements of CEQA. The BLM's paleontological guidelines are designed to meet the requirements of NEPA and the FLPMA and are, in general, only relevant to projects on BLM-administered land or under the oversight of the BLM.

As defined by the SVP (2010:11), significant paleontological resources are

> …fossils and fossiliferous deposits, here defined as consisting of identifiable vertebrate fossils, large or small, uncommon invertebrate, plant, and trace fossils, and other data that provide taphonomic, taxonomic, phylogenetic, paleoecologic, stratigraphic, and/or biochronologic information. Paleontological resources are considered to be older than recorded human history and/or older than middle Holocene (i.e., older than about 5,000 radiocarbon years).

As defined by the BLM (2009:19), significant paleontological resources are

> …any paleontological resource that is considered to be of scientific interest, including most vertebrate fossil remains and traces, and certain rare or unusual invertebrate and plant fossils. A significant paleontological resource is considered to be scientifically important because it is a rare or previously unknown species, it is of high quality and well-preserved, it preserves a previously unknown anatomical or other characteristic, provides new information about the history of life on earth, or has identified educational or recreational value. Paleontological resources that may be considered to not have paleontological significance include those that lack provenience or context, lack physical integrity because of decay or natural erosion, or that are overly redundant or are otherwise not useful for

> research. Vertebrate fossil remains and traces include bone, scales, scutes, skin impressions, burrows, tracks, tail drag marks, vertebrate coprolites (feces), gastroliths (stomach stones), or other physical evidence of past vertebrate life or activities.

These definitions of significant resources are similar in that both recognize any type of fossil (invertebrate, vertebrate, plant, or trace fossils) can be scientifically significant if it is identifiable or well preserved and contributes scientifically valuable data.

A geologic unit known to contain significant fossils is considered sensitive to adverse impacts if there is a high probability that earth-moving or ground-disturbing activities in that rock unit will either disturb or destroy fossil remains directly or indirectly. This definition of sensitivity differs fundamentally from the definition for archaeological resources, as follows:

> It is extremely important to distinguish between archaeological and paleontological resources when discussing the paleontological potential of rock units. The boundaries of an archaeological resource site define the areal/geographic extent of an archaeological resource, which is generally independent from the rock unit on which it sits. However, paleontological sites indicate that the containing rock unit or formation is fossiliferous. Therefore, the limits of the entire rock unit, both areal and stratigraphic, define the extent of paleontological potential. (SVP 2010)

Many archaeological sites contain features that are visually detectable on the surface. In contrast, fossils are often contained within surficial sediments or bedrock and are, therefore, not observable or detectable unless exposed by erosion or human activity.

Numerous paleontological studies have developed criteria for the assessment of significance for fossil discoveries (e.g., Eisentraut and Cooper 2002; Murphey and Daitch 2007; Scott and Springer 2003). In general, these studies assess fossils as significant if one or more of the following criteria apply:

1. The fossils provide information on the evolutionary relationships and developmental trends among organisms, living or extinct;
2. The fossils provide data useful in determining the age(s) of the rock unit or sedimentary stratum, including data important in determining the depositional history of the region and the timing of geologic events therein;
3. The fossils provide data regarding the development of biological communities or interaction between paleobotanical and paleozoological biotas;
4. The fossils demonstrate unusual or spectacular circumstances in the history of life; or
5. The fossils are in short supply and/or in danger of being depleted or destroyed by the elements, vandalism, or commercial exploitation, and are not found in other geographic locations.

In summary, paleontologists cannot know either the quality or quantity of fossils prior to natural erosion or human-caused exposure. As a result, even in the absence of fossils on the surface, it is necessary to assess the sensitivity of rock units based on their known potential to produce significant fossils elsewhere within the same geologic unit (both within and outside the study area), a similar geologic unit, or based on whether the unit in question was deposited in a type of environment known to be favorable for fossil preservation. Monitoring by experienced paleontologists greatly increases the probability that fossils will be discovered during ground-disturbing activities and that, if these remains are significant, successful mitigation and salvage efforts may be undertaken to prevent adverse impacts to these resources.

Both the SVP and the BLM have developed a ranking system for assessing the paleontological sensitivity of a geologic formation. For projects with a state nexus, the SVP classification system is generally used, while for federal projects, the BLM's classification system is used. These systems are discussed below.

SVP Categories of Paleontological Potential

Paleontological potential is defined as the potential for a geologic unit to produce scientifically significant fossils. This is determined by rock type, history of the geologic unit in producing significant fossils, and fossil localities recorded from that unit. Paleontological sensitivity is derived from the known fossil data collected from the entire geologic unit, not just from a specific survey. In its *Standard Procedures for the Assessment and Mitigation of Adverse Impacts to Paleontological Resources*, the SVP (2010:1–2) defines four categories of paleontological sensitivity (potential) for rock units: high, low, undetermined, and no potential. These categories are defined as follows:

> **High Potential**. "Rock units from which vertebrate or significant invertebrate, plant, or trace fossils have been recovered are considered to have a high potential for containing additional significant paleontological resources. Rocks units classified as having high potential for producing paleontological resources include, but are not limited to, sedimentary formations and some volcaniclastic formations (e.g., ash or tephra), and some low-grade metamorphic rocks which contain significant paleontological resources anywhere within their geographical extent, and sedimentary rock units temporally or lithologically suitable for the preservation of fossils (e.g., middle Holocene and older, fine-grained fluvial sandstone, argillaceous and carbonate-rich paleosols, cross-bedded point bar sandstone, fine-grained marine sandstone, etc.). Paleontological potential consists of both a) the potential for yielding abundant or significant vertebrate fossils or for yielding a few significant fossils, large or small, vertebrate, invertebrate, plant, or trace fossils and b) the importance of recovered evidence for new and significant taxonomic, phylogenetic, paleoecologic, taphonomic, biochronologic, or stratigraphic data. Rock units which contain potentially datable organic remains older than late Holocene, including deposits associated with animal nests or middens, and rock units which may contain new vertebrate deposits, traces, or trackways are also classified as having high potential."
>
> **Low Potential**. "Reports in the paleontological literature or field surveys by a qualified professional paleontologist may allow determination that some rock units have low potential for yielding significant fossils. Such rock units will be poorly represented by fossil specimens in institutional collections, or based on general scientific consensus only preserve fossils in rare circumstances and the presence of fossils is the exception not the rule, e.g. basalt flows or Recent colluvium. Rock units with low potential typically will not require impact mitigation measures to protect fossils."
>
> **Undetermined Potential**. "Rock units for which little information is available concerning their paleontological content, geologic age, and depositional environment are considered to have undetermined potential. Further study is necessary to determine if these rock units have high or low potential to contain significant paleontological resources. A field survey by a qualified professional paleontologist to specifically determine the paleontological resource potential of these rock units is required before a PRIMP can be developed. In cases where no subsurface data are available, paleontological potential can sometimes be determined by strategically located excavations into subsurface stratigraphy."
>
> **No Potential**. "Some rock units have no potential to contain significant paleontological resources, for instance high-grade metamorphic rocks (such as gneisses and schists) and plutonic igneous

rocks (such as granites and diorites). Rock units with no potential require no protection or impact mitigation measures relative to paleontological resources" (SVP 2010:1–2).

BLM Potential Fossil Yield Classification

The Potential Fossil Yield Classification (PFYC) system was developed to provide baseline guidance for assessing paleontological resources and allow BLM employees to make initial assessments of paleontological resources. The presence of paleontological resources is correlated with mapped geologic units, and the PFYC was based on available geologic maps. The system assigns a class value to each geological unit, representing the potential abundance and significance of paleontological resources that occur in that geological unit. A complete discussion of the background and context for the PFYC system is provided in the BLM IM2016-124 document (BLM 2016). The following descriptions of paleontological sensitivity class rankings pertinent to this project and drawn directly from the BLM Guidelines are provided here:

Class 1–Very Low. Geologic units that are not likely to contain recognizable paleontological resources. Units assigned to Class 1 typically have one or more of the following characteristics:

- Geologic units are igneous or metamorphic, excluding air-fall and reworked volcanic ash units.
- Geologic Units are Precambrian in age.

(1) Management concerns for paleontological resources in Class 1 units are usually negligible or not applicable.

(2) Paleontological mitigation is unlikely to be necessary except in very rare or isolated circumstances that result in the unanticipated presence of paleontological resources, such as unmapped geology contained within a mapped geologic unit. For example, young fissure-fill deposits often contain fossils but are too limited in extent to be represented on a geological map; a lava flow that preserves evidence of past life, or caves that contain important paleontological resources. Such exceptions are the reason that no geologic unit is assigned a Class 0.

Overall, the probability of impacting significant paleontological resources is very low and further assessment of paleontological resources is usually unnecessary. An assignment of Class 1 normally does not trigger further analysis unless paleontological resources are known or found to exist. However, standard stipulations should be put in place prior to authorizing any land use action in order to accommodate an unanticipated discovery.

Class 2–Low. Geologic units that are not likely to contain paleontological resources. Units assigned to Class 2 typically have one or more of the following characteristics:

- Field surveys have verified that significant paleontological resources are not present or are very rare.
- Units are generally younger than 10,000 years before present.
- Recent aeolian deposits.
- Sediments exhibit significant physical and chemical changes (i.e., diagenetic alteration) that make fossil preservation unlikely.

(1) Except where paleontological resources are known or found to exist, management concerns for paleontological resources are generally low and further assessment is usually unnecessary except in occasional or isolated circumstances.

(2) Paleontological mitigation is only necessary where paleontological resources are known or found to exist.

The probability of impacting significant paleontological resources is low. Localities containing important paleontological resources may exist, but are occasional and should be managed on a case-by-case basis. An assignment of Class 2 may not trigger further analysis unless paleontological resources are known or found to exist. However, standard stipulations should be put in place prior to authorizing any land use action in order to accommodate unanticipated discoveries.

Class 3–Moderate. Sedimentary geologic units where fossil content varies in significance, abundance, and predictable occurrence. Units assigned to Class 3 have some of the following characteristics:

- Marine in origin with sporadic known occurrences of paleontological resources.
- Paleontological resources may occur intermittently, but abundance is known to be low.
- Units may contain significant paleontological resources, but these occurrences are widely scattered.
- The potential for an authorized land use to impact a significant paleontological resource is known to be low-to-moderate.

