Unit Strategic Fire Plan developed for the Shasta-Trinity Unit

This Plan:

- Was collaboratively developed. Interested parties, Federal, State, City, and County agencies within the Unit have been consulted and are listed in the plan.
- Identifies and prioritizes pre-fire and post fire management strategies and tactics meant to reduce the loss of values at risk within the Unit.
- Is intended for use as a planning and assessment tool only. It is the responsibility of those implementing the projects to ensure that all environmental compliance and permitting processes are met as necessary.

Unit Chief

EXECUTIVE SUMMARY

The Shasta-Trinity Unit Strategic Fire Plan is a living document that is to be updated yearly with addendums. These addendums reflect the unit's progress on meeting statewide and unit priority goals and objectives as identified in the 2010 Strategic Fire Plan for California.

This plan recognizes that wildland fires are a natural and necessary occurrence in California. In Shasta and Trinity Counties the question at hand is, how do we utilize and live with the risk of wildfire? Our goal is to create a state that is more resistant and resilient to the damaging effects of catastrophic wildfire while recognizing the beneficial aspects of fire. Our goal is to enhance the protection of lives, property and natural resources from wildland fire, as well as improve environmental resistance to wildland fire. Community protection includes safeguarding and protecting the public, emergency responders, private property, resources and other improvements.

This plan is divided into battalions, or geographical boundaries, where fuel, weather, topography and fire history specific to each battalion are identified. Firefighting strategies and tactics are pre-planned and evaluated for success and actions such as fire prevention education and pre-fire inspections are pursued to educate the public to enhance life safety and fire protection capabilities. Through identifying communities and assets at risk, project areas can be targeted for hazard reduction and mitigation. These projects are completed in collaboration with stakeholders such as private landowners, fire safe councils, fire wise communities, resource conservation districts and other federal, state and local agencies.

This plan will utilize the following seven goals from the 2010 Strategic Fire Plan for California and incorporates them into the planning and implementation process:

1. Identify and evaluate wildland fire hazards and recognize life, property and natural resource assets at risk, including watershed, habitat, social and other values of functioning ecosystems. Facilitate the sharing of all analyses and data collection across all ownerships for consistency in type and kind.
2. Articulate and promote the concept of land use planning as it relates to fire risk and individual landowner objectives and responsibilities.
3. Support and participate in the collaborative development and implementation of wildland fire protection plans and other local, county and regional plans that address fire protection and landowner objectives.
4. Increase awareness, knowledge and actions implemented by individuals and communities to reduce human loss and property damage from wildland fires, such as defensible space and other fuels reduction activities, fire prevention and fire safe building standards.
5. Develop a method to integrate fire and fuels management practices with landowner priorities and multiple jurisdictional efforts within local, state and federal responsibility areas.
6. Determine the level of fire suppression resources necessary to protect the values and assets at risk identified during planning processes.

7. Address post-fire responsibilities for natural resource recovery, including watershed protection, reforestation and ecosystem restoration.

SECTION I: UNIT OVERVIEW

Unit Description

The Shasta-Trinity Unit is located at the northern end of the Sacramento Valley. It encompasses most of Shasta County and portions of eastern Trinity County. Federal lands are administered by the Shasta-Trinity National Forest, Lassen National Forest, Bureau of Land Management, Bureau of Indian Affairs, Bureau of Reclamation and National Park Service, which are all contained within the unit.

Traveling west to east on Highway 299 from Weaverville to the Lassen County line is approximately 150 miles. South to north on Interstate 5 from Cottonwood to the Siskiyou County line is approximately 75 miles. Within this area, there are distinct differences in climate, fuels and topography, all of which affect fire behavior and the fire danger rating.

The unit includes portions of the Great Valley, the Southern Cascade, the North Coast Ranges and the Modoc Plateau. The eastern slopes of Shasta County gently rise across the toe of the Southern Cascade Range toward the Modoc Plateau. To the west and north, the valley abruptly rises to the Klamath Mountains. Southern Trinity County and the southwest corner of Shasta County are partially located in the North Coast Range.

The mountains to the north, west and east, the Sacramento Valley to the south and the Pacific Ocean 150 miles to the west produces unique weather and makes weather forecasting difficult. The CAL FIRE State Responsibility Area (SRA) within the unit is divided into five distinct National Fire Danger Rating System (NFDRS) areas based on climate, topography and fuels, and modified to match existing Wildland Fire Response Area boundaries. These NFDRS areas reflect historical average burning conditions and have been used for fire dispatch and planning in the unit since 1994. Areas of the unit not included in the NFDRS areas are in the United States Forest Service (USFS) Direct Protection Area (DPA) and are mostly in the Interior Timber Planning Belt.

The Redding Emergency Command Center uses the NFDRS areas to determine the fire danger rating and dispatch levels for the Unit based on daily weather observations taken from a Remote Automatic Weather Station (RAWS) in each area.

Fire Danger Rating Areas

Timber West

This area is the mixed conifer forest of the CAL FIRE DPA in Trinity County. Many areas are managed for timber production and therefore, logging slash is a common fuel component. There are also significant areas of manzanita and ceanothus undergrowth.

The main communities within the Timber West area are Hayfork, Lewiston and Weaverville. Smaller communities exist as well as various small areas of urbanization. Most of the urbanization lies in the lower elevations of Trinity County in valleys or along streams. The terrain is very steep and contains large amounts of heavy fuels.

Trinity County has experienced several catastrophic fires in recent history, including last year's Helena Fire which was the most destructive fire in Trinity Counties history. These fires damaged not only valuable timberlands but also caused significant structure and private property loss. Significant fires include:

- 1999: Lowden Fire (1,945 acres)
- 2001: Oregon Fire (1,695 acres)
- 2006: Junction Fire (3,130 acres)
- 2009: Coffin Fire (1,098 acres)
- 2014: Oregon Fire (580 acres)
- 2017: Helena Fire (21,846 acres)

Brush Area

The mid-elevations (1,000ft. - 2,000ft.) surrounding the Sacramento Valley are merged into the Brush Area. The area is typically chaparral with chamise and manzanita. These elevations include oak woodland fuels with a high mixture of brushy fuels. Communities include Shasta Lake, Mountain Gate, Shasta, Keswick and French Gulch.

Most of the lands to the northwest of Redding were void of vegetation in the early 1900s due to copper mining and smelting operations. This area now consists of mostly brush fields that are 50 years old or older. Recent fire history includes the 2004 French Fire which scorched 12,675 acres and the 2008 Motion Fire which burned 28,330 acres. Despite the large fire history in the area, significant fuels remain to sustain large and damaging fires (NFDRS fuel model F).

The lands to the west of Redding - located at the base or lower levels of the mountains - are covered mostly in brush or oak woodland with a heavy brush understory. This area is also highly urbanized which creates a high threat to life and property from wildfire. Subdivisions that were developed prior to 1982 often have narrow, one-lane roads and do not have community water systems. Access to structures in this area is difficult due to the predominance of single-access roads. Some subdivisions were developed with "fire emergency access" roads, however, many of these roads are no longer maintained making them impassable. Communities in this area to the west of Redding include Igo, Centerville, Shasta, Keswick, the City of Shasta Lake and portions of the City of Redding.

The Brush Area east of Redding is generally located in rangeland. However, urbanization in the brush area exists in the western edge of the communities of Shingletown, Whitmore, Oak Run, Round Mountain and Montgomery Creek. This area has experienced significant fires in the past and with the current urbanization can expect future fires to be more damaging. Significant fires include:

- 2004: Bear Fire (10,441 acres)
- 2008 Pine 2 Fire (1,193 acres)
- 2014: Bully Fire (13,661 acres)
- 2014: Gulch Fire (1,375 acres)

Valley Floor (Grass Area)

This is the south-central part of the unit extending from the Sacramento River outwards to an approximate elevation of 1,000 feet. This is the most populated and developed area of the unit and includes the Cities of Anderson and Redding, and the communities of Bella Vista, Cloverdale, Millville, Olinda/Happy Valley and Palo Cedro. The area is typically grass oak woodland, with blue oak, valley oak, gray pine and annual grasses. There are also large areas covered by various brush types and some of the woodland areas have a dense brush understory. Significant fires include:

- 1999: Canyon Fire (2,579 acres)
- 1999: Jones Fire (26,202 acres)
- 2004: Bear Fire (10,441 acres)
- 2012: Dale Fire (1 ,037 acres)
- 2013: Clover Fire (8077 acres)

Fires in these fuels are particularly damaging during north wind events. Since the primary fuel is annual grass, the fire danger remains every year even after a significant fire. The fine fuels react quickly to weather changes, especially wind (NFDRS model C).

Timber East

The Timber East area is the forested area east of Redding. The area extends from the 2,000-foot elevation of the Sacramento Valley to Highway 89. Much of the area is managed for timber production. This is a mixed species conifer forest that varies from the Timber West Zone in topography and weather. Slash and brush are part of the fuel component. Fire behavior fuel model 9 and NFDRS fuel model U are used in this area. Several communities exist within this zone including: Shingletown, Whitmore, Oak Run, Round Mountain, Montgomery Creek and Burney. Significant fires include:

- 1998: Burney Fire (3,264 acres)
- 1992: Fountain Fire (60,290 acres)
- 2012: Ponderosa Fire (27,676 acres)
- 2014: Eiler Fire (32,416 acres).

Northeast Plateau

This is the area east of Highway 89. The area is high elevation sage brush, junipers and ponderosa pine. Sage brush is the predominant problem fuel, so NFDRS fuel model T is used. The area is represented by the Soldier Mountain RAWS station. Significant fires include:

- 2014: Day Fire (13,153 acres)
- 2014: Bald Fire (39,736 acres)

UNIT PREPAREDNESS AND FIREFIGHTING CAPABILITIES

There are three incorporated cities that lie within the boundaries of the Shasta-Trinity Unit: Anderson, Redding and the City of Shasta Lake. The remaining communities within the unit are not incorporated.

Several independent special districts referred to as County Service Areas (CSA) provide other services including water and sewer. CSA 1 provides fire protection for all of the unincorporated areas within Shasta County that are not in a fire district. Trinity County is served by 17 special districts.

