1.3 User Entered Comments & Non-Default Data

Project Characteristics - MIG Modeler: Phil Gleason. GHG intensity factors adjusted to reflect estimated SCE 2030 RPS energy mix.

Land Use - Source: EIR Table 3-5 Maximum Development Potential; inputs do not include public facilities (other than schools) or open space. Building square footage and acreage decreased by factor of 10 to prevent CalEEMod overflow.

Construction Phase - Future operationa run - no construction emissions modeled.

Trips and VMT - Future operational run - no construction emissions modeled.

Grading - Future operational run - no construction emissions modeled.

Architectural Coating -

Woodstoves - Wood burning devices excluded from new development pursuant to SCAQMD Rule 445. Modeling assumes existing development that remains has stoves/hearts per default values. (SFH includes existing Wood/Gas from Mobile Home Park).

Area Coating - Residential and Non-Residential Interior and Exterior coatings are required to meet 50 g/L VOC content per SCAQMD Rule 1113.

Energy Use - T24 standards adjusted downwards to reflect increased efficiency between 2016-2019 standards (CEC, 2017).

Water And Wastewater -

Solid Waste -

Table Notes:

A Road segment classification obtained from Table 3 of the Desert Hot Springs General Plan Update Traffic Impact Analysis (Ganddini Group Inc. 2019).

B Posted speed obtained from the City's Engineering and Traffic Survey For Speed Limits (City of Desert Hot Springs 2018), if available, or Google Earth imagery. If information was not available, the speed limit was assumed to be 65/55/35/25 miles per hour (mph) for freeway/rural/commercial/residential roads.

C Average daily traffic (ADT) values obtained from Table 3 of the Desert Hot Springs General Plan Update Traffic Impact Analysis (Ganddini Group Inc. 2019).

D ADT values obtained from the City's Engineering and Traffic Survey For Speed Limits (City of Desert Hot Springs 2018)

E TNM Modeling based on the lowest reported segment ADT to provide a conservative estimate (i.e., likely to underestimate) existing traffic noise levels.

F "NA" = Not applicable. This road segment does not exist under 2019 conditions.

G ADT values obtained from 2017 Caltrans traffic volume data for I10 and SR62 (Caltrans 2017a and 2017b).

Table Notes:

A ADT from Appendix Table A.

B Equivalent hourly traffic calculated by multiplying vehicles per hour from Appendix Table C times Caltrans equivalent vehicle factors for medium and heavy duty trucks (Caltrans 2013a, see also Appendix Table XYZ).

C Evening and nighttime CNEL values equal to L_{eq} (h) values plus 5 and 10 dBA, respectively.

D 24-hour CNEL assumes 12 hours of daytime L_{eq} (h), plus 3 hours of evening CNEL value L_{eq} (h), plus 9 hours of nighttime CNEL value L_{eq} (h).

E Daytime roadway segment was modeled using TNM Version 2.5.

F Daytime, evening, and nighttime roadway segment L_{eq} (h) and/or CNEL values estimated using Caltrans equation 4.2 (Caltrans, 2013a).

Table Notes:

A Road segment classification obtained from Table 5 of the Desert Hot Springs General Plan Update Traffic Impact Analysis (Ganddini Group Inc. 2019a).

B Posted speed information for different roadway classifications was obtained from the City's Engineering and Traffic Survey For Speed Limits (City of Desert Hot Springs 2018), if available, or Google Earth imagery. The posted speed limit was assumed to be 65 miles per hour (mph) for freeways, 55 mph for XYZ, 45 mph for XYZ, and 35 mph for XYZ.

C Average daily traffic (ADT) values obtained from Table 5 of the Desert Hot Springs General Plan Update Traffic Impact Analysis (Ganddini Group Inc. 2019a).

D "NA" = Not applicable. This road segment does not exist under current General Plan 2040 conditions.

E ADT values obtained from autmobile and truck traffic count plots provided by Ganddini Group, Inc. (2019b and 2019c).

Table Notes:

A ADT from Appendix Table F.

B Vehicles per hour calculated by multiplying the roadway segment ADT by Riverside County daytime, evening, and nighttime traffix mix percentages for the given roadway classification (see Appendix Table N).

Desert Hot Springs General Plan Update
Desert Hot Springs, CA
Appendix: Current General Plan 2040 Traffic Noise CNEL Calculations
Prepared by MIG, October 2019

TABLE H: Current General Plan 2040 Traffic Noise CNEL Calculations

Table Notes:

A ADT from Appendix Table F.

B Equivalent hourly traffic calculated by multiplying vehicles per hour from Appendix Table G times Caltrans equivalent vehicle factors for medium and heavy duty trucks (Caltrans 2013a, see also Appendix Table XYZ).

C Evening and nighttime CNEL values equal to L_{eq} (h) values plus 5 and 10 dBA, respectively.

D 24-hour CNEL assumes 12 hours of daytime L_{eq} (h), plus 3 hours of evening CNEL value L_{eq} (h), plus 9 hours of nighttime CNEL value L_{eq} (h).

E Daytime roadway segment was modeled using TNM Version 2.5.

F Daytime, evening, and nighttime roadway segment L_{eq} (h) and/or CNEL values estimated using Caltrans equation 4.2 (Caltrans, 2013a).

Table Notes:

A Road segment classification obtained from Table 8 of the Desert Hot Springs General Plan Update Traffic Impact Analysis (Ganddini Group Inc. 2019a).

B Posted speed information for different roadway classifications was obtained from the City's Engineering and Traffic Survey For Speed Limits (City of Desert Hot Springs 2018), if available, or Google Earth imagery. The posted speed limit was assumed to be 65 miles per hour (mph) for freeways, 55 mph for XYZ, 45 mph for XYZ, and 35 mph for XYZ.

C Average daily traffic (ADT) values obtained from Table 8 of the Desert Hot Springs General Plan Update Traffic Impact Analysis (Ganddini Group Inc. 2019a).

D ADT values obtained from autmobile and truck traffic count plots provided by Ganddini Group, Inc. (2019d and 2019e).

Table Notes:

A ADT from Appendix Table J.

B Vehicles per hour calculated by multiplying the roadway segment ADT by Riverside County daytime, evening, and nighttime traffix mix percentages for the given roadway classification (see Appendix Table N).

Desert Hot Springs General Plan Update
Desert Hot Springs, CA
Appendix: Proposed General Plan Update 2040 Traffic Noise CNEL Calculations
Prepared by MIG, September 2019

Table Notes:

A ADT from Appendix Table J.

B Equivalent hourly traffic calculated by multiplying vehicles per hour from Appendix Table K times Caltrans equivalent vehicle factors for medium and heavy duty trucks (Caltrans 2013a, see also Appendix Table XYZ).

C Evening and nighttime CNEL values equal to L_{eq} (h) values plus 5 and 10 dBA, respectively.

D 24-hour CNEL assumes 12 hours of daytime L_{eq} (h), plus 3 hours of evening CNEL value L_{eq} (h), plus 9 hours of nighttime CNEL value L_{eq} (h).

E Daytime roadway segment was modeled using TNM Version 2.5.

F Daytime, evening, and nighttime roadway segment L_{eq} (h) and/or CNEL values estimated using Caltrans equation 4.2 (Caltrans, 2013a).

Appendix: TNM Information - Vehicle Class Distributions

Prepared by MIG, October 2019

Table M: Riverside County Daily Traffic Vehicle Class Distribution

Road Classification	Average Daily Traffic By Vehicle Class		
	Auto	Medium Truck	Heavy Truck
Urban Arterial	92.0%	3.0%	5.0%
Major Arterial	92.0%	3.0%	5.0%
Minor Arterial	92.0%	3.0%	5.0%
Secondary	97.4%	1.8%	0.7%
Minor Collector	97.4%	1.8%	0.7%
Local Collector	97.4%	1.8%	0.7%
Freeway (SR62)	86.2%	6.6%	7.2%
Freeway (I10)	75.1%	6.1%	18.8%

Table N: Riverside County Daytime, Evening, and Nightime Vehicle Class Distribution

Road Classification	Daytime (7 AM to 7 PM) Vehicle Class Distribution		
	Auto	Medium Truck	Heavy Truck
Arterial	69.50%	1.44%	2.40%
Secondary	73.60%	0.90%	0.35%
Collector	73.60%	0.90%	0.35%
Freeway (SR62)	47.41%	3.62%	3.97%
Freeway (I10)	41.67%	3.41%	10.42%
Road Classification	**Evening (7 PM to 10 PM) Vehicle Class Distribution**		
	Auto	**Medium Truck**	**Heavy Truck**
Arterial	12.90%	0.06%	0.10%
Secondary	13.60%	0.04%	0.04%
Collector	13.60%	0.04%	0.04%
Freeway (SR62)	9.70%	0.74%	0.81%
Freeway (I10)	8.35%	0.68%	2.09%
Road Classification	**Nightime (10 PM to 7 AM) Vehicle Class Distribution**		
	Auto	**Medium Truck**	**Heavy Truck**
Arterial	9.60%	1.50%	2.50%
Secondary	10.20%	0.90%	0.35%
Collector	10.20%	0.90%	0.35%
Freeway (SR62)	29.10%	2.22%	2.44%
Freeway (I10)	25.05%	2.05%	6.26%

EMFAC2017 (v1.0.2) Emissions Inventory
Region Type: Sub-Area
Region: Riverside (SS)
Calendar Year: 2019, 2040
Season: Annual
Vehicle Classification: EMFAC2007 Categories
Units: miles/day for VMT, trips/day for Trips, tons/day for Emissions, 1000 gallons/day for Fuel Consumption
NOTE: This EMFAC output was modifed by deleting all columns after the population output

1. INTRODUCTION

This section describes the study purpose and objectives, site location/study area, and the proposed development.

