Section 1
Introduction

CDM Smith Inc. (CDM Smith) has prepared this Annual Groundwater Monitoring Report on behalf of the Anadite California Restoration Trust (Anadite). This report describes the 2016 annual monitoring and well installation and development activities completed at the former Anadite facility located in the City of South Gate, California, including the rationale, technical approach, and results. Portions of this introduction section are in part a restatement of the information provided in the CDM Smith reports dated August 22, 1994 (CDM, 1994); July 6, 1998 (CDM, 1998); June 28, 1999 (CDM, 1999a); July 21, 1999 (CDM, 1999b); October 13, 1999 (CDM, 1999c); February 1, 2000 (CDM, 2000a); April 14, 2000 (CDM, 2000b); April 19, 2000 (CDM, 2000c); July 13, 2000 (CDM, 2000d); October 2, 2000 (CDM, 2000e); October 16, 2000 (CDM, 2000f); January 18, 2001 (CDM, 2001a); April 15, 2001(CDM, 2001b); July 13, 2001 (CDM, 2001c); April 15, 2002 (CDM, 2002a); October 21, 2002 (CDM, 2002b); April 1, 2003 (CDM, 2003a); September 12, 2003 (CDM, 2003b), January 29, 2004 (CDM, 2004a), July 26, 2004 (CDM, 2004b), January 27, 2005 (CDM, 2005a), July 28, 2005 (CDM, 2005b), January 26, 2006 (CDM 2006a), July 27, 2006 (CDM 2006b), July 30, 2007 (CDM, 2007), August 27, 2008 (CDM, 2008), July 31, 2009 (CDM, 2009),July 30, 2010 (CDM, 2010), August 12, 2011 (CDM, 2011), July 31, 2013 (CDM Smith, 2013), September 12, 2014 (CDM Smith, 2014a), and July 31, 2015 (CDM Smith, 2015).

1.1 Report Overview

CDM Smith has prepared this report in general accordance with the groundwater monitoring requirements outlined in "Interim Site Assessment and Cleanup Guidebook" (Los Angeles Regional Water Quality Control Board [RWQCB], 1996). The work was performed under the agreement between Anadite and CDM Smith for Consultant Engineering Services. The groundwater monitoring and sampling were conducted in accordance with Cleanup and Abatement Order (CAO) No. 98-004, the monitoring plan prepared by CDM Smith, dated November 24, 1998, and the recommendations presented by the RWQCB on December 3, 1999 (RWQCB, 1999), January 25, 2001 (RWQCB, 2001), November 5, 2002 (RWQCB, 2002), September 16, 2004 (RWQCB, 2004a), September 27, 2004 (RWQCB, 2004b), December 23, 2005 (RWQCB, 2005), March 2, 2006 (RWQCB, 2006), and October 10, 2008 (RWQCB, 2008). Request for modification to the groundwater monitoring and sampling program pursuant to the CAO No.980004 was approved by the RWQCB in a letter dated June 11, 2013. The 2015 annual groundwater monitoring and sampling activities were conducted in accordance with the modified monitoring program and focused on the key wells needed to track the central “high concentration” portions of the plume. In addition, the second quarter 2016 Waste Discharge Requirements (WDR Order No. R4-2011-0036, File #97-019) monitoring event for *In Situ* Enhanced Anaerobic Bioremediation (EAB) of Volatile Organic Compounds (VOC) was conducted as part of the annual sampling event. Additional five groundwater monitoring wells were sampled as required by the monitoring and reporting program (MRP No. CI-8685) dated September 8, 2015 and the results were included in this report.

1.2 Site Description

The former Anadite South Gate facility (Site) is located at 10647 Garfield Avenue, in the City of South Gate, California (Figure 1-1). The Site is located approximately 1,600 feet east of the confluence of the Los Angeles and the Rio Hondo Rivers (both are lined drainage channels). The Site is relatively flat with an elevation of approximately 95 feet above mean sea level. Approximately 95 percent of the Site is covered with asphalt or concrete pavement (including building slab floors).

Site features formerly included a paint shop, 16 process tanks (Big Line Tanks) used for immersion/treating metal products, other process buildings (Hard Anodizing and White House), storage buildings, an office, and a Chem-Milling Tank Building (Figure 1-2). Site operations largely ceased in the latter portion of 2003; however, limited Site operations resumed again in 2008.

1.3 Site Background

The following background summary is based on a review of Anadite environmental documents, reports of Site investigations conducted by other consultants, and previous Site investigations completed by CDM Smith. Summaries of these studies are highlighted in Table 1-1.

1.4 Local Geology/Hydrogeology

The Site is located in the Downey Plain within the Central Basin of the Coastal Plain of Los Angeles County. The Site is underlain by approximately 150 feet of Recent alluvium, including the Bellflower aquiclude (clay and sandy clay), and the Gaspur aquifer (sand and gravel with some interbedded clay). The Lakewood and San Pedro formations underlie the recent alluvium and are important water-bearing deposits in the Los Angeles Basin. The Lakewood formation aquifers consist of the Exposition and the Gage. The San Pedro formation aquifers include the Hollydale, Jefferson, Silverado, and Sunnyside (Hydrotech, 1991).

During various investigations, the lithology observed in the borings drilled at the Site from the ground surface to approximately 150 feet below ground surface (bgs), consisted generally of those discussed below.

- Shallow soils from the ground surface to about 20 to 25 feet bgs are predominantly silt and sandy silt with lesser amounts of silty sand. A few poorly graded sand and clay lenses have been encountered within the initial 20 feet of sediment. Below 20 to 25 feet bgs, the lithology transitions primarily to silty sand and sand.
- Shallow groundwater beneath the Site occurs at approximately 37 to 45 feet bgs. The subsurface lithology within the saturated zone consists primarily of a coarsening downward sequence of sand and silty sand interbedded with relatively thin layers (less than five feet thick) of sandy silt, silt, clayey silt, and silty clay.

The presence of laterally pervasive fine-grained lithologic layers at depths of approximately 50 and 80 feet bgs have resulted in relatively distinct local groundwater zones. These zones have been designated the 50-foot, 80-foot, and 100-foot zones. The bases of the 50-foot and 80-foot zones are marked by relatively fine-grained layers at those depths. The 100-foot zone begins below the 80-foot silt and the base of this zone has not yet been reached in monitoring wells drilled at the Site. However, as the 100-foot zone is presumed to be the Gaspur aquifer, it is expected that the base of the 100-foot zone would occur at approximately 200 feet bgs. There are references to 150, and 200-foot zone wells in later sections of this report. This designation is only to distinguish between potentiometric and/or chemical data collected from wells installed at approximately 150 and 200 feet bgs, from the shallower 100-foot wells. The 100-foot, 150-foot, and 200-foot wells are all considered to be screened within the 100-foot groundwater zone (Gaspur aquifer).

The 50-foot zone consists primarily of interbedded sandy silt, silty sand, and fine sand. The 80-foot zone consists primarily of fine to medium sand with lesser amounts of silty sand and sandy silt. The 100-foot zone consists primarily of medium to coarse-grained sand and sandy gravel.

Section 2
Scope of Work

2.1 Field Activities

Field activities reported herein were conducted at the Site between May 23, 2016 and May 26, 2016. Based on the modified groundwater monitoring program (RWQCB, 2013), and RWQCB's letter dated October 14, 2014 (RWQCB, 2014b), the scope of work for this annual groundwater monitoring and sampling event consisted of the following tasks:

- Measure depth-to-groundwater from wells MW-1 through MW-65;
- Measure pH, electrical conductance, turbidity, and temperature during purging of the wells;
- Collect groundwater samples from 26 selected wells;
- Collect groundwater samples from 5 selected wells for WDR monitoring ;
- Include a performance evaluation sample for volatile organic compounds (VOCs);
- Analyze all groundwater samples for VOCs, and selected samples for 1,4-dioxane;
- Evaluate and summarize the data; and
- Report preparation.

2.2 Groundwater Monitoring and Sampling

Groundwater monitoring and sampling were performed in accordance with CDM Smith's Standard Field Procedures manual, Work Plan for Supplemental Site Evaluation, recommendations from the RWQCB dated December 3, 1999, January 25, 2001, November 5, 2002, September 16 and 27, 2004, December 23, 2005, March 2, 2006, and October 10, 2008, and a CDM Smith Site-specific Health and Safety Plan (HSP).

Additionally, as discussed and agreed upon with the RWQCB on May 12, 2003, CDM Smith altered the sampling methods to use low flow purge and sampling techniques ("micro purging"). The low flow purge and sample method consists of groundwater extraction from the wells at a very low flow rate (0.5 to 1.5 liters/minute). The pump intake is set approximately in the middle of the well screen intervals. The wells are purged at the low flow rate until the field parameters (temperature, pH, specific conductivity, turbidity, dissolved oxygen, and ORP [oxidation reduction potential]) have stabilized to within ten percent over a minimum of three readings. Care is also taken to make sure the water level within the well does not drop more than one foot below the stabilized initial water level reading taken before purging began. The sample is then collected directly from the pump discharge at a low flow rate. During the 2016 annual sampling event, an insufficient amount of water was available for pumping in well MW-1, MW-2, MW-9A and MW-10A, therefore grab samples were collected at these locations. MW-11 had insufficient amount of water for sampling therefore, no sample was collected at this location.

Monitoring well construction details are summarized in Table 2-1. Sample handling, chain of custody documentation, equipment decontamination, and quality control sample collection are presented in Appendix A. Sample container descriptions are summarized in Table 2-2.

Section 3
Results

3.1 Groundwater Sampling

The following subsections provide information on water levels/elevations and field screening of groundwater conditions. The field data sheets prepared for water level measurements and monitoring well purging/sampling are presented in Appendix B, and the data collected during the well purging activities is summarized in Table 3-1. The monitoring wells were purged using low flow techniques in order to minimize the amount of purge water generated, minimize mixing of stagnant casing water and formation water, and minimize the potential for communication between the different depth zones.

The following wells were sampled during the 2016 annual sampling event, including five additional wells sampled for WDR monitoring and reporting program (MW-16, MW-18, MW-20, MW-21, and MW-23):

- 50- foot zone wells: MW-1, -2, -9A,-10A,-12A, and -13;
- 80-foot zone wells: MW-15, -16, -18, -20, -22, -36, -38, and -45;
- 100-foot zone wells: MW-19, -21, -23, -27, -28, -40, -47, -52, and -53;
- 150-foot zone wells: MW-43, -49, -55, -61, -62, and -63; and
- 200-foot zone wells: MW-35, -56, and -65.

Well MW-11 was found to be dry during this sampling event.

3.1.1 Groundwater Elevations

Depth-to-groundwater measurements were collected on May 23, 2016. Groundwater elevations were calculated by subtracting the depth to groundwater in each well from the surveyed measuring point elevations (top of polyvinyl chloride [PVC] casing). Groundwater elevation data from the current and previous monitoring events are presented in Table 3-2 and a hydrograph illustrating the groundwater elevations over time is shown in Figure 3-1.

In the shallow 50-foot zone, groundwater elevations ranged from 38.38 (MW-10A) to 46.91 (MW-13) feet above mean sea level (MSL) and were noted to have, on average, decreased by an average of 3.02 feet compared to elevations recorded during June 2015. Based on the current data, the estimated groundwater flow direction across the Site in the shallow 50-foot zone is to the east at a gradient of approximately 0.0099 feet/foot (ft/ft) (Figure 3-2).

In the 80-foot zone, groundwater elevations ranged from 32.5 (MW-22) to 39.72 (MW-25) feet above MSL and were noted to have decreased by an average of 3.00 feet compared to elevations similarly recorded during June 2015. Based on the current data, the estimated groundwater flow direction in

the vicinity of the Site in the 80-foot zone is to the south-southeast at a gradient of approximately 0.0025 ft/ft (Figure 3-3).

In the 100-foot zone, groundwater elevations ranged from 32.75 (MW-52) to 38.06 (MW-51) feet above MSL and were noted to have decreased by an average of 2.71 feet compared to elevations similarly recorded during June 2015. Based on the current data, the estimated groundwater flow direction in the vicinity of the Site in the 100-foot zone is variable with flow vectors ranging from the northeast to the southeast (Figure 3-4). On average the groundwater gradient in the 100-foot zone is on the order of 0.0020 ft/ft. The groundwater elevation data within the 100-foot zone has been variable and appears to indicate the presence of some type of recharge in the vicinity of MW-21, based on the apparent mounding observed. However, it should be noted that the apparent mounding in the vicinity of MW-21, is not evident in the shallower 50-foot or 80-foot zone wells.

In the 150-foot zone, groundwater elevations ranged from 32.72 (MW-63) to 35.66 (MW-30) feet above MSL and were noted to have decreased by an average of 2.42 feet compared to elevations similarly recorded during June 2015. Based on the current data, the estimated groundwater flow direction in the vicinity of the Site in the 150-foot zone is generally south at a gradient of approximately 0.00029 ft/ft (Figure 3-5).

In the 200-foot zone, groundwater elevations ranged from 32.49 (MW-65) to 35.26 (MW-35) feet above MSL and were noted to have decreased by an average of 2.53 feet compared to elevations similarly recorded during June 2015. Based on the current data, the estimated groundwater flow direction in the vicinity of the Site in the 200-foot zone is generally south-southwestward at a gradient of approximately 0.00038 ft/ft (Figure 3-6).

Vertical gradient information was evaluated from data collected from thirteen well groups screened within different depth zones. The predominant trend observed between the 50-, 80-, 100-, and 150_foot depth zones was a downward vertical gradient throughout the monitoring well network. Historically, the trend observed between the 150- and 200-foot depth zones was generally an upward vertical gradient, but since 2010, two of the three well pairs monitored exhibited a downward vertical gradient. The vertical gradient information is summarized as follows:

Well Group	Depth Zones	G.W. Elevation	Net Diff/Gradient
MW-1	50	40.79	
MW-23	100	36.02	-4.77 ↓
MW-2	50	40.99	
MW-15	80	38.28	-2.71 ↓
MW-12A	50	44.78	
MW-20	80	37.57	-7.21↓
MW-21	100	36.89	-0.68↓
MW-31	150	35.20	-1.69↓
MW-13	50	46.91	
MW-25	80	39.72	-7.19↓
MW-27	100	36.57	-3.15↓
MW-24	100	35.50	
MW-30	150	35.66	0.16↑
MW-26	80	37.08	
MW-29	100	35.36	-1.72↓
MW-32	150	35.45	0.09↑
MW-33	80	36.86	
MW-46	100	36.77	-0.09↓
MW-34	150	35.01	-1.76↓
MW-35	200	35.26	0.25↑
MW-36	80	37.85	
MW-37	150	35.06	-2.79↓
MW-38	80	36.03	
MW-39	150	35.02	-1.01↓
MW-42	80	36.60	
MW-49	150	34.59	-2.01↓
MW-53	100	36.98	
MW-43	150	34.84	-2.14↓
MW-54	150	33.92	
MW-56	200	33.31	-0.61↓
MW-55	150	33.45	
MW-57	200	33.89	0.44↑
MW-63	150	32.72	
MW-65	200	32.49	-0.23↓

All wells were re-surveyed in May 2005 and well locations and casing elevations are in State-Plane coordinates (NAVD83) as required by Geotracker per the RWQCB. Newly installed wells MW-9A, 10A, and -12A were surveyed in June 2015.

3.1.2 Electrical Conductance

Electrical conductance measurements recorded from purged groundwater from the on-site and off-site wells ranged between 480 and 3149 micro Siemens per centimeter (µS/cm) (Table 3-1).

3.1.3 Other Physical Parameters

Temperature, pH, oxidation reduction potential (ORP) and turbidity measurements were also recorded in association with well purging (Appendix B). Temperatures measured during purging ranged between 68.4 and 76.3 Fahrenheit (ºF). The pH measurements ranged between 4.24 and 7.79. ORP measurements were recorded between -162 and 164 millivolts (mV). Final turbidity measurements taken immediately prior to sample collection ranged between 3 and 736 nephelometric turbidity units (NTUs) with the exception of MW-9A, MW-13, MW-15, MW-19, and MW-22 with readings of >1000 NTU. It should be noted that grab samples were collected from the wells with high turbidity and four of these wells were previously injected with emulsified vegetable oil [EVO]) solution and bioaugmentation culture during the EAB injection activitiesA summary of the well purging data is presented in Table 3-1.

3.2 Analytical Results of Groundwater Samples

Groundwater samples collected from the Site were submitted to Eurofins Calscience Inc. (Calscience), a State-certified environmental laboratory located in Garden Grove, California, for chemical analysis. The samples were analyzed in accordance with the sampling and analysis plan summarized in Table 3-3.

3.2.1 VOCs

The analytical results indicated that eight chlorinated VOCs were detected in the samples collected from the Site: tetrachloroethene (PCE), trichloroethene (TCE), 1,1-dichloroethene (1,1-DCE), 1,1-dichloroethane (1,1-DCA), 1,2-dichloroethane (1,2-DCA), cis-1,2-dichloroethene (cis-1,2-DCE), trans-1,2-dichloroethene (trans-1,2-DCE), and vinyl chloride (VC).

1,4-dioxane, a common solvent stabilizer (typically associated with 1,1,1-trichloroethane [TCA]), was also detected in several samples collected from the Site. These concentrations are discussed in Section 3.2.3.

A summary of analytical results for chlorinated VOCs and 1,4-dioxane is presented in Table 3-4. The complete analytical results for VOCs are summarized in Tables 3-5 and 3-6, and the laboratory reports are presented in Appendix C. The interpreted distribution of PCE, TCE, cis-1,2-DCE, 1,1-DCE, VC, and 1,4-dioxane concentrations for the 50- foot, 80-foot, 100-foot, and 150-foot-depth zones are illustrated in Figures 3-7 through 3-29. Graphs illustrating PCE and TCE concentrations over time for wells sampled during this sampling event are presented in Appendix D.

50-Foot Zone

PCE was detected in the groundwater samples collected from four 50-foot zone wells at concentrations ranging from 5.4 µg/L (MW-1) to 520 µg/L (MW-10A).

TCE was detected in all groundwater samples collected from four 50-foot zone wells at concentrations ranging from 2.4 µg/L (MW-13) to 240 µg/L (MW-2).

Cis-1,2-DCE was detected in the groundwater samples collected from five 50-foot zone wells at concentrations ranging from 4.5 µg/L (MW-12A) to 310 µg/L (MW-9A).

Trans-1,2-DCE was detected in groundwater samples collected from two 50-foot zone wells at concentrations ranging from 4.8 µg/L (MW-2) to 6.2 µg/L (MW-12A).

1,2-DCA was detected in the groundwater sample from one 50-foot zone well at a concentration of 5.4 µg/L (MW-12A).

VC was detected in the groundwater sample collected from two 50-foot wells at concentrations ranging from 12 µg/L (MW-9A) to 96 µg/L (MW-2).

1,1-DCE and 1, 1-DCA were not detected in the groundwater samples collected from the 50-foot wells.

In general, VOC concentrations in the 50-foot zone decreased when compared to the previous sampling rounds. The most significant decreases in PCE and TCE concentrations were observed in well MW-9A, which was used as the 50-foot zone injection well during the EAB injections conducted between October 12 and November 16, 2015 (CDM Smith, 2016).

80-Foot Zone

PCE was detected in the groundwater samples collected from two 80-foot zone wells at concentrations ranging from 6.5 µg/L (MW-16) to 1,200 µg/L (MW-22).

TCE was detected in groundwater samples collected from six 80-foot zone wells at concentrations ranging from 1.1 µg/L (MW-36) to 280 µg/L (MW-22).

Cis-1,2-DCE was detected in groundwater samples collected from seven 80-foot zone wells at concentrations ranging from 1.4 µg/L (MW-36) to 3,100 µg/L (MW-18).

Trans-1,2-DCE was detected in groundwater samples collected from four 80-foot zone wells at concentrations ranging from 4.4 µg/L (MW-16) to 77 µg/L (MW-18).

1,1-DCA was detected in the groundwater sample from one 80-foot zone well at a concentration of 8 µg/L (MW-38).

1,2-DCA was detected in the groundwater sample from one 80-foot zone well at a concentration of 2.5 µg/L (MW-38).

1,1-DCE was detected in the groundwater sample collected from two 80-foot zone wells at a concentrations ranging between of 23 µg/L (MW-18) and 35 µg/L (MW-38).

VC was detected in groundwater samples collected from five 80-foot zone wells at concentrations ranging from 3.5 µg/L (MW-16) to 120 µg/L (MW-22).

In general, VOC concentrations in the 80-foot zone wells decreased or remained essentially the same when compared to the previous sampling rounds. The most significant decreases in PCE and TCE concentrations were observed in wells MW-15 and MW-22, which were used as the 80-foot zone injection wells during the EAB injections conducted between October 12 and November 16, 2015 (CDM Smith, 2016).

100-Foot Zone

PCE was detected in the groundwater samples collected from one 100-foot well at 1.4 µg/L (MW-23).

TCE was detected in groundwater samples collected from five 100-foot zone wells at concentrations ranging from 1.2 µg/L (MW-53) to 480 µg/L (MW-28).

Cis-1,2-DCE was detected in groundwater samples collected from eight 100-foot zone wells at concentrations ranging from 9.8 µg/L (MW-27) to 9,400 µg/L (MW-28).

Trans-1,2-DCE was detected in groundwater samples collected from eight 100-foot zone wells at concentrations ranging from 1.3 µg/L (MW-27) to 140 µg/L (MW-28).

1,1-DCE was detected in the groundwater samples collected from four 100-foot zone wells at concentrations ranging from 1.5 µg/L (MW-47) to 140 µg/L (MW-28).

1,2-DCA was detected in the groundwater sample from one 100-foot zone well at concentration of 4.0 µg/L (MW-47).

VC was detected in groundwater samples collected from seven 100-foot zone wells at concentrations ranging from 2 µg/L (MW-47) to 320 µg/L (MW-21).

1,1-DCA was not detected in the groundwater samples collected from the 100-foot wells.

In general, VOC concentrations in the 100-foot-zone wells have been variable with some decreasing and some increasing values when compared to the previous sampling rounds. The most significant decreases in PCE and TCE concentrations were observed in well MW-19, which was used as the 100-foot injection well during the EAB injections conducted between October 12 and November 16, 2015 (CDM Smith, 2016).

150-Foot Zone

TCE was detected in six groundwater samples collected from the 150-foot zone wells at concentrations ranging from 2.8 µg/L (MW-63) to 170 µg/L (MW-55).

Cis-1,2-DCE was detected in six groundwater samples collected from the 150-foot zone wells at concentrations ranging from 3.6 µg/L (MW-62) to 1,600 µg/L (MW-49).

Trans-1,2-DCE was detected in groundwater samples collected from five 150-foot zone wells at concentrations ranging from 1.2 µg/L (MW-63) to 110 µg/L (MW-49).

1,1-DCE was detected in the groundwater samples collected from two 150-foot zone wells at concentrations ranging from 4.1 µg/L (MW-61) to 6.4 µg/L (MW-55).

1,1-DCA was detected in the groundwater samples collected from one 150-foot zone wells at a concentration of 1.3 µg/L (MW-61).

VC was detected in six groundwater samples collected from the 150-foot zone wells at concentrations ranging from 0.55 µg/L (MW-62) to 84 µg/L (MW-43).

PCE and 1,2-DCA were not detected in the groundwater samples collected from the 150-foot wells.

In general, VOC concentrations in the 150-foot-zone wells slightly decreased or remained the same when compared to the previous sampling rounds.

200-Foot Zone

No VOCs were detected in the 200-foot-zone wells. These results are consistent with previous monitoring rounds.

3.2.2 Metals

No samples were collected for metals analyses during the 2016 annual groundwater monitoring event. Historically, the primary metal tracked at the Site was hexavalent chromium. However, based on the non-detect results observed over several monitoring rounds, sampling and analysis for hexavalent chromium was discontinued per the LARWQCB in a letter dated October 10, 2008.

3.2.3 1,4-Dioxane

Fourteen of the seventeen n wells sampled during this round contained detectable concentrations of 1,4-dioxane ranging from 1.8 µg/L (MW-15, MW-47, and MW-61 in the 80-foot zone, 100-foot zone and 150 ft zone, respectively) to 26 µg/L (MW-28 in the 100- foot zone.). The analytical results for 1,4-dioxane are summarized in Table 3-6, and the laboratory reports are presented in Appendix C. The distribution of 1,4-dioxane concentrations for the 50- ,80-, 100-, and 150-foot-depth zones are illustrated in Figures 3-12, 3-18, 3-24, and 3-30, respectively.

In general, 1,4-dioxane concentrations were consistent with previous sampling rounds.

3.3 Quality Assurance/Quality Control (QA/QC)

QA/QC measures were employed in the field to maximize sample integrity and quality. Prior to sampling, all sampling equipment was decontaminated to minimize the chance of cross contamination. Additionally, field QA/QC samples were collected and tested to provide quality control checks on the representativeness of the environmental samples collected, the accuracy and precision of sample analyses, and sample handling procedures. The following field QC samples were collected: duplicate groundwater samples, equipment decontamination blanks and trip blanks. Results of the field quality control samples are discussed in the following sections. The results of laboratory QA/QC measures are discussed in Section 3.3.5.

3.3.1 Duplicate Samples

Two duplicate samples were collected during the 2016 annual groundwater sampling event. The duplicate samples were collected from wells MW-12 and MW-43, and submitted to the laboratory with the identifications of MW-12K and MW-43K, respectively. The duplicate samples were analyzed for the same parameters as the original samples. The results of the field duplicate analyses can be used to assess both field and laboratory precision.

Results from the field duplicate pairs were evaluated to calculate the relative percent differences (RPDs) to assess precision. An RPD criterion for field duplicates of 25 percent for results that are greater than five times the laboratory reporting limit (RL) was used to determine if field duplicate results were within acceptable limits.

If results were detected at concentrations less than five times the RL, then the difference between the two results was compared to the criterion of + 2 times the RL. Results were deemed within acceptable limits if the difference was less than two times the RL. All results from the field duplicate analyses demonstrated acceptable precision, except for trans-1,2-DCE in the MW43 field duplicate pair. Therefore, the trans-1,2-DCE results in field duplicate pair for MW43 are qualified as estimated due to field duplicate imprecision.

3.3.2 Equipment Blanks

Equipment blanks (i.e., decontamination rinseate blanks) were collected to evaluate the potential for cross-contamination from sampling equipment. The blanks were prepared in the field by pouring laboratory-provided, purified water through the sampling equipment and into the appropriate sample containers after equipment decontamination. The equipment blanks serve as a check to verify the effectiveness of decontamination procedures. Equipment blanks were collected at a frequency of one each day of field sampling.

Three equipment blanks (EB1, EB2 and EB3) were submitted to the laboratory and analyzed for VOCs. No VOCs were detected in the equipment blanks at concentrations above their respective laboratory r RLs, which demonstrates that cross-contamination from sample equipment did not occur.

3.3.3 Trip Blanks

Trip blanks consisted of organic-free water that is transported from the analytical laboratory to the sampling site, and then returned to the laboratory along with the field samples without having been opened in the field. Trip blanks are used to determine whether sample containers were contaminated during transport to the Site, storage, or transfer from the Site. Trip blanks are labeled in the same manner as all other samples and are analyzed for VOCs. Trip blanks are analyzed at a frequency of one blank each day in which samples are submitted for VOC analyses or one blank for every set of groundwater samples submitted to the laboratory for VOC analysis.

Three trip blanks were submitted for VOC analyses. No VOCs were detected in the blanks at concentrations above their respective laboratory RLs, which demonstrates that cross-contamination during sample transport and storage did not occur.

3.3.4 Performance Evaluation Sample

During this sampling event, one performance evaluation (PE) sample was submitted blind to the laboratory to assess analytical accuracy. Environmental Resource Associates (ERA) provided certified values for the constituents present in the PE sample (MW-8P) that was prepared and provided to CDM Smith. The certification documentation and data are included in Appendix E. The Performance Acceptance Limits (QC PALs) represent a range of values that should be expected from accurate laboratory analysis, with a statistical 95 percent confidence interval. Additional proficiency testing PALs (PT PALs) were provided based on calculations using regression equations and fixed acceptance criteria specified by USEPA or NELAP proficiency testing requirements. All results were within at least one of these two recommended PAL ranges, which demonstrate acceptable laboratory accuracy.

3.3.5 Laboratory QA/QC

All laboratory analytical data were reviewed and evaluated to ensure that they were usable and met the project objectives. USEPA's Contract Laboratory Program National Functional Guidelines for Organic Data Review (USEPA, 2008) were used to assess overall analytical data quality.

Laboratory data were reviewed for inclusion and frequency of the necessary QC supporting information. Supporting QC documentation that was evaluated for each analytical report included the following major items:

- Sample holding times,
- Initial and continuing calibrations,
- Method blanks,
- Matrix spike/matrix spike duplicate (MS/MSD) recoveries,
- RPDs between MS and MSD sample pairs,
- Laboratory control sample (LCS) recoveries, and
- Surrogate spike recoveries.