The Shasta-Trinity Unit is operated under one unit headquarters office located in Redding. The State Responsibility Area of the unit is divided into six field battalions, numbered from east to west. The Shasta-Trinity Unit employs 151 permanent fire personnel and 136 seasonal personnel during fire season. Note: Staffing numbers are adjusted based on extreme weather conditions and may be increased or decreased due to the presence or absence of extreme weather or drought.

Declared Fire Season Staffing:

Engines	Dozers	Hand Crews	Air Tactical Planes	Air Tankers
19	3	12	1	2

*These staffing numbers are adjusted based on extreme weather conditions including drought.

The Shasta County Fire Department (which is administered through a cooperative fire agreement with CAL FIRE), the City of Redding Fire Department and 11 fire districts provide local fire protection responsibility for improvements within Shasta County. The Shasta-Trinity Unit also has a dispatch agreement with the Shasta County Fire Department.

Trinity County is made up of five fire districts, four community service districts, three volunteer fire companies and one PUD providing local fire protection responsibility.

SECTION II: COLLABORATION

COMMUNITY / AGENCIES / FIRE SAFE COUNCILS

Representatives involved in the development of the Shasta-Trinity Unit Strategic Fire Plan are included in the following table. Their organization are indicated below:

Plan Development Team:

Western Shasta Resource Conservation District	Gary Lauben	530-365-7332 ext. 209

SECTION III: VALUES

A: Values

Assets at Risk in the Shasta-Trinity Unit (SHU) include: watersheds, water, timber, wildlife (including rare and endangered species), habitat, rural communities, unique areas (scenic, cultural, and historic), recreation, range, structures, infrastructure and air quality. Protecting these Assets at Risk while ensuring citizen and firefighter safety is of utmost importance. Each of the Assets at Risk have a unique set of stakeholders and public issues.

A tool to help evaluate the AAR is a program called CalMAPPER which contains a database that can be queried to provide initial areas to focus on. The identified Assets at Risk enable the unit and other fire service managers to set priorities for fire management project work. Assets susceptible to fire damage in the unit are identified in the communities at risk table on page 10.

B: Communities

Fifty-four communities within the Shasta-Trinity Unit have been recognized as communities at risk by CAL FIRE'S Office of the State Fire Marshal. More information regarding communities at risk can be found at:

http://osfm.fire.ca.gov/fireplan/fireplanning_communities_at_risk

Communities at Risk:

Fifty-four communit	Federal Threat	Community	Federal Threat	Community	Federal Threat
Anderson		Fall River Mills	X	O'Brien	X
Beegum	X	Forest Glen	X	Oak Run	
Bella Vista	X	French Gulch	X	Old Station	X
Big Bar	X	Gibson	X	Ono	
Big Bend	X	Glenburn		Palo Cedro	
Burney	X	Hat Creek	X	Pitville	X
Burnt Ranch	X	Hayfork	X	Platina	X
Cassel	X	Hyampom	X	Redding	
Castella	X	Igo	X	Redding Rancheria	X
Centerville	X	Junction City	X	Roaring Creek Rancheria	X
Central Valley	X	Keswick	X	Round Mountain	X
Coffee	X	Lakehead	X	Shasta	X
Cottonwood	X	Lamoine	X	Shingletown	X
Covington Mill	X	Lewiston	X	Sims	X
Dana	X	McArthur		Trinity Center	X
Del Loma	X	Millville		Weaverville	X
Denny	X	Montgomery Creek	X	Whitmore	
Douglas City	X	Mountain Gate	X	Wildwood	X

The Community Wildfire Protection Plan's (CWPP) have identified and prioritized areas within the county that fuel treatments are needed to limit the negative impacts of wildland fires. Prioritization of areas was based on population, fuel loading, fuel type, terrain, completed fuel treatments and weather patterns. In addition, ingress/egress routes were evaluated for fuel treatment projects to enhance safer travel for residents and response personnel. Prioritization was on a regional scale, tying ridgetop fuel breaks into community defensible zones.

Shasta County:

<http://www.westernshastarc.org/Docs/ShastaCWPPs-2016.pdf>

Trinity County:

http://www.tcrd.net/fsc/pdf/CWPP_2015_Update_Final.pdf

SECTION IV: PRE-FIRE MANAGEMENT STRATEGIES

A: Fire Prevention

CAL FIRE's goal is to contain 95 percent of all wildfires at 10 acres or less. Fire ignition data, such as fire cause and location, can reveal whether the unit has met this goal. Determining causal trends can direct the unit to specific prevention efforts to change that causal trend. Knowing where most fires occur helps determine where prevention and pre-fire engineering efforts might produce the greatest result.

CAL FIRE's California All-Incident Reporting System (CAIRS) collects data that is utilized for the ignition workload assessment. CAIRS utilizes the National Fire Protection Association (NFPA) Standard 901 coding convention. CAL FIRE has historically classified fire causes into 12 general categories while the NFPA causal data is collected as causal factors. CAIRS data uses latitude and longitude information that points the ignitions to the actual area of origin.

The Shasta-Trinity Unit collects data for all ignitions including non-vegetation fires such as structure or vehicle fires. Many of these ignitions could have spread to the wildland vegetation but suppression activity contained the fire to the original material ignited.

The goals of the fire prevention bureau are education, information, planning and enforcement. The fire prevention bureau's objective is to reduce ignitions by identifying and addressing all ignitions that threaten public safety and lands within SHU's jurisdiction. Specific fire cause classifications are identified by researching the data collected. The results from the research are then used to educate and inform the public. The unit provides public education in the form of news releases, commercials, fliers and other safety messages. Enforcing the public resource code through warnings and citations is another method used to reduce specific fire causes.

Public Resource Code 4291

The California Public Resource Code 4291 (Government Code 51182), amended by Governor Schwarzenegger and signed into law on September 23, 2004 increased the minimum clearance (defensible space) requirement from 30' to 100' around structures. PRC 4291 provides that state law or local ordinance rules or regulations specify requirements of greater than 100' around buildings because of extra hazardous conditions or where a firebreak of only 100 feet around such building or structure is not sufficient to provide reasonable fire safety.

The vegetation surrounding a building or structure is fuel for a fire. Even the building or structure itself is considered fuel. Research and observation has shown that fuel reduction around a building or structure increases the probability of it surviving a wildfire. Good defensible space allows firefighters a better opportunity to protect and save buildings or structures.

Terrain, climate conditions and vegetation interact to affect fire behavior. The diversity of California's geography also influences fire behavior and fuel reduction standards as well. While fuel reduction standards will vary throughout the state, there are some common practices that guide fuel modification treatments to ensure creation of adequate defensible space:

- Properties with higher fire hazard will require more clearing. Clearing requirements will be greater for those lands with steeper terrain, larger and denser fuels, fuels that are highly volatile and in locations subject to frequent fires.

- Creation of defensible space through vegetation management usually means reducing the amount of fuel around the building or structure, providing separation between fuels and/or reshaping retained fuels by trimming. Defensible space can be created by removing dead vegetation, separating fuels and pruning lower limbs.
- In all cases, fuel reduction means arranging the trees, shrubs and other fuel sources in a way that makes it difficult for fire to transfer from one fuel source to another. It does not mean cutting down all trees and shrubs or creating a bare ring of earth across the property.
- A homeowner's clearing responsibility is limited to 100 feet away from their building or structure or to the property line, whichever is less. While individual property owners are not required to clear beyond 100 feet, groups of property owners are encouraged to extend clearances beyond the 100-foot requirement to create communitywide defensible spaces.
- Homeowners who do fuel reduction activities that remove or dispose of vegetation are required to comply with all federal, state or local environmental protection laws and obtain permits when necessary. Environmental protection laws include threatened and endangered species, water and air quality and cultural/archeological resources. For example, trees removed for fuel reduction that are used for commercial purposes require permits from CAL FIRE Resource Management. Also, many counties and towns require tree removal permits when cutting trees over a specific size. Contact your local resource or planning agency officials to ensure compliance.

CAL FIRE is dedicated to public safety and defensible space inspections. CAL FIRE inspects private properties with structures to educate and advise the public in making their structures compliant with the 100' defensible space requirements. These inspections are done, primarily from the late winter and through the summer months, giving homeowners time to mitigate non-compliance issues around homes and structures before the high fire danger summer months.

Defensible Space Flyer:

http://calfire.ca.gov/communications/downloads/fact_sheets/DefensibleSpaceFlyer.pdf

ENGINEERING & STRUCTURE IGNITABILITY

Fire Protection Planning

The state Fire Safety Regulations are codified in the Shasta County Development Standards as Chapter 6. The Development Standards are uniformly applied throughout the County. Other agencies may elect to enforce stricter standards; however, the state Fire Safety Regulations are the minimum level of fire protection planning allowed. The regulations incorporate elements of Title 19 and 24, Public Resources Code 4290 and Government Code sections 51175-51189.

In accordance with the Cooperative Fire Agreement, the Unit Chief is appointed as the County Fire Warden. The Board of Supervisors delegates authority to the Fire Warden to enforce the Fire Safety Regulations for all new land divisions within the County. This authority is, in turn, delegated to the Fire Marshal of the Shasta County Fire Department.

The Shasta County Fire Marshal works closely with the Planning Department and is an integral component of the review process. Applicable conditions are applied to each project to ensure conformity with the Fire Safety Regulations. Once projects are approved by the Planning Commission and/or Board of Supervisors, the Fire Marshal inspects work completed to ensure it meets the conditions applied to the project.

Structure Ignitability and WUI

Beginning in January 2008, the new 2007 California Building Code (CBC) went in to effect. Certain building products used for new construction in State Responsibility Areas (SRA) and Very High Fire Hazard Severity Zones (VHFHSZ) of Local Response Areas (LRA) now must meet specific fire safety standards.

The State Fire Marshal (SFM) published the "WUI Products Handbook" to provide homeowners, industries, designers and local fire and building officials with a list of compliant WUI products. All products published in this handbook have been reviewed and verified for compliance with the new 2007 CBC by SFM staff and have been approved by the SFM. They are not "listed" unless a SFM listing number is attached. It should be noted that products that are not in the WUI Products Handbook may still comply with the standards even if they have not been verified by the SFM.