PURPOSE AND OBJECTIVES

The purpose of this traffic impact analysis is to provide an assessment of traffic operations and the roadway improvements necessary to accommodate ultimate buildout of the City of Desert Hot Springs General Plan Land Use Plan. The study objectives include documentation of existing and forecast transportation operations and identification of roadway improvements and system management actions needed to achieve the performance standards established by the City of Desert Hot Springs.

The following scenarios are analyzed during typical weekday AM and PM peak hour conditions:

- Existing Conditions
- Current General Plan Buildout (Year 2040)
- Proposed General Plan Buildout (Year 2040)

Although this is a technical report, effort has been made to write the report clearly and concisely. A glossary is provided in Appendix A to assist the reader with technical terms related to transportation engineering.

SITE LOCATION AND STUDY AREA

The City of Desert Hot Springs is located within the Coachella Valley geographic region of eastern Riverside County. Figure 1 shows the regional location map and Figure 2 illustrates the project study area.

Study locations were generally selected based on review of previous General Plan updates, review of key intersections and roadway segments, and scoping input from City of Desert Hot Springs engineering staff. The study area consists of the following study intersections and roadway segments:

Study Intersections[1]	Existing Traffic Control
1. State Route 62 [SR-62] (NS) at Indian Canyon Drive (EW)	Traffic Signal
2. SR-62 (NS) at Pierson Boulevard (EW)	Cross Street Stop
3. SR-62 (NS) at Dillon Road (EW)	Traffic Signal
4. Indian Canyon Drive (NS) at Mission Lakes Boulevard (EW)	Traffic Signal
5. Indian Canyon Drive (NS) at Pierson Boulevard (EW)	All Way Stop
6. Indian Canyon Drive (NS) at 14th Avenue (EW)	No Control
7. Indian Canyon Drive (NS) at Dillon Road (EW)	All Way Stop
8. Indian Canyon Drive (NS) at 20th Avenue (EW)	Traffic Signal
9. Little Morongo Road (NS) at Mission Lakes Boulevard (EW)	All Way Stop
10. Little Morongo Road (NS) at Pierson Boulevard (EW)	All Way Stop
11. Little Morongo Road (NS) at Two Bunch Palms Trail (EW)	All Way Stop
12. Little Morongo Road (NS) at Dillon Road (EW)	All Way Stop
13. Little Morongo Road (NS) at 20th Avenue (EW)	*Future Intersection*
14. Palm Drive (NS) at Mission Lakes Boulevard (EW)	All Way Stop

[1] (NS) = North-South Roadway; (EW) = East-West Roadway

PROPOSED LAND USE PLAN

Figure 3 shows the proposed General Plan Land Use Plan. The proposed General Plan Update will modify the current City of Desert Hot Springs General Plan Land Use Element. This report analyzes future traffic conditions associated with Year 2040 buildout of the proposed City of Desert Hot Springs General Plan Land Use Element. The following is a summary of the socio-economic data associated with the proposed General Plan buildout totals:

Type		Desert Hot Springs		Sphere of Influence		Planning Area	
		Existing (2018)	Proposed (2040)	Existing (2018)	Proposed (2040)	Existing (2018)	Proposed (2040)
Dwelling Units	SF[1]	8,358	22,214	7,292	18,025	15,650	40,239
	MF[2]	3,204	12,594	246	831	3,450	13,425
	Total	**11,562**	**34,808**	**7,538**	**18,856**	**19,100**	**53,664**
Population		29,390	88,476	19,160	47,926	48,550	136,402
Non-Residential Building SF[3]		2,655,016	13,140,605	559,250	7,209,099	3,214,266	20,349,704
Employees		4,162	14,611	1,020	5,920	5,182	20,531
Hotel/Motel Rooms		755	1,652	--	--	755	1,652
Students		6,326	12,900	763	7,100	7,089	20,000

Notes:
1) SF = Single Family Dwelling Units
2) MF = Multiple Family Units
3) Non-Residential Building = Commercial, Office, and Industrial buildings

2. METHODOLOGY

This traffic impact analysis has been prepared in accordance with the guidance and parameters established in the Riverside County Transportation Department Traffic Impact Analysis Preparation Guide (April 2008) ["Riverside County Guidelines"].

INTERSECTION DELAY METHODOLOGY

To assess the performance of an intersection, the City of Desert Hot Springs uses the intersection delay method based on procedures contained in the Highway Capacity Manual (Transportation Research Board, 6th Edition). The methodology considers the traffic volume and distribution of movements, traffic composition, geometric characteristics, and signalization details to calculate the average control delay per vehicle and corresponding Level of Service. Control delay is defined as the portion of delay attributed to the intersection traffic control (such as a traffic signal or stop sign) and includes initial deceleration, queue move-up time, stopped delay, and final acceleration delay. The intersection control delay is then correlated to Level of Service as shown in Table 1 below.

Table 1. Intersection Control Delay and Level of Service Criteria

Level of Service	Intersection Control Delay (Seconds / Vehicle)		Description
	Signalized Intersection	Unsignalized Intersection	
A	≤ 10.0	≤ 10.0	EXCELLENT OPERATION. All approaches to the intersection appear quite open, turning movements are easily made and nearly all drivers find freedom of operation.
B	> 10.0 to ≤ 20.0	> 10.0 to ≤ 15.0	VERY GOOD OPERATION: Many drivers begin to feel somewhat restricted within platoons of vehicles. This represents stable flow. An approach to an intersection may occasionally be fully utilized and traffic queues start to form.
C	> 20.0 to ≤ 35.0	> 15.0 to ≤ 25.0	GOOD OPERATION. Occasionally backups may develop behind turning vehicles. Most drivers feel somewhat restricted.
D	> 35.0 to ≤ 55.0	> 25.0 to ≤ 35.0	FAIR OPERATION. There are no long-standing traffic queues. This level is typically associated with design practice for peak periods.
E	> 55.0 to ≤ 80.0	> 35.0 to ≤ 50.0	POOR OPERATION. Some long-standing vehicular queues develop on critical approaches.
F	> 80.0	> 50.0	FORCED FLOW. Represents jammed conditions. Backups from locations downstream or on the cross street may restrict or prevent movements of vehicles out of the intersection approach lanes; therefore, volumes carried are not predictable. Potential for stop-and-go type traffic flow.

Source: Transportation Research Board, Highway Capacity Manual (6th Edition).

Level of Service is used to qualitatively describe the performance of a roadway facility, ranging from Level of Service A (free-flow conditions) to Level of Service F (extreme congestion and system failure). At intersections with traffic signal or all way stop control, Level of Service is determined by the average control delay for the overall intersection. At intersections with cross street stop control (i.e., one- or two-way stop control), Level of Service is determined by the average control delay for the worst individual movement (or movements sharing a single lane).

Intersection delay analysis was performed using the Vistro (Version 6.00-00) software. The Level of Service analysis has been performed in accordance with the input parameters identified in Exhibit C of the Riverside County Guidelines. Default values recommended in the Highway Capacity Manual were used for any values not specifically identified in the Riverside County Guidelines.

ROADWAY SEGMENT VOLUME-TO-CAPACITY METHODOLOGY

Roadway segment performance is based on the volume-to-capacity ratio, which is calculated by dividing the volume of traffic using the roadway by the theoretical roadway capacity. The volume-to-capacity ratio is then correlated to Level of Service based on the same thresholds as Intersection Capacity Utilization shown above.