The review included data generated by Calscience. The number of samples, types of samples, and analytical methods performed by Calscience are summarized as follows:

Analyte	Analytical Method	Number/Type of Samples[1]				
		GW	EB	TB	Dup	PE
VOCs	EPA 8260B	31	3	3	2	1
1,4-dioxane	GC/MS isotope dilution	14	--	--	2	--

[1] Sample Types:
GW – Primary groundwater sample
EB – Equipment blank
TB – Trip blank
Dup – Duplicate groundwater sample
PE – Performance evaluation sample

Additionally, analyses were performed on three new wells for waste discharge requirement reports. Laboratory QA/QC data were reviewed for these additional analyses, but is not presented in this report.

The following sections briefly summarize the findings of the data evaluation.

Holding Times

For water samples, the maximum method holding times for each analytical method are summarized as follows:

Analyte	Analytical Method	Holding Time
VOCs	EPA 8260B	14 days
1,4-dioxane	GC/MS isotope dilution	7 days from sample collection to extraction; 40 days from extraction to analysis

All groundwater samples collected during the May 2016 groundwater monitoring event were analyzed within the specified holding times.

Initial and Continuing Calibrations

As required by Method 8260B for the analysis of VOCs, five system performance check compounds (SPCCs) must meet the following minimum average response factors (RFs):

Chloromethane	0.10
1,1-Dichloroethane	0.10
Bromoform	0.10
Chlorobenzene	0.30
1,1,2,2-Tetrachloroethane	0.30

The average RF for each of the five SPCCs met the minimum calibration criteria listed above.

Additionally, the relative standard deviation (RSD) between the RFs of the initial calibration curve should be less than or equal to 30 percent for six calibration check compounds (CCCs). The six CCCs are 1,1-dichloroethene, chloroform, 1,2-dichloropropane, toluene, ethylbenzene and vinyl chloride. If the RSD of the target analytes is 15 percent or less and less than 30 percent for the six CCCs, then the RF is assumed to be constant over the calibration range and the average RF can be used for quantitation. Also, if average of the responses for all analytes is within 15 percent and therefore the calibration has been verified.

Based on the review, it was determined that all SPCCs and CCCs met the calibration criteria. All criteria for initial calibration were met for all other compounds, except for several analytes that had RSDs of greater than 15 percent. The laboratory allows higher maximum RSD than the method (up to 30 or 50 percent for different compounds), and therefore analytes that were above 15 percent were considered valid. No analytes were above the laboratory RSD limits of 30 or 50 percent for initial calibration.

The %D between the continuing calibration and the initial calibration response factors for each target analyte was within the method criteria of 15 percent for most compounds. For the compounds with a %D above 15 percent, the laboratory allows higher maximum percent differences than the method (either 20 or 50 percent for different compounds), except for 2-chloroethyl vinyl ether and vinyl acetate. Because the continuing calibration RFs were greater than the initial calibration RFs for 2-chloroethyl vinyl ether and vinyl acetate, resulting in the high %Ds, and because these results associated with the continuing calibration were non-detectable, the potentially high bias does not impact the data. Therefore, the data were reported without qualification.

With respect to 1,4-dioxane analyses, the RSD between the RFs over the entire calibration curve for 1,4-dioxane was 5 percent, which meets general criteria (specified in Method 8000) of less than 15 percent. Therefore, the calibration curve for 1,4-dioxane was considered valid. The difference between the continuing calibration verification standard and the initial value for 1,4-dioxane was less than 20 percent, which demonstrates that the initial calibration was valid.

Method Blanks

Method blanks were analyzed at a frequency of one blank per analytical batch for each sample matrix. An analytical batch is defined as a maximum of 20 samples of similar matrix from one project that are analyzed together. The method blank is processed through all procedures, materials, reagents and lab ware used for sample preparation and analysis. No detectable concentrations of target analytes were reported in any of the method blanks at concentrations greater than their respective laboratory limits.

Laboratory Control Samples

LCS, also referred to as blank spikes, are prepared by spiking a known amount of the pure analyte into a method blank, which is then carried along with the samples through the entire sample preparation/analysis sequence. LCS results are used to provide information on the accuracy of the analytical method and on the laboratory's performance. LCS samples were analyzed for VOCs.

All LCS recoveries for target analytes were within the acceptable ranges, except for several LCS recoveries as follows.

Work Order	LCS Number	Analyte	% Recovery	Action
16051774	16051774-2857	1,2,4-Trichlorobenzene	121	Qualify sample MW45-052416 as estimated.
16051774	16051774-2864	1,2,4-Trichlorobenzene	123	None because no detected results are associated with this high LCS recoveries
16051774	16051774-2864	n-Butylbenzene	121	
16051774	16051774-2864	t-1,3-Dichloropropene	124	
16051774	16051774-2864	Tert-Butyl Alcohol (TBA)	121	
16051863	16051863-2864	1,2,4-Trichlorobenzene	123	
16051863	16051863-2864	n-Butylbenzene	121	
16051863	16051863-2864	t-1,3-Dichloropropene	124	
16051863	16051863-2864	Tert-Butyl Alcohol (TBA)	121	
16051863	16051863-2866	1,1,1,2-Tetrachloroethane	131	
16051863	16051863-2866	1,2-Dibromo-3-Chloropropane	125	
16051863	16051863-2866	2,2-Dichloropropane	153	
16051863	16051863-2866	c-1,3-Dichloropropene	123	
16051863	16051863-2866	t-1,3-Dichloropropene	148	
16051863	16051863-2868	2,2-Dichloropropane	122	
16051863	16051863-2868	Carbon Disulfide	131	
16051863	16051863-2868	t-1,3-Dichloropropene	129	
16051957	16051957-2865	1,1,2-Trichloro-1,2,2-Trifluoroethane	127	
16051957	16051957-2865	Bromomethane	122	

Matrix Spike and Matrix Spike Duplicate Samples

MS samples are prepared by adding a known amount of pure analyte to the sample before extraction. MSD samples are prepared from a second aliquot of the sample analyzed as the matrix spike. MS and MSD results are used to assess background and interferences that may have an effect on the sample analyte, and the RPD is used to assess precision between samples of similar type. MS/MSD samples were analyzed at a frequency of one per 20 samples, or one per analytical batch of similar matrix, for all analytical methods.

Based on a review of the laboratory QC summary sheets, all MS and MSD samples were analyzed at the method specified frequency of one per 20 samples. Furthermore, the QC summary sheets also indicate

that the MS and MSD recoveries were within the acceptance limits established by the laboratory, which indicates acceptable accuracy, except for several analytes. Cis-1,2-DCE, tTCE, ethanol, trans-1,3-trichloropropene, 1,1,1,2-tetrachloroethane, acetone, 1,1,2-trichloro-1,2,2-trifluoroethane, bromomethane, t-1,2-dichloroethene, methylene chloride, carbon disulfide, 1,1-dDCE were recovered at levels above the acceptance limits established by the laboratory in at least one MS or MSD samples. 2-Chloroethyl vinyl and vinyl acetate were recovered at levels below the acceptance limits established by the laboratory in at least one MS or MSD samples. Because the corresponding LCS recoveries for these analytes were within acceptable criteria, qualification was not warranted.

Surrogate Spike Samples

Laboratory performance on individual samples is established by means of spiking activities. All samples analyzed for organics are spiked with surrogates just prior to sample purging. Three surrogates were added to each sample during VOC and 1,4-dioxane analyses. Percent recoveries, as well as the acceptable control limits (established by the laboratory), for surrogates were provided for VOC and 1,4-dioxane. Percent recoveries for surrogates spiked during the organic analyses were within the required ranges.

Overall Assessment of Groundwater Sampling Data

Analytical reports and field QC sample results were reviewed and evaluated to assess the overall quality and usability of the data. Several QC deficiencies were noted for high LCS recovery of several analytes and field duplicate imprecision, which required that some project data be qualified as estimated. Although qualified, these data were still deemed usable for the project purposes. The 1,2,4-trichlorobenzene result in sample MW45-052416 is qualified as estimated (flagged with a J) due to a high LCS recovery. The trans-1,2-DCE results in the field duplicate pair for MW43 are qualified as estimated due to field duplicate imprecision.

Section 4
Summary of the Results

4.1 Summary

This section presents a summary of data compiled during the 2016 annual groundwater monitoring and sampling at the Anadite facility in South Gate, California.

- Groundwater elevations were observed to have decreased with respect to the previous monitoring round conducted in June 2015. Groundwater elevations decreased by an average of 3.12 feet within the 50-foot zone wells, 3.00 feet within the 80-foot zone wells, 2.71 feet in the 100-foot-zone wells, 2.44 feet in the 150-foot-zone wells, and 2.53 feet in the 200-foot zone wells. This is consistent with the historical decreasing trend in the groundwater elevations that has been observed in all zones at the Site since 2007.

- The groundwater gradients in the 50-, 80-, 100-, 150-, and 200-foot zones were interpreted to be approximately 0.0099 ft/ft toward the east, 0.00246 ft/ft to the south-southeast, 0.002 ft/ft with variable flow vectors to the northeast and to the southeast, 0.00029 ft/ft to the south, and 0.00038 ft/ft to the south-southwest, respectively.

- Vertical gradient information was evaluated from data collected from thirteen well groups screened within different depth zones. The predominant trend observed between the 50-, 80-, 100-, and 200-foot depths zones was a downward vertical gradient throughout the monitoring well network. Historically, the trend observed between the 150- and 200-foot depth zones was generally an upward vertical gradient, but in the last five annual monitoring rounds two of the three well pairs monitored exhibited a downward vertical gradient.

  - In the 50-foot zone, PCE, TCE, and cis-1,2-DCE were detected at the highest concentration and frequency. In general, VOC concentrations in the 50-foot zone decreased when compared to the previous sampling rounds. The most significant decreases in PCE and TCE concentrations were observed in well MW-9A, which was used as the 50-foot zone injection well during the EAB injections conducted between October 12 and November 16, 2015 (CDM Smith, 2016).
  - In the 80-foot zone, PCE, TCE, cis-1,2-DCE, trans-1,2-DCE, and VC were detected at the highest frequency with cis-1,2-DCE detected at the highest concentration. In general, VOC concentrations in the 80-foot zone wells decreased or remained essentially the same when compared to the previous sampling rounds. The most significant decreases in PCE and TCE concentrations were observed in wells MW-15 and MW-22, which were used as the 80-foot zone injection wells during the EAB injections conducted between October 12 and November 16, 2015 (CDM Smith, 2016).
  - In the 100-foot zone, TCE, cis-1,2-DCE, trans-1,2-DCE, and VC were detected at the highest frequency with cis-1,2-DCE detected at the highest concentration. In general, VOC concentrations in the 80-foot zone wells decreased or remained essentially the same when compared to the previous sampling rounds. most significant decreases in PCE and TCE concentrations were observed in wells MW-15 and MW-22, which were used as the 80-foot zone injection wells during the EAB injections conducted between October 12 and November 16, 2015 (CDM Smith, 2016).

- In the 150-foot-zone, TCE, cis-1,2-DCE, trans-1,2-DCE, and VC were the compounds detected at the highest frequency with cis-1,2-DCE detected at the highest concentration. In general, VOC concentrations in the 150-foot-zone wells slightly decreased or remained the same when compared to the previous sampling rounds.

- No VOCs were detected in the 200-foot-zone wells. These results are consistent with previous monitoring rounds.

- The nature of the VOC contamination exhibits a distinct shift from the 80- to the 100-foot-depth zones, where the primary contaminant (highest frequency and concentration) transitions from PCE to the breakdown products TCE and cis-1,2-DCE, and now to a lesser extent VC, trans-1,2-DCE, and 1,1-DCE. PCE is somewhat limited to the vicinity of the Site with the breakdown products of TCE, cis-1,2-DCE, and VC migrating considerably downgradient from the Site.

- In general, 1,4-dioxane concentrations were consistent with previous sampling rounds.

Table 1-1
Anadite - South Gate
Site History

Investigation Title	Year	Borings/Wells	Results
Report of Findings, Subsurface Soil Investigation for Anadite Inc., Big Line Tank Area Hydrotech, July 30, 1991	1991	B-1 B-2 B-3 B-4 B-5 B-6	• Agency: Los Angeles Department of Public Works (LADPW) • Hydrotech conducted a subsurface investigation during May 1991. Drilled six slant borings (B-1 through B-6) to approximately 40 feet below ground surface (bgs) • Soil samples contained maximum concentrations of total and hexavalent chromium of 2,150 milligrams per kilogram (mg/kg) and 257 mg/kg, respectively. • Report submitted to LADPW on July 30, 1991
United States Environmental Protection Agency (USEPA) Region IX	1993	N/A	• On September 28, 1993, EPA Region IX conducted a waste discharge compliance inspection of the Anadite facility in accordance with Resource Conservation and Recovery Act (RCRA) requirements. • Region IX staff became aware of the soil investigation conducted for DPW and the elevated chromium concentrations detected in subsurface soils. • EPA indicated they considered the property a "high priority" site. • DPW responded by requesting Anadite to further investigate the soil contamination and submit a workplan by June 20, 1994 (CDM, 1994).
Report for Groundwater Investigation Program - Anadite, Inc., South Gate, CA CDM, August 22, 1994	1994	MW-1 MW-2 MW-3	• In June 1994, CDM completed a limited field investigation that included drilling and sampling three hollow-stem auger soil borings (MW-1, MW-2, and MW-3). • Groundwater was determined to be flowing in a southerly direction across the Site. • Total and hexavalent chromium detected at maximum concentrations of 56 and 66 milligrams per liter (mg/L), respectively. • VOCs were reported at maximum concentrations of 1,200 and 6,400 micrograms per liter (µg/L) for trichloroethene (TCE) and tetrachloroethene (PCE), respectively.
Site Evaluation Report - Anadite, Inc., 10647 Garfield Ave, South Gate, CA CDM, July 6, 1998	1998	MW-4 MW-5 MW-6 B-7 B-8	• The investigation included the installation of three additional monitoring wells (MW-4, MW-5, and MW-6), and sampling the six Site monitoring wells (MW-1 through MW-6) to further characterize groundwater quality. • Two wells, MW-3 and MW-5, contained total and hexavalent chromium at concentrations of 42 and 40 mg/L respectively for MW-3 and 55.8 and 43 mg/L, respectively for MW-5. These values are above the Maximum Contaminant Level (MCL) for total chromium. • VOCs, specifically PCE and TCE, were detected in each well at concentrations above their respective MCLs, ranging from 145 to 17,900 µg/L. • Aromatic hydrocarbon compounds were detected at concentrations above 1 µg/L in wells MW-1, MW-2, MW-3 and MW-4.

Table 1-1
Anadite - South Gate
Site History

Investigation Title	Year	Borings/Wells	Results
Supplement Site Assessment Evaluation and Source Elimination Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, June 28, 1999	1999	Installed B-9 through B-12, B-14, B-16 and B-17 VE1/B-13 VE-2/B-15 MW-7 MW-8 MW-9	• Twelve borings were drilled. • Three of the 12 borings were completed as groundwater monitoring wells (MW-7, MW-8, and MW-9). • Two of the 12 borings (Hard Anodizing Building) were converted into vapor extraction wells (VE-1 and VE-2). • Three of the 12 borings(White House Building) were completed as soil gas probes (B-9 through B-11) to monitor soil vapors and evaluate whether the probes could provide useful information on induced soil gas influence/movement. • This report also included the first quarter groundwater monitoring report. • VOCs, specifically PCE and TCE, were detected in each well at concentrations above their respective MCLs, ranging from 115 to 26,400 µg/L and 32.5 to 6,820 µg/L, respectively. • Other chlorinated organic compounds, typically degradation products (e.g., cis-1,2-DCE), were also detected in the wells. • Aromatic hydrocarbon compounds were detected at concentrations above 1 µg/L in wells MW-1, MW-2, MW-7, MW-8, and MW-9.
Quarterly Groundwater Monitoring Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, July 21, 1999	1999	No wells installed. Sampled wells MW-1 through MW-9	• CDM performed the second quarter groundwater monitoring event on April 29 and 30, 1999. • Groundwater elevations declined by an average of 0.1 feet since the previous quarter with an approximate gradient of 0.002 ft/ft to the south. • VOCs exhibited a general decline in concentrations compared to the previous quarter for 1999. • BTEX was detected in groundwater samples collected from the five wells sampled. MTBE was not detected. • Hexavalent chromium was not detected in the groundwater samples analyzed. • Minor concentrations of several metals (primarily copper, barium, molybdenum and zinc) were detected in groundwater samples. None were above their respective soluble threshold limit concentration (STLC), except arsenic in well MW-7 (upgradient well).

Table 1-1
Anadite - South Gate
Site History

Investigation Title	Year	Borings/Wells	Results
Quarterly Groundwater Monitoring Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, October 13, 1999	1999	Installed:MW-10 MW-11 MW-12 MW-13 B-19	• CDM performed the third quarter groundwater monitoring event in July/August, 1999. • Three new off-site wells (MW-10, MW-11, and MW-12) and one on-site well (MW-13) were added during this quarter. • Groundwater elevations declined by an average of 0.21 feet since the previous quarter with an approximate gradient of 0.002 ft/ft to the south. Hydraulic conductivity of the water-bearing soils was calculated between 0.87 and 8.11ft/day where clay and silty sand were present, and was calculated to 25.11 ft/day where well graded sand was present. • VOCs exhibited a general decline in concentrations compared to the previous quarter, except for wells MW-5 and MW-7. • BTEX was not detected in groundwater samples collected from the wells sampled, except for ethlybenzene. MTBE was not detected. • Hexavalent chromium was not detected. • Minor concentrations of several metals (primarily copper, barium, molybdenum and zinc) were detected in groundwater samples. None were above their STLC, except arsenic in well MW-7 (upgradient well).
Quarterly Groundwater Monitoring Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, February 1, 2000	1999	No wells installed. Sampled wells MW-1 through MW-13	• CDM performed the fourth quarter groundwater monitoring event on December 7 through 9, 1999. • Groundwater elevations declined by an average of 0.43 feet since the previous quarter with a gradient of 0.002 ft/ft to the south. • Chlorinated VOCs exhibited a general decline in concentrations in 1999. • BTEX was not detected except for ethlybenzene in MW-11 and MW-12 at concentrations well below the California MCL for drinking water. MTBE was not detected. • Hexavalent chromium was detected in MW-3 and MW-5. Total chromium was detected in wells MW-1 through MW-6. Two samples MW-3 (7.2 mg/L) and MW-5 (3.71 mg/L) were above the MCL of 0.050 mg/L. • Minor concentrations of several metals (primarily copper, barium, molybdenum and zinc) were detected in groundwater samples. • TPH-carbon chain analyses, range C7 to C36, were performed on 13 wells. TPH was detected in samples from three wells, MW-2, MW-5, and MW-9. TPH was reported as C9-C10 (1,060 to 7,360 µg/L) in well MW-2, MW-5, and MW-9 and C8 (1,930 µg/L in well MW-5).
Supplemental CPT Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, April 14, 2000	1999	Advanced and sampled: CPT-1 through CPT-4	• CDM conducted a subsurface soil investigation on December 29 and 30, 1999 to further define the stratigraphy underneath and adjacent to the Site. Four cone penetrometer tests (CPT) were advanced immediately downgradient from wells MW-2, MW-4, MW-7 and MW-11. • Soil samples had detectable concentrations of PCE and TCE ranging from 19 to 2,700 mg/kg and 21 to 1,700 mg/kg, respectively. Minor concentrations of cis-1,2-DCE were detected from 6.9 to 28 mg/kg. • Four soil samples were analyzed for selected metals. None were above their EPA Region 9 Preliminary Remediation Goals (PRGs) except for arsenic.

Table 1-1
Anadite - South Gate
Site History

Investigation Title	Year	Borings/Wells	Results
Quarterly Groundwater Monitoring Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, April 19, 2000	2000	No wells installed. Sampled wells MW-1 through MW-13	• CDM performed the first quarter 2000 groundwater monitoring event on March 6 through 8, 2000. • Groundwater elevations declined by an average of 0.17 feet since the previous quarter with an approximate gradient of 0.002 ft/ft to the south. • VOCs exhibited a general increase in concentrations compared to the previous quarter. • BTEX and MTBE was not detected in groundwater samples collected from the 13 wells sampled. • Hexavalent chromium was detected in wells MW-3 (6.5 mg/L) and MW-5 (3.4 mg/L). • Minor concentrations of several metals (arsenic, antimony, iron, and nickel) were detected in groundwater samples. None were above their MCLs, except arsenic in well MW-7 (upgradient well) and antimony in wells MW-3 and MW-12.
Quarterly Groundwater Monitoring Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, July 13, 2000	2000	No wells installed. Sampled wells MW-1 through MW-13	• CDM performed the second quarter 2000 groundwater monitoring event on June 13 through 15, 2000. • Groundwater elevations declined by an average of 0.39 feet since the previous quarter with an approximate gradient of 0.002 ft/ft to the south. • PCE exhibited a general increase and TCE a general decrease in concentrations compared to the previous quarter. • BTEX and MTBE was not detected in groundwater samples collected from the 13 wells sampled. • Hexavalent chromium was detected in wells MW-3 (2.8 mg/L) and MW-5 (5 mg/L). • Minor concentrations of several metals (arsenic, antimony, iron, and nickel) were detected in groundwater samples. All were below their respective MCLs, except arsenic and antimony.
Vertical Chem-Milling Tank Closure Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, October 2, 2000	2000	Installed MW-14	• 1,400 gallons of sludge were pumped and disposed of from the Vertical Chem Milling tank on May 8, 24, 25, and June 12, 2000. • On June 13, 2000 CDM E&C performed the tank abandonment approved by LACDPW leaving the tank in place. • A new monitoring well (MW-14) was installed on June 20, 2000. • Laboratory results from groundwater samples showed PCE,TCE, 1,1-DCE, 1,2-DCA, cis-1,2-DCE, and TPH carbon chain concentrations detected above there reporting limit. • Soil and water samples were collected from boring B-19. The compounds detected in these samples differed from the sludge samples and seemed closely related to site-wide conditions. CDM recommended that LACDPW approve closure of the tank with no further action.

Table 1-1
Anadite - South Gate
Site History

Investigation Title	Year	Borings/Wells	Results
Quarterly Groundwater Monitoring Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, October 16, 2000	2000	No wells installed. Sampled wells MW-1 through MW-13	• CDM performed the third quarter 2000 groundwater monitoring event on September 12 through 14, 2000. • Groundwater elevations declined by an average of 0.21 feet since the previous quarter with an approximate gradient of 0.002 ft/ft to the south. • PCE and TCE exhibited a general increase in concentrations compared to the previous quarter. • BTEX and MTBE were not detected in groundwater samples collected from the 13 wells sampled. • Hexavalent chromium was detected in wells MW-3 (7.1 mg/L) and MW-5 (20 mg/L). • Minor concentrations of several metals (arsenic, antimony, iron, and nickel) were detected in groundwater samples. All were below their respective MCLs, except arsenic and antimony.
Quarterly Groundwater Monitoring Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, January 18, 2001	2000	No wells installed. Sampled wells MW-1 through MW-13	• CDM performed the fourth quarter 2000 groundwater monitoring event on November 28 through 29, 2000. • Groundwater elevations declined by an average of 0.38 feet since the previous quarter with an approximate gradient of 0.002 ft/ft to the south. • PCE and TCE appear consistent through the last five sampling events. • Benzene and Toluene were detected in MW-5 at concentrations below their respective MCLs. MTBE was not detected in groundwater samples collected from the 13 wells sampled. • Hexavalent chromium was detected in wells MW-3 (2.4 mg/L) and MW-5 (35 mg/L). • Minor concentrations of several metals (arsenic, antimony, iron, and nickel) were detected in groundwater samples. All were below their respective MCLs, except arsenic and iron.
Quarterly Groundwater Monitoring Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, April 15, 2001	2001	No wells installed. Sampled wells MW-1 through MW-14	• CDM performed the first quarter 2001 groundwater monitoring event on February 26 through 28, 2001 and March 16, 2001. • Groundwater elevations declined by an average of 0.46 feet since the previous quarter with an approximate gradient of 0.002 ft/ft to the south. • PCE and TCE appear consistent through the last six sampling events except for wells MW-5 and MW-9. • Benzene and Toluene ,ethlbenzene, total xylenes, and MTBE were not detected in groundwater samples collected from the 14 wells sampled. • Hexavalent chromium was detected in wells MW-6 (0.004 mg/L), MW-3 (0.44 mg/L), and MW-5 (49 mg/L). • Minor concentrations of two metals (arsenic and iron) were detected in groundwater samples. Both were above their respective MCLs.

Site History

Investigation Title	Year	Borings/Wells	Results
Quarterly Groundwater Monitoring Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, July 13, 2001	2001	No wells installed. Sampled wells MW-1 through MW-14	• CDM performed the second quarter 2001 groundwater monitoring event on June 11 and 12, 2001. • Groundwater elevations declined by an average of 0.1 feet since the previous quarter with an approximate gradient of 0.002 ft/ft to the south. • PCE and TCE appear consistent with previous sampling events. • Benzene and Toluene ,ethlbenzene, total xylenes, and MTBE were not detected in groundwater samples collected from the 14 wells sampled. • Hexavalent chromium was detected in wells MW-6 (0.006 mg/L), MW-3 (0.48 mg/L), and MW-5 (37 mg/L). • Minor concentrations of two metals (arsenic and iron) were detected in groundwater samples. Concentrations were slightly above their respective MCLs.
December 2001- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, April 15, 2002	2001	MW-15 OW-1 PZ5-1 PZ5-2	• CDM performed the December 2001 groundwater monitoring event on December 17 and 18, 2001. • Groundwater elevations declined by an average of 0.62 feet since the previous quarter with an approximate gradient of 0.002 ft/ft to the south. • PCE and TCE appear consistent with previous sampling events. • Benzene and Toluene ,ethlbenzene, total xylenes, and MTBE were not detected in groundwater samples collected from the wells sampled. • Hexavalent chromium was detected in wells MW-3 (1.5 mg/L) and MW-5 (17 mg/L). • Minor concentrations of two metals (arsenic and iron) were detected in groundwater samples. Concentrations were slightly above their respective MCLs.
Technical Memorandum and Work Plan to Conduct an Additional "Deep" Groundwater Zone Investigation - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, February 14, 2002	2002	CPT-5 through CPT-12	Summarizes the drilling of eight cone penetrometer test (CPT) borings and multiple depth hydropunch sampling. Results of the hydropunch sampling basis for installing additional "deep" groundwater monitoring wells.
Technical Memorandum and Work Plan to Conduct an Additional "Deep" Groundwater Zone Investigation - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, May 29, 2002	2002	MW-16 through MW-24	Summarizes the drilling, installation, and sampling of nine groundwater monitoring wells in the 80-foot and 100-foot deep groundwater zones. Wells are all offsite and deeper than previous groundwater monitoring wells in order to assess the lateral and vertical extent of VOC concentrations.

Table 1-1
Anadite - South Gate
Site History

Investigation Title	Year	Borings/Wells	Results
June 2002- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, October 21, 2002	2002	Wells MW-1 through MW-24 sampled.	• CDM performed the June 2002 groundwater monitoring event from June 3 through 5, 2002. • Groundwater elevations declined by an average of 0.47 feet since the previous quarter with an approximate gradient of 0.002 ft/ft to the south. • PCE and TCE appear consistent with previous sampling events. • Benzene and Toluene ,ethlbenzene, total xylenes, and MTBE were not detected in groundwater samples collected from the wells sampled. • Total chromium was detected in five of ten wells at concentrations ranging from 0.0305 mg/L (MW-17) to 25.7 mg/L (MW-5). Hexavalent chromium was detected in three of six wells at concentrations ranging from 0.0063 mg/L (MW-6) to 26 mg/L (MW-5). • Minor concentrations of two metals (arsenic and iron) were detected in groundwater samples.
Technical Memorandum and Work Plan to Conduct an Additional "Deep" Groundwater Zone Investigation - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, December 10, 2002	2002	MW-25 through MW-32 installed.	Summarizes the drilling, installation, and sampling of eight groundwater monitoring wells in the 80-foot, 100-foot, and 150-foot deep groundwater zones. Wells are all offsite and were installed and sampled in order to continue to assess the lateral and vertical extent of VOC concentrations.
December 2002- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, April1, 2003	2002	Wells MW-15 through MW-32 sampled.	• CDM performed the December 2002 groundwater monitoring event from December 16-19,and 27, 2002. • Groundwater elevations declined by an average of 1 foot in the 50-foot, 0.93 feet in the 80-foot, and 0.88 feet in the 100-foot zone wells since the previous quarter. Gradients are similar to the last period. • PCE and TCE appear consistent with previous sampling events. The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE and cis-1,2-DCE. • Groundwater was analyzed for 1,4-dioxane from five wells (MW-15 through MW-17, MW-22, and MW-24. Concentrations ranged from 3 to 43 µg/L. • Total chromium was not detected in the two wells (MW-16 and MW-17) sampled.
Technical Memorandum and Work Plan to Conduct an Additional "Deep" Groundwater Zone Investigation - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, June 18, 2003	2003	MW-33 through MW-41 installed.	Summarizes the drilling, installation, and sampling of nine groundwater monitoring wells in the 80-foot, 100-foot, 150-foot, and 200-foot deep groundwater zones. Wells are all offsite and were installed and sampled in order to continue to assess the lateral and vertical extent of VOC concentrations.