(1) Management concerns for paleontological resources are moderate because the existence of significant paleontological resources is known to be low. Common invertebrate or plant fossils may be found in the area, and opportunities may exist for casual collecting.

(2) Paleontological mitigation strategies will be proposed based on the nature of the proposed activity.

This classification includes units of moderate or infrequent occurrence of paleontological resources. Management considerations cover a broad range of options that may include record searches, pre-disturbance surveys, monitoring, mitigation, or avoidance. Surface-disturbing activities may require assessment by a qualified paleontologist to determine whether significant paleontological resources occur in the area of a proposed action, and whether the action could affect the paleontological resources.

Class 4–High. Geologic units that are known to contain a high occurrence of paleontological resources. Units assigned to Class 4 typically have the following characteristics:

- Significant paleontological resources have been documented but may vary in occurrence and predictability.
- Surface disturbing activities may adversely affect paleontological resources.
- Rare or uncommon fossils, including nonvertebrate (such as soft body preservation) or unusual plant fossils, may be present.
- Illegal collecting activities may impact some areas.

(1) Management concerns for paleontological resources in Class 4 are moderate to high, depending on the proposed action.

(2) Paleontological mitigation strategies will depend on the nature of the proposed activity, but field assessment by a qualified paleontologist is normally needed to assess local conditions.

The probability for impacting significant paleontological resources is moderate to high, and is dependent on the proposed action. Mitigation plans must consider the nature of the proposed disturbance, such as removal or penetration of protective surface alluvium or soils, potential for future accelerated erosion, or increased ease of access that could result in looting. Detailed field assessment is normally required and on-site monitoring or spot-checking may be necessary during land disturbing activities. In some cases avoidance of known paleontological resources may be necessary.

Class 5–Very High. Highly fossiliferous geologic units that consistently and predictably produce significant paleontological resources. Units assigned to Class 5 have some or all of the following characteristics:

- Significant paleontological resources have been documented and occur consistently.
- Paleontological resources are highly susceptible to adverse impacts from surface disturbing activities.
- Unit is frequently the focus of illegal collecting activities.

(1) Management concerns for paleontological resources in Class 5 areas are high to very high.

(2) A field survey by a qualified paleontologist is almost always needed. Paleontological mitigation may be necessary before or during surface disturbing activities.

The probability for impacting significant paleontological resources is high. The area should be assessed prior to land tenure adjustments. Pre-work surveys are usually needed and on-site monitoring may be necessary during land use activities. Avoidance or resource preservation through controlled access, designation of areas of avoidance, or special management designations should be considered.

Class U–Unknown Potential. Geologic units that cannot receive an informed PFYC assignment. Characteristics of Class U may include:

- Geological units may exhibit features or preservational conditions that suggest significant paleontological resources could be present, but little information about the actual paleontological resources of the unit or area is known.
- Geological units represented on a map are based on lithologic character or basis of origin, but have not been studied in detail.
- Scientific literature does not exist or does not reveal the nature of paleontological resources.
- Reports of paleontological resources are anecdotal or have not been verified.
- Area or geologic unit is poorly or under-studied.
- BLM staff has not yet been able to assess the nature of the geologic unit.

(1) Until a provisional assignment is made, geologic units that have an unknown potential have medium to high management concerns.

(2) Lacking other information, field surveys are normally necessary, especially prior to authorizing a ground-disturbing activity.

An assignment of "Unknown" may indicate the unit or area is poorly studied, and field surveys are needed to verify the presence or absence of paleontological resources. Literature searches or consultation with professional colleagues may allow an unknown unit to be provisionally assigned to another Class, but the geological unit should be formally assigned to a Class after adequate survey and research is performed to make an informed determination.

Results

Geologic Setting

The SCAG region covers most of southern California and an incredible diversity of geology. Rocks found in the region span over two billion years of Earth's history, from Precambrian granite and metasedimentary rocks to Holocene alluvium, the deposition of which is ongoing today (see Figure 2 for geologic time scale). The state of California has been divided into 11 geomorphic provinces in order to accurately generalize the distinctive geologic regions of the state. Five of these provinces compose the SCAG region: Basin and Range, Colorado Desert, Mojave Desert, Peninsular Ranges, and Transverse Ranges (Figure 3). These provinces and their generalized geology and paleontology are discussed below.

BASIN AND RANGE

Within the SCAG region, the southernmost edge of the Basin and Range Geomorphic Province occurs in northern San Bernardino County. The Basin and Range Geomorphic Province extends from the Sierra Nevada Mountains in the north and east into Nevada in the west and is bounded by the Garlock Fault in northern San Bernardino County to the south (Norris and Webb 1990). This province is characterized by high geographic relief, with steep mountain ranges separated by deep valleys, such as Death Valley, Owens Valley, and Saline Valley. These basins have very little permanent water supplies, with the exception of Mono Lake and the Owens River (Norris and Webb 1990).

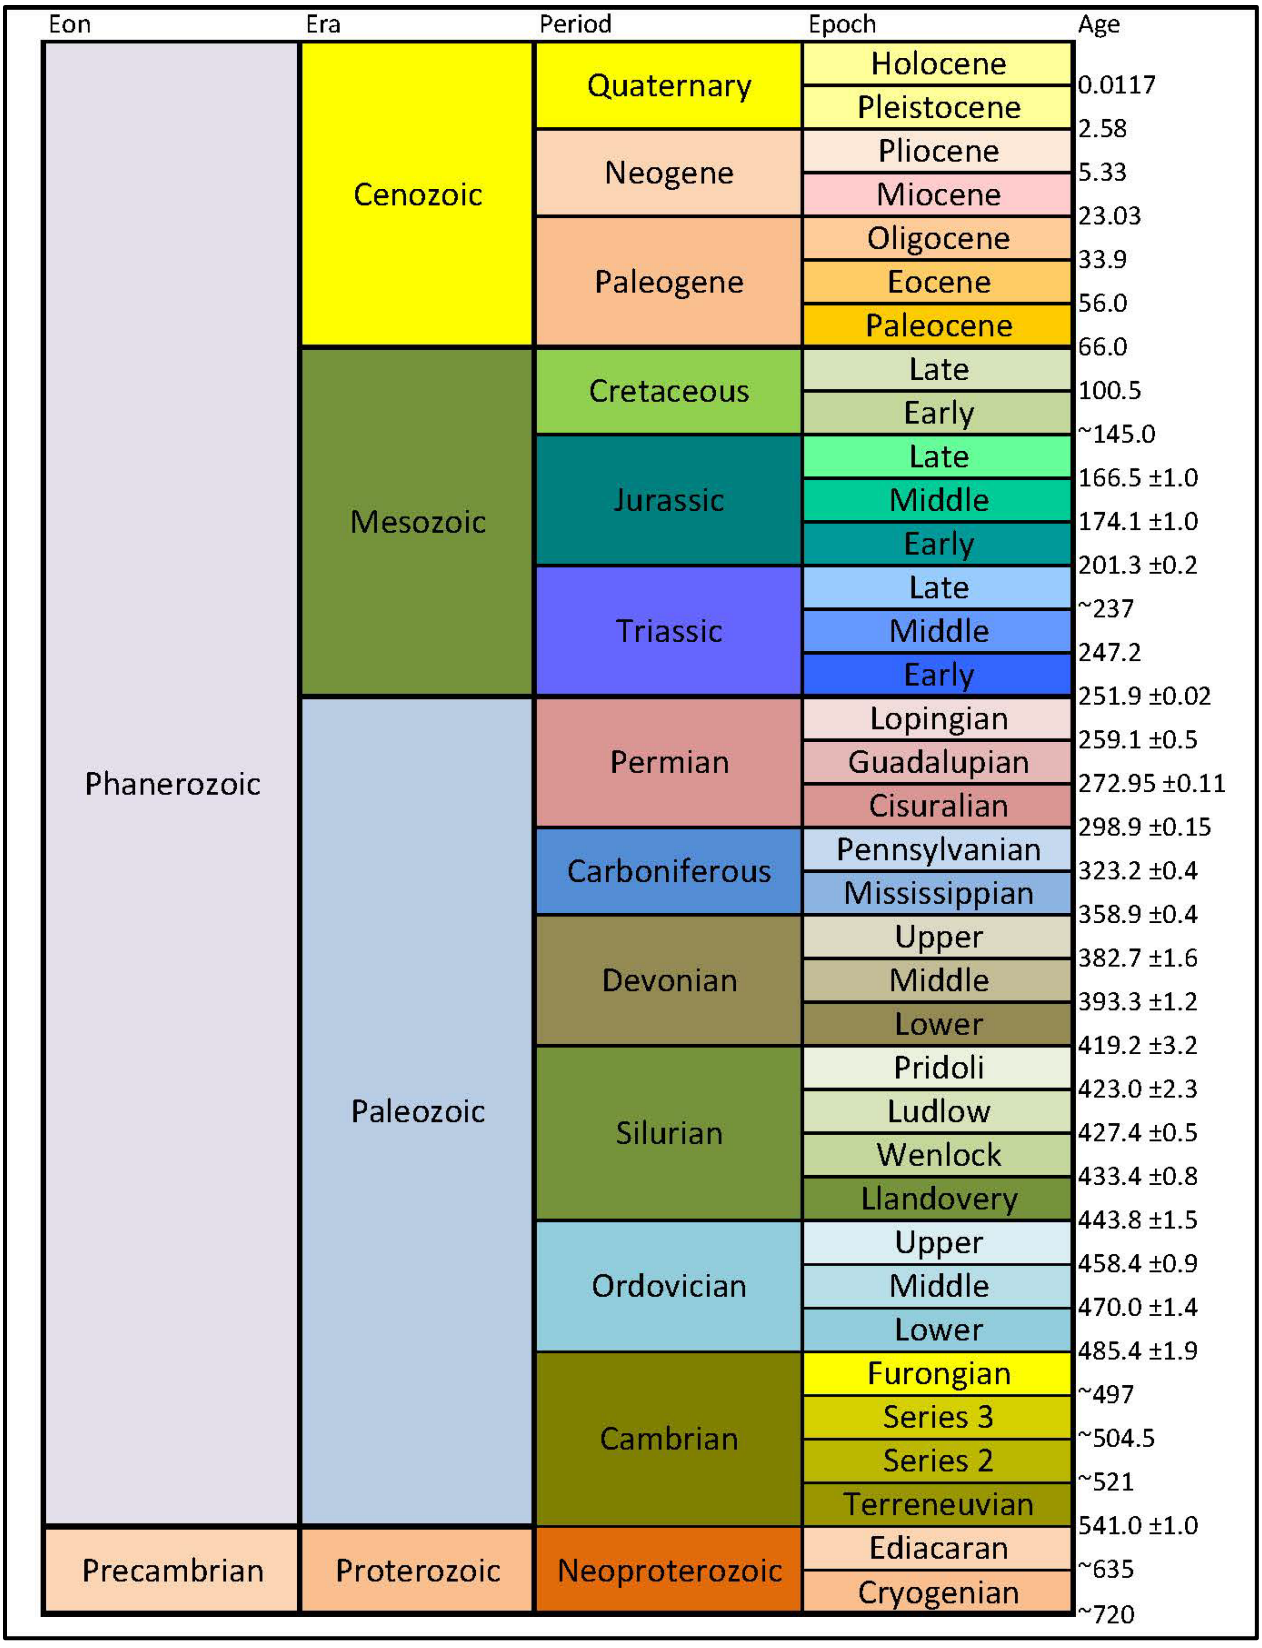

Figure 2. Geologic timescale.