Table 2 below shows the theoretical daily traffic volume capacity for roadway segment planning purposes. Actual daily roadway capacity is a function of many factors, including, but not limited to, roadway alignment, intersection and driveway spacing, signal timing, lane widths, and duration of peak periods. Roadway segment volume-to-capacity ratios, based on daily traffic volumes, are used for planning level analysis to identify locations with potential peak hour deficiencies. Ultimately, actual roadway capacity is generally determined by peak hour intersection operations since intersections are typically the most constraining portions of a roadway.

Table 2. Daily Roadway Capacity Estimates

Classification	Right-Of-Way	Number of Lanes	Level of Service E Capacity
Urban Arterial	134 feet	8D	72,000
Major Arterial	110 feet	6D	54,000
Minor Arterial	110 feet	4D	36,000
Major Collector	100 feet	4D	36,000
Minor Collector	88 feet	4U	26,000
Secondary	80 feet	4U	26,000
Local Collector	60 feet	2U	13,000

LEVEL OF SERVICE STANDARD

The current City of Desert Hot Springs General Plan Circulation Element identifies Level of Service D as generally acceptable during the peak operating periods.

Consistent with previous General Plan updates, Level of Service D shall be maintained as the minimum acceptable Level of Service for the circulation network.

3. EXISTING CONDITIONS

This section documents existing transportation conditions as of 2019 for the City of Desert Hot Springs. Existing conditions data was compiled from information provided by the City, recent plans and studies, field observations, and field data collection. Specifically, this section provides an overview of the following components of the existing City transportation system:

- Roadway system
- Roadway segment and intersection traffic volumes
- Roadway segment and intersection Levels of Service
- Transit services
- Bicycle facilities

ROADWAY SYSTEM

Figure 4 identifies the existing intersection traffic controls and lane geometry based on a field survey of the study area. The two major routes providing regional access for the City of Desert Hot Springs are Interstate 10 and State Route 62. Figure 5 shows the existing and future traffic signals currently in design/construction.

Interstate 10 (I-10) provides regional east-west access from its westerly origin in Santa Monica, through the Coachella Valley, and eastward through the southern United States. I-10 is an eight-lane divided freeway through the region. Interchanges providing access for City of Desert Hot Springs are located at Indian Canyon Drive and Palm Drive.

State Route 62 (SR-62) generally trends in a north-south direction along the western side of the City before transitioning into an east-west orientation in Yucca Valley. SR-62 is a four-lane divided highway providing regional access from the junction at I-10 to its eastern terminus at US 95S at the Arizona state line. Primary access points for City of Desert Hot Springs access are provided at Indian Canyon Drive, Pierson Boulevard, and Dillon Road.

ROADWAY SEGMENT AND INTERSECTION VOLUMES

Figure 6 shows the Existing conditions average daily traffic volumes for the study roadway segments. Existing average daily traffic volumes were obtained from the Coachella Valley Association of Governments Traffic Census Report and from 24-hour roadway segment counts collected in April 2018.

Existing peak hour intersection volumes are based upon AM peak period and PM peak period intersection turning movement counts obtained in April 2018 during typical weekday conditions and while local schools were in session. The AM peak period was counted between 7:00 AM and 9:00 AM and the PM peak period was counted between 4:00 PM and 6:00 PM. The actual peak hour within the peak period is the four consecutive 15 minute periods with the highest total volume when all movements are added together. Thus, the PM peak hour at one intersection may be 4:45 PM to 5:45 PM if those four consecutive 15 minute periods have the highest combined volume. Intersection turning movement count worksheets are provided in Appendix B.

Figure 7 and Figure 8 show the AM peak hour and PM peak hour intersection turning movement volumes for Existing conditions.

EXISTING ROADWAY SEGMENT LEVEL OF SERVICE

The study roadway segment capacity analysis and Levels of Service for Existing conditions are shown in Table 3.

The study roadway segments currently operate within acceptable Levels of Service (D or better), except for the following roadway segments (see Table 3):

R34. Palm Drive between Two Bunch Palms Trail and Dillon Road
R35. Palm Drive between Dillon Road and 20th Avenue
R36. Palm Drive between 20th Avenue and Varner Road
R70. Two Bunch Palms Trail between Little Morongo Road and Cholla Drive

EXISTING INTERSECTION LEVEL OF SERVICE

The study intersection Levels of Service for Existing conditions are shown in Table 4. Existing intersection Level of Service calculation worksheets are provided in Appendix C.

The study intersections currently operate within acceptable Levels of Service (D or better) during the peak hours for Existing conditions, except for the following intersections (see Table 4):

7. Indian Canyon Drive (NS) at Dillon Road (EW) (LOS E, AM/PM peak hours)
19. Palm Drive (NS) at 20th Avenue (EW) (LOS F, PM peak hour)
23. Mountain View Road (NS) at Varner Road (EW) (LOS F, AM peak hour)

TRANSIT SERVICE

The City of Desert Hot Springs is currently served by the SunLine Transit Agency. Figure 9 shows the following transit routes, Line 14 and Line 15, currently serving the City of Desert Hot Springs.

BICYCLE FACILITIES

Figure 10 shows existing bicycle facilities as documented in the City of Desert Hot Springs Bicycle and Pedestrian Master Plan (2016). Figure 11 shows the future bicycle network as established in the City of Desert Hot Springs Bicycle and Pedestrian Master Plan (2016).

GENERAL PLAN CONTEXT

Figure 12 shows the current General Plan roadway classification map. This figure shows the nature and extent of arterial and collector roadways that are needed to adequately serve the ultimate development designated by the Land Use Element of the current General Plan (2000). Figure 13 shows the current General Plan roadway cross-sections.

Notes:

(1) TS = Traffic Signal; CSS = Cross Street Stop; AWS = All Way Stop

(2) Delay is shown in seconds/vehicle. For intersections with traffic signal or all way stop control, overall average intersection delay and LOS are shown. For intersections with cross street stop control, Level of Service is based on average delay of the worst individual lane (or movements sharing a lane).

(3) LOS = Level of Service

4. TRAFFIC MODEL PROJECTIONS

This section describes how current and proposed General Plan buildout traffic volumes were developed.

RIVERSIDE TRANSPORTATION ANALYSIS MODEL

To derive current and proposed General Plan buildout traffic volumes, the Riverside Transportation Analysis Model (RivTAM) was used. To provide a general point of reference, the current RivTAM data was used for the current General Plan buildout analysis. The Traffic Analysis Zones (TAZs) and baseline roadway network were refined for the proposed General Plan land use plan. The socio-economic data for the proposed General Plan were disaggregated by TAZ and input into RivTAM along with the refined roadway network and attributes. Model runs were performed by AFSHA Consulting in accordance with County of Riverside transportation modelling procedures.

Socio-Economic & Roadway Attributes

The socio-economic and roadway network utilized for the proposed General Plan model runs are provided in Appendix D. The following is a summary of the socio-economic data associated with the proposed General Plan buildout totals:

Type		Desert Hot Springs		Sphere of Influence		Planning Area	
		Existing (2018)	Proposed (2040)	Existing (2018)	Proposed (2040)	Existing (2018)	Proposed (2040)
Dwelling Units	SF[1]	8,358	22,214	7,292	18,025	15,650	40,239
	MF[2]	3,204	12,594	246	831	3,450	13,425
	Total	**11,562**	**34,808**	**7,538**	**18,856**	**19,100**	**53,664**
Population		29,390	88,476	19,160	47,926	48,550	136,402
Non-Residential Building SF[3]		2,655,016	13,140,605	559,250	7,209,099	3,214,266	20,349,704
Employees		4,162	14,611	1,020	5,920	5,182	20,531
Hotel/Motel Rooms		755	1,652	--	--	755	1,652
Students		6,326	12,900	763	7,100	7,089	20,000

Notes:
1) SF = Single Family Dwelling Units
2) MF = Multiple Family Units
3) Non-Residential Building = Commercial, Office, and Industrial buildings

Post-Processing Procedures

In accordance with standard post-processing procedures, the long-range traffic volume forecasts have been determined using a growth increment approach on the Year 2008 and Year 2040 roadway link volumes. This difference defines the growth in traffic volumes over the 32 year period. The incremental traffic growth was factored to reflect the forecast growth between existing traffic volumes (Year 2019) and Year 2040. For this purpose, linear growth between the Year 2008 base condition and the forecast Year 2040 condition was assumed. Since the increment between existing Year 2019 and Year 2040 is 21 years of the 32 year time frame, a factor of 0.65 (i.e., 21/32) was used.

