From Table ES-1. Elements detected in jet fuel

Technical Report 1845, Trade Element and Polycyclic Aromatic Hydrocarbon Analyses of Jet Fuesl: Jet A, JP5, and JP8. L. A. Shumway, December 2000

Element	Jet A (ppb)
Aluminum	ND
Barium	3
Calcium	555
Chromium	26
Copper	5
Iron	210
Lead	11
Magnesium	ND
Manganese	6
Nickel	ND
Niobium	ND
Potassium	ND
Scandium	11
Selenium	ND
Strontium	12
Sulfur	1220
Tin	10
Titanium	100
Vanadium	ND
Zirconium	16

ND = No Detect

Section 1

Introduction

The human health risk assessment (HHRA) presented in this technical appendix estimates cancer risks, chronic (long-term) non-cancer health hazards, and acute (short-term) non-cancer health hazards associated with exposure to toxic air contaminants (TAC) that would be emitted during construction and operation of the Los Angeles International Airport (LAX) Airfield and Terminal Modernization Project (proposed Project).

1.1 Purpose

The proposed Project would make certain improvements within the north airfield, develop a new concourse and terminal with new gates, and provide for ground access (roadway) improvements that help relieve traffic congestion on Sepulveda Boulevard and provide landside access to the new terminal. Although the proposed Project itself would not result in any changes to future aviation activity levels projected for LAX at build-out, the modifications and additions to the airfield, terminals, and ground access facilities would alter the locations and amounts of TAC released by aircraft, ground support equipment (GSE), vehicles, and stationary sources in ways that could result in impacts on human health. In addition, construction of the proposed improvements would release TAC.

As with all activities at facilities that accommodate vehicles and equipment that consume fuel, activities at LAX release TAC to the air. These TAC may come from aircraft; GSE; other motor vehicles; combustion of fossil fuels to produce hot water, steam, and power; and other sources. These operational releases, and releases during construction activities, could have an impact on people living and working in the vicinity of the airport. Impacts to human health associated with TAC releases may include increased cancer risks, increased chronic (long-term) non-cancer health hazards, and increased acute (short-term) non-cancer health hazards from inhalation of TAC.

The objective of this HHRA is to assess the potential health impacts from changes in TAC exposure from the construction and operation of the proposed Project. For this analysis, construction of the proposed Project was assumed to begin in 2021 and end in 2028, with operations starting in 2028. Operational emissions were quantified for existing conditions (2018) and build-out of the proposed Project (2028). The approach and methods used in this HHRA have been consistently applied over several years as part of EIRs prepared to evaluate LAWA projects. The analysis discloses whether implementation of the proposed Project would increase health risks for people living, working, or attending school near LAX.

Emissions evaluated in the HHRA include both construction and operational sources. Therefore, human health risks associated with both construction and operational activities from the proposed Project were evaluated and are presented in this HHRA. These emissions formed the basis for estimating impacts from TAC. Incremental risks were assessed in three ways for this assessment:

- Baseline conditions were modeled by using 2018 operations data and applying typical emissions rates for aircraft, vehicles, and stationary sources. This baseline represents impacts to air quality for airport operations in the absence of the proposed Project. This baseline is the basis from which predicted effects of Project construction were compared for the calculation of incremental impacts.
- Construction-related TAC emissions were modeled for each year of construction using the schedule for proposed Project construction activities and typical emissions factors for construction equipment and activities. Year-by-year emissions estimates were used to account for changes in both location and types of activities anticipated to occur as Project construction progresses. In addition, indirect construction emissions, which would be caused by construction-related aircraft taxiing and idling delays during the temporary closure of the north airfield runways, were included in TAC emissions and dispersion analyses.
- Proposed Project operations were modeled for conditions in 2028. This year was based on construction completion when all components of the proposed Project were expected to be in operation. 2028 operational impacts were calculated as incremental impacts compared to the 2018 baseline.

Possible human health risks associated with the proposed Project were estimated using modeled TAC concentrations in air and standard methods developed by California Environmental Protection Agency (CalEPA) and U.S. Environmental Protection Agency (USEPA). Health impacts were evaluated for incremental cancer risks and chronic and acute non-cancer health hazards. An impact was considered significant if incremental cancer risks or non-cancer health hazards exceeded thresholds based on SCAQMD guidance.

1.2 General Approach

This HHRA presents an analysis of incremental human health risks and hazards associated with airborne releases of TAC which would occur during the construction and operation of the proposed Project. The approach and methods used in this HHRA have been consistently applied as part of EIRs prepared to evaluate LAWA projects. The calculation of cancer risks, as well as the chronic and acute non-cancer health hazard assessments, depended on the estimation of TAC concentrations in air in two steps: (1) emissions of TAC associated with construction and operation were estimated and concentrations were subsequently estimated using dispersion modeling of those TAC to downwind receptor locations; and (2) health risks were estimated associated with the inhalation of those TAC. Estimated emission rates were used, along with meteorological and geographic information, as inputs to an air dispersion model. The dispersion model predicted possible concentrations of TAC released during airport construction within the study area around the airport as defined in the protocol.¹ Modeled concentrations were used to estimate human health risks and hazards, which were the basis of the significance determinations for the proposed Project.

¹ CDM Smith, *Los Angeles International Airport – Airfield and Terminal Modernization Project, Final Supplement 1 – Human Health Risk Assessment Methodology to the CEQA Protocol for Conducting an Air Quality Impact Analysis of Criteria Air Pollutants*, March 16, 2020. This protocol is included as **Appendix C.8** of the EIR.

Potential impacts to human health were estimated using modeled TAC concentrations in air and methods developed by the CalEPA and the USEPA, as described below. Results of the analysis were then interpreted by comparing incremental cancer risks and chronic and acute non-cancer health hazards to regulatory thresholds. For the purposes of assessing the significance of any health impacts, these comparisons were made for maximally exposed individuals (MEI) at locations where TAC concentrations were predicted to be the highest by air dispersion modeling. An impact was considered significant² if cancer risks and/or chronic non-cancer health hazards for MEI was predicted to exceed significance thresholds. In addition, the range of possible risks and hazards was addressed by evaluating risks for all modeled locations within the defined study area.

Human health risks were evaluated using the *Air Toxics Hot Spots Program, Risk Assessment Guidelines, Guidance Manual for Preparation of Health Risk Assessments*³ methodology. Human health risks were also evaluated using the Risk Assessment Guidance for Superfund (RAGS) Part F; these results are presented in the uncertainties analysis (see Section 5) to allow for comparability of the LAX Airfield and Terminal Modernization Project to previously conducted analyses at LAX. Significance determinations were made from results of the analysis using CalEPA methodology.

Methods for conducting this HHRA are presented in Section 2; TAC emission calculation approach and results and a discussion of the dispersion analysis are presented in Section 3; associated health risks are presented in Section 4; and uncertainties are discussed in Section 5.

² The term "significant" is used as defined under CEQA regulations and does not imply an independent judgment of the acceptability of risks or hazards.

Section 2

Methodology

The methodology for the HHRA is documented in the LAX Airfield and Terminal Modernization Project CEQA Protocol for Conducting an Air Quality Impact Analysis for Criteria Air Pollutants, Supplement 1 – Human Health Risk Assessment Methodology to the CEQA Protocol,⁴ which was presented to South Coast Air Quality Management District (SCAQMD) prior to the initiation of this HHRA. This methodology is described below.

The HHRA was based on estimates for construction and operational TAC emissions associated with the proposed Project. Operational baseline conditions are 2018 existing operational conditions. Because no Project-related construction occurred in 2018, the construction baseline condition is zero emissions. Emissions sources during construction were analyzed for each construction year, from 2021 through early 2028. For the operational scenario, emissions sources were analyzed for 2028 with and without the proposed Project, as well as for 2018 baseline conditions. Changes in operations at the airport due to the proposed Project were expected to be realized during the 2028 horizon year. During construction (i.e., between 2021 and 2028), operations were not anticipated to vary from the without project scenario, and incremental impacts from operations during this period were, therefore, assumed to be zero.

The HHRA was developed as required under State of California statutes and regulations,⁵ and was conducted in four steps as defined in SCAQMD, CalEPA, and USEPA guidance^{6,7,8} consisting of:

- Selection of TAC of Concern - Identification of TAC that may be released in sufficient quantities to present a public health risk
- Exposure Assessment - Analysis of ways in which people might be exposed to TAC
- Toxicity Assessment - Evaluation of the toxicity of TAC that may present public health risks
- Risk Characterization - Characterization of the magnitude of health risks for the exposed community, and of locations in the community where the greatest risks or hazards may be realized

HHRA analyses for the proposed Project address the following issues and provide additional information on the potential for human health impacts:

- Quantitative assessment of cancer risks due to release of TAC associated with construction and operational activities for the proposed Project. (For the construction scenario, the starting year of exposure for each receptor was adjusted to yield the highest risk over the exposure period for individual receptors, i.e., starting year may be different for each receptor).
- Quantitative assessment of cancer burden due to release of TAC associated with construction and operational activities for the proposed Project.
- Quantitative assessment of chronic non-cancer health hazards due to release of TAC associated with construction and operational activities for the proposed Project (selecting the year of exposure that generated the highest total chronic hazard based on the TAC annual concentrations).
- Quantitative evaluation of possible acute non-cancer health hazards due to release of TAC during construction or operational activities for the proposed Project (selecting the year of exposure that generated the highest total acute hazard based on TAC hourly concentrations).
- Quantitative evaluation of possible 8-hour on-airport occupational exposure compared to California Occupational Safety and Health Administration (CalOSHA) permissible exposure limits (PELs) due to release of TAC during construction activities for the proposed Project (selecting the highest TAC 8-hourly concentrations).

Health protective⁹ methods that are likely to overestimate rather than underestimate possible health risks were used to estimate cancer risks and chronic and acute non-cancer health hazards. Incremental risks and hazards associated with the proposed Project were calculated for individuals assumed to live, work, or attend school at locations where TAC concentrations were predicted to be highest, even if people are not currently present at these locations. For example,

⁹ The terms “protective” and “conservative” are often used interchangeably to indicate that risk assessment methods were designed to err on the side of over-estimating risk. “Protective” is used in this HHRA to avoid confusion over what “conservative” means in different situations. For example, a “conservative” estimate of the time that someone might live in a given residence could imply to some readers that a minimum time was identified.

school-aged children were evaluated for all locations within residential areas, even though no schools existed or were anticipated to be opened at most of these locations.

Further, these individuals were assumed to be exposed to TAC for almost all days of the year and for many years to maximize estimates of possible exposure. No attempt was made to account for issues such as residents that work outside of the study area or move in or out of the study area, workers that change jobs and locations or have jobs that require movement within and/or outside the study area.

“Maximally exposed individuals” or MEI are hypothetical individuals used to represent receptors that would be subject to the highest exposures. Risk estimates for MEI are upper-bound predictions that could in theory be experienced by people working or living near LAX who breathe TAC released during construction and airport operations associated with the proposed Project. If hypothetical individuals that receive the highest exposures would be protected, actual members of the population near LAX would also be protected.

MEI probably do not actually exist. The coincidence of individuals that meet protective exposure assumptions, and location of maximum incremental impacts is unlikely. The locations of receptors were extended sufficiently to identify the point at which impacts would drop below the level of significance.

The HHRA for the proposed Project also evaluated the potential for short-term (1-hour) exposures to cause immediate, or acute, non-cancer health impacts. These estimates were also intentionally conservative; they used, for example, the highest 1-hour concentrations for assessing acute impacts regardless of whether individuals might have access to locations where maximum concentrations occur. This approach helped ensure that actual exposure concentrations in off-airport areas were not underestimated.

2.1 Selection of TAC of Concern

California Assembly Bill 2588 (AB 2588) identifies TAC for which Office of Environmental Health Hazard Assessment (OEHHA) has developed cancer slope factors and chronic and/or acute reference exposure levels (RELs). For this analysis, TAC of concern were derived based on the AB 2588 list, emissions estimates, human toxicity information, and results of previous HHRA conducted for LAX [LAX South Airfield Improvement Project (SAIP) Final EIR,¹⁰ LAX Crossfield Taxiway Project (CFTP) Final EIR,¹¹ LAX Bradley West Project Final EIR,¹² LAX Central Utility

Plant Replacement Project (CUP-RP) Final EIR,¹³ LAX Specific Plan Amendment Study (SPAS) Final EIR,¹⁴ and LAX Master Plan Final EIR,¹⁵]. This list of TAC was further refined to include only TAC with chronic RELs, acute RELs, and cancer potency values identified by the CalEPA OEHHA. The resulting list of TAC of concern evaluated in this HHRA is provided in **Table 2-1**. Few of these TAC contribute substantively to possible incremental health impacts. They were carried through the risk assessment process, however, as a demonstration of this conclusion and to comply with CalEPA risk assessment policy and guidance.

Table 2-1 Toxic Air Contaminants of Concern for the Proposed Project

Toxic Air Contaminant	Type	Toxic Air Contaminant	Type
Acetaldehyde	VOC	Aluminum	PM-Metal
Acrolein	VOC	Antimony	PM-Metal
Benzene	VOC	Arsenic	PM-Metal
1,3-Butadiene	VOC	Barium	PM-Metal
Cyclohexane	VOC	Cadmium	PM-Metal
Ethylbenzene	VOC	Chromium VI	PM-Metal
Formaldehyde	VOC	Cobalt	PM-Metal
n-Hexane	VOC	Copper	PM-Metal
Isoprene	VOC	Lead	PM-Metal
Isopropylbenzene	VOC	Manganese	PM-Metal
Methyl alcohol	VOC	Mercury	PM-Metal
Methyl ethyl ketone	VOC	Nickel	PM-Metal
Propionaldehyde	VOC	Selenium	PM-Metal
Propylene	VOC	Silver	PM-Metal
Styrene	VOC	Vanadium	PM-Metal
Toluene	VOC	Zinc	PM-Metal
1,2,4-Trimethylbenzene	VOC	Ammonium Ion	PM-Inorganics
2,2,4-Trimethylpentane	VOC	Bromine	PM-Inorganics
Xylene (total)	VOC	Chlorine	PM-Inorganics
Naphthalene	PAH	Phosphorus	PM-Inorganics
Diesel PM	Diesel Exhaust	Silicon	PM-Inorganics
		Sulfates	PM-Inorganics

2.2 Exposure Assessment

2.2.1 Exposure Populations

The following sensitive receptors were selected for quantitative evaluation: on-airport workers, off-airport workers, and community receptors including adult residents, child residents, and school children. These receptors were selected because they represent unique populations and a range of exposure conditions (i.e., location and duration of exposure). In addition, these receptors would be subject to the highest exposures, allowing for assessment of the risks and hazards to MEI, which is required to evaluate the level of significance. As previously noted, by evaluating impacts for the most exposed individuals for determination of significance, the general population is protected.

2.2.2 Exposure Pathways

To assess a receptor's exposure to TAC, various exposure pathways by which receptors might be exposed to TAC were identified for each receptor and used to develop exposure scenarios for each receptor.

An exposure pathway consists of four parts:

- A TAC source (e.g., construction equipment fuel combustion)
- A release mechanism (e.g., construction equipment engine exhaust)
- A means of transport from point of release to point of exposure (e.g., local winds)
- A route of exposure (e.g., inhalation)

If any of these elements of an exposure pathway is absent, no exposure can take place, and, the pathway is considered incomplete. Incomplete pathways were not evaluated in this HHRA.

In addition, some exposure pathways may be complete, but may result in little or negligible exposure. In the programmatic HHRA developed for the LAX Master Plan EIR¹⁶ (see LAX Master Plan Final EIR Technical Report 14a and Technical Report S-9a), multiple exposure pathways, including uptake from soil into homegrown vegetables, transport of TAC in soil to indoor dust and/or surface water, and other indirect pathways, were addressed quantitatively. These analyses showed that inhalation was the only exposure pathway that was an important contributor to human health risk. Based on this previous analysis, inhalation of airport-related TAC was the only exposure pathway used to evaluate human health risk for the proposed Project. Pathways other than inhalation were not assessed in this HHRA.

2.2.3 Exposure Concentrations

Analyses of cancer risk and non-cancer health hazards, both chronic and acute exposures, were included in the exposure assessment for the receptors identified in Section 2.2.1. Chronic and

¹⁶ City of Los Angeles, *Final Environmental Impact Report for Los Angeles International Airport (LAX) Proposed Master Plan Improvements*, (SCH 1997061047), Technical Report 14a - Health Risk Assessment, and Technical Report S-9a - Supplemental Health Risk Assessment, April 2004. Available: <https://www.lawa.org/en/lawa-our-lax/environmental-documents/documents-certified/2004-lax-master-plan-program/final-environmental-impact-report-feir>.

acute exposure to TAC from proposed Project-specific construction and airport-related operations were estimated by:

- Estimation of annual (for chronic exposure) and peak daily (for acute exposure) construction source emissions.
- Dispersion modeling of construction emissions over an area that consists of the airport property and urban areas to the north, east, and south.
- Dispersion modeling of proposed Project incremental operational emissions over the same areas as for the construction sources. Note that the proposed Project incremental operational emissions are the difference in emissions between the proposed Project in 2028 and the baseline operations emissions in 2018 for each TAC.

Modeled concentrations of TAC at locations where highest concentrations were anticipated (MEI locations) were used to estimate incremental human health risks and hazards. These estimates served as the basis for significance determinations for the proposed Project. To estimate cancer risks and the potential for adverse non-cancer health hazards, TAC exposure via inhalation for each receptor were estimated.

In February 2015, CalEPA OEHHA released the Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments. Exposure equations and parameter values presented in this report come from that guidance, unless otherwise noted. The guidance recommends the use of a software program, Hot Spots Analysis and Reporting Program Version 2 (HARP2) developed by the California Air Resources Board (CARB), for calculating and presenting health risk assessment results for the Hot Spots Program. For this HHRA, the HARP2 equations and calculations were built into an Excel spreadsheet to allow for customization of the calculations to address Project-specific criteria and for the ease of conducting multiple iterations of calculations.

The HARP2 equations recommend that the concentration of the chemical in air be used as the exposure metric resulting in the following formula for an exposure concentration:¹⁷

$$EC = CA \times (BR/BW) \times A \times EF \times 10^{-6}$$

Where: EC = exposure concentration (mg/kg/d)

CA = chemical concentration in air ($\mu\text{g}/\text{m}^3$)

(BR/BW) = daily breathing rate normalized to body weight (L/kg body weight – day)

A = inhalation absorption factor (unitless)

EF = exposure frequency (unitless), days/365 days

10^{-6} = micrograms to milligrams conversion, liters to cubic meters conversion

¹⁷ California Environmental Protection Agency, Office of Environmental Health Hazard Assessment, *Air Toxics Hot Spots Program, Risk Assessment Guidelines, Guidance Manual for Preparation of Health Risk Assessments*, February 2015.

Risks are then estimated using cancer potency factor using the following equation: ¹⁸

$$\text{RISK} = \text{EC} \times \text{CPF} \times \text{ASF} \times \text{ED}/\text{AT} \times \text{FAH}$$

Where: RISK = inhalation cancer risk

EC = exposure concentration (mg/kg/d)

CPF = inhalation cancer potency factor (mg/kg-day⁻¹)

ASF = age sensitivity factor for a specified age group (unitless)

ED = exposure duration (in years) for a specified age group

AT = averaging time for lifetime cancer risk (years)

FAH = fraction of time spent at home/school/work (unitless)

Averaging time for estimation of cancer risk is 70 years or 25,550 days. Cancer risk is evaluated as the lifetime average daily dose (LADD) according to CalEPA and USEPA guidance.

Chronic hazard quotient (HQ) is calculated using the following equation: ¹⁹

$$\text{Chronic Hazard Quotient} = \text{Annual Average Concentration} / \text{Chronic REL}$$

Where: Annual Average Concentration = (µg/m³)

Chronic REL = reference exposure level (µg/m³)

Assessment of potential chronic human health impacts due to release of TAC associated with operation of the proposed Project assumed that receptors would be exposed to concentrations of TAC over a 9-, 30-, or 70-year period for off-airport residential receptors; a 12-year period for off-airport school children; and a 25-year period for off-airport workers.

For the construction analysis, the focus of construction activities was assumed to move as different portions of the proposed Project are constructed throughout the construction period (2021 to early 2028). To incorporate this variability into the model, construction emissions were modeled separately for each year of construction. Risks for receptors were calculated by grid point for each year of construction and then added together to determine total risk by grid point. Operational TAC concentrations were added to the construction TAC concentrations during the 2028 horizon year when proposed Project operations were assumed to commence. For receptors whose exposure periods would extend beyond the 2028 horizon year, the 2028 proposed Project incremental TAC concentrations from operations were used for the remainder of their exposure period.

The locations of grid points were selected to be representative of where construction impacts were likely to be greatest. Such risk estimates overestimate risks for most people living, working, or attending school near LAX. This conservatism (protection) is built into the risk assessment

¹⁸ California Environmental Protection Agency, Office of Environmental Health Hazard Assessment, *Air Toxics Hot Spots Program, Risk Assessment Guidelines, Guidance Manual for Preparation of Health Risk Assessments*, February 2015.

¹⁹ California Environmental Protection Agency, Office of Environmental Health Hazard Assessment, *Air Toxics Hot Spots Program, Risk Assessment Guidelines, Guidance Manual for Preparation of Health Risk Assessments*, February 2015.

developed for the proposed Project to help counter any future changes in Project construction that cannot now be anticipated quantitatively.

Exposure parameters used to calculate the risks and hazards for all receptors for the inhalation pathway are summarized in **Table 2-2**. Exposure parameters were based on CalEPA Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments²⁰ and USEPA Exposure Factors Handbook,²¹ as well as other pertinent guidance. Since it has been a number of years since the health risk analyses were conducted for the LAX Master Plan Final EIR,²² the SAIP EIR,²³ the CFTP EIR,²⁴ the Bradley West Project EIR,²⁵ and the SPAS EIR,²⁶ a number of these parameters have been updated to be consistent with recent guidance compared to the exposure parameters used in past analyses. The potential impact of these updates is examined in the uncertainties analysis (Section 5).

In addition to the exposure parameters presented in Table 2-2, some of the exposure parameters varied according to age groups to address the methodology detailed in the CalEPA Air Toxics Hot Spots Program Guidance.²⁷ These exposure parameters are presented in **Table 2-3**.

² Fractions provided here are for reference based on a receptor being in the designated age group for their entire exposure period. In the calculations, the fractions used may vary from what is shown on this table depending on the age range of the receptor during the period that they are exposed (i.e., the receptor's age during his exposure period may not coincide with the length of time in the age group).						

2.3 Toxicity Assessment

Risks from exposure to TAC were calculated by combining estimates of potential exposure with chemical-specific toxicity criteria developed by CalEPA, USEPA, or both. A toxicity assessment initially examined quantitative toxicity criteria for TAC as required under Sections (§)69021(a), (b), and (c) of the *Toxicity Criteria for Human Health Risk Assessments, Screening Levels, and Remediation Goals* rule.²⁸

A toxicity assessment for TAC of concern was conducted for the LAX Master Plan Final EIR, as described in Technical Report 14a of that EIR. Conclusions of that assessment have not changed materially; that is, no changes to toxicity criteria for TAC that contribute substantively to cancer risks and chronic and acute non-cancer hazards have occurred. Both the CalEPA OEHHA, and USEPA continually update toxicity values as new studies are completed, and toxicity information provided in Technical Report 14a was reviewed and updated as appropriate by researching recent information available from USEPA, CalEPA OEHHA, and Agency for Toxic Substance and Disease Registry (ATSDR).

Acute RELs developed by the State of California were used in the characterization of potential acute non-cancer health hazards associated with the proposed Project. Cancer unit risk factors, cancer slope factors, and chronic RELs developed by the State of California were used to characterize cancer risks and chronic non-cancer health hazards associated with longer-term inhalation of emissions from construction and operational activities. Both types of toxicity criteria are based on studies of chronic exposure in animals or, in some cases, to people. Inhalation unit risk (for USEPA RAGS Part F cancer risk calculations) and cancer slope factors are presented in **Table 2-4**. Chronic RELs and reference concentrations (RfCs) are presented in **Table 2-5**.

Acute RELs were used to characterize potential hazards associated with short-term exposure (usually from exposures on the order of 1-hour). RELs are based on the most sensitive, relevant, adverse health effect reported in the medical and toxicological literature. Since margins of safety²⁹ are incorporated to address data gaps and uncertainties, exceeding an REL does not automatically indicate an adverse health impact. Acute RELs are applicable to all receptors, children and adults, and hazards are the ratio of estimated or measured concentrations and the REL. Acute RELs for the TAC of concern included in this analysis are provided in **Table 2-6**.

²⁸ California Department of Toxic Substances Control (DTSC) Human and Ecological Risk Office (HERO), *Human Health Risk Assessment (HHRA) Note Number 10, Toxicity Criteria*, February 25, 2019. Available: <https://dtsc.ca.gov/wp-content/uploads/sites/31/2019/02/HHRA-Note-10-2019-02-25.pdf>.

²⁹ Margin of safety is a ratio of the no-observed-effect level to the estimated exposure dose. Margins of safety are incorporated in the development of toxicity values to account for differences in dose-response among individuals. For example, the same dose of alcohol may have a greater effect on a woman than a man, not only because a woman is smaller in body size but also because men and women metabolize alcohol at different rates.

2.4 Risk Characterization

Risk characterization combines information developed for exposure and for toxicity to produce quantitative estimates of health impacts to receptors in the study area. Methods used are similar under CalEPA and USEPA guidance.

2.4.1 Maximally Exposed Individuals (MEI)

For the proposed Project, grid points were analyzed within the study area. In addition, several on-airport grid points that were not within the Project site were also modeled (for on-airport workers) and in the center of LAX (for on-airport construction workers). These locations were anticipated to represent MEI, based on previous dispersion modeling for LAX. Concentrations of each TAC at these grid points representing locations of potentially exposed populations, including locations for MEI exposure scenarios (worker, resident, student), and toxicity criteria were used to calculate cancer risk, and chronic and acute non-cancer health hazard estimates associated with the proposed Project. These calculations were used to identify locations with maximum

cancer risks and maximum non-cancer health hazards and serve as the basis for significance determinations.

MEI estimates were partially land use specific. On-airport locations were used to identify commercial and on-airport worker locations for the operational scenario. For off-airport locations, land uses were designated as either residential, school (including day-care and preschool), hospital (including elder care), and commercial/industrial based on internet web searches and reviews of receptor locations in Google Earth Pro. These land use identifications were used to determine appropriate receptors (workers at commercial/industrial locations; adult and child residents and school children at residential locations; etc.). Locations of schools, hospitals, nursing homes, daycares, etc. were identified as sensitive receptor locations and designated as residential/commercial so that these grid points were evaluated for both worker and residential receptors.

Risks for people recreating near the airport would be lower than those for workers, residents, and students at any given location because of much shorter times spent in recreational activities. No risks were calculated for this population. Where risks would not be significant for other receptor groups, risks for recreational visitors near LAX could also be considered less than significant.

2.4.2 Methodology for Evaluating Cancer Risks

Cancer risks were estimated by multiplying exposure estimates for carcinogenic chemicals by corresponding cancer slope factors. The result is a risk estimate expressed as the probability of developing cancer. Consistent with recent OEHHA guidance,³⁰ cancer risks were based on exposure durations of 30 years for adult residents, 9 years for child residents, 12 years for school children, and 25 years for off-airport workers. The methodology is conservative, as it assumes individuals would be exposed to TAC for almost every hour of each day of the receptor's respective exposure duration. For each receptor's years of exposure after construction, the increment of future operational risk over the 2018 baseline operational risk was added to the risk calculated for the construction period. Impacts of exposure to multiple TAC were accounted for by summing cancer risk estimates for exposure to each individual TAC.

To determine whether releases of TAC during construction or operation of the proposed Project would be significant, incremental human health risks for the proposed Project were compared to the appropriate threshold of significance identified in SCAQMD CEQA guidance:³¹ cancer risk threshold of 10 in 1 million.

2.4.3 Methodology for Evaluating Chronic Non-Cancer Health Hazards

Chronic non-cancer health hazard estimates were calculated by dividing exposure estimates by RELs. RELs are estimates of highest exposure levels that would not cause adverse health effects even if exposures continue over a lifetime. The ratio of exposure concentration to reference

³⁰ California Environmental Protection Agency, Office of Environmental Health Hazard Assessment, *Air Toxics Hot Spots Program, Risk Assessment Guidelines, Guidance Manual for Preparation of Health Risk Assessments*, February 2015. Available: <https://oehha.ca.gov/air/crn/notice-adoption-air-toxics-hot-spots-program-guidance-manual-preparation-health-risk-0>.

