Appendix G:
Parking Analysis for Commercial Uses

FEHR PEERS

DRAFT Memorandum

Date: September 30, 2020

To: Hillary Gitelman and Karl Heisler, ESA

From: Franziska Church and Ryan Caldera, Fehr & Peers

Subject: Downtown West Mixed-Use Commercial Parking Evaluation

SJ19-1951

The Downtown West Mixed-Use Project ("Project") proposes the inclusion of up to 7,160 vehicle parking spaces, 4,800 of which would be publicly accessible and provided for the site-specific commercial uses, and up to 2,360 parking spaces would be provided for the Project's residential uses. The residential parking supply meets the City's parking requirements per its Municipal Code (§20.70). However, the proposed commercial parking supply is 2,191 spaces fewer than required by the City Code, including municipal code allowed reductions for TDM strategies and mixed-use projects.

The purpose of this memorandum is to determine whether the commercial parking supply of up to 4,800 spaces would serve the commercial land uses' core parking demand. The parking evaluation is reflective of the Project's TDM program and the City-envisioned dense, urban, and high-quality transit context in which the Project will be built over time. The parking supply incentivizes multimodal access over driving and parking, in support of the City's long-term goals consistent with *Envision 2040*. Specifically, the memorandum focuses on the weekday peak midday demand for the site-specific commercial uses. The commercial parking spaces will be publicly accessible and be able to accommodate weekday evening and weekend activities, when the Project's commercial parking demand is low.

The site is located in downtown San José, served by several major transit facilities and a developed multimodal network. Upon full project buildout, several major transit improvements will further improve transit access, including Caltrain Electrification and Bay Area Rapid Transit (BART) Silicon Valley Phase 2 to Diridon station. Moreover, as part of its Environmental Impact Report (EIR)

mitigation measure AQ-2h, the Project applicant will be required to implement a robust TDM program to increase the non-SOV mode share of employees and residents. As discussed further in this memo, the Project's characteristics and TDM program are expected to reduce the number of vehicles driving to the site, and the Project is anticipated to have lower parking demand than developments in other contexts.

1. Project Overview and Parking Supply Code Compliance Assessment

The Project area encompasses approximately 81 acres in downtown San José, west of State Route (SR) 87, north of Interstate (I) 280 in the vicinity of the Diridon and future BART Stations, and future High-Speed Rail (HSR) facility. The Project includes construction of the following uses in multiple new structures distributed throughout the Project area:

- 7.3 million gross square feet of commercial office uses
- 5,900 dwelling units
- 500,000 gross square feet of commercial retail space
- 300 hotel rooms
- 800 limited-term corporate accommodations[1]
- 100,000-gross square foot event space
- 130,000 gross square feet of on-site centralized utility plants
- 100,000 on-site logistics centers to serve the commercial on-site uses

1.2 Required Parking Supply per City Code

Chapter 10 of the Project's *Local Transportation Analysis* (September 2020) compares the Project's proposed parking supply to the City of San José's parking supply requirements for the Project as a whole. This section presents a similar comparison, though each land use is evaluated individually to identify which land uses meet the City's parking supply requirements.

The City of San José's Municipal Code §20.70 defines the vehicle parking supply requirements for developments within Downtown San José. The City of San José's parking supply requirements in downtown are lower than parking requirements in other parts of the City to reflect the downtown's multimodal network that includes a robust network of transit, bicycle, and pedestrian facilities.

[1] Limited-term corporate accommodations would operate akin to a suites hotel for Google employees typically visiting the site or newly relocated to the area for up to 60 days. These accommodations would not be open to the public. These accommodations could occur as stand-alone uses or as part of mixed-use buildings.

1.2.1 Land Uses Without Parking Supply Requirements
(Active/Retail Uses, Event/Conference Center, Central Utilities Plant, and Logistics/Warehouse)

Per the City's Municipal Code, most active/retail uses within the downtown are not required to have off-street vehicle parking. (Land uses not required to have off-street parking are still required to provide bicycle parking spaces, per the City's Municipal Code.) Downtown retail uses generally serve the already present daytime population (i.e., employees) for whom it is easier to walk or bike. As such, visitors to these uses are expected to primarily use non-SOV travel modes or taxis/Transportation Network Companies (TNCs) (e.g., Uber, Lyft), and therefore would not require any vehicle parking. Travelers who need vehicle parking facilities are expected to utilize on-street parking and/or existing public parking lots or structures.