Table 1-1
Anadite - South Gate
Site History

Investigation Title	Year	Borings/Wells	Results
May 2003- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, September 12, 2003	2003	Wells MW-1 through MW-41 sampled (except MW-8 and MW-14).	• CDM performed the May 2003 groundwater monitoring event from May 19 through 23, 2003. • Groundwater elevations declined by an average of 0.87 feet in the 50-foot, 0.50 feet in the 80-foot, 0.60 feet in the 100-foot, and 0.48 feet in the 150-foot zone wells since the previous quarter. Gradients are similar to the last period. • PCE and TCE appear consistent with previous sampling events. The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE and cis-1,2-DCE. • Groundwater was analyzed for 1,4-dioxane from 21 of the 39 wells sampled. Concentrations ranged from below the detection limit of 2 µg/L to 90 µg/L (MW-19). • Total chromium was not detected in two of the wells (MW-16 and MW-17) sampled. Total chromium (0.307mg/L, MW-3 and 0.693 mg/L, MW-5) and hexavalent chromium (0.29 mg/L, MW-3 and 0.70 mg/L MW-5) were detected in wells MW-3 and MW-5.
November 2003- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, January 29, 2004	2003	Wells MW-15 through MW-41 sampled.	• CDM performed the November 2003 groundwater monitoring event from November 17 through 20, 2003. • Groundwater elevations declined by an average of 0.65 feet in the 50-foot, 0.48 feet in the 80-foot, 0.40 feet in the 100-foot, and 0.39 feet in the 150-foot zone wells since the previous quarter. Gradients are similar to the last period. • PCE and TCE appear consistent with previous sampling events. The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE and cis-1,2-DCE. • Analytical results indicated that 1,4-dioxane was detected in 14 of 27 wells sampled. Concentrations ranged from below the detection limit of 2 µg/L to 86 µg/L (MW-19). • Total chromium and hexavalent was not detected in the two wells (MW-16 and MW-17) sampled.
Technical Memorandum for the "Deep" Groundwater Zone Investigation - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, April 20, 2004	2004	MW-42 and MW-43 installed.	Summarizes the drilling, installation, and sampling of two groundwater monitoring wells, one in the 80-foot and one in the 150-foot deep groundwater zones, MW-42 and MW-43, respectively. Wells are all offsite and were installed and sampled in order to continue to assess the lateral and vertical extent of VOC concentrations.

Table 1-1

Site History

Investigation Title	Year	Borings/Wells	Results
May 2004- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, January 29, 2004	2004	Wells MW-1 through MW-43 sampled (except MW-8 and MW-14).	• CDM performed the May 2004 groundwater monitoring event from May 24 through 28, 2004. • Groundwater elevations declined by an average of 0.69 feet in the 50-foot, 0.52 feet in the 80-foot, 0.49 feet in the 100-foot, and 0.52 feet in the 150-foot zone wells since the previous quarter. Gradients are similar to the last period. • PCE and TCE appear consistent with previous sampling events. The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE and cis-1,2-DCE. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events. Concentrations ranged from below the detection limit of 2 µg/L to 45 µg/L. • Total chromium was detected in wells MW-3 and MW-5 at concentrations of 0.26 and 0.605 mg/L, respectively. Hexavalent chromium was detected in wells MW-3 and MW-5 at concentrations of 0.029 and 0.53 mg/L, respectively. Total and hexavalent chromium were not detected in wells MW-16 and MW-17, which is consistent with the last four sampling rounds.
November 2004- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, January 27, 2005	2004	Wells MW-15 through MW-43 sampled.	• CDM performed the November 2004 groundwater monitoring event from November 15 through 18, 2004. • Groundwater elevations declined by an average of 0.84 feet in the 50-foot, 0.91 feet in the 80-foot, 1.01 feet in the 100-foot, and 1.01 feet in the 150-foot zone wells since the previous quarter. Gradients are similar to the last period. • PCE and TCE appear consistent with previous sampling events. The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE and cis-1,2-DCE. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events. Concentrations ranged from below the detection limit of 2.3 µg/L to 33 µg/L.
Technical Memorandum for the "Deep" Groundwater Zone Investigation - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, May 12, 2005	2005	MW-44 through MW-52 installed.	Summarizes the drilling, installation, and sampling of nine groundwater monitoring wells, two in the 80-foot, four in the 100-foot zone, and three in the 150-foot deep groundwater zones. Wells are all offsite and were installed and sampled in order to continue to assess the lateral and vertical extent of VOC concentrations.

Table 1-1
Anadite - South Gate
Site History

Investigation Title	Year	Borings/Wells	Results
May 2005- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, July 28, 2005	2005	Wells MW-1 through MW-52 sampled (except MW-8 and MW-14).	• Groundwater elevations increased by an average of 0.32 feet in the 50-foot, 0.69 feet in the 80-foot, 0.62 feet in the 100-foot, and 0.44 feet in the 150-foot zone wells since the previous event (November 2004). Gradients were similar to the last period. • PCE and TCE appear consistent with previous sampling events. The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE and cis-1,2-DCE. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events. Concentrations ranged from below the detection limit of 2 µg/L to 46 µg/L. Concentrations were noted to increase slightly in wells MW-5, MW-28, and MW-40.
November 2005- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, January 26, 2006	2005	Wells MW-15 through MW-52 sampled	• Groundwater elevations increased by an average of 0.46 feet in the 50-foot, 0.96 feet in the 80-foot, 0.98 feet in the 100-foot, and 1.13 feet in the 150-foot zone wells since the previous event (November 2004). Gradients were similar to the last period. • PCE and TCE appear consistent with previous sampling events with the exception of the pilot study wells MW-5, MW-15 and the surrounding observation wells (see the WDR progress reports). The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE, cis-1,2-DCE, and vinyl chloride. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events. Concentrations ranged from below the detection limit of 2 µg/L to 45 µg/L. Concentrations were noted to increase slightly in well MW-28.
Technical Memorandum for the "Deep" Groundwater Zone Investigation - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, July 25, 2006	2006	MW-53 through MW-58 installed.	Summarizes the drilling, installation, and sampling of six groundwater monitoring wells, two in the 100-foot zone, two in the 150-foot zone, and two in the 200-foot deep groundwater zones. Wells are all offsite and were installed and sampled in order to continue to assess the lateral and vertical extent of VOC concentrations.

Table 1-1
Anadite - South Gate
Site History

Investigation Title	Year	Borings/Wells	Results
May 2006- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, July 27, 2006	2006	Wells MW-1 through MW-58 sampled (except MW-8 and MW-14).	• Groundwater elevations increased by an average of 0.81 feet in the 50-foot, 0.87 feet in the 80-foot, 1.11 feet in the 100-foot, and 1.02 feet in the 150-foot zone wells since the previous event (May 2005). Gradients were similar to the last period. • PCE and TCE appear consistent with previous sampling events with the exception of the pilot study wells MW-5, MW-15 and the surrounding observation wells (see the WDR progress reports). The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE, cis-1,2-DCE, and vinyl chloride. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events. Concentrations ranged from below the detection limit of 2 µg/L to 45 µg/L. Concentrations were noted to increase slightly in wells MW-5 and MW-28, and to decreasing in wells MW-15, MW-16, MW-17, MW-19, MW-22, and MW-38.
Final Groundwater Remediation Pilot Study Report and Remedial Action Plan - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, January 26, 2007	2007	Pilot study wells	Summarizes the results of the recent groundwater remediation pilot study conducted at the Site and discusses the procedure to develop, evaluate, and select potential remedial alternatives to address groundwater impacted with contaminants of concern (COCs) and to propose remedial actions for groundwater contamination for the source areas at the Site.
Technical Memorandum for the "Deep" Groundwater Zone Investigation - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, May 18, 2007	2007	MW-59 through MW-61 installed.	Summarizes the drilling, installation, and sampling of three groundwater monitoring wells in the 150-foot zone deep groundwater zones. Wells are all offsite and were installed and sampled in order to continue to assess the downgradient extent of VOC concentrations.
May 2007- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, July 30, 2007	2007	Wells MW-1 through MW-61 sampled (except MW-8 and MW-14).	• Groundwater elevations increased by an average of 0.00 feet in the 50-foot, 0.33 feet in the 80-foot, 0.16 feet in the 100-foot, and 0.24 feet in the 150-foot zone wells since the previous event (May 2006). Gradients were similar to the last period. • PCE and TCE appear consistent with previous sampling events with the exception of the MW-5. The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE, cis-1,2-DCE, and vinyl chloride. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events.
Groundwater Remedial Design and Implementation Plan - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, May 30, 2008	2008	Wells installed to date: MW-1 through MW-65	Report presented to outline plan for Enhanced Anaerobic Bioremediation (EAB) at the site to address contaminants of concern. The purpose of the document was to outline the remedial approach; provide a design basis and rationale for system selection; and describe the major components for the remedial system to be constructed at the Site. Additionally, the document delineated the means to evaluate the system's efficacy in treating groundwater impacted with the contaminants of concern.

Table 1-1
Anadite - South Gate
Site History

Investigation Title	Year	Borings/Wells	Results
May 2008- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, August 27, 2008	2008	Wells MW-1 through MW-61 sampled (except MW-8 and MW-14).	• Groundwater elevations decreased by an average of 1.77 feet in the 50-foot, 1.58 feet in the 80-foot, 1.53 feet in the 100-foot, and 1.49 feet in the 150-foot zone, and 1.45 feet in the 200-foot zones wells since the previous event (May 2007). Gradients were similar to the last period. • PCE and TCE appear consistent with previous sampling events with the exception of the MW-5. The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE, cis-1,2-DCE, and vinyl chloride. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events.
May 2009- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, July 31, 2009	2009	Wells MW-1 through MW-65 sampled (except MW-8, MW-10, MW-14, MW-41, MW-44, MW-45, and MW-51).	• Groundwater elevations decreased by an average of 0.87 feet in the 50-foot, 1.32 feet in the 80-foot, 1.45 feet in the 100-foot, and 1.12 feet in the 150-foot zone, and 1.32 feet in the 200-foot zones wells since the previous event (May 2008). Gradients were similar to the last period. • PCE and TCE appear consistent with previous sampling events with the exception of the MW-5. The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE, cis-1,2-DCE, and vinyl chloride. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events.
May 2010- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, July 30, 2010	2010	Wells MW-1 through MW-65 sampled (except MW-8, MW-10, and MW-14).	• Groundwater elevations decreased by an average of 2.37 feet within the shallow 50-foot zone wells, 2.78 feet in the 80 foot-zone wells, 2.80 feet in the 100-foot-zone wells, 2.86 feet in the 150 foot zone wells, and 2.83 feet in the 200-foot zone wells. Gradients were similar to the last period. •PCE and TCE appear consistent with previous sampling events . The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE, cis-1,2-DCE, and vinyl chloride. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events.
May 2011- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, August 12, 2011	2011	Wells MW-1 through MW-65 sampled (except MW-8, MW-10, MW-14, MW-41, MW-44, MW-45, and MW-51).	• Groundwater elevations, decreased by an average of 1.38 feet (relative to the last monitoring event May 2010) within the shallow 50-foot zone wells, 0.27 feet in the 80 foot-zone wells, 0.44 feet in the 100-foot-zone wells, 0.16 feet in the 150 foot zone wells, and 0.11 feet in the 200-foot zone wells. Gradients were similar to the last period. •PCE and TCE appear consistent with previous sampling events The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE, cis-1,2-DCE, and vinyl chloride. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events.

Table 1-1
Anadite - South Gate
Site History

Investigation Title	Year	Borings/Wells	Results
June 2013- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM Smith, July 31, 2013	2013	In accordance with the modified monitoring program approved by the RWQCB on June 11, 2013, the following wells were sampled during the 2013 annual sampling event: -50- foot zone wells: MW-1, -2, -9, -11, and -13; - 80-foot zone wells: MW-15, -22, -36, -38, and -45; - 100-foot zone wells: MW-19, -27, -28, -47, -52, and -53; - 150-foot zone wells: MW-43, -49, -55, -61, -62, and -63; and -200-foot zone wells: MW-35, -56, and -65. Well MW-12 was found to be dry during this sampling event.	• With the exception of the shallow 50-foot zone (decrease by an average of 0.42 feet), groundwater elevations were observed to have a slight increased with respect to the previous monitoring round conducted in May 2011.Gradients were generally consistent with previous monitoring rounds. •PCE and TCE slightly decreased or remained the same. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events.
Reduced Scale Groundwater Remedial Action Plan and Implementation Plan Former Anadite Facility, South Gate, California CDM Smith, July 31, 2013	2013	selected wells	During a meeting held on May 1, 2013 between the Trust and the LARWQCB, the Trust indicated that the EAB recirculation groundwater remediation system outlined in the approved RAP and RD/IP documents could not be implemented due to limited financial resources. The LARWQCB indicated that some form of reduced-scale groundwater remediation targeting the areas with the highest VOC concentrations would still be required. In a May 20, 2013 letter to the LARWQCB, the Trust proposed to develop and submit a reduced-scale RAP by August 30, 2013. The approach to submit a reduced-scale RAP was approved by the LARWQCB in a letter dated June 11, 2013. The overall reduced-scale remedial approach is to implement enhanced anaerobic bioremediation (EAB) in select areas at the Site and its immediate vicinity that contain the highest or some of the highest concentrations of the COCs by performing focused injections of electron donor(s) and potential bioaugmentation cultures into groundwater with the purpose of reductively dechlorinating chlorinated VOCs to ethene through biological pathways.

Table 1-1
Anadite - South Gate
Site History

Investigation Title	Year	Borings/Wells	Results
July 2014- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM Smith, September 12, 2014	2014	Sampled: 50- foot zone wells: MW-1, -2, -11, and -13; 80-foot zone wells: MW-15, -22, -36, -38, and -45; 100-foot zone wells: MW-19, -27, -28, -47, -52, and -53; 150-foot zone wells: MW-43, -49, -55, -61, -62, and -63; and -D56 200-foot zone wells: MW-35, -56, and -65. Well MW-9 and MW-12 were found to be dry during this sampling event.	• Groundwater elevations decreased by an average of 1.31 feet within the 50-foot zone wells, 2.30 feet within the 80-foot zone wells, 2.54 feet in the 100 foot-zone wells, 2.25 feet in the 150-foot-zone wells, and 2.49 feet in the 200-foot zone wells. Gradients were generally consistent with previous monitoring rounds. •PCE and TCE slightly decreased or remained the same. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events.
July 2015- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM Smith, July 31, 2015	2015	In accordance to RWQCB's letter dated October 14, 2014 three new wells were installed and sampled: MW-9A, MW-10a, and MW-12A. Sampled: 50- foot zone wells: MW-1, -2, 9A, -10A, 12A, and -13; 80-foot zone wells: MW-15, -22, -36, -38, and -45; 100-foot zone wells: MW-19, -27, -28, -47, -52, and -53; 150-foot zone wells: MW-43, -49, -55, -61, -62, and -63; and -D56 200-foot zone wells: MW-35, -56, and -65. Well MW-11 was found to be dry	• Groundwater elevations decreased by an average of 1.66 feet within the 50-foot zone wells, 2.67 feet within the 80-foot zone wells, 2.83 feet in the 100 foot-zone wells, 2.93 feet in the 150-foot-zone wells, and 2.83 feet in the 200-foot zone wells. Gradients were generally consistent with previous monitoring rounds. •PCE and TCE slightly decreased or remained the same. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events.
October/Novever 2015- Waste Discharge Requirements Monitoring Report- Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM Smith, January 15, 2016	2015	EAB Injection: 50-foot zone - MW-9A 80-foot zone - MW-15, -22 100-foot zone - MW-19	Three additional quarterly monitoring events in accordance with the MRP are planned for 2016 to complete the first year of WDR post-injection monitoring and reporting.

Table 1-1
Anadite - South Gate
Site History

Investigation Title	Year	Borings/Wells	Results
February 2016- Waste Discharge Requirements Monitoring Report- Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM Smith, April 15, 2016	2016	Sample: 50-foot zone - MW-10A 80-foot zone - MW-18, -20 100-foot zone - MW-21, -28	As of First Quarter 2016, the three groundwater zones of interest have not been influenced by the implementation of EAB amendment injections with EVO solution and bioaugmentation culture.
July 2016- Waste Discharge Requirements Monitoring Report- Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM Smith, July 15, 2016	2016	Sample: 50-foot zone - MW-1, -2, -9A, -10A, -12A, -13 80-foot zone - MW-15, -16, -18, -20, -22, -36, -38, -45 100-foot zone - MW-19, -21, -23, -27, -28, -40, -47, -52, -53 150-foot zone - MW-43, -49, -55, -61, -62, -63 200-foot zone - MW-35, -56, -57	• Groundwater elevations decreased by an average of 3.12 feet within the 50-foot zone wells, 3.00 feet within the 80-foot zone wells, 2.71 feet in the 100 foot-zone wells, 2.44 feet in the 150-foot-zone wells, and 2.53 feet in the 200-foot zone wells. Gradients were generally consistent with previous monitoring rounds. • The nature of the VOC contamination exhibits a distinct shift from the 80- to the 100-foot-depth zones, where the primary contaminant (highest frequency and concentration) transitions from PCE to the breakdown products TCE and cis 1,2 DCE, and now to a lesser extent VC, trans 1,2 DCE, and 1,1-DCE. PCE is somewhat limited to the vicinity of the Site with the breakdown products of TCE, cis-1,2-DCE, and VC migrating considerably downgradient from the Site. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events.

Notes:
MSL = Mean Sea Level
bgs - below ground surface
[1] - Schedule 40 PVC casing
[2] - notch at the top of PVC casing
[3] - All wells were resurveyed in May 2005. Coordinates will now be State Plane Coordinates (NAD83 datum) as required by GeoTracker.

Table 2-2
Anadite - South Gate
Groundwater Analytical Parameters

Parameter:	Volatile Organic Compounds	1,4-dioxane
Method:	EPA 8260B	GC/MS Isotope dilution
No. of Containers:	5	1
Container Size:	40 ml	500 ml
Container Type:	Clear/Amber Glass Vial	Amber Glass Bottle
Preservative:	HCL	None

Notes:
EPA = Environmental Protection Agency.
ml = milliliter
HCL= Hydrochloric Acid

MW-65	5/26/16	10.5	70.7	7.79	546	3	0.25	-117

Notes:
EC = electrical conductivity, measured in microSiemens per centimeter (µS/cm).
NTU = nephelometric turbidity units.
ORP = oxidation reduction potential, measured in millivolts (mV).
DO = Dissolved Oxygen, measured in milligrams per liter (mg/L).
DRY = Not sampled during this sampling event.

Notes:

Number of detections and percentage of total are based on number of wells sampled for each zone.
50-foot-zone wells include: MW-1, MW-2, MW-9A, MW-10A, MW-12A, and MW-13.
80-foot-zone wells include: MW-15, MW-16, MW-18, MW-20, MW-22, MW-36, MW-38, and MW-45
100-foot-zone wells include: MW-19, MW-21, MW-23, MW-27, MW-28, MW-40, MW-47, MW-52, and MW-53.
150-foot-zone wells include: MW-43, MW-49, MW-55, MW-61, MW-62, and MW-63.
200-foot-zone wells include: MW-35, MW-56, and MW-57.
µg/L= micrograms per liter.
DCA = dichloroethane.
DCE = dichloroethene.
PCE = tetrachloroethene.
TCE = trichloroethene.
VC = vinyl chloride
MCL = Maximum Contaminant Level.
*= California Notification Level
Field duplicate results are not included in this evaluation
Only detected chlorinated VOCs are listed in this table.

Notes:

PCE = Tetrachloroethene; TCE = Trichloroethene; TCA = Trichloroethane; DCE = Dichloroethene; DCA = Dichloroethane; PCA = Tetrachloroethane TCB = Trichlorobenzene; CE = Chloroethane; CFM = Chloroform; MCL = Methylene chloride; DCB = Dichlorobenzene; CBN = Chlorobenzene; VC = Vinyl chloride; FRE = 1,1,2-Trichloro-1,2,2-Trifluoroethane (Freon 113) and 1,2,3-TCP = 1,2,3-Trichloropropane.

California Maximum Contaminant Levels (MCLs) are shown in parenthesis. MCL shown for chloroform is the sum of trihalomethane isomers. A California Notifcation Level is indicated with an asterisk (*).

Samples analyzed by EPA Method 8260.
All concentrations are reported in micrograms per liter (ug/L).
Only compounds detected in one or more samples are listed.
U = Not detected at a concentration greater than the reporting limit shown.
UB = Qualified as a non-detectable concentration due to laboratory contamination.
J = Estimated concentration.
-- = Analyte not analyzed or not reported.

Sample Type:
K = Field Duplicate sample

Notes:

MTBE = Methyl tert-butyl ether; ETBE = Ethyl tert-butyl ether; TBA = Tert-butyl alcohol; TMB = Trimethylbenzene; NAP = Naphthalene; CDS = Carbon disulfide

California Maximum Contaminant Levels (MCLs) are shown in parenthesis. A California Notification Level is indicated with an asterisk (*). MCL for xylenes is for a single isomer or the sum of isomers.

All concentrations are reported in micrograms per liter (ug/L).
U = Not detected at a concentration greater than the reporting limit shown.
J = Estimated concentration.
-- = Analyte not analyzed or not reported.

Sample Type:
K = Field Duplicate sample

Appendix A
Field Activities/Procedures

The following section describes the procedures and equipment used during this groundwater sampling event.

Groundwater Monitoring and Sampling

All groundwater monitoring and sampling activities were performed in accordance with CDM Smith's Standard Field Procedures manual, Work Plan for Supplemental Site Evaluation, recommendations from the RWQCB dated December 3, 1999, January 25, 2001, November 5, 2002, September 16 and 27, 2004, December 23, 2005, March 2, 2006, and October 10, 2008, and a CDM site-specific HSP.

CDM Smith measured the depths to groundwater on May 23, 2016. Groundwater samples were collected from selected 33 monitoring wells. Wells MW-11 was found to be dry. CDM Smith recorded this data in the field logbook and on a form included in Appendix B.

Depth to Groundwater Measurements

CDM Smith measured the depth to groundwater before purging and sampling each groundwater monitoring well. These measurements were taken as a round moving from historically "least impacted" to "most impacted" well, on the first morning of this phase of fieldwork. The measurements were taken using a Solinst™ water level indicator. A mark or notch previously installed on the top, north side of the PVC casing for each well was used as the reference point. Repeated confirmatory water level measurements were obtained from each well by completely removing the water level indicator from the water for approximately one minute before repeating each reading. If two successive readings were the same, then the water level was recorded in the logbook.

Monitoring Well Purging and Sampling

During this sampling period, low flow purge and sampling techniques (“micro purging”) were utilized. The low flow purge and sample method consisted of groundwater extraction from the wells at a very low flow rate (0.5 to 1.5 liters per minute). The pump intake was set approximately in the middle of the well screen intervals. The wells were purged at the low flow rate until the field parameters (temperature, pH, specific conductivity, turbidity, dissolved oxygen, and oxidation reduction potential [Eh]) had stabilized to within 10 percent over a minimum of three readings. Care was also taken to make sure the water level within the wells did not drop more than one foot below the stabilized initial water level reading taken before purging began. The samples were then collected directly from the pump discharge at a low flow rate.

Each well was purged using a decontaminated 1.7 inch-diameter, submersible Grundfos Redi Flo 2™ pump that was powered by a generator. Care was exercised when handling and locating the generator to ensure samples would not be contaminated by fugitive petroleum hydrocarbons from the generator. These precautions included changing gloves after handling the generator and placing the generator downwind from the pump location during operation. The intake of the pump was situated close to the middle of the screened interval. Each well was pumped using low flow purging techniques as described above. Measurements of temperature, pH, specific conductance, turbidity, and Eh were collected and recorded during purging. The field parameter readings were allowed to stabilize to within the following limits:

Parameter	Variance
pH	0.1 pH units
Specific Conductance	± 5%
Temperature	± 5%
Turbidity	± 5% if above 10 NTUs, ± 10% if below 10 NTUs
Eh	± 5%
Dissolved Oxygen	± 5%

Groundwater generated during well purging activities and water generated during equipment decontamination was contained on-site in a 300-gallon poly storage tank and/or 55-gallon steel/poly drums pending proper handling and disposal, following receipt of chemical analyses. The storage tank and/or drums were appropriately labeled with their contents, estimated volume, date and source.

Groundwater samples were collected from monitoring wells in the order of least to highest concentrations of VOCs present in the wells, based on the previous sampling event. Groundwater samples were collected in the order of the analytical parameters' volatility.

Performance Evaluation Samples

Performance evaluation (PE) samples were prepared by Environmental Resource Associates (ERA) for VOCs and hexavalent chromium. A PE sample is more commonly known as a blind standard. ERA provided certified samples with known values for the constituents present in the PE samples. The VOCs were ready for submittal to the laboratory in sealed 40 milliliter (ml) volatile organic analysis vials.

Field Log Book

A permanently bound field log book was used to record all monitoring and sampling activities. The field log book had consecutively numbered pages and was used to record the following:

- Name and address of the company performing the sampling
- Name of the project
- Purpose of sampling
- Name and address of the field contact
- Appearance of the samples
- Number and volume of samples taken
- Description of sampling point and sampling methodology
- Date and time of sample collection
- Type of sample
- Sample identification numbers

- References such as maps or photographs of the sampling site
- Field observations
- Location of the sampling point
- Field measurements made (e.g., organic vapor, water levels, etc.)

Disposal of Investigation-Derived Waste

Purge and decontamination water generated during the sampling event was stored on Site pending transportation to and processing at an appropriate disposal facility.

Eurofins Calscience, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Work Order Narrative

Work Order: 16-05-1774 Page 1 of 1

Condition Upon Receipt:

Samples were received under Chain-of-Custody (COC) on 05/24/16. They were assigned to Work Order 16-05-1774.

Unless otherwise noted on the Sample Receiving forms all samples were received in good condition and within the recommended EPA temperature criteria for the methods noted on the COC. The COC and Sample Receiving Documents are integral elements of the analytical report and are presented at the back of the report.

Holding Times:

All samples were analyzed within prescribed holding times (HT) and/or in accordance with the Calscience Sample Acceptance Policy unless otherwise noted in the analytical report and/or comprehensive case narrative, if required.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

Quality Control:

All quality control parameters (QC) were within established control limits except where noted in the QC summary forms or described further within this report.

Subcontractor Information:

Unless otherwise noted below (or on the subcontract form), no samples were subcontracted.

Additional Comments:

Air - Sorbent-extracted air methods (EPA TO-4A, EPA TO-10, EPA TO-13A, EPA TO-17): Analytical results are converted from mass/sample basis to mass/volume basis using client-supplied air volumes.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are always reported on a wet weight basis.

Glossary of Terms and Qualifiers

Work Order: 16-05-1774 Page 1 of 1

Qualifiers	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to suspected matrix interference. The associated LCS recovery was in control.
4	The MS/MSD RPD was out of control due to suspected matrix interference.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to suspected matrix interference.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
BV	Sample received after holding time expired.
CI	See case narrative.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
JA	Analyte positively identified but quantitation is an estimate.
ME	LCS Recovery Percentage is within Marginal Exceedance (ME) Control Limit range (+/- 4 SD from the mean).
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

A calculated total result (Example: Total Pesticides) is the summation of each component concentration and/or, if "J" flags are reported, estimated concentration. Component concentrations showing not detected (ND) are summed into the calculated total result as zero concentrations.

Eurofins Calscience, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Work Order Narrative

Work Order: 16-05-1863 Page 1 of 1

Condition Upon Receipt:

Samples were received under Chain-of-Custody (COC) on 05/25/16. They were assigned to Work Order 16-05-1863.

Unless otherwise noted on the Sample Receiving forms all samples were received in good condition and within the recommended EPA temperature criteria for the methods noted on the COC. The COC and Sample Receiving Documents are integral elements of the analytical report and are presented at the back of the report.

Holding Times:

All samples were analyzed within prescribed holding times (HT) and/or in accordance with the Calscience Sample Acceptance Policy unless otherwise noted in the analytical report and/or comprehensive case narrative, if required.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

Quality Control:

All quality control parameters (QC) were within established control limits except where noted in the QC summary forms or described further within this report.

Subcontractor Information:

Unless otherwise noted below (or on the subcontract form), no samples were subcontracted.

Additional Comments:

Air - Sorbent-extracted air methods (EPA TO-4A, EPA TO-10, EPA TO-13A, EPA TO-17): Analytical results are converted from mass/sample basis to mass/volume basis using client-supplied air volumes.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are always reported on a wet weight basis.

