SPECIES	STATUS*	HABITAT	POTENTIAL FOR OCCURRENCE
Wildlife			
song sparrow – "Suisun Population" <i>Melospiza melodia maxillaris</i>	BCC, SSC	Resident of brackish-water marshes surrounding Suisun Bay. Inhabits cattails, tules and other sedges, and Salicornia; also known to frequent tangles bordering sloughs.	No Potential [to nest]. The Study Area is located outside this subspecies' range along Suisun Bay.
Swainson's hawk Buteo swainsoni	ST, BCC	Summer resident in California's Central Valley and limited portions of the southern California interior. Nests in tree groves and isolated trees in riparian and agricultural areas, including near buildings. Forages in grasslands and scrub habitats as well as agricultural fields, especially alfalfa. Preys on arthropods year-round as well as smaller vertebrates during the breeding season.	Present. During surveys conducted in 2018 WRA biologists identified two nests for this species within the Study Area. Two additional nests were observed during the same surveys in close proximity to the Study Area, but outside of the actual property boundary.
tricolored blackbird Agelaius tricolor	BCC, SSC, SC	Usually nests over or near freshwater in dense cattails, tules, or thickets of willow, blackberry, wild rose or other tall herbs. Nesting area must be large enough to support about 50 pairs.	Moderate Potential [to nest]. There are records of the species within 5 miles of the Study Area, and likely breeding colonies within 10 miles (CDFW 2018a). Though the majority of the Study Area does not provide suitable habitat for the species, freshwater marshes with dense emergent vegetation on the margins of the Study Area, especially in the south, could potentially support habitat for a breeding colony. Current maintenance of much of the Liberty Farms area as managed wetlands could limit food availability during the nesting season, thus the restoration project would increase the chances that a colony would be found in the Study Area.

SPECIES	STATUS*	HABITAT	POTENTIAL FOR OCCURRENCE
Wildlife			
western yellow-billed cuckoo Coccyzus americanus	FT, SE, BCC, FS sensitive	Summer resident, breeding in dense riparian forests and jungles, typically with early successional vegetation present. Utilizes densely-foliaged deciduous trees and shrubs. Eats mostly caterpillars. Current breeding distribution within California very restricted.	No Potential [to nest]. The Study Area does not contain the dense old-growth riparian forest required by this species.
western snowy plover Charadrius alexandrinus nivosus	FT, BCC, SSC	Federal listing applies only to the Pacific coastal population. Year-round resident and winter visitor on sandy beaches, salt pond levees and shores of large alkali lakes. Requires sandy, gravelly or friable soils for nesting.	No Potential [to nest]. The Study Area does not contain sandy beaches, alkaline lakes or other such suitable habitat to support nesting by this species.
whimbrel Numenius phaeopus	BCC	Breeds in tundra habitat, from wet lowlands to dry heath. In migration, frequents various coastal and inland habitats, including fields and beaches. Winters in tidal flats and shorelines, occasionally visiting inland habitats.	No Potential [to nest]. This species does not nest in this portion of California (USFWS 2018a). The species can be found foraging in the area during winter migrations only. Because the species does not nest in the area, there is no potential to impact nesting by this species from the Project.
white-tailed kite Elanus leucurus	CFP	Year-round resident in coastal and valley lowlands with scattered trees and large shrubs, including grasslands, marshes and agricultural areas. Nests in trees, of which the type and setting are highly variable. Preys on small mammals and other vertebrates.	Moderate Potential [to nest]. This species typically uses grassland or agricultural fields like those within the Study Area for foraging. Additionally, scattered large trees throughout the area may provide nesting habitat for the species. No active nests for this species were observed during surveys by WRA; however, there is still a moderate potential for the species to nest in the Study Area.