The 500,000 square feet of active uses have not been defined but include a list of permitted and conditional uses.[2] (A full list of these uses is provided in **Attachment A**.) Most of the permitted uses, which do not require subsequent City approval, do not require any off-street vehicle parking per City code, while some of the conditional uses do have vehicle parking requirements. All active uses are required to provide a specified number of bicycle parking spaces, as identified in the Project LTA. The conditional uses would go through their own City review process and may need to provide additional off-site vehicle parking for patrons.

The event/conference center, central utilities plant, and logistics/warehouse uses are also not required to provide any off-street vehicle parking per City code. (The event/conference center is required to provide a number of bicycle parking spaces, as identified in the Project LTA.)

1.2.2 Land Uses With Parking Supply Requirements
(Residential, Hotel, Limited-Term Corporate Accommodation, and Office Uses)

Residential, hotel, limited-term corporate accommodation, and office uses are required to provide off-street parking facilities per the City of San José's Municipal Code §20.70. In addition to the base parking supply rate requirements presented in City Code, the City allows for additional parking supply reductions for TDM programs and mixed-use projects. Based on Municipal Code §20.70.330.A, a project may receive up to a 15 percent reduction in the required off-street parking spaces when the Project has developed a TDM program with evidence that parking demand will be reduced. Also, mixed-use projects may qualify for a 50 percent reduction in required parking supply

[2] The Permitted Uses are designed to promote and sustain a vibrant urban center. Land uses proposed for a particular building or structure shall be identified as part of the Downtown West PD Zoning / Design Conformance Review and shall be approved if consistent with the General Development Plan, the applicable planned development permit, and the applicable General Plan land use designation. Conditional land uses require a Conditional Use Permit, which is subject to review and approval by the Planning Commission.

based on a finding that the reduction in parking supply will not adversely affect surrounding projects or facilities based on Municipal Code §20.70.330.B.

The Project will supply up to 2,360 spaces for residential uses and up to 4,800 spaces for non-residential uses. A portion of the residential spaces would be made available for shared use with office employees.

Table 1 presents the Project's required parking supply based on the City of San José's Municipal Code. The table also presents the Project's planned parking supply.

Table 1: City Municipal Code Parking Supply Requirements (Residential, Hotel, Limited-Term Corporate Accommodations, and Office Uses)

Land Uses	Size[1]	Parking Supply Rate Requirement		Required Parking Supply (spaces)		Planned Parking Supply (spaces) *(Difference)*
		Without Reductions	With Reductions[2]			
Residential (dwelling units)	5,900 du	1.0 spaces/du	0.4 spaces/du	2,360		2,360 *(+/- 0)*
Hotel (rooms)	300 rm	0.35 spaces/rm	0.15 spaces/rm	45	6,991	4,800 *(-2,191)*
Limited-Term Corporate Accommodation (rooms)	800 rm	0.35 spaces/rm	0.15 spaces/rm	120		
Office (square feet)	7,300 ksf	2.5 spaces/ksf[3]	1.1 spaces/ksf[3]	6,826		
Total Project				**9,351**		**7,160 *(-2,191)***

Note: Square footage and unit counts are maximums and are assumed for buildout scenarios.

1. du = dwelling units; ksf = 1,000 gross square feet; rm = rooms.
2. Required parking supply rate reductions include a 15 percent reduction due to TDM and a 50 percent reduction due to the Project's mixed-use nature, for a total net reduction of 42.5 percent ((1-50%) x (1-15%) = 42.5%).
3. Per Municipal Code §20.90.050, "floor area" is defined as 85 percent of the "total gross floor area" of the building. Thus, parking supply requirement for offices, business and administrative, is calculated based on 85% total gross floor area (7,300,000 sf GFA x 85% = 6,205,000 sf).

Source: Downtown West Mixed-Use, 2020.

