Land Use	SF/ DU/ Seat/ Room /Spaces	KSF	Acres	CalEEMod Land Use Type
Industrial - New	44,295	44.30	7	General Industrial
Paving Area	4,300	4.30		Non-Asphalt

OCSD - P1-105

Construction Assumptions

Construction Schedule

	Max Daily		
	Start	Months	Days
Demolition	1/1/2019	10	220
Site Preparation/Grading/Excavation	1/1/2019	19	418
Building Construction (Rehabilitation)	1/1/2019	45	990
Building Construction (New)	1/1/2019	51	1122
Paving	1/1/2019	1	22
Architectural Coating	1/1/2019	5	110

Construction will occur 5 days per week between 7 am and 8 pm, which will conservatively result in an approximately 10 hour operational day for onsite equipment once lunch, breaks, daily meetings and maintenance are factored into the daily activities.

Demolition, site preparation/grading/excavation will overlap with the Rehabilitation phase, however will need to be completed prior to the new construction. New Construction will overlap with the Rehabilitation phase.

Total Onsite Equipment

Equipment Type	#	CalEEMod Designation
Dirt Truck	1	Off-road Truck
Skidsteer	2	Skid Steer Loader
Wheel Loader	1	Tractor/loader/backhoe
Backhoe Loader	3	Tractor/loader/backhoe
Dozer	2	Rubber Tired Dozer
Trackhoe	2	Tractor/loader/backhoe
Trackhoe w/ Hammer	1	Tractor/loader/backhoe
Water Truck	1	water truck
Concrete Mixer	2	Cement/mortar mixer
Crane	2	crane
Telehandler	1	Forklift Hp adjusted to 140
Forklift	2	Forklift
Pile Driver	1	Crane
Compactor	1	Plate Compactor
Paver	1	Paver
Generator	1	Generator
Groundwater Pump	1	Pump

Note the equipment above represents the total number of each piece of equipment that will be onsite at any given time. Where phases overlap the equipment is only accounted for in one of the phases.

OCSD - P1-105

Construction Assumptions

Construction Equipment

Rehabilitation

Equipment	#	hrs/day	CalEEMod Equipment Type
Hand tools	Not modeled		
concrete mixers	2	10	Concrete and Motar Mixers
cranes	2	9	Cranes
telehandlers	1	10	Forklift w/HP adjusted to 140
forklifts	2	10	Forklifts
elevated work platforms	Not modeled		
pavers	1	10	Pavers
backhoe loader	3	9	Tractor/Loader/Backhoe

Demolition

12,500 cubic yards construction material
10,000 Tons of debris (Rounds up 1,463 lbs per cubic yard)

Equipment	#	hrs/day	CalEEMod Equipment Type
dirt trucks	1	5	Off-highway Truck
skidsteers	2	10	Skid Steer Loader
wheel loaders	1	10	Tractor Loader Backhoe
backhoe loaders	0		Accounted for in Rehabilitation
dozers	2	10	Rubber Tierd Dozer
trackhoses	2	10	Tractor Loader Backhoe
trackhoe w/hammer	1	10	Tractor Loader Backhoe
water truck	1	5	Off-highway Truck

Site Prep/Grading/Excavation (1) - Associated with Demolition

4,200 cubic yards of soil - exported
12,500 cubic yards of soil - imported

Site Prep/Grading/Excavation (2) - Associated with New Structures

21,300 cubic yards of soil - exported
15,750 cubic yards of soil - imported

*Equipment for Site Prep/Grading/Excavation Phases are assumed to be accounted for in the other modeled phases given the total equipment list provided. These phases are only included for import/export of soil associated with these phases.

OCSD - P1-105

Construction Assumptions

New Structures

Equipment	#	hrs/day	
Hand tools	Not Modeled		
Dirt trucks	1	5	Off-highway Truck
concrete mixers	0		Accounted for in Rehabilitation
cranes	0		Accounted for in Rehabilitation
telehandlers	0		Accounted for in Rehabilitation
forklifts	0		Accounted for in Rehabilitation
pile drivers	1	1	Crane
elevated work platforms	Not Modeled		
skidsteers	2	10	Skid Steer Loader
wheel loaders	1	10	Tractor/Loader/ Backhoe
backhoe loaders	0		Accounted for in Rehabilitation
dozers	2	10	Rubber Tired Dozer
trackhoes	2	10	Tractor/Loader/ Backhoe
water trucks	1	5	Off-highway Truck
compactors	1	10	Plate Compactor
pavers	0		Accounted for in Rehabilitation
generators	1	10	Generator Set
groundwater pump	1	10	pump

OCSD - P1-105

Construction Assumptions

Paving

Paving is assumed to be part of the provided construction phases. A Phasing phase is only added to account for any fugitive emissions that would occur from paving activities. Therefore, onsite construction equipment is not modeled because it is accounted for under the New Structures Building Phase.

Architectural Coating

Architectural coating will occur as part of the New Structure Phase and is only included to account for fugitive ROG emissions from the application of architectural coating. Therefore, onsite equipment is not modeled because it would be accounted for as part of the New Structures Building Phase.

Trips and VMT - Uses Defaults from CalEEMod

Note: Trip length for Waste hauling in demolition is based on distance from the site to the disposal site. According to Mapquest, maximum distance is 18.8 miles which is used in the analysis.

OCSD - P1-105
Construction Assumptions

CalEEMod Modeling Notes:

PM10 and PM2.5 Fugitive emissions report the "Mitigated" scenario because the "Mitigated" scenario represents emissions with the incorporation of SCAQMD Rule 403 which is a requirement of construction within SCAQMD Jurisdiction. Rule 403 assumes watering 3 times per day.

OCSD P1-105 Construction Only

Los Angeles-South Coast County, Winter

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Light Industry	44.30	1000sqft	7.00	44,300.00	0
Other Non-Asphalt Surfaces	4.30	1000sqft	0.10	4,300.00	0

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	33
Climate Zone	11			Operational Year	2027
Utility Company	Southern California Edison				
CO2 Intensity (lb/MW hr)	531.74	CH4 Intensity (lb/MW hr)	0.029	N2O Intensity (lb/MW hr)	0.006

3.1 Mitigation Measures Construction

Use Cleaner Engines for Construction Equipment

Use Soil Stabilizer

Replace Ground Cover

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

3.2 Demolition - 2019

Unmitigated Construction On-Site

3.1 Mitigation Measures Construction

Use Cleaner Engines for Construction Equipment

Use Soil Stabilizer

Replace Ground Cover

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

3.2 Demolition - 2019

Unmitigated Construction On-Site

EXECUTIVE SUMMARY

The Orange County Sanitation District (OCSD) proposes to implement the Headworks Rehabilitation and Expansion Project at the Plant 1 wastewater treatment facility located in Fountain Valley, California (Project No. P1-105; referred to herein as the “proposed project”). The proposed project would be located entirely within OCSD Plant 1 boundary. Plant 1 is located at 10844 Ellis Avenue and is bound by Ellis Avenue to the north, the Orange County Water District (OCWD) and Ward Street to the west, Garfield Avenue to the south, and the Santa Ana River (SAR) and SAR Trail to the east. The proposed project includes rehabilitation, demolition, and new construction of headworks structures on Plant 1.

The greatest potential for TAC emissions during Project construction would be related to diesel particulate matter emissions associated with heavy-duty equipment during demolition, grading and excavation, and building construction activities. Construction activities associated with the Project would be sporadic, transitory, and short term in nature. OEHHA is responsible for developing and revising guidelines for performing health risk assessments (HRAs) under the State’s the Air Toxics Hot Spots Program Risk Assessment (AB 2588) regulation. According to the SCAQMD, under the new OEHHA guidelines, a typical 1-acre office project with a 6-month construction duration would likely result in a significant health risk impact with regard to construction emissions.

As project construction would disturb more than one acre and would last more than 6-months, this refined Health Risk Assessment (HRA) was conducted to provide a Project and site specific risk analysis associated with construction activities. This report summarizes the results of the refined HRA. The findings of the analyses are as follows:

- The project would result in potential significant cancer risk prior to mitigation. With the implementation of mitigation measure MM-AQ-1, cancer risk would be reduced to below regulatory thresholds. Therefore, the project would not expose sensitive receptors to significant cancer risk.
- The project would result in non-cancer prior to mitigation that is below regulatory thresholds. With the implementation of mitigation measure MM-AQ-1, non-cancer risk would be further reduced. Therefore, the project would not expose sensitive receptors to significant non-cancer risk.

