Executive Summary

This study presents the analysis and findings of the Transportation Impact Assessment (TIA) prepared for the Cambria Hotel “Project” in Pleasant Hill, California.

Project Description and Analysis Parameters

The approximately 2.5-acre site is located in the City of Pleasant Hill, west of Main Street and south of Oak Park Boulevard. The project would remove an existing 9,740 square-foot occupied restaurant building and an existing 3,070 square-foot vacant retail building, and construct a 4-story, 155-room hotel. Approximately 133 surface parking spaces are proposed. Access to the site is currently provided from two right-in/right-out driveways on Main Street and one full access driveway on Oak Park Boulevard. As part of the project, the northern most site driveway would be modified to provide left-turn access into the site and restricted to inbound vehicle travel only. A shuttle would be provided between the hotel and Pleasant Hill BART station for hotel guests.

Off-Site Findings

No significant intersection impacts to intersections were identified with construction of the project in either the existing or cumulative scenarios. However, there could be potentially significant impacts during the construction phase of the project, which would be reduced to a less-than-significant level with implementation mitigation measures.

On-Site Findings

Based on a detailed site plan review, recommendations were made to enhance access and circulation for all modes, as detailed in Chapter 6, as well as to manage the proposed parking supply.

1. Introduction

This report presents the analysis results and findings of the Transportation Impact Assessment (TIA) prepared for the Cambria Hotel (project). This chapter discusses the analysis methods, criteria used to identify significant impacts, and report organization.

TIA Purpose

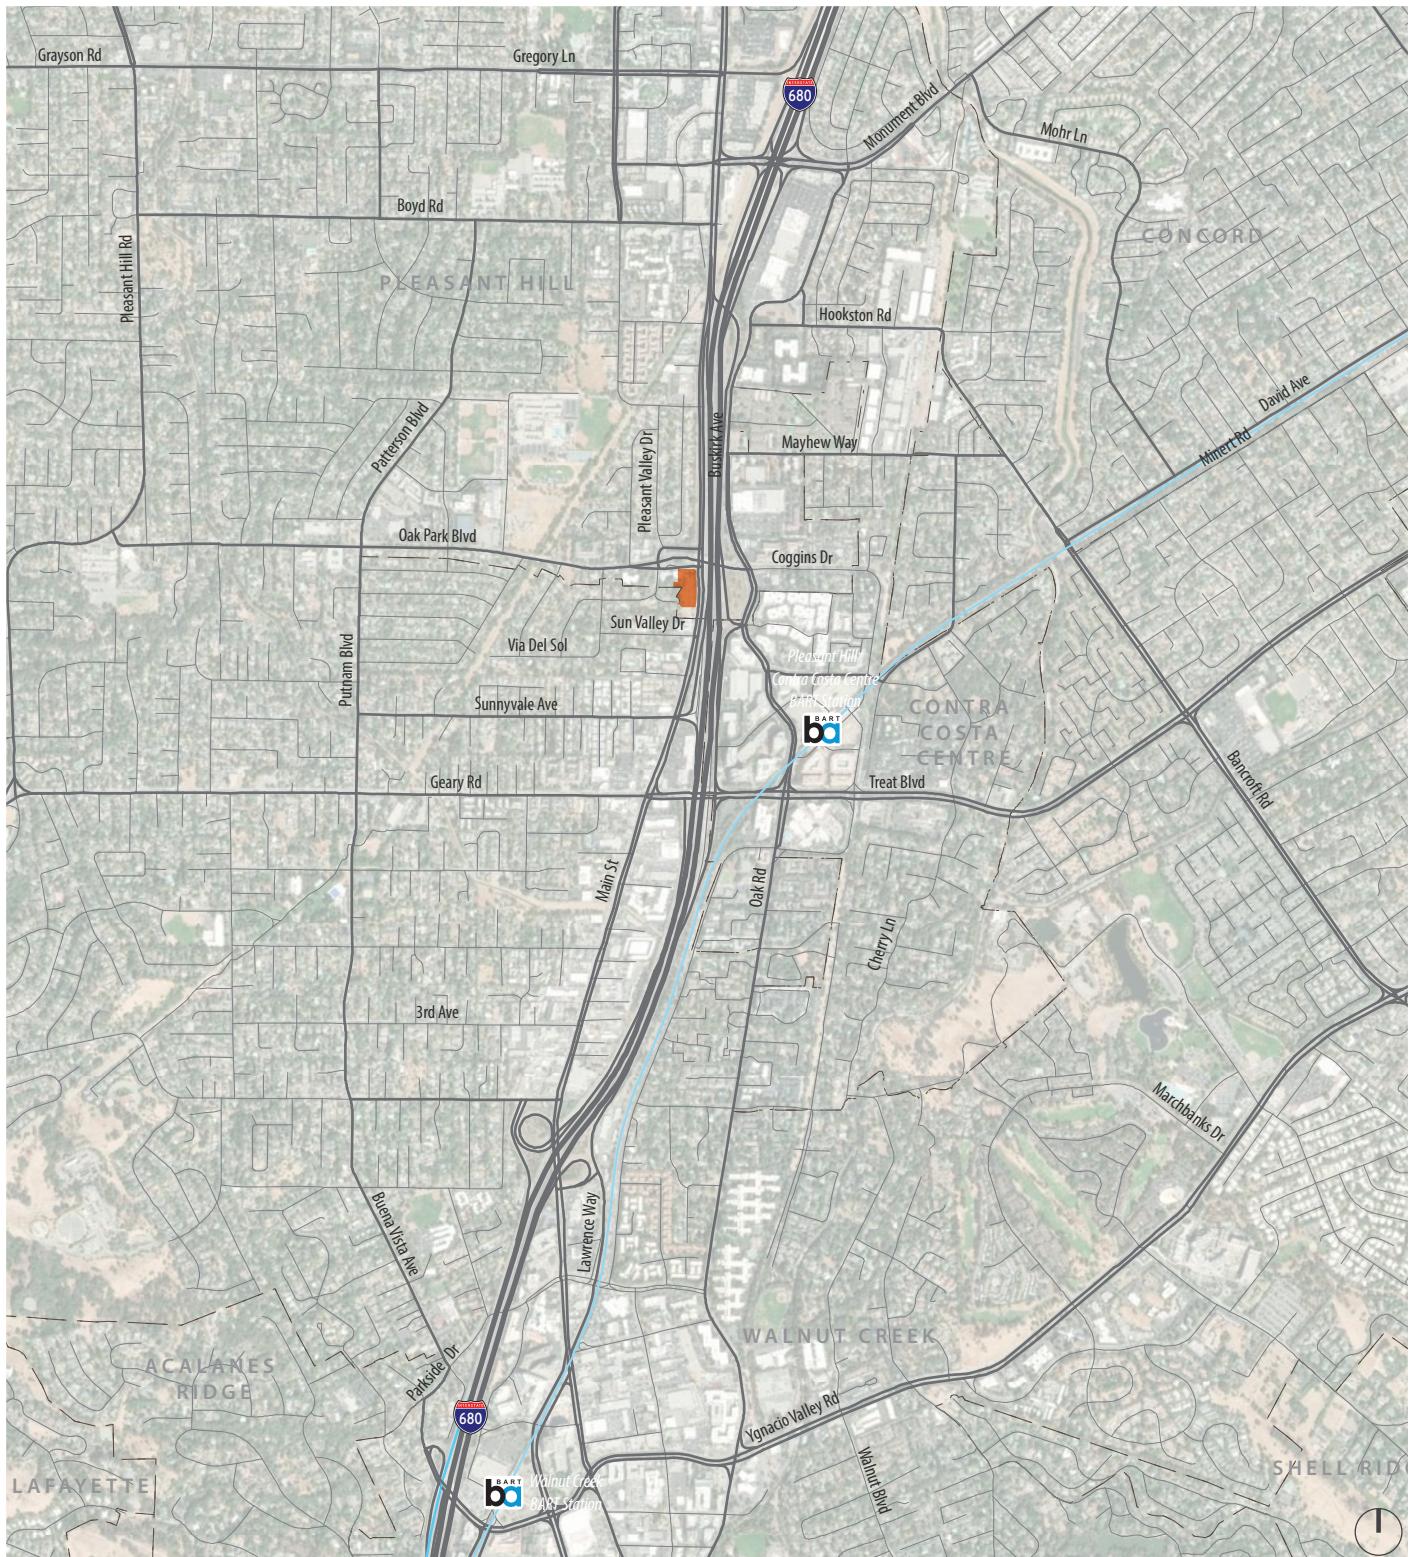

The approximately 2.5-acre site is located in the City of Pleasant Hill, west of Main Street and south of Oak Park Boulevard, as shown on **Figure 1**. The project would remove an existing 9,740 square-foot occupied restaurant building and an existing 3,070 square-foot vacant retail building, and construct a 4-story, 155-room hotel. A conceptual project site plan is shown on **Figure 2**. Approximately 133 surface parking spaces are proposed. Access to the site is currently provided from two right-in/right-out driveways on Main Street and one full access driveway on Oak Park Boulevard. As part of the project, the northern most site driveway would be modified to provide left-turn access into the site and restricted to inbound vehicle travel only. A shuttle would be provided between the hotel and Pleasant Hill BART station for hotel guests.

This study addresses the project's impacts on the roadway system under existing and cumulative scenarios and discusses potential impacts to the adjacent bicycle, pedestrian, and transit network. A parking assessment was also conducted.

Report Organization

This report is divided into seven chapters as described below:

- **Chapter 1 – Introduction** discusses the purpose and organization of this report.
- **Chapter 2 – Existing Conditions** describes the transportation system in the project vicinity, including the surrounding roadway network, peak period intersection turning movement volumes, existing bicycle, pedestrian, and transit facilities, and intersection operations.
- **Chapter 3 – Project Characteristics** presents the project description, and trip generation, distribution, and assignment.
- **Chapter 4 – Existing with Project Traffic Conditions** addresses the existing condition with the project and discusses vehicular impacts.