³¹ South Coast Air Quality Management District. *South Coast AQMD Air Quality Significance Thresholds*, April 2019. Available: <http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf>.

concentration is termed the HQ. A HQ greater than 1 indicates the potential for adverse health effects and a HQ less than 1 indicates that adverse health effects are unlikely. RELs are developed by OEHHA and account for the most vulnerable members of a population. Therefore, it is generally accepted that HQs only slightly higher than 1 are associated with low or no risks of adverse effects and the potential for adverse effects increases as the HQ gets larger.³²

Exposure to multiple TAC with the potential to cause adverse chronic non-cancer health effects were accounted for by summing HQs for chemicals that would affect like target organs or tissues in the human body. This sum is the total chronic Hazard Index (HI) which reflects the total possible chronic non-cancer health hazard increment. Although inhalation is the only pathway determined to have an important contribution to risk, exposure to TAC through inhalation has the potential to affect multiple organ systems. Therefore, the combined risk for each target organ system was evaluated for exposure to TAC associated with the proposed Project.

To determine whether releases of TAC during construction or operation of the proposed Project would be significant, incremental human health risks for the proposed Project were compared to the appropriate threshold of significance identified in SCAQMD CEQA guidance.³³ non-cancer chronic HI of 1.

2.4.4 Methodology for Evaluating Acute Non-Cancer Health Hazards

Short-term concentrations for TAC associated with construction of the proposed Project were estimated by modeling 1-hour maximum concentrations. Acute non-cancer health hazards were then estimated at each receptor location by dividing estimated maximum 1-hour TAC concentrations in air by acute RELs to determine the HQ.

An acute REL is a concentration in air below which adverse effects are unlikely for people, including sensitive subgroups, exposed for a short time on an intermittent basis. USEPA defines intermittent exposure as an exposure lasting less than 24 hours and occurring no more than monthly.³⁴ RELs for acute non-cancer health hazards do not distinguish between adults and children, and are established at levels that are considered protective of sensitive populations. Since margins of safety are incorporated to address data gaps and uncertainties, exceeding the REL does not automatically indicate an adverse health impact. Most RELs have been developed for a 1-hour exposure duration, although several are based on an 8-hour exposure period. CalEPA's OEHHA has developed acute RELs for several of the TAC of concern identified for the proposed Project.

Exposure to multiple TAC with the potential to cause adverse acute non-cancer health effects were accounted for by summing HQs for chemicals that would affect like target organs or tissues in the human body. This sum is the total acute HI, which reflects the total possible acute non-

³⁴ California Environmental Protection Agency, Office of Environmental Health Hazard Assessment, *Air Toxics Hot Spots Risk Assessment Guidelines Technical Support Document For the Derivation of Noncancer Reference Exposure Levels*, June 2008. Available: <http://oehha.ca.gov/media/downloads/cnr/noncancertsdfinal.pdf>.

cancer health hazard increment. The resulting acute HIs were compared to the SCAQMD CEQA TAC acute HI significance threshold of 1. HIs less than 1 indicate that adverse acute non-cancer health hazard impacts are not expected.

2.4.5 Methodology for Evaluating Occupational Health Hazards

Impacts to on-airport workers were evaluated based on CalOSHA PELs.³⁵ PELs are established to protect on-site workers from hazardous exposure. For each TAC of concern for which CalOSHA PEL thresholds have been established, the maximum 8-hour modeled concentration was compared against the corresponding CalOSHA PEL.

2.4.6 Methodology for Evaluating Population-Based Risks

When MEI risks exceed threshold levels, CalEPA guidance indicates that population-based risks should be evaluated.³⁶ A population-based assessment estimates the cancer burden that might be experienced within an exposed population. The cancer burden is the sum of individual risks for people living in the study area. It is calculated in a manner similar to individual cancer risk based on an exposure period ranging from the third trimester to age 70 and corresponding age sensitivity factors and exposure parameters. Population-based risk conservatively assumes that a population (not necessarily the same individuals) will live within the study area over a 70-year lifetime period. In this sense, cancer burden calculations are more conservative than individual cancer risks, which are calculated assuming an exposure duration of 30 years.

For the proposed Project, the population-based risk was calculated by using census population counts for census tracts within the 1 in 1 million maximally exposed individual resident (MEIR) exposure area and multiplying the identified population counts by the average individual 70-year burden risk modeled for the tract. For example, if 100,000 people live in an area that experiences an increased cancer risk of 10 in 1 million due to airport emissions, the chance of a single case of cancer in this population caused by airport emissions would be 1 in 100 (100,000 times 10×10^{-6}). In cases where a single census block may contain more than one modeled receptor point, the average of the calculated risks for the points was used for the calculation. The sum of population-based risks in all modeled census tracts represented the total cancer burden associated with Project impacts.

A similar approach was used for the assessment of population-wide hazard impacts. However, instead of multiplying the HIs, zones of impact were identified, as where HIs exceeded 0.5, 1.0, and above in increments of 1.0. The population counts for each zone of impact were summed to provide a single number for each zone of impact. As with the cancer burden, when a single census block contained more than one modeled grid point, the average of the calculated HIs for the grid points within the census block was used to determine which zone of impact the census block was representative. Population estimates for acute, 8-hour, and chronic health impacts are presented separately.

Available: <https://oehha.ca.gov/air/crnr/notice-adoption-air-toxics-hot-spots-program-guidance-manual-preparation-health-risk-0>.

2.4.7 Methodology for Evaluating Cumulative Impacts

Cumulative impacts of emissions on health risks were based on studies conducted by governmental agencies. Specifically, the evaluation of cumulative cancer risks was based on the most recent Multiple Air Toxics Exposure Study, MATES-IV, prepared by SCAQMD.³⁷ Data presented in USEPA's National Air Toxics Assessment³⁸ were used to evaluate cumulative chronic non-cancer health hazards. For cumulative acute non-cancer health hazards, conservative approximations of short-term concentrations were made using generic conversion factors and the annual average estimates of TAC in air from USEPA, which were used to provide a semi-quantitative evaluation of the possible range of cumulative impacts. The methodology for evaluating cumulative impacts is described in more detail in Section 4.3 of this report.

2.4.8 HHRA Significance Thresholds

The SCAQMD has developed health risk and hazard significance thresholds for CEQA impact analyses. These thresholds are provided in **Table 2-7**. Note that these thresholds have been developed for project incremental impacts. Project incremental impacts for comparison to the significance thresholds were determined by using the proposed Project incremental construction and operational emissions as described in Section 2.2.3 to calculate the proposed Project health impacts. For disclosure purposes, a second calculation was performed that determines incremental operational impacts for the future Without Project scenario compared to 2018 baseline conditions. This analysis is provided in the Uncertainties Section (Section 5).

Table 2-7 Health Risk and Health Hazard Significance Thresholds

Health Risk or Hazard	Project Incremental Significance Threshold
Cancer Risk (MEI Resident or MEI Worker)	Maximum Incremental Cancer Risk ≥ 10 in 1 million
Cancer Burden for Exposed Population	> 0.5 Excess cancer cases (in areas ≥ 1 in 1 million cancer risk)
Chronic Non-Cancer Hazards	$HI_c \geq 1.0$
Acute Non-Cancer Hazards	$HI_a \geq 1.0$
Source: South Coast Air Quality Management District, <i>South Coast AQMD Air Quality Significance Thresholds</i> , April 2019. Available: http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf .	

No standards exist that establish acceptable levels of human health risks or that identify a threshold of significance for cumulative health risk impacts; therefore, a general discussion of the cumulative impacts for the proposed Project relative to regional cancer risk estimates and TAC concentration predictions based on information available from SCAQMD and USEPA is provided in Section 4.

Section 3

TAC Emissions and Dispersion

3.1 TAC Emissions

The first step in the process of establishing concentrations of TAC in air was estimation of TAC emissions during project construction. During the construction phase, emissions of diesel particulate matter (DPM) were expected to contribute the majority to total incremental cancer risks. Other TAC were evaluated for incremental contributions to total cancer risk, and for contributions to chronic and acute non-cancer health hazards.^{39,40} Sources of TAC during construction include off-road heavy duty construction equipment; on-road equipment and vehicles; and construction materials (e.g., volatile organic compounds (VOC) from striping, asphalt paving, and architectural coating), with engine exhaust associated with highest estimates for possible health impact. An additional source of TAC, aircraft, was evaluated due to an increase in aircraft taxi times during the temporary runway closures anticipated to occur during 2023 and 2024 as described in Section 4.1.1, *Air Quality*, of the EIR. Evaluated sources of TAC during operations included traffic on on-airport and public roadways and parking lots; aircraft; heating and cooling for Concourse 0, Terminal 9, and their associated facilities; and Ground Support Equipment.

The basis for TAC emission estimates were VOC and particulate matter with an aerodynamic diameter less than or equal to 10 micrometers (PM₁₀) emission calculations for construction and operations presented in Section 4.1.1, *Air Quality*, of the EIR.

Total organic gases (TOG) and PM₁₀ emissions used in the dispersion analysis of construction sources are summarized in **Table 3-1**. Once these emissions were determined, estimates of TAC emissions were developed from speciation profiles developed by CARB. The profiles used in this analysis are summarized in **Table 3-2**.

Notes: ¹ TOG aircraft exhaust speciation profile is based on data from USEPA, <i>Recommended Best Practice for Quantifying Speciated Organic Gas Emissions from Aircraft Equipped with Turbofan, Turbojet, and Turboprop Engines</i> ; Table 1, 2009. ² PM aircraft exhaust speciation profile is based on data from L. A. Shumway 2000, <i>Trace Element and Polycyclic Aromatic Hydrocarbon Analyses of Jet Engine Fuels: Jet A, JP5, and JP8</i> ; Table ES-1.			

3.2 Exposure Concentrations (Dispersion)

TAC concentrations were estimated in two steps: first, dispersion modeling was used to estimate total VOC⁴¹ and PM₁₀ concentrations, and then individual organic or particulate TAC concentrations were calculated using CARB speciation profiles to break down (speciated) total VOC and PM₁₀ estimates into individual elements and compounds (species). For example, if total VOC at a given location was 0.1 microgram per cubic meter ($\mu\text{g}/\text{m}^3$) and a given volatile TAC makes up 1 percent of this total, the concentration of that TAC at that location would be 0.001 $\mu\text{g}/\text{m}^3$. All dispersion modeling was performed using USEPA required AERMOD and AEDT 3b (see Section 4.1.1, *Air Quality*, of the EIR for a more detailed description of the air dispersion model).

Project-related concentrations for TAC from proposed Project sources were estimated using the air dispersion model (AERMOD) with model options for 1-hour maximum, 8-hour maximum and annual average concentrations selected.⁴² Annual average concentrations for carcinogens were determined for every year of construction, and for 2028 operations. Construction and operational concentrations were combined for 2028 (last year of construction). After 2028, all concentrations were assumed to be equal to the 2028 operational concentrations.

3.2.1 Source Areas

Area or volume sources were used to model construction areas and construction roadway travel. Specifically, the pollutant emissions estimated for the sources were grouped by the source area that each was associated with, based on data in the resource-loaded construction schedule. Each construction area or site was modeled as a polygon area in AERMOD. Construction source parameters were based on the SCAQMD *Localized Significance Threshold Methodology*.⁴³ Construction equipment exhaust emissions were modeled with a 5-meter release height with a 1.4-meter initial vertical dimension, and construction dust (PM₁₀) was modeled at ground level with a 1-meter initial vertical dimension.

3.2.2 Receptors

TAC concentrations were estimated at 371 sensitive receptor locations within the study area around the airport. In addition, several on-airport locations that are not within the project site were also modeled (for on-airport/off-site workers) and in the center of LAX (for on-airport/on-site construction workers). Based on previous dispersion modeling for LAX, these locations (designated as grid points in the air quality model) are anticipated to represent where airport emissions would have the greatest impact. Modeled concentrations at these locations were used to estimate incremental human health risks and hazards for making determinations of significance of health impacts for the proposed Project. The modeled receptors are shown on **Figure 3-1**.

⁴¹ VOCs are a precursor in the formation of ozone.

⁴² The AERMOD modeling system is a steady-state plume model that incorporates air dispersion based on planetary boundary layer turbulence structure and scaling concepts, including treatment of both surface and elevated sources, and both simple and complex terrain. Additional information, documentation, and guidance regarding the AERMOD modeling system, including the model code and documentation for AERMOD is available on the USEPA's website at <https://www.epa.gov/scram/air-quality-dispersion-modeling-preferred-and-recommended-models>.

Construction and Operations Grid Point Locations

3.2.3 Meteorology

Airport-specific meteorological data were used to analyze air quality impacts. The data set used consisted of five years of hourly surface data collected at LAX for calendar years 2012 through 2016, the most recent data years available from the SCAQMD's on-airport meteorological and air quality monitoring station. This data set, provided by the SCAQMD, included ambient temperature, wind speed, wind direction, atmospheric stability, and mixing height parameters from the appropriate upper air station, and was provided "AERMOD-ready."

This page intentionally left blank.

Section 4

Human Health Risk Assessment

This HHRA assesses incremental changes to health impacts for people who would be exposed to TAC resulting from construction and operational activities associated with the proposed Project. Cancer risk and chronic non-cancer health hazard estimates for impacts of the proposed Project were based on estimated project construction and operational emissions and air dispersion modeling as discussed above and are discussed in the following sections. Acute non-cancer health hazard estimates were also addressed using emission estimates and dispersion modeling.

For determining significance, the following scenario was evaluated:

- Incremental 2021 Project through 2028 Project for unmitigated project construction with project operations commencing in 2028 as compared to 2018 baseline conditions

For disclosure purposes, the following additional scenario was evaluated and presented in the Uncertainties Section (Section 5). This scenario was not used for significance determination but is provided for risk management and mitigation considerations.

- Incremental 2028 Future Without Project for operations as compared to 2018 baseline conditions

Risk calculations, presented in **Attachment 1** to this memorandum, indicate that estimates of cancer risks associated with emissions during construction and operations with implementation of the proposed Project would be below the threshold of significance within the study area. Chronic non-cancer health hazards and acute non-cancer HIs would also be below the threshold of significance.

Since health risks were evaluated at locations throughout the study area and TAC concentrations vary from grid point to grid point, maximum risks and hazards apply to a small subset of receptors and to areas on and around LAX.

The following subsections discuss incremental cancer risk and chronic and acute non-cancer health hazard estimates for impacts of the proposed Project by scenario and receptor.

4.1 Cancer Risks and Non-Cancer Health Hazards Associated with the Proposed Project

Cancer risk estimates from exposure to construction sources are presented below for on-airport workers (occupational exposure), and off-airport workers, residents, and school children. Acute and chronic non-cancer health hazards are also discussed.

4.1.1 Comparison of On-Airport Air Concentrations with CalOSHA Limits for On-Airport Workers

On-airport worker exposure to on-airport air concentrations from the proposed Project were evaluated by comparing modeled on-airport maximum 8-hour concentrations for each TAC during its peak year of construction (peak year for each TAC is listed in **Table 4-1**), against the corresponding CalOSHA 8-hour Time-Weighted Average Permissible Exposure Levels (PEL-TWAs).⁴⁴ On-airport worker exposure was assessed at 39 on-airport locations including some located at the airfield-facing ends of each terminal and at the Midfield Satellite Concourse. These receptors were evaluated for occupational health only as they are neither ambient air, nor peak impact areas. Estimated air concentrations and PEL-TWAs for TAC of concern for unmitigated construction and operation of the proposed Project are presented in Table 4-1 and **Table 4-2**, respectively.

The resulting 8-hour concentrations ranged from a few to several orders of magnitude below PELs for all TAC. This result indicates that air concentrations from airport emissions with implementation of the proposed Project would not be expected to exceed CalOSHA standards.

4.1.2 Cancer Risks and Chronic Non-Cancer Health Hazards for Maximally Exposed Individuals (MEI) – Residents and School Children

Grid points analyzed within the study area in the vicinity of the airport are shown on Figure 3-1. For proposed Project construction, each construction year from 2021 to 2028 was modeled separately. Operations were modeled for 2018 baseline and for 2028 at estimated completion of proposed Project construction. Risks for operations were added to the construction risks in 2028, for receptors whose exposure periods would extend beyond the construction period.

Concentrations at these grid point locations represent maximum concentrations of TAC predicted by the air dispersion modeling and were used to evaluate exposure to a MEI. Thus, risks and hazards calculated at these grid points provide a ceiling for risks and hazards for off-airport residents, workers, and students. In essence, these calculations assumed that people spend all their time within this study area - living, working, and going to school. This assumption is obviously conservative. Exposures or risks due to emissions from LAX within the community outside of the study area are unlikely to be higher than those calculated in this HHRA.

Air concentrations for TAC for construction and operational sources were developed using emissions estimates and dispersion modeling as described in Sections 3.1 and 3.2. Incremental TAC concentrations were determined by comparing 2028 With Project to 2018 baseline conditions. The difference between these two conditions was used to determine incremental Project-related emissions in 2028.⁴⁵ Using these incremental emission estimates, exposure parameters for potential receptors, and current toxicity values, cancer risks and chronic non-cancer health hazards were calculated for adult residents, resident children ages 0 to 9 years, and for school children at locations where air concentrations for TAC were predicted. These Project incremental impacts were used for comparison to the significance thresholds. Peak cancer risks

⁴⁵ Operational baseline conditions for significance are 2018 existing conditions. Construction baseline conditions are zero because no Project-related construction occurred in 2018; therefore, construction emissions were modeled directly without subtracting any baseline.

and chronic non-cancer health hazards for MEI are presented in **Table 4-3** and summarized in the following sections. Calculations are presented in **Attachment 1**.

Table 4-3 Incremental Cancer Risks and Chronic Non-Cancer Human Health Hazards for Maximally Exposed Individuals from Proposed Project Construction and Operation

Receptor Type	Incremental Cancer Risks ¹ (per million people)	
	Construction ^{2,3}	Operation ^{3,4}
	Unmitigated	2028 With Project vs. 2018 Baseline
Off-Airport Worker, 25 years	5	5
Adult Resident, 70 years ⁵	-2	-4
Adult Resident, 30 years	-1	-4
Child Resident, 9 years	-0.1	-3
School Child, 12 years ⁶	-0.2	-1
Receptor Type	Incremental Non-Cancer Chronic Hazards ⁷	
	Construction ⁸	Operation
	Unmitigated	2028 With Project vs. 2018 Baseline
Residential	0.08	0.02
Commercial	0.3	0.09

Source: CDM Smith, 2020. (Attachment Tables 1-1 and 1-2)

Notes:

- Values provided are changes in the number of cancer cases per million people. Values greater than the threshold are in bold.
- Construction of the proposed Project is estimated to take 8 years – starting in 2021 and ending in 2028. Following construction, it was assumed that beginning in the 8th year (2028), construction and operations would be overlapping and continuing through the remainder of the receptors' exposure periods. Starting in 2028, receptors would be exposed to incremental 2028 With Project operations-related TAC as compared to 2018 baseline operations.
- Negative values indicate a beneficial impact.
- For operations, receptors are exposed to operations-related TAC beginning in 2028 and continuing through the remainder of the receptors' exposure periods.
- Although the 30-year residential scenario was used for the significance determination, the 70-year residential scenario was also calculated to determine cancer burden for evaluation of population-wide risks discussed in Section 4.2.
- The MEI value for the school child cancer risk is at a residential/commercial grid location and not at an existing school location. The highest estimated cancer risk for school children at an existing school is estimated to be -0.4 in 1 million for construction and -1 in 1 million for operations at Cowan Avenue Elementary School (the school at grid point 176).
- Hazard indices (HI) are unitless.
- Total chronic HI is shown for the peak construction year of 2023.

4.1.2.1 Residents (Adults and Young Children)

Construction

For the construction scenario, residential risks were evaluated using 155 representative off-airport receptor locations identified as residential, residential/commercial, or sensitive receptor locations. Construction of the proposed Project was estimated to take 8 years – starting in 2021 and ending in 2028. Following construction, it was assumed that annual operations-related TAC emissions would be equal to the increment of the operations-related TAC emissions from 2028 with the proposed Project over 2018 baseline operations for each receptors' remaining years in their respective exposure periods.

Incremental MEI cancer risks for 30-year and 70-year adult residents were estimated to be -1 in 1 million and -2 in 1 million, respectively. Both values are below the threshold of significance of 10 in 1 million. The negative values indicate that compared to the 2018 baseline, the proposed Project would result in decreases of some TAC concentrations (most notably DPM), which would thereby result in decreases in cancer risk estimates, producing beneficial impacts for adult residents. DPM is primarily emitted from diesel construction equipment, haul trucks, and concrete trucks. Over 90 percent of the cancer risk is driven by DPM, and DPM emissions from on-road trucks, shuttle trips, and airport GSE would be lower under the proposed Project than 2018 baseline, producing the reduction in cancer risk. The MEI cancer risk location for residents is shown on **Figure 4-1**. Since all residential cancer risks are negative, no isopleth figure was generated for the residential cancer risks.

Incremental MEI cancer risk for child residents is estimated to be -0.1 in 1 million, which is below the threshold of significance of 10 in 1 million. Because children have a shorter exposure period than adults and beneficial effects are cumulative with each year of exposure, they would experience less beneficial impacts than adults, resulting in the higher incremental cancer risk estimate.

Project-related chronic non-cancer HI for the peak year (2023) for construction impacts associated with the proposed Project is provided in Table 4-3. Non-cancer HIs for adult residents and child residents are the same because the OEHHA methodology does not normalize HIs to body weight. Incremental chronic non-cancer health hazards for residents were predicted to be 0.08 for the proposed Project construction scenario, below the significance threshold of 1. At the peak HI location in 2023, the HI is primarily attributable to acrolein (69 percent), formaldehyde (14 percent), and 1,3-butadiene (8 percent).

Chronic non-cancer health hazards were evaluated for all receptor locations by initially calculating maximum HI by summing the HQs for all TAC, irrespective of target organ. If the screening had resulted in an HI exceeding the HI threshold of 1, a detailed analysis would have been used, which would have summed the HQs of all TAC known to affect like organ systems and presented the maximum HI for any organ system. However, as shown in Table 4-3, the maximum total HI for chronic exposure to all TAC during construction would not be greater than the threshold of 1; thus, no organ-system breakdown was necessary. The MEI chronic hazard location for residents is shown on **Figure 4-2**. Since the maximum HI is less than 0.5, no isopleth figure was generated for the chronic non-cancer HIs.

Peak Incremental Cancer Risk Locations - Construction

SOURCE: Esri, DigitalGlobe, GeoEye, Earthstar Geographics, CNES/Airbus DS, USDA, USGS, AeroGRID, IGN, and the GIS User Community, August 2020
 PREPARED BY: CDM Smith Inc., August 2020

Peak Incremental Chronic Hazard Locations - Construction

Operations

For impacts due to operational emissions, residential risks were evaluated using 155 representative off-airport receptor locations identified as residential, residential/commercial, or sensitive receptor locations for exposure to operations-related TAC beginning the 8th year of overlapping construction and operations (2028) and continuing through the remainder of the 30-year or 70-year exposure period for the adult and 9-year exposure period for the child. Incremental MEI cancer risks for 30-year and 70-year adult residents were both estimated to be -4 in 1 million. Incremental MEI cancer risk for child residents was estimated to be -3 in 1 million. These values are negative, indicating a beneficial impact, and below the threshold of significance of 10 in 1 million. The MEI cancer risk location for residents is shown on **Figure 4-3**. Since all residential cancer risks were negative, no isopleth figure was generated for the residential cancer risks.

Project-related chronic non-cancer HI for residents was estimated to be 0.02 when comparing 2028 With Project vs. 2018 baseline operations. The HI is primarily attributable to acrolein, formaldehyde, and 1,3-butadiene. The peak residential hazard location for operations is shown on **Figure 4-4**. Since the maximum HI was less than 0.5, no isopleth figure was generated for the chronic non-cancer HIs.

4.1.2.2 School Children

Construction

For the construction scenario, school child risks were evaluated using 155 representative off-airport receptor locations identified as residential, residential/commercial, or sensitive receptor locations. Construction of the proposed Project was estimated to take 8 years – starting in 2021 and ending in 2028. Following construction, it was assumed that for the remaining 4 years of their 12-year exposure period, school children would be exposed to operations-related TAC emissions equivalent to the increment of the operations-related TAC emissions from 2028 with the proposed Project over 2018 baseline operations.

Incremental MEI cancer risk for school children is estimated to be -0.2 in 1 million, which is below the threshold of significance of 10 in 1 million. DPM would contribute to the majority of the cancer risk (81 percent) followed by 1,3-butadiene (10 percent), and benzene (6 percent). The MEI cancer risk location for school children is shown on Figure 4-1. This MEI location was at a residential grid location and not at an existing school location. Grid locations that were evaluated include all locations where current land use is residential or residential/commercial locations. In theory, schools could be constructed in these areas in the future. Schools do not currently exist at almost all of these locations. The highest estimated cancer risk for school children at an existing school was estimated to be -0.4 in 1 million at Cowan Avenue Elementary School (the school at grid point 176). Since the school was an elementary school that provides instruction for children from kindergarten through sixth grade (i.e., 7 years), actual exposure for a child at this facility would likely be less than the 12-year exposure scenario that was modeled.

Based on the 2015 OEHHA Guidance methodology for calculating chronic non-cancer HI, the hazard calculation for school children would not be different from the hazard calculation for child residents. Thus, chronic non-cancer HI was not calculated separately for the school child.

Peak Incremental Cancer Risk Locations -
 Operations (2028 With Project Compared to 2018 Baseline)

SOURCE: Esri, DigitalGlobe, GeoEye, Earthstar Geographics, CNES/Airbus DS, USDA, USGS, AeroGRID, IGN, and the GIS User Community, August 2020
 PREPARED BY: CDM Smith Inc., August 2020

Peak Incremental Chronic Hazard Locations -
 Operations (2028 With Project Compared to 2018 Baseline)

Operations

School child risks were evaluated using 155 representative off-airport receptor locations identified as residential, residential/commercial, or sensitive receptor locations for exposure to operations-related TAC beginning in 2028 and continuing through the remainder of their 12-year exposure period. Incremental MEI cancer risk for school children was estimated to be -1 in 1 million, which is negative, indicating a beneficial impact, and below the threshold of significance of 10 in 1 million. DPM would contribute to the majority of the cancer risk (68 percent) followed by 1,3-butadiene (19 percent), and benzene (6 percent). The MEI cancer risk location for school children is shown on Figure 4-3. This MEI location was at a residential/commercial grid location and not at an existing school location. The highest estimated cancer risk for school children at an existing school was estimated to be -1 in 1 million at Cowan Avenue Elementary School (the school at grid point 176).

Based on the 2015 OEHHA Guidance methodology for calculating chronic non-cancer HI, the hazard calculation for school children would not be different from a hazard calculation for a resident child. Thus, chronic non-cancer HI was not calculated separately for the school child.

4.1.2.3 Off-Airport Workers

Construction

Off-airport workers were evaluated at 236 representative off-airport receptor locations identified as commercial or residential/commercial. Construction of the proposed Project was estimated to take 8 years – starting in 2021 and ending in 2028. Following construction, it was assumed that the TAC emissions for the worker's 17 remaining years of the 25-year exposure period would be equal to the increment of the operations-related TAC emissions from 2028 with the proposed Project over 2018 baseline operations.

Incremental MEI cancer risk for off-airport workers was estimated to be 5 in 1 million, which is below the threshold of significance of 10 in 1 million. DPM would contribute to most of the cancer risk (96 percent). The MEI cancer risk location for off-airport workers during proposed Project construction is shown on Figure 4-1.

For chronic non-cancer hazards, health impacts were estimated on a year-by-year basis to account for varying emission rates and source locations during the construction period. Chronic exposure is typically defined as exposure lasting 7 years or longer, and yearly estimates are not reflections of the potential for non-cancer health impacts. Further, unlike evaluation of cancer risks, non-cancer hazards are based on average daily dose, rather than on cumulative lifetime dose. Thus, the most appropriate way to estimate non-cancer hazards is to develop an average exposure concentration over the period of construction. However, examining yearly HI estimates can provide initial screening. If the highest yearly HI estimates are less than the significance threshold of 1, then any average exposure rate encompassing years with lower HI estimates would also be less than 1. This screening approach was used in the discussion of HI estimates for off-airport workers.

Project-related chronic non-cancer HIs for construction impacts associated with the proposed Project are provided in Table 4-3. The peak HI at the peak location for the off-airport worker was estimated to be 0.3 during the 2023 construction year. The peak off-airport worker chronic

hazard location for construction is shown on Figure 4-2. All incremental chronic non-cancer health indices for off-airport workers were predicted to be below the significance threshold of 1. At the peak HI location for 2023, HIs were primarily attributable to acrolein (26 percent), DPM (12 percent) and silicon (21 percent). Silicon is a component of construction dust. Since even peak HI estimates were less than one, HI estimates for any chronic time frame would also be less than one and the screening analysis is sufficient to demonstrate lack of significant impact.