The California Building Commission adopted the Wildland-Urban Interface (WUI) codes in late 2005. Most of the new requirements took effect in 2008 and were updated in the 2013 California Building Code. These new codes include provisions for ignition resistant construction standards in the WUI.

The updated fire hazard severity zones will be used by building officials to determine appropriate construction materials for new buildings in the WUI. During a property sale the updated fire hazards severity zones must be disclosed to the buyers. It is likely that the fire hazard severity zones will be used by local government as they update the safety element of general plans and maintain compliance with Senate Bill 1241/GC 65302.

The new building standard for the Fire Hazard Severity Zones will be enforced by the building official as projects go through the plan checking process. To best assist them in determining if a product meets the code requirements, the State Fire Marshal's Building Materials Listing program (BML) is accepting applications for materials for listing or for the review of meeting the standards.

The Wildland Hazard and Building Codes can be found at:

http://www.fire.ca.gov/fire_prevention/fire_prevention_wildland_codes

The SFM listing service provides building authorities, architectural and engineering communities, contractors and the fire service with a reliable and readily available source of information.

Since the materials under Wildland Urban Interface Building Codes (except roof wood shakes and shingles) are not required by law to be listed by the SFM, the listings for these products are strictly voluntary. Materials not listed by the SFM may still qualify for use provided they meet all the requirements under Chapter 7A. If not listed on the SFM site, all documentation and testing certificates showing compliance must be submitted to the building official having jurisdiction for final approval.

Code Enforcement

Within Shasta County, each fire protection Authority Having Jurisdiction (AHJ) is responsible for conducting fire safety occupancy inspections and code enforcement. The Shasta County Fire Department conducts inspections of all non-residential occupancies falling within its jurisdiction. The target interval for inspections is every three years. Any complaint regarding alleged violations of the Uniform Fire Code is investigated immediately. The Shasta County Fire Marshal's office coordinates and conducts the fire safety inspections.

Shasta County has adopted the 2013 Uniform Fire Code, Residential Code and Uniform Building Code for all new construction and inspections its jurisdiction. The Fire Marshal's office works closely with the County Building Department to ensure applicable fire safety codes are applied. Information regarding codes can be found at:

<http://shastacountyfire.org/firemarshal/>

Information and Education

The use of information and education programs is key to raising public awareness regarding how fires start and how they can be prevented. In addition, fire prevention staff are members of the Shasta County Fire Prevention Officers Association where ideas and collaboration in fire prevention help to educate the public.

The Shasta-Trinity Unit's information and education efforts are focused primarily into the following three types of programs:

- **School Programs**

SHU staffs its year-round fire prevention school programs with both paid and volunteer personnel who reach out to nearly 5,000 children and young adults. This demographic includes several programs addressing children with special needs. Teaching children

about the dangers of fire and the consequences of such actions is important in preventing wildland fires caused by children or young adults playing with fire.

- **Youth Fire-setter Prevention & Intervention Program (YFPI)**
SHU personnel were active in the creation and implementation of the YFPI program. The program utilizes an evidence-based survey tool to assess the fire setting potential of youth. Parents, school officials, fire agencies, law enforcement and other community members can refer youth fire setters into the program. SHU personnel participate in surveying youth referred into the program and participate in the annual fire safety academies aimed at preventing future youth fire setting activity. Youth fire setters are often referred to one of the annual academies featuring educational presentations by law enforcement, fire personnel and other professionals. The goal of the academies and the program in general is to mitigate the recurrence of youth fire setting activity with education.
- **Public and Community Information Events or Programs**
Using venues such as home and garden shows, earth day festivals and other community oriented events, SHU prevention staff can educate residents of all ages regarding fire safety and prevention of fire. The emphasis at these events is educating residents on the need for defensible space. There is also an emphasis on doing the right thing, the right way and at the right time. Many of the tools we use to create defensible space can ignite a fire (i.e., mowers, trimmers, etc.) since they produce heat that can ignite duff or causes sparks. In addition, staff educate the public at these events on other ways fires start including dooryard debris burning and outdoor fire safety when recreating in the wildland.

B. Vegetation Management

Fuel Reduction

The Resource Management Forest Practice Program provides several functions, including enforcement of laws that regulate logging on privately-owned lands in California through the Forest Practice Act to preserve and protect our fish, wildlife, forests and streams. The Forest Practice Act provides several timber harvesting permits which facilitate fuel reduction around homes, property and communities. These permits include harvesting dead, dying or diseased exemption, 150-foot fire hazard removal exemption (around habitable structures), removal of substantially damaged timber, forest fire prevention exemption, woody debris slash removal exemption, fuel hazard reduction emergency notice, as well as sanitation salvage and fuel break timber harvest plans.

The Vegetation Management Program (VMP) offers similar fuel reduction plans, but focuses on prescribed burning. Through prescribed burning and other fuel reduction methods, the risk of wildfire can be reduced while restoring forest ecology. Prescribed burns remove the thick underbrush in wildland areas in a controlled manner rather than through destruction from a catastrophic wildfire. This keeps wildfires smaller, less destructive and easier to control.

Fuel reduction not only improves the growing conditions of native plant and wildlife species but, a treated site can act as a fire break, stopping or slowing a wildfire and providing firefighters with safe areas to make a stand. Specialized CAL FIRE personnel coordinate with landowners to determine sites and create plans for prescribed burns. CAL FIRE works with other cooperators, such as the Air Quality Management District and wildlife agencies, to ensure burning is done with minimal impact on air quality or biological diversity.

Suppression Repair

The CAL FIRE 7000 manual outlines the standard protection measures for suppression repair. Section 7013.11.3 states: "The Pattern for mitigation measures rest in large part on the standards in the Forest Practice Regulation. These are the same standards that CAL FIRE foresters enforce on private logging operations." The Forest Practice Program (through the departments Forester I, II and III's) often provide lead on suppression repair activities.

Vegetation Management Program coordinators are also familiar with suppression repair activities, have a strong knowledge base on local concerns and issues and often the preplanning and implementation aspect of a VMP project reduces the need for post-fire suppression repair.

Forest and Range Health

The goal of forest management under the Forest Practice Program in relation to the Forest Practice Act falls into four objectives:

1. Achieve a balance between growth and harvest over time.
2. Maintain functional wildlife habitat with a planning watershed.
3. Retain or recruit late and diverse seral stage habitat components for wildlife.
4. Maintain growing stock, genetic diversity and soil productivity.

Additionally, all VMP projects that qualify will go through the California Environmental Quality Act (CEQA) process.

CAL FIRE foresters and VMP coordinators diversity in education, training and background help strengthen our department's ability to help local landowners, communities and counties manage the health of their forests and rangelands. The Forest Practice Program and the Vegetation Management Program work with other cooperators such as the Department of Fish and Wildlife, Regional Water Quality Control Boards, US Fish and Wildlife Service and many other agencies to provide solid and balanced perspectives to forest and rangeland health.

State law (Public Resource Code 4789) requires that CAL FIRE periodically assess California's forest and rangeland resources. The Forest Practice Program and the Vegetation Management Program utilize the information provided by Fire and Resource Assessment Program (FRAP), which identifies emerging resource issues on wildlands, analyzes the results of different types of land use and management on wildland conditions, reviews and evaluates policies by federal, state and local agencies as they relate to wildland protection and identifies policy options for the Board of Forestry and Fire Protection. The program has established a statewide geographic information system (GIS) of biological, physiographic, demographic and other types of data needed to address CAL FIRE's mission, including information on vegetation, wildlife, soils, watersheds, fire behavior and ownership.

SECTION V: PRE- FIRE MANAGEMENT TACTICS

DIVISION / BATTALION / PROGRAM PLANS

SHU Battalion 1

Battalion Overview

Battalion 1 is located at the northeast corner of the Shasta-Trinity Unit. The Battalion is comprised of state, federal and local firefighting resources. Battalion 1 borders the USFS Lassen National Forest to the south, the USFS Shasta-Trinity National Forest to the northwest, the Modoc National Forest to the northeast, the CAL FIRE Siskiyou Unit to the north and the CAL FIRE Lassen/Modoc Unit to the east. Within Battalion 1's Direct Protection Area (DPA), there is a mixture of private property, USFS, BLM and state land. There are two BLM Wilderness Study Areas (WSA's) comprising of approximately 30,000 acres. In the Fall River Valley, there are several thousand acres of local responsibility land (LRA) that border the state DPA. They are protected by the Shasta County Fire Department (administered by CAL FIRE SHU), Fall River Fire District and the McArthur Fire District.

Battalion Resources

The CAL FIRE and SCFD resources are under the supervision of Battalion Chief 2411. Fire Protection within the battalion is largely made up of volunteer and seasonal staffing within CAL FIRE and Shasta County Fire. There are three fire districts within Battalion 1. Burney Fire Protection District staff's equipment with full time paid staffing, along with volunteers. The Fall River and McArthur Fire Districts are staffed with volunteers.

CAL FIRE

Battalion 1 consists of two Schedule B (state funded) stations, and one lookout. Burney Station 14 houses two Type III Schedule B (state funded) engines, a Type II bulldozer, a Forester I and a Battalion Chief. Big Bend Station 19 houses one Type III Schedule B engine and is collocated with a Type III engine from the USFS Shasta-Trinity National Forest. Soldier Mountain lookout is located eight miles north of Fall River Mills and is staffed with career or retired firefighters during times of severe fire danger.

Shasta County Fire Department

Volunteer Fire Companies include the Cassel, Hat Creek, Old Station, Soldier Mountain/Dana and Big Bend. Battalion 1 consists of a Type II engine, a Type III engine, water tender and transport capable rescue vehicle.

Fire Protection Districts and Municipality

There are three fire protection districts within the battalion; Fall River, McArthur (Shasta County portion) and Burney. Fall River and McArthur Fire Districts consist largely of LRA, with both having some portions of their districts in SRA. All the Burney Fire Protection District falls within the SRA.

Wildland and Urban Interface

Battalion 1 is largely comprised of private timberland with Sierra Pacific, Roseburg Forest Products, Beatty & Associates and Fruit Growers being the largest land holders. There are several small communities with mostly residential structures spread throughout the SRA. The

Town of Burney is the largest town in the battalion with several commercial properties as well a few thousand residential structures within the wildland urban interface.