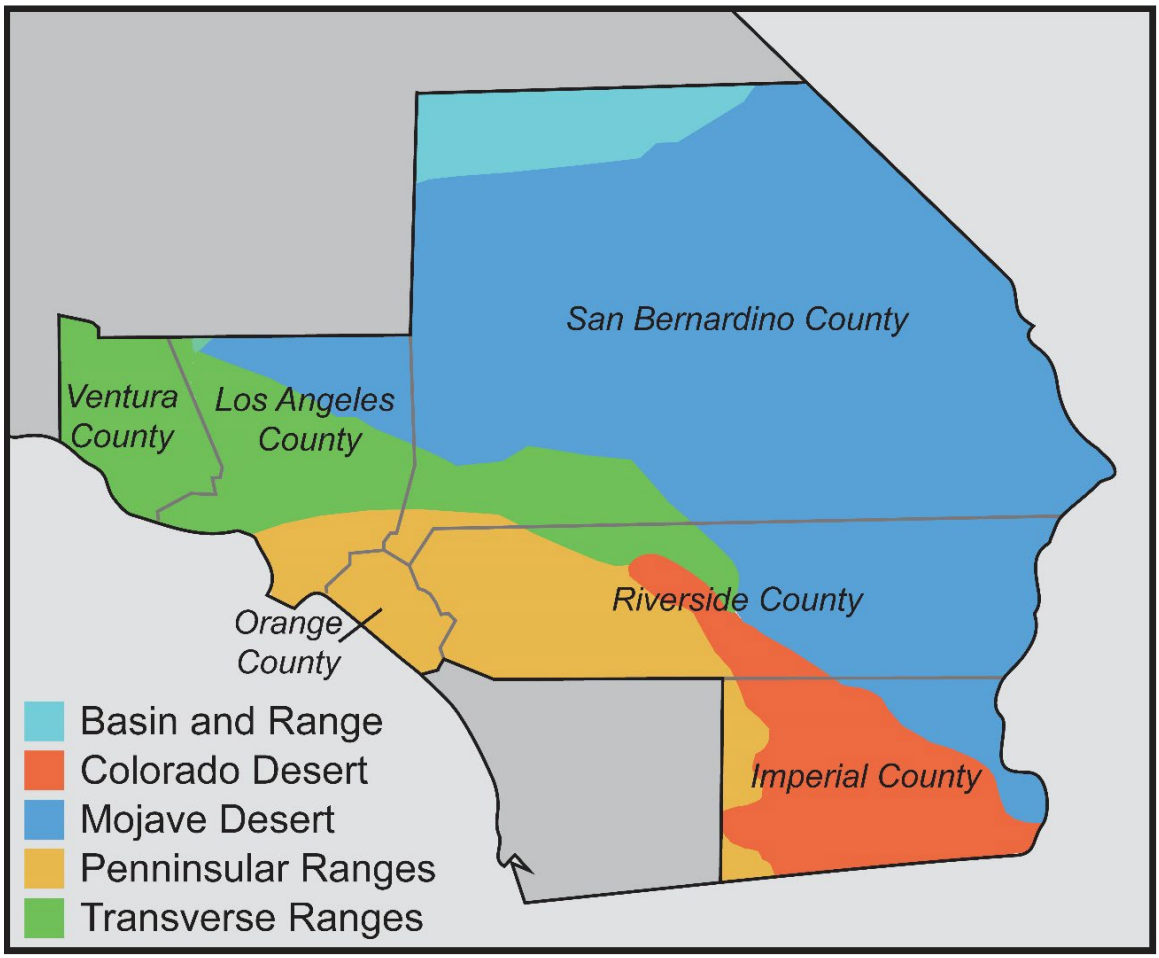

Figure 3. Geomorphic provinces in SCAG region.

The Basin and Range Province preserves some of the oldest rocks in the state, exposed around Death Valley, a sequence of early to middle Proterozoic metamorphic and granitic rocks that date to 1.8 billion years old (Norris and Webb 1990). A thick sequence of younger Proterozoic rocks composed of slightly metamorphosed sedimentary rocks deposited in a nearshore marine environment overlies these basement rocks, which are best exposed around Death Valley and in the Mojave as well (Corsetti and Hagadorn 2000). This sequence is in turn overlain by rocks that preserve the Proterozoic-Paleozoic transition, with rocks in the White-Inyo Mountains preserving fossils of the first organisms to evolve hard shells at the beginning of an evolutionary radiation paleontologists refer to as the Cambrian Explosion (Waggoner and Hagadorn 2005). Younger Paleozoic rocks are represented by beds of limestone and dolomite that are thickest in the Inyo Mountains and thin towards the east and indicate deposition along the slope and shelf of an ancient ocean margin (Norris and Webb 1990). Few sedimentary rocks are preserved from the Mesozoic in the Basin and Range Province, where rocks of this age are primarily intrusive igneous rocks and volcanic deposits (Ingersoll 1983). Cenozoic deposits in the Basin and Range date back to the Oligocene and preserve terrestrial environments with continued volcanic input (Norris and Webb 1990).

The modern topography of the Basin and Range began forming in the Miocene, when crustal extension, or stretching, began as a result of a change in plate motion between the Pacific and North American plates (Zoback 1989). This extension resulted in prominent horst-and-graben fault block patterns, where basins are formed along normal faults between down-dropped blocks lowered relative to the upward moving mountain blocks (Zoback 1989). Continual tectonic activity resulted in the basins observed today, many

of which host playa beds and saline deposits deposited during wetter periods toward the end of the last glaciation (Reheis et al. 2002). Volcanism also continued in the Basin and Range, with abundant volcanic rocks dating from the Late Pliocene to Holocene. The youngest of these deposits are in the Coso Mountains around Red Hill, and date to slightly over 10,000 years old (Crowley et al. 2007).

COLORADO DESERT

The Colorado Desert Geomorphic Province is bounded to the east by the Colorado River, to the south by the international border, and to the west by the Peninsular Ranges, occupying the majority of Imperial County and extending northwards into central Riverside County within the SCAG region. Norris and Webb (1990) define the northern border as the southern edge of the eastern Transverse Ranges and the San Bernardino-Riverside County line.

The Colorado Desert is similar geologically to the Mojave Desert (see below) and generally only distinguished from the Mojave by being lower in elevation, and, thereby, with a slightly different climate and vegetation (Norris and Webb 1990). The dominant feature of this province is the Salton Trough, a large depression extending from the San Gorgonio Pass in the north to the Gulf of California in Mexico. Within this large structural depression, the Salton Basin is restricted to the portion draining into the Salton Sea in southern Riverside and northern Imperial counties (Dorsey 2010).

The stratigraphy of the Colorado Desert is much like that of the Mojave, discussed in more detail below, with Proterozoic granitic rocks forming the core of scattered mountain ranges, which have been intruded by younger igneous bodies dating from the late Paleozoic to the middle Cenozoic (Norris and Webb 1990). Preserved sediment dates to the Eocene, with alternating periods of terrestrial and marine-dominated deposition. Uplift of the mountains present in the Colorado Desert today began in the Mesozoic, and, since that time, the uplifted areas have been actively eroding, leading to large deposits of sedimentary rocks that date from the middle Cenozoic to modern times (Davis et al. 1994).

MOJAVE DESERT

The Mojave Desert occupies about 65,000 square kilometers (km) (25,097 square miles), bounded to the northwest by the Transverse Ranges and to the southeast by the Colorado Desert. The Sierra Nevada and the Basin and Ranges provinces establish the northern boundary and the Nevada state line and Colorado River establish the eastern boundary (Norris and Webb 1990). The Mojave Desert province is wedged in a sharp angle between the Garlock Fault (southern boundary Sierra Nevada) and the San Andreas Fault, where the latter bends east from its northwest trend. The northern boundary of the Mojave is separated from the prominent Basin and Range by the eastern extension of the Garlock Fault (Dokka and Travis 1990). Roughly half of the SCAG region, divided diagonally, occurs in the Mojave Desert: the majority of San Bernardino County, the eastern half of Riverside County, and the northeastern corners of Los Angeles and Imperial counties.

The province is very similar in terms of geology to the Colorado Desert, discussed above, differing by being at a generally higher elevation. The Mojave Desert is characterized by scattered mountain blocks bounded by normal and strike-slip faults and the broad alluvial basins between them (Dibblee 1967). Basin fill ranges from thick sequences of Miocene sediments north of Barstow to more recent Quaternary depressions north of Baker, and even rock-floored pediments in the northeastern Mojave (Norris and Webb 1990). Lava flows that date from the Cenozoic are also common features across the Mojave, such as Amboy Crater, Cima Dome, and around Pisgah, with volcanic sediments intermixed with terrestrial sediments dating as far back as the Miocene (Dibblee 1967). A more recent feature are the many playas scattered across Mojave, these being particularly numerous in the eastern Mojave (Norris and Webb 1990).

The sedimentary record in the western Mojave is dominated by Cenozoic deposits, with earlier deposits of Mesozoic and Paleozoic to Precambrian age generally limited to the eastern Mojave (Dibblee 1967). The Cenozoic record in the western Mojave is predominantly non-marine except for a few thin, restricted lower Miocene marine sediments. The western Mojave region includes extensive thicknesses of non-marine alluvium, with widespread tuff, ash and other volcaniclastics, interbedded with lake-bed sediments and evaporates. Miocene-aged rocks are prominent among the Cenozoic basins of the western Mojave, and occur where tectonic activity has exposed these sequences, such as within the Barstow Basin north of Barstow (Norris and Webb 1990).