SECTION 1

Introduction

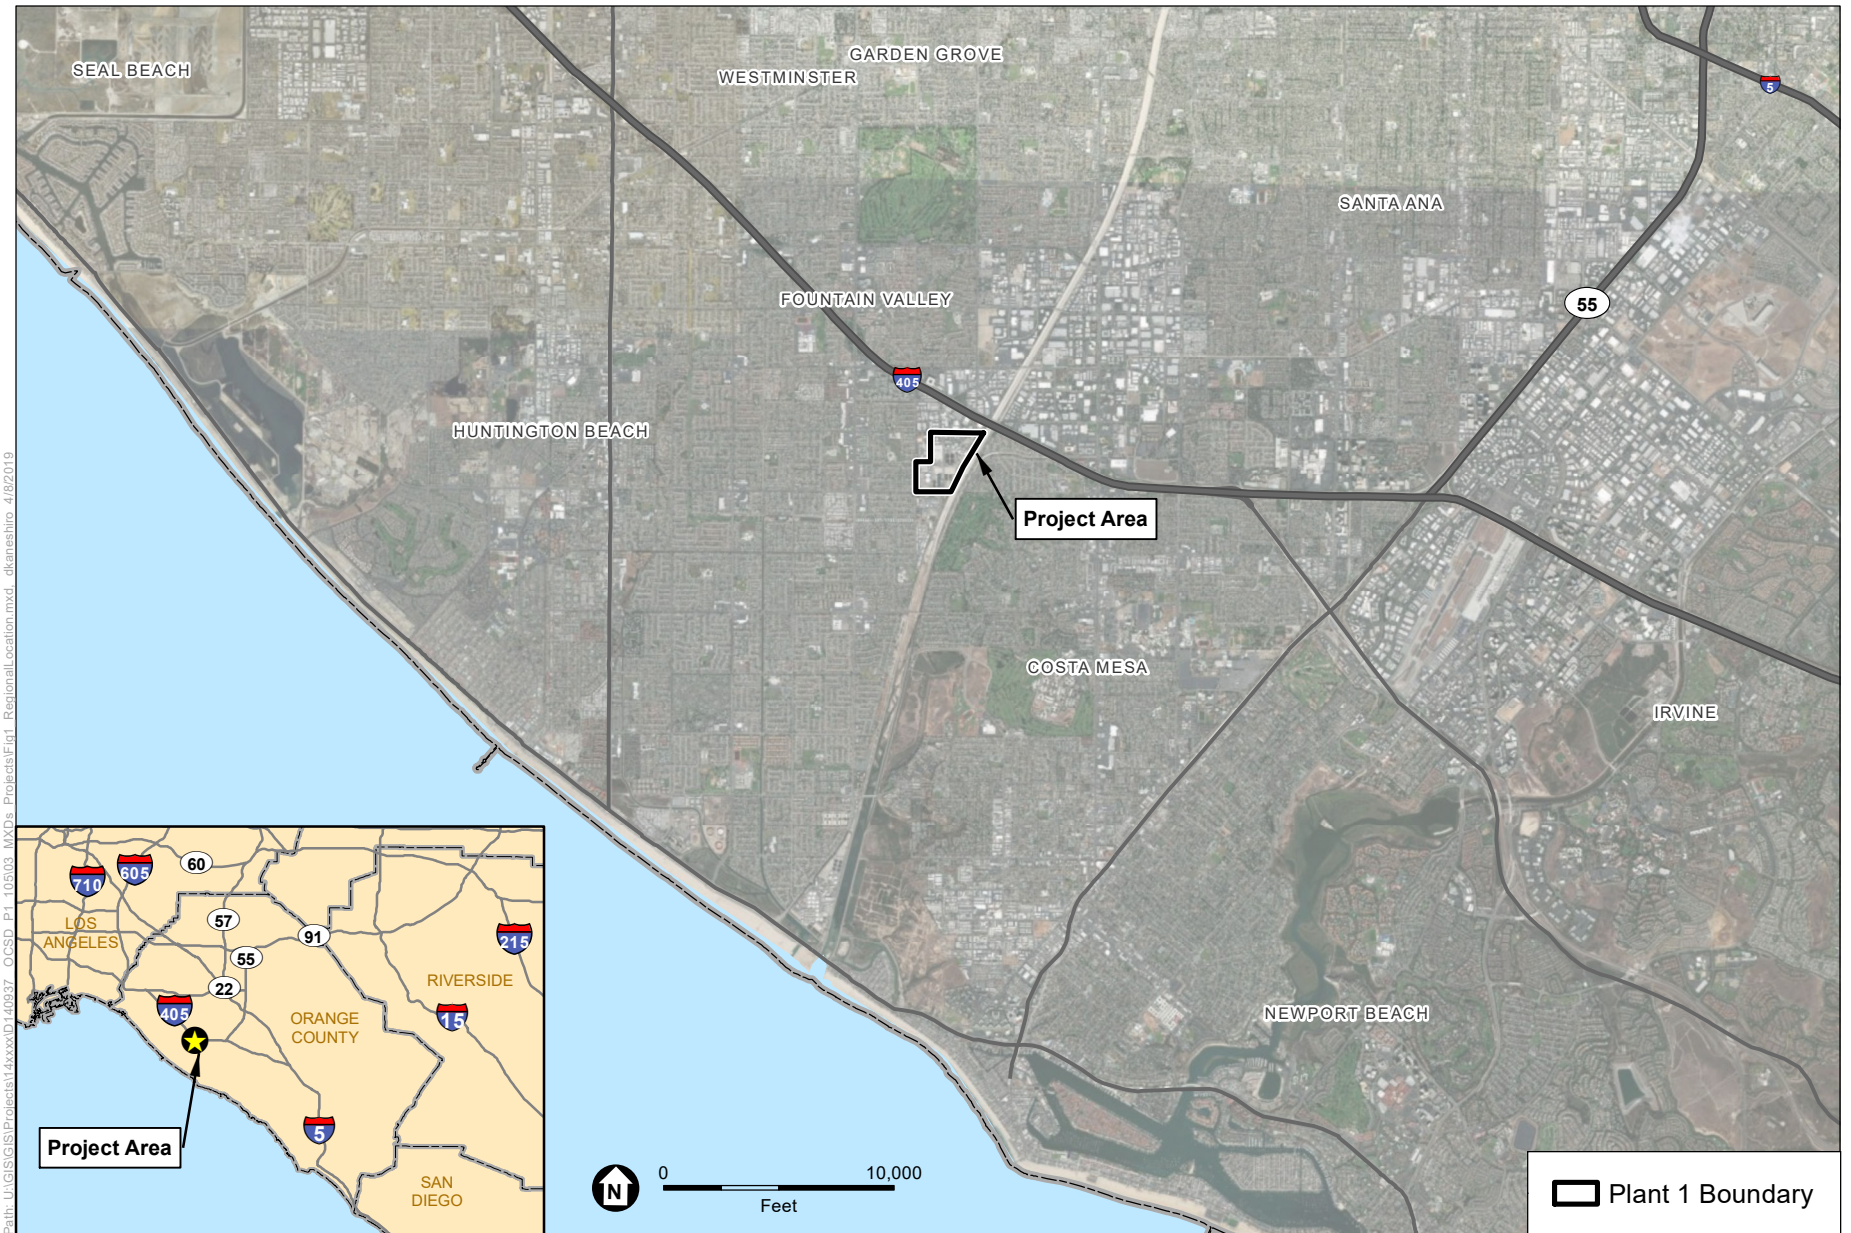

1.1 Project Introduction

1.1.1 Existing Conditions

The Orange County Sanitation District (OCSD) proposes to implement the Headworks Rehabilitation and Expansion Project at the Plant 1 wastewater treatment facility located in Fountain Valley, California (Project No. P1-105; referred to herein as the “proposed project”). The headworks facilities at OCSD's Plant No. 1 include Headworks No. 1 and Headworks No. 2. Headworks No. 1 was built and modified in the 1950s and 1960s, and is currently out of service, except for influent pumping that can be used when capacity is needed for peak storm flows. Headworks No. 2 began in operation in 1989 and is more than 25 years old. Due to the severe duty and corrosive atmosphere of the headworks processes, some structures and equipment associated with Headworks No. 2 is damaged and/or corroded. The proposed project is intended to extend the useful life of Headworks No. 2, as well as increase the influent pumping capacity of Headworks No. 2 so that Headworks No. 1 can be demolished. The proposed project would not change the existing total capacity of the headworks facilities at Plant 1 (i.e., 320 million gallons per day [mgd]).

OCSD facilities are located in northwestern Orange County, California as depicted on **Figure 1, Regional Location**. The proposed project would be located entirely within OCSD Plant 1 boundary. Plant 1 is located in the City of Fountain Valley, which is geographically located just north of the cities of Huntington Beach, Costa Mesa, and Newport Beach, and just south of the cities of Santa Ana and Anaheim. Plant 1 is a 112-acre wastewater treatment plant and is characterized as a developed industrial site containing numerous structures that vary in height, mass and function. Plant 1 is located at 10844 Ellis Avenue and is bound by Ellis Avenue to the north, the Orange County Water District (OCWD) and Ward Street to the west, Garfield Avenue to the south, and the Santa Ana River (SAR) and SAR Trail to the east.

Commercial uses are located across Ellis Avenue and Interstate 405 is located approximately 0.15 miles north of Plant 1. Residential neighborhoods are located west of Ward Street with the nearest residential property being approximately 100 feet west of the project site across Ward Street with active construction occurring more than 1,900 feet from the nearest residential location west of Ward Street. Additional residential neighborhoods are located east of the SAR Trail approximately 400 feet from the project site boundary and 500 feet from where construction activities will occur. Industrial uses are located to the south across Garfield Avenue and recreational uses exist along the SAR Trail, approximately 150 feet to the east of the construction

Headworks Rehabilitation and Expansion Project (Project No. P1-105)

Figure 1
Regional Location

activities. The Fountain Valley General Plan designates Plant No. 1 as a Specific Plan Area and is zoned as Specific Plan-Orange County Sanitation District.

The project area is specifically located within the northeastern portion of Plant 1, east of the OCWD property. The project area is depicted on **Figure 2, Project Area** and totals approximately 7 acres. This project area captures the footprint and associated staging areas needed for demolition, construction, and rehabilitation activities.

1.1.2 Project Description

The proposed project includes rehabilitation of existing process facilities; demolition of the Metering and Diversion Structure, Headworks No. 1 Structure, Power Building 3A, Chlorine Building, Headworks Odor Control structure, and multiple chemical facilities; and construction of new structures and a new tunnel extension to the new Power Building 3. Rehabilitation, demolition, and new structures associated with the proposed project are described further below. **Figure 3, Demolition and Rehabilitation Plan** depicts existing structures to be demolished or rehabilitated; **Figure 4, New Facilities Plan** depicts the new structures that would be constructed.