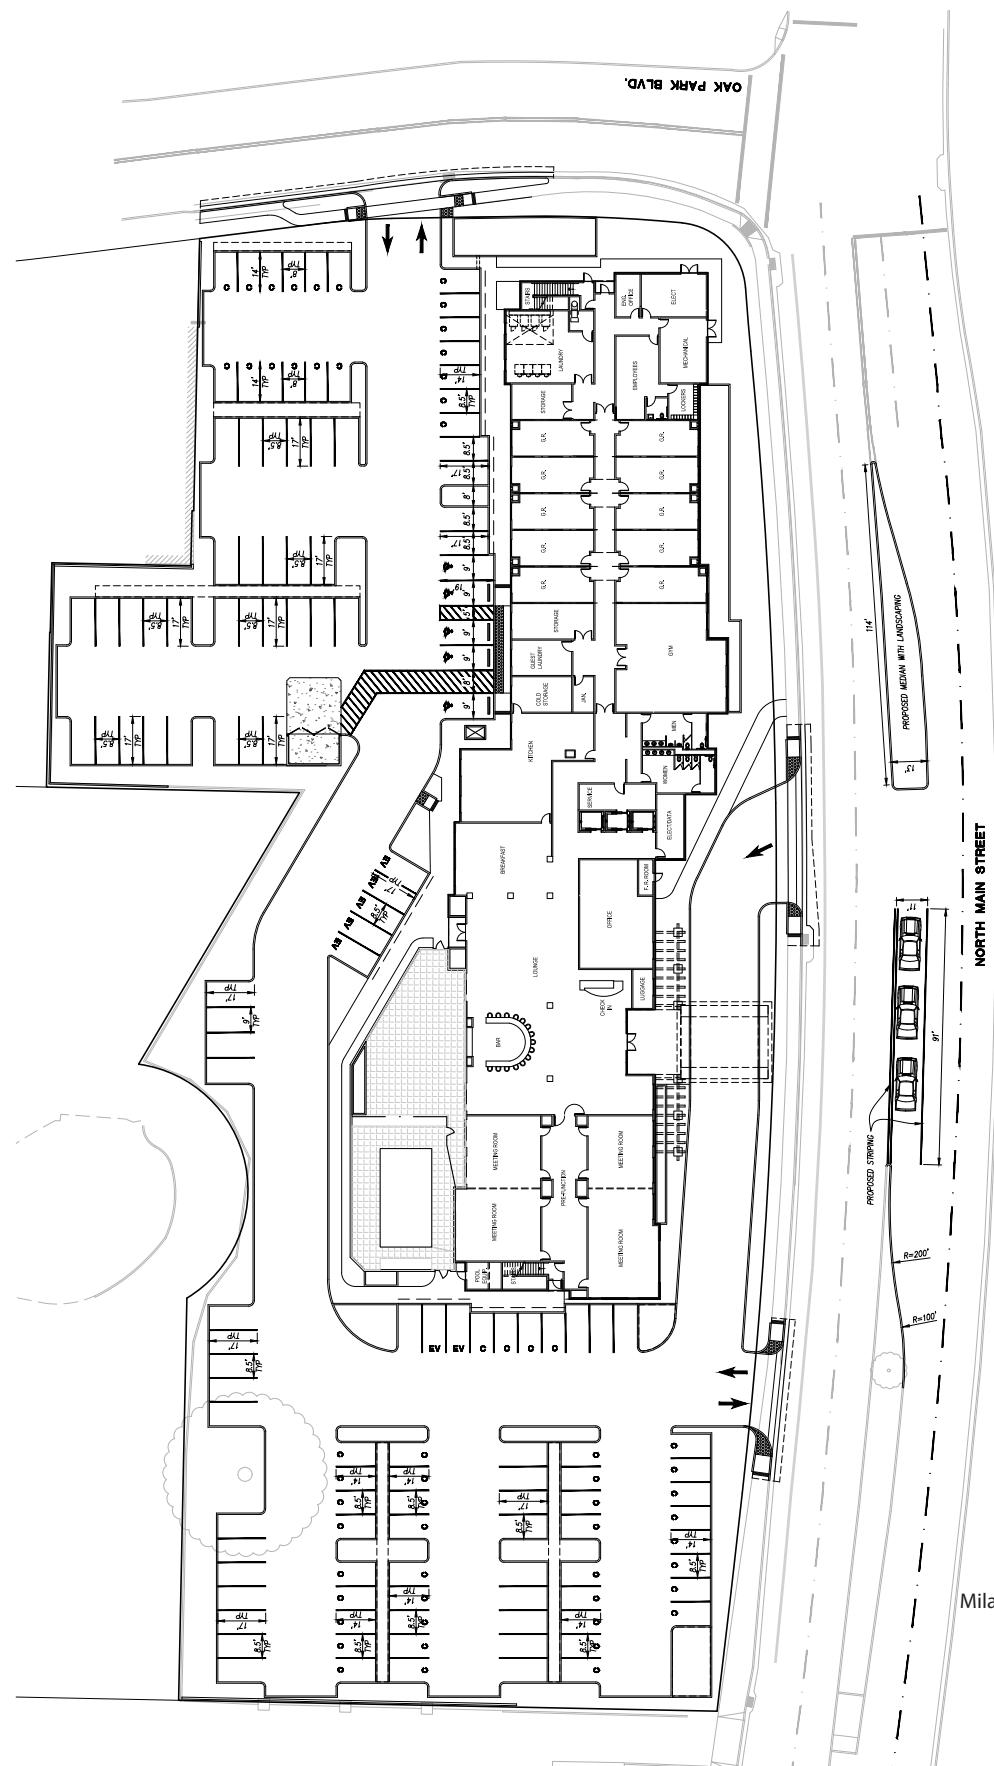

Project Site

Figure 1

Regional Project Site Vicinity

 Site Plan Source:
Milani & Associates, 12/4/18

Figure 2

Conceptual Project Site Plan

- **Chapter 5 – Cumulative Traffic Conditions** addresses future conditions, both without and with the project, and discusses vehicular impacts.
- **Chapter 6 – Site Access, Circulation and Parking** discusses site access, circulation and parking based on the current site plan for all modes of travel. Recommendations are provided.
- **Chapter 7 – Vehicle Miles of Travel** presents the results of the VMT assessment conducted for informational purposes only.

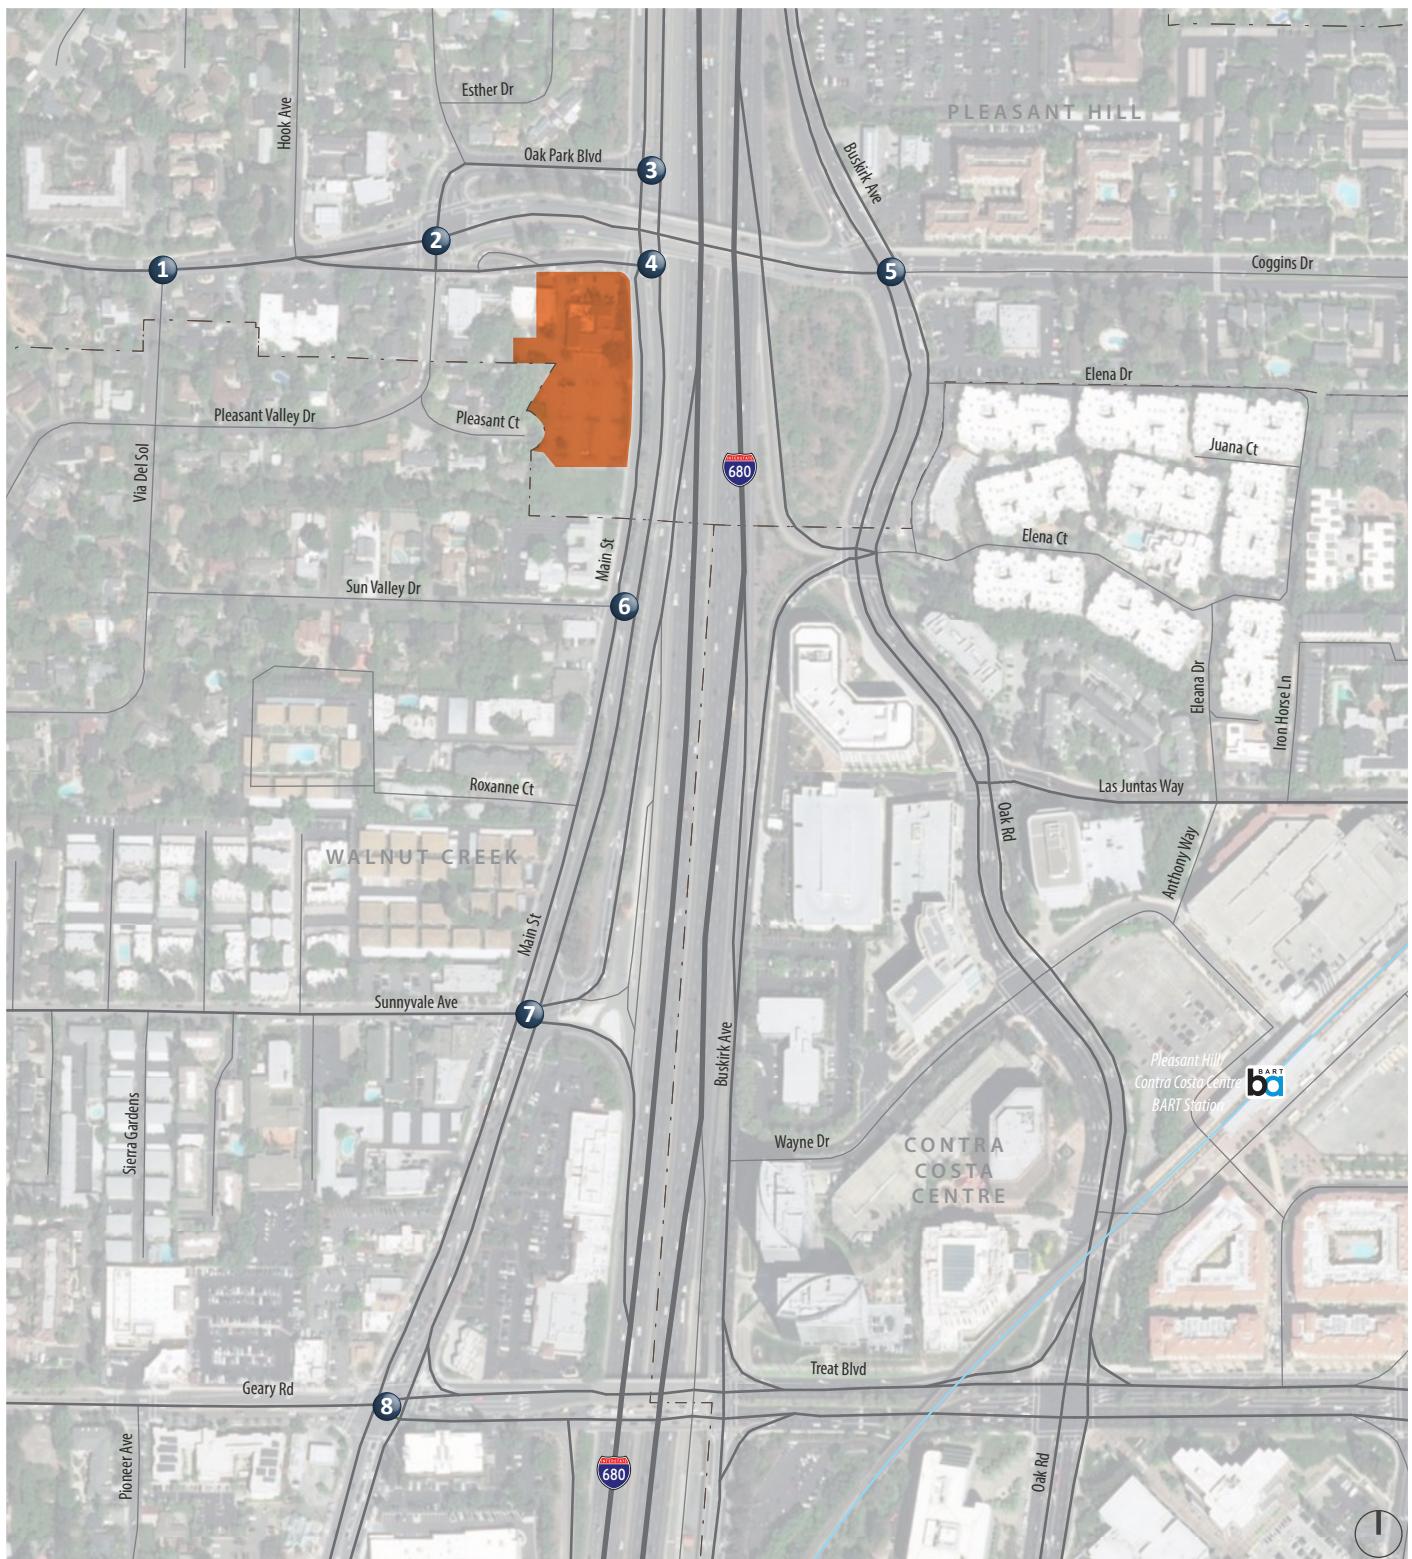

Study Locations, Analysis Scenarios and Analysis Methods

Project impacts to the study area roadway facilities were identified by measuring the effect of project traffic during the weekday morning (7:00 to 9:00 AM) and evening (4:00 to 6:00 PM) peak periods, when commute traffic is typically the highest. The study intersections were selected in consultation with City of Pleasant Hill staff based on a review of the project location and the amount of traffic that could be added to the intersections in the site vicinity. The study intersections are listed below and shown on **Figure 3**, with the responsible agency noted in parentheses.

1. Oak Park Boulevard at Via Del Sol (City of Pleasant Hill)
2. Oak Park Boulevard at Pleasant Valley Drive (City of Pleasant Hill)
3. Pleasant Valley Drive at Main Street (City of Pleasant Hill)
4. Oak Park Boulevard at Main Street (City of Pleasant Hill)
5. Oak Park Boulevard/Coggins Drive at Buskirk Avenue/Oak Road (City of Pleasant Hill)
6. Sun Valley Drive at Main Street (City of Pleasant Hill)
7. Sunnyvale Avenue at North Main Street (City of Walnut Creek)
8. Geary Road at North Main Street (City of Walnut Creek)

The operations of roadway facilities are described with the term "level of service" (LOS). LOS is a qualitative description of traffic flow from a vehicle driver's perspective based on factors such as speed, travel time, delay, and freedom to maneuver. Six levels of service are defined ranging from LOS A (free-flow conditions) to LOS F (over capacity conditions). LOS E corresponds to operations "at capacity." When volumes exceed capacity, stop-and-go conditions result and operations are designated LOS F.

Different methods are used to assess signalized and unsignalized (stop-controlled) intersections.

Project Site # Study Intersection

Figure 3

Project Site Vicinity and Study Intersection Locations

Analysis Scenarios

Intersections operations were evaluated for the following scenarios:

1. Existing – Based on traffic counts collected at the study intersections in 2018.
2. Existing Plus Project – Existing traffic counts plus traffic generated by the project.
3. Cumulative – Forecasts for the cumulative scenario are based on traffic growth trends as described in the Pleasant Hill General Plan EIR and supplemented by a check of traffic forecasts for the study area in the Contra Costa Countywide Travel Demand Model. In addition to considering the regional growth trends, the forecasts also consider approved/pending projects in the immediate study area.
4. Cumulative Plus Project – Cumulative forecasts plus traffic expected to be generated by the project.

Analysis Methodology

The traffic operations analysis uses the Synchro 10.0 software, based on the procedures outlined in the 2010 *Highway Capacity Manual* (Transportation Research Board). Intersection operation inputs include vehicle, bicycle, and pedestrian volumes, lane geometry, signal phasing and timing, pedestrian crossing times, and peak hour factors.

