1. Introduction

This report presents the results of a local transportation analysis (LTA) conducted for the proposed Downtown West Mixed-Use Rezoning and Development Plan (the "Project" or "Plan") in the western half of downtown San José and associated General Plan Amendments (GPAs). The purpose of the LTA is to identify potential adverse effects of the proposed Project on the surrounding transportation system. Consistent with the City of San José Transportation Analysis Policy (Council Policy 5-1), adverse effects were evaluated following guidelines from the City of San José's *Transportation Analysis Handbook* ("Handbook"), direction from City staff where thresholds are not established in the Handbook, and the Santa Clara Valley Transportation Authority (VTA), the congestion management agency for Santa Clara County. The analysis presented for the LTA takes a more comprehensive approach than outlined in the City's Handbook and provides additional analysis on multimodal access and capacity constraints within the immediate vicinity of the Project area, and includes intersection level of service and operational analysis along the main access points to the Project area, defined as intersections within half of a mile that are known to operate deficiently, as well as CMP intersections per VTA requirements.

The intent of the LTA is to identify adverse effects of the Project on the surrounding transportation system and recommend improvements. The LTA evaluates adverse effects for all modes, including pedestrians, bicycles, transit, and vehicles. Consistent with Envision 2040, the City through the entitlement process, seeks to identify and fund needed transportation improvements for all transportation modes, giving first consideration to improvement of bicycling, walking, and transit facilities and encourages investment that reduces vehicle travel demand. Improvements that increase vehicle capacity could have secondary effects and must not have unacceptable effects on existing or planned transportation facilities. Where adverse effects are identified improvements consistent with General Plan policies, goals, and street typologies are discussed. Adverse effects are either directly addressed through identified improvements or through off-setting improvements that address multimodal access within the downtown.

As part of an LTA the City typically includes specific site access and on-site circulation evaluations, including driveway operations, sight distance, and other relevant metrics. However, the Project currently does not include a specific site plan that designates exact building location and access for each parcel. As development is initiated, the Project applicant will be required to develop focused LTAs for the Project area to address the City's requirements for site access and on-site circulation, in addition to providing detailed evaluation of multimodal access within the Project area.

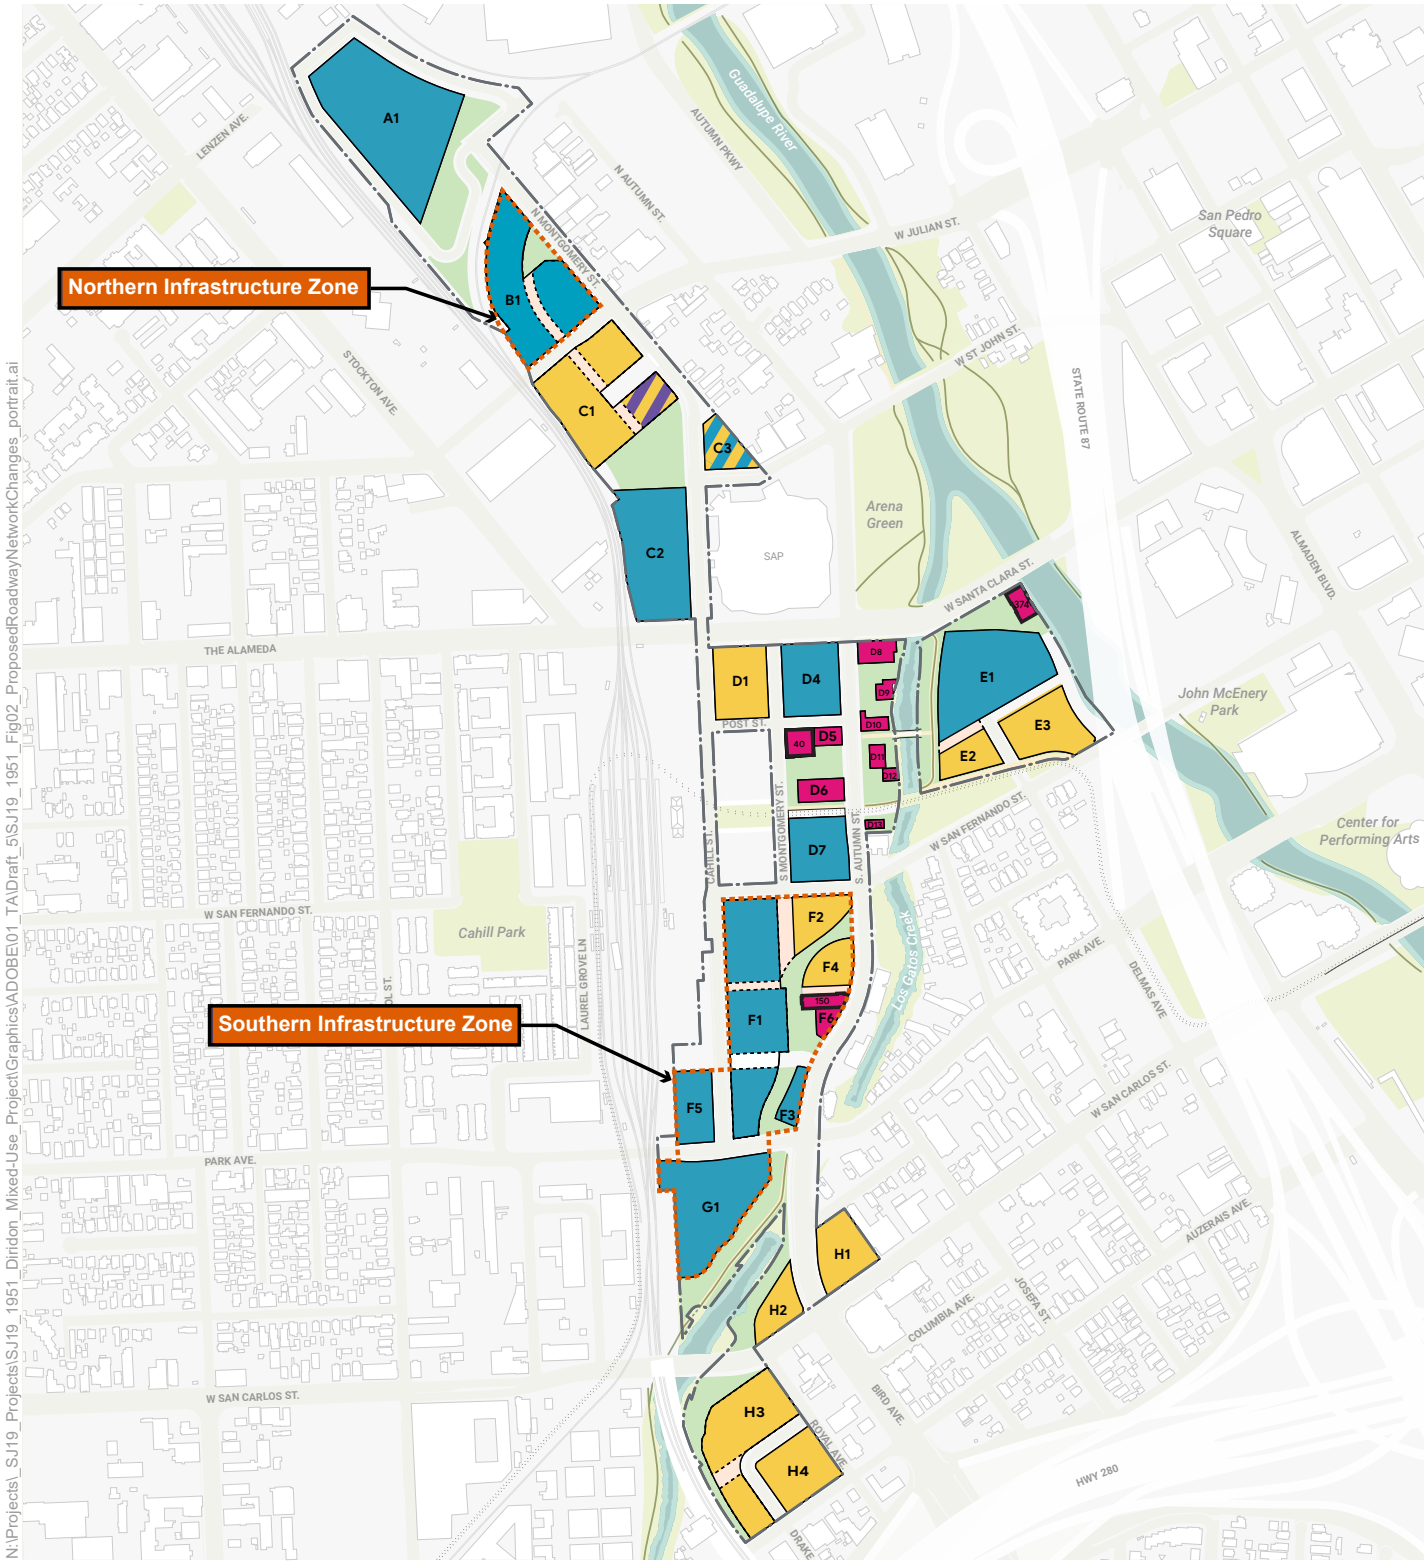
A separate Transportation Analysis (TA) report was also prepared for the City of San José per the City Council Policy 5-1. The purpose of the TA is to identify potentially significant impacts of the proposed Project on the surrounding transportation system per the California Environmental Quality Act (CEQA) and to recommend measures to mitigate significant impacts. The LTA included in this report is prepared to address specific circulation metrics as part of the City's development application purposes and is not prepared for CEQA purposes.

1.1 Project Description

The Downtown West Mixed-Use Project area encompasses approximately 81 acres in downtown San José, west of State Route (SR) 87, north of Interstate (I) 280 in the vicinity of the Diridon Station and future Bay Area Rapid Transit District (BART) station, and future High-Speed Rail (HSR) facility.

Much of the Project area is currently developed with low density one- and two-story buildings that cover only portions of their lots, with the remaining unbuilt lot space used as surface parking. The area in the core of the site, especially around Diridon Station and the SAP Center, is surrounded by surface parking lots that would be redeveloped by the Project. The total floor area of buildings currently on the Project area accounts for approximately 755,000 square feet; many of the existing buildings are vacant. Thus, with the Project, the area would transform from being car-centric to a downtown with a mix of land uses and multimodal access.

1.1.1 Proposed Land Uses



The Project includes construction of the following uses in multiple new structures distributed throughout the Project area[1]:

- 7.3 million gross square feet of commercial office uses
- 5,900 dwelling units
- 500,000 gross square feet of commercial retail space
- 300 hotel rooms
- 800 limited-term corporate accommodations
- 100,000-gross square foot event space
- 130,000 gross square feet of on-site centralized utility plants
- 100,000 on-site logistics centers to serve the commercial on-site uses

The Project also includes the provision of up to 4,800 publicly accessible and/or commercial parking spaces to meet the demand for parking of site-specific users and the public, and up to 2,360 parking spaces for the Project's residential uses.

An illustrative framework/site plan from the universal planning application is included as **Figure 1** for reference.

[1] Square footage and unit counts are maximums and are assumed for buildout scenarios.

Legend

- Project boundary
- Approximate location of pedestrian mid-block passageways
- Office
- Residential
- Hotel
- Active uses (including commercial retail/restaurant, arts, cultural, institutional, child care and education, maker spaces, non-profit, small-format office space)
- Historic resources to remain
- Centralized utility plant and logistics hub areas

Figure 1

Illustrative Framework Plan

Downtown West

1.1.2 Assembly Bill 900

On December 30, 2019, Governor Newsom certified the Project under Assembly Bill (AB) 900, the Jobs and Economic Improvement through Environmental Leadership Act of 2011 (Assembly Bill 900 or AB 900, as amended by Senate Bill 734 and AB 246). AB 900, as amended, provides judicial streamlining benefits under CEQA for environmental leadership development projects and defines an environmental leadership development project as the following:[2]

- The project is residential, retail, commercial, sports, cultural, entertainment, or recreational in nature;
- The project, upon completion, will qualify for Leadership in Energy and Environmental Design (LEED) gold certification or better;
- The project will achieve at least 15 percent greater transportation efficiency than comparable projects;[3]
- The project is located on an infill site[4] and in an urbanized area;
- In the Bay Area, the project is consistent with the general use designation, density, building intensity, and applicable policies specified for the Project area in *Plan Bay Area 2040*, the region's sustainable communities strategy;[5] and
- Private vehicle parking spaces for multi-family residential projects are priced and rented or purchased separately from dwelling units; or dwelling units are subject to affordability restrictions that prescribe rent or sale prices, and the cost of parking spaces cannot be unbundled from the cost of dwelling units.[6]

As part of the AB 900 application prepared for the proposed Project, trip reduction measures were quantified to demonstrate the Project could achieve a 15 percent improvement in transportation efficiency compared to a similar project, as required by the law.

---

[2] California Public Resources Code 21178 et seq. and Governor's Office of Planning and Research, California Jobs (AB 900), *Governor's Guidelines for Streamlining Judicial Review Under the California Environmental Quality Act Pursuant to AB 900.* Available online at http://opr.ca.gov/ceqa/california-jobs.html, accessed November 2, 2019.

[3] "Transportation efficiency" is defined as the number of vehicle trips by employees, visitors, or customers to the project divided by the total number of employees, visitors, and customers. The applicant shall provide information setting forth its basis for determining and evaluating comparable projects and their transportation efficiency, and how the project will achieve at least 15 percent greater transportation efficiency. For the purpose of this provision, comparable means a project of the same size, capacity, and location.

[4] An infill site is defined in Public Resources Code Section 21061.3 as a site that "has been previously developed for qualified urban uses." A "qualified urban use" is defined in Public Resources Code Section 21072 as "any residential, commercial, public institutional, transit or transportation passenger facility, or retail use, or any combination of those uses."

[5] California Public Resources Code Section 21180(b).

[6] California Public Resources Code Section 21184(a), added by SB 734 (2016).

1.1.3 Transportation Demand Management (TDM)

As outlined in the City's H*andbook,* TDM programs are one of the recommended options to reduce Project traffic. There are a multitude of TDM measures the City supports to reduce traffic and increase pedestrian, bicycle, and transit use, and improve the environment surrounding a project. As required for mitigation of the Project's CEQA impacts discussed in the Project's Environmental Impact Report (EIR) and TA, the Project applicant will be required to develop and submit a TDM program for review and approval by the Directors of Public Works and Planning, Building, and Code Enforcement or the Directors' designees prior to or concurrent with the adoption of the Planned Development Permit. The TDM program shall be designed such that all project-related daily vehicle trips are reduced with the primary focus on the office and residential component of the proposed Project[7]. Specifically, the TDM program will be required to:

> The TDM program shall:
>
> A. Be designed to meet performance standards that include exceeding the 15 percent transportation efficiency requirement of AB 900 *and* achieving additional vehicle trip reductions to mitigate transportation-related environmental impacts and reduce criteria pollutant emissions from mobile sources, as described below;
> B. Describe project features and TDM measures that shall and may be used to achieve the performance standard commitments;
> C. Describe a monitoring and reporting program, including a penalty structure for non-compliance; and
> D. Recognizing that commute patterns, behavior and technology continue to evolve, describe a process for amending and updating the TDM program as needed over time while continuing to achieve the performance standards described below.
>
> These elements of the TDM Program are described further below.

[7] While the TDM program is designed to reduce trips from all uses, the focus is on the office and residential uses, because TDM programs are generally more effective with employees and residents, who travel to and from the site every day, rather than with visitors, who travel to the location less frequently. The office and residential components of the project account for approximately 85 percent of the total daily Project trips. TDM measures for retail uses are generally limited to parking policies and availability of multimodal infrastructure/options. Several of the key TDM measures outlined in the program, such as reduced parking supply and market-rate pricing, directly influence travel decisions of retail patrons and employees and would increase their non-SOV mode share even if not directly monitored. In addition, the Project's TDM Program relies on regular surveys to measure its effectiveness. There are some limitations on the success of surveys for retail patrons, since employers and residential developments can more directly require or encourage survey participation than for retail patrons, who are often are not willing to participate in lengthy travel surveys.

A. **Performance Standards**: The Project's TDM program shall be designed to achieve the performance standards described below:

- Assuming currently available public transit service levels (pre-COVID 19), achieve a non-SOV rate of 50%, which is estimated to be equivalent to a 24% reduction in daily vehicle trips from the City model's travel demand outputs;
- Following completion of service enhancements related to Caltrain Electrification, achieve a non-SOV rate of 60%, which is estimated to be equivalent to a 26% reduction in daily vehicle trips from the City model's travel demand outputs; and
- Following completion of service enhancements related to the commencement of BART service to Diridon Station, achieve a non-SOV rate of 65%, which is estimated to be equivalent to a 27% reduction in daily vehicle trips from the City model's travel demand outputs.

B. **TDM Program:** Project features and required SOV trip reduction strategies shall include the following elements:

1. Improvements to pedestrian and bicycle facilities on-site and connecting the site to surrounding areas, including the construction/contribution to Los Gatos Creek Trail improvements and on-street connectors between West San Carlos Street and West Santa Clara Street;
2. Limited parking supplies on-site, including no more than 4,800 parking spaces for commercial uses and no more than 2,360 spaces for residential development (a portion of the residential spaces would be made available for shared use with the office employees) and enforcement of parking maximums for new uses as a disincentive for employees and visitors to the site, encouraging them to carpool, take transit, bike, and walk instead of drive;
3. Market-rate parking pricing for non-residential uses and unbundled parking for market rate residential uses;
4. Pre-tax commuter benefits for employees allowing employees to exclude their transit or vanpooling expenses from taxable income or an alternate commuter benefit option consistent with the MTC/BAAQMD Commuter Benefits Program required for employers with 50 or more full-time employees;
5. Marketing (encouragement and incentives) to encourage transit use, carpooling, vanpooling, and all non-SOV travel by employees and residents, including welcome packets for new employees and residents, and dissemination of information about Spare the Air Days within the San Francisco Bay Area Air Basin as recommended by the 2017 Clean Air Plan; and
7. Rideshare coordination, such as implementation of the 511 Regional Rideshare Program or equivalent, as recommended by the 2017 Clean Air Plan.

Other supplemental SOV trip reduction strategies to meet performance standards shall include some combination of the following:

Transit Fare Subsidy	Make available transit passes to employees and residents to make transit an attractive, affordable mode of travel.
Parking Pricing Structure	Ensure that the parking pricing structure complements on-street parking pricing and encourages "park once" behavior for all uses.
Preferential Carpool and Vanpool Parking	Provide dedicated parking for carpool and vanpool vehicles near building and garage entrances.
On-Site Bicycle Parking and Storage	Provide additional security and convenience for bike parking, such as lockers or secured bicycle rooms.
Designated Ride-Hailing Waiting Areas	Dedicate curbside areas for passenger pickup by ride-hailing services, to minimize traffic intrusion and double-parking by rideshare vehicles.
Traffic Calming	Implement on-site traffic calming improvements to support the increased use of walking, biking, and transit.
Express Bus or Commuter Shuttle Services	Provide express bus or other commuter shuttle services to complement existing, high-quality, high-frequency public transit; service may also be provided through public/private partnerships with transit providers.
Alternative Work Schedules and Telecommuting	Allow and encourage employees to adopt alternative work schedules and telecommute when possible, reducing the need to travel to the office component of the project.
First-/Last-Mile Subsidy	Provide subsidies for first-/last-mile travel modes to employees to reduce barriers to the use of transit as a primary commute mode by making short connecting trips to and from longer transit trips less costly and more convenient. First-/last-mile subsidies could be used to access bicycle share, scooter share, ride hailing, and local bus and shuttle services, and could subsidize bicycling and walking.
On-Site Transportation Coordinators	Provide TDM program outreach and marketing via on-site transportation coordinators who can also give individualized directions, establish ridesharing connections, and provide other alternative travel information to project employees and residents.
Technology-Based Services	Use technology-based information, encouragement, and trip coordination services to encourage carpooling, transit, walking, and biking by project employees and visitors. These can include third-party apps to distribute incentives to people who choose to use these modes.

Employer-Sponsored Vanpools	Coordinate and provide subsidized vanpools for employees who cannot easily commute via transit.
Biking Incentives and On-Site Bike Repair Facilities	Provide additional incentives that encourage bicycle usage and ability to repair bikes on site.
Carshare Program	Provide car share subsidies to residents encourage the use of carshare programs (such as ZipCar, Car2Go, and Gig) and limit parking demand.
Building-Specific TDM Plans	Develop customized TDM plans for specific buildings and tenants to better address the needs of their users.
Transportation Management Agency Membership	Join a non-profit transportation management association if formed for Downtown San José and leverage the larger pool of commuters and residents to improve TDM program marketing and coordinate TDM programs.

C. **Monitoring and Enforcement:** Starting in the calendar year after the City issues the first certificate of occupancy for the first office building in the first development phase, the project applicant shall retain the services of an independent City-approved transportation planning/engineering firm to conduct an annual mode-share survey of the office and residential components of the project each fall (mid-September through mid-November) to determine whether the project is achieving the non-SOV mode share for office and residential uses sufficient to indicate the specified trip reductions. The applicant shall submit an annual report to the staff of the San José Department of Transportation each January 31.

The annual report shall describe: (a) implementation of the TDM program; and (b) results of the annual mode split survey, including a summary of the methodology for collecting the mode split data, statistics on response rates, a summary conclusion, and an outline of additional TDM measures (i.e., a corrective action plan) to be implemented in subsequent years should the non-SOV mode split goal not be reached.

If timely reports are not submitted and/or reports indicate that the office and residential uses have failed to achieve the non-SOV mode share specified above in two consecutive years after issuance of the certificate of occupancy for 50 percent of the office development, the project will be considered in violation of this mitigation measure. The City will issue a notice of non-compliance after the first year the project fails to meet monitoring requirements (submittal of timely reports and/or achieving specified non-SOV mode share), after which the applicant has one year to comply with the monitoring requirements.

After two years of not meeting monitoring requirements, the City may initiate enforcement action against the applicant and successors, including imposition of financial penalties to the owners and/or operators of the office and residential development that will support the funding and management of transportation improvements that would bring the non-SOV mode share to the targeted level. Enforcement actions shall generally be consistent with City Council Policy 5-1 and include a mutually agreed-upon monetary cap.

If timely reports are submitted and demonstrate that the applicant has implemented required features and strategies and has achieved the non-SOV mode share specified above for five consecutive years after full project occupancy, annual monitoring shall no longer be required, and shall be required every five years, or upon request by the City of San Jose Planning, Building, and Code Enforcement Department or Department of Public Works for an annual update.

D. **Flexibility and Amendments:** The project applicant may propose amendments to the approved TDM program as part of its annual report each year, provided that the applicant shall not be permitted to decrease the performance standards specified in subsection (A) and subject to review and approval by Directors of Public Works and Planning, Building, and Code Enforcement or the Directors' designees. The applicant shall not be permitted to decrease the performance standards specified in Section A, above. The City and the project applicant expect that the TDM program will evolve as travel behavior changes and as new technologies become available. Any proposed changes will be considered approved unless the Department of Public Works and Planning, Building, and Code Enforcement object to the proposed change within 30 days of receipt.

The analysis presented in the LTA accounts for an approximately 18 percent trip reduction due a basic TDM program and does not include the additional nine percentage points required by the EIR TDM mitigation measure. The purpose of applying a different analysis approach is to provide a conservative analysis consistent with those prepared for other LTAs in the City and allow for better comparison of results. Details of how the TDM elements are accounted for in the Project's trip generation estimates is discussed in **Chapter 4** (Project Travel Demand).

1.1.4 Proposed Transportation Changes

This section summarizes the transportation network changes proposed as part of the Project. Within the Project area, changes are proposed to the roadway, bicycle, and pedestrian network.

1.1.4.1 Roadway Network Changes

The Project proposes to extend portions of certain streets across the Project area and remove sections of other streets as shown on **Figure 2**. The most notable roadway network change is the extension of Cahill Street from its current terminus at West Santa Clara Street to Julian Street in the north, and to Park Avenue in the south, to enhance north–south connectivity throughout the length of the Project area. The

Project would also extend North Autumn Street to the site's northern edge. A summary of proposed street network changes is listed below:

- Public Roadway Extensions and Additions:
    - Cahill Street between West Santa Clara Street and North Montgomery Street in the north and between San Fernando Street and Park Street in the south to provide continuous north-south connectivity throughout the length of the Project area
    - West St. John Street between Montgomery Street and the new Cahill Street extension toward the north of the site
    - Block-long east-west extension of Post Street between South Montgomery Street and Autumn Street
    - A new street between Cinnabar Street and Lenzen Avenue along the eastern border of northern parcel (A1)
    - Emergency vehicle access into the Project area north of Union Pacific railroad tracks
- Public Roadway Removal:
    - Cinnabar Street west of North Montgomery Street
    - Delmas Avenue between West Santa Clara Street and West San Fernando Street
    - North Montgomery Street between West St. John and Cahill Street
    - South Montgomery Street between West San Fernando Street and Park Avenue
    - Otterson Street west of South Montgomery Street
- New Private Roadways (generally publicly accessible)
    - "Ring Road" extending west from the intersection of North Montgomery and Cinnabar Street around the rear (west) of Block A1, connecting to the former Lenzen Avenue right-of-way north of Block A1 and to a new public street along the east side of Block A1
    - "L-shaped" street linking Royal Avenue and Auzerais Street (between Blocks H3 and H4
    - West from North Montgomery Street within Parcel C 1
    - North from West San Fernando Street along the alignment of Delmas Street between Blocks E2 and E3 and turning east to the Guadalupe River
    - Limited-access private streets providing primarily service and loading access would include a street that would run north of West San Fernando Street and parallel to Delmas Avenue at the eastern border of the project site and a connection between Cahill Street and South Autumn Street north of Park Avenue (through Block F1)

The City will require the Project applicant to prepare future focused LTAs consistent with the City's *Handbook*, and will evaluate circulation internal to the Project area to ensure the proposed roadway design meets City requirements and standards.

It should be noted the Project area is adjacent to two rail crossings (the Montgomery Street corridor (Union Pacific Rail Road (UPRR)) and Auzerais Avenue corridor (Caltrain)) and that any changes to the roadway approaches to the crossings (including striping, sidewalk, driveways, etc.) within approximately 200 feet of the crossing would require the City to apply for California Public Utility Commission (CPUC) approval.

1.1.4.2 Mid-Block Passages

The Project applicant proposes to construct publicly accessible mid-block passages at several locations throughout the Project area to facilitate pedestrian and bicycle access. Mid-block passages are a small-scale pedestrian network of paseos that provide mid-block shortcuts for people walking and increases accessibility between different areas

1.1.4.3 Additional Emergency Vehicle Access

The Project applicant is evaluating access for emergency vehicles at the northern edge of the Project boundary and may develop one or two additional at-grade crossings of the Union Pacific Railroad tracks between the Project area and the San José Market Center, to the Project's northeast, or extend Lenzen Avenue underneath the railroad tracks along the Project's western edge into the Project area. The City is applying to the Federal Rail Administration (FRA) for a quiet zone on the Warm Springs corridor from Montgomery Street to Horning Street. Any new at-grade or grade-separated crossing proposed by the development within the proposed quite zone limits would require coordination with the City's quiet zone application and respective approving agencies (CPUC, FRA, etc.).

1.1.4.4 Transit Network Changes

The Project does not propose any specific transit network changes; however, changes to bus stops may be needed in the future as part of roadway modifications and will be reviewed under future focused LTAs to ensure they meet City and Santa Clara Valley Transportation Authority (VTA) standards.

1.1.4.5 Bicycle Network Changes

The Project includes several proposed bike network changes to provide bicycle connectivity within the Project area and to the surrounding neighborhoods and regional destinations. Within the Project boundaries, proposed improvements include:

- A multi-use path parallel to the light rail tracks between South Montgomery Street and West San Fernando Street.
- Off-street path connections along Los Gatos Creek within the Project boundary will fill in gaps in the existing trail, with an off-street path connection (Class I) running along the western edge of the Los Gatos Creek between Auzerais Avenue and Park Avenue, as well as along the eastern edge of the creek from San Fernando to Santa Clara. These trail segments will be connected by on-street protected bikeways (Class IV) along Autumn Street between Park Avenue and the VTA tracks.

- On-street bicycle facilities (Class IV or Class II) along Park Avenue, West San Fernando Street, West St. John Street, West Julian Street, South Autumn Street, North Montgomery Street, and Cahill Street
- Shared public streets that would have traffic calming, low speeds, and potential restrictions to auto travel along South Montgomery Street between West San Fernando Street and West Santa Clara Street, and Post Street between Cahill Street and South Autumn Street.
- An additional network of private streets, most of which would be generally accessible to the public and some of which would predominantly provide service and loading access. Generally accessible private streets would include a new street extending west and north from North Montgomery Street to the rear (west) of the northern most parcel (Block A1) connecting to Lenzen Avenue; a dead-end street extending west from North Montgomery Street between West Julian and West St. John Streets (within Block C1); an L-shaped street along the alignment of Delmas Avenue north of the light rail tracks and turning east to reach the Guadalupe River; and an L shaped street linking Royal Avenue and Auzerais Street (between Blocks H3 and H4). Limited-access private streets would include a service street that would run north of West San Fernando Street and parallel to Delmas Avenue at the eastern border of the project site and a service connection between Cahill Street and South Autumn Street north of Park Avenue (through Block F1).

Figure 3 illustrates the proposed bike network changes.

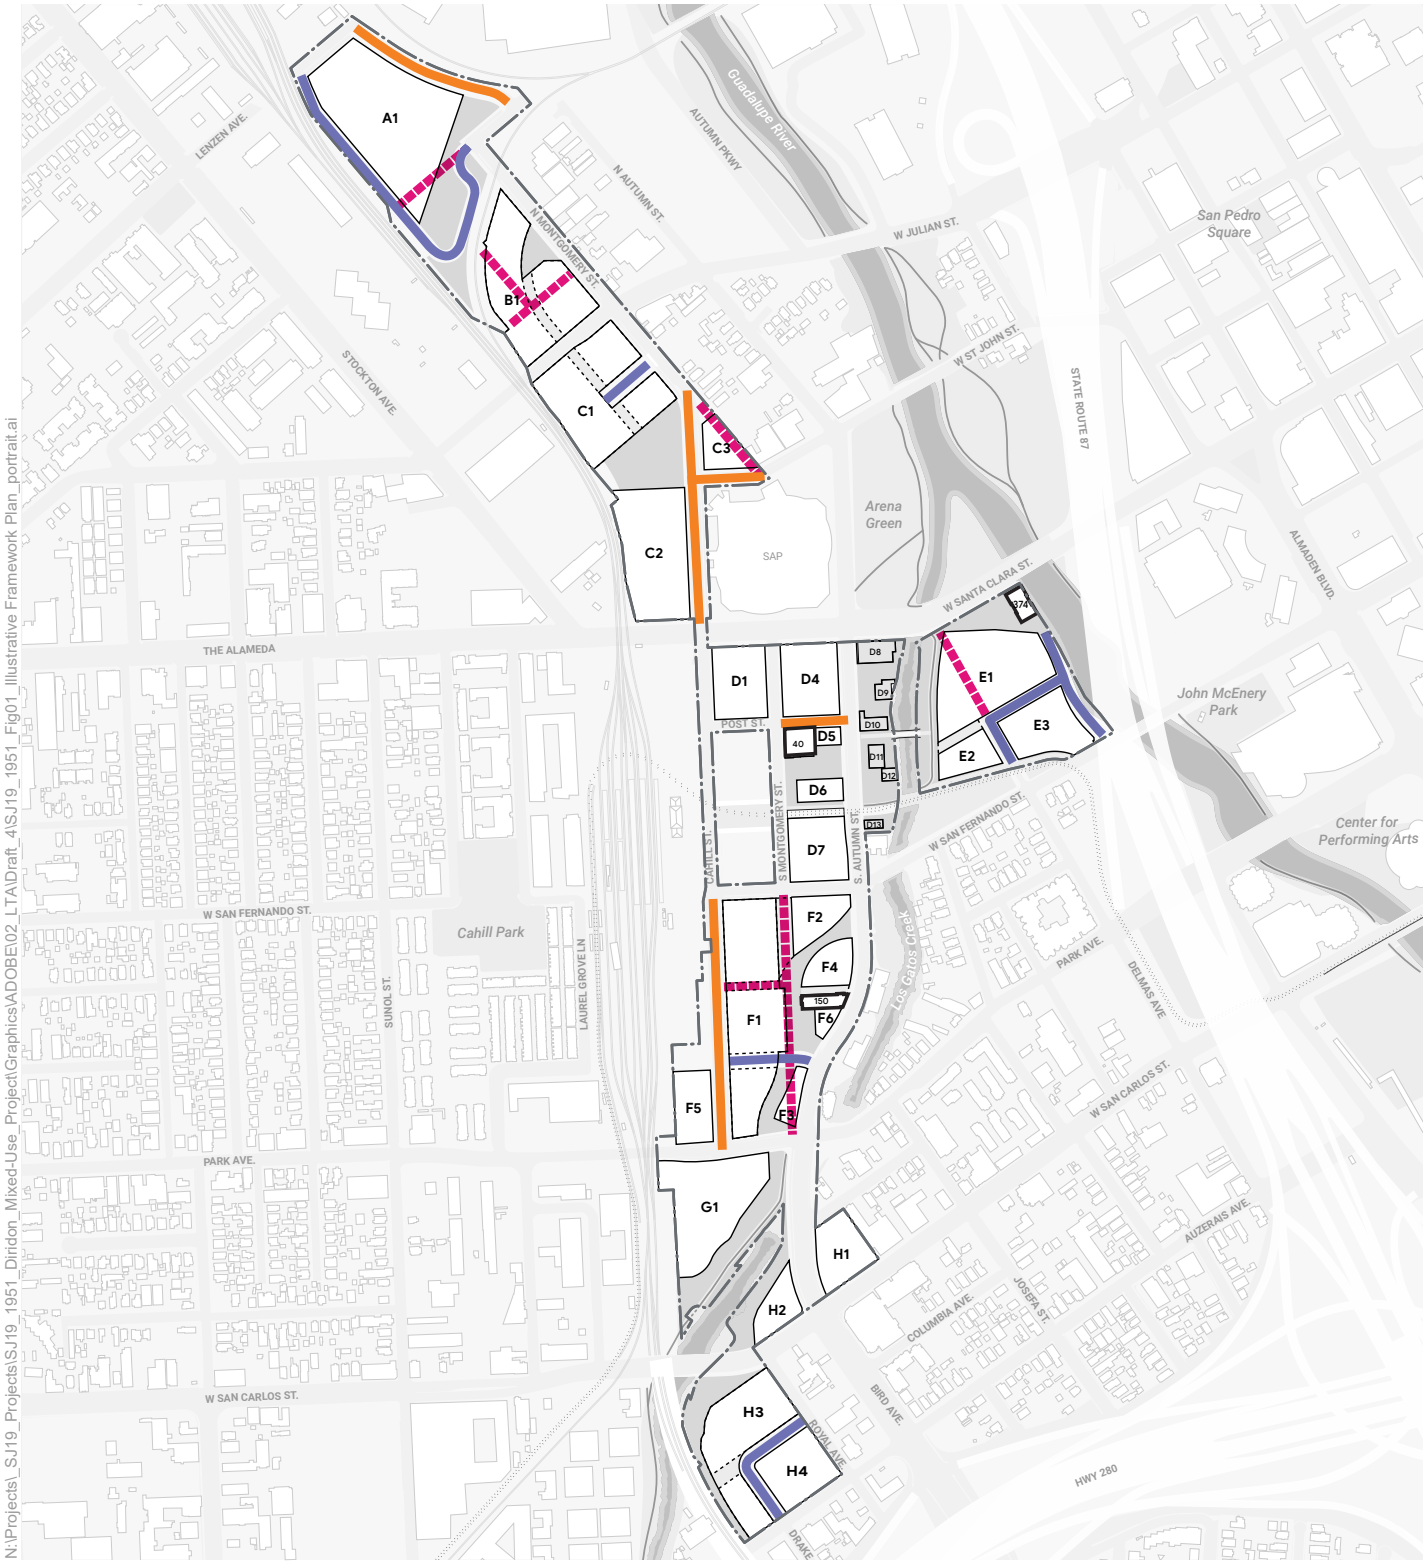
1.1.4.6 Pedestrian Network Changes

The Project would provide various improvements to public areas such as sidewalk widenings, plazas, and new street trees to improve pedestrian spaces and enhance connectivity to regional transit that would be available in the immediate vicinity. The improvements will also enhance local pedestrian circulation to Downtown San José, adjacent neighborhoods, and regional trails for residents and visitors. **Figure 4** illustrates the proposed pedestrian network changes.

Much of the Project area is currently developed with low density one- and two-story buildings that cover only portions of their lots, with the remaining unbuilt lot space used as surface parking. The area in the core of the site, especially around Diridon Station and the SAP Center, is surrounded by surface parking lots that would be redeveloped by the Project. The total floor area of buildings currently on the Project area accounts for approximately 618,000 square feet; many of the existing buildings are vacant. Thus, with the Project, the area would transform from being car-centric to a downtown with a mix of land uses and multimodal access.

1.1.4.7 Downtown West Design Standards and Guidelines

As part of the proposed Project, the project applicant is proposing the adoption of detailed design standards and guidelines that would apply to development on the Project area. These enforceable *Downtown West Design Standards and Guidelines* would be approved as part of the Planned Development Permit. In addition to the project-specific *Downtown West Design Standards and Guidelines*, the *Downtown*



Design Guidelines and the *Complete Streets Standards and Guidelines* would continue to apply to development of the project unless a standard or guideline under the *Downtown Design Guidelines* or the *Complete Streets Standards and Guidelines* is expressly superseded by the *Downtown West Design Standards and Guidelines*. The *Downtown West Design Standards and Guidelines* would impose mandatory standards —enforceable by the City—on the Project's design and implementation with respect to land use, open space, building design, public rights-of-way, sustainability, and lighting and signage. In this way, the *Downtown West Design Standards and Guidelines* would ensure compliance with the City-adopted program for the project site.

1.1.5 Project Context

The City of San José (City) adopted the Diridon Station Area Plan (DSAP) in 2014 in anticipation of future High-Speed Rail and BART services and a potential Major League Baseball ballpark. The Plan included policies to guide future land use development that support transit ridership and improve pedestrian, bicycle, vehicle, and transit connectivity between the Diridon Station and adjacent uses. The City initiated amendments to the DSAP in 2019 to address several changes in planning assumptions (including removal of the ballpark proposal), and the City's participation, along with Caltrain, the California High-Speed Rail Authority, and the Santa Clara Valley Transportation Authority (VTA), in the Diridon Integrated Station Concept (DISC) Plan process.

The DISC Plan will evaluate how to expand and redesign Diridon Station as a world-class transit center that provides intermodal connections and integration with surrounding neighborhoods and beyond. The DISC Plan does not propose any land use changes, but focuses on station design, including the spatial configuration of how the various track and station elements will fit together and relate to the surrounding neighborhood.

In December 2018, Google LLC, entered into a Memorandum of Understanding (MOU) with the City of San José with an intention to "collaborate on development in and around the Diridon Station Area to aid implementation of the planned expansion of San José's Downtown, the Diridon Station Area Plan, and the General Plan." The MOU set forth goals for new development to transform the current area through new construction and adaptive reuse of existing facilities to a vibrant, fully functional transit-oriented neighborhood. To further the goals of the MOU and consistent with Council Policy 5-1, the analysis presented in this document identifies and addresses adverse effects to the transportation system resulting from Project operations and circulation.

1.2 Relevant Regulatory Agencies and Plans

This section describes the relevant transportation regulatory agencies for the purposes of this LTA. This includes regional and local agencies and their programs and plans relevant to the Project.

1.2.1 Relevant Regional Plans

There are two main plans that provide policy guidelines affecting land use and transportation planning decisions within the Bay Area that are relevant to the City of San José; these are discussed below.

1.2.1.1 Plan Bay Area 2040

Plan Bay Area is overseen by MTC and ABAG. It serves as the region's Sustainable Community Strategy (SCS) pursuant to SB 375 and the 2040 RTP (preceded by Transportation 2035), integrating transportation and land use strategies to manage greenhouse gas emissions and plan for future population growth. The RTP and SCS include policies that call for shifting more travel demand to transit and accommodating growth along transit corridors in "Priority Development Areas (PDAs)". In July 2013, Plan Bay Area was adopted by ABAG and the MTC. The update to Plan Bay Area, known as Plan Bay Area 2040, was subsequently developed by MTC and adopted in July 2017.

Major transit projects included in Plan Bay Area 2040 include a BART extension to San José/Santa Clara, Caltrain Electrification, enhanced service along the Amtrak Capitol Corridor, and improvements to local and express bus services.

1.2.1.2 Valley Transportation Plan (VTP) 2040

As the CMA for Santa Clara County, VTA is responsible for the development of a long-range countywide transportation plan, called Valley Transportation Plan (VTP) 2040. VTP 2040 provides programs, projects, and policies for roadways, transit, Intelligent Transportation Systems (ITS) and Systems Operations Management, bicycle facilities, pedestrian facilities, and the integration of land use and transportation. VTP 2040 projects serve as VTA's recommendations for the RTP known as Plan Bay Area. VTP 2040 was adopted by the VTA Board of Directors in September of 2014.

1.2.2 Relevant City Plans

The City of San José has jurisdiction over the local transportation network including City streets and City-operated traffic signals, as well as over land use and zoning policies. The City of San José also has adopted several plans that provide guidance for managing the City's transportation system, land use policies, and zoning.

1.2.2.1 Envision San José 2040 General Plan

The City's General Plan (*Envision San José 2040 General Plan*) includes goals, policies, and strategies regarding land use and community design, transportation, housing, environmental resources, and municipal services to 2040. The Land Use and Transportation Element of the General Plan establishes the link between land use and transportation with an emphasis on encouraging growth in compact mixed-use

developments and a balanced transportation system. Other key themes in the General Plan are (1) construction of a comprehensive, safe, direct, and well-maintained citywide bikeway network, (2) supporting the development of amenities and land uses that contribute to increased transit ridership, and (3) reducing the number of vehicle miles traveled. It also recognizes that under SB 743, automobile level of service (LOS) will be replaced with vehicle miles traveled (VMT) as the City's metric for CEQA transportation analysis.

1.2.2.2 Downtown Strategy 2040

The *Downtown Strategy 2040* (DTS 2040) is an integrated strategic design plan focused on the revitalization of Downtown San José through the development of underutilized land uses and increasing the density of infill developments within the Downtown boundary. The DTS 2040 updates the 2000 Downtown Strategy by increasing the number of residential units in Downtown by 4,000 units compared to what is planned in the *Envision San José 2040 General Plan* as well as shifting 3,000,000 square feet of allocated office development from Coyote Valley to Downtown.

1.2.2.3 Diridon Station Area Plan

The *Diridon Station Area Plan* (DSAP) was approved by the San José City Council on June 17, 2014 and incorporated into the General Plan. The DSAP establishes a vision for Diridon Station and the surrounding area in response to the planned extension of Bay Area Rapid Transit (BART) and High-Speed Rail service to San José. The City-initiated amendments to the DSAP in 2019 in light of several changes in planning assumptions, including:

- New uses contemplated for a site (located within the boundary of the Project area analyzed in the Project's EIR) previously identified for a proposed Major League Baseball ballpark
- The City policy, adopted in March 2019, to allow greater building height limits in the station area
- The City's focus on environmental sustainability through Climate Smart San José, adopted in 2018
- The adopted Downtown Design Guidelines and proposed Downtown Transportation Plan
- The City's participation, along with Caltrain, the California High-Speed Rail Authority, and the Santa Clara Valley Transportation Authority (VTA), in the DISC Plan process that will evaluate how to expand and redesign Diridon Station as a world-class center of transit and public life that provides for intermodal connections and integration with the surrounding neighborhoods

The DSAP amendments are intended to adapt the DSAP to updated circumstances; align with and complement other adopted and ongoing plans, including the DISC Plan; and support and facilitate DSAP implementation relative to both private development and public investment.

The City does not expect to make major changes to the primary objectives of the DSAP. Anticipated changes include reallocating development capacity from elsewhere in the City's development capacity and updating the plan's existing sections pertaining to land use, design, transportation, and public spaces. The City will also prepare area-wide implementation plans for shared parking, infrastructure financing, and affordable housing.

1.2.2.4 San José Bike Plan 2020

The *City of San José Bike Plan 2020* was adopted in November 2009 and recommends policies, projects, and programs to achieve a vision where bicycling is an integral part of life in San José. The bike plan defines 450 miles of bikeways and emphasizes connection between the on-street and off-street bikeway network. It should be noted the San José Better Bike Plan 2025 will update the existing Bike Plan and is expected to be finalized in the Fall of 2020. Projects listed in the bike plan that are near the Project area include the implementation of a Class II bicycle facility (bike lanes) on Park Avenue between Sunol Street and Market Street as well as the implementation of a Class II bicycle facility on Santa Clara Street between Montgomery Street and Almaden Boulevard.

1.2.2.5 San José Complete Streets Design Standards & Guidelines

The *San José Complete Streets Design Standards & Guidelines* were developed as a comprehensive set of street design standards and guidelines to inform how the City of San José builds and retrofits streets. The document presents standards for the design and implementation of streets that are comfortable and welcoming for all modes of travel in accordance with the City's Vision Zero. The design standards and guidelines vary depending on roadway typology and context of the built environment including Downtown Areas, which are characterized by intensive office, retail, service, residential, and entertainment land uses. Transit usage and pedestrian activity are given primary emphasis over automobile activity in this context. The designs standards and guidelines refer to the 2003 *Downtown Streetscape Master Plan* (DSMP) for identified pedestrian networks in the Downtown area.

1.2.2.6 Downtown Transportation Plan

The City of San José recently initiated The Downtown Transportation Plan (DTP) that will identify and advance the big transportation moves that will help shape the future of downtown. Building from past and ongoing work, it will identify ways to improve safety, equity, access and mobility throughout the downtown area to meet future travel needs. A comprehensive community engagement process will be used to identify and establish network-level transportation plans designed to complement adjacent land uses and accommodate all travel modes. In addition, the plan will develop prioritization methods to rank transportation projects and programs and produce concept level designs and implementation strategies for high priority improvements. The Downtown Transportation Plan began in late 2019 and is expected to be completed in early 2021.

1.3 Report Organization

The following chapters are included in this report to meet City requirements for evaluating transportation impacts of the Project:

Chapter 1. Introduction includes the Project description, the relevant regulatory agencies and plans, and an overview of the report.

Chapter 2. Scope of Study and Assumptions outlines the scope of the study and analysis methods, along with a description of the analysis scenarios included in the report, a description of which analysis was conducted under different scenarios, as well as a description of the City's travel demand model.

Chapter 3. Existing Conditions describes the transportation system near the Project area including the surrounding roadway network, existing transit, bicycle, and pedestrian facilities, morning and evening peak period intersection turning movement volumes, intersection levels of service, and freeway segment levels of service.

Chapter 4. Project Travel Demand describes the travel demand for the proposed Project, which was estimated using the City of San José's travel demand model.