PENINSULAR RANGES

The Peninsular Ranges extend from the Mexican border in the south to the Transverse Ranges in the north and northeast and are bordered by the Pacific Ocean on the west and the Colorado Desert on the east. Within the SCGA region, southern Los Angeles County, southeastern-most San Bernardino County, western Riverside and Imperial Counties, and all of Orange County occur in the Peninsular Ranges. The Peninsular Ranges are a series of northwest-trending mountain ranges extending approximately 240 km (149 miles) to the Mexican border, where they then continue for an additional 1,200 km (746 miles) along the Baja Peninsula (Harden 2004).

The core of the Peninsular Ranges is made up of Mesozoic plutonic rocks and represents the roots of a magmatic arc formed by active subduction along the Pacific Plate boundary (Harden 2004). Two main batholiths (western and eastern) form the core of the Peninsular Ranges. The western batholith is 140 to 105 million years old (Ma) and consists of mafic plutonic rocks, while the eastern batholith is 99 to 92 Ma and is made of more silica-rich granodiorites and tonalities (Kimbrough et al. 2001). These plutonic rocks intruded into the older rocks of a Paleozoic through Jurassic carbonate platform and forearc basin, heavily metamorphosing them locally (Harden 2004). Above these plutonic rocks, around 130 to 120 Ma, the Santiago Peak Volcanics were deposited as primarily andesitic and silicic flows, and then metamorphosed by the batholith emplacement (Fife et al. 1967). Cretaceous sedimentary rocks deposited as turbidity currents overlie the plutons and volcanic rocks (Kimbrough et al. 2001). These rocks are in turn overlain by more recent sedimentary deposits leading up to the present day. These deposits were marine through the Eocene and then shifted to terrestrial volcanic and sedimentary strata by the Oligocene and lower Miocene (Powell 1993).

TRANSVERSE RANGES

The Transverse Ranges run from west to east across the northwestern SCAG region, crossing all of Ventura County, central Los Angeles County, southwestern San Bernardino County, and north-central Riverside County. The Transverse Ranges Geomorphic Province consists of a complex series of young, east/west-trending mountain ranges and valleys that contradict the general north/south orientation of California's other mountain ranges, such as the Peninsular Ranges and Coastal Ranges (Matti et al. 1992). The Transverse Ranges begin at Point Conception in Santa Barbara County and extend in an easterly direction, terminating at the San Bernardino Mountains in San Bernardino County. Westerly, the Transverse Ranges continue offshore as the northern Channel Islands. Most of the ranges are bounded to the north and east by the San Andreas Fault System, which separates the ranges from the Coastal Ranges and Peninsular Ranges. Components of the ranges that lie north of the San Andreas Fault are the Tehachapi Mountains and San Bernardino Mountains. Most of the tallest peaks are in the eastern portion of the range and include Mount San Gorgonio and San Bernardino Peak. The Transverse Ranges are noted for being extremely steep and difficult to traverse.

The Transverse Ranges include a wide variety of geologic units, ranging in age from the Proterozoic to the recent (Norris and Web 1990). The Transverse Ranges are underlain by a thick sequence of late

Mesozoic- and Cenozoic-age strata that rest uncomfortably on a variety of basement rocks (Namson and Davis 1988). These ranges are undergoing active north/south shortening due to faulting (Dibblee 1967), which causes a significant rise in elevation on an annual scale. These fault-bounded ranges are mainly composed of two distinct types of crystalline basement rocks that are separated by thrust faults. The lower rocks consist of metamorphosed sedimentary and volcanic rocks known as the Pelona Schist.
The uppermost rock comprises older metamorphic and plutonic rocks that originally formed part of the ancient North American continental platform known as Mendenhall Gneiss and gabbro (Norris and Web 1990).

Paleontologic Setting

Given the diversity of geologic units found in the SCAG region, the paleontology is equally diverse, and, in some areas, fossils are quite abundant. A detailed analysis of the paleontological sensitivity of each geologic formation in the SCAG region is beyond the scope of this analysis and should be the subject of project-specific paleontological assessments (see recommendations below). The SVP (2010) defines fossils as being over 5,000 years in age, while the BLM (2009, 2016) generally considers fossils to be Pleistocene in age or older (11,700 years in age). Therefore, sediments younger than middle or early Holocene are too young to preserve fossil resources and have low (SVP) or PFYC 2 (BLM) paleontological sensitivity. Other types of geologic units with low sensitivity are moderately metamorphosed rocks, as the heat and pressure associated with metamorphism is likely to destroy fossils. High grade metamorphic rocks, as well as igneous rocks, have no paleontological sensitivity.

Some generalizations about the primary types of fossil bearing rocks can be made, based on the 1:750,000 scale geologic mapping by Jennings et al. (2010), as discussed below.

CENOZOIC MARINE DEPOSITS

Cenozoic marine deposits date from the Paleocene to the Pliocene and were deposited on the ancient seafloor. These geologic formations are well known for being highly fossiliferous in southern California and may preserve a wide variety of marine fauna: invertebrates such as mollusks, crustaceans, echinoderms, and others; marine vertebrates such as shark and other fish, whales, seals, sea lions, and others; and even terrestrial vertebrates such as horse, camel, bison, and others that washed out to sea and where buried in the near-shore marine deposits.

These deposits are particularly common at the surface in the Transverse Ranges in Ventura County, where Eocene and Miocene units are prevalent, coastal Orange County, central Imperial County as scattered outcrops around the Salton Sea, and central Los Angeles County. In the subsurface, these deposits are likely to be encountered underlying the younger surficial alluvium across large parts of the Los Angeles and San Bernardino basins.

Some of these units with the highest paleontological sensitivity (BLM PFYC class 4 or 5, SVP high potential) are discussed below:

> **Shallow Marine Deposits**. Shallow marine deposits such as the San Pedro Sand and the Palos Verdes Sand have a strong record of preserving Pleistocene-aged marine and terrestrial fossils. The San Pedro Sand has yielded a diverse fauna of nearshore marine invertebrates such as crabs, snails, bivalves, gastropods, and echinoids (Kennedy 1975; Valentine 1989; Woodring 1957) and vertebrates such as sharks, bony fish, amphibians, reptiles, birds, whales, antelopes, mammoth, dire wolves, rodents, and bison (Barnes and McLeod 1984; Fitch 1967; Kennedy 1975; Woodring 1957). These units are common along coastal southern California, including Ventura, Los Angeles, and Orange Counties in the SCAG region. Many abundant fossil localities have been collected from excavations in San Pedro around the Port of Los Angeles, where the setting is very

similar to that of the program area, with artificial fill covering old marine deposits. These deposits have yielded thousands of specimens of marine invertebrates that are significant for reconstructing changes in shallow marine ecosystems as the climate has changed since the Pleistocene (DeBusk et al. 2009; Jacobs 2005; Powell and Stevens 2000).

Fernando Formation. The Fernando Formation dates to the Pliocene and consists of marine siltstone, sandstone, pebbly sandstone, and conglomerate (Morton and Miller 2006). The Fernando is common in the Transverse Ranges, particularly in Los Angeles County, where it is found extensively in the subsurface throughout the Los Angeles Basin. The lower part of the Fernando Formation consists of a pebble-cobble conglomerate in a sandstone matrix that fines upwards into a coarse sandstone and then a silty sandstone (Schoellhamer et al. 1981). The upper Fernando Formation consists of coarse-grained sandstone with conglomerate lenses (Schoellhamer et al. 1981). The Fernando Formation has an extensive record of preserving scientifically significant fossils, including invertebrates such as mollusks, echinoids, and bryozoans (Groves 1992; Morris 1976; Woodring 1938), fish (Huddleston and Takeuchi 2006), squid (Clarke et al. 1980), and a number of unidentified megafossils (Schoellhamer et al. 1981).

Bouse Formation. The Bouse Formation spans the early Pliocene to the late Miocene and has been interpreted to represent either a marine estuarian or lacustrine depositional environment (Spencer and Patchett 1997). The Bouse Formation is found in the Mojave Desert Geomorphic Province and consists of calcareous clay, silt, and sand (Carr and Dickey 1980). Abundant common invertebrate fossils such as gastropods, ostracodes, barnacles, and foraminifera, as well as fish and plants are known from the Bouse Formation (Carr and Dickey 1980; Spencer and Patchett 1997).

Puente Formation. The Puente Formation, often synonymous with the Modelo Formation, consists of marine sandstone, siltstone, and shale that dates from the early Pliocene to the Miocene (Critelli et al. 1995; Morton and Miller 2006). The Puente Formation has a history of preserving both invertebrate and vertebrate marine fossils, such as cephalopods (Saul and Stadum 2005), crustaceans (Feldman 2003), fishes (Carnevale et al. 2008; David 1943; Hilton and Grande 2006; Huddleston and Takeuchi 2006), and other marine and terrestrial vertebrates (Barboza et al. 2017; Leatham and North 2017). The Puente Formation is common in the Peninsular Ranges and Transverse Ranges provinces.

Monterey Formation. The Monterey Formation records the filling of a deep basin formed by tectonism along the California margin (Pisciotto and Garrison 1981) and constitutes one of the major elements of California geology and can range up to several thousands of feet thick (Bramlette 1946). The Monterey ranges in age from the Pliocene to middle Miocene (Obradovich and Naeser 1981) and can be found throughout the basins of the Peninsular Ranges and Transverse Ranges provinces in the subsurface. The Monterey has yielded a diverse fauna consisting of some mollusks (Bramlette 1946) and common fish skeletons (Bramlette 1946; Dibblee 1973), and remains of larger marine macrofauna such as whales (Pyenson and Haasl 2007) and the giant extinct Desmostylus (Hannibal 1922), as well as birds (Warheit 1992), crocodiles (Barboza et al. 2017) and rare land organisms such as horse and land plants (Bramlette 1946).

Vaqueros Formation. The Vaqueros Formation consists of predominately limey sandstone interbedded with siltstone and shale deposited in an offshore basin (Bartow 1974; Morton and Miller 2006). The Vaqueros Formation is common in the Peninsular Ranges and Transverse Ranges provinces and dates from the early Miocene to the late Eocene (Morton and Miller 2006). Common fossils in the Vaqueros include marine invertebrates such as barnacles, ostreids, pectinids and marine ichnofossils (Bartow 1974), as well as terrestrial vertebrates (Whistler and Lander 2003) and marine megafauna (Morton and Miller 2006).