Rehabilitation

The following existing structures on Plant 1 would be subject to mechanical and/or electrical rehabilitation as part of the proposed project:

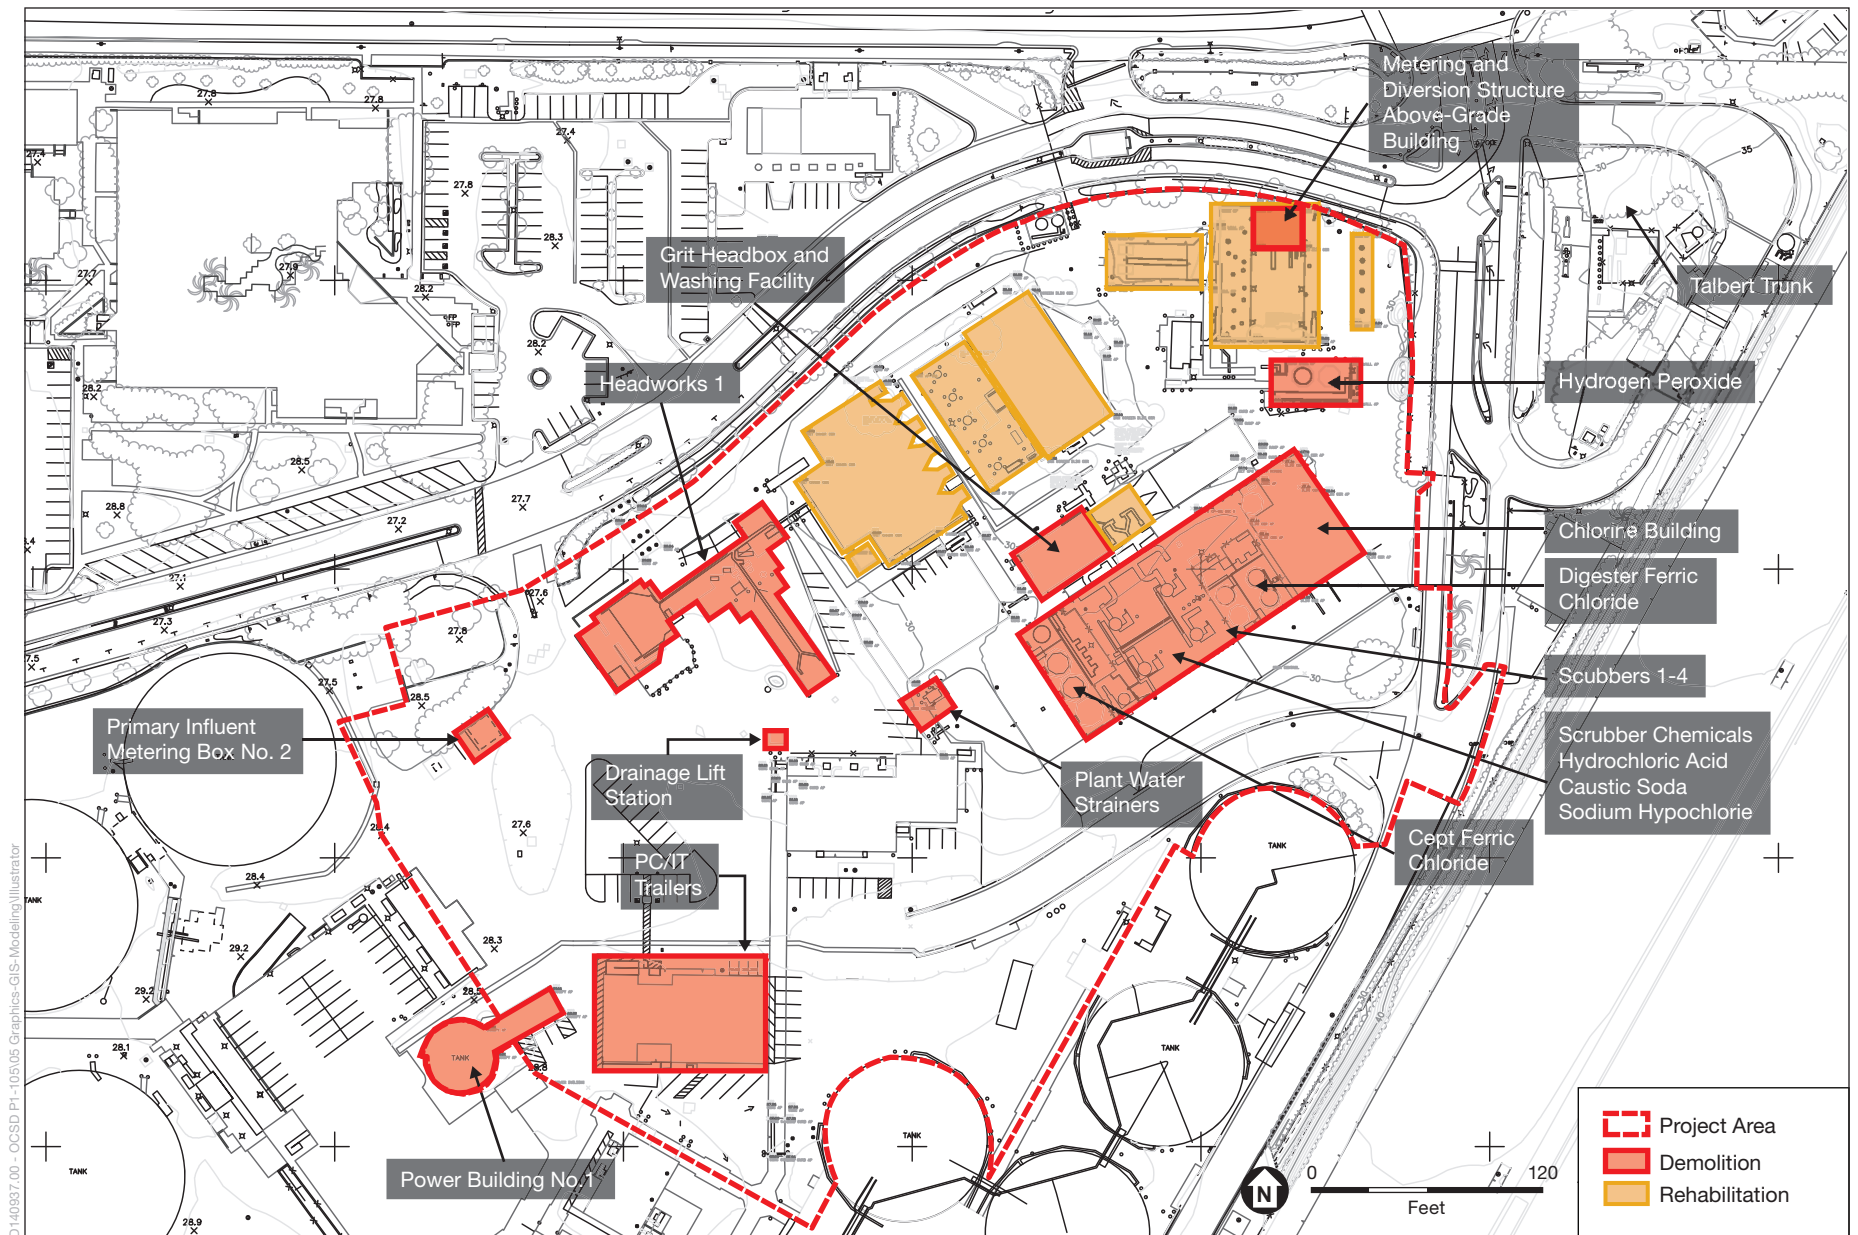

- **Metering and Diversion (M&D) Box:** Below-grade, water-bearing, enclosed structure. The box gives capability to divert flow from the incoming sewer trunks. Structural rehabilitation of walls and pipelines.
 - **M&D Structure (Below grade):** Enclosed structure that measures flow from the sewer trunks through large pipelines. Structural and mechanical rehabilitation throughout the structure.
 - **Sunflower Pump Station:** Below-grade, open structure housing two approximate 10-foot diameter screw pumps. Both pumps would be replaced in-kind.
 - **Bar Screen Facility:** Above-grade, approximately 35 feet high, enclosed building housing four mechanical bar screens. Complete mechanical rehabilitation with two additional bar screens being provided.
 - **Bin Loading Building:** Above-grade, enclosed, two-story building for handling of screened material. Complete mechanical rehabilitation.
1. **Main Sewage (Influent) Pump Station:** Below-grade, enclosed structure housing five main sewage pumps. Complete mechanical rehabilitation.

Headworks Rehabilitation and Expansion Project (Project No. P1-105)

Figure 4
New Facilities Plan

- **Grit Basins:** Above-grade, water-bearing structure for grit removal. Complete mechanical rehabilitation.
- **PI Splitter Box:** Above-grade, water-bearing structure for flow splitting. Complete mechanical rehabilitation.
- **Influent Sampling Building:** Above-grade, 13 feet high, enclosed building that houses two automatic samplers. Complete mechanical rehabilitation.
- **Existing Tunnels:** Rehabilitation of piping, cable trays, electrical wiring, and supports in Tunnels 1 through 7.

Demolition

Demolition of existing facilities would generally include removal of concrete, steel, mechanical equipment, piping, electrical wiring, raceways and ductbanks, as well other utilities which may be present. The following existing structures on Plant 1 would be demolished as part of the proposed project:

- **M&D Structure (Above-Grade):** An 830 sq ft, 12.5 ft high, above-grade building on top of the below-grade M&D Structure. Houses electrical and instrumentation equipment and a restroom.
- **Grit Headbox and Washing Facility:** A facility containing grit handling equipment, that includes a 112 sq ft, 13 ft high, above-grade headbox and a 1056 sq ft, partially below and above grade washing facility. The washing facility extends 14 ft below grade at its lowest point and has a deck that extends 6 ft above grade.
- **Headworks No. 1 Structure:** The structure includes the following: a 2,000 sq ft, 10 ft high, above-grade, partial water bearing structure that also includes an electrical room; a 2,900 sq ft, 10 ft high grit basin with grit removal equipment and an 18 ft high grit conveyor and truck hopper; a 2000 sq ft, 20 ft below grade enclosed water bearing feed channel; a 1,400 sq ft, 23 ft below-grade enclosed pump station housing influent pumps.
- **Primary Influent Metering Box No. 2:** A 289 sq ft, 10 ft deep, below-grade structure containing a 72" reinforced concrete pipe and flow meter that measures flow leaving Headworks 1.
- **Drainage Lift Station:** An 80 sq ft, 18 ft deep, below-grade structure containing 2 drainage sump pumps. The lift station collects storm water collected in the area of existing Power Building 3A.
- **Plant Water Strainer Station:** A 180 sq ft above-grade pipe station. The station is a slab on grade with no walls. A 12" plant water pipe rises above grade over the pad for access to a water strainer. This system is no longer in service.