Chapter 5. Transit Analysis describes existing and future transit access around the Project area, along with transit ridership projections and a transit delay analysis.

Chapter 6. Bicycle Analysis describes bicycle access around the Project area and includes a level of stress analysis to evaluate the effectiveness of the existing and planned bicycle network to accommodate anticipated growth in bicycle ridership in Downtown San José.

Chapter 7. Pedestrian Analysis describes pedestrian access in the immediate vicinity of the Project area and provides an analysis of pedestrian throughway capacity.

Chapter 8. City Intersection Operations Analysis presents the results of the intersection level of service calculations for the standard City intersections under Background Conditions without the Project and with the Project under the Phase 1 Project, Project Buildout, and Goal-Based Project Buildout assumptions.

Chapter 9. Localized Access and Queuing Analysis presents the localized access and queuing results using SimTraffic for study intersections that provide direct access to the Project area.

Chapter 10. Congestion Management Program Analysis includes CMP intersection and freeway level of service analysis as required by VTA.

Chapter 11. Parking Assessment compares the Project's proposed parking supply to the City of San José's parking supply requirements.

Chapter 12. Neighborhood Traffic and Parking Intrusion Monitoring Plan outlines the neighborhood and parking intrusion management framework strategy for the Project to address potential future neighborhood intrusion.

Chapter 13. Construction Management Plan outlines plans and best practices to implement during the construction of the Project.

Chapter 14. Roadway Network Closures evaluates the vehicle LOS effects of the proposed closure of Delmas Avenue (between Santa Clara Street and San Fernando Street) and Montgomery Street (between San Fernando Street and Park Avenue).

Chapter 15. Conclusions summarizes the transportation analysis results.

2. Scope of Study and Assumptions

This chapter outlines the scope of the LTA analysis and includes a summary of analysis scenarios and assumptions that form the basis of the LTA.

2.1 Scope of Study

Given the adoption of Senate Bill (SB) 743 and the City of San José Transportation Analysis Policy (Council Policy 5-1), the analysis for the LTA is conducted for the City's development application process and not CEQA purposes. The City of San José Transportation Analysis Policy (Council Policy 5-1) requires projects to perform a LTA to demonstrate conformance with multimodal trasnportation strategies, goals and policies in the General Plan, and address adverse effects to the transportaiton system. The LTA evaluates the effects of a development project on transportation, access, circulation, and related safety elements in the proximate area of the Project. An LTA also establishes consistency with the General Plan policies and goals through the following three objectives:

1. Ensures that a local transportation system is appropriate for serving the types, characters, and intensity of the surrounding land uses;
2. Encourages projects to reduce personal motorized vehicle-trips and increase alternative transportation mode share;
3. Addresses issues related to operations and safety for all transportation modes, with trade-offs guided by the General Plan street typology.

The focus of the LTA for the Project is on pedestrian, bicycle, and transit access and capacity constraints, though the LTA also includes intersection level of service and operational analysis consistent with standard practices as well as detailed operations analysis for the site's main access points. Specific topics covered in the LTA include:

- Transit Access and Demand
- Bicycle Access and Demand
- Pedestrian Access and Demand
- City Intersection LOS Analysis
- Localized Access and Queuing Analysis
- CMP Intersection and Freeway Segment Analysis
- Parking Supply and City Code Requirements
- Neighborhood Traffic and Parking Intrusion Monitoring Plan
- Construction Phasing
- Roadway Network Changes

The City's *Handbook* also includes specific topics related to site access and circulation. As development phases are initiated, the applicant will be required to complete focused LTAs that cover these topics since the current site plans do not cover the level of detail necessary to provide a comprehensive evaluation on these site-specific components.

2.1.1 Study Area

The study area varies based on the type of modal analysis conducted as discussed below, though broadly speaking, the study area is bordered by I-280, I-880, and SR 87.

2.1.1.1 Transit Assessment

For the transit assessment, Transit Priority Corridors (as specified in *Envision San José 2040*) within one mile of the Project boundary were considered for evaluation. As shown on **Figure 5**, there are five Transit Priority Corridors within one mile of the Project boundary:

1. Santa Clara Street-The Alameda between I-880 and 6th Street,
2. San Carlos Street between Buena Vista Avenue and 2nd Street,
3. Meridian Avenue between Park Avenue and Fruitdale Avenue,
4. Montgomery Street between Santa Clara Street and Park Avenue, and
5. First Street between Virginia Street and Hedding Street (including Second Street between San Carlos Street and St. James Street).

The transit delay analysis presented in this report focuses on the transit corridors that provide direct transit connections to the Project area and are served by local routes in addition to limited stop and/or express bus routes. The three corridors that meet this criterion are:

1. Santa Clara Street-The Alameda between I-880 and 6th Street,
2. San Carlos Street between Buena Vista Avenue and 2nd Street,
3. First Street between Virginia Street and Hedding Street (including Second Street between San Carlos Street and St. James Street).

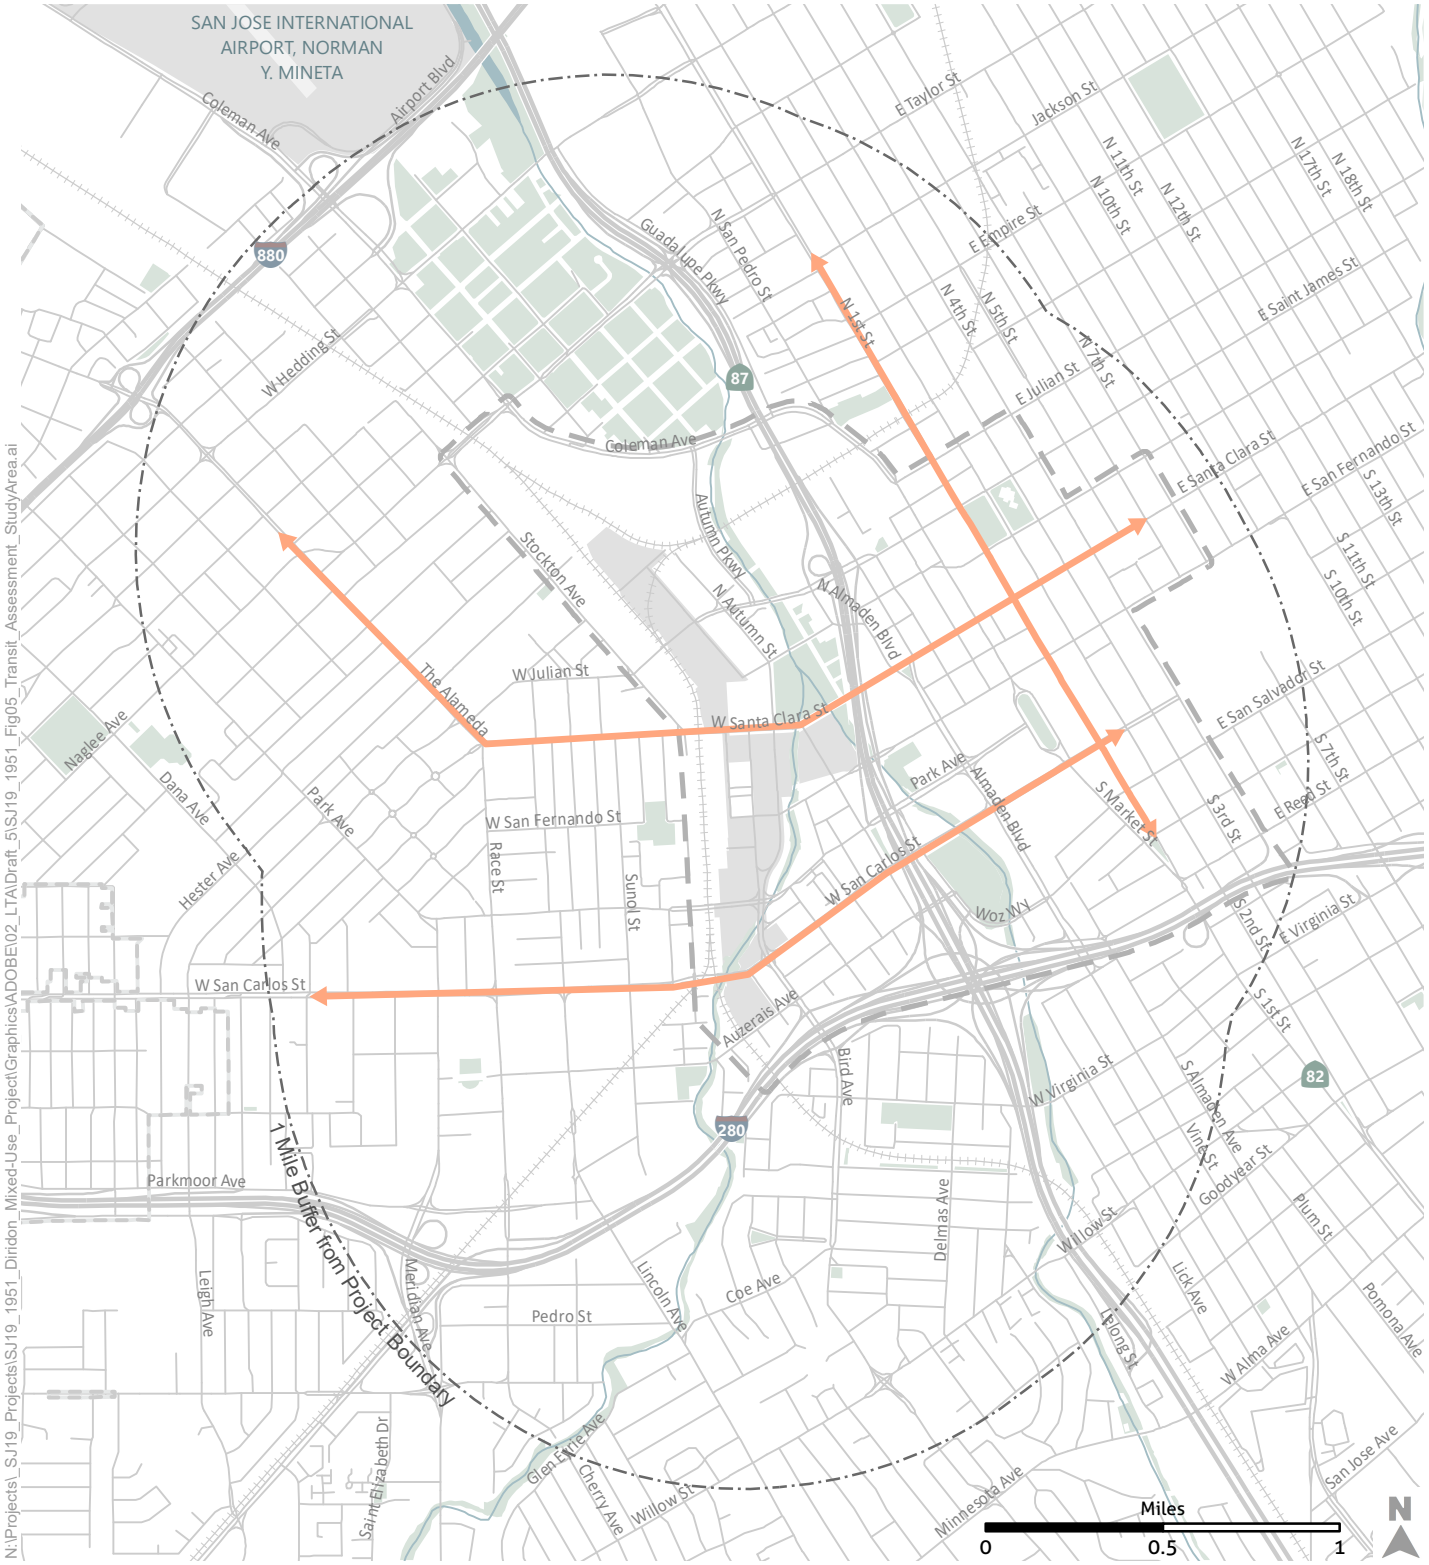

Figure 5

Transit Assessment Study Area

Downtown West

2.1.1.2 Bicycle Assessment

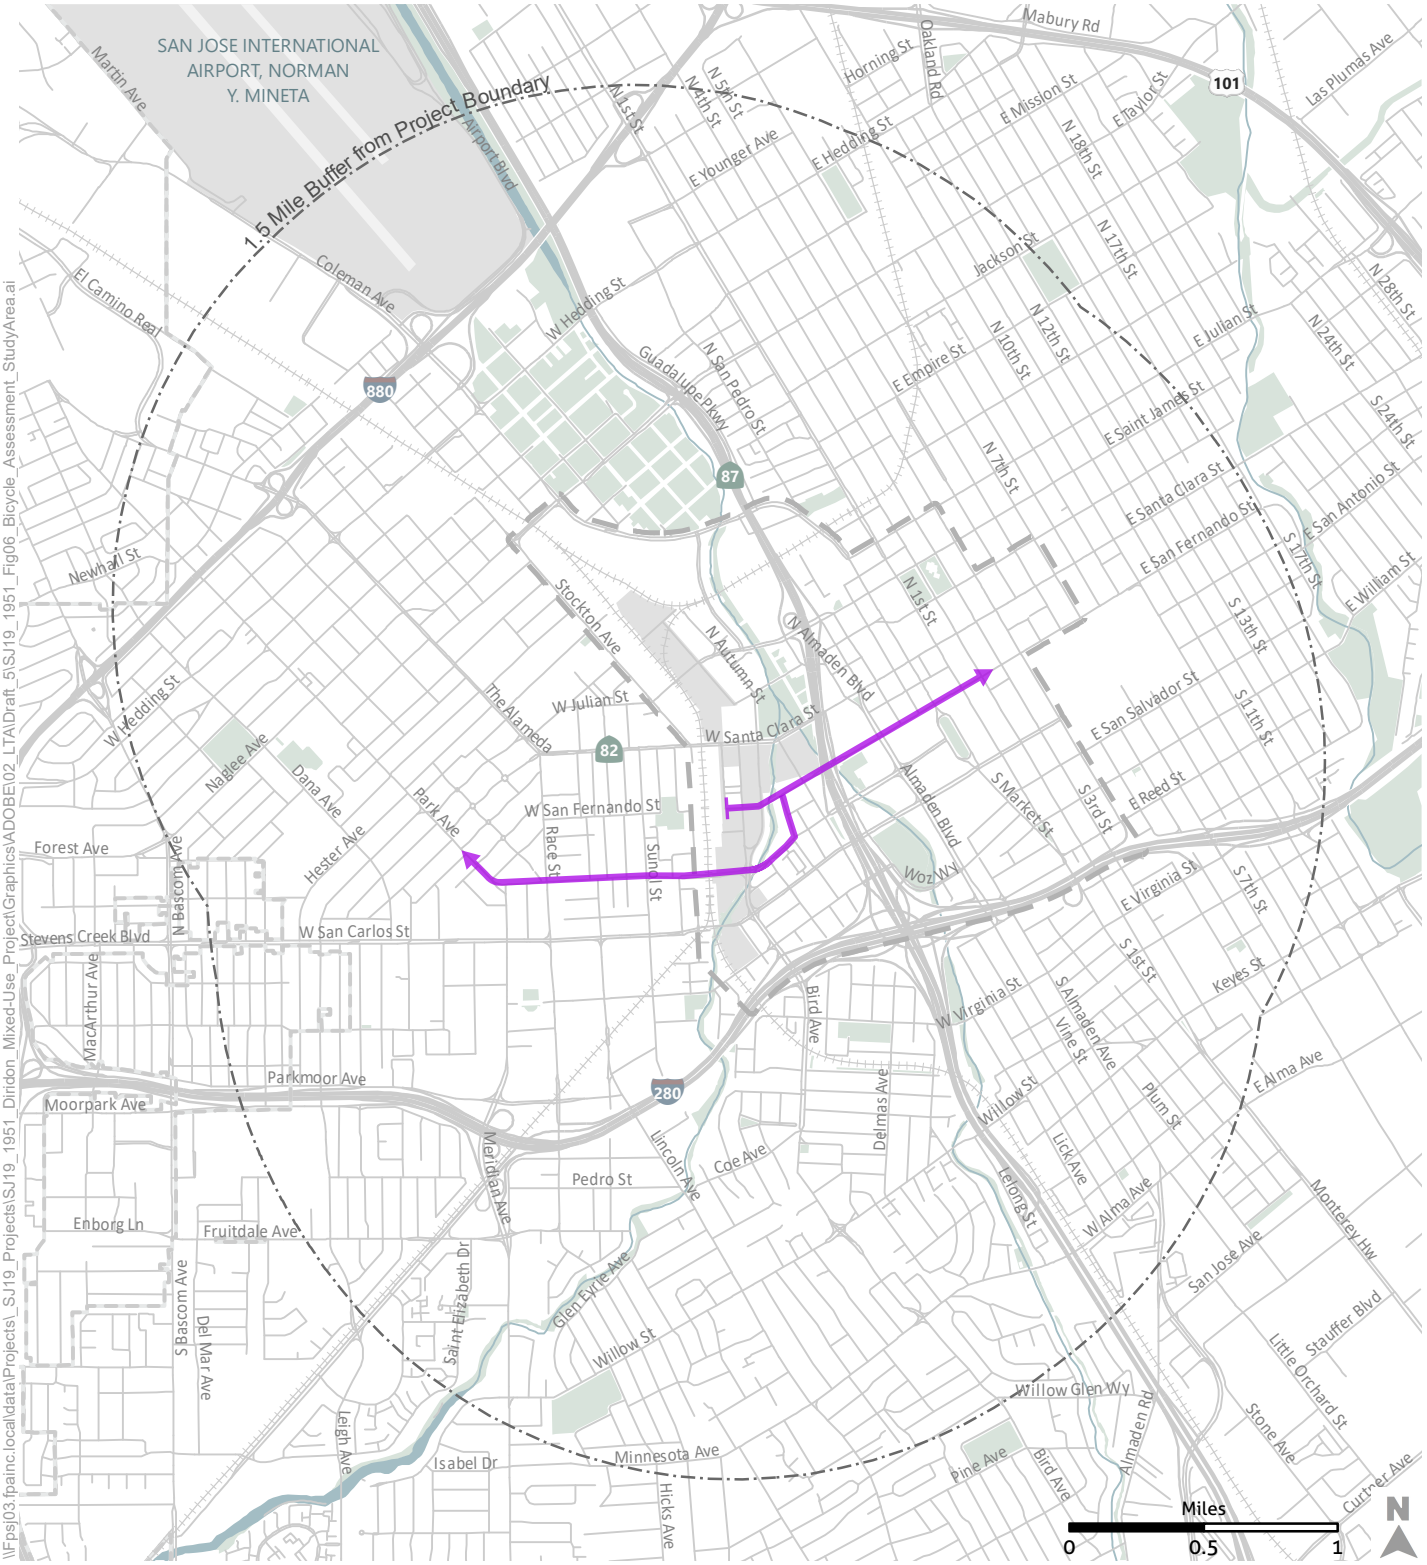
The bicycle assessment focuses on Primary Bicycle Corridors, as specified in *Envision San José 2040* General Plan, marked bike lanes, and trails within 1.5 miles of the Project boundary, as shown on **Figure 6.** The on-street primary bike facilities from *Envision San José 2040* within 1.5 miles of the study area include:

1. Park Avenue between I-880 and Gifford Avenue,
2. San Fernando Street between Cahill Street and 16th Street, and
3. Hedding Street between Park Avenue and 10th Street.

Marked bikeways and trails are also provided along several corridors within 1.5-miles of the Project area.

2.1.1.3 Pedestrian Assessment

The study area for the pedestrian assessment is within a half-mile radius of the Project boundary, as shown on **Figure 7**, with a focus on main pedestrian access routes between the Project and major pedestrian generators and attractors.



2.1.1.4 Intersection Operations Analysis

The study area for intersections depend on the type of analysis conducted. For the purposes of this LTA three different study areas are defined for City, CMP, and localized access and queuing intersections. Each of the intersection study areas are defined below.

2.1.1.4.1 City-Guideline Required Intersection Operations Analysis

City guideline-required intersections for operations analysis are signalized intersections within a half-mile of the Project boundary that are not within the City designated Downtown Core as well as select study intersections within the City of Santa Clara, per Santa Clara's guidance for determining study intersections. The following 21 City intersections, as shown on **Figure 8**, are analyzed in TRAFFIX for intersection LOS purposes:

1	Coleman Avenue & Hedding Street	12	Bird Avenue & Coe Avenue
2	Coleman Avenue & Taylor Street	13	De La Cruz Boulevard & Central Expressway (CMP)
3	The Alameda & Julian Street	14	De La Cruz Boulevard & Martin Avenue (Santa Clara)
4	Park Avenue & Race Street	15	De La Cruz Boulevard & Reed Street (Santa Clara)
5	San Carlos Street & Race Street	16	Coleman Avenue & Brokaw Road (Santa Clara)
6	Race Street & Auzerais Avenue	17	El Camino Real & Benton Street (Santa Clara)
7	Race Street & Saddle Rack Street	18	El Camino Real & Palm Drive (Santa Clara)
8	Race Street & Parkmoor Avenue	19	El Camino Real & Campbell Avenue (Santa Clara)
9	Auzerais Avenue & Lincoln Street	20	El Camino Real & The Alameda (Santa Clara)
10	Auzerais Avenue & Sunol Street	21	The Alameda & Newhall Street (Santa Clara)
11	Bird Avenue & Virginia Street

2.1.1.5 Localized Access and Queuing Analysis

The following 14 intersections were analyzed in Synchro/SimTraffic to evaluate roadway system capacity at the main entry points to the Project area and to provide localized access and queuing analysis.

22	Julian Street & Stockton Avenue	29	Julian Street & SR 87 S Ramp
23	The Alameda & Stockton Avenue	30	Julian Street & SR 87 N Ramp
24	Santa Clara Street & Cahill Street	31	Santa Clara Street & SR 87 N Off-Ramp
25	San Carlos & Bird Avenue	32	Park Avenue & Delmas Avenue/SR 87 S Off-Ramp
26	Bird Avenue & I-280 N Ramps	33	Park Avenue & SR 87 N On-Ramp/Woz Way
27	Bird Avenue & I-280 S Ramps	34	Auzerais Avenue & Delmas Avenue/SR 87 S Ramp
28	Julian Street & Autumn Parkway	35	Woz Way & SR 87 N Off-Ramp

The localized access study intersections are shown on **Figure 9**.

2.1.1.6 Congestion Management Program Analysis

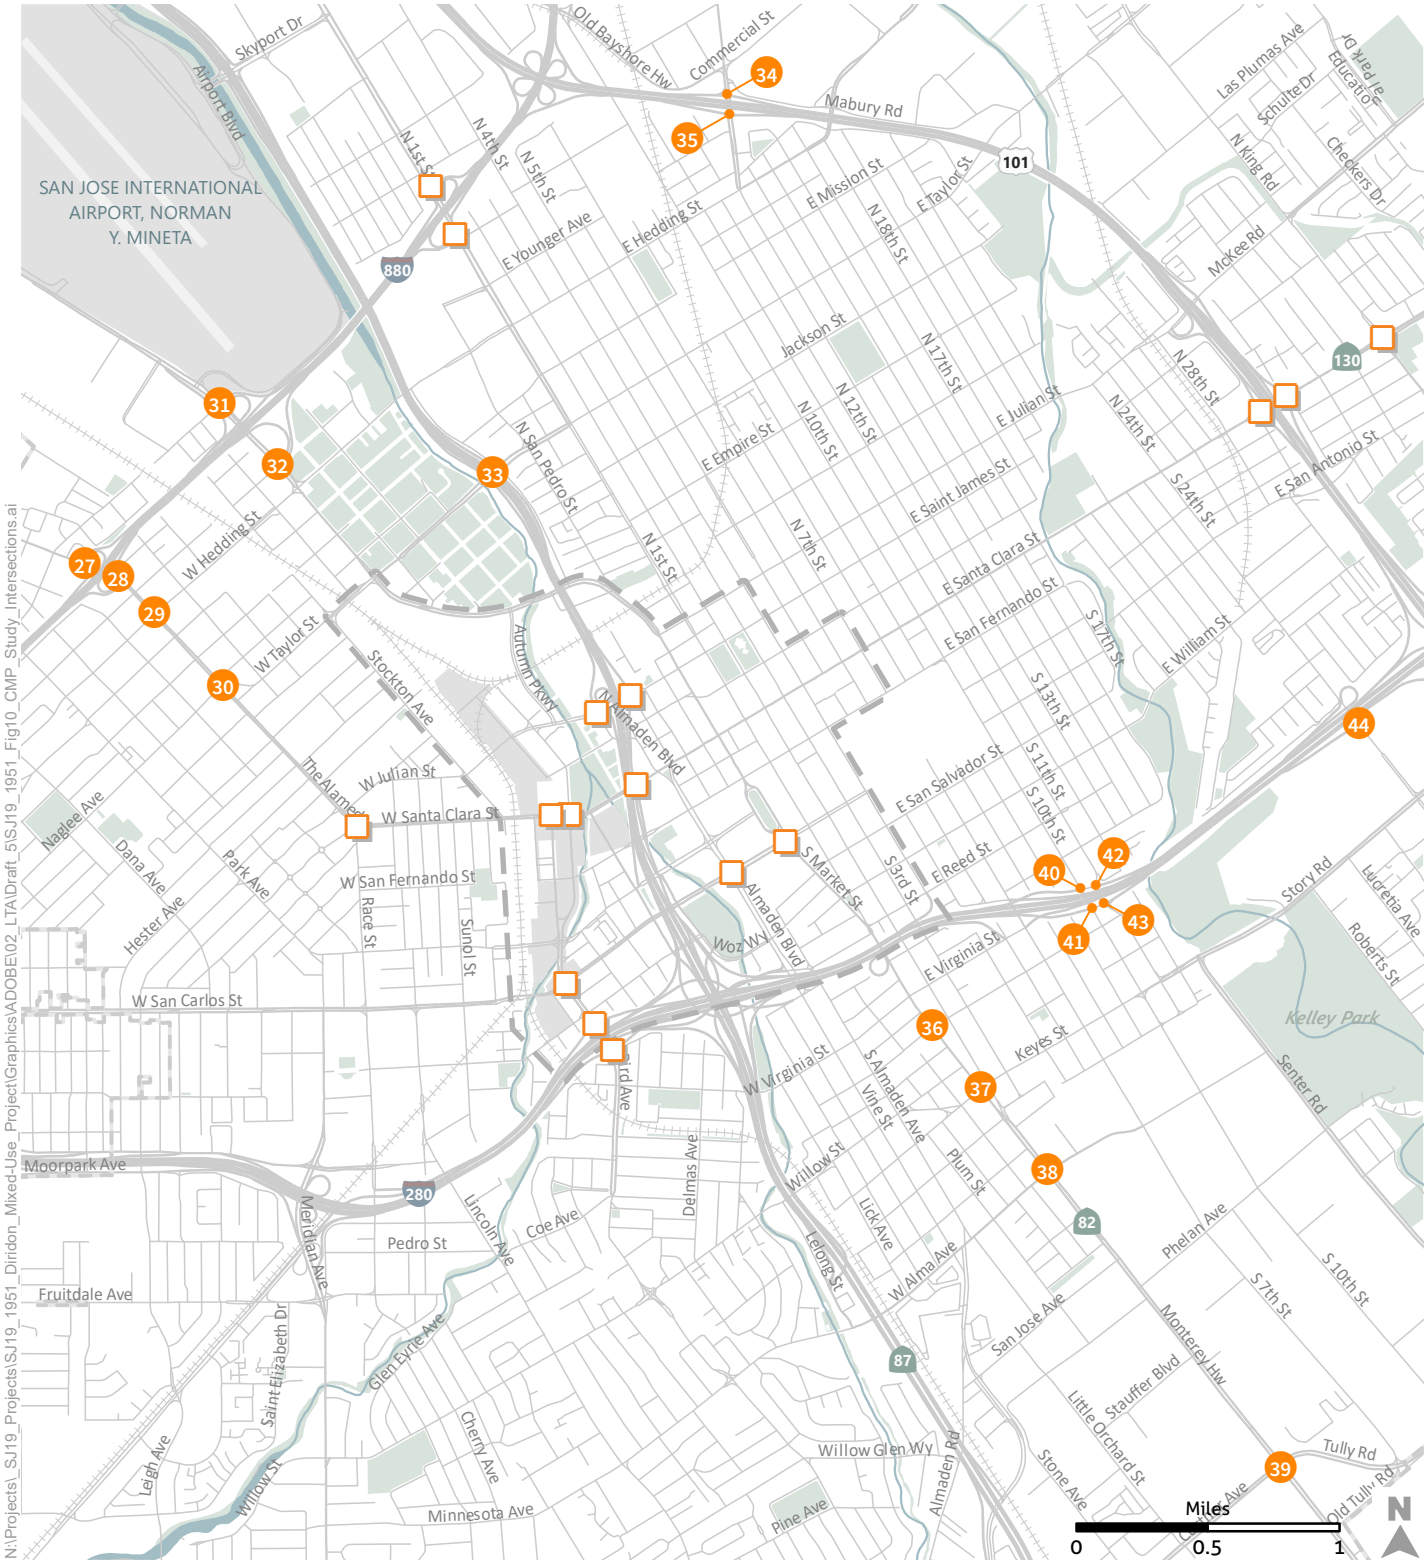
The CMP analysis focuses on CMP intersections and freeway segments per VTA guidelines as outlined below.

2.1.1.6.1 CMP Intersection Operations Analysis

Following VTA's ten vehicle trips per lane guideline, the following 18 CMP intersections were analyzed in TRAFFIX per VTA Guidelines:

36	The Alameda & I-880 S Off-Ramp	45	First Street & Willow Street
37	The Alameda & I-880 N Off-Ramp	46	First Street & Goodyear Street/Keyes Street
38	The Alameda & Hedding Street	47	First Street & Alma Avenue
39	The Alameda & Naglee Street	48	Monterey Road & Curtner Avenue/Tully Road
40	Coleman Avenue & I-880 S Off-Ramp	49	Tenth Street & I-280 N On-Ramp
41	Coleman Avenue & I-880 N Ramps	50	Tenth Street & I-280 S Off-Ramp
42	Taylor Street & SR 87 N/S Ramps	51	Eleventh Street & I-280 N Off-Ramp
43	Oakland Road & US 101 N Ramps	52	Eleventh Street & I-280 S On-Ramp
44	Oakland Road & US 101 S Ramps	53	McLaughlin Avenue & I-280 S Off-Ramp

The CMP study intersections are shown on **Figure 10**.



The City of San José designated areas within the downtown as Infill Opportunity Zones (IOZ) to support the implementation of infill and mixed-use developments within walking distance of mass transit facilities and high-density areas. Within the IOZ, CMP facilities are exempt from the provisions of CMP's intersection operations standards, and thus are not included in the list of CMP intersections analyzed for this LTA. **Figure 10** illustrates the CMP intersections within the IOZ that were not included in the LOS analysis.

2.1.1.6.2 Freeway Analysis

Per VTA TIA Guidelines, freeway segments where the Project is anticipated to add more than one percent of the segment's capacity were included in the analysis. As a result, the analysis includes over 70 freeway segments on SR 87, US 101, I-280, I-680, and I-880 as shown on **Figure 11**.

2.2 Analysis Methods and Threshold

This chapter describes the LOS methods and threshold for intersection and freeway analysis.

2.2.1 Level of Service

The operations of roadway facilities are described with the term *level of service*. Level of Service (LOS) is a qualitative description of traffic flow from a driver's perspective based on factors such as speed, travel time, delay, and freedom to maneuver. There are six levels from LOS A, with little or no delay, to LOS F, with excessive delay. LOS E represents "at-capacity" operations. When traffic volumes exceed the capacity, stop-and-go conditions result, and operations are designated as LOS F.

2.2.2 Intersection Analysis

This section outlines the intersection analysis method and thresholds.

2.2.2.1 Signalized Intersections Analysis Methods

The method described in Chapter 16 of the 2000 *Highway Capacity Manual* (HCM) (Special Report 209, Transportation Research Board) was used to prepare the level of service calculations for the signalized study intersections. This level of service method, which is approved by the City of San José and VTA, analyzes a signalized intersection's operation based on average control delay per vehicle. Control delay includes the initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. The average control delay for signalized intersections is calculated using TRAFFIX analysis software and is correlated to a LOS designation as shown in **Table 1**.

Table 1: Signalized Intersection Level of Service Definitions Using Average Control Vehicular Delay

Level of Service	Description	Average Control Delay Per Vehicle (Seconds)
A	Operations with very low delay occurring with favorable progression and/or short cycle lengths.	≤ 10.0
B+ B B-	Operations with low delay occurring with good progression and/or short cycle lengths.	10.1 to 12.0 12.1 to 18.0 18.1 to 20.0
C+ C C-	Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	20.1 to 23.0 23.1 to 32.0 32.1 to 35.0
D+ D D-	Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, and high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.	35.1 to 39.0 39.1 to 51.0 51.1 to 55.0
E+ E E-	Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences.	55.1 to 60.0 60.1 to 75.0 75.1 to 80.0
F	Operations with delays unacceptable to most drivers occurring due to over-saturation, poor progression, or very long cycle lengths.	> 80.0

Source: *Traffic Level of Service Analysis Guidelines*, October 2014; VTA Congestion Management Program, June 2003; *Highway Capacity Manual*, Transportation Research Board, 2000.

2.2.2.2 Intersection LOS Standards

Signalized intersection operations and impacts were evaluated based on the appropriate jurisdiction's LOS standards as summarized **Table 2.** San José's Council Policy 5-1 guides transportation analysis and adverse effects for the City of San José. San José's minimum threshold for acceptable signalized intersection operations is LOS D, unless governed by an Area Development Policy. For CMP intersections under VTA's jurisdiction, the minimum threshold for acceptable intersection operations is LOS E.

Table 2: Intersection LOS Standards

Local Jurisdiction	Signalized Intersection Type	
	City Controlled	CMP
City of San José[1]	LOS D, except those governed by an Area Development Policy (LOS threshold varies by location)	LOS E
City of Santa Clara[2]	LOS D, except designated CMP and Expressway intersections (LOS E threshold).	LOS E
VTA[3]	LOS E for all Santa Clara County CMP intersections	LOS E

Notes:
1. City of San José, Council Policy 5-1.
2. City of Santa Clara General Plan, 2011.
3. VTA Congestion Management Program, 2015

2.2.2.3 Intersection Adverse Effect Criteria

Adverse effect criteria for signalized intersections are discussed below. Signalized intersection operations and adverse effects were evaluated based on the appropriate jurisdiction's LOS standards discussed above as summarized **Table 2** and are included in adverse effect threshold discussion below.

2.2.2.3.1 City of San José

On February 27, 2018, the San José City Council adopted Council Policy 5-1, which replaces Council Policy 5-3. In response to SB 743, Council Policy 5-1 removes transportation LOS and replaces it with VMT analysis as a measure of transportation impacts for CEQA analysis. It went into effect on March 29, 2018, 30 days after City Council approval. The City's *Handbook* provides implementation guidelines for Council Policy 5-1 as it relates to LTAs, which have been followed for purposes of this analysis.

Generally, San José's minimum threshold for acceptable signalized intersection operations is LOS D, unless governed by an Area Development Policy.

Adverse effects at signalized City of San José study intersections would occur when the addition of project traffic causes one of the following:

- Intersection operations deteriorate from an acceptable level of service (LOS D or better) to an unacceptable level (LOS E or LOS F); or,
- Exacerbates unacceptable operations by increasing the critical delay by four seconds or more and increases the critical volume-to-capacity (V/C) ratio by 0.01 or more; or
- An increase in the V/C ratio of 0.01 or more at an intersection with unacceptable operations when the change in critical delay is negative (i.e., decreases). This can occur if the critical movements change.

2.2.2.3.2 City of Santa Clara

The City of Santa Clara has established a minimum acceptable operation level of LOS D for local streets (*City of Santa Clara General Plan*, 2011). The City of Santa Clara defers to VTA and applies LOS E threshold to CMP intersections. Adverse effects at signalized City of Santa Clara intersections would occur when the addition of project traffic causes one of the following:

- Intersection operations degrade from an acceptable level (LOS D or better) to an unacceptable level (LOS E or F); or
- Exacerbates unacceptable operations by increasing the critical delay by four seconds or more, and increasing the volume-to-capacity (V/C) ratio by 0.01 or more; or
- An increase in the V/C ratio of 0.01 or more at an intersection with unacceptable operations when the change in critical delay is negative (i.e., decreases). This can occur if the critical movements change.

2.2.2.3.3 Santa Clara County and Congestion Management Program (CMP)

The LOS standard for Santa Clara County (*VTA Congestion Management Program*, 2015) expressway and CMP intersections is LOS E. Adverse Effects at expressway and CMP intersections would occur when the addition of traffic associated with a project causes:

- Intersection operations to deteriorate from an acceptable level (LOS E or better) to an unacceptable level (LOS F); or
- Exacerbates unacceptable operations by increasing the average critical delay by four seconds or more and increases the critical volume-to-capacity (V/C) ratio by 0.01 or more at an intersection operating at LOS F; or
- The V/C ratio increases by 0.01 or more at an intersection with unacceptable operations (LOS F) when the change in critical delay is negative (i.e., decreases). This can occur if the critical movements change.

CMP regulations allow for some flexibility in determining how congestion is measured and what improvements are implemented in response to increased congestion. Examples include shifting the focus of transportation investments from roadway expansion to alternative transportation modes.

2.2.3 Freeway Analysis

This section outlines the freeway analysis method and thresholds.

2.2.3.1 Freeway Segment Analysis Methods

Freeway segments are evaluated using VTA's analysis procedure, which is based on the density of traffic flow calculated using methods described in the *2000 HCM*. Density is expressed in passenger cars per mile per lane. The Congestion Management Program (CMP) ranges of densities for each freeway segment level of service are shown in **Table 3**.

2.2.3.2 Freeway LOS Standards

As defined by VTA, the LOS standard for freeway segments is LOS E.

Table 3: Freeway Segment Level of Service Definitions

Level of Service	Density (passenger cars per mile per lane)
A	≤ 11
B	11.1 to 18.0
C	18.1 to 26.0
D	26.1 to 46.0
E	46.1 to 58.0
F	> 58.0

Sources: *Traffic Level of Service Analysis Guidelines*, October 2014; VTA Congestion Management Program, June 2003; *Highway Capacity Manual*, Transportation Research Board, 2000.

2.2.3.3 CMP Impact Criteria

As required by VTA, the applicable LOS standard for freeway segments is LOS E. Per VTA's *Transportation Impact Analysis Guidelines*, traffic impacts on a CMP freeway segment occurs when the addition of project traffic causes:

- Freeway segment operations to deteriorate from an acceptable level (LOS E or better) under Existing Conditions to an unacceptable level (LOS F)
- An increase in traffic of more than one percent of the capacity of a segment that operates at LOS F under Existing Conditions.

Consistent with VTA Guidelines, freeway LOS is only analyzed under Existing Plus Project Conditions.

2.3 Analysis Scenarios

The transportation effects of the Project are evaluated under several scenarios. Each scenario includes specific buildout assumptions of the Project, along with specific assumptions about the surrounding land use growth and implementation of planned transportation improvements.

The following scenarios are included in the report:

Scenario 1: *Existing Conditions* – Existing (pre-COVID 19) year conditions based on counts, observations, and data from 2018 and 2019.

Scenario 2a: *Background No Project Conditions* – Existing volumes plus traffic from "approved but not yet built" and "not occupied" developments in the area and their required transportation system improvements per the City's Approved Trip Inventory (ATI).

Scenario 2b: *Background Plus Phase 1 Project Conditions* – Scenario 2a volumes plus traffic generated by the level of development constructed prior to the completion of BART to Diridon. This scenario also includes any Project proposed roadway modifications associated with the first phase of development in addition to BART service to the Berryessa station (BART Phase 1) and Caltrain Electrification.

Scenario 2c: *Background Plus Project Buildout Conditions* – Scenario 2a volumes plus traffic generated by full buildout of the Project and any Project proposed roadway modifications and TDM measures. This scenario assumes future transit service enhancements associated with BART Phase 2 (i.e., BART service at Diridon Station) and Caltrain Business Plan service levels.

Scenario 2d: *Background Plus Goal-Based Project Buildout Conditions* – Scenario 2c assumptions, plus City mode split goals applied to meet the City's *Envision San José 2040* mode split targets. This scenario is presented to illustrate the long-term vision of Downtown San José, which has a greater focus on multimodal access and travel.

Scenario 3a: *Year 2040 General Plan Conditions (i.e., Cumulative No Project Conditions)* – The City's model was used to develop traffic volume forecasts per the land use and transportation assumptions consistent with *Envision San José 2040 General Plan*. This scenario assumes future transit service enhancements associated with BART Phase II and Caltrain Electrification.

Scenario 3b: *Year 2040 Cumulative Plus Goal-Based Project Conditions (i.e., Cumulative Plus Project Conditions)* – Scenario 3 volumes plus traffic generated by buildout of the Project and associated roadway modifications with implementation of the City's mode split goals applied to meet the City's *Envision San José 2040* mode split targets.

Not all transportation assessments were conducted under all scenarios. Consistent with direction from the City of San José, the elements of the City's *Transportation Analysis Handbook*, and VTA guidelines, **Table 4** summarizes the analysis scenarios under which each transportation assessment was analyzed.

Table 4: Summary of Analysis Scenarios

Transportation Assessment	Scenarios

2.4 Scenario Assumptions

This section outlines the key assumptions included in each of the analysis scenarios outlined above. First, the parameters of the City of San José's travel demand forecasting model (City model) are summarized, which serves as the basis for the Project travel demand and development of future travel forecasts, followed by a discussion of assumptions included in each of the "no Project" and "plus Project" scenarios.

2.4.1 City of San José Travel Demand Forecasting Model

The City model was used to develop trip generation estimates and Year 2040 traffic growth estimates. The City model is a refinement of the San Mateo City and County Association of Government (C/CAG) and VTA Bi-County transportation model (VTA Model) and provides more analytical detail and increased local accuracy of travel in the City of San José. It was developed by Hexagon Transportations Consultants in collaboration with the City of San José and VTA. The City of San José provided the most recent copies of their Year 2015 (the most recent base model) and Year 2040 models for use in this analysis. The Year 2015 model was used to develop initial trip generation estimates under the Background scenarios and the Year 2040 model was used to develop cumulative trip generation estimates as well as forecasts for the Cumulative No Project and Cumulative Plus Project scenarios.

2.4.1.1 2015 Land Uses and Network Assumptions

The base year model was developed using year 2015 land use data from the City[8] and validated against 2015 morning and evening peak hour traffic counts. Collector roads and residential streets were coded into the City model transportation network to provide additional analytical detail to the transportation system compared to the VTA model. For the purposes of this analysis the 2015 model was used without changes to develop initial trip generation estimates for Phase 1 of the Project, Project Buildout, and Goal-Based Project Buildout conditions for the Background scenarios.

2.4.1.2 2040 Land Uses and Network Assumptions

The future year 2040 model is the same model used for the 2018 Downtown Strategy Plan. For the Downtown Strategy Plan, the City's Department of Planning, Building, and Code Enforcement prepared 2040 land use forecasts for the City of San José that represent the City's General Plan. These forecasts are different from the ABAG projections used in the VTA Model. The San José General Plan assumes slightly fewer housing units but significantly more jobs in San José. In order to maintain consistency with the 2040 ABAG projections, the number of housing units and jobs for the transportation analysis zones (TAZs) outside Santa Clara County were adjusted (housing units were increased, and jobs were reduced) to match ABAG's regional control totals.

The City model includes all major transportation infrastructure identified in the *Envision San José 2040 Land Use/Transportation Diagram and the Valley Transportation Plan 2040* (VTP 2040), adopted by VTA in October 2013. The improvements include several new roadways that will provide enhanced connectivity and circulation to and within the Downtown area and throughout the City of San José.

For the purposes of this analysis the 2040 model was used to develop Cumulative No Project volumes. Specifically, the volume differences between the City's current 2040 model and the 2015 base year model were added to the existing counts to develop Cumulative No Project volumes. The 2040 model was modified to include changes in Project land uses — including the growth reallocation as part of the DASP and Project proposed GPA — and roadway network to develop initial trip generation estimates for the Goal-Based Project Buildout scenario. The DSAP and proposed Project land reallocation included in the 2040 model are discussed below.

General Plan Growth Reallocation

As described in the Project's EIR Chapter 2, *Project Description*, as part of the City's separate ongoing process to update the DSAP, the City is considering increasing the number of residential units and commercial/office uses projected in Downtown San José by the year 2040 by reallocating up to 12,619 housing units and 14,144,154 gross square feet of commercial/office uses from other General Plan growth areas in the city to the DSAP. The additional 12,619 Downtown housing units would likely be transferred from the Horizon 2 and 3 Urban Village growth areas. The commercial/office uses would be shifted from

[8] The 2015 VTA model land use data set is generally consistent with the 2013 ABAG Projections for the year 2015. The 2015 City land use data set is different from ABAG/VTA in terms of the number of housing units and jobs. However, the City land use data set was determined to more accurately reflect the 2015 land use activity in San José.

other General Plan–designated employment areas, such as the North Coyote Valley growth area. The final growth allocation, including the precise numbers of dwelling units and jobs transferred from each growth area, will be determined by the San José City Council via adoption of a General Plan amendment following a public planning process.

The General Plan amendment for the proposed project would reallocate a subset of the total reallocation being considered for the DSAP as a whole to ensure that Downtown San José has more than enough capacity for the project. Specifically, the General Plan amendment proposed for the project would reallocate 5,575 housing units and 6,306,000 gross square feet of commercial/office uses. 469,000 gross square feet of retail uses, and 1,100 hotel rooms from other General Plan growth areas outside of Downtown to the DSAP. This total proposed reallocation is less than the overall development program for the proposed project because one site within the DSAP—the San José Water Company site—was entitled previously. With this reallocation, the total amount of growth anticipated under the General Plan would not change, but instead would shift to the more transit-rich Downtown area.

2.4.2 No Project Scenario Assumptions

This section provides a summary of the data, land use, and transportation assumptions included under each of the "no Project" scenarios for Existing Background, and Cumulative Conditions.