CENOZOIC TERRESTRIAL DEPOSITS

Cenozoic terrestrial deposits date from the Paleocene to the Pleistocene and were deposited in terrestrial environments as alluvial sediments, fluvial sediments, and lacustrine deposits. These geologic formations are well known for being highly fossiliferous in southern California and may preserve a wide variety of terrestrial fauna: invertebrates such as mollusks; plants; and abundant terrestrial vertebrates such as horse, camel, bison, and others.

These deposits are particularly common at the surface in the Mojave and Colorado Desert provinces but are found scattered across the entire SCAG region. Some of these units with the highest paleontological sensitivity (BLM PFYC class 4 or 5, SVP high potential) are discussed below.

Pleistocene Alluvium. Pleistocene alluvium consists of sand, silt, and gravel deposited in terrestrial environments as the result of erosion of surrounding highlands and dates to the Pleistocene (11,000–2.58 ma; Jennings et al. 2010). Pleistocene sediments have a rich fossil history in southern California (Hudson and Brattstrom 1977; Jefferson 1991a, 1991b; McDonald and Jefferson 2008; Miller 1941, 1971; Roth 1984; Scott 2010; Scott and Cox 2008; Springer et al. 2009). The most common Pleistocene terrestrial mammal fossils include the bones of mammoth, horse, bison, camel, and small mammals, but other taxa, including lion, cheetah, wolf, antelope, peccary, mastodon, capybara, and giant ground sloth, have been reported (Graham and Lundelius 1994), as well as birds, amphibians, and reptiles such as frogs, salamanders, snakes, and turtles (Hudson and Brattstrom 1977). In addition to illuminating the striking differences between Southern California in the Pleistocene and today, this abundant fossil record has been vital in studies of extinction (e.g., Sandom, et al. 2014; Scott 2010), ecology (e.g., Connin et al. 1998), and climate change (e.g., Roy et al. 1996).

An excellent example of the striking abundance and diversity of these Pleistocene sediments comes from Riverside County, just south of San Bernardino County, where nearly 100,000 identifiable fossil specimens representing 105 vertebrate, invertebrate, and plant species were collected from more than 2,000 individual localities during the construction of the dam at Diamond Valley Lake (Springer et al. 2009) and are now housed at the Western Science Center in Hemet, California. This site represents the second largest late Pleistocene fossil assemblage known from the American Southwest after the La Brea Tar Pits in Los Angeles (Springer et al. 2009). Other Ice Age fossils have been found throughout the inland valleys (Miller 1971; Reynolds and Reynolds 1991; Reynolds et al. 2012) and the Mojave Desert (Jefferson 1987, 1988; Scott et al. 2004, 2006; Scott and Cox 2008).

Manix Formation. The Manix Formation consists of around 40 m of lacustrine, fluvial, and alluvial sediments deposited in and around the Middle to late Pleistocene Lake Manix (Jefferson et al. 2003). This formation occurs to the east of Barstow in the Mojave Desert. The lacustrine and fluvial deposits in this formation have yielded a diverse fauna, preserving invertebrates such as mollusks and ostracods as well as aquatic and terrestrial vertebrates such as fish, birds, and numerous Ice Age mammals (Jefferson et al. 2003).

San Timoteo Formation. The San Timoteo Formation dates from the Pleistocene to the Pliocene and consists of stream-deposited alluvial sediments that are made up of detritus eroded from the San Bernardino Mountains in the Mojave Desert and southeastern Transverse Ranges provinces. A number of significant fossil deposits have been discovered in the San Timoteo.
The construction of the El Casco Substation in San Timoteo Canyon between September 2009 and January 2011 produced numerous fossils, including riparian and aquatic plants, insects, slugs and snails, fish, tortoise, lizards, snakes, small mammals, birds, a giant camel, a llama, two ground sloths, and two different types of saber tooth cats (Reynolds et al. 2012). The Shutt Ranch fauna is a collection of hundreds of significant fossils belonging to 37 species of small mammals,

as well as larger macrofauna such as sloth, camel, deer, horse, and others, found in the San Timoteo beds (Albright 1999). The scientific literature records a rich fossil history from this unit that includes fossils of more than 30 plant taxa (Axelrod 1966, 1979) and over forty animal taxa, including camels, deer, sloth, elephants, bears, rabbits, and rodents (Albright 1999). This fauna has been the subject of study for almost 100 years (Frick 1921, 1933; Matti and Morton 1975; Reynolds and Reeder 1991).

Avawatz Formation. The Avawatz Formation consists of four members: conglomerate, siltstone and sandstone, breccias, and sandstone, siltstone, and tuff deposited in alluvial fans, floodplains, and lakes, spanning a period of around 40 Ma, during the late Miocene (Spencer 1977). The Avawatz Formation is found in the Avawatz Mountains in the Mojave Desert province (Spencer 1977). The Avawatz preserves a typical Miocene mammalian fauna of early ancestors of horses and camels, as well as abundant rodents and some reptiles. In addition, the Avawatz is known for preserving exceptional fossil trackways from dozens of different types of animals, including birds, camels, and cats (Lofgren et al. 2006; Reynolds and Milner 2012; Sarjeant and Reynolds 2001). Trackways are significant fossil resources, and provide valuable information on not only foot morphology, but also how an animal moved and potentially whether it was part of a herd. The Raymond M. Alf Museum in Claremont, California, has more than 100 fossil trackways collected from the Avawatz (Lofgren et al. 2006) in San Bernardino County.

Topanga Group. The Topanga Group is predominantly composed of sandstone but also some siltstone, breccia, and shale (Morton and Miller 2006; Vedder 1972). Formations within the Topanga Group are common across the basins of the Peninsular Ranges and Transverse Ranges provinces. The Topanga is interpreted to represent wave-dominated coastal deposits grading into river-dominated deltaic deposits and fluvial deposits in the upper parts of the formation (Critelli and Ingersoll 1995). The Topanga Formation dates to the middle Miocene, around 20 to 16 Ma (Morton and Miller 2006). Fossils from the Topanga Formation include numerous invertebrate and vertebrate remains from both marine and terrestrial settings, including sharks, bony fishes, birds, whales, dolphins, and land mammals (Boessenecker and Churchill 2015; Campbell and Yerkes 1980; Morton and Miller 2006; Whistler and Lander 2003).

Barstow Formation. The Barstow Formation is composed of fluvial and lacustrine sediments interbedded with air-fall tuff beds deposited in lakes from around 14.8 to 19.3 ma (Woodburne et al. 1990). This formation crops out across the Mojave Desert province (Woodburne et al. 1990). The fossil mammal fauna of the Barstow is so abundant it has been used to define a biostratigraphic portion of the middle Miocene called the Barstovian North American Land Mammal Age (Pagnac 2009; Wood et al. 1941). The University of California, Berkeley, conducted extensive excavations of the mammal fossils shortly after they were first discovered in the Mud Hills (Baker 1911). The most common fossils from the Barstow Formation include early ancestors of horses, antelope, and camels, as well as small mammals such as mice and rabbits, with birds, fish, invertebrates, reptiles, and early ancestors of canines and elephants less common but well represented. In addition to the vertebrate fauna, an extensive record of exceptionally preserved small organisms, such as insects and arthropods, are known from the Barstow (Leggitt 2006; Miller and Lubkin 2001; Park and Downing 2001). These fossils have been extensively studied and reported on in the scientific literature, leading to a better understanding of the early evolution of many modern animals ranging from horses (Forsten 1973; MacFadden 1986) and camels (Pagnac 2005) to insects (Lister 1981), as well as paleoecology (Brattstrom 1961; Park and Downing 2001).

Sensitivity Assessment

The review of geologic mapping, scientific literature, and online records of the UCMP and SDNHM indicate that the six counties comprising the SCGA region record the diverse geologic history of southern California, including an abundant and significant fossil record. Paleontological resources range from the fossils of ancient marine creatures to land-dwelling plants and animals.

Paleontological sensitivity is tied to the potential of mapped geologic units, whether at the surface or in the subsurface, to preserve fossils. This analysis has highlighted a number of the best examples of high sensitivity geologic formations in the SCAG region, such as the Monterey and Topanga formations, as well as alluvial sediments that date to the Pleistocene. This overview is not exhaustive as there are numerous other geologic units that are more limited in occurrence and therefore cannot be included in this overview. For example, the most abundant fossil deposits in the SCAG region are from the La Brea Tar Pits, which preserve millions of Pleistocene fossils outside downtown Los Angeles.

1. INTRODUCTION

This report has been prepared for the Southern California Association of Governments (SCAG) to provide support for the 2020-2045 Connect SoCal Regional Transportation Plan (RTP)/Sustainable Communities Strategies (SCS) Program Environmental Impact Report (PEIR). The purpose of the report is to assess aviation noise impacts at a regional scale. SCAG is a metropolitan planning organization and does not have planning authority over airports but is primarily a regional surface transportation planning agency focused on airport activity as it affects the traffic accessing the airports. The seven commercial airports located in the SCAG region are the subject of this report, as these are the airports where employees, passengers, and cargo are traveling the region's transit systems. Detailed airport-specific noise analysis was not performed for this report due to SCAG's focus in ensuring adequate ground transportation access to the region's airports, as well as the limitation of available data to forecast future airport operations and potential changes in technology.

The report sections below refer to the noise metric Community Noise Exposure Level (CNEL). CNEL is a cumulative noise metric that reflects the noise exposure at a location over a 24-hour period for the average day of the year. For this report, the CNEL is reported on the basis of annual aircraft operations. An entire year of flight operations are examined utilizing specialized aircraft noise modeling programs. To account for the higher sensitivity to noise during the evening hours of 7:00 pm to 10:00 pm, CNEL adds a 4.77 dBA penalty, equivalent to multiplying the number of aircraft events by three in the noise modeling program. CNEL also adds a 10 dBA penalty for noise occurring during the sensitive nighttime hours of 10:00 pm to 7:00 am, equivalent to multiplying the number of aircraft events by ten[1]. Title 21 of the *California Code of Regulations* contains the State of California Airport Noise Standards which identifies the noise impact boundary of airports to be a noise exposure of CNEL 65 or greater[2].