Since all HIs are equal to or less than 0.5, no isopleth figure was generated for the chronic non-cancer HIs.

Operations

Off-airport workers were evaluated at 239 representative off-airport receptor locations (identified as commercial or residential/commercial) for exposure to operations-related TAC beginning in 2028. Incremental MEI cancer risk for off-airport workers was estimated to be 5 in 1 million, which is below the threshold of significance of 10 in 1 million. DPM would contribute to most of the cancer risk (97 percent). The MEI cancer risk location for off-airport workers is shown on Figure 4-3.

The peak Project-related incremental chronic non-cancer HI for off-airport workers was estimated to be 0.09 for proposed Project operations, which is below the threshold of significance. HIs were primarily attributable to chlorine (43 percent), acrolein (36 percent) and DPM (18 percent). The peak off-airport worker chronic hazard location for operations is shown on Figure 4-4. Since all HIs were less than 0.5, no isopleth figure was generated for the chronic non-cancer HIs.

4.1.3 Acute Non-Cancer Health Hazards

As with cancer risks and chronic non-cancer health hazards, acute non-cancer health hazards were analyzed at grid points within the study area. Short-term concentrations for TAC associated with construction of the proposed Project were estimated by modeling 1-hour maximum concentrations. All TAC identified in the proposed Project construction emissions and for which CalEPA has developed acute RELs were evaluated for potential acute non-cancer health hazards. All acute non-cancer health hazard estimates are specific for airport emissions and are independent of county-wide estimates developed by USEPA.

Land use distinctions and different exposure scenarios are irrelevant for assessment of acute non-cancer health hazards. For example, someone visiting a commercial establishment would potentially be subject to the same acute non-cancer health hazards as someone working at the establishment. For the acute non-cancer health hazards analysis, all of the grid points were distinguished by their receptor type although the calculation for the acute non-cancer health hazard was the same. Retaining land use designations puts some perspective on who might be subject to exposure to the highest short-term concentrations of TAC.

Construction

Acute non-cancer health hazards were evaluated for each year of construction from 2021 to 2028. The peak emission year for acute non-cancer health hazards during construction was identified as 2023. All hazards quotients due to acute exposure were below 1 for all evaluated off-airport grid

points within the study area. Hence, no acute non-cancer health impacts are expected from construction of the proposed Project. A HI equal to or greater than 1 would indicate the potential for acute adverse health effects.

Maximum acute non-cancer health hazards associated with exposure to acrolein, manganese, formaldehyde, nickel, and benzene associated with emissions from the proposed Project construction are summarized in **Table 4-4**. Peak locations are shown in **Figure 4-5**. Calculations are provided in **Attachment 2** to this report.

Table 4-4 Range of Peak Construction-Related Incremental Acute (1-Hour) Non-Cancer Hazard Indices for Proposed Project Construction

Receptor Type	Summary of Incremental Acute Non-Cancer Hazard Indices ¹				
	Acrolein	Benzene	Formaldehyde	Manganese	Nickel
On-Airport Worker					
Maximum HI ²	0.1	0.03	0.1	0.08	0.006

Notes:					
¹ Emissions were modeled in 2023 for the acute 1-hour unmitigated construction scenario.					
² HI = Hazard Index.					

Acrolein, manganese, formaldehyde, nickel, and benzene were the TAC with the highest acute HI estimates, all less than the threshold of one. At the location of the peak total acute non-cancer health hazard, acrolein (contributing 35 to 59 percent), manganese (contributing 13 to 23 percent), and formaldehyde (contributing 20 to 28 percent) were the primary contributors. Nickel and benzene contributed less at 1 to 2 percent and 6 to 9 percent, respectively, of the total acute non-cancer health hazards. Note that the target organ for acute toxicity of manganese was the nervous system and its actions would not be expected to be additive to the effects of acrolein and formaldehyde, which target the respiratory system, nor to the effects of benzene, which could result in developmental impacts and impacts to the immune and hematologic systems.

 PREPARED BY: CDM Smith Inc., October 2020

Peak Incremental Acute Hazard Locations - Construction

Acute exposures to acrolein typically result in mild irritation of eyes and mucous membranes. Acute exposures to formaldehyde may result in irritation to the eye and respiratory system and potentially adverse effects to the immune system. Acute exposures to nickel could also potentially impact the immune system. Acute exposures to benzene could result in developmental impacts and impacts to the immune and hematologic systems. The target organ for acute toxicity of manganese is the nervous system.

Operations

Acute non-cancer health hazards were evaluated for operations in 2028. All hazards quotients due to acute exposure were below the significance threshold of 1 for all evaluated on-airport and off-airport grid points within the study area of the proposed Project. Hence, no acute non-cancer health impacts were expected from projected operational emissions.

Maximum acute non-cancer health hazards associated with exposure to manganese, formaldehyde, nickel, and benzene associated with emissions from the proposed Project operations are summarized in **Table 4-5**. Peak locations are shown in **Figure 4-6**. Calculations are provided in **Attachment 2** to this report.

At the location of the peak total acute non-cancer health hazard, acrolein contributed 66 to 100 percent of the total of all maximum acute non-cancer health hazards under operations. Formaldehyde and benzene contributed up to 25 percent, and up to 8 percent, respectively, of the total of all maximum acute non-cancer health hazards under operations at the peak location for each receptor.

Table 4-5 Range of Operation-Related Incremental Acute (1-Hour) Non-Cancer Hazard Indices for 2028 With Project Compared to 2018 Baseline

Receptor Type	Summary of Incremental Acute Non-Cancer Hazard Indices				
	Acrolein	Benzene	Formaldehyde	Manganese	Nickel
On-Airport Worker

Peak Incremental Acute Hazard Locations -
 Operations (2028 With Project Compared to 2018 Baseline)

4.2 Population-Wide Risks (Cancer Burden)

When incremental MEI cancer risk estimates exceed the threshold of 10 in one million, CalEPA guidance requires an estimate of population level risks. These estimates are protective estimates of the number of cancer cases that could occur in the exposed population. If more than 0.5 cases are estimated, the impact is determined to be significant.

To determine the population-wide risks, Project-related risks for construction and operation impacts were evaluated for a 70-year residential scenario. The 2017 population by census tract was estimated from the 2013-2017 American Community Survey 5-year estimates available from the U.S. Census.⁴⁶ The next decennial census is being conducted in 2020, so the 2017 values were cross-checked with the 2010 census population estimates for Los Angeles County. When multiple grid points were located within a single census tract, cancer risk was estimated as the average within the tract. The total cancer burden for the Project was determined as the sum of individual census tract cancer burdens.

As shown in Table 4-3, cancer risks for the 70-year residential scenario for both construction and operations impacts associated with the proposed Project were estimated to be negative, indicating a beneficial impact. As such, figures showing cancer risk isopleths to identify the 1 in a million zone of impact were not generated since cancer burdens would similarly be negative and below the threshold of significance of 0.5. Calculations are provided in **Attachment 1** to this report.

Because all incremental chronic non-cancer health hazards for residents were below 1, population-level estimates for non-cancer health impacts were not estimated. The same is true for acute health hazards.

4.3 Cumulative Risks and Non-Cancer Health Hazards Associated with the Proposed Project

Unlike air quality, for which standards have been established that determine acceptable levels of pollutant concentrations, no standards exist that establish acceptable levels of human health risks or that identify a threshold of significance for cumulative health risk impacts. Therefore, the discussion below addresses cumulative health risk impacts, and Project-related contributions to those impacts; however, no determination is made regarding the significance. Since these results are not used for significance determination, a general discussion of the cumulative impacts for the proposed Project is provided. Based on information available from SCAQMD, relative to regional cancer risk estimates and TAC concentration predictions, geographic areas considered in the cumulative health risk impacts analysis include the South Coast Air Basin for cancer risk and the LAX area for non-cancer health hazards, as further described below.

4.3.1 Cumulative Cancer Risks

In June 1987, the SCAQMD published the first Multiple Air Toxics Exposure Study (MATES), which was the most comprehensive air toxics study ever conducted in an urban environment. This original study has been updated several times; the most recent study, MATES-IV, was published

⁴⁶ <http://www.census.gov/>.

in May 2015.⁴⁷ Air toxics monitoring for MATES-V is expected to extend through 2019. The study estimates cancer risk from TAC emissions throughout the South Coast Air Basin by conducting a comprehensive monitoring program, an updated emissions inventory of TAC, and a modeling effort to fully characterize health risks for those living in the South Coast Air Basin. The study includes a series of maps showing regional trends in estimated outdoor inhalation cancer risk from toxic emissions. These risk maps depict inhalation cancer risk due to modeled outdoor TAC pollutant levels, and do not account for cancer risk due to other types of exposure. The study found that the largest contributors to inhalation cancer risk are diesel engines. According to MATES-IV, cancer risks in the South Coast Air Basin range from 320 in 1 million to 480 in 1 million, with an average of 418 in 1 million. These cancer risk estimates are relatively high (although substantially lower than those found in MATES-III) and indicate that current impacts associated with ongoing releases of TAC (e.g., from vehicle exhaust) and from sources of TAC from past and present projects in the region are substantial.

As part of the MATES-III Study, the SCAQMD prepared a series of maps that show regional trends in estimated outdoor inhalation cancer risk from toxic emissions, as part of an ongoing effort to provide insight into relative risks. The maps' estimates represent the number of potential cancers per million people associated with a lifetime of breathing air toxics (24 hours per day outdoors for 70 years) in parts of the area. The estimated lifetime cancer risk from exposure to TAC for those residing within the vicinity of the proposed Project is estimated at 884 cancers per million, while the vast majority of the area surrounding LAX ranges between 500 to 1,200 cancers per million.⁴⁸ However, the visual resolution available in the map is 1 kilometer by 1 kilometer and, thus, impacts for individual neighborhoods are not discernible on this map. In general, the risk near the project site is comparable with other locations in the Los Angeles area; the risk from air toxics is lower near the coastline, and increases inland, with higher risks concentrated near large diesel sources (e.g., freeways, airports, and ports).

The SCAQMD also provides guidance on performing an HHRA through its publication, *Supplemental Guidelines for Preparing Risk Assessment for the Air Toxics Hot Spots Information and Assessment Act* (AB 2588), June 2015. This document incorporates the updated risk methodologies established by OEHHA's 2015 Guidance Manual that take into account early childhood exposure. According to MATES-IV, although in general there has been an overall South Coast Air Basin-wide reduction in air toxics concentrations since MATES-III, application of the updated risk estimation methods recently adopted by OEHHA result in an estimated population weighted risk across the South Coast Air Basin range of 897 per million, an increase in cancer risks compared to the prior risk estimation methods.

CARB also prepares a series of maps that show regional trends in estimated outdoor inhalable cancer risk from air toxic emissions. The Year 2010 Los Angeles County Central map, which is the most recently available map to represent existing conditions, shows cancer risk ranging from 500

⁴⁷ South Coast Air Quality Management District, *Final Report – Multiple Air Toxics Exposure Study in the South Coast Air Basin – MATES IV*, May 2015. Available: <http://www.aqmd.gov/docs/default-source/air-quality/air-toxic-studies/mates-iv/mates-iv-final-draft-report-4-1-15.pdf?sfvrsn=7>.

⁴⁸ South Coast Air Quality Management District, *Multiple Air Toxics Exposure Study III Model Estimated Carcinogenic Risk*. Available: <http://www3.aqmd.gov/webappl/matesiii/>, accessed August 11, 2016.

to 1,500 cancers per million in the project area, which is generally consistent with the SCAQMD's risk maps.⁴⁹

The data from the SCAQMD and CARB provide a slightly different ranges of risk. This difference is primarily related to the fact that the SCAQMD risk is based on monitored pollutant concentrations and the CARB risk is based on dispersion modeling and emission inventories. Regardless, both the SCAQMD and CARB data show that an inherent health risk associated with living in urbanized areas of the South Coast Air Basin, where mobile sources (e.g., cars, trucks, trains, ships, aircraft, etc.) represent the greatest contributors to the overall risk.

The MATES-IV study is an appropriate estimate of present cumulative impacts of TAC emissions in the South Coast Air Basin. It does not, however, have sufficient resolution to determine the fractional contribution of current LAX operations to TAC in the air shed. Only possible incremental contributions to cumulative impacts can be assessed.

Meaningful quantification of future cumulative health risk exposure in the entire South Coast Air Basin is not possible. Moreover, the threshold of significance used to determine cancer risk impacts associated with the proposed Project is based on the cancer risks associated with individual projects; this threshold is not appropriately applied to conclusions regarding cumulative cancer risk in the South Coast Air Basin.

However, based on the relatively high cancer risk level associated with TAC in air in the South Coast Air Basin (i.e., an additional 897 cancer cases per million according to MATES-IV), the proposed Project MEI off-airport worker risk would amount to less than 1 percent of the cancer risk in the South Coast Air Basin and would not add substantially to the already high cumulative cancer risk in the South Coast Air Basin. Neither this small increase estimated for off-airport workers nor the risk decreases estimated for residents would be measurable in collected cancer statistics against urban background conditions in the South Coast Air Basin.

The above comparisons do not account for possible positive changes in air quality in the South Coast Air Basin in the future. SCAQMD and other agencies are consistently working to reduce air pollution. In particular, reductions in emissions of diesel particulates are being considered and implemented. Since DPM is the major contributor to estimated cancer risks, substantial reductions in diesel emissions would result in substantial reductions in cumulative cancer risks. These, and other such regulations intended to reduce TAC emissions within the South Coast Air Basin, would reduce cumulative impacts overall. While continued, if not increased, regulation by the SCAQMD of point sources as well as more stringent emission controls on mobile sources would reduce TAC emissions. Whether such measures would alter incremental contributions of TAC releases to cumulative impacts under the proposed Project cannot be ascertained.

Regarding reasonably foreseeable future projects, continued growth and development in the region, as well as other construction projects at LAX, may result in additional emissions of TAC. Future emissions of TAC in the airshed in general cannot be quantitatively assessed.

4.3.2 Cumulative Chronic Non-Cancer Health Hazards

For the proposed Project, chronic non-cancer health hazards would be primarily attributable to acrolein, DPM, and chlorine, and to a lesser extent silicon, formaldehyde, and 1,3-butadiene. In 2018, USEPA⁵⁰ published an independent study that included annual average air concentrations within the South Coast Air Basin associated with a variety of TAC, including acrolein, chlorine, and DPM. These estimates provide a means for assessing cumulative chronic non-cancer health hazard impacts of airport operations in much the same manner as cumulative cancer risks were assessed using the MATES-IV results.

As shown in **Attachment 1** (Table 1-6), within the study area, USEPA predictions for annual average concentrations yield acrolein hazard quotients by census tract ranging from 0.1 to 0.5, with an average of 0.2; DPM HIs range from 0.05 to 0.09, with an average of 0.07; and chlorine HIs range from 0.05 to 0.08, with an average of 0.07. As shown in Table 4-3, incremental chronic non-cancer HIs for the proposed Project were estimated to range from 0.02 to 0.3, all below the threshold of significance of one. Given the relatively small HIs associated with proposed Project emissions, the proposed Project is not expected to add significantly to cumulative chronic non-cancer health hazards.

Because of the substantial uncertainties associated with the USEPA estimates, the cumulative analysis for chronic non-cancer health hazard impacts is semi-quantitative and based on a range of possible contributions. This cumulative analysis does not address the issue of potential interactions among acrolein and criteria pollutants. Such interactions cannot, at this time, be addressed in a quantitative fashion. A qualitative discussion of the issue is presented in the LAX Master Plan Final EIR⁵¹ Technical Report S-9a, Section 7.

As discussed in the LAX Master Plan Final EIR⁵² (Section 4.24.1.2), limited data are available for describing acrolein emissions. Therefore, estimates of chronic non-cancer health hazards are very uncertain. Chronic non-cancer health hazards associated with the proposed Project should only be used to provide a relative comparison to basin-wide conditions. These hazards should not be viewed as absolute estimates of potential health impacts. Moreover, USEPA's estimates are based on data from 2014 and are, therefore, several years old. Emissions from some important sources may have been reduced as a result of continuing efforts by SCAQMD and other agencies to improve air quality in the South Coast Air Basin. Finally, the estimates do not consider degradation of TAC in the atmosphere. Degradation may be very important for relatively reactive chemicals such as acrolein.

Available: <https://www.lawa.org/en/lawa-our-lax/environmental-documents/documents-certified/2004-lax-master-plan-program/final-environmental-impact-report-feir>.

4.3.3 Cumulative Acute Non-Cancer Health Hazards

Acrolein, formaldehyde, and manganese would be the primary TAC of concern in proposed Project construction emissions that might be present at concentrations approaching the threshold for acute non-cancer health hazards. The primary TAC of concern in proposed Project operations emissions for acute non-cancer hazards would be acrolein. Predicted concentrations of TAC released from both construction activities and operations for the proposed Project estimate that acute non-cancer health hazards would be below the significance threshold of 1.

The assessment of cumulative acute non-cancer health hazards follows the methods used to evaluate cumulative acute non-cancer health hazards presented in the LAX Master Plan Final EIR⁵³ (Section 4.24.1.7 and Technical Report S-9a, Section 6.3), incorporating updated National-Scale Air Toxics Assessment (NATA) tables⁵⁴ from 2014. USEPA-modeled emission estimates by census tract were used to estimate annual average ambient air concentrations. These census tract emission estimates are subject to high uncertainty, thus, for the analysis of cumulative acute non-cancer health hazards, estimates for each census tract within the study area within Los Angeles County were identified and the range of concentrations was used as an estimate of the possible range of annual average concentrations.

This range of concentrations was used to estimate a range of acute non-cancer HIs using the same methods as described in the LAX Master Plan Final EIR⁵⁵ (Section 4.24.1.7 and Technical Report S-9a, Section 6.1). The methodology entails converting the USEPA annual average estimates to maximum 1-hour average concentrations by dividing annual average estimates by 0.08.⁵⁶ Then the maximum 1-hour average concentrations were divided by the acute REL to calculate acute non-cancer HIs. The range of HIs was then used as a basis for comparison with estimated maximum acute non-cancer health hazards for the proposed Project. The relative magnitude of acute non-cancer health hazards calculated using this method were taken as a general measure of relative cumulative impacts. Emphasis must be placed on the relative nature of these estimates. Uncertainties in the analysis preclude estimation of absolute impacts.

As shown in **Attachment 1** (Table 1-7), when USEPA annual average estimates within the HHRA study area were converted to possible maximum 1-hour average concentrations, acrolein acute non-cancer HIs were estimated to range from 0.2 to 0.8, with an average of 0.4; formaldehyde acute non-cancer HIs were estimated to range from 0.3 to 0.5, with an average of 0.4; and manganese acute non-cancer HIs were estimated to range from 0.08 to 0.2, with an average of 0.1. Predicted overall maximum incremental acute non-cancer health hazards for the proposed Project from construction and operations ranged from 0.1 to 0.4 for acrolein; from 0.04 to 0.1 for formaldehyde; and from 0.02 to 0.1 for manganese (Tables 4-4 and 4-5). The target organ for manganese is the nervous system, while the target organ for formaldehyde and acrolein is the

⁵⁶ California Air Resources Board, *HARP User Guide: Appendix H Recommendations for Estimating Concentrations of Longer Averaging Periods from the Maximum One-Hour Concentration for Screening Purposes*, December 2003.

eyes. Thus, the hazard quotient for manganese would not be summed with the hazard quotients for formaldehyde and acrolein in an organ system breakdown of the HI. With the resulting HIs being below 1, this analysis indicates that the acute non-cancer health hazards for the proposed Project would not be cumulatively considerable.

4.3.4 Conclusions

Although no defined thresholds for cumulative health risk impacts are available, it is the policy of the SCAQMD to use the same significance thresholds for cumulative impacts as for the project-specific impacts analyzed in the EIR.⁵⁷ Based on this policy, the proposed Project's contribution to the cumulative cancer risk would not be cumulatively considerable under the construction scenario since the incremental cancer risk impacts for both construction and operation for evaluated receptors would be below the individual cancer risk significance thresholds of 10 in one million.

In contrast to cancer risk, the SCAQMD policy does have different significance thresholds for project-specific and cumulative impacts for HIs for TAC emissions. A project-specific significance threshold is one (1.0) while the cumulative threshold is 3.0. Based on this SCAQMD policy, chronic and acute non-cancer HIs associated with airport emissions for both construction and operation under the proposed Project would not be cumulatively considerable.

Section 5

Uncertainties

Uncertainties are present in all facets of human health risk assessment. Potential important uncertainties associated with the HHRA for the LAX Master Plan are discussed in detail in Technical Report 14a and Technical Report S-9a of the LAX Master Plan Final EIR. These same uncertainty considerations apply to the analyses presented in the proposed Project EIR. These uncertainties are briefly summarized below.

5.1 Uncertainties Associated with Emission Estimates and Dispersion Modeling

Risk estimates were based on chemical concentration estimates obtained through emissions and dispersion modeling. Emissions estimates are sensitive to the values used to represent the numerous emission source variables (e.g., project construction and future traffic assumptions) and to the air toxic emission factor values used for each source. Consequently, estimated emissions values are subject to uncertainties. Different assumptions and values of variables would result in different emissions estimates. The HHRA used well-accepted methods and best available emission factor data to develop estimates of emissions, and estimates and assumptions are reasonable and appropriate. Actual emissions are unlikely to be meaningfully greater than those used in the analyses.

In accordance with the Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments,⁵⁸ a simplification was made in the emissions modeling to model DPM and not the speciated emissions from diesel-fueled engines for the emission concentrations used in the evaluation of cancer risk or chronic non-cancer health impacts. According to the guidance, the inhalation cancer potency factor and chronic REL for DPM already account for inhalation impacts from speciated emissions from diesel-fueled engines. Therefore, this omission in the modeling is not expected to impact the results of the analysis.

5.2 Evaluation of Sensitive Receptor Populations

Certain subpopulations may be more sensitive or susceptible to negative health impacts caused by environmental contaminants than the population at large. A recent study by the University of California, Los Angeles (UCLA) examined the role of ultrafine particulates (UFPs), which are less than 0.1 micrometers in aerodynamic diameter, from jet aircraft emissions in increased rates of preterm births⁵⁹ from pregnant mothers living downwind of LAX.⁶⁰ Although the small size of these particles allows them to easily enter the lungs and the bloodstream and there is evidence

⁵⁸ California Environmental Protection Agency, Office of Environmental Health Hazard Assessment, Air Toxics Hot Spots Program, Risk Assessment Guidelines, Guidance Manual for Preparation of Health Risk Assessments, February 2015.

⁵⁹ For purposes of the study, a preterm birth was defined as a live birth occurring before 37-week gestation.

⁶⁰ Wing, Sam E., Timothy V. Larson, Neelakshi Hudda, Sarunporn Boonyarattaphan, Scott Fruin, and Beate Ritz, "Preterm Birth among Infants Exposed to in Utero Ultrafine Particles from Aircraft Emissions," *Environmental Health Perspectives*, 128(4), 2020. Available: <https://ehp.niehs.nih.gov/doi/pdf/10.1289/EHP5732>.

that UFPs can cross the placenta, it is not clear how UFPs contribute to prematurity.⁶¹ The study looked at 174,186 birth records between 2008 and 2016 for all mothers living within 15 kilometers (9 miles) of LAX. Variables known to influence preterm birth were tracked, such as airport noise levels and the mother's age, education level, and race. In addition, records were adjusted for nitrogen dioxide (NO₂), which was used as a proxy for traffic-related air pollution. Air dispersion modeling was used to predict the concentration of UFPs along two incoming flight paths, which was further validated by mobile air measurements of daytime UFP concentrations.⁶² The study found that mothers living in the area with the largest concentration of UFP were about 14 percent more likely to have a preterm birth than mothers living in the area with the lowest concentration of UFP.

While the data suggests that airplane pollution (beyond the air pollution caused by traffic in the study area) contributes to preterm births, the study is not sufficient to prove a causal effect. Many variables that could impact the results of the study were not controlled by researchers.⁶³ For example, they could not confirm how much time the mothers spent exposed to airport UFP or whether they lived in homes with indoor air filtering systems.

Currently, air pollution is measured in volumes of small particles of 2.5 micrometers in diameter. According to the EPA,⁶⁴ the studies on UFPs are limited and not sufficient to inform policy-relevant conclusions; thus, UFPs are not routinely monitored or regulated by state or federal governments. While the recent UCLA study is suggestive of UFP impacts and calls for future studies to evaluate the potential impacts of UFP, the state of the science regarding these particles and their contribution to preterm births is not yet conclusive.

Risk estimates presented in the HHRA represent a wide range of potential exposures including the highest that can be reasonably expected. Thus, even though risk estimates are not provided for all potentially sensitive receptors in the area, populations not specifically evaluated are still expected to be represented. For example, quantitatively evaluated populations include those with the highest expected exposure durations and exposure frequencies (e.g., residents). Exposures are, therefore, expected to be less for other populations, even those with higher chemical sensitivities.

5.3 Uncertainties Associated with Exposure Parameter Assumptions

Evaluating human exposure requires many assumptions about how people actually contact chemicals in the environment. Key issues associated with exposure assessment are discussed below.

⁶¹ Konkell, Lindsey. "Move Over, Traffic: Aircraft Emissions and Preterm Birth," *Environmental Health Perspectives*, 128(7), 2020. Available: <https://ehp.niehs.nih.gov/doi/pdf/10.1289/EHP7161>.

⁶⁴ U.S. Environmental Protection Agency, *Policy Assessment for the Review of the National Ambient Air Quality Standards for Particulate Matter*, EPA-452/R-20-002, 2000. Available: https://www.epa.gov/sites/production/files/2020-01/documents/final_policy_assessment_for_the_review_of_the_pm_naaqs_01-2020.pdf.

5.3.1 Uncertainties in Exposure Duration for Cancer Risks

In accordance with the CalEPA guidance,⁶⁵ an exposure duration of 30 years was used to estimate possible cancer risks associated with the proposed Project for the resident for the significance determination. This exposure duration combined with other exposure parameters used in this HHRA assumed that an individual exists who resides where maximum impacts would occur in a location near construction similar to construction anticipated for LAX, and that the individual would be sedentary, spending essentially all of his/her time at home. The person was assumed to be constantly exposed to emissions at the point of greatest impact for 30 years. This combination of factors is highly unlikely, and any estimates of cancer risk based on such a combination would greatly overestimate possible cancer risks for everyone in the study area.

Although the 30-year residential scenario was used for the significance determination, the 70-year residential scenario was also calculated to determine cancer burden for evaluation of population-wide risks. These 70-year results are presented in Table 4-3 and Section 4.2 of this report. Varying exposure duration within a reasonable range for residents evaluated for the proposed Project would not materially affect conclusions about the cancer risk impact of the proposed Project. Conclusions regarding significance of cancer risk associated with the proposed Project would remain the same.

5.4 Uncertainties Associated with Toxicity Assessment

Quantitative evaluation of chemical toxicity requires assumptions to extrapolate toxicity information in the literature to possible impacts on people from exposure to chemicals in the environment. Key assumptions are discussed briefly below.

5.4.1 Uncertainties Associated with Toxicity Criteria

A potentially large source of uncertainty is inherent in the derivation of the CalEPA toxicity criteria (cancer slope factors and RELs). In many cases, data used to develop toxicity criteria must be extrapolated from animals to sensitive humans. For example, the application of uncertainty factors to estimate no-observable-adverse-effects-levels (NOAELs) or lowest-observed-adverse-effects-levels (LOAELs) are typically used to develop RELs. While these factors are designed to be protective, they often result in toxicity criteria that overestimate the differences between humans and animals, and among humans.

In some cases, however, toxicity criteria may be based on studies that did not detect the most sensitive adverse effects. For example, many past studies have not measured possible toxic effects on the immune system. Moreover, some chemicals may cause subtle effects not easily recognized in animal studies. Overall, toxicity criteria are likely to be protective for most or all exposed populations. These criteria are constantly being reconsidered in light of new research and are subject to occasional change during this process. The nature and direction of these changes cannot be predicted and currently available criteria are the best source of toxicity information for use in health risk assessments.

⁶⁵ California Environmental Protection Agency, Office of Environmental Health Hazard Assessment, *Air Toxics Hot Spots Program, Risk Assessment Guidelines, Guidance Manual for Preparation of Health Risk Assessments*, February 2015.