SPECIES	STATUS*	HABITAT	POTENTIAL FOR OCCURRENCE
Wildlife			
willet Tringa semipalmata	BCC	Inhabits open beaches, bayshores, marshes, mudflats, and rocky coastal zones. Nests inland on the ground along pond edges and other seasonal wetlands, or on raised sites near water, often in native grasslands.	No Potential [to nest]. This species does not nest in this portion of California (USFWS 2018a). The species can be found foraging in the area during winter migrations only. Because the species does not nest in the area, there is no potential to impact nesting by this species from the Project.
wrentit Chamaea fasciata	BCC	Year-round resident in coastal scrub and chaparral along the West Coast. Nests in many types of vegetation including California sage, coyote brush, blackberry, poison oak, coffeeberry, Douglas-fir, bush lupine, wild rose, valley oak, and wild grape.	Unlikely [to nest]. The Study Area does not contain scrub or chaparral which is more characteristic of the species habitat. The Study Area provides suboptimal habitat for the species, and while it may infrequently be observed in the area, it is unlikely to nest in the Study Area.
yellow warbler Setophaga (Dendroica) petechia brewsteri	BCC, SSC	Frequents riparian plant associations. Prefers willows, cottonwoods, aspens, sycamores and alders for nesting and foraging. Also nests in montane shrubbery in open conifer forests.	Moderate Potential [to nest]. Willow riparian areas lining Lookout Slough and within portions of Liberty Farms provide potential nesting habitat for the species. Potential foraging habitat is also supported throughout the riparian and edge habitat as well.
yellow-billed magpie Pica nuttalli	BCC	Endemic to the Central Valley and central Coast Ranges. Favors open park-like areas with expanses of open ground, including oak savannah, orchards, and along stream courses. Large, dome-shaped stick nests are placed in trees.	Unlikely [to nest]. This species is not known to nest in this area of Solano County (Rippey et al 2014). Additionally, suitable nest trees are fairly uncommon except along waterways which are not typically favored nesting situations for the species. While the species has been observed on site, and may opportunistically forage in the Study Area, it is unlikely to nest at the site due to the absence of woodland habitat typical of the species nesting habitat requirements.

SPECIES	STATUS*	HABITAT	POTENTIAL FOR OCCURRENCE
Wildlife			
yellow-breasted chat Icteria virens	SSC	Summer resident, occurring in riparian areas with an open canopy, very dense understory, and trees for song perches. Nests in thickets of willow, blackberry, and wild grape.	Unlikely [to nest]. The Study Area does not contain dense riparian habitat to support foraging or nesting in this species. Additionally, this species is uncommon in the region and has very few documented nesting occurrences in Solano County (Rippey et al 2014; eBird 2017).
yellow-headed blackbird Xanthocephalus xanthocephalus	SSC	Summer resident. Breeds colonially in freshwater emergent wetlands with dense vegetation and deep water, often along borders of lakes or ponds. Requires abundant large insects such as dragonflies; nesting is timed for maximum emergence of insect prey.	Unlikely [to nest]. This species is not known to nest within this portion of Solano County (Rippey et al 2014). Individuals may winter with mixed flocks of blackbirds in the area; however, no nesting colonies have been documented within Solano or Yolo County (CDFW 2019). The Study Area is lacking suitable dense emergent wetlands bordering deep water characteristic of the species nesting habitat.
Reptiles and Amphibians			
California red-legged frog Rana draytonii	FT, SSC	Lowlands and foothills in or near permanent sources of deep water with dense, shrubby or emergent riparian vegetation. Requires 11 to 20 weeks of permanent water for larval development. Must have access to estivation habitat.	Unlikely. This species was evaluated as part of the Solano County HCP and the Study Area was determined to be outside of the species known range within Solano County (Solano 2012). The species was not observed during field surveys either, and it is unlikely to occur in the Study Area.