Glossary of Terms and Qualifiers

Work Order: 16-05-1863 Page 1 of 1

Qualifiers	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to suspected matrix interference. The associated LCS recovery was in control.
4	The MS/MSD RPD was out of control due to suspected matrix interference.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to suspected matrix interference.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
BV	Sample received after holding time expired.
CI	See case narrative.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
JA	Analyte positively identified but quantitation is an estimate.
ME	LCS Recovery Percentage is within Marginal Exceedance (ME) Control Limit range (+/- 4 SD from the mean).
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

A calculated total result (Example: Total Pesticides) is the summation of each component concentration and/or, if "J" flags are reported, estimated concentration. Component concentrations showing not detected (ND) are summed into the calculated total result as zero concentrations.

Eurofins Calscience, Inc. (Calscience) certifies that the test results provided in this report meet all NELAC requirements for parameters for which accreditation is required or available. Any exceptions to NELAC requirements are noted in the case narrative. The original report of subcontracted analyses, if any, is attached to this report. The results in this report are limited to the sample(s) tested and any reproduction thereof must be made in its entirety. The client or recipient of this report is specifically prohibited from making material changes to said report and, to the extent that such changes are made, Calscience is not responsible, legally or otherwise. The client or recipient agrees to indemnify Calscience for any defense to any litigation which may arise.

Work Order Narrative

Work Order: 16-05-1957 Page 1 of 1

Condition Upon Receipt:

Samples were received under Chain-of-Custody (COC) on 05/26/16. They were assigned to Work Order 16-05-1957.

Unless otherwise noted on the Sample Receiving forms all samples were received in good condition and within the recommended EPA temperature criteria for the methods noted on the COC. The COC and Sample Receiving Documents are integral elements of the analytical report and are presented at the back of the report.

Holding Times:

All samples were analyzed within prescribed holding times (HT) and/or in accordance with the Calscience Sample Acceptance Policy unless otherwise noted in the analytical report and/or comprehensive case narrative, if required.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

Quality Control:

All quality control parameters (QC) were within established control limits except where noted in the QC summary forms or described further within this report.

Subcontractor Information:

Unless otherwise noted below (or on the subcontract form), no samples were subcontracted.

Additional Comments:

Air - Sorbent-extracted air methods (EPA TO-4A, EPA TO-10, EPA TO-13A, EPA TO-17): Analytical results are converted from mass/sample basis to mass/volume basis using client-supplied air volumes.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are always reported on a wet weight basis.

Glossary of Terms and Qualifiers

Work Order: 16-05-1957 Page 1 of 1

Qualifiers	Definition
*	See applicable analysis comment.
<	Less than the indicated value.
>	Greater than the indicated value.
1	Surrogate compound recovery was out of control due to a required sample dilution. Therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to suspected matrix interference. The associated LCS recovery was in control.
4	The MS/MSD RPD was out of control due to suspected matrix interference.
5	The PDS/PDSD or PES/PESD associated with this batch of samples was out of control due to suspected matrix interference.
6	Surrogate recovery below the acceptance limit.
7	Surrogate recovery above the acceptance limit.
B	Analyte was present in the associated method blank.
BU	Sample analyzed after holding time expired.
BV	Sample received after holding time expired.
CI	See case narrative.
E	Concentration exceeds the calibration range.
ET	Sample was extracted past end of recommended max. holding time.
HD	The chromatographic pattern was inconsistent with the profile of the reference fuel standard.
HDH	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but heavier hydrocarbons were also present (or detected).
HDL	The sample chromatographic pattern for TPH matches the chromatographic pattern of the specified standard but lighter hydrocarbons were also present (or detected).
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
JA	Analyte positively identified but quantitation is an estimate.
ME	LCS Recovery Percentage is within Marginal Exceedance (ME) Control Limit range (+/- 4 SD from the mean).
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
SG	The sample extract was subjected to Silica Gel treatment prior to analysis.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Solid - Unless otherwise indicated, solid sample data is reported on a wet weight basis, not corrected for % moisture. All QC results are reported on a wet weight basis.

Any parameter identified in 40CFR Part 136.3 Table II that is designated as "analyze immediately" with a holding time of <= 15 minutes (40CFR-136.3 Table II, footnote 4), is considered a "field" test and the reported results will be qualified as being received outside of the stated holding time unless received at the laboratory within 15 minutes of the collection time.

A calculated total result (Example: Total Pesticides) is the summation of each component concentration and/or, if "J" flags are reported, estimated concentration. Component concentrations showing not detected (ND) are summed into the calculated total result as zero concentrations.

SAMPLE ANOMALY REPORT

DATE: 05 / 2 / 2016

SAMPLES, CONTAINERS, AND LABELS:

- ☐ Sample(s) NOT RECEIVED but listed on COC
- ☐ Sample(s) received but NOT LISTED on COC
- ☐ Holding time expired (list client or ECI sample ID and analysis)
- ☑ Insufficient sample amount for requested analysis (list analysis)
- ☐ Improper container(s) used (list analysis)
- ☐ Improper preservative used (list analysis)
- ☐ No preservative noted on COC or label (list analysis and notify lab)
- ☐ Sample container(s) not labeled
- ☐ Client sample label(s) illegible (list container type and analysis)
- ☐ Client sample label(s) do not match COC (comment)
  - ☐ Project information
  - ☐ Client sample ID
  - ☐ Sampling date and/or time
  - ☐ Number of container(s)
  - ☐ Requested analysis
- ☐ Sample container(s) compromised (comment)
  - ☐ Broken
  - ☐ Water present in sample container
- ☐ Air sample container(s) compromised (comment)
  - ☐ Flat
  - ☐ Very low in volume
  - ☐ Leaking (not transferred; duplicate bag submitted)
  - ☐ Leaking (transferred into ECI Tedlar™ bags*)
  - ☐ Leaking (transferred into client's Tedlar™ bags*)

* Transferred at client's request.

Comments

(-2) Received 1 vial w/HCL for 8260 and received 1 vial w/HCL for RSK-175

Appendix E
Performance Evaluation Sample Certification Report

ERA
A Waters Company

Reference Materials

▪ Certificate of Analysis ▪

Product: WatR™ Pollution Volatiles
Catalog Number: 710
Lot No. P249-710
Certificate Issue Date: February 23, 2016
Expiration Date: September 02, 2018
Revision Number: Original

CDM Smith Irvine
ERA Sample ID # 0509-16-02

Reference Materials

▪ Certificate of Analysis ▪

1. The **Certified Values** are the actual "made-to" concentrations confirmed by ERA analytical verification. The certified values are monitored and purchasers will be notified of any significant changes resulting in recertification or withdrawal of this certified reference material during the period of validity of this certificate.

2. The **Uncertainty** is the total propagated uncertainty at the 95% confidence interval. The uncertainty is based on the preparation and internal analytical verification of the product by ERA, multiplied by a coverage factor. The uncertainty applies to the product as supplied and does not take into account any required or optional dilution and/or preparations the laboratory may perform while using this product.

3. The **QC Performance Acceptance Limits (QC PALs™)**are based on actual historical data collected in ERA's Proficiency Testing program. The QC PALs™ reflect any inherent biases in the methods used to establish the limits and closely approximate a 95% confidence interval of the performance that experienced laboratories should achieve using accepted environmental methods. Use the QC PALs™ to realistically evaluate your performance against your peers.

4. The **PT Performance Acceptance Limits (PT PALs™)** are calculated using the regression equations and fixed acceptance criteria specified in the NELAC proficiency testing requirements. Use the PT PALs™ when analyzing this QC standard alongside USEPA and NELAC compliant PT standards. Please note that many PT study acceptance limits are concentration dependent (some non-linearly) and, therefore, the acceptance limits of this QC standard and any PT standard may differ relative to their difference in concentrations.

5. The **PT Data/Traceability** data include the mean value, percent recovery and number of data points reported by the laboratories in our Proficiency Testing study compared to the Certified Values. In addition, where NIST Standard Reference Materials (SRMs) are available, each analyte has been analytically traced to the NIST SRM listed. This product is traceable to the lot numbers of its starting materials. All gravimetric and volumetric measurements related to its manufacture are traceable to NIST through an unbroken chain of comparisons.
Traceability Recovery (%) = [(% recovery certified standard)/(% recovery NIST SRM)]*100
The traceability data shown were compiled by analyzing the ERA standards or their associated stock solutions against the applicable NIST SRMs.

6. For additional information on this product such as intended use, instructions for use, level of homogeneity, and safety information, please refer to the provided Instruction Sheet

If you have any questions or need technical assistance, please call ERA technical assistance at 1-800-372-0122 or send an email to info@eraqc.com.

Anadite South Gate

Comprehensive Site Investigation Work Plan

Prepared for:

Anadite California Restoration Trust

Prepared by:

CDM Smith
46 Discovery, Suite 250
Irvine, California 92618

October 30, 2020

Project No. 2639-251115

Certification

The information contained in the document titled "*Comprehensive Site Investigation Work Plan" for the Anadite South Gate facility, 10647 Garfield Avenue, South Gate, California*," dated October 30, 2020, has received appropriate technical review and approval. The conclusions and recommendations presented represent professional judgments and are based upon findings from the investigations and sampling identified in the document and the interpretation of such data based on our experience and background. This acknowledgement is made in lieu of all warranties, either expressed or implied. The activities outlined in this report will be performed under the supervision of a California Registered Professional Engineer and/or a California Professional Geologist.

I certify that the information contained in or accompanying this submittal is true, accurate, and complete. As to those portions of this submittal for which I cannot personally verify the accuracy; I certify that this submittal and all attachments were prepared at my direction in accordance with procedures designed to assure that qualified personnel properly gathered and evaluated the information submitted.

Section 1
Introduction

CDM Smith Inc. (CDM Smith formerly CDM) has prepared this comprehensive work plan (work plan) to conduct a subsurface investigation on behalf of the Anadite California Restoration Trust (the Trust) to assess the residual contamination in the soil, soil vapor, and groundwater at the former Anadite facility (referred herein as the Site) located at 10647 Garfield Avenue, in the City of South Gate, California.

In January 1998, Los Angeles Regional Water Quality Control Board (LARWQCB) issued a Cleanup and Abatement Order No (CAO), No. 98-004, (File No. 97-019, SLIC No. 541, Site ID No. 2041C00), to the Trust, which required additional investigations and implementation of remedial actions. The CAO directs Anadite to initiate a phased cleanup and abatement program that addresses discharges of contaminants into soil and groundwater from historical land use and former manufacturing operations.

In March 2020, the California State Water Board (State Water Board) issued a Site Cleanup Subaccount Program (SCAP) Grant Agreement NO. SWRCB0000000000D191007500 to the Trust to evaluate source area data gaps, restart the existing soil vapor extraction (SVE) system, conduct focused indoor air assessment onsite and adjacent residential properties, and continue groundwater monitoring at the Site.

The objective of activities described in this work plan is to further characterize the soil, soil vapor, and groundwater impacts within the source area and near the north property boundary bordering residential properties and to provide additional data required for developing enhanced soil and groundwater remedial measures as per the scope outlined in the aforementioned SCAP grant agreement.

1.1 Site Description and Background

The former Anadite South Gate facility is located at 10647 Garfield Avenue, in the City of South Gate, California as shown in **Figure 1-1**. The Site is located approximately 1,600 feet east of the confluence of the Los Angeles and the Rio Hondo River (both are lined drainage channels). The Site is relatively flat with an elevation of approximately 95 feet above mean sea level. Approximately 95 percent of the Site is covered with asphalt or concrete pavement (including building slab floors).

The Anadite facility has been engaged in industrial plating, coating, chemical milling, and hard anodizing at the Site since the early 1950s. Facility infrastructure includes a paint shop, a building that formerly contained aboveground process tanks (Big Line Tanks) used for dipping/treating metal products, storage buildings, and offices related to the metal processing operations as shown in **Figure 1-2**. Over the years, numerous modifications and changes to the facility and operations have occurred. Currently, the majority of the Site operations have been shut down and with only limited ongoing operations.

1.2 Local Geology/Hydrogeology

The Site is located in the Downey Plain within the Central Basin of the Coastal Plain of Los Angeles County. The Site is underlain by approximately 150 feet of Recent alluvium, including the Bellflower aquiclude (clay and sandy clay), and the Gaspur aquifer (sand and gravel with some interbedded clay). The Lakewood and San Pedro formations underlie the Recent alluvium and are important water-bearing deposits in the Los Angeles Basin. The Lakewood formation aquifers consist of the Exposition and the Gage. The San Pedro formation aquifers include the Hollydale, Jefferson, Silverado, and Sunnyside (Hydrotech, 1991).

Based on previous investigations where soil borings were advanced onsite to approximately 200 feet below ground surface (bgs), Site-specific lithology generally consists of the following:

- 0 to 20 to 25 feet bgs: predominantly silt and sandy silt with lesser amounts of silty sand. A few poorly graded sand and clay lenses have been encountered within the upper 20 feet of soil.
- Below 20 to 25 feet bgs, the lithology transitions primarily to silty sand and sand.
- The subsurface lithology below approximately 37 feet and into the saturated zone consists primarily of a coarsening downward sequence of sand and silty sand interbedded with relatively thin layers (less than 5 feet thick) of sandy silt, silt, clayey silt, and silty clay. Note that shallow groundwater beneath the Site previously occurred at approximately 37 to 45 feet bgs, but several years of drought conditions have dropped the groundwater levels substantially. The presence of laterally pervasive fine-grained lithologic layers at depths of approximately 50 and 80 feet bgs have resulted in relatively distinct local groundwater zones. These zones have been designated the 50-foot, 80-foot, and 100-foot zones. The base of the 50- and 80-foot zones is marked by relatively fine-grained layers at those depths.
- The 100-foot zone begins below the 80-foot silt and the base of this zone has not yet been reached in monitoring wells drilled at the Site. However, as the 100-foot zone is presumed to be the Gaspur aquifer, it is expected that the base of the 100-foot zone would occur at approximately 200 feet bgs. There are references to 150- and 200-foot zone wells in later sections of this report. This designation is only to distinguish between potentiometric and/or chemical data collected from wells installed at approximately 150 and 200 feet bgs, from the shallower 100-foot wells. The 100-foot, 150-foot, and 200-foot wells are all considered to be screened within the 100-foot groundwater zone (Gaspur aquifer). The 50-foot zone consists primarily of interbedded sandy silt, silty sand, and fine sand. The 80-foot zone consists primarily of fine to medium sand with lesser amounts of silty sand and sandy silt. The 100-foot zone consists primarily of medium to coarse sand and sandy gravel.

Since 2017, the monitoring wells in the shallow 50-foot zone have been dry due to a declining trend in groundwater elevations observed from 2007 to the present. The groundwater gradients in the 80-, 100-, 150-, and 200-foot zones during the most recent monitoring event in July 2020 were interpreted to be approximately 0.002 foot per foot (ft/ft) toward the southeast, 0.002 ft/ft to the southeast, 0.0003 ft/ft to the south/southeast, and 0.0003 ft/ft to the south, respectively (CDM Smith, 2020). The gradients have been generally consistent over several years of

monitoring. Although some localized upward vertical gradients were observed in the deeper zones, the predominant trend observed was a downward vertical gradient throughout the monitoring well network.

1.3 Previous Investigations and Remedial Measures

Based on the previous investigations conducted at the Site, the primary chemicals of concern are the chlorinated hydrocarbon compounds tetrachloroethene (PCE) and trichloroethene (TCE), and hexavalent chromium (Cr^{6+}). The primary source areas at the Site have been identified as the Big Line Tanks, White House Building, and Hard Anodizing Building (**Figure 1-2**). **Table 1-1** presents an investigation summary for the Site. Refer to previous investigation reports for further details regarding the summaries presented below (CDM Smith, 1999-2006).

1.3.1 Soil

1.3.1.1 Soil Impacts

During soil investigations conducted at the Site, PCE soil-matrix concentrations have been reported up to 18,800 micrograms per kilogram (µg/kg) in boring B-14/VE-2 located in the Hard Anodizing Building; and soil-vapor concentrations have been reporting up to 4,600 parts per million by volume (ppmv) in vapor probe VE-3D located outside the northern portion of the Hard Anodizing Building. TCE concentrations have been reported up to 930 µg/kg in boring VE-9 located outside the western portion of the White House Building; and soil-vapor concentrations have been reporting up to 350 ppmv in vapor probe VP-5D located south of the White House Building (**Figure 1-2**). Cr^{6+} soil-matrix concentrations have been reported up to 250 milligrams per kilogram (mg/kg) in boring B-1 located adjacent to the Big Line Tanks.

1.3.1.2 Soil Remediation

CDM Smith conducted an initial limited SVE pilot test at the Hard Anodizing Building using two SVE well locations (VE-1 and VE-2) on April 15, 1999. The results of this limited pilot test were presented in Section 10 of the Supplemental Site Assessment Evaluation and Source Elimination Report (CDM Smith, 1999). The test results indicated the viability of SVE technology for mass removal of volatile organic compounds (VOCs) in soil; however, it also indicated that additional design parameters were needed from a larger scale SVE pilot system test.

A larger scale SVE pilot system was subsequently installed and operated in accordance with the CDM letter dated August 8, 2000, which was conditionally approved by the LARWQCB in a letter dated August 28, 2000. For this larger scale pilot system, 19 additional extraction wells (eight shallow and 11 deep) were installed at the Site in eight clusters well and three single well locations (VE-3 to VE-13). In addition, 12 soil vapor probes (SVPs) (six shallow and six deep) were installed at the Site at 6 locations (VP-1 to VP-6) for the purpose of monitoring soil vapor removal progress, estimating the zone of influence, and monitoring effectiveness of the SVE system (**Figure 1-2**). The pilot-scale SVE system was configured to operate primarily in two areas of the northern portion of the Site, designated as the west and east sides. The pilot scale system was operated between November 28, 2000 and May 31, 2002, during which time approximately 3,663 pounds (lbs) of VOCs were removed from the subsurface soils at the Site.

On May 29, 2002, CDM requested to continue to operate the pilot-scale SVE system as an interim remedial measure while system modifications were made to convert the pilot-scale system to a full-scale remediation system. CDM proposed this measure to continue to provide beneficial source removal at the Site while a full-scale system was being designed, permitted, and installed. The LARWQCB approved this request in a letter dated June 18, 2002. The pilot-scale system was reactivated on July 2, 2002 and continued to operate on the west side until August 16, 2002. The system was moved back to the east side of the pilot test area and reactivated on August 19, 2002. In accordance with the LARWQCB letter, the system was operated as an interim remedial measure on the east side between August 19 and December 30, 2002. The total mass of VOCs removed from the subsurface soils during the interim remedial measures was approximately 336 lbs.

Full-scale SVE system operations were initiated at the Site on March 21, 2003. In 2004, additional SVPs were installed in six locations (VP-18 through VP-23). Between March 27 and 28, 2006, four additional cluster SVE wells (VE-14 through VE-17) were installed along the northern property boundary. The purpose of the additional SVE well installations was to reduce VOC concentrations in the vadose zone soils beneath the northern portion of the Site and adjacent residential properties. Eleven additional shallow SVPs (VP-24A through VP-28A) were installed on April 3, 2006 (**Figure 1-2**).

In October 2018, when operations were suspended due to financial liquidity issues with Trust. Per LARWQCB's request, shallow vapor monitoring activities were conducted for the selected seven SVPs (VP-16A, VP-18A, VP-24A, VP-25A, VP-26A, VP-27A and VP-28A) in the immediate vicinity of the residential area by the north of the Site. Sampling was conducted initially monthly and then semi-annually (March, May, July and September 2019 and March 2020) while the SVE system was not in operation. SVE operations were resumed in August 2020 and are ongoing, under funding from the State Water Board, and it is estimated that approximately 18,000 lbs of VOCs have been removed from the subsurface soils beneath the Site and its immediate vicinity to the north (residential houses) since 2003.

The details of pilot-system installation, soil sample analytical results, and soil vapor monitoring results were presented in CDM's document titled "Technical Memorandum-Pilot Scale Soil Remediation System Using Vapor Extraction" (CDM Smith, 2001) and quarterly and semiannually progress reports since the startup. The details of the full-scale system installation were presented in CDM's first quarterly progress report dated August 14, 2003. A Site plan showing the SVE infrastructure (extraction wells, vapor probes, piping runs, and treatment compound locations) is presented as **Figure 1-2.** Soil vapor data collected from the SVE wells and vapor monitoring probes (VMPs) since the system startup are included in **Appendix A**. SVE well and associated VMP details are presented in **Table 1-2**. The current soil vapor plume maps for PCE and TCE, the primary contaminants of potential concern (COPCs), at the Site using the most recent data collected from the 5, 10, and 25 feet bgs vapor probes are presented in **Figures 1-3** through **1-8**.

1.3.1.3 Vapor Intrusion Evaluation

In October 2006, CDM completed a vapor intrusion (VI) evaluation to determine the potential risk to adjacent residences from migration of volatile contaminants through the subsurface and release of these contaminants into indoor air. The Site is adjacent to a row of single-story

residential homes on Karmont Avenue/Glady Street. If contaminants migrate off-site and through the foundations of these residential homes, residents may be exposed to these contaminants via inhalation.

The scope of work for the VI evaluation included the following:

- Review of the existing data for soil properties and VOCs in soil gas at and around the Site;
- Conducting a screening risk evaluation of the soil-gas concentrations using the Johnson and Ettinger model for evaluating subsurface VI into indoor air;
- Evaluation of the potential for preferential flow of VOCs along utility lines; and
- Determination of the types of foundations used in residences near the Site.

The results of the risk evaluation, based on inhalation of VOCs in soil gas migrating to indoor air, indicated that the potential cancer risks for off-site residents are on the low end of the United States Environmental Protection Agency (USEPA) acceptable risk range, and non-cancer health hazards for residents are below the threshold of one. Risks and hazards are primarily attributable to exposure to PCE in soil gas. Periodic monitoring of the shallow 5-foot monitoring probes [(VP-24A through VP-28A)] near residential homes adjacent to the Site was recommended to evaluate effectiveness of the boundary SVE wells(CDM Smith, 2007b).

1.3.2 Groundwater

1.3.2.1 Groundwater Impacts

During groundwater investigations conducted at the Site, a total of 71 groundwater monitoring wells have been installed and sampled at the Site. There are 21 wells completed within the 50-foot zone (MW-1 through MW-14, PZ5-1, PZ5-2, OW-1 through OW-4, and EW-1); 13 wells completed within the 80-foot zone (MW 15, MW-16, MW-18, MW-20, MW-22, MW-25, MW-26, MW-33, MW-36, MW-38, MW-42, MW-44, and MW-45); 16 wells completed within the 100-foot zone (MW17, MW 19, MW-21, MW-23, MW-24, MW-27, MW-28, MW-29, MW-40, MW-41, MW-46, MW-47, MW-51, MW-52, MW-53, and MW-58); 18 wells completed within the 150-foot zone (MW-30, MW-31, MW-32, MW-34, MW-37, MW-39, MW-43, MW-48, MW-49, MW-50, MW-54, MW-55, MW-59, MW-60, MW-61, MW-62, MW-63, and MW-64); and three wells completed within the 200-foot zone (MW-35, MW-56, and MW-57) (**Figure 1-9**). The monitoring well construction details are provided in **Table 1-3**.

Several VOCs have been detected in the monitoring wells at the Site and within the Site vicinity, most notably PCE, TCE, 1,1-dichloroethene (1,1-DCE), 1,1-dichloroethane (1,1-DCA), *cis*-1,2-dichloroethene (*cis*-1,2-DCE), *trans*-1,2-dichloroethene (*trans*-1,2 DCE), 1,4-dioxane, vinyl chloride (VC), and Cr^{6+}. The groundwater analytical results for monitoring events through 2020 are presented in **Appendix B** and summarized below.

- PCE concentrations in groundwater have been reported up to 28,000 micrograms per liter (µg/L) in the 50-foot-zone wells (MW-5); up to 34,000 µg/L in the 80-foot-zone wells (MW-15); up to 2,200 µg/L in the 100-foot-zone wells (MW-19); up to 16 µg/L in the 150-foot-zone wells (MW-30); and up to 1.6 µg/L in the 200-foot-zone wells (MW-35).

- TCE concentrations have been reported up to 6,820 µg/L in the 50-foot-zone wells (MW-5); up to 10,000 µg/L in the 80-foot-zone wells (MW-20); up to 14,000 µg/L in the 100-foot-zone wells (MW-17 and MW-19); up to 2,600 µg/L in the 150-foot-zone wells (MW-49); and up to 1.0 µg/L in the 200-foot-zone wells (MW-35).
- 1,1-DCE concentrations have been reported up to 111 µg/L in the 50-foot-zone wells (MW-9); up to 490 µg/L in the 80-foot-zone wells (MW-22); up to 250 µg/L in the 100 foot-zone wells (MW-19); and up to 17 µg/L in the 150-foot-zone wells (MW-49).
- 1,1-DCA concentrations have been reported up to 66 µg/L in the 50-foot-zone wells (MW-2); up to 170 µg/L in the 80-foot-zone wells (MW-22); up to 93 µg/L in the 100 foot-zone wells (MW-19); and up to 6.1 µg/L in the 150-foot-zone wells (MW-32).
- *Cis*-1,2-DCE concentrations have been reported up to 2,600 µg/L in the 50-foot-zone wells (MW-5); up to 11,000 µg/L in the 80-foot-zone wells (MW-18); up to 14,000 µg/L in the 100-foot-zone wells (MW-28); up to 1,800 µg/L in the 150-foot-zone wells (MW-32); and up to 2.8 µg/L in the 200-foot-zone wells (MW-35).
- *Trans*-1,2-DCE concentrations have been reported up to 21 µg/L in the 50-foot-zone wells (MW-10A); up to 230 µg/L in the 80-foot-zone wells (MW-38); up to 200 µg/L in the 100-foot-zone wells (MW-17); and up to 110 µg/L in the 150-foot-zone wells (MW 49).
- VC concentrations have been reported up to 96 µg/L in the 50-foot-zone wells (MW 2); up to 2,400 µg/L in the 80-foot-zone wells (MW-15); up to 720 µg/L in the 100-foot-zone wells (MW-21); up to 170 µg/L in the 150-foot-zone wells (MW-32); and up to 7.9 µg/L in the 200-foot-zone wells (MW-35). Detectable concentrations of VC were generally not found within the monitoring well network prior to implementation of the groundwater remediation pilot studies, indicating the pilot studies have had a positive effect on the breakdown of PCE and TCE into daughter products.
- 1,4-dioxane concentrations have been reported up to 94 µg/L in the 50-foot-zone wells (MW-9); up to 74 µg/L in the 80-foot-zone wells (MW-38); up to 90 µg/L in the 100 foot-zone wells (MW-19); up to 12 µg/L in the 150-foot-zone wells (MW-54); and up to 2.5 µg/L in 200 foot-zone wells (MW-65).

Concentrations in excess of one percent of solubility are generally considered indicative of the presence of dense non-aqueous phase liquid (DNAPL). The solubility of PCE is 150,000 µg/L and one percent of this value is 1,500 µg/L; and the solubility of TCE is 1,100,000 µg/L and one percent of this value is 11,000 µg/L. The PCE concentrations reported in the samples collected from monitoring wells MW-2, MW-5, and MW-6 in the "50-foot zone" and MW-15 and MW-22 in the "80-foot zone" are in excess of one percent of PCE's solubility, therefore there was concern that PCE may have been present as a DNAPL at these depths beneath these areas of the Site. The lateral extent of the DNAPL-indicative concentrations appears to have been assessed. The vertical extent of PCE concentrations indicative of DNAPL appears to have been assessed as the concentrations in the "100-foot zone" were below one percent of PCE's solubility (CDM Smith, 2013).

Although the TCE concentration reported in samples collected from monitoring well MW 17 and MW-19 in the "100-foot zone" have been near one percent of TCE's solubility, it is not expected that there is TCE DNAPL present at this depth. Rather, the elevated TCE concentrations are likely the degradation product of the high dissolved-phase PCE concentrations observed from the 80-foot zone.

The lateral and vertical extent of the elevated dissolved-phase concentrations has been assessed.

In addition to the chlorinated hydrocarbon issues at the Site, elevated concentrations of Cr^{6+} (up to 50 milligrams per liter [mg/L]) had previously been detected in the 50-foot-zone wells at the Site but was limited to the western portion of the Site around wells MW-3, MW-5, and MW-6. However, since 2005 Cr^{6+} has only been detected in MW-3 and MW-6 at relatively low concentrations (up to 0.047 and 0.042 mg/L, respective). As such, Cr^{6+} is no longer considered to represent a groundwater issue at the Site (CDM Smith, 2013).

The groundwater contours for cis-1,2-DCE and TCE, the primary contaminants of concern at the Site, for the 80-, 100-, 150-, and 200-foot zones are presented in **Figures 1-10** through **1-17**.