Fuels

Most of Battalion 1 is comprised of eastside pine and mixed brush. The north end of the battalion through the Pit River drainage and into Big Bend is composed of a mixed conifer fuel type, with some brush on south facing slopes.

Weather

Under a typical summer high pressure weather pattern, the fire activity will lower after dark. The normal wind pattern is west to southwest during the afternoon. There are many occasions when there will be a significant down canyon wind after midnight down the Pit River canyon and the west slope of Hatchet Mountain. On a normal year, we can expect to have two or three significant lightning events with the potential of starting 50 plus fires within the battalion. Normal lightning storms will begin in the late afternoon and typically last until approximately midnight. Most storms will begin somewhat dry with increasing moisture into the evening hours. Storms that occur early in the day have a greater potential to produce extended or major attack incidents.

Topography

Battalion 1 is in the Cascade Mountain Range. Most of the battalion has been shaped over millions of years by volcanic events. The battalion lies between Mount Shasta to the north and Mount Lassen to the south. There are several lava flows and cinder cones in the south end of the battalion. The Pit River drainage runs through the center of the battalion with very steep and narrow canyons.

Battalion Fire History

Battalion 1 has a significant fire history with both lightning and human-caused fires. Most of the fires burn out of the southwest under a normal summer high pressure weather pattern in the afternoon. There have been several major fires that have threatened the community of Burney including the 1988 the Burney Fire (3264 acres), the 1992 Fountain Fire (60,290 acres), the 2014 Eiler Fire (32,416 acres), and the 2014 Bald fire (39,736 acres). The battalion has also experienced lightning sieges that have included multiple major fires in 1990, 1999, 2008, 2009, and 2014.

Fuels Reduction/Battalion Projects and Priorities

There are three active Fire Safe Councils within Battalion 1. The Hat Creek Fire Safe Council covers the Hat Creek Valley through the community of Cassel, north to the Burney Falls State Park. Hat Creek Fire Safe Council operates under the Western Shasta Resource Conservation District (WSRCD). The Day Road Fire Safe Council covers Day Road in both SHU and LMU. The Day Road Fire Safe Council operates under the Fall River Resource Conservation District (FRRCD). Recently the Burney Basin Fire Safe Council (BBFSC) has formed, also operating under the FRRCD. The BBFSC received multiple grants and is currently developing a Community Wildfire Protection Plan (CWPP).

CAL FIRE Personnel regularly complete LE-100 inspections for most areas of the battalion. The Hat Creek Fire Safe Council has successfully completed several shaded fuel breaks in and

around the community of Cassel. Other fuel breaks have been recently completed to the west of Burney, with additional projects currently in progress around Burney and Johnson Park.

Battalion 1 has a proven lightning plan, and is updated regularly due to lightning potential, with an established Incident Command Post held at the CAL FIRE Station in Burney. Other emergency pre-plans, consisting of roads, addresses and assets at risk within Battalion 1, have been established and are monitored for changes annually. Both Hat Creek and Day Bench Fire Safe Councils have exceptional pre-plan maps for public use. As part of the BBFSC CWPP they are also developing an emergency pre-plan and evacuation plan.

SHU Battalion 2

Battalion Overview

Battalion 2 is generally located south of the Pit River arm of Shasta Lake, east of Interstate 5 and the City of Redding, north of Whitmore Road and west of Hatchet Mountain.

Battalion Resources

The CAL FIRE and SCFD resources are under the supervision of Battalion Chief 2412. Battalion 2 consists of four CAL FIRE Stations as well as four Shasta County Volunteer Fire Companies. CAL FIRE Battalion 2 consists of three Schedule B stations, one Conservation Camp, one Type II bulldozer and one lookout. Hillcrest Station 75 houses one Type III Schedule B engine. Buckhorn Station 34 houses one Type III Schedule B engine. Diddy Wells Station 74 houses one Type III Schedule B engine. Sugar Pine Conservation Camp supports six crews and a Type II bulldozer and is located west of Ingot Canyon.

Shasta County Fire Department

Volunteer Fire Companies include Oak Run, Bella Vista, Montgomery Creek and Jones Valley. Battalion 2 SCFD consists of a Type II fire engine, a Type III fire engine, water tender and a transport capable rescue vehicle. Jones Valley also has a fire/rescue boat located at the Jones Valley Marina on Shasta Lake. Shasta College Fire District Shasta College Station 73 provides service for northern Shasta County in the communities of Bella Vista, Jones Valley, Lakehead and the areas in and around the Shasta College Fire District as a year-round cooperative agreement with CAL FIRE. The Station has one engine which is staffed 24 hours a day with a minimum of one CAL FIRE company officer and one CAL FIRE firefighter during Amador months, and staffing of one CAL FIRE Company Officer with a minimum of two CAL FIRE firefighters during declared fire season. Station 73 also maintains and operates a fire/rescue boat moored at Bridge Bay on Shasta Lake.

Wildland and Urban Interface

Battalion 2 is largely comprised of commercial, residential, agricultural and highway uses. Private land includes grazing land to the west to commercial timber land in the east. Some of the land owners that have assets include: Beatty and Associates, Fruit Growers Association, Roseburg and Sierra Pacific Industries. There are several communities in the battalion. These include Bella Vista, Round Mountain, Montgomery Creek, Oak Run and Jones Valley. These communities contain a wide range of commercial property such as restaurants, grocery stores, gasoline, propane fueling services and medical facilities. Most of the communities also contain public schools and churches.

There are historical Assets at Risk (AAR) such as the Phillips Mill in Oak Run. Large infrastructure that is considered an AAR is the Pacific Gas and Electric (PG&E) substation and two sets of 500kv transmission lines. Shasta Community College resides on the west side of the battalion, and the north side of the battalion is USFS land along Shasta Lake that is protected by state DPA. While not an inclusive list, these are some examples of the diversity that falls within the Battalion.

Fuels

Fuels along the southwest area of Battalion 2 include grass and oak woodland up to 1,000ft.-1,500ft. in elevation. There is a predominate brush belt within the 1,000ft.-2,000ft. elevations including Diddy Wells and Oak Run, that transition into mixed conifer and oak in the communities of Hillcrest and Oak Run.

Weather

Weather is generally warm and dry during the day with moderate humidity recovery at night. Peak summer temperatures average 85 to 95 degrees with temperatures reaching more than 110 degrees for two to five day periods. The average relative humidity is 15 to 35%. Gradient winds are generally out of the west, southwest 5 to 12 miles per hour (mph). Occasional light east winds occur in the morning then shifting to more west/southwest flow in the afternoon and can reach speeds of 15 to 20 mph, generally up slope and up canyon. North wind events occur periodically throughout the fire season and can reach the 10 to 40 mph range with associated higher gusts. These winds frequently switch to the northeast and strengthen after dark, with occasional stronger winds reaching 50 mph in the Hillcrest/Round Mountain area between 2:00 A.M. to after sunrise.

Topography

The elevation ranges between 420 ft. at Cow Creek up to Hatchet Mountain at 5,500 ft. Topography varies greatly within Battalion 2. The west side of the battalion consists of mainly the Sacramento Valley with rolling hills with small drainages. As the elevation increases to the northeast the topography gradually becomes more rugged and steep.

Battalion Fire History

Battalion 2 has experienced several catastrophic wildfires. While fires caused by lightning have destroyed several thousand acres within the battalion in the last decade, most fires have been caused by humans and were predominately wind-driven. Many of these fires destroyed several structures and many acres of commercial timber land. Burn patterns indicative of the west-east drainages and local up-canyon winds influenced by the valley heating have scarred the landscape. Historical fires such as the 1992 Fountain Fire (60,290 acres) resulted in significant structure and timber loss. Both the 1999 Jones Fire (26,202 acres) and 2004 Bear Fire (10,441 acres) were wind driven and human caused. More recent fire activity has been the 2008 SHU Lightning (86,500 acres) and 2014 Gulch Fire (1,375 acres). The Jones and Bears Fire's rank as some of Shasta Counties most devastating fires.

Fuels Reduction/Battalion Projects and Priorities

Battalion 2 experiences an overwhelming participation with stakeholders to suppress wildfires. Pre-plans to ranches and private industry lands have been collaborated and in place to speed suppression efforts for emergency personnel, ultimately saving life and property. Battalion

pre-plans are in place to identify helicopter landing zones for medical emergencies, safety zones for firefighters, evacuation routes and locations for citizens, water sources, staging areas for firefighting equipment and fire resource augmentation plans for extended attack fires. LE-100 inspections have become an integral part of pre-fire season operations intended to educate property owners of the benefits to preparing their homes against the potential for catastrophic loss due to wildfire.

A lightning plan is maintained and has been utilized several times to organize and deploy firefighters to over 100 fires collectively.

There are many natural and man-made features that may serve as fire breaks including roads, highways, streams and irrigated pastures. Local, state and federal budgetary constraints have led small local community fire safe councils within the battalion to merge their efforts for project work under the umbrella of the Shasta County Fire Safe Council, administered under the direction of the Western Shasta Resource Conservation District (WSRCD). The WSRCD has established a Community Wildfire Protection Plan (CWPP) for areas within Battalion 2. The goal of this CWPP is to reduce the destruction and associated costs from wildfire by creating shaded fuel breaks, increase homeowner and fire department access and egress, watershed restoration and public information and education on developing Firewise Communities. Several shaded fuel breaks along county roads and Highway 299 East surrounding the communities of Oak Run, Hillcrest, Montgomery Creek, and Round Mountain have been initiated by the WSRCD.

There have been several years when California experienced an overwhelming influx of lightning-caused fires that taxed firefighters at every level, increasing the recognition and importance of structural defensible space, visible structure addresses and access. The benefit of pre-fire projects that proved to slow and/or stop fires at existing fire breaks has also been recognized.

SHU Battalion 3

Battalion Overview

Battalion 3 (Shingletown-Whitmore Battalion) is comprised of an integrated, multi-agency workforce of state, local and federal firefighting resources, which provide wildland fire protection to southeastern Shasta County under cooperative agreements. Battalion 3 is located at the north end of the Sacramento Valley in southeastern Shasta County. Battalion 3 is bordered on the west by the Sacramento Valley and runs east paralleling the Tehama County border until reaching Lassen National Park which is the eastern boundary. Battalion 3 includes the communities of Manton, Millville, Shingletown, Whitmore and Viola. There is one independent Fire District within the Battalion, Millville Fire Protection District.