Accounting for the applicable parking supply reductions, the Project is required to supply 2,360 spaces for residential uses and 6,991 spaces for non-residential uses per City code. The Project proposes to supply up to 2,360 spaces for residential uses and up to 4,800 spaces for non-residential uses. Therefore, the Project's residential parking supply meets City code requirements, and the Project's non-residential parking supply is 2,191 spaces (31 percent) fewer than required.

1.2.3 Parking Supply Requirement Assessment

The Project will supply the required number of parking spaces per City code for residential land uses, and thus is compliant with City code for residential parking supply.

The Project will supply 2,191 spaces fewer than required for non-residential land uses that require parking (i.e., hotel, limited-term corporate accommodations, and office uses). This parking supply is 31 percent lower than required by City Code and the Project does not meet the City's standard code requirements for hotel, limited-term corporate accommodations, and office uses. (The City's Planned Development Zoning provisions, which are proposed to apply to the Project, allow for further reductions in parking supply subject to City approval.)

The Project does not provide off-street parking for active uses, the event/conference center, central utilities plan, and logistics warehouse uses. Because these uses are not required to provide off-street parking, the Project meets the City's code requirements for these uses.

Section 2 presents a detailed parking demand and shared parking evaluation to determine whether the proposed 4,800 commercial spaces are sufficient to meet the demand.

1.3 Project Programs Reducing Parking Demand

This section highlights the Project programs that reduce vehicle travel and associated parking demand. Specifically, this section summarizes several of the Project's TDM strategies and neighborhood parking monitoring strategies.

1.3.1 Project TDM Plan and Parking

The Project's Enhanced TDM Program, required as part of the Project's EIR mitigation measures, includes several key measures that will reduce the Project's parking demand by encouraging multimodal travel. A combination of specific and selective TDM measures that contribute to reducing parking demand include:

- Providing car share subsidies to residents;
- Allowing telecommuting for employees;
- Implementing a commute trip reduction marketing strategy;
- Operating an employer-sponsored vanpool/express buses; and
- Market-pricing on-street and off-street parking.

These TDM measures are discussed in greater detail in the Project LTA.

The Project will also contribute to several bicycle and pedestrian infrastructure improvements within and outside of the Project area. For example, Class IV protected bicycle facilities are planned along West San Fernando Street, Autumn Street, and North Montgomery Street. These facilities will

connect the Project to surrounding neighborhoods and transit stations. Additionally, sidewalk widenings, plazas, and new street trees are planned for public areas in the immediate vicinity, which will improve comfort for pedestrians and increase walkability in the Project area. Physical bicycle and pedestrian improvements like those included in the Project encourage travelers to use non-vehicular modes of travel to and from the site. As travelers choose to make more trips by bicycle and walking, driving trips and vehicle ownership will decrease, reducing parking demand as well.

Further, major transit projects are planned near the Project area. Specifically, VTA's Bart Silicon Valley Extension, Caltrain Electrification, and the Caltrain Business Plan will all contribute to greater transit connectivity for employees and residents near Diridon Station. These improvements are anticipated to substantially increase transit ridership for nearby developments, including the proposed Project. As transit connectivity improves, the need for driving and vehicle ownership will decrease such that parking demand will as well. Although these improvements are not directly associated with the Project, they will contribute to the City's mode split goal and ultimately lower the Project's need for vehicle parking.

1.3.2 Neighborhood Parking Monitoring Plan

The City requires a neighborhood traffic intrusion analysis when a project is expected to potentially result in excessive speeds, volumes, and/or parking intrusion on neighborhood streets. As the Project area develops, the Project has the potential to add traffic to residential streets in adjacent neighborhoods west of the Diridon Station, north and south of The Alameda, especially if the operations of intersections in and around the Project area deteriorate and vehicle drivers seek alternate travel routes. Additionally, with the reduced parking supply, overflow parking may also encroach into adjacent neighborhoods.

A Neighborhood Parking Monitoring Plan will be developed to identify parking intrusion management strategies that would reduce the Project's effect on nearby neighborhoods. Several policies identified in the plan that would discourage spillover parking include:

- Time limits and restrictions,
- Parking charges,
- Development of a parking benefits district,
- Urban design and signage,
- Parking enforcement, and
- Comprehensive curb lane management policy.