To derive AM and PM peak hour intersection turning movement volumes, the traffic volume growth forecasts were further refined using a spreadsheet program developed by the Federal Highway Administration and consistent with traffic volume forecasting procedures outlined in the National Cooperative Highway Research

Program Report 255. The spreadsheet program uses a linear programming algorithm to calculate future turning movements based on the relationship of existing intersection turning movements and forecast model growth. The forecast turning movements developed by the spreadsheet program were reviewed for reasonableness and adjusted as necessary to ensure traffic growth. The end results of the post-processing procedures are future traffic volumes suitable for analysis. Post-processing worksheets are contained in Appendix E. Figures illustrating the final analysis volumes are presented in the following sections.

5. CURRENT GENERAL PLAN BUILDOUT

This section presents the current General Plan buildout traffic volume forecasts and operational analysis for the study roadway segments and intersections. The current General Buildout analysis is based on the current RivTAM data for the City of Desert Hot Springs. The current General Plan buildout analysis assumes the roadway segments are constructed at their ultimate condition in accordance with the baseline roadway classifications used for prior General Plan updates as shown on Figure 14.

CURRENT GENERAL PLAN BUILDOUT TRAFFIC VOLUMES

Forecast average daily traffic volumes for current General Plan buildout conditions are shown on Figure 15. Forecast AM and PM peak hour intersection turning movement volumes for current General Plan buildout conditions are shown on Figure 16 and Figure 17.

CURRENT GENERAL PLAN BUILDOUT LEVEL OF SERVICE

Roadway Segment Level of Service

The study roadway segment capacity analysis and Levels of Service for current General Plan buildout conditions are shown in Table 5. As shown in Table 5, the study roadway segments forecast to operate within acceptable Levels of Service (D or better) for current General Plan Buildout conditions assuming roadway segments are constructed at their ultimate condition in accordance with the baseline roadway classifications.

Intersection Level of Service

The study intersection Levels of Service for current General Plan buildout conditions without improvements are shown in Table 6. As shown in Table 6, 17 out of the 24 study intersections are forecast to operate at unacceptable Level of Service (E or F) for current General Plan buildout conditions without improvements. Detailed intersection Level of Service calculation worksheets are provided in Appendix C.

The following ultimate lane configurations are recommended to maintain the minimum acceptable Level of Service (D or better) for current General Plan buildout conditions:

- SR-62 (NS) at Indian Canyon Drive (EW) - #1
  - Northbound: One left turn lane, three through lanes, and one right turn lane
  - Southbound: Two left turn lanes, two through lanes, and one right turn lane
  - Eastbound: One shared left/through/right turn lane
  - Westbound: One shared left/through lane and one right turn lane

- SR-62 (NS) at Pierson Boulevard (EW) - #2
  - Install a traffic signal
  - Northbound: One left turn lane, three through lanes, and one right turn lane
  - Southbound: One left turn lane, three through lanes, and one right turn lane
  - Eastbound: One shared left/through lane, one through lane, and one right turn lane
  - Westbound: One shared left/through lane and one shared through/right turn lane

- SR-62 (NS) at Dillon Road (EW) - #3
  - Northbound: One left turn lane, three through lanes, and one right turn lane
  - Southbound: One left turn lane, three through lanes, and one right turn lane
  - Eastbound: One shared left/through lane and one right turn lane
  - Westbound: One shared left/through lane and one right turn lane

- Indian Canyon Drive (NS) at Mission Lakes Boulevard (EW) - #4
    - No change from existing

- Indian Canyon Drive (NS) at Pierson Boulevard (EW) - #5
    - Install a traffic signal
    - Northbound: One left turn lane, one through lane, and one right turn lane
    - Southbound: One shared left/through/right turn lane
    - Eastbound: One shared left/through lane and one right turn lane
    - Westbound: One shared left/through/right turn lane

- Indian Canyon Drive (NS) at Two Bunch Palms Trail (EW) - #6
    - Install a traffic signal
    - Northbound: One shared left/through lane and one right turn lane
    - Southbound: One shared left/through lane and one right turn lane
    - Eastbound: One shared left/through/right turn lane
    - Westbound: One shared left/through/right turn lane

- Indian Canyon Drive (NS) at Dillon Road (EW) - #7
    - Install a traffic signal
    - Northbound: One left turn, two through lanes, and one right turn lane
    - Southbound: One left turn, two through lanes, and one right turn lane
    - Eastbound: One left turn lane, one through lane, and one right turn lane
    - Westbound: One left turn lane, one through lane, and one right turn lane

- Indian Canyon Drive (NS) at 20th Avenue (EW) - #8
    - Northbound: One left turn lane, two through lanes, and one shared through/right turn lane
    - Southbound: One left turn lane, two through lanes, and one shared through/right turn lane
    - Eastbound: One left turn lane, one through lane, and one right turn lane
    - Westbound: Two left turn lanes, one shared through/right turn lane, and one right turn lane

- Indian Canyon Drive (NS) at Mission Lakes Boulevard (EW) - #9
    - No change from existing

- Little Morongo Road (NS) at Pierson Boulevard (EW) - #10
    - Install a traffic signal
    - Northbound: One left turn lane and one shared through/right turn lane
    - Southbound: One left turn lane and one shared through/right turn lane
    - Eastbound: One left turn lane, one through lane, and one right turn lane
    - Westbound: One left turn lane, one through lane, and one right turn lane

- Little Morongo Road (NS) at Two Bunch Palms Trail (EW) - #11
    - Install a traffic signal
    - Northbound: One left turn lane and one shared through/right turn lane
    - Southbound: One left turn lane and one shared through/right turn lane
    - Eastbound: One left turn lane and one shared through/right turn lane
    - Westbound: One left turn lane and one shared through/right turn lane

- Little Morongo Road (NS) at Dillon Road (EW) - #12
    - Install a traffic signal
    - Northbound: One left turn lane, one through lane, and one right turn lane
    - Southbound: One left turn lane, one through lane, and one right turn lane
    - Eastbound: One left turn lane and one shared through/right turn lane
    - Westbound: Two left turn lanes, one through lane and one right turn lane

- Little Morongo Road (NS) at 20th Avenue (EW) - #13
  - Construct new intersection with all way stop control
  - Northbound: One shared left/through/right turn lane
  - Southbound: One shared left/through/right turn lane
  - Eastbound: One left turn lane and one shared through/right turn lane
  - Westbound: One shared left/through/right turn lane

- Palm Drive (NS) at Mission Lakes Boulevard (EW) - #14
  - No change from existing

- Palm Drive (NS) at Pierson Boulevard (EW) - #15
  - No change from existing

- Palm Drive (NS) at Hacienda Avenue (EW) - #16
  - No change from existing

- Palm Drive (NS) at Two Bunch Palms Trails (EW) - #17
  - No change from existing

- Palm Drive (NS) at Dillon Road (EW) - #18
  - Northbound: One left turn lane, two through lanes, and one right turn lane
  - Southbound: One left turn lane, three through lanes, and one right turn lane
  - Eastbound: One left turn lane, one through lane, and one right turn lane
  - Westbound: One left turn lane, one through lane, and one right turn lane

- Palm Drive (NS) at 20th Avenue (EW) - #19
  - Install a traffic signal
  - Northbound: One left turn lane, two through lanes, and one right turn lane
  - Southbound: One left turn lane, two through lanes, and one right turn lane
  - Eastbound: One left turn lane and one shared through/right turn lane
  - Westbound: Two left turn lanes and one shared through/right turn lane

- Palm Drive (NS) at Varner Road (EW) - #20
  - Northbound: One left turn lane, one through lane, and one shared through/right turn lane
  - Southbound: Two left turn lanes, one through lane, and one shared through/right turn lane
  - Eastbound: One shared left/through/right turn lane
  - Westbound: One shared left/through/right turn lane

- Mountain View Road (NS) at Hacienda Avenue (EW) - #21
  - No change from existing

- Mountain View Road (NS) at Dillon Road (EW) - #22
  - Northbound: One left turn lane, one through lane, and one right turn lane
  - Southbound: One left turn lane, one through lane, and one right turn lane
  - Eastbound: One left turn lane, one through lane, and one right turn lane
  - Westbound: One left turn lane and one shared through/right turn lane

- Mountain View Road (NS) at Varner Road (EW) - #23
  - Install a traffic signal
  - Southbound: One left turn lane and one right turn lane
  - Eastbound: Two left turn lanes and one shared through lane
  - Westbound: One through lane and two right turn lanes

- <u>Long Canyon Road (NS) at Dillon Road (EW) - #24</u>
  - Northbound: One shared left/through/right turn lane
  - Southbound: One shared left/through/right turn lane
  - Eastbound: One left turn lane, one through lane, and one shared through/right turn lane
  - Westbound: One left turn lane and one shared through/right turn lane

Table 7 shows the study intersection Levels of Service for current General Plan buildout conditions with improvements. The study intersections are forecast to operate within acceptable Levels of Service (D or better) for current General Plan Buildout conditions with improvements (see Table 7).