Wildlife			
California tiger salamander Ambystoma californiense	FE/FT, ST, SSC	Inhabits grasslands, oak woodland and scrublands. Spends most of the year underground in mammal burrows and Adults utilize mammal burrows as estivation habitat.	Unlikely. The Study Area does not fall within the potential or known range of the species within Solano County (Solano 2012). The Study Area has been farmed as flood irrigated agriculture, a practice which is destructive to salamander habitat (Ford et al 2013). Additionally, the Study Area lies within the 100-year floodplain, an area which does not typically support the species due to loss of estivation habitat (FEMA 2017, Ford et al 2013).
giant garter snake Thamnophis gigas	FT, ST, RP	Prefers freshwater marsh and low gradient streams. Has adapted to drainage canals and irrigation ditches. This is the most aquatic of the garter snakes in California.	Present. During reconnaissance level eDNA surveys in 2018 this species was detected in Lookout and Sycamore Sloughs. Additionally, a specimen of this species was recorded in the CNDDB on the roadway atop the boundary levee at the southeastern edge of the Study Area (CDFW 2018a).
western pond turtle Actinemys marmorata	SSC	Occurs in perennial ponds, lakes, rivers and streams with suitable basking habitat (mud banks, mats of floating vegetation, partially submerged logs) and submerged shelter.	Present. Within the slough complex surrounding the Study Area deep water habitat, foraging opportunities and basking sites such as downed trees and rocks are present and may support use by the species. Grassland habitat on the existing levees and within the Study Area provide potential nesting habitat.

SPECIES	STATUS*	HABITAT	POTENTIAL FOR OCCURRENCE
Wildlife			
Chinook salmon, Central Valley fall/late fall-run Evolutionary Significant Unit (ESU) Oncorhynchus tshawytscha	SSC, NMFS	Populations spawning in the Sacramento and San Joaquin Rivers and their tributaries. Adults migrate upstream to spawn in cool, clear, well-oxygenated streams. Juveniles may remain in fresh water for 1 or more years before migrating downstream to the ocean	High Potential. Cache, Hass and Shag Sloughs surround the Study Area and are used by juveniles of this species as rearing habitat. Typical spawning grounds for this species are upstream of the Study Area; therefore, it is likely that they will pass through and forage in sloughs surrounding the Study Area during outmigrations. The existing levee structure and water diversion system with the Study Area; however, excludes this species from occurring within the interior aquatic features of the site.
Chinook salmon, Central Valley spring-run ESU Oncorhynchus tshawytscha	FT, ST, NMFS	Anadromous, spending most of life cycle in the ocean. Federal listing includes populations spawning in the Sacramento River and its tributaries. Adults migrate upstream to spawn in cool, clear, well-oxygenated streams. Juveniles remain in fresh water for one or more years before migrating downstream to the ocean.	High Potential. Cache, Hass and Shag Sloughs surround the Study Area and are used by juveniles of this species as rearing habitat. Typical spawning grounds for this species are upstream of the Study Area; therefore, it is likely that they will pass through and forage in sloughs surrounding the Study Area during outmigrations.
Chinook salmon, Sacramento River winter-run ESU Oncorhynchus tshawytscha	FE, SE, NMFS	Occurs in the Sacramento River below Keswick Dam. Spawns in the Sacramento River but not in tributary streams. Requires clean, cold water over gravel beds with water temperatures between 6 and 14 degrees C for spawning. Adults migrate upstream to spawn in cool, clear, well-oxygenated streams. Juveniles typically migrate to the ocean soon after emergence from the gravel.	High Potential. Cache, Hass and Shag Sloughs surround the Study Area and are used by juveniles of this species as rearing habitat. Typical spawning grounds for this species are upstream of the Study Area; therefore, it is likely that they will pass through and forage in sloughs surrounding the Study Area during outmigrations. The existing levee structure and water diversion system with the Study Area; however, excludes this species from occurring within the interior aquatic features of the site.

