Dear Mr. Sullivan:

At your request, **GeoSolve, Inc.** presents our Additional Soil Sampling Activities report, which summarizes shallow soil sampling activities at the above referenced site. The subject property of additional concern is located at 1433, 1453, 1463, 1483 and 1493 El Camino Real, Santa Clara, California, with Assessor's Parcel Numbers (APNs) 224-48-004, 224-48-005, and 224-48-006. The property had mixed use and was used as a car wash, an auto repair shop and has an older residence situated on the site. The property encompasses approximately 1.69-acres of land. The site vicinity is shown on Figure 1, Site Vicinity Map.

## **Background**

Cornerstone Earth Group (CEG) conducted a Phase I Environmental Site Assessment (ESA) and Preliminary Soil, Soil-Gas, and Groundwater Quality Evaluation at the property (Reference 1) and prepared a Soil and Soil-Vapor Quality Evaluation and Soil Removal Work Plan (Reference 2) for the elevated concentrations of petroleum hydrocarbons detected in subsurface soil beneath the former underground storage tank (UST) on 1483 El Camino Real. Based on CEG's References 1 and 2, the extent of groundwater contamination is defined and limited primarily to the former UST excavation. Benzene and ethylbenzene were detected in a grab groundwater sample collected from within the former UST excavation at 3,000 micrograms per liter ( $\mu\text{g}/\text{L}$ ) and 5,200  $\mu\text{g}/\text{L}$ , respectively. The benzene and ethylbenzene concentrations exceed their respective Regional Water Quality Control Board (RWQCB) residential environmental screening levels (ESLs) for groundwater vapor intrusion to indoor air. Although groundwater concentrations exceed their respective ESLs, a soil vapor sample collected from within the former UST excavation indicated concentrations of benzene and ethylbenzene in soil vapor to be below their respective residential vapor intrusion ESLs.

Based on these results, the County of Santa Clara Department of Environmental Health (CSCDEH) approved the Soil Removal Work Plan (Reference 3) with specific requirements, including additional shallow soil sampling at the site.

The purpose of this work was to evaluate the shallow soil for organochlorine pesticides and metals in the shallow soil in the data gap areas outlined by the CSCDEH.

## **ADDITIONAL SOIL SAMPLING ACTIVITIES**

### **Fieldwork**

On October 3 and 11, 2018, a *GeoSolve, Inc.* field geologist visited the subject site and observed Exploration GeoServices, Inc., a State-certified drilling contractor, advance seven shallow borings and collected seven shallow soil samples SS-1 through SS-7 using clean glass jars supplied by McCampbell Analytical, Inc. The location of shallow soil samples SS-1 through SS-7 are shown on Figure 2, Site Plan. The borings were backfilled with neat cement to grade. The soil samples were delivered under chain-of-custody documentation to McCampbell Analytical, Inc., a State-certified hazardous waste laboratory (Certification No. 1644), in Pittsburg, California, for analysis.

### **Laboratory Analytical Methods and Results**

Soil samples SS-1 through SS-7 were analyzed by McCampbell Analytical, Inc. for organochlorine pesticides and CAM 17 metals using Environmental Protection Agency (EPA) Methods SW846/SW3550B/3640Am/3630Cm/SW8081A and SW3050B/SW6020. The laboratory analytical results are shown on Tables 1 and 2 below and the McCampbell Analytical, Inc. laboratory reports and chain-of-custody documentation are attached to this letter report.

ESLs = Environmental Screening Levels (RWQCB – Region 2, February 2013, Summary of Soil)

\* = Background is the screening level for arsenic according to Cal EPA.

The laboratory analytical results of shallow soil samples SS-1 through SS-7 indicated no detectable to very low concentrations of organochlorine pesticides. DDT was detected up to 0.030 milligram per kilogram (mg/Kg), dieldrin was detected up to 0.00036 mg/Kg, and DDE was detected up to 0.054 mg/Kg. Metals were detected within background concentrations in soil samples SS-1 through SS-7 within the Santa Clara Valley of the San Francisco Bay area, except for lead. Lead was detected at 340 mg/Kg in soil sample SS-4 and was detected at 170 mg/Kg in soil sample SS-7.

### **Discussion**

All the shallow soil samples SS-1 through SS-7 indicated organochlorine pesticide concentrations below the California Regional Water Quality Control Board – Region 2 (RWQCB) Environmental Screening Levels (ESLs) for shallow soil exposure for residential development (February 2016). Most metals were also detected below ESLs for shallow soil exposure for residential development. However, arsenic and lead were detected above the shallow soil exposure for residential development ESLs of 0.067 mg/Kg and 80 mg/Kg, respectively.

Arsenic was detected at concentrations ranging from 3.6 mg/Kg to 7.7 mg/Kg, which represents background arsenic concentrations in the Santa Clara Valley. Although the residential ESL for arsenic is 0.067 mg/Kg, the current standard of care methodology through the California Environmental Protection Agency (Cal EPA) and its divisions Department of Toxic Substances Control (DTSC) and the RWQCB utilize background arsenic concentrations to establish permissible levels.