Intersection operations are described using the term "Level of Service" (LOS). LOS is a quantitative measure of the average delay experienced by a driver at the intersection. It ranges from LOS A, with no congestion and little delay, to LOS F, with excessive congestion and delay.

Signalized Intersections

Operations of signalized intersections were evaluated using the method from Transportation Research Board's 2010 Highway Capacity Manual (HCM 2010), which uses various intersection characteristics (such as traffic volumes, lane geometry, and signal phasing) to estimate the average control delay experienced by motorists traveling through an intersection. Control delay incorporates delay associated with deceleration, acceleration, stopping, and moving up in the queue. **Table 1** summarizes the relationship between average delay per vehicle and LOS for signalized intersections. This method evaluates each intersection in isolation and the effects of vehicle queue spillback are not considered in the analysis results.

Table 1: Signalized Intersection LOS Criteria

Level of Service	Description	Delay in Seconds
A	Progression is extremely favorable and most vehicles arrive during the green phase. Most vehicles do not stop at all. Short cycle lengths may also contribute to low delay.	< 10.0
B	Progression is good, cycle lengths are short, or both. More vehicles stop than with LOS A, causing higher levels of average delay.	> 10.0 to 20.0
C	Higher congestion may result from fair progression, longer cycle lengths, or both. Individual cycle failures may begin to appear at this level, though many still pass through the intersection without stopping.	> 20.0 to 35.0
D	The influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, or high volume to capacity (V/C) ratios. Many vehicles stop, and the proportion of vehicles not stopping declines. Individual cycle failures are noticeable.	> 35.0 to 55.0
E	This level is considered by many agencies to be the limit of acceptable delay. These high delay values generally indicate poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences.	> 55.0 to 80.0
F	This level is considered unacceptable with oversaturation, which is when arrival flow rates exceed the capacity of the intersection. This level may also occur at high V/C ratios below 1.0 with many individual cycle failures. Poor progression and long cycle lengths may also be contributing factors to such delay levels.	> 80.0

Source: *Highway Capacity Manual*, 2010.

Unsignalized Intersections

Operations at unsignalized intersections were evaluated using the method from the HCM 2010. With this method, operations are defined by the average control delay per vehicle (measured in seconds) for each movement that must yield the right-of-way. At two-way or side street-controlled intersections, the control delay (and LOS) is calculated for each controlled movement, the left-turn movement from the major street, and the entire intersection. For controlled approaches composed of a single lane, the control delay is computed as the average of all movements in that lane. The delays for the entire intersection and for the movement or approach with the highest delay are reported. **Table 2** summarizes the relationship between delay and LOS for unsignalized intersections.

Table 2: Unsignalized Intersection LOS Criteria

Level of Service	Description	Delay in Seconds
A	Little or no delays	< 10.0
B	Short traffic delays	> 10.0 to 15.0
C	Average traffic delays	> 15.0 to 25.0
D	Long traffic delays	> 25.0 to 35.0
E	Very long traffic delays	> 35.0 to 50.0
F	Extreme traffic delays with intersection capacity exceeded	> 50.0

Source: *Highway Capacity Manual*, 2010.

Vehicle Miles of Travel

In response to Senate Bill 743 (SB 743), the Office of Planning and Research (OPR) is updating California Environmental Quality Act (CEQA) guidelines to include new transportation-related evaluation metrics. Draft guidelines were developed in August 2014, with final guidelines published in November 2017 incorporating public comments from the August 2014 and January 2016 guidelines. New guidelines are undergoing a formal rule-making process; full compliance with the guidelines is expected by July 2020. In response to the final guidelines, a preliminary assessment of vehicle miles of travel (VMT) generated by the proposed project was prepared for informational purposes only.

Regulatory Setting

The determination of significance for project impacts is based on applicable policies, regulations, goals, and guidelines defined by the City of Pleasant Hill, Walnut Creek, Contra Costa County, and the Contra Costa Transportation Authority (CCTA). Changes to the CEQA guidelines as dictated by Senate Bill 743 are also considered.

The impacts of the project were evaluated by comparing the results of the level of service calculations under Existing with Project and Cumulative with Project conditions to the results under Existing and Cumulative without Project conditions, respectively. The following criteria were used to identify significant off-site impacts of the proposed project under the various criteria.

Roadway Network

For this study, based on guidance contained in the City of Pleasant Hill General Plan and recently prepared environmental documents for other projects in the City, a significant transportation-related impact would occur if a project results in:

- Deterioration of peak hour operations at a signalized intersection from acceptable to unacceptable operations
- At an intersection projected to operate unacceptably prior to the addition of project traffic, the project increases delay by more than 5-seconds
- Deterioration of peak hour operations at a controlled movement at an unsignalized intersection from LOS E or better to LOS F, or at intersections where a controlled movement already operates at LOS F, one of the following:
 1. Project traffic results in satisfaction of the peak hour volume traffic signal warrant;
 2. Project traffic increases minor movement delay by more than 30 seconds; or
 3. Where the peak hour volume signal warrant is met without project traffic and delay cannot be measured, project increases traffic by 10 or more vehicles per lane on the controlled approach.
- The addition of project traffic at a study intersection would result in the 95th percentile vehicle queue exceeding the available storage or would increase 95th percentile queue by more than two vehicles where the queue already exceeds the available storage space (for example, vehicle queues extending beyond the available turn pocket length, impeding travel in the adjacent lanes)

The goal of City Pleasant Hill is to maintain LOS D during the peak hours, however signalized intersections located along CCTA Congestion Management Plan (CMP) network may operate at LOS E (i.e. intersections 3, 4, 6 , 7 and 8). Additionally, the level of service standard at the North Main Street at Geary Road intersection is LOS F.

Bicycle and Pedestrian Network

The *City of Pleasant Hill 2003 General Plan* and *City of Pleasant Hill Draft Pedestrian and Bicycle Master Plan, 2011*, describes related policies necessary to ensure that pedestrian and bicycle facilities are safe and effective for City residents. Using these plans as a guide, significant impacts to these facilities would occur when a project or an element of the project:

- Creates a hazardous condition that currently does not exist for pedestrians and bicyclists, or otherwise interferes with pedestrian accessibility to the site and adjoining areas; or

- Conflicts with an existing or planned pedestrian or bicycle facility; or
- Conflicts with policies related to bicycle and pedestrian activity adopted by the City of Pleasant Hill.

Transit System

Generally, a project causes a significant impact to transit facilities and services if an element of it conflicts with existing or planned transit services. The evaluation of transit facilities shall consider if:

- A project creates demand for public transit services above the capacity which is provided, or planned;
- A project or project-related mitigation disrupts existing transit services or facilities;¹
- A project or project-related mitigation conflicts with an existing or planned transit facility; or
- A project or project-related mitigation conflicts with transit policies adopted by the City of Pleasant Hill, CCTA, or County Connection for their respective facilities in the study area.

Vehicle Miles of Travel

According to the *Update to CEQA Thresholds of Significance and Transportation Impact Study Guidelines* dated November 27, 2017, VMT impacts could have a significant effect on the environment if the project would:

1. Conflict with a plan, ordinance, or policy addressing the safety or performance of the circulation system, including transit, roadways, bicycle lanes, and pedestrian paths (except for automobile level of service or other measures of vehicle delay); or
2. Cause additional VMT per capita, per service population, or other appropriate efficiency measure²; or
3. Substantially induce additional automobile travel by increasing physical roadway capacity in congested areas (i.e., by adding new mixed-flow lanes) or by adding new roadways to the network.

¹This includes disruptions caused by proposed-project driveways on transit streets and impacts to transit stops/shelters; and impacts to transit operations from traffic improvements proposed or resulting from a project.

²Based on the latest guidance from OPR, residential development that would generate vehicle travel that is 15 or more percent below the existing residential VMT per capita, measured against the region or city, may indicate a less-than-significant transportation impact. In MPO areas, development measured against city VMT per capita (rather than regional VMT per capita) should not cumulatively exceed the population or number of units specified in the SCS for that city because greater-than-planned amounts of development in areas above the region-based threshold would undermine the VMT containment needed to achieve regional targets under SB 375.

Neither the City of Pleasant Hill, Contra Costa County nor the Contra Costa Transportation Authority have adopted VMT thresholds, and the new guidelines section 15064.3 states that they do not take effect until July 1, 2020 unless the lead agency adopts them earlier. As agencies have until 2020 to fully implement VMT, this analysis is being prepared for informational purposes only.

2. Existing Conditions

This chapter describes the existing transportation conditions in the study area including the roadway network, and transit, pedestrian, and bicycle facilities in the vicinity of the project site.

Roadway System

The project site is located in the City of Pleasant Hill, a City in Contra Costa County, north of the City of Walnut Creek and west of the City of Concord. The immediate area surrounding the project site is primarily residential with supporting commercial uses in close proximity.

Regional access to the site is provided by North Main Street and Interstate 680, with local access provided from Oak Park Boulevard. The following discusses the roadways that would provide access to the site and are most likely to experience direct traffic impacts, if any, from the proposed project.

Interstate I-680 is a north-south freeway located east of the project site. In the study area, it provides 5 mixed-flow and one high-occupancy vehicle lane in the southbound direction and 5 mixed-flow lanes in the northbound direction in addition to auxiliary lanes between interchanges. In the project area, approximately 260,000 vehicles per day travel on I-680. Access to/from northbound I-680 in the study area is provided from Oak Road on the east side of the freeway. Access to/from southbound I-680 is provided from North Main Street at Sunnyvale Avenue. Ramps at Contra Costa Boulevard also provide freeway access to the area.

North Main Street is a north-south four-lane arterial that runs parallel to Interstate 680. Oak Park Boulevard has an overpass with ramps to access North Main Street. South of Oak Park Boulevard, the right lane in both directions is a Class III bicycle facility with bike sharrows markings. North of Oak Park Boulevard, buffered bicycle lanes are provided until the roadway transitions to Contra Costa Boulevard, where a bicycle lane is provided in the northbound direction, and Class III lane marking provided in the southbound direction. Sidewalks are also present on both sides of the road. No on-street parking is allowed along this arterial in the study area. The posted speed limit is 35 miles per hour.

Oak Park Boulevard is an east-west collector roadway that extends west from Buskirk Avenue to Pleasant Hill Road. It features a four-lane bridge across I-680, and then reduces to a two-lane undivided road at Pleasant Valley Drive. The roadway has wide shoulders that are primarily used for on-street parking, but is also used by bicyclists. Sidewalks vary along the road, with small stretches without sidewalks on either side of the road. The posted speed limit is 30 miles per hour.

Oak Road/Buskirk Avenue is a north-south arterial that runs parallel to Interstate 680. Oak Road is four-lanes between Oak Park Boulevard and Walden Road before it becomes Civic Drive. Buskirk Avenue is two-lanes between Oak Park Boulevard and Hookston Court before it widens to four-lanes between Hookston Court and Monument Boulevard; the four-lane segment of Buskirk Avenue is a Class III bicycle facility with bike sharrows markings. North of Monument Boulevard, Buskirk Avenue becomes Ramona Drive. Sidewalks are present at least one side of the road and sometimes both. No on-street parking is allowed along this arterial in the study area. The posted speed limit is between 25 and 30 miles per hour.

Geary Road/Treat Boulevard is an east-west arterial that extends from Camino Verde to Clayton Road. Geary Road is two-lanes between North Main Street and Camino Verde before it continues as Pleasant Hill Road. Treat Boulevard is six-lanes between North Main Street and San Simeon Drive and four-lanes north of San Simeon before it continues as Denkinger Road at Clayton Road. Geary Road is a Class II bicycle facility with bike lanes. Sidewalks are present on both sides of the road except between North Main Street and Buskirk Avenue. On-street parking is allowed on Geary Road, but not Treat Boulevard. The posted speed limit is 35 miles per hour.

Via Del Sol is a two-lane residential street that extends from the EBMUD Trail to Oak Park Boulevard. There are sidewalks along the frontage of some residential properties, however for the most part there are no sidewalks along either side of the road. On-street parking is typically provided in unpaved shoulder areas.

Sun Valley Drive is a two-lane residential street that extends from Via Del Sol to North Main Street. There are no sidewalks along either side of the road except along the frontage of Oak Park Hills Chapel. On-street parking is typically provided in unpaved shoulder areas.

Sunnyvale Avenue is a two-lane residential street that extends from Putnam Boulevard to North Main Street. Sunnyvale Avenue provides direct access to Southbound Interstate I-680. There are sidewalks along both sides of the road east of the EBMUD Trail and only along the frontage of some residential properties west of the EBMUD Trail. On-street parking is provided.