This report also refers to airport runway nomenclature such as Runway 15/33. Runways are numbered between 01 and 36 representing the magnetic heading of the runway in degrees divided by ten. Runway 09 heads 90 degrees clockwise from magnetic north, or due east, Runway 27 is directed 270 degrees or due west, and Runway 36 (360 degrees, not 0 degrees) points north.[3] Runway 15/33 heads 150 degrees from magnetic north or southwest. If the runway operates in the opposite direction, 180 degrees difference, the heading is 330 degrees and the runway number is 33. Some airports have parallel runways with identical headings, and the letters L, R, and C are added to distinguish between the left, right, and center runways.

2. SCAG REGION

The SCAG Region includes the six counties of Ventura County, Los Angeles County, Orange County, San Bernardino County, Riverside County, and Imperial County, making it the largest metropolitan planning organization (MPO) in the nation. The region covers 191 cities, over 19 million residents, and 38,000 square miles. The area contains an expansive multiple airport system with seven commercial airports, seven government/military fields, and over 30 reliever and general aviation airports.

3. AIRPORT DESCRIPTIONS

Hollywood-Burbank Airport (BUR)

Location

The Hollywood-Burbank Airport, or Bob Hope Airport, is located three miles northwest of downtown Burbank in the western portion of Los Angeles County. It is closer to Downtown Los Angeles than Los Angeles International Airport, located in the northern Los Angeles area, one mile south of Interstate 5, three miles north of State Highway 134, and three miles east of State Highway 170. The airport is surrounded by single family and multi-family residential land use within 0.2 miles of the runway on the north side and within 0.33 miles of the runway on the south side. The airport has some adjacent noise buffers including commercial land use directly east and west of the east-west runway and a cemetery to the south. Figure 1, *Hollywood-Burbank Airport Location*, indicates the airport general location and relationship to these adjacent uses.

Physical and Operational Characteristics

The airport is categorized as a medium-hub primary airport (serving between 0.25 percent and 1.0 percent of total national enplanements) utilizing two intersecting runways. Runway 15/33 is 6,886 feet long by 150 feet wide and runs in the northwest-southeast direction while cross Runway 8/26 is 5802 feet long by 150 feet wide and runs east-west[4]. Aircraft operations include general aviation aircraft, scheduled commercial flights and military operations. Aircraft generally take off to the south on Runway 15 due to prevailing winds, and most landings occur on Runway 8. There is no currently no limit on the number of aircraft operations at the airport, but the commercial airlines have agreed verbally to abide by a voluntary curfew on operations between 10 p.m. and 7 a.m. and the current plans are to maintain this voluntary curfew[5].

In 2014 a Regional Intermodal Transportation Center (RITC) was built adjacent to the airport providing the only area airport with a direct rail connection to Los Angeles. The Amtrak Pacific Surfliner and the Metrolink Ventura County Line provide service to the RITC as do the Metro Bus and BurbankBus. The Metrolink Antelope Valley Line provides service to the Burbank-Airport North Train Station where a complimentary airport shuttle service provides access to the airport.[6] The airport plans a replacement terminal in the future.

Figure 1 – Hollywood-Burbank Airport Location[7]

[7] Google Earth; 8/29/2019

Existing Conditions

BUR operations for 2018 included 5.3 million annual passengers (MAP) and 54,700 tons of cargo with 132,023 total aircraft operations[8]. The airport is closely located to single family and multi-family residential land use within 0.2 miles of the runway on the north side and within 0.33 miles of the runway on the south side. The airport completed a Residential Acoustical Treatment Program to sound insulate approximately 2,450[9] dwellings within the 65 CNEL noise impacted area[10]. Burbank-Glendale-Pasadena Airport Authority (BGPAA) operates a permanent noise monitoring system utilizing 20 noise monitors located in Burbank and the City of Los Angeles to assist in updating aircraft noise exposure on a quarterly basis[11]. The Airport provides access to the noise monitoring real-time measurements, flight tracking, and submission of noise complaints through the online *WebTrack* system[12]. The 65 CNEL and 70 CNEL contours from the *Quarterly Noise Monitoring at Hollywood Burbank Airport First Quarter 2019*[13] (updated airport noise report based on average airport operations over the preceding 12 months) are shown on Figure 2, *Burbank Airport – 70 CNEL Contour for 1st Quarter 2019*, and Figure 3, *Burbank Airport – 65 CNEL Contour for 1st Quarter 2019*. Contour information for the remainder of 2019 is not yet available at the time of this assessment. The flight operations data through May 2019[14] indicates operations are currently running approximately 4% higher than the operations included in the contours presented. However, the contours represent an annualized average and operations adjust seasonally; current operations include peak summer travel months that may be consistent this year with last year or may be slightly higher. Therefore, annualized operations may average out to be similar to or possibly slightly greater, resulting in similar or slightly larger assuming the same aircraft fleet mix. In the near term it is expected the aircraft fleet mix will remain similar; the fleet mix changes as air carriers replace aircraft with newer models or swap existing aircraft to accommodate changes in passenger demand.

Imperial County Airport (IPL)

Location

Imperial County Airport is located one-half mile south of the center of the business district of the City of Imperial and three miles north of El Centro, approximately 95 miles east of San Diego and 12 miles north of the California-Mexico border. It is north of Interstate 8 and west of State Highway 111. The airport is located partially in the City of Imperial and partially in the unincorporated area of Imperial County. The airport is surrounded by single family residential land use as close as 0.1 miles from the runway at the northeast, some agricultural land use to the north and west, and commercial/industrial land use to the south and east. Figure 4, *Imperial County Airport Location*, illustrates the airports relationship to these land uses. There are no residences within the 65 CNEL noise impact contour of the airport.

Physical and Operational Characteristics

The airport is a small public-use airport categorized as a non-hub primary commercial service airport (serving less than 0.05 percent of total national enplanements) with two asphalt runways: 8/26 runs east-west and measures 4,501 feet by 75 feet and 14/32 northwest-southeast and measures 5,308 feet by 100 feet[15]. Aircraft operations include general aviation aircraft, scheduled commercial flights and military operations. There is currently no limit on the number of aircraft operations at the airport.

Existing Conditions

IPL operations for 2018 included approximately 0.0133 million passengers per year (MAP) with 14,573 aircraft operations and cargo operations totaled 1,448 tons[16]. Imperial County adopted an updated *Airport Land Use Compatibility Plan, Imperial County Airport*[17], in 1996, which indicated projected future noise contours for use in land use planning. The earlier compatibility plan included noise contours based on more than double the number of operations considered plausible in the updated plan, and the aircraft mix included aircraft and business jets much noisier than those in use at the time of the update. Therefore, these earlier predicted noise contours were much larger than the actual noise contours of the airport. The future predicted noise contours for the 1996 update indicating the 55, 60, and 65 CNEL contours are shown in Figure 5, *Imperial County Airport Future Noise Contours*[18]. These future noise contours were developed considering a 20-year projection (i.e., theoretically through the year 2016) for 102,000 aircraft operations. As aircraft operations are well below this projected number, the current noise contours are significantly smaller than those indicated and no update to the ALUP is needed.

John Wayne Airport (SNA)

Location

John Wayne Airport is located on unincorporated land in Orange County approximately 0.5 miles southeast of the intersection of Interstate 405 and State Highway 55 with the north end of the airport abutting Interstate 405 and the south end of the airport adjacent on the east side of State Highway 73. The airport is surrounded by the cities of Irvine, Costa Mesa and Newport Beach with commercial land use adjacencies to the north, east and west. There is residential land use interspersed among the commercial use with multi-family land use 0.25 west of the runway, and residential land use (single family and multi-family) beyond the commercial land use approximately 0.75 miles to the north, 0.5 miles to the west, 1 mile to the east, and approximately 0.25 miles to the south. Figure 6, *John Wayne Airport Location*, illustrates the airports relationship to these land uses.

Physical and Operational Characteristics

The airport is categorized as a medium-hub primary airport (serving between 0.25 percent and 1.0 percent of total national enplanements) and utilizes two parallel north-south runways. Runway 2L/20R is 5,701 feet long by 150 feet wide and is used for commercial aircraft activity, and Runway 2R/20L is 2,887 feet long and 75 feet wide and serves general aviation aircraft[20]. Aircraft operations include general aviation aircraft, scheduled commercial flights and military operations. Due to the short length of the commercial runway and the proximity of residential land use, commercial aircraft typically depart at or near full power to reach takeoff speed and larger/heavier aircraft may require a steep climb to allow for a power reduction to quiet the overflight of residential land one-half mile from the airport. Aircraft types and number of passengers are limited to meet the community noise levels agreed to in the 1985 Settlement Agreement[21] and in the updated *Phase 2 Commercial Airline Access Plan and Regulation*[22] (Phase 2 Access Plan) amended through December 2, 2015. These plans limit aircraft to 200,000 pounds gross weight for aircraft with dual gear main landing gear-type and to 300,000 pounds gross weight for aircraft with dual tandem gear main landing gear-type. They also classify the noise of the aircraft into Type A and Type E, and they require compliance with the noise levels set forth in Table 1, *Class A Aircraft Energy Averaged SENEL Levels*, and Table 2, *Class E Aircraft Energy Averaged SENEL Levels*.

The airport has a limit of 10.8 MAP through December 31, 2020 but no limit on the number of aircraft flights[23]. While the amount of cargo is not limited, there is a limit of four cargo arrival

flights and four cargo departure flights in effect until 2030 with no current plan for expansion[24]. The MAP limit increases to 11.8 in January 2021 and to either 12.2 or 12.5 in January 2026 through December 2030, depending on passenger demand experienced between 2021 and 2025. The Phase 2 Access Plan terminates December 31, 2030 without further action from the County of Orange Board of Supervisors. Commercial flights are restricted by County Ordinance to departure hours of 7:00 am to 10:00 pm Monday through Saturday and 8:00 am to 10:00 pm on Sunday, and arrival hours of 7:00 am to 11:00 pm Monday through Saturday and 8:00 am to 11:00 pm on Sunday. General aviation aircraft are allowed to operate 24 hours a day as long as the aircraft meets the general aviation noise limits for daytime/nighttime operations as measured at specified airport noise monitoring stations[25]. General aviation passengers are not included in the airport MAP counts.