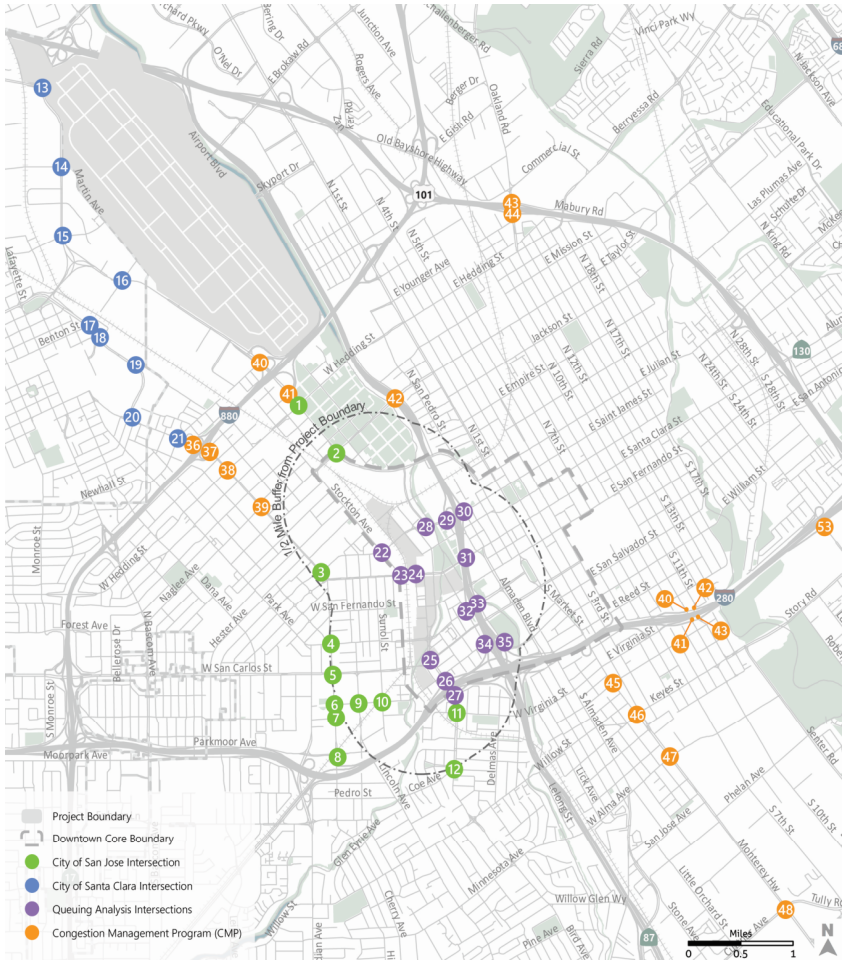
2.4.2.1 Existing Conditions

Existing Conditions is based on 2018 and 2019 data and assumes the current (January 2020) roadway, transit, bicycle, and pedestrian network within the study area. The City of San José provided recent traffic counts for several of the study intersections. For the intersections without recent counts, new traffic counts (including vehicular, bicycle, and pedestrian volumes) were conducted in November 2019. Copies of the transportation counts are included in **Appendix A**. Existing Conditions is described in more detail in **Chapter 3**.

2.4.2.2 Background No Project Conditions

Background No Project scenario includes existing vehicle, transit, bicycle, and pedestrian volumes plus added growth from "approved but not yet built" and "not occupied" developments in the area and their required transportation system improvements per the City provided Approved Trip Inventory (ATI).

2.4.2.2.1 Traffic Volumes

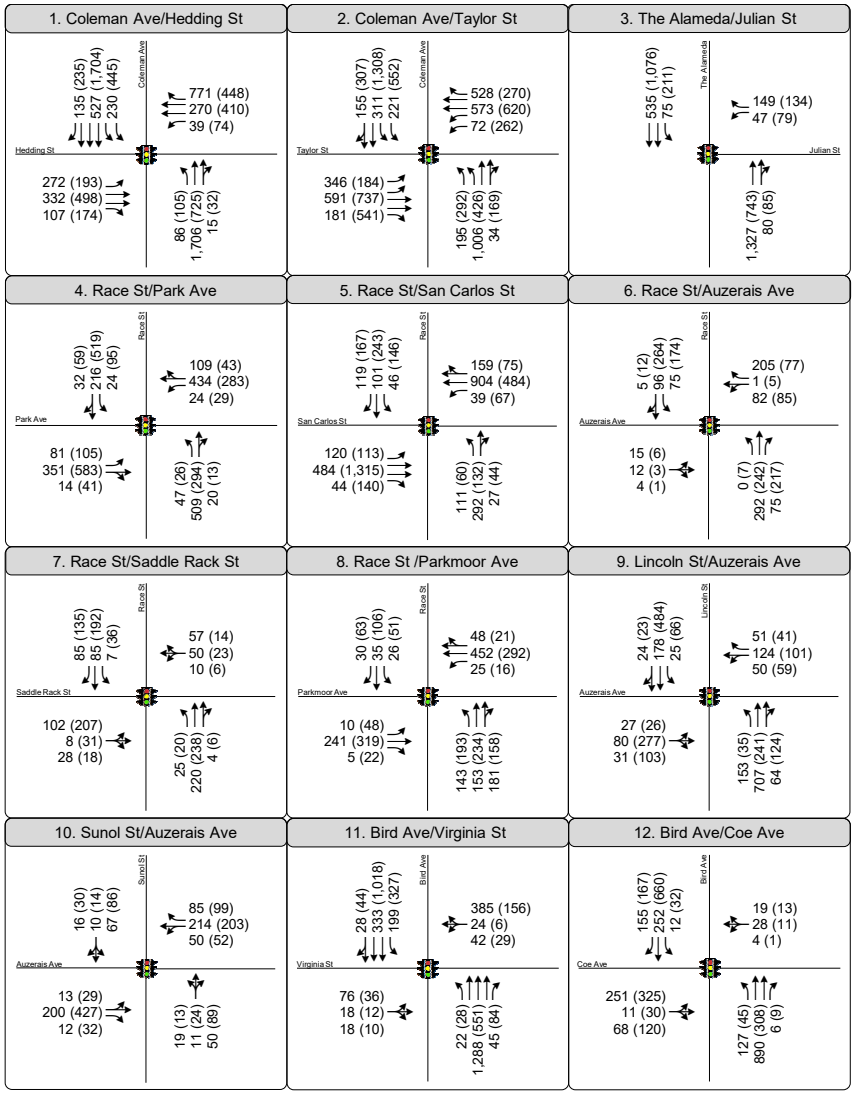


Appendix B includes a full list of approved and not occupied projects included in the background volume estimates. The list includes both projects within the City of San José and the adjacent jurisdiction of the City of Santa Clara. San José's ATI was used to add trips from developments in San José. Where needed, the ATI was balanced to adjacent intersections. Staff from the City of Santa Clara provided a list of "approved but not yet built or occupied" development projects in their jurisdiction. Trip generation estimates for Santa Clara projects were obtained from their respective traffic reports or estimated based on trip generation rates published in the Institute of Transportation Engineers *Trip Generation* (10th Edition). Vehicle trips for each of the background projects were then assigned to the roadway network

based on the relative locations of complementary land uses, as well as existing and estimated future travel patterns. **Figure 12** illustrates the Background No Project volumes.

2.4.2.2.2 Roadway Network Improvements

Generally, existing intersection geometries are modified under Background Conditions to include improvements that are currently under construction, fully funded, or will reasonably be constructed within the next ten years. The City of San José does not currently have approved intersection improvements at the study intersection and the Existing geometries were applied for the Background analysis.



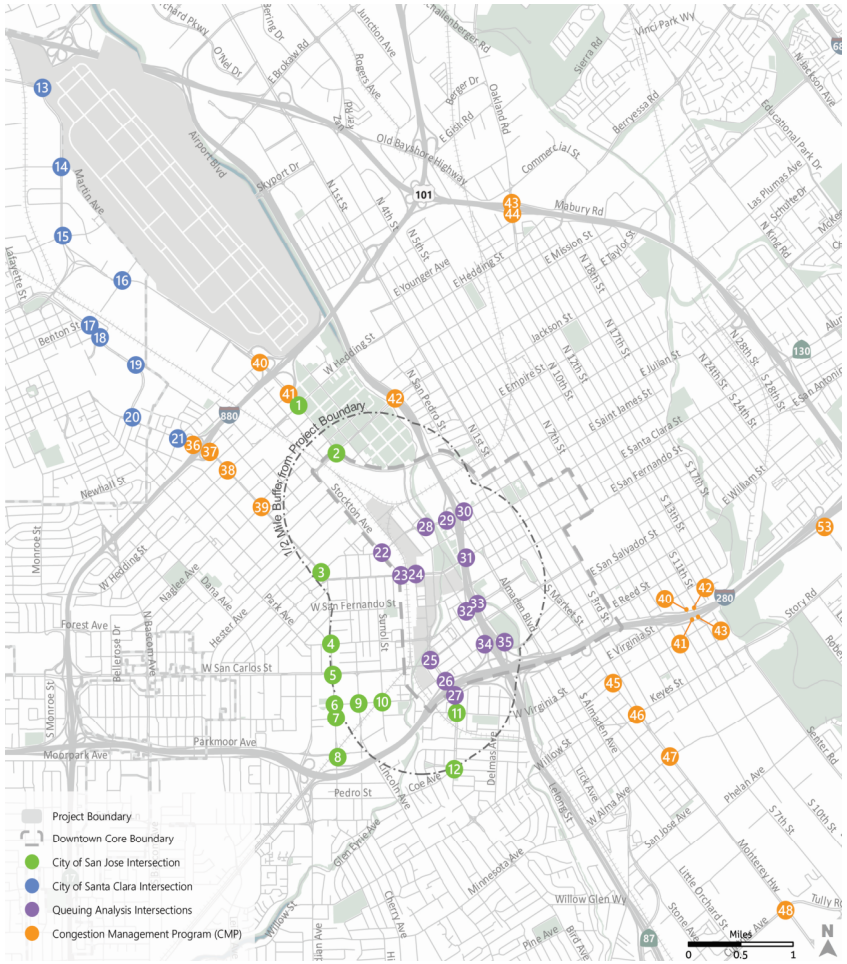


Figure 12
Intersection Volumes and Geometries
Background No Project Conditions

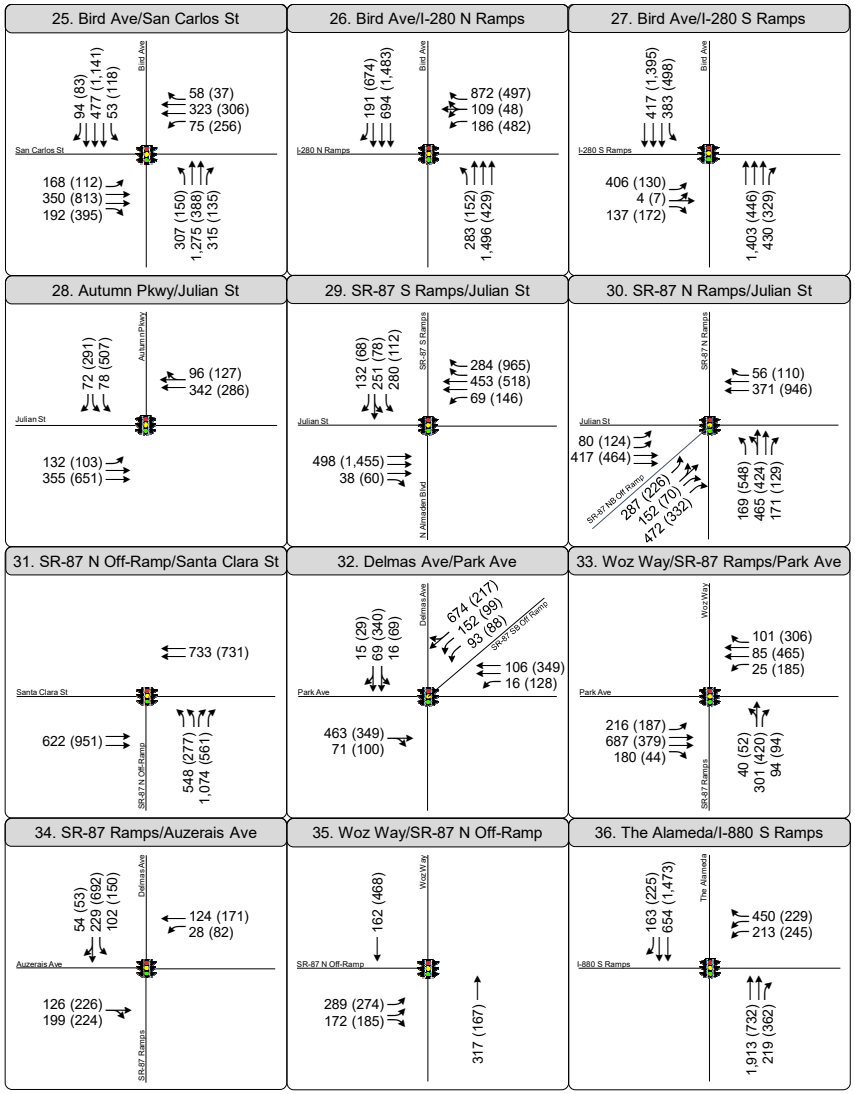
Intersection Volumes and Geometries
Background No Project Conditions



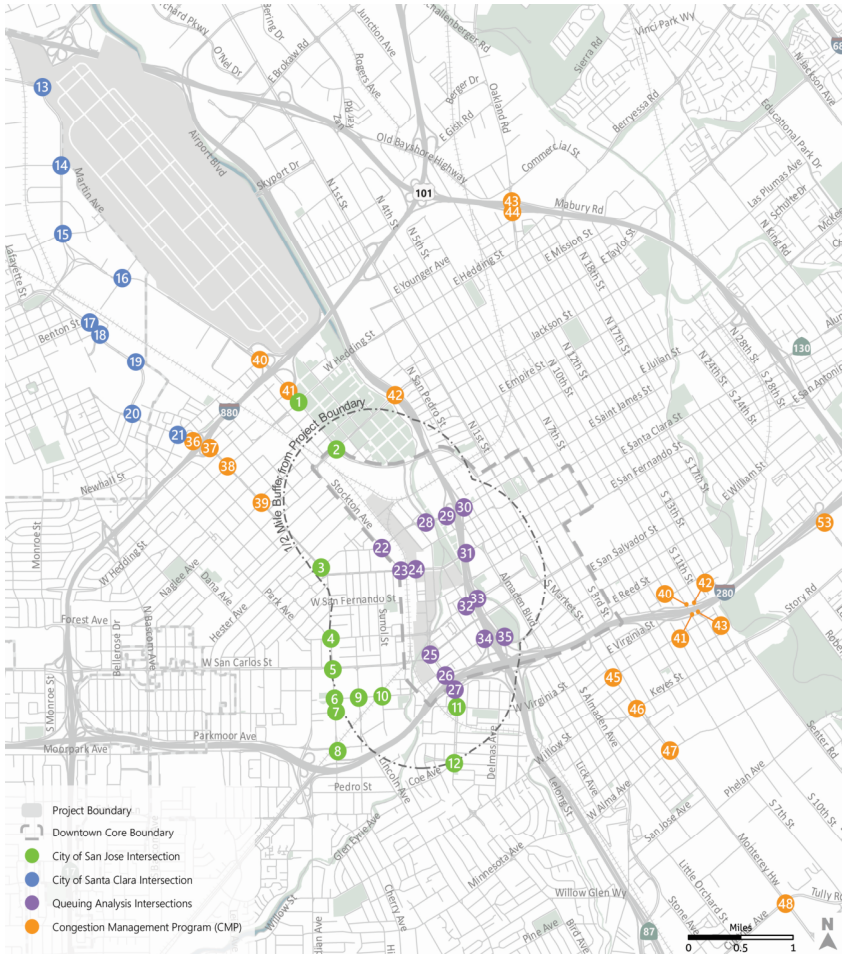


Figure 12
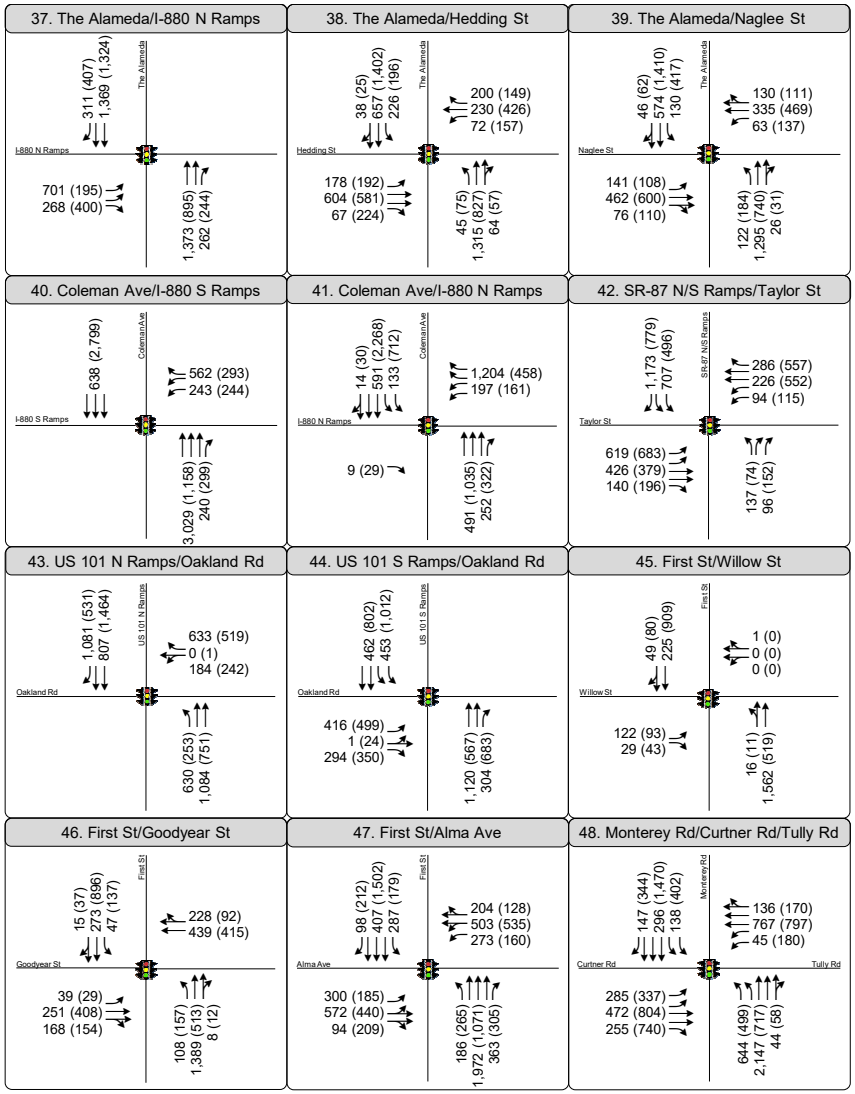
Intersection Volumes and Geometries
Background No Project Conditions



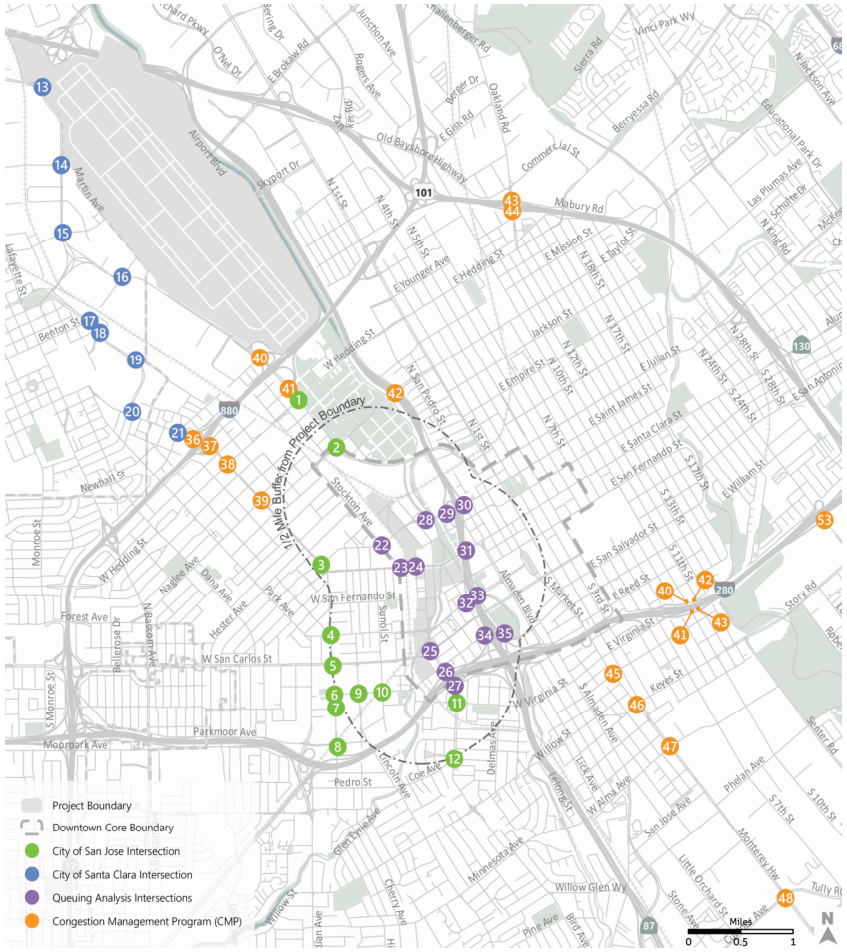


Figure 12
Intersection Volumes and Geometries
Background No Project Conditions

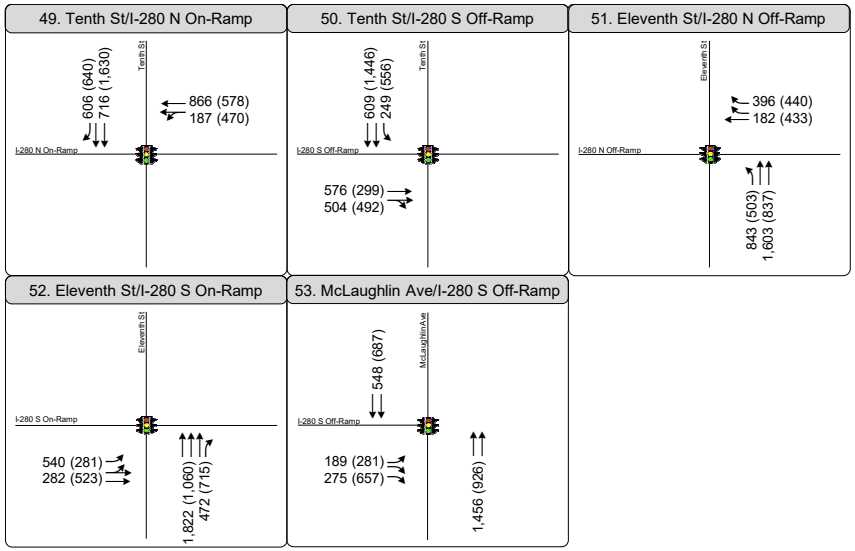

Figure 12
Intersection Volumes and Geometries
Background No Project Conditions

2.4.2.2.3 Transit Improvements

The Background No Project scenario also includes transit service improvements included as part of BART's extension to the Berryessa Transit Center (BART Phase 1) in east San José, Caltrain Electrification, and Caltrain Business Plan. With the BART to Berryessa extension, BART service extends from Alameda County into Santa Clara County, with stops at Milpitas and Berryessa/North San José. June 2020 was the start of revenue service of BART Phase I. The Berryessa station is about five miles from Diridon Station and is served via VTA's Rapid 500, with 10- to 15-minute headways throughout the day.

2.4.2.2.4 Bicycle and Pedestrian Improvements

While not adopted, the City's future bicycle network as described in San José Better Bike Plan 2025 Draft Plan is included per City direction under Background Conditions. No pedestrian improvements were assumed to be implemented.

2.4.2.3 Cumulative No Project Conditions

The City model was used to evaluate the Cumulative No Project scenario consistent with *Envision San José 2040 General Plan*. The details of the model assumptions are summarized under *City of San José Travel Demand Forecasting* in **Section 2.4.1**.

2.4.2.3.1 Traffic Volumes

Traffic volume forecasts were developed using The City model per the land use and transportation assumptions consistent with *Envision San José 2040 General Plan*.

2.4.2.3.2 Roadway Network Improvements

The City model includes all major transportation infrastructure identified in the *Envision San José 2040 Land Use/Transportation Diagram and the Valley Transportation Plan 2040* (VTP 2040), adopted by VTA in October 2013. The improvements include several new roadways that will provide enhanced connectivity and circulation to and within the Downtown area and throughout the City of San José.

2.4.2.3.3 Transit Improvements

This scenario assumes future transit service enhancements associated with BART Phase II. BART Phase II, currently in the design and engineering stage, will extend service from the Berryessa Transit Center to stations at 28th Street/Little Portugal, Downtown San José, Diridon Station, with the end of service in Santa Clara.

2.4.2.3.4 Bicycle and Pedestrian Improvements

Under Cumulative Conditions, the bicycle and pedestrian network was generally assumed to be the same as under Background Conditions.

2.4.3 Plus Project Scenario Assumptions

For the purpose of this analysis three separate project conditions were evaluated including Phase 1, Buildout, and Goal-Based Buildout. This section outlines the assumptions included in each of the three Project conditions.

2.4.3.1 Phase 1 Project Conditions

Phase 1 Project Conditions includes level of development that is assumed to be constructed prior to the completion of BART to Diridon (BART Phase II). This scenario also includes any Project proposed roadway modifications associated with the first phase of development as outlined in **Table 5**, as well as Project proposed TDM measures.

Table 5: Phase 1 and Buildout Land Use Summary

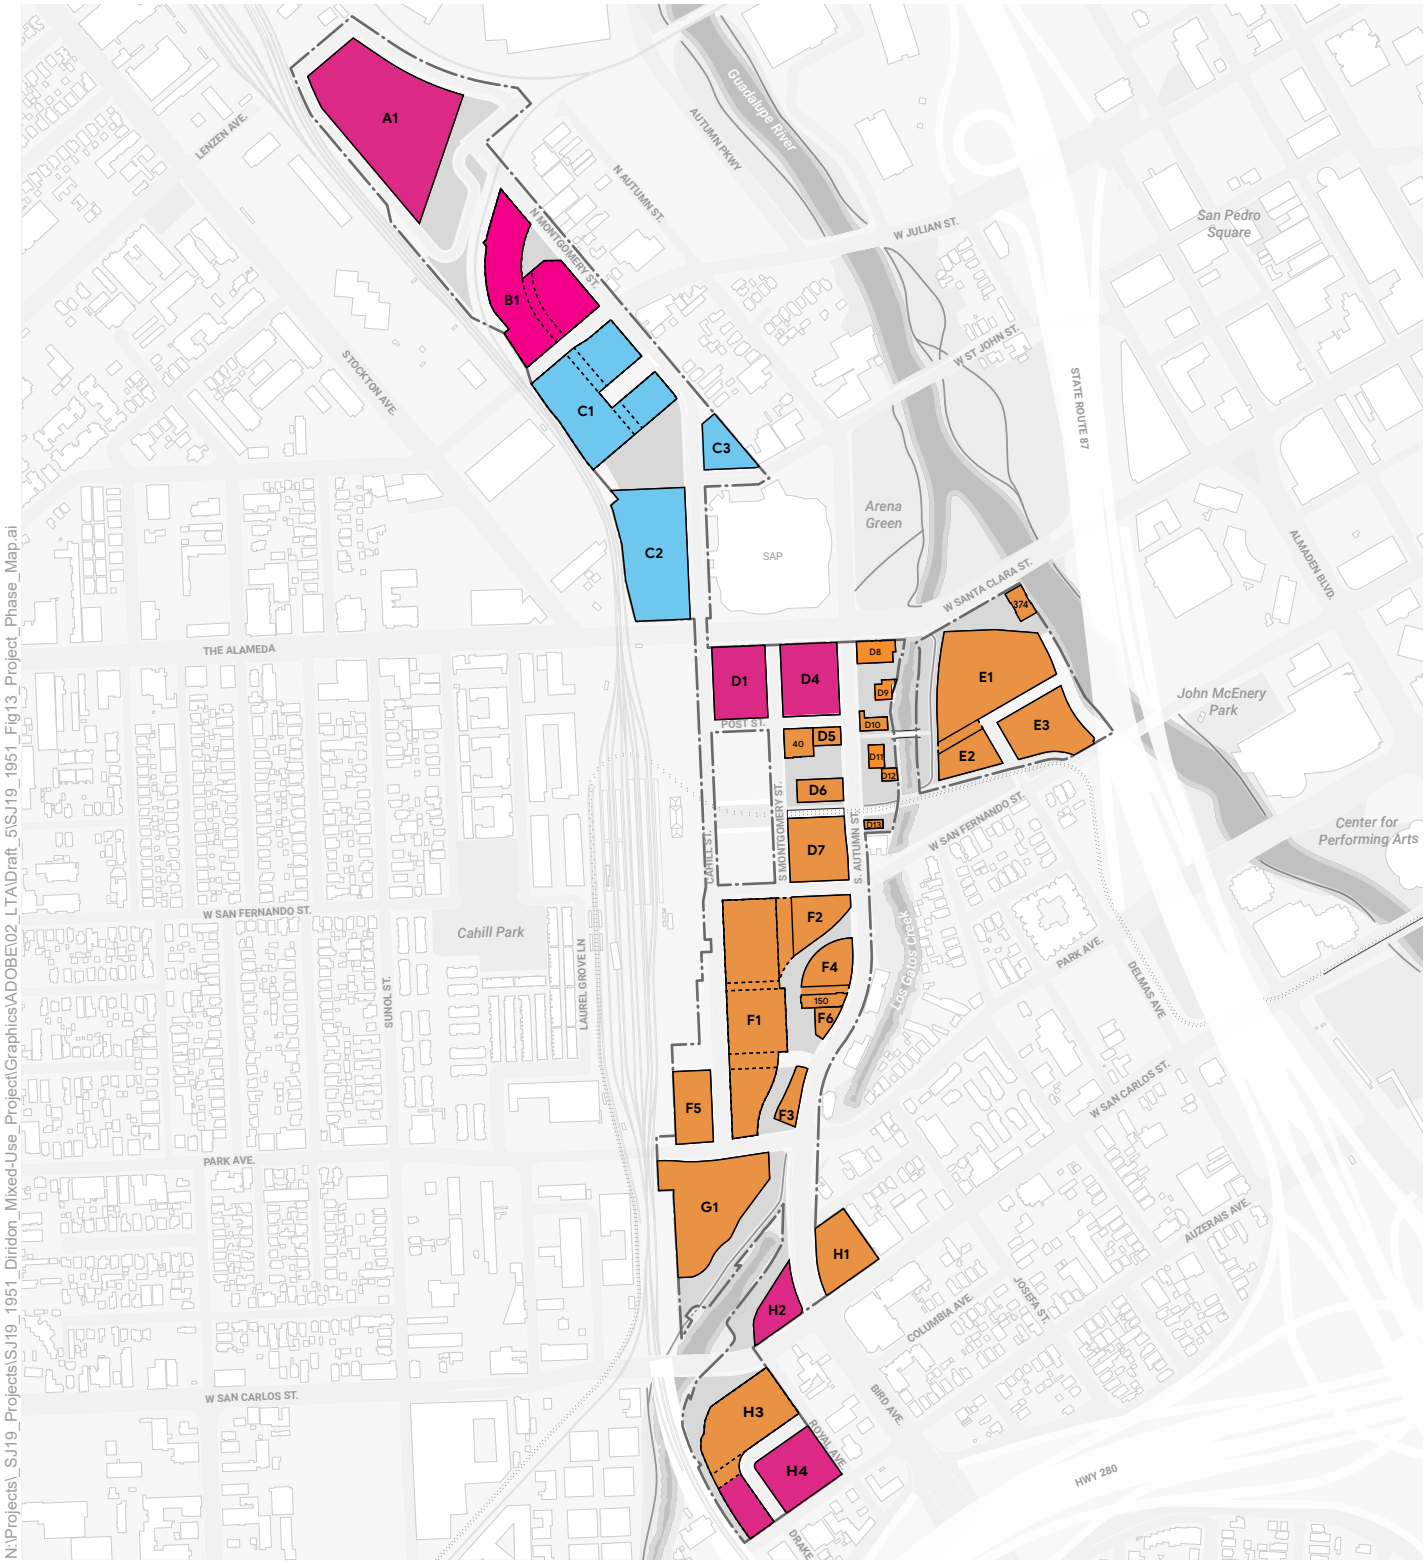
Land Use	Unit[1]	Project Phase	
		Phase 1 (Scenario 2b)	Buildout (Scenarios 2c, 2d, 3b)
Commercial Office	1,000 sq. ft.	4,300	7,300
Residential	du	2,870	5,900
Commercial Retail	1,000 sq. ft.	315	500
Hotel	rooms	0	300
Limited-Term Corporate Accommodations	rooms	570	800
Event Space	1,000 sq. ft.	100	100

Notes:
1. 1,000 sq. ft. = 1,000 square feet; du = dwelling units
Source: Google, Inc., November 2019.

2.4.3.2 Project Buildout Conditions

Project Buildout Conditions is the full buildout of the Project as outlined in **Table 5**. This scenario also assumes future transit service enhancements associated with BART Phase 2 (i.e., BART service at Diridon Station) and Caltrain Business Plan service levels.

2.4.3.3 Goal-Based Project Buildout Conditions



Goal-Based Project Buildout Conditions represents full buildout of the Project with City mode split goals applied to meet the City's *Envision San José 2040* mode split targets. This scenario is presented to illustrate the long-term vision of downtown San José, which has a greater focus on multimodal access and travel. This travel demand is used for analysis of Scenarios 2d and 3b, and represents the City's aspirational goals that could only be achieved if the full vision of *Envision San José 2040* is realized.

Envision San José 2040 sets a goal that no more than 40 percent of commute trips are completed by driving alone (or at least a 60 percent non-SOV mode split). The 60 percent non-SOV goal represents a

citywide average. The City recognizes that not all areas of the City can equally attain this goal because of varying land use densities and availability of multimodal connections. Areas with good multimodal access would need to achieve higher non-SOV goals, and areas on the urban fringes with lower multimodal access would have lower non-SOV goals. Based on City provided data, the Project would need to achieve a 75 percent non-SOV mode split to reach San José's citywide mode split goals. Further, the 75 percent non-SOV mode split represents the City's aspirational goals that could only be achieved if the full vision of *Envision San José 2040* is realized.

While the City and the Project applicant share a goal of achieving the non-SOV rate of 75 percent for the Project area consistent with the citywide goals set forth in Envision 2040, an analysis of available transit and the likely effectiveness of TDM programs was used to develop project-specific performance measure requirements. Ultimately, following the completion of service enhancements related to the final Caltrain Business Plan and commencement of BART service to Diridon Station the Project applicant will be required to achieve a non-SOV rate of 65% for office uses, which is sufficient to indicate a 27% reduction in daily vehicle trips from the City model's baseline travel outputs.

Downtown West

3. Existing Conditions

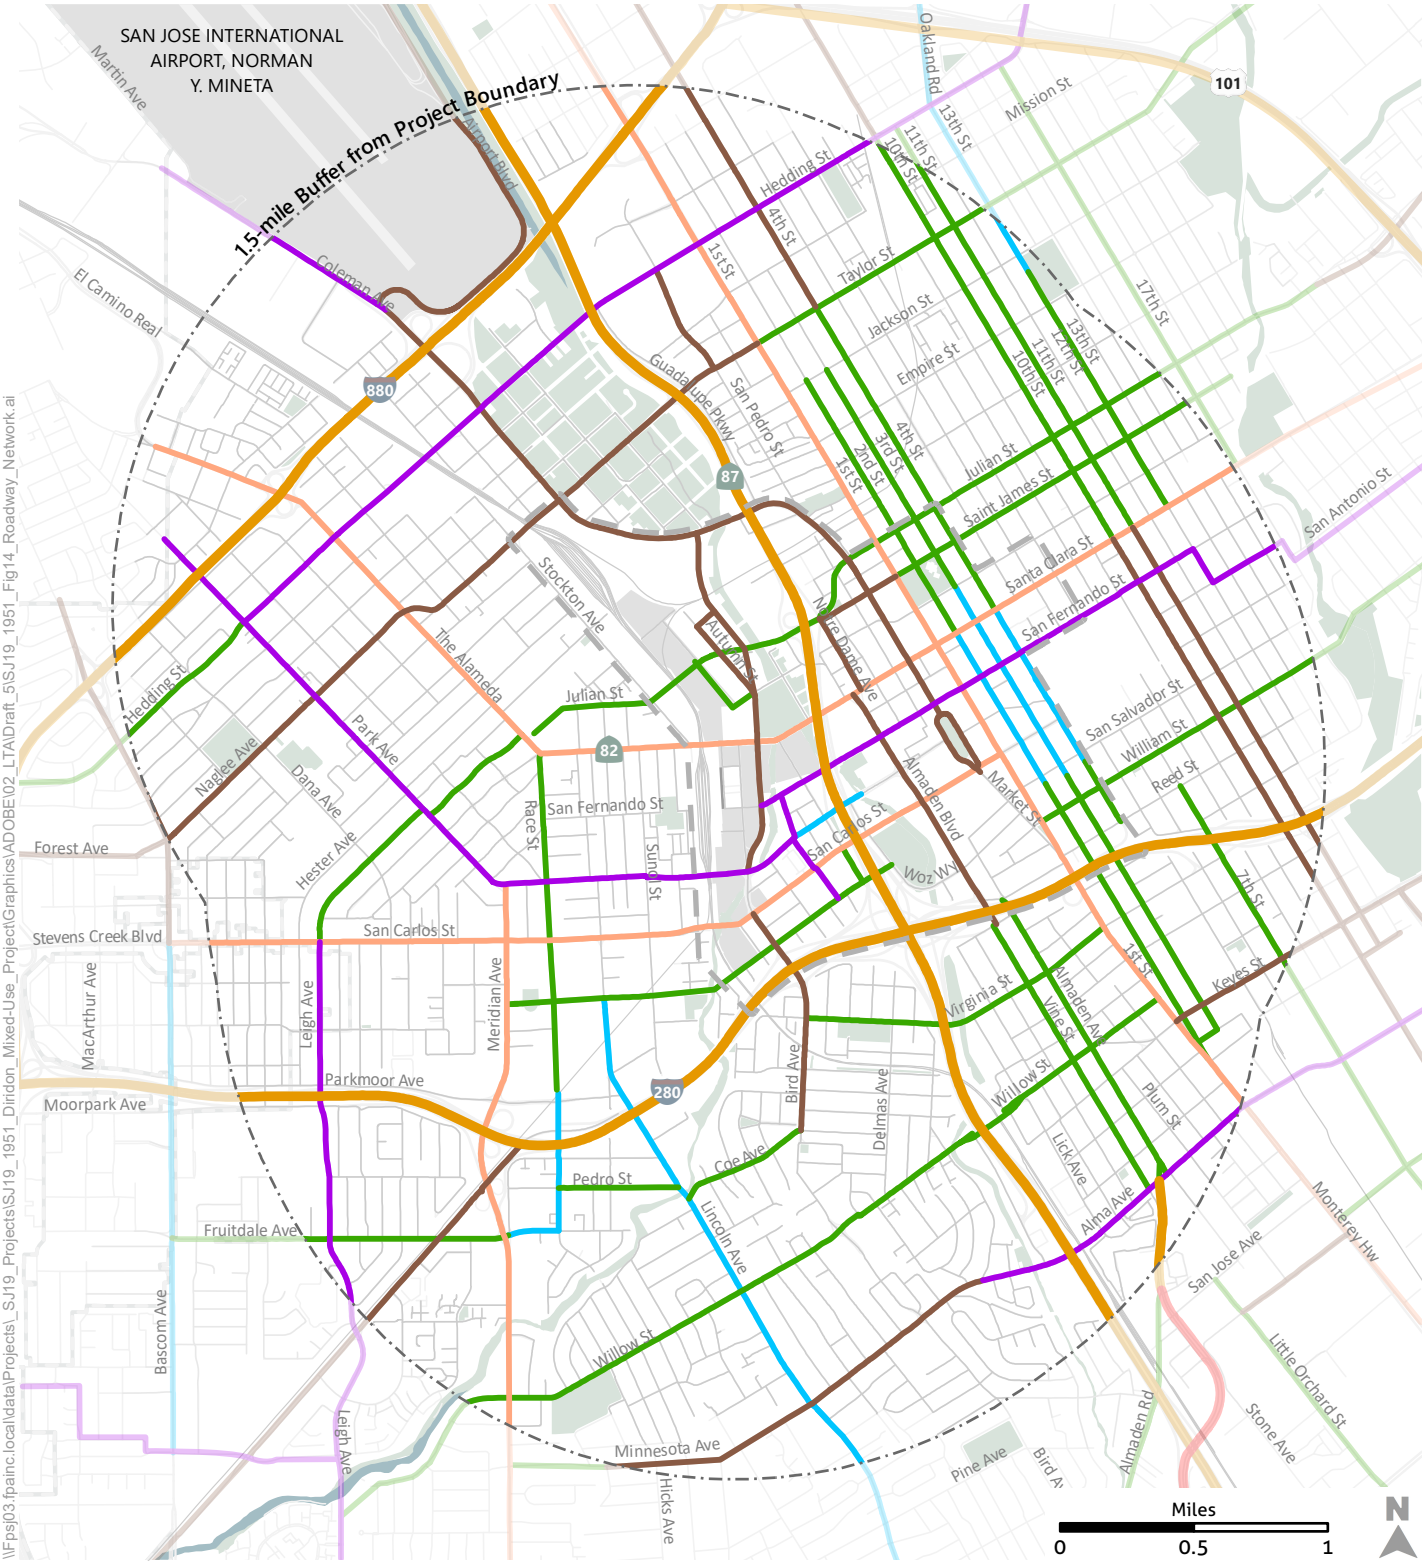
The transportation system near and within the Project area is multimodal and includes freeways, other major roadways, bus and light rail transit services, bicycle facilities, and pedestrian facilities.

3.1 Roadway Facilities

State Route (SR) 87, Interstate (I) 880, and I-280 provide regional access to the Project area. Local access is provided by The Alameda, Auzerais Avenue, Autumn Street, Cahill Street, Delmas Avenue, Julian Street, Park Avenue, St. John Street, San Carlos Street, San Fernando Street, Santa Clara Street, and Stockton Avenue. The City of San José organizes streets according to "typologies" that consider street context and travel mode priorities in addition to functional classifications. Further information about these street "typologies" can be found in Chapter 5 of the *Envision San José 2040 General Plan*. The existing roadway network and typologies in the vicinity of the Project area are shown on **Figure 2**.

3.1.1 Roadway Descriptions

SR 87 is a north–south State Highway extending from the U.S. Highway (U.S.) 101 interchange north of Norman Y. Mineta San José International Airport south to the SR 85 interchange. It is located directly east of the Project area. This state highway has two general-purpose lanes and one high-occupancy vehicle (HOV) lane in each direction. HOV lanes are restricted to vehicles with two or more people, motorcycles, and clean-air vehicles during the morning and evening peak periods. Access to SR 87 from the Project area is via West Julian Street, Park Avenue, or Delmas Avenue.



I-280 is a north-south interstate highway extending north from the I-680/US 101 interchange in San José to San Francisco. It is located directly south of the Project area. This interstate highway has four general purpose lanes and one HOV lane in each direction. Access to I-280 from the Project area is via SR 87 or Bird Avenue.

I-880 is a north-south interstate highway extending north from the I-280/I-880/SR 17 interchange in San José to Oakland. The interstate has three general purpose lanes and one HOV lane in each direction. Access to I-880 from the Project area is via Coleman Avenue or The Alameda.

The Alameda is an east-west Grand Boulevard that is a continuation of Santa Clara Street. It is a four-lane roadway and extends northwest from Stockton Avenue to Santa Clara University.

Auzerais Avenue is a north-south Local Connector Street that runs along the southern border of the Project area. It is a two-lane roadway that extends from SR 87 to Meridian Avenue.

Autumn Street is a north-south City Connector Street that runs through the entire Project area. It operates as a one-way couplet with Montgomery Street between Park Avenue and Santa Clara Street. It operates as a two-way street north of Santa Clara Street.

Downtown West

Cahill Street is a north-south local street (not classified in the General Plan). It is a two-lane roadway that extends from West Santa Clara Street to San Fernando Street and provides access to Diridon Station.

Cinnabar Street is an east–west local street (not classified in the General Plan). It is an approximately 500-foot two-lane roadway. To the west it terminates at the railroad tracks and to the east at a cul-de-sac. The section of Cinnabar Street within the Project area is only accessible via Montgomery Street.

Crandall Street is a one-lane, one-way eastbound Local Street that extends between Cahill Street and South Montgomery Street and provides access from Diridon Station. It's part of the Stover Street-Crandall Street one-way couplet.

Delmas Avenue is a north-south Local Connector Street south of San Carlos Street and a Main Street north of San Carlos Street. It is a two-lane roadway that extends from Santa Clara Street to Auzerais Avenue and runs through the western edge of the Project area.

Julian Street is an east-west Local Connector Street that runs through the northern portion of the Project area. It is a four-lane roadway from the SR 87 interchange to Montgomery Street, where it becomes a two-lane roadway. It extends east toward Downtown San José and west toward The Alameda.

Montgomery Street is a disconnected north–south roadway that travels between Cinnabar Street and St. John Street (North Montgomery Street) and between Santa Clara Street and San Carlos Street (South Montgomery Street). North Montgomery Street is defined as a two-lane, two-way Local Connector street between Julian Street and St. John Street, while South Montgomery Street is defined as a two-lane, one-way Grand Boulevard between Santa Clara Street and Park Avenue; and a two-way City Connector street between Park Avenue and San Carlos Avenue. South of San Carlos Avenue, the roadway continues as Bird Avenue, which is defined as a City Connector street.

Otterson Street is a short (approximately 300 feet) east-west two-lane Local Street that travels east of South Montgomery Street and provides access to light industrial uses along its frontage.

Park Avenue is an east-west On-Street Primary Bike Facility that runs through the center of the Project area. It is a two-lane roadway extending west from Market Street in Downtown San José past Diridon Station.

Royal Avenue is north-south local street (not classified in the General Plan). It is a two-lane roadway that provides a connection between San Carlos Street and Auzerais Avenue.

St. John Street is an east-west, two-lane roadway that extends from Montgomery Street through Downtown San José to Roosevelt Park. It is a Local Connector Street between North Montgomery Street and North Autumn Street and a local street (not classified in the General Plan) east of North Autumn Street. It can be accessed from the Project area via Montgomery Street.

San Carlos Street is an east-west Grand Boulevard that runs through the southern portion of the Project area. It is a four-lane roadway that extends west from San José State University to become Stevens Creek Boulevard.

San Fernando Street is an east-west On-Street Primary Bike Facility that turns into Cahill Street near Diridon Station. It is a two-lane roadway that extends from Diridon Station east through Downtown San José.

Santa Clara Street is an east-west Grand Boulevard that is a continuation of The Alameda running through the middle of the Project area. It is a four-lane roadway that extends east from Stockton Avenue through Downtown San José and toward Alum Rock Avenue.

Stockton Avenue is a north-south local street (not classified in the General Plan) that runs along the western border of the Project area. It is a two-lane roadway that extends from Santa Clara Street to Taylor Street. It can be accessed from the Project area via Julian Street.