Notes:

(1) TS = Traffic Signal; CSS = Cross Street Stop; AWS = All Way Stop

(2) Delay is shown in seconds/vehicle. For intersections with traffic signal or all way stop control, overall average intersection delay and LOS are shown. For intersections with cross street stop control, Level of Service is based on average delay of the worst individual lane (or movements sharing a lane).

(3) LOS = Level of Service

6. PROPOSED GENERAL PLAN BUILDOUT

This section presents the Proposed General Plan Buildout traffic volume forecasts and operational analysis for the study roadway segments and intersections. For the Proposed General Plan Buildout analysis, the Traffic Analysis Zones (TAZs) and baseline roadway network were refined for the proposed General Plan land use plan. The baseline roadway classifications are based on the classification map used for prior General Plan updates as shown in the previous section on Figure 14.

PROPOSED GENERAL PLAN BUILDOUT TRAFFIC VOLUMES

Forecast average daily traffic volumes for Proposed General Plan Buildout conditions are shown on Figure 18. Forecast AM and PM peak hour intersection turning movement volumes for Proposed General Plan Buildout conditions are shown on Figure 19 and Figure 20.

PROPOSED GENERAL PLAN BUILDOUT LEVEL OF SERVICE

Roadway Segment Level of Service

The baseline study roadway segment capacity analysis and Levels of Service for Proposed General Plan Buildout conditions are shown in Table 8. As shown in Table 8, the study roadway segments forecast to operate within acceptable Levels of Service (D or better) for Proposed General Plan Buildout conditions assuming roadway segments are constructed at their ultimate condition in accordance with the baseline roadway classifications.

The baseline roadway classifications are forecast to result in more than sufficient roadway capacity at several roadway segments. Additionally, the nomenclature used in the current General Plan and the baseline roadway classifications is unusual since collector roadways are typically lower in the hierarchy than secondary roadways. Therefore, Table 8 also shows the roadway segment capacity analysis and Levels of Service with recommended modifications to the roadway system where excess capacity is anticipated and with the following recommended classifications

Proposed Classifications	Right-of-Way	Number of Lanes	Level of Service E Capacity
Urban Arterial	134 feet	8D	72,000
Primary I	110 feet	6D	54,000
Primary II	110 feet	4D	36,000
Secondary I	100 feet	4D	36,000
Secondary II	80-88 feet	4U	26,000
Collector	72 feet	2D	18,000
Local Collector	60 feet	2U	13,000

As shown in Table 8, the study roadway segments forecast to operate within acceptable Levels of Service (D or better) for Proposed General Plan Buildout conditions with the recommended roadway classifications.

Intersection Level of Service

The study intersection Levels of Service for Proposed General Plan buildout conditions without improvements are shown in Table 9. As shown in Table 9, 16 out of the 24 study intersections are forecast to operate at unacceptable Level of Service (E or F) for Proposed General Plan Buildout conditions without improvements. Detailed intersection Level of Service calculation worksheets are provided in Appendix C.

The following ultimate lane configurations are recommended to maintain the minimum acceptable Level of Service (D or better) for Proposed General Plan Buildout conditions:

- SR-62 (NS) at Indian Canyon Drive (EW) - #1
  - Northbound: One left turn lane, three through lanes, and one right turn lane
  - Southbound: Two left turn lanes, two through lanes, and one right turn lane
  - Eastbound: One shared left/through/right turn lane
  - Westbound: One shared left/through lane and two right turn lanes

- SR-62 (NS) at Pierson Boulevard (EW) - #2
  - Install a traffic signal
  - Northbound: One left turn lane, two through lanes, and one right turn lane
  - Southbound: One left turn lane, two through lanes, and one right turn lane
  - Eastbound: One shared left/through lane and one right turn lane
  - Westbound: One left turn lane and one shared through/right turn lane

- SR-62 (NS) at Dillon Road (EW) - #3
  - No change from existing

- Indian Canyon Drive (NS) at Mission Lakes Boulevard (EW) - #4
  - Northbound: One shared left/through lane and one right turn lane
  - Southbound: One left turn lane and one shared through/right turn lane
  - Eastbound: One shared left/through/right lane
  - Westbound: One left turn lane and one shared through/right turn lane

- Indian Canyon Drive (NS) at Pierson Boulevard (EW) - #5
  - Install a traffic signal
  - Northbound: One left turn lane, one through lane, and one right turn lane
  - Southbound: One shared left/through/right turn lane
  - Eastbound: One shared left/through lane and one shared through/right turn lane
  - Westbound: One left turn lane and one shared through/right turn lane

- Indian Canyon Drive (NS) at Two Bunch Palms Trail (EW) - #6
  - Install a traffic signal
  - Northbound: One shared left/through/right turn lane
  - Southbound: One left turn lane and one shared through/right turn lane
  - Eastbound: One shared left/through/right turn lane
  - Westbound: One shared left/through/right turn lane

- Indian Canyon Drive (NS) at Dillon Road (EW) - #7
  - Install a traffic signal
  - Northbound: One left turn, two through lanes, and one right turn lane
  - Southbound: One left turn, two through lanes, and one right turn lane
  - Eastbound: One left turn lane, one through lane, and one right turn lane
  - Westbound: Two left turn lanes, one through lane, and one right turn lane

- Indian Canyon Drive (NS) at 20th Avenue (EW) - #8
  - Northbound: One left turn lane, two through lanes, and one right turn lane
  - Southbound: One left turn lane, two through lanes, and one shared through/right turn lane
  - Eastbound: One left turn lane, one through lane, and one right turn lane
  - Westbound: Two left turn lanes, one shared through/right turn lane, and one right turn lane

- Indian Canyon Drive (NS) at Mission Lakes Boulevard (EW) - #9
  - No change from existing

- Little Morongo Road (NS) at Pierson Boulevard (EW) - #10
  - Install a traffic signal
  - Northbound: One shared left/through/right turn lane
  - Southbound: One shared left/through/right turn lane
  - Eastbound: One left turn lane, one through lane, and one right turn lane
  - Westbound: One left turn lane, one through lane, and one right turn lane

- Little Morongo Road (NS) at Two Bunch Palms Trail (EW) - #11
  - Install a traffic signal
  - Northbound: One left turn lane, one through lane, and one right turn lane
  - Southbound: One shared left/through/right turn lane
  - Eastbound: One shared left/through/right turn lane
  - Westbound: One left turn lane, one through lane, and one right turn lane

- Little Morongo Road (NS) at Dillon Road (EW) - #12
  - Install a traffic signal
  - Northbound: One left turn lane, one through lane, and one right turn lane
  - Southbound: One left turn lane, one through lane, and one right turn lane
  - Eastbound: Two left turn lanes and one shared through/right turn lane
  - Westbound: One left turn lane and one shared through/right turn lane

- Little Morongo Road (NS) at 20th Avenue (EW) - #13
  - Construct new intersection with all way stop control
  - Northbound: One left turn lane and one shared through/right turn lane
  - Southbound: One shared left/through/right turn lane
  - Eastbound: One shared left/through/right turn lane
  - Westbound: One shared left/through/right turn lane

- Palm Drive (NS) at Mission Lakes Boulevard (EW) - #14
  - No change from existing

- Palm Drive (NS) at Pierson Boulevard (EW) - #15
  - No change from existing

- Palm Drive (NS) at Hacienda Avenue (EW) - #16
  - No change from existing

- Palm Drive (NS) at Two Bunch Palms Trails (EW) - #17
  - No change from existing

- Palm Drive (NS) at Dillon Road (EW) - #18
  - Northbound: Two left turn lanes, two through lanes, and one right turn lane
  - Southbound: One left turn lane, two through lanes, and one right turn lane
  - Eastbound: One left turn lane, one through lane, and one right turn lane
  - Westbound: Two left turn lanes, one through lane, and one right turn lane