Pedestrian Facilities

Pedestrian facilities include sidewalks, pathways, crosswalks, and pedestrian signals. Sidewalk coverage is not ubiquitous in the study area and there are gaps along sections of Oak Park Boulevard, Via Del Sol, Sun Valley Drive, and other residential streets in the immediate study area. There are high-visibility crosswalks with pedestrian actuated warning light systems in the study area that include the trail crossing on Oak Park Boulevard.

Bicycle Facilities

Bicycle facilities include the following general types:

- Class I: Shared Use Path – These facilities provide a completely separate right-of-way and are designated for the exclusive use of bicycles and pedestrians with vehicle cross-flow minimized.
- Class II: Bicycle Lane – Bicycle lanes provide a restricted right-of-way and are designated for the use of bicycles for one-way travel with a striped lane on a street or highway. Bicycle lanes are generally a minimum of five feet wide. Vehicle/pedestrian cross-flow are permitted.
- Class III: Bicycle Route with Sharrows – These bikeways provide right-of-way designated by signs or pavement markings for shared use with motor vehicles. These include sharrows or "shared-lane markings" to highlight the presence of bicyclists.
- Class IV: Buffered Bicycle Lanes – Bicycle lanes that include a physically separated lane for increased comfort and protection of cyclists. Can be physically separated by a barrier, such as planters or on-street parking, grade-separated from the roadway, or a painted buffer area.

Figure 4 shows the location of various bicycle facilities in the study area, which includes Class IV and Class III facilities on North Main Street, Class II bicycle facilities on Geary Road, and Class II and Class III bicycle facilities on portions of Oak Park Boulevard.

The East Bay Municipal Utilities District (EBMUB) Trail is a shared use path that crosses Oak Park Boulevard approximately 650-feet west from Via Del Sol. This trail connects to the Contra Costa Canal Trail in the south and Contra Costa Boulevard in the north. From the Contra Costa Canal Trail, connections can be made to the regional trail system including the Iron Horse Trail.

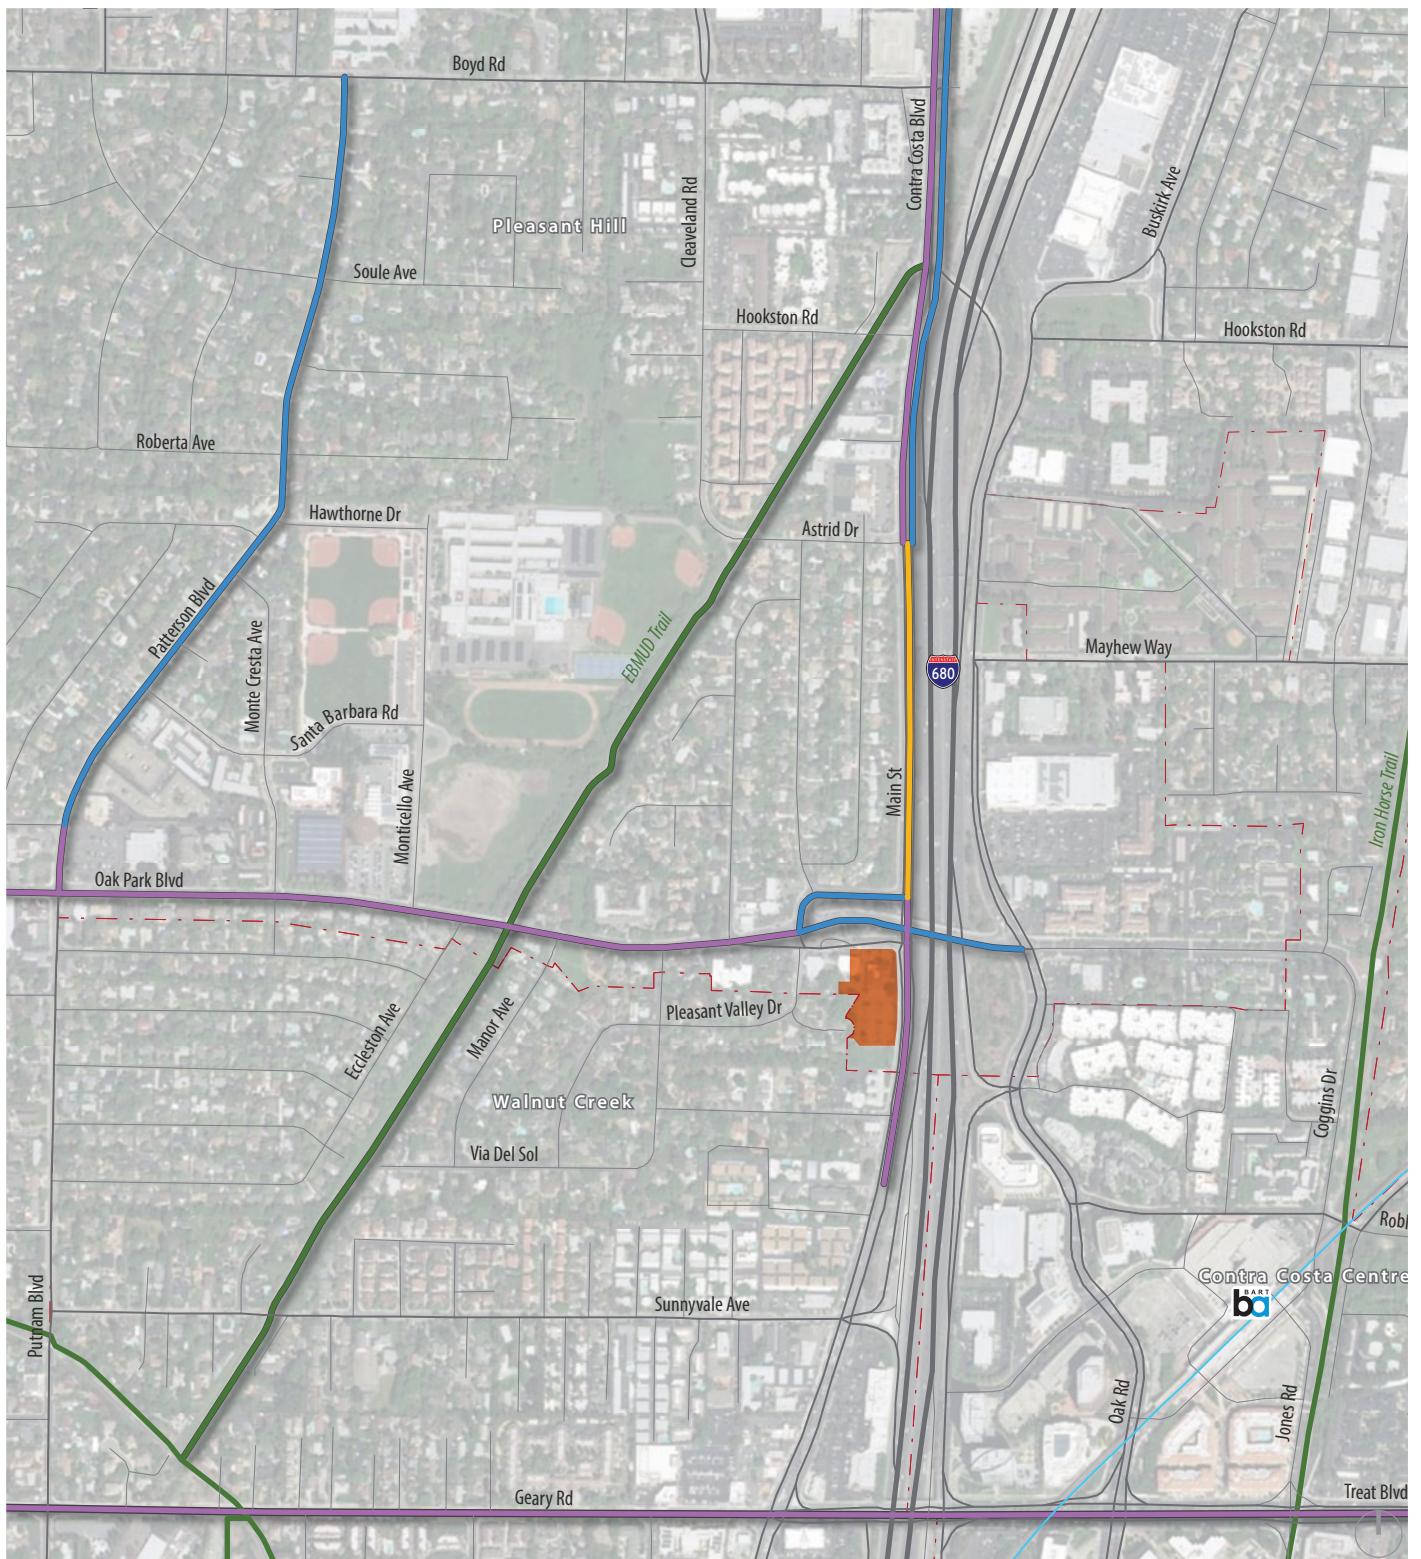

Figure 4

Existing Bicycle Facilities

Transit Service

Transit service in the area is primarily provided by The County Connection and Bay Area Rapid Transit (BART), with existing transit routes in the area shown on **Figure 4**, along with the transit stops in the immediate vicinity of the project site.

The County Connection provides fixed route, express route, school service and paratransit transit service within and connecting to Central Contra Costa County. The study area is served by Route 9, which travels on Oak Park Boulevard in the study area, and connects the Pleasant Hill BART Station to Diablo Valley College (DVC), and numerous schools, residential areas, and commercial areas along the way. Service is provided on headways ranging between 30 and 60 minutes. On a typical weekday, this route serves approximately 500 passengers a day; the majority of riders have a destination at the BART station or DVC. Approximately 50 passengers per day on Route 9 originate from within the study area and access service from stops on Oak Park Boulevard. At the BART station, connections to numerous other County Connection routes and other transit service providers are available. Based on existing levels of ridership, excess capacity is available to accommodate increased levels of ridership.

Bay Area Rapid Transit (BART) provides regional transportation connections to much of the Bay Area and the Antioch line provides direct access to San Francisco, with several stops in Oakland where connections may be made to other lines. The closest BART station is the Pleasant Hill/Contra Costa Cente Station located less than a mile southeast the study area. BART train frequency ranges between 6-20 minutes from approximately 5:00 AM to 12:00 AM. Based on 2018 data from BART, approximately 8,000 passengers per day enter/exit the BART system at the Pleasant Hill/Contra Costa Cente Station.

Existing Traffic Counts

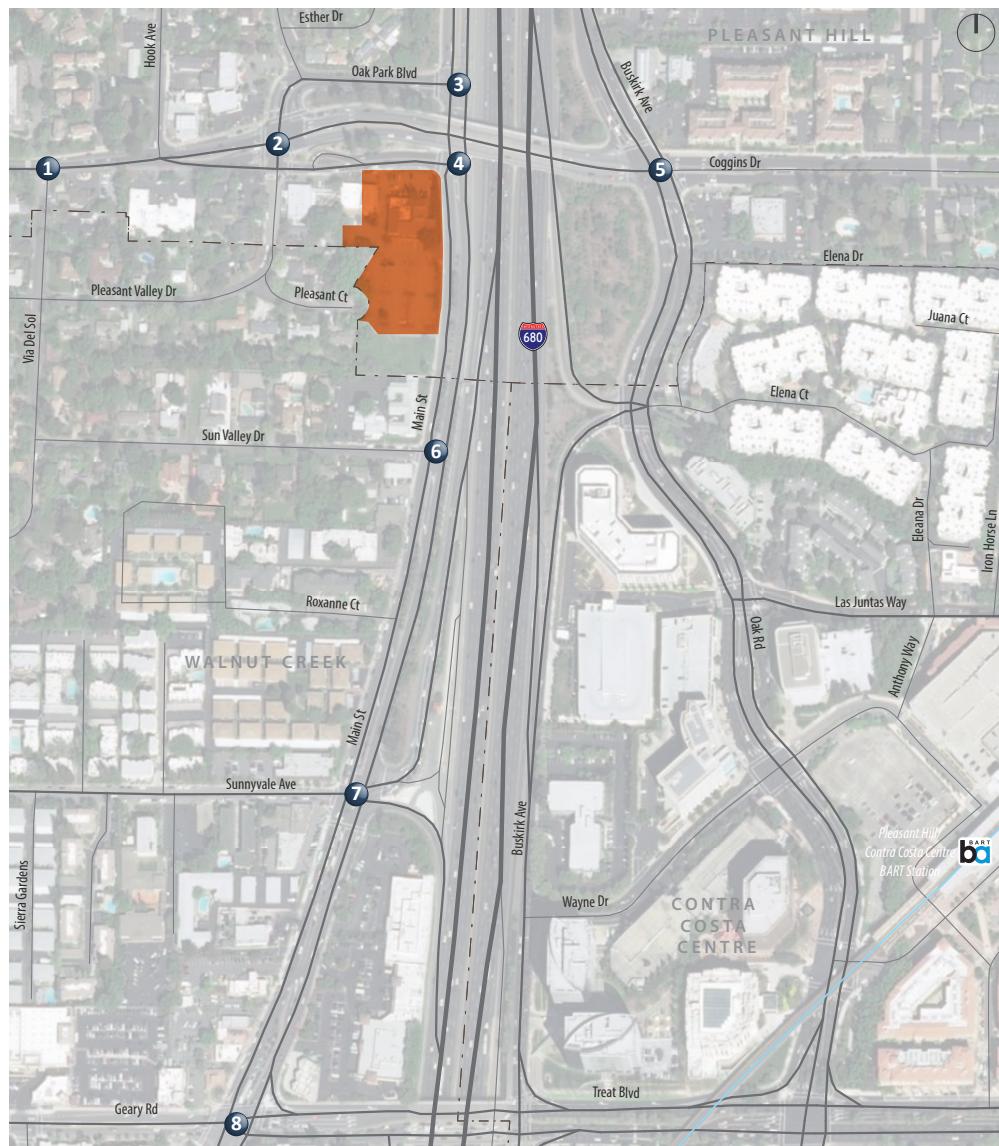

Weekday morning (7:00 to 9:00 AM) and weekday evening (4:00 to 6:00 PM) peak period intersection turning movement counts were conducted at the study intersections, in addition to separate counts of pedestrians, bicycles and heavy vehicles. For each of the count periods, a global peak hour was identified. The weekday AM and PM peak hours were identified to be 8:00 to 9:00 AM and 4:45 to 5:45 PM, respectively. The peak hour volumes are presented on **Figure 6** along with the existing lane configuration and traffic control. Existing bicycle and pedestrian volumes are shown on **Figure 7**. Traffic count worksheets are provided in **Appendix A**.