SPECIES 1	STATUS*	HABITAT	POTENTIAL FOR OCCURRENCE
Wildlife			
coho salmon, central California coast ESU Oncorhynchus kisutch	FE, SE, NMFS	Federal listing includes populations between Punta Gorda and San Lorenzo River. State listing includes populations south of San Francisco Bay only. Occurs inland and in coastal marine waters. Requires beds of loose, silt-free, coarse gravel for spawning. Also needs cover, cool water and sufficient dissolved oxygen.	No Potential. This species has been extirpated from the waters of San Francisco Bay and its tributaries.
Delta smelt Hypomesus transpacificus	FT, SE	Endemic to the Sacramento Delta, where it is distributed from the Suisun Bay upstream through the Delta in Contra Costa, Sacramento, San Joaquin, Solano and Yolo counties. The delta smelt is a pelagic and euryhaline species	High Potential. Cache, Hass and Shag Sloughs that surround the Study Area are typical habitat used by adults and juveniles of this species. Nearby occurrences in CDFW trawls have confirmed the species is present in the Cache Slough Complex (CDFW 2017b). The existing levee structure and water diversion system with the Study Area; however, excludes this species from occurring within the interior aquatic features of the site.
green sturgeon, southern Distinct Population Segment (DPS) Acipenser medirostris	FT, SSC NMFS	Spawn in the Sacramento River and the Klamath River. Spawn at temperatures between 8-14 degrees C. Preferred spawning substrate is large cobble, but can range from clean sand to bedrock. Spawn in deep pools or "holes" in large, turbulent, freshwater river mainstems. Adults live in oceanic waters, bays, and estuaries when not spawning. Species is known to forage in estuaries and bays.	Moderate Potential. Cache, Hass and Shag Sloughs surround the Study Area and are used by juveniles of this species as rearing habitat. Typical spawning grounds for this species are upstream of the Study Area within the Feather and Sacramento Rivers, therefore it is likely that the species will pass through or forage in sloughs surrounding the Study Area during outmigrations. The existing levee structure and water diversion system with the Study Area; however, excludes this species from occurring within the interior aquatic features of the site.

SPECIES	STATUS*	HABITAT	POTENTIAL FOR OCCURRENCE
Wildlife			
hardhead Mylopharodon conocephalus	SSC	Low to mid-elevation streams in the Sacramento-San Joaquin drainage. Clear, deep pools with sand-gravel-boulder bottoms and slow water velocity. Typically found with Sacramento Pikeminnow and Sacramento Sucker.	Unlikely. This species forages, rears and spawns in creeks or rivers with deep clear pools, and gravelly bottoms. These conditions are not present within or surrounding the Study Area.
longfin smelt Spirinchus thaleichthys	ST, FC	Euryhaline, nektonic and anadromous. Found in open waters of estuaries, mostly in middle or bottom of water column. Prefer salinities of 15 to 30 ppt, but can be found in completely freshwater to almost pure seawater.	High Potential. Cache, Hass and Shag Sloughs that surround the Study Area are typical habitat used by adults and juveniles of this species. Nearby occurrences in CDFW trawls have confirmed the species is present in the Cache Slough Complex (CDFW 2017b). The existing levee structure and water diversion system with the Study Area; however, excludes this species from occurring within the interior aquatic features of the site.
Sacramento Splittail Pogonichthys macrolepidotus	SSC	Endemic to the lakes and rivers of the Central Valley, but now confined to the Sacramento Delta, Suisun Bay and associated marshes. Occurs in slow-moving river sections and dead end sloughs. Requires flooded vegetation for spawning and foraging for young. Splittail are primarily freshwater fish, but are tolerant of moderate salinity and can live in water where salinity levels reach of 10-18 parts per thousand.	Present. During fisheries surveys in 2018 this species was observed within the irrigation ditches running throughout the Study Area. Nearby occurrences in CDFW trawls have also confirmed the species is present in the Cache Slough Complex (CDFW 2018b).