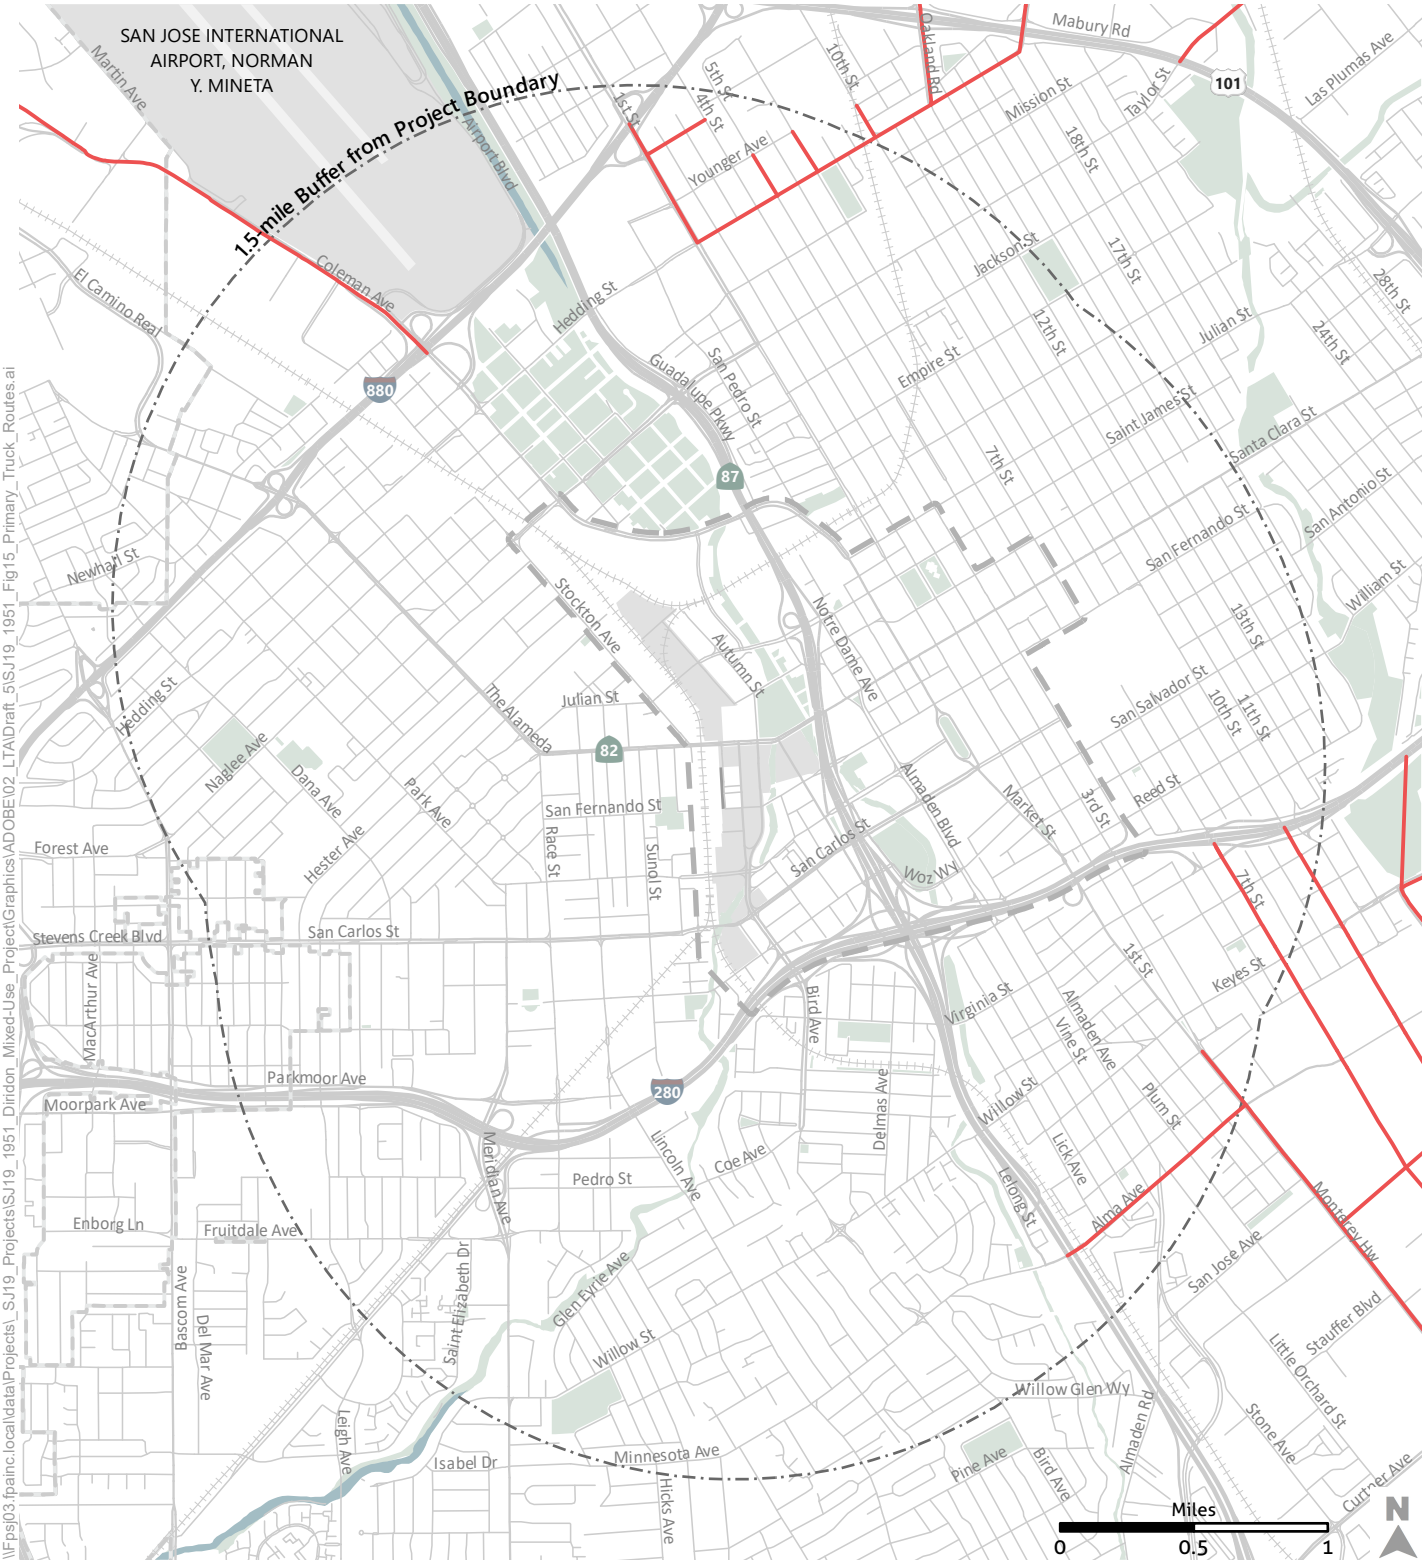
Stover Street is a one-lane, one-way westbound local street (not classified in the General Plan) that traverses between Montgomery Street and Cahill Street and provides direct access to Diridon Station. It's part of the Stover Street-Crandall Street one-way couplet.

3.1.2 Existing Truck Routes

To provide for the safe and efficient movement of goods to support commerce and industry in the City of San José, primary truck routes were established. Further information about policies pertaining to goods movement can be found in Chapter 6 of the *Envision San José 2040 General Plan*. The existing primary truck routes in the vicinity of the Project area are shown on **Figure 15** and are described below:

Coleman Avenue is a north-south primary truck route that extends from the US 101 interchange to the I-880 interchange. This truck route provides access to the vicinity of the Project area from US 101 and I-880.

East Hedding Street is east-west primary truck route that extends from the I-680 interchange to North First Street. This truck route provides access to the vicinity of the Project area from I-680 and East San José.



First Street is a north-south primary truck route that extends from the I-880 interchange to East Hedding Street. This truck route provides access to the vicinity of the Project area from I-880.

Monterey Road/First Street is a north-south primary truck route that extends from Goodyear Street/Keyes Street to the southern border of the City. This truck route provides access to the vicinity of the Project area from I-280 and from South San José.

Seventh Street is a north-south primary truck route that extends from Tully Road to the I-280 interchange. This truck route provides access to the vicinity of the Project area from light industrial land uses located south of Downtown.

Tenth Street is a north-south primary truck route that extends from Tully Road to the I-280 interchange. This truck route provides access to the vicinity of the Project area from light industrial land uses located south of Downtown.

3.2 Existing Transit Services

The Project area is well served by a variety of transit services. These services include local bus and light rail transit services, commuter rail services, and inter-city rail services. The existing transit services (pre-COVID 19 pandemic) in the vicinity of the Project area are shown on **Figure 16**.

3.2.1 Bus and Light Rail Transit (LRT) Services

Bus and light rail transit (LRT) service in Santa Clara County is operated by the Santa Clara Valley Transportation Authority (VTA). In December 2019 VTA implemented their New Transit Plan, which aims to maximize ridership and enhance geographical coverage. The 2019 New Transit Service Plan is an enhanced version of the Next Network Plan that targets design changes to the existing transit network.

With the New Transit Plan, the Project area is served by VTA local bus route 64B; VTA frequent bus routes 22, 23, 64A, 66, 68, 500 (Rapid), 522, and 523; VTA express bus routes 168 and 181; and by VTA light rail line 902. In addition, the Project area is also served by Santa Cruz Metro Highway 17 Express and Monterey-Salinas Transit (MST) route 55. Diridon Station acts as the central hub for bus and light rail service within the Project area. The 13 VTA transit routes and two inter-county transit routes are summarized in **Table 6**.

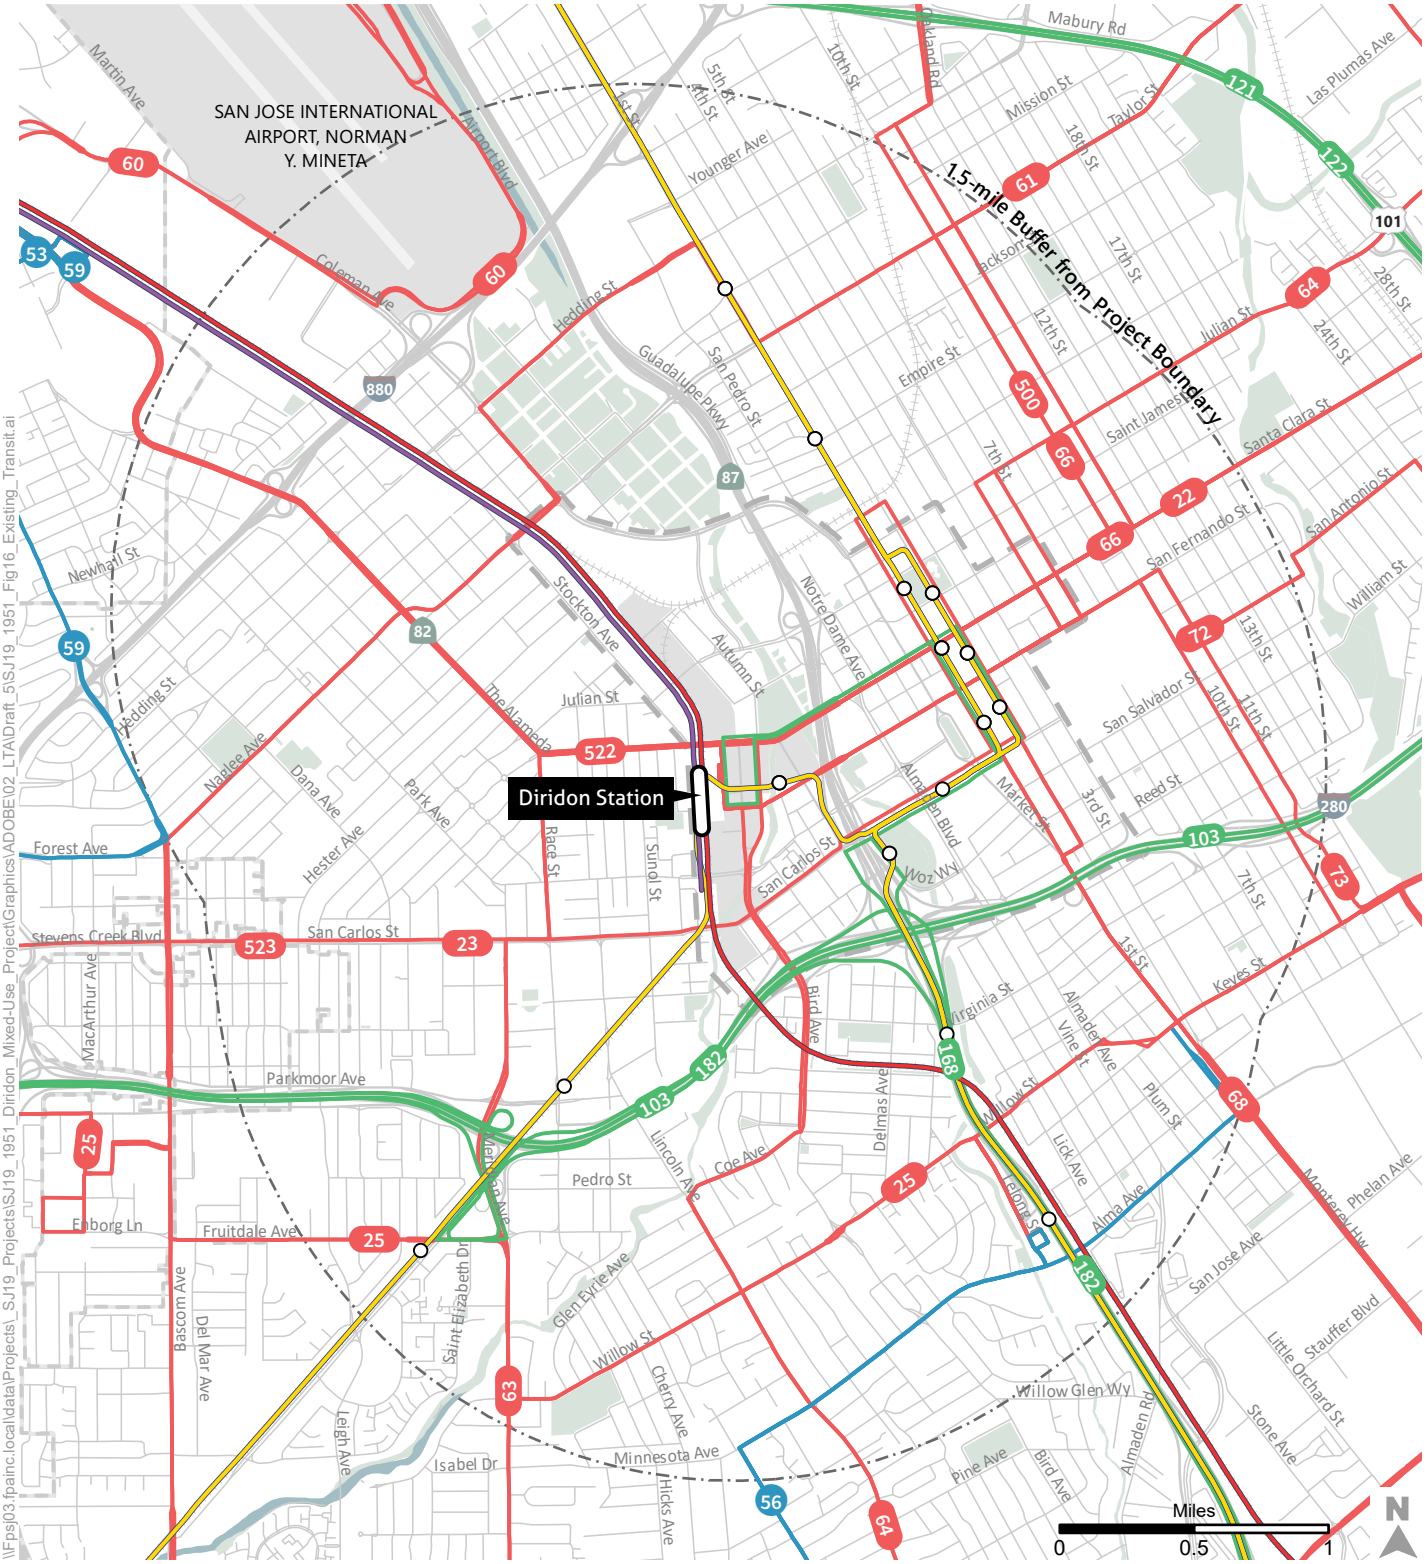

Table 6: Existing Transit Service[1]

Route	From	To	Weekday		Weekends	
			Operating Hours	Peak Headway (minutes)	Operating Hours	Peak Headway (minutes)
VTA Local Bus Routes						
64B	Almaden & Camden	McKee & White	6:00 am – 9:00 pm	15	9:00 am – 6:00 pm	60
VTA Frequent Bus Routes						
22	Palo Alto Transit Center	Eastridge Transit Center	24 Hours a Day	15	24 Hours a Day	15

3.2.2 Commuter and Inter-City Rail Service

Diridon Station serves as the central passenger rail station for Santa Clara County, and Silicon Valley. commuter and freight rail facilities (Caltrain corridor and UPRR traverse the western border of the Project area, and one UPRR rail line passes through the northern end of the site. Currently, Caltrain, Altamont Corridor Express (ACE), Amtrak (Amtrak Capitol Corridor and Amtrak Coast Starlight) have trains stopping at and departing from Diridon Station.

3.2.2.1 Caltrain

The Peninsula Corridor Joint Powers Board (PCJPB) is a government entity which manages the Caltrain commuter rail line operating on the San Francisco Peninsula and into Santa Clara Valley. The Caltrain right-of-way is located between the San Francisco 4th & King Station and the San José Tamien Station. Caltrain service extends south of the Tamien Station to Gilroy on right-of-way owned by Union Pacific Railroad. The PCJPB consists of three member agencies from the three counties the Caltrain line serves; each member agency sends three representatives to make up the nine-member Board of Directors. The member agencies are:

- The City and County of San Francisco
- San Mateo County – San Mateo County Transit District (SamTrans)
- Santa Clara County – VTA

Caltrain operates commuter rail service between San Francisco and Gilroy seven days a week with 92 trains on weekdays and 68 trains on weekends. The average mid-weekday ridership at the Diridon Station (AMWR) in 2019 was nearly 4,800, with systemwide ridership at roughly 64,000. Local, limited-stop, and Baby Bullet Caltrain service all stop at Diridon Station. Trains depart frequently during the weekday AM and PM peak hours with hourly service during non-peak hours and weekends.

3.2.2.2 Altamont Corridor Express

The San Joaquin Regional Rail Commission operates the Altamont Corridor Express (ACE) to provide commuter rail service between Stockton, Tracy, Pleasanton, and San José during commute hours on weekdays. Four westbound trains arrive at Diridon Station between 6:32 AM and 9:17 AM and four eastbound trains depart Diridon Station between 3:35 PM and 6:38 PM on weekdays.

3.2.2.3 Amtrak

The Amtrak Capitol Corridor and Amtrak Coast Starlight stop at Diridon Station. The Capitol Corridor provides service between San José and the Sacramento region with multiple trains departing from Diridon Station each day. The Coast Starlight provides service along the West Coast with stops in Seattle, Portland, San José, the California Central Coast, and Los Angeles with one northbound train and one southbound train departing from the station each day. Connecting bus service to the Amtrak San Joaquin service is also provided at Diridon Station.

3.2.2.4 Future Rail and Bus Service and Improvements[9]

Planned rail service to Diridon Station includes the VTA BART Silicon Valley Phase II extension and the proposed California High-Speed Rail (HSR). Furthermore, the planned electrification of the Caltrain corridor will enable faster and more frequent service.

3.2.2.4.1 VTA Bart Silicon Valley Extension

The VTA BART Silicon Valley Phase II project will extend BART service from its current terminus at Berryessa Station through Downtown San José with a stop at Diridon Station and terminate at the Santa Clara Caltrain Station. As of spring 2020, service is expected to begin in 2030 and is projected to serve 9,600 daily passengers at Diridon Station by 2035.

3.2.2.4.2 Caltrain Electrification

The Caltrain Electrification project, which will electrify the corridor between 4th and King and Tamien stations, is currently underway with electric train passenger service to begin in 2022 between Fourth and King Station in San Francisco to Tamien Station. The Caltrain Electrification project improves train performance, as electric trains can accelerate and decelerate more quickly than diesel-powered trains currently used. This will enable more frequent and faster train service for riders. The number of peak hour trains in each direction will increase from five to six and will increase combined seating and standing capacity by about 30 percent[10]. Furthermore, Caltrain Electrification will lay the groundwork to provide additional capacity improvements in the new Caltrain Business Plan.

3.2.2.4.3 Caltrain Business Plan

Caltrain is currently in the process of creating a business plan to shape the future of the agency. The Caltrain Business Plan addresses four major focus areas: service, business case, community interface, and organization. The Long-Range Service Vision part of the Business Plan will provide the following peak hour capacity improvements:

- Eight trains per hour per direction between Tamien Station in San José and San Francisco, extended to the Salesforce Transit Center when the Downtown Extension is completed
- Four trains per hour per direction between the Blossom Hill and Tamien Stations, subject to the securing of necessary operating rights from UPRR
- Two trains per hour per direction between the Gilroy and Blossom Hill Stations, subject to the securing of necessary operating rights from UPRR

[9] Temporarily reduced public agency revenues because of the COVID-19 pandemic may affect the funding and/or timelines of the planned future rail and bus service improvements identified in this report.

[10] Caltrain Modernization. CalMod: Project Benefits, Rider Benefits. Available online at https://calmod.org/project-benefits/rider-benefits/. Accessed February 22, 2020.

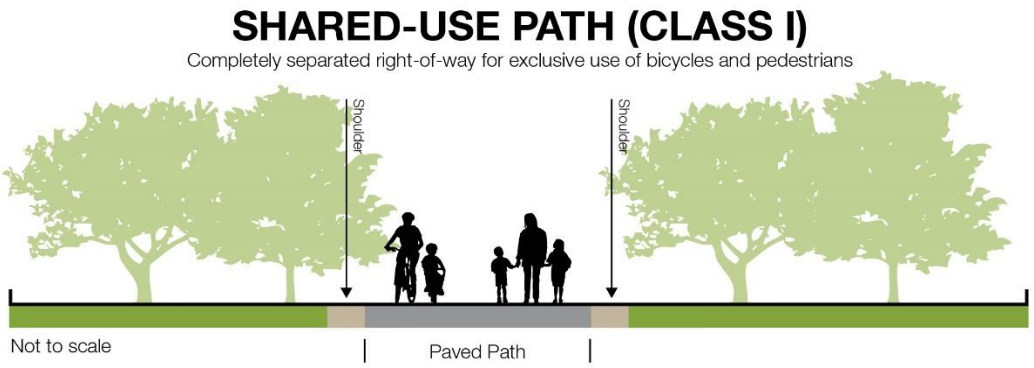
3.2.2.4.4 Diridon Integrated Station Concept (DISC)

The Diridon Integrated Station Concept (DISC) Plan is being prepared in a joint effort by the City of San José, Caltrain, VTA, the California High-Speed Rail Authority, and MTC. The DISC Plan will evaluate how to expand and redesign Diridon Station as a world-class transit center that provides intermodal connections and integration with the surrounding neighborhoods. The DISC Plan will not propose any land use changes, but will focus on station design, including a spatial configuration determining how the various track and station elements will fit together and relate to the surrounding neighborhood. In Spring 2020, the City Council, Caltrain Board, VTA Board, and the California High-Speed Rail Authority each endorsed a Concept Layout for the DISC Plan.[11]

3.2.2.4.5 Bus Rapid Transit

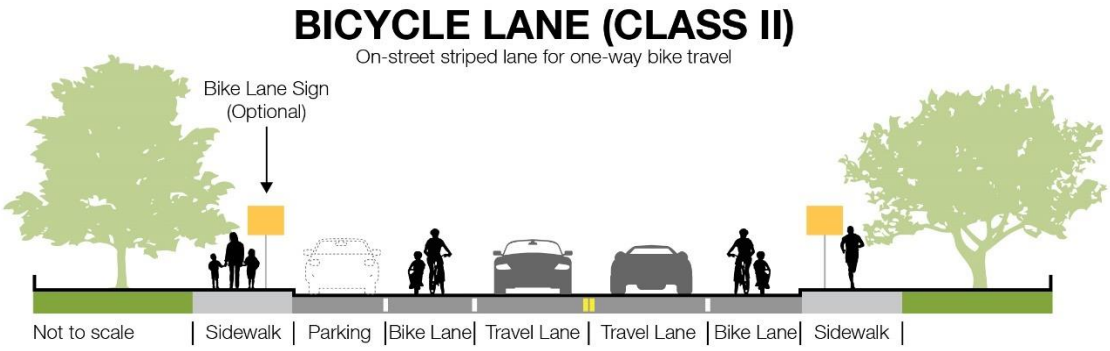
A Bus Rapid Transit (BRT) line currently operates between the Eastridge Transit Center and Downtown San José. The BRT line includes limited-stop, frequent service in exclusive center-running bus lanes with boarding platforms on Alum Rock Avenue between the Eastridge Transit Center and U.S. 101. VTA and the City of San José plan to implement enhancements to the BRT line along Santa Clara Street from 17th Street to I-880. The implementation timeline for the BRT enhancements in this corridor is unknown at this time.

3.2.2.4.6 California High-Speed Rail



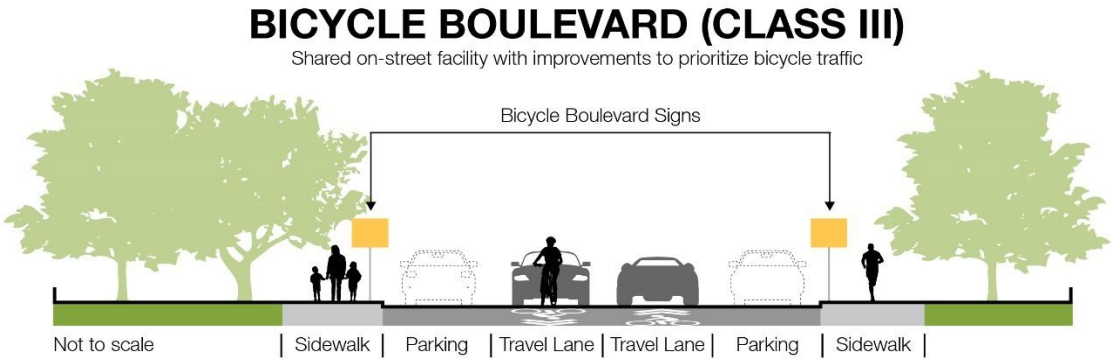
The California HSR project will connect the Los Angeles metropolitan area, the Central Valley, and the San Francisco Bay area and is currently under construction in the Central Valley between Merced and Bakersfield. California HSR plans to serve Diridon Station before continuing north to San Francisco. Service on the Central Valley segment is planned for 2028-2029, with no service date currently identified for operations at Diridon Station

3.3 Bicycle Facilities

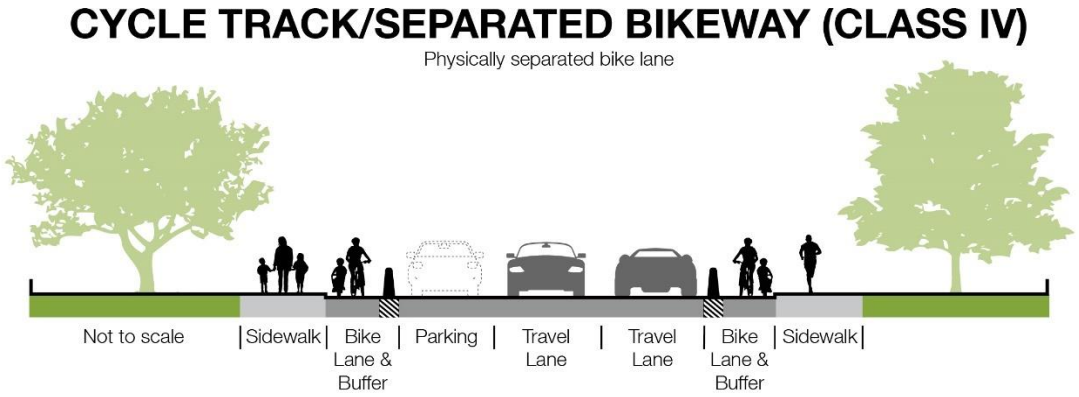


Bikeway planning and design in California typically relies upon guidelines and design standards established by the California Department of Transportation (Caltrans) in the *Highway Design Manual* (Chapter 1000: Bikeway Planning and Design). Caltrans provides for four distinct types of bikeway facilities, as described below and shown in the accompanying figures.

Class I Bikeways (Shared-Use Paths) provides separate right-of-way and are designated for the exclusive use of bicycles and pedestrians, with vehicle and pedestrian crossflow minimized. In general, bike paths serve corridors when on-street facilities are not feasible or where sufficient right-of-way exists to allow them to be constructed.



[11] City of San José, City Council Meeting Minutes, February 4, 2020. Available at https://sanJosé.legistar.com/MeetingDetail.aspx?ID=712175&GUID=42B7D295-2384-4896-AA46-B400D3F914C6&Options=info&Search=. Accessed March 20, 2020.



Class II Bikeways (Bicycle Lanes) are dedicated lanes for bicyclists generally adjacent to the outer vehicle travel lanes. These lanes have special lane markings, pavement legends, and signage. Bicycle lanes are typically five feet wide. Adjacent vehicle parking and vehicle/pedestrian crossflow are permitted.

Class III Bikeways (Bicycle Routes) are designated by signs or pavement markings for shared use with pedestrians or motor vehicles but have no separated bike right-of-way or lane striping. Bike routes serve either to a) provide a connection to other bicycle facilities where dedicated facilities are infeasible, or b) designate preferred routes through high-demand corridors.

Class IV Bikeways (cycle tracks or "separated" bikeways) provide a right-of-way designated exclusively for bicycle travel within a roadway and are protected from other vehicle traffic by physical barriers including, but not limited to, grade separation, flexible posts, and inflexible vertical barriers such as raised curbs or parked cars.

3.3.1 Existing Bicycle Facilities

The City's existing bicycle facilities are illustrated on **Figure 17** and summarized below.

3.3.1.1 Shared-Use Paths (Class I)

The Guadalupe River Trail is located directly east of the Project area, and the Los Gatos Creek Trail is located directly south of the Project area. The Guadalupe Creek Trail is a nine-mile north-south trail that stretches from Virginia Street south of Downtown San José to Gold Street in Alviso. This trail can be accessed from the Project area via Class II bike facilities (bike lanes) on Julian Street, Santa Clara Street or San Fernando Street. The Los Gatos Creek Trail is a 1.9 mile north-south trail that stretches from San Carlos Street to Lonus Street on the south side of I-280. The trail can be accessed by following McEnvoy Street south onto Dupont Street where the trail entrance is located under San Carlos Street. Both trails are part of the major trail system along creeks and rivers in San José that supports recreational and commuting trips by bike or foot.

3.3.1.2 Bicycle Lanes (Class II)

Class II Bikeways (bike lanes) can be found on Julian Street, Santa Clara Street, and San Fernando Street between Gifford Avenue and Almaden Boulevard, Park Avenue, Autumn Street, and Stockton Avenue. The network of Class II bikeways in the vicinity of the Project area provides north-south as well as east-west bicycle access to the surrounding areas. It should be noted that the Better Bike Plan project has recently implemented safety improvements to Class IV bikeways on San Fernando Street, which includes swapping the location of on-street parking and bike lanes as well as the installation of bollards along the bike lanes where appropriate.

3.3.1.3 Bicycle Routes (Class III)

Class III bikeways (bike routes) can be found on Cahill Street to connect the bike lanes on San Fernando Street to Diridon Station, West San Carlos Street, and West Saint John Street. Class III bikeways, along with Class I and Class II bikeway facilities, complete the bikeway network in the vicinity of the Project area.

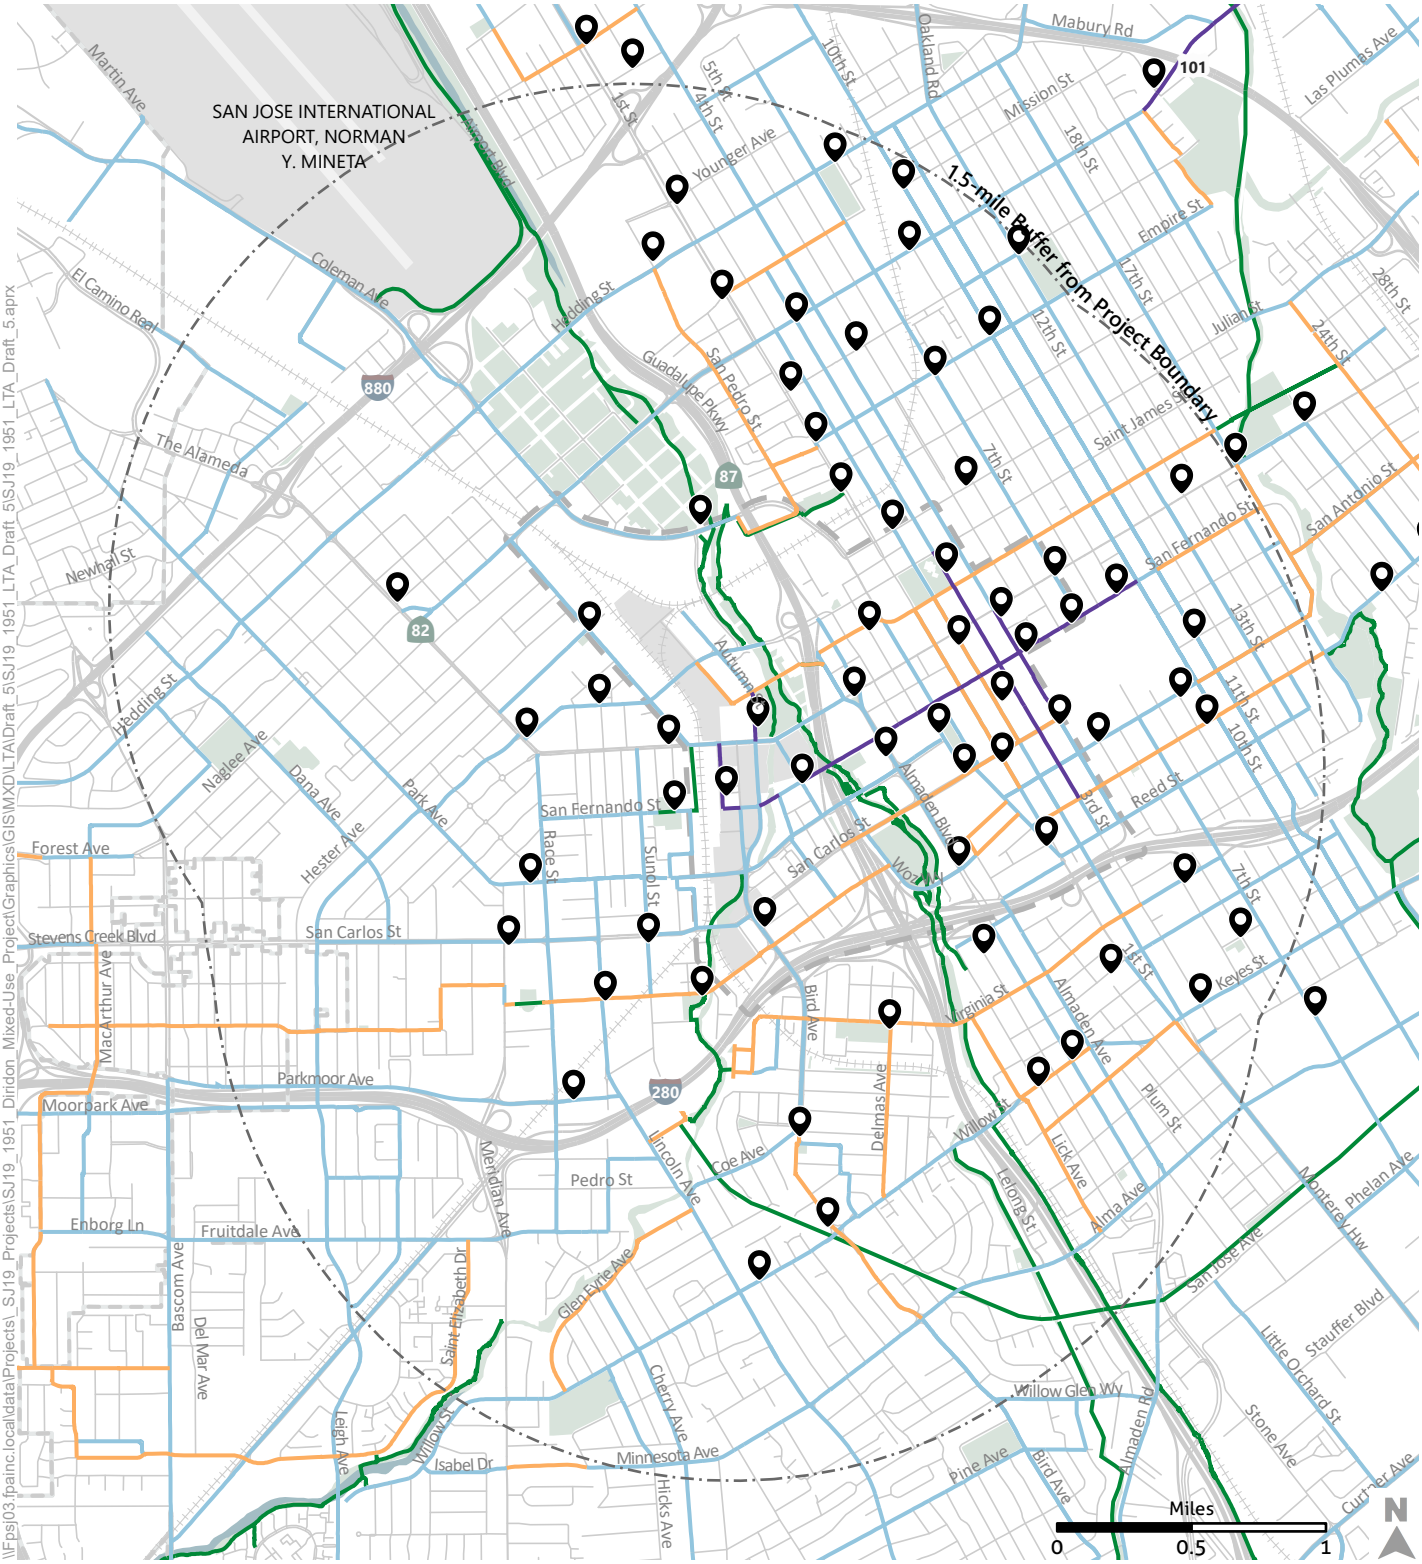
3.3.1.4 Cycle Track/Separated Bikeway (Class IV)

Within the vicinity of the Project area, there are currently Class IV bikeways on Cahill Street between Santa Clara Street and San Fernando Street, and on San Fernando Street between Cahill Street and 10th Street.

3.3.1.5 Future Bike Network

The San José Better Bike Plan 2025 will update the existing Bike Plan and is expected to be finalized in the Fall of 2020. Projects currently identified in the bike plan that are near the Project area include the implementation of a Class II bicycle facility (bike lanes) on Park Avenue between Sunol Street and Market Street as well as the implementation of a Class II bicycle facility (bike lanes) on Santa Clara Street between Montgomery Street and Almaden Boulevard. The proposed bike network improvements are discussed in more detail in **Chapter 6**.

3.4 Shared Micro Mobility



There are several shared micro mobility options within the Project area vicinity that provide first mile-last mile transportation solutions, including bikes, e-bikes, and e-scooters.

3.4.1.1 Bike Share and E-Bikes

Bike share services are provided by Bay Wheels. Bay Wheels is a regional bike sharing system that operates in the San Francisco Bay Area and is managed by MTC. Bay Wheels operates a system of fixed stations where users can rent and return Bay Wheels bicycles. The locations of Bay Wheels stations are shown on **Figure 17**. There are several bikeshare stations in the vicinity of the Project area such as one station on Auzerais Avenue at Los Gatos Creek Trail, one on Bird Avenue south of San Carlos Street, one on Autumn Street north of West Santa Clara Street, one on West Santa Clara Street west of Stockton Avenue, one on San Fernando Street west of the Project area, and one within the Project area north of San Fernando street on Cahill Street.

3.4.1.2 E-scooters

E-scooters began appearing in San José in March of 2018 with multiple companies – including Lyft, Bird, and Lime – now operating e-scooter sharing programs on City streets. A permit program went into effect in February 2019 that required e-scooter vendors to register with the City prior to operating. Unlike Bay Wheels, scooter rental services are free floating, which grants increased flexibility to rent and park e-scooters in appropriate locations on public right-of-way. The City of San José has developed regulations to promote the safe and responsible operation of e-scooters. Basic elements of the regulations state that e-scooters should be operated on streets (not sidewalks), that you need to have a valid driver's license or instruction permit, and only one person at a time may ride an e-scooter.

3.5 Pedestrian Facilities

Pedestrian facilities including sidewalks, crosswalks, curb ramps, and pedestrian signals are provided throughout the study area. Sidewalks are generally provided along all surface roadways in the Project area. A notable gap in the sidewalk network occurs along the south side of West Julian Street between Stockton Avenue and North Montgomery Street. Pedestrian signals and crosswalks are provided at all signalized intersections within the Project area. Curb ramps are also generally provided at all intersections within the Project area. Existing pedestrian facilities in the vicinity of the Project area are shown on **Figure 19**.

3.6 Existing Intersection LOS

This section of the report summarizes the existing intersection and freeway LOS for the identified study location. The City and CMP intersections were evaluated using TRAFFIX LOS software, while the Localized Access intersections were evaluated with Synchro/SimTraffic. Freeway segments were evaluated based on the density of traffic flow. This section first describes the LOS methods, and threshold and then presents the results.

3.6.1 Existing Intersection Volumes and Lane Configurations

The existing operations of the study intersections were evaluated for the highest one-hour volumes during the weekday morning and evening peak periods. **Figure 21** presents the existing AM and PM peak-hour turning movement volumes, lane configurations, and traffic control devices at the study intersections.

3.6.2 Existing Intersection Level of Service

Existing intersection lane configurations, signal timings, and peak hour turning movement volumes were used to calculate the levels of service for study intersections during each peak hour. LOS calculations were generally conducted using TRAFFIX analysis software. The Localized Access intersections were evaluated using Synchro/SimTraffic analysis software. The results of the LOS analysis for Existing Conditions are presented in **Table 7. Appendix C** contains the corresponding calculation sheets. The results indicate that all study intersections operate at acceptable service levels (generally LOS D or better for City intersections, and LOS E or better CMP intersections) during the AM and PM peak hours, except for the following locations:

- Intersection #13. De La Cruz Boulevard & Central Expressway (City LOS): LOS F during the AM peak hour
- Intersection #16. Coleman Avenue & Brokaw Road (City LOS): LOS E+ during the PM peak hour

Notes: **Bold text** indicates intersection operates at unacceptable level of service.

1. Signal = Signalized Intersection.
2. LOS Standard of intersection's jurisdiction.
3. AM = morning peak hour (between 7:00 and 9:00 AM), PM = evening peak hour (between 4:00 and 6:00 PM).
4. Whole intersection weighted average control delay expressed in seconds per vehicle for signalized and all-way stop control intersections.
5. LOS = Level of Service calculations conducted using the TRAFFIX level of service analysis software package, which applies the methodology described in the *2000 HCM*.
6. Level of Service calculations for Localized Access intersections analyzed using Synchro/SimTraffic to measure the effects of queuing

Source: Fehr & Peers, August 2020.

3.6.3 Field Observations

Field observations at the Project area and study intersections were conducted in November 2019 to verify the calculated intersection LOS operations for the Existing Conditions and to observe overall transportation characteristics. Observations indicated that all study intersections are operating at or near the calculated LOS values. Furthermore, cycle lengths of signal phasing were observed at all study intersections and applied to the calculation of existing intersection LOS described in **Section 3.6.2.**

Traffic surrounding the Project area is directional, with most vehicles traveling into Downtown San José during the AM peak, and most vehicles out of Downtown San José during the PM peak. Bottlenecks into and out of the Downtown San José vicinity are located at freeway on- and off-ramps. This results in freeway off-ramps experiencing moderate to long queues during the AM peak hour and moderate to long queues for vehicle movements onto freeway on-ramps during the PM peak hour. Freeway ramps experiencing increased delay during the AM peak hour include the Santa Clara Street and SR 87 N off-ramp, and the Bird Avenue and I-280 off-ramps. Freeway ramps experiencing increased delay during the PM peak include the Julian Street and SR 87 S on-ramp, the Auzerais Avenue and Delmas Avenue/SR 87 S on-ramp, and the Bird Avenue and I-280 on-ramps. The increased delay at freeway ramps during the PM peak hour causes queue spillback to adjacent intersections in some instances. At the Julian Street and SR 87 S on-ramp, the queue spills back past Julian Street and Autumn Parkway. At the Auzerais Avenue and Delmas/SR 87 S on-ramp, the queue spills back to W San Carlos Street.

3.7 Freeway Analysis

This section outlines the freeway analysis results under Existing Conditions.

3.7.1 Existing Freeway Segment Levels of Service

Existing freeway operations are described with LOS results from the *2016 VTA Monitoring and Conformance Report*, the most recent report available as of the date of the Notice of Preparation (NOP). **Table 8** and **Table 9** summarize the existing freeway segment levels of service for the mixed-flow and HOV lanes in table format and **Figure 22** and **Figure 23** illustrate the freeway mixed-flow LOS in the study area for the AM and PM peak hours, respectively.

40 mixed-flow segments operate at unacceptable LOS F during the AM peak hour, and 29 segments during the PM peak hour. Similarly, 18 HOV lane segments operate at unacceptable LOS F each during the AM peak hour, and seven HOV lane segments operate at unacceptable LOS F during the PM peak hour.

4. Project Travel Demand

This chapter discusses travel demand for the proposed Project, which was estimated using the City of San José's travel demand model ("City model"). The City model produces estimates of vehicle trips and person trips by mode for both the AM and PM peak periods and distributes those trips and assigns them to various roadways (for vehicle trips) or transit lines (for transit trips). Travel demand for the Project was prepared for three separate Project conditions:

- *Phase 1 Project Conditions:* level of Project development that would be constructed prior to the completion of BART to Diridon. This scenario includes any Project proposed roadway modifications associated with the first phase of development, in addition to BART service to the Berryessa station (BART Phase 1) and Caltrain Electrification. This travel demand is used for analysis of the Background Plus Phase 1 Project scenario and includes implementation of a TDM program.
- *Project Buildout Conditions:* full buildout of the Project and any Project proposed roadway modifications and TDM measures. This scenario also assumes future transit service enhancements associated with BART Phase 2 (i.e., BART service at Diridon Station) and Caltrain Business Plan service levels. This travel demand is used for analysis of the Background Plus Project Buildout scenario and includes implementation of a TDM program.
- *Goal-Based Project Buildout Conditions:* Full buildout of the Project, and City mode split goals applied to meet the City's *Envision San José 2040* mode split targets. This scenario is presented to illustrate the long-term vision of downtown San José, which has a greater focus on multimodal access and transit travel. This travel demand is used for analysis of the Goal-Based scenarios under Background and Cumulative Conditions.