Intersection Levels of Service

Existing operations were evaluated using the methodology described in Chapter 1. The results are summarized in **Table 3** based on the HCM 2010 method unless otherwise specified. Observed peak hour factors³ were used at all intersections, and truck, pedestrian and bicycle activity was factored into the analysis. Study intersections generally operate at overall acceptable service levels in accordance with benchmarks set by the City of Pleasant Hill and CCTA during both the weekday morning and evening peak hours, which was confirmed during field observations. Detailed intersection LOS calculation worksheets are provided in **Appendix B**. Although the intersection of Geary Road/Treat Boulevard at North Main Street is operates at LOS E during the evening peak hour, the level of service standard for this intersection is LOS F.

Although the study intersections are shown to operate within acceptable levels of service, significant levels of traffic diversion from I-680 and other regional travel routes can occur through the study area when there is recurring and non-recurring congestion on other routes. Congestion on I-680, State Route 242, and State Route 24 can influence the operations of intersections in the study area – for example, when traffic deviates from I-680 to Main Street, it can result in vehicle queue spillback that often extends from Geary Road through the signal at Oak Park Boulevard. The data collection effort and subsequent analysis is reflective of a day when there was not a major incident that resulted in atypical traffic diversion through the study area. Analyzing the effects of project traffic on roadway operations considering increased traffic diversion due to non-recurring incidents on the regional transportation system would serve to dilute the effects of project traffic and would reduce the project's proportionate share to potential impacts.

³ The relationship between the peak 15-minute flow rate and the full hourly volume is given by the peak-hour factor (PHF) based on the following equation: PHF=Hourly volume/(4* volume during the peak 15 minutes of flow). The analysis of level of service is based on peak rates of flow occurring within the peak hour because substantial short-term fluctuations typically occur during an hour.

Table 3: Existing Conditions - Peak Hour Intersection Levels of Service

Intersection	Control ¹	Peak Hour	Existing Conditions	
			Delay ^{2,3} (seconds)	LOS
1. Oak Park Boulevard at Via Del Sol	SSSC	AM PM	1 (34) 1 (32)	A (D) A (D)

8. Geary Road/Treat Boulevard at North Main Street	Signal	AM PM	46 73	D E

Notes: **Bold** indicates operations below the local LOS standard for acceptable operations.

1. SSSC = Side-street Stop Controlled
2. For side-street stop-controlled intersections, delay is presented for intersection average (worst movement).
3. Intersections 3 and 4 are evaluated using the HCM 2000 methodology.

Source: Fehr & Peers, 2018.

Vehicle Queues

Although all intersections currently operate within the standards set by the City of Pleasant Hill and CCTA, there can be periodic vehicle queue spillback and delays greater than shown in Table 3 for some movements. For signalized intersections, **Table 4** presents the 95th percentile vehicle queue results for turn movements with exclusive lanes. Queue worksheets are provided in **Appendix B**.

Table 4: Existing Conditions – 95th Percentile Queue Summary

	SBR	125	25	150

Notes: **Bold** indicates queue potentially extends beyond available storage.

An additional 60 to 90 feet of storage is typically provided in the taper area outside of the through lane, which is not reflected in the storage length above.

Source: Fehr & Peers, 2018.

Vehicle queues can exceed the available storage at the following intersections:

5. Oak Park Boulevard/Coggins Drive at Buskirk Avenue/Oak Road (northbound left-turn AM and PM peak hours)
7. Sunnyvale Avenue at North Main Street(northbound and southbound left-turn AM peak hour; and northbound right-turn PM peak hour)
8. Geary Road at North Main Street (westbound left-turn AM peak hour; southbound left-turn AM and PM peak hours, and northbound right-turn PM peak hour)

Peak Hour Signal Warrants

Peak hour traffic signal warrants were reviewed at the unsignalized study intersections. Peak hour warrants⁴ are not met at any of the unsignalized study intersection based on existing traffic volumes. Peak hour signal warrant worksheets are shown in **Appendix C**.

⁴ Unsignalized intersection warrant analysis is intended to examine the general correlation between existing conditions and the need to install new traffic signals. Existing peak-hour volumes are compared against a subset of the standard traffic signal warrants recommended in the Manual on Uniform Traffic Control Devices (MUTCD) and associated State guidelines. This analysis should not serve as the only basis for deciding whether and when to install a signal. To reach such a decision, the full set of warrants should be investigated based on field-measured traffic data and a thorough study of traffic and roadway conditions by an experienced engineer. Furthermore, the decision to install a signal should not be based solely on the warrants because the installation of signals can lead to certain types of collisions. The responsible State or local agency should undertake regular monitoring of actual traffic conditions and accident data and conduct a timely re-evaluation of the full set of warrants in order to prioritize and program intersections for signalization.

3. Project Characteristics

This chapter provides an overview of the proposed project components and addresses the proposed project trip generation, trip distribution, and trip assignment characteristics, allowing for an evaluation of project impacts on the surrounding roadway network. The amount of traffic associated with the project was estimated using a three-step process:

1. **Trip Generation** – The *amount* of vehicle traffic entering/exiting the site was estimated.
2. **Trip Distribution** – The *direction* trips would use to approach and depart the area was projected.
3. **Trip Assignment** – Trips were then *assigned* to specific roadway segments and intersection turning movements.

Project Description

The approximately 2.5 acre project area is located west of Main Street and south of Oak Park Boulevard. The project would remove an existing 9,740 square-foot occupied restaurant building and an existing 3,070 square-foot vacant retail building, and construct a 4-story, 155-room hotel. Approximately 133 surface parking spaces are proposed. As part of the project, the northern most site driveway would be modified to provide left-turn access into the site and restricted to inbound vehicle travel only. As part of the project, the northern most site driveway would be modified to provide left-turn access into the site.

Project Trip Generation

Trip generation refers to the process of estimating the amount of vehicular traffic a project would add to the surrounding roadway system. Project trip generation estimates for the one-hour peak period during the weekday morning and evening commute when traffic volumes on the adjacent streets are typically the highest. Project trip generation was estimated using rates from the Institute of Transportation Engineers (ITE) *Trip Generation Manual* (10th Edition).

As the surveys of hotel sites included in the *Trip Generation Manual* were conducted prior to rise in use of Transportation Network Companies (TNC) such as Lyft and UBER, the resulting trip generation estimates were increased to account for use of these services to and from the site, which is considered likely given the projects proximity to BART – a little more than a half-mile – which may be too far for some people to walk, especially if they have luggage or there is inclement weather. Although a shuttle is proposed to connect the hotel and Pleasant Hill BART station for hotel guests, no transit discount was considered in the initial

evaluation of potential project impacts as the operational characteristics of the proposed shuttle in terms of operating hours and frequency are not well defined.

To determine the amount of TNC activity that could be expected, a trip generation study prepared by Fehr & Peers that includes surveys of TNC activity at hotels in a variety of land use/transportation settings was reviewed. Based on the available data, it is expected that up to 15 percent of peak hour trip generation activity for a hotel in a suburban setting close to transit could be a TNC trip. To account for the extra trip end with TNC activity, the initial trip generation estimates were increased by 15 percent to account for a TNC vehicle making two trips per group of arriving/departing guests, versus a vehicle that would park at the site.

As part of the trip generation assessment, traffic counts were conducted at the site access driveways in late May 2018 at the same time intersection turning movement counts were conducted to establish the level of traffic generated by the existing restaurant. Based on the driveway counts, the existing site use generates approximately 3 morning peak hour trips, and 82 evening peak hour trips. As daily traffic counts were not collected at the driveways, daily trip generation for the restaurant was estimated using ITE rates for a quality-restaurant based on a 9,740 square-foot restaurant.

As shown in **Table 5**, the project is expected to generate a net 1,350 new weekday daily trips, including approximately 107 net new morning peak hour, and 48 evening peak hour trips when considering TNC use and trips already generated by existing site uses.

Table 5: Weekday Project Trip Generation

Use	Size	Weekday Daily	Weekday AM Peak Hour			Weekday PM Peak Hour

Trip Distribution & Assignment

Project trip distribution refers to the directions of approach and departure that vehicles would take to access and leave the site. Estimates of project trip distribution were developed based on existing travel patterns in the area, a select zone analysis using the Contra Costa Transportation Authority (CCTA) travel demand model, and the location of complementary land uses. The resulting trip distribution percentages are shown on **Figure 8**. Project trips were assigned to the roadway network based on the general directions of approach and departure shown on Figure 8. The project trip assignment is shown on **Figure 9**.

Given the location of project access points, there is the potential for some guest and employees to travel through the adjacent neighborhood. For example, someone exiting the site from the right-out only driveway on Main Street could turn right onto Sun Valley Drive, right onto Via Del Sol, right onto the Oak Park Boulevard to either travel north on North Main Street, or travel east of I-680. While the number of trips expected to make these maneuvers is expected to be low, some vehicles could be routed through the adjacent neighborhood. This routing is reflected in the project trip assignment.

4. Existing with Project Conditions

This chapter evaluates potential off-site traffic impacts under Existing with Project conditions.

Existing with Project Traffic Volumes and Roadway Improvements

Project-only traffic volumes (Figure 9) were added to the existing peak hour traffic volumes (Figure 6) to estimate Existing with Project peak hour intersection turning movement volumes, as shown on **Figure 10**. Intersection lane configurations, traffic control, traffic signal timings, peak hour factors, heavy vehicle percentages, and pedestrian and bicycle activity at the study intersections were left unchanged from existing conditions.

Analysis of Existing with Project Conditions

Intersection Levels of Service

Existing with Project conditions were evaluated using the same methods described in Chapter 1. The analysis results are presented in **Table 6**, based on the traffic volumes and lane configurations presented on Figure 10. Table 6 also includes the operations results for the Existing without Project conditions for comparison purposes.

The addition of project traffic would worsen LOS D operations at the Sunnyvale Avenue at North Main Street intersection to LOS E operations during the morning peak hour by increasing average delay by 2-seconds. Although LOS E is considered acceptable for this intersection, optimizing traffic signal timings along the North Main Street corridor, which the Cities of Walnut Creek and Pleasant Hill do as a part of regular maintenance, could result in LOS D operations at this intersection.

At the Geary Road at North Main Street intersection, the addition of project traffic does not appreciably increase average delay (1-second increase) during the PM peak hour when the intersection operates at LOS E. All other study intersections would continue to operate within the established level of service standards with the addition of project traffic in the existing condition. Detailed intersection LOS calculation worksheets are provided in **Appendix B**.

2. For side-street stop-controlled intersections, delay is presented for intersection average (worst movement).
3. Intersections 3 and 4 are evaluated using the HCM 2000 methodology.

Source: Fehr & Peers, 2018.

Vehicle Queues

Vehicle queues were assessed for the signalized intersections in the with project condition, and the addition of project traffic is not expected to result in vehicle queues to increase by more than 50-feet (or 2 car-lengths) for movements where the 95th percentile queue exceeds capacity, as presented in **Table 7**. Queue worksheets are provided in **Appendix B**.

Signal Warrants

Signal warrants were evaluated for the unsignalized intersections. As shown in Table 6, signalization of the unsignalized study intersections is not warranted with the addition of project traffic in the existing condition. Signal warrant worksheets are provided in **Appendix C**.