SPECIES	STATUS*	HABITAT	POTENTIAL FOR OCCURRENCE
Wildlife			
steelhead - Central Valley DPS Oncorhynchus mykiss	FT, NMFS	Anadromous, spending most of life cycle in the ocean. Occurs in the Sacramento and San Joaquin Rivers and their tributaries, excluding San Francisco and San Pablo bays and their tributaries. Adults migrate upstream to spawn in cool, clear, well-oxygenated streams. Juveniles remain in fresh water for 1 or more years before migrating downstream to the ocean.	High Potential. Cache, Hass and Shag Sloughs surround the Study Area and are used by juveniles of this species as rearing habitat. Typical spawning grounds for this species are also upstream of the Study Area; therefore, it is likely that they will pass through and forage in sloughs surrounding the Study Area during outmigrations. The existing levee structure and water diversion system with the Study Area; however, excludes this species from occurring within the interior aquatic features of the site.
tidewater goby Eucyclogobius newberryi	FE, SSC	Habitat is characterized by brackish water in shallow lagoons and in lower stream reaches where the water is fairly still but not stagnant. Restricted to waters with low to moderate salinities in California's coastal wetland habitats.	No Potential. This species has been extirpated from the waters of San Francisco Bay and its tributaries.
white sturgeon Acipenser transmontanus	SSC	Found in most estuaries along the Pacific coast. Adults in the San Francisco Bay Estuary system spawn in the Sacramento River and are not known to enter freshwater or non-tidal reaches of Estuary streams. Spawn May through June.	Moderate Potential. Cache, Hass and Shag Sloughs surround the Study Area and are used by juveniles of this species as rearing habitat. Typical spawning grounds for this species are upstream of the Study Area within the Sacramento and Feather Rivers, therefore it is likely that they will migrate through waters surrounding the Study Area during outmigrations. The existing levee structure and water diversion system with the Study Area; however, excludes this species from occurring within the interior aquatic features of the site.

SPECIES	STATUS*	HABITAT	POTENTIAL FOR OCCURRENCE
Wildlife			
Antioch Dunes anthicid beetle Anthicus antiochensis	SSI	Anthicus antiochensis is apparently extirpated from the type locality at Antioch Dunes. Stabilization of the dunes in the 1950s may have eliminated the loose, sandy substrate preferred by this species. In the early 1990s it was collected for the first time at several sites along the Sacramento River in Glenn, Tehama, Shasta, and Solano Counties, and from one site at Nicolas on the Feather River in Sutter County (Davis 1991). bare, unvegetated sand	No Potential. The Study Area is outside of the known range for this species.
California linderiella Linderiella occidentalis	SSI	Seasonal pools in unplowed grasslands with old alluvial soils underlain by hardpan or in sandstone depressions. Water in the pools has very low alkalinity, conductivity, and TDS.	No Potential. While occurrences of this species are recorded within 5-miles of the Study Area, they are restricted to higher elevation uplands to the north and west (CDFW 2018a). Uplands in these areas support vernal pools, which are required by the species. The Study Area is outside of both the historic and current distribution of vernal pools within Solano County (Solano 2012). Additionally, lands within the Study Area have been used for flood irrigated pasture and winter waterfowl management collectively for several decades which are practices that eliminates use of an area as branchiopod habitat (USFWS 2007).
Callippe silverspot butterfly Speyeria callippe callippe	FE, SSI	Two populations in San Bruno mountain and the Cordelia Hills are recognized. Hostplant is Viola pedunculata, which is found on serpentine soils. Most adults found on east-facing slopes; males congregate on hilltops in search of females.	No Potential. The Study Area is outside of the very restricted range of this species and does not contain suitable habitat nor the host plant.

SPECIES	STATUS*	HABITAT	POTENTIAL FOR OCCURRENCE
Wildlife	gine and green are not		
conservancy fairy shrimp Branchinecta conservatio	FE, SSI, RP	Endemic to the grasslands of the northern two-thirds of the Central Valley; found in large, turbid pools. Inhabit astatic pools located in swales formed by old, braided alluvium; filled by winter/spring rains, last until June.	No Potential. While occurrences of this species are recorded within 5-miles of the Study Area, they are restricted to higher elevation uplands to the north and west (CDFW 2018a). Uplands in these areas support vernal pools, which are required by the species. The Study Area is outside of both the historic and current distribution of vernal pools within Solano County (Solano 2012). Additionally, lands within the Study Area have been used for flood irrigated pasture and winter waterfowl management collectively for several decades which are practices that eliminates use of an area as branchiopod habitat (USFWS 2007).
Delta green ground beetle Elaphrus viridis	FT, SSI, RP	Restricted to the margins of vernal pools in the grassland area between Jepson Prairie and Travis Air Force Base. Prefers the sandy mud substrate where it slopes gently into the water, with low-growing vegetation, 25 to100% cover.	No Potential. The Project does not contain vernal pools suitable to support this species. Additionally grazing, farming, duck hunting and flood irrigation are practices which diminish conditions required to support this species.