- **Chlorine Building:** A 3,800 sq ft, 26 ft high, above-grade building consisting of bulk chlorine storage and chlorinator rooms, an electrical room, and a plant air compressor located outside the building. All mechanical and chlorine equipment have been removed from the building as part of a previous project.
- **Headworks Odor Control and Chemical Facility:** A 14,800 sq ft above-grade facility consisting of the following facilities:
 - Chemical Odor Control Scrubbers: Four 35 ft tall odor scrubbing vertical towers.
 - Sodium Hypochlorite: One bulk storage tank and chemical feed pumps.
 - Hydrochloric Acid: One bulk storage tank and chemical feed pumps.
 - Caustic Soda: One bulk storage tank and chemical feed pumps.
 - Ferric Chloride: Four bulk storage tanks and chemical feed pumps.
- **Hydrogen Peroxide Facility:** A 1,600 sq ft above-grade facility with one bulk storage tank and chemical feed pumps.

New Structures

The following structures would be constructed as part of the proposed project. New above-grade structures would range between 18 and 39 feet in height.

- **Grit Pump Station:** A 2,700 sq ft, 18 ft deep, below-grade, open concrete structure housing grit pumps. The pump station includes a 295 sq ft, 15 above-grade grit headbox.
- **Grit Handling Building:** A 3,100 sq ft, 28 ft high, above-grade, one story, enclosed concrete building housing grit handling equipment.
- **Headworks Odor Control Facility:** Four new 39 ft high vertical chemical odor scrubbers. The scrubbers are above grade and sit on a 4,300 sq ft concrete pad.
- **Ferric Chloride Facility:** A 3,200 sq ft above grade chemical station containing three ferric chloride storage tanks and pumps. The station includes a 12 ft high canopy over the pumps. The chemical tanks rise 24 ft above grade.
- **Chemical Facilities for new Odor Scrubbers:** Caustic Soda (one tank), Sodium Hypochlorite (two tanks), Hydrochloric Acid (one tank). Tanks would be no taller than 20 feet.
- **Headworks Electrical Building:** Above-grade, one story, enclosed concrete electrical building.
- **Power Building 3:** A 11,200 sq ft, 18 ft high, above-grade, one story, enclosed concrete electrical building that will contain motor control centers, switchgear, and transformers.

Will have a 12.5 ft deep basement spanning the full floor area. The transformers will be located outside of the building.

- **Headworks Standby Power Building:** A 6,700 sq ft, 26 ft high, above-grade, one story, enclosed concrete electrical building housing 4 diesel standby generators and an air compressor room. Will have a partial basement and a below-grade fuel tank.
- **Tunnel 5 Extension:** New below-grade concrete utility tunnel to Power Building 3. The tunnel is approximated 200 ft in the length and extends 15 ft below grade.

1.1.3 Project Construction

Construction Schedule

It is anticipated that the construction phase of the proposed project would begin in 2019 and would take approximately 8 years to complete. In general, construction activities would occur between 7:00 a.m. and 8:00 p.m., Monday through Friday. **Table 1, Construction Phase Duration** summarizes the proposed construction and estimated durations for those activities. Rehabilitation of existing facilities will occur from start to finish of the proposed project and will be restricted to the dry-weather season only.

TABLE 1
CONSTRUCTION PHASE DURATION

Type of Construction	Estimated Duration
Demolition	10 months
Site Preparation/Grading/Excavation	19 months
Building Construction (Rehabilitation)	45 months ¹
Building Construction (New)	51 months
Total Construction Phase Duration	8 years

¹ Rehabilitation of existing facilities would occur from project start to finish and would be restricted to the dry-weather season only.

Construction Activities

All construction activities associated with the proposed project would occur within the Plant 1 boundaries. Construction equipment, vehicles, personnel, and materials staging areas would be located onsite at Plant 1. Access to Plant No. 1 would primarily utilize the I-405 Freeway, the Euclid Street off-ramp, Ellis Avenue, Ward Street and Garfield Avenue. Construction traffic would utilize the entrance along Garfield Avenue. The follow subsections provide descriptions of the various aspects of the proposed project's construction phase. **Table 2, Construction Heavy Equipment** summarizes heavy equipment that will be used during construction of the proposed project.

TABLE 2
CONSTRUCTION HEAVY EQUIPMENT

Equipment Type	Estimated Quantity
Dirt Truck	1
Skidsteer	2
Wheel Loader	1
Backhoe Loader	3
Dozer	2
Trackhoe	2
Trackhoe with Hammer Attachment	1
Water Truck	1
Concrete Mixer	2
Crane	2
Telehandler	1
Forklift	2
Pile Driver	1
Compactor	1
Paver	1
Generator	1
Groundwater Pump	1

Rehabilitation

The proposed project includes the mechanical and/or electrical rehabilitation of various facilities on Plant 1. Rehabilitation would be completed using hand tools, concrete mixers, cranes, telehandlers, forklifts, elevated work platforms, pavers, backhoe loaders. Excavation associated with rehabilitation would be minor; excavated soils would be reused onsite as backfill.

Demolition

The proposed project would demolish 11 existing structures, totaling approximately 12,500 cubic yards of construction material. In addition, 4,200 cubic yards of soil will be excavated and removed from the site during demolition of existing facilities and 12,500 cubic yards of soil will be imported for backfill. Generally, ground disturbance during demolition would not extend deeper than 25 feet; concrete below this depth would be left in place. Demolition would be completed using dirt trucks, skid steers, wheel loaders, backhoe loaders, dozers, track hoes, track hoes with hammer attachment, and water trucks. Construction waste would be disposed of at the Frank R. Bowerman Landfill located at 11002 Bee Canyon Access Road in the City of Irvine.

New Structures

The proposed project would construct seven new above-grade structures and two below-grade structures. Each new structure will require the installation of piles, which would be driven to a depth of approximately 80 feet. Equipment needed for construction of new structures would include hand tools, dirt trucks, concrete mixers, cranes, telehandlers, forklifts, pile drivers,

elevated work platforms, skid steers, wheel loaders, backhoe loaders, dozers, track hoes, water trucks, compactors, pavers, generators, and groundwater pumps. Due to soil conditions (clays), only a small portion of excavated soil is re-usable as fill for new construction. Unusable excavated soil material will be hauled offsite. Approximately 21,300 cubic yards of soil will be exported, and 15,750 cubic yards of soil will be imported during construction of new facilities.

Construction Work Force and Truck Trips

Up to 150-200 workers per day would be required during the peak construction phase of the proposed project. Construction activities associated with the proposed project will include haul truck trips, construction material truck trips and employee trips.

1.1.4 Project Operation and Maintenance

Full operation of all components of the proposed project is estimated to commence in 2027, and operate as needed 24 hours per day, 7 days a week. Operation of proposed facilities would require periodic maintenance, daily staffing, and periodic deliveries similar to existing facilities. The proposed facilities are anticipated to require a nominal increase in the number of employees as the existing facilities. Therefore, the proposed project would not require a significant increase in OCSD full-time employees for operation and maintenance of rehabilitated and newly constructed facilities. No changes in the number of truck trips associated with chemical deliveries would occur with the proposed project. Therefore, there is no new operational health risk associated with the proposed project and therefore not operational health risk is calculated.

1.2 Existing Conditions

Climate

The project area is located in the City of Fountain Valley within the South Coast Air Basin (SCAB), which is under the jurisdiction of the South Coast Air Quality Management District (SCAQMD). The SCAB is a 6,600-square-mile coastal plain bounded by the Pacific Ocean to the southwest and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east. The SCAB includes the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties, and all of Orange County.

The ambient concentrations of air pollutants are determined by the amount of emissions released by sources and the atmosphere's ability to transport and dilute such emissions. Natural factors that affect transport and dilution include terrain, wind, atmospheric stability, and sunlight. Therefore, existing air quality conditions in the area are determined by such natural factors as topography, meteorology, and climate, in addition to the amount of emissions released by existing air pollutant sources.

Atmospheric conditions such as wind speed, wind direction, and air temperature gradients interact with the physical features of the landscape to determine the movement and dispersal of air pollutants. The topography and climate of southern California combine to make the SCAB an area of high air pollution potential. The SCAB is a coastal plain with connecting broad valleys and low hills, bounded by the Pacific Ocean to the west and high mountains around the rest of the

perimeter. The general region lies in the semi-permanent high-pressure zone of the eastern Pacific, resulting in a mild climate tempered by cool sea breezes with light average wind speeds. The usually mild climatological pattern is disrupted occasionally by periods of extremely hot weather, winter storms, or Santa Ana winds. During the summer months, a warm air mass frequently descends over the cool, moist marine layer produced by the interaction between the ocean's surface and the lowest layer of the atmosphere. The warm upper layer forms a cap over the cool marine layer and inhibits the pollutants in the marine layer from dispersing upward. In addition, light winds during the summer further limit ventilation. Furthermore, sunlight triggers the photochemical reactions that produce ozone.

Based on past climate records from the Western Regional Climate Center (WRCC), the average annual maximum temperature in the area is 68 degrees Fahrenheit (°F) and the average annual minimum temperature is 55° F. The average precipitation in the area is about 11 inches annually, occurring primarily from December through March.¹

Toxic Air Contaminants (TACs)

The SCAQMD periodically assesses levels of TACs in the Air Basin. TACs refer to a diverse group of “non-criteria” air pollutants that can affect human health. TACs are classified as carcinogenic and non-carcinogenic, where carcinogenic TACs can cause cancer and non-carcinogenic TAC can cause acute and chronic impacts to different target organ systems (e.g., eyes, respiratory, reproductive, developmental, nervous, and cardiovascular).

The California Air Resources Board (CARB) and the Office of Environmental Health Hazard Assessment (OEHHA) determine if a substance should be formally identified, or “listed,” as a TAC in California. The complete list of such substances is located at www.arb.ca.gov/toxics/id/taclist.htm.