- Palm Drive (NS) at 20th Avenue (EW) - #19
    - Install a traffic signal
    - Northbound: One left turn lane, two through lanes, and one right turn lane
    - Southbound: One left turn lane, three through lanes, and one right turn lane
    - Eastbound: One shared left/through/right turn lane
    - Westbound: One shared left/through/right turn lane

- Palm Drive (NS) at Varner Road (EW) - #20
    - Northbound: One left turn lane, three through lanes, and one right turn lane
    - Southbound: One left turn lane, three through lanes, and one right turn lane
    - Eastbound: One left turn lane, one through lane, and one right turn lane
    - Westbound: Two left turn lanes, two through lanes, and one right turn lane

- Mountain View Road (NS) at Hacienda Avenue (EW) - #21
    - No change from existing

- Mountain View Road (NS) at Dillon Road (EW) - #22
    - Northbound: One left turn lane and one shared through/right turn lane
    - Southbound: One left turn lane and one shared through/right turn lane
    - Eastbound: One left turn lane and one shared through/right turn lane
    - Westbound: Two left turn lanes and one shared through/right turn lane

- Mountain View Road (NS) at Varner Road (EW) - #23
    - Install a traffic signal
    - Southbound: One left turn lane and one right turn lane
    - Eastbound: One shared through/right turn lane
    - Westbound: One through lane and one right turn lane

- Long Canyon Road (NS) at Dillon Road (EW) - #24
    - Northbound: One shared left/through lane and one right turn lane
    - Southbound: One left turn lane and one shared through/right turn lane
    - Eastbound: One left turn lane, one through lane, and one shared through/right turn lane
    - Westbound: One left turn lane, one through lane, and one right turn lane

Table 10 shows the study intersection Levels of Service for Proposed General Plan Buildout conditions with improvements. The study intersections are forecast to operate within acceptable Levels of Service (D or better) for Proposed General Plan Buildout conditions with improvements (see Table 10).

(1) TS = Traffic Signal; CSS = Cross Street Stop; AWS = All Way Stop

(2) Delay is shown in seconds/vehicle. For intersections with traffic signal or all way stop control, overall average intersection delay and LOS are shown. For intersections with cross street stop control, Level of Service is based on average delay of the worst individual lane (or movements sharing a lane).

(3) LOS = Level of Service

7. RECOMMENDATIONS

RECOMMENDED GENERAL PLAN ROADWAY CLASSIFICATIONS

As previously noted, the baseline roadway classifications are forecast to result in more than sufficient roadway capacity at several roadway segments. Additionally, the nomenclature used for the baseline roadway classifications (as currently identified in the current General Plan) is unusual since collector roadways are typically lower in the hierarchy than secondary roadways. Therefore, it is recommended that the roadway classifications be modified as shown in Table 11 below. Table 11 shows the recommended changes from current to proposed General Plan roadway classifications and capacities.

Table 11. Recommended General Plan Roadway Classifications & Daily Capacity Estimates

Current				Proposed				
					ROW			
Classification	ROW	Number of Lanes	LOS E Capacity	Classification	Without Bike Lane	With Bike Lane	Number of Lanes	LOS E Capacity
Urban Arterial	134'	8D	72,000	Urban Arterial	n/a	142'	8D	72,000
Major Arterial	110'	6D	54,000	Primary I	110'	118'	6D	54,000
Minor Arterial	110'	4D	36,000	Primary II	n/a	110'	4D	36,000
Major Collector	100'	4D	36,000	Secondary I	n/a	100'	4D	36,000
Minor Collector	88'	4U	26,000	Secondary II	80-88'	90'	4U	26,000
Secondary	80'	4U	26,000	Collector	72'	82'	2D	18,000
Local Collector	60'	2U	13,000	Local Collector	60'	70'	2U	13,000

Notes:
ROW = Right-of-Way (in feet)
LOS = Level of Service

The recommended roadway classification map for the proposed General Plan buildout is illustrated on Figure 21. The proposed General Plan buildout roadway cross-sections are shown on Figure 22.

SUMMARY OF ULTIMATE INTERSECTION LANE CONFIGURATION

A summary of the recommended ultimate intersection lane configurations for the Proposed General Plan Buildout is illustrated on Figure 23.

GLOSSARY

GLOSSARY OF TERMS

ACRONYMS

AC	Acres
ADT	Average Daily Traffic
Caltrans	California Department of Transportation
DU	Dwelling Unit
ICU	Intersection Capacity Utilization
LOS	Level of Service
TSF	Thousand Square Feet
V/C	Volume/Capacity
VMT	Vehicle Miles Traveled

TERMS

AVERAGE DAILY TRAFFIC: The average 24-hour volume for a stated period divided by the number of days in that period. For example, Annual Average Daily Traffic is the total volume during a year divided by 365 days.

BANDWIDTH: The number of seconds of green time available for through traffic in a signal progression.

BOTTLENECK: A point of constriction along a roadway that limits the amount of traffic that can proceed downstream from its location.

CAPACITY: The maximum number of vehicles that can be reasonably expected to pass over a given section of a lane or a roadway in a given time period.

CHANNELIZATION: The separation or regulation of conflicting traffic movements into definite paths of travel by the use of pavement markings, raised islands, or other suitable means to facilitate the safe and orderly movements of both vehicles and pedestrians.

CLEARANCE INTERVAL: Nearly same as yellow time. If there is an all red interval after the end of a yellow, then that is also added into the clearance interval.

CONTROL DELAY: The component of delay, typically expressed in seconds per vehicle, resulting from the type of traffic control at an intersection. Control delay is measured by comparison with the uncontrolled condition; it includes delay incurred by slowing down, stopping/waiting, and speeding up.

CORDON: An imaginary line around an area across which vehicles, persons, or other items are counted (in and out).

CORNER SIGHT DISTANCE: The minimum sight distance required by the driver of a vehicle to cross or enter the lanes of the major roadway without requiring approaching traffic travelling at a given speed to radically alter their speed or trajectory. Corner sight distance is measured from the driver's eye at 42 inches above the pavement to an object height of 36 inches above the pavement in the center of the nearest approach lane.

CYCLE LENGTH: The time period in seconds required for a traffic signal to complete one full cycle of indications.

CUL-DE-SAC: A local street open at one end only and with special provisions for turning around.

DAILY CAPACITY: A theoretical value representing the daily traffic volume that will typically result in a peak hour volume equal to the capacity of the roadway.

DELAY: The time consumed while traffic is impeded in its movement by some element over which it has no control, usually expressed in seconds per vehicle.

DEMAND RESPONSIVE SIGNAL: Same as traffic-actuated signal.

DENSITY: The number of vehicles occupying in a unit length of the through traffic lanes of a roadway at any given instant. Usually expressed in vehicles per mile.

DETECTOR: A device that responds to a physical stimulus and transmits a resulting impulse to the signal controller.

DESIGN SPEED: A speed selected for purposes of design. Features of a highway, such as curvature, superelevation, and sight distance (upon which the safe operation of vehicles is dependent) are correlated to design speed.

DIRECTIONAL SPLIT: The percent of traffic in the peak direction at any point in time.

DIVERSION: The rerouting of peak hour traffic to avoid congestion.

FORCED FLOW: Opposite of free flow.

FREE FLOW: Volumes are well below capacity. Vehicles can maneuver freely and travel is unimpeded by other traffic.

GAP: Time or distance between successive vehicles in a traffic stream, rear bumper to front bumper.

HEADWAY: Time or distance spacing between successive vehicles in a traffic stream, front bumper to front bumper.

INTERCONNECTED SIGNAL SYSTEM: A number of intersections that are connected to achieve signal progression.

LEVEL OF SERVICE: A qualitative measure of a number of factors, which include speed and travel time, traffic interruptions, freedom to maneuver, safety, driving comfort and convenience, and operating costs.

LOOP DETECTOR: A vehicle detector consisting of a loop of wire embedded in the roadway, energized by alternating current and producing an output circuit closure when passed over by a vehicle.

MINIMUM ACCEPTABLE GAP: Smallest time headway between successive vehicles in a traffic stream into which another vehicle is willing and able to cross or merge.

MULTI-MODAL: More than one mode; such as automobile, bus transit, rail rapid transit, and bicycle transportation modes.

OFFSET: The time interval in seconds between the beginning of green at one intersection and the beginning of green at an adjacent intersection.

PLATOON: A closely grouped component of traffic that is composed of several vehicles moving, or standing ready to move, with clear spaces ahead and behind.