5.4.2 Uncertainties Associated with Unavailable Toxicity Values

1,2,4-trimethylbenzene; 2,2,4-trimethylpentane, bromine, cumene, cyclohexane, naphthalene, n-hexane, isoprene, propionaldehyde, propylene, silicon, aluminum, antimony, barium, cadmium, hexavalent chromium, cobalt, lead, phosphorus, selenium, silver, zinc, and DPM do not have acute RELs that have been developed by OEHHA. However, antimony, cadmium, and phosphorus have acute toxicity screening levels from the ATSDR in the form of published acute minimal risk levels (MRLs) for hazardous substances. MRLs were established to provide a screening tool for public health professionals to use to identify if potential human health hazards exist from contamination at hazardous waste sites. MRLs are often based on animal studies because relevant human studies are lacking. ATSDR assumes that humans are more sensitive than animals to the effects of hazardous substances and that certain persons may be particularly sensitive. Thus, ATSDR recommendations for MRLs may be as much as a hundred-fold below levels shown to be nontoxic in laboratory animals. This approach is protective for public health. Acute inhalation MRLs for antimony, cadmium, and phosphorus are $1 \mu\text{g}/\text{m}^3$, $0.03 \mu\text{g}/\text{m}^3$, and $20 \mu\text{g}/\text{m}^3$, respectively. These MRLs are below and above the acute MRL of acrolein ($3 \mu\text{g}/\text{m}^3$), reflecting the relative toxicity of these chemicals to acrolein. The maximum estimated one-hour concentrations for antimony, cadmium, and phosphorus for unmitigated construction were $0.0006 \mu\text{g}/\text{m}^3$, $0.0009 \mu\text{g}/\text{m}^3$, and $0.04 \mu\text{g}/\text{m}^3$. It's unlikely that acute non-cancer health hazards associated with these chemicals would rival acrolein, the risk driver for potential acute non-cancer health hazards from aircraft emissions. Lack of inclusion of these chemicals in the quantitative risk assessment would not be expected to change the conclusions of the acute non-cancer health hazard evaluation.

Although DPM does not have an acute REL, several components of DPM (such as arsenic, chlorine, mercury, nickel, vanadium, and sulfates) were evaluated in the acute non-cancer health hazard analysis. Therefore, in order to account for potential acute impacts from DPM, the speciated components of DPM (arsenic, chlorine, mercury, nickel, vanadium, and sulfates) were evaluated in the acute non-cancer health hazard analysis. As noted in Section 5.1, Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments⁶⁶ indicates that toxicity values for DPM were developed for whole diesel exhaust (gas and particulate matter). As such, DPM should be the only TAC considered in the calculation of cancer risks and chronic non-cancer health hazards for diesel engine emissions; speciated diesel exhaust components (e.g., PAHs, metals) should not be evaluated along with DPM. Studies used to support the DPM toxicity value also indicate that "potential cancer risk from inhalation exposure to whole diesel exhaust will outweigh the multipathway cancer risk from the speciated components."

The potential impact of not having acute inhalation toxicity values for the remaining chemicals without acute inhalation toxicity screening levels on the conclusions of the acute risk evaluation is unknown.

Similarly, 2,2,4-trimethylpentane, bromine, isoprene, copper, lead, phosphorus, silver, and sulfates did not have chronic RELs that have been developed by OEHHA nor did they have EPA chronic inhalation reference concentrations. These chemicals also did not have chronic inhalation

⁶⁶ California Environmental Protection Agency, Office of Environmental Health Hazard Assessment, *Air Toxics Hot Spots Program, Risk Assessment Guidelines, Guidance Manual for Preparation of Health Risk Assessments*, February 2015.

toxicity screening levels in the form of ATSDR MRLs. Thus, the potential impact of not having toxicity values for these chemicals on the conclusions of the chronic risk evaluation is unknown.

5.5 Uncertainties in Risk Characterization

Combining estimates of exposure and toxicity to estimate risks and hazards to human health require the use of methods that simplify actual exposure. For the inhalation pathway, important issues for risk characterization are discussed below.

5.5.1 Uncertainties Associated with Elimination of Potentially Complete Exposure Pathways

The proposed Project HHRA evaluated the potential complete exposure pathway of direct inhalation of TAC which would be released during construction of the proposed Project. However, other exposure pathways, such as exposure to TAC deposited onto soils, could also be important. For example, children might ingest TAC that deposited onto soil through hand-to-mouth activity during outdoor play, or residents who have gardens could ingest TAC taken up from soil into plants. For the proposed Project HHRA, based on the multi-pathway screening analysis in the LAX Master Plan Final EIR and other airport HHRAs, inhalation of TAC was identified as the primary exposure pathway, and exposures and risks from inhalation of TAC were quantified.

Other potential exposure pathways were analyzed in a two-step screening process described in Technical Report 14a Attachment B, Section 2.5.3 of the LAX Master Plan Final EIR. In the first step, air dispersion modeling was used to determine potential TAC concentrations in air on or near LAX, and these concentrations were used to estimate deposition of TAC onto soils over time. In the second screening step, concentrations of TAC estimated in soil were compared to the range of background concentrations of these chemicals to determine the relative impacts of deposition from air. This analysis indicated that impacts to soils from deposition of TAC from airport construction would be negligible and that the estimated contribution from LAX emissions would result in no measurable difference in expected background concentrations of metals. Therefore, secondary pathways involving TAC in soil were not further evaluated.

5.5.2 Uncertainties Associated with Different Methodology from Previous LAX EIRs

Cancer risks for significance determination were evaluated in this report using the Air Toxics Hot Spots Program, Risk Assessment Guidelines, Guidance Manual for Preparation of Health Risk Assessments⁶⁷ methodology. The human health risk analyses for previous tiered LAX EIRs followed either RAGS Part F or RAGS Part A methodology. OEHHA's methodology uses higher estimates of cancer potency during early life exposure, thereby, resulting in higher calculated risks than risks calculated using previous RAGS methodologies for the same TAC concentrations.

In addition, the recommended exposure parameters in OEHHA's methodology differ from the parameters used in previously conducted human health risk analyses conducted for previous tiered LAX EIRs. For example, the risk analyses in previous EIRs used an exposure duration of 6

⁶⁷ California Environmental Protection Agency, Office of Environmental Health Hazard Assessment, *Air Toxics Hot Spots Information and Assessment Act of 1987*, Section 44300; California Environmental Protection Agency, Office of Environmental Health Hazard Assessment, *Air Toxics Hot Spots Program, Risk Assessment Guidelines, Guidance Manual for Preparation of Health Risk Assessments*, February 2015.

years for a child resident, 6 years for a school child, and 40 years for an off-airport worker. In this risk analyses, the exposure durations used were for 9 years for a child resident, 12 years for a school child, and 25 years for an off-airport worker. For the child resident and school child, the exposure durations are longer, thus calculated risks using these longer exposure durations would be more conservative than previous methods using the shorter exposure durations. For the off-airport worker, the exposure duration used with OEHHA's methodology is shorter than the exposure duration used with the previous methodologies. To assess the potential impact of this difference, this alternate exposure duration was also evaluated using the RAGS Part F methodology.

Results for cancer risks calculated using RAGS, Part F methodology are presented in discussions of uncertainties to enable the results of LAX Airfield and Terminal Modernization Project to be compared with previously conducted analyses at LAX. Results are shown in **Table 5-1**. Equations for the RAGS, Part F methodology and calculations are provided in **Attachment 3**. As seen in the table, cancer risks calculated using RAGS F methodology would be similar to those calculated for the significance determination and below the threshold of significance.

Table 5-1 Incremental Cancer Risks for Maximally Exposed Individuals¹ from Project Construction and Operation Using RAGS Part F Methodology

Receptor Type	Incremental Cancer Risks ² (per million people)			
	Unmitigated Construction ³		Operation - 2028 With Project vs. 2018 Baseline ⁴

Key: NA = Not applicable				
Notes:				
¹ Maximally Exposed Individual (MEI) locations are shown on Figures 4-1 and 4-3.				
² Negative values indicate a beneficial impact.				
³ Construction of the proposed Project is estimated to take 8 years – starting in 2021 and ending in 2028. Following construction, it was assumed that beginning in the 8th year (2028), construction and operations would be overlapping and continuing through the remainder of the receptors' exposure periods. Starting in 2028, receptors would be exposed to incremental 2028 With Project operations-related TAC as compared to 2018 baseline operations.				
⁴ It was assumed that for operations, receptors are exposed to operations-related TAC beginning in 2028 and continuing through the remainder of the receptors' exposure periods.				

5.5.3 Uncertainties Associated with Additional Scenarios

For disclosure purposes, the following additional scenario was evaluated and is presented here.

- 2028 Future Without Project vs. 2018 Baseline operations

Results are presented in **Table 5-2** and **Table 5-3** and shown in **Figures 5-1, 5-2, and 5-3**. This scenario was not used for significance determination but is provided to remove the influence of background growth and the differences in motor vehicle emission factors between 2018 and 2028. The difference between this scenario and the scenario used for significance determination highlights the air pollutant concentration impacts of the proposed Project compared to future concentrations that were projected to occur without the Project. This comparison is made for informational purposes only.

Table 5-2 Incremental Cancer Risks for Maximally Exposed Individuals for 2028 With Project Operations Compared to 2018 Baseline and 2028 Without Project Compared to 2018 Baseline

Receptor Type	Incremental Cancer Risks ^{1,2,3,4} (per million people)

Off-Airport Adult Worker	0.2	0.009	0.04	0.03	0.01	0.3
Resident	0.3	0.0007	0.03	0.01	0.004	0.4
Source: CDM Smith, 2020. (Attachment 2 , Tables 2-2.2 and 2-3.2)						
Notes:						
¹ Maximally Exposed Individual (MEI) locations for incremental acute non-cancer hazards for the 2028 With Project Operations Compared to 2018 Baseline are shown on Figure 4-6. MEI locations for the 2028 Without Project Operations Compared to 2018 Baseline are shown on Figure 5-3.						
² Hazard quotients (HQs) and hazard indices (HIs) are unitless.						
³ Total acute non-cancer health hazards may not add up exactly due to trace hazard quotients from unlisted TAC. The HQs for the TAC shown represent 98 percent or more of the calculated peak total hazard index.						

Existing emissions and dispersion of TAC from LAX operations were used as a baseline to estimate the impact of anticipated increases in future airport activity. Incremental impacts to human health were assessed by comparing health risks and hazards associated with Project and without Project in 2028 to 2018 baseline conditions. If risks or hazards associated with the 2028 condition were estimated to be higher than risks or hazards associated with baseline conditions, the difference in risks or hazard would represent an incremental increase in possible health impacts. If the opposite were found (i.e., the value was negative), the difference in risks or hazard would represent an incremental beneficial impact.

Incremental MEI cancer risks and chronic and acute non-cancer hazards for the 2028 Without Project scenario compared to 2018 baseline conditions are the same or lower than the incremental cancer risks and non-cancer hazards for the 2028 With Project scenario compared to 2018 baseline conditions for the evaluated receptors. Negative values indicate that future operations would result in decreases of important TAC concentrations (most notably diesel particulate matter), which thereby would result in decreases in cancer risk and non-cancer hazard estimates and beneficial impacts for residents when compared to 2018 baseline impacts. Estimated incremental cancer risks were more negative for adults than for children, because exposure duration for adults is longer (i.e., adults would experience a greater beneficial impact).

Although an increase in mobile sources along with population growth in the future is expected, currently adopted emission standards for mobile sources will tend to push TAC emissions, including emissions of DPM, downward in the future.

Section 6

Summary

The purpose of the HHRA is to address potential human health impacts from inhalation of TAC related to construction and operation of the proposed Project, including both cancer risks and acute (short-term) and chronic (long-term) non-cancer health hazards. Risk assessment is an evolving and highly uncertain process. Large uncertainties exist in emission estimates and dispersion modeling, evaluation of sensitive receptor populations, exposure parameter assumptions, toxicity assessment, the assumptions inherent in the 2015 OEHHA Air Toxics Methodology, and interactions among acrolein and criteria pollutants. This HHRA relied upon the data and methods based on the current state of the science.

Although the proposed Project itself would not result in any changes to future aviation activity levels projected for LAX at build-out, the modifications and additions to the airfield, terminals, and ground access facilities would alter the locations and amounts of TAC released by aircraft, GSE, vehicles, and stationary sources in ways that could result in impacts on human health. In addition, construction of the proposed improvements would release TAC. Potential impacts to human health associated with releases of TAC may include increased cancer risks and increased acute and chronic non-cancer health hazards from inhalation of TAC.

Although no regulations exist that establish thresholds of significance for an entire facility like LAX, LAWA developed HHRA significance thresholds based on recent SCAQMD policies. The significance thresholds used in the analysis represent a best effort to understand and evaluate the potential impacts to human health in terms of cancer risk to workers, residents and children within the study area, cancer burden (evaluation of population-wide cancer risk), chronic non-cancer health hazards, acute non-cancer health hazards, and the potential for criteria pollutants to exceed established exposure concentrations. The specific impact thresholds are described in detail in Section 4.1.2.4 of the EIR.

The primary findings of the HHRA are as follows:

- The incremental cancer risks for both construction and operations for off-airport workers would be higher than 2018 baseline conditions but would be less than the significance threshold of 10 in 1 million.
- The incremental cancer risks for both construction and operations for adult residents (70- and 30-year exposures), child residents, and school children would be negative when compared to baseline conditions, and thus beneficial. Because these impacts would be negative, the calculated cancer burden would similarly be negative. Impacts within the zone of impact of 1 in a million (10^{-6}) would be below the threshold of significance of 0.5.
- The incremental chronic non-cancer health hazards for both residents and workers would be greater than baseline conditions during both construction and operations. However, impacts would be less than the significance threshold of 1.

- The incremental acute non-cancer health hazards for both residents and workers would be greater than baseline conditions during both construction and operations but would be less than the significance threshold of 1.
- On-airport worker health hazards for the proposed Project were compared to the CalOSHA PEL during the peak year of construction and during operations. Estimated 8-hour concentrations of each TAC were found to be less than their respective CalOSHA PELs. Therefore, health impacts to on-airport workers would be less than significant.
- The cumulative cancer risk from the proposed Project would slightly increase, amounting to approximately 1 percent of the cancer risk in the South Coast Air Basin and would not add substantially to the already high regional cumulative cancer risk in the South Coast Air Basin.
- Cumulative non-cancer hazards (chronic and acute) could only be evaluated semi-quantitatively because of substantial uncertainties associated with the USEPA predictions for TAC emissions and concentrations. However, because of the relatively small estimated HIs associated with the proposed Project emissions, the proposed Project would not be expected to add significantly to cumulative acute and chronic health hazards.
- Estimated cumulative risks and hazards from emissions for concurrent construction projects at LAX would not be measurable against urban background conditions in the South Coast Air Basin.

Table 1-1.1B
Cancer Risk Calculation for LAX Airfield and Terminal Modernization Project, 2021 Unmitigated Construction Through 2033 Operations - Lifetime Exposure
70-Year Adult Resident Scenario
(Based on Peak Location of Residential Cancer Risks¹)

	Start Age	End Age	Equations															
Child Resident	0	9 Year	Risk = Cair*DBR*EF*CF*A*ASF*ED*FAH*CPF															
School Child	7	18 Year	HQ = Cair / REL															
30-year Resident	0	30 Year	Where: HQ = Hazard Quotient Cair = Exposure Concentration															
70-year Resident	0	70 Year	DBR = Daily Breathing Rate ASF = Age sensitivity factor															
			EF = Fraction of Year ED = Fraction of Averaging time															
			A = Absorption Fraction FAH = Fraction of Time at Home															
			CF = Conversion Factor CPF = Cancer Potency Factor															
TAC	Toxicity Criteria		Cancer Risk to Adult 30-Year Resident															
	EPA	CalEPA	Construction								Operation							
	Inhalation CPF (mg/kg-day) ⁻¹	Inhalation CPF (mg/kg-day) ⁻¹	2021	2022	2023	2024	2025	2026	2027	2028	2028	2029	2030	2031	2032	2033	2034 - 2090	TOTAL Cancer Risk to Resident for Max Location

NA = Not Available ug/m³ = micrograms per cubic meter
NC = Not Calculated mg/kg-d = milligrams per kilogram day

Table 1-1.1C
Cancer Risk Calculation for LAX LAX Airfield and Terminal Modernization Project, 2021 Unmitigated Construction Through 2033 Operations - Lifetime Exposure
Child Resident Scenario
(Based on Peak Location of Residential Cancer Risks¹)

Exposure Parameters	3rd Trimester	Ages 0<2	Ages 2<9	Start Age	End Age
Daily Breathing Rate (DBR)	361 L/kg-d	1090 L/kg-d	861 L/kg-d	Child Resident	0 9 Year
Fraction of Year (EF)	0.96 unitless	0.96 unitless	0.96 unitless	School Child	7 18 Year
Absorption Fraction (A)	1 unitless	1 unitless	1 unitless	30-year Resident	0 30 Year
Conversion Factor (CF)	0.000001 m ³ /L	0.000001 m ³ /L	0.000001 m ³ /L	70-year Resident	0 70 Year
Age-adjustment (ASF)	10 unitless	10 unitless	3 unitless		
Fraction of Averaging Time (ED)	0.00357 unitless	0.01429 unitless	0.01429 unitless		
Fraction of Time at Home (FAH)	1.00 unitless	1.00 unitless	1.00 unitless		

TAC	Concentration at Location w/Maximum Risk (ug/m ³)										Operation

Attachment 1.2 Operation (2028 With Project vs 2018 Baseline)

This page intentionally left blank.

Table 1-2.1A
Cancer Risk Calculation for LAX Airfield and Terminal Modernization Project
Incremental 2028 Operations with Project over 2018 Baseline Operations - Lifetime Exposure, 30-Year Adult Resident Scenario
(Based on Peak Location of Residential Cancer Risks¹)

Exposure Parameters	Units	3rd Trimester	Ages 0<2	Ages 2<9	Ages 2<16	Ages 16<30	Ages 16<70		Start Age	End Age	Equations						
Daily Breathing Rate (DBR)	(L/kg-d)	361	1090	861	745	335	290	Child Resident	0	9 Year	Risk = Cair*DBR*EF*CF*A*ASF*ED*FAH*CPF						
Fraction of Year (EF)	(unitless)	0.96	0.96	0.96	0.96	0.96	0.96	School Child	7	18 Year	HQ = Cair / REL						
Absorption Fraction (A)	(unitless)	1	1	1	1	1	1	30-year Resident	0	30 Year	Where: HQ = Hazard Quotient Cair = Exposure Concentration						
Conversion Factor (CF)	(m³/L)	0.000001	0.000001	0.000001	0.000001	0.000001	0.000001	70-year Resident	0	70 Year	DBR = Daily Breathing Rate ASF = Age sensitivity factor						
Age-adjustment (ASF)	(unitless)	10	10	3	3	1	1				ED = Fraction of Averaging time						
Fraction of Averaging Time (ED)	(unitless)	0.00357	0.01429	0.01429	0.01429	0.2	0.771				FAH = Fraction of Time at Home						
Fraction of Time at Home (FAH)	(unitless)	1.00	1.00	1.00	1	0.73	0.73				CPF = Cancer Potency Factor						
Toxicity Criteria																	
TAC	Concentration at Location w/Maximum Risk (ug/m³)						EPA Inhalation CPF	CalEPA Inhalation CPF	Cancer Risk to Adult 30-Year Resident							TOTAL	
	Operation by Year						(mg/kg-day) ⁻¹	(mg/kg-day) ⁻¹	Operation by Year					Ops		Cancer Risk to Resident for Max Location

Table 1-2.3
Cancer Risk Calculation for LAX Airfield and Terminal Modernization Project
Incremental 2028 Operations with Project over 2018 Baseline Operations - Lifetime Exposure, Worker Scenario
(Based on Peak Location of Commercial Cancer Risks¹)

Exposure Parameters			Units	Ages 16<30	Ages 16<70	Equations											
Worker 8-hr Daily Breathing Rate (DBR)			(L/kg-d)	240	230	Risk = Cair*DBR*EF*CF*A*ASF*ED*FAH*CPF											
Fraction of Year (EF)			(unitless)	0.68	0.68	HQ = Cair / REL											
Absorption Fraction (A)			(unitless)	1	1	Where: HQ = Hazard Quotient Cair = Exposure Concentration											
Conversion Factor (CF)			(m³/L)	0.000001	0.000001	DBR = Daily Breathing Rate ASF = Age sensitivity factor											
Age-adjustment (ASF)			(unitless)	1	1	EF = Fraction of Year ED = Fraction of Averaging time											
Fraction of Averaging Time (ED)			(unitless)	0.01429	0.01429	A = Absorption Fraction FAH = Fraction of Time at Home											
Worker Adjustment Factor (WAH)			(unitless)	1	1	CF = Conversion Factor CPF = Cancer Potency Factor											
TAC	Concentration at Location w/Maximum Risk (ug/m³)						Toxicity Criteria		Cancer Risk to Worker								TOTAL Cancer Risk to Worker for Max Location
	Operation by Year						EPA Inhalation CPF	CalEPA Inhalation CPF	Operation by Year					Ops	Ops

Table 1-2.4
Hazard Calculation for LAX Airfield and Terminal Modernization Project
Incremental 2028 Operations with Project over 2018 Baseline Operations - Lifetime Exposure, Worker Scenario
(Based on Peak Location of Commercial Cancer Risks¹)

Exposure Parameters		Units	Ages 16<30		Ages 16<70		Equations							
Worker 8-hr Daily Breathing Rate (DBR)		(L/kg-d)	240		230		Risk = Cair*DBR*EF*CF*A*ASF*ED*FAH*CPF							
Fraction of Year (EF)		(unitless)	0.68		0.68		HQ = Cair / REL							
Absorption Fraction (A)		(unitless)	1		1		Where: HQ = Hazard Quotient Cair = Exposure Concentration							
Conversion Factor (CF)		(m³/L)	0.000001		0.000001		DBR = Daily Breathing Rate ASF = Age sensitivity factor							
Age-adjustment (ASF)		(unitless)	1		1		EF = Fraction of Year ED = Fraction of Averaging time							
Fraction of Averaging Time (ED)		(unitless)	0.01		0.157		A = Absorption Fraction FAH = Fraction of Time at Home							
Worker Adjustment Factor (WAH)		(unitless)	1		1		CF = Conversion Factor CPF = Cancer Potency Factor							
TAC	Concentration at Location w/Maximum Risk (ug/m³)						Toxicity Criteria		Hazard Quotient to Worker					
	Operations						EPA	CalEPA	Operations

Attachment 1.3 Operation (2028 Without Project vs 2018 Baseline)

This page intentionally left blank.

Table 1-3.1A
Cancer Risk Calculation for LAX Airfield and Terminal Modernization Project
Incremental 2028 Operations Without Project over 2018 Baseline Operations - Lifetime Exposure, 30-Year Adult Resident Scenario
(Based on Peak Location of Residential Cancer Risks¹)

Exposure Parameters		Units	3rd Trimester	Ages 0<2	Ages 2<9	Ages 2<16	Ages 16<30	Ages 16<70		Start Age	End Age	Equations					
Daily Breathing Rate (DBR)		(L/kg-d)	361	1090	861	745	335	290	Child Resident	0	9 Year	Risk = Cair*DBR*EF*CF*A*ASF*ED*FAH*CPF					
Fraction of Year (EF)		(unitless)	0.96	0.96	0.96	0.96	0.96	0.96	School Child	7	18 Year	HQ = Cair / REL					
Absorption Fraction (A)		(unitless)	1	1	1	1	1	1	30-year Resident	0	30 Year	Where: HQ = Hazard Quotient Cair = Exposure Concentration					
Conversion Factor (CF)		(m³/L)	0.000001	0.000001	0.000001	0.000001	0.000001	0.000001	70-year Resident	0	70 Year	DBR = Daily Breathing Rate ASF = Age sensitivity factor					
Age-adjustment (ASF)		(unitless)	10	10	3	3	1	1				ED = Fraction of Averaging time					
Fraction of Averaging Time (ED)		(unitless)	0.00357	0.01429	0.01429	0.01429	0.2	0.771				FAH = Fraction of Time at Home					
Fraction of Time at Home (FAH)		(unitless)	1.00	1.00	1.00	1	0.73	0.73				CPF = Cancer Potency Factor					
Toxicity Criteria

Table 1-3.3
Cancer Risk Calculation for LAX Airfield and Terminal Modernization Project
Incremental 2028 Operations Without Project over 2018 Baseline Operations - Lifetime Exposure, Worker Scenario
(Based on Peak Location of Commercial Cancer Risks¹)

Exposure Parameters							Units	Ages 16<30		Ages 16<70		Equations										TOTAL Cancer Risk to Worker for Max Location
Worker 8-hr Daily Breathing Rate (DBR)							(L/kg-d)	240		230		Risk = Cair*DBR*EF*CF*A*ASF*ED*FAH*CPF										
Fraction of Year (EF)							(unitless)	0.68		0.68		HQ = Cair / REL										
Absorption Fraction (A)							(unitless)	1		1		Where: HQ = Hazard Quotient Cair = Exposure Concentration										
Conversion Factor (CF)							(m³/L)	0.000001		0.000001		DBR = Daily Breathing Rate ASF = Age sensitivity factor										
Age-adjustment (ASF)							(unitless)	1		1		EF = Fraction of Year ED = Fraction of Averaging time										
Fraction of Averaging Time (ED)							(unitless)	0.01429		0.01429		A = Absorption Fraction FAH = Fraction of Time at Home										
Worker Adjustment Factor (WAH)							(unitless)	1		1		CF = Conversion Factor CPF = Cancer Potency Factor										
TAC	Concentration at Location w/Maximum Risk (ug/m³)						EPA	CalEPA	Cancer Risk to Worker						Ops		Max Location					
	Operation by Year						Inhalation	Inhalation	Operation by Year						Ops

Table 1-3.4
Hazard Calculation for LAX Airfield and Terminal Modernization Project
Incremental 2028 Operations Without Project over 2018 Baseline Operations - Lifetime Exposure, Worker Scenario
(Based on Peak Location of Commercial Cancer Risks¹)

Exposure Parameters		Units	Ages 16<30	Ages 16<70	Equations									
Worker 8-hr Daily Breathing Rate (DBR)		(L/kg-d)	240	230	Risk = Cair*DBR*EF*CF*A*ASF*ED*FAH*CPF									
Fraction of Year (EF)		(unitless)	0.68	0.68	HQ = Cair / REL									
Absorption Fraction (A)		(unitless)	1	1	Where: HQ = Hazard Quotient									
Conversion Factor (CF)		(m ³ /L)	0.000001	0.000001	DBR = Daily Breathing Rate									
Age-adjustment (ASF)		(unitless)	1	1	EF = Fraction of Year									
Fraction of Averaging Time (ED)		(unitless)	0.01	0.157	A = Absorption Fraction									
Worker Adjustment Factor (WAH)		(unitless)	1	1	CF = Conversion Factor									
					Cair = Exposure Concentration									
					ASF = Age sensitivity factor									
					ED = Fraction of Averaging time									
					FAH = Fraction of Time at Home									
					CPF = Cancer Potency Factor									

TAC	Concentration at Location w/Maximum Risk (ug/m ³)					Toxicity Criteria		Hazard Quotient to Worker						
	Operations					EPA RfC	CalEPA REL	Operations

¹ Census tract was matched to air model grid points identified as residential or residential/commercial.

² The 2017 ACS population

³ Cancer Risk is based on the sum of exposure to unmitigated construction and operations at a grid point. When multiple grid points are located within a tract, census tract the cancer risk is the average of risk at within the census

⁴ Total cancer burden is the sum of individual census tract cancer burdens.

REL = reference exposure level

TAC = toxic air contaminant

$\mu\text{g}/\text{m}^3$ = micrograms per cubic meter

Cancer Risk and Chronic Non-Cancer Health Hazard Calculations by RAGS Part F Methodology

This page intentionally left blank.

In 2009, the EPA released the RAGS, Part F⁶⁸ (hereafter referred to as RAGS Part F). This guidance recommends that inhalation dosimetry methodology be used to calculate inhalation exposures. In this approach, the concentration of the chemical in air is the exposure metric (e.g., milligrams per cubic meter, mg/m³), and risks are estimated using a unit risk that predicts cancer risk for each mg/m³. Inhalation rate and body weight are no longer used in the calculations. RAGS Part F methodology is currently used exclusively by USEPA for calculating risks and hazards for the inhalation pathway and has become universally applied within the United States.

RAGS Part F recommends that the concentration of the chemical in air be used as the exposure metric resulting in the following formula for an exposure concentration:⁶⁹

$$EC = (CA \times ET \times EF \times ED) / AT$$

Where: EC = exposure concentration (µg/m³)

CA = chemical concentration in air (µg/m³)

ET = exposure time (hours/day)

EF = exposure frequency (days/year)

ED = exposure duration (years)

AT = averaging time; e.g., the period over which exposure is averaged, lifetime in years x 365 days/year x 24 hours/day (hours)

Averaging time for estimation of cancer risk is 70 years or 25,550 days multiplied by 24 hours/day. Cancer risk is evaluated as the LADD according to CalEPA and USEPA guidance. Averaging time for estimation of non-cancer health hazards is the duration of exposure, expressed in hours. Non-cancer health hazards are evaluated as average daily dose (ADD) over the period of exposure, again, following CalEPA and USEPA guidance.