1.3.2.2 Groundwater Characteristics

Aquifer performance testing activities, including slug tests and pumping tests, have been implemented at the Site in the past in order to determine the hydraulic characteristics for purposes of evaluating Site remediation. The results of the various aquifer performance testing and subsequent evaluation of the data, which are detailed in the 2007 Groundwater RAP (CDM Smith, 2007a) were also summarized below.

In September 1999, slug testing was conducted on selected monitoring wells within the 50-foot zone. The results indicated that the hydraulic conductivity of the water bearing soils in the 50-foot zone ranged from 0.87 to 8.11 feet per day (ft/day) for the clay, silty sand and well graded sand, and approximately 25.11 ft/day for the well graded sand.

In September 2003, an aquifer testing program was implemented at the Site in order to determine the hydraulic characteristics for purposes of evaluating Site remediation. This analysis utilized both pumping tests, where water is removed from a well and water levels are monitored in the test well and at other nearby locations; and slug tests, where a short-term displacement of water occurs and the water level recovery in the well itself is monitored. The changes in water levels over the period of the test provide the basis for evaluating aquifer characteristics by comparing the observed response to an appropriate analytical model. Pumping tests were conducted in the 50-foot (MW-5) and 80-foot (MW-15) zones. No pumping tests were conducted in the 100-foot zone in order to minimize the potential for cross contamination from possible DNAPL in the 80-foot zone. The 100-foot zone was tested using slug tests at MW-17, MW-19, MW-23, and MW-24.

50-foot Zone Pumping Test

The results of Test 1 indicate that the aquifer in this area generally behaves as an unconfined system. The results of the analyses indicate that the transmissivity of the aquifer is about 467 square feet per day (ft^2/day). The storativity of the aquifer was not calculated due to the short duration of pumping. The response at the more distant well (PZ5-2) was ambiguous due to the

short term nature of the test and was not analyzed. Values of hydraulic conductivity can be estimated by dividing transmissivity by the saturated thickness of the aquifer being tested. Based on the lithology of the pumping and observation wells, an effective saturated thickness of seven feet was used to determine the hydraulic conductivity. The results of the analyses indicate that the hydraulic conductivity of the aquifer is about 67 ft/day.

80-foot Zone Pumping Test

The results of Test 2 indicate that the aquifer in this area generally behaves as a semi confined system. The analyses indicate that the transmissivity of the aquifer ranges from about 409 to 540 ft^2/day with a geometric mean of 470 ft^2/day. The storage coefficient was determined to be about 10^{-3}, which is consistent with the semi-confined conditions that were postulated based on the boring logs. Values of hydraulic conductivity based on the saturated thickness of the aquifer, is estimated at about 47 ft/day.

100-foot Zone Slug tests

The results of the slug tests conducted within the 100-foot zone indicated that the hydraulic conductivity ranged from seven to 66 ft/day in these wells, with a geometric mean of 19 ft/day. These values are lower than expected, based on the coarse grained sandy lithology of the screened zone. This may be due to borehole effects from drilling that decrease the permeability, such as development of a mud cake in mud rotary drilled holes

1.3.2.3 Intrinsic Biodegradation Parameters

In 2001, CDM Smith conducted an evaluation of intrinsic contaminant attenuation for the 50-foot zone. A subsequent evaluation was conducted for the 80-, 100-, and 150-foot zone wells in 2003. The purpose of the evaluations was to address key issues regarding the importance of contaminant biotransformation reactions for the Site. Some of the data were compared to historic data to assist in validating anomalous data and for supporting trends in the data sets.

Analysis of 50-foot Zone Wells

Groundwater geochemical parameters (e.g., pH, alkalinity, and dissolved organic carbon [DOC]) generally indicated that groundwater within the 50-foot groundwater zone is conducive to contaminant biotransformation processes.

- Groundwater pH values ranged from 6.51 (MW-11) to 7.17 (MW-12), and fall within the optimal range for biological processes (i.e., six to eight).
- Total alkalinity values (as mg/L $CaCO_3$) ranged from 200 mg/L (MW-2) to 1,200 mg/L (MW 5), with a background value of 360 mg/L (MW-7).
- DOC values were fairly low, ranging from 1.7 mg/L at MW-8 and MW-7 (background) to 3.4 mg/L at monitoring well MW-12 and indicated low availability of electron donors (EDs).

Electron acceptor (EA) and metabolic byproduct data within the 50-foot groundwater zone indicated that groundwater is reduced and likely under nitrate to sulfate reducing conditions.

- Dissolved oxygen (DO) concentrations at the background monitoring well MW-7 (0.16 mg/L) was less than 1.0 mg/L indicating that groundwater migrating into the Site is reduced and under anaerobic conditions.
- Nitrate concentrations were low in the background well MW-7 (0.3 mg/L) and remained below five mg/L at most down-gradient monitoring locations. Low nitrate concentrations indicated that groundwater flowing into the contaminant plume is already reduced beyond the level of denitrification or that nitrate is not a significant component of groundwater in this aquifer.
- The metabolic by-product of ferric iron reduction (ferrous iron) was generally below the detection limit at all monitoring wells. The highest concentration of ferrous iron was 0.02 mg/L in well MW-11.
- Sulfate concentrations were moderate to high throughout the Site, ranging from 20 mg/L (MW-12) to 1,300 mg/L (MW-3) with a background sulfate concentration of 230 mg/L (MW-7).
- Finally, methane concentrations were very low to non-existent with a high of 2.2 µg/L (MW-4) indicating very little, if any, methanogenic activity at the Site. Thus, EA and geochemical metabolic by-product data suggest that groundwater is likely under nitrate reducing to sulfate reducing conditions.

Analysis of 80-, 100-, and 150-foot Zone Wells

Groundwater geochemical parameters in the 80-, 100-, and 150-foot zones (e.g., pH, temperature, alkalinity, DOC, and redox) generally indicate that Site groundwater is conducive to contaminant biotransformation processes.

- Groundwater pH values ranged from 7.27 (MW-19 and MW-24) to 7.80 (MW-35), and fall within the optimal range for biological processes (i.e., six to eight).
- Temperature values in the wells sampled ranged between 20.1 °C (MW-27) and 25.3 °C (MW-26) which are optimal for high metabolic activity.
- Total alkalinity concentrations ranged between 240 mg/L (MW-35) and 620 mg/L (MW-42), which will support a moderate ability to buffer groundwater pH against changes that can inhibit intrinsic biodegradation processes.
- DOC values ranged from 3.2 mg/L (MW-39) to 5.9 mg/L (MW-38 and MW-41), which are fairly low and indicate low availability of EDs.
- Oxidation-reduction potential (ORP) values ranged from -10 millivolts (mV) (MW-43) to -219 mV (MW-35), indicating that a reductive pathway is likely at the Site.

EA and metabolic by-product data indicate that groundwater is reduced and likely under sulfate reducing conditions.

- DO concentrations are less than 1.0 mg/L in all wells sampled, ranging from 0.1 mg/L to 0.7 mg/L (MW-17) indicating that groundwater is reduced and under anaerobic conditions. One exception was well MW-37 which had a DO reading of three, but is probably anomalous due to field error.

- Nitrate and nitrite concentrations are below the reporting limits of 0.1 mg/L in all wells sampled except for one well (MW-20) which was detected at a low concentration of 0.1 mg/L. Low nitrate/nitrite concentrations indicate that groundwater is reduced beyond the level of denitrification or that nitrate is not a significant component of groundwater in this aquifer.

- The metabolic by-product of ferric iron reduction (ferrous iron) is below the reporting limit of 0.1 mg/L in twenty-two of the twenty-nine wells sampled, which may indicate that ferric iron reduction (as well as nitrate reduction) has been depleted and is now in the stage of sulfate reduction. Concentrations in the wells that contained a detectable concentration ranged from 0.19 mg/L (MW-36) to 0.58 mg/L (MW-26) which are fairly low.

- Sulfate concentrations range from 70 mg/L (MW-23) to 900 mg/L (MW 16 and MW-17) and average 310 mg/L which are relatively high. High sulfate concentrations may interfere with some reductive dechlorination reactions (e.g. cis-1,2-DCE to VC). Significant cis-1,2-DCE reduction may not be observed until sulfate concentrations are reduced to very low levels. Elevated sulfate concentrations may also restrict the development of highly reduced methanogenic conditions, which are very conducive to reductive dechlorination.

- Ortho-phosphate is a macronutrient essential for the growth of most microorganisms. Six concentrations of ortho-phosphate were detected (0.15 mg/L for MW-16, 0.12 mg/L for MW-22, 0.11 mg/L for MW-33, 0.31 mg/L for MW-29, and 0.16 mg/L for MW-41). The other twenty-three wells were below the detection limit of 0.10 mg/L.

- Fluoride concentrations ranged from 0.29 mg/L (MW-18) to 2.3 mg/L (MW-16). Bromide concentrations ranged from 0.19 mg/L (MW-19) to 1 mg/L (MW 36 and MW-38). Chloride concentrations ranged from 39 mg/L (MW-23) to 200 mg/L (MW-22). Significant chloride concentrations can interfere with groundwater trace studies using halogenated tracer compounds.

- Methane concentrations are very low with the exception of the 100-foot zone well MW-41 (220 µg/L). Methane concentrations in the other wells range from 1.5 µg/L (MW-42) to 31 µg/L (MW-35). These concentrations indicate very little, if any, methanogenic activity at the Site.

1.3.2.4 Natural Oxidant Demand Testing

Prior to conducting chemical oxidation pilot testing at the Site, an evaluation of the natural oxidant demand of the aquifer materials within the 80-foot zone was conducted. The measurement of the natural oxidant demand is used to estimate the concentration of potassium permanganate ($KMnO_4$) that will be consumed by the natural reducing agents in the soil during a given period. The results of the testing indicated that the Site conditions are favorable for the in situ placement of $KMnO_4$. The soil samples had a low demand for $KMnO_4$ for each test that was

performed. The data showed that TCE and PCE levels can be significantly lowered with $KMnO_4$, without significant interference of the natural oxidant demands of the subsurface soils (CDM Smith, 2007a).

1.3.2.5 Enhanced Anaerobic Bioremediation (EAB) and In Situ Chemical Oxidation (ISCO) Pilot Testing

Groundwater pilot testing was performed at three designated areas including the north-central portion (pilot study #1), the southwestern portion (pilot study #2), and the south-central portion (pilot study #3) at the Site as shown in **Figure 1-18**. EAB was evaluated as part of pilot studies #1 and #2 whereas ISCO followed by EAB was implemented as part of pilot study #3 (CDM Smith, 2006).

Pilot Study #1 – EAB with Passive Injection

For pilot study #1 in the north-central portion of the Site, approximately 43 kilograms (kg) of sodium lactate was injected via passive injection to facilitate microbially-mediated reductive dechlorination of Site contaminants. Specifically, groundwater was extracted from MW-1 into a holding tank and amended with sodium lactate to approximately 5,000 mg/L. Subsequently, the amended groundwater was reinjected back into MW-1 at approximately the same rate as the extraction rate. Pilot study #1 was largely unsuccessful and thus was terminated in 2005.

Pilot Study #2 – EAB with Groundwater Recirculation

Approximately 3,000 kg of sodium lactate and 207 kg of dipotassium phosphate as a buffering reagent were injected to facilitate EAB in the southwestern portion of the Site as part of the pilot study #2 in 2006. Impacted groundwater was extracted from extraction well EW-1, amended with sodium lactate, and reinjected into MW-5. Groundwater monitoring was conducted at the injection well (MW-5), the extraction well (EW-1), one upgradient location (MW-6), and two downgradient locations (PZ5-1 and PZ5-2) to evaluate remedial progress and performance.

Results from this pilot study indicated contaminant mass reduction can be achieved in a relatively rapid manner and with moderate success via EAB technology in this portion of the Site. Specifically, geochemical conditions typical of sulfate reduction and/or methanogenesis, which are conductive to EAB, were attained within months of the initial EAB amendment injections. Development of such highly reducing conditions was accompanied by transformation of parent chlorinated compounds such as PCE and TCE to degradation daughter products including cis-1,2-DCE, VC, and ethene. Note that bioaugmentation was not required to achieved complete dechlorination, indicating that Dehalococcoides was present in sufficient quantity within the indigenous microbial population. For example, in injection well MW-5, PCE concentrations decreased from 3,500 (baseline) to 2.9 µg/L, then increased to 680 µg/L (May 2006), a 81 percent decline; TCE concentrations decreased from 1,200 (baseline) to <1 µg/L then increased to 470 µg/L (May 2006), a 61 percent decline; cis-1,2-DCE concentrations initially increased from <10 µg/L (baseline) to a maximum of 520 µg/L, then decreased to <1 µg/L, and increased again to 2,600 µg/L (May 2006); VC concentrations from <10 µg/L (baseline) to 140 µg/L then decreased to 10 µg/L (May 2006); ethene concentrations increased from 330 (baseline) to 39,000 nanograms per liter (ng/L) then decreased to 250 ng/L (May 2006); methane concentrations increased from 6.3 (baseline) to 15,000 µg/L then decreased to 4.1 µg/L (May 2006); and total chloroethenes in molar concentrations decreased from 31 micromoles per liter (µmoles/L) to 2.3

µmoles/L, an approximate 93 percent reduction in total chloroethenes, then increased to 35 µmoles/L (14% increase).

In extraction well EW-1, PCE concentrations decreased from 8,400 (baseline) to 430 µg/L, an approximate 95 percent decline; TCE concentrations decreased from 2,600 (baseline) to 280 µg/L, an approximate 89 percent decline; cis-1,2-DCE concentrations initially increased from 16 µg/L (baseline) to a maximum of 4,500 µg/L, then decreased to 320 µg/L, then increased again to 3,800 µg/L; VC concentrations have remained at non-detectable levels; ethene concentrations increased from 270 (baseline) to 2,400 ηg/L; methane concentrations increased from 4.7 (baseline) to 12 µg/L; and total chloroethenes, in molar concentrations, decreased from 71 (baseline) to 44 µmoles/L, an approximate 38 percent reduction in total chloroethenes.

The significant decreases in PCE and TCE concentrations, combined with the spikes in cis 1,2-DCE concentrations, increases in VC, ethene, and methane, and reductions in total chloroethenes, indicate that biological degradation of PCE and daughter products was successfully initiated in this portion of the Site via EAB.

Pilot Study #3 – ISCO Followed by EAB

Approximately 15 kg of $KMnO_4$ and 190 kg of sodium lactate were injected into the south-central portion of the Site as part of the Phase 1 and Phase 2 of the pilot study #3, respectively, in 2006. Specifically, during Phase 1, groundwater extracted from MW-15 was amended with permanganate then reinjected. Subsequently, the same groundwater extraction and amendment scheme was performed, but with sodium lactate to facilitate EAB. Performance monitoring was conducted at the injection well (MW-15), one upgradient location (MW-6), and two downgradient locations (OW-3 and OW-4).

Results from this pilot study indicated that complete dechlorination can be achieved via EAB following the initial ISCO injection, at least within the injection well. For example, at injection well MW-15, PCE concentrations decreased from 15,000 (baseline) to below the detection limit of 20 µg/L; TCE concentrations initially increased from 350 (baseline) to 2,800 µg/L, then also decreased to below the detection limit of 20 µg/L; cis-1,2-DCE concentrations initially increased from <25 µg/L (baseline) to a maximum of 11,000 µg/L, then decreased to below the detection limit of 20 µg/L; VC concentrations initially increased from <13 µg/L (baseline) to 4,700 µg/L, then decreased to 2,400 µg/L; ethene concentrations dramatically increased from <5 (baseline) to 920,000 ng/L; methane concentrations increased from 2 (baseline) to 430 µg/L; and total chloroethenes, in molar concentrations, decreased from 93 (baseline) to 33 µmoles/L, an approximate 59 percent reduction in chloroethenes.

In observation well OW-3, PCE concentrations decreased from 20,000 (baseline) to 12,000 µg/L, an approximate 40 percent decline; TCE concentrations decreased from 6,100 (baseline) to 3,200 µg/L, an approximate 48 percent decline; cis-1,2-DCE concentrations increased from 160 (baseline) to 3,200 µg/L; VC concentrations increased from <50 µg/L to 360 µg/L; ethene and methane concentrations all remained relatively stable or increased; and total chloroethenes, in molar concentrations, remained generally consistent with a slight decrease from 170 (baseline) to 140 µmoles/L, an approximate 20 percent reduction in total chloroethenes.

In observation well OW-4, PCE concentrations remained essentially unchanged, decreasing slightly from 15,000 (baseline) to 13,000 µg/L, an approximate 13 percent decline (likely normal sample variation); TCE concentrations decreased from 4,600 (baseline) to 2,600 µg/L, an approximate 37 percent decline; cis-1,2-DCE concentrations had remained at non-detect levels throughout the pilot study until the previous quarter where concentration were detected at 1,100 µg/L (April 2006) and 410 µg/L (May 2006); VC concentrations had remained at non-detect levels throughout the pilot study until May 2006 where detected at 80 µg/L; methane concentrations remained relatively stable; ethene concentrations remained relatively stable until May 2006 where concentrations increased from a baseline of 130 ng/L to 1,300 ng/L; and total chloroethenes, in molar concentrations, remained generally consistent with a slight decrease from 130 (baseline) to 100 µmoles/L, an approximate 18 percent reduction in total chloroethenes.

The measurable decreases in PCE and TCE concentrations, combined with the spikes in cis-1,2-DCE concentrations, increases in VC, ethene, and methane, and reductions in total chloroethenes, particularly within the injection well (MW-15), indicate that biological degradation of PCE and daughter products was successfully initiated at the site. Only partial dechlorination was evident within the observation wells. However, complete dechlorination could have been achieved had a more aggressive injection program coupled with groundwater recirculation for enhanced amendment delivery and distribution within the entire target treatment zone been implemented.

1.3.2.6 Groundwater Remediation

A reduced-scale interim remedial action was performed to address groundwater contamination at the Site in 2015 as per the Reduced-Scale Groundwater Remedial Action Plan and Implementation Plan (submitted to the LARWQCB on November 27, 2013 and approved by the LARWQCB on March 10, 2014). Specifically, the interim action consisted of injecting an emulsified vegetable oil (EVO) solution and bioaugmentation culture into four existing onsite wells (including MW-9A, MW-15, MW-22, and MW-19). Results associated with performance, downgradient, and upgradient monitoring wells are summarized below.

Performance Monitoring Wells

Contaminant concentration, geochemistry, and microbiology results indicate that the 80-foot zone and potentially the 100-foot zone have likely been influenced by the implementation of EAB amendment injections with an EVO solution and bioaugmentation culture and that some changes in geochemical conditions likely attributable to these activities continued to be seen as of Fourth Quarter 2017. It is possible that the 50-foot zone may have been influenced; however, data to prove the impact of the amendment injection could not be collected due to the dry nature of the performance monitoring wells.

Downgradient Monitoring Wells

Contaminant concentration, geochemical, and microbiological results indicated that the downgradient groundwater quality has not been impacted by the EAB amendment injection work performed upgradient, as expected. The changes in VOC concentrations noted in the 80- and 100-foot zone downgradient wells are believed to be the result of changes in overall groundwater quality at the Site and/or due to naturally-occurring biodegradation.

Upgradient Monitoring Wells

Contaminant concentration, geochemical, and microbiological results indicated that the upgradient monitoring wells have not been impacted by the EAB amendment injection work performed downgradient, as expected. Some changes in VOC concentrations observed at some of the wells including the upgradient monitoring wells could be the result of fluctuations in water levels and/or changes in overall groundwater quality at the Site.

Results from this reduced-scope interim remedial action indicate the following:

- EAB could have been more successful at the Site but its performance could not be verified because declining water levels in 50-foot zone rendered EAB performance evaluation impossible at monitoring wells located within the anticipated injection radius of influence (ROI).
- Monitoring wells used as part of the EAB performance monitoring are located too far from the injection points given the site-specific low groundwater velocity. At these locations, very minimal impacts of EAB were observed.
- EAB has been successfully implemented at many sites in Southern California with similar hydrogeological and stratigraphic characteristics by CDM Smith and other firms. Note that EAB is often most successful when implemented in recirculation approach to increase ambient groundwater velocity which significantly enhances amendment distribution in the subsurface and in combination with bioaugmentation.
- No significant changes in contaminant profile and geochemistry were observed in majority of the monitoring wells during the required monitoring period. No adverse changes in geochemical conditions like significant changes in pH levels or metals dissolution were observed in the monitoring wells

1.4 3D Modeling of Soil Vapor and Groundwater Impacts

To better visualize and understand the soil vapor and groundwater impacts at the Site, a three-dimensional (3D) model was developed using Leapfrog Works® software Version 2.1.2 to include the existing database of soil lithology obtained from numerous borehole logs as well as soil vapor and groundwater monitoring data. The model included geographic information system shapefiles of Site features such as topography and existing infrastructure. Visualizations of the current and historical Site features, historical investigation locations, geologic stratigraphy, and nature and extent of COPCs in soil, soil vapor, and groundwater were created. The model was used to visualize the distribution of Site contaminants and to generate cross sections to facilitate placement of characterization points. By overlaying multiple datasets within the model, the current vertical and lateral extent of soil, soil vapor, and groundwater contamination at the Site were visualized. Where applicable, the historical data associated with an investigation location were replaced with the most current dataset to facilitate depiction of the most current conceptual site model (CSM). On the other hand, historical data were used in areas where no current data are available. In essence, the most recently available dataset was used in the development of the 3D model.

The cross-sectional line map for soil vapor is presented in **Figure 1-19**. A-A', B-B', and C-C' soil vapor sectional maps developed via the 3D model for PCE and TCE are shown in **Figures 1-20** to **1-25**. The cross-sectional line map for groundwater is presented in **Figure 1-23**. D-D', E-E', and F-F' groundwater cross sectional maps developed via the 3D model for the two primary groundwater contaminants of concern TCE and cis-1,2-DCE are shown in **Figures 1-27** to **1-32**. Note that while the aforementioned cross sectional figures primarily focused on the source area of the Site to facilitate the proposed source investigation, the 3D model was developed to encompass all data available across the entire Site, including the downgradient areas. Examples of the 3D model representation of the soil vapor plume and the groundwater plume are presented in **Figures 1-33** and **1-34**, respectively.

This page intentionally left blank.

Section 2
Conceptual Site Model

A CSM is presented herein as **Figure 2-1** to provide a general representation of potential exposure scenarios to compounds and/or constituents released from historical activities at the Site. An assessment of exposure pathway consists of the following elements:

- A chemical source and mechanism of release;
- An environmental transport medium for the released chemical;
- A point of potential human exposure with the contaminated medium (medium of concern), and;
- A route of exposure (e.g., inhalation, ingestion, or dermal absorption).

The absence of any one of these elements would result in an incomplete exposure pathway.

2.1 Nature and Extent of Contamination

The primary sources of contamination at the Site were VOCs released to the subsurface during historical site operations in and around the Hard-Anodizing building and the White House building. A list of all VOCs that have been consistently detected in soil vapor samples collected from the Site after fifteen years of SVE system operation and exceed their applicable USEPA and California Department of Toxic Substances Control (DTSC) soil vapor screening levels (SLs) are provided in **Table 2-1.** Based on the maximum concentrations and frequency of exceedances observed to-date, PCE is the primary COPC for soil vapor at the Site. The primary residential and commercial/industrial soil vapor SLs were calculated by adjusting the USEPA Region 9 residential air Regional Screening Levels (RSLs) last updated in May 2020 (USEPA, 2020) and modified based on DTSC Human and Ecological Risk Office (HERO) document HHRA (Human Health Risk Assessment) Note Number: 3, DTSC-modified Screening Levels (DTSC-SLs) which was last updated in June 2020 (DTSC HERO, 2020), with a default attenuation factor of 0.03. The primary contaminants of concern (COCs) in groundwater are PCE, TCE, 1,1-DCE, 1,1-DCA, *cis*-1,2-DCE, *trans*-1,2-DCE, VC, and 1,4-dioxane as shown in **Table 2-2**.

2.2 Contaminant Fate and Transport

A second step in the development of the CSM is to identify environmental transport media for the released contamination. VOCs in soils and groundwater commonly volatilize to soil vapor, which may be released through vapor migration to indoor air as a consequence of pressure differentials and diffusion.

2.3 Potential Exposure Pathways

As described previously, source media at the Site consist of soil, groundwater, and soil vapor. Potential exposure to these media is described in the following paragraphs:

Soil: VOC contamination exists in the vadose zone soils beneath the Site. However, as the Site is entirely paved, direct exposure of current and future commercial/industrial workers to chemicals in soil through ingestion, dermal contact, or inhalation of soil particulates is not a complete exposure pathway. Further, the soil impacts are currently being addressed through the ongoing SVE remediation operations. VOC soil matrix impacts also contribute directly to soil vapor impacts and potential VI, which are discussed below.

Groundwater: VOC contamination exists in the groundwater beneath the Site and has migrated downgradient from the Site. There is no current or planned use of the groundwater for Site operations and/or consumption. Additionally, there are no groundwater production wells threatened by the groundwater impacts originating from the Site (CDM Smith, 2013). Therefore, all direct pathways of exposure to groundwater (i.e., ingestion, dermal exposure, inhalation of VOCs released during domestic use) are incomplete.

Soil Vapor: VOC contamination exists in the soil vapor beneath the Site. VI to indoor air can occur from soil vapor originating from soil impacts or off-gassing of VOC-contaminated groundwater. Although workers in the on-site Buildings are separated from soil vapor by the building slab, and the ongoing SVE operations create vacuum conditions in the subsurface preventing or substantially limiting the potential for VI, there is still a potential for this exposure pathway. Additionally, the potential VI exposure pathway is also present for neighboring houses adjacent to the Site to the north. Potential for VI exposure from off-gassing from the groundwater downgradient from the Site does not appear to be likely based on the depth of the impacted groundwater, therefore this potential pathway is judged to be incomplete.

Therefore, the only potentially complete exposure pathway for the Site COCs and receptors is VI from soil vapor to indoor air for the on-site buildings and the adjacent residences to the north of the Site. The CSM is graphically illustrated as **Figure 2-1** and reflects the above discussion.

2.4 Data Gaps

Based on our review of the most recent and available Site-specific data, the following data gaps were identified:

- Groundwater impacts in areas with the highest residual VOC concentrations in soil vapor and in the vicinity of/between existing monitoring wells where elevated VOC concentrations have been historically observed have not been fully delineated. In addition, the lateral extent of groundwater impacts in the northeastern portion, crossgradient, and downgradient of the Site as well as within and/or in the vicinity of existing Site infrastructures including the White House Building, the Hard Anodizing Building, the Chem Mill Building, and the Big Line Tanks Building has not been fully characterized.
- The vertical and lateral extent of soil and soil vapor impacts near existing probes with elevated VOC soil gas concentrations as well as in the vicinity of Site existing structures including the Big Line Tanks Building and the White House Building have not been fully delineated.
- Potential VI health risks to current and future onsite commercial/industrial workers in the Site buildings and residential buildings to the north are not well understood.

Proposed indoor air and sub slab sampling to address the aforementioned indoor air data gap will be presented in a separate stand-alone work plan, which is due October 30, 2020. The scope and rationale for soil, soil vapor, and groundwater characterization are presented in **Tables 2-3** and **2-4**, and are described in more details in the subsequent sections.

This page intentionally left blank.

Section 3
Field Investigation Program

This section describes the scope of the proposed investigation program to further characterize the soil, soil vapor, and groundwater impacts at the Site. A field sampling and analysis plan including field procedures, standard operating procedures, and associated methodologies used to implement the scope of work is included as **Section 4** of this work plan.

The proposed scope of work will include the following:

- The details regarding the indoor air and sub-slab sampling will be presented in a separate stand-alone work plan and is not discussed further in this work plan.
- Drilling, installation and sampling of 12 SVPs to depths of approximately 45 feet bgs. Vapor probes will be installed at each of the proposed SVP locations at depths of approximately 10, 25, 35, and 45 feet bgs, except for five of the locations that are co-located with existing SVPs that already have vapor probes at 10 and 25 feet bgs. At those locations vapor probes will be installed at depths of approximately 35 and 45 feet bgs. Soil samples will be collected during drilling activities at approximate 5-feet-depth intervals and up to four samples per boring will be selected for chemical analysis based on field observations and photoionization detector (PID) readings. The soil and soil vapor data will be used to further delineate the source areas at the Site to aid in the re-design of the full-scale SVE system. The proposed SVP locations are shown in **Figure 3-1** and the rationale for each of the locations is summarized **Table 2-3**
- Drilling and logging of 15 cone penetration test (CPT)/ membrane interface probe (MIP) borings within the source area at the Site. The high-resolution site characterization (HRSC) tools CPT and MIP will be used to further delineate the source area at the Site to aid in the design of the full-scale groundwater remediation. The CPT/MIP borings will be advanced to of approximately 100 feet bgs. The CPT data will provide a detailed lithologic profile for each of the well locations and the MIP testing data will provide a VOC concentration profile that will identify the depth intervals where the VOCs are distributed and likely being transported. Based on the CPT/MIP results, a limited number of co-located, direct-push borings will be drilled for the collection of up to 25 selected soil samples and up to 25 depth-discrete groundwater samples. The proposed CPT/MIP locations are shown in **Figure 3-2** and the rationale for each of the locations are summarized in **Table 2-4**.