### **Potential Natural Arsenic Sources and Background Concentrations**

Arsenic occurs in more than 200 minerals and is present mainly in the heavy-mineral fraction of soil as arsenate ( $\text{As}^{+5}$ ) or the oxidized form of arsenic. Arsenic is naturally found in the arsenic-ore mineral arsenopyrite ( $\text{FeAsS}$ ) and abundant concentrations of arsenic have been detected in the mineral pyrite (up to 77,000 mg/Kg), marcasite (up to 126,000 mg/Kg), ferric oxyhydroxide and hematite (up to 77,000 mg/Kg) as trace elements (Campbell, 2006). Conversely, the lowest levels of arsenic are found in granitic sandy soils (Chang and et. al., 2004). Higher arsenic levels are associated with alluvial soils, rich in organic matter and soils derived from shales and hydrothermally and metamorphically altered bedrock, ancient hot-spring deposits (Campbell, 2006). Furthermore, in the Background Metal Concentrations in Soils within Northern Santa Clara County, California (Scott, 1991), the maximum concentration detected for arsenic was reported as 20 mg/Kg.

### Upper Confidence Limit (UCL) Concentration Calculations for Arsenic

*GeoSolve, Inc.* utilized the EPA's ProUCL 4.00.02 statistical computer program to calculate the 95% UCL for arsenic at the subject site. The 95% UCL for arsenic was calculated at 6.171 mg/Kg and an average arsenic concentration of 5.175 mg/Kg was calculated using the 95% Student's-t UCL.

### Conclusions and Recommendations

Based on the laboratory analytical results of the shallow soil samples collected and analyzed from the site, *GeoSolve, Inc.* concludes and recommends the following:

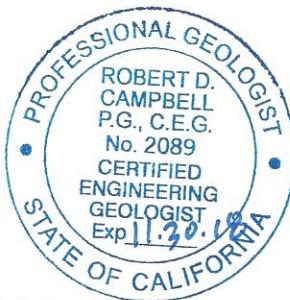

- Organochlorine pesticides were either not detected or detected well below the RWQCB's ESLs for shallow soil in residential land use in shallow soil samples SS-1 through SS-7.
- CAM 17 metals were detected below most RWQCB's ESLs for shallow soil in residential land use, except for arsenic and lead. Arsenic was detected above the residential ESL for shallow soil of 0.067 mg/Kg in all soil samples; however, arsenic concentrations were detected within background concentrations, which is the current screening level for residential development.
- Lead was detected below the RWQCB's ESL for residential land development in shallow soil of 80 mg/Kg in shallow soil samples SS-1 through SS-3, SS-5 and SS-6. Lead was detected at 340 mg/Kg and 170 mg/Kg in shallow soil samples SS-4 and SS-7, which exceeded the ESL.
- The areas around shallow soil samples SS-4 and SS-7 must be excavated and properly disposed at an approved landfill under signed manifests. The excavations should be 10 feet by 10 feet from the centers of each soil sample location and extend to 2.5 feet below ground surface. Confirmation soil samples must be collected at the excavation sidewalls and bottoms and be analyzed for total lead. If lead is detected above 80 mg/kg, then additional excavation, disposal and confirmation sampling activities must be conducted until lead is detected below the ESL of 80 mg/Kg.