Cancer risks and the non-cancer health hazards are then calculated using the following formulas:⁷⁰

$$\text{Risk} = \text{IUR} \times \text{EC}$$

$$\text{HQ} = \text{EC} / (\text{RfC} \times 1000 \text{ µg/mg})$$

Where: IUR = inhalation unit risk (µg/m³)⁻¹

EC = exposure concentration (µg/m³)

⁶⁹ U.S. Environmental Protection Agency, Office of Emergency and Remedial Response, *Risk Assessment Guidance for Superfund Volume I: Human Health Evaluation Manual (Part F, Supplemental Guidance for Inhalation Risk Assessment)*, Final, EPA-540-R-070-002, OSWER 9285.7-82, January 2009.

⁷⁰ U.S. Environmental Protection Agency, Office of Emergency and Remedial Response, *Risk Assessment Guidance for Superfund Volume I: Human Health Evaluation Manual (Part F, Supplemental Guidance for Inhalation Risk Assessment)*, Final, EPA-540-R-070-002, OSWER 9285.7-82, January 2009.

HQ = hazard quotient

RfC = reference concentration (mg/m³)

Assessment of potential chronic human health impacts due to release of TAC associated with the proposed Project assumes that exposure concentrations of TAC are constant over an up to 70-year period for residential receptors. For this analysis, chemical concentrations from construction were assumed to continue for 8 years (from 2021 to 2028). For the remaining years in a receptor's exposure period, construction emissions were assumed to be zero and operations emissions were assumed as the exposure chemical concentrations. Risk estimates using these predicted TAC concentrations were based locations where construction impacts were likely to be maximal. Such risk estimates overestimate risks for most people living, working or attending school near LAX. This protection is built into the risk assessment developed for the proposed Project to help counter any future changes in Project construction that could not be anticipated quantitatively.

For the uncertainties analysis discussed in Section 5, only the proposed Project cancer risks were calculated using RAGS F methodology for the sensitivity analysis. Exposure parameters used to calculate LADD for all receptors for the inhalation pathway are summarized in **Table A3-1**. Exposure parameters were based on CalEPA Supplemental Guidance for Human Health Multimedia Risk Assessments of Hazardous Waste Sites and Permitted Facilities,⁷¹ USEPA Exposure Factors Handbook,⁷² and CalEPA Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments.⁷³ Although USEPA has recently released another version of the Exposure Factors Handbook⁷⁴ that updates some of the recommended exposure parameters, the exposure parameters in Table A3-1 were selected to maintain consistency with the health risk analyses conducted for the LAX Master Plan Final EIR,⁷⁵ the SAIP EIR,⁷⁶ the CFTP EIR,⁷⁷ the Bradley West Project EIR,⁷⁸ and the SPAS EIR. A few adjustments were made to the exposure durations to make the results more comparable to the analysis presented in Section 4.

For example, instead of 6-year child and 6-year school child scenarios that were presented in some previous LAX EIRs, the RAGS F methodology calculations in the uncertainties analysis for this proposed Project (Section 5) were calculated assuming 9-year child and 12-year school child scenarios. Also, a 25-year worker scenario is presented in addition to the 40-year scenario that was presented in some previous LAX EIRs.

Table A3-1 Parameters Used to Estimate Exposures to TAC of Concern

Exposure Pathway Parameters for Inhalation of Particulates and Gases	Off-Airport Receptors			
	Off-Airport Residents		Off-Airport School Child	Off-Airport Worker
	Adult	Child		
Exposure Frequency (days/yr)	350 ^{1,2}	350 ^{1,2}	200 ³	245 ¹
Exposure Duration (years)	30, 70 ^{1,4}	9 ¹	12 ⁶	25 ¹ , 40 ¹
Exposure Time (hrs/day)	24 ⁵	24 ⁵	8 ⁶	10 ⁶
Averaging Time - Cancer (days)	25,550 ^{1,5}	25,550 ^{1,5}	25,550 ^{1,5}	25,550 ^{1,5}

Source: CDM Smith 2020				

The equation for the RAGS Part F methodology requires exposure time, an exposure parameter that was not previously defined for the LAX Master Plan EIS/EIR and other tiered LAX EIRs (SAIP EIR, CFTP EIR, Bradley West Project EIR, and CUP-RP EIR) because it was not required for the RAGS, Part A methodology (hereafter referred to as RAGS Part A).⁷⁹ For exposure time, assumptions adopted for the SPAS EIR were used. Residents were assumed to be exposed 24 hours a day. A school child was assumed to be exposed eight hours per day to account for six hours of school instruction and two hours of after-school activities. An off-airport worker was assumed to be exposed 10 hours per day.

⁷⁹ In the LAX Master Plan EIS/EIR and other tiered LAX EIRs (SAIP EIR, CFTP EIR, Bradley West Project EIR, and CUP-RP EIR), average long-term daily intakes were used to estimate risk and hazards for cancer and non-cancer risk assessment in accordance with RAGS Part A. Since RAGS Part F was released in 2009, RAGS Part A methodology is considered obsolete, tends to be overly conservative, and overestimates risk. (CDM Smith, *Memorandum to Lisa Trifiletti - LAWA, Subject: West Aircraft Maintenance Area (WAMA) Human Health Risk Assessment (HHRA) - Risk Assessment Guidance for Superfund (RAGS), Part A*, August 28, 2013.)

ug/m³ = micrograms per cubic meter

mg/kg-d = milligrams per kilogram day

Table 3-1.2
RAGS F Risk Calculation for LAX Airfield and Terminal Modernization Project, 2021-2028 Unmitigated Construction and 2028-2033 Operations - Lifetime Exposure - Child Resident
(Based on Peak Location of Residential Cancer Risks¹)

RAGS F Equations												
EC = (CA x ET x EF x ED) / (AT)												
Risk = IUR x EC												
HQ = EC / REL												
Where: HQ = Hazard Quotient												
IUR = Inhalation Unit Risk												
REL = Reference Exposure Level												
EC = Exposure Concentration												
AT = Averaging Time (for cancer or non-cancer)												
Toxicity Criteria											2022-2030

¹ Residential Maximum Grid No. 8

NA = Not Available

NC = Not Calculated

Source: CDM Smith, 2020

ug/m³ = micrograms per cubic meter

mg/kg-d = milligrams per kilogram day

Table 3-1.3

RAGS F Risk Calculation for LAX Airfield and Terminal Modernization Project, 2021-2028 Unmitigated Construction and 2028-2033 Operations - Lifetime Exposure - School Child
(Based on Peak Location of Residential Cancer Risks¹)

RAGS F Equations														
EC = (CA x ET x EF x ED) / (AT)														
Risk = IUR x EC														
HQ = EC / REL														
Where: HQ = Hazard Quotient EC = Exposure Concentration														
IUR = Inhalation Unit Risk AT = Averaging Time (for cancer or non-cancer)														
REL = Reference Exposure Level														
Toxicity Criteria														
2021-2032

Protocol Supplement 1 – Human Health Risk Assessment Methodology

Section 1

Background

1.1 Introduction

Los Angeles World Airports (LAWA) is the City of Los Angeles (City) department that operates Los Angeles International Airport (LAX). LAWA has determined that it will prepare an Environmental Impact Report (EIR) in compliance with the California Environmental Quality Act (CEQA) for the proposed LAX Airfield and Terminal Modernization Project (ATMP or “proposed Project”). The Federal Aviation Administration (FAA) anticipates that it will prepare an Environmental Assessment (EA) in compliance with the National Environmental Policy Act (NEPA), conduct a General Conformity Applicability Analysis and, if needed, prepare a General Conformity Determination (GCD) under the federal Clean Air Act (CAA). The federal analyses and documentation will be processed separately from the EIR.

This CEQA Protocol for Conducting an Air Quality Impact Analysis of Criteria Air Pollutants (Protocol) for ATMP describes the air quality impact analysis methods and assumptions that will be used to generate Project-related pollutant emissions and concentrations estimates that will be compared to appropriate significance thresholds under CEQA. This protocol includes the following sections: Section 1 provides a brief overview of the proposed Project; Section 2 summarizes the applicable significance thresholds; Section 3 presents the methodologies to be used for estimating project criteria pollutant emissions; and Section 4 presents the methodology to be used for estimating Project-related criteria air pollutant concentrations.

Supplements to this Protocol will be developed for analysis of greenhouse gases (GHG) and inhalation pathway human health risk assessment (HHRA). The supplements will be appended to this protocol once they have been reviewed by the appropriate state and local air quality regulatory agencies.

1.2 Project Overview

The main elements of the proposed Project include improvements to the north airfield (i.e., proposed westerly extension of Taxiway D and new Runway 6L-24R exits), terminal improvements (i.e., proposed Concourse 0 and Terminal 9, and associated modifications to existing curbs and taxiways), and roadway improvements (i.e., new arrival and departure roadways and a new parking garage to support the proposed Terminal 9 passenger facility, along with new roadway segments that would improve vehicle access to, and egress from, the existing Central Terminal Area [CTA]). **Figure 1** shows the Project site in relationship to the region (Regional Location Map), **Figure 2** shows the general boundaries of the Project site, and **Figure 3** illustrates the nature and locations of the proposed improvements (proposed Project). In addition, there are several “enabling projects,” which are existing uses located within or near the proposed improvement areas that would need to be removed and/or relocated in order to accommodate the proposed improvements. Several of those projects are already planned and/or approved to occur independently from the proposed Project; these removals and relocations will be analyzed at a cumulative impacts level.

1.3 Project Location

The Project site is located within the City of Los Angeles, at LAX, primarily on LAWA property. LAX is the primary airport for the greater Los Angeles area, encompassing approximately 3,800 acres, and is situated at the western edge of the City of Los Angeles. The Project site is located within the northern and eastern portions of LAX. The Project site consists of highly-developed areas within and adjacent to a busy international airport, including paved airfield areas; airfield and airport access roadways; the LAXit lot (temporary passenger pickup area for taxis and transportation network companies [TNCs] such as Uber and Lyft); airport-related uses (remote aircraft gates, cargo and maintenance facilities, and the American Eagle commuter facility); and airport ancillary facilities (LAX Records Retention Building, and the LAX Police Headquarters building). In addition, the proposed Project would require the acquisition of parcels located immediately east of the CTA, including commercial parking lots and a Los Angeles Community College District storage/educational facility.¹

The land use setting around the Project site is characterized by airport operations with commercial uses along Sepulveda Boulevard and Century Boulevard, a Los Angeles Community College District storage/educational facility, and vehicle parking (surface and structure parking) along 96th Street, 98th Street, and Vicksburg Avenue. The Project site also includes the entrance to LAX located at World Way and Sepulveda Boulevard.

1.4 Scenarios to be Evaluated

The air quality impact analysis will address several scenarios for multiple years. The basic scenarios to be addressed include: (i) Existing Conditions, (ii) Proposed Project, and (iii) No Project. Existing conditions will be based on activity levels and infrastructure in place in calendar year 2018. The future forecast analysis will consider the first year after final project build-out. Both the Proposed Project and No Project scenarios will be analyzed for the horizon year. The construction air quality impact analysis will be considered for all relevant years.

In 2018, approximately 87 million passengers traveled through LAX.² Total aircraft operations reached 707,833, including 649,092 air carrier, 40,310 air taxi, 17,940 general aviation, and 491 military flights. Cargo tonnage transported through LAX, including mail, totaled 2.45 million tons.

¹ The Los Angeles Community College District property is improved with two airplane hangars that West Los Angeles College currently uses for the warehousing of movie set props and for instruction to support its Film/Television Production Crafts program.

Section 2

Significance Thresholds

The air quality impact analysis for ATMP is intended to provide results that will be comparable to appropriate significance thresholds under CEQA. The South Coast Air Quality Management District (SCAQMD) has identified emission and concentration thresholds for criteria air pollutants for CEQA impact analyses. This section of the protocol lists applicable CEQA significance thresholds.

2.1 Criteria Pollutants of Concern

The criteria air pollutants associated with ATMP emission sources include carbon monoxide (CO), nitrogen dioxide (NO₂), ozone (O₃), particulate matter with an aerodynamic diameter less than or equal to 10 micrometers (PM₁₀), particulate matter with an aerodynamic diameter less than or equal to 2.5 micrometers (PM_{2.5}), and sulfur dioxide (SO₂). Although lead (Pb) is also a listed criteria air pollutant, none of the sources associated with ATMP would emit Pb; motor fuel no longer contains Pb, and LAXFUELS (the commercial aircraft fuel supplier at LAX) no longer stores or loads aviation gasoline at LAX. Therefore, Pb will not be analyzed as a criteria air pollutant in the ATMP analyses.^{3,4}

Ozone is a secondary pollutant, meaning that it is formed in the atmosphere from emissions of precursor compounds. The ozone precursor compounds are nitrogen oxides (NO_x) and volatile organic compounds (VOC). Therefore, analysis of ozone will be conducted through analysis of NO_x and VOC emissions. Ambient PM_{2.5} includes both directly emitted PM as well as secondary PM formed in the atmosphere from precursor compounds. The PM_{2.5} precursor compounds include sulfur oxides (SO_x), NO_x, VOC, and ammonia (NH₃).

2.2 CEQA Significance Thresholds

The SCAQMD has developed and updated significance thresholds for air quality impacts under CEQA for several decades. The current summary of significant levels includes: (i) separate daily emission rate thresholds (pounds per day [lbs/day]) for project regional construction and operational emissions associated with the project; (ii) localized significance thresholds (LST) for

³ Construction of the proposed Project would require the demolition and removal of existing buildings located at the airport. Due to the age of the buildings, there is a possibility that lead-containing surfaces (LCS) may be detected prior to demolition of the buildings. Prior to issuance of any permit for the demolition or alteration of any existing structure(s), a lead-based paint survey would be performed following protocols of the Los Angeles Department of Building and Safety designed to detect all lead-based paint. Should lead-based paint materials be identified, standard handling and disposal practices would be implemented pursuant to federal Occupational Safety and Health Administration (OSHA) and California OSHA regulations to limit worker and environmental risks. Vehicle trips associated the remedial action will be included in the construction impact analysis.

⁴ Lead-based paint is defined by U.S. Department of Housing and Urban Development (HUD) to have a surface density of greater-than-or-equal-to 1.0 mg Pb per cubic centimeter. At that density, the total surface area covered with lead-based paint would need to be 24 million square feet to reach the conformity *de minimis* threshold of 25 tons of Pb per year. Given that the facilities being demolished for the proposed Project are much smaller than that, it is not probable that lead emissions would exceed 25 tons per year from building demolition. In addition, if the buildings did contain lead-based paint, most of the lead from the demolition of these facilities would not actually be emitted into the air.

construction activities that represent the level of construction emissions that could potentially cause a significant impact to ambient air quality at the project fence-line; and (iii) ambient air pollutant concentration thresholds for most of the criteria pollutants.

Under the CEQA air quality impact analysis, determination of the significance of project impacts will be based on the future with project conditions minus the existing conditions.⁵ The future with project conditions minus future without project conditions will also be calculated and provided for disclosure purposes only.

The SCAQMD CEQA regional emission significance thresholds are summarized in **Table 1**. These significance thresholds will be applicable to the CEQA analysis only.

Table 1 SCAQMD CEQA Emission Significance Thresholds for Regional Construction and Operations

Pollutant	Mass Daily Thresholds	
	Construction	Operations
Nitrogen Oxides (NO _x)	100 lbs/day	55 lbs/day
Volatile Organic Compounds (VOC)	75 lbs/day	55 lbs/day
Carbon Monoxide (CO)	550 lbs/day	550 lbs/day
Sulfur Oxides (SO _x)	150 lbs/day	150 lbs/day
Respirable Particulate Matter (PM ₁₀)	150 lbs/day	150 lbs/day
Fine Particulate Matter (PM _{2.5})	55 lbs/day	55 lbs/day
Lead (Pb)	3 lbs/day	3 lbs/day

Source: South Coast Air Quality Management District, *SCAQMD Air Quality Significance Thresholds*, April 2019.

Available: <http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf?sfvrsn=2>.

The SCAQMD CEQA concentration significance thresholds are summarized in **Table 2**. The gaseous pollutant, Project-related concentrations must be added to the background concentrations before comparing to the significance thresholds. The particulate matter (PM₁₀ and PM_{2.5}) Project-related concentrations are compared directly to the SCAQMD concentration significance thresholds without adding in background concentrations.

Because of the duration of construction that is likely to be involved with ATMP, construction impacts on ambient air quality will be explicitly modeled using the appropriate air dispersion model, AERMOD (either as incorporated into Aviation Environmental Design Tool [AEDT] or as a stand-alone model). Therefore, the LST emission significance thresholds developed by SCAQMD will not be used to determine the significance of construction emissions on ambient air quality.

⁵ To provide the most accurate picture practically possible of the ATMP's impacts, existing conditions will include operational levels associated with LAX projects that have already been approved and are expected to be operational by the time the ATMP is constructed.

Table 2 SCAQMD CEQA Concentration Significance Thresholds for Project-Related Criteria Air Pollutants

Pollutant	Averaging Period	Concentration Thresholds for Criteria Pollutants		
		Construction	Operations	Total or Project Only
NO ₂	1-Hour (State) Annual (State) Annual (Federal)	0.18 ppm 0.030 ppm 0.0534 ppm	Same thresholds as construction	Total incl. Background
SO ₂	1-Hour (Federal) 1-Hour (State) 24-Hour (State)	0.075 ppm ^a 0.25 ppm 0.04 ppm	Same thresholds as construction	Total incl. Background
CO	1-Hour (Federal) 1-Hour (State) 8-Hour (Federal/State)	35 ppm 20 ppm 9.0 ppm	Same thresholds as construction	Total incl. Background
PM ₁₀	24-Hour Annual	10.4 µg/m ³ 1.0 µg/m ³	2.5 µg/m ³ 1.0 µg/m ³	Project only
PM _{2.5}	24-Hour	10.4 µg/m ³	2.5 µg/m ³	Project only

Source: South Coast Air Quality Management District, *SCAQMD Air Quality Significance Thresholds*, April 2019. Available: <http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf?sfvrsn=2>.

Note:

- a. The Federal 1-hour SO₂ NAAQS is attained when the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site does not exceed the standard value.

Key:

ppm = parts per million (by volume)

µg/m³ = micrograms per cubic meter

This page intentionally left blank.

Section 3

Emission Estimation Methodologies

This section describes the methodologies proposed for estimating criteria air pollutant emissions from Project-related sources at LAX. Emission inventories will be developed for the following source types:

- aircraft engines;
- on-board auxiliary power units (APU);
- ground support equipment (GSE);
- ground access vehicles (passenger, employee, cargo);
- new terminal and concourse space/water heating and emergency generator units; and
- construction equipment and construction activities that generate air pollutant emissions.

Existing maintenance facilities and the Central Utility Plant are not proposed to be substantially changed by ATMP and, thus, will not be evaluated in this analysis.

The primary emission models that will be used to develop criteria air pollutant inventories for ATMP include:

- FAA's AEDT, Version 3b⁶ or later, for aircraft engine and APU emissions;
- California Air Resources Board's (CARB's) OFFROAD2017⁷ model for GSE and construction equipment engine exhaust emissions;
- CARB's EMFAC2017, v1.0.2⁸ or later, model for on-road motor vehicles engine exhaust, tire wear, brake wear, and evaporative emissions;
- USEPA's AP-42 Compilation of Air Pollutant Emission Factors, Chapter 13⁹ for construction activity dust emissions and on-road vehicle paved road dust emissions; and

⁹ U.S. Environmental Protection Agency, *AP 42 Compilation of Air Pollutant Emission Factors, Fifth Edition, Volume I, Chapter 13: Miscellaneous Sources*. Available: <https://www3.epa.gov/ttn/chief/ap42/ch13/index.html>.

- California Air Pollution Control Officers Association's (CAPCOA's) California Emissions Estimator Model (CalEEMod), Version 2016.3.2, may be used to supplement input data used in the emissions models for such parameters as default trip lengths for construction haul trips, haul truck capacities, concrete truck capacities, and truck travel speeds.¹⁰

These emission models and programs may be supplemented with emission factors and emission estimates from SCAQMD and CARB's CalEEMod program for miscellaneous area and stationary sources that are found to be Project-related.

3.1 Aircraft Engines

As noted above, aircraft engine emissions will be estimated using FAA's AEDT (Version 3b or later). Aircraft emissions are primarily dependent on:

- Aircraft airframe and engine combinations, including number of engines for each airframe (aircraft fleet).
- Number of operations by each airframe/engine combination for a given scenario (scenario fleet mix).
- Time spent in each operational mode (approach, landing, taxi-in, taxi-out, takeoff, climb out) for each aircraft/engine combination. In AEDT, the operating modes are defined somewhat differently than in previous airport air quality models. The modes of interest for air quality impacts include:
 - Startup (only used to determine VOC emissions for initial 60 seconds of engine on time);
 - Climb Taxi (the increment of this mode was previously referred to as Taxi Out);
 - Climb Ground and Climb Below 1,000 feet (the combined increment of these two modes were previously referred to as Takeoff);
 - Climb Below Mixing Height (the increment of this mode was previously referred to as Climbout);
 - Descend Below Mixing Height and Descend Below 1,000 feet (the combined increment of these two modes were previously referred to as Approach);
 - Descend Ground (the increment of this increment was previously referred to as the Landing Roll, and includes Reverse Thrust); and
 - Descend Taxi (the increment of this mode was previously referred to as Taxi In).
- Aircraft engine emissions for each operational mode.

¹⁰ California Air Pollution Control Officers Association, *California Emissions Estimator Model (CalEEMod)*, Version 2016.3.2, November 2017. Available: <http://www.caleemod.com/>.

3.1.1 Aircraft Fleet, Scenario Fleet Mix, and Operations

The aircraft fleet, scenario fleet mix, and operations for each scenario will be developed by the ATMP consultant team using SIMMOD (an airport operations simulation model). The operations will be reported for the peak month, average day (PMAD) condition.¹¹ This activity level will be used to assess impacts to short-term ambient standards (standards with 24-hour averaging periods or shorter). Peak hourly activity is determined using the PMAD activity to determine activity levels in each 15-min interval and adding those for each hour to identify the peak hour. Annual average emissions will be based on applying both month-of-year and day-of-week temporal factors to the PMAD activity to estimate the annual average activity. The month-of-year activity will be based on the LAX Air Traffic Comparison (TCOM)¹² statistics for 2018 (the latest full year of data available at this time); and the day-of-week factors will be based on the activity levels collected in the 2018 Airport Noise and Operations Monitoring System (ANOMS) database for LAX.

3.1.2 Time in Mode

The time spent in each operational mode will be calculated using AEDT with the modeled airport layout, scenario fleet mix, and total operations for each scenario, with one exception; taxi-in and taxi-out times, including ground delay, will be based on the SIMMOD modeled taxi times. The takeoff/climb out and approach time-in-mode will be based on an annual average mixing height at LAX of 1,806 feet.¹³

3.1.3 Aircraft Engine Emission Factors

The aircraft engine emission factors for each engine in the scenario fleet mix are included in the AEDT databases. Therefore, the AEDT emission factors will be incorporated into the emission modeling.

The AEDT emission factors are primarily based on the International Civil Aviation Organization (ICAO) Engine Emissions Databank. Once an aircraft engine has been assigned to an airframe in the scenario aircraft fleet, AEDT uses the ICAO engine emission factors for that engine to develop emission estimates for operations of that aircraft.

Because evaluation of the proposed Project will include forecasts out to the 2030s, the ICAO engine emission indices will be reviewed, and if FAA concurs, may be adjusted to account for the incorporation of newer cleaner engines into the fleet over time. The impact that the ICAO Committee on Aviation Environmental Protection (CAEP) emission standards have had on NO_x emission indices for aircraft engines is demonstrated in **Figure 4**. The trend line indicates a reduction in the NO_x emission index of approximately 2 percent per year.

¹¹ The definition of the peak month, average day (PMAD) is often considered to mean an average weekday in the peak month. Weekdays typically have more activity than weekends.

¹² Los Angeles World Airports, *Traffic Comparison (TCOM) – Los Angeles International Airport*, January 2017 through December 2017. Available: <https://www.lawa.org/en/lawa-investor-relations/statistics-for-lax/volume-of-air-traffic>.

Source: CDM Smith, 2018.

Figure 4 Aircraft Engine Certification NO_x Emission Indices as a Percent of the ICAO Committee on Aviation Environmental Protection CAEP/8 Standard, 1973 - 2017¹⁴

3.2 Auxiliary Power Unit (APU)

Emissions of criteria pollutants from aircraft APUs will be estimated using the AEDT APU assignments to aircraft type (airframes). Most contact passenger gates at LAX have preconditioned air and gate power supplied by the electrical grid. Therefore, APU operating times at these gates are assumed to be 15 minutes per landing and takeoff (LTO) turnaround.¹⁵ For parking positions that do not have gate power and preconditioned air (such as for all cargo aircraft), APU operating times per LTO are assumed to be 40 minutes for narrow-body aircraft, 60 minutes for wide-body aircraft (except the Airbus 380 series), and 120 minutes for the Airbus 380 series.

¹⁴ ICAO Aircraft Engine Emissions Databank, v. 25a, May 2018. Available: <https://www.easa.europa.eu/easa-and-you/environment/icao-aircraft-engine-emissions-databank>.

¹⁵ Williams, R.C., *Honeywell Engines & Systems, Letter to B. Manning, U.S. EPA Office of Transportation and Air Quality, Re: APU Emissions*, September 29, 2000.

3.3 Ground Support Equipment (GSE)

LAWA collects GSE data annually for the LAX GSE Emission Reduction Policy adopted in 2015.¹⁶ Therefore, GSE emissions of criteria pollutants for existing conditions will be calculated using the LAX-specific GSE population, approximate age, and fuel type, and CARB's OFFROAD model emission factors, activity, load factor, and horsepower data. Future GSE emissions will be based on growth of aircraft operations between the existing conditions scenario and each future scenario for GSE that service aircraft. Several categories of GSE that maintain the airport, such as sweepers, may be grown based on changes in airport infrastructure (area of runways and taxiways, or terminal area).

Because the operational sources must be modeled through AEDT, the final emission rates for each piece of GSE in the scenario inventory will be incorporated as user-defined GSE into AEDT.

3.4 Ground Access Vehicles (GAV)

Ground access vehicles include on-road vehicle activity associated with passengers, air cargo, tenant operations, and airport employee (LAWA and tenant) travel to and from LAX. The vehicle fleet mix will be obtained from the ATMP traffic analysis prepared for the EIR, supplemented by information obtained from CARB's EMFAC model. The EMFAC model also provides criteria pollutant emission factors for engine exhaust, evaporative emissions, tire wear, and brake wear. The traffic analysis is expected to provide the number of vehicle trips on the design day (peak month, average day or PMAD). The traffic analysis is also expected to provide the vehicle miles traveled for trips that begin or end at the airport.

Regional emissions associated with airport-related traffic will be calculated for both peak daily and peak annual periods. Emissions will be estimated from the EMFAC emission factors, number of trips by vehicle category, and approximate mileage for each trip. The mileage used for estimating emissions will be any airport-related trip miles for travel within the South Coast Air Basin.

3.5 Stationary Sources

The proposed Project will include installation of natural gas heaters for space and water heating in the new concourse and terminal areas, as well as an emergency generator set in each facility. CalEEMod will be used to provide the space and water heating energy demand that is expected to be supplied with natural gas heaters. Required emergency power service from the Project design team will be used to determine approximate sizes of each generator engine. Emission factors will be obtained from appropriate USEPA AP-42 sections, from SCAQMD regulations applicable to these sources, or from CalEEMod.

¹⁶ Los Angeles World Airports, *Ground Support Equipment Emissions Policy*, April 16, 2015. Available: https://www.lawa.org/-/media/lawa-web/environment/files/lax_gse_emission_reduction_policy_boac.ashx?la=en&hash=A46EAB51C1192B3B8DF6FCD0BF55E478EA76DAE5.

3.6 Construction Emissions

The construction emission sources generally include on-site and off-site construction equipment, haul and delivery trucks, construction dust, fugitive organics, and worker vehicle trips that would occur during the construction period.

3.6.1 Construction Schedule

Two potential construction schedules have been developed by LAWA, an aggressive (faster) one that completes in under seven (7) years, and a less aggressive (slower) one that will take approximately seven years to complete. Construction phasing and representative equipment will be developed by the Project design team, including equipment number, horsepower, and operating hours for both on-site equipment and off-site hauling. **Table 3** provides the aggressive construction schedule by key Project elements, understanding that this schedule will likely result in the highest daily and annual emissions. However, emissions will be developed for both schedules before determining the most appropriate to carry forward in the EIR. Emissions will be developed for each year of construction to verify that the peak emissions year is identified and carried forward for analysis.

