Background and Purpose

Majestic Realty Co. is proposing to develop 2 logistics industrial buildings on approximately 97 acres of land in the City of Chino. The property is located at the southeast corner of Mountain Avenue and Bickmore Avenue in south Chino. The property is formerly dairy land and is unimproved except for some small structures fronting on Mountain Avenue. The site is currently vacant and unused.

The purpose of this report is to establish the basis for final design of flood protection and drainage conveyance elements, ensure that these elements can be sized properly, and to ensure the development can comply with County of San Bernardino requirements when constructed.

Project Scope

This study contemplates the entire project site. Due to the improvements that exist on the perimeter of the site and the existing topography, there are no tributary areas that direct runoff to the site, only onsite areas will be considered. Both the existing pre-developed condition of the site and the post-developed proposed condition are analyzed for comparison to ensure compliance with current drainage policies and regulations.

The Hydrology Maps for both the existing condition and proposed condition are given in Appendix A & B respectively.

Flood Designation

Modifications to Prado Dam were recently completed where the main embankment has been raised from 566 feet, NGVD to elevation 594.4 feet, NGVD. A new outlet works was also constructed to allow for increased release capabilities from the dam.

When the water surface elevation in the reservoir reaches 543.0 feet, NGVD uncontrolled releases from the spillway will commence. The spillway is also planned for modification in the future where it will be raised 20 feet, up to elevation 563 feet, NGVD. The Interim Water Control Plan will be implemented during this time to reflect operation of the dam using the new outlet works features while the spillway remains at elevation 543.0 feet, NGVD.

The property is located within the Prado Dam backwater area below the 566 contour elevation, and as such, the proposed finish floor elevations will be set at an elevation of 567. The current FEMA FIRM map no. 06071C9335H date March of 1996 indicates the Site is in Zone D – “Flood hazards are undetermined, but possible”.

Project Location

Design Criteria and Methods

The runoff calculations presented in this study are produced using the Unit Hydrograph method for developed condition detailed in the current San Bernardino County Hydrology Manual. Unit Hydrograph method was used for the developed condition as it is the input for basin routing to ensure capacity and peak flow attenuation. Because this is a preliminary study to determine feasibility, multiple recurrence interval storms were not produced as would be required on a final report. This study presents the typical worst case storm event; the 24 hr, 100 year storm. Pre-development hydrology was produced with the rational method as detailed in the current San Bernardino County Hydrology Manual.

The County requires that post-development runoff does not exceed pre-development runoff, and the City of Chino requires that a maximum of 80% and the pre-developed runoff rate.

The proposed detention basins are to be sized for the 100 year, 24 hour storm event. No volume reduction is taken for infiltration. The detention basin will also act as a Water Quality basin and will be designed as a Bio-Retention Facility in accordance with State and County standards. Detention basin volume and outflow calculations are produced with a spreadsheet program. Outlet pipe hydraulics is based on the peak outlet Q from the basin and the use of dual wall, HDPE storm drain pipe designed in accordance with City of Chino and County of San Bernardino standards as well as in accordance with EM 1110-2-2902, Chapter 6.

Street flow in Mountain Ave will not exceed curb height in the 100 year storm event.

Hydrology Model Assumptions

Existing Condition:

Soils Type = C – Soil map included.

Rainfall Data – NOAA Atlas 14 per SB County requirements.

AMC = 2 - Typical for studies of this nature.

Base Flow = 0 – There are no existing watercourses in the study catchment.

Proposed Condition:

Soils Type = C – Soil map included.

Rainfall Data – NOAA Atlas 14 per SB County requirements.

AMC = 2 - Typical for studies of this nature.

Unit Hydrograph Lag Time – Calculated by Hydrology program based on physical properties.

Base Flow = 0 – There are no existing watercourses in the study catchment.

Basin Outlet Structure

The proposed structure controlling outlet flows to the Cypress Channel is the interface between the basins and the offsite storm drain. The outlet storm drain will be directed to the east along the southerly property line and will connect to the Cypress Channel outlet structure at its southerly end.

This structure will limit the flow out of the basin by providing an open orifice at the top of the structure at the proper elevation to ensure proper Water Quality treatment volume, drawdown time, ensure peak inflow attenuation, and safely outlet design storm flows to the outlet storm drain.

Preliminary Hydrology Results

Existing Condition

	100 YR
SUBAREA	CFS
A	137.7
B	39.8
TOTALS	177.5

Developed Condition

Tributary to Detention Basin

	100 YR- INFLOW	OUTLET TO CYPRESS CHANNEL
SUBAREA	CFS	CFS
A	215.8	131.0

Allowable Q based on pre-developed runoff = (177.5 cfs) x (0.8) = 142.0 cfs

Conclusion

This study and the related calculations indicated that the proposed development design flows can be conveyed to the proposed detention basins without danger of site flooding. Additionally, the detention basins are properly sized to attenuate the difference between pre-development runoff and runoff from the completed development.

Note that a final Hydrology and Hydraulics study will be required to accompany final construction documents to analyze final basin geometry, provide conveyance element hydraulics for proper pipe sizing, surface drainage facilities and energy dissipation.