The trip generation estimates presented in this LTA differ from those presented in the TA prepared for CEQA purposes. The LTA builds upon the trip estimates presented in the TA and incorporates TDM program elements, as well as a scenario that includes specific mode split goals to meet the City's overall vision consistent with their General Plan. As such, the TA trip generation estimates are more conservative, and the LTA estimates provide a range of trip estimates to more accurately reflect the near-term and cumulative vision of the City.

4.1 Trip Generation Approach

Trip generation refers to the amount of travel activity associated with a change in land use at a given location. The City model uses City-specific trip generation characteristics of different land uses to estimate vehicle trips and person trips by mode including drive alone, shared-ride, walking, bicycling, and transit.

The Project's land uses were allocated to the appropriate Transportation Analysis Zones (TAZs) based on their location. The City model adjusts the resulting trip generation to account for internalization of trips within the Project area. Because existing conditions at the Project area include active land uses, the

Project's trip generation represents the change in total trips between the no Project and plus Project conditions for each scenario.

Table 10 summarizes the land use assumptions for Phase 1 and Buildout. For the purposes of the trip generation analysis the event space for day-to-day operations is assumed to be included in the office trip generation estimates. External trips to the site would vary based on the type of event; though most events would be targeted toward Google employees, and as a result most attendees (generally 70 percent) would already be in the Project area and would not generate a substantial number of additional peak hour trips.

Our initial estimates do not include trips generated by the event space, as it will be used primarily by employees at the commercial office land use on-site, except for during special events. Similarly, the Project's 130,000 square feet of central utility plant space and 100,000 square feet of on-site logistics/warehouse space would not generate a substantial number of additional peak hour trips[12]. They both are primarily intended to serve as accessory to the primary office, residential, and retail land uses; including more efficient management and distribution of daily deliveries through the logistics space; and therefore, peak hour trip estimates for those land uses are not included.

Table 10: Land Use Summary

Land Use	Unit[2]	LTA Analysis Project Phase[1]	
		Phase 1	Buildout
Commercial Office	1,000 sq. ft.	4,170	7,300
Residential	du	3,130	5,900
Commercial Retail	1,000 sq. ft.	370	500
Hotel	rooms	0	300
Limited-Term Corporate Accommodations	rooms	530	800
Event Space	1,000 sq. ft.	100	100
Central Utility Plant	1,000 sq. ft.	130	130
On-Site Logistics/Warehouse	1,000 sq. ft.	100	100

Notes:
1. The LTA analysis phases differ from the Project phases. LTA Phase 1 includes Project phases 1 and 2, and the LTA Buildout phase includes all three Project phases.
1. 1,000 sq. ft. = 1,000 square feet; du = dwelling units
Source: Google, Inc., November 2019.

[12] Based on ITE rates for warehouse uses (Land Use 150), the logistics center would generate up to 5.05 daily trips per employee, including 0.61 during the AM peak hour and 0.69 trips during the PM peak hour. Assuming generic rate of 650 square feet per employee, the logistics warehouse would have up to 155 employees and would generate just over 780 daily trips, 95 AM peak hour trips, and about 105 PM peak hour trips. This equates to less than one percent of the gross vehicle trips presented in **Table 14**.

At the highest level of analysis, the land use detailed above in **Table 10** was input into the City model. The outputs of that analysis provide the basis for the Project's VMT effects, discussed in detail in the *Transportation Assessment*, and are used for determining transportation impacts under CEQA. These estimates are presented in **Chapter 4.1.2**, as well as in the CEQA Transportation Assessment, but are not used for traffic operations analysis, as they do not reflect certain aspects of the Project. Instead, they can be thought of as representing how the Project's land use totals, if presented in a "business as usual" manner, would result in a larger number of vehicle trips.

4.1.1 Trip Generation Methods

Two trip generation methods were applied to estimate the Project's travel effects and to provide nuance and detail on expected operations for the Project. The two methods include the application of a basic TDM Program and a goal-based mode share approach. Each of these is discussed in more detail below. The TDM program approach was applied to both Phase 1 and Buildout scenarios, while the more aspirational goal-based approach was only applied to the Buildout scenario.

For both trip generation methods, this analysis provides an assessment of the Project's total travel demand, including the demand for vehicle trips, as well as transit riders, biking, and walking. This demand was adjusted only by the two methods discussed below and was not constrained by other variables such as roadway capacity, driveway capacity, or parking capacity. As such, it serves as a starting point for evaluating how the City and the Project applicant could consider addressing potential adverse effects in topics such as roadway operations, bicycle/pedestrian network connectivity and demand, as well as transit capacity.

4.1.1.1 TDM Program Travel Characteristics

Project components that reduce vehicle trips that are not fully captured by the travel model include programmatic or unique built environment measures that can reasonably be expected to affect travel to and from the Project area. For instance, the travel demand model does not include private shuttle operations, detailed parking pricing or supply adjustments, or data on how transportation demand management (TDM) programs may change the total number of vehicle trips. Because the model does not account for these measures, the second level of analysis incorporates reasonable estimates of how a TDM program would reduce vehicle trips, and increase transit, walk, and bike trips. The Project incorporates many TDM programs; this analysis evaluates the expected reductions from a basic TDM program that results in an approximately 18 percent trip reduction, which exceeds the Project's AB 900 application requirements. These estimates are presented in **Chapter 4.1.4.1**. As noted previously, the analysis does not include the additional nine percentage points (total 27 percent trip reduction) required by the EIR's *Enhanced TDM Mitigation Program*. The purpose of applying a different analysis approach is to provide a conservative analysis consistent with those prepared for other LTAs in the City and allow for better comparison of results.

4.1.1.2 Goal-Based Travel Characteristics

Envision San José 2040 sets a goal that no more than 40 percent of commute trips are completed by driving alone (or at least a 60 percent non-SOV mode split). The 60 percent non-SOV goal represents a citywide average. The City recognizes that not all areas of the City can equally attain this goal because of varying land use densities and availability of multimodal connections. Areas with good multimodal access would need to achieve higher non-SOV goals, and areas on the urban fringes with lower multimodal access would have lower non-SOV goals. Based on City provided data, the Project in the long-term would need to achieve a 75 percent non-SOV mode split and represents the City's aspirational goals that could only be achieved if the full vision of *Envision San José 2040* is realized. The goal-based mode split analysis is used for the cumulative plus Project analysis and is intended to reflect all future City investments in VMT reduction, GHG reduction, and improvements to the transit and bikeway networks. These estimates are presented in **Chapter 4.1.4.3**.

4.1.2 Gross Travel Demand Estimates

Initial travel estimates were developed to capture the gross trips for Phase 1 and Buildout land use assumptions.

4.1.2.1 Phase 1 Project Gross Travel Demand Estimates

Travel demand for Phase 1 Project uses a conservative estimate of mode split based on the raw model outputs for existing development in the Project area.

Table 11 summarizes the estimated total external person trips associated with each land use for Phase 1. As shown, the Project is expected to generate around 120,000 gross daily person trips, of which around 10,000 gross trips would occur during the AM peak hour and around 12,000 gross trips would occur during the PM peak hour. This includes trips made by all modes.

Table 11: Phase 1 Project Land Uses and Gross Person Trip Generation without TDM

ITE Land Use	Units	Quantity	Daily	AM Total	AM In	AM Out	PM Total	PM In	PM Out
Office	1,000 sq. ft.	4,300	70,100	6,400	5,400	950	7,500	1,550	6,150
Residential	Units	2,870	24,000	2,650	900	1,750	2,700	1,500	1,050
Limited-Term Corporate Accommodations	Units	570	4,800	500	150	350	550	300	200
Retail and Cultural	1,000 sq. ft.	315	20,200	250	50	200	1,100	900	150
Hotel	Rooms	0	0	0	0	0	0	0	0
Total Phase 1 Gross Person Trips			**119,100**	**9,800**	6,450	3,300	**11,850**	4,300	7,600

Rounded to nearest 100 or 50 trips. Rows may not sum to total due to rounding.
Source: CSJ Model; Fehr & Peers, 2020.

Using model-produced mode splits for the Phase 1 condition, person trips from **Table 11** were converted to person trips by mode, as summarized in **Table 12**. Based on the CSJ model, around 51 percent of trips to and from the Project would be made by single-occupancy vehicles under existing conditions; an additional 26 percent are made in vehicles with more than one occupant. These mode splits reflect travel patterns produced by the model under interim conditions and include transit improvements associated with BART service to the Berryessa station (BART Phase 1) and Caltrain Electrification.

Table 12: Phase 1 Project Person Gross Trip Estimates by Mode without TDM

Mode of Travel	Mode %	Daily	AM Total	AM In	AM Out	PM Total	PM In	PM Out
Drive Alone	51%	61,100	5,050	3,300	1,700	6,100	2,200	3,900
Drive with Others	26%	30,400	2,500	1,650	850	3,000	1,100	1,950
Transit	13%	15,800	1,300	850	450	1,600	550	1,000
Bike	2%	2,500	200	150	50	250	100	150
Walk	8%	9,300	750	500	250	900	350	600
Phase 1 Gross Person Trips		**119,100**	**9,800**	6,450	3,300	**11,850**	4,300	7,600
Phase 1 Gross Vehicle Trips		**72,400**	**6,000**	3,950	2,050	**7,200**	2,650	4,700

Rounded to nearest 100 or 50 trips. Rows may not sum to total due to rounding.
Source: CSJ Model; Fehr & Peers, 2020.

As shown in **Table 12**, under the Phase 1 scenario, the Project is estimated to generate 72,400 gross vehicle, 15,800 gross transit, and 11,800 gross walk and bike trips on a daily basis. During the AM peak hour, Phase 1 generates around 6,000 gross vehicle trips; during the PM peak hour, it generates around 7,000 gross vehicle trips.

4.1.2.2 Project Buildout Gross Travel Demand Estimates

Table 13 summarizes the land use program for the Project at Buildout, and the total person trips associated with each land use. As shown in **Table 13**, the Project is expected to generate around 201,200 gross daily person trips, of which 16,600 gross trips would occur during the AM peak hour and 18,450 gross trips would occur during the PM peak hour. This includes trips made by all modes.

Table 13: Project Buildout Land Uses and Gross Person Trip Generation without TDM

ITE Land Use	Units	Quantity	Daily	AM Total	AM In	AM Out	PM Total	PM In	PM Out
Office	1,000 sq. ft.	7,300	111,700	10,200	8,700	1,550	11,150	2,400	9,000
Residential	Units	5,900	50,500	5,100	1,750	3,300	4,900	2,850	1,900

Rounded to nearest 100 or 50 trips. Rows may not sum to total due to rounding.
Source: CSJ Model; Fehr & Peers, 2020.

The gross trip estimates for Buildout uses the daily mode split produced for the CJS model. The daily mode split includes mode shift due to the Project's density and diversity of land use; the mode split used for Phase 1 Project was focused on existing travel patterns in the study area, without necessarily accounting for the full effects of the Project itself (i.e., that the Project may raise overall transit mode split by providing an increase in jobs near transit). **Table 14** shows gross trips by mode for Project Buildout.

Table 14: Project Buildout Gross Person Trip Estimates by Mode without TDM

Mode of Travel	Mode %	Daily	AM Total	AM In	AM Out	PM Total	PM In	PM Out
Drive Alone	51%	98,300	8,400	5,500	2,900	9,300	3,550	5,750
Drive with Others	25%	48,700	4,150	2,700	1,450	4,600	1,750	2,850
Transit	12%	23,000	1,950	1,300	650	2,200	850	1,350
Bike	2%	3,900	350	250	100	350	150	200
Walk	11%	20,600	1,750	1,150	600	1,950	750	1,200
Buildout Total Gross Person Trips		**194,500**[1]	**16,600**	10,900	5,700	**18,400**	7,050	11,350
Buildout Total Gross Project Vehicle Trips		**117,400**	**10,100**	6,700	3,350	**11,600**	4,250	7,350

1. The total person trip estimate differs slightly from that shown in **Table 13** due to removal of intra-TAZ trips from the model results during the distribution and assignment phases. Approximately 6,000 daily person trips are expected to remain within Project area.
Rounded to nearest 100 or 50 trips. Rows may not sum to total due to rounding.
Source: CSJ Model; Fehr & Peers, 2020.

As shown in **Table 14**, under Project Buildout, around half of all gross person trips would be made in a single-occupant vehicle, with an additional 25 percent of person trips made in vehicles with more than one occupant. This results in 117,400 gross daily vehicle trips, including 10,100 gross trips in the AM peak hour and 11,600 gross trips in the PM peak hour. The Project also results in 23,000 gross new transit trips, and 24,500 gross new daily walk and bike trips.

4.1.3 Travel Demand Effects of TDM

As noted, the Project applicant will be required to implement an Enhanced TDM Program as part of its EIR mitigation measure, which would reduce vehicle travel demand by 27 percent. However, to provide a conservative analysis consistent with those prepared for other LTAs in the City and allow for better comparison of results; a more basic TDM program was evaluated for the LTA.

Making off-model adjustments to account for a TDM program will help to more accurately assess not only how the Project would affect traffic operations, but also the total amount of transit, bicycle, and pedestrian demand generated by the Project. Because the TDM Program is an integrated part of the Project, the effects of TDM were incorporated off-model to provide a final travel demand estimates for the Project.

To provide a conservative assessment of TDM effectiveness, the analysis presented here focuses on a basic TDM program with three measures that have proven and quantifiable effects on travel behavior using quantification methods provided California Air Pollution Control Officers Association (CAPCOA) *Quantifying Greenhouse Gas Mitigation Measures* (August 2010). It should be noted that effectiveness of a basic TDM program is only included for the LTA analysis purposes. The Project includes a more robust and comprehensive TDM program as part of it EIR mitigation requirement.

4.1.3.1 Transit Passes

Up to a 12.0 percent reduction in vehicle mode share can be achieved due to provision of transit passes to residents and employees. This reduction would apply to trips related to office and residential land uses (approximately 78 percent of all daily trips), with individuals shifting primarily to transit, with some additional walking activity (i.e., individuals who take transit to the site are more likely to walk to other locations rather than drive). This reduction is in addition to the transit mode use assumed in the initial model runs.

4.1.3.2 Parking Policies

Up to a 10 percent reduction in vehicle mode share can be achieved due to the Project's parking policies, including constrained parking supply and market-rate pricing for parking.[13] This reduction would apply to trips to and from all land uses, as the constrained parking supply and parking pricing would apply to nearly all site visitors. Individuals changing their behavior are expected to shift to carpooling, transit, biking, and walking at rates proportionate to the mode share of the rest of the site.

4.1.3.3 Express Buses

Up to a four percent reduction in vehicle mode share due to provision of employer-based express buses. This reduction would apply only to office-based trips, which represent around 57 percent of all daily trips. Individuals are expected to shift primarily to transit (which include private shuttles), although there may be some additional shift to walking during the day.

[13] The Project's AB 900 application assigned a 19% reduction in vehicle trips due to the Project's parking policies. However, because the CSJ Model includes some rudimentary information on parking availability and cost in each TAZ, we have dampened the effectiveness somewhat to present a conservative analysis.

4.1.3.4 Summary

Combined, the three measures listed above are expected to further reduce drive-alone trips by approximately 24 percent,[14] although not every measure applies to every land use, as shown in **Table 15**.

Table 15: Applicability of Basic TDM Measures by Land Use

TDM Measure	Land Uses Applied to	Percent Reduction	Share of Total Trips Associated with Applicable Land Uses (Phase 1 / Buildout)		
			Daily	AM Peak	PM Peak
Transit Passes	Office, Residential	12%	78% / 75%	92% / 93%	80% / 83%
Parking Policies	Office, Retail, Residential	10%	100% / 100%	100% / 100%	100% / 100%
Express Buses	Office	4%	57% / 42%	76% / 74%	64% / 63%

Source: CSJ Model; Fehr & Peers, 2020.

4.1.3.5 City of San José VMT Evaluation Tool

The effectiveness of the three TDM measures outlined above were evaluated using CAPCOA methods and not the City of San José's VMT Evaluation Tool (City VMT Tool). The City's VMT Tool only allows for the analysis of individual parcels and not an entire project area. To compare results between the two methods, representative parcels were selected for analysis through the City's VMT Tool in the southern, central, and northern areas of the project site. Though some of the results from individual TDM measures vary between the City VMT Tool and CAPCOA results (for instance, analysis of one parcel using the City's tool shows a nine percent VMT reduction with the inclusion of express buses, compared to the four percent reduction shown in **Table 15** above), the total percent reductions outlined above are generally consistent with the City's established methodologies.

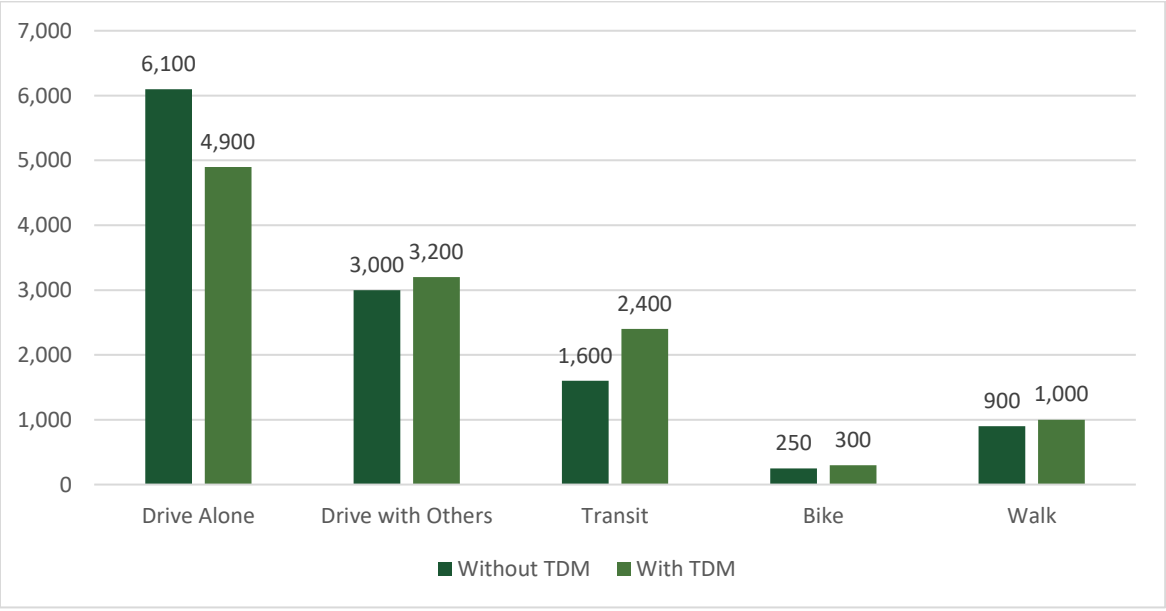
4.1.4 Final Travel Demand Estimates

This section summarizes the final travel demand estimates incorporating the TDM elements discussed above, along with the City's goal-based mode splits.

4.1.4.1 Background Plus Phase 1 Project Final Travel Demand Estimates

Table 16 shows the total person trip generation for Phase 1 Project including TDM reductions. With the TDM program in place, Phase 1 is expected to generate around 58,400 total net new daily vehicle trips,

[15] GTFS refers to the General Transit Feed Specification, a format for data from transit agencies that provides information on transit stops, arrivals, departures, and services. Static GTFS data (i.e., schedule data) was used for this analysis, rather than real-time data.



around 19 percent fewer than in the same scenario without TDM. These figures are also shown visually for the PM peak hour on **Figure 24**.

Table 16: Background Plus Phase 1 Project Person Trips by Mode with TDM Reductions

Mode of Travel	Mode %	Daily	AM Total	AM In	AM Out	PM Total	PM In	PM Out
Drive Alone	38%	45,400	4,000	2,600	1,400	4,900	1,750	3,150
Drive with Others	27%	32,600	2,700	1,800	900	3,200	1,150	2,050
Transit	23%	27,000	2,100	1,350	750	2,400	850	1,550
Bike	2%	2,900	200	150	50	300	100	200
Walk	9%	11,200	900	600	300	1,000	400	600

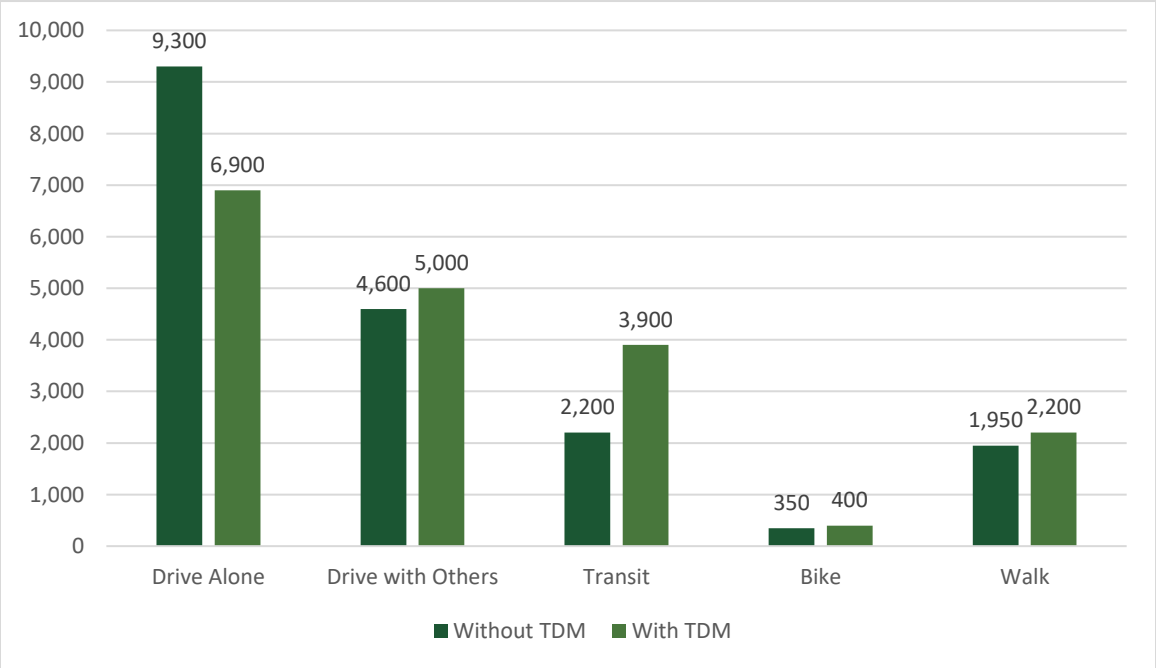
Figure 24: Comparison of Background Plus Phase 1 Project PM Peak Hour Project Trips by Mode, before and after TDM Reduction

4.1.4.2 Background Plus Project Buildout Final Travel Demand Estimates

Table 17 shows the resulting total trip generation for the Project under the Buildout scenario including TDM reductions. With the TDM program in place, the full Project is expected to generate around 95,700 net new total daily vehicle trips, around 18 percent fewer than in the buildout conditions without TDM.



These results are shown visually for the PM peak hour on **Figure 25**. TDM measures result in slightly different percentage reductions and mode shares between the Phase 1 and Buildout scenarios, because different TDM measures apply for each land use, as shown in **Table 15**. In addition, the buildout includes more retail and residential uses, which typically have a higher drive along mode share.

Table 17: Background Plus Project Buildout Person Trips by Mode, Including TDM Reduction

Mode of Travel	Mode %	Daily	AM Total	AM In	AM Out	PM Total	PM In	PM Out
Drive Alone	39%	74,900	6,100	3,950	2,150	6,900	2,650	4,250
Drive with Others	27%	52,100	4,500	3,000	1,500	5,000	1,950	3,050
Transit	20%	39,500	3,600	2,550	1,050	3,900	1,650	2,250
Bike	2%	4,600	400	250	150	400	150	250
Walk	12%	23,400	2,000	1,300	700	2,200	850	1,350
Total Project Buildout Person Trips with TDM		**194,500**	**16,600**	10,900	5,700	**18,400**	7,050	11,350
Total Project Buildout Vehicle Trips with TDM		**95,700**	**7,900**	5,150	2,750	**8,900**	3,450	5,450

Rounded to nearest 100 or 50 trips. Rows may not sum to total due to rounding.

Figure 25: Comparison of Project Buildout PM Peak Hour Person Trips by Mode, before and after TDM Reduction

4.1.4.3 Background Plus Goal-Based Project and Cumulative Plus Goal-Based Project Final Project Travel Demand

The Project analyzed for Background and Cumulative Goal-Based Project Buildout scenarios uses the same land use program and total person trips shown above in **Table 14**. However, it accounts for the City' goal that no more than 40 percent of commute trips are completed by driving alone (or at least a 60 percent non-SOV mode split). The 60 percent non-SOV goal represents a citywide average. The City recognizes that not all areas of the City can equally attain this goal because of varying land use densities and availability of multimodal connections. Based on City provided data, the Project in the long-term would need to achieve a 75 percent non-SOV mode split. These mode shares account for different levels of access to transit, and the land uses around the Project, and represent an aggressive and aspirational outcome of both Project and citywide mobility strategies that could only be achieved if the full vision of *Envision San José 2040* is realized. **Table 18** shows trips by mode for the Project Buildout under the goal-based scenarios. The cumulative trip generation assumptions presented in the LTA differ from those presented in the Project's TA, which did not account for any TDM or goal-based mode share in the cumulative analysis. In the TA, TDM was only accounted for in the mitigation measure.

Table 18: Project Buildout Goal-Based Person Trips by Mode, Including Total Vehicle Trips

Mode of Travel	Mode %	Daily	AM Total	AM In	AM Out	PM Total	PM In	PM Out
Drive Alone	25%	47,700	4,050	2,650	1,400	4,500	1,700	2,800
Drive with Others	21%	40,100	3,400	2,250	1,150	3,800	1,450	2,350
Transit	33%	64,100	5,450	3,600	1,850	6,050	2,300	3,750
Bike	6%	11,700	1,000	650	350	1,100	400	700
Walk	16%	31,400	2,650	1,750	900	2,950	1,150	1,800
Total Project Vehicle Trips		**63,700**	**5,400**	3,550	1,850	**6,000**	2,300	3,700

Rounded to nearest 100 or 50 trips. Rows may not sum to total due to rounding.
Source: *CSJ Model; Fehr & Peers, 2020.*

As shown in **Table 18**, under the Goal-Based scenarios, 25 percent of person trips would be made in a single-occupant vehicle, with an additional 21 percent of person trips made in vehicles with more than one occupant. This results in 63,700 net new daily vehicle trips, including 5,400 in the AM peak hour and 6,000 in the PM peak hour. The Goal-Based scenario would also result in 64,100 new transit trips, and 43,100 new daily walk and bike trips; this represents a reduction of around 43,000 daily vehicle trips when compared to Background Plus Project Buildout conditions.

4.1.4.4 Summary of Final Vehicle Trips

Table 19 summarizes the final estimated vehicle trip generation for each scenario.

Table 19: Summary of Final Project Vehicle Trips

Scenario	Daily	AM Total	AM In	AM Out	PM Total	PM In	PM Out
Background Plus Phase 1 Project (with TDM)	**58,400**	**5,100**	3,300	1,750	**6,200**	2,200	3,950
Background Plus Project Buildout (with TDM)	**95,700**	**7,900**	5,150	2,750	**8,900**	3,450	5,450
Background Plus Goal-Based Project and Cumulative Plus Goal-Based Project	**63,700**	**5,400**	3,550	1,850	**6,000**	2,300	3,700

Notes:
Subject to change based on input from City staff.

Source: CSJ Model; Fehr & Peers, 2020.

4.2 Vehicle Trip Distribution and Assignment

Trip distribution is defined as the directions of approach and departure vehicles would use to arrive at and depart from the site. Trip distribution is generally based on the locations of complementary land uses, prevailing travel patterns, and population densities in nearby neighborhoods and communities. For the purposes of this LTA, Project trips were distributed onto the roadway system using the City model. Specifically, the City model was adjusted to reflect the trip estimates summarized in **Table 19** and the model was rerun to distribute and assign Project trips.

Figure 26 shows the average AM and PM peak hour Project trip distribution. **Figure 27, Figure 28,** and **Figure 29** show the net new Project trips assigned to each turning movement by intersection. The Project trip assignment was added to the no Project volumes to represent Background with Project Phase 1, Project Buildout, and Goal-Based Project Buildout conditions, respectively. The Project trip assignment for the goal-based assumptions were added to the Cumulative No Project volumes to represent Cumulative with Goal-Based Project Buildout Conditions. Volumes for Background and Cumulative with Project Conditions are presented in **Appendix D**.

5. Transit Analysis

This chapter discusses existing and future transit access around the Project area, along with transit ridership projections and a transit delay analysis.

5.1 Transit Access

The Project area is well served by a variety of transit services. These services include local bus and light rail transit services, commuter rail services, and inter-city rail services. The existing transit services in the vicinity of the Project area are discussed in **Section 3.2** of the Existing Conditions chapter. The Project's location and the existing transportation network are shown on **Figure 16**. Diridon Station is expected to increase transit services over the next 20 years. This includes increases in Caltrain services per Caltrain Electrification and the Caltrain Business Plan, the extension of BART to Diridon Station (BART Phase II), and the provision of Bus Rapid Transit (BRT) service along Santa Clara Street. These service enhancements are supportive of the Project's vision and City's mode-split goals.

5.2 Transit Supply and Demand

An assessment of existing and future transit demand and supply helps identify potential Project-related effects and opportunities for future transit operations. Transit supply is estimated based on the existing or planned capacity of each transit service under the Background and Cumulative No Project scenarios. The Project-generated transit demand was developed based on the methodology outlined in **Chapter 4** (Project Travel Demand) and assigned to each transit service based on transit assignment from the City model. Transit services currently providing or with plans to serve Diridon Station include Caltrain, BART, VTA Bus, VTA Light Rail, Altamont Corridor Express, and Capitol Corridor (Amtrak). Transit supply and the Project's transit demand were developed for the following scenarios:

- **Existing Conditions:** 2019 baseline transit supply at Diridon Station
- **Background Plus Phase 1 Project:** 2019 estimated demand from Phase 1 of the Project, evaluated against 2019 baseline transit supply
- **Background Plus Project Buildout:** 2019 estimated demand from Project buildout, evaluated against baseline transit supply
- **Cumulative Plus Goal-Based Project Buildout:** adds supply from the moderate growth scenario of the Caltrain Business Plan and BART extension to Diridon Station, and uses 2040 estimated demand from the Project with goal-based mode splits

The Project's effects on transit demand are not assessed for the Background No Project, Background Plus Goal-Based Project Buildout, and Cumulative No Project scenarios as the transit demand is similar to or less than what's presented in other scenarios.

Supply is expressed in terms of total seats on each service during either a peak hour or a typical weekday. Demand is expressed as the number of expected Project transit trips that will use a given service, as well as the percentage of total supply Project-generated transit trips would represent. Capacity utilization is presented in two forms:

- Directional percentage utilization for core rail services such as Caltrain and BART
- Cordon directional percentage utilization for general transit trips leaving the site in each of the cardinal directions (north, east, south, and west)

Supply and demand are each summarized by "cordons," representing the direction toward which the line provides immediate service. Cordon directions are assigned based on the destination of individual heavy rail lines, and the immediate direction of light rail and bus routes. VTA bus supply and demand are presented, aggregated at the cordon level only, and include non-VTA bus services that have active GTFS[15] feeds (such as Monterey-Salinas Transit and Amtrak 17 Express). **Table 20** summarizes which services and bus routes are included in each directional cordon.

Table 20: Transit Cordons and Corresponding Lines/Services

Cordon	Services	VTA Routes	Notes
North	Caltrain VTA	Green Line toward Santa Clara Bus Route 86	Also includes non-VTA services reported in GTFS during peak hours
East	BART ACE Capitol Corridor VTA	Bus Routes 22, 23, 55, 86, 500, 522, 523, 64A, 64B, 68, 181	Also includes non-VTA services reported in GTFS during peak hours
South	VTA	Green Line toward Winchester Bus Routes 64A, 168	Also includes non-VTA services reported in GTFS during peak hours Caltrain capacity south of Diridon is discussed qualitatively
West	VTA	Bus Routes 22, 23, 522, 523, 64B	Also includes non-VTA services reported in GTFS during peak hours

Source: Fehr & Peers, 2020; GTFS, 2020.

The Project's transit utilization is also expressed as a percentage of total service capacity on each service. Because ridership fluctuates from station to station, these percentages represent the share of total service capacity on each service at the stop closest to the Project. Because passengers board and alight at

[15] GTFS refers to the General Transit Feed Specification, a format for data from transit agencies that provides information on transit stops, arrivals, departures, and services. Static GTFS data (i.e., schedule data) was used for this analysis, rather than real-time data.

different points, each service would have fewer Project passengers at stations farther from the Project area. The implications of this pattern for each service are discussed in greater detail below.

Transit utilization is a function of both supply and demand; even in cases where the Project generates a larger number of riders, if a service is more frequent or has more capacity, the Project will have a lower utilization. As an example, under Phase 1 the Project is estimated to use around five to six percent of total Caltrain capacity under Phase 1 conditions, compared to around 20 percent of total capacity on VTA bus routes crossing the south cordon away from the site. This is because very few routes cross the south cordon, with most southbound buses first traveling through downtown San José to the east.

5.2.1 Existing Conditions

5.2.1.1 Existing Supply

Existing transit supply and demand data at Diridon Station were collected via available ridership reports and use of GTFS data. All trains and buses arriving at and leaving from Diridon Station during the AM and PM peak hours were included in the analysis. The AM peak hour is 7:15 to 8:15 AM and the PM peak hour is 5:00 to 6:00 PM. Transit supply was determined by the capacity of AM and PM peak number of trains or buses. The total existing transit supply is summarized in **Table 21**.

Supply is expressed in terms of available seats: for instance, a local bus with 40 seats heading north from the site provides a supply of 40 seats across the north cordon. If that line has four buses in the peak hour, the total supply is 160 seats for that line (four buses per hour x 40 seats per bus). This supply is expressed solely in terms of seated passengers; however, for rail services, utilization of up to 130 percent is deemed acceptable; it allows for most riders to be seated with space for the remainder to stand comfortably. As shown in **Table 21**, the total capacity of all services to and from the Project area is around 8,000 seats in each direction (inbound and outbound) during each peak hour, and 174,220 seats daily.

Transit supply is also complicated by the nature of seat utilization: longer trips use more capacity for a longer period, and most routes have portions that operate at lower utilization and portions that may operate above capacity. The implications of these load issues are discussed further in the Summary and Trends by Service in **Section 5.2.6**.

Table 21: Existing Transit Supply (Seats on In-Service Vehicles)

Transit Service/Direction	*AM Peak Inbound*	*AM Peak Outbound*	*PM Peak Inbound*	*PM Peak Outbound*	*Daily*

5.2.2 Background No Project Conditions

To analyze supply and demand under baseline conditions, which include Caltrain Electrification and extension of BART to Berryessa, the existing transit supply data was used. By analyzing capacity using existing supply, rather than the increased number of trains due to Caltrain Electrification, this analysis presents a conservative estimate of the Project's transit utilization. In addition, trips using BART to

Berryessa were assigned to VTA bus routes to make the final connection to Diridon Station and the Project area.

5.2.2.1 Background No Project Supply

The total baseline transit supply is summarized in **Table 21**. Some qualitative discussion regarding the effects of electrification on Caltrain service is included below, under **Summary and Trends by Service**.

As shown in **Table 21**, the total capacity of all services to and from the Project area is around 8,000 seats inbound and outbound in the AM peak, 7,500 seats inbound in the PM peak, and 175,000 seats daily.

5.2.3 Background Plus Phase 1 Project Conditions

The Phase 1 Project transit demand was compared to the Background No Project supply discussed above.

5.2.3.1 Phase 1 Project Transit Demand

The Project's transit demand for each service was calculated based on the transit person trips presented in the Project Travel Demand chapter (**Chapter 4**), combined with transit assignment from the City model. Minor adjustments were made to the model-derived transit assignment to integrate peak hour demand for ACE and Capitol Corridor services (the City model presents only daily mode shares for those services). In addition, demand for SamTrans services was added to Caltrain boardings, as they were a low percentage of total trips. The resulting trip assignment is shown in **Table 22**.

Table 22: Phase 1 Project Transit Assignment by Service

	Peak Periods	Off-Peak	Daily
Caltrain	23%	7%	20%
BART[1]	0%	0%	0%
VTA Bus	37%	74%	51%
VTA Light Rail	27%	20%	23%
ACE	7%	0%	3%
Amtrak	5%	0%	3%

Notes:
1. Ridership for the BART to Berryessa extension are included in the VTA Bus estimates, since VTA buses provided the transit connection between the Project area and Berryessa BART.
Source: City of San José Travel Demand Model, 2020; Fehr & Peers, 2020.

Under Phase 1 Project conditions, VTA services are expected to carry most Project trips, with Caltrain carrying the largest share of trips with origins or destinations outside the San José area.

The Phase 1 travel demand for the Project, shown as person trips using each service, is shown in **Table 24**. In total, the Project is expected to add around 360 riders to Caltrain in the peak hour / peak direction and

would also add around 425 riders to the VTA Green Line during each peak period (including all directions).

5.2.3.2 Phase 1 Project Capacity Utilization

The Project's transit utilization is also expressed as a percentage of total service capacity on each service. Because ridership fluctuates from station to station, these percentages represent the share of total service capacity on each service at the stop closest to the Project. Because passengers board and alight at different points, each service would have fewer Project passengers at stations farther from the Project area. The implications of this pattern for each service are discussed in greater detail below.

Table 25 shows the Project's transit demand as a percentage of capacity on each service. Across all services, the Project would result in the highest share of demand to supply during the AM peak inbound and PM peak outbound periods, at around 11 percent of all transit capacity to and from the Project area.

5.2.4 Background Plus Project Buildout Conditions

The Project Buildout transit demand were added to the Background No Project supply discussed above.

5.2.4.1 Project Buildout Transit Demand

The Project's transit demand for each service was calculated based on the transit person trips presented in the Project Travel Demand section, combined with transit assignment from the City of San José Model Run (in this case, using the change in boardings by service from scenario 2a to scenario 2b). Minor adjustments were made to the model-derived transit assignment to integrate peak hour demand for ACE and Capitol Corridor services (the City model presents only daily mode shares for those services; those shares were doubled for the peak hour, as these services only operate in the peak hour). In addition, demand for SamTrans services was added to Caltrain boardings, as they were a low percentage of total trips. The resulting trip assignment is shown in **Table 23**.

Table 23: Project Buildout Project Transit Assignment by Service

	Peak Periods	Off-Peak	Daily
Caltrain	29%	6%	19%
BART[1]	0%	0%	0%
VTA Bus	34%	76%	54%
VTA Light Rail	24%	18%	21%
ACE	7%	0%	3%
Amtrak	6%	0%	3%

Note:
1. Ridership for the BART to Berryessa extension are included in the VTA Bus estimates, since VTA buses provided the transit connection between the Project area and Berryessa BART.
Source: City of San José Travel Demand Model, 2020; Fehr & Peers, 2020

Compared to Phase 1 of the Project, a larger share of transit users would use Caltrain during the peak periods, but most trips would continue to be made on VTA bus or light rail service.

The travel demand for Project Buildout, shown as person trips using each service, is presented in **Table 26**. In total, the Project is expected to add around 750 riders to Caltrain in the peak hour / peak direction and would also add around 550 riders to the VTA Green Line during each peak period (including all directions).

5.2.4.2 Project Buildout Capacity Utilization

The Project's transit utilization is also expressed as a percentage of total service capacity on each service. Because ridership fluctuates from station to station, these percentages represent the share of total service capacity on each service at the stop closest to the Project. Because passengers board and alight at different points, each service would have fewer Project passengers at stations farther from the Project area. The implications of this pattern for each service are discussed in greater detail below.

Table 27 shows the Project's transit demand as a percentage of capacity on each service. Across all services, the Project would result in the highest share of demand to supply during the AM peak inbound and PM peak outbound periods, at around 31 percent of all transit capacity to and from the Project area. This high level of capacity utilization reflects that this analysis assumes a fully completed Project without corresponding increases in transit service; Caltrain service, for instance, is shown the same as existing levels even though the Project will not be constructed until after electrification. As such, this scenario shows the "worst case" for transit crowding of each individual scenario.

Source: Fehr & Peers, 2020

5.2.5 Cumulative Plus Goal-Based Project Buildout Conditions

Cumulative Conditions account for all planned transit enhancements in the area and maximum project utilizations under the Goal-Based Project scenario.

5.2.5.1 Cumulative No Project Supply

To analyze cumulative conditions, which include implementation of the Caltrain Moderate Growth Business Plan ("Caltrain Business Plan" or "CBG") and extension of BART to Diridon Station, the transit supply was adjusted based on proposed 2040 service frequencies and capacities for BART and Caltrain. For all other services, existing transit supply data was used. The total cumulative transit supply is summarized in **Table 29**.

As shown in **Table 29**, the total capacity of all services to and from the Project area increases to 19,000 seats in each direction during both the AM and PM peak hours, and 426,720 seats daily. This represents more than a doubling of existing supply.

5.2.5.2 Project Cumulative Transit Demand

The Project's transit demand for each service was calculated based on the transit person trips presented in the Project Travel Demand section, combined with transit assignment from the City of San José Model Run (in this case, using adjusted systemwide boardings by service in both Cumulative Plus Project and Baseline Plus Project conditions). Minor adjustments were made to the model-derived transit assignment to integrate peak hour demand for ACE and Capitol Corridor services (the City model presents only daily mode shares for those services; those shares were doubled for the peak hour, as these services only operate in the peak hour). In addition, demand for SamTrans services was added to Caltrain boardings, as they were a low percentage of total trips. The resulting trip assignment is shown in **Table 28**.

Table 28: Project Buildout Transit Assignment by Service, Cumulative Conditions

	Peak Periods	Off-Peak	Daily
Caltrain	23%	11%	15%
BART	30%	32%	30%
VTA Bus	21%	38%	34%
VTA Light Rail	19%	19%	18%
ACE	4%	0%	2%
Amtrak	3%	0%	2%

Source: City of San José Travel Demand Model, 2020; Fehr & Peers, 2020

Cumulative conditions include expected growth in the entire Bay Area, and as such there are substantial shifts in transit assignment under cumulative conditions. VTA services are no longer expected to serve most transit trips, with BART becoming the most common peak hour transit service for trips to and from

the Project. Changes in trip distributions and growth of residential development along the BART corridor likely results in cumulative Caltrain transit share decreasing slightly compared to baseline conditions.

The travel demand for Project Buildout under cumulative conditions, shown as person trips using each service, is presented in **Table 30**. In total, the Project is expected to add around 900 riders to Caltrain in the peak hour / peak direction but would also add up to 1,800 new BART trips in the PM peak hour.

5.2.5.2.1 Project Capacity Utilization

The Project's transit utilization is also expressed as a percentage of total service capacity on each service. Because ridership fluctuates from station to station, these percentages represent the share of total service capacity on each service at the stop closest to the Project. Because passengers board and alight at different points, each service would have fewer Project passengers at stations farther from the Project area. The implications of this pattern for each service are discussed in greater detail below.

Table 31 shows the Project's cumulative transit demand as a percentage of capacity on each service. Across all services, the Project would result in the highest share of demand to supply during the AM peak inbound and PM peak outbound periods, at around 20 percent of all transit capacity to and from the Project area.

5.2.6 Summary and Trends by Service

5.2.6.1 Caltrain

Caltrain is currently the most utilized service at Diridon Station, and experiences peak hour crowding issues during both the AM and PM periods, although trains are typically operating with excess capacity south of Palo Alto. As such, the extent to which the Project would affect Caltrain operations depends largely on what share of users are onboard trains during segments where trains are most crowded.

In addition, the Project's transit demand is inverse from the peak transit demand; currently, Caltrain has its highest ridership northbound in the AM and southbound in the PM, while the Project generates more demand in the opposite direction in each peak. **Figure 30** shows this pattern visually. In addition, Caltrain segments south of Diridon Station operate well below capacity, and as such Project demand for those segments is assessed only qualitatively.

Figure 30: 2040 Estimated Caltrain Ridership Patterns

Source: Caltrain Business Plan Quarterly Update, May 2019 (https://caltrain2040.org/wp-content/uploads/CBP_Quarterly_Board_Update_May2019_V2.pdf)

Caltrain has indicated that crowding is acceptable at up to 135 percent of capacity. As such, the Project's demand for Caltrain services would not lead crowding to exceed Caltrain's comfortable crowding level during the peak hour and peak direction (PM peak hour, southbound), as shown in **Table 32**. This pattern holds even for the interim period, where full Project buildout is assumed and compared to existing and post-electrification service and demand levels for Caltrain. The Project will benefit from Caltrain's

investment in the Business Plan, particularly as the Project's demand for Caltrain grows under the cumulative scenario, which has a higher transit mode share.

Table 32: Comparison of Project Demand and Caltrain Capacity

	Existing	Buildout at Baseline, Existing Supply	Buildout at Baseline, with Electrification	Buildout, Cumulative
Project Demand, PM Peak Southbound (passengers)	152	633	633	652
Project Demand, PM Peak Southbound (% of supply)	9%	22%	15%	9%

Exceeds comfortable crowding level?	**No**	**No**	**No**	**No**

Source: Caltrain Business Plan Analysis, 2019; Fehr & Peers, 2020

5.2.6.2 BART

BART did not provide service to San José in 2019, so such service is not included in Existing Conditions; however, the baseline Project scenario does include extension of BART to Berryessa Station, and the cumulative scenarios include extension of BART to Diridon Station. The Berryessa Station is assumed to have a limited effect on travel to and from the Project and is mostly reflected in bus trips across the east cordon.

BART currently experiences heavy crowding during the peak periods; however, it reaches its max load point between West Oakland station and Embarcadero Station, both of which are located at least forty minutes away from the Project. The travel demand generated by the Project is expected to be largely counter-commute and utilize portions of the system not currently experiencing crowding during the peak hours. The expansion of BART also provides high quality off-peak service throughout the day, which will be of benefit to Project employees and residents and will likely help further shift mode share.

Because BART's current peak occurs in the AM period on trains to San Francisco, **Table 33** shows the Project's contributions during that time period. In total, at Diridon Station, the Project's transit demand accounts for around 15 percent of the BART capacity. Many of these riders will disembark prior to the current max load point at the Transbay Tube. Therefore, the Project is unlikely to cause excessive crowding on BART.

Table 33: Comparison of Project Demand for BART Service, Peak Hour/Peak Direction (AM Peak Outbound)

	Phase 1 with Existing Supply	Buildout at Baseline, Existing Supply	Buildout, Cumulative
Project Demand (Seats / Boardings)	n/a	n/a	624
Project Demand as Percentage of Capacity	<1%	<1%	14%

Source: Fehr & Peers, 2020; City of San José Travel Demand Model, 2019

5.2.6.3 VTA Bus and Light Rail

A large share of the total Project transit trips are projected to use either VTA bus or VTA light rail, particularly for transit trips occurring outside the peak hour. Light rail trips are assumed to initially board the Green Line; however, the demand includes individuals who may transfer to a different line to complete their journey.

Table 34 shows the estimated peak hour and peak direction ridership associated with the Project. The Project uses the most capacity of the VTA system during the PM peak hour, in directions outbound from the Project.