Table 3 ATMP Project Element Estimated Construction Dates and Durations

ATMP Project Element	Construction Dates
North Airfield Improvements	
Runway 6L-24R Exits	May 2022 – Dec 2024

3.6.2 Construction Equipment Engines and Emission Factors

The emission factors for the on-road and off-road construction equipment will be developed using EMFAC for on-road equipment and vehicles and OFFROAD for off-road construction equipment. The equipment operating schedule and times will be based on construction phasing information provided by the project team. Construction equipment emission factors will be from the models listed in **Table 4**.

Table 4 Construction Sources, Pollutants, and Emission Models Summary^a

Construction Source	Pollutants	Model/Reference
Off-Road (Non-Road) Equipment	VOC, NOx, CO, SO ₂ , PM ₁₀ , PM _{2.5} , GHGs	California Off-Road Emissions Model (commonly referred to as OFFROAD2017) ^b
On-Road Vehicles (operating on-site or off-site)	CO, VOC, NOx, SO ₂ , PM ₁₀ , PM _{2.5} , GHGs	EMFAC2017 ^c
Construction Dust	PM ₁₀ , PM _{2.5}	USEPA AP-42 ^d or WebFIRE ^e
Fugitive Organics	VOC	CalEEMod ^f
Off-Road, On-Road, Construction Dust, Fugitive Organics	Hazardous Air Pollutants	The models described above for PM ₁₀ and VOCs combined with CARB Speciation Profiles ^g

3.6.3 Other Construction Activities

Construction activities that typically generate air pollutant emissions include: (i) painting, coating, paving, and striping using paints or asphalts that emit VOC, and (ii) material (soil, sand, gravel, cement, etc.) movements such as stockpiling, loading, unloading, grading, and excavating that emit particulate matter. Quantities of paints and materials will be obtained from the Project design team. Emission factors will be obtained from appropriate USEPA AP-42 sections or

WebFIRE database for construction dust, and from CAPCOA's CalEEMod for fugitive VOCs, modified as necessary to address SCAQMD regulations applicable to these sources.

3.6.4 Construction Emission Inventories

3.6.4.1 Off-Road (Non-Road) Equipment Emissions

Off-road construction equipment includes dozers, loaders, sweepers, and other heavy-duty construction equipment that is not licensed for travel on public roadways. Daily emissions for each piece of equipment will be calculated by multiplying the appropriate OFFROAD emission factor by the horsepower, load factor, and operating hours for that equipment, as shown in Equation 1:

$$E = (HP) \times (L) \times (n) \times (H) \times (EF) \quad (\text{Equation 1})$$

Where:

E = emissions (lb/day)

HP= project equipment horsepower

L = load factor

n = number of pieces of equipment in a specified equipment category

H = hours per day of equipment operation

EF = emission factor (lb/hp-hr)

3.6.4.2 On-Road Vehicle Emissions

On-road vehicles include shuttle vans transporting construction employees from the employee parking areas to the construction site, on-site pickup trucks, crew vans, water trucks, dump trucks, haul trucks, material delivery trucks, other on-road vehicles (i.e., vehicles licensed to travel on public roadways), and worker vehicle trips to and from the job site. Number of trips and/or vehicle operating hours will be estimated by the Project design team. Exhaust emissions from on-road sources will be calculated using peak construction year emission factors for CO, VOC, NO_x, PM₁₀, and PM_{2.5} from CARB's emission factor model EMFAC2017.

On-road vehicle types from the proposed Project construction schedule will be matched with vehicle types corresponding to the EMFAC2011 vehicle categorization scheme within EMFAC2017.¹⁷ Other factors including region, calendar year, season, model year, speed, and fuel type will also be selected for each vehicle type. The EMFAC2017 model will output emission rates (grams/mile) for each vehicle type. To calculate the total emissions, roundtrip distances for both on-site and off-site travel will be determined for each vehicle category and substituted into Equation 2 shown below. Off-site travel includes vehicle miles traveled to and from the trip end points within the South Coast Air Basin. The EMFAC factors account for start-up, running, and idling. In addition, VOC emission factors include diurnal, hot soak, running, and resting emissions, and the PM₁₀ and PM_{2.5} factors include tire and brake wear.

¹⁷ California Air Resources Board, *EMFAC2017 Volume II – Handbook for Project-Level Analyses*, Version 1.0.2, March 1, 2018. Available: <https://ww3.arb.ca.gov/msei/downloads/emfac2017-volume-ii-pl-handbook.pdf>

$$E = (\text{VMT}) \times (\text{EF}) \quad (\text{Equation 2})$$

Where:

E = emissions (lb/day)

VMT= vehicle miles traveled per day (mi/day)

EF = emission factor (lb/mi)

3.6.4.3 Construction Dust

Additional sources of PM₁₀ and PM_{2.5} emissions associated with construction activities are related to fugitive dust. Fugitive dust includes re-suspended road dust from both off- and on-road vehicles, dust from grading, loading and unloading, hauling and storage activities, as well as rock crushing operations and batch plants. Fugitive dust emissions (PM₁₀ and PM_{2.5}) will be calculated using the guidance from the USEPA's Compilation of Air Pollutant Emission Factors (AP-42)¹⁸ and SCAQMD's CEQA Air Quality Handbook.¹⁹ Fugitive dust emissions will be calculated as outlined in AP-42 for the following construction activities:

- Vehicles traveling on paved roads. All haul trucks, flatbed trucks, and automobiles are assumed to travel on paved roads.
- On-site construction activities (grading, crushing, loading, hauling, and storage) will be calculated based on LAWA's current Title V permit for batch plants. The emissions will be calculated based on construction material demand using the emissions equation in the permit. Operations activities of an on-site construction batch plant will be calculated.
- An on-site rock crusher. An overall emission factor will be derived by summing emission factors for crushing activities including tertiary crushing, fines crushing, and screening, if applicable.

Monthly fugitive dust emissions will be calculated for each piece of construction equipment or construction activity, from which annual and daily fugitive dust emissions will be determined.

3.6.4.4 Fugitive Organics (Paving and Painting)

Construction materials that can be sources of VOC emissions include hot-mix asphalt paving, asphaltic-concrete paving, parking lot striping, and architectural coating. VOC emissions from asphalt paving operations result from the evaporation of the petroleum distillate solvent, or diluent, used to liquefy asphalt cement. Asphalt paving emissions will be calculated using the SCAQMD recommended approach included in the CalEEMod model.

Section 4

Air Dispersion Modeling

Air dispersion modeling will be used to estimate ambient criteria pollutant concentrations for the scenarios described in Section 1.4. The Project-related contribution to ambient concentrations will be compared to the CEQA thresholds presented in Section 2, Table 2. The predicted incremental difference in concentrations between the proposed Project and No Project scenarios for each year modeled will represent the Project-related contribution to ambient concentrations. For the gaseous criteria air pollutants CO, NO₂, and SO₂, the Project-related contribution will be added to background and the results compared to the SCAQMD CEQA significance thresholds. Project-related contributions to PM₁₀ and PM_{2.5} concentrations will be directly compared to the SCAQMD CEQA significance thresholds for each of these pollutants.

The air dispersion analysis will be performed in accordance with FAA,^{20,21} and SCAQMD²² modeling guidelines. The air dispersion analysis requires the following: 1) selection of the dispersion model, 2) evaluation of potential terrain considerations, 3) selection of appropriate dispersion coefficients based on land use, 4) selection and/or preparation of meteorological data, 5) identification of source locations and modeling parameters, 6) selection of receptor locations, and 7) selection of appropriate averaging time periods. Each of these steps is described in greater detail in the sections that follow.

The coordinate system used in the dispersion modeling analysis will be the Universal Transverse Mercator (UTM) system, UTM Zone 11 North, referenced to World Geodetic System 1984 datum.

Available: https://aedt.faa.gov/3b_information.aspx.

²² South Coast Air Quality Management District, *SCAQMD Modeling Guidance for AERMOD*. Available: <https://www.aqmd.gov/home/air-quality/air-quality-data-studies/meteorological-data/modeling-guidance>, accessed November 27, 2018.

4.1 Model Selection

The first step in an air dispersion analysis is the selection of an applicable model. The required air dispersion model for analysis of air quality impacts at airports is FAA's AEDT program,²³ which uses USEPA's AERMOD model for conducting the dispersion analysis. The current version of AEDT at the time of the drafting of this protocol is Version 3b. A later release may be used if substantial modeling²⁴ has not already been completed using Version 3b. The current version of AERMOD at the time of the drafting of this protocol is Version 19191.

4.2 Terrain

Terrain data will be incorporated in the analysis using, in order of preference, National Elevation Dataset (NED) one-third arc-second data, NED one arc-second data, or 7.5-minute Digital Elevation Model (DEM) data – all available from the U.S. Geological Survey. The terrain data will be used to set the base elevation for each source and each receptor incorporated into the model. At a minimum, the terrain data will cover the area included in the Venice and Inglewood, California, 7.5-minute topographic maps. The range may be expanded if necessary, to include all sources and receptors in the model analyses.

4.3 Land Use

Another important consideration in an air dispersion modeling analysis is the selection of rural or urban dispersion coefficients. Auer's method of classifying land use as either rural or urban has been used to analyze the surrounding region. This method calls for analysis of a three-kilometer radius around a facility to determine if the majority of the land can be classified as either rural (i.e., undeveloped) or urban. The area in and around LAX is urban; therefore, urban dispersion coefficients will be used in the modeling, consistent with SCAQMD Guidance.²⁵

4.4 Meteorological Data

Meteorological data for LAX is available from both the SCAQMD in post-processed form, and from the National Oceanic and Atmospheric Administration's (NOAA) National Centers for Environmental Information (NCEI) and Earth System Research Laboratory (ESRL) Radiosonde Database in raw form. Because AEDT requires several intermediate files to be saved from the AERMET processor which are not kept in the SCAQMD meteorological online data sets, the most recent five years of surface air data was requested from SCAQMD, including the intermediate files needed for use with AEDT. SCAQMD provided all necessary files to CDM Smith on August 27, 2019, via secure file transfer. The meteorological data provided was for calendar

²³ U.S. Department of Transportation, Federal Aviation Administration, 80 FR 27853 - *Noise, Fuel Burn, and Emissions Modeling Using the Aviation Environmental Design Tool Version 2b*, May 15, 2015. Available: <https://www.federalregister.gov/documents/2015/05/15/2015-11803/noise-fuel-burn-and-emissions-modeling-using-the-aviation-environmental-design-tool-version-2b>.

²⁴ For this protocol, "substantial modeling" means that operational emission inventories for at least one scenario (Existing Conditions, Proposed Project, or No Project) has been completed. This would indicate that the airport configuration (taxiways, runways, and gates) has been input into the AEDT model for one scenario and will only require limited modifications to the that scenario to create any remaining scenarios.

²⁵ South Coast Air Quality Management District, *SCAQMD Modeling Guidance for AERMOD*. Available: <https://www.aqmd.gov/home/air-quality/air-quality-data-studies/meteorological-data/modeling-guidance>, accessed November 27, 2018.

years 2012 through 2016, and included background ozone files if needed for conducting NO₂ dispersion using the ozone limiting method (OLM) option in AERMOD.

4.5 Source Parameters

The following emission sources identified in the emission inventories described in Section 3 will be modeled: 1) aircraft engines, 2) APU and GSE, 3) ground access vehicles, and 4) construction equipment and activities. The location of the sources will be determined from the airport layout plan, maps, aerial photos and other information provided by the LAWA for existing conditions, as well as plans for ATMP and alternatives. All sources require the identification of modeling source parameters, including any temporal variations in emissions. The identification of this information is described in greater detail in the following sections.

4.5.1 Aircraft Engines

Aircraft engine emissions occur in operating modes as described in Section 3.1. The dispersion of emissions from aircraft operations at the airport will be modeled as the area source types generated in AEDT 3b (or later version). Actively used taxiways, runways, and approach/departure paths will be entered into AEDT.

Each aircraft operation (arrival or departure) will be grouped into combinations that represent the (i) aircraft type, (ii) starting or ending terminal (or other aircraft parking area), and (iii) runway used; based on the assignments included in the SIMMOD analysis for each scenario.

Due to the large number of passenger gates at LAX, the dispersion analysis will use a general terminal location (centroid) instead of individual gates to reduce model runtimes. Terminals 1 through 8, proposed Terminal 9, and proposed Concourse 0 will each be modeled with a single gate, with all activity to those terminals/concourses modeled to the centroid. The Tom Bradley International Terminal and Midfield Satellite Concourse will each be modeled with two centroids, one on the north and one on the south. A single centroid will be used to model the Remote West Pads. Other individual gates may be used for commuter terminals, cargo locations, or other aircraft parking areas.

The hour-of-day temporal profile for each of the aircraft/terminal/runway combinations will also be developed from the SIMMOD analysis.

4.5.2 GSE/APU

Pollutant emissions from GSE/APU operations will be modeled using the source inputs generated by AEDT. The locations of GSE/APU sources are at the terminals and other aircraft parking areas. Pollutant emissions from GSE/APU sources vary throughout the day. The temporal pattern for aircraft (Section 4.5.1) will be applied to GSE/APU sources at the terminals and other aircraft parking areas.

4.5.3 Ground Access Vehicles

4.5.3.1 Roadways and Parking Lots

The locations of ground access sources (traffic and parking) will be determined from the airport layout plan, ATMP drawings and plans, and recent aerial photos. Roadways and parking facilities located within airport property will be modeled as area sources, as generated by AEDT. Also,

roadways and parking lots outside of the airport that would be modified (added, reconfigured, or removed) by the proposed Project will also be modeled. Temporal patterns (by hour-of-day, day-of-week, and month-of-year) for traffic will be estimated from the traffic analysis, supplemented by data used in the aircraft SIMMOD analysis.

4.5.3.2 Hot Spot Analysis

Dispersion analysis CO or PM hot spots may be conducted on up to three (3) intersections. If such an analysis is warranted, the intersection with the highest volume of traffic, the intersection with the worst volume-to-capacity ratio, and the largest new intersection would be analyzed. This analysis would be conducted only if the roadway modeling under Section 4.5.3.1 does not already address these intersections.

4.5.4 Building Space and Water Heating

Heaters used to supply hot water and comfort space heating in the new concourse and terminal areas are assumed to exhaust above the new facility rooflines. These heaters will be modeled as point sources (with rain caps) approximately six (6) feet above the proposed roof elevation for each building. Emergency generator engines are assumed to exhaust from stacks discharging through the outside walls of these facilities. These engines will be modeled as point sources (with rain caps) at 10 feet above ground level.

4.5.5 Construction Equipment and Activity

Construction source dispersion will be modeled following the general methodologies presented in SCAQMD's Localized Significance Threshold Methodology document.²⁶ Area or volume sources will be used to model construction areas and construction roadway travel. Construction dust emissions will be modeled as a ground source with a zero (0) meter release height. Construction equipment exhaust emissions will be modeled with an approximate five (5) meter release height.

4.6 Receptor Locations

Locations of receptors will be determined such that peak ambient air pollutant impacts associated with the proposed Project will be identified. LAX property line receptors, CTA receptors, and community receptors around LAX will be included in the analysis. For the criteria air pollutant impact analysis, receptors will be placed at ground level. Receptors spacing along property lines will be 100 meters or less. Initial offsite receptors in the area east of the CTA will also have 100-meter spacings. The initial receptors are shown in **Figure 5**. Refined receptors will be placed immediately around the initial receptor(s) with the peak impact, using 25-meter spacing to verify that ultimate peaks have been identified.

4.7 Dispersion Factor Averaging Periods

The calculation of criteria pollutant concentrations will be based on the averaging period(s) included in the NAAQS and/or CAAQS for each pollutant analyzed. These averaging periods are noted above in Table 2 in Section 2.

Source: CDM Smith, 2019.

Figure 5 Initial Receptor Locations

This page intentionally left blank.

4.8 Background (Existing) Ambient Concentrations

SCAQMD maintains ambient air quality monitoring stations throughout the South Coast Air Basin, including one located on LAX Property. That station is identified as the Southwest Coastal Los Angeles Monitoring Station (referred to as the LAX Hastings site), less than 0.5-mile from Runway 6L-24R (northernmost LAX runway). Criteria pollutants monitored at this station include O₃, CO, SO₂, NO₂, and PM₁₀. The nearest representative monitoring station that monitors PM_{2.5} is the South Coastal Los Angeles County 1 Station, located on Pacific Coast Highway in Long Beach. The most recent data available from the SCAQMD for these monitoring stations encompass the years 2014 to 2018, as shown in **Table 5**.

The peak value for the last 3-years of available data (2016-2018) will be used as the background concentration for most of the criteria air pollutants. However, background hourly NO₂ concentrations may be developed for each hour-of-day following USEPA guidance.^{27,28,29,30} To develop the hour-of-day (or hour-of-day by season-of-year) background concentrations, a three-year dataset of hourly NO₂ concentrations³¹ will be used which includes concentrations measured in 2016 through 2018. The development of background hour-of-day, or hour-of-day by season-of-year, will follow the methodology detailed in guidance provided by CAPCOA³² and SCAQMD.^{33,34}

Section 1

Human Health Risk Assessment Methodology

The objective of the proposed project Human Health Risk Assessment (HHRA) is to assess incremental changes to health impacts for people exposed to TACs resulting from construction and operation associated with the proposed project. The results of the HHRA will indicate whether the proposed project would significantly¹ increase health risks for people living, working, recreating, or attending school near LAX. This protocol supplements the Los Angeles International Airport (LAX) Airfield and Terminal Modernization Project (ATMP) CEQA Protocol for Conducting an Air Quality Impact Analysis of Criteria Air Pollutants.

1.1 General Approach

This HHRA protocol outlines the approach and methodologies that will be used to develop the HHRA analysis. The HHRA will focus on analysis of incremental human health risks and hazards associated with airborne releases of Toxic Air Contaminants (TACs) during construction and operation of the proposed project. Cancer risks, as well as chronic and acute non-cancer health hazard assessments depend on estimating potential exposure to incremental TACs associated with the proposed project.

This protocol is consistent with State of California statutes and regulations,² and describes the following four primary steps typically used to assess health risk:^{3,4,5,6,7,8}

- ¹ Thresholds of significance for health risks and hazards are presented in Section 2, Table 2-1 of this protocol.

- ⁷ U.S. Environmental Protection Agency, Office of Superfund Remediation and Technology Innovation, *Risk Assessment Guidance for Superfund, Volume I: Human Health Evaluation Manual (Part F, Supplemental Guidance for Inhalation Risk Assessment)*, Final. January 2009.
- ⁸ The SCAQMD has recently adopted revised supplemental guidance for stationary source facilities subject to AB 2588 reporting and analysis (South Coast Air Quality Management District, *AB 2588 and Rule 1402 Supplemental Guidelines (Supplemental Guidelines for Preparing Assessments for the Air Toxics "Hot Spots" Information and Assessment Act*, September 2018). This guidance was developed to provide explicit requirements for ensuring compliance with AB 2588 reporting requirements for those stationary facilities under SCAQMD jurisdiction and does not modify the general analysis approach specified in the OEHHA guidance cited above. The HHRA analysis conducted for the proposed Project will follow several of the guidelines including: specification of source and receptor locations in Universal Transverse Mercator (UTM) coordinates referenced to World Geodetic System 1984 (WGS84) spatial system; and estimation of cancer burden for residential areas within the 1 in 1 million cancer risk zone from proposed Project-related TAC emissions.

- Selection of TACs of Concern - Identification of TACs that may be released in sufficient quantities to present a public health risk
- Exposure Assessment - Analysis of ways in which people might be exposed to TACs
- Toxicity Assessment - Evaluation of the toxicity of TACs that may present public health risks
- Risk Characterization - Characterization of the magnitude of health risks for the exposed individuals and populations, and of locations in the community where the greatest risks or hazards may be realized

1.2 Selection of TACs of Concern

In general, TACs of concern selected for the HHRA are based on TACs identified under California Assembly Bill AB 2588 and for which the CalEPA, Office of Environmental Health Hazard Assessment (OEHHA) has developed cancer slope factors, chronic reference levels, and/or acute reference levels.

The list of TACs of concern used in this HHRA protocol was developed using regulatory lists, emissions estimates, human toxicity information, results of the LAX Master Plan HHRA contained in the LAX Master Plan Final EIR,⁹ and a review of health risk assessments included in the LAX Landside Access Modernization Program (LAMP) Final EIR,¹⁰ LAX Specific Plan Amendment Study (SPAS) Final EIR,¹¹ Long Beach Airport Terminal Area Improvement Project Final EIR,¹² and the Oakland International Airport - Airport Development Program (ADP) Final Supplemental EIR.¹³ This list of TACs was further refined to include only TACs with chronic Reference Exposure Levels (RELs), acute RELs, and cancer potency values identified by the CalEPA OEHHA.¹⁴ The resulting list of TACs of concern evaluated in this HHRA is provided in **Table 1-1**. Few of these TACs contribute substantively to possible incremental health impacts from specific LAWA projects. They are carried through the risk assessment process, however, as a demonstration of this conclusion and to comply with CalEPA risk assessment policy and guidance.

¹⁴ Chemical-specific toxicity criteria used in the health risk calculations will consider toxicity values developed by CalEPA, USEPA, or both as described in Section 1.4 of this protocol.

Table 1-1 Toxic Air Contaminants of Concern for the Human Health Risk Assessment

Toxic Air Contaminant	Type	Toxic Air Contaminant	Type
Acetaldehyde	VOC	Diesel PM	Diesel Exhaust
Acrolein	VOC	Aluminum	PM-Metal
Benzene	VOC	Antimony	PM-Metal
1,3-Butadiene	VOC	Arsenic	PM-Metal
Cyclohexane	VOC	Barium	PM-Metal
Ethylbenzene	VOC	Cadmium	PM-Metal
Ethylene	VOC	Chromium VI	PM-Metal
Formaldehyde	VOC	Cobalt	PM-Metal
n-Hexane	VOC	Copper	PM-Metal
Isoprene	VOC	Lead	PM-Metal
Isopropylbenzene	VOC	Manganese	PM-Metal
Methyl alcohol	VOC	Mercury	PM-Metal
Methyl ethyl ketone	VOC	Nickel	PM-Metal
Propionaldehyde	VOC	Selenium	PM-Metal
Propylene	VOC	Silver	PM-Metal
Styrene	VOC	Thallium	PM-Metal
Toluene	VOC	Vanadium	PM-Metal
1,2,4-Trimethylbenzene	VOC	Zinc	PM-Metal
2,2,4-Trimethylpentane	VOC	Ammonium Ion	PM-Inorganics
Xylene (total)	VOC	Bromine	PM-Inorganics
Naphthalene	PAH	Chlorine	PM-Inorganics
		Non-phosphate phosphorous	PM-Inorganics
		Phosphorus	PM-Inorganics
		Silicon	PM-Inorganics
		Sulfates	PM-Inorganics

Notes:

PAH = Polycyclic aromatic hydrocarbons

PM = Particulate matter

VOC = Volatile organic compounds

1.3 Exposure Assessment

1.3.1 Exposure Populations

For the HHRA analysis of the existing conditions, future no project, and future proposed project, the following receptors types will be evaluated: on-airport workers (both project and non-project workers), off-airport workers, off-airport adult residents, off-airport child residents, and off-airport school children. Each receptor represents a unique population and set of exposure conditions. As a whole, they cover a range of exposure scenarios for people who may be affected by LAX emissions to the greatest extent. Receptors for which exposure scenarios are prepared were selected to provide risks and hazards estimates for the maximally exposed individuals (MEI), and to demonstrate the range of risks and hazards in the vicinity of the airport. The final boundaries of the analysis will be defined by the 1 in 1-million cancer risk zone associated with

proposed Project TAC emissions, which is determined through the dispersion modeling and risk assessment analysis.

1.3.2 Exposure Pathways

Different receptors (e.g., off-site workers, school children) could be exposed to TACs through several exposure pathways. Exposure scenarios are developed for each receptor. Each scenario considers various pathways through which each receptor may be exposed to TACs.

An exposure pathway consists of four parts:

- A TAC source (e.g., construction equipment fuel combustion)
- A release mechanism (e.g., construction equipment engine exhaust)
- A means of transport from point of release to point of exposure (e.g., local winds)
- A route of exposure (e.g., inhalation)

If any of these elements of an exposure pathway is absent, no exposure can take place and the pathway is considered incomplete. Incomplete pathways will not be evaluated in the HHRA.

In addition, some exposure pathways may be complete, but may result in little or negligible exposure. Thus, numerous possibly complete exposure pathways exist for receptors at or near LAX, but most are anticipated to make minimal to negligible contribution to total risks and hazards. Other exposure pathways -- including deposition of TAC onto soils and subsequent exposure via incidental ingestion of this soil, uptake from soil into homegrown vegetables, and other indirect pathways -- were addressed quantitatively in the programmatic HHRA developed for the LAX Master Plan EIR¹⁵. In the LAX Master Plan EIR - Technical Report 14a,¹⁶ screening level studies for a large number of TACs were conducted to assess potential contributions to health risks for the following exposure media and routes: deposition onto soils and surfaces leading exposure via dermal contact, incidental ingestion, and vegetable uptake; deposition and runoff to surface waters leading to exposure via ingestion; and airborne TACs leading to exposure via inhalation. The screening level contributions for the non-inhalation pathways were found to be negligible compared to the contributions from the inhalation pathway, and the non-inhalation pathway risks would not change soil or water concentrations of the TACs to levels above the typical background concentrations found in the western United States, including California.¹⁷

¹⁵ City of Los Angeles, *Final Environmental Impact Report for Los Angeles International Airport (LAX) Proposed Master Plan Improvements*, (SCH 1997061047), Technical Report 14a - Health Risk Assessment, and Technical Report S-9a - Supplemental Health Risk Assessment, April 2004. ¹⁷ Shacklette and Boerngen, *Element Concentrations in Soils and Other Surficial Materials of the Conterminous United States*, US Geological Survey Professional Paper 1270, 1984.

No pathway other than inhalation was found to be an important contributor to exposure and, thus, to risk/hazard. Based on this previous analysis, pathways other than inhalation will not be assessed in this HHRA. For the proposed project, the inhalation pathway is the primary and most important complete exposure pathway and will be quantitatively evaluated for all receptors.

1.3.3 Exposure Concentrations

1.3.3.1 Non-Cancer Chronic and Acute Exposure Concentrations

Analyses of both non-cancer chronic and acute exposures will be included in the exposure assessment for the receptors identified in Section 1.3.1. Chronic and acute exposure to TACs from proposed project-specific construction and airport-related operations will be estimated by:

- Estimation of construction source emissions for peak annual (for chronic exposure) and for peak day (for acute exposure).
- Dispersion modeling of construction emissions over an area that consists of the airport property and urban areas to the north, east, and south.
- Dispersion modeling of proposed project incremental operational emissions over the same receptors as for the construction sources. Note that the proposed project incremental operational emissions are the difference in emissions between the proposed project for a given year and the Existing Condition emissions for each TAC.¹⁸

The methodologies for calculating emissions and dispersion of TACs follows those in the LAX ATMP CEQA Protocol for Conducting an Air Quality Impact Analysis of Criteria Air Pollutants. Because the TACs associated with airport operations and construction are generally subsets of particulate matter with an aerodynamic diameter less than or equal to 10 micrometers (PM₁₀) and volatile organic compound (VOC) emissions, the concentrations of TACs will be determined from concentrations of PM₁₀ and VOC for specific source types using particulate matter and organic compound speciation profiles developed by the California Air Resources Board (CARB), except that the turbine aircraft engine organic speciation is from the U.S. Environmental Protection Agency (USEPA) and Federal Aviation Administration (FAA), and PM speciation is from the U.S. Navy. The profiles to be used in this analysis are summarized in **Table 1-2**.

¹⁸ The Existing Condition sources include the operational sources at the airport in 2018. These are the same operational sources described in the LAX ATMP CEQA Protocol for Conducting an Air Quality Impact Analysis of Criteria Air Pollutants. The only difference will be in the activity levels between the 2018 conditions and the proposed Project conditions in the future years.

Table 1-2 Speciation Profiles

Source Agency & PM Profile No.	PM Profile Source Description	Source Agency & TOG Profile No.	TOG Profile Source Description
CARB 400	Gasoline Vehicle Exhaust - Catalyzed	CARB 716	Paving
CARB 420	Construction Dust	CARB 717	Architectural Coatings
CARB 425	Diesel Vehicle Exhaust	CARB 818	Diesel Equipment Exhaust
CARB 472	Tire Wear	CARB 2120	Gasoline Vehicle Exhaust - Catalyzed
CARB 473	Brake Wear		
US Navy	Aircraft Jet A Fuel Trace Elements	USEPA 5565	Aircraft Engine Exhaust – Turbofan, Turbojet, and Turboprop Engines

Sources: California Air Resources Board 2018. Speciation Profiles Used in ARB Modeling. U.S. Environmental Protection Agency/Federal Aviation Administration 2009. *Recommended Best Practice for Quantifying Speciated Organic Gas Emissions from Aircraft Equipped with Turbofan, Turbojet, and Turboprop Engines, Version 1.0*, EPA-420-R-09-901 (May). U.S. Navy 2000. *Trace Element and Polycyclic Aromatic Hydrocarbon Analyses of Jet Engine Fuels: Jet A, JP5, and JP8*, Technical Report 1845 (December).