This page intentionally left blank.

Section 4

Field Procedures, Sampling and Analysis Plan

The section presents the methods and procedures that will be used for installation of the SVPs and CPT/MIP borings for the site investigation program described in **Section 3**. In general, the approach to the site investigation will involve the following components:

- Pre-Field and Mobilization Activities;
- Field Investigation;
- Laboratory Analysis;
- Quality Assurance/Quality Control; and
- Data Evaluation and Reporting.

All field work will be performed under the supervision of a California Registered Geologist and/or a Registered Civil Engineer.

4.1 Pre-Field Activities

Pre-field activities for the field work proposed herein will consist of the following activities:

4.1.1. Permitting

On behalf of Anadite, CDM Smith will obtain well permits from the Los Angeles County Department of Environmental Health for conducting the CPT/MIP investigation. A well permit application will be completed and duly signed and stamped by a Professional Civil Engineer or Professional Geologist. The permit application will include well construction details and other details as required.

In addition, encroachment permits will be needed from City of South Gate for drilling CPT/MIP borings in public right of way. Traffic control plans for the work, where necessary will be developed in accordance with the latest edition of Southern California Chapter of the American Public Works Association's (APWA) published Work Area Traffic Control Handbook (WATCH) Manual and implemented by consultants/ contractors specialized in such services.

4.1.2. Health and Safety

The existing site-specific Health and Safety Plan (HASP), which was prepared in accordance with 29 Code of Federal Regulations (CFR) 1910.120 and 8 California Code of Regulations (CCR) 5192 will be updated. The HASP will be available on-site during the field activities for CDM Smith and subcontracted personnel use.

4.1.3. Underground Clearances

Prior to any intrusive work, utility information, including maps of the existing buildings (if on private property and available), will be reviewed and a Site visit will be conducted to locate utilities, mark the SVP and CPT/MIP locations, and determine Site clearing needs for drill rig access. The proposed location will be marked on the ground with white spray paint and Underground Service Alert (USA, also known as Dig Alert) will be notified a minimum of three working days (72 hours) in advance of beginning field work to give utility owners in the area sufficient time to respond and locate existing underground utilities and obstructions. CDM Smith also proposes to utilize the services of utility locating service to detect and delineate underground utilities at the proposed boring locations. A geophysical survey will be conducted to locate underground utilities. The survey will be performed using one or more of ground penetrating radar (GPR), magnetic gradiometer, line tracer, or electromagnetic induction equipment. In addition, each boring/well location will be hand augured to a depth of approximately 5 feet bgs as an additional precaution to identify potential buried utilities in that location that may not have been identified by USA or the geophysical survey

If significant adjustments need to be made to the SVP or CPT/MIP, locations, CDM Smith will provide an updated site plan to the LARWQCB prior to beginning the field work.

4.1.4. Mobilization

Following approval of the Work Plan and obtainment of Site access and utilities clearance, field personnel and equipment will be mobilized to the work areas. All equipment will be delivered to the work area in a clean condition. Mobilization activities include procuring and moving sampling equipment and materials to the work area, as well as health and safety awareness training and site orientation for field personnel.

4.2 SVP Installation and Sampling Procedures

4.2.1 SVP Drilling, Logging, and Installation

The SVPs will be advanced and sampled using the direct push drilling method. All drill rods will be decontaminated prior to and after drilling at each location. One boring will be advanced at each SVP location to a depth of approximately 55 feet bgs, with two to four vapor probes installed in each boring. At new SVP locations, the anticipated vapor probe depths are 10, 25, 35, and 45 feet bgs. At SVP locations that are co-located with existing SVPs that already have probes at 10 and 25 feet bgs, the anticipated vapor probe depths are 35 and 45 feet bgs. Each boring will be continuously sampled using a Macrocore sampler to document the soil profile and collect soil samples for chemical analysis. Individual vapor probe depths may be adjusted slightly depending on lithology.

During drilling operations, an on-site geologist will maintain a lithologic log for each boring to provide information on the nature of the subsurface materials at each location. The Unified Soil Classification System (USCS) will be used to describe sample lithologies and soil type designations. The heading of each boring log will be completed with information regarding on-site CDM Smith or subcontracted personnel, drilling company personnel and equipment, site location, and general boring specifications. The following technical information will be included on each boring log:

- Depth of sample below surface;
- Sample interval;
- Sample type, and identification number; and
- Soil description and classification using the USCS (ASTM D 2484-88).

In addition to the information above, observations regarding drilling rate, equipment operation, and other field conditions encountered while drilling will be recorded in a field logbook.

Soil cores obtained from the borings will be observed for signs of any contamination based on visible staining or discoloration and the presence of unusual odors. The soil cores will also be screened will also be screened in the field for organic vapors at approximately five-foot intervals or more frequent intervals, as appropriate (i.e. where fine-grained materials are encountered). Field headspace screening will be performed using an organic vapor analyzer equipped with a PID. A small amount of soil will be placed inside resealable plastic bags and left to equilibrate for approximately five to ten minutes. The PID probe tip will then be inserted inside each bag and the material screened for organic vapors. Field screening results will be recorded in the field logbook as well as the boring log for the sampling depth where the reading was taken. All drilling, logging, and soil sampling activities will be performed under the supervision of a State of California Professional Geologist.

Based on visual observations and PID readings, up to 40 discrete soil samples from the borings will be collected for laboratory chemical analysis for VOCs in accordance with USEPA Method 8260B. All soil samples submitted for VOC analyses will be collected and preserved using the Encore™ or Terra Core™ sampling systems in accordance with USEPA Method 5035. All the sample containers will then be labeled, logged onto a chain-of-custody form, placed in a plastic Ziploc® bag, and immediately stored in a cooler on ice. The samples will then be sent to the offsite analytical laboratory within 24 hours for the analyses.

Following collection of soil samples at each boring location, Nylaflow™ tubing (1/8-inch diameter) and an airstone filter will be used for probe construction at each depth. The filter will be placed midway within an approximate 6-inch layer of filter pack material (#3 sand). Above the filter pack, a minimum of 6-inches of dry granular bentonite will be added to prevent moisture from infiltrating the filter pack. The borehole will be then backfilled with hydrated bentonite to approximately 3 inches below the shallow probe's depth. The procedure will be repeated for the shallower probe by placing a 6-inch layer of filter pack material, with a second airstone filter located midway, followed by dry granular bentonite (6 inches minimum) above the filter pack. The borehole will be backfilled to the surface using hydrated bentonite. The SVPs will be completed at grade in water-tight, traffic-rated well boxes set in concrete. Well identification numbers will be stenciled onto the exterior of the protective casing.

4.2.2 SVP Soil Vapor Sampling and Analysis

All soil vapor sampling activities will be conducted in accordance with the Advisory for Active Soil Gas Investigations (ASGI Advisory), (DTSC, 2015), including probe construction, shut-in testing, leak testing, tubing blank analysis, and sampling and analytical testing.

Soil vapor samples for the newly installed SVPs will be collected and analyzed for VOCs by USEPA Method 8260 using an on-site mobile laboratory (H&P Mobil Geochemistry). SVPs and sampling collection equipment will be checked for leaks before purging or sampling of SVPs begins. The purpose of such testing is to determine if ambient air is introduced into the soil vapor sample during the collection process. Atmospheric leakage may result from advection through voids in the probe or well packing material or along the borehole sidewall, advection through the soil column, or through fittings in the above-ground sampling train. Leak tests and shut-in tests are conducted to rule out the aforementioned causes and ensure the collection of a representative sample.

Leak tests will be performed following the installation of the newly installed SVPs and prior to the initial sampling to assess possible leakage. Each leak test will be performed by spraying a clean rag with a tracer gas and then applying it to the top of the SVP surface completion. If no leaks are present, the tracer gas will not penetrate the vapor probe and will be undetected in the sample. Various tracer gases are available on the market. Qualities of a preferred tracer gas include: non-toxic, inexpensive, and generally not present in the subsurface at concentrations that might interfere with the test. 1,1-difluoroethane will be utilized as a tracer gas for leak testing of the new SVP installations.

Shut-in tests will also be conducted before each sample collection at every SVP. Shut-in tests are commonly performed to determine the presence of leaks in the above-ground sampling system following complete assembly of all lines, valves and fittings downstream from the top of the probe. During a shut-in test, a pump is used to exert a pressure or vacuum on the sampling train after which all valves are closed and the pressure or vacuum is observed over time. Typically, a target vacuum or pressure level of 100 inches of water column is appropriate. Pressures or vacuums applied to a lesser degree may not adequately stress the sample train and will diminish the resolution of the observations. The detection of a leak is confirmed if the magnitude of pressure or vacuum diminishes over the course of the test. The vacuum gauge used for monitoring should be calibrated and sensitive enough to indicate a pressure change of 0.5 inches of water column. If a leak is detected, all connections should be disconnected and carefully reconnected one at a time until the source of the leak is identified through repeat testing of each connection in turn. After a successful shut-in test, the sampling train will not be altered.

Following the completion of the above tests, a default of three borehole volumes will be purged from each temporary probe and soil gas samples will be collected using a decontaminated glass syringe. Within 30 minutes of collection, samples will be analyzed by the on-Site mobile laboratory.

4.3 CPT/MIP Procedures

To further characterize the subsurface conditions in the source area at the Site, a total of 15 CPT/MIP borings will be advanced to depths of approximately 100 feet bgs. The CPT data will provide a detailed lithologic profile for each of the well locations and the MIP testing data will provide a VOC concentration profile that will identify the depth intervals where the VOCs are distributed and likely being transported. These tools will help to identify the optimum locations and screen intervals for remediation wells and aid in the groundwater remediation system design.

CPT uses an integrated electronic cone system installed in a climate-controlled direct-push rig. The soundings are conducted using a 20 to 30-ton capacity cone with a tip area of at least 15 square centimeters (cm^2) and a friction sleeve area of at least 225 cm^2. The cone is typically designed with an equal end area friction sleeve and a tip end area ratio of 0.80. The cone takes measurements of cone bearing (qc), sleeve friction (fs) and dynamic pore water pressure (*u2)* at typically 5-centimeter (cm) intervals during penetration to provide a nearly continuous hydrogeologic log. CPT data reduction and interpretation is performed in real time facilitating on-site decision making. The above-mentioned parameters are stored on disk for further analysis and reference. All CPT soundings are performed in accordance with revised (2012) ASTM standards (D 5778-12). The cone also contains a porous filter element located directly behind the cone tip. It consists of porous plastic and is 5.0-millimeters (mm) thick. The filter element is used to obtain dynamic pore pressure as the cone is advanced as well as Pore Pressure Dissipation Tests during appropriate pauses in penetration. It should be noted that prior to penetration, the element is fully saturated with silicon oil under vacuum pressure to ensure accurate and fast dissipation. When the soundings are complete, the test holes are grouted using a support rig. The grouting procedure consists of pushing a hollow CPT rod with a "knock out" plug to the termination depth of the test hole. Grout is then pumped under pressure as the tremie pipe is pulled from the hole.

The MIP probe is comprised of a hydrophobic, semi-permeable membrane located immediately above the cone penetrometer. Due to this reason, there may be a one foot to three-foot difference in the total depth of data recorded by sensors on both CPT and MIP tools (e.g., if the total depth of the CPT boring is 50 feet bgs, MIP data may only be available between 47 and 49 feet bgs). This membrane is surrounded and inset in a heater block. During the test, the heater block is used to maintain a constant temperature greater than 100 °C around the membrane. This heat volatilizes VOCs near the membrane and creates a pressure gradient that causes the VOCs to diffuse across the membrane. Once across the membrane, the VOCs are "swept" by an inert carrier gas to a series of chemical detectors located in the CPT rig. The detectors typically used are the flame ionization detector (FID), PID, electron capture detector (ECD), and/or a halogen-specific detector (XSD). These detectors are selected because they identify a wide range of VOCs including but not limited to petroleum hydrocarbons (benzene, toluene, ethylbenzene, and xylene), chlorinated hydrocarbons (TCE, PCE, VC) and aliphatics (methane). The combined CPT/MIP plot shows soil lithology and chemical detector responses versus depth.

Based on the data obtained from the CPT/MIP borings, direct-push borings will be advanced at selected locations adjacent to the borings with the highest VOC readings from the MIPs profiles. In each of the direct-push borings, discrete-depth soil and/or HydroPunch groundwater samples will be collected from depths corresponding to the VOC spikes identified from the MIPs and submitted for chemical analyses. Up to 25 total soil samples and 25 total discrete-depth-HydroPunch groundwater samples will be collected for VOC analyses in accordance with USEPA Method No. 8260B. All soil samples submitted for VOC analyses will be collected and preserved using the Encore™ or Terra Core™ sampling systems in accordance with USEPA Method 5035. All the sample containers will then be labeled, logged onto a chain-of-custody form, placed in a plastic Ziploc® bag, and immediately stored in a cooler on ice. The samples will then be transferred to the analytical laboratory within 24 hours for the analyses. Chain-of-custody forms

will be maintained throughout sample collection and transport. All samples will be analyzed with a standard turnaround time of approximately 7 to 10 working days.

Upon completion, the direct-push borings will be grouted with cement/bentonite grout tremied from the bottom up and capped at the ground survey with concrete. Data obtained from the CPT/MIP investigation along with depth-discrete soil and groundwater sampling will be used to update the 3D model and develop plans for the full scale remedies.

4.4 Equipment Decontamination Procedures

All reusable field equipment used to collect and handle samples or collect field measurements will be decontaminated before coming into contact with any sample. Reusable sample collection (sampling pump, cables, etc.) and field measurement equipment (water level meter, water quality field parameter sensors, etc.) will be decontaminated before first use and between each sample in accordance with the attached USEPA Region 9 standard operating procedures for low flow sampling. All used sample tubing will be disposed as investigation-derived waste (IDW).

All equipment used for drilling operations will also be decontaminated before first use and between use at each boring location. Sample collection equipment will be decontaminated before first use and between each sample. Decontamination of heavy equipment such as drill rigs and casings will consist of a thorough cleaning using a high-pressure steam cleaner, and potable water. Portable decontamination areas will be established for cleaning equipment between sample locations. General decontamination procedures for sampling equipment are as follows:

- Ample amounts of tap water with a detergent (Alconox™) and a stiff brush will be used to wash reusable sampling equipment, which will be rinsed thoroughly with tap water, checked for any residual dirt, and rewashed if necessary.
- The item will be rinsed twice with tap water, followed by a final deionized water rinse.
- The item will be allowed to air dry and will be covered or wrapped in plastic, if not immediately used.
- Large items (i.e., casing, drill pipe, augers, drill bits, etc.) will be steam cleaned and placed on clean polyethylene sheeting and allowed to air dry.

All equipment decontamination procedures and events will be recorded in the field logbook. All liquids generated from decontamination procedures will be contained in 55-gallon drums temporarily staged near the boring/well location during working hours and then moved to the Site at the end of each day where they may remain in 55-gallon drums or be transferred to appropriate storage tanks pending profiling and subsequent disposal.

4.5 Containment and Disposal of Investigation-Derived Waste

IDW generated during these field activities generally includes: drill cuttings, decontamination fluids, any used personal protective equipment (PPE), debris (e.g., empty cement bags, etc.), and miscellaneous disposable sampling equipment. All drill cuttings and decontamination fluids will

be assumed to be hazardous waste and labeled as such until the analytical results prove otherwise.

Drums and/or other containers (i.e., roll off bins, Baker tanks, as appropriate) containing soil cuttings and decontamination water will be temporarily staged near the boring/well location during working hours or at another secure location depending on the boring/well location and then moved to a designated area at the Site at the end of each day where they may remain in 55-gallon drums or be transferred to appropriate storage tanks. All drums and/or other containers will be clearly labeled with a pre-printed, unclassified materials label. The label will state that the unclassified materials are being held pending evaluation of laboratory analyses. The label will also note the generator, date, materials stored, origin of materials and the contact person. Once analytical data are received, and the waste profiling is completed the containers will be transported for off-site disposal as directed by Anadite.

Used PPE including gloves, Tyvek suits, respirator cartridges, and disposable filters, and other miscellaneous items will be double-bagged using plastic trash bags and then disposed of as solid waste. Items such as empty cement bags and wrapping materials will be placed directly into solid waste dumpsters. Items that appear to be contaminated with hazardous materials or wastes will be inserted into plastic bags and placed inside 55-gallon drums for subsequent disposal at an appropriate facility. The drums will be inventoried and labeled to indicate the origin (boring/well number) of the drum contents.

4.6 Demobilization

Following the completion of the field activities, demobilization will occur. This will include final decontamination activities, cleanup and restoration of the work areas, and removal of equipment and personnel from the site. Drums, tanks and/or roll-off bins containing IDW will be stored in a staging area at the Site pending analytical results and proper disposal.

4.7 Quality Assurance/Quality Control Procedures

In accordance with the ASGI Advisory, all field and laboratory quality assurance (QA)/ quality control (QC) data will be evaluated to assess the overall quality and usability of the data. Additionally, USEPA's Contract Laboratory Program National Functional Guidelines for Organic Data Review (Functional Guidelines, latest edition) will be used to assist in the process of the technical review of the data; however, QC criteria specified in the analytical methods or by the laboratory will be used as the basis for acceptance or data qualification.

4.7.1 Field Quality Assurance

Field duplicate soil vapor samples will be collected each day by the onsite laboratory and used to assess the precision of sampling techniques and laboratory analysis. Duplicate soil vapor samples will be collected and analyzed at a frequency of one per day by the onsite mobile laboratory, which is in accordance with AGSI Advisory. Results from field duplicates will be used to assess field and laboratory precision.

Field quality control samples for soil and groundwater sampling will include field duplicate, trip blank, and equipment blank samples, as described below.

- Field duplicate samples are collected to assess the overall precision of the laboratory's analytical system. Duplicates will be collected for each sample matrix at a rate of 5 percent (1 per 20 samples). Duplicates are collected by alternately filling bottles for the same analysis. Duplicates will be submitted to the laboratory as "blind" samples with a unique sample identification number. Duplicate samples will be designated by adding 100 to the location number (for example CDM-SB-107 would indicate a duplicate of sample CDM-SB-7). Duplicate samples will be analyzed for all target analytes as the primary samples.

- Equipment blank samples are used to assess the effectiveness of equipment decontamination. One equipment blank will be collected at a frequency of one per day of sampling for each sample equipment type (not to exceed two per day). Equipment blanks are collected by pouring demonstrated analyte-free water over or through decontaminated sampling equipment. Equipment blanks will be designated "EB-SS-mmddyy" for soil sampling equipment, "EB-GW-mmddyy" for groundwater sampling equipment, and "EB-SB-mmddyy" for soil vapor sampling equipment. Equipment blanks will be analyzed for organic constituents only.

- Trip blank samples are used to assess potential cross contamination from sample storage, handling, and shipping. Trip blanks will be prepared by the laboratory and submitted with the soil and groundwater samples for VOC analysis. Groundwater trip blanks consist of a 40-milliliter (mL) volatile organic analysis (VOA) vials filled with organic-free deionized water. Trip blanks will be designated "TB-mmddyy."

4.7.2 Laboratory Quality Assurance

4.7.2.1 Soil Vapor

Soil vapor samples collected from the probes will be analyzed by an onsite mobile laboratory using USEPA Method 8260. USEPA Method 8260 analyzes VOCs using gas chromatography/mass spectrometer methodology, with all standard analytes reported, which includes all VOC compounds detected at the Site Because the State of California does not offer an accreditation for analyzing vapor samples by a mobile laboratory, the laboratories are certified to analyze vapor samples by USEPA Methods 8260 and TO-15 through the Environmental Laboratory Accreditation Program (ELAP).

Before field work, the measurement performance criteria or QA goals for precision accuracy, representativeness, data comparability, and sensitivity will be determined for the proposed laboratory for the analysis of VOCs in soil vapor. Additionally, copies of the proposed laboratory's QC criteria for analyzing soil vapor samples by their mobile laboratory using Modified USEPA Method 8260will be obtained.

4.7.2.2 Soil and Groundwater

The analytical laboratories chosen to perform the analyses of soil and groundwater samples collected during this project will be certified by California's Department of Public Health (CDPH) ELAP for hazardous waste analysis. In general, the laboratory will adhere to those recommendations as promulgated in criteria described in "Test Methods for the Analysis of Solid Wastes" (SW-846, 3rd Ed. with latest updates); and the Federal Register "40 CFR Part 136," October 1984. All method-specific quality control measures, such as external and internal

standard calibration procedures, instrument performance verifications, quantitation using method of standard additions, etc., which are suggested within any referenced method (e.g., gas chromatograph methods in SW-846), will be performed. It is anticipated that Eurofins Calscience Laboratories, Inc. (Calscience) will perform the analyses at their off-Site laboratory. Calscience is accredited through CDPH's ELAP (ELAP number 2944).

The quantitation limits or reporting limits (RLs) will be less than or equal to the limits suggested in the EPA SW-846 guidance documents for the respective analytical method. Data for this project will be reported to the method detection limits (MDLs). Results detected above the MDLs, but below RLs will be flagged with a "J." by the laboratory, to indicate that the results are estimated.

Where possible, the undiluted RLs for individual compounds in groundwater samples will be lower than the California Maximum Contaminant Levels (MCLs) or other applicable California levels in the absence of MCLs (i.e. notification levels, action levels, etc.). Similarly, the undiluted RLs for individual compounds in soil samples will be lower than the USEPA Region 9 (updated May 2020) RSLs for commercial/industrial soil risk-based SLs as modified by the DTSC (HERO document titled *HHRA (Human Health Risk Assessment) Note Number: 3* (DTSC HERO, 2020). It should be noted that RLs are matrix dependent and may be higher if sample dilution is required. The laboratory will report the lowest reporting limit for each analyte.

It is possible that matrix interferences, which may be caused by any high levels of VOCs or other contaminants, may require the dilution of the sample (thereby increasing the quantitation limits) and/or otherwise prevent the proper detection of compounds of interest. In this case it may be necessary to perform special cleanup of the sample or extracts as indicated in the SW-846 documents for the particular method and/or switch to alternate methods to obtain the required data of acceptable quality.

This page intentionally left blank.

Section 5
Reporting

Following the completion of the tasks as described herein, an investigation report will be prepared that describes the investigation activities and presents the results of the data collected during the investigation activities. The key elements of this report are anticipated to include the following items:

- A summary of investigation results (i.e. summary tables, boring and sample location maps, updated groundwater contour maps, geologic cross-sections, etc.) and a description of the investigative methods and procedures.
- A discussion of key decision points and/or deviations encountered and resolved during the course of the investigation.
- Conclusions and recommendations for future activities, as appropriate.

The assessment report will be submitted to the LARWQCB within 60 days of receipt of all the laboratory data.

This page Intentionally left blank.

Tables

Table 1-1. Site History

Investigation Title	Year	Borings/Wells	Results
Report of Findings, Subsurface Soil Investigation for Anadite Inc., Big Line Tank Area Hydrotech, July 30, 1991	1991	B-1 B-2 B-3 B-4 B-5 B-6	• Agency: Los Angeles Department of Public Works (LADPW) • Hydrotech conducted a subsurface investigation during May 1991. Drilled six slant borings (B-1 through B-6) to approximately 40 feet below ground surface (bgs) • Soil samples contained maximum concentrations of total and hexavalent chromium of 2,150 milligrams per kilogram (mg/kg) and 257 mg/kg, respectively. • Report submitted to LADPW on July 30, 1991
United States Environmental Protection Agency (USEPA) Region IX	1993	N/A	• On September 28, 1993, EPA Region IX conducted a waste discharge compliance inspection of the Anadite facility in accordance with Resource Conservation and Recovery Act (RCRA) requirements. • Region IX staff became aware of the soil investigation conducted for DPW and the elevated chromium concentrations detected in subsurface soils. • EPA indicated they considered the property a "high priority" site. • DPW responded by requesting Anadite to further investigate the soil contamination and submit a workplan by June 20, 1994 (CDM, 1994).
Report for Groundwater Investigation Program - Anadite, Inc., South Gate, CA CDM, August 22, 1994	1994	MW-1 MW-2 MW-3	• In June 1994, CDM completed a limited field investigation that included drilling and sampling three hollow-stem auger soil borings (MW-1, MW-2, and MW-3). • Groundwater was determined to be flowing in a southerly direction across the Site. • Total and hexavalent chromium detected at maximum concentrations of 56 and 66 milligrams per liter (mg/L), respectively. • VOCs were reported at maximum concentrations of 1,200 and 6,400 micrograms per liter (µg/L) for trichloroethene (TCE) and tetrachloroethene (PCE), respectively.
Site Evaluation Report - Anadite, Inc., 10647 Garfield Ave, South Gate, CA CDM, July 6, 1998	1998	MW-4 MW-5 MW-6 B-7 B-8	• The investigation included the installation of three additional monitoring wells (MW-4, MW-5, and MW-6), and sampling the six Site monitoring wells (MW-1 through MW-6) to further characterize groundwater quality. • Two wells, MW-3 and MW-5, contained total and hexavalent chromium at concentrations of 42 and 40 mg/L respectively for MW-3 and 55.8 and 43 mg/L, respectively for MW-5. These values are above the Maximum Contaminant Level (MCL) for total chromium. • VOCs, specifically PCE and TCE, were detected in each well at concentrations above their respective MCLs, ranging from 145 to 17,900 µg/L. • Aromatic hydrocarbon compounds were detected at concentrations above 1 µg/L in wells MW-1, MW-2, MW-3 and MW-4.

Table 1-1. Site History

Investigation Title	Year	Borings/Wells	Results
Supplement Site Assessment Evaluation and Source Elimination Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, June 28, 1999	1999	Installed B-9 through B-12, B-14, B-16 and B-17 VE1/B-13 VE-2/B-15 MW-7 MW-8 MW-9	• Twelve borings were drilled. • Three of the 12 borings were completed as groundwater monitoring wells (MW-7, MW-8, and MW-9). • Two of the 12 borings (Hard Anodizing Building) were converted into vapor extraction wells (VE-1 and VE-2). • Three of the 12 borings(White House Building) were completed as soil gas probes (B-9 through B-11) to monitor soil vapors and evaluate whether the probes could provide useful information on induced soil gas influence/movement. • This report also included the first quarter groundwater monitoring report. • VOCs, specifically PCE and TCE, were detected in each well at concentrations above their respective MCLs, ranging from 115 to 26,400 µg/L and 32.5 to 6,820 µg/L, respectively. • Other chlorinated organic compounds, typically degradation products (e.g., cis-1,2-DCE), were also detected in the wells. • Aromatic hydrocarbon compounds were detected at concentrations above 1 µg/L in wells MW-1, MW-2, MW-7, MW-8, and MW-9.
Quarterly Groundwater Monitoring Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, July 21, 1999	1999	No wells installed. Sampled wells MW-1 through MW-9	• CDM performed the second quarter groundwater monitoring event on April 29 and 30, 1999. • Groundwater elevations declined by an average of 0.1 feet since the previous quarter with an approximate gradient of 0.002 ft/ft to the south. • VOCs exhibited a general decline in concentrations compared to the previous quarter for 1999. • BTEX was detected in groundwater samples collected from the five wells sampled. MTBE was not detected. • Hexavalent chromium was not detected in the groundwater samples analyzed. • Minor concentrations of several metals (primarily copper, barium, molybdenum and zinc) were detected in groundwater samples. None were above their respective soluble threshold limit concentration (STLC), except arsenic in well MW-7 (upgradient well).