The Neighborhood Parking Monitoring Plan is described in greater detail in Chapter 11 of the Project LTA.

2. Parking Evaluation

This section estimates the Project's peak shared parking demand for those land uses that do not meet City parking requirements (i.e., office and hotel uses).

The Urban Land Institute (ULI) sponsored a national study in 1984 that established basic methods for analyzing parking demand in mixed-use developments and developed average parking rates by land use. Fehr & Peers staff were involved in the 2004 update of this national study sponsored by ULI. In 2020, ULI released a third update to this study to include revised parking demand rates and internalization methods. The analysis presented in this memorandum utilizes data from the updated *Shared Parking, Third Edition* report.

In the shared parking methodology, the base parking rate and daily/hourly/seasonal patterns for each land use are established, and the overall parking demand is calculated by considering the unique travel characteristics of the Project being analyzed. For land uses without large seasonal fluctuations (i.e., non-retail land uses), hourly parking demand patterns are primarily used to identify the highest parking demand for a typical weekday.

Parking demand patterns included in *Shared Parking* include data from sites nationwide. For all land uses included in the Project, local parking demand data is available and was used in this assessment. Daily/hourly/seasonal patterns from *Shared Parking* were used to calculate the shared parking demand reduction for all land uses.

First, the parking demand for the commercial uses were evaluated on their own. Then because the Project allows for shared parking with the residential uses, the parking demand for all uses were also evaluated at different levels of shared parking.

2.1 Base Parking Rate Assumptions

The City of San José developed parking requirements (i.e., the required number of parking *spaces*) to adequately meet a development's peak parking demand (i.e., the maximum number of *vehicles* parked at a site during a given time). Base parking rates were generally established to be consistent with the City's parking requirement as outlined below. The City of San José has specific parking requirements for office land uses in downtown. These requirements are intended to reflect the general mode choice shifts to non-driving modes due to the availability of transit, bicycle, and pedestrian facilities in downtown San José.

2.1.1 Parking Demand Rates for Office Uses

This assessment uses the City's parking requirement of 2.50 spaces per 1,000 square feet as the base parking rate for office uses.

2.1.2 Parking Demand Rates for Hotel Uses

This assessment uses the City's parking requirement of 0.35 spaces per room as the base parking rate for hotel uses, including standard hotel and limited-term corporate accommodations.

2.1.3 Parking Demand Rates for Residential Uses

The Project proposes to supply up to 2,360 residential spaces, which equates to 0.4 spaces per residential dwelling unit. As identified above, the Project meets the City's required parking supply requirements for residential uses. However, because residential parking demand and office parking demand peak at different times of day, sharing some or all residential parking with non-residential uses is beneficial. This assessment considers three different amounts of shared parking between residential and non-residential uses (discussed later in this memo).

This assessment also uses a base parking demand rate of 0.4 spaces per dwelling unit for residential units for residents parking in the shared parking supply.

2.2 Mode Adjustment and Noncaptive Ratio Adjustments

The ULI Shared Parking Analysis methodology includes adjustments to account for variation in the mode of travel other than single-occupancy vehicles (typically associated with TDM) and internalization that occurs when a person parks once and visits multiple land uses on the site. The mode adjustments were applied to the peak parking rates to reflect use of modes other than single-occupancy vehicles, including carpooling, bicycling, walking, and using transit. The noncaptive ratio adjustments were applied to the peak parking rates to account for internalization. **Table 2** presents a summary of the reductions discussed in this section.

Table 2: Mode Adjustments and Noncaptive Ratio Adjustments by Land Use

Land Uses	Mode Adjustment[1]	Noncaptive Ratio Adjustment[2]
Office	55% to 75%	-
Hotel	73%[3]	-
Limited-Term Corporate Accommodation		
Residential	-	15%

Notes:
1. Mode adjustments reflect reductions in parking demand due to shifting to non-SOV modes, including walking, biking, and transit.
2. Noncaptive ratio adjustments reflect reductions in parking demand due to internalization (i.e., those who park at one land use but use non-driving modes to travel to other nearby land uses).
3. ULI methodology considers hotels and limited-term corporate accommodations as the same land use, so the same adjustments were applied to both uses.