Dispersion modeling of PM₁₀ and VOC (or total organic gases, TOG¹⁹) will be conducted using the same models (AEDT and AERMOD) and methods described in the LAX ATMP CEQA Protocol for Conducting an Air Quality Impact Analysis of Criteria Air Pollutants.

The highest modeled incremental TAC concentrations for each receptor type will be used to estimate project-related non-cancer chronic and acute human health hazards. These estimates will serve as the basis for significance determinations for the proposed project.

1.3.3.2 Carcinogenic Exposure Concentrations

To estimate cancer risks TAC exposure via inhalation for each receptor will be estimated. In February 2015, CalEPA OEHHA released the Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments.²⁰ Exposure equations and parameter values presented in this protocol come from that guidance, unless otherwise noted. The guidance recommends the use of a software program, Hot Spots Analysis and Reporting Program Version 2 (HARP2) developed by CARB, for calculating and presenting Health Risk Assessment (HRA) results for the Hot Spots Program. For this HHRA, the HARP2 equations and calculations were built into an Excel spreadsheet to allow for customization of the calculations to address project-specific criteria and for the ease of conducting multiple iterations of calculations.

¹⁹ Appropriate CARB and USEPA factors for converting VOC to TOG will be used to develop organic TAC emissions and dispersion.

²⁰ California Environmental Protection Agency, Office of Environmental Health Hazard Assessment, *Air Toxics Hot Spots Program, Risk Assessment Guidelines, Guidance Manual for Preparation of Health Risk Assessments*, February 2015.

The HARP2 equations recommend that the concentration of the chemical in air be used as the exposure metric resulting in the following formula for an exposure concentration:

$$EC = CA \times (BR/BW) \times A \times EF \times 10^{-6}$$

Where: EC	= exposure concentration (mg/kg/d)
CA	= chemical concentration in air ($\mu\text{g}/\text{m}^3$)
(BR/BW)	= daily breathing rate normalized to body weight (L/kg body weight – day)
A	= inhalation absorption factor (unitless)
EF	= exposure frequency (unitless), days/365 days
10^{-6}	= micrograms to milligrams conversion, liters to cubic meters conversion

Assessment of potential human health impacts due to release of carcinogenic TACs associated with the proposed Project assumes that receptors are exposed to concentrations of TACs over a 9-, 30-, or 70-year period for off-site residential receptors; a 12-year period for off-site school children, and a 25-year period for off-site workers. Because the construction period is shorter than the suggested averaging periods for estimating cancer risk, the risk analysis will include the combination of proposed Project-related construction and operational impacts.

For the construction phase, the focus of construction activities is assumed to move as different portions of the proposed project are constructed throughout the approximate 7-year construction period (potentially 2021 to early 2028). To incorporate this variability into the model, construction emissions will be modeled separately for each year of construction. TAC concentrations for each receptor type will be calculated by grid point for each year of construction. For the portion of the receptors' exposure periods that are longer than the construction period, construction emissions will be set to zero; however, cancer risks for the years following construction were calculated using the TAC incremental concentrations from proposed Project operations. Operational TAC incremental concentrations will be added to the construction TAC concentrations for all years after the start of construction, through the 2028 horizon year when proposed project operations are assumed to commence. Operational concentrations only will be estimated beyond 2028. For receptor types whose exposure periods extend beyond the 2033 horizon year, the 2033 proposed Project incremental TAC concentrations will be used for the remainder of their exposure period.

The estimate of incremental TAC concentrations for operations will be based on the difference in concentrations between the proposed Project and the Existing Conditions (2018) operational concentrations. The proposed Project TAC concentrations are assumed to change linearly between 2018 and 2028, and between 2028 and 2033.

The locations of grid points will be selected to be representative of where construction impacts would likely to be greatest, including the nearest residential and/or offsite worker location in each wind direction from the proposed Project construction sites. This approach typically overestimates risks for most people living, working, or attending school near LAX. This

conservatism (protection) is built into the risk assessment developed for the proposed project to help provide a buffer for any future changes in project construction that cannot now be anticipated quantitatively.

Exposure parameters used to calculate the risks and hazards for all receptors for the inhalation pathway are summarized in **Table 1-3**. Exposure parameters are based on CalEPA Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments,²¹ and USEPA Exposure Factors Handbook,²² as well as other pertinent guidance.

Table 1-3 Exposure Parameters

Exposure Pathway Parameters for Inhalation of Particulates and Gases	Off-Airport Receptors			
	Off-Site Adult Resident	Off-Site Child Resident	Off-Site School Child	Off-Site Worker
Exposure Frequency (Fraction of Year) (unitless)	0.96 (350 days/365 days) ¹	0.96 ¹	0.96 ¹	0.685 (250 days/365 days) ¹
Exposure Duration (years)	30, 70 ^{1,2,6,7}	9 ^{1,6}	12 ³	25 ¹
Exposure Time (hrs/day)	24 ⁴	24 ⁴	8 ¹	8 ¹
Absorption Fraction	1 ¹	1 ¹	1 ¹	1 ¹
Fraction of Time at Home	0.73 ¹	1 ^{1,5}	1 ^{1,5}	0.73 ¹
Averaging Time - Non-cancer (days)	10,950;25,550 ^{1,4}	3,285 ⁴	4,380 ⁴	9,125 ⁴
Averaging Time - Cancer (days)	25,550 ^{1,4}	25,550 ^{1,4}	25,550 ^{1,4}	25,550 ^{1,4}

Notes:

NA = not applicable

1.4 Toxicity Assessment

Risks from exposure to TACs are calculated by combining estimates of potential exposure with chemical-specific toxicity criteria developed by CalEPA, USEPA, or both. The toxicity assessment will initially examine quantitative toxicity criteria for TACs as required under 22 Cal. Code Regs. Sections (§)69021(a), (b), and (c), as described in the *Toxicity Criteria for Human Health Risk Assessments, Screening Levels, and Remediation Goals* rule.²⁴

Acute RELs developed by the State of California were used in the characterization of potential acute non-cancer health hazards associated with the proposed project. Cancer unit risk factors, cancer slope factors, and chronic RELs developed by the State of California were used to characterize cancer risks and chronic non-cancer health hazards associated with longer-term inhalation of emissions from construction and operational activities. Both types of toxicity criteria are based on studies of chronic exposure in animals or, in some cases, to people.

Acute RELs were used to characterize potential hazards associated with short-term exposure (usually from exposures on the order of 1-hour). RELs are based on the most sensitive, relevant, adverse health effect reported in the medical and toxicological literature. Since margins of safety²⁵ are incorporated to address data gaps and uncertainties, exceeding an REL does not automatically indicate an adverse health impact. One acute REL is developed for each TAC and that REL value is applicable to all receptors, residents and workers, children and adults.

²⁴ California Department of Toxic Substances Control (DTSC) Human and Ecological Risk Office (HERO). *Human Health Risk Assessment (HHRA) Note Number 10, Toxicity Criteria*, February 25, 2019. Available at: <https://dtsc.ca.gov/wp-content/uploads/sites/31/2019/02/HHRA-Note-10-2019-02-25.pdf>.

²⁵ Margin of safety is a ratio of the no-observed-effect level to the estimated exposure dose. Margins of safety are incorporated in the development of toxicity values to account for differences in dose-response among individuals. For example, the same dose of alcohol may have a greater effect on a woman than a man, not only because a woman is smaller in body size but also because men and women metabolize alcohol at different rates.

1.5 Risk Characterization

Risk characterization combines information developed for exposure and for toxicity to produce quantitative estimates of health impacts to receptors in the study area.

1.5.1 Methodology for Evaluating Cancer Risks and Non-Cancer Health Hazards

Concentrations of TAC of concern in air, locations of potentially exposed populations, including locations for MEI exposure scenarios (worker, resident, student), and toxicity criteria will be used to calculate incremental human health risks associated with the proposed project. Risks for people recreating near the airport would be lower than those for workers, residents, and students at any given location because of much shorter times spent in recreational activities. No risks will be calculated for this population. Where risks are not significant for other receptor groups, risks for recreational visitors near LAX will also be considered insignificant.

Cancer risks will be estimated by multiplying exposure estimates for carcinogenic chemicals by corresponding cancer slope factors. Cancer risk results will be expressed as the odds of developing cancer over a lifetime for a given period of exposure. Cancer risks will be based on the exposure durations listed in Table 1-3 relative to a 70-year lifetime²⁶. The cancer risks will be estimated using cancer potency factor in the following equation:

$$\text{RISK} = \text{EC} \times \text{CPF} \times \text{ASF} \times \text{ED}/\text{AT} \times \text{FAH}$$

Where: RISK = inhalation cancer risk

EC = exposure concentration (mg/kg/d)

CPF = inhalation cancer potency factor (mg/kg-day⁻¹)

ASF = age sensitivity factor for a specified age group (unitless)

ED = exposure duration (in years) for a specified age group

AT = averaging time for lifetime cancer risk (years)

FAH = fraction of time spent at home/school/work (unitless)

Chronic non-cancer health hazard estimates were calculated by dividing exposure estimates by RELs. RELs are estimates of highest exposure levels that would not cause adverse health effects even if exposures continue over a lifetime. The ratio of exposure concentration to reference concentration is termed the HQ. Risks or odds of adverse effects cannot be estimated using reference doses.

Impacts of exposure to multiple chemicals will be accounted for by adding cancer risk estimates for exposure to all carcinogenic chemicals, and by adding estimated HQs for non-carcinogenic chemicals that affect the same target organ or tissue in the body. Addition of HQs for TAC that produce effects in similar organs and tissues results in a Hazard Index (HI) that reflects possible total hazards. Several TACs have effects on the respiratory system including acetaldehyde, acrolein, formaldehyde, xylenes, and diesel particulates. Non-cancer health hazards for the

²⁶ California Environmental Protection Agency, Office of Environmental Health Hazard Assessment, Air Toxics Hot Spots Program, Risk Assessment Guidelines, Guidance Manual for Preparation of Health Risk Assessments, February 2015.

proposed project will be calculated for the respiratory system, which accounted for essentially all potential non-cancer health hazards.

To determine whether releases of TACs during construction and operation of the proposed project would be significant, incremental human health risks for the proposed project were compared to thresholds of significance identified in SCAQMD CEQA guidance²⁷ and summarized in Section 2, below.

1.5.2 Maximally Exposed Individuals (MEI)

For the proposed project, grid points will be analyzed along the airport fence-line and within the study area. In addition, several on-airport grid points that are not within the project construction sites²⁸ will also be modeled (for on-airport/off-site workers). These locations are anticipated to represent MEI, based on previous dispersion modeling for LAX. Concentrations of each TAC at these nodes will be used in calculating cancer risk, and chronic and acute non-cancer health hazard estimates. These calculations will be used to identify locations with maximum cancer risks and maximum non-cancer health hazards and serve as the basis for significance determinations.

MEI estimates will be based on the land use for each receptor location. On-airport locations will be identified as commercial and on-airport worker locations for the operational scenario. For off-airport locations, land uses will be designated as either residential, school (including day-care and preschool), hospital (including elder care), and commercial/industrial based on internet web searches and reviews of receptor locations in Google Earth Pro. These land use identifications will be used to determine appropriate receptors (workers at commercial/industrial locations; adult and child residents and school children at residential locations; etc.). Locations of schools, hospitals, nursing homes, daycares, etc. will be identified as sensitive receptor locations and designated as residential/commercial so that these grid points will be evaluated for both worker (teachers and staff) and residential receptors (school children).

1.5.3 Methodology for Evaluating Acute Impacts

Acute non-cancer health risk estimates will be calculated by dividing estimated maximum 1-hour TAC concentrations in air by acute RELs. An acute REL is a concentration in air below which adverse effects are unlikely for people, including sensitive subgroups, exposed for a short time on an intermittent basis. RELs for acute non-cancer health hazards do not distinguish between adults and children. Since margins of safety are incorporated to address data gaps and uncertainties, exceeding the REL does not automatically indicate an adverse health impact. Most RELs have been developed for a 1-hour exposure duration, although several are based on an 8-hour exposure period. CalEPA's OEHHA has developed acute RELs for several of the TACs of concern identified for the proposed project.

Short-term concentrations for each TAC associated with the proposed project will be divided by acute RELs to determine an acute HQ. Impacts of exposure to multiple chemicals will be accounted for by adding estimated HQs for TACs that affect the same target organ or tissue in the

²⁷ South Coast Air Quality Management District. *South Coast AQMD Air Quality Significance Thresholds*. April 2019. Available at: <http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf>.

²⁸ See LAX Airfield and Terminal Modernization Project CEQA Protocol for Conducting An Air Quality Impact Analysis of Criteria Air Pollutants, Figures 2 and 3, for general construction site locations.

body, generating an acute HI for each receptor. The resulting acute HIs will be compared to the SCAQMD CEQA TAC acute HI significance threshold of 1. HIs less than 1 suggests that adverse acute non-cancer health hazard impacts are not expected.

1.5.4 Methodology for Evaluating Population-Wide Risks

Population-based health impact will be evaluated since the proposed project has the potential for exposing relatively large numbers of people to TAC concentrations. The purpose of this type of assessment is to provide perspective on the magnitude of the potential public health threat posed by emissions of a project. Population-wide risk assumes that a population (not necessarily the same individuals) will live within the study area over a 70-year lifetime period.

To evaluate the cancer risk over the exposed population, the cancer burden method will be used to assess the number of excess cancer cases that could occur in the study area. The cancer burden will be calculated by multiplying the cancer risk calculated for a 70-year resident at a grid point by the number of people who live in the census block associated with that grid point. The sum of these estimates represents the cancer burden across each zone of impact (10^{-6} , 10^{-5} , etc.) for the study area. If a single census block contains more than one modeled grid point, the average of the calculated risks for the grid points within the census block will be used for the calculation.

A similar approach will be used for the assessment of population-wide hazard impacts. However, instead of multiplying the hazard indices, zones of impact will be identified where hazard indices exceeded 0.5, 1.0, and above in increments of 1.0. The population counts for each zone of impact will be summed to provide a single number for each zone of impact. As with the cancer burden, when a single census block contains more than one modeled grid point, the average of the calculated hazard indices for the grid points within the census block will be used. Population estimates for acute, 8-hour, and chronic health impacts will be presented separately.

Section 2

HHRA Significance Thresholds

The SCAQMD has developed health risk and hazard significance thresholds for CEQA impact analyses. These thresholds are provided in **Table 2-1**. Note that these thresholds have been developed for project incremental impacts. Project incremental impacts for comparison to the significance thresholds will be determined by using the proposed project incremental operational emissions and construction emissions as described in Section 1.3.3 to calculate the proposed Project health impacts. The proposed-Project construction and operational TAC concentrations will be combined in determining the total health risk impacts at each receptor.

For disclosure purposes, a second calculation will be performed which determines project incremental impacts by subtracting the future No Project scenario health impacts from the future proposed Project scenario health impacts.

Table 2-1 Health Risk and Health Hazard Significance Thresholds

Health Risk or Hazard	Project Incremental Significance Threshold
Cancer Risk (MEI Resident or MEI Worker)	Maximum Incremental Cancer Risk ≥ 10 in 1 million
Cancer Burden for Exposed Population	> 0.5 Excess cancer cases (in areas ≥ 1 in 1 million cancer risk)
Chronic Non-Cancer Hazards	Hlc ≥ 1.0
Acute Non-Cancer Hazards	Hla ≥ 1.0

Source: South Coast Air Quality Management District, South Coast AQMD Air Quality Significance Thresholds, April 2019. Available: <http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf>.

In addition, on-site concentrations will be compared to Permissible Exposure Limits²⁹ – Time-Weighted Average or Threshold Limit Values for proposed Project workers. An exceedance of any of PELs for one or more TACs would be considered a significant impact.

No standards exist that establish acceptable levels of human health risks or that identify a threshold of significance for cumulative health risk impacts; therefore, the HHRA will include a general discussion of the cumulative impacts for the proposed project relative to regional cancer risk estimates and TAC concentration predictions based on information available from SCAQMD and USEPA.

²⁹ California Division of Occupational Safety and Health (DOSH, also known as Cal/OSHA), Table AC-1 Permissible Exposure Limits for Chemical Contaminant. Available: https://www.dir.ca.gov/title8/5155table_ac1.html.

Appendix C.9 Screening of Potential Mitigation Measures to Reduce Criteria Air Pollutants and Greenhouse Gases

This page intentionally left blank.

During the process of identifying mitigation measures to address air quality and greenhouse gas significant impacts, LAWA compiled and reviewed a broad array of potential measures from various sources such as the FAA, the Airport Cooperative Research Program (ACRP), the California Air Resources Board (CARB), and the South Coast Air Quality Management District (SCAQMD). The review indicated that many of those potential measures are already being implemented at LAX under existing LAWA programs and requirements and/or would be incorporated into the proposed Project as project features. Of the remaining measures, some were considered feasible to add as mitigation measures for the proposed Project, while others were determined to be not applicable or infeasible to include as mitigation measures for the Project. **Table C.9-1** presents an overview of potential measures for the reduction of air pollutant and greenhouse gas emissions. The table indicates whether such measures are already being implemented at LAX, are proposed to be included in the Project as a design/operational feature, are proposed as a mitigation measure, or are considered to be not applicable to, or infeasible for, LAX and the proposed Project.

This page intentionally left blank.

Table C.9-1 Review and Screening of Potential Measures for Reduction of Criteria Air Pollutant and Greenhouse Gas Emissions					
ID#	Measure	Relevant Emission Sources (and Pollutants - Criteria or GHGs)	LAX Existing Program (EP), ATMP Project Feature (PF), or ATMP Proposed Mitigation Measure (MM)	Not Applicable or Infeasible	Comment
Projects that may be funded through the FAA Voluntary Airport Low Emission (VALE) grant program or other sources:					
1	Alternative Fuel Vehicles. VALE incentivizes airport sponsors by funding the incremental cost of alternative fuel vehicles instead of conventionally-powered diesel and gasoline vehicles. Alternative fuels include compressed natural gas (CNG), electricity, hybrid technologies, and hydrogen. The supporting recharging/refueling infrastructure is also eligible for funding.	Motor Vehicles GSE (Criteria & GHGs)	EP		LAWA has several existing programs related to providing incentives to encourage the use of Alternative Fuel Vehicles, including: - The LAX Alternative Fuel Vehicle (AFV) Program to require the use of clean fuel medium and heavy-duty vehicles at LAX and thereby reduce emissions - The LAX AFV Incentive Program to help fund the purchase of clean fuel medium and heavy-duty vehicles at LAX and thereby reduce emissions. - LAWA Zero-Emission Bus Program: 20 percent of LAWA buses to be zero-emission by 2023 and 100 percent by 2031. BOAC approved the purchase of 20 all-electric airfield buses to replace aging diesel buses in 2018. Based on LAWA's current bus fleet size, these 20 buses will comprise nearly 24 percent of LAWA's bus fleet - Mitigation Measure MM-AQ/GHG (ATMP)-5 calls for LAWA to update the Electric Vehicle Purchasing Policy to require 100 percent of LAWA's light-duty vehicle fleet to be all-electric by 2031.
2	Electric Pre-conditioned Air (PCA) (point-of-use or centralized) and ground power converter units (mobile or fixed) significantly reduce emissions associated with aircraft APU usage. Necessary upgrades to the supporting electrical infrastructure to operate the equipment are also eligible for funding All new passenger gates included with the proposed Project will have electric PCA and gate power included in the design.	APU GSE Energy Use (Criteria & GHGs)	EP PF		The LAX Design and Construction Handbook (DCH) requires all new aircraft parking positions be installed with ground power and PCA, where applicable, which compliments the fact that all existing passenger contact gates at LAX are equipped with ground power and PCA. LAWA has also been working on installing ground power at cargo, hangar, and maintenance aircraft parking positions. LAWA received a VALE grant to provide ground power to remain-over-night (RON) positions at the West Remote Gates. LAWA completed this project in 2019.
3	Electric ground power converter units reduce aircraft APU and/or conventional-fueled ground power unit emissions by providing clean electricity to remote parking positions for Remain Over Night (RON), cargo, and maintenance operations. The necessary upgrades to the supporting electrical infrastructure are also eligible for funding. The airport is investigating potential funding opportunities funding to expansion of electric ground power converter units are remote parking locations.	APU GSE Energy Use (Criteria & GHGs)	EP		Aircraft Parking Requirements in DCH: All new aircraft parking positions shall be installed with ground power and PCA, where applicable, as coordinated and approved by LAWA Environmental Planning Group. LAWA has been working on installing ground power at cargo, hangar, and maintenance aircraft parking positions. LAWA received a VALE grant to provide ground power to RON positions at the West Remote Gates. LAWA completed this project in 2019.
4	Ground Support Equipment (GSE). Replacing airport sponsor-owned conventionally—fueled belt loaders, cargo loaders, bag tugs, and pushback tractors with electric or hydrogen-powered counterparts can significantly reduce on-airport emissions. Refueling stations and/or recharging equipment, and necessary infrastructure are eligible for funding.	GSE (Criteria & GHGs)	EP PF		LAWA does not own or operate GSE at LAX but, through the GSE Emissions Reduction Program, LAWA does impose requirements on airlines and GSE operators to reduce emissions from GSE at LAX. Existing program requires GSE average emission performance targets for NOx of 1.8 g/hp-hr by 2023 and 1 g/hp-hr by 2031. GSE Incentive Program: LAWA adopted the LAX Electric Ground Support Equipment Incentive Program in 2019 with \$500,000 from LAWA's own funds to accelerate the use of zero-emission GSE at LAX.
5	Geothermal Systems. Geothermal systems improve air quality and reduce emissions by utilizing the earth's underground temperature to supply airport buildings with cooled air in the summer and warmed air in the winter. VALE funding can be provided for the pro-rated share of the geothermal system that directly offsets conventional fuel use.			Not Applicable	No useable geothermal resources existing on LAWA properties. LAWA does purchase a portion of its electric power demand as green power from LADWP (see Measure 30 below); and will add solar power generation systems on ATMP facilities where feasible as noted in Measure 6 below. While not geothermal, these other existing measures to reduce LAWA's carbon footprint.
6	Solar Thermal Technologies. Utilizing solar thermal technologies can offset or eliminate the use of fossil-fuel hot water systems. These projects are eligible for VALE funding inasmuch as they offset heating and cooling emissions produced by on-airport gas and oil-fired burners.	Energy Use (Criteria & GHGs)	MM		Mitigation Measure MM-AQ/GHG (ATMP)-6 requires LAWA to implement solar energy, such as, but not limited to, photovoltaic solar panels on ATMP buildings and facilities where feasible based on costs, grid tie-in capability, environmental clearance, compliance with FAA Part 77, and FAA requirements for land leases and funding as applicable.

Table C.9-1 Review and Screening of Potential Measures for Reduction of Criteria Air Pollutant and Greenhouse Gas Emissions					
ID#	Measure	Relevant Emission Sources (and Pollutants - Criteria or GHGs)	LAX Existing Program (EP), ATMP Project Feature (PF), or ATMP Proposed Mitigation Measure (MM)	Not Applicable or Infeasible	Comment
7	Hydrant Fueling Systems. The purpose of any hydrant fueling system is to provide fuel to aircraft via valves in underground structures located at the terminal gates. While parked at the terminal, an aircraft is connected to the valves via a hose and a hydrant cart. Emission reductions can be achieved by replacing large fuel trucks with zero-emission, electric fueling carts.	Motor Vehicles (Criteria & GHGs)	EP PF		LAX receives the vast majority of jet fuel via four underground pipelines. LAX also has a fuel hydrant system to deliver that fuel to the gates. There is a small amount of sustainable (renewable) aviation jet fuel delivered via tanker trucks. New gates developed as part of the proposed Project would have hydrant fueling infrastructure installed as part of the project design.
Projects that may be funded through the FAA Airport Zero Emission Vehicle (ZEV) and Infrastructure Pilot Program or other sources:					
8	These are often vehicles with all-electric or hydrogen-powered drive trains. Vehicles that transport airport passenger and employees are the most common vehicle type. Certain light and heavy-duty trucks may also be eligible for funding. The airport can expand the use of ZEV vehicles onsite.	Motor Vehicles (Criteria & GHGs)	EP MM		LAWA Zero-Emission Bus Program (in LAX Air Quality Implementation Measures [AQIM], in SCAQMD MOU): 20 percent of LAWA buses to be zero-emission by 2023 and 100 percent by 2031. BOAC approved the purchase of 20 all-electric airfield buses to replace aging diesel buses in 2018. Based on LAWA's current bus fleet size, these 20 buses will comprise nearly 24 percent of LAWA's bus fleet. Mitigation Measure MM-AQ/GHG (ATMP)-5 calls for LAWA to update the Electric Vehicle Purchasing Policy to require 100 percent of LAWA's light-duty vehicle fleet to be all-electric by 2031.
9	This pertains to ZEV infrastructure including refueling stations, rechargers, on-site fuel storage tanks, and other equipment needed for station operation. Airports must limit the capacity of refueling and recharging stations to the number of project vehicles and their fueling requirements. The airport can expand the ZEV infrastructure onsite.	Motor Vehicles (Criteria & GHGs)	EP PF MM		LAWA currently has over 100 EV chargers available to the public and employees. LAWA will be expanding its EV charger infrastructure with the LAX Landside Access Modernization Program facilities (the CONRAC and ITF West). LAWA has long-standing fueling locations for its CNG vehicles. In addition, Clean Energy has fueling stations for the public located near LAX. Mitigation Measure MM-AQ/GHG (ATMP)-4 calls for LAWA to install EV charging infrastructure in the Terminal 9 parking facility beyond the minimum amount required by code. The exact number of spaces and types of parking (Electrical Vehicle Supply Equipment [EVSE] or Electric Vehicle Charging Stations [EVCS]) shall be determined during project design and shall exceed the minimum requirements for EVSE and EVCS specified in the code at the time of design by at least 5 percent.
10	Aircraft operational changes, such as single-engine taxi and reduced use of reverse thrust at the pilots' discretion.	Aircraft (Criteria & GHGs)		Infeasible	LAWA does not have legal authority to regulate aircraft in flight or regulate pilots' discretion in operating an aircraft; however, LAWA will work with airlines for the purpose of evaluating and encouraging single-engine taxiing under all or certain conditions, and encouraging the reduced use of reverse thrust during landing under all or certain conditions.
11	Fee-based strategies, such as increased or variable landing fees, based on emissions that result in a greater charge being levied on higher polluting aircraft entering the airport. Variable aircraft landing fees have been implemented at Zurich and Geneva Airports in Switzerland, and at nineteen airports in Sweden.			Infeasible	Public-use airport operators in the United States are not permitted to create facility use regulations that are discriminatory against one type or size of aircraft.
12	Requiring the purchase of cleaner alternatives when fleet vehicles or equipment are replaced or added.	Motor Vehicles (Criteria & GHGs)	MM		Mitigation Measure MM-AQ/GHG (ATMP)-5 calls for LAWA to update the Electric Vehicle Purchasing Policy to require 100 percent of LAWA's light-duty vehicle fleet to be all-electric by 2031.
13	Developing a declining fleet emissions target can be utilized to achieve emissions reductions from GSE and ground access vehicles.	Motor Vehicles (Criteria & GHGs)	EPs		See discussions of Measures 1 and 4 above regarding alternative fuel vehicles and ground support equipment.
14	Use of Tier 4 diesel equipment in cases where alternative fuels are not used.	Construction (Criteria)	EP		Construction equipment emission requirements set forth in Section 7 of the DCH include the requirement that off-road diesel-powered equipment greater than 50 horsepower must meet USEPA Tier 4 (final) standards or the next cleanest equipment available.