SPECIES	STATUS*	HABITAT	POTENTIAL FOR OCCURRENCE
Wildlife			
midvalley fairy shrimp Branchinecta mesovallensis	SSI	Known only from the Central Valley, primarily its central portions. Typically inhabits short-lived, grass-bottomed vernal pools and other seasonal water features.	No Potential. While occurrences of this species are recorded within 5-miles of the Study Area, they are restricted to higher elevation uplands to the north and west (CDFW 2018a). Uplands in these areas support vernal pools, which are required by the species. The Study Area is outside of both the historic and current distribution of vernal pools within Solano County (Solano 2012). Additionally, lands within the Study Area have been used for flood irrigated pasture and winter waterfowl management collectively for several decades which are practices that eliminates use of an area as branchiopod habitat (USFWS 2007).
Ricksecker's water scavenger beetle Hydrochara rickseckeri	SSI	Small aquatic beetle known only from pond habitats scattered around the San Francisco Bay area, including Marin, Sonoma, Alameda, and Contra Costa counties. Extensive surveys from 1988 failed to locate this species. The locations of existing populations remain unknown (Hafernick 1989).	No Potential. The Study Area is outside of the species known range.
Sacramento anthicid beetle Anthicus sacramento	SSI	Anthicus sacramento is found in several locations along the Sacramento and San Joaquin rivers, from Shasta to San Joaquin counties, and at one site along the Feather River at Nicolaus. Inhabit sand slipfaces among bamboo and willow. Interior sand dunes and sand bars; has also been found in dredge spoil heaps	No Potential. The Study Area is not within the limited range for this species.

SPECIES	STATUS*	HABITAT	POTENTIAL FOR OCCURRENCE
Wildlife			
valley elderberry longhorn beetle Desmocerus californicus dimorphus	FT, SSI, RP	Occurs only in the central valley of California, in association with blue elderberry (Sambucus spp.). Prefers to lay eggs in elderberry 2 to 8 inches in diameter; some preference shown for "stressed" elderberry.	Unlikely. Lands within the Study Area have been used for flood irrigated pasture and winter waterfowl management collectively for several decades. Land management, grazing practices, and levee maintenance result in frequent disturbance and alteration of vegetation within the Study Area. In 2018, focus surveys for elderberry (the species host plant) were conducted and only one small isolated group of elderberry shrubs were found on the outboard (flood side) of the levee, in an area devoid of a dominant riparian canopy vegetation layer. Surveys followed USFWS 2017 Framework for Assessing Impacts to the Valley Elderberry Longhorn Beetle, which included all areas within 50 m (165 ft) of the host plant. No exit holes of any type were observed in the elderberry shrubs; which only occurred in an area subject to flooding and within an area where levee maintenance frequently occurs as evident by riprap near the plants. Due to the extensive disturbance, isolation of the Study Area from documented occurrences, marginal host plant availability, and absence of exit holes, it is unlikely that the species would occur in the Study Area.

SPECIES / SPECIES	STATUS*	HABITAT	POTENTIAL FOR OCCURRENCE
Wildlife			
Vernal pool andrenid bee Andrena blennospermatis	SSI	A solitary, ground-nesting bee found in upland areas near vernal pools. Its host plant is <i>Blennosperma spp.</i> and does not forage far from the host plant. Range is Contra Costa, El Dorado, Lake, Placer, Sacramento, San Joaquin, Solano, Sonoma, Tehama, and Yolo counties.	No Potential. While occurrences of this species are recorded within 5-miles of the Study Area, they are restricted to higher elevation uplands to the north and west (CDFW 2018a). Uplands in these areas support vernal pools, which are required by the species. The Study Area is outside of both the historic and current distribution of vernal pools within Solano County (Solano 2012). Additionally, lands within the Study Area have been used for flood irrigated pasture and winter waterfowl management collectively for several decades which are practices that eliminates use of an area as branchiopod habitat (USFWS 2007).
vernal pool fairy shrimp Branchinecta lynchi	FT, SSI, RP	Endemic to the grasslands of the Central Valley, central coast mountains, and south coast mountains, in astatic rain-filled pools. Inhabit small, clearwater sandstone-depression pools and grassed swale, earth slump, or basalt-flow depression pools.	No Potential. While occurrences of this species are recorded within 5-miles of the Study Area, they are restricted to higher elevation uplands to the north and west (CDFW 2018a). Uplands in these areas support vernal pools, which are required by the species. The Study Area is outside of both the historic and current distribution of vernal pools within Solano County (Solano 2012). Additionally, lands within the Study Area have been used for flood-irrigated pasture and winter waterfowl management collectively for several decades which are practices that eliminates use of an area as branchiopod habitat (USFWS 2007).