Diesel particulate matter (DPM), which is emitted in the exhaust from diesel engines, was listed by the state as a TAC in 1998. DPM has historically been used as a surrogate measure of exposure for all diesel exhaust emission. DPM consists of fine particles (Fine particles have a diameter less than 2.5 micrometer), including a subgroup of ultrafine particles (ultrafine particles have a diameter less than 0.1 micrometer). Collectively, these particles have a large surface area which makes them an excellent medium for absorbing organics. The visible emissions in diesel exhaust include carbon particles or “soot.” Diesel exhaust also contains a variety of harmful gasses and cancer-causing substances.

Exposure to DPM may be a health hazard, particularly to children whose lungs are still developing and the elderly who may have other serious health problems. DPM levels and resultant potential health effects may be higher in close proximity to heavily traveled roadways with substantial truck traffic or near industrial facilities. According to CARB, DPM exposure may lead to the following adverse health effects: (1) aggravated asthma; (2) chronic bronchitis;

¹ Western Regional Climate Center (WRCC). 2016. Newport Beach Harbor California (046175) Period of Record Monthly Climate Summary.

(3) increased respiratory and cardiovascular hospitalizations; (4) decreased lung function in children; (5) lung cancer; and (6) premature deaths for people with heart or lung disease.^{2 3}

Existing Health Risk in the Surrounding Area

Between July 2012 and June 2013, the SCAQMD conducted the Multiple Air Toxics Exposure Study (MATES IV), which is a follow-up to previous air toxics studies conducted in the Air Basin, analyzes the potential risk to residents based on their location within the SCAQMD's jurisdiction as well as their exposure to toxic air contaminants including DPM. The MATES IV Final Report was issued in May 2015. The study, based on actual monitored data throughout the Air Basin, consisted of several elements. Approximately 68 percent of the risk is attributed to DPM emissions, approximately 22 percent to other toxics associated with mobile sources (including benzene, butadiene, and formaldehyde), and approximately 10 percent of all airborne carcinogenic risk is attributed to stationary sources (which include industries and other certain businesses, such as dry cleaners and chrome plating operations).⁴

The SCAQMD has prepared maps that show regional trends in estimated outdoor inhalation cancer risk from toxic emissions, as part of an ongoing effort to provide insight into relative risks, as part of the MATES IV study. The maps depict the estimated number of potential cancers per million people associated with a lifetime of breathing air toxics (24 hours per day outdoors for 70 years). According to the MATES IV study, the background potential cancer risk per million people within the Project area is estimated at up to 839 per million (compared to an overall South Coast Air Basin-wide risk of 418 per million).⁵ However, the visual resolution available in the map is 1 kilometer by 1 kilometer and, thus, impacts from individual facilities for individual neighborhoods are not discernable on this map. In general, the risk for the area is consistent with the urban areas of Fountain Valley. Generally, the risk from air toxics is lower near the coastline: it increases inland, with higher risks concentrated near diesel sources (e.g., freeways, airports, and ports). These model estimates were based on monitoring data collected at 10 fixed sites within the SCAB.

1.3 Sensitive Receptors

Certain population groups, such as children, elderly, and acutely and chronically ill persons (especially those with cardio-respiratory diseases), are considered more sensitive to the potential effects of air pollution than others. The following are land uses (sensitive sites) where sensitive receptors are typically located: schools, playgrounds and childcare centers, long-term health care facilities, rehabilitation centers, convalescent centers, hospitals, retirement homes, and

residences.⁶ Nearest existing sensitive uses in the vicinity of the Project site include the following:

- Residential neighborhoods are located west of Ward Street with the nearest residential property being approximately 100 feet west of the project site across Ward Street with active construction occurring more than 1,900 feet from the nearest residences.
- Additional residential neighborhoods are located east of the SAR Trail approximately 400 feet from the project site boundary and 500 feet from where construction activities will occur.

All other air quality sensitive receptors are located at greater distances from the Project Site, and would be less impacted by Project emissions. Impacts are quantified for the sensitive receptors listed here.

1.4 Regulatory Setting

California Air Resources Board On-Road and Off-Road Vehicle Rules

In 2004, CARB adopted an Airborne Toxic Control Measure (ATCM) to limit heavy-duty diesel motor vehicle idling in order to reduce public exposure to DPM and other TACs. The ATCM applies to diesel-fueled commercial vehicles with gross vehicle weight ratings greater than 10,000 pounds that are licensed to operate on highways, regardless of where they are registered. This ATCM does not allow diesel-fueled commercial vehicles to idle for more than 5 minutes at any given time.

In 2008 CARB approved the Truck and Bus regulation to reduce NO_x, PM₁₀, and PM_{2.5} emissions from existing diesel vehicles operating in California. The requirements were amended in December 2010 and apply to nearly all diesel fueled trucks and busses with a gross vehicle weight rating greater than 14,000 pounds. For the largest trucks in the fleet, i.e., those with a gross vehicle weight rating greater than 26,000 pounds, there are two methods to comply with the requirements. The first method is for the fleet owner to retrofit or replace engines, starting with the oldest engine model year, to meet 2010 engine standards, or better. This is phased over eight years, starting in 2015 and would be fully implemented by 2023, meaning that all trucks operating in the State subject to this option would meet or exceed the 2010 engine emission standards for NO_x and PM by 2023. The second option, if chosen, requires fleet owners, starting in 2012, to retrofit a portion of their fleet with diesel particulate filters achieving at least 85 percent removal efficiency, so that by January 1, 2016 their entire fleet is equipped with diesel particulate filters. However, diesel particulate filters do not typically lower NO_x emissions. Thus, fleet owners choosing the second method must still comply with the 2010 engine emission standards for their trucks and busses by 2020.

In addition to limiting exhaust from idling trucks, CARB recently promulgated emission standards for off-road diesel construction equipment of greater than 25 horsepower (hp) such as

⁶ SCAQMD, Guidance Document for Addressing Air Quality Issues in General Plans and Local Planning. Chapter 2: Air Quality Issues Regarding Land Use. May, <http://www.aqmd.gov/docs/default-source/planning/air-quality-guidance/chapter-2---air-quality-issues-regarding-land-use.pdf>, accessed May 2017.

bulldozers, loaders, backhoes and forklifts, as well as many other self-propelled off-road diesel vehicles. This regulation adopted by the CARB on July 26, 2007, aims to reduce emissions by installation of diesel soot filters and encouraging the retirement, replacement, or repower of older, dirtier engines with newer emission controlled models. Implementation is staggered based on fleet size (which is the total of all off-road horsepower under common ownership or control), with the largest fleets to begin compliance January 1, 2014. Each fleet must demonstrate compliance through one of two methods. The first method is to calculate and maintain fleet average emissions targets, which encourages the retirement or repowering of older equipment and rewards the introduction of newer cleaner units into the fleet. The second method is to meet the Best Available Control Technology (BACT) requirements by turning over or installing Verified Diesel Emission Control Strategies (VDECS) on a certain percentage of its total fleet horsepower. The compliance schedule requires that BACT turn overs or retrofits (VDECS installation) be fully implemented by 2023 in all equipment in large and medium fleets and across 100 percent of small fleets by 2028.

Toxic Air Contaminant Identification and Control Act

The Toxic Air Contaminant Identification and Control Act (Assembly Bill [AB] 1807, Chapter 1047, Statutes of 1983) created the California Air Toxics Program in 1983. It established a two-step process of risk identification and risk management to address potential health effects associated with public exposure to toxic substances in the air. In the risk identification step, CARB and the Office of Environmental Health Hazard Assessment (OEHHA) determine if a substance should be formally identified, or “listed,” as a TAC in California. Since program inception, a number of such substances have been identified and listed. In 1993, legislative amendments were enacted for the program to identify the 189 federal hazardous air pollutants (HAPs) as TACs.

In the risk management step, CARB reviews emission sources of an identified TAC to determine whether regulatory action is needed to reduce the risk. Based on results of that review, CARB has promulgated a number of airborne toxic control measures (ATCMs), both for mobile and stationary sources. In 2004, CARB adopted an ATCM to limit heavy-duty diesel motor vehicle idling in order to reduce public exposure to diesel PM and other TACs. The measure applies to diesel-fueled commercial vehicles with gross vehicle weight ratings greater than 10,000 pounds that are licensed to operate on highways, regardless of where they are registered. This measure does not allow diesel-fueled commercial vehicles to idle for more than five minutes at any given time. These diesel-related measures are critical in reducing the statewide cancer risk and creating healthier communities.

CARB Air Toxics “Hot Spots” Information and Assessment Act of 1987

The California Air Toxics Program is supplemented by the Air Toxics “Hot Spots” program, which became law (AB 2588, Statutes of 1987) in 1987. In 1992, the AB 2588 program was amended by Senate Bill 1731 to require facilities that pose a significant health risk to the community to perform a risk reduction audit and reduce their emissions through implementation of a risk management plan. Under this program, which is required under the Air Toxics “Hot

Spots” Information and Assessment Act (Section 44363 of the California Health and Safety Code), facilities are required to report their air toxics emissions, assess health risks, and notify nearby residents and workers of significant risks when present. In March 2015, the OEHHA adopted “The Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments” in accordance with the Health and Safety Code, Section 44300. The Final Guidance Manual incorporates the scientific basis from three earlier developed Technical Support Documents to assess risk from exposure to facility emissions. The 2015 OEHHA Final Guidance has key changes including greater age sensitivity in particular for children, decreased exposure durations, and higher breathing rate profiles. Because cancer risk could be up to three times greater using this new guidance, it may result in greater mitigation requirements, more agency backlog, and increased difficulty in getting air permits. Regardless of the change in calculation methodology, actual emissions and cancer risk within South Coast Air Basin has declined by more than 50 percent since 2005.

California’s Diesel Risk Reduction Program

CARB identified particulate emissions from diesel-fueled engines as TACs in August 1998. Following the identification process, CARB was required by law to determine if there is a need for further control, which led to the risk management phase of the program.

For the risk management phase, CARB formed the Diesel Advisory Committee to assist in the development of a risk management guidance document and a risk reduction plan. With the assistance of the Diesel Advisory Committee and its subcommittees, CARB developed the Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles and the Risk Management Guidance for the Permitting of New Stationary Diesel-Fueled Engines. The Diesel Advisory Committee approved these documents on September 28, 2000, paving the way for the next step in the regulatory process: the control measure phase.