The eastern portion of Battalion 3 consists of Federal Responsibility Area (FRA) and is administered by the Lassen National Forest and the Lassen National Park. While statutory responsibility for all wildland fires within Lassen National Forest is federal Direct Protection Area (DPA), all other types of incidents including medical aids, traffic collisions and structure fires is the responsibility of Shasta County Fire Department (SCFD) administered by CAL FIRE. The Lassen National Park has sole responsibility for all incidents within the park boundaries. Battalion 3 also includes the LaTour Demonstration State Forest, administered by CAL FIRE.

This is a demonstration forest consisting of 9,033 acres of mainly mixed conifer commercial timberland.

Battalion Resources

The CAL FIRE and SCFD resources are under the supervision of Battalion Chief 2413. Fire protection within Battalion 3 is made up of career paid staffing from CAL FIRE, United States Forest Service and National Park Service. Volunteer firefighters make up a large majority of the firefighting work force in all the unincorporated communities consisting of Millville Fire Protection District and SCFD.

CAL FIRE

Battalion 3 consists of two Schedule B stations and one lookout. CAL FIRE Shingletown Fire Station 22 is staffed with two Type III Schedule B engines during the peak fire season months, while in the winter months the staffing is reduced to one engine under a cooperative agreement with SCFD. Whitmore Fire Station 35 is staffed with one Type III Schedule B engine during the peak fire season months and is closed during the off season. Battalion 3 also administers LaTour Butte Lookout which is staffed with career or retired firefighters during times of severe fire danger.

Shasta County Fire Department

Volunteer Fire Companies include Shingletown and Whitmore. Battalion 3 SCFD consists of three Type II engines, two Type III engines, two Type I water tenders, two Type II water tenders, two rescues and one transport capable rescue.

Fire Protection District

Independent fire protection districts within Battalion 3 include Millville Fire Protection District utilizing two Type II engines, one Type III engine, one Type I water tender and one rescue.

Wildland and Urban Interface

Battalion 3 is largely comprised of residential, rangeland and commercial timberland. The community of Shingletown is the largest residential area within Battalion 3. It's mainly a bedroom community for people who work in the Redding area as well as a retirement and vacation home community. Large subdivisions of 200+ homes in the area include Shasta Forest Village, Starlite Pines and Lake McCumber. The smaller community of Whitmore, along with Shingletown, presents the greatest threat for a catastrophic Wildland Urban Interface (WUI) fire due to population density and fuel loading. Large ranches exist in the lower elevation front country. Several of these ranches exceed 5,000 acres. Private commercial timberlands comprise the eastern third of the battalion and include large land owners such as Sierra Pacific Industries and Beaty & Associates.

Fuels

Fuels within Battalion 3 transition from grass/oak woodland in the Sacramento Valley and Millville Plains to brush to mixed hardwood/conifer to pure conifer stands. Fuel models 1, 4, 10 and 11 are examples. At lower elevations, open areas of annual grasses are interspersed with 15 to 50-year-old stands of decadent brush (chaparral). The fuel's dead to live ratio averages approximately 20%. Annual chaparral live fuel moistures vary from 120% to less than 75% in late summer. Fuels transition from chaparral to mixed hardwood/conifer stands at approximately 2,500 feet. Above 4,500 feet you'll find continuous stands of short needled conifer. Current

mixed hardwood/conifer and solid conifer stands have occasional pockets of dead trees due to bug and snow kill.

Weather

The climate is characterized as Mediterranean with hot and dry summers. Temperatures in the summer in the Sacramento Valley average over 100 degrees in the valley and near 90 degrees in the higher elevations. The relative humidity averages from 10-25% in the afternoon, and is often followed by poor nighttime humidity recovery in the mid to upper elevations. Rainfall during the summer is normally less than one inch total. Average winter precipitation in the Sacramento Valley averages around 30 inches and in the higher elevations averages 35-50 inches.

LaTour Demonstration State Forest can see as much as 12-15 ft. of snow pack in a wet winter. Normal gradient winds are from the southwest and average between 6-12 mph in the mid-afternoon. These winds can be enhanced by an onshore or southerly flow which can increase speed to 12-18 mph. The humidity with this type of wind in Battalion 3 tends to only increase a few percent due to the distance from the ocean.

Foehn winds, from the north-northeast in direction, often occur during the late summer and early fall. On the eastern side of Shasta County this wind is normally the strongest toward the end of the wind event and occurs at night when the normal gradient winds enhance the northeast wind flow of the Foehn wind. These winds are also enhanced and funneled by the alignment of the main drainages within the battalion that run from the northeast to the southwest. Peak winds during these wind events can reach over 50 mph. Examples of these foehn wind driven fires include the 1988 Fern Fire (7,558 acres) and 2003 Whitmore Fire (1,004 acres).

Topography

The elevation ranges from 375 ft. at the Sacramento River up into the Cascade Range and Latour Butte Lookout at 6,740 ft. Topography varies greatly within Battalion 3. The west side of the battalion consists of mainly the Sacramento Valley with rolling grass/oak woodland with small drainages. As the elevation increases to the east the topography gradually becomes more rugged. The main drainages within the battalion consist of Cow Creek, Bear Creek and Battle Creek.

Battalion Fire History

Battalion 3 has seen numerous significant fires in the past. Fire history demonstrates moderate to rapid rates of spread, within fuel model 1 and in fuel model 10 and 11 during foehn wind events. These fast-moving fires can occur during north wind weather patterns as well as during a strong onshore flow pushing up the Sacramento Valley, causing south to southwest winds of 12-18 mph. The humidity with these onshore/south winds tend to only increase a few percent due to the distance from the ocean. In fuel model 4, flame lengths in the chaparral can range from 12 to 20 feet once the live fuel moisture reaches a critical level of 80%. Fire history demonstrates the greatest risk for large damaging fires to occur mostly in the hard/conifer fuel belt running through the battalion. This is especially true once the 1,000-hour dead fuel moisture reaches critical level of less than 12%.

Examples: 1958 Blue Mountain Fire (7,731 acres), 1965 Highway 44 Fire (13,708 acres), 1978 Whitmore Fire (7,285 acres), 1988 Fern Fire (7,558 acres), 2003 Whitmore Fire (1,004 acres) and 2012 Ponderosa Fire (27,676 acres).

Fuels Reduction/Battalion Projects and Priorities

Battalion 3 has one of the oldest fire safe councils in California within the community of Shingletown. Over the years this fire safe council has developed, completed and maintained approximately five miles of shaded fuel break around the community of Shingletown. They have also worked on numerous fuels reduction projects and continue to develop and look for new ways to reduce the fuel loading in and around the community of Shingletown. A comprehensive plan has been developed with the assistance of the Shasta County Fire Safe Council and the Western Shasta Resource Conservation District. An additional shaded fuel breaks/escape routes are being constructed in two more locations along Shingletown Ridge.

There is one other fire safe council in the community of Manton, which lies in both Shasta and Tehama Counties. This council is also very active but most of their work has been completed within Tehama County. Currently the two fire safe councils are working together and are developing future projects in Shasta County along the Tehama County line. Both councils are also working hard to ensure their communities are designated Firewise Communities in hopes of securing additional grants in the future. With the continued threat of catastrophic wildland fires and the increasing population growth within the wildland urban interface (WUI), the battalion aggressively provides defensible space inspections and information/education presentations on an ongoing basis. Additionally, the Shasta Forest Subdivision, with support from unit staff, are working to become an NFPA designated Firewise community.

SHU Battalion 4

Battalion Overview

Battalion 4 (Redding Battalion) is a multi-agency workforce of state, local and federal firefighting resources which provide wildland fire protection to the heart of Shasta County under cooperative agreements. Battalion 4 is located east to west in the valley floor of Shasta County. The north boundary is the Pit River Bridge along the Interstate 5 and the Tehama County line to the south. Battalion 4 is interspersed with three incorporated cities: The City of Redding, the City of Anderson and the City of Shasta Lake. There are also three unincorporated communities within the battalion which are served by independent Fire Districts which include (from north to south) Mountain Gate, Olinda/Happy Valley and Cottonwood.

The northern portion of Battalion 4, north of the community of Mountain Gate, is federal Direct Protection Area (DPA) and is administered by the Shasta-Trinity National Forest and the Shasta Lake National Recreation Area. While the statutory responsibility for all wildland fires is federal responsibility, the protection responsibility for medical aids, traffic collisions, boat fires on Lake Shasta and other improvement fires is served by the Shasta County Fire Department (SCFD), administered by CAL FIRE under a cooperative agreement.

Lake Shasta is located within this Federal DPA and is the largest reservoir in California. At full pool, the lake has an elevation of 1,067 feet, a surface area of 30,000 acres with a storage capacity of more than four million acre feet of water.

Battalion Resources

The CAL FIRE and Shasta County Fire Department are under the supervision of Battalion Chief 2414. Fire Protection within the battalion is largely made up of career paid staffing, specifically within the incorporated cities, while CAL FIRE/Shasta County Fire Department career and

volunteer firefighters make up a large majority of the firefighting work force in the unincorporated areas. CAL FIRE Battalion 4 consists of two career fire stations and one lookout. Redding Fire Station 43 is served by two Type III Schedule B engines and one Type II Schedule A engine during the peak fire season months, while in the winter months the staffing is reduced to two engines under Amador and Schedule A contracts.

The Palo Cedro Fire Station 32 is a combination career and volunteer staffed Schedule A fire station, which houses one Type II fire engine. Battalion 4 is also home to the Shasta Bear Lookout which is staffed with career or retired firefighters during times of severe fire danger. Shasta County Fire Department Volunteer Fire Companies include Lakehead, Palo Cedro and West Valley.

The Mountain Gate Fire Protection District is located along Interstate 5, directly south of Lake Shasta, and is comprised of one station with one career paid chief and a volunteer firefighting workforce.

The Shasta Lake Fire Protection District serves the City of Shasta Lake and surrounding areas, and is comprised of two fire stations with one career paid chief, two career battalion chiefs and six career firefighters.