Table 2 – Class E Aircraft Energy Averaged SENEL Levels

Figure 6 – John Wayne Airport Location[26]

[26] Google Earth; 8/30/2019

Existing Conditions

SNA 2018 operations consisted of 10.7 million annual passengers (MAP), 19,552 tons of cargo, and 316,783 aircraft operations[27]. The airport is closely located to residential land use (as noted above multi-family residential is located 0.25 miles west and multi-family/single family residential use surrounds the airport within 0.25 to 1.0 miles), and the airport completed a residential sound insulation program to sound insulate 418 dwellings[28] within the 65 CNEL noise impacted area[29]. The John Wayne Airport Access and Noise Office operates a permanent noise monitoring system with 10 monitors to monitor individual aircraft compliance with airport-permitted noise levels (as indicated in Tables 1 and 2 above), commercial carrier compliance with the allowable quarterly average noise level per aircraft type, and to assist with updating quarterly noise contours. The noise monitor locations and the respective residential area is shown on Figure 7, *John Wayne Airport Noise Monitors and Residential Area.* The 65 CNEL contour from the first quarter of 2019 (updated airport noise report based on average airport operations over the preceding 12 months) is shown on Figure 8, *John Wayne Airport Noise Contours 1st Quarter 2019*[30]. The residential properties highlighted on this figure represent the remaining incompatible land use. Contour information for the remainder of 2019 is not yet available at the time of this assessment. Operations measured for April and May[31] indicate a slight decrease in operations due to air carriers utilizing larger capacity aircraft and maintaining a higher percentage of passengers which would tend to reduce the noise contour area. Operations for the remainder of 2019[32] are anticipated to be similar to operations included in the contours presented in Figure 8 so that the contours are anticipated to also be similar assuming the same aircraft fleet mix. In the near term it is expected the aircraft fleet mix will remain similar; the fleet mix changes as air carriers replace aircraft with newer models or swap existing aircraft to accommodate changes in passenger demand.

Los Angeles International Airport (LAX)

The Los Angeles International Airport is currently in the middle of an *Airfield & Terminal Modernization Project* study with plans to complete environmental documents in the 4th quarter of 2020. These environmental documents will assess aviation noise impacts in detail.

Location

Los Angeles International Airport is located in the Westchester district in the southwestern portion of the City of Los Angeles, with residential and commercial areas of the El Segundo to the south, Westchester and Playa del Rey to the north, and Inglewood and unincorporated portions of Los Angeles County to the east. It is bordered by Intestate 105 to the south, Interstate 405 to the east, and State Highway 42 to the north. Figure 9, *Los Angeles International Airport Location*, illustrates the airports relationship to these land uses.

Physical and Operational Characteristics

The airport is categorized as a large-hub primary airport (serving between 1.0 percent or more of total national enplanements), it is the busiest airport in the Los Angeles area, and it is the second busiest airport in the U.S.[34] The airport utilizes two sets of parallel runways running in the east-west direction. Runways 24R/06L and 24L/06R are north of the airport terminals, running 8,926 feet long by 150 feet wide and 10,885 feet long by 150 feet wide, respectively. Runways 7L/25R and 7R/25L are south of the airport terminals and measure 12,923 feet long by 150 feet wide and 11,095 feet long by 200 feet wide, respectively[35]. Aircraft operations include general aviation aircraft, scheduled commercial flights and military operations. Due to prevailing winds, aircraft generally depart to the west and approach from the east. The Los Angeles World Airports (LAWA) department of the City of Los Angeles is currently constructing an Automated People Mover (APM) electric train to reduce ground traffic congestion and provide a direct rail connection to Los Angeles and adjacent cities[36]. The APM is planned to open for passenger services in 2023. There is currently no limit on the number of aircraft operations at the airport.

Existing Conditions

LAX operations for 2018 included 87.5 million annual passengers (MAP) with 641,460 flight operations and 2.4 million tons of cargo[37]. As noted above, the airport is located in close proximity to residential land use. The airport completed a residential sound insulation program for City of Los Angeles dwellings within the 65 CNEL noise impacted area, sound insulating over 7,300 dwelling units[38]. Inglewood and the County of Los Angeles are currently managing a

residential sound insulation program for dwellings in their jurisdictions, and have sound insulated over 7,832 and 4,084 dwellings, respectively, while the El Segundo program was suspended in 2016[39] after completing 1,943 dwellings[40]. The Noise Management Bureau of LAWA maintains a permanent noise monitoring system utilized to assist in updating aircraft noise exposure on a quarterly basis. The 65 CNEL, 70 CNEL and 75 CNEL contours from the first quarter of 2019 (updated airport noise report based on average airport operations over the preceding 12 months) are shown in Figure 10, *LAX First Quarter 2019 Noise Contours – Western Area*, and in Figure 11, *LAX First Quarter 2019 Noise Contours – Eastern Area*. Contour information for the remainder of 2019 is not yet available at the time of this assessment. Operations have measured approximately 2% lower during recent months as compared than the operations during the same months of 2019 included in the contours presented. Due to the large number of operations at LAX, this slight decrease in operations is expected to produce similar noise contours assuming the same aircraft fleet mix. In the near term it is expected the aircraft fleet mix will remain similar; the fleet mix changes as air carriers replace aircraft with newer models or swap existing aircraft to accommodate changes in passenger demand.

Long Beach Airport (LGB)

Location

Long Beach Airport is located three miles northeast of downtown Long Beach in the southern part of Los Angeles County near the Los Angeles County and Orange County borders. It is just north of Interstate 405, three miles east of Interstate 710, and three miles west of Interstate 605. The airport borders commercial land use to the north, east, and south, and borders single family residential land use to the southeast. Outside the bordering commercial land use there is single family and multi-family residential land use approximately 0.33 miles north, 0.33 miles east, 0.1 miles south and 0.25 miles to the west. Figure 12, *Long Beach Airport Location*, illustrates the airport location and its relationship to the adjacent land uses.

Physical and Operational Characteristics

The airport is categorized as a non-hub primary commercial service airport (serving less than 0.05 percent of total national enplanements) served with a pair of parallel east-west runways and one northwest-southeast runway. Runways 8R/26L and 8L/26R measure 3,918 feet long by 100 feet wide and 6,192 feet long by 150 feet wide, respectively. Runway 12/30 is 10,000 feet long by 200 feet wide[42]. Aircraft operations include general aviation aircraft and scheduled commercial flights. Due to the airport's location near dense residential housing, the airport operates within a strict noise budget to keep aircraft operations limited and noise controlled. There is no currently no limit on the number of aircraft operations at the airport as long as the maximum noise levels of the noise budget are not exceeded. The LGB noise budget by City law allows the airport to add aircraft operations if the noise level with the additional operations does not exceed the noise levels from the baseline year of 1989-1990[43].

Existing Conditions

[42] www.airnav.com/airport/KLGB; 8/7/2019

[43] http://www.lgb.org/information/noise_abatement/frequently_asked_questions.asp; 8/7/2019

LGB operations for 2018 included 3.9 million annual passengers (MAP) with 33,906 flight operations and 23,849 tons of cargo with 1,060 flights[44]. The Long Beach Airport Noise Office maintains a permanent noise monitoring system with 18 noise monitors utilized to assist in updating aircraft noise exposure on a quarterly basis[45]. The 60 CNEL, 65 CNEL and 70 CNEL contours applicable to the allowable noise budget are shown in Figure 13, *Long Beach Airport Noise Contours*. These contours are slightly larger than the realized noise contours as LGB operations typically do not reach the allowable operations of the noise budget. To ensure the airport does not exceed these levels, two of

[44] http://www.lgb.org/information/noise_abatement/monthlyreport.asp; 8/7/2019

[45] http://www.lgb.org/information/noise_abatement/default.asp; 8/30/2019

the noise monitors are calibrated for this purpose and the data is checked periodically[46]. Due to the low number of aircraft operations and the strict noise budget, the 65 CNEL noise impact contour does not extend very far into the neighboring community and only encompasses a few residential

units at the south end of the airport runway. The airport completed a small residential sound insulation program to sound insulate 27[47] dwellings.

Ontario International Airport (ONT)

Location

Ontario International Airport is located two miles east of downtown Ontario in southwest San Bernardino County, approximately 38 miles east of Downtown Los Angeles. It is positioned north/south between Interstate 10 and State Highway 60, and east/west between Interstate 15 and State Highway 83. The airport was owned and operated by the City of Los Angeles and controlled by Los Angeles World Airports prior to November 2016 when ownership was turned over to and operated by the Ontario International Airport Authority, formed under a joint-powers agreement between the city of Ontario and San Bernardino County. The airport is bordered on all sides by commercial land use, but residential land use is located within one-half mile of the west end of the airport runways to the north and south and three-quarters of a mile due west from the end of the runway. Figure 14, *Ontario International Airport Location*, shows the airport location with the neighboring land uses.

Physical and Operational Characteristics

Ontario is categorized as a medium hub airport (serving between 0.25 percent and 1.0 percent of total national enplanements) served with a pair of parallel east-west runways. Runways 8R/26L and 8L/26R measure 10,200 feet long by 150 feet wide and 12,197 feet long by 150 feet wide, respectively[49]. Aircraft operations include general aviation aircraft and scheduled commercial flights. Aircraft typically depart towards the west and arrive from the east. There is no currently no limit on the number of aircraft operations at the airport.

Existing Conditions

ONT operations for 2018 included 5.1 million annual passengers (MAP) and 751,529 tons of cargo[50]. As noted above, the airport is located near single family and multi-family residential land use (within one-half to three-quarters of a mile), and the airport completed a residential sound insulation program to sound insulate 1,599 dwellings within the 65 CNEL noise impacted area[51]. ONT maintains a permanent noise monitoring system with 15 noise monitors utilized to assist in updating aircraft noise exposure on a quarterly basis. The 65 CNEL, 70 CNEL and 75 CNEL contours from the third quarter 2016 Quarterly Noise Report are shown in Figure 15, *Ontario International Airport Noise Contours, 3rd Quarter 2016*. These contours were the last noise contours developed while LAWA operated the airport and the 2019 baseline contours would be slightly larger as operations in 2016 were lower at 4.2 MAP, assuming the same aircraft fleet mix. In the near term it is expected the aircraft fleet mix will remain similar; the fleet mix changes as air carriers replace aircraft with newer models or swap existing aircraft to accommodate changes in passenger demand.