PASSENGER CAR EQUIVALENT (PCE): A metric used to assess the impact of larger vehicles, such as trucks, recreational vehicles, and buses, by converting the traffic volume of larger vehicles to an equivalent number of passenger cars.

PEAK HOUR: The 60 consecutive minutes with the highest number of vehicles.

PRETIMED SIGNAL: A type of traffic signal that directs traffic to stop and go on a predetermined time schedule without regard to traffic conditions. Also, fixed time signal.

PROGRESSION: A term used to describe the progressive movement of traffic through several signalized intersections.

QUEUE: The number of vehicles waiting at a service area such as a traffic signal, stop sign, or access gate.

QUEUE LENGTH: The length of vehicle queue, typically expressed in feet, waiting at a service area such as a traffic signal, stop sign, or access gate.

SCREEN-LINE: An imaginary line or physical feature across which all trips are counted, normally to verify the validity of mathematical traffic models.

SHARED/RECIPROCAL PARKING AGREEMENT: A written binding document executed between property owners to provide a designated number of off-street parking stalls within a designated area to be available for specified businesses or land uses.

SIGHT DISTANCE: The continuous length of roadway visible to a driver or roadway user.

SIGNAL CYCLE: The time period in seconds required for one complete sequence of signal indications.

SIGNAL PHASE: The part of the signal cycle allocated to one or more traffic movements.

STACKING DISTANCE: The length of area available behind a service area, such as a traffic signal or gate, for vehicle queueing to occur.

STARTING DELAY: The delay experienced in initiating the movement of queued traffic from a stop to an average running speed through an intersection.

STOPPING SIGHT DISTANCE: The minimum distance required by the driver of a vehicle on the major roadway travelling at a given speed to bring the vehicle to a stop after an object on the road becomes visible. Stopping sight distance is measured from the driver's eye at 42 inches above the pavement to an object height of 6 inches above the pavement.

TRAFFIC-ACTUATED SIGNAL: A type of traffic signal that directs traffic to stop and go in accordance with the demands of traffic, as registered by the actuation of detectors.

TRIP: The movement of a person or vehicle from one location (origin) to another (destination). For example, from home to store to home is two trips, not one.

TRIP-END: One end of a trip at either the origin or destination (i.e., each trip has two trip-ends). A trip-end occurs when a person, object, or message is transferred to or from a vehicle.

TRIP GENERATION RATE: The quantity of trips produced and/or attracted by a specific land use stated in terms of units such as per dwelling, per acre, and per 1,000 square feet of floor space.

TRUCK: A vehicle having dual tires on one or more axles, or having more than two axles.

TURNING RADIUS: The circular arc formed by the smallest turning path radius of the front outside tire of a vehicle, such as that performed by a U-turn maneuver. This is based on the length and width of the wheel base as well as the steering mechanism of the vehicle.

UNBALANCED FLOW: Heavier traffic flow in one direction than the other. On a daily basis, most facilities have balanced flow. During the peak hours, flow is seldom balanced in an urban area.

VEHICLE MILES OF TRAVEL: A measure of the amount of usage of a section of highway, obtained by multiplying the average daily traffic by length of facility in miles.

Intersection Analysis Summary

ID	Intersection Name	Control Type	Method	Worst Mvmt	V/C	Delay (s/veh)	LOS
1	SR-62 (NS) at Indian Canyon Dr (EW)	Signalized	HCM 6th Edition	WB Right	0.450	10.5	B
3	SR-62 (NS) at Dillon Rd (EW)	Signalized	HCM 6th Edition	NB Left	0.438	9.1	A
4	Indian Canyon Dr (NS) at Mission Lakes Blvd (EW)	Signalized	HCM 6th Edition	SB Left	0.250	16.6	B
5	Indian Canyon Dr (NS) at Pierson Blvd (EW)	All-way stop	HCM 6th Edition	SB Thru	0.631	15.0	C
6	Indian Canyon Dr (NS) at 14th Ave (EW)	Two-way stop	HCM 6th Edition	WB Left	0.000	15.6	C
7	Indian Canyon Dr (NS) at Dillon Rd (EW)	All-way stop	HCM 6th Edition	WB Left	1.007	49.3	E
8	Indian Canyon Dr (NS) at 20th Ave (EW)	Signalized	HCM 6th Edition	SB Left	0.395	15.7	B
9	Little Morongo Rd (NS) at Mission Lakes Blvd/16th St (EW)	All-way stop	HCM 6th Edition	WB Left	0.264	10.1	B
10	Little Morongo Rd (NS) at Pierson Blvd (EW)	All-way stop	HCM 6th Edition	WB Thru	0.538	14.5	B
11	Little Morongo Rd (NS) at 14th Ave/2 Bunch Palms (EW)	All-way stop	HCM 6th Edition	WB Left	0.495	12.3	B
12	Little Morongo Rd (NS) at Dillon Rd (EW)	All-way stop	HCM 6th Edition	WB Thru	0.723	19.3	C
14	Palm Dr (NS) at 16th St (EW)	All-way stop	HCM 6th Edition	NB Left	0.486	12.6	B
15	Palm Dr (NS) at Pierson Blvd (EW)	Signalized	HCM 6th Edition	NB Left	0.536	22.1	C
16	Palm Dr (NS) at Hacienda Ave (EW)	Signalized	HCM 6th Edition	WB Left	0.473	18.6	B
17	Palm Dr (NS) at Two Bunch Palms Trail (EW)	Signalized	HCM 6th Edition	EB Right	1.018	55.0	E
18	Palm Dr (NS) at Dillon Rd (EW)	Signalized	HCM 6th Edition	NB Left	0.687	27.1	C
19	Palm Dr (NS) at 20th Ave (EW)	Two-way stop	HCM 6th Edition	WB Left	0.004	19.0	C

20	Palm Dr (NS) at Varner Rd (EW)	Signalized	HCM 6th Edition	SB Left	0.778	7.9	A
21	Mountain View Rd (NS) at Hacienda Ave (EW)	Signalized	HCM 6th Edition	EB Left	0.472	25.2	C
22	Mountain View Rd (NS) at Dillon Rd (EW)	Signalized	HCM 6th Edition	SB Left	0.718	25.8	C
23	Mountain View Rd (NS) at Varner Rd (EW)	All-way stop	HCM 6th Edition	SB Left	1.163	83.1	F
24	Long Canyon Rd (NS) at Dillon Rd (EW)	All-way stop	HCM 6th Edition	WB Thru	0.618	12.9	B
101	SR-62 SB (NS) at Pierson Blvd (EW)	Two-way stop	HCM 6th Edition	WB Left	0.370	30.7	D
102	SR-62 NB (NS) at Pierson Blvd (EW)	Two-way stop	HCM 6th Edition	EB Thru	0.010	12.5	B

V/C, Delay, LOS: For two-way stop, these values are taken from the movement with the worst (highest) delay value. For all other control types, they are taken for the whole intersection.

Intersection Level Of Service Report

DATE: November 22, 2019

SUBJECT: Desert Hot Springs General Plan Update Traffic Analysis Addendum
18-0236

The purpose of this addendum is to clearly specify the level of signficance for impacts associated with the current General Plan and proposed General Plan Update.

CURRENT GENERAL PLAN IMPACT FINDINGS

Consistent with City practice, as specific development projects are proposed, the City would analyze impacts to the transportation system. While the analysis shows that all roadway segments would operate at an acceptable LOS assuming expansion based on the roadway classification, given the uncertainty of timing regarding future roadway improvements, it is possible that some segments would experience unacceptable LOS prior to installation of the roadway expansion improvement. Additionally, there is also a possibility that not all identified roadway improvements would be ultimately constructed due to site specific physical constraints. Given the uncertainty of timing of installation of roadway improvements, and because there may be physical constraints to expanding roadways as certain locations within the Planning Area, this would be considered a significant and unavoidable impact to roadway segment operations.

Potentially significant/unavoidable impacts have been identified as those where roadway widening is required and there currently exists physical constraints due to adjacent development that may preclude such widening. Any currently undeveloped parcels of land adjacent to future widening locations will be required to provide the necessary right-of-way dedications in conjunction with development.

Study Intersections

Table 1 summarizes the impact findings for the study area intersections. As shown in Table 1, the following six (6) study intersections are forecast to experience significant/unavoidable impacts with buildout of the current General Plan:

- SR-62 at Indian Canyon Drive - #1
- SR-62 at Pierson Boulevard - #2
- SR-62 at Dillon Road - #3
- Indian Canyon Drive at Dillon Road - #7
- Palm Drive at Dillon Road - #18
- Palm Drive at Varner Road - #20
- Mountain View Road at Varner Road - #23

The intersections of SR-62 at Indian Canyon Drive (#1), Pierson Boulevard (#2), and Dillon Road (#3) are located within Caltrans jurisdiction. Although the proposed improvements appear feasible, the City of Desert Hot Springs cannot guarantee any improvements will be constructed outside of its jurisdiction and the impact is considered potentially significant and unavoidable.