Table C.9-1
Review and Screening of Potential Measures for Reduction of Criteria Air Pollutant and Greenhouse Gas Emissions

ID#	Measure	Relevant Emission Sources (and Pollutants - Criteria or GHGs)	LAX Existing Program (EP), ATMP Project Feature (PF), or ATMP Proposed Mitigation Measure (MM)	Not Applicable or Infeasible	Comment
15	Use of low or no volatile organic compound (VOC) paint and consumer products.	Construction (Criteria)	EP PF		The DCH contains VOC criteria for various materials and products, including cleaning products, sealant materials, adhesive materials, sealer materials, epoxy membrane materials, flooring adhesives, shade cloth, and mastics. For paint, DCH specifies that products shall comply with VOC limits of Los Angeles Department of Building and Safety and LAWA requirements. The SCAQMD also requires low or no-VOC paints. In accordance with LAWA Sustainable Design and Construction Policy, Concourse 0 and Terminal 9 would be built to achieve a minimum of LEED® Silver certification; methods to achieve credits for this certification level may include use of low VOC products.
16	Installation of low NO _x boilers or replacement of boilers with solar thermal technologies.	Stationary (Criteria)	PF		Boilers installed in conjunction with Concourse 0 and Terminal 9 would be of a low NO _x design.
17	Use of renewable diesel fuel in equipment onsite.	Motor Vehicles (Criteria & GHGs)	MM		Mitigation Measure MM-AQ/GHG (ATMP)-2 requires ATMP contractors to use renewable diesel fuel in proposed Project construction off-road equipment and on-site, on-road trucks (i.e., on-site water trucks), as feasible based on commercial renewable fuel availability. For purposes of this measure, commercially-available renewable fuel is defined as renewable fuel that is available in the regional area at a comparable price (i.e., without a substantial premium) and not incurring substantial transportation costs (i.e., higher costs associated with having to transport it to the project site over substantially longer distances from the supplier[s] of renewable diesel fuel).
The <i>Sustainable Airport Construction Practices</i> report from the Airport Cooperative Research Program, specifically, ACRP Report 42 (ISSN 1935-9802) from 2011 identifies numerous measures that could serve to reduce emissions. Specific measures include:					
18	Provide infrastructure for pre-conditioned air and ground power, and minimize the use of auxiliary power units.	APU GSE (Criteria & GHGs)	PF		See discussions of Measures 2 and 3 above regarding PCA and ground power.
19	Design airside layout to reduce aircraft delay and surface vehicle congestion.	Aircraft (Criteria & GHGs)	PF		Aircraft movement simulation modeling conducted for the proposed Project indicated a reduction in aircraft delay times with implementation of the proposed Project compared to without the proposed Project.
20	Implement emission-based incentives and landing fees.			Infeasible	See discussion of Measure 11 above regarding fee-based incentives.
21	Support modernization of air traffic management by using satellite-based navigation and other technology.			Not Applicable	The FAA Metroplex Program, which has been implemented in Los Angeles and throughout southern California, provides for such improved technology. LAWA does not have jurisdictional authority over airspace.
22	Support reduced engine taxiing by reducing the number of engines for aircraft taxiing or idling on the ground.	Aircraft (Criteria & GHGs)		Infeasible	See discussion of Measure 10 above regarding single-engine taxiing.
23	Support use of alternative fuels in aircraft through development or facilitation of fuel supply.	Aircraft (Criteria & GHGs)	PF		LAWA will work with airlines for the purpose of promoting the delivery and use of sustainable aviation fuel.
24	Use airport-specific Sustainable Planning, Design, and Construction Guidelines, and set a policy for green building certification of buildings.	Construction (Criteria & GHGs)	EP PF		LAWA adopted its Sustainable Design and Construction Policy in 2017. In accordance with the policy, development of Concourse 0 and Terminal 9 would meet LEED® Silver at a minimum.

Table C.9-1 Review and Screening of Potential Measures for Reduction of Criteria Air Pollutant and Greenhouse Gas Emissions					
ID#	Measure	Relevant Emission Sources (and Pollutants - Criteria or GHGs)	LAX Existing Program (EP), ATMP Project Feature (PF), or ATMP Proposed Mitigation Measure (MM)	Not Applicable or Infeasible	Comment
25	Provide employees incentives to use public transportation.	Motor Vehicles (Criteria & GHGs)	EP PF MM		LAWA currently provides incentives for LAWA employees to take public transit. Relative to Project Features, LAWA is currently constructing the LAX Landside Access Modernization Program that includes an Automated People Mover station adjacent to the future Airport Metro Connector (AMC), which will help support and encourage transit ridership at LAX; an additional APM station at Terminal 9 is proposed as part of the Project that would also help support use of transit by employees (and passengers). Mitigation Measure MM-T (ATMP)-1 provides for several strategies for reducing vehicular travel including, but not limited to, additional incentives for LAX employees to use public transportation.
26	Provide bicycle access, storage, and changing rooms for building users.			Infeasible	The proposed Project involves development of a new concourse and new terminal within the LAX CTA. Bicycle use and activity within the CTA is negligible and is not in the best interest of safety, and a measure in support of bicycle assess, storage, and changing rooms for Concourse 0 and Terminal 9 users is therefore considered infeasible.
27	Install fueling stations for alternative-fueled vehicles.	Motor Vehicles (Criteria & GHGs)	EP MM		See discussions of Measures 1, 4, 8, and 9 above regarding alternative fuel vehicles, GSE, and ZEV.
28	Optimize energy performance above minimum levels of efficiency, including the use of light-emitting diode (LED) lighting on the airfield.	Energy Use (Criteria & GHGs)	EP		LAWA currently uses LED lighting on the airfield where feasible.
29	Use alternative refrigerants to chlorofluorocarbons, hydrochlorofluorocarbons, and hydrofluorocarbons based on their global warming potential (GWP).	Stationary (GHGs)	PF		Concourse 0 and Terminal 9 would obtain at least LEED® Silver certification, which requires fundamental refrigerant management to phase out CFCs and eliminate leakage (LEED® E&A Prereq 3).
30	Generate or procure green power.	Energy Use (Criteria & GHGs)	EP		Over the past several years, LAWA has purchased a percentage (from 2-10%) of its power from LADWP as green power.
31	Use clean-fuel construction vehicles with pollution-control technology or low-emission construction vehicles.	Motor Vehicles (Criteria & GHGs)	EP		LAWA's DCH includes a requirement that construction projects use Tier 4 final diesel off-road construction equipment or the next cleanest alternative. In addition, haul trucks must be 2010 or newer.
32	Create a carbon offset purchasing strategy.			Infeasible	FAA takes the position that any use of funds by LAWA absent a specific regulatory requirement is prohibited by revenue diversion policies. (FAA, <i>Policy and Procedures Concerning the Use of Airport Revenue</i> at § V(B)(10), 64 Fed. Reg. 7696, 7720 (1999).)
33	Offer voluntary carbon offsets for passengers.	Aircraft (GHGs)	EP		LAWA is currently providing LAX passengers access to the Good Traveler voluntary carbon offset program on the LAWA website. The Good Traveler provides passengers the ability to easily purchase carbon offsets for their air travel on line. See https://thegoodtraveler.org/
34	Develop an airport expansion and development GHG emission policy.	Multiple (GHGs)	EP		LAWA does not currently have a formal, adopted policy specific to GHG emissions; it does have several other programs and requirements that serve to reduce or minimize GHG emissions within its control. Those include the LAX AQIM, which are recognized by the SCAQMD; the Sustainability Action Plan, including development of an air quality management plan to address GHGs; and Sustainability requirements in the Sustainable Design and Construction Requirements, and the LAWA DCH.
35	Develop and maintain Environmental Management Systems to integrate environmental considerations in the management of an airport.	Multiple (Criteria & GHGs)	EP		LAWA uses an Environmental Management System such as Enviance or similar.
36	Implement a construction vehicle idling plan, and specify low-emissions construction vehicles and equipment.	Construction (Criteria & GHGs)	EP		See discussion of Measure 14 above regarding low-emission construction equipment. Also, the DCH contains restrictions and regulations on construction vehicle idling, relying on CARB Vehicle Idling Rule.

Table C.9-1
Review and Screening of Potential Measures for Reduction of Criteria Air Pollutant and Greenhouse Gas Emissions

ID#	Measure	Relevant Emission Sources (and Pollutants - Criteria or GHGs)	LAX Existing Program (EP), ATMP Project Feature (PF), or ATMP Proposed Mitigation Measure (MM)	Not Applicable or Infeasible	Comment
37	Recycle and reuse construction and demolition materials.	Energy Use (GHGs)	EP MM		The DCH requires compliance with the City of Los Angeles Demolition Debris Recycling Program, which outlines disposal permitting requirements, reporting and documentation requirements, and other requirements related to AB 939 diversion goals. Mitigation Measure MM-GHG (ATMP)-1 sets forth a requirement for construction contractors to recycle or salvage a minimum of 85 percent of nonhazardous construction and demolition waste generated directly from construction of the ATMP.
38	Install sustainable, long-term vegetation and invest in terrestrial carbon sinks.	Energy Use (GHGs)	EP PF		Outdoor landscaping under the proposed Project would comply with California Code of Regulations Title 23 Division 2 Chapter 2.7 Model Water Efficient Landscape Ordinance. In addition, in accordance with the Water Supply Assessment for the Project, LAWA would install drought-tolerant plants for 15 percent of total Project-related landscaping, with the remaining 85 percent consisting of mulch, sand, and other drought-tolerant landscaping elements.
39	Implement energy management measures: - Use thermal imaging to identify energy losses. - Develop and market an energy conservation program for building users. - Implement a lighting system energy conservation program. - Purchase Energy Star equipment. - Incorporate use of natural ventilation and economizer control. - Utilize sophisticated energy models for building design. - Install window awnings or sunshades. - Change set points or exclude selected zones from heating and cooling. - Develop a strategic energy management plan. - Evaluate fuel mix.	Energy Use (Criteria & GHGs)	PF		Concourse 0 and Terminal 9 would be constructed to meet LEED® Silver certification standards or better. Meeting this standard would require using energy conserving procedures and materials throughout the building, thereby reducing energy consumption and GHG emissions.
40	Enter into a green power purchase agreement.	Energy Use (Criteria & GHGs)	EP		See discussion of Measure 30 above regarding green power.
41	Support alternatively-fueled GSE.	GSE (Criteria & GHGs)	EP PF		See discussions of Measures 1 through 4 above regarding alternative fuel vehicles and GSE.
42	Promote public transit to the airport and increase mass transit access to the airport.	Motor Vehicles (Criteria & GHGs)	EP PF MM		See discussion of Measure 25 above regarding public transit.
43	Support alternatively-fueled taxis.			Not applicable	The City of Los Angeles exclusively regulates taxis in Los Angeles. The City of Los Angeles requires taxis to be hybrid vehicles or better.
44	Start or enhance a waste reduction or recycling program.	Energy Use (GHGs)	EP MM		LAWA has an existing waste reduction and recycling program. Under Mitigation Measure MM-GHG (ATMP)-4, LAWA shall enhance the existing recycling program to include expanding the number of facilities in the program (including Concourse 0 and Terminal 9), updating agreements requiring tenant diversion goals, and incorporating necessary provisions from the Green Procurement Policy.

Table C.9-1 Review and Screening of Potential Measures for Reduction of Criteria Air Pollutant and Greenhouse Gas Emissions					
ID#	Measure	Relevant Emission Sources (and Pollutants - Criteria or GHGs)	LAX Existing Program (EP), ATMP Project Feature (PF), or ATMP Proposed Mitigation Measure (MM)	Not Applicable or Infeasible	Comment
45	Start or enhance a green procurement program.	Energy (GHGs)	EP MM		LAWA reports on Environmentally Preferred Purchasing (EPP) annually to the City of Los Angeles. Under Mitigation Measure MM-GHG (ATMP)-3, LAWA would develop and adopt an airport-wide Green Procurement Policy applicable to LAWA purchasing which will apply to the ATMP. The Green Procurement Policy shall identify requirements and standards for products or services that have a lesser or reduced effect on human health and the environment when compared with competing products or services that serve the same purpose.
46	Create a detailed operations and maintenance manual.	Energy (Criteria & GHGs)	EP		The development and commissioning of new equipment includes operations and maintenance manual(s), as appropriate.
47	Use a computerized maintenance management system.	Multiple (Criteria & GHGs)	EP		LAWA uses Maximo to manage maintenance requests.
48	Conduct regular greenhouse gas emission inventories.	Multiple (GHGs)	EP		LAWA prepares annual GHG inventories for the Airport Carbon Accreditation (ACA) program and to meet the requirements of AB 32.
49	Install tenant energy sub-metering systems.	Energy (Criteria & GHGs)	EP PF		LAWA currently complies with the City of Los Angeles's Existing Building Energy and Water Efficiency Ordinance (EBEWEO). EBEWEO requires LAWA to report water and energy use per building, including tenant occupied buildings, on an annual basis. Development of Concourse 0 and Terminal 9 would include submetering.
50	Install building-mounted or ground-mounted solar photovoltaic panels, and install solar thermal systems for hot water production.	Energy (Criteria & GHGs)	EP MM		The LAX Landside Access Modernization Program project will include 4 megawatts of solar energy on the CONRAC and the APM Maintenance Facility. Mitigation Measure MM-AQ/GHG (ATMP)-6 calls for LAWA to implement solar energy technology, such as, but not limited to, photovoltaic solar panels, on Airfield and Terminal Modernization Project buildings and facilities where feasible based on costs, grid tie-in capability, environmental clearance, compliance with FAR Part 77, and FAA requirements for land leases and funding as applicable. LAWA also intends to explore the feasibility of developing a solar energy facility on its Palmdale land holding. However, any potential installation at Palmdale would not be a project feature for the ATMP.
51	Install building-mounted wind turbines and on- or off-airport wind turbines.			Infeasible	LAWA does not have the wind regime to support wind energy. In addition, the most notable location for wind turbines would be at the dunes, which poses a safety issue and is in the California Coastal Zone. Therefore, this measure is infeasible.
52	Replace refrigerants with natural or lower Global Warming Potential gases, incorporate intelligent fault diagnosis for HVAC refrigerant systems, and install microchannel components and heat exchangers.	Stationary (GHGs)	PF		See discussion of Measure 29 above regarding alternative refrigerants.
53	Runway, taxiway, hold pad, and other airfield improvements that would reduce emissions by reducing airfield congestion.	Aircraft (Criteria & GHGs)	PF		The airfield improvements proposed as part of the proposed Project include the westerly extension of Taxiway D, which would improve the operational management of aircraft movements in the north airfield, and would help reduce or avoid congestion on the airfield.
54	Energy assessments on new buildings or on the expansion of an existing building, funded as incidental elements of the building design.	Energy (Criteria & GHGs)	EP PF MM		Development of Concourse 0 and Terminal 9 would meet LEED® Silver certification at a minimum, which includes energy use evaluation.
55	Energy-efficient terminal development projects, including baggage claim delivery areas, automated baggage-handling equipment, public-use corridors to boarding areas, central waiting rooms, restrooms, holding areas, foyers and entryways, and passenger loading bridges.	Energy (Criteria & GHGs)	EP PF		See discussion of Measure 24 above regarding green building development.

Table C.9-1 Review and Screening of Potential Measures for Reduction of Criteria Air Pollutant and Greenhouse Gas Emissions					
ID#	Measure	Relevant Emission Sources (and Pollutants - Criteria or GHGs)	LAX Existing Program (EP), ATMP Project Feature (PF), or ATMP Proposed Mitigation Measure (MM)	Not Applicable or Infeasible	Comment
56	On-airport rapid transit systems and multimodal terminal buildings.	Motor Vehicles (Criteria & GHGs)	PF		The proposed Project includes a new APM station which would further support the use and value of the APM.
Appendix B to the State’s 2017 Scoping Plan ¹ identifies potential actions that could be undertaken at a local level to support the State’s climate goals:					
Construction					
57	Enforce idling time restrictions for construction vehicles.	Construction (Criteria & GHGs)	EP		See discussion of Measure 36 above regarding construction equipment idling.
58	Require construction vehicles to operate with the highest tier engines commercially available.	Construction (Criteria & GHGs)	EP		See discussion of Measure 14 above regarding Tier 4 Final off-road construction equipment and 2010 or newer on-road trucks for construction.
59	Divert and recycle construction and demolition waste, and use locally-sourced building materials with a high recycled material content to the greatest extent feasible.	Construction (GHGs)	MM PF		See discussion of Measure 37 above regarding recycle and reuse of construction and demolition materials. Concourse 0 and Terminal 9 would be constructed to meet LEED® Silver certification standards or better, with LEED® points available for building materials with a high recycled material content.
60	Minimize tree removal, and mitigate indirect GHG emissions increases that occur due to vegetation removal, loss of sequestration, and soil disturbance.	Construction (Criteria & GHGs)	PF		The vast majority of the Project site consists of existing buildings, apron areas, and pavement devoid of trees and other vegetation. The limited ornamental vegetation that would be removed by proposed Project improvements would be replaced by new drought tolerant, low water use vegetation.
61	Utilize existing grid power for electric energy rather than operating temporary gasoline/diesel powered generators.	Construction (Criteria & GHGs)	PF		The DCH specifies that, for stationary point-source emission controls, every effort shall be made to utilize grid-based electric power at any construction site, where feasible. Grid-based power can be from a direct hookup or a tie in to electricity from power poles.
62	Increase use of electric and renewable fuel powered construction equipment and require renewable diesel fuel where commercially available.	Construction (Criteria & GHGs)	MM		Mitigation Measure MM-AQ/GHG (ATMP)-2 calls for LAWA to require Project contractors to use renewable diesel fuel in proposed Project construction off-road equipment and on-site, on-road trucks (i.e., on-site water trucks), as feasible based on commercial renewable fuel availability. For purposes of this measure, commercially-available renewable fuel is defined as renewable fuel that is available in the regional area at a comparable price (i.e., without a substantial premium) and not incurring substantial transportation costs (i.e., higher costs associated with having to transport it to the project site over substantially longer distances from the supplier[s] of renewable diesel fuel).
63	Require diesel equipment fleets to be lower emitting than any current emission standard.	Construction (Criteria & GHGs)	EP		See discussion of Measure 14 above regarding Tier 4 Final off-road construction equipment and 2010 or newer on-road trucks for construction.
Operation					
64	Comply with lead agency’s standards for mitigating transportation impacts under SB 743.	Motor Vehicles (Criteria & GHGs)	MM		Mitigation Measure MM-T (ATMP)-1 provides numerous VMT reduction strategies.
65	Require on-site EV charging capabilities for parking spaces serving the Project to meet jurisdiction-wide EV proliferation goals.	Motor Vehicles (Criteria & GHGs)	EP MM		See discussion of Measure 9 above regarding ZEV charging infrastructure.
66	Allow for new construction to install fewer on-site parking spaces than required by local municipal building code, if appropriate.			Not Applicable	The City of Los Angeles parking requirements do not apply to LAX.

Table C.9-1 Review and Screening of Potential Measures for Reduction of Criteria Air Pollutant and Greenhouse Gas Emissions					
ID#	Measure	Relevant Emission Sources (and Pollutants - Criteria or GHGs)	LAX Existing Program (EP), ATMP Project Feature (PF), or ATMP Proposed Mitigation Measure (MM)	Not Applicable or Infeasible	Comment
67	Dedicate on-site parking for shared vehicles.	Motor Vehicles (Criteria & GHGs)	EP		LAWA's Employee Rideshare program includes carpools and vanpools and LAWA provides preferential parking in employee parking lots for carpool and vanpool vehicles.
68	Provide adequate, safe, convenient, and secure on-site bicycle parking and storage in multi-family residential projects and in non-residential projects.			Infeasible	See discussion of Measure 26 above regarding bicycle use at the CTA.
69	Provide on- and off-site safety improvements for bike, pedestrian, and transit connections, and/or implement relevant improvements identified in an applicable bicycle and/or pedestrian master plan.	Motor Vehicles (Criteria & GHGs)	EP		The LAX Landside Access Modernization Program provides for such improvements to the extent appropriate for LAX.
70	Require on-site renewable energy generation.	Energy Use (Criteria & GHGs)	EP MM		See discussion of Measure 50 above regarding solar energy, and discussion of Measure 51 regarding wind energy.
71	Prohibit wood-burning fireplaces in new development, and require replacement of wood-burning fireplaces for renovations over a certain size developments.			Not Applicable	The proposed Project does not involve wood-burning fireplaces.
72	Require cool roofs and “cool parking” that promotes cool surface treatment for new parking facilities, as well as existing surface lots undergoing resurfacing.	Energy Use (Criteria & GHGs)	MM		Mitigation Measure MM-AQ/GHG (ATMP)-3 requires that a cool roof be installed at the Terminal 9 parking facility to reduce energy use and urban heat-island effects, providing that rooftop solar panels are not instead installed at the Terminal 9 parking facility.
73	Require solar-ready roofs.	Energy Use (Criteria & GHGs)	EP		CCR Title 24 already stipulates requirements for solar readiness for buildings based on type, use, and other factors. The proposed Project would be subject to such building code provisions.
74	Require organic collection in new developments.	Energy Use (GHGs)	MM		Mitigation Measure MM-GHG (ATMP)-2 requires that waste collection procedures at Concourse 0 and Terminal 9 conform with the LAX Organic Waste Collection and Diversion Program (which is otherwise voluntary).
75	Require low-water landscaping in new developments (see CALGreen Divisions 4.3 and 5.3 and the Model Water Efficient Landscape Ordinance [MWELO], which is referenced in CALGreen). Require water efficient landscape maintenance to conserve water and reduce landscape waste.	Energy Use (GHGs)	EP PF MM		Outdoor landscaping under the proposed Project would comply with California Code of Regulations Title 23 Division 2 Chapter 2.7 Model Water Efficient Landscape Ordinance. In addition, in accordance with the Water Supply Assessment for the Project, LAWA would install drought-tolerant plants for 15 percent of total Project-related landscaping, with the remaining 85 percent consisting of mulch, sand, and other drought-tolerant landscaping elements. Mitigation Measure MM-GHG (ATMP)-5 requires that LAWA use only non-potable water for ATMP on-airport landscaping.
76	Achieve Zero Net Energy performance building standards prior to dates required by the Energy Code.	Energy Use (Criteria & GHGs)	EP PF		See discussion of Measure 24 above regarding Green Building and LEED® certification, which support achieving energy efficiency beyond that required by the building code.
77	Encourage new construction, including municipal building construction, to achieve third-party green building certifications, such as the GreenPoint Rated program, LEED rating system, or Living Building Challenge.	Multiple (Criteria & GHGs)	EP PF		See discussion of Measure 24 above regarding Green Building and LEED® certification.
78	Require the design of bike lanes to connect to the regional bicycle network.			Infeasible	See discussion of Measure 26 above regarding bicycle use at the CTA.
79	Expand urban forestry and green infrastructure in new land development.			Infeasible	The highly-developed and limited footprint of LAX provides limited opportunity for the establishment of urban forestry and green infrastructure as part of the proposed Project. Moreover, the need to avoid establishment of vegetation that is a potential wildlife/bird attractant is a key safety consideration for minimizing the potential for aircraft bird strikes.
80	Require preferential parking spaces for park and ride to incentivize carpooling, vanpooling, commuter bus, electric vehicles, and rail service use.	Motor Vehicles (Criteria & GHGs)			See discussion of Measure 67 above regarding preferential parking.

Table C.9-1 Review and Screening of Potential Measures for Reduction of Criteria Air Pollutant and Greenhouse Gas Emissions					
ID#	Measure	Relevant Emission Sources (and Pollutants - Criteria or GHGs)	LAX Existing Program (EP), ATMP Project Feature (PF), or ATMP Proposed Mitigation Measure (MM)	Not Applicable or Infeasible	Comment
81	Require a transportation management plan for specific plans which establishes a numeric target for non-SOV travel and overall VMT.	Motor Vehicles (Criteria & GHGs)	EP MM		Although the proposed Project is not a specific plan, LAWA already has an extensive rideshare program for reduction of single occupancy vehicle travel by LAWA employees. Additionally, Mitigation Measure MM-TR (ATMP)-1, <i>VMT Reduction Program</i> , includes numerous strategies for reducing VMT and includes a numeric target for reduction of employee VMT.
82	Develop a rideshare program targeting commuters to major employment centers.	Motor Vehicles (Criteria & GHGs)	EP PF MM		See discussion of Measure 25 above regarding rideshare programs.
83	Require the design of bus stops/shelters/express lanes in new developments to promote the usage of mass-transit.	Motor Vehicles (Criteria & GHGs)	EP PF		Under the LAX Landside Access Modernization Program, there will be a multi-modal link to the future Metro Airport Metro Connector station linking to the Crenshaw line. The proposed Metro AMC 96th Street Transit Station would also consist of a bus plaza and terminal facility for Metro and municipal bus operators, a bicycle hub with parking for up to 150 bicycles, passenger vehicle pick-up and drop-off area, and a Metro center/building to connect passengers between the various modes of transportation. Under the proposed Project, the Terminal 9 APM platform would be designed in a manner consistent with the other APM platforms and built to facilitate safe and efficient use of the APM.
84	Require gas outlets in residential backyards for use with outdoor cooking appliances such as gas barbeques if natural gas service is available.			Not Applicable	The proposed Project does not involve residential development.
	Require the installation of electrical outlets on the exterior walls of both the front and back of residences to promote the use of electric landscape maintenance equipment.				
	Require the design of the electric outlets and/or wiring in new residential unit garages to promote electric vehicle usage.				
	Require each residential unit to be “solar ready,” including installing the appropriate hardware and proper structural engineering.				
	Require the installation of energy conserving appliances such as on-demand tank-less water heaters and whole-house fans.				
85	Provide electric outlets to promote the use of electric landscape maintenance equipment to the extent feasible on parks and public/quasi-public lands.			Not Applicable	The proposed Project does not involve parks or parklands.
86	Require electric vehicle charging station (conductive/inductive) and signage for non-residential developments.	Motor Vehicles (Criteria & GHGs)	EP MM		See discussion of Measure 8 above regarding support of ZEV charging.
87	Require each residential and commercial building equip buildings with energy efficient AC units and heating systems with programmable thermostats/timers.	Energy Use (Criteria & GHGs)	EP PF		See discussion of Measure 24 above regarding Green Building and LEED® certification.
88	Require large-scale residential developments and commercial buildings to report energy use, and set specific targets for per-capita energy use.	Energy Use (Criteria & GHGs)	EP		City of Los Angeles ordinance requires LAWA to benchmark energy use per building and report on energy use each year thereafter.
89	Require each residential and commercial building to utilize low flow water fixtures such as low flow toilets and faucets (see CALGreen Divisions 4.3 and 5.3, as well as Appendices A4.3 and A5.3).	Energy Use (Criteria & GHGs)	EP PF		See discussion of Measure 24 above regarding Green Building and LEED® certification.
¹ Appendix B to the AB 32 2017 Scoping Plan provides examples of local actions that are organized into two categories: (A) local municipal code changes, zoning changes, or policy directions that could apply broadly to the community within the general plan or climate action plan area; and (B) mitigation measures that could be required of individual projects when the local jurisdiction is the lead agency. LAWA does not have authority over the City or County of Los Angeles’ municipal codes, zoning codes, general plans, or climate action plans. As such, the potential mitigation measures included in this table are those that fall into the second category.					

Table C.9-1 Review and Screening of Potential Measures for Reduction of Criteria Air Pollutant and Greenhouse Gas Emissions					
ID#	Measure	Relevant Emission Sources (and Pollutants - Criteria or GHGs)	LAX Existing Program (EP), ATMP Project Feature (PF), or ATMP Proposed Mitigation Measure (MM)	Not Applicable or Infeasible	Comment
South Coast Air Quality Management District, Mitigation Measures and Control Efficiencies. Available: http://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-analysis-handbook/mitigation-measures-and-control-efficiencies					
90	Off-Road Engines – provides examples of off-road equipment engine retrofits and repowers for older engines.	Construction (Criteria & GHGs)	EP		See Measures 14 and 31 regarding the DCH requirement for use of Tier 4 Final equipment engines on LAWA construction projects.
91	On-Road Engines – provides examples of on-road vehicle engine retrofits and repowers for older vehicles.	Construction (Criteria & GHGs)	EP		See Measure 31 regarding the DCH requirement for use of on-road truck engines on LAWA construction projects to be model year 2010 or newer.
92	Fugitive Dust Table XI-C: Mitigation Measure Examples for Fugitive Dust from Paved Roads. Indicates that implementation of a street sweeping program for local, arterial, and collector streets with Rule 1186 compliant PM10 efficient vacuum units can reduce road dust emissions from 9 to 26 percent depending on sweeping frequency and type of street.	Construction (Criteria & GHGs)	EP		The LAWA DCH Section 1.5 – Dust Control includes requirements for construction contractors to provide street sweeping of paved roadways during project construction when requested by LAWA. In addition, LAWA does spend substantial effort minimizing dust emissions near the airfield to avoid the potential safety hazards and mechanical issues associated with aircraft engines ingesting dust and debris.
93	CAPCOA GHG Mitigation Quantification Methodology – includes lists of potential mitigation measures for Energy, Transportation, Water, Area Landscaping, Solid Waste, Vegetation, Construction, Miscellaneous, and General Plans.	Multiple (GHGs)	EP PF MM		See, for example, Measures 1-4, 6-9, 17, 19, 23-25, 29, 31, and 33 that describe a number of existing policies, project features, and mitigation measures anticipated to reduce GHG emissions. The potential measures in the CAPCOA Quantification of Greenhouse Mitigation Measures that are applicable to LAWA facilities and projects are generally included in the LAWA Design and Construction Handbook, Sustainable Design and Construction Policy and Requirements, and Sustainable Action Plan.