During the control measure phase, specific statewide regulations designed to further reduce DPM emissions from diesel-fueled engines and vehicles have and continue to be evaluated and developed. The goal of each regulation is to make diesel engines as clean as possible by establishing state-of-the-art technology requirements or emission standards to reduce DPM emissions. To date, the most comprehensive study of air toxics in the SCAB is the Multiple Air Toxics Exposure Study (MATES IV), conducted by SCAQMD in 2015. This study is detailed under the SCAQMD in the Regional Regulatory Setting below.

CARB Air Quality and Land Use Handbook

The CARB published the Air Quality and Land Use Handbook in April 2005 to serve as a general guide for considering impacts to sensitive receptors from facilities that emit TAC emissions. The recommendations provided therein are voluntary and do not constitute a requirement or mandate for either land use agencies or local air districts. The goal of the guidance document is to protect sensitive receptors, such as children, the elderly, acutely ill, and chronically ill persons, from exposure to TAC emissions. Some examples of CARB’s siting recommendations include the following: (1) avoid siting sensitive receptors within 500 feet of a freeway, urban road with 100,000 vehicles per day, or rural roads with 50,000 vehicles per day; (2) avoid siting sensitive

receptors within 1,000 feet of a distribution center (that accommodates more than 100 trucks per day, more than 40 trucks with operating transport refrigeration units per day, or where transport refrigeration unit operations exceed 300 hours per week); (3) avoid siting sensitive receptors within 300 feet of any dry cleaning operation using perchloroethylene and within 500 feet of operations with two or more machines and (4) avoid siting sensitive receptors within 300 feet of a large gasoline dispensing facility (3.6 million gallons per year or more) or 50 feet of a typical gasoline dispensing facility (less than 3.6 million gallons per year).⁷

South Coast Air Quality Management District

Under SCAQMD Regulation XIV (Toxics and Other Non-Criteria Pollutants), and in particular Rule 1401 (New Source Review), all sources that possess the potential to emit TACs are required to obtain permits from SCAQMD. Permits may be granted to these operations if they are constructed and operated in accordance with applicable regulations, including new source review standards and air toxics control measures. SCAQMD limits emissions and public exposure to TACs through a number of programs. SCAQMD prioritizes TAC-emitting stationary sources based on the quantity and toxicity of the TAC emissions and the proximity of the facilities to sensitive receptors.

The Air Toxics Control Plan (March 2000, revised March 26, 2004) is a planning document designed to examine the overall direction of SCAQMD's air toxics control program. It includes development and implementation of strategic initiatives to monitor and control air toxics emissions. Control strategies that are deemed viable and are within SCAQMD's jurisdiction will each be brought to the SCAQMD Board for further consideration through the normal public review process. Strategies that are to be implemented by other agencies will be developed in a cooperative effort, and the progress will be reported back to the Board periodically.

As discussed previously, In May 2015 the SCAQMD completed the Multiple Air Toxics Exposure Study IV.⁸ MATES IV is a monitoring and evaluation study conducted in the SCAB and is a follow up to previous air toxics studies. The study is a follow up to the 2008 MATES III study and consists of several elements including a monitoring program, an updated emissions inventory of toxic air contaminants, and a modeling effort to characterize risk across the SCAB.⁹ The study focuses on the carcinogenic risk from exposure to air toxics.¹⁰ However, it does not estimate mortality or other health effects from particulate exposures.

SECTION 2

Health Risk Assessment

2.1 Significance Thresholds

Based on criteria set forth by the SCAQMD, the Project would expose sensitive receptors to substantial concentrations of toxic air contaminants if any of the following were to occur:¹¹

- The Project would emit carcinogenic materials or TACs that exceed the maximum incremental cancer risk of ten in one million or a cancer burden greater than 0.5 excess cancer cases (in areas greater than or equal to 1 in 1 million); or
- The Project would result in an acute or chronic hazard index of 1.0.

2.2 Methodology

The methodologies and assumptions used in this HRA are consistent with the guidance recommended by the OEHHA Air Toxic Hot Spots Program Risk Assessment Guidelines.¹² The OEHHA methodology used in this assessment uses a dose-response assessment to characterize risk from cancer due to inhaled TACs and the assessment of acute and chronic non-cancer hazards from DPM.

Based on the OEHHA guidance, the evaluation of potential health risks uses the following standard four-step risk assessment process:

1. Hazard Identification
2. Exposure Assessment
3. Dose-Response Assessment
4. Risk Characterization

Each step is described in detail below.

Hazard Identification

The hazard identification process is undertaken to determine what TACs are potentially present with respect to project construction, and if so, identifies what the pollutants of concern are along with their potential adverse health effects. In this HRA, the greatest potential for TAC emissions during Project construction would be related to diesel particulate matter emissions associated with

¹¹ South Coast Air Quality Management District, CEQA Air Quality Handbook, Chapter 6 (Determining the Air Quality Significance of a Project) and Chapter 10 (Assessing Toxic Air Pollutants), (1993); SCAQMD Air Quality Significance Thresholds, (March 2011), <http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf?sfvrsn=2>. Accessed June 2017.

¹² Office of Environmental Health Hazard Assessment. 2015. *Air toxics Hot Spots Program Guidance Manual for the Preparation of Health Risk Assessments*, <https://oehha.ca.gov/air/crnrr/notice-adoption-air-toxics-hot-spots-program-guidance-manual-preparation-health-risk-0>, February 2018.

heavy-duty equipment during demolition, grading and excavation, and building construction activities. Construction activities associated with the Project would be sporadic, transitory, and short term in nature. CARB has identified DPM as a TAC with potential cancer and chronic non-cancer effects.

DPM is the solid material in diesel exhaust, of which more than 90 percent has a diameter of less than 1 micron and is therefore a subset of PM_{2.5} and PM₁₀. Conservatively, the analysis uses PM₁₀ to represent DPM emissions. DPM historically has been used as a surrogate measure of exposure for whole diesel exhaust emissions. Diesel exhaust is a complex mixture of thousands of gases and fine particles (commonly known as soot). Examples of other constituents in DPM include polycyclic aromatic hydrocarbons, benzene, formaldehyde, acetaldehyde, acrolein, 1,3-butadiene, volatile organic compounds, and oxides of nitrogen. Diesel exhaust particles and gases are suspended in the air due to thermal buoyancy and the small size of the particles. The composition of diesel exhaust varies depending on engine type, operating conditions, fuel composition, lubricating oil, and presence of an emission control system. One of the main characteristics of diesel exhaust is the release of particles at a relative rate approximately 20 times greater than from gasoline-fueled vehicles, on an equivalent fuel basis. Diesel particulates are mainly aggregates of spherical carbon particles coated with inorganic and organic substances. The inorganic fraction primarily consists of small carbon (elemental carbon) particles ranging from 0.01 to 0.08 micron in diameter. The organic fraction consists of soluble organic compounds.¹³

As noted above, the greatest potential for TAC emissions would be related to diesel particulate matter emissions associated with heavy equipment operations during demolition, grading and excavation, and building construction activities. In addition, incidental amounts of toxic substances such as oils, solvents, and paints would be used. These products would comply with all applicable SCAQMD rules for their manufacture and use. The Project will be subject to several SCAQMD rules designed to limit exposure to TACs during construction activities. The Project would be required to comply with the CARB Air Toxics Control Measure that limits diesel powered equipment and vehicle idling to no more than 5 minutes at a location, and the CARB In-Use Off-Road Diesel Vehicle Regulation; compliance with these would minimize emissions of TACs during construction. The Project would also comply with the requirements of SCAQMD Rule 1403 if asbestos is found during demolition activities.

Exposure Assessment

The degree of the Project's exposure to DPM was evaluated under the exposure assessment portion of the HRA. This assessment starts with the quantification of DPM emissions, followed by dispersion modeling and an estimation of long-term exposure levels. The amount of DPM emissions generated by the project was determined using PM₁₀ from diesel exhaust as a surrogate. PM₁₀ emissions were modeled using the CalEEMod model. Assumptions and modeling used to determine PM₁₀ emissions are included in Appendix A.

¹³ California Air Resources Board and Office of Environmental Health Hazard Assessment, California Environmental Protection Agency. 1998. Proposed Identification of Diesel Exhaust as a Toxic Air Contaminant.

Detailed Modeling

Air dispersion models are often used to simulate atmospheric processes for situations where the spatial scale is in the tens of meters to tens of kilometers. Selection of air dispersion models depends on many factors, such as the characteristics of emission sources (point, area, volume, or line), the type of terrain (flat or complex) at the emission source locations, and source-receptor relationships. Air dispersion modeling was conducted using the American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD). AERMOD is a steady state, multiple-source, Gaussian dispersion model designed for use with emission sources situated in terrain where ground elevations can exceed the release heights of the emission sources (i.e., complex terrain). AERMOD is the United States Environmental Protection Agency's (U.S. EPA's) regulatory dispersion model specified in the Guideline for Air Quality Methods (Code of Federal Regulations, Title 40, Part 51, Appendix W). AERMOD is recommended for use by the SCAQMD, which has established its own modeling guidance for the model.¹⁴

The parameters used for dispersion modeling are based on the latest SCAQMD modeling guidance for AERMOD.¹⁵ The remaining portion of this section describes the assumptions used to conduct the AERMOD dispersion modeling analysis.

Emission Sources

Within AERMOD, diesel haul truck traffic was modeled as a line source comprised of separated volume sources along the potential haul route from the site north to the I-405. Once on the I-405, the emissions from these trucks blend into the daily truck traffic associated with the I-405 and therefore risk associated specifically with the project beyond entrance to the I-405 is not modeled. SCAQMD Rule 1401 which requires analysis of receptors within a quarter mile of a source which is significantly less than the distance modeled. Diesel exhaust emissions were modeled using a release height of 5 meters (16 feet), which is the estimated height of an exhaust stack above ground level for diesel trucks. The plume height was determined by multiplying the release height by a factor of 2, while the plume width was determined by using the roadway width plus 6 meters.