The City of Redding Fire Department serves the City of Redding and the Buckeye Fire Protection District and is comprised of eight career staffed fire stations with 78 uniformed firefighting personnel.

The Anderson Fire Protection District is located within the City of Anderson and surrounding areas, and is comprised of one career staffed fire station with one career paid chief, one battalion chief and six firefighting personnel.

The Happy Valley Fire Protection District is located on Happy Valley Road, directly west of Highway 273, and is comprised of two fire stations with one career paid chief, two paid firefighters and a volunteer firefighter workforce.

The Cottonwood Fire Protection District located along Interstate 5 at the Shasta-Tehama County line and is comprised of one station with one career paid chief and a volunteer firefighter workforce.

Wildland and Urban Interface

Battalion 4 is largely comprised of commercial, residential, agricultural and highway uses, including Interstate 5 and State Highways 44, 273 and 299 east. Commercial properties include three active lumber mills, three large bulk propane facilities and the Knighton Road Truck Stop. There are numerous public schools, churches, mobile home parks and residential developments located in the battalion. While most of these occupancies exist within the large portion of LRA in Battalion 4, other mixed retail and commercial occupancies exist throughout the Battalion's SRA areas.

Fuels

Fuels within Battalion 4 transition from grass/oak woodland to brush, fuel models 1 and 4. At lower elevations, open areas of annual grasses are interspersed with 15 to 50-year-old stands of decadent brush (chaparral). These fuels' dead to live ratio average approximately 20%. Annual chaparral live fuel moistures vary from 120% to less than 75%. Fuels transition from chaparral to conifer stands above 3,000 feet just outside of the battalion. Current live oak stands have occasional pockets of dead trees due to bug and snow kill.

Weather

The weather is generally warm and dry during the day with moderate humidity recovery at night. Peak summer temperatures average 90 to 100 degrees with temperatures reaching more than 110 degrees for two to five day periods.

The average relative humidity is 15 to 35%. Gradient winds are generally out of the south, southwest 5 to 12 mph. Occasional light east winds occur in the morning then shift to more south/southwest flow in the afternoon and can reach speeds of 15 to 20 mph, generally up slope and up canyon. North wind events occur periodically throughout the fire season and can reach in the 10 to 30 mph range with associated higher gusts. These winds frequently switch to the northeast and strengthen after dark, maintaining low relative humidity's, often in the single digits throughout a 24-hour period.

Topography

The elevation ranges between 460 ft. at the Sacramento River up to the Shasta Bear Lookout at 1971 ft. Topography varies greatly within Battalion 4. The battalion consists of mainly the Sacramento Valley with rolling grass/oak woodland with small drainages.

Battalion Fire History

Fire history suggests moderate to rapid rates of spread, specifically within fuel model 1. Spotting can be expected to have a major impact on firefighting resources, creating complexity within the Wildland Urban Interface (WUI), which is a large make-up of Battalion 4's composition. Flame lengths in the chaparral can range from 12 to 20 feet. Normal Burning Indexes (BI's) from July to October average over 40. The 1999 Canyon Fire (2,580 acres) and Jones Fire (26,200 acres) were both driven by powerful north wind events and consumed more than 1,184 homes throughout a large portion of Battalion 4 within a single burning period. Lightning fires are also common place in Shasta County, when as recently as 2008, the valley floor was hit with hundreds of lightning caused fires.

Fuels Reduction/Battalion Projects and Priorities

Many defensible space projects have completed in subdivisions, including small scale or isolated fuel breaks. There are many natural and man-made features that may serve as fire breaks including roads, highways, railroads and the Sacramento River. Local, state, and federal budgetary constraints have led small local community fire safe councils within the battalion to merge their efforts for project work under the umbrella of the Shasta County

Fire Safe Councils are administered under the direction of the Western Shasta Resource Conservation District (WSRCD). The WSRCD has established fire plans for areas within Battalion 4 that include the Cottonwood Creek Watershed to the south, the Cow Creek Watershed to the east, the Community of Lakehead to the north, the lower Clear Creek Watershed to the west, and the Stillwater/Churn Creek Watershed plan in the heart of the Battalion which includes the communities of the City of Shasta Lake, Buckeye Fire Protection District, the City of Redding and the City of Anderson. The goal of these plans is to reduce the destruction and associated costs from wildfire by creating shaded fuel breaks, increase homeowner and fire department access and egress, watershed restoration, and public information and education on developing fire wise communities.

SHU Battalion 5

Battalion Overview

Battalion 5 is located at the northern end of the Sacramento Valley with the City of Redding forming the eastern boundary and Trinity County forming the western border. The battalion includes portions of the coast range with elevations ranging from 500 to 6,919 feet. The unincorporated communities of Centerville, Igo, Ono, Platina, French Gulch, Keswick and (Old) Shasta all lie within the battalion. The Whiskeytown National Recreation Area is a popular local and tourist destination where people enjoy water sports, camping and hiking. The battalion is comprised of a multi-agency workforce of state, local and federal firefighting resources which provide wildland fire protection to the western portions of Shasta County under a cooperative agreement.

Battalion Resources

The CAL FIRE and SCFD are under the supervision of Battalion Chief 2415. Fire Protection within the Battalion is made up of CAL FIRE, SCFD, and the National Park Service. CAL FIRE Battalion 5 consists of two career fire stations. Shasta Station 58 is served by two Type III Schedule B engines and one Type II bulldozer during peak fire season. In the winter months, the staffing at station 58 is reduced to one engine under a Amador cooperative agreement with SCFD. Ono Station 57 is served by one Type III Schedule B engine during the fire season.

Shasta County Fire Department Volunteer Fire Companies include Igo/Ono utilizing one Type II engine, two Type III engines, one water tender and one rescue. Centerville utilizes one Type II engine and one Type III engine. Keswick utilizes one Type II engine, one Type III engine, one water tender and one rescue. French Gulch utilizes one Type II engine, one Type III engine and one rescue.

Shasta Fire Department

Shasta Fire Department Station 56 is in the community of Old Shasta. Station 56 utilizes one Type I engine, one Type II engine, one Type III engine, one water tender and one rescue.

Whiskeytown National Recreation Area

The National Park Service staffs one Type III engine during the fire season at their Oak Bottom Fire Station in the Whiskeytown NRA.

Wildland and Urban Interface

Battalion 5 is largely comprised of brush and timberland with residential subdivisions located within the wildland. The subdivisions contain mainly single family residences with a few public schools and commercial businesses located within the communities. All the communities within the battalion have the potential for a catastrophic Wildland Urban Interface (WUI) fire due to population density and fuel loading.

Fuels

Fuels within Battalion 5 transition from grass, grass/oak woodland to brush, fuel models 1 and 4. At lower elevations, open areas of annual grasses are interspersed with 15 to 50-year-old stands of decadent brush (chaparral). These fuel's dead to live ratio average approximately 20%. Annual chaparral live fuel moistures vary from 120% to less than 75%. Fuels transition from

chaparral to conifer stands above 2,500 feet on the west side of the battalion. Current live oak stands have occasional pockets of dead trees due to bug and snow kill.

Weather

The climate is characterized by hot, dry summers and cool, wet winters. The summer high temperatures average from 90 to 100 degrees, with average relative humidity ranging between 15%-35%. Most precipitation occurs during the winter with an average of 30-40 inches falling per year. Gradient winds are generally out of the west to southwest with wind speeds of 15-20 mph in the late afternoon during the summer. Foehn wind events occur periodically throughout the summer and fall with wind speeds for these events ranging from 10-30 mph out of the north.

Topography

The east side of battalion 5 captures some of the Sacramento Valley toe slope with gentle hill. Moving west the topography quickly becomes steep and rugged. The eastern coast range is the dominant topographic feature within the battalion with abundant 2,000-4,000 foot peaks. Bully Choop Peak (with Bully Choop lookout) sits on the western boundary of the battalion at 6,919 feet.

Battalion Fire History

The battalion has an extensive fire history. Some of the larger fires in the battalion are the 1946 Muletown Fire (25,993 acres), 1972 Swasey Fire (3,215 acres), 2004 French Fire (12,675 acres), 2008 Motion Fire (28,330 acres), 2008 Moon Fire (35,312 acres), 2013 Clover Fire (8,077 acres) and the 2014 Bully Fire (12,661 acres).

Fuels Reduction/Battalion Projects and Priorities

The battalion aggressively pursues defensible space inspections as well as fire safety presentations within the community. Information and education presentations are made at the local schools, area churches and at the two CAL FIRE stations within the battalion. The Battalion has many natural and manmade features which could serve as fire breaks including roads, highways, and waterways. State Highway 299 bisects the battalion from Trinity County to the Redding city limits. Highway 299 is a major thoroughfare to the Northern California coast.

Federal, state and local budgetary constraints have led small local community fire safe councils within the Battalion to merge their efforts for project work under the umbrella of the Shasta County Fire Safe Council, administered under the direction of the Western Shasta Resource Conservation District (WSRCD). The WSRCD has established Community Wildfire Protection Plans (CWPP) for areas within the Battalion. The goal of the plans is to reduce the destruction and associated costs from wildfire by creating shaded fuel breaks, increase homeowner and fire department access and education on developing Firewise Communities.

SHU Battalion 6

Battalion Overview

Battalion 6 encompass all SRA of Trinity County. General boundaries are east of South Fork Mountain and Devils Backbone to Shasta County. The northern boundary is the Siskiyou-Trinity County line and the southern boundary is the Yolla Bolla Wilderness

Area. The county is dissected by three state highways. State Route 299 and State Route 36 run east/west and State Route 3 runs north/south. The county is situated in mountainous, heavily forested land between the Sacramento Valley and the Coastal Mountain Range. A large portion of the land in Trinity County is federally owned. The Trinity County population is just under 14,000 people, with an overall population density of four persons per square mile. The largest community is Weaverville, the county seat, with an estimated population of 3,600 people. The Direct Protection Area (DPA) for the battalion includes the communities of Douglas City, Lewiston, Hayfork, Weaverville and most of Junction City. Federal DPA is to the north, west, and south of the state DPA which includes Lewiston Lake, Trinity Lake and the Trinity Alps. There are no areas in Trinity County that have been identified as a Local Responsibility Area (LRA).