Source: Urban Land Institute; Fehr & Peers, 2020.

2.2.1 Mode Shift Adjustments for Office Uses

This section discuses mode shift adjustments related to the Project's required TDM Program as well as additional market forces, which are described in more detailed below. For this assessment, a range of mode adjustments were considered to inform the Project's parking needs at different levels of mode shift as described below:

- **55% mode shift –** the Project increases the non-SOV mode share to 55% through TDM
- **60% mode shift –** the Project increases the non-SOV mode share to 60% through TDM
- **65% mode shift –** the Project increases the non-SOV mode share to 65% through TDM
- **70% mode shift –** the Project increases the non-SOV mode share to 65% through TDM *and* market forces cause an additional 5 percentage point increase in the non-driving mode share for office uses
- **75% mode shift –** the Project increases the non-SOV mode share to 65% through TDM *and* market forces cause an additional 10 percentage point increase in the non-driving mode share for office uses

It should be noted that the 75% mode shift is consistent with the City's ultimate mode shift goal for the plan area. Consistent with *Envision 2040*, the downtown area would need to have 75% non-SOV mode split to support the citywide goal of at least 60%of commute trips completed by non-SOV alone modes.

For each of the analyzed mode shifts, the percentage was applied for all office uses to the driving adjustment in ULI's parking evaluation.

TDM Program

As discussed in **Section 1.3,** the Project will be required to meet a 65% non-SOV mode share target for office uses as part of its TDM Plan. The first three levels of mode shift for office uses assume the Project will reduce employee driving mode share entirely through the Project's TDM Plan. The TDM Plan is estimated to reduce employee driving mode share by up to 65%. Mode shifts of 50% and 55% were also assessed for informational purposes.

Market Forces

The City of San Jose's base parking rates, identified in **Section 2.1**, intend to reflect anticipated parking conditions in downtown San José. However, when comparing these parking rates to those of other high-density areas (e.g., San Francisco), we found that these rates do not fully account for the high availability of transit and low availability, and high cost, of parking, typical of an urban core. The parking analysis assumes two additional levels of mode shift (70% and 75%) that would occur due to market forces created by downtown San José's parking-constrained environment (not inclusive of the mode shifts due to parking supply assumed in the TDM plan). This concept of

market forces and its affect on parking has been applied to other recent studies, such as the *University of California San Francisco Comprehensive Parnassus Heights Plan Draft EIR* (July 2020).

The concept of market forces draws upon the scarcity and trade-offs principles of economics: how people weigh and choose suitable alternatives when the market is not providing a good/service at a cost, whether in terms of dollars, time, or both, that the user is willing to pay. In this use of market forces, we mean how people arrive at their decision of how and when to travel based on their knowledge that there is a deficit of parking as compared to the amount of people who would otherwise wish to use it free of price and time constraints. This decision of how to travel based on parking availability and cost happens every day in urban cities: most people opt for the reliability, cost, and convenience of transit as compared to driving and paying/looking for parking. In other words, market forces shape urban cores; where space is at a premium and land costs are high, comparatively taller and/or more dense land uses are generally favored at the preferred land use in conjunction with modes of transportation that allow more people to move in less space (e.g., transit, sidewalks, etc.).

In order to be conservative with respect to the amount of vehicle trips generated by the Project we presume that employees who do not drive to work due to market forces, and not already accounted for in mode shifts due to Project-required TDM, would typically shift to taxis or TNCs to commute to work; though employees could be incentivized to ride their bike or walk further distances or shift to micromobility.

One reason taxi/TNC services are attractive is that they do not require a parking space; people can travel to/from the Project site without needing to park a vehicle. It is expected that Project vehicle arrivals in the future are less likely to drive and park, and more likely to travel by taxi/TNC due to the door-to-door convenience and elimination of looking for and paying for parking in a parking constrained destination. Those who would otherwise desire to drive alone or carpool to/from the campus site would be reasonably expected to shift their travel behavior and be more likely to travel by taxi/TNC or drop-off in the future, which reflects a desire to travel by automobile – but one that is not limited by parking availability. Additional market force reductions of five and ten percentage points beyond the TDM requirement were presumed for this assessment.

