Construction will occur 5 days per week between 7 am and 8 pm, which will conservatively result in an approximately 10 hour operational day for onsite equipment once lunch, breaks, daily meetings and maintenance are factored into the daily activities.

Demolition, site preparation/grading/excavation will overlap with the Rehabilitation phase, however will need to be completed prior to the new construction. New Construction will overlap with the Rehabilitation phase.

Construction Assumptions

Paving

Paving is assumed to be part of the provided construction phases. A Phasing phase is only added to account for any fugitive emissions that would occur from paving activities. Therefore, onsite construction equipment is not modeled because it is accounted for under the New Structures Building Phase.

Architectural Coating

Architectural coating will occur as part of the New Structure Phase and is only included to account for fugitive ROG emissions from the application of architectural coating. Therefore, onsite equipment is not modeled because it would be accounted for as part of the New Structures Building Phase.

Trips and VMT - Uses Defaults from CalEEMod

Note: Trip length for Waste hauling in demolition is based on distance from the site to the disposal site. According to Mapquest, maximum distance is 18.8 miles which is used in the analysis.

OCSD - P1-105
Construction Assumptions

CalEEMod Modeling Notes:

PM10 and PM2.5 Fugitive emissions report the "Mitigated" scenario because the "Mitigated" scenario represents emissions with the incorporation of SCAQMD Rule 403 which is a requirement of construction within SCAQMD Jurisdiction. Rule 403 assumes watering 3 times per day.

Notes

Emissions from the year 2019 were used to calculate total emissions. When a construction phase extends beyond one year, the emissions for 2019 are multiplied by the total number of years to get total emissions. These totals are identified in the Adjusted Column. The CalEEMod column identifies the emissions directly from CalEEMod for the 2019 modeling year.

The Rehabilitation phase will only occur during the dry weather, therefore the 3.8 years of active construction will be spread out over the 8 year construction timeline. The emissions for GHGs are estimated based on the estimated number of months each phase will occur regardless of where in the schedule the activities will take place.

Emissions are amortized over a 30 year project lifetime. Because there are no operational emissions associated with the project, the amortized emissions are compared to the regulatory threshold.

Operational Emissions

There are no new operational activities and therefore no new operational emissions. While the new buildings will require energy consumption, they will be more efficient than the buildings that are being replaced and therefore may ultimately result in a decrease in energy consumption from the project site.