Battalion Resources

CAL FIRE resources are under the supervision of Battalion Chief 2416. Battalion 6 consists of a multi-agency response that includes the United States Forest Service and Volunteer Fire Districts.

CAL FIRE

Battalion 6 consists of three Schedule B stations, one conservation camp and one lookout. Weaverville Station 60 has one Type III Schedule B engine. Hayfork Station 62 has one Type III Schedule B engine. Fawn Lodge Station 61 has two Type III Schedule B engines. Trinity River Conservation Camp is a six-crew camp and is located north of Lewiston. Bully Choop lookout located near the Shasta/Trinity County Line and is staffed with career or retired firefighters during times of severe fire danger.

Districts

There are areas in the battalion DPA that are not covered by local departments and districts (unprotected for improvement fires). All local fire entities are staffed by volunteers, with only a few of paid members in the larger communities. Being volunteer based, response from departments varies between departments, time of day, time of year, etc. The following are the districts and departments within the battalion DPA:

Douglas City Community Services District: one Type I engine, two Type IV engines, one Type I water tender.

Hayfork Fire Protection District: one Type I engine, one Type II engine, and one water tender.

Junction City Fire Protection District: one Type I engine, one Type II engine, two Type III engines, and one Type I water tender.

Lewiston Fire Protection District: one Type II engine, two Type III engines, one Type I water tender.

Weaverville Fire Department: one Type I engine, one Type II engine, one Type III engine and one water tender.

Wildland and Urban Interface

Developments within Trinity County tend to be guided by the terrain. Structural development includes one working lumber mill, multiple schools, light commercial and residential housing. Population density is generally greater in the flatter areas of the county. Because of the terrain there are multiple areas in the county that do not have a secondary ingress/egress. Multiple roads outside of the communities are either unnamed or unmarked. Large fire apparatus have limited mobility outside of the communities. The county is presently implementing a standardized addressing system, but some communities still have no addresses. Water systems for fire suppression are limited to the larger communities and most do not have generator back-up to support the system during power failures. Fire suppression resources rely on water tenders using the Trinity River and numerous creeks for water supply.

Fuels

Fuels within the battalion are primarily timber and oak woodland with pockets of brush and grass. Timber fuel loading is increasing due to changing logging practices, lack of regular fire occurrence and natural effects (bug, snow, and wind). Fuel model 1 best represents most of Trinity County timber would be: Fuel Model 10, TL3 (moderate load conifer) and TL 6 (heavy load conifer). There are numerous brush pockets in the battalion that are too dense to walk through. The dead component in these brush pockets can exceed 50%. Fuel Model 4 best represents these pockets during peak season.

Unit fire occurrence and history maps show that there are areas in the battalion that have not burned in over 100 years. Fires during peak season in these areas will most likely cause significant damage to the water shed and natural resources. Large areas of annual grasses are limited to the Hayfork Valley, old fire areas with large tree and brush kills, and areas of the county where the tree density still allows for grass growth. Fuel Model 1 and 2 best represent the grass during the peak season.

The county contains large pockets of dead and down material. These are areas where low fire intensity did not consume the material and there was little or no post fire clean-up. These fuel beds are estimated to have greater than 75 tons of large fuel (above 3" in diameter) accumulations. Fires in these fuels are time consuming to extinguish and pose significant control problems during peak season. Fire modeling is difficult because the models do not account for the large diameter fuel loading.

Weather

Weather is generally warm and dry with occasional thunderstorms throughout the summer. Average daily high temperatures during the summer range between 85 to 93 degrees with highs above 100. Average relative humidity daily minimums are 19% to 12% with single digit relative humidity a couple of days most summers. Typical gradient winds are west to east. Diurnal winds upslope and up canyon occur during the afternoon hours with down slope winds occurring during the night. Both upslope and downslope winds can be influenced by the Sacramento Valley and the coast causing higher than normal wind speeds. Precipitation during the summer averages less than two inches for the months of June, July, and August combined.

Topography

Trinity County topography is dominated by mountainous terrain, with the Trinity Alps reaching over 9,000' in elevation. The Trinity River dissects the battalion with multiple tributaries. Slopes of 100% are common with only a few small areas of the county considered flat.

Battalion Fire History

Most communities within Trinity County have been under evacuation orders due to wildland fires within the last 15 years. Most fires requiring the evacuation orders were over 1,000 acres in size. Examples are the Oregon fire (2001, 1,695 acres) Junction Fire (2006, 3,150 acres) Oregon fire, (2014, 580 acres), Barker Fire (2015, 36,503 acres) and the Helena Fire (2017, 21,846 acres). These larger fires are characterized as stand replacement fires creating significant environmental concerns. Fires starting at the bottom of a slope will typically reach the top of that slope. Winds aloft will transport embers into the next drainage creating spot fires in receptive fuel beds. Damage to structures caused by wildland fire is occurring more frequently as structures are built in the wildland urban interface while fuel loading continues to increase.

Fuels Reduction/Battalion Projects and Priorities

The battalion has one fire captain responsible for implementing the Public Resource Code 4290 in the county. Working in conjunction with the County Building Department, Planning Commission, General Plan Committee, and Subdivision Committee, the fire captain provides guidance to prepare and interpret ordinances as subject matter experts. In addition, personnel assist developers in applying Fire Safe Regulations to their projects. The Trinity County Resource Conservation District (TRCD) and Hayfork Water Shed Center, in conjunction with the Trinity County Fire Safe Council, have taken lead roles in implementing fuels reduction projects and pre-fire activities within the battalion. All communities have been identified as a community at risk and are registered NPFA Firewise Communities. TRCD assisted in updating a map book of the county, created pre-fire attack maps with water sources, structures locations, roads, staging areas and gates.

TRCD in partnership with Bureau of Land Management created the Weaverville Community Forest, a stewardship to reduce the fuel loading on the west side of Weaverville. The plan is to expand the Community Forest to include additional areas to the west and north of Weaverville and include Forest Service property. The local volunteer department has received grant funding to assist land owners in defensible space clearances. Defensible space inspections are coordinated with the local projects to enhance the overall project success.

This approach has produced a positive impact in the community by providing residents that otherwise could not complete the clearances, a means to comply with the law with little to no out of pocket cost. This multiple project in landscape approach is being implemented throughout the county with cooperation between federal, state, and local resources to reduce fuels in and around communities.

The Hayfork Water Shed Center is implementing projects that started with fuel breaks and defensible space clearances. The second phase of the projects will include a combination of hand, mechanical and prescribed fire to treat large blocks (over 1,000 acres) of Bureau of Land Management and private lands. Battalion personnel work with school officials to provide education to grade school children. Coordination of resources between federal, state, and local resources occur when the school is within a multi-jurisdictional area

SHU Training

The Shasta-Trinity Unit Training Bureau statement of goals:

The Shasta-Trinity Unit is dedicated to providing our employees with the highest degree of training, incorporating industry recognized standards and certifications, focusing on cost

efficiency and fiscal responsibility while assuring operational needs are met. The Shasta-Trinity Unit training goals are based on defined, measurable training objectives, provided in a safe and harassment free environment meeting department policy and state statutes. It is expected that each employee dedicates 15% of their shift to training, whether it's informal at the fire station, or formal multi-agency training. By maintaining this commitment, we can perform at the highest level of service in mitigating all types of emergency incidents, public education, law enforcement and administration for our customers, the people of California and its valuable resources.

The Training Bureau is under the supervision of Battalion 2407. The Training Bureau consists of a fire captain and a part-time office assistant. In the winter the staff is increased by adding up to four training officers from the CAL FIRE ranks to deliver training to SCFD. These training officers are comprised of permanent fire apparatus engineers and fire captains, both bringing a wide range of experience. These training officers are assigned Shasta County vehicles and equipment to conduct training to the individual volunteer companies within Shasta County. Every year the Shasta County Training Committee (consisting of representatives from CAL FIRE and SCFD training officers) recommends subjects, topics and evolutions which are then incorporated into the training schedule.

The training schedule meets the federal and state mandated requirements for firefighters training. The training sessions are a minimum of three hours each evening, and included the following topics: Structure fire drills, CPR/AED, Defensive Driver, Hazardous Materials Refresher, Fit Testing, L-180, EMS Skills, Command and Control Wildland Fires, Rope Rescue, Wildland Safety Training and RT-130. The Shasta County Training Bureau annually supplies over 3,000 instructor hours with the average SCFD Volunteer attending over 125 hours of focused training.

In the winter a fire captain is assigned to assist with training in Trinity County. The fire captain assists the local volunteer agencies in Trinity County with their regular training schedule.

Camps

Sugar Pine Conservation Camp

Sugar Pine Conservation Camp (SPCC) is a 120-man camp forming six crews, and houses one CAL FIRE bulldozer. The camp is located approximately fifteen miles outside the town of Bella Vista. SPCC opened in 1988 and is operated by CAL FIRE and the California Department of Corrections and Rehabilitation. The fire crews work on grade projects five days a week year-round. These projects include many fuel reduction projects for fire safe councils, municipalities, schools, county government, state government agencies and federal government agencies. Acres treated vary by project and stakeholder needs and desires. As recognized by the 2010 Strategic Fire Plan, inmate labor for fuel reduction projects provides good training for fire-fighting crews and defensible space around valuable assets and infrastructure at a reasonable cost to the taxpayer. In addition to the fire crews Sugar Pine Camp has an engraving shop, cabinet shop, and automotive repair shop.

Trinity River Conservation Camp

Trinity River Conservation Camp (TRCC) is a 120-man camp forming six crews and is located in Trinity County, approximately 12 miles outside of the town of Lewiston. Opened in 1988, TRCC is operated by CAL FIRE and the California Department of Corrections and

Rehabilitation. The fire crews work on grade projects five days a week year-round. The crews are engaged in federal, state, and local community projects which include reforestation, hazard fuel reduction, erosion control, fish habitat, wildlife improvements, school site cleanup, and other projects supporting the public good. Acres treated vary by project and stakeholder needs and desires. As recognized by the fire plan, inmate labor for fuel reduction projects provides good training for fire-fighting crews and defensible space around valuable assets and infrastructure at a reasonable cost to the taxpayer. In addition to the fire crews, Trinity River Camp has a wood shop, lumber mill, welding shop, sew shop and automotive repair shop.