Table 34: Comparison of Project Demand for VTA Services, Peak Hour/Peak Direction (PM Peak Outbound)

	Phase 1 with Existing Supply	Buildout at Baseline, Existing Supply	Buildout, Cumulative
Light Rail (bi-directional)	424	550	724
North Cordon Bus	87	115	116
East Cordon Bus	289	352	465
South Cordon Bus	29	38	39
West Cordon Bus	115	153	155

Source: Fehr & Peers, 2020; City of San José Travel Demand Model, 2019

The Project's effect on VTA would be most pronounced on bus service closest to the Project, and on Green Line service. When compared to existing service levels, the Project at build-out could utilize up to 80 percent of the Green Line's current capacity, assuming service includes four trains per hour, and each train can accommodate 120 seated passengers. Analysis shows that under buildout, the Project may lead to mild to moderate crowding on VTA services during peak hours.

5.2.6.4 Capital Corridor

The Capitol Corridor Amtrak service provides a connection between Diridon Station, the East Bay, and Sacramento. It acts as a commuter rail service, with bi-directional service during each peak period. The Project would generate the most demand for the service in the PM peak outbound direction; the Project demand is shown in **Table 35**. At buildout, the Project would generate between 120 and 130 trips in the peak hour and peak direction, representing 17 percent of the total supply of seats departing San José.

Table 35: Comparison of Project Demand for Capitol Corridor Service, Peak Hour/Peak Direction (PM Peak Outbound)

	Phase 1 with Existing Supply	Buildout at Baseline, Existing Supply	Buildout, Cumulative
Project Demand (Seats / Boardings)	83	126	129
Project Demand as Percentage of Capacity	11%	17%	17%

Source: Fehr & Peers, 2020; City of San José Travel Demand Model, 2019

5.2.6.5 Altamont Corridor Express

The ACE train provides service from Diridon Station through the Livermore Valley to Tracy, and acts as a commuter line traveling into San José in the AM peak hour and out of San José in the PM peak hour. Service is very limited. At buildout, the Project is expected to generate around 350 new trips in the peak hour and peak direction, representing around half of peak hour capacity. Note that during the peak hour there is only one ACE train, and that the Project would have a lesser effect on other departures during the peak period. Project-related ridership would decrease slightly under cumulative conditions due to demand shifting to BART for trips from the East Bay.

Table 36: Comparison of Project Demand for ACE Service, Peak Hour/Peak Direction (PM Peak Outbound)

	Phase 1 with Existing Supply	Buildout at Baseline, Existing Supply	Buildout, Cumulative
Project Demand (Seats / Boardings)	160	254	243
Project Demand as Percentage of Capacity	25%	39%	37%

Source: Fehr & Peers, 2020; City of San José Travel Demand Model, 2019

5.2.7 Transit Supply and Demand Conclusions

Model results indicate the Project will utilize both local and regional transit during all phases of development. While analysis of Project buildout conditions shows the Project would potentially result in crowding of key transit services if there is no increase in those services, cumulative conditions show that Project-generated transit trips would use around 15 percent of total daily transit capacity, and up to 20 percent of peak hour transit capacity. The Project would continue to provide access to Diridon Station and bus stops to help facilitate this growth in transit demand. In short, while the Project would contribute many peak hour riders to all transit services in its vicinity, those increases in ridership would not themselves create barriers to transit use. The Project would maintain and support public transit use, and as such would not have an adverse effect on transit access or demand.

5.3 Transit Vehicle Delay

For the purposes of this study, transit network performance is analyzed during the AM and PM peak hours based on the average transit vehicle delay associated with congestion at signalized intersections for specified routes with and without the Project. The change in average transit vehicle delay was determined using the following process:

- TRAFFIX analysis software output from the intersection LOS calculations was reviewed.
- The sum of movement average delays at each signalized intersection along the transit vehicle path of travel for each study bus route was determined for both with and without Project conditions.
- The sum for with Project conditions was subtracted from the sum for without Project conditions to determine the average transit vehicle delay associated with congestion at intersections on each study bus route. Note that the transit vehicle dwell time at transit stops is not included in the analysis.

It should be noted that the transit delay analysis presented in the LTA is different than the analysis presented in the Project's TA. Per City requirements, the TA uses the City model to evaluate transit speeds, while the analysis presented here relies on intersection LOS analysis results to calculate added delay. Thus, the conclusions between these two documents may vary.

The following routes, all within one mile of the Project area with full day service with a frequency of 30 minutes or less, were analyzed:

- Route 23 – San Carlos Street: De Anza College Transit Center to Alum Rock Station
- Route Rapid 523 – San Carlos Street: Lockheed Martin Transit Center to Berryessa Transit Center
- Route 22 – The Alameda/Santa Clara Street: Palo Alto Transit Center to Eastridge Transit Center
- Route Rapid 522 – The Alameda/Santa Clara Street: Palo Alto Transit Center to Eastridge Transit Center
- Route 500 – The Alameda/Santa Clara Street: San José Diridon Station to Santa Clara & 6th
- Route 64A – The Alameda/Santa Clara Street: Ohlone/Chynoweth to McKee/White

- Route 64B – The Alameda/Santa Clara Street: Almaden Expressway/Camden to McKee/White
- Route Express 181 – 1st Street: San José Diridon Station to Warm Springs BART
- Route 68 – 1st Street: Gilroy Transit Center to San José Diridon Station
- Route Express 168 – 1st Street: Gilroy Transit Center to San José Diridon Station

The City of San José and the VTA do not have adopted standards related to transit corridor performance associated with congestion resulting from new development projects. Per the VTA TIA Guidelines, i*f increased transit vehicle delay is found, the Lead Agency* [City of San José] *should work with VTA to identify feasible transit priority measures near the affected facility and include contributions to any applicable projects that improve transit speed and reliability in the TIA*.

5.3.1 Background with Project Conditions

The additional delay to transit service in the area due to implementation of Project Buildout, and Goal-Based Project Buildout under Background Conditions is summarized in **Table 37**. The added traffic on San Carlos Street, The Alameda/Santa Clara Street, and First Street would increase the delays for all study routes under both Project scenarios. The Proposed Project would generally not add any noticeable delay to the 1.9-mile San Carlos Street corridor in eastbound direction and would add delays of about 80 seconds during AM and PM peak hour in westbound direction under Project Buildout Conditions. Under the Goal-Based scenario, the proposed project would add less than one-minute delay along San Carlos Street Corridor. Along The Alameda/Santa Clara Street corridor (2.7 miles) delays are generally less than three minutes during both AM and PM peak hours under the Project Buildout scenario. For the Goal-Based scenario, delays are generally less than one minute. Along the 2.3-mile corridor of First Street, added delays are 70 seconds or less.

Table 37: Background Plus Project Added Transit Delay

Transit Corridor	Bus Routes	Study Corridor Length (Miles)	Peak Hour	Project Buildout (seconds)		Goal-Based Project Buildout (seconds)	
				NB/EB	SB/WB	NB/EB	SB/WB
San Carlos Street	23/523	1.9	AM PM	NC NC	82 84	46 55	12 NC
The Alameda/Santa Clara Street	22/522	2.7	AM PM	102 163	43 34	18 8	66 44
	500		AM PM	NC NC	72 NC	44 37	NC NC
	64A		AM PM	11 NC	68 107	47 40	NC NC
	64B		AM PM	45 23	141 198	51 42	8 NC
First Street	181	2.3	AM PM	51 NC	38 70	NC NC	8 16
	68		AM PM	49 NC	NC NC	18 10	NC 27
	168		AM PM	13 NC	23 NC	NC 13	NC 39

Note:
NS = service only provided in the peak direction of travel.
NC = The Project was considered to have no change if the increase in travel time was fewer than five seconds or the travel time improved slightly (due to changes in critical movement changes, lane geometry changes, etc.).
Source: Fehr & Peers, August 2020.

5.3.2 Cumulative with Project Conditions

The additional delay to transit service in the area due to implementation of the Goal-Based Project Buildout scenario is summarized in **Table 38**. The added traffic on San Carlos Street, The Alameda/Santa Clara Street, and First Street would cause increases in delays for all study routes under the Cumulative Goal Based Project Buildout scenario. Delay increases are generally three minutes or more along San Carlos Street Corridor and The Alameda/Santa Clara Street Corridor and two minutes or less along First Street, which is largely a function of the cumulative growth and congestion estimated by the year 2040.

Table 38: Cumulative Plus Goal-Based Project Buildout Added Transit Delay

Transit Corridor	Bus Routes	Study Corridor Length (Miles)	Peak Hour	Goal-Based Project Buildout (seconds)	
				NB/EB	SB/WB
San Carlos Street	23/523	1.9	AM PM	203 278	50 134
The Alameda/ Santa Clara Street	22/522	2.7	AM PM	70 83	211 230
	500		AM PM	172 207	21 68
	64A		AM PM	190 223	21 62
	64B		AM PM	196 231	28 73
First Street	181	2.3	AM PM	26 51	41 81
	68		AM PM	60 31	29 130
	168		AM PM	46 18	40 194

Note:
NS = service only provided in the peak direction of travel.
NC = The Project was considered to have no change if the increase in travel time was fewer than five seconds or the travel time improved slightly (due to changes in critical movement changes, lane geometry changes, etc.).
Source: Fehr & Peers, August 2020.

5.3.3 Transit Delay Improvements

The City of San José and VTA do not currently have established policies or significance criteria related to transit vehicle delay. Per VTA Guidelines, if increased transit vehicle delay is found, the City of San José should work with VTA to identify transit priority measures near the affected facility and include contributions to any applicable projects that improve transit speed and reliability. As additional reference, in 2019 the San Francisco Planning Department released an updated Transportation Impact Analysis Guidelines that includes significance criteria to evaluate project conflicts with public transit services (https://sfplanning.org). To determine whether a project would substantially delay public transit, these Guidelines define a transit delay threshold of four minutes under existing plus project and/or cumulative scenarios. The methodology described in the guidelines to measure transit delay includes three components: traffic congestion delay, transit re-entry delay and passenger boarding delay. The transit delay analysis presented in this LTA (**Table 37** and **Table 38**) only includes congestion delay and does not account for transit re-entry and passenger boarding delay.

Under both VTA Guidelines and San Francisco Planning Guidelines, the additional delay to transit service due to the implementation of the project (**Table 37** and **Table 38**) would be considered a substantial adverse effect and require offsite transit improvements.

The City of San José and the VTA have identified two types of transit improvements that can address increases in transit delays caused by added growth and congestion:

1. Dedicated Public Service Lanes. Dedicated public service lanes provide dedicated right-of-way for transit vehicle to operate outside of regular vehicular travel lanes. Transit travel time data collected for the Rapid 522 service along Alum Rock, which has a dedicated public service lane, shows how dedicated transit lanes isolate transit operations from auto traffic, helping to maintain transit speeds regardless of congestion.
2. Transit Signal Priority. Transit signal priority facilitates the movement of transit vehicles through traffic-signal controlled intersections making transit service more reliable, faster, and more cost effective.

To support the Project's multimodal and TDM goals, the Project applicant will fund a study to evaluate the feasibility of a dedicated public service lane along Santa Clara Street/The Alameda between 17th Street and I-880.

6. Bicycle Analysis

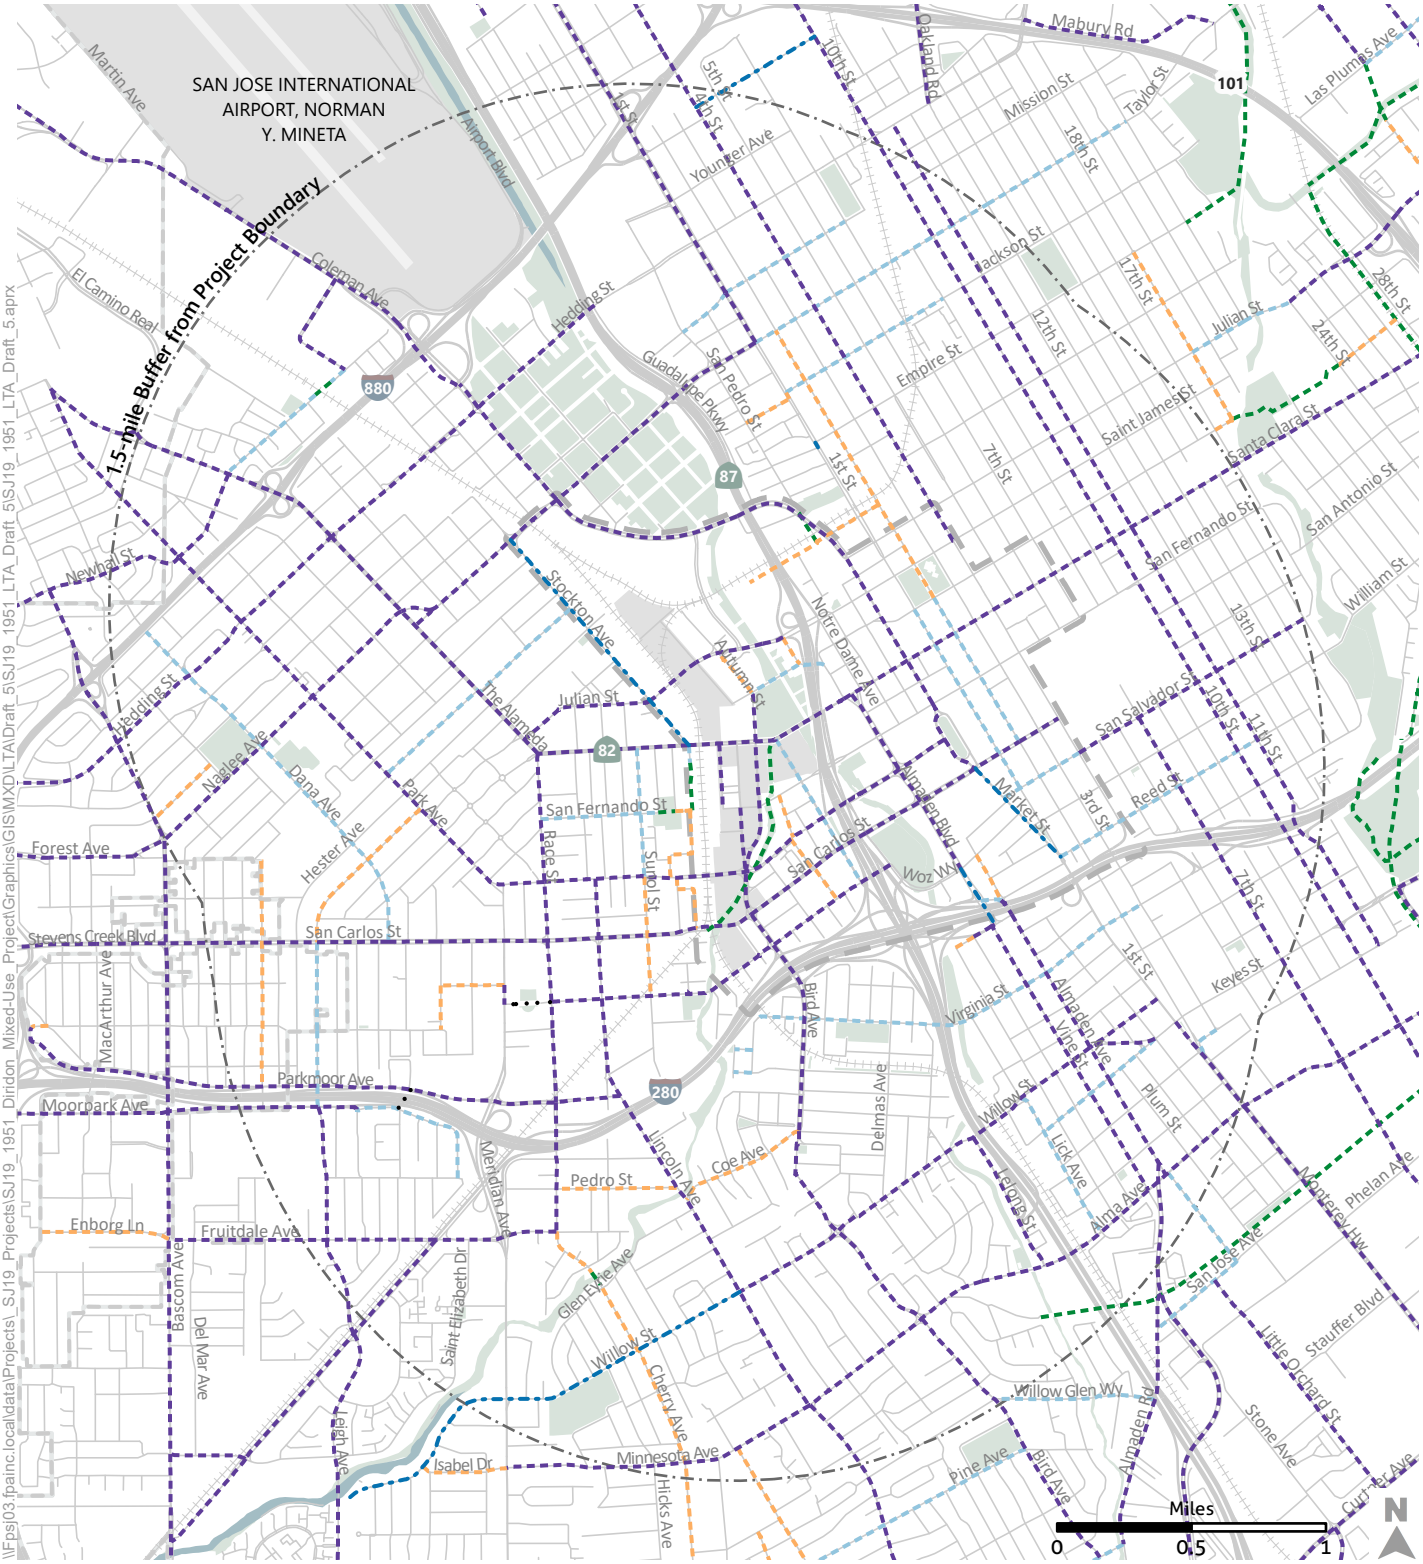
This chapter describes bicycle access around the Project area and includes a level of stress analysis to evaluate the effectiveness of the existing and planned bicycle network to accommodate anticipated growth in bicycle ridership in Downtown San José.

6.1 Bicycle Access

The existing bicycle network is described in detail in **Chapter 3** (Existing Conditions) and is illustrated on **Figure 17**. Gaps in the existing bike network that currently have no designated bicycle facilities include:

- Trail connection between Guadalupe Trail and Los Gatos Creek Trail east of the Project area, a segment that extends from West Santa Clara Street to West San Carlos Street
- White Street west of Diridon Station with north-south connectivity
- Delmas Avenue west of the Guadalupe Freeway from West Santa Clara Street to Auzerais Avenue
- Sunol Street west of the Project area from The Alameda to Park Avenue
- San Fernando Street west of the Project area from Race Street to Wilson Avenue
- Laurel Cove Lane west of Diridon Station from Bush Street to Park Avenue
- North Autumn Street from West Julian Street to West Saint John Street
- Autumn Street from West Saint John to West Santa Clara Street
- North Almaden Boulevard from West Julian Street to West Saint John Street
- West Julian Street from Stockton Avenue to North Almaden Boulevard
- The Alameda from Race Street to Stockton Avenue
- Race Street from Park Avenue to West San Carlos Street
- Lincoln Avenue from Park Avenue to West San Carlos Street
- West San Carlos Street between Lincoln Avenue and Sunol Street, and from Montgomery Avenue to Delmas Avenue

6.1.1 City Planned Bicycle Facilities (Better Bike Plan 2025)



Per the City of San José Better Bike Plan 2025 Draft Plan, multiple bike facilities are proposed in the vicinity of the Project area to fill gaps in the existing bike network. As discussed previously, there is no bike path connection between Guadalupe Trail and Los Gatos Creek Trail adjacent to the Project area, a segment that extends from West Santa Clara Street west of Delmas Avenue to West San Carlos Street east of Dupont Street. Per the City of San José Better Bike Plan 2025, a Class I bike facility is proposed between West Santa Clara Street and West San Carlos Street to fill this gap as shown on **Figure 31**. In addition, a Class I bike facility is also proposed along the extension of White Street west of the Project area connecting West San Carlos Street to Laurel Grove Lane.

Per the Better Bike Plan, Class II bike lanes are proposed along Delmas Avenue between West Santa Clara Street and Auzerais Avenue, West Saint John Street between North Autumn Street and Almaden Boulevard, South 1st and South 2nd Street between Saint James Park and East San Fernando Street, Sunol Street between The Alameda and Park Avenue, and West San Fernando Street between Race Street and Wilson Avenue.

In addition, the City's Better Bike Plan proposes to install a bike boulevard along Gifford Avenue west of Delmas Avenue between West San Fernando Street and Auzerais Avenue. Furthermore, to provide more north-south connectivity on the west side of the Diridon Station, a Class III bike route is proposed along Laurel Grove Lane and Dupont Street which connects to the Los Gatos Creek Trail south of West San Carlos Street. Per the Plan, a bike route is also proposed along Sunol Street between Park Avenue and Auzerais Avenue.

San José Better Bike Plan also proposes an extended network of separated bike lanes along most of the major streets around the Diridon Station to provide a safer north-south and east-west connectivity for cyclists. These roadways include but are not limited to West Julian Street, West Santa Clara Street, Park Avenue, West San Carlos Street, Auzerais Avenue, Almaden Boulevard, North Autumn Street, Montgomery Street, and Bird Avenue as shown on **Figure 31**.

Overall, the Better Bike Plan 2025 addresses all the existing gaps discussed under the previous section.

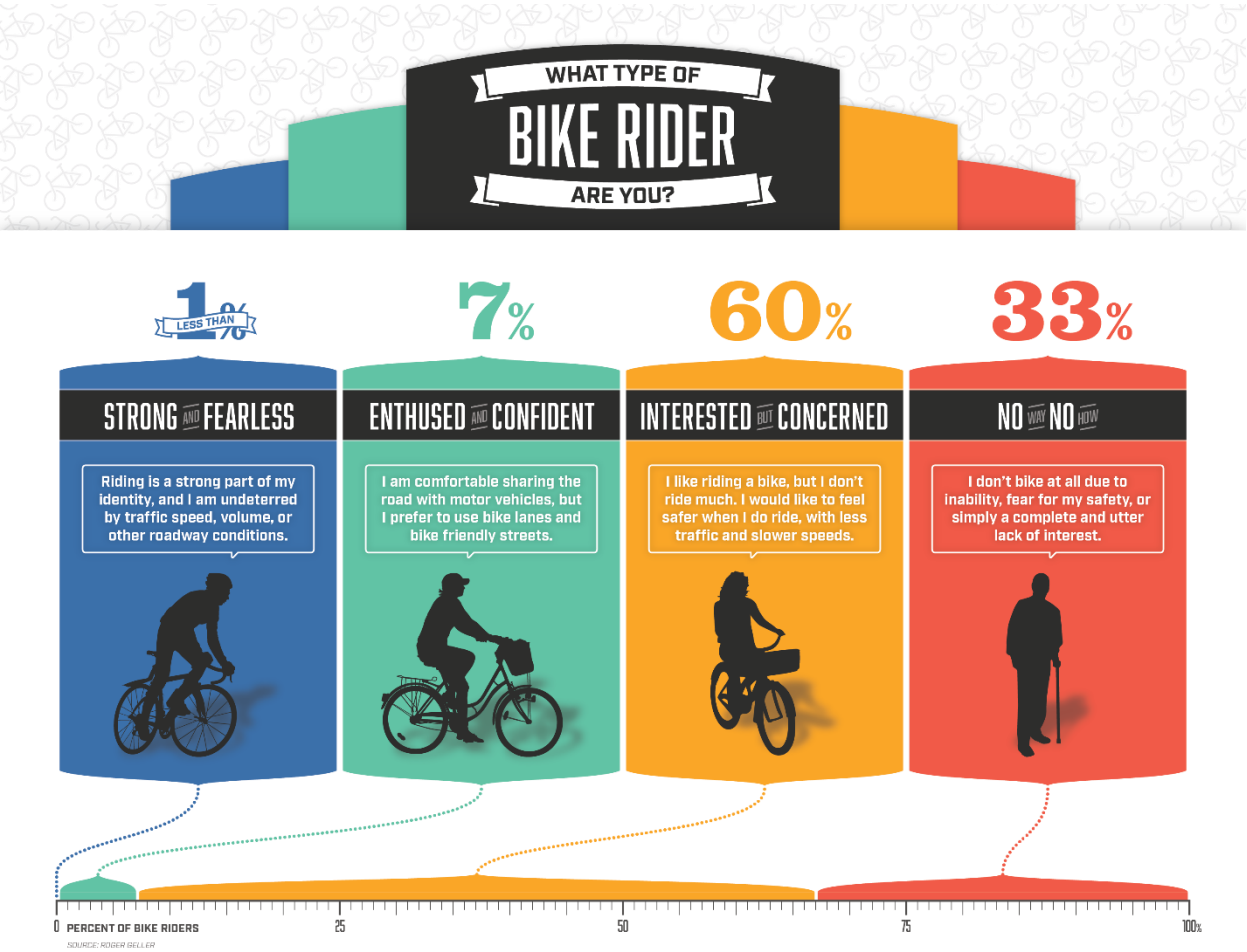
Downtown West

6.1.2 Proposed by Project Bicycle Facilities

Overall, the Project proposes a bicycle network that would connect to and complement the City's existing and proposed bike network to optimize multimodal options to create a network for all users, with renewed emphasis on bicycle and pedestrian travel within the Project area. The Project includes several proposed bike network changes to provide bicycle connectivity within the Project area and to the surrounding neighborhoods and regional destinations. After full implementation, the Project would include the following bicycle facilities, some of which exist today:

- A multi-use path parallel to the light rail tracks between South Montgomery Street and West San Fernando Street.
- Off-street path connections along Los Gatos Creek within the Project boundary will fill in gaps in the existing trail, with an off-street path connection (Class I) running along the western edge of the Los Gatos Creek between Auzerais Avenue and Park Avenue, as well as along the eastern edge of the creek from San Fernando to Santa Clara. These trail segments will be connected by on-street protected bikeways (Class IV) along Autumn Street between Park Avenue and the VTA tracks.
- On-street bicycle facilities (Class IV or Class II) along Park Avenue, West San Fernando Street, West St. John Street, West Julian Street, South Autumn Street, North Montgomery Street, and Cahill Street
- Shared public streets that would have traffic calming, low speeds, and potential restrictions to auto travel along South Montgomery Street between West San Fernando Street and West Santa Clara Street, and Post Street between Cahill Street and South Autumn Street.
- An additional network of private streets, most of which would be generally accessible to the public and some of which would predominantly provide service and loading access. Generally accessible private streets would include a new street extending west and north from North Montgomery Street to the rear (west) of the northern most parcel (Block A1) connecting to Lenzen Avenue; a dead-end street extending west from North Montgomery Street between West Julian and West St. John Streets (within Block C1); an L-shaped street along the alignment of Delmas Avenue north of the light rail tracks and turning east to reach the Guadalupe River; and an L shaped street linking Royal Avenue and Auzerais Street (between Blocks H3 and H4). Limited-access private streets would include a service street that would run north of West San Fernando Street and parallel to Delmas Avenue at the eastern border of the project site and a service connection between Cahill Street and South Autumn Street north of Park Avenue (through Block F1).

Figure 3 illustrates the proposed bike network changes.



6.2 Types of Bicyclists

Many people in the general population are willing to ride bicycles for recreation, particularly on paths separated from vehicle traffic. People differ substantially, however, in their readiness to use bicycles for

transportation. The Portland (OR) Bureau of Transportation has developed a typology of transportation cyclists which divides the adult population into four groups:

- ***Strong and Fearless:*** People who will ride regardless of roadway conditions, and who are willing to use streets with high traffic volumes and/or speeds, and who do not necessarily prefer to use dedicated facilities such as bicycle lanes. Strong and fearless riders make up less than one percent of the adult population;
- ***Enthused and Confident:*** These bicycle riders will share street space with automobiles, especially if traffic speeds are slow and volumes are low, but prefer to use dedicated facilities such as bicycle lanes, bicycle paths, and cycle tracks. Enthused and confident riders make up approximately five to ten percent of the population;
- ***Interested but Concerned:*** These people are unwilling to ride on streets with high volumes or speeds of vehicle traffic, even if a bicycle lane is provided. They may bicycle within their neighborhoods but are unlikely to commute to work via bicycle or to ride for longer distances. Interested but concerned riders may comprise up to 60 percent of the population;
- ***No Way, No How:*** These people are not willing or able to ride bicycles for transportation under any conditions, even separated bike paths. They make up approximately one-third of the population.

THE FOUR TYPES OF BICYCLISTS

Bicyclists in San José today cycle for a variety of reasons, be it commuting to work, errands, or fitness. Regardless of trip purpose, many of the bicyclists riding in San José today are highly confident bicyclists who are comfortable riding in traffic, as the existing bicycle facilities require skilled urban cycling in the presence of a high volume of generally higher speed autos. People comfortable with riding under those conditions are typically considered among the "strong and fearless" or "confident and enthused" category of cyclists. Together these two groups account for only about eight percent of the total population. However, emerging research highlights that almost 60 percent of the population identify as "interested but concerned," which is to say they would like to ride but do not feel safe or comfortable doing so today. These riders are likely to feel more comfortable riding on trails or separated bikeways than typical bicycle lanes.

6.3 Bicycle Level of Stress (LTS) Analysis

To evaluate the City's existing and proposed bicycle network, a Level of Stress (LTS)[16] analysis was conducted. LTS measures how much stress is experienced by bicyclists across a City's street network based on auto speeds, number of travel lanes, and bikeway characteristics. LTS methodology is based on an application of Dutch bicycling standards and existing research in bicycle transportation. LTS rankings range from 1 (very low stress; tolerable by all) to 4 (very high stress; tolerable to only a few).

LTS measures the quality of a person's experience while bicycling. The two are interrelated: low stress bikeways (LTS 1 and 2) are generally tolerated by *Strong and Fearless*, *Enthused and Confident*, and most *Interested but Concerned* cyclists; in contrast, high stress bikeways are tolerated by mainly *Strong and Fearless* cyclists, as described in the figure above. The development of a low-stress network and elimination of high-stress barriers is critical to broaden the appeal of bicycling, especially for *Enthused and Confident* and *Interested but Concerned* cyclists, who represent a large share of the population. The low-

[16] The LTS methodology was developed by Merkuria, Furth, and Nixon in *Low Stress Bicycling and Network Connectivity* (2012).

stress bicycle network must therefore have a broad reach with continuous facilities to promote new bicycling trips.

6.3.1 LTS Data and Methodology

The base map data used in the LTS analysis is from Open Street Map (OSM), for which San José has a well-defined and curated street network. OSM is a collaborative project to create a free, editable map of the world. The local OSM community regularly updates and curates the data for the street network. The City of San José provided the latest bicycle facilities location data, which was cross referenced with OSM and recent aerial photos to validate existing on-street facility types. This ensured the most up to date bicycle facilities are included in the OSM data used and processed in the LTS analysis. To further enhance the LTS analysis, the use of intersection based Annual Daily Traffic (ADT) counts allow for an additional metric of traffic stress. Understanding the volume of traffic along the bicycle facilities will assist in identifying the level of comfort for cyclists.

6.3.2 LTS Study Area

LTS was evaluated for 58 street segments around the Project area under each study scenario. The existing bike infrastructure applies to existing and background scenarios, whereas the proposed bike facilities from San José's Better Bike Plan 2025 are included under cumulative conditions. The summary of street segments evaluated with existing and proposed bike facilities is shown in **Table 39**.

Table 39: Summary of Study Street Segments

Notes:
1. Level of Traffic Stress (LTS) measures how much stress is experienced by bicyclists across a City's street network based on auto speeds, number of travel lanes, and bikeway characteristics. LTS rankings range from 1 (very low stress; tolerable by all) to 4 (very high stress; tolerable to only a few).
2. There is no existing trail at this part of the Guadalupe River bank.

Bold text indicates scores that improve from the existing scenario. *Italic text* indicates scores that degrade compared to the existing scenario.
Source: Fehr & Peers, August 2020.

In general, LTS analysis is sensitive to roadway characteristics such as bicycle facility type, number of traffic lanes, and traffic volume. Therefore, variation in the LTS score is not observed if the roadway characteristics or the roadway volume is not changing substantially.

6.3.3.1 Existing Conditions

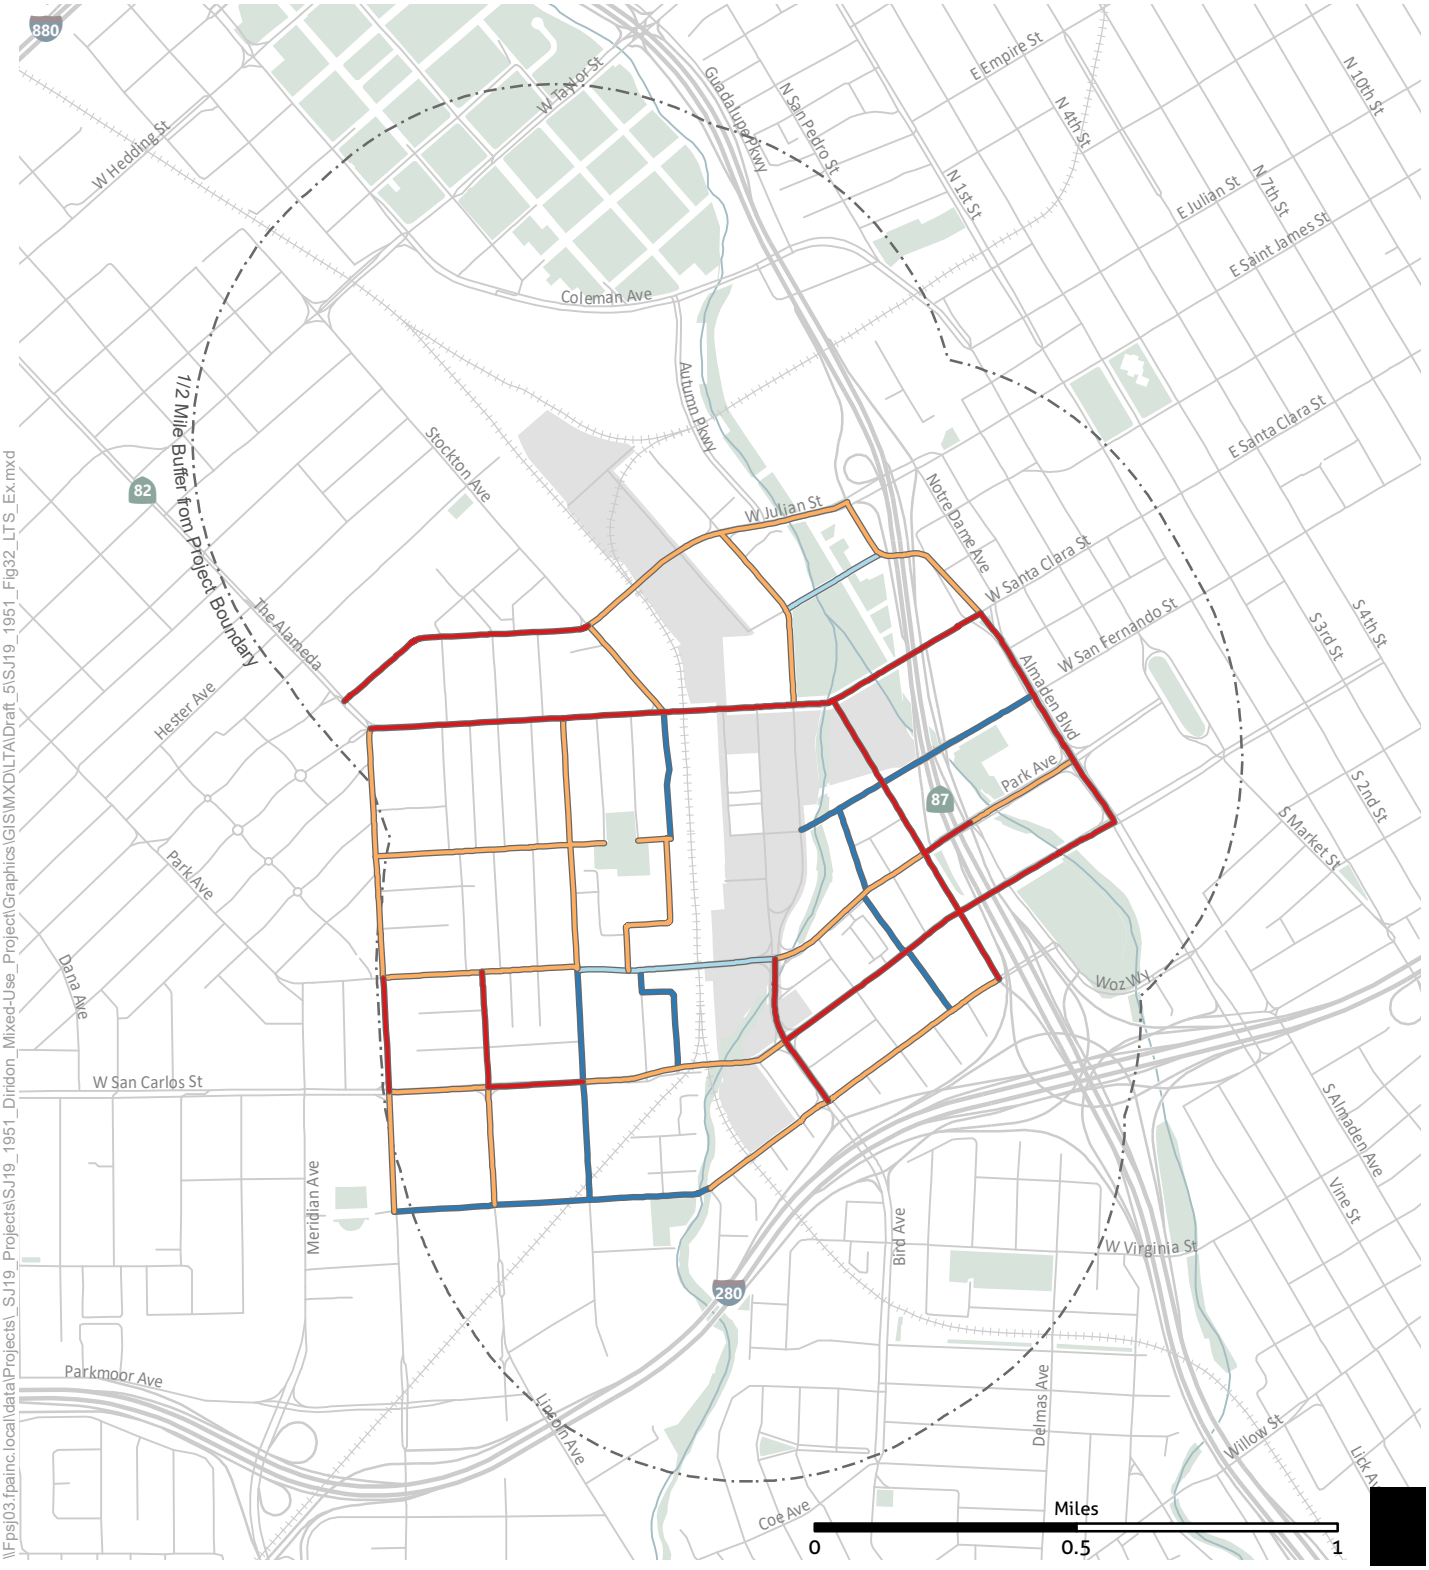
The existing LTS analysis result is shown on **Figure 32**. In general, the LTS score aligns with the condition of existing bike facilities. The traffic stress is the lowest (LTS = 1) for streets with Class IV protected bike lanes like San Fernando Street, and residential streets with low speed limits and low ADT such as Gifford Avenue and Sunol Street. Streets with existing Class II bike lanes, like Park Avenue, have an LTS score of 2 if the segments have a low speed limit and low ADT. The traffic stress score degrades to 3 or 4 for streets with Class II bike lanes as the speed limit and/or the ADT increases, since cyclists must ride along higher volume and/or faster moving traffic without protection. An example of Class II streets with an LTS score of 3 or 4 is Julian Street between The Alameda and Stockton Avenue. Similarly, the LTS score varies for streets with sharrows (Class III) depending on the speed limit and ADT, and can be as high as LTS 4, but for the majority of streets with a Class III facility the LTS score is 1, including Sunol Street between Auzerais Avenue and Park Avenue, and Dupont Street between Park Avenue and San Carlos Street near the Project area. Multi-lane arterials with high speed and high ADT have an LTS score of 4. The high traffic stress for such streets applies even if the street has a Class II bike lane, such as Bird Avenue between San Carlos and Auzerais Avenue.

6.3.3.2 Background Conditions

The LTS analysis results for Background Plus Project Buildout and the comparison between Background Plus Project Buildout and Background No Project is shown on **Figure 33**. The LTS results for Background No Project, Background with Project Phase 1, and Background with Goal-Based Project Buildout Conditions, are included in **Appendix E**. The background scenarios include the bike networks as proposed by the City's Better Bike Plan 2025 as summarized in **Table 40**. In addition, the LTS analysis is affected by the difference in roadway volumes for each scenario.

Compared to Existing Conditions, the LTS score for Background Conditions improves for multiple street segments. This is because the proposed bike facilities in the City's Better Bike Plan 2025 include Class IV protected bike lanes for most of the study street segments where there are no existing facilities, or where the existing facilities are Class II bike lanes. Therefore, LTS score improves to 1 under the Background Conditions along Julian Street, The Alameda/Santa Clara Street, Park Avenue, San Carlos Street, Race Street, Lincoln Avenue, Autumn Street, Montgomery Street, Bird Avenue, Almaden Boulevard, Stockton Avenue, and Auzerais Avenue. While the Better Bike Plan implementation is an assumption that improves the LTS score for the majority of the bike corridors, it is contingent upon improvements through private development, as well as, capital and grant funded projects.

For several street segments with no bike facilities change, the LTS score degrades due to traffic volume increases that results in more traffic stress for bikes. The LTS score for Sunol Street between Park Avenue and San Carlos Street degrades from a score of 1 to 3 under Background with Project Phase 1, Background with Project Buildout, and Background with Goal-Based Project Buildout Conditions. The LTS score for Autumn Street between Julian Street and Saint John Street degrades from a score of 3 to a 4 under Background Buildout Conditions due to high traffic volume.



6.3.3.3 Cumulative Conditions

The LTS analysis results for Cumulative Plus Goal-Based Project Buildout Conditions is shown on **Figure 34.** Cumulative No Project LTS figures are included in **Appendix E.** The cumulative scenarios include the bike networks as proposed by the City's Better Bike Plan 2025 as summarized in **Table 40**. In addition to the bike network changes, the roadway volumes were also adjusted to reflect cumulative year 2040 conditions.

The LTS score for Cumulative Conditions is similar to Background Conditions and the traffic stress is mainly affected by roadway volumes. Streets with lower traffic volumes like Saint John Street show improved LTS scores, from 2 to 1. Streets with increased traffic volumes compared to Background Conditions have degraded LTS scores. LTS for Sunol Street degrades to a score of 4 since the traffic volume increases under Cumulative Conditions but there is no proposed infrastructure improvement. LTS for Almaden Boulevard between Julian Street and Saint John Street degrades to a score of 4 due to high traffic volume despite the proposed Class III shared facility.

6.3.3.4 Summary of Analysis

Most of the existing bike facilities in the vicinity of the Project area are along major corridors with east-west connectivity such as West San Fernando Street, Park Avenue, and West San Carlos Street. Street segments lacking bike facilities introduce gaps in the existing network and increase traffic stress for cyclists, such as San Fernando Street between Race Street and Wilson Avenue, and The Alameda between Race Street and Sunol Street. Network gaps lead to higher traffic stress under Background conditions where traffic volume grows from Existing conditions. The LTS score reflects that the proposed bike facility improvements which fill in gaps in the existing network will reduce traffic stress across multiple roadways. However, as noted, while the Better Bike Plan implementation is an assumption that improves the LTS score for the majority of the bike corridors, it is contingent upon improvements through private development, as well as, capital and grant funded projects. As discussed under the Project Description in **Chapter 1**, the Project includes select bike network improvements that implement or complement the City's Better Bike Plan 2025.

6.4 Bicycle Parking

The Project's bicycle parking requirements are discussed in more detail in **Chapter 10** (Parking Assessment). Overall, the Project would provide at least 3,292 bicycle parking spaces, of which 1,552 would be for office uses, 1,475 would be required for residential uses, and 265 spaces for the remaining land uses, as required by the Municipal Code. Per the City of San José zoning, of the total 3,292 bicycle parking spaces, at least 1,269 would need to be long-term spaces. Short-term bicycle parking facilities shall be in a convenient, highly visible and well-lit area within 20 feet of a building entrance and within view of pedestrian traffic. Long-term bicycle parking facilities shall be conveniently accessible by pedestrians from the street and located within 100 feet of building entrances accessible by tenants and occupants.

Pedestrian Analysis

This chapter describes pedestrian access in the immediate vicinity of the Project area and provides an analysis of pedestrian throughway capacity.

6.5 Pedestrian Access

This section describes pedestrian access within a half mile radius of the Project and identifies key connections to the Project.

6.5.1 Existing Infrastructure

The surrounding pedestrian infrastructure is well developed, with sidewalks available on most of the studied streets and a variety of crosswalks available within a half a mile radius of the Project boundary, as shown on **Figure 19**.

The only notable location without sidewalks is at Sunol Street and Auzerais Avenue, due to construction that has closed off the sidewalk on the west side of Sunol Street and the north side of Auzerais Avenue. The sidewalks are expected to re-open to the public upon construction completion.

The sidewalks along major roads like The Alameda and Santa Clara Street tend to be around 20 feet wide, with effective widths ranging from 10 to 15 feet. San Fernando Street also has a 20-foot-wide sidewalk on the south side between Delmas Avenue and Almaden Boulevard. The other sidewalks generally are around 10 feet wide. The effective widths vary based on the location of tree wells, light poles, traffic and parking signage, and street furniture. Effective width also includes "shy distance" to account for the distance kept away from the edge of curb and from buildings with window displays. Most of the sidewalks have effective widths ranging from 7 to 15 feet, with residential streets ranging from 5 to 8 feet, and main thoroughfares ranging from 10 to 15 feet wide.

As the sidewalks extend from the Project boundary toward the east to downtown, they generally tend to increase in width. For example, the south sidewalk along San Fernando Streets changes from 10 feet near Delmas to 20 feet near Almaden Boulevard. Most of the sidewalks to the west of the Project are in residential/commercial areas and tend to not be as wide. For example, Sunol Street cuts through a residential area, with only one lane of traffic in each direction. Many of the sidewalks also have trees that provide shade.

High-visibility crosswalks are located primarily along The Alameda and Santa Clara Street and on the streets to the east of the Project area near downtown. There are two rectangular rapid flashing beacons (RRFB) — one on The Alameda and one on Auzerais Avenue. The other intersections adjacent to the studied sidewalks have standard crosswalks.