SPECIES	STATUS*	HABITAT	POTENTIAL FOR OCCURRENCE
Wildlife			
vernal pool tadpole shrimp Lepidurus packardi	FE, SSI, RP	Inhabits vernal pools and swales in the Sacramento Valley containing clear to highly turbid water. Pools commonly found in grass bottomed swales of unplowed grasslands. Some pools are mud-bottomed and highly turbid.	No Potential. While occurrences of this species are recorded within 5-miles of the Study Area, they are restricted to higher elevation uplands to the north and west (CDFW 2018a). Uplands in these areas support vernal pools, which are required by the species. The Study Area is outside of both the historic and current distribution of vernal pools within Solano County (Solano 2012). Additionally, lands within the Study Area have been used for flood-irrigated pasture and winter waterfowl management collectively for several decades which are practices that eliminates use of an area as branchiopod habitat (USFWS 2007).
western bumble bee Bombus occidentalis	SSI	Formerly common throughout much of western North America; populations from southern British Columbia to central California have nearly disappeared (Xerces 2017). Occurs in a wide variety of habitat types. Nests are constructed annually in pre-existing cavities, usually on the ground (e.g. mammal burrows). Many plant species are visited and pollinated.	Unlikely. Lands within the Study Area have been used for flood-irrigated pasture and winter waterfowl management collectively for several decades. Land management, grazing practices, and levee maintenance result in frequent disturbance and minimize available small mammal burrows. Therefore, the Study Area is unlikely to support nesting by the species.

Greenhouse Gas(GHG) Emissions Reduction Plan **Consistency Determination**

For Projects Using Contractors or Other Outside Labor

This form is to be used by DWR project managers to document a DWR CEQA project's consistency with the DWR Greenhouse Gas Emissions Reduction Plan. This form is to be used only when DWR is the Lead Agency and when contractors or outside labor and equipment are used to implement the project.

Additional Guidance on filling out this form can be found at: http://dwrclimatechange.water.ca.gov/guidance_resources.cfm

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
User Defined Recreational	1.00	User Defined Unit	3,395.00	0.00	0

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	6.8	Precipitation Freq (Days)	56
Climate Zone	4			Operational Year	2021
Utility Company	User Defined				
CO2 Intensity (lb/MWhr)	0	CH4 Intensity (lb/MWhr)	0	N2O Intensity (Ib/MWhr)	0

1.3 User Entered Comments & Non-Default Data

Lookout Slough v1 - Solano-Sacramento County, Annual

Project Characteristics - Utility details not included as GHG was analyzed using a separate tool.

Land Use - Arbitrary use of user defined recreational land use would not affect the output of construction emissions.

Construction Phase - Select all construction hours in 2020 and 2021 to happen on one day each year to obtain total emissions

Off-road Equipment - According to equipment hours provided by project applicant.

Off-road Equipment - According to equipment hours provided by project applicant.

Off-road Equipment - According to equipment hours provided by project applicant.

Off-road Equipment - According to equipment hours provided by project applicant.

Off-road Equipment - According to equipment hours provided by project applicant.

Grading - Assume all material export would occur in 2020

Demolition - Demo debris tonnage given by project applicant

Trips and VMT - Assume maximum scenario of 150 workdays per year, 26 workers per day, 3.5-hour worker roundtrips. Haul trips calculated based on material export.

Energy Use -