Notes: **Bold** indicates queue potentially extends beyond available storage. An additional 60 to 90 feet of storage is typically provided in the taper area outside of the through lane, which is not reflected in the storage length above.

1. With the project, the turn-pocket would be reduced to approximately 75 feet.

Source: Fehr & Peers, 2018.

Existing Conditions Impacts and Mitigation

Although potential off-site intersection impacts related to levels of service and vehicle queues are considered less-than-significant based on the significance criteria, there could be temporary significant impacts during the construction phase of the project.

Impact Statement 1: Construction related activities could create potential conflicts with other roadway users, such as construction related activities resulting in lane closures along the project frontage, construction vehicles queuing within the public right-of-way waiting entry to the site, construction worker parking in non-designated parking areas, or construction debris on public streets. Construction impacts would be temporary in nature; however, this impact is considered ***potentially significant***.

Mitigation Measure 1: Although construction impacts would be temporary, development of a construction management plan would reduce the potential for construction vehicle conflicts with other roadway users. The plan should include:

- Project staging plan to maximize on-site storage of materials and equipment
- A set of comprehensive traffic control measures, including scheduling of major truck trips and deliveries to avoid peak hours; lane closure proceedings; signs, cones, and other warning devices for drivers; and designation of construction access routes
- Permitted construction hours
- Location of construction staging
- Identification of parking areas for construction employees, site visitors, and inspectors, including on-site locations
- Provisions for street sweeping to remove construction related debris on public streets

Implementation of the construction management plan would reduce the temporary construction impact to a ***less-than-significant*** level.

5. Cumulative Conditions

This chapter presents the results of the level of service calculations under cumulative conditions without and with the project.

Cumulative Intersection Volumes and Roadway Improvements

Cumulative forecasts were developed using traffic growth trends as described in the Pleasant Hill General Plan supplemented by a check of traffic forecasts for the study area in the Contra Costa Transportation Authority (CCTA) Countywide Travel Demand Model, as well as considering approved and potential projects in the immediate study area.

Based on growth trends projected by the CCTA model, traffic volumes on Main Street and Treat Boulevard are projected to increase by approximately 2 percent per year (between 2018 and 2040), with some of the increase from traffic diverting from regional travel routes to local roadways. Through traffic volumes are expected to increase on Oak Park Boulevard by approximately 1 percent per year. Turning movements to/from residential neighborhoods are not expected to significantly change, but existing observed traffic volumes were rounded up to the nearest 10 vehicles to account for potential minor changes to travel patterns to/from existing established neighborhoods. Model plots from the travel demand model near the study area are provided in **Appendix D**.

In addition to considering the regional growth trends, the forecasts also consider the following approved/pending projects in the immediate study area:

1. Oak Park/Monticello Specific Plan
2. Day Care center at the intersection of Boyd Road at Kahrs Avenue
3. Fountainhead Day Care Center on Oak Park Boulevard
4. Development of Housing Element Opportunity sites on Beatrice Road and Cleaveland Road⁵
5. 85 Cleaveland

The trip generation assumptions for these projects is provided in **Appendix E**.

⁵ No development is currently contemplated on these sites, but up to 200 multi-family homes could be constructed in the area. As no development is proposed, all access was assumed to occur from Cleaveland Road for the purposes of this analysis.

The resulting intersection turning movement forecasts are presented on **Figure 11** for the cumulative without project scenario. Project-only traffic volumes (**Figure 9**) were added to the cumulative without project peak hour traffic volumes (Figure 11) to estimate Cumulative with Project peak hour intersection turning movement volumes, presented on **Figure 12**. The resulting cumulative forecast are an estimate of conditions in 2040.

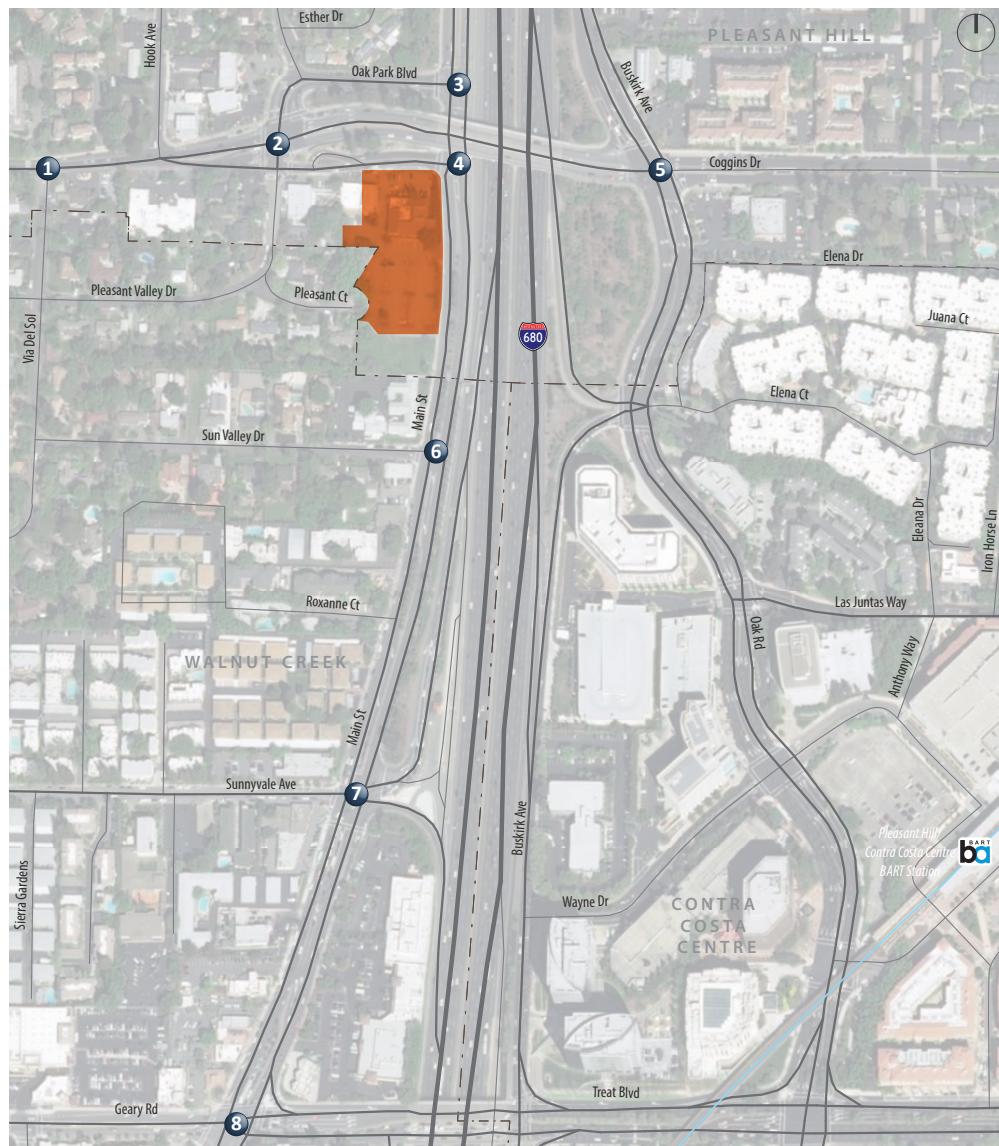

The forecasting described above does not take into consideration some foreseeable travel changes, including increased use of transportation network companies, such as Uber and Lyft, nor the potential for autonomous vehicles. Although the technology for autonomous vehicles is expected to be available over the planning horizon, the Federal and State legal and policy frameworks are uncertain. Initial modeling of an autonomous future indicates that with automated and connected vehicles, the capacity of the existing transportation system would increase as vehicles can travel closer together; however, these efficiencies are only realized when a high percentage of vehicles on the roadway are automated and connected. There is also the potential for vehicle travel to increase with zero-occupant vehicles on the roadway, off-setting any potential capacity benefits. Although the future baseline is uncertain, the project's incremental effect on that future baseline is expected to be similar to the analysis results presented below.

Analysis of Cumulative Conditions

Intersection Level of Service

Existing peak hour factors, heavy vehicle percentages, and pedestrian and bicycle activity at the study intersections remain unchanged from the existing condition for the assessment of Cumulative conditions. No improvements were assumed to be in place at any of the study intersections.

Traffic signal timings were optimized at intersections where the initial analysis indicated LOS E or F operations, reflecting that as part of the City of Pleasant Hill and Walnut Creek's continuing maintenance of traffic signals, signal timing for intersections near capacity are regularly updated to better accommodate actual travel demand. **Table 8** presents the Cumulative without and with Project intersection level of service results.

Notes: **Bold** indicates operations below the local LOS standard for acceptable operations (below LOS D).

1. SSSC = Side-street Stop Controlled
2. For side-street stop-controlled intersections, delay is presented for intersection average (worst movement).
3. Intersections 3 and 4 are evaluated using the HCM 2000 methodology.

Source: Fehr & Peers, 2018.

The addition of project traffic would not degrade the operation of any study intersection from an overall acceptable service level to an unacceptable service level, although it would worsen side-street delay at the unsignalized Sun Valley Drive at North Main Street intersection from LOS D to LOS E during the morning peak hour, as well as add traffic to the Oak Park Boulevard at Via Del Sol intersection where the side-street movement is projected to operate at an unacceptable LOS F prior to the addition of project traffic. Additionally, the addition of project traffic could worsen the operation of two signalized intersections projected to operate at LOS E or F prior to the addition of project traffic. Consideration of whether the project would have a significant impact at this intersections is further discussed below.

The Oak Park Boulevard at Via Del Sol intersection is projected to operate at an overall LOS A with the side-street movement operating at LOS F during both the morning and evening peak hours prior to the addition of project traffic in the cumulative condition. The addition of project traffic would not increase average

delay for the side-street movement in either peak hour, and peak hour traffic signal warrants are not satisfied. Based on the significance criteria, this is not a significant impact.

The Sun Valley Drive at North Main Street intersection is projected to operate at an overall LOS A with the side-street movement operating at LOS D during the morning peak hour prior to the addition of project traffic in the cumulative condition. The addition of project traffic would result in LOS E operations for the side-street movement in the morning peak hour by increasing delay for that movement by 3-seconds. Peak hour signal warrants would not be satisfied. Based on the significance criteria, this is not a significant impact.

The Sunnyvale Avenue at North Main Street intersection is projected to operate at LOS E during the evening peak hour prior to the addition of project traffic in the cumulative condition. The addition of project traffic would increase average delay by 1-second. As LOS E is the standard for this intersection, and the delay increase is less than 5-seconds, this is not considered a significant impact.

The Geary Road at North Main Street intersection is projected to operate at LOS F during the evening peak hour prior to the addition of project traffic in the cumulative condition. The addition of project traffic would increase average delay by 1-second. As LOS F is the standard for this intersection, and the delay increase is less than 5-seconds, this is not considered a significant impact.

As detailed above, the project would not have a significant impact at intersections operating below established level of service ranges in the cumulative condition and all other study intersections would continue to operate within the established level of service ranges with the addition of project traffic in the cumulative condition. Therefore the project would not have a significant impact related to intersection operation under the cumulative condition. Detailed intersection LOS calculation worksheets are provided in **Appendix B**.

Vehicle Queues

Vehicle queues were assessed for the signalized intersections in the Cumulative condition, and the addition of project traffic is not expected to result in vehicle queues to increase by more than 50-feet (or 2 car-lengths) for movements where the 95th percentile queue is projected to exceed the available storage in the without project condition, as presented in **Table 9**. However, the addition of project traffic could result in the vehicle queue for the northbound left-turn movement to extend beyond the available storage at the Pleasant Valley Drive at North Main Street intersection in the morning peak hour. Queue worksheets are provided in **Appendix B**.

Table 9: Cumulative Conditions – 95th Percentile Queue Summary

Intersection	Movement	Storage Length (ft)	AM Peak Period		PM Peak Period	
			Without Project	With Project	Without Project	With Project

	NBR	675	450	450	600	600
	SBL	350	600	600	600	600
8. Geary Road at North Main Street	EBL	200	100	100	150	150
	WBL	250	700	700	375	375
	WBR	625	0	0	0	0
	NBL	250	300	300	275	275
	NBR	100	175	175	875	875
	SBL	200	525	525	850	850
	SBR	125	50	50	200	200

Notes: **Bold** indicates queue potentially extends beyond available storage.

An additional 60 to 90 feet of storage is typically provided in the taper area outside of the through lane, which is not reflected in the storage length above.

Source: Fehr & Peers, 2018.

Signal Warrants

Signal warrants were evaluated for the unsignalized intersections. As shown in Table 8, none of the unsignalized study intersections is projected to meet signal warrants in the cumulative condition prior to or with the addition of project traffic. Signal warrant worksheets are provided in **Appendix C**.