There are some intersections that do not have crosswalks for all four directions. For example, there is no north-south crosswalk on the west side of Delmas Avenue and Santa Clara Street, and no east-west crosswalk on the north side of Auzerais Avenue and Woz Way. Crosswalks are not present at the following locations:

- East and west legs of the SR 87 off-ramp/Santa Clara Street intersection
- East leg of Santa Clara Street/and Almaden Boulevard intersection
- East leg of San Fernando Street/Delmas Avenue intersections
- West leg of San Carlos Street/Lincoln Avenue intersection
- East leg of the San Carlos Street/Woz Way intersection

All the signalized intersections near the Project area have pedestrian countdown timers. The Alameda and Santa Clara Street, both of which are main thoroughfare / commercial corridors, have more pedestrian amenities such as benches, trash cans, and bulb-outs.

Most of the existing/baseline pedestrian volumes were observed near downtown (e.g., the streets bordering The Almaden and Delmas Avenue) or near the Diridon Station and SAP Center. These areas accounted for nearly 65 percent of the pedestrian traffic observed. The remaining 35 percent were observed to the west of the Project area.

Downtown West will provide pedestrian enhancements within the Project area, but there are no planned pedestrian improvements along the pedestrian corridors studied in this LTA.

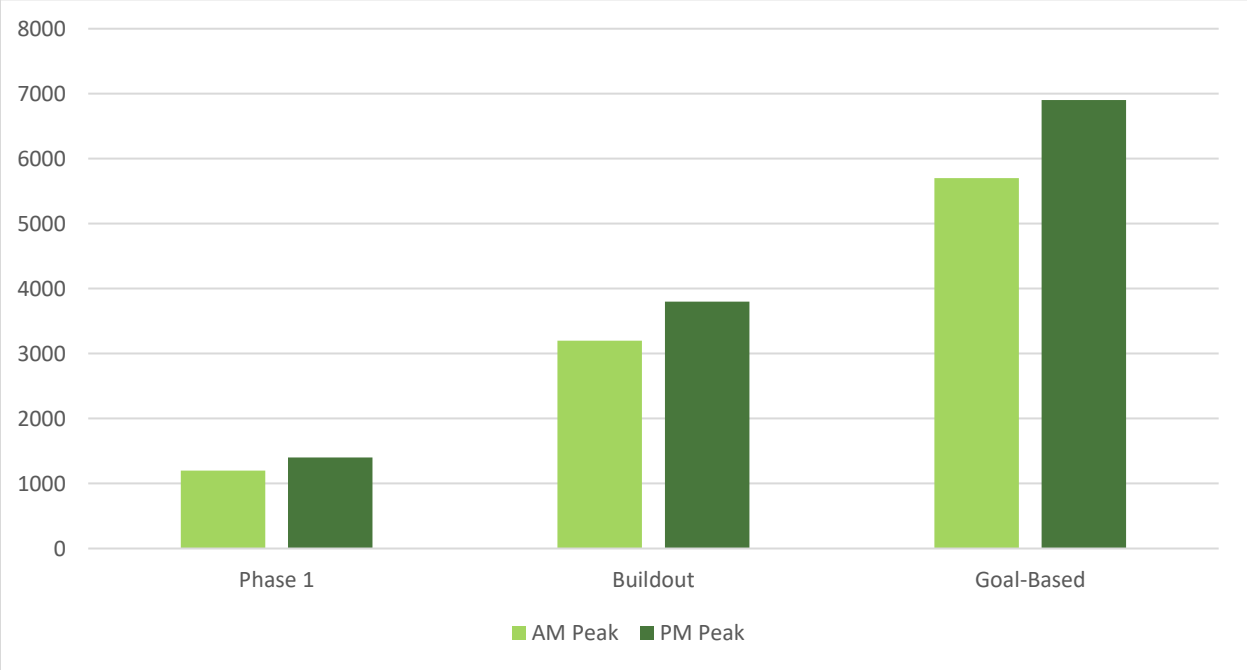
6.6 Pedestrian Volumes

This section summarizes the existing pedestrian volumes, along with growth in pedestrian activity from the Project and future growth.

Nine sidewalk segments were quantitively assessed:

1. The Alameda, between Race Street and Sunol Street
2. Park Avenue, between Race Street and Sunol Street
3. San Carlos Street between Race Street and Sunol Street
4. Auzerais Avenue between Lincoln Avenue and Sunol Street
5. Santa Clara Street between Autumn Street and Almaden Boulevard
6. San Fernando Street between Delmas Avenue and Almaden Boulevard
7. San Carlos Street between Montgomery / Bird Avenue and Almaden Boulevard
8. Sunol Street between The Alameda and San Carlos Street
9. Delmas Avenue between San Fernando Street and San Carlos Street

These sidewalks were selected because they provide either east-west connectivity to the Project area or are north-south facilities parallel to the Project, both of which help inform the pedestrian volumes immediately around the Project.



6.6.1 Existing Pedestrian Volumes

The existing volume observed along the study corridors is about 250 people during the AM peak period and 325 people in the PM peak period per 15-minute interval. The volumes range from three people per 15-minute interval on Auzerais Avenue (between Lincoln Street and Sunol Street) and on Sunol Street (between Park Avenue and San Carlos Street) during the PM peak period, to between 30 and 35 people per 15-minute interval along San Fernando Street (between Delmas and Almaden Boulevard) and on Sunol Street (between The Alameda and Park Avenue) during the PM peak period, respectively.

6.6.2 Project Volumes

Project generated pedestrian volumes were developed based on the methodology outlined in **Chapter 4 (Project Travel Demand)**. The Background Plus Phase 1 Project scenario generates an additional 1,200 peak period pedestrian AM trips and an additional 1,400 peak period pedestrian PM trips. The Background Plus Project Buildout scenario generates an additional 3,200 peak period pedestrian AM trips and an additional 3,800 peak period pedestrian PM trips. The Goal-Based scenarios are estimated to generate an additional 5,700 peak period pedestrian AM trips and an additional 6,900 peak period pedestrian PM trips, respectively. **Figure 35** summarizes the estimated Project-generated pedestrian volumes for each scenario.

Figure 35: Project Pedestrian Estimates

6.6.3 Future Volumes

The peak hour future pedestrian volumes from growth other than the Project are shown in **Table 45**. Scenarios 2b – 2d reflect the anticipated pedestrian volume in 2030 with various phases of Project

buildout using Scenario 2a volumes as the baseline. Scenario 3b reflects the anticipated pedestrian volume in 2040 with the full Project buildout using Scenario 3a volumes as the baseline.

Table 41: Summary of Future 15-Minute Pedestrian Volumes

Volume of people per 15-minute interval	Background No Project	Background Plus Phase 1 Project	Background Plus Project Buildout	Background Plus Goal-Based Project Buildout	Cumulative No Project	Cumulative Plus Goal-Based Project Buildout
AM peak period	300	1,050	2,300	3,862	366	3,928
PM peak period	395	1,270	2,770	4,707	481	4,794

6.7 Pedestrian Throughway Capacity

This section presents the method and analysis results of the pedestrian throughway capacity analysis to evaluate the effectiveness of the existing sidewalks to accommodate growth in pedestrian activity.

6.7.1 Methodology

The pedestrian capacity analysis was done following the procedure outlined in the *Highway Capacity Manual*, 6th Edition (2016). Counts were taken at the following intersections during the AM and PM peak hours (7-9 AM and 4-6 PM).:

- The Alameda and Race Street
- The Alameda and Sunol Street
- Santa Clara Street and Autumn Street
- Santa Clara Street and Almaden Boulevard
- San Fernando Street and Delmas Avenue
- Park Avenue and Race Street
- Park Avenue and Sunol Street
- San Carlos Street and Race Street
- San Carlos Street and Lincoln Avenue
- San Carlos Street and Sunol Street
- San Carlos Street and Montgomery / Bird Avenue
- San Carlos Street and Delmas Avenue
- San Carlos Street and Almaden Boulevard
- Auzerais Avenue and Lincoln Avenue
- Auzerais Avenue and Sunol Street

The actual and effective widths of the sidewalks were determined using aerial imagery. The 15-minute volumes at the sidewalks were calculated by selecting the highest 15-minute volume during the peak hours. No peak hour factor was applied, as we chose the highest 15-minute volume during the peak period instead of taking an average of the volumes.

For the purposes of the analysis, all pedestrians going to the east were presumed to be on the north sidewalk, whereas all traffic going to the west were presumed to be on the south sidewalk. Similarly, all traffic going to the north was assigned to the east sidewalk, and all traffic going to the south was assigned to the west sidewalk. For the projected baseline loads, we assumed a 2 percent yearly growth in pedestrian volume over 20 years (assuming no Project development).

The flow rate for the sidewalk (person / min / ft) was calculated by taking the 15-minute volumes and dividing it by the denominator of 15 times the effective width of the sidewalk.

The LOS is determined by the flow rate. There are two different levels of service: an average LOS (e.g., an individual person) and platoon LOS (e.g., groups of people in downtown areas), with the LOS definitions shown in **Table 46**.

Table 42: Definition of Level of Service for Pedestrian Volumes

LOS	Flow Rate (p/min/ft)	
	Average	Platoon
A	≤ 5	≤ 0.5
B	> 5 – 7	> 0.5 – 3
C	> 7 – 10	> 3 – 6
D	> 10 – 15	> 6 – 11
E	> 15 – 23	> 11 – 18
F	> 23	> 18

Source: *Highway Capacity Manual*, 6th Edition (2016).

To distribute the Project generated trips, 30 percent of the trips were allotted to streets that intersect with Almaden Boulevard, as those areas are toward downtown and most of the local attractions (see **Figure 7**). Twenty percent of trips were allotted to streets that intersect Delmas, as it is also close to downtown. Fifteen percent went to Autumn and Santa Clara, due to proximity to the SAP Center and Diridon Station. Fifteen percent went to Sunol and The Alameda due to being located on a major street. The other 20 percent went to the residential streets to the west of the Project.

The years 2030 and 2040 were selected for the baseline models. For the purpose of the pedestrian throughway capacity analysis, the year 2030 (i.e., 10-year growth) was assumed for the Background scenario and the year 2040 represents the Cumulative scenario.

For "plus Project" scenarios, the Project-generated pedestrian trips were distributed among the sidewalks by multiplying the total additional AM / PM peak period trips by the distribution of future growth divided by eight (to convert the two-hour peak period to 15 minutes). This incorporates a conservative assumption that all the increased pedestrian growth will go through each sidewalk of the section. For example, if an additional 2,000 AM trips are added, 30 percent of the growth allotted to streets that intersect with Almaden Boulevard will go to each street. Each street will see an increase of 600 trips, instead of the 600 trips being divided among the three streets and their six sidewalks that border Almaden Boulevard.

6.7.2 Analysis Results

Based on the level of service, all the sidewalks are sufficient to meet the expected pedestrian volumes. For the existing conditions, all the sidewalks have both an average and platoon LOS of A due to both the adequate effective sidewalk widths and the low pedestrian volumes for most sidewalks, as many of them had 15-minute pedestrian volumes fewer than ten people (see **Table 43** for reference).

For both the Background and Cumulative No Project scenarios, the additional pedestrian trips do not substantially change the LOS of any of the sidewalks, with most of them maintaining both an average and platoon LOS of A, with only one platoon LOS dropping to B under the Cumulative No Project scenario.

For the Phase 1 Project and Project Buildout scenarios under Background conditions, the additional peak hour trips cause many of the sidewalks to have a platoon LOS of B. For the Goal-Based scenarios under Background and Cumulative Conditions, all the sidewalks have a platoon LOS of B. **Table 48** shows the pedestrian volume for the scenario with the highest pedestrian volume (i.e., Cumulative Plus Goal-Based Project Buildout conditions). **Figure 36** and **Figure 37** show the peak PM average and platoon LOS for Existing Conditions and Cumulative Plus Goal-Based Project Buildout on the corresponding streets, respectively. **Appendix F** includes the detailed pedestrian throughway capacity analysis for all other scenarios.

Overall, the Project-generated pedestrian trips will be accommodated by the surrounding pedestrian infrastructure, as the average LOS remains at A for all scenarios, with only the platoon LOS going down to B, even with the growth in 15-min pedestrian volumes. Nonetheless, various sidewalk improvements are proposed within the Project area to improve walkability and connectivity in accordance with the Downtown West Design Standards and Guidelines.

7. City-Guideline Required Intersection Operations Analysis

This section presents the results of the intersection level of service calculations for the standard City required intersections under Background Conditions without the Project and with the Project under the *Phase 1 Project*, *Project Buildout*, and *Goal-Based Project Buildout* assumptions.

7.1 Background Conditions

Traffic volumes for Background No Project Conditions are based on existing volumes plus traffic generated by approved but not yet constructed and/or occupied developments as summarized in **Section 2.4**.

Background with Project Conditions are defined as Background No Project Conditions plus traffic generated by each of the *Phase 1 Project*, *Project Buildout*, and *Goal-Based Project Buildout* assumptions. The peak hour vehicle trip estimates to and from the Project area are based on the trip estimates accounting for a 18 percent TDM reduction as discussed in **Chapter 4 (Project Travel Demand)** and the turning movements shown in **Appendix D**. Impacts to the roadway system are identified by comparing the level of service results under each of the Background Plus Project Conditions to those under Background No Project Conditions.

7.2 Intersection Analysis

Level of service calculations were applied to operations of the study intersections under Background No Project and Background Plus Project Conditions (Phase 1 Project, Project Buildout, and Goal-Based Project Buildout). The results are presented in **Table 45**, **Table 46**, and **Table 47** along with the projected increases in critical delay and critical volume-to-capacity (V/C) ratios. Critical delay represents delay associated with the critical movements of the intersection, or movements that require the most traffic signal "green time" and have the greatest effect on overall intersection operations. The corresponding LOS calculation sheets are included in **Appendix C**.

Adverse effects are identified by comparing Background No Project and Background with each of the three Plus Project conditions. Adverse effects are identified based on the impact criteria discussed in **Chapter 2**, which includes changes in LOS from an acceptable to an unacceptable level or changes in critical delay and critical V/C ratio for an intersection operating unacceptably.

7.2.1 Phase 1 Project Analysis

The LOS analysis results are summarized in **Table 45**. Under Background Plus Phase 1 Project conditions, all intersections operate at acceptable levels except the following intersection under the identified peak period:

- **Intersection #2 – Coleman Avenue/Taylor Street (City of San José, LOS D):** the addition of Project traffic would degrade intersection operations from acceptable LOS D to unacceptable LOS E+ during the PM peak hour.
- **Intersection #13 – De La Cruz Boulevard/Central Expressway (County, LOS E):** the addition of Project traffic would maintain intersection operations at unacceptable LOS F during the AM peak hour.

7.2.2 Project Buildout Analysis

The LOS analysis results are summarized in **Table 46**. Under Background Plus Project Buildout conditions, all intersections operate at acceptable levels except the following intersections under the identified peak period:

- **Intersection #2 – Coleman Avenue/Taylor Street (City of San José, LOS D):** the addition of Project traffic would degrade intersection operations from acceptable LOS D to unacceptable LOS E during the PM peak hour.

- **Intersection #13 – De La Cruz Boulevard/Central Expressway (County, LOS D):** the addition of Project traffic would maintain intersection operations at unacceptable LOS F during the AM peak hour.

7.3 City Adverse Effects and Improvements

Adverse effects and potential improvements for the Background scenarios are discussed below. **Table 48** provides a summary of the adverse effects under Background with Project conditions for the Phase 1 Project, Project Buildout, and Goal-Based Project Buildout scenarios.

Table 48: Background with Project City Required Intersection Adverse Effect Summary[1]

City Intersection		LOS Threshold[2]	Peak Hour[3]	Phase 1 Project	Project Buildout	Goal-Based Project Buildout
2	Coleman Avenue/ Taylor Street	D	AM PM	❍ ■	❍ ■	❍ ■
13	De La Cruz Boulevard/ Central Expressway	E	AM PM	□ ❍	□ ❍	■ ❍

Notes:

1. Intersection adverse effects based on delays, LOS results, and changes in critical volume-to-capacity ratio and delay as presented in **Table 45**, **Table 46**, and **Table 47**, and the applicable LOS thresholds and adverse effect criteria described in **Section 2.2.**
2. LOS Threshold is the lowest acceptable LOS (the threshold between acceptable and unacceptable level of service).
3. AM = morning peak hour, PM = evening peak hour.

❍ = acceptable service levels, no improvement discussion required.
☐ = unacceptable service levels, but adverse effect threshold not met, and no improvement needed.
■ = unacceptable service levels and adverse effect threshold met; improvement required.
Source: Fehr & Peers, August 2020.

The Project meets adverse effect thresholds at the Colman Avenue/Taylor Street (#2) and the De La Cruz Boulevard/Central Expressway (#13) intersection under the specified scenarios as discussed below.

7.3.1 Adverse Effects and Improvements

Based on the City's *Handbook*, there are three possible approaches to address negative effects at signalized intersections:

- Reduce project vehicle-trips to eliminate the adverse effects and bring the intersections back to the background conditions;
- Construct improvements to the subject intersection(s) or other roadway segments of the citywide transportation system to increase overall capacity;
- Implement a trip cap, the maximum number of daily vehicle-trips allowed to be generated by a project.

A project should prioritize improvements related to alternative transportation modes, parking measures, and/or TDM measures. Improvements that increase vehicle capacity are secondary and must not have unacceptable effects on existing or planned transportation facilities. Unacceptable effects on existing or planned transportation facilities include the following:

- Inconsistent with the General Plan Transportation Network and Street Typologies;
- Reduction of any physical dimension of a transportation facility below the minimum design standards per the San José Complete Streets Design Standards and Guidelines; or
- Substantial deterioration in the quality of existing or planned transportation facilities, including pedestrian, bicycle, and transit systems and facilities, as determined by the Director of Transportation.

Coleman Avenue/Taylor Street (Intersection #2): The Phase 1, Project Buildout, and Goal-Based Project Buildout scenarios would degrade acceptable intersection operations to unacceptable levels and meet the City's adverse effect threshold during the PM peak hour.

Improvements to address the adverse effect would need a southbound right-turn lane. However, there are right-of-way constraints that limit the feasibility of the improvement measure. A dedicated right-turn lane, through lane, and a Class IV bike lane (as proposed in the City's Better Bike Plan) would need a minimum width of 28 feet. The current widths between the number two through-lane and the curb is about 18 feet. Thus, the improvement measure would not be feasible, and the vehicle LOS adverse effect cannot be reduced for Project Buildout.

However, to support the Project's multimodal and TDM goals, the project applicant would be required to construct City planned multi-modal improvements at the Coleman Avenue/Taylor Street intersection. The plans include Improvements at the Coleman Avenue/West Taylor Street intersection to enhance bicycle connectivity along West Taylor Street from Walnut Street to Stockton Avenue. Improvements to the pedestrian walkway, removal of corner islands, and widening within the existing rail undercrossing could also be included.

De La Cruz Boulevard/Central Expressway (Intersection #13): The Goal-Based Project Buildout scenario would exacerbate unacceptable intersection operations and meet the county's adverse effect threshold during the AM peak hour.

The VTA's VTP 2040 identifies a highway project that is relevant to the identified intersection adverse effects: VTP ID H25: US 101 Southbound/Trimble Road/De La Cruz Boulevard/Central Expressway Interchange Improvements. This project includes several ramp modifications, in addition to widening of the De La Cruz Boulevard bridge across US 101 from four to six lanes. Cost in 2013 dollars: $39.0 million. Complete improvement of freeway interchange impacts is considered beyond the scope of an individual development project, due to the inability of any individual project or City to fully fund a major freeway mainline improvement. Thus, consistent with the Project's multimodal and TDM goals, no improvements are identified for this intersection.

8. Localized Access and Queuing Analysis

This chapter presents the localized access and queuing analysis results for the study intersections that provide direct access to the Project area. The analysis considers the intersection operation in terms of LOS and evaluates the adequacy of the turning lane storage capacity. The 14 study intersections are evaluated under Existing Conditions, Background No Project, Project Buildout, and Goal-Based Project Buildout conditions.

8.1 SimTraffic Model

The TRAFFIX software used in the City intersection operations analysis (**Chapter 7**) evaluates intersections in isolation without considering the operations of adjacent or nearby intersections. Therefore, to capture the interactions between closely spaced intersections, the simulation module of the Synchro software, SimTraffic, was used to evaluate operations. SimTraffic modeling is a microsimulation tool used to model behaviors of each vehicle in the roadway, whereas TRAFFX is a macro simulation tool used to determine LOS per HCM. SimTraffic is not a tool used by the City to identify LOS adverse effects per Council Policy 5-1; the City applies TRAFFIX software for determination of adverse effects. The SimTraffic Model is included in the LTA for information purposes to support the City in improving operations in and around the Project area.

The Synchro/SimTraffic analysis software was used to evaluate intersection LOS, turn lane queuing, and off-ramp queuing. The Synchro/SimTraffic model analysis considered three subarea corridors that are defined as follows:

1. Julian Street & Santa Clara Street Corridor – State Route 87 to Stockton Avenue
2. Delmas Avenue & Woz Way Corridor – Park Avenue to Auzerais Avenue
3. Montgomery Street & Bird Avenue -Park Avenue to Virginia Street

The SimTraffic model network includes an extra 15 intersections in addition to the 14 study intersections to accurately account for signal platooning effects as vehicles enter/exit the study area intersections. Analysis results are not reported for the 15 extra intersections. To capture the effect of pedestrian activity, pedestrian volumes were included in the SimTraffic model. Where available, pedestrian volumes are based on counts; otherwise pedestrian volumes were estimated based on surrounding land uses and knowledge of the area. **Table 7** summarizes the peak hour factors and heavy vehicle percentages used for each sub-network during the morning and evening peak periods.

Table 49: SimTraffic Intersection Data Inputs

Subnetwork	Peak Hour Factor		Heavy Vehicle Percentage	
	AM	PM	AM	PM
Julian St & Santa Clara St Corridor	0.92	0.89	4%	2%
Delmas Av & Woz Way Corridor	0.95	0.96	2%	1%
Montgomery Av & Bird Ave Corridor	0.95	0.95	2%	1%

8.2 Intersection Operations

This section describes the intersection operations for the 14 localized access intersections under Existing, Background No Project, Background Plus Project Buildout, and Background Plus Goal-Based Project Buildout conditions.

All the localized access and queuing study intersections are within the Downtown Core and, therefore, do not have established LOS thresholds. For the purposes of this analysis, intersections that operate at LOS F (i.e., above capacity), were considered for potential improvements.

8.2.1 Existing Conditions

Existing intersection lane configurations, signal timings, pedestrian movements, and peak hour turning movement volumes were used to calculate the LOS for study intersections during each peak hour. The Existing Conditions model is used to calibrate the model to existing traffic counts. The results of the LOS analysis for Existing Conditions are presented in **Table 50. Appendix B** contains the corresponding calculation sheets. The results indicate that all study intersections operate at LOS E or better during the AM and PM peak hours, except for the Autumn Parkway/Julian Street intersection (#19), which operates at LOS F during the evening peak hour.

8.2.2 Background Conditions

The assumptions and methodologies outlined in **Chapter 2** were used to develop forecasts for Background conditions. The results of the LOS analysis for Background Conditions are presented in **Table 51. Appendix B** contains the corresponding calculation sheets. As shown in **Table 51** under Background No Project Conditions the following intersections operate at LOS F:

- Intersection #13 – Julian Street & Stockton Avenue during PM peak hour
- Intersection #19 – Julian Street & Autumn Parkway during the PM peak hour
- Intersection #23 – Park Avenue & Delmas Avenue/SR 87 Southbound Off-Ramp during the PM peak hours
- Intersection #24 – Park Avenue& SR 87 Northbound On-Ramp/Woz Way during the PM peak hour
- Intersection #26 – Woz Way & SR 87 N Off-Ramp during the AM and PM peak hours

Table 50: Intersection Operations – Existing Year (2019)

Intersection		Control	LOS / Control Delay	
			AM	PM
22	Julian Street & Stockton Avenue	Signal	B / 13	A / 8
23	The Alameda & Stockton Avenue	Signal	D / 44	D / 50
24	Santa Clara Street & Cahill Street	Signal	B / 14	E / 71
25	San Carlos & Bird Avenue (CMP)	Signal	D / 40	D / 54
26	Bird Avenue & I-280 N Ramps (CMP)	Signal	B / 19	C / 28

Notes:
For signal control, the overall intersection LOS and control delay (in seconds per vehicle) is reported.
Bold font indicates LOS F conditions.
Source: Fehr & Peers, August 2020.

With implementation of Project Buildout, the Project would exacerbate LOS F operations at the intersections identified above, and degrade operations to LOS F at the following additional locations:

- Intersection #22 – Julian Street & Stockton Avenue during the AM and PM peak hours (the intersection already operates at LOS F during the PM peak hour under the Background No Project scenario)
- Intersection #23 – The Alameda-Santa Clara Street & Stockton Avenue-White Street during the PM peak hour
- Intersection #25 – San Carlos & Bird Avenue-Montgomery Avenue during the AM peak hour
- Intersection #26 – Bird Avenue & I-280 Northbound Ramps during the AM peak hour
- Intersection #27 – Bird Avenue & I-280 Southbound Ramps during the AM peak hour
- Intersection #28 – Julian Street & Autumn Parkway during the PM peak hour (the intersection already operates at LOS F during the PM peak hour under the Background No Project scenario)

- Intersection #31 – Santa Clara Street & SR 87 Northbound Off-Ramp during the AM and PM peak hours
- Intersection #32 – Park Avenue & Delmas Avenue/SR 87 S Off-Ramp during the AM and PM peak hours (the intersection already operates at LOS F during the PM peak hour under the Background No Project scenario)
- Intersection #34 – Auzerais Avenue & Delmas Avenue/SR 87 S On-Ramp during the PM peak hour
- Intersection #35 – Woz Way & SR 87 N Off-Ramp during the AM and PM peak hours (the intersection already operates at LOS F during the AM and PM peak hour under the Background No Project scenario)

It should be noted that the analysis for intersection LOS adverse effects that occur under the Project Buildout scenario, do not include the additional 9 percentage point trip reduction required under the Project's *Expanded TDM Program and Monitoring Plan* required as part of the EIR; thus the adverse effects would be lower than identified.

The Goal-Based Project Buildout scenario has fewer intersections that operate at LOS F. Compared to the Background No Project scenario the following additional intersections operate at LOS F:

- Intersection #22 – Julian Street & Stockton Avenue during the PM peak hour (the intersection already operates at LOS F during the PM peak hour under the Background No Project scenario)
- Intersection #28 – Julian Street & Autumn Parkway during the PM peak hour (the intersection already operates at LOS F during the PM peak hour under the Background No Project scenario)

Based on the simulation, ongoing signal coordination would improve intersection operations and may result in better vehicle progression along these corridors, especially along Julian Street and Delmas Avenue. Below is a summary of the main bottlenecks within the corridors and possible improvements to these locations.

8.2.2.1 Stockton Avenue/Julian Street

The Stockton Avenue/Julian Street intersection operates with high vehicular delay due to the capacity constraints on all approaches. Particularly, the demand at the southbound approach is relatively high, increasing the average intersection delay. Right-of-way constraints limit the opportunity to increase vehicular capacity by constructing new travel lanes, although signal timing optimizations may slightly reduce vehicle delay. No improvements are identified for this intersection.

8.2.2.2 Auzerais Avenue/SR 87 Southbound On-Ramp

At the Auzerais Avenue/SR 87 Southbound On-Ramp, the vehicle queues for the southbound through lane on Delmas Avenue (that access the southbound SR 87 on-ramp) frequently extend back to Park Avenue, causing excessive delays along Delmas Avenue. From a vehicle operations perspective, the dedicated southbound left-turn lane on Delmas Avenue would be converted to a shared left-turn/through

lane to provide added capacity to the through movement accessing the southbound on-ramp. This improvement would need two receiving lanes on the on-ramp itself. There isn't enough right-of-way to provide two mixed-flow and one HOV lane on the on-ramp. The HOV lane could be converted to a mixed-flow lane, though Caltrans typically prefers an HOV by-pass lane on all their metered on-ramps; thus, this improvement is likely not feasible. However, addressing some of the operational concerns at the Julian Street/SR 87 southbound intersection could divert some of the trips from the Auzerais Avenue/SR 87 Southbound On-Ramp to the Julian Street interchange.

The Project applicant will construct multimodal intersection improvement at the Auzerais Avenue/SR 87 Southbound On-Ramp intersection. Improvements include signal modifications at the intersection and widening of the Auzerais north sidewalk beneath SR 87 freeway to provide for a continues sidewalk that is not interrupted by the existing pillars from SR 87 freeway overcrossing.

8.3 Left-Turn and Right-Turn Storage Analysis

The addition of Project traffic along the roadway network could add vehicles to right-turn and left-turn movements and has the potential to cause turn queues to exceed the turn pocket storage lengths. Queues that exceed the turn pocket storage length have the potential to impede adjacent through traffic movements. The analysis results presented in **Section 8.2** were used to evaluate right-turn and left-turn storage capacity at intersections where the Project adds at least 50 right-turn vehicles and 30 left-turn vehicles. The results of the turn lane analysis are presented in **Table 52** for Background Plus Project Buildout and Background Plus Goal-Based Project Buildout Conditions.

Table 52: Intersection Turn-Lane Queuing Analysis

Intersection		Movement[1]	Available Storage[2]	Queue Estimates in Feet			
				Background Plus Project Buildout		Background Plus Goal-Based Project Buildout	
				AM	PM	AM	PM
22	Julian Street & Stockton Avenue	EBL	110 feet	**130**	**120**	**110**	**120**
		WBL	80 feet	**120**	**120**	**130**	**130**

		NBL	315 feet	**510**	**500**	280	**500**
31	Santa Clara Street & SR 87 N (CMP) Off-Ramp	NBL	910 feet	**1,020**	640	150	130
32	Park Avenue & Delmas Avenue/SR 87 S Off-Ramp	SBR (from off-ramp)	355 feet	350	**560**	270	**470**
33	Park Avenue & SR 87 N On-Ramp/Woz Way	EBL	155 feet	**220**	**200**	**230**	**180**
34	Auzerais Avenue & Delmas Avenue/SR 87 S On-Ramp	SBL	210 feet	90	**640**	100	**420**
35	Woz Way & SR 87 N Off-Ramp	EBL	180 feet	**270**	**280**	110	120

Notes:
1. NBL = northbound left-turn; SBL = southbound left-turn, EBL = eastbound left-turn WBL = westbound left-turn, NBR = northbound left-turn, SBR = southbound right-turn, EBR = eastbound right-turn, WBR = westbound right-turn.
2. Storage length is the length of the longest left turn lane.
3. Queue length is measured in feet for longest 95th percentile queue length based on SimTraffic analysis results.
4. Impact results for the Occupied/Re-tenanted Mall alternative is presented for informational purposes only. The mall is an entitled land use and would not require any impact assessment or CEQA clearance to re-occupy.

Bold/underlined text indicates projected queue length exceeds available storage length.
Source: Fehr & Peers, August 2020.

Several turn pocket lengths are exceeded in future volume conditions with both the Project Buildout and Goal-Based Project Buildout scenarios. To address potential queue spillback at the intersections identified

in **Table 52**, ITS improvements, such as adaptive signal control, advanced signal loop detectors or video image detectors, could be implemented to improve signal operations and queuing. Most turn-pockets that exceed storage capacity cannot be extended due to right of way constraints. However, there are several locations where turn-pockets could potentially be extended within the existing right-of-way:

- **Intersection 23 – The Alameda/Stockton Avenue:** The southbound left-turn pocket could be extended by an additional 50 feet by extending the current striping on Stockton Avenue. While this would not fully address queueing at the location, it would help alleviate queue spillback. The pocket cannot be extended any further than 50 feet due to right of way constraints.
- **Intersection 27 – Bird Avenue/I-280 Southbound Ramps:** The storage at the off-ramp could potentially be extended by constructing a new retaining wall to widen the off-ramp and extend the storage capacity of the left-turn lane by an additional 200 feet, which would meet estimated queue at this location.
- **Intersection 29 – Julian Street/SR 87 Southbound Ramps:** The storage at the off-ramp could potentially be extended by widening the roadway to extend the storage capacity of the left-turn lane by an additional 200 feet, which would meet estimated queue at this location.

Consistent with the City's multimodal goals and the Project's TDM goals, the vehicle capacity enhancing improvements are not recommended. The Project applicant would contribute to the Bird Avenue/I-80 Bicycle-Pedestrian multimodal connection from Diridon Station area to the Gardner community.

It should be note, that the analysis for adverse effects to the turn lanes that occur under the Project Buildout scenario do not include the additional 9 percentage point trip reduction required under the Project's *Expanded TDM Program and Monitoring Plan* required as part of the EIR; thus the adverse effects would be lower than identified.

8.4 Off-Ramp Queuing

In addition to the turn-lane queuing analysis presented in **Section 8.3**; an off-ramp queue analysis was conducted. The off-ramp queuing analysis is used to determine if queues at the ramp terminus intersection will spillback onto the freeway mainline. The SimTraffic model results of the off-ramp queuing analysis are shown in **Table 53**.

Table 53: Off-Ramp Queue Analysis

Off-Ramp	Storage (ft)	Queue Estimates in Feet			
		Background Plus Project Buildout		Background Plus Goal-Based Project Buildout	
		AM	PM	AM	PM
SR 87 Southbound to Julian St	1,250	**1,420**	220	240	140
SR 87 Northbound to Julian St	845	530	230	270	200
SR 87 Northbound to Santa Clara St	910	**1,020**	640	**1,160**	280

Table 53: Off-Ramp Queue Analysis

Off-Ramp	Storage (ft)	Queue Estimates in Feet			
		Background Plus Project Buildout		Background Plus Goal-Based Project Buildout	
		AM	PM	AM	PM
SR 87 Southbound to Park Ave	900	**1,020**	**970**	**1,020**	290
SR 87 Northbound to Woz Way	540	**860**	**700**	110	120
I-280 Northbound to Bird Ave	1,465	**1,730**	740	740	370
I-280 Southbound to Bird Ave	1,390	**1,390**	100	630	100

Note:
Bold/underlined text indicates projected queue length exceeds available storage length.
Average maximum queue length in feet is reported from SimTraffic.
Source: Fehr & Peers, August 2020.

As the results of the analysis show in **Table 53**, all off-ramps would need additional storage capacity to minimize queue spillback onto the freeway mainline during the AM peak hour. During the PM peak hour, only the SR 87 off-ramps at Park Avenue (southbound ramp) and Woz Way (northbound ramp) would need additional storage capacity to minimize queue spillback.

While ITS improvements at the ramp terminal intersections could alleviate some of the queueing, most off-ramps would likely require further modifications to increase the storage capacity or through-put at the intersection. On initial review of aerial photography, there appears to be some additional right-of-way to increase the off-ramp storage capacities at the southbound Julian Street off-ramp, southbound Park Avenue off-ramp, and southbound Bird Avenue off-ramp. However, there is no available right-of-way at northbound Bird Avenue off-ramp from I-280. The additional storage capacity would not fully address the off-ramp queues, but would help minimize the frequency of queue spillbacks onto the mainline. It should be noted that the analysis for adverse effects to the off-ramps that occur under the Project Buildout scenario, do not include the additional 9 percentage point trip reduction required under the Project's *Expanded TDM Program and Monitoring Plan* required as part of the EIR; thus the adverse effects would be lower than identified.

As an off-setting improvement consistent with the Project's multimodal and TDM goals, the project applicant will contribute to planned pedestrian and bicycle improvements at the Bird Avenue/I-80 Bicycle-Pedestrian multimodal connection from Diridon Station area to the Gardner community.

8.5 On-Ramp Capacity

This section presents on-ramps capacity for ramps within the study area. Within Santa Clara County, including San José, Caltrans operates ramp-meters. Ramp meters use dynamic metering rates based on queues on the freeways and ramps. The maximum metering rate used by Caltrans is 900 vehicles per hour per lane (vphpl). Each on-ramp was evaluated based on the maximum capacity of that on-ramp (i.e.,

number of on-ramp lanes x 900 vphpl). HOV by-pass lanes are served on demand, and they were not included in the capacity analysis. Of the total volume accessing the on-ramp, 15 percent were assumed to use the HOV lane where provided. The on-ramp capacity analysis is presented in **Table 54**.

Table 54: On-Ramp Capacity Analysis

On-Ramp	HOV By-Pass Lane	Maximum Capacity[1]	Mixed-Flow Demand[2]			
			Background Plus Project Buildout		Background Plus Goal-Based Project Buildout	
			AM	PM	AM	PM
SR 87 Southbound from Julian St	Yes	900	331	**1,056**	204	800
SR 87 Northbound from Julian St	Yes	1,800	686	965	662	834
SR 87 Southbound from Auzerais Ave	Yes	900	742	**998**	485	872
SR 87 Northbound from Park Avenue	Yes	900	719	**966**	654	793
I-280 Northbound from Bird Ave	No	1,800	619	874	499	861
I-280 Southbound from Bird Ave	No	900	**1,221**	866	885	866

Note:
1. Maximum Capacity = number of mixed-flow lanes x max metering rate of 900 vphpl.
2. Demand = total demand from ramp-terminal turning movements. Demand is reduced by 15% to account for HOV usage.

Bold/underlined text indicates on-ramp demand exceeds maximum capacity.
Source: Fehr & Peers, August 2020.

Based on the analysis results presented in **Table 54**, the southbound on-ramps at Julian Street, Auzerais Avenue, and Bird Avenue, as well as the northbound on-ramp at Park Avenue, would exceed the maximum capacity under the Background Plus Project Buildout scenario and queue onto the surface streets. The results under the Goal-Based scenario show that the maximum capacities meet project demand at all on-ramps.

On initial review of aerial photography, there does not appear to be sufficient right-of-way to provide additional on-ramp capacity at the Julian Street (southbound), Auzerais Avenue (southbound), Park Avenue (northbound), or Bird Avenue (southbound) on-ramps without completely rebuilding the on-ramps. It should be noted that the analysis for adverse effects to the on-ramps only occur under the Project Buildout scenario, which does not include the additional 9 percentage point trip reduction required under the Project's *Expanded TDM Program and Monitoring Plan* required as part of the EIR; thus the adverse effects would be lower than identified.

9. Congestion Management Program Analysis

This chapter includes CMP intersection and freeway level of service as required by VTA. CMP intersections are evaluated under the Background and Cumulative scenarios, where all three Project assumptions (Phase 1 Project, Project Buildout, and Goal-Based Project Buildout) are evaluated under Background Plus Project Conditions, and only the Goal-Based Project Buildout is evaluated under Cumulative plus Project Conditions. Freeway segments are evaluated under Existing Conditions, Existing Plus Project Buildout, and Existing Plus Goal Based Conditions.

9.1 CMP Intersections Analysis

This section presents the results of the intersection level of service calculations for the CMP intersections under Background Conditions without the Project and with the Project under the Phase 1 Project, Project Buildout, and Goal-Based Project Buildout assumptions; as well as cumulative No Project and Cumulative Plus Goal-Based Project Buildout Conditions.

9.1.1 Background Conditions

Traffic volumes for Background No Project Conditions are based on existing volumes plus traffic generated by approved but not yet constructed and/or occupied developments as summarized in **Section 2.4**.

Background with Project Conditions are defined as Background No Project Conditions plus traffic generated by each of the *Phase 1 Project*, *Project Buildout*, and *Goal-Based Project Buildout* assumptions. The peak hour vehicle trip estimates to and from the Project area are based on the trip estimates discussed in **Chapter 4 (Project Travel Demand)** and the turning movements shown in **Appendix D**. Impacts to the roadway system are identified by comparing the level of service results under each of the Background Plus Project Conditions to those under Background No Project Conditions.

Level of service calculations were applied to operations of the study CMP intersection under Background No Project and Background Plus Project Conditions. The results are presented in **Table 55**, **Table 56**, and **Table 57** along with the projected increases in critical delay and critical volume-to-capacity (V/C) ratios. The corresponding LOS calculation sheets are included in **Appendix C**.

Adverse effects are identified by comparing Background No Project and Background with each of the three Plus Project conditions. Adverse effects are identified based on the adverse effect criteria discussed in **Section 2.2**, which includes changes in the LOS from an acceptable to an unacceptable level or changes in critical delay and critical V/C ratio for intersections operating unacceptably.

9.1.1.1 Phase 1 Project Analysis

The LOS analysis results are summarized in **Table 55**. Under Background Plus Phase 1 Project conditions, all CMP intersections operate at acceptable levels and the Project is considered to have no adverse effects on CMP intersections.

Table 55: Background No Project and Background Plus Phase 1 Project CMP Intersection Levels of Service

ID	CMP Intersection	LOS Threshold[1]	Peak Hour[2]	Background No Project		Background Plus Phase 1 Project

9.1.1.1.1 Phase 1 Project CMP Adverse Effects and Improvements

Since all the CMP intersections studied for this analysis are projected to operate at acceptable service levels under Goal-Based Project Buildout scenarios, the Project does not have any adverse effects to CMP intersections, and no improvements are required.

9.1.1.2 Project Buildout Analysis

The LOS analysis results are summarized in **Table 56**. Under Background Plus Project Buildout conditions, all intersections operate at acceptable levels except the following intersection under the identified peak period:

- **Intersection #47 – First Street/Alma Avenue (LOS E Threshold):** the addition of Project traffic would degrade acceptable LOS E operations to unacceptable LOS F operations during the AM peak hour.

Under Background Plus Project Buildout conditions, all CMP intersections operate at acceptable levels and the Project is considered to have no adverse effects on CMP intersections.

Adverse effects are identified by comparing Background No Project and Background Plus Project Buildout conditions. Adverse effects are identified based on the adverse effect criteria discussed in **Section 2.2**, which includes changes in the LOS from an acceptable to an unacceptable level or changes in critical delay and critical V/C ratio for intersections operating unacceptably.

9.1.1.2.1 Project Buildout CMP Adverse Effects and Improvements

Adverse effects and potential improvements for Background Plus Project Buildout conditions are discussed below.

First Street/Alma Avenue (Intersection #47): Project Buildout scenario would exacerbate unacceptable intersection operations and meet the VTA's adverse effect threshold during the AM peak hour.

Improvements to address the adverse effect would need a second northbound left-turn lane from Monterey Highway (south of Alma Avenue First Street continue as Monterey Highway) onto westbound Alma Street. However, there are right-of-way constraints that limit the feasibility of the improvement measure. An additional turn lane would need a minimum width of ten feet and there currently is no additional right-of-way to accommodate an additional turn lane. Thus, the improvement measure would not be feasible, and the vehicle LOS adverse effect cannot be reduced for the Background Plus Project Buildout scenario. It should be noted, that with the goal-based mode split assumptions, the Project is not project to have an adverse effect at this intersection (see **Section 9.1.1.3**).

Further, South First Street-Monterey Highway is identified as a "Grand Boulevard" in *Envision San José 2040*. Grand Boulevards are intended as primary transit corridors where the accommodation of pedestrians is also an important goal as transit riders are pedestrians when they are not riding transit. Widening roadways increases pedestrian crossing distances; thus, widening of the roadway to provide a second left-turn lane would conflict with the functional intent of First Street-Monterey Highway and no improvements are identified for this intersection.

9.1.1.3 Goal-Based Project Buildout Analysis

The LOS analysis results are summarized in **Table 57**. Under Background Plus Goal-Based Project Buildout conditions, all CMP intersections operate at acceptable levels and the Project is considered to have no adverse effects on CMP intersections.

9.1.1.3.1 Goal-Based CMP Adverse Effects and Improvements

Since all the CMP intersections studied for this analysis are projected to operate at acceptable service levels under Goal-Based Project Buildout scenarios, the Project does not have any adverse effects to CMP intersections, and no improvements are required.

9.1.2 Cumulative Conditions

Traffic volumes for Cumulative No Project Conditions represent the year 2040 and are based on the City of San José's model as summarized in **Section 2.4**.

Cumulative with Project Conditions are defined as Cumulative No Project Conditions plus traffic generated by the Goal-Based Project Buildout assumptions. The peak hour vehicle trip estimates to and from the Project area are based on the trip estimates discussed in **Chapter 4 (Project Travel Demand)** and the turning movements shown in **Appendix D**. Impacts to the roadway system are identified by comparing the level of service results under each of the Cumulative Plus Goal-Based Project Buildout Conditions to those under Cumulative No Project Conditions.

9.1.2.1 Cumulative CMP Intersection Analysis

Level of service calculations were applied to operations of the study CMP intersection under Cumulative No Project and Cumulative Plus Goal-Based Project Buildout Conditions. The results are presented in **Table 58** along with the projected increases in critical delay and critical volume-to-capacity (V/C) ratios. The corresponding LOS calculation sheets are included in **Appendix C**.

Under Cumulative Plus Goal-Based Project Buildout conditions, all intersections operate at acceptable levels except the following intersections under the identified peak period:

- **Intersection #38 – The Alameda/Hedding Street (LOS E Threshold):** the addition of Project traffic would exacerbate unacceptable LOS F operations during the PM peak hour.
- **Intersection #39 – The Alameda/Naglee Street (LOS E Threshold):** the addition of Project traffic would exacerbate unacceptable LOS F operations during the PM peak hour.
- **Intersection #42 – Taylor Street/SR 87 Ramps (LOS E Threshold):** the addition of Project traffic would exacerbate unacceptable LOS F operations during the AM peak hour.
- **Intersection #46 – Fist Street/Goodyear Street (LOS E Threshold):** the addition of Project traffic would exacerbate unacceptable LOS F operations during the PM peak hour.

Source: Fehr & Peers, August 2020.

Adverse effects are identified by comparing Cumulative No Project and Cumulative Plus Goal-Based Project Buildout conditions. Adverse effects are identified based on the adverse effect criteria discussed in **Section 2.2**, which includes changes in the LOS from an acceptable to an unacceptable level or changes in critical delay and critical V/C ratio for intersections operating unacceptably.

9.1.2.1.1 Cumulative CMP Adverse Effects and Improvements

Adverse effects and potential improvements for Cumulative Plus Goal-Based Project Buildout conditions are discussed below.

The Alameda/Hedding Street (Intersection #38): The Goal-Based Project Buildout scenario would exacerbate unacceptable intersection operations and meet the VTA's adverse effect threshold during the PM peak hour.

Improvements to address the adverse effect would need a second southbound left-turn lane from The Alameda onto eastbound Hedding Street. However, there are right-of-way constraints that limit the feasibility of the improvement measure. An additional turn lane would need a minimum width of ten feet and there currently is no additional right-of-way to accommodate an additional turn lane. Thus, the improvement measure would not be feasible, and the vehicle LOS adverse effect cannot be reduced for the Cumulative Plus Goal-Based Project Buildout scenario.

Further, The Alameda is identified as a "Grand Boulevard" in *Envision San José 2040*. Grand Boulevards are intended as primary transit corridors where the accommodation of pedestrians is also an important goal as transit riders are pedestrians when they are not riding transit. Widening roadways increases pedestrian crossing distances; thus, widening of the roadway to provide a second left-turn lane would conflict with the functional intent of The Alameda and no improvements are identified for this intersection.