Program License Serial Number 6262

***** Hydrology Study Control Information *****

Rational hydrology study storm event year is 100.0
Computed rainfall intensity:
Storm year = 100.00 1 hour rainfall = 1.410 (In.)
Slope used for rainfall intensity curve b = 0.6000
Soil antecedent moisture condition (AMC) = 2

+++++
Process from Point/Station 11.000 to Point/Station 12.000
**** INITIAL AREA EVALUATION ****

COMMERCIAL subarea type
Decimal fraction soil group A = 0.000
Decimal fraction soil group B = 0.000
Decimal fraction soil group C = 1.000
Decimal fraction soil group D = 0.000
SCS curve number for soil(AMC 2) = 69.00
Pervious ratio(Ap) = 0.1000 Max loss rate(Fm)= 0.055 (In/Hr)
Initial subarea data:
Initial area flow distance = 990.000(Ft.)
Top (of initial area) elevation = 573.000(Ft.)
Bottom (of initial area) elevation = 567.000(Ft.)
Difference in elevation = 6.000(Ft.)
Slope = 0.00606 s(%)= 0.61
TC = k(0.304)*[(length^3)/(elevation change)]^0.2
Initial area time of concentration = 13.324 min.
Rainfall intensity = 3.478(In/Hr) for a 100.0 year storm
Effective runoff coefficient used for area (Q=KCIA) is C = 0.886
Subarea runoff = 2.372(CFS)
Total initial stream area = 0.770(Ac.)
Pervious area fraction = 0.100
Initial area Fm value = 0.055 (In/Hr)

+++++
Process from Point/Station 12.000 to Point/Station 13.000
**** STREET FLOW TRAVEL TIME + SUBAREA FLOW ADDITION ****

Top of street segment elevation = 567.000(Ft.)
End of street segment elevation = 551.800(Ft.)
Length of street segment = 1844.000(Ft.)
Height of curb above gutter flowline = 2.0 (In.)
Width of half street (curb to crown) = 100.000(Ft.)
Distance from crown to crossfall grade break = 50.000(Ft.)
Slope from gutter to grade break (v/hz) = 0.005
Slope from grade break to crown (v/hz) = 0.005
Street flow is on [1] side(s) of the street
Distance from curb to property line = 50.000(Ft.)
Slope from curb to property line (v/hz) = 0.020
Gutter width = 2.000(Ft.)

Gutter hike from flowline = 0.150(In.)
Manning's N in gutter = 0.0150
Manning's N from gutter to grade break = 0.0150
Manning's N from grade break to crown = 0.0150
Estimated mean flow rate at midpoint of street = 5.113(CFS)
Depth of flow = 0.174(Ft.), Average velocity = 1.733(Ft/s)
Warning: depth of flow exceeds top of curb
Distance that curb overflow reaches into property = 0.37(Ft.)
Streetflow hydraulics at midpoint of street travel:
Halfstreet flow width = 34.327(Ft.)
Flow velocity = 1.73(Ft/s)
Travel time = 17.73 min. TC = 31.05 min.
Adding area flow to street
COMMERCIAL subarea type
Decimal fraction soil group A = 0.000
Decimal fraction soil group B = 0.000
Decimal fraction soil group C = 1.000
Decimal fraction soil group D = 0.000
SCS curve number for soil(AMC 2) = 69.00
Pervious ratio(A_p) = 0.1000 Max loss rate(F_m)= 0.055(In/Hr)
Rainfall intensity = 2.093(In/Hr) for a 100.0 year storm
Effective runoff coefficient used for area,(total area with modified rational method)($Q=KCIA$) is $C = 0.876$
Subarea runoff = 5.425(CFS) for 3.480(Ac.)
Total runoff = 7.797(CFS)
Effective area this stream = 4.25(Ac.)
Total Study Area (Main Stream No. 1) = 4.25(Ac.)
Area averaged F_m value = 0.055(In/Hr)
Street flow at end of street = 7.797(CFS)
Half street flow at end of street = 7.797(CFS)
Depth of flow = 0.204(Ft.), Average velocity = 1.898(Ft/s)
Warning: depth of flow exceeds top of curb
Distance that curb overflow reaches into property = 1.88(Ft.)
Flow width (from curb towards crown)= 40.355(Ft.)
End of computations, Total Study Area = 4.25 (Ac.)
The following figures may
be used for a unit hydrograph study of the same area.
Note: These figures do not consider reduced effective area
effects caused by confluences in the rational equation.

Area averaged pervious area fraction(A_p) = 0.100
Area averaged SCS curve number = 69.0

FLOOD HYDROGRAPH ROUTING PROGRAM
Copyright (c) CIVILCADD/CIVILDESIGN, 1989 - 2005
Study date: 11/01/19

MAJESTIC CHINO LOGISTICS CENTER
100 YEAR, 24 HR FLOOD ROUTING
BASIN A
100105RTE

Program License Serial Number 6262

***** HYDROGRAPH INFORMATION *****

From study/file name: 100105uh.rte
***** HYDROGRAPH DATA *****
Number of intervals = 302
Time interval = 5.0 (Min.)
Maximum/Peak flow rate = 215.793 (CFS)
Total volume = 48.741 (Ac.Ft)
Status of hydrographs being held in storage
Stream 1 Stream 2 Stream 3 Stream 4 Stream 5
Peak (CFS) 0.000 0.000 0.000 0.000 0.000
Vol (Ac.Ft) 0.000 0.000 0.000 0.000 0.000

+++++
Process from Point/Station 1.000 to Point/Station 2.000
**** RETARDING BASIN ROUTING ****

User entry of depth-outflow-storage data

Total number of inflow hydrograph intervals = 302
Hydrograph time unit = 5.000 (Min.)
Initial depth in storage basin = 0.00(Ft.)

Initial basin depth = 0.00 (Ft.)
Initial basin storage = 0.00 (Ac.Ft)
Initial basin outflow = 0.00 (CFS)

Depth vs. Storage and Depth vs. Discharge data:

Basin Depth (Ft.)	Storage (Ac.Ft)	Outflow (CFS)	(S-O*dt/2) (Ac.Ft)	(S+O*dt/2) (Ac.Ft)

¹ Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.