LaTour Demonstration State Forest

This property became a state forest in 1946 when the State Lands Commission deeded the property to the then California Division of Forestry. It is in Shasta County, south of Burney and east of Redding at the edge of the Lassen National Forest. The 9,033-acre State Forest contains many interesting volcanic, glacial and geological features, and comprises the headwaters of two major tributaries to the Sacramento River, including Old Cow Creek and South Cow Creek.

The forest supports 10 coniferous tree species of commercial value. They include sugar pine, ponderosa pine, Jeffrey pine, western white pine, lodge-pole pine, Douglas-fir, white and red fir, incense cedar and mountain hemlock. The stands contain lesser amounts of hardwood trees, such as California black oak, canyon live oak, big leaf maple and red alder.

Near the southern extent of the Cascade Range, the area is popular with campers and snowmobilers. Other recreational activities include hiking, biking and horseback riding. Hunting and fishing may be enjoyed in season, and in accordance with the Department of Fish and Wildlife laws and regulations.

The forest is normally, accessible to vehicles from late May until early November. Winter and spring months are often a time of high winds, deep snow, and extreme cold, making the area inaccessible to vehicle traffic except snowmobiles. The four campgrounds found on LaTour include multiple campsites, picnic tables, fire rings and restroom facilities. Potable water is only available at the Old Station Campground and the Forest Headquarters.

LaTour Demonstration State Forest utilizes crews from Sugar Pine Conservation Camp to work on fuels projects such as thinning along roadways to increase forest health and create shaded fuel breaks. The Forest has recently started utilizing prescribed low intensity burning to reduce fuels and mitigate large scale canopy loss from intense summer fires.

The State Capital Christmas Tree has been harvested annually from LaTour Demonstration State Forest since 2012 and permits for personal Christmas Trees are available from the Redding Headquarters from October thru December. LaTour is also open to the public to cut dead and down trees for firewood with a valid permit, also available from the Redding Headquarters.

APPENDIX A: PRE- FIRE PROJECTS

<u>PROJECT NAME</u>	<u>PROJECT STATUS</u>	<u>TYPE</u>	<u>ACRES</u>
Aldridge VMP	Planned	VMP	600.00
Brown Ranch Mini Management Plan	Complete	CFIP	232.05

Tamarack Fuel Break	Planned	Fire Plan	500.00
Trinity County CWPP 2015 Update	Complete	Fire Plan	0.00
Weaverville Airport	Active	VMP	35.00

APPENDIX B: UNIT GOALS AND OBJECTIVES

Goals and Objectives of the Shasta-Trinity Unit

The overall goal of the Shasta-Trinity Unit is to reduce the costs and losses associated with wildfire through continuing collaborative efforts from the unit, stakeholders and cooperators with shared objectives to be implemented in this plan, including:

- Conduct fuel reduction projects
 - Complete fuel treatment projects on 1,000 acres per year.
 - Treat 1,000 acres with broadcast prescribed burning per year.
- Collect, analyze and share data with stakeholders and cooperators
 - This will be accomplished by working with resource conservation districts, fire safe councils, other federal, state and local resources.
- Support resource conservation districts, fire safe councils and other local organizations in the development and implementation of community wildfire protection plans
 - Attend local meetings and having representatives offer guidance and support from CAL FIRE.
 - Complete projects utilizing CAL FIRE/CDCR/CCC hand crews.
 - Support and encourage communities certification as NFPA Firewise Communities.
- Evaluate and identify where wildfire threatens life, property and natural resources within the unit, and work towards establishing wildfire protections plans for those areas
 - Utilize local knowledge from field battalion chiefs.
 - Develop plans collaboratively with local landowners and organizations, and local, state and federal government's.
 - Ensure consistency between different wildfire protection plans
- Inspect 35% of the unit's habitable structures in the SRA per year, while promoting an increased level of education and compliance with defensible space laws and regulations
 - Maintain full-time seasonal staff of four forestry aids/defensible space inspectors to conduct inspections each spring and summer.
 - Ensure active participation of station crews to conduct defensible space inspections throughout year.
- Increased inspections on railway and power supply infrastructure
 - Work with the railroad companies to complete inspections with use to ensure right of way clearance.
 - Work with PG&E to educate personnel on equipment and required clearance.

- Create and utilize latest technology for personnel to identify and record problem locations.
- Increase public outreach and awareness
 - Provide timely press releases to educate public on changing seasons and conditions.
 - Increase the public awareness on how to reduce wildfire ignitions through newspapers, radio, television stations and social media.
 - Utilize roadside signs and billboards with public messages promoting wildfire awareness.

C: IGNITION ANALYSIS

The Shasta-Trinity Unit uses fire ignition cause data to analyze and determine the trend in fire causes. The analysis below is based on data from the 2017 calendar year. For 2017 the Shasta-Trinity Unit recorded the highest number of fire ignitions from undetermined sources, followed by arson. Ongoing training of engine company personnel and prevention personnel can reduce the number of undetermined caused fires, though it also points to the challenge of determining fire cause.

Arson has consistently been a major fire cause for the Shasta-Trinity Unit. Arson was a cause for 25 fires or approximately 12% of all fires in the unit. Our active prevention bureau made 14 arson arrests for the year, which likely kept our arson caused fires lower than they could have been. A continued active prevention bureau will be key to controlling arson as a fire cause.

The next largest cause classes were debris burning and vehicles. To reduce the number of debris burn escapes, the prevention bureau has focused extra effort on informing the public of the rules and regulations of debris burning, as well as providing education of how to determine safe practices to complete debris burning. Debris burning has always been an issue during the early part of the spring during them months of April and May. During the past several years there has been an increase of debris fire escapes in the fall. To reduce the amount of fires caused by debris burning public announcements, media releases and enforcement action has been utilized.

Vehicle and equipment use also remain major contributors in fire starts. Media releases, education and enforcement have resulted in decreasing the number of these fire causes. Another program, the "One less Spark One Less Fire," developed by the United States Forest Service has also helped to bring the attention to the public on the issue of vehicle and equipment caused fires. The charts below illustrate the causes of fires in the Shasta-Trinity Unit over the 2017 calendar year, expressed both as a count and percentage.

Note:

Miscellaneous fires are fires which have a clearly identified ignition but do not fit into the other cause classes. Causes under miscellaneous include, but are not limited to: powerlines, fireworks, cutting, welding, grinding, firearms, blasting, structures, glass refraction/magnification, spontaneous combustion

2017 ANNUAL ACCOMPLISHMENTS REPORTING

SUPPLEMENT: 2017

Annual Report of Unit Accomplishments

In 2017, the Shasta-Trinity Unit continued to work with cooperators to identify new projects and continued progress on current projects. The Shasta-Trinity Unit continued with Public Resource Code 4291 inspections throughout the year, completing 4,968 inspections and exceeding defensible space inspection targets set by the Chief Pimlott. Sugar Pine and Trinity River Camps continued to support local agencies with crew hours to progress or complete projects within the unit.

In 2017, unit staffed worked with the recently formed Burney Basin Fire Safe Council to begin a draft community wildfire protection plan (CWPP). This document is being collaboratively developed and will help the community be better prepared for wildfire. Having a developed CWPP will also increase the eligibility to obtain grant funding for additional projects. The unit will stay engaged with this process through the completion and implementation of the plan.

Fuel break construction continued throughout the unit in 2017. In the Burney area, shaded fuel breaks were completed to the west of town. Other projects to the south of town and around the Johnson Park community are also in progress. In Shingletown, the Shingletown ridge project was continued. These projects were completed in coordination with multiple landowners and other agencies.

In 2017 the unit actively supported area landowners to begin the process for completing broadcast burning prescribed fire projects. These projects, implemented under the Vegetation Management Program (VMP), use a cost share model to fund the mutually beneficial projects. Currently the unit has multiple VMP's in the planning process with plans to start many more.

LE 100 Defensible Space Program

In 2017 the unit completed a total of 4,968 inspections. Most of these inspections were completed by the unit forestry aids/defensible space inspectors, but there was also involvement from our stations crews. The significant fire activity during the 2017 fire season was a limiting factor in engine availability to perform inspections.

2017 Fire Prevention Bureau Statistics:

- Fire prevention bureau officers responded to 1,113 incidents
- 14 arson arrests were made within the unit
- 171 various nature citations were issued
- 39 LE 38's were issued

2017 Cadres/Workgroups:

- FI-210 cadre
- Youth Fire-setter Prevention and Intervention Program
- Shasta Arson Task Force
- Shasta County Fire Prevention Officers Association
- CAL FIRE Defensible Space Collector App
- CAL FIRE Damage Inspection Specialist cadre

2017 Fire Season Ignition Statistics

Wildland fire ignition statistics were tracked for the entire year of 2017. The unit experienced 199 wildland fires within its Direct Protection Area (DPA). Wildland fire statistics are tracked based on information from each LE-66 fire report submitted to the fire prevention bureau.

2017 Significant Fires in the Unit:

- 1) LaVerne: 180 acres, 5 homes and 23 outbuildings destroyed
 - a. Cause: Discarded ashes
- 2) Helena: 21,846 acres, 72 homes and 61 outbuildings destroyed
 - a. Cause: Powerlines
- 3) Berry: 995 acres
 - a. Cause: Lightning

2017 Fire Causes in the Unit:

The top five causes of fires in the unit were:

- | | | |
|----|----------------|------------------|
| 1) | Undetermined | (36 fires – 18%) |
| 2) | Arson | (25 fires – 13%) |
| 3) | Debris Burning | (24 fires – 12%) |
| 4) | Vehicle | (24 fires – 12%) |
| 5) | Equipment | (21 fires – 11%) |

The remaining causes of fires in the unit were:

- | | | |
|-----|-------------------|------------------|
| 6) | Lightning | (19 fires – 10%) |
| 7) | Electrical | (19 fires – 10%) |
| 8) | Miscellaneous | (16 fires – 8%) |
| 9) | Smoking | (6 fires – 3%) |
| 10) | Playing with fire | (6 fires – 3%) |
| 11) | Campfire | (3 fires – 2%) |