Sincerely,

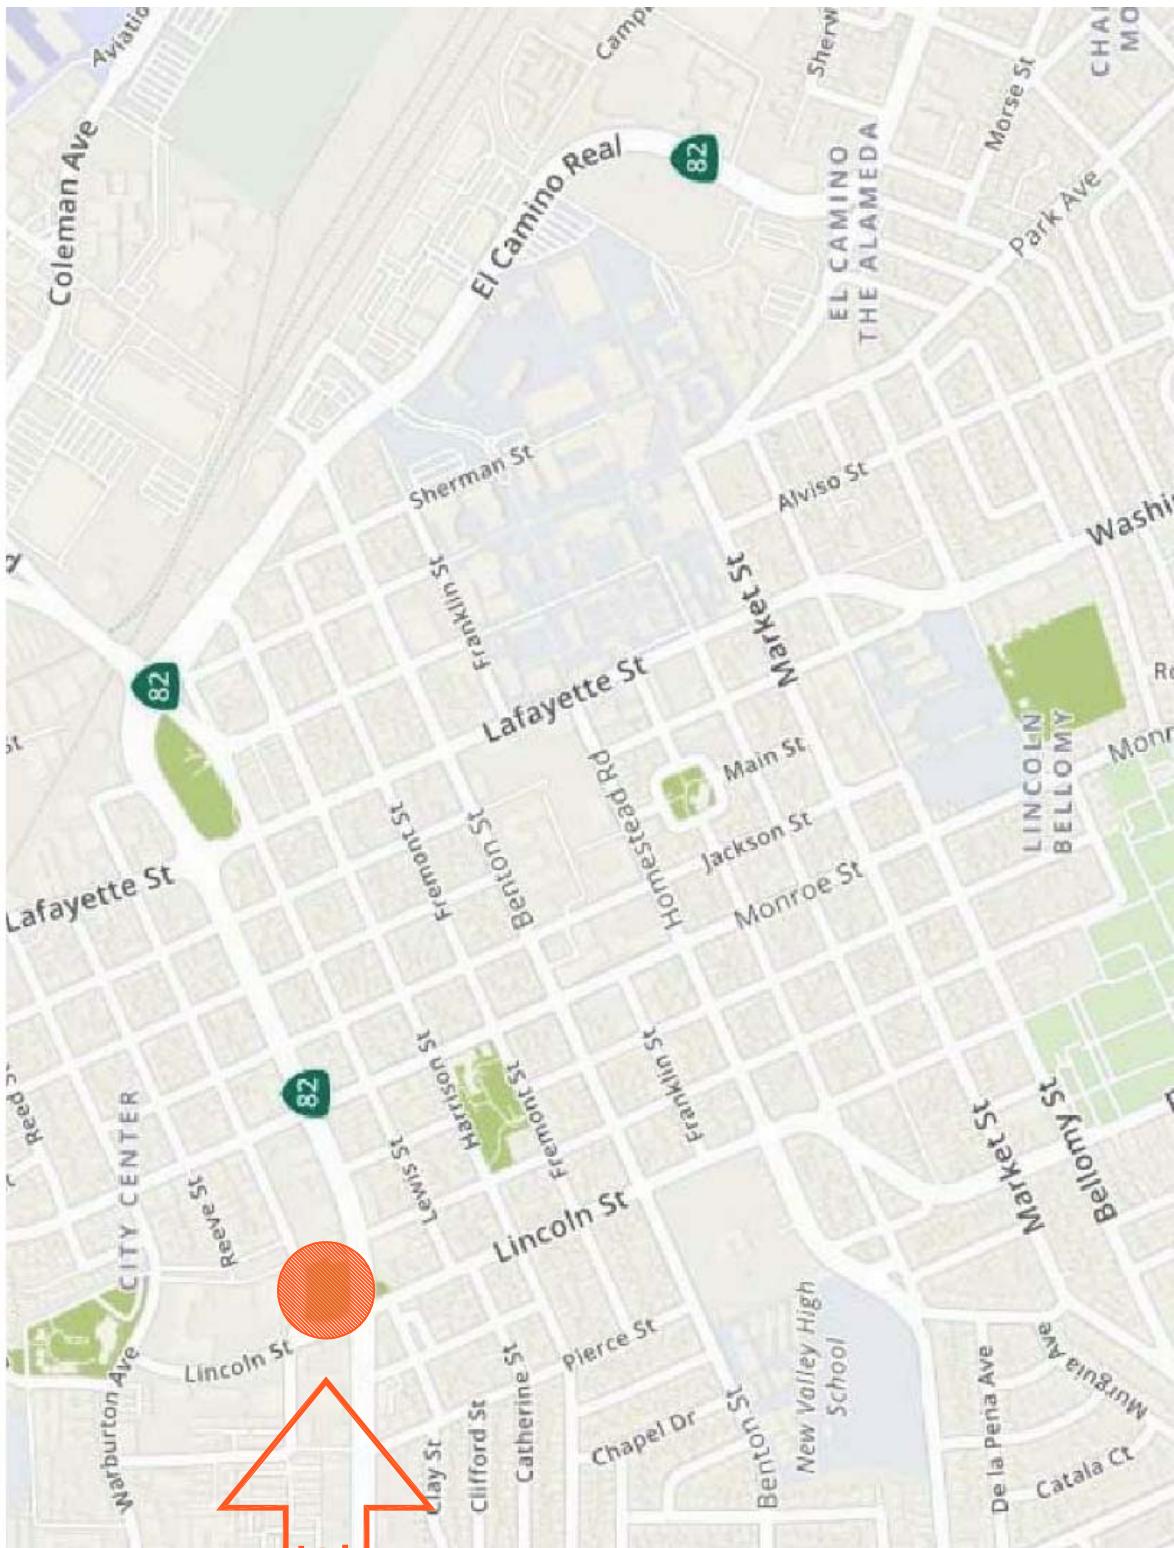

*GeoSolve, Inc.*

## Analytical Report

**WorkOrder:** 1810591

**Report Created for:** Geosolve, Inc.

1807 Santa Rita Road, Suite D-165  
Pleasanton, CA 94566

**Project Contact:** Rob Campbell

**Project P.O.:** 2018-31

**Project:** 2018-31; Catalina II

**Project Received:** 10/11/2018

Analytical Report reviewed & approved for release on 10/12/2018 by:

Yen Cao  
Project Manager

*The report shall not be reproduced except in full, without the written approval of the laboratory. The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in the case narrative.*

## Glossary of Terms & Qualifier Definitions

**Client:** Geosolve, Inc.  
**Project:** 2018-31; Catalina II  
**WorkOrder:** 1810591

### Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

### Analytical Qualifiers

a3      Sample diluted due to high organic content.