Cumulative Impacts and Mitigation

No off-site intersection impacts were identified in the cumulative condition and no project specific mitigation is required.

6. Site Access, Circulation & Parking

This section is based on the site plan presented previously on Figure 2. Considerations for all modes of travel as well as parking are provided. Site plan recommendations are summarized on **Figure 13**.

Site Access and Circulation

Vehicular Access

Access to the site is currently provided from two right-in/right-out driveways on Main Street and one full access driveway on Oak Park Boulevard. As part of the project, the northern most site driveway would be modified to provide left-turn access into the site and would be restricted to inbound traffic only; a landscaped median would also be constructed on Main Street at the approach to Oak Park Boulevard to prevent left-turn movements from the site. A review of site access operations indicates that the site access intersections would operate acceptably as side-street stop-controlled intersections as summarized in **Table 10**. Although site access intersections would operate acceptable, vehicle queues on Oak Park Boulevard at North Main Street could extend beyond the project driveway, impeding site access.

Table 10: Site Access Intersections Peak Hour Intersection Levels of Service

Intersection	Control ¹	Peak Hour	Cumulative With Project	
			Delay ^{2,3}	LOS ^{2,3}
9. Oak Park Boulevard at Project Entry	SSSC	AM	2 (11)	A (B)
		PM	2 (10)	A (A)
10. Northern Project Driveway at North Main Street	SSSC	AM	0 (14)	A (B)
		PM	0 (11)	A (B)
11. Northern Project Driveway at North Main Street	SSSC	AM	0 (16)	A (C)
		PM	0 (11)	A (B)

Notes:

1. SSSC = side-street stop controlled intersection
2. Average and worst movement delay calculated using the 2010 HCM method.
3. For SSSC intersections, average delay or LOS is listed first followed by the delay or LOS for the worst approach in parentheses.

Source: Fehr & Peers, 2018.

Recommendation 1: Provide signage on-site noting that the northern entry driveway provides for inbound travel only.

General Recommendations

- Monitor parking demand and implement additional parking demand management strategies, if needed
- Install at least three short-term and five long-term bicycle parking spaces and identify shared mobility hub area
- Provide bicycle facilities on North Main Street driveway influence areas
- Provide pedestrian scale lighting along project frongages

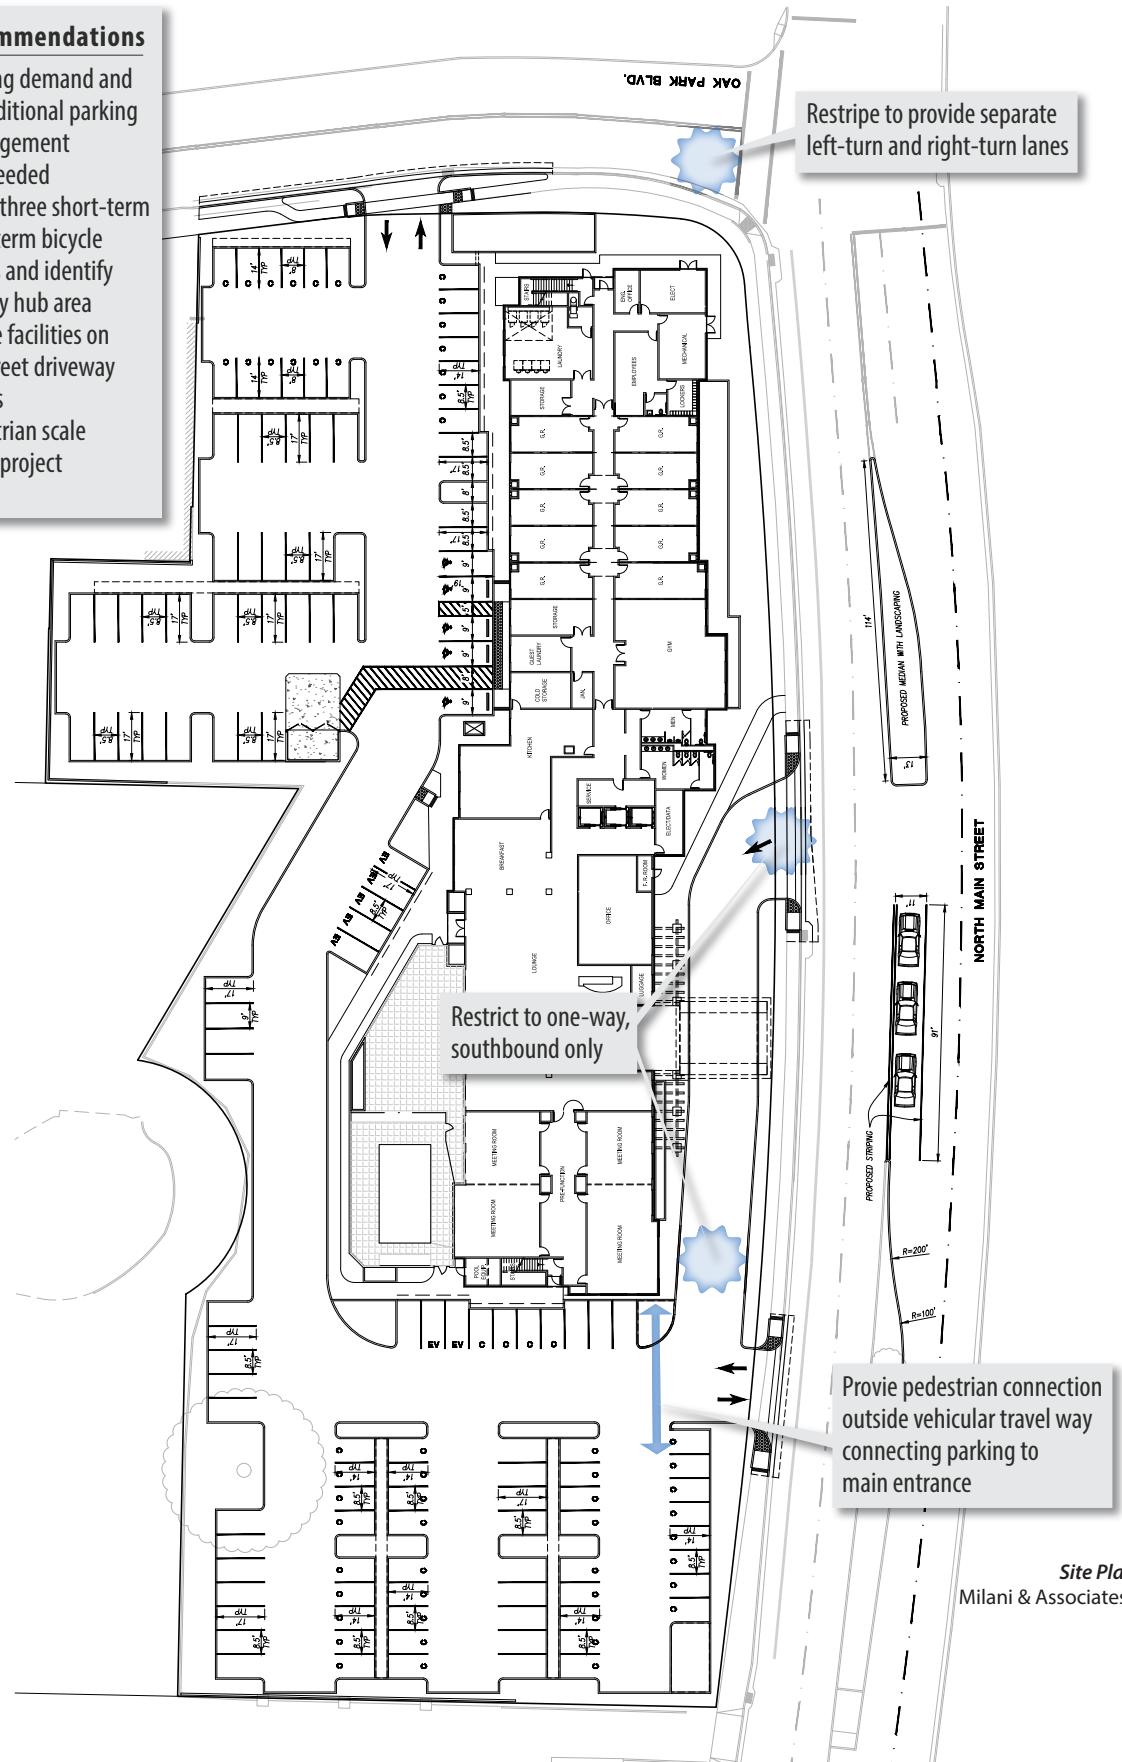

Figure 13

Recommendation 2: Within the existing pavement cross-section, restripe Oak Park Boulevard east of the project driveway along the project frontage to provide separate left-and right-turn lanes to North Main Street.

Pedestrian Facilities

The conceptual project site plan shows pedestrian facilities along the project frontages on Oak Park Boulevard and North Main Street with reconstructed directional curb ramps at the project driveways. A six-foot walkway connecting the public sidewalk to the main entry is also proposed. A pedestrian path does not completely encircle the building and guests may need to walk in the primary travel way to access the building entrance. Insufficient details are provided to fully evaluate the proposed pedestrian network.

Recommendation 3: Provide a pedestrian connection from the southern parking area to the main entrance so guests do not need to walk in the main entry travel way.

Recommendation 4: Restrict landscaping in the driveway influence areas to maintain visibility between vehicles and pedestrians. Install pedestrian scale lighting along project frontages.

Bicycle Facilities

The project would not alter existing bicycle facilities within the project area, although it would increase potential bicycle/vehicle conflicts in the driveway influence areas.

Recommendation 5: Modify bicycle facilities along the North Main Street project frontage with a focus on driveway area conflict zones. Potential improvements could include a bike ramp to the sidewalk and widening the sidewalk to 10-feet, or providing skip-stripe pavement marking within the driveway influence area to provide a space for cyclists and to alert drivers to the potential presence of cyclists.

Transit Accessibility

County Connection bus service provides local access to the area via Route 9. Based on the existing County Connection ridership data (Chapter 2), there is sufficient excess capacity to accommodate potential transit demand from the project.

A County Connection transit stop is located on the north side of Oak Park Boulevard, just east of the Pleasant Valley Drive for eastbound travel and west of Pleasant Valley Drive for westbound travel. The project does not propose to make any changes in the vicinity of the bus stops in the area.

Emergency Vehicles

Several factors determine whether a project has sufficient access for emergency vehicles, including:

1. Location of closest fire stations
2. Number of access points (both public and emergency access only)
3. Width of access points
4. Width of internal roadways

Each of these factors is discussed in further detail below.

The fire station closest to the site is located on Boyd Road, approximately 1.2 miles from the site via Cleaveland Road and North Main Street. A second fire station is located at 2012 Geary Road approximately 1.5-miles from the project site via Putnam Boulevard/Geary Road or Main Street/Geary Road. Primary access to the project site would occur from existing roadways that would not be changed as part of the project. The conceptual project site plan shows drive aisles throughout the site of at least 24-feet with at least 26-foot drive aisles surrounding the building, which provides the required clear-way for fire access.

Parking

Off-street parking requirements and design guidance are outlined in the City of Pleasant Hill Municipal Code Chapter 18.55.30. Surface parking is proposed to support the proposed project with 133 parking spaces. Parking itself is not a CEQA issue. Potential parking short-falls could result in parking demand spillover along the project frontage and potentially the adjacent neighborhood, which, while not rising to the level of a CEQA impact, could be considered undesirable from the perspective of the City and neighbors. A discussion of parking supply and demand, and recommendations related to parking are included below for informational purposes.

Vehicle Parking Requirements

For hotel uses, one off-street parking space per room plus one off-street space per each 50 square-feet of banquet facilities is required. No banquet facilities are proposed as part of the project. A 15 percent reduction to the parking supply is permitted for projects within the City's Priority Development Areas (PDAs). Based on the City Code requirements with a 15 percent PDA reduction, as presented in **Table 11**, 132 off-street parking spaces are required. The project proposes to provide 133-spaces, which is 1-space above code requirements.

Parking demand for the project is also likely to be influenced by the potential use of Transportation Network Companies such as UBER and Lyft (see project trip generation on Pages 25 and 26), as well as the proposed

shuttle between the site and BART. When considering these other travel options to the site, a greater surplus could be expected.

Table 11: Automobile Parking Requirements

Land Use	Size	Base Requirement	Total Requirement
Hotel	155-Room	1 per guest room + 1 per each 50 square feet of banquet area; less a 15 percent PDA reduction	132
Proposed Supply			133
Surplus/(Deficit)			1

Source: City Pleasant Hill Municipal Code, Fehr & Peers, 2018.

Although the project would provide sufficient parking to meet code requirements, and the use of TNCs and shuttles are expected to reduce overall site parking demand, variations in parking demand and unforeseen circumstances could result in periodic parking shortfalls.