Area sources were used to model potential idling locations. It is conservatively assumed that trucks would idle for 5 minutes entering the site, 5 minutes once it gets to the construction activity location, and for 5 minutes prior to leaving the site.

Diesel onsite equipment use was modeled as a line volume or volume sources comprised of adjacent volume sources covering the area in which construction activities would occur. Similar to haul trucks, diesel exhaust emissions were modeled using a release height of 5 meters (16 feet), which is the estimated height of an exhaust stack above ground level for diesel trucks. The plume height was determined by multiplying the release height by a factor of 2, while the plume width

¹⁴ SCAQMD 2018. *SCAQMD Modeling Guidance for AERMOD*. <http://www.aqmd.gov/home/air-quality/air-quality-data-studies/meteorological-data/modeling-guidance>. Accessed February 2018.

¹⁵ SCAQMD 2018. *AERMOD Table 1 Meteorological Stations & Years of Meteorological data*. <http://www.aqmd.gov/home/air-quality/air-quality-data-studies/meteorological-data/aermod-table-1>. Accessed February 2018.

was determined by based on the width of the vehicles. Sources were modeled assuming a 13-hour work day consistent with the potential construction times identified in the Project Description.

Emission Rates

Emission rates for the AERMOD model were based on unitized 1 gram per second (g/sec) so the dispersion modeling results could be used to determine risk based on project-specific emission rates.

Meteorological Data

In order to run AERMOD, the following hourly surface meteorological data are required: wind speed, wind direction, ambient temperature, and opaque cloud cover. These meteorological variables are used to estimate air dispersion of pollutants in the atmosphere. Wind speed determines how rapidly pollutants are diluted and influences the rise of the emission plume in the air, thus affecting downwind pollutant concentrations. Wind direction determines where pollutants will be transported. The opaque cloud cover and upper air sounding data are used in calculations to determine other important dispersion parameters. These include atmospheric stability (a measure of turbulence and the rate at which pollutants disperse laterally and vertically) and mixing height (the vertical depth of the atmosphere within which dispersion occurs). The greater the mixing height is, the larger the volume of atmosphere is available to dilute the pollutant concentration.

The dispersion modeling for the project utilized pre-processed meteorological data from the John Wayne International Airport Meteorological Station, which is the station nearest to the project site, obtained from SCAQMD's website.¹⁶ This meteorological data set includes the years 2012, 2013, 2014, 2015, and 2016. This represents the latest available SCAQMD meteorological data for performing dispersion modeling.

Receptors

Discrete receptors were placed up to 3,000 feet to the west of the construction activities and up to 1,000 feet of the construction activities to the east. This was to ensure that residential receptors to both the east and west were accounted for. Based on SCAQMD's AERMOD modeling guidance, all receptors should be set to a height of 0.0 meters, so that ground-level concentrations are analyzed. SCAQMD recommends a spacing of no more than 100 meters for receptors that are within 1,000 meters of the project site. Receptor spacing for receptors to the east of the project site is 50 meters. Receptors spacing for receptors to the west of the project site is 100 meters. Note that while there is a school located within the receptor grid for the receptors west of the project site, these receptors were conservatively modeled as residential receptors. Risk to school students would be less than that reported for residential receptors.

¹⁶ SCAQMD 2018. AERMOD Table 1 Meteorological Stations & Years of Meteorological data. <http://www.aqmd.gov/home/air-quality/air-quality-data-studies/meteorological-data/aermod-table-1>. Accessed February 2018.

Terrain Data

The modeling analysis also included terrain data to assess impacts in three dimensions. The terrain data used for the analysis was from the digital elevation model data for the USGS National Elevation Dataset (NED).

Urban/Rural

The AERMOD model requires that the user specify whether a site should be modeled as either urban or rural. The urban option allows the user to incorporate the effects of increased surface heating from an urban area on pollutant dispersion under stable atmospheric conditions. This surface heating typically causes better dispersion, which results in lower pollutant concentrations.

Based on SCAQMD's AERMOD modeling guidance, all air quality impact analyses in the South Coast Air Basin should be executed using the urban modeling option. In addition, all sources should be modeled with urban effects using the population of the County where the project is located. As SCAQMD provides the various County populations within AQMD jurisdiction, the population of 3,010,232 for Orange County was used in the AERMOD run.¹⁷

Dose-Response Assessment

The dose-response assessment is the process of characterizing the relationship between exposure to diesel exhaust and the incidence of an adverse health effect in exposed populations. The dose to which receptors are exposed is the primary factor used to determine health risk (i.e., the potential exposure to TACs to be compared to applicable standards). Dose is a function of the concentration of a substance or substances in the environment and the duration of exposure to the substance. Dose is positively correlated with time, meaning that a longer exposure period would result in a higher exposure level for the maximally exposed individual. According to OEHHA, carcinogenic health risk assessments, which determine the exposure of sensitive receptors to TAC emissions, should be based on a 30-year exposure period for residential receptors and worker receptors and 9 for elementary school receptors; however, such assessments should be limited to the period or duration of activities associated with the proposed project. The construction period for the project is limited to sporadic activity over approximately 8 years. Therefore, for the residential receptors the health risk assessment presents exposure over 8 years, and assumes the worst case for construction beginning in the third trimester of an existing resident.

The estimation of potential inhalation cancer risk posed by exposure to DPM require a cancer potency factors. Cancer potency factors are expressed as the upper bound probability of developing cancer assuming continuous lifetime exposure to diesel exhaust at a dose of one milligram per kilogram of body weight, and are expressed in units of inverse dose as a potency slope (i.e., $[\text{mg/kg/day}]^{-1}$). A cancer potency factor when multiplied by the dose of a carcinogen

¹⁷ SCAQMD 2018. *SCAQMD Modeling Guidance for AERMOD*. <http://www.aqmd.gov/home/air-quality/air-quality-data-studies/meteorological-data/modeling-guidance>. Accessed February 2018.

gives the associated lifetime cancer risk. The cancer potency factor for DPM is 1.1 (mg/kg/day)⁻¹.^{18, 19}

The estimation of potential inhalation chronic and acute non-cancer effects posed by exposure to DPM requires chronic reference exposure levels (REL). A chronic REL is a concentration level (that is expressed in units of micrograms per cubic meter [$\mu\text{g}/\text{m}^3$] for inhalation exposures), at or below which no adverse health effects are anticipated following long-term exposure. The chronic REL for DPM is 5 $\mu\text{g}/\text{m}^3$.²⁰ There is no acute REL for DPM. The hazard index target organ for DPM is the respiratory system.

Health Risk Calculations

Health risk impacts were assessed using methodology provided in the 2015 OEHHA *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments*. For this risk assessment, the AERMOD dispersion model output was converted into specific cancer risks and non-cancer chronic health hazard impacts using a spreadsheet tool based on the HARP2 model developed by CARB, which was released March 2015.²¹

The results of this HRA were calculated based on identifying the maximum exposed individual (MEI). The location of the MEI for calculation of chronic non-cancer health hazards and cancer risks may vary depending on the haul route (either adjacent to the eastern side of the spreading basin or down the center of the spreading basin) and the mitigation scenario.

Health impacts are evaluated using a dose-response assessment, which describes the relationship between the amount of exposure to a substance (i.e., the dose) and the incidence or occurrence of injury (i.e., the response).²² In order to determine the total dose to offsite sensitive receptors, the applicable pathways of exposure and receptor locations were identified. The applicable exposure pathways determine the exposure algorithms that are used to estimate dose. After the exposure pathways were identified, the applicable fate and transport algorithms were used to estimate concentrations in the applicable exposure media (e.g., air) and the exposure algorithms were used to determine the substance-specific dose.

In accordance with the OEHHA Guidelines, the inhalation pathway was evaluated. For the inhalation pathway, dose is directly proportional to the breathing rate. As a conservative (i.e.,

¹⁸ In the HARP Model, used to evaluate cancer risk, the cancer potency factor for DPM from the inhalation pathway is derived from whole diesel exhaust. Therefore the inhalation impacts from speciated emissions of diesel exhaust are taken into account in the risk analysis.

health protective) approach, maximum breathing rates were used in this analysis. Also using the methodology outlined in the OEHHA Guidelines, the cancer risk from soil ingestion and dermal adsorption pathways were incorporated in the risk analysis. Intake parameters are provided in Appendix B and C.

Once dose is calculated, the risk of adverse health consequences is estimated for both cancer and non-cancer health effects. Cancer risk is calculated by accounting for cancer potency of the specific pollutant, age sensitivity, exposure duration, averaging time for lifetime cancer risk, and fraction of time spent at home (sensitive receptor). The Cancer Potency Factor (CPF) is specific for each pollutant and is determined through peer reviewed scientific studies. OEHHA has determined that DPM has an inhalation unit risk factor (URF) of $3.0\text{E-}4 \text{ (ug/m}^3\text{)}^{-1}$ and an oral slope factor of $1.1 \text{ (mg/kg-day)}^{-1}$.²³ The age sensitivity factor (ASF) accounts for greater susceptibility in early life, starting from the third trimester of pregnancy to 70 years. The fraction of time at home (FAH) takes into account the time actually residing at the sensitive receptor location and is specific for various age groups. For example, newborns are expected to reside at home for longer periods of time compared to school age children, and the elderly (retirees) are expected to spend more time at home compared to people of working age. Each age group has different exposure parameters, which require cancer risk to be calculated separately for each age group. CPF for DPM are identified in the Dose-Response Assessment section above, ASF and FAH values are presented in **Table 3**, *OEHHA Recommended Residential Daily Breathing Rates, Fraction of Time at Home and Age Sensitivity Factors for Residential Receptors*.

TABLE 3
OEHHA RECOMMENDED DAILY BREATHING RATES, FRACTION OF TIME AT HOME, AND AGE SENSITIVITY FACTORS FOR RESIDENTIAL RECEPTORS

Age Range	Age Sensitive Factor	Fraction of Time at Home	Daily Breathing Rate
3 rd Trimester and 0<2 Years	10	0.85	361
0<2 years	10	0.85	1090
2<16 Years	3	0.72	631
16-70 Years	1	0.73	260

SOURCE: OEHHA Air Toxics Hot Spots Program Guidance Manual. February 2015.