As noted, the shift to taxi/TNC or drop-off would add additional vehicle trips compared to a similar scenario where travelers drive themselves to work. When someone drives to a destination, they typically generate one trip when arriving, park during their stay, and generate one trip when leaving (totaling two trips). However, using a taxi/TNC or drop-off would generate two trips when arriving and two trips when leaving (totaling four trips); although in dense urban areas, taxi/TNC drivers can typically chain trips/ride-hails, which results in shorter than average vehicle trips than would occur in the area. It should be noted that the base analysis in the TA does not account for any mode shift due to the Project TDM program, and that the LTA includes lower TDM effectiveness to be more consistent with City practices; thus any shift to taxi/TNC due to market forces would not

substantially change the conclusions of the TA and LTA because the models utilized for these analyses are conservative and assume a higher trip generation than would actually occur. In addition, passenger loading areas would experience greater demand as taxi/TNC or drop-off use increases. The proposed Project is expected to be able to meet these additional demands due to market forces. Ultimately, the Project's ability to meet its transportation demands, including parking demands, will be regularly monitored as part of the TDM Plan identified in **Section 1.3.1** and the Neighborhood Parking Monitoring Plan identified in **Section 1.3.2**. It will be Google's responsibility to adjust their parking policies (e.g., parking pricing) and TDM programs to meet their transportation obligations if spillover parking (due to a reduced parking supply) is observed.

2.2.2 Adjustments for Hotel Uses

Hotel uses include 300 rooms of publicly available hotel use and 800 rooms of limited-term corporate accommodations.

Occupants of limited-term corporate accommodations are employees or invited guests of the office use tenant who will typically fly to San José from out of town. These occupants may stay at the Project site for up to 60 days per stay, and will generally travel to the office and local retail using alternate modes. It will be cost-prohibitive for them to rent a car for their entire stay, so it is assumed these occupants will rely on taxi/TNC use or carshare to travel to and from the Project site for non-work travel. The occupants of the limited-term corporate accommodations will therefore have minimal parking needs due to this shift from driving mode.

All hotel land uses were combined for this assessment per *Shared Parking, Third Edition* recommended methods. To account for the internalization of limited-term corporate accommodations, the mode shift variable between office and hotel land uses was increased to 73% to reflect that all limited-term corporate accommodations will not require parking supply, and that all other hotel use will require parking supply (i.e., 800 limited-term corporate accommodations / 1,100 total hotel rooms = 73%). This mode shift is additive to the base mode shift already considered in *Shared Parking, Third Edition*.

Lastly, the occupants of the standard hotel are expected to use taxis/TNCs and carshare at a higher-than-average rate for off-site trips due to the site's downtown context. A 60% mode-shift reduction was applied to the base demand rate for hotels to account for the increased TNC use.

In total, the mode shift adjustments applied to hotel and limited-term corporate accommodations result in a net adjustment of 88% mode shift.

2.2.3 Adjustments for Residential Uses

The Project will increase office employment in downtown San José. As such, it is reasonable to assume a portion of residents will also work at the Project site. These employee-residents may still own vehicles at a similar rate of non-employee-residents; however, they are not expected to

commute via driving and instead opt to walk or bike via the Project's expansive bicycle and pedestrian path network. The internalization factor was obtained from the 2017 Longitudinal Employer-Household Dynamics web tool published by the Center for Economic Studies and the Census Bureau, which compiles and provides geospatial demographics data. The web tool summarized that approximately 15% of those living in the greater downtown San José area also work there. Therefore, this assessment assumes an internalization factor of 15% for residential uses (i.e., a peak period parking reduction of 15% of residential parking demand) to account for the driving patterns of employee-residents.