Recommendation 6: Monitor project parking demand between 6 months and 1 year of occupancy. The parking monitoring shall include parking demand observations on a weekday and a weekend, establish the level of TNC activity, and use of the proposed shuttle. Based on the occupancy levels at the time of data collection, project parking demands with full occupancy. Should potential parking shortfalls be identified with full occupancy, implement additional parking demand management strategies, that could include:

- Valet Parking
- Employee Transit Passes
- Increased shuttle hours
- TNC Subsidies

With implementation of this measure, parking demand spillover to adjacent residential neighborhoods is expected to be minimal.

The City of Pleasant Hill requires that new commercial parking areas provide electric vehicle charging stations, at a rate of 1 space for each lot with between 25 and 50 spaces, and 1 EV charging station for each 50 additional spaces. Five electric vehicle parking stalls are identified on the site plan, which exceeds the requirement of at least four electric vehicle charging spaces.

Parking Stall Design

The design of parking stalls was reviewed based on City standards. For commercial uses, standard perpendicular parking stalls are required to be 8.5 feet by 19 feet, with small car spaces required to be 8.5 feet by 16 feet. When considering the planter overhang of 2-feet, the proposed stall dimensions meet code requirements. Up to 50 percent of spaces are allowed to be small car spaces. 58 small car spaces are proposed, which equates to 44 percent of the parking supply.

Bicycle Parking

The City of Pleasant Hill requires that for commercial developments bicycle parking be provided at a rate of 2 percent of the parking supply, which would result in 3 bicycle spaces based on the unadjusted code required parking. Secure employee bicycle parking could encourage employees to bicycle to work.

Recommendation 7: Provide at least 3-short term bicycle parking spaces and a bicycle locker. Identify a designed shared mobility hub where shared bicycles and scooters could be dropped-off outside of main pedestrian travel routes.

Other CEQA Considerations

Based on Appendix G of the CEQA guidelines, other CEQA criteria were also assessed based on the information presented above.

- Would the Project result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that result in substantial safety risks?
 - The project is not located in proximity to an airport and would not result in a change to air traffic patterns. Therefore, there is no impact to air travel.
- Would the Project substantially increase traffic hazards due to a design feature (e.g. sharp curves or dangerous intersections) or incompatible uses (e.g. farm equipment)?
 - Although the project would be designed to meet City standards, the project could increase the potential for bicycle and pedestrian conflicts. While this would not rise to a level of a significant impact under CEQA, improvements to lessen the potential for conflicting vehicular movements are provided as part of **Recommendations 3, 4 and 5**.
- Would the project result in inadequate emergency access?
 - Three site access locations are provided with internal drive aisles that meet fire access standards.
- Would the Project conflict with adopted policies, plans, or programs regarding public transit, bicycle or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?

- The project site plan does not conflict with existing or planned transit, bicycle or pedestrian facilities in the area.
- The project could increase the potential for bicycle and pedestrian conflicts. While this would not rise to a level of a significant impact under CEQA, improvements to lessen the potential for conflicting vehicular movements are provided as part of **Recommendations 3, 4 and 5**.

7. Vehicle Miles of Travel

In response to Senate Bill 743 (SB 743), the Office of Planning and Research (OPR) updated the California Environmental Quality Act (CEQA) guidelines to include new transportation-related evaluation metrics. Draft guidelines were developed in August 2014, with updated draft guidelines prepared January 2016, which incorporated public comments from the August 2014 guidelines. OPR released final proposed Guidelines on November 27, 2017. The final proposed Guidelines include a new Section 15064.3 on VMT analysis and thresholds for land use developments. OPR also released a Technical Advisory on Evaluating Transportation Impacts in CEQA. New Guidelines section 15064.3 states that they do not take effect until July 1, 2020 unless the lead agency adopts them earlier. Neither the City of Pleasant Hill nor Contra Costa Transportation Authority nor Contra Costa County has established any standards or thresholds on VMT. Therefore, the new guidelines have not yet been adopted and are not in effect at this time.

The final guidelines may change based on the comments received during the Natural Resources Agency formal administrative rulemaking process for adoption under the Administrative Procedure Act. Since there are no standards in effect on VMT analysis, a preliminary assessment of the vehicle miles of travel (VMT) generated by the proposed project was prepared for information and disclosure purposes only. No determination on the significance of VMT impacts is made in this document since none is legally required.

CEQA Guidelines

Proposed changes to Appendix G of the CEQA guidelines, as presented in *Revised Proposal on Updates to the CEQA Guidelines on Evaluating Transportation Impacts in CEQA (November 2017)*⁶ provides the potential basis for the evaluation of vehicle miles of travel generated by a project.

Text of Proposed Amendments to Appendix G

b) For a land use project, would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)(1)?

(b) Criteria for Analyzing Transportation Impacts.

(1) Land Use Projects. Vehicle miles traveled exceeding an applicable threshold of significance may indicate a significant impact. Generally, projects within one-half mile of either an existing major transit stop or a stop along an existing high quality transit corridor should be presumed to cause a

⁶ Additional information can be found here:
<http://opr.ca.gov/ceqa/updates/sb-743/>

less than significant transportation impact. Projects that decrease vehicle miles traveled in the project area compared to existing conditions should be considered to have a less than significant transportation impact.

OPR has established a draft threshold for the evaluation of residential, office and retail trips. For those uses, developments that have an estimated vehicle miles of travel 15 percent below existing regional (office and residential if the number of residential units exceeds allotted amount in the Sustainable Communities Strategy (SCS)) and/or city (residential if the number of residential units is within allotted amount in the (SCS)) VMT/capita (work-based) would be considered less than significant. For retail uses, a net-increase in VMT would be considered significant. As a Hotel use does not fall within the office, retail or residential category only the work-based trips were considered for the purposes of this SB 743 assessment.

Analysis Methods

To conduct the VMT assessment, Fehr & Peers used information from the Metropolitan Transportation Commission (MTC).⁷ The existing average trip lengths for the City of Pleasant Hill, Contra Costa County and the Bay Area based on the MTC data are presented in **Table 12**, along with home based trips for informational purposes. Trip length information for the travel analysis zone (TAZ)⁸ in which the project is located is also shown in Table 12. Home based trips in Pleasant Hill and Contra Costa County are slightly higher than the Bay Area average, while work based trips to jobs in Pleasant Hill are lower than the county average, but higher than the Bay Area average, indicating that people who have jobs in Pleasant Hill tend to commute longer than average distances than the remainder of the Bay Area.

Analysis Results

For the assessment of VMT for purposes of SB 743, only the work-based trips are considered as a hotel would have limited control over how guests access the hotel. Based on data published by MTC, the average VMT for workers in the project TAZ is **25.76 vehicle miles** worker per day. This level of vehicle travel is higher than the Bay Area average, but slightly lower than both the County average (lower by 5 percent) or city-wide average (lower by 0.5 percent).

⁷ <http://analytics.mtc.ca.gov/foswiki>Main\PlanBayAreaVmtPerCapita>

⁸ Travel analysis zones are used in travel behavior models to represent specific geographic extents, and the various land use, demographic, and socioeconomic characteristics that area.

Table 12: Existing Average Trip Lengths

Land Use Type	Project TAZ	Pleasant Hill	Contra Costa County	Bay Area
Home Based VMT	16.7	17.5	18.0	15.3
Work VMT	25.76	25.9	27.2	22.7

Source: Source: MTC, Fehr & Peers, 2018.

VMT Conclusions

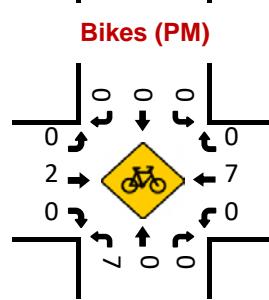

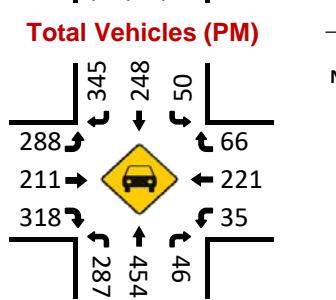

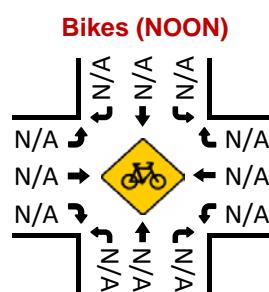

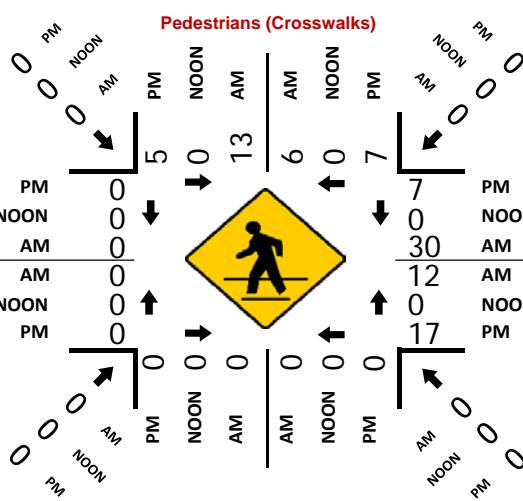

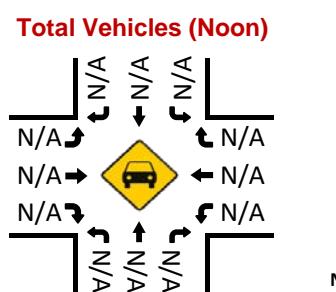

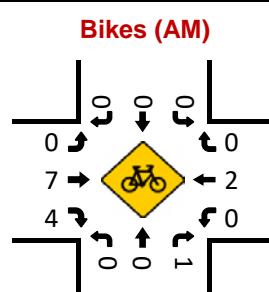

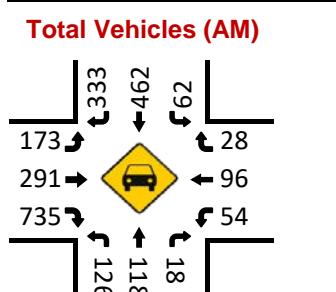

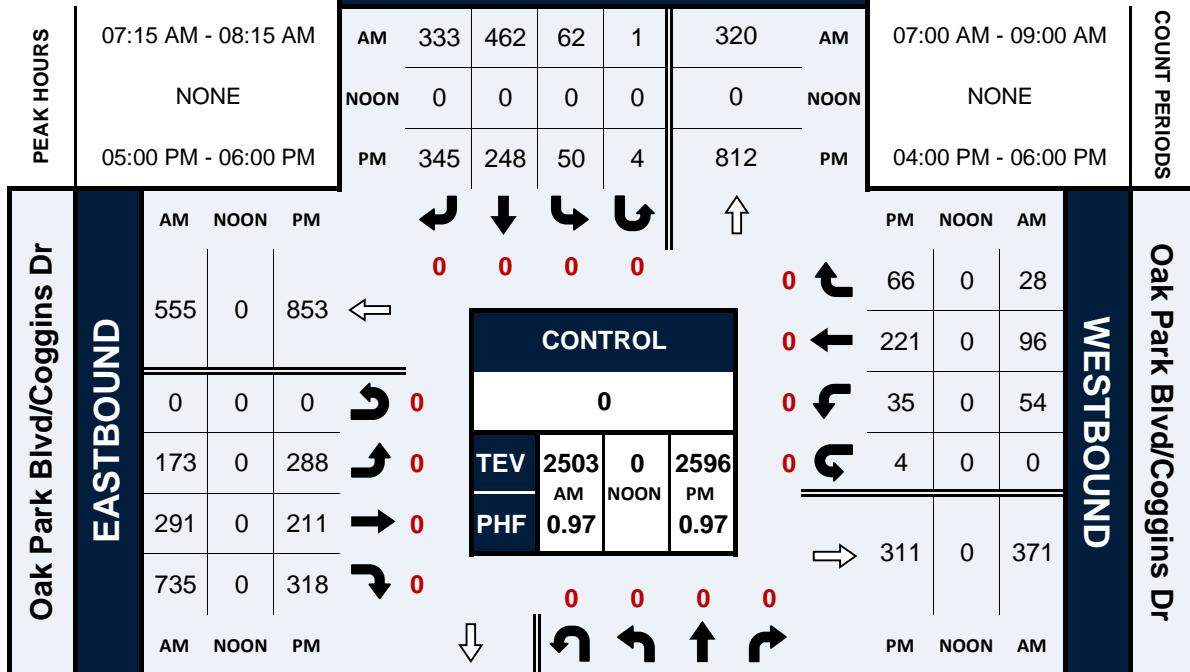

Results of the VMT analysis indicate that the project would contribute to a slight decrease in vehicle miles of travel on a per-employee basis; however, the VMT generated by the project employees is not expected to be 15 percent below the City baseline without implementation of employee-focused transportation demand management strategies. As there are no thresholds of significance, this analysis is being prepared for informational purposes only.