Table 1-1. Site History

Investigation Title	Year	Borings/Wells	Results
Quarterly Groundwater Monitoring Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, October 13, 1999	1999	Installed:MW-10 MW-11 MW-12 MW-13 B-19	• CDM performed the third quarter groundwater monitoring event in July/August, 1999. • Three new off-site wells (MW-10, MW-11, and MW-12) and one on-site well (MW-13) were added during this quarter. • Groundwater elevations declined by an average of 0.21 feet since the previous quarter with an approximate gradient of 0.002 ft/ft to the south. Hydraulic conductivity of the water-bearing soils was calculated between 0.87 and 8.11ft/day where clay and silty sand were present, and was calculated to 25.11 ft/day where well graded sand was present. • VOCs exhibited a general decline in concentrations compared to the previous quarter, except for wells MW-5 and MW-7. • BTEX was not detected in groundwater samples collected from the wells sampled, except for ethlybenzene. MTBE was not detected. • Hexavalent chromium was not detected. • Minor concentrations of several metals (primarily copper, barium, molybdenum and zinc) were detected in groundwater samples. None were above their STLC, except arsenic in well MW-7 (upgradient well).
Quarterly Groundwater Monitoring Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, February 1, 2000	1999	No wells installed. Sampled wells MW-1 through MW-13	• CDM performed the fourth quarter groundwater monitoring event on December 7 through 9, 1999. • Groundwater elevations declined by an average of 0.43 feet since the previous quarter with a gradient of 0.002 ft/ft to the south. • Chlorinated VOCs exhibited a general decline in concentrations in 1999. • BTEX was not detected except for ethlybenzene in MW-11 and MW-12 at concentrations well below the California MCL for drinking water. MTBE was not detected. • Hexavalent chromium was detected in MW-3 and MW-5. Total chromium was detected in wells MW-1 through MW-6. Two samples MW-3 (7.2 mg/L) and MW-5 (3.71 mg/L) were above the MCL of 0.050 mg/L. • Minor concentrations of several metals (primarily copper, barium, molybdenum and zinc) were detected in groundwater samples. • TPH-carbon chain analyses, range C7 to C36, were performed on 13 wells. TPH was detected in samples from three wells, MW-2, MW-5, and MW-9. TPH was reported as C9-C10 (1,060 to 7,360 µg/L) in well MW-2, MW-5, and MW-9 and C8 (1,930 µg/L in well MW-5).
Supplemental CPT Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, April 14, 2000	1999	Advanced and sampled: CPT-1 through CPT-4	• CDM conducted a subsurface soil investigation on December 29 and 30, 1999 to further define the stratigraphy underneath and adjacent to the Site. Four cone penetrometer tests (CPT) were advanced immediately downgradient from wells MW-2, MW-4, MW-7 and MW-11. • Soil samples had detectable concentrations of PCE and TCE ranging from 19 to 2,700 mg/kg and 21 to 1,700 mg/kg, respectively. Minor concentrations of cis-1,2-DCE were detected from 6.9 to 28 mg/kg. • Four soil samples were analyzed for selected metals. None were above their EPA Region 9 Preliminary Remediation Goals (PRGs) except for arsenic.

Table 1-1. Site History

Investigation Title	Year	Borings/Wells	Results
Quarterly Groundwater Monitoring Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, April 19, 2000	2000	No wells installed. Sampled wells MW-1 through MW-13	• CDM performed the first quarter 2000 groundwater monitoring event on March 6 through 8, 2000. • Groundwater elevations declined by an average of 0.17 feet since the previous quarter with an approximate gradient of 0.002 ft/ft to the south. • VOCs exhibited a general increase in concentrations compared to the previous quarter. • BTEX and MTBE was not detected in groundwater samples collected from the 13 wells sampled. • Hexavalent chromium was detected in wells MW-3 (6.5 mg/L) and MW-5 (3.4 mg/L). • Minor concentrations of several metals (arsenic, antimony, iron, and nickel) were detected in groundwater samples. None were above their MCLs, except arsenic in well MW-7 (upgradient well) and antimony in wells MW-3 and MW-12.
Quarterly Groundwater Monitoring Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, July 13, 2000	2000	No wells installed. Sampled wells MW-1 through MW-13	• CDM performed the second quarter 2000 groundwater monitoring event on June 13 through 15, 2000. • Groundwater elevations declined by an average of 0.39 feet since the previous quarter with an approximate gradient of 0.002 ft/ft to the south. • PCE exhibited a general increase and TCE a general decrease in concentrations compared to the previous quarter. • BTEX and MTBE was not detected in groundwater samples collected from the 13 wells sampled. • Hexavalent chromium was detected in wells MW-3 (2.8 mg/L) and MW-5 (5 mg/L). • Minor concentrations of several metals (arsenic, antimony, iron, and nickel) were detected in groundwater samples. All were below their respective MCLs, except arsenic and antimony.
Vertical Chem-Milling Tank Closure Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, October 2, 2000	2000	Installed MW-14	• 1,400 gallons of sludge were pumped and disposed of from the Vertical Chem Milling tank on May 8, 24, 25, and June 12, 2000. • On June 13, 2000 CDM E&C performed the tank abandonment approved by LACDPW leaving the tank in place. • A new monitoring well (MW-14) was installed on June 20, 2000. • Laboratory results from groundwater samples showed PCE,TCE, 1,1-DCE, 1,2-DCA, cis-1,2-DCE, and TPH carbon chain concentrations detected above there reporting limit. • Soil and water samples were collected from boring B-19. The compounds detected in these samples differed from the sludge samples and seemed closely related to site-wide conditions. CDM recommended that LACDPW approve closure of the tank with no further action.

Table 1-1. Site History

Investigation Title	Year	Borings/Wells	Results
Quarterly Groundwater Monitoring Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, October 16, 2000	2000	No wells installed. Sampled wells MW-1 through MW-13	• CDM performed the third quarter 2000 groundwater monitoring event on September 12 through 14, 2000. • Groundwater elevations declined by an average of 0.21 feet since the previous quarter with an approximate gradient of 0.002 ft/ft to the south. • PCE and TCE exhibited a general increase in concentrations compared to the previous quarter. • BTEX and MTBE were not detected in groundwater samples collected from the 13 wells sampled. • Hexavalent chromium was detected in wells MW-3 (7.1 mg/L) and MW-5 (20 mg/L). • Minor concentrations of several metals (arsenic, antimony, iron, and nickel) were detected in groundwater samples. All were below their respective MCLs, except arsenic and antimony.
Quarterly Groundwater Monitoring Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, January 18, 2001	2000	No wells installed. Sampled wells MW-1 through MW-13	• CDM performed the fourth quarter 2000 groundwater monitoring event on November 28 through 29, 2000. • Groundwater elevations declined by an average of 0.38 feet since the previous quarter with an approximate gradient of 0.002 ft/ft to the south. • PCE and TCE appear consistent through the last five sampling events. • Benzene and Toluene were detected in MW-5 at concentrations below their respective MCLs. MTBE was not detected in groundwater samples collected from the 13 wells sampled. • Hexavalent chromium was detected in wells MW-3 (2.4 mg/L) and MW-5 (35 mg/L). • Minor concentrations of several metals (arsenic, antimony, iron, and nickel) were detected in groundwater samples. All were below their respective MCLs, except arsenic and iron.
Quarterly Groundwater Monitoring Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, April 15, 2001	2001	No wells installed. Sampled wells MW-1 through MW-14	• CDM performed the first quarter 2001 groundwater monitoring event on February 26 through 28, 2001 and March 16, 2001. • Groundwater elevations declined by an average of 0.46 feet since the previous quarter with an approximate gradient of 0.002 ft/ft to the south. • PCE and TCE appear consistent through the last six sampling events except for wells MW-5 and MW-9. • Benzene and Toluene ,ethlbenzene, total xylenes, and MTBE were not detected in groundwater samples collected from the 14 wells sampled. • Hexavalent chromium was detected in wells MW-6 (0.004 mg/L), MW-3 (0.44 mg/L), and MW-5 (49 mg/L). • Minor concentrations of two metals (arsenic and iron) were detected in groundwater samples. Both were above their respective MCLs.

Table 1-1. Site History

Investigation Title	Year	Borings/Wells	Results
Quarterly Groundwater Monitoring Report - Anadite, Inc., 10647 Garfield Avenue, South Gate, CA CDM, July 13, 2001	2001	No wells installed. Sampled wells MW-1 through MW-14	• CDM performed the second quarter 2001 groundwater monitoring event on June 11 and 12, 2001. • Groundwater elevations declined by an average of 0.1 feet since the previous quarter with an approximate gradient of 0.002 ft/ft to the south. • PCE and TCE appear consistent with previous sampling events. • Benzene and Toluene ,ethlbenzene, total xylenes, and MTBE were not detected in groundwater samples collected from the 14 wells sampled. • Hexavalent chromium was detected in wells MW-6 (0.006 mg/L), MW-3 (0.48 mg/L), and MW-5 (37 mg/L). • Minor concentrations of two metals (arsenic and iron) were detected in groundwater samples. Concentrations were slightly above their respective MCLs.
December 2001- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, April 15, 2002	2001	MW-15 OW-1 PZ5-1 PZ5-2	• CDM performed the December 2001 groundwater monitoring event on December 17 and 18, 2001. • Groundwater elevations declined by an average of 0.62 feet since the previous quarter with an approximate gradient of 0.002 ft/ft to the south. • PCE and TCE appear consistent with previous sampling events. • Benzene and Toluene ,ethlbenzene, total xylenes, and MTBE were not detected in groundwater samples collected from the wells sampled. • Hexavalent chromium was detected in wells MW-3 (1.5 mg/L) and MW-5 (17 mg/L). • Minor concentrations of two metals (arsenic and iron) were detected in groundwater samples. Concentrations were slightly above their respective MCLs.
Technical Memorandum and Work Plan to Conduct an Additional "Deep" Groundwater Zone Investigation - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, February 14, 2002	2002	CPT-5 through CPT-12	Summarizes the drilling of eight cone penetrometer test (CPT) borings and multiple depth hydropunch sampling. Results of the hydropunch sampling basis for installing additional "deep" groundwater monitoring wells.
Technical Memorandum and Work Plan to Conduct an Additional "Deep" Groundwater Zone Investigation - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, May 29, 2002	2002	MW-16 through MW-24	Summarizes the drilling, installation, and sampling of nine groundwater monitoring wells in the 80-foot and 100-foot deep groundwater zones. Wells are all offsite and deeper than previous groundwater monitoring wells in order to assess the lateral and vertical extent of VOC concentrations.

Table 1-1. Site History

Investigation Title	Year	Borings/Wells	Results
June 2002- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, October 21, 2002	2002	Wells MW-1 through MW-24 sampled.	• CDM performed the June 2002 groundwater monitoring event from June 3 through 5, 2002. • Groundwater elevations declined by an average of 0.47 feet since the previous quarter with an approximate gradient of 0.002 ft/ft to the south. • PCE and TCE appear consistent with previous sampling events. • Benzene and Toluene ,ethlbenzene, total xylenes, and MTBE were not detected in groundwater samples collected from the wells sampled. • Total chromium was detected in five of ten wells at concentrations ranging from 0.0305 mg/L (MW-17) to 25.7 mg/L (MW-5). Hexavalent chromium was detected in three of six wells at concentrations ranging from 0.0063 mg/L (MW-6) to 26 mg/L (MW-5). • Minor concentrations of two metals (arsenic and iron) were detected in groundwater samples.
Technical Memorandum and Work Plan to Conduct an Additional "Deep" Groundwater Zone Investigation - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, December 10, 2002	2002	MW-25 through MW-32 installed.	Summarizes the drilling, installation, and sampling of eight groundwater monitoring wells in the 80-foot, 100-foot, and 150-foot deep groundwater zones. Wells are all offsite and were installed and sampled in order to continue to assess the lateral and vertical extent of VOC concentrations.
December 2002- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, April1, 2003	2002	Wells MW-15 through MW-32 sampled.	• CDM performed the December 2002 groundwater monitoring event from December 16-19,and 27, 2002. • Groundwater elevations declined by an average of 1 foot in the 50-foot, 0.93 feet in the 80-foot, and 0.88 feet in the 100-foot zone wells since the previous quarter. Gradients are similar to the last period. • PCE and TCE appear consistent with previous sampling events. The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE and cis-1,2-DCE. • Groundwater was analyzed for 1,4-dioxane from five wells (MW-15 through MW-17, MW-22, and MW-24. Concentrations ranged from 3 to 43 µg/L. • Total chromium was not detected in the two wells (MW-16 and MW-17) sampled.
Technical Memorandum and Work Plan to Conduct an Additional "Deep" Groundwater Zone Investigation - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, June 18, 2003	2003	MW-33 through MW-41 installed.	Summarizes the drilling, installation, and sampling of nine groundwater monitoring wells in the 80-foot, 100-foot, 150-foot, and 200-foot deep groundwater zones. Wells are all offsite and were installed and sampled in order to continue to assess the lateral and vertical extent of VOC concentrations.

Table 1-1. Site History

Investigation Title	Year	Borings/Wells	Results
May 2003- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, September 12, 2003	2003	Wells MW-1 through MW-41 sampled (except MW-8 and MW-14).	• CDM performed the May 2003 groundwater monitoring event from May 19 through 23, 2003. • Groundwater elevations declined by an average of 0.87 feet in the 50-foot, 0.50 feet in the 80-foot, 0.60 feet in the 100-foot, and 0.48 feet in the 150-foot zone wells since the previous quarter. Gradients are similar to the last period. • PCE and TCE appear consistent with previous sampling events. The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE and cis-1,2-DCE. • Groundwater was analyzed for 1,4-dioxane from 21 of the 39 wells sampled. Concentrations ranged from below the detection limit of 2 µg/L to 90 µg/L (MW-19). • Total chromium was not detected in two of the wells (MW-16 and MW-17) sampled. Total chromium (0.307mg/L, MW-3 and 0.693 mg/L, MW-5) and hexavalent chromium (0.29 mg/L, MW-3 and 0.70 mg/L MW-5) were detected in wells MW-3 and MW-5.
November 2003- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, January 29, 2004	2003	Wells MW-15 through MW-41 sampled.	• CDM performed the November 2003 groundwater monitoring event from November 17 through 20, 2003. • Groundwater elevations declined by an average of 0.65 feet in the 50-foot, 0.48 feet in the 80-foot, 0.40 feet in the 100-foot, and 0.39 feet in the 150-foot zone wells since the previous quarter. Gradients are similar to the last period. • PCE and TCE appear consistent with previous sampling events. The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE and cis-1,2-DCE. • Analytical results indicated that 1,4-dioxane was detected in 14 of 27 wells sampled. Concentrations ranged from below the detection limit of 2 µg/L to 86 µg/L (MW-19). • Total chromium and hexavalent was not detected in the two wells (MW-16 and MW-17) sampled.
Technical Memorandum for the "Deep" Groundwater Zone Investigation - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, April 20, 2004	2004	MW-42 and MW-43 installed.	Summarizes the drilling, installation, and sampling of two groundwater monitoring wells, one in the 80-foot and one in the 150-foot deep groundwater zones, MW-42 and MW-43, respectively. Wells are all offsite and were installed and sampled in order to continue to assess the lateral and vertical extent of VOC concentrations.

Table 1-1. Site History

Investigation Title	Year	Borings/Wells	Results
May 2004- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, January 29, 2004	2004	Wells MW-1 through MW-43 sampled (except MW-8 and MW-14).	• CDM performed the May 2004 groundwater monitoring event from May 24 through 28, 2004. • Groundwater elevations declined by an average of 0.69 feet in the 50-foot, 0.52 feet in the 80-foot, 0.49 feet in the 100-foot, and 0.52 feet in the 150-foot zone wells since the previous quarter. Gradients are similar to the last period. • PCE and TCE appear consistent with previous sampling events. The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE and cis-1,2-DCE. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events. Concentrations ranged from below the detection limit of 2 µg/L to 45 µg/L. • Total chromium was detected in wells MW-3 and MW-5 at concentrations of 0.26 and 0.605 mg/L, respectively. Hexavalent chromium was detected in wells MW-3 and MW-5 at concentrations of 0.029 and 0.53 mg/L, respectively. Total and hexavalent chromium were not detected in wells MW-16 and MW-17, which is consistent with the last four sampling rounds.
November 2004- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, January 27, 2005	2004	Wells MW-15 through MW-43 sampled.	• CDM performed the November 2004 groundwater monitoring event from November 15 through 18, 2004. • Groundwater elevations declined by an average of 0.84 feet in the 50-foot, 0.91 feet in the 80-foot, 1.01 feet in the 100-foot, and 1.01 feet in the 150-foot zone wells since the previous quarter. Gradients are similar to the last period. • PCE and TCE appear consistent with previous sampling events. The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE and cis-1,2-DCE. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events. Concentrations ranged from below the detection limit of 2.3 µg/L to 33 µg/L.
Technical Memorandum for the "Deep" Groundwater Zone Investigation - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, May 12, 2005	2005	MW-44 through MW-52 installed.	Summarizes the drilling, installation, and sampling of nine groundwater monitoring wells, two in the 80-foot, four in the 100-foot zone, and three in the 150-foot deep groundwater zones. Wells are all offsite and were installed and sampled in order to continue to assess the lateral and vertical extent of VOC concentrations.

Table 1-1. Site History

Investigation Title	Year	Borings/Wells	Results
May 2005- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, July 28, 2005	2005	Wells MW-1 through MW-52 sampled (except MW-8 and MW-14).	• Groundwater elevations increased by an average of 0.32 feet in the 50-foot, 0.69 feet in the 80-foot, 0.62 feet in the 100-foot, and 0.44 feet in the 150-foot zone wells since the previous event (November 2004). Gradients were similar to the last period. • PCE and TCE appear consistent with previous sampling events. The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE and cis-1,2-DCE. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events. Concentrations ranged from below the detection limit of 2 µg/L to 46 µg/L. Concentrations were noted to increase slightly in wells MW-5, MW-28, and MW-40.
November 2005- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, January 26, 2006	2005	Wells MW-15 through MW-52 sampled	• Groundwater elevations increased by an average of 0.46 feet in the 50-foot, 0.96 feet in the 80-foot, 0.98 feet in the 100-foot, and 1.13 feet in the 150-foot zone wells since the previous event (November 2004). Gradients were similar to the last period. • PCE and TCE appear consistent with previous sampling events with the exception of the pilot study wells MW-5, MW-15 and the surrounding observation wells (see the WDR progress reports). The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE, cis-1,2-DCE, and vinyl chloride. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events. Concentrations ranged from below the detection limit of 2 µg/L to 45 µg/L. Concentrations were noted to increase slightly in well MW-28.
Technical Memorandum for the "Deep" Groundwater Zone Investigation - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, July 25, 2006	2006	MW-53 through MW-58 installed.	Summarizes the drilling, installation, and sampling of six groundwater monitoring wells, two in the 100-foot zone, two in the 150-foot zone, and two in the 200-foot deep groundwater zones. Wells are all offsite and were installed and sampled in order to continue to assess the lateral and vertical extent of VOC concentrations.

Table 1-1. Site History

Investigation Title	Year	Borings/Wells	Results
May 2006- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, July 27, 2006	2006	Wells MW-1 through MW-58 sampled (except MW-8 and MW-14).	• Groundwater elevations increased by an average of 0.81 feet in the 50-foot, 0.87 feet in the 80-foot, 1.11 feet in the 100-foot, and 1.02 feet in the 150-foot zone wells since the previous event (May 2005). Gradients were similar to the last period. • PCE and TCE appear consistent with previous sampling events with the exception of the pilot study wells MW-5, MW-15 and the surrounding observation wells (see the WDR progress reports). The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE, cis-1,2-DCE, and vinyl chloride. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events. Concentrations ranged from below the detection limit of 2 µg/L to 45 µg/L. Concentrations were noted to increase slightly in wells MW-5 and MW-28, and to decreasing in wells MW-15, MW-16, MW-17, MW-19, MW-22, and MW-38.
Final Groundwater Remediation Pilot Study Report and Remedial Action Plan - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, January 26, 2007	2007	Pilot study wells	Summarizes the results of the recent groundwater remediation pilot study conducted at the Site and discusses the procedure to develop, evaluate, and select potential remedial alternatives to address groundwater impacted with contaminants of concern (COCs) and to propose remedial actions for groundwater contamination for the source areas at the Site.
Technical Memorandum for the "Deep" Groundwater Zone Investigation - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, May 18, 2007	2007	MW-59 through MW-61 installed.	Summarizes the drilling, installation, and sampling of three groundwater monitoring wells in the 150-foot zone deep groundwater zones. Wells are all offsite and were installed and sampled in order to continue to assess the downgradient extent of VOC concentrations.
May 2007- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, July 30, 2007	2007	Wells MW-1 through MW-61 sampled (except MW-8 and MW-14).	• Groundwater elevations increased by an average of 0.00 feet in the 50-foot, 0.33 feet in the 80-foot, 0.16 feet in the 100-foot, and 0.24 feet in the 150-foot zone wells since the previous event (May 2006). Gradients were similar to the last period. • PCE and TCE appear consistent with previous sampling events with the exception of the MW-5. The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE, cis-1,2-DCE, and vinyl chloride. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events.
Groundwater Remedial Design and Implementation Plan - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, May 30, 2008	2008	Wells installed to date: MW-1 through MW-65	Report presented to outline plan for Enhanced Anaerobic Bioremediation (EAB) at the site to address contaminants of concern. The purpose of the document was to outline the remedial approach; provide a design basis and rationale for system selection; and describe the major components for the remedial system to be constructed at the Site. Additionally, the document delineated the means to evaluate the system's efficacy in treating groundwater impacted with the contaminants of concern.

Table 1-1. Site History

Investigation Title	Year	Borings/Wells	Results
May 2008- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, August 27, 2008	2008	Wells MW-1 through MW-61 sampled (except MW-8 and MW-14).	• Groundwater elevations decreased by an average of 1.77 feet in the 50-foot, 1.58 feet in the 80-foot, 1.53 feet in the 100-foot, and 1.49 feet in the 150-foot zone, and 1.45 feet in the 200-foot zones wells since the previous event (May 2007). Gradients were similar to the last period. • PCE and TCE appear consistent with previous sampling events with the exception of the MW-5. The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE, cis-1,2-DCE, and vinyl chloride. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events.
May 2009- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, July 31, 2009	2009	Wells MW-1 through MW-65 sampled (except MW-8, MW-10, MW-14, MW-41, MW-44, MW-45, and MW-51).	• Groundwater elevations decreased by an average of 0.87 feet in the 50-foot, 1.32 feet in the 80-foot, 1.45 feet in the 100-foot, and 1.12 feet in the 150-foot zone, and 1.32 feet in the 200-foot zones wells since the previous event (May 2008). Gradients were similar to the last period. • PCE and TCE appear consistent with previous sampling events with the exception of the MW-5. The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE, cis-1,2-DCE, and vinyl chloride. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events.
May 2010- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, July 30, 2010	2010	Wells MW-1 through MW-65 sampled (except MW-8, MW-10, and MW-14).	• Groundwater elevations decreased by an average of 2.37 feet within the shallow 50-foot zone wells, 2.78 feet in the 80 foot-zone wells, 2.80 feet in the 100-foot-zone wells, 2.86 feet in the 150 foot zone wells, and 2.83 feet in the 200-foot zone wells. Gradients were similar to the last period. •PCE and TCE appear consistent with previous sampling events . The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE, cis-1,2-DCE, and vinyl chloride. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events.

Table 1-1. Site History

Investigation Title	Year	Borings/Wells	Results
May 2011- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM, August 12, 2011	2011	Wells MW-1 through MW-65 sampled (except MW-8, MW-10, MW-14, MW-41, MW-44, MW-45, and MW-51).	• Groundwater elevations, decreased by an average of 1.38 feet (relative to the last monitoring event May 2010) within the shallow 50-foot zone wells, 0.27 feet in the 80 foot-zone wells, 0.44 feet in the 100-foot-zone wells, 0.16 feet in the 150 foot zone wells, and 0.11 feet in the 200-foot zone wells. Gradients were similar to the last period. •PCE and TCE appear consistent with previous sampling events The nature of VOC contamination exhibits a distinct shift from the 80- to the 100-foot depth zones, where the primary contaminant (highest frequency and contamination) transitions from PCE to the breakdown products TCE, cis-1,2-DCE, and vinyl chloride. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events.
June 2013- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM Smith, July 31, 2013	2013	In accordance with the modified monitoring program approved by the RWQCB on June 11, 2013, the following wells were sampled during the 2013 annual sampling event: -50- foot zone wells: MW-1, -2, -9, -11, and -13; - 80-foot zone wells: MW-15, -22, -36, -38, and -45; - 100-foot zone wells: MW-19, -27, -28, -47, -52, and -53; - 150-foot zone wells: MW-43, -49, -55, -61, -62, and -63; and -200-foot zone wells: MW-35, -56, and -65. Well MW-12 was found to be dry during this sampling event.	• With the exception of the shallow 50-foot zone (decrease by an average of 0.42 feet), groundwater elevations were observed to have a slight increased with respect to the previous monitoring round conducted in May 2011.Gradients were generally consistent with previous monitoring rounds. •PCE and TCE slightly decreased or remained the same. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events.

Table 1-1. Site History

Investigation Title	Year	Borings/Wells	Results
Reduced Scale Groundwater Remedial Action Plan and Implementation Plan Former Anadite Facility, South Gate, California CDM Smith, July 31, 2013	2013	selected wells	During a meeting held on May 1, 2013 between the Trust and the LARWQCB, the Trust indicated that the EAB recirculation groundwater remediation system outlined in the approved RAP and RD/IP documents could not be implemented due to limited financial resources. The LARWQCB indicated that some form of reduced-scale groundwater remediation targeting the areas with the highest VOC concentrations would still be required. In a May 20, 2013 letter to the LARWQCB, the Trust proposed to develop and submit a reduced-scale RAP by August 30, 2013. The approach to submit a reduced-scale RAP was approved by the LARWQCB in a letter dated June 11, 2013. The overall reduced-scale remedial approach is to implement enhanced anaerobic bioremediation (EAB) in select areas at the Site and its immediate vicinity that contain the highest or some of the highest concentrations of the COCs by performing focused injections of electron donor(s) and potential bioaugmentation cultures into groundwater with the purpose of reductively dechlorinating chlorinated VOCs to ethene through biological pathways.
July 2014- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM Smith, September 12, 2014	2014	Sampled: 50- foot zone wells: MW-1, -2, -11, and -13; 80-foot zone wells: MW-15, -22, -36, -38, and -45; 100-foot zone wells: MW-19, -27, -28, -47, -52, and -53; 150-foot zone wells: MW-43, -49, -55, -61, -62, and -63; and -D56 200-foot zone wells: MW-35, -56, and -65. Well MW-9 and MW-12 were found to be dry during this sampling event.	• Groundwater elevations decreased by an average of 1.31 feet within the 50-foot zone wells, 2.30 feet within the 80-foot zone wells, 2.54 feet in the 100 foot-zone wells, 2.25 feet in the 150-foot-zone wells, and 2.49 feet in the 200-foot zone wells. Gradients were generally consistent with previous monitoring rounds. •PCE and TCE slightly decreased or remained the same. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events.

Table 1-1. Site History

Investigation Title	Year	Borings/Wells	Results
July 2015- Groundwater Monitoring Report - Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM Smith, July 31, 2015	2015	In accordance to RWQCB's letter dated October 14, 2014 three new wells were installed and sampled: MW-9A, MW-10a, and MW-12A. Sampled: 50- foot zone wells: MW-1, -2, 9A, -10A, 12A, and -13; 80-foot zone wells: MW-15, -22, -36, -38, and -45; 100-foot zone wells: MW-19, -27, -28, -47, -52, and -53; 150-foot zone wells: MW-43, -49, -55, -61, -62, and -63; and -D56 200-foot zone wells: MW-35, -56, and -65. Well MW-11 was found to be dry during this sampling event.	• Groundwater elevations decreased by an average of 1.66 feet within the 50-foot zone wells, 2.67 feet within the 80-foot zone wells, 2.83 feet in the 100 foot-zone wells, 2.93 feet in the 150-foot-zone wells, and 2.83 feet in the 200-foot zone wells. Gradients were generally consistent with previous monitoring rounds. •PCE and TCE slightly decreased or remained the same. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events.
October/Novever 2015- Waste Discharge Requirements Monitoring Report- Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM Smith, January 15, 2016	2015	EAB Injection: 50-foot zone - MW-9A 80-foot zone - MW-15, -22 100-foot zone - MW-19	Three additional quarterly monitoring events in accordance with the MRP are planned for 2016 to complete the first year of WDR post-injection monitoring and reporting.
February 2016- Waste Discharge Requirements Monitoring Report- Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM Smith, April 15, 2016	2016	Sample: 50-foot zone - MW-10A 80-foot zone - MW-18, -20 100-foot zone - MW-21, -28	As of First Quarter 2016, the three groundwater zones of interest have not been influenced by the implementation of EAB amendment injections with EVO solution and bioaugmentation culture.