The estimation of cancer risk uses the following algorithms:

$$\text{Risk} = \text{Dose inhalation} \times \text{Inhalation CPF} \times \text{ASF} \quad (\text{Equation 1})$$

$$\begin{aligned} \text{Where: Dose inhalation} &= \text{CAIR} \times \text{DBR} \times \text{A} \times \text{EF} \times \text{ED} \times \text{FAH} / \text{AT} \quad (\text{Equation 2}) \\ \text{Inhalation CPF} &= \text{inhalation cancer potency factor} \\ \text{ASF} &= \text{age sensitivity factor} \end{aligned}$$

²³ Office of Environmental Health Hazard Assessment. 2015. *Air toxics Hot Spots Program Guidance Manual for the Preparation of Health Risk Assessments*, <https://oehha.ca.gov/air/crnrr/notice-adoption-air-toxics-hot-spots-program-guidance-manual-preparation-health-risk-0>, February 2018.

Where:

CAIR	=	concentration of compound in air in micrograms per cubic meter ($\mu\text{g}/\text{m}^3$)
DBR	=	breathing rate in liter per kilogram of body weight per day (L/kg-body weight/day)
A	=	inhalation absorption factor (1 for DPM)
EF	=	exposure frequency in days per year (day/year)
ED	=	exposure duration in years (year)
FAH	=	fraction of time at home
AT	=	averaging time period over which exposure is averaged in days (day)

The OEHHA recommended values for the parameters listed above were used in the HRA analysis. The daily breathing rate (DBR) used in the analysis was based on OEHHA recommendations which vary depending on age which are shown in Table 3. The recommended exposure frequency (EF) is 350 days per year which is equivalent to 0.96 (350 days / 365 days a year). The inhalation absorption factor (A) is assumed to be 1 for inhalation-based risk assessment.

As indicated in Equation 1 above, each age group has different exposure parameters which require cancer risk to be calculated separately for each age group. Values for FAH and ASF are also presented in Table 3. Once dose is calculated, cancer risk is calculated by accounting for cancer potency of the specific pollutant, and the ASF.

Non-cancer risks to health are calculated using a RELs developed by OEHHA to evaluate acute and chronic exposure including the elderly and the very young. As a conservative assumption, acute and chronic non-cancer health impact analyses do not take into account FAH. Cancer risks were calculated for the residential child and adult receptors by multiplying the exposure doses by the pollutant-specific CPF values.

2.3 Risk Analysis

For carcinogenic exposures, the cancer risk from DPM emissions from construction of the Project is estimated to result in an unmitigated maximum carcinogenic risk of approximately 39 in one million. The maximum risk from the project would occur at approximately 500 feet (152 meters) east from the Project site. The maximum unmitigated cancer risk for the west receptor group is 3 in one million. **Figure 5, Receptor Locations**, shows the receptors analyzed for the project along with the maximum receptor location for the residential groups east and west of the project site. As discussed previously, the lifetime exposure under OEHHA guidelines takes into account early life (infant and children) exposure. The calculated cancer risk assumes sensitive receptors (residential and school uses) would not have any mitigation, such as mechanical filtration and exposure would occur with windows open. The since the maximum unmitigated cancer risk exceeds the significance of 10 in one million and therefore represents a potentially significant impact.

SOURCE: ESRI

Headworks Rehabilitation and Expansion Project (Project No. P1-105)

Figure 5
Noise Measurement Locations

Implementation of mitigation measure MM-AQ-1 would reduce cancer risk from construction activities by implementing Tier 4 equipment standards and therefore would reduce the emissions of diesel exhaust. With the implementation of mitigation measure MM-AQ-1, cancer risk from construction activities are reduced to approximately 6 in one million for the maximum receptor location east of the project site and 0.5 for the maximum receptor location west of the project site. This is below the 10 in one million threshold.

Potential non-cancer effects of chronic (i.e., long term) DPM exposures were evaluated using the Hazard Index approach as described in the OEHHA Guidance. A hazard index equal to or greater than 1.0 represents a significant chronic health hazard. Nearby off-site sensitive receptors would be exposed to a maximum chronic impacts that would equal 0.05 before mitigation at the maximum offsite receptor (located to the east of the site) and would not exceed the threshold of 1.0. With implementation of Mitigation Measure MM-AQ-1 the chronic impact would be further reduced to 0.008.

The process of assessing health risks and impacts includes a degree of uncertainty, which is dependent on the availability of data and the extent to which assumptions are relied upon in cases where the data are incomplete or unknown. All HRAs rely upon scientific studies to reduce the level of uncertainty; however, it is not possible to completely eliminate uncertainty from the analysis. Where assumptions are used to substitute for incomplete or unknown data, it is standard practice in performing HRAs to err on the side of health protection to avoid underestimating or underreporting the risk to the public by assessing risk on the most sensitive populations, such as children and the elderly. As discussed above, cancer risk for nearby sensitive receptors would below reduced to below significance thresholds with the implementation of MM-AQ-1. These short-term emissions would not substantially contribute to a significant construction health risk. No residual emissions and corresponding individual cancer risk are anticipated after Project construction. Therefore, the proposed Project would result in a less than significant impact related to construction TAC emissions.

Mitigation Measures

The following mitigation measure shall be incorporated into the project in order to reduce emissions.

AQ-1: Equipment engines shall be maintained in proper tune and construction equipment shall be operated so as to minimize exhaust emissions. Mobile off-road construction equipment (wheeled or tracked) used during construction of the proposed project shall meet the USEPA Tier 3 standards for the first two years. Beginning in the third year of construction, Tier 4 final standards, either as original equipment or equipment retrofitted to meet the Tier 4 final standards. A copy of each unit's certified tier specification or model year specification shall be available upon request at the time of mobilization of each applicable unit of equipment. This mitigation applies to off-road equipment and does not apply to on-road vehicles.

Construction Assumptions

Construction Schedule

	Max Daily		
	Start	Months	Days
Demolition	1/1/2019	10	220
Site Preparation/Grading/Excavation	1/1/2019	19	418
Building Construction (Rehabilitation)	1/1/2019	45	990
Building Construction (New)	1/1/2019	51	1122
Paving	1/1/2019	1	22
Architectural Coating	1/1/2019	5	110

Construction will occur 5 days per week between 7 am and 8 pm, which will conservatively result in an approximately 10 hour operational day for onsite equipment once lunch, breaks, daily meetings and maintenance are factored into the daily activities.

Demolition, site preparation/grading/excavation will overlap with the Rehabilitation phase, however will need to be completed prior to the new construction. New Construction will overlap with the Rehabilitation phase.

Total Onsite Equipment

Equipment Type	#	CalEEMod Designation
Dirt Truck	1	Off-road Truck
Skidsteer	2	Skid Steer Loader
Wheel Loader	1	Tractor/loader/backhoe
Backhoe Loader	3	Tractor/loader/backhoe
Dozer	2	Rubber Tired Dozer
Trackhoe	2	Tractor/loader/backhoe
Trackhoe w/ Hammer	1	Tractor/loader/backhoe
Water Truck	1	water truck
Concrete Mixer	2	Cement/mortar mixer
Crane	2	crane
Telehandler	1	Forklift Hp adjusted to 140
Forklift	2	Forklift
Pile Driver	1	Crane
Compactor	1	Plate Compactor
Paver	1	Paver
Generator	1	Generator
Groundwater Pump	1	Pump

Note the equipment above represents the total number of each piece of equipment that will be onsite at any given time. Where phases overlap the equipment is only accounted for in one of the phases.

OCSD - P1-105

Construction Assumptions

Paving

Paving is assumed to be part of the provided construction phases. A Phasing phase is only added to account for any fugitive emissions that would occur from paving activities. Therefore, onsite construction equipment is not modeled because it is accounted for under the New Structures Building Phase.

Architectural Coating

Architectural coating will occur as part of the New Structure Phase and is only included to account for fugitive ROG emissions from the application of architectural coating. Therefore, onsite equipment is not modeled because it would be accounted for as part of the New Structures Building Phase.

Trips and VMT - Uses Defaults from CalEEMod

Note: Trip length for Waste hauling in demolition is based on distance from the site to the disposal site. According to Mapquest, maximum distance is 18.8 miles which is used in the analysis.

OCSD - P1-105
Construction Assumptions

CalEEMod Modeling Notes:

PM10 and PM2.5 Fugitive emissions report the "Mitigated" scenario because the "Mitigated" scenario represents emissions with the incorporation of SCAQMD Rule 403 which is a requirement of construction within SCAQMD Jurisdiction. Rule 403 assumes watering 3 times per day.

3.1 Mitigation Measures Construction

Use Cleaner Engines for Construction Equipment

Use Soil Stabilizer

Replace Ground Cover

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

3.2 Demolition - 2019

Unmitigated Construction On-Site

3.1 Mitigation Measures Construction

Use Cleaner Engines for Construction Equipment

Use Soil Stabilizer

Replace Ground Cover

Water Exposed Area

Reduce Vehicle Speed on Unpaved Roads

3.2 Demolition - 2019

Unmitigated Construction On-Site

Idling Emissions Calculations

EMFAC2014 (v1.0.7) Emission Rates

Region Type: County

Region: Los Angeles

Calendar Year: 2019

Season: Annual

Vehicle Classification: EMFAC2007 Categories

Units: miles/day for VMT, g/mile for RUNEX, PMBW and PMTW

Region	CalYr	VehClass	MdlYr	Speed	Fuel	VMT	PM10_RUNEX	
Los Angeles	2019	HHDT	Aggregated	5	DSL	50495.6445	0.049442162	g/mile
							0.247210809	g/hr
							0.020600901	b/truck (5 minutes idling)
							4.54172E-05	lbs/truck (5 minutes idling)
							0.041201802	g/truck (10 minutes idling)
							9.08343E-05	lbs/truck (10 minutes idling)

**** Note:** Idling emissions are calculated using the 5 mph speed bin from EMFAC 2014.