The intersection of Indian Canyon Drive at Dillon Road (#7) has existing development on the south leg of the intersection which may preclude construction of the identified improvements; therefore, the impact is considered potentially significant and unavoidable.

The intersection of Palm Drive at Dillon Road (#18) has existing development on the southwest corner and northeast corner of the intersection which may preclude construction of the identified improvements; therefore, the impact is considered potentially significant and unavoidable.

The intersections of Palm Drive at Varner Road (#20) and Mountain View Road at Varner Road (#23) are located entirely or partially within City of Cathedral City jurisdiction. Although the proposed improvements appear physically feasible, the City of Desert Hot Springs cannot guarantee any improvements will be constructed outside of its jurisdiction and the impact is considered potentially significant and unavoidable.

Improvements at study intersections located on the boundary with County of Riverside are considered feasible based on past improvements whereby the City and County have jointly constructed any necessary improvements identified by the City of Desert Hot Springs.

Study Roadway Segments

Table 2 summarizes the impact findings for the study area roadway segments. As shown in Table 2, the following seven (7) study roadway segments are forecast to experience significant/unavoidable impacts with buildout of the current General Plan as a result of existing development that may preclude the necessary roadway widening:

- Indian Canyon Drive: Hacienda Avenue and Two Bunch Palms Trail – R19
- Indian Canyon Drive: Dillon Road and 20th Avenue – R21
- West Drive: 8th Street and Pierson Boulevard – R28
- West Drive: Hacienda Avenue and Two Bunch Palms Trail – R29
- Palm Drive: north of Mission Lakes Boulevard – R30
- Palm Drive: Two Bunch Palms Trail and Dillon Road – R34
- Palm Drive: Dillon Road and 20th Avenue – R35
- Palm Drive: Varner Road and I-10 Freeway – R37
- Bubbling Wells Road: Dillon Road and 20th Avenue – R39
- Mountain View Road: Hacienda Avenue and Dillon Road – R40
- Hacienda Avenue: east of Mountain View Road – R64
- Two Bunch Palms Trail: east of Palm Drive – R72

The following roadway segments are not located within the ultimate jurisdictional boundary of the City of Desert Hot Springs:

- Mountain View Road: 20th Avenue and Varner Road
- Dillon Road: Diablo Road and Karen Avenue
- Dillon Road: east of Long Canyon Road

- 20th Avenue: Worsley Road and Diablo Road
- 20th Avenue: Diablo Road and Karen Avenue
- 20th Avenue: Karen Avenue and Indian Canyon Drive
- Varner Road: Palm Drive and Mountain View Road
- Varner Road: east of Mountain View Road

Although these segments require roadway widening, the proposed widening has equal or fewer lanes and right-of-way requirements than those identified in the County of Riverside General Plan. Therefore, it is presumed the widening will occur as necessary and the project impact is considered less than significant with mitigation.

Congestion Management Program (CMP) Impacts

SR-62 and Interstate 10 (I-10) are CMP designated facilities in the Riverside County CMP. The current General Plan does not propose any changes to I-10; however, buildout of the current General Plan could potentially conflict with the CMP if the identified improvements at SR-62 and the intersections of Indian Canyon Drive (#1), Pierson Boulevard (#2), and Dillon Road (#3) are not approved by Caltrans and implemented. Thefefore, buildout of the current General Plan is forecast to result in significant significant/unavoidable impacts at the following three (3) CMP study intersections:

- SR-62 at Indian Canyon Drive - #1
- SR-62 at Pierson Boulevard - #2
- SR-62 at Dillon Road - #3

PROPOSED GENERAL PLAN IMPACT FINDINGS

Consistent with City practice, as specific development projects are proposed, the City would analyze impacts to the transportation system. While the analysis shows that all roadway segments would operate at an acceptable LOS assuming expansion based on the roadway classification, given the uncertainty of timing regarding future roadway improvements, it is possible that some segments would experience unacceptable LOS prior to installation of the roadway expansion improvement. Additionally, there is also a possibility that not all identified roadway improvements would be ultimately constructed due to site specific physical constraints. Given the uncertainty of timing of installation of roadway improvements, and because there may be physical constraints to expanding roadways as certain locations within the Planning Area, this would be considered a significant and unavoidable impact to roadway segment operations.

Potentially significant/unavoidable impacts have been identified as those where roadway widening is required and there currently exists physical constraints due to adjacent development that may preclude such widening. Any currently undeveloped parcels of land adjacent to future widening locations will be required to provide the necessary right-of-way dedications in conjunction with development.

Study Intersections

Table 3 summarizes the impact findings for the study area intersections. As shown in Table 3, the following five (5) study intersections are forecast to experience significant/unavoidable impacts with buildout of the proposed General Plan:

- SR-62 at Indian Canyon Drive - #1
- SR-62 at Pierson Boulevard - #2

- Palm Drive at Dillon Road - #18
- Palm Drive at Varner Road - #20
- Mountain View Road at Varner Road - #23

The intersections of SR-62 at Indian Canyon Drive (#1) and Pierson Boulevard (#2) are located within Caltrans jurisdiction. Although the proposed improvements appear feasible, the City of Desert Hot Springs cannot guarantee any improvements will be constructed outside of its jurisdiction and the impact is considered potentially significant and unavoidable.

The intersection of Palm Drive at Dillon Road (#18) has existing development on the southwest corner and northeast corner of the intersection which may preclude construction of the identified improvements; therefore, the impact is considered potentially significant and unavoidable.

The intersections of Palm Drive at Varner Road (#20) and Mountain View Road at Varner Road (#23) are located entirely or partially within City of Cathedral City jurisdiction. Although the proposed improvements appear physically feasible, the City of Desert Hot Springs cannot guarantee any improvements will be constructed outside of its jurisdiction and the impact is considered potentially significant and unavoidable.

Improvements at study intersections located on the boundary with County of Riverside are considered feasible based on past improvements whereby the City and County have jointly constructed any necessary improvements identified by the City of Desert Hot Springs.

Study Roadway Segments

Table 4 summarizes the impact findings for the study area roadway segments. As shown in Table 4, the following seven (7) study roadway segments are forecast to experience significant/unavoidable impacts with buildout of the proposed General Plan as a result of existing development that may preclude the necessary roadway widening:

- Indian Canyon Drive: Hacienda Avenue and Two Bunch Palms Trail – R19
- Indian Canyon Drive: Dillon Road and 20th Avenue – R21
- Palm Drive: Two Bunch Palms Trail and Dillon Road – R34
- Palm Drive: Dillon Road and 20th Avenue – R35
- Palm Drive: Varner Road and I-10 Freeway – R37
- Mountain View Road: Hacienda Avenue and Dillon Road – R40
- Two Bunch Palms Trail: east of Palm Drive – R72

The following roadway segments are not located within the ultimate jurisdictional boundary of the City of Desert Hot Springs:

- Mountain View Road: 20th Avenue and Varner Road
- Dillon Road: Diablo Road and Karen Avenue
- Dillon Road: east of Long Canyon Road
- 20th Avenue: Worsley Road and Diablo Road
- 20th Avenue: Diablo Road and Karen Avenue
- 20th Avenue: Karen Avenue and Indian Canyon Drive
- Varner Road: Palm Drive and Mountain View Road
- Varner Road: east of Mountain View Road

Although these segments require roadway widening, the proposed widening has equal or fewer lanes and right-of-way requirements than those identified in the County of Riverside General Plan. Therefore, it is presumed the widening will occur as necessary and the project impact is considered less than significant with mitigation.

Congestion Management Program (CMP) Impacts

SR-62 and Interstate 10 (I-10) are CMP designated facilities in the Riverside County CMP. The current General Plan does not propose any changes to I-10; however, buildout of the proposed General Plan could potentially conflict with the CMP if the identified improvements at SR-62 and the intersections of Indian Canyon Drive (#1) and Pierson Boulevard (#2) are not approved by Caltrans and implemented. Thefefore, buildout of the current General Plan is forecast to result in significant significant/unavoidable impacts at the following two (2) CMP study intersections:

- SR-62 at Indian Canyon Drive - #1
- SR-62 at Pierson Boulevard - #2