Table 1-1. Site History

Investigation Title	Year	Borings/Wells	Results
July 2016- Waste Discharge Requirements Monitoring Report- Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM Smith, July 15, 2016	2016	Sample: 50-foot zone - MW-1, -2, -9A, -10A, -12A, -13 80-foot zone - MW-15, -16, -18, -20, -22, -36, -38, -45 100-foot zone - MW-19, -21, -23, -27, -28, -40, -47, -52, -53 150-foot zone - MW-43, -49, -55, -61, -62, -63 200-foot zone - MW-35, -56, -57	• Groundwater elevations decreased by an average of 3.12 feet within the 50-foot zone wells, 3.00 feet within the 80-foot zone wells, 2.71 feet in the 100 foot-zone wells, 2.44 feet in the 150-foot-zone wells, and 2.53 feet in the 200-foot zone wells. Gradients were generally consistent with previous monitoring rounds. • The nature of the VOC contamination exhibits a distinct shift from the 80- to the 100-foot-depth zones, where the primary contaminant (highest frequency and concentration) transitions from PCE to the breakdown products TCE and cis 1,2 DCE, and now to a lesser extent VC, trans 1,2 DCE, and 1,1-DCE. PCE is somewhat limited to the vicinity of the Site with the breakdown products of TCE, cis-1,2-DCE, and VC migrating considerably downgradient from the Site. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events.
July 2017- Annual Groundwater Monitoring Report- Anadite, Inc. 10647 Garfield Avenue, South Gate, CA CDM Smith, July 28, 2017	2017	Sample: 50-foot zone - MW-2, -10A, -12A, -13 80-foot zone - MW-15, -16, -18, -20, -22, -36, -38, -45 100-foot zone - MW-19, -21, -23, -27, -28, -40, -47, -52, -53 150-foot zone - MW-43, -49, -55, -61, -62, -63 200-foot zone - MW-35, -56, -65 Wells MW-1, -9A, -11 were dry or had insufficient water to sample.	• Groundwater elevations decreased by an average of 2.06 feet within the 50-foot zone wells, 1.47 feet within the 80-foot zone wells, 1.53 feet in the 100 foot-zone wells, 1.37 feet in the 150-foot-zone wells, and 1.54 feet in the 200-foot zone wells. Gradients were generally consistent with previous monitoring rounds. • The nature of the VOC contamination exhibits a distinct shift from the 80- to the 100-foot-depth zones, where the primary contaminant (highest frequency and concentration) transitions from PCE to the breakdown products TCE and cis 1,2 DCE, and now to a lesser extent VC, trans 1,2 DCE, and 1,1-DCE. PCE is somewhat limited to the vicinity of the Site with the breakdown products of TCE, cis-1,2-DCE, and VC migrating considerably downgradient from the Site. • Analytical results indicated that 1,4-dioxane concentrations in general were consistent with previous sampling events.

VINYL ACETATE	7,000	29,333	12	1	/	176

*__*Notes*__ :

'-- = No Regulatory Level

µg/m3 - micrograms per cubic meter

- The maximum detected result detected between 1/1/2017 and 9/30/2020 for VP wells are

Soil Gas Screening Levels were calculated by adjusting the EPA residential and industrial/commercial air Regional Screening Levels (RSLs, May 2020) as modified based on DTSC HHRA Note 3 (DTSC HERO, June 2020), with a default attenuation factor of 0.03 (Existing Residential Scenario) in accordance with the Guidance for the Evaluation and Mitigation of Subsurface VI to IA (DTSC 2011).

BOLD - Screening Level exceedances

Selected chemical of Potential concerns (COPCs)

Table 2-2. Groundwater Contaminants of Concern

Groundwater Contaminants of Concern		MCL (µg/L)	Maximum Concentration (µg/L)
PCE	tetrachloroethene	5	34,000
TCE	trichloroethene	5	14,000
cis-1,2-DCE	cis-1,2-dichloroethene	6	14,000
trans-1,2-DCE	trans-1,2-dichloroethene	10	230
1,1-DCE	1,1-dichloroethene	6	490
1,1-DCA	1,1-dichloroethane	5	170
1,2-DCA	1,2-dichloroethane	0.5	43
VC	vinyl chloride	0.5	2,400
1,4-dioxane	1,4-dioxane	3*	94

Notes :

- MCL: maximum contaminant level
- µg/L: microgram per liter
- Maximum concentrations are as of 2020

* California notification level

Table 2-3. Proposed Soil and Soil Vapor Sampling Locations and Rationale

VP Boring ID	Location	Boring Depth (ft bgs)	Proposed VP Depth (ft bgs)	Rationale
VP-5D2	Adjacent to VP-5	55	35, 45	Assess soil matrix concentrations and deeper soil vapor impacts at the VP-5 location within the high concentration area of the soil vapor plume.
VP-6D2	Adjacent to VP-6	55	35, 45	Assess soil matrix concentrations and deeper soil vapor impacts at the VP-6 location within the high concentration area of the soil vapor plume.
VP-11D2	Adjacent to VP-11	55	35, 45	Assess soil matrix concentrations and deeper soil vapor impacts at the VP-11 location within the high concentration area of the soil vapor plume.
VP-16D2	Adjacent to VP-16	55	35, 45	Assess soil matrix concentrations and deeper soil vapor impacts at the VP-16 in the eastern portion of the soil vapor plume.
VP-18D2	Adjacent to VP-18	55	35, 45	Assess soil matrix concentrations and deeper soil vapor impacts at the VP-18 location within the high concentration area of the soil vapor plume.
VP-29	NE Corner of Big Line Tanks Building	55	10, 25, 35, 45	Assess soil matrix and soil vapor impacts adjacent to the Big Line Tanks building NW of VE-9.
VP-30	Inside southern portion of Big Line Tanks building	55	10, 25, 35, 45	Assess soil matrix and soil vapor impacts in the southern portion of the Big Line Tanks building and assess high soil vapor concentrations to the north of VP-6
VP-31	Inside the central portion of the Paint Shop building	55	10, 25, 35, 45	Assess the southern extent of the higher soil vapor concentrations to the south of VP-6 and VP-7.
VP-32	SW Corner of White House Building	55	10, 25, 35, 45	Assess soil matrix concentrations and soil vapor impacts at the SW corner of the White House Building within the high concentration area of the soil vapor plume.
VP-33	SE Corner of Big Line Tanks Building	55	10, 25, 35, 45	Assess soil matrix concentrations and soil vapor impacts at the SE corner of the Big Line Tanks Building within the high concentration area of the soil vapor plume between VP-5 and VP-6.
VP-34	SE Corner of White House Building	55	10, 25, 35, 45	Assess soil matrix concentrations and soil vapor impacts at the SE corner of the White House Building within the high concentration area of the soil vapor plume.
VP-35	NW Portion of the Site	55	10, 25, 35, 45	Assess soil matrix concentrations and soil vapor impacts in the NE portion of the Site between VP-3 and VP-16.

Table 2-4. Proposed CPT/MIP Boring Locations and Rationale

CPT/MIP Boring ID	Location	Boring Depth (ft bgs)	Rationale
CPT-13	Northeast Portion of Site	100	Assess groundwater impacts in the northeastern portion of the Site.
CPT-14	Near VP-5	100	Assess soil and groundwater impacts in the source area around the White House Building area with highest residual VOC concentrations in soil vapor.
CPT-15	Near MW-6	100	Assess soil and groundwater impacts between the White House Building and MW-15.
CPT-16	Near MW-14	100	Assess soil and groundwater impacts in the Chem Mill Building between the White House Building and the Hard Anodizing Building.
CPT-17	North End of Hard Anodizing Building	100	Assess soil and groundwater impacts at the northern end of the Hard Anodizing Building.
CPT-18	Between MW-2 and MW-6	100	Assess soil and groundwater impacts between the White House Building and MW-2/MW-15.
CPT-19	Warehouse Building Near MW-15	100	Assess soil and groundwater impacts in the Chem Mill Building between the White House Building and the Hard Anodizing Building.
CPT-20	Adjacent to MW-9A	100	Assess soil and groundwater impacts immediately east of the Hard Anodizing Building.
CPT-21	Near MW-11	100	Further refine VOC concentration contours proximal to the Site in the down to crossgradient direction.
CPT-22	East of MW-16 and MW-17	100	Assess soil and groundwater impacts between MW-16/MW-17 and MW-2/MW-15.
CPT-23	West of MW-2 and MW-15	100	Assess soil and groundwater impacts between MW-16/MW-17 and MW-2/MW-15.
CPT-24	East of MW-2 and MW-15	100	Assess soil and groundwater impacts between MW-2/MW-15 and MW-22.
CPT-25	Near MW-18	100	Further refine VOC concentration contours proximal to the Site in the downgradient direction.
CPT-26	Between MW-11 and MW-18	100	Further refine VOC concentration contours proximal to the Site in the down to crossgradient direction.
CPT-27	Near MW-3	100	Assess soil and groundwater impacts to the south of the Big Line Tanks building.

Notes:

PCE = Tetrachloroethene; TCE = Trichloroethene; TCA = Trichloroethane; DCA = Dichloroethane; DCE = Dichloroethene; CMT = Chloromethane; CBN = Chlorobenzene; DCB = Dichlorobenzene; TCB = Trichlorobenzene; CFM = Chloroform; MCL = Methylene chloride; CCL = Carbon tetrachloride; DCPA = Dichloropropane; BEN = Benzene; TOL = Toluene; EBN = Ethylbenzene; TMB = Trimethylbenzene; MTBE = Methyl tert-butyl ether; ET = Ethyltoluene; and THF = Tetrahydrofuran; 13B = 1,3-Dichlorobenzene; HXN = Hexane; IPA = Isopropyl alcohol.

Samples analyzed by EPA Method TO-15 or TO-14.
All concentrations are reported in ppb (v/v).
Only the most frequently detected compounds reported in the vapor extraction well samples are listed.
If blank, compound was not reported.
U = Not detected at a concentration greater than the reporting limit shown.
"--" = Not Analyzed

Notes:

PCE = Tetrachloroethene; TCE = Trichloroethene; TCA = Trichloroethane; DCA = Dichloroethane; DCE = Dichloroethene; CTC = Carbon tetrachloride; CET = Chloroethane; CFM = Chloroform; MCL = Methylene chloride; BEN = Benzene; TOL = Toluene; EBN = Ethylbenzene; TMB = Trimethylbenzene; ET = Ethyltoluene; TMP = Trimethylpentane; BMT = Bromomethane; IPA = Isopropyl alcohol; THF = Tetrahydrofuran; VAC = Vinyl Acetate; HPT= Heptane; 1 ,4-D = 1,4-Dioxane.

Samples analyzed by EPA Method TO-14A.
All concentrations are reported in ppb (v/v).
Only compounds detected the most frequently are listed.
If blank, analyte was not reported.
J = Results are estimated due to results exceeding the calibration range.
U = Not detected at a concentration greater than the reporting limit shown.
"--" = Not Analyzed

Notes:

PCE = Tetrachloroethene; TCE = Trichloroethene; TCA = Trichloroethane; DCE = Dichloroethene; DCA = Dichloroethane; PCA = Tetrachloroethane TCB = Trichlorobenzene; CE = Chloroethane; CFM = Chloroform; MCL = Methylene chloride; DCB = Dichlorobenzene; CBN = Chlorobenzene; VC = Vinyl chloride; FRE = 1,1,2-Trichloro-1,2,2-Trifluoroethane (Freon 113) and 1,2,3-TCP = 1,2,3-Trichloropropane.

California Maximum Contaminant Levels (MCLs) are shown in parenthesis. MCL shown for chloroform is the sum of trihalomethane isomers. A California Notifcation Level is indicated with an asterisk (*).

Samples analyzed by EPA Method 8260.
All concentrations are reported in micrograms per liter (ug/L).
Only compounds detected in one or more samples are listed.
U = Not detected at a concentration greater than the reporting limit shown.
UB = Qualified as a non-detectable concentration due to laboratory contamination.
J = Estimated concentration.
-- = Analyte not analyzed or not reported.

Sample Type:
K = Field Duplicate sample

Notes:

MTBE = Methyl tert-butyl ether; ETBE = Ethyl tert-butyl ether; TBA = Tert-butyl alcohol; TMB = Trimethylbenzene; NAP = Naphthalene; CDS = Carbon disulfide

California Maximum Contaminant Levels (MCLs) are shown in parenthesis. A California Notification Level is indicated with an asterisk (*). MCL for xylenes is for a single isomer or the sum of isomers.

All concentrations are reported in micrograms per liter (ug/L).
U = Not detected at a concentration greater than the reporting limit shown.
J = Estimated concentration.
-- = Analyte not analyzed or not reported.

Sample Type:
K = Field Duplicate sample

Notes:

California Maximum Contaminant Levels (MCLs) are shown in parenthesis. Secondary MCLs are shown for iron, silver and zinc; a notification level is shown for vanadium;and action levels from Lead and Copper Rule (22 CCR 64672.3) are shown for lead and copper.

All concentrations are reported in milligrams per liter (mg/L).
Metals analyzed by EPA Method 6010, except for Cr (+6) and Mercury, which were analyzed by EPA Methods 7196/7199 and 7471, respectively.
U = Not detected at a concentration greater than the reporting limit shown.
J = Estimated concentration. Sample analyzed after holding time had elapsed.
Analyte not analyzed or not reported if left blank.

Sample Type:
K = Field Duplicate sample

Subject: **Semiannual 2021 Progress Report**
Soil Vapor Extraction System Operations
Former Anadite, Inc. Facility
10647 Garfield Avenue, South Gate, California
CAO No.: 98-004

Dear Mr. Changkuon:

This semiannual report summarizes the results of the monitoring activities conducted for the operation of the full-scale soil vapor extraction (SVE) system for the period from October 1, 2020 to March 31, 2021, at the former Anadite, Inc. facility located at 10647 Garfield Avenue (Site), South Gate, California (Figure 1).

The Los Angeles Regional Water Quality Control Board (LARWQCB) approved the reduction of the frequency of progress reporting from quarterly to semiannually in a letter dated December 3, 2009. During this reporting period, the SVE system operations, maintenance and monitoring activities were conducted in accordance with the scope of work outlined in the State Water Recourses Control Board (State Board) Site Cleanup Subaccount Program (SCAP) grant, which is currently funding the Site remedial activities.

1.0 Background

CDM Smith conducted an initial limited SVE pilot test at the Hard Anodizing Building using two vapor extraction well (VEW) locations (VE-1 and VE-2) on April 15, 1999. The results of this limited pilot test were presented in Section 10 of the CDM Smith document titled "Supplemental Site Assessment Evaluation and Source Elimination Report" dated June 28, 1999. The test results indicated the viability of SVE technology for mass removal of volatile organic compounds (VOCs) in soil; however, it also indicated that additional design parameters were needed from a larger scale SVE pilot test.

A larger scale SVE pilot system was subsequently installed and operated in accordance with the CDM Smith letter dated August 8, 2000, which was conditionally approved by the LARWQCB in a letter dated August 28, 2000. For this larger scale pilot system, 19 additional VEWs (8 shallow and 11 deep) were installed at the Site in eight cluster wells and three single well locations (VE-3

to VE-13). In addition, 12 soil vapor probes (SVPs) (six shallow and six deep) were installed at the Site at six locations (VP-1 to VP-6) for the purpose of monitoring soil vapor removal progress, estimating the zone of influence, and monitoring effectiveness of the SVE system. The pilot-scale SVE system was configured to operate primarily in two areas of the northern portion of the Site, designated as the west and east sides. The pilot-scale system was operated between November 28, 2000 and May 31, 2002, during which time approximately 3,663 pounds (lbs) of VOCs were removed from the subsurface soils at the Site.

On May 29, 2002, CDM Smith requested the LARWQCB to allow continued operation of the pilot-scale SVE system as an interim remedial measure while system modifications were made to convert the pilot-scale system to a full-scale remediation system. CDM Smith proposed this measure to continue to provide beneficial mass removal at the Site while a full-scale system was being designed, permitted, and installed. The LARWQCB approved this request in a letter dated June 18, 2002. The pilot scale system was reactivated on July 2, 2002 and continued to operate on the west side until August 16, 2002. The system was moved back to the east side of the pilot test area and reactivated on August 19, 2002. In accordance with the June 2002 LARWQCB letter, the system was operated as an interim remedial measure on the east side between August 19 and December 30, 2002. The total mass of VOCs removed from the subsurface soils during the interim remedial measures was approximately 336 lbs.

The details of pilot-system installation, soil sample analytical results, and soil vapor monitoring results were presented in CDM Smith document titled “Technical Memorandum-Pilot Scale Soil Remediation System Using Vapor Extraction” (dated February 5, 2001) and the monthly and quarterly progress reports submitted to the LARWQCB since the startup.

The full-scale SVE system components, operations, maintenance, and monitoring were proposed in a letter from CDM Smith dated August 29, 2002 and were conditionally approved by the LARWQCB in a letter dated November 4, 2002.

The details of the full-scale system installation were presented in CDM Smith’s first quarterly progress report dated August 14, 2003. The full-scale SVE system layout is shown in Figure 2.

Between February 7 and 9, 2005, CDM Smith conducted a supplemental soil-gas investigation, which was requested by the LARWQCB in their review letter dated September 22, 2004. The objective of this investigation was to further assess the extent of elevated VOC concentrations in soil gas in the immediate vicinity of the Site (Figure 2). Soil-gas samples from depths of approximately 10 and 25 feet below ground surface (bgs) at seventeen locations were collected and analyzed for VOCs. Based on the field analytical results, six locations (VP-18 through VP-23) were selected for permanent SVP installation. The newly installed multi depth SVPs (six shallow and six deep) were added to the monitoring program for the SVE system in March 2005.

In a letter dated December 16, 2005, the LARWQCB requested that additional shallow SVPs be installed around the off-site residential properties to the north of the Site and additional SVE wells be installed along the northern property boundary. CDM Smith submitted a work plan, dated February 8, 2006, which summarized the scope of work to install the requested SVPs and SVE wells. The LARWQCB approved the work plan in a letter dated February 27, 2006.

Between March 27 and 28, 2006, four additional cluster SVE wells (VE-14 through VE-17) were installed along the northern property boundary in accordance with the approved work plan. The purpose of the additional SVE well installations was to reduce VOC concentrations in the vadose zone soils beneath the northern portion of the Site and adjacent residential properties. Eleven additional shallow SVPs (VP-24A through VP-28A) were installed on April 3, 2006. CDM Smith submitted a letter report dated June 14, 2006, which summarized the installation and sampling of the additional SVE wells and SVPs. The construction details of all SVE wells and SVPs are included in Table 1.

As indicated in CDM Smith's letter to LARWQCB dated June 30, 2011, due to Anadite California Restoration Trusts' (Trust) temporary financial liquidity issues, all Site remediation activities were suspended in June 2011. In a letter dated March 18, 2013, the LARWQCB requested that remediation and monitoring activities be resumed immediately, including SVE operation. The SVE system operations were re-started on June 14, 2013 and continued until October 2018.

Due to the Trust's inability to fund Site remediation activities, the SVE system was shut down on October 16, 2018 and the LARWQCB was notified in a letter dated October 19, 2018. The Trust started the application process for the State Board 's SCAP grant to continue remediation activities including SVE system operations at the Site. In their response letter dated March 12, 2019, LARWQCB required the Trust to resume shallow vapor monitoring activities for the selected seven SVPs (VP-16A, VP-18A, VP-24A, VP-25A, VP-26A, VP-27A and VP-28A) in the immediate vicinity of the residential area by the north of the Site. Sampling was conducted initially monthly and then semi-annually (March, May, July and September 2019 and March 2020) while the SVE system was not in operation and results were submitted to LARWCB. and are also included in this report.

The Trust's grant application was approved in July 2020. The SVE system was repaired and restarted in accordance with the scope of work outlined in the approved SCAP grant allowing operations of northern property boundary wells (VE-7S, VE-7D, VE-14S, VE-14D, VE-15S, VE-15D, VE-16S, and VE-16D) on August 12, 2020. In addition, groundwater monitoring well MW-1 located adjacent to the northern residential boundary wall, which has gone dry due to long-term declines in the groundwater elevation, was converted to a vapor extraction well and connected to the system (Figure 2). The construction details of MW-1 are included in Table 1.

2.0 SVE Systems Specifications

The system infrastructure includes 31 VEWs, designated VE-1S through VE-17D with screen intervals installed to depths ranging from approximately 15 to 30 feet; and 37 SVPs, designated VP-1S through VP-28A with probes set at depths ranging from approximately 5 to 25 feet. Monitoring well MW-1, which is screened from 34.5 to 59.5 feet, was recently converted to a VEW and connected to the system. The construction details for the VEWs and SVPs are summarized in Table 1 and the system layout is shown on Figure 3 and Figure 4.

The SVE system is comprised of a 15 horsepower (hp), Rotron Model EN909 regenerative blower capable of extracting approximately 300 standard cubic feet per minute (scfm) at 87 inches water vacuum ("H2O). Extracted soil vapor is processed through three Pure Effect, Inc. Model SA1000V vapor phase granular activated carbon (VPGAC) vessels (1,000 lbs each) connected in series. The SVE unit is permitted through the South Coast Air Quality Management District (SCAQMD) for full-scale site-specific in-situ operations (Permit No. F58689, A/N 410034).

3.0 System Operations

The system operations for this reporting period cover the period from October 1, 2020 through March 31, 2021 and included operation of the nine northern property boundary wells (VE-7S, VE-7D, VE-14S, VE-14D, VE-15S, VE-15D, VE-16S, VE-16D and SVE-MW-1). The system was in operation for 168 out of 182 days for this reporting period, resulting in an uptime of approximately 92%. The downtime for this reporting period, was for changeouts of the granular activated carbon (GAC) in accordance with the SCAQMD site specific permit conditions.

4.0 System Monitoring and Evaluation

The SVE system monitoring activities are currently conducted according to the following schedule:

Weekly

- Check that the system is operating properly and perform routine maintenance;
- Collect flow rate, vacuum, and PID readings for the operating VEWs and total system influent; and
- Collect PID readings before, between, and after the three carbon vessels to document compliance with the SCAQMD permit to operate[1].

[1] In accordance with SCAQMD requirements, the data collected to document compliance with the permit to operate is kept on file at CDM Smith's offices in Irvine, California.

Monthly

- Collect PID readings at the selected 27 SVP locations (VP-5S, VP-5D,VP-11S, VP-11D, VP-12A, VP-12S, VP-12D, VP-15A, VP-15S, VP-15D, VP-16A, VP-16S, VP-16D, VP-18A, VP-18S, VP-18D, VP-22A, VP-22S, VP-22D, VP-23A, VP-23S, VP-23D, VP-24A, VP-25A, VP-26A, VP-27A, and VP-28A)

- Collect system influent samples for laboratory analysis; and

- Collect system effluent samples to document compliance with SCAQMD permit to operate[1].

Semiannual

- Collect samples from the selected 27 SVPs for laboratory analysis

4.1 Vapor Flow Rate

The total combined system flow rate from the operating extraction wells ranged between 170 and 275 scfm. Based upon the recorded flow rates from the extraction wells, it is estimated that approximately 43.3 million cubic feet of soil vapor were extracted between October 1, 2020 through March 31, 2021 and a total of 1.78 billion cubic feet of soil vapor have been extracted from the subsurface soils from March 31, 2003 (full-scale system startup) through March 31, 2021 (Appendix A).

4.2 Field Monitoring

During this reporting period, the SVPs, VEWs, and treatment system influent were monitored using a RAE Systems MiniRAE 3000 (10.6 eV ionization potential) PID, calibrated to hexane, while the system was in operation. The PID readings from the SVPs are summarized in Table 2 and are graphically illustrated in Appendix B. The PID readings from the system influent and VEWs are summarized in Table 3 and graphically illustrated in Figures 5 through 14.

4.3 Soil Vapor Sampling

During this reporting period, soil vapor samples were collected from the treatment system influent and effluent. Soil vapor samples were collected using laboratory-supplied 1-liter Summa canisters. The samples were submitted to Eurofins Calscience, LLC, a State-certified environmental laboratory located in Garden Grove, California, and analyzed for VOCs using EPA Method No. TO-15. Laboratory reports for the soil vapor samples collected during this reporting period are presented in Appendix C. Historical results for previously monitored SVPs and SVEs are presented in Appendix D.

4.3.1 Extraction Wells

Soil vapor samples were not collected from the operating VEWs during this reporting period. Table 4 summarizes the previously detected VOCs in the currently operating nine VEWs. Historical PCE trends in the VEWs are graphically illustrated in Figures 15 through 23.

4.3.2 Soil Vapor Probes

Soil vapor samples were collected from 27 selected SVPs on March 15 and 16, 2021, Total VOC concentrations in the SVPs ranged from non-detect to 883,000 ppbv. PCE was detected in 26 of the 27 VMPs at concentrations up to 830,000 ppbv(Figure 2). The highest PCE concentrations were detected in VP- 5S and -5D, however, these concentrations were an order of magnitude lower than the September 2020 results (Figure 2). In general, PCE concentrations detected in 10 foot and deeper probes (23-30 feet bgs) decreased when compared to the September 2020 results. On the other hand, the PCE concentrations in shallow (5-foot) probes varied with some increasing and some increasing results. However, monthly PID readings from the shallow probes continued to show non-detect levels (Table 2). All analytical results from the VMPs are summarized in Table 5.

4.3.3 System Influent and Effluent

During this reporting period, monthly system influent and effluent samples were collected on October 28, November 25, and December 23, 2020, and January 26, February 24, and March 24, 2021. Total VOC concentrations in the system influent samples ranged from 7.48 to 38.24 ppmv. The analytical results for the system influent samples are summarized in Table 6 and the PCE and total VOCs (sum of all detected VOCs) concentrations versus time are illustrated in Figure 24.

Monthly effluent samples were also collected after the GAC vessels from the system exhaust stack in accordance with the SCAQMD permit to operate. The effluent monthly total VOC results (presented in Appendix C), ranged between 0.00307 to 0.03584 ppmv and were in compliance with the permit.

4.4 Mass Removal Rate

The VOC mass removal rate is estimated by multiplying the linearly interpolated daily average extraction flow rate by the linearly interpolated VOC concentrations of the soil gas samples collected from the system influent as shown below:

$$M_{VOC} = Q \times C_{VOC} \times A$$

Where:

M_{VOC} = Daily mass of VOC removal (pounds/day
Q = Volumetric flow rate (cubic feet/day)

C_{VOC} = VOC concentrations (micrograms per liter [µg/L])
A = Conversion Factor (6.24×10^{-8} liter pounds/micrograms cubic feet)

The estimated VOC mass removal rates and cumulative mass removal are presented in the operations summary (Table 7 and Appendix A) and illustrated in Figures 25 and 26, respectively.

Between, October 1, 2020 and March 24, 2021, approximately 447 lbs of VOCs were estimated to have been removed from the soil at the Site. The total estimated cumulative VOC mass removed during full-scale operations (since March 31, 2003) is approximately 18,433 lbs.

5.0 Summary

The data collected during this operational period indicated that the system operated as expected and was effective in removing VOC contaminant mass from the subsurface soil vapor at the northern boundary of the Site and reducing in-situ soil-vapor concentrations.

Notes:

Concentrations reported in parts per million by volume (ppmv)

SVP - soil vapor probe

NM - not measured

OR - over range

VP-18 through 23 were installed in February 2005

VP-12A, 15A, 16A, 18A, and 22A through 28A were installed in April 2006

Notes:

PCE = Tetrachloroethene; TCE = Trichloroethene; TCA = Trichloroethane; DCA = Dichloroethane; DCE = Dichloroethene; CMT = Chloromethane; CBN = Chlorobenzene; DCB = Dichlorobenzene; TCB = Trichlorobenzene; CFM = Chloroform; MCL = Methylene chloride; CCL = Carbon tetrachloride; DCPA = Dichloropropane; BEN = Benzene; TOL = Toluene; EBN = Ethylbenzene; TMB = Trimethylbenzene; MTBE = Methyl tert-butyl ether; ET = Ethyltoluene; and THF = Tetrahydrofuran; 13B = 1,3-Dichlorobenzene; HXN = Hexane; IPA = Isopropyl alcohol.

Samples analyzed by EPA Method TO-15 or TO-14.
All concentrations are reported in ppb (v/v).
Only the most frequently detected compounds reported in the vapor extraction well samples are listed.
If blank, compound was not reported.
U = Not detected at a concentration greater than the reporting limit shown.
"--" = Not Analyzed

SVP Analytical Results
VOC Analytical Summary
Anadite - South Gate, CA

Probe Number	Sample Date	Sample Type	PCE	TCE	1,1,1-TCA	1,1-DCA	1,2-DCA	1,1-DCE	cis-1,2-DCE	trans-1,2-DCE	CTC	CET	CFM	MCL	BEN	TOL	EBN	m,p-Xylenes	o-Xylene	1,2,4-TMB	1,3,5-TMB	Acetone	4-ET	2,2,4-TMP	BMT	IPA	THF	VAC	HPT	1,4-D

Notes:

PCE = Tetrachloroethene; TCE = Trichloroethene; TCA = Trichloroethane; DCA = Dichloroethane; DCE = Dichloroethene; CTC = Carbon tetrachloride; CET = Chloroethane; CFM = Chloroform; MCL = Methylene chloride; BEN = Benzene; TOL = Toluene; EBN = Ethylbenzene; TMB = Trimethylbenzene; ET = Ethyltoluene; TMP = Trimethylpentane; BMT = Bromomethane; IPA = Isopropyl alcohol; THF = Tetrahydrofuran; VAC = Vinyl Acetate; HPT= Heptane; 1 ,4-D = 1,4-Dioxane.

Samples analyzed by EPA Method TO-14A.
All concentrations are reported in ppb (v/v).
Only compounds detected the most frequently are listed.
If blank, analyte was not reported.
J = Results are estimated due to results exceeding the calibration range.
U = Not detected at a concentration greater than the reporting limit shown.
"--" = Not Analyzed