2.3 Shared Parking Supply Assumptions

This assessment assumes the Project will supply up to 4,800 off-street parking spaces for non-residential land uses (i.e., office and hotel) and up to 2,360 reserved off-street parking spaces for residential land uses. The Project proposes that residential parking may be made available for commercial uses. This assessment assumes three different levels of shared parking supply scenarios:

1. **No Shared Residential Parking** – Shared parking supply only includes the **4,800 off-street parking spaces** for non-residential land uses (i.e., office and hotel). Neither residential parking demand nor residential parking supply are included in this assessment.
2. **Partial Shared Residential Parking** – Shared parking supply includes the 4,800 off-street parking spaces for non-residential land uses *and* 1,000 off-street parking spaces for residential land uses, totaling **5,800 shared parking spaces**. A proportional portion of the residential parking demand (42%) is included in this assessment.
3. **Total Shared Residential Parking** – Shared parking supply includes the 4,800 off-street parking spaces for non-residential land uses *and* 2,360 off-street parking spaces for residential land uses, totaling **7,160 shared parking spaces**. All residential parking demand is included in this assessment.

2.4 Shared Parking Demand Results

Peak period parking demand was calculated for the Project using the parking rates and methods outlined above. **Attachment B** presents a detailed peak period parking demand summary for the Project under each study scenario. **Attachment C** includes a graph presenting the hourly parking demand by land use for each shared parking supply scenario at 65% mode shift to illustrate the change in parking demand over the course of a typical weekday. **Table 3** below presents the parking supply surplus or shortfall for the Project under each shared parking supply scenario and percent mode shift for office uses.

Table 3: Peak Period Parking Demand and Supply Summary

Shared Parking Scenario	Shared Residential Parking (spaces)	*Total Parking Demand Surplus or Shortfall Relative to the Proposed 4,800 Commercial Space Supply*[1]				
		75% mode shift (65% commuter choice + 10% market force)	70% mode shift (65% commuter choice + 5% market force)	65% mode shift	60% mode shift	55% mode shift
No Shared Residential Parking	0	+230	-670	-1,580	-2,480	-3,380
Partial Shared Residential Parking	1,000	+650	-250	-1,150	-2,050	-2,950
Total Shared Residential Parking	2,360	+1,200	+300	-600	-1,500	-2,400

Note:
1. A positive number indicates surplus of commercial parking and a negative number indicates a shortfall of commercial parking as compared to the 4,800 commercial spaces proposed by the Project.

Source: Fehr & Peers, 2020.

As shown in the table above, there will be a surplus of parking spaces supplied relative to demand under four scenarios analyzed (as indicated in green), and there will be a shortfall of parking spaces supplied relative to demand under the remaining 11 scenarios.

The 4,800 commercial spaces can meet the Project's parking demand under all three parking supply scenarios (i.e., at all levels of shared parking between residential and non-residential land uses). Under the No Shared Residential Parking scenario, the planned parking supply will meet the peak period parking demand when the TDM Plan effects a 65% mode shift and market forces effect an additional eight percentage point shift. Under the Partial Shared Residential Parking scenario, the planned parking supply will meet the peak period parking demand when the TDM Plan effects a 65% mode shift and market forces effect an additional six percentage point shift. Under the Total Shared Residential Parking scenario, the planned parking supply will meet the peak period parking demand when the TDM Plan effects a 65% mode shift and market forces effect an additional three percentage point shift.

Moreover, under the scenarios where there is a surplus of parking, some amount of parking may be removed while still meeting the Project's parking demand. At a 75% mode shift (65% mode shift through the TDM Plan and 10% mode shift through market forces), between 230 and 1,200 parking spaces could be removed from the commercial parking supply without creating a parking shortfall, depending on shared parking supply scenario. At 70% mode shift (65% mode shift through the TDM Plan and 5% mode shift through market forces), up to 300 parking spaces could be removed from the commercial parking supply without creating a parking shortfall under the Total Shared Residential Parking scenario.

Figure 1 below illustrates the temporal distribution of the parking demand for the 70 percent mode shift scenario that assumes no shared parking with the residential uses. As shown, the peak mid-day parking demand starts decreasing at 4:00 PM and provides an excess of nearly 3,400 parking spaces by 6:00 PM that can be used by the surrounding land uses.