Palm Springs International Airport (PSP)

Location

Palm Springs International Airport is located two miles east of downtown Palm Springs in the central portion of Riverside County. It borders State Highway 111 on the east and is 2.5 miles southwest of Interstate 10. The airport borders commercial land use to the east and has some adjacent vacant land buffers but is closely surrounded by single family residential land use approximately 0.1 miles away. Figure 16, *Palm Springs International Airport Location*, indicates the relative location of the airport to its surrounding land uses.

Physical and Operational Characteristics

PSP is categorized as a small-hub primary airport (serving between 0.05 percent and 0.25 percent of total national enplanements) served with a pair of parallel northeast-southwest runways. Runways 13R/31L and 13L/31R measure 10,000 feet long by 150 feet wide and 4,952 feet long by 75 feet wide, respectively[53]. Aircraft operations include general aviation aircraft and scheduled commercial flights. There is no currently no limit on the number of aircraft operations at the airport.

Existing Conditions

PSP operations for 2018 included 2.3 million annual passengers (MAP) with 57,665 flights[54]. The airport as noted above has residential land use within 0.1 miles of the airport. PSP has completed a residential sound insulation program to sound insulate 128[55] dwellings within the noise impacted area. The 2015 existing 65 CNEL, 70 CNEL and 75 CNEL contours from the Airport Master Plan Mitigated Negative Declaration CEQA Appendix C, Noise Modeling Technical Report Figure C-6[56] are shown in Figure 17, *Palm Springs International Airport 2015 Noise Contours*. This document also included a forecast for 2020 future conditions, shown in Figure 18, *Palm Springs International Airport 2020 Noise Contours*, which indicated that with a 9% increase in operations, the 65 CNEL contour lobes at the north and south of the runways enlarge slightly assuming the same aircraft fleet mix. In the near term it is expected the aircraft fleet mix will remain similar; the fleet mix changes as air carriers replace aircraft with newer models or swap existing aircraft to accommodate changes in passenger demand.

4. AIRPORT GROWTH FORECAST

As noted above, SCAG does not have any regulatory, developmental, operational, or planning authority over the airports. Rather, SCAG is primarily a regional surface transportation planning agency that maintains a list of airport ground access projects and a consultative relationship with the airports. Therefore, SCAG is focused on air and passenger cargo activity from the perspective of how the traffic coming and going from the airports affects the region's roads, highways, and transit system. One critical aspect of SCAG's role in aviation systems and transportation planning is the Aviation Element of the Draft 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (2020 RTP/SCS) (Connect SoCal).

The 2020-2045 Connect SoCal Aviation appendix references a comprehensive review of various forecasts for aviation growth in the SCAG Region. This review concluded with the following forecasts:

- Regional air passenger transportation is anticipated to grow by an average of 2.1% annually; from 110.17 MAP in 2017 to 197.1 MAP in 2045
- Reginal air cargo transportation is anticipated to grow by an average of 3.3% annually, from 3.14 million in 2017 to 7.77 million tons in 2045
- Total regional aircraft operations are not anticipated to grow as fast as passenger and/or cargo growth. Regional aircraft operations are anticipated to grow by an average of 0.74% annually, from 3.7 million operations in 2017 to 4.58 million operations in 2045

As mentioned above, LAX is the only regional large-hub primary airport, and the operational data listed for each regional airport indicates most regional airport operations are associated with LAX. Recent statistics show that while passenger traffic has increased by approximately 1% in 2019, aircraft operations have reduced by approximately 2%. This reduction in operations, if continued, would reduce airport noise levels in the surrounding community. The LAWA department of the City of Los Angeles is also currently constructing an Automated People Mover (APM) electric train to reduce ground traffic congestion, accommodate future operational growth, and provide a direct rail connection to Los Angeles and adjacent cities[58]. The APM is planned to open for passenger services in 2023, and APM operation will reduce ground traffic and ground traffic noise.

The 2020-2045 Connect SoCal RTP/SCS addresses growth between 2017 and the horizon year 2045. The PEIR addresses impacts compared to existing conditions (2019) to the extent that data is available. Region-wide growth between 2017 to mid-year 2019 is estimated to be up to approximately 2% for air passengers and less than 0.5% for aircraft operations. For the purposes of assessing regional noise impacts from aviation, the above bulleted forecasts reasonably approximate the 2019 to 2045 time period.

As noted above, the aircraft operations growth forecast is significantly smaller than the air passenger and air cargo percentages. This is anticipated because newer aircraft carry a higher volume of passengers and carriers are running at a higher load factor than in the past. When the airlines carry more passengers per flight, the flights are more profitable and fewer flights are needed to carry the

[58] https://www.lawa.org/en/connectinglax/automated-people-mover; 8/30/2019

same volume of passengers to a specific location. This allows the airlines to schedule some of these flights to other locations and/or reduce their airport operations.

5. AIRPORT OPERATION GROWTH AND IMPACT ON AIRCRAFT NOISE LEVELS AND NOISE CONTOURS

Aircraft Operations

The noise propagating from airports is directly related to the number of aircraft operations as well as the size, aircraft type, and number and type of engines, with additional contributions from other airport activities and ground transportation (noise from ground transportation is separately addressed in the 2020-2045 Connect SoCal RTP/SCS PEIR).

In general, if the mix of aircraft remains constant, the aviation noise contours grow larger or shrink smaller as the operations increase or decrease. Noise levels do not increase algebraically as the noise sources increase but increase in a logarithmic fashion. For example, two noise sources each emitting a noise level of 60 dB add together to produce noise of 63 dB, not 120 dB. Doubling the number of noise sources increases the overall noise level by 3 dB and doubling the number of aircraft operations would also increase the overall airport noise level by 3 dB and expand the area inside the noise contours, assuming all other factors such as aircraft type, engines, flight ~~paths~~tracks, etc., remain the same.

The formula for the relative increase in aircraft noise as the noise sources increase is:

$$\Delta \text{ dB} = 10*\text{Log}(S_H/S_B)$$

S_H is the number of sources (aircraft) for the Horizon year

S_B is the number of sources (aircraft) for the base year.

Considering the growth of SCAG Region airport operations from 3.7 million to 4.58 million, if all aircraft types and operational characteristics were to remaining equal, the forecasted increase in noise would equate to 0.9 decibels. However, this average increase in aircraft operations is not the same expected increase at all airports, as different airports will experience different changes and noise contours may grow or shrink independently at each airport. The airport noise levels are expected to increase more at the popular airports such as LAX, ONT, PSP and BUR, while noise levels at airports currently with noise and/or operations restraints as well as less popular airports are expected to increase less. The details needed to computer model the airport noise level changes over the forecast period are not available to provide specific changes. Additionally, airports across the nation have received an increase in noise complaints since implementation in 2015 of FAA's *NextGen* program to modernize the nation's air transportation system[59]. One aspect of *NextGen* utilizes satellite navigation that precisely direct aircraft flight tracks for more efficient performance,

[59] https://www.faa.gov/nextgen/. 9/20/2019

reducing fuel costs and associated carbon emissions, and to increase overall flight capacity[60]. Aircraft flight track changes in some cases moved flights over areas that previously did not experience overflights or concentrated aircraft over areas that already experienced overflights, and airport noise complaints increased[61]. As the FAA and SCAG region airports such as LAX and BUR[62] wrestle with the contending issues of an efficient airspace and noise complaints, it is unclear whether aircraft flight tracks will remain constant, further complicating the details needed for forecasting airport noise level changes over the forecast period.

Changes to Size of Planes (Change to Fleet Mixes) and Technological Changes to Aircraft Engines

The aircraft industry continues to develop aircraft with higher capacity, lower fuel consumption, and lower carbon emissions, but as it does, the industry must also comply with FAA and international aircraft compliance requirements. One of these requirements regards the aircraft noise. The noise of aircraft is classified into various Stages, with current Stage 3 and 4 aircraft operating quieter than previously used Stage 2 aircraft. Stage 3 aircraft measure between 7 and 20 EPNdB (Effective Perceived Noise Level, decibels) quieter than State 2 aircraft, while Stage 4 aircraft are an additional 10 EPNdB quieter than Stage 3 aircraft. Stage 2 aircraft no longer fly in the U.S., with some exceptions for lighter weight aircraft, taking the noisiest aircraft out of service. As airlines replace older and noisier Stage 3 aircraft with quieter Stage 4 aircraft, the aircraft fleet becomes quieter. As a recent example, American Airlines retired the last of its Stage 3 compliant McDonnell Douglas MD-80 aircraft in September 2019, and looks to replace the aircraft with more fuel-efficient aircraft with lower maintenance costs[63].

Even as the aircraft fleet mix changes to include more larger planes with more powerful engines, the requirements to comply with the quieter Stage 4 noise levels will result in a quieter aircraft fleet. The FAA in 2018 adopted regulations requiring newly designed aircraft to meet even quieter Stage 5 requirements with a reduction of 7 EPNdB, and as these aircraft come into service (and some aircraft currently in operation already meet this standard), this will lower the aircraft noise level further.

It is possible that in the long term, as aircraft operations grow over the next 25 years, the lower noise levels of aircraft will offset the increased operations to maintain or even reduce the aircraft noise contour footprints around SCAG Region airports. This has been the general trend in aviation noise over the previous 40 years. It may also be possible that the growth in operations at some airports may overtake the trend toward a quieter aircraft fleet and cause aircraft noise and the noise contours to increase. These issues will continue to be the focus of the airport noise offices to ensure

the continued success of the airport economy considers the environmental health of the community surrounding it.

Conclusion Regarding Changes to Noise Contours and Regional Aviation Noise Impact

As aircraft operations increase, it is expected that noise contours would grow and receptors close to airport could experience a higher cumulative noise level. While the individual aircraft operational noise level is not louder, the increased operations causes more noise events which, in turn, increases the CNEL. However, as the fleet mix changes to include quieter aircraft (even though aircraft may be bigger), these changes are anticipated to somewhat offset noise level increases caused by the increased operations. Because the noise profiles of future aircraft types and their engines are unknown, as is the timeframe for phasing out older aircraft and replacing them with newer aircraft, we cannot speculate on the overall impact of the forecasted increase in operations with a future aircraft fleet mix. Conservatively we conclude that sensitive receptors may experience greater noise impacts than at present in the vicinity of airports.

In summary, aircraft noise would increase in the vicinity of most regional airports due to increased operations causing noise contour growth. However, over time decreases in aircraft noise could occur due to a quieter fleet mix as new aircraft are incorporated, causing noise contours to shrink.