The Alameda/Naglee Street (Intersection #39): The Goal-Based Project Buildout scenario would exacerbate unacceptable intersection operations and meet the VTA's adverse effect threshold during the PM peak hour.

Improvements to address the adverse effect would need a second southbound left-turn lane from The Alameda onto eastbound Naglee Street. However, there are right-of-way constraints that limit the

feasibility of the improvement measure. An additional turn lane would need a minimum width of ten feet. There is an eight-foot median between the northbound and southbound travel lanes, but the provision of the second left-turn lane would need an additional two feet of right-of-way. Thus, the improvement measure would not be feasible, and the vehicle LOS adverse effect cannot be reduced for the Cumulative No Project and Cumulative Plus Goal-Based Project Buildout scenario.

Further, The Alameda is identified as a "Grand Boulevard" in *Envision San José 2040*. Grand Boulevards are intended as primary transit corridors where the accommodation of pedestrians is also an important goal as transit riders are pedestrians when they are not riding transit. Medians provide added areas of comfort for pedestrians as they cross streets; thus, the removal of the median to provide a second left-turn lane would conflict with the functional intent of The Alameda and no improvements are identified for this intersection.

Taylor Street/SR 87 (Intersection #42): The Goal-Based Project Buildout scenario would exacerbate unacceptable intersection operations and meet the VTA's adverse effect threshold during the AM peak hour.

Improvements to address the adverse effect would need a second northbound left-turn lane from the SR 87 northbound off-ramp onto westbound Taylor Street.

An additional turn lane would need a minimum width of ten feet and there currently is no additional right-of-way to accommodate an additional turn lane. Thus, the improvement measure would not be feasible, and the vehicle LOS adverse effect cannot be reduced for the Cumulative Plus Goal-Based Project Buildout scenario.

However, to support the Project's multimodal and TDM goals, the Project will contribute to the City/Caltrans programmed signal and bikeway improvements at the Taylor Street/SR 87 interchange. The programmed interchange improvements would improve safety for bicycles and pedestrians through the single point urban interchange (SPUI) at Taylor Street/SR 87 interchange by reallocating the existing cross section width to create a proposed bicycle buffer with vertical delineators for the existing bicycle facilities throughout the SPUI. Bicycle safety will be increased thru the interchange by highlighting conflict zones and better delineating motor vehicles and bicyclists in an effort to prevent collisions. The project also proposes a traffic signal modification to signalize the SR 87 southbound off-ramp and address the safety of bicyclists and pedestrians at this major unsignalized conflict zone. Work includes the installation of traffic signal poles on existing foundations, traffic vehicle heads, shallow detection loops, pedestrian signal heads, bicycle lane sensors, accessible pedestrian signals (APS), and new conductors in existing conduits.

First Street/Goodyear Street (Intersection #46): The Goal-Based Project Buildout scenario would exacerbate unacceptable intersection operations and meet the VTA's adverse effect threshold during the PM peak hour.

Improvements to address the adverse effect would need either a second northbound left-turn lane from First Street onto westbound Goodyear Street, or a southbound left-turn lane from First Street onto

eastbound Goodyear Street. However, there are right-of-way constraints that limit the feasibility of the improvement measure. An additional turn lane would need a minimum width of ten feet and there currently is no additional right-of-way to accommodate an additional turn lane. Thus, the improvement measure would not be feasible, and the vehicle LOS adverse effect cannot be reduced for the Cumulative Plus Goal-Based Project Buildout scenario.

Further, First Street is identified as a "Grand Boulevard" in *Envision San José 2040*. Grand Boulevards are intended as primary transit corridors where the accommodation of pedestrians is also an important goal as transit riders are pedestrians when they are not riding transit. Widening roadways increases pedestrian crossing distances; thus, widening of the roadway to provide a second left-turn lane would conflict with the functional intent of First Street.

However, to support the Project's multimodal and TDM goals, the Project applicant will contribute to the multimodal intersection improvements identified in the Story-Keyes Complete Streets Corridor project for the First Street/Goodyear Street intersection.

9.2 CMP Freeway Segment Analysis

This section presents the freeway segment analysis results for the Project Buildout Conditions under Existing Conditions, consistent with VTA guidelines.

9.2.1 Freeway Analysis

The results of the mixed-flow and HOV freeway segment analysis during the AM and PM peak hours under Existing with Project Interim conditions are shown in **Table 59** and under Existing with Project Buildout conditions shown in **Table 60**.

For mixed-flow lanes, freeway segment capacities are defined as 2,200 vehicles per hour per lane (vphpl) for four-lane freeway segments and 2,300 vphpl for six-lane freeway segments. HOV lane capacities are defined as 1,650 vphpl.

For the Existing Plus Project Interim scenario, 40 mixed-flow segments are estimated to operate at unacceptable LOS F during the AM peak hour, and 29 segments during the PM peak hour. Similarly, 18 HOV lane segments are estimated to operate at unacceptable LOS F during the AM peak hour, and seven segments during the PM peak hour.

For the Existing Plus Project Buildout scenario, 40 mixed-flow segments are estimated to operate at unacceptable LOS F during the AM peak hour, and 29 segments during the PM peak hour. Similarly, 21 HOV lane segments are estimated to operate at unacceptable LOS F during the AM peak hour, and seven segments during the PM peak hour.

9.2.2 CMP Freeway Segment Adverse Effects and Improvement Measures

Based on the results presented in **Table 59**, the Project has the following freeway adverse effects under the Existing Plus Project Phase 1 conditions:

- SR 87, Northbound, between Curtner Avenue and Almaden Road: mixed-flow and HOV in AM Peak Hour
- SR 87, Northbound, between Almaden Road and Alma Avenue: mixed-flow in AM Peak Hour
- I-280, Westbound, between US 101 and McLaughlin Avenue: mixed-flow in AM peak hour
- I-280, Westbound, between McLaughlin Avenue and 10th Street: mixed-flow in AM peak hour
- I-280, Eastbound, between I-880 and Meridian avenue: mixed-flow in PM peak hour
- I-680, Southbound, between Alum Rock Avenue and Capitol Expressway: mixed-flow in AM peak hour
- I-680, Southbound, between Capitol Expressway and King Road: mixed-flow in AM peak hour
- I-680, Southbound, between King Road and US 101: mixed-flow in AM peak hour
- I-880, Northbound, between North First Street and US 101: mixed-flow PM peak hour
- I-880, Southbound, between US 101 and North First Street: mixed-flow in AM peak hour

Based on the results presented in **Table 60**, the Project has the following freeway adverse effects under the Existing Plus Project Buildout conditions:

- SR 87, Northbound, between Curtner Avenue and Almaden Boulevard: mixed-flow and HOV in AM Peak Hour
- SR 87, Southbound, between US 101 and Skyport Drive: mixed-flow in PM peak hour
- SR 87, Southbound, between Julian Street and I-280: mixed-flow and HOV in PM peak hour
- SR 87, Southbound, between I-280 and Alma Avenue: mixed-flow and HOV in PM peak hour
- I-280, Westbound, between US 101 and McLaughlin Avenue: mixed-flow in AM peak hour
- I-280, Westbound, between 10th Street and SR 87: mixed-flow in AM peak hour
- I-680, Southbound, between Alum Rock Avenue and Capitol Expressway: mixed-flow in AM peak hour
- I-680, Southbound, between Capitol Expressway and King Road: mixed-flow in AM peak hour
- I-680, Southbound, between King Road and US 101: mixed-flow in AM peak hour
- I-880, Southbound, between Montague Expressway and Brokaw Road: mixed-flow in AM peak hour
- I-880, Northbound, between North First Street and US 101: mixed-flow PM peak hour
- I-880, Southbound, between Brokaw Road and US 101: mixed-flow in AM peak hour
- I-880, Southbound, between US 101 and North First Street: mixed-flow in AM peak hour

There are limited options to widen the impacted freeway segment due to right-of-way constraints. Additionally, the widening of roadways can lead to other effects, such as induced travel demand (e.g., more vehicles on the roadway due to increased capacity), air quality degradation, increases in noise associated with motor vehicles, and reductions in transit use (less congestion or reduced driving time may make driving more attractive than transit travel).

The VTA's VTP 2040 identifies the following freeway projects that are relevant to the identified freeway segment adverse effects:

- **VTP ID H4: SR 87 Express Lanes (SR 85 to US 101):** This project converts HOV lanes to express lanes on SR 87. Cost in 2013 dollars: $35 million.
- **VTP ID H11: I-280 Express Lanes (Leland Avenue to Magdalena Avenue):** This project converts HOV lanes to express lanes on I-280 between Leland Avenue and Magdalena Avenue. Cost in 2013 dollars: $58 million.
- **VTP ID H15: I-880 Express Lanes (US 101 to I-280):** this project builds new express lanes on I-880 between US 101 and I-280. Cost in 2013 dollars: $186 million.

Complete improvement of freeway impacts is considered beyond the scope of an individual development project, due to the inability of any individual project or City to fully fund a major freeway mainline improvement. Thus, consistent with the Project's multimodal and TDM goals, the Project applicant is not required to provide any freeway capacity enhancements.

Notes:

1. Level of service based on density, measured in passenger cars per mile per lane.
2. Mixed = Mixed-Flow.
3. HOV = High-Occupancy Vehicle.
4. >1% volume increase = are the added Project trips greater than 1% of the freeway segments density.

n/a = not applicable. Freeway segment does not have HOV lanes.

Bold/underlined text indicates unacceptable operations (LOS F); **Bold/highlighted** text indicates freeway adverse effect.

10. Parking Assessment

This chapter compares the Project's proposed parking supply to the City of San José's parking supply requirements. This chapter also discusses the City of San José's parking agreement with the SAP Center.

10.1 Off-Street Parking Supply Requirements

The City of San José's Municipal Code §20.70 ("Parking Code") defines the vehicle parking supply requirements for developments within Downtown San José. Additionally, Municipal Code §20.70.485 and §20.90 define bicycle parking supply requirements for all land uses. **Table 61** below presents the vehicle and bicycle parking supply requirements for the land uses included in the Plan.

Table 61: City of San José Parking Supply Requirements by Land Use

Land Use	Parking Spaces Required[1]	
	Vehicle	Bicycle
Offices, business and administrative	2.5 spaces per 1,000 sf[2]	1 space per 4,000 sf[2,3]
Residential, multiple dwelling	1 space per du	1 space per 4 du[4]
Retail sales, goods and merchandise	*No parking required*	2 short-term spaces and 1 long-term space per store[5]
Hotel or motel	0.35 spaces per room	1 space plus 1 per 10 guest rooms[3]
Event Center	*No parking required*	2 short-term spaces and 1 long-term space[5]

Notes:
1. sf=square feet; du=dwelling units
2. Per Municipal Code §20.90.050, "floor area" is defined as eighty-five percent of the "total gross floor area" of the building. Thus, parking supply requirement for offices, business and administrative, is calculated based on 85% total gross floor area.
3. At least 80 percent of the bicycle parking spaces shall be provided in short-term bicycle parking facilities and at most 20 percent shall be provided in long-term bicycle facilities.
4. Bicycle parking spaces shall consist of at least 60 percent long-term and at most 40 percent short-term spaces.
5. Per Municipal Code §20.70.485, land uses that do not require any off-street parking for motorized vehicles shall be required to provide only two short-term bicycle parking spaces and one long-term bicycle parking space per store or event center.

Source: City of San José Municipal Code, 2020.

Based on Municipal Code §20.70.330.A, a project may receive up to a 15 percent reduction in the required off-street parking spaces when the project has developed a TDM program with evidence that parking demand will be reduced. Also, mixed-use projects may qualify for a 50 percent reduction in required parking supply if it is proven that the reduction in parking supply will not adversely affect surrounding projects or facilities based on Municipal Code §20.70.330.B.

The proposed land uses presented in **Section 1.1.1** and parking supply requirements presented in the table above were used to calculate the Project's required parking supply, as shown in **Table 62**.

Table 62: Required Parking Supply

Land Use	Size[1]	Parking Spaces Required			
		Vehicle		Bicycle	
		Rate	Spaces	Rate	Spaces
Offices, business and administrative	7,300,000 sf GFA	2.5 spaces per 1,000 sf[2]	15,513	1 space per 4,000 sf[2,3]	1,552
Residential, multiple dwelling	5,900 du	1 space per du	5,900	1 space per 4 du[4]	1,475
Retail sales, goods and merchandise	500,000 sf	*No parking required*	0	2 short-term spaces and 1 long-term space per store[6]	150
Hotel or motel (Limited term accommodations)	300 rooms	0.35 spaces per room	105	1 space plus 1 per 10 guest rooms[3]	31
	800 rooms		280		81
Event Center	100,000 sf	*No parking required*	0	2 short-term spaces and 1 long-term space[6]	3
Required Parking Supply without reductions (A)		**-**	**21,798**	**-**	**3,292**
TDM Program Reduction (B=A x 15%)		**-**	***3,096***	**-**	***n/a[5]***
Required Parking Supply with TDM Program Reduction (C=A-B)		**-**	**18,702**	**-**	**3,292**
Mixed-use Project Reduction (D=C x 50%)		**-**	***9,351***	**-**	***n/a[5]***
Required Parking Supply with Mixed-use Project and TDM Program Reductions (E=C-D)		**-**	**9,351**	**-**	**3,292**

Notes:

1. sf=square feet; du=dwelling units; GFA = gross floor area
2. Per Municipal Code §20.90.050, "floor area" is defined as eighty-five percent of the "total gross floor area" of the building. Thus, parking supply requirement for offices, business and administrative, is calculated based on 85% total gross floor area (7,300,000 sf GFA x 85% = 6,205,000 sf)
3. At least 80 percent of the bicycle parking spaces shall be provided in short-term bicycle parking facilities and at most 20 percent shall be provided in long-term bicycle facilities.
4. Bicycle parking spaces shall consist of at least 60 percent long-term and at most 40 percent short-term spaces.
5. n/a = parking reductions are not applied to bicycle parking.
6. Per Municipal Code §20.70.485, land uses that do not require any off-street parking for motorized vehicles shall be required to provide only two short-term bicycle parking spaces and one long-term bicycle parking space per store or event center. This assessment assumes each store will be 10,000 square feet on average.

Source: City of San José Municipal Code; Fehr & Peers, 2020.

As presented in **Table 62**, the Project is required to supply a total of 21,798 vehicle parking spaces and 3,292 bicycle parking spaces without any reductions per City of San José Municipal Code requirements. With the 15% TDM program reduction for vehicle parking, the Project is required to supply a total of 18,702 vehicle parking spaces and 3,292 bicycle parking spaces. With the additional 50% mixed-use Project reduction, the Project is required to supply a total of 9,351 vehicle parking spaces and 3,292 bicycle parking spaces.

10.2 Parking Supply Assessment

The Project proposes to provide up to 4,800 publicly accessible and/or commercial parking spaces to meet the demand for parking of site-specific users and the public, and up to 2,360 parking spaces for the Project's residential uses. In total, the Project will provide up to 7,160 vehicle parking spaces. Including the mixed-use Project reduction and TDM Program reduction, the Project will provide 2,104 fewer parking spaces than required by the City of San José's current Parking Code.

However, the City's current Parking Code does not reflect the City's vision for Downtown. As noted earlier, Envision San José 2040 outlines a vision where San José shifts from being an auto-dependent community to a multimodal one, where most trips are made by walking, biking, transit, or carpool. Specifically, the Project area would need to have 75 percent non-SOV mode split, to support the citywide goal of at least 60 percent of commute trips completed by walking, biking, transit, and carpool. Since the availability of parking encourages driving[17], providing less parking will encourage more trips to be completed via alternative modes and support the City's ambitious multimodal access/non-SOV goal.

In this context, the proposed parking supply, which represents a 67 percent reduction from the Project's baseline parking requirement, is in alignment with the City's vision for Downtown and directly furthers its mode split goal for the Project area. A detailed parking evaluation for the commercial parking supply is included in **Appendix G**.

10.2.1 TDM Elements that Affect Parking

The Project's features, proposed multimodal improvements, and access to transit TDM have an effect on reducing the Project's overall parking demand. Free and available parking encourages vehicle trips.[18] To reduce the Project's parking demand, the Project will implement parking policies, including a reduced parking supply, as well as market-rate parking pricing for non-residential uses and unbundled parking for market rate residential uses. The California Air Pollution Control Officers Association (CAPCOA) concludes that the following parking strategies that individually can reduce travel up to the indicated rage: limited parking supply up to 12.5 percent; unbundled parking costs up to 13.0 percent; on-street marked pricing

[17] https://www.sciencedirect.com/science/article/abs/pii/S0967070X11001028
[18] "Parking facilities and the built environment: Impacts on travel behavior" Christiansen, et.al., 2017

up to 5.5 percent.[19] Combined, these parking strategies can achieve a maximum reduction in travel of up to 20 percent, thus reducing the Project's travel demand.

If parking spaces are ample and offered free of charge, the appeal of driving will increase significantly, even in contexts and conditions that offer compelling alternatives to driving, such as that of the Project site. For example, a 2015 study found that an increase in parking provision from 0.1 to 0.5 parking spaces per person is associated with a 30 percentage point increase in SOV mode share.[20] By contrast, parking supply conditions in which authorized spaces are difficult to find, or costly to use, will reduce the appeal of driving, particularly where and when non-driving travel options are compelling on their own merits. This underscores the importance for the Project and new development in the downtown to both anticipate and help create the parking supply conditions necessary to realize the City's mode shift and multimodal goals.

To further reduce the need for travel, the Project's Enhanced TDM Program required as part of the Project's EIR mitigation measures, includes several key measures that will reduce the Project's parking demand by encouraging multimodal travel, as discussed in **Section 1.1.3**).

10.2.2 Bicycle and Pedestrian Infrastructure

The Project will also contribute to several bicycle and pedestrian infrastructure improvements within and outside of the Project area. For example, Class IV protected bicycle facilities are planned along Park Avenue, West San Fernando Street, and West Santa Clara Street. These facilities will connect the Project to surrounding neighborhoods and transit stations. Additionally, sidewalk widenings, plazas, and new street trees are planned for public areas in the immediate vicinity, which will improve comfort for pedestrians and increase walkability in the Project area. (These improvements are described in greater detail in **Section 1.1.4.4** and **Section 1.1.4.5**, and shown on **Figure 3** and **Figure 4**). Physical bicycle and pedestrian improvements like those included in the Project encourage travelers to use non-vehicular modes of travel to and from the site. As travelers choose to make more trips by bicycle and walking, driving trips and car ownership will decrease, reducing the parking demand as well.

10.2.3 Transit Service

Furthermore, major transit projects are planned near the Project area. Specifically, VTA's Bart Silicon Valley Extension, California High-Speed Rail, Caltrain Electrification, and the Caltrain Business Plan will all contribute to greater transit connectivity for employees and residents near Diridon Station. These improvements are anticipated to substantially increase transit ridership for nearby developments, including the proposed Project. As transit connectivity improves, the need for driving and car ownership will decrease such that parking demand will as well. Although these improvements are not directly

[19] "Quantifying Greenhouse Gas Mitigation Measures: A Resource for Local Government to Assess Emission Reductions from Greenhouse Gas Mitigation Measures," California Air Pollution Control Officers Association (CAPCOA), August 2010.

[20] "Effects of Parking Provision on Automobile Use in Cities: Inferring Causality," McCahill, Garric, Atkinson-Palombo, and Polinski, November 13, 2015

associated with the Project, they will contribute to the City's mode split goal and ultimately lower the Project's need for vehicle parking.

10.3 Bicycle Parking Requirements

As noted in **Table 62** the Project is required to provide 3,292 bicycle parking spaces, of which 1,552 would be for office uses, 1,475 would be required for residential uses, and 265 spaces for the remaining land uses.

Bike parking is categorized into two types by duration of use: short-term and long-term. Short-term bike parking provides a bike rack to lock a bike for a few minutes to a few hours. Common examples include bike racks in front of a retail store or restaurant. Short-term bike parking emphasizes convenience over security: racks must be near destinations such as storefronts. Long-term parking, on the other hand, provides a protected enclosure for a higher degree of security. Common examples include employee bike lockers, bike cages, bike stations at transit centers, and dedicated indoor office space such as a secure storage room.

Per City requirement, at least 60 percent of the residential bicycle parking, or 885 spaces (1,475 x 60%) would need to be long-term bicycle parking facilities. For the office and hotel land uses, the long-term parking requirement is at most 20 percent, or 333 spaces (1,664 x 20%). Additionally, for each land use with no parking requirement, one long-term parking space must be provided. Thus, of the total 3,292 bicycle parking spaces, 1,269 would need to be long-term spaces. Including a higher portion of long-term bicycle parking for residential uses and/or including a lower portion of long-term bicycle parking for office/hotel land uses is permissible per City requirements.

It should be noted that these are the minimum requirements to meet City of San José standards. Given the location of the Project in the downtown and the long-term vision for a more robust multimodal system, additional bicycle parking should be provided to maximize bicycle use in the Project area.

The Project would provide at least 3,292 bicycle parking spaces. Therefore, the Project meets the bicycle parking supply requirements outlined in the Municipal Code.

10.4 SAP Center

The City of San José is required to provide a certain number of available, public parking spaces for events at the SAP Center. Specifically, the Arena Management Agreement (AMA, comprehensive agreement between the City and San José Arena Management, provides that the City must ensure a minimum number of parking spaces close to the arena throughout the term of the AMA, which ends in 2040. Most of these parking spaces are currently in surface parking lots within the Project area. With Project Buildout, many surface parking lots will be redeveloped into mixed-use buildings with parking garages. The City of San José is working with the Project sponsor to ensure that the parking supply required by this agreement is maintained throughout the construction process and after completion of the Project.

10.5 BART Silicon Valley Phase II

VTA's BART Silicon Valley Phase II project will extend BART service six miles from the Berryessa Transit Center through downtown San José, terminating at the Santa Clara Transit Center. VTA estimates that Phase II will carry 52,000 passengers to destinations throughout the Bay Area by 2035.

During BART construction at Diridon Station, some parking lots will be reserved for storage of construction vehicles and equipment. This will cause a temporary shortage of local parking supply for the Project area and neighboring uses. When construction is complete, some, but not all, of the reserved parking lots will be reopened. BART service will increase transit accessibility for the Project area, reducing the need for parking and private vehicle ownership. It is anticipated that the decrease in parking demand will offset the removal of parking lots due to BART construction.

11. Neighborhood Traffic and Parking Intrusion Monitoring Framework

This chapter outlines the neighborhood and parking intrusion management framework strategy for the Project. The City requires a neighborhood traffic intrusion analysis when a project is expected to potentially result in excessive speeds, volumes, and/or parking intrusion on neighborhood streets. As the Project area develops, the Project has the potential to add traffic to residential streets in adjacent neighborhoods west of the Diridon Station, north and south of The Alameda, especially if the operations of intersections in and around the Project area deteriorate and vehicle drivers seek alternate travel routes. Additionally, with the constrained parking supply, overflow parking may also encroach into adjacent neighborhoods. This chapter includes a description of existing City policies as well as a summary of monitoring locations and potential neighborhood and parking intrusion management strategies that could be included in the final Traffic and Parking Intrusion Monitoring Plans. The final monitoring plans would be reviewed and approved by the Directors of Public Works and Planning, Building, and Code Enforcement or the Directors' designees prior to or concurrent with the adoption of the Planned Development Permit. The final monitoring plans should be responsive to future changes in data collection methodologies and technologies that may allow for more accurate, time-efficient, and/or cost-efficient monitoring procedures.

11.1 Neighborhood Traffic/Speeding and Parking Intrusion Analysis Requirements

The City of San José *Transportation Analysis Handbook* (2018) outlines the requirements for monitoring potential neighborhood cut-through traffic, speeding concerns, and parking intrusion from the trips generated by developments. After project approval, initial monitoring data would be collected to establish the initial baseline to which future conditions would be compared. To more accurately measure the Project's effect, baseline data would be reestablished as major changes to the background conditions occur that would potentially increase neighborhood and parking intrusion from other uses, such as after Caltrain Electrification, BART to Diridon station, or construction of other major developments in the area. Regular monitoring would occur after the Project is constructed and occupied to ensure surrounding neighborhoods do not experience excessive cut-through traffic, speeding, and/or parking spillover. If the Project is found to exceed established thresholds, specific actions would be required to reduce the effect of the increased traffic and/or parking in the area due to the Project.

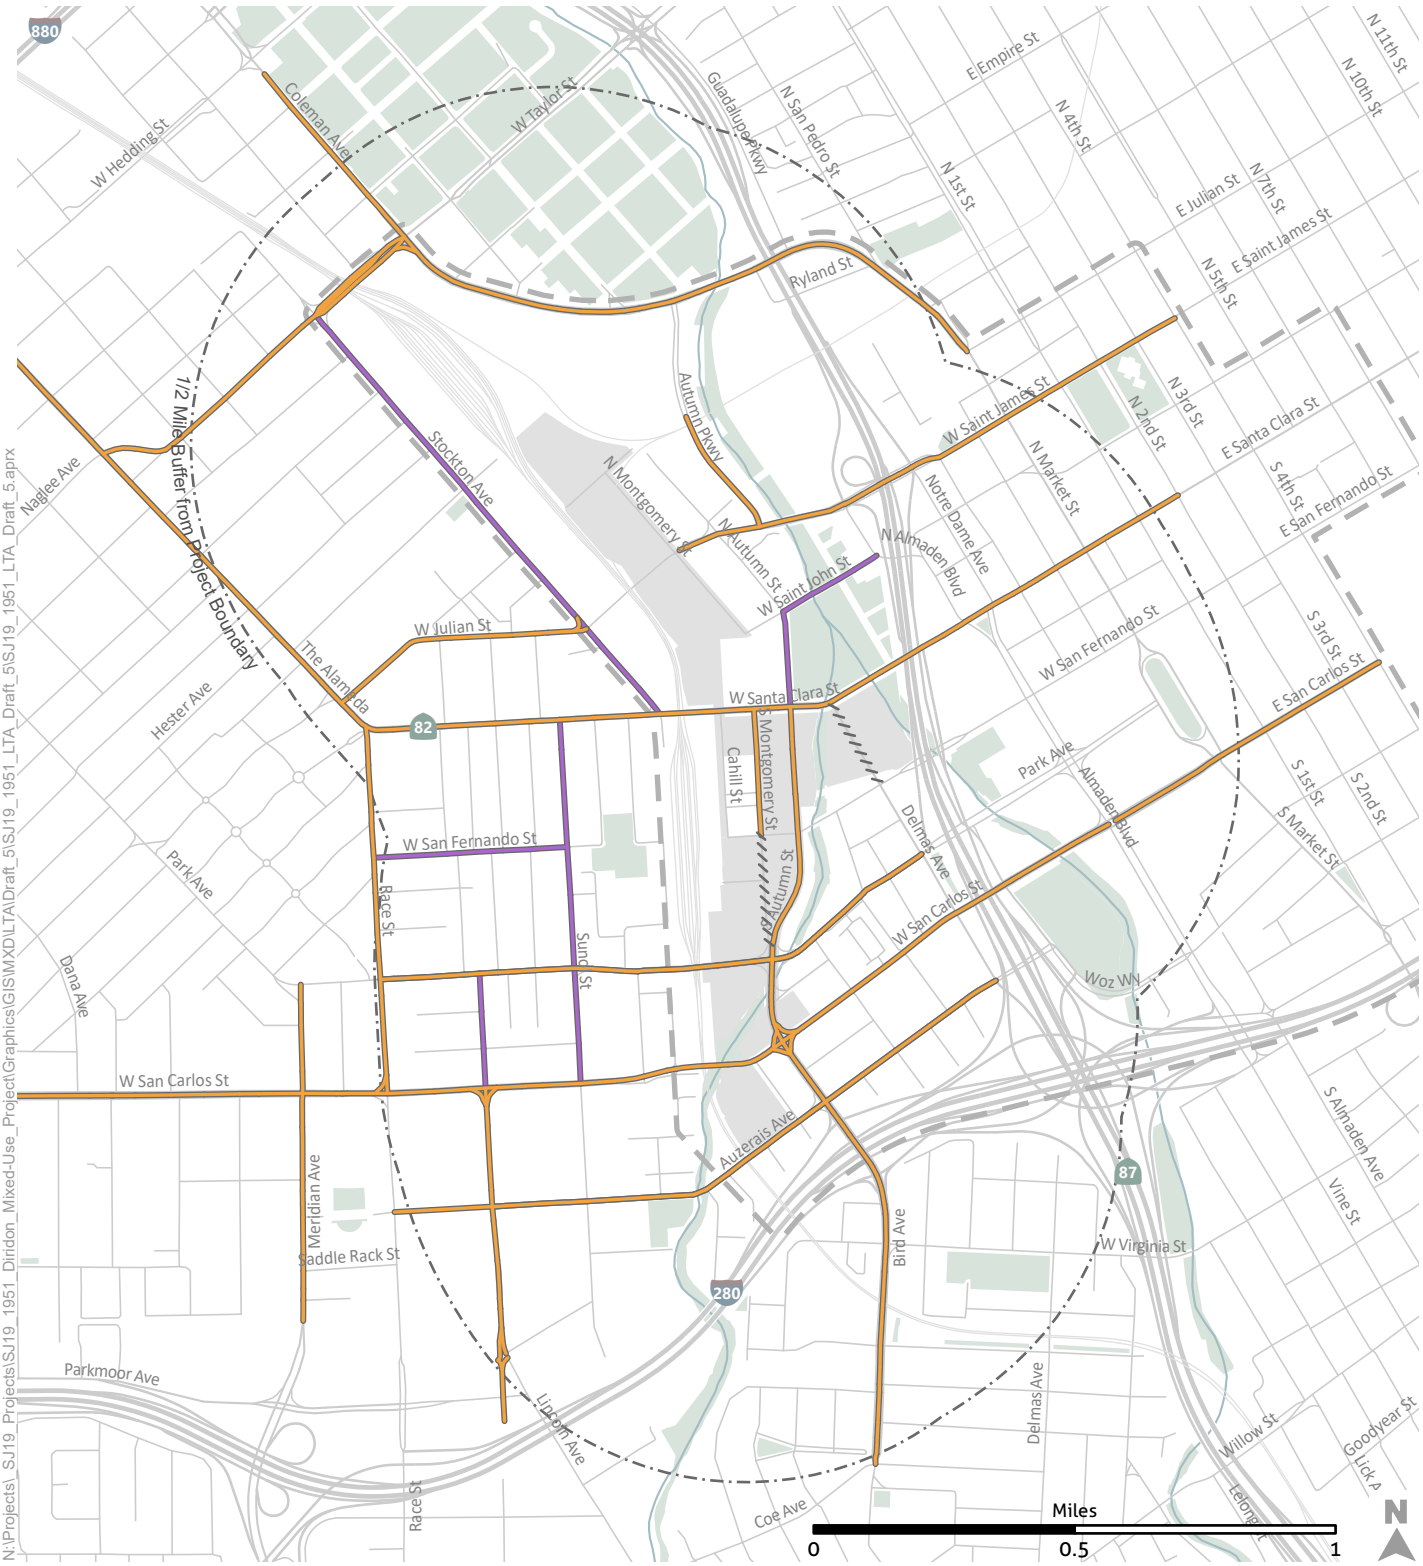
11.2 Cut-Through Traffic and Speeding Monitoring

While most of the Project-generated vehicle traffic would occur on major through streets in the area, some vehicle trips may divert onto neighborhood streets, especially during peak times when major thoroughfares are congested. This can create higher traffic volumes and increased wear on neighborhood streets that are not designed to accommodate higher traffic volumes, as well as increase the potential for conflicts with neighborhood residents who are walking and bicycling. Speeding may also be a concern through these neighborhood streets during peak times when major arterials are more congested.

11.2.1 Project Trip Generation

As described in **Chapter 4**, Project Buildout (which is the highest trip generator) would result in 7,900 new vehicle trips in the AM peak hour, 8,900 new vehicle trips in the PM peak hour, and a total of 95,700 new vehicle trips on a typical weekday. During the peak periods, around 60 percent of trips would occur in the peak direction (inbound toward the site in the AM peak hour and outbound away from the site in the PM peak hour). **Figure 28** shows the estimated trip assignment for the Project Buildout scenario.

11.2.2 Cut-Through Traffic and Speeding Analysis Methods



Consistent with City practices, neighborhood collectors and local streets within one-half mile of the Project were identified to be analyze for potential cut-through traffic. Streets south of I-280 and east of SR 87 were excluded since few local streets connect across freeways. Neighborhood streets that connect two major streets or run parallel to a major corridor have the highest potential for cut-through traffic and speeding.

11.2.3 Locations for Potential Cut-Through Traffic and Speeding

The Project's trip assignment and the local street grid were reviewed to identify likely cut-through traffic locations. The streets most likely to have Project-generated cut-through traffic and speeding are shown in **Figure 38**. Per City guidelines, these streets are

- classified as local or neighborhood collectors,
- connect or run parallel to major thoroughfares, and
- are likely to carry higher volumes of cut-through traffic or speeding based on the traffic assignment.

While these are initial assumptions based on available data, travel behavior related to cut-through traffic is hard to predict. The monitoring approach detailed in the subsequent section is designed to capture the areas most likely to be affected; however, the final Neighborhood Traffic Intrusion Plan should be flexible and should be adjusted to reflect observed travel patterns in surrounding neighborhoods.

11.2.4 Monitoring Framework

This section outlines the monitoring framework components to evaluate possible future neighborhood cut-through traffic and speeding, as well as, strategies to address identified issues. The monitoring framework would be incorporated into the final Parking Intrusion Monitoring Plan.

11.2.4.1 Data Collection

Per San José's *Transportation Analysis Handbook*, at least two sets of vehicle speed and volume counts should be conducted to evaluate cut-through traffic and speeding:

- **Baseline counts** should be conducted after Project approval and before construction begins, which would likely be in 2020 or 2021. Baseline counts should be conducted at the likely cut-through traffic locations identified on **Figure 38**. Baseline counts would periodically need to be reestablished as major changes to the background conditions occur that would potentially increase neighborhood traffic intrusion from other uses, such as after Caltrain Electrification, BART to Diridon station, or construction of other major developments in the area.
- **Interim post-occupancy counts:** The Project is expected to take several years to be fully constructed. If cut-through traffic becomes a concern before the Project is complete, an interim set of counts could be conducted when Phase 1b of the Project is 75 percent occupied.
- **Post-occupancy counts** should be conducted after the Project has been completed and occupied for six to 12 months. After the first post-occupancy counts, monitoring counts would occur annually for no more than four years, as requested by the City. These counts should be conducted at the same monitoring locations shown on **Figure 38**.

The current uses around the Project area, including the SAP Center and Diridon Station, may already be responsible for a share of cut-through traffic and potentially speeding on nearby streets. As the Project is built and new development continues in the Diridon neighborhood, cut-through traffic and speeding may increase overall even if it is not generated by the Project. The Project would be responsible for the monitoring program and its proportional share of the costs to implement these strategies, as needed.

All data collection should take the form of 48-hour speed and volume studies, conducted by a third-party count specialist or consultant. To best capture typical conditions, counts should be conducted on a Tuesday, Wednesday, or Thursday in the spring or fall when schools are in session during a week without holidays. The consultant would prepare a memorandum comparing the post-occupancy counts to the baseline counts as well as to the Project's initial trip distribution assessment (**Figure 28**) to evaluate if traffic intrusion is occurring on neighborhood streets.

11.2.4.2 Levels of Traffic Calming Measures

Per the City of San José's *Transportation Analysis Handbook* (2018), a project may be required to construct traffic calming measures if traffic generated by the project results in excessive traffic speeds or traffic volumes on neighborhood streets.[21]

The City's Traffic Calming Policy establishes criteria for two levels of traffic calming:

- **Basic traffic calming** includes installation of traffic control devices, traffic enforcement, and safety education;
- **Comprehensive traffic calming measures** are physical roadway design features or dynamic signage or warning systems and are considered on residential, two-lane local or neighborhood collector streets with a maximum posted speed of 30 mph.[22]

11.2.4.3 Cut-Through Traffic Thresholds

Streets must meet one of the following thresholds to be considered for traffic calming treatments:

- Local Streets with a posted speed limit of 25 mph and 1,000-3,000 vehicles per day
    - 85th percentile speed of 33 mph or more, or
    - 40 percent or more of daily traffic is cut-through traffic
- Neighborhood Collector Streets with a posted speed limit of 25 mph or 30 mph and 1,000-6,000 vehicles per day
    - 85th percentile speed of 33 mph or more on 25 mph posted streets, or
    - 85th percentile speed of 37 mph or more on 30 mph posted streets

If a street included in the intrusion monitoring program for the proposed Project meets one of these thresholds, it is a candidate for traffic calming measures. The consultant would coordinate with City staff to review the analysis and determine if and what types of traffic calming measures should be implemented to eliminate or minimize the portion of the adverse impacts resulting from the Project.

11.2.5 Cut-Through Traffic and Speeding Management Strategies

Table 63 lists the traffic calming options included in the City's Toolkit. It also identifies the level of estimated cost and secondary effects of implementing each strategy. As Diridon Station develops, there is potential for additional neighborhood cut-through traffic due to increased use of the existing Diridon Station, SAP Center, and other local destinations. The Project would be responsible for its proportional share of the costs to implement these strategies, as needed.

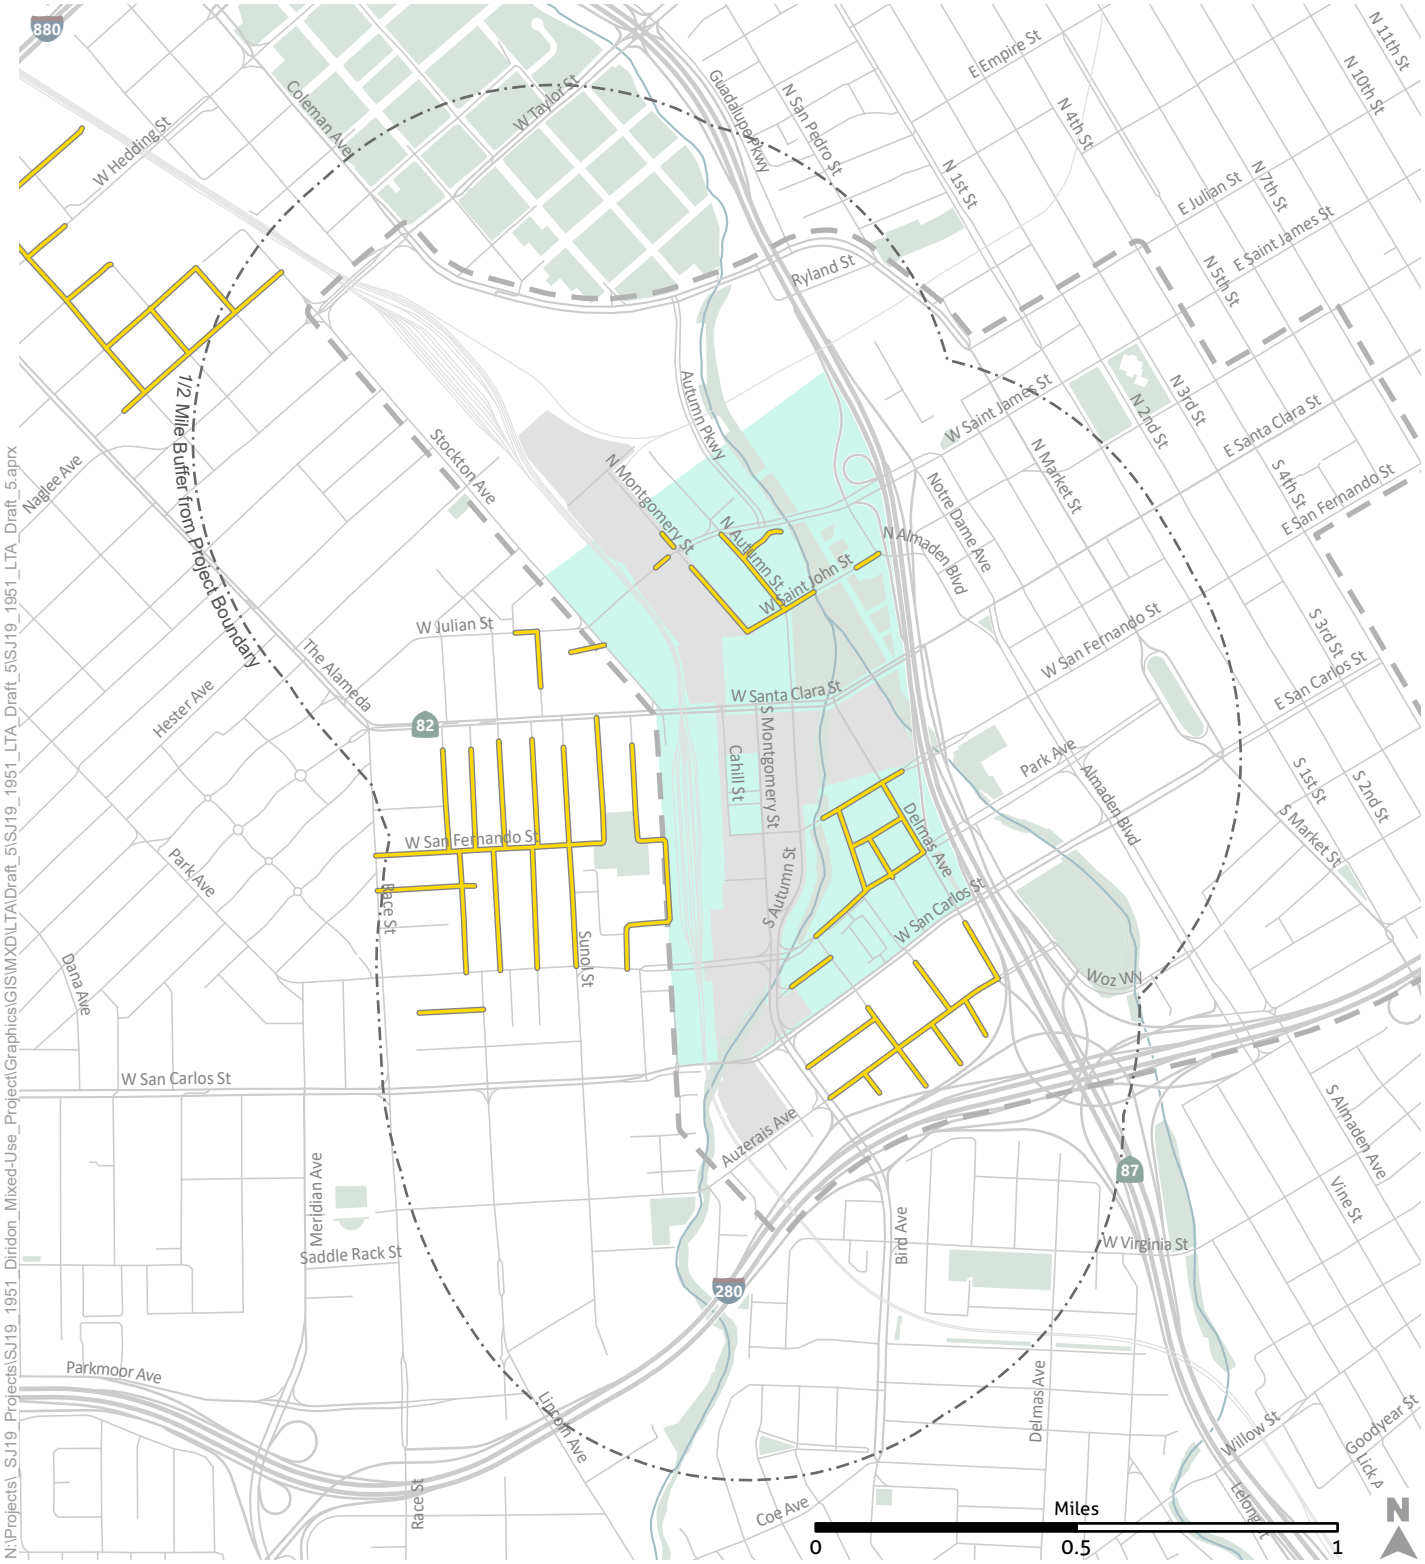
11.3 Parking Intrusion Monitoring

The Project has proposed a total parking supply of no more than 7,160 spaces; of which no more than 4,800 publicly available parking spaces would be provided for the commercial uses and no more than 2,360 spaces would be provided the for residential uses. In addition, the Project includes market-rate parking pricing for commercial uses and unbundled parking for residential uses. The proposed commercial parking supply is lower than required by City code; though is anticipated to meet the site's demand as discussed in **Chapter 10**. However, having a reduced parking supply and parking pricing could result in some drivers choosing to try and find parking in the surrounding neighborhoods by either driving when viable non-driving options are not available or avoiding paying for parking. This could

adversely affect nearby residents and businesses that rely upon on-street parking, and the Project is required to have a parking monitoring plan to evaluate nearby neighborhoods for parking intrusion.



11.3.1 Existing Parking Program and Meter Areas

Currently, there are seven residential parking programs (RPPs) on streets within one-half mile of the Project, as shown on **Figure 39** and summarized below:

- College Park
- Garden/Alameda
- St. Leo's
- Cahill Park
- Autumn/Montgomery
- Parkside
- Delmas Park

Six of the RPPs offer unlimited residential permits and two guest permits per residence. Cahill Park does not offer any residential permits and only one guest permit per residence. All seven programs offer business permit parking for employees depending on the availability of off-site parking and visitor parking needs.

The Arena/Diridon Area Parking Meter District encompasses a portion of the Project area, bounded by Cinnabar Street on the north, White Street on the west, W San Carlos Street on the north, and SR 87 on the east. The meters in this district have variable time limits and hours of implementation. **Figure 39** also shows the location of the Arena/Diridon Area Parking Meter District.

11.3.2 Parking Spillover Locations

Existing parking restrictions and street connectivity near the Project were reviewed to identify potential locations for spillover parking due to the Project. Several parking spillover locations were identified within one-half mile of the Project. Project residents and workers are unlikely to park more than a ten-minute walk (or one-half mile) from the Project, and they are also unlikely to park west of SR 87, since most of the parking in downtown San José is already time restricted or fee-based. The Bird Avenue overpass is walkable, so the streets south of I-280 were included in the potential spillover parking locations. It is also unlikely that streets with residential parking programs would be used due to the possibility of getting a ticket for parking in these locations, though increased enforcement may be necessary to continue the effectiveness of the existing RPPs.

Figure 40 shows the most likely parking spillover locations near the site. While these are initial assumptions based on available data, future parking patterns are hard to predict. The monitoring approach detailed in the subsequent section is designed to capture the areas most likely to be affected; however, the final Parking Monitoring Plan should be flexible and should be adjusted to reflect observed parking patterns in surrounding neighborhoods.

11.3.3 Monitoring Framework

This section outlines the monitoring framework components to evaluate possible parking spillover in the neighborhood surrounding the Project and identifies strategies to address parking spillover issues that may arise. The monitoring framework would be incorporated into the final Parking Intrusion Monitoring Plan.

11.3.3.1 Data Collection

Per San José's *Transportation Analysis Handbook*, at least two parking surveys should be conducted to evaluate potential parking spillover:

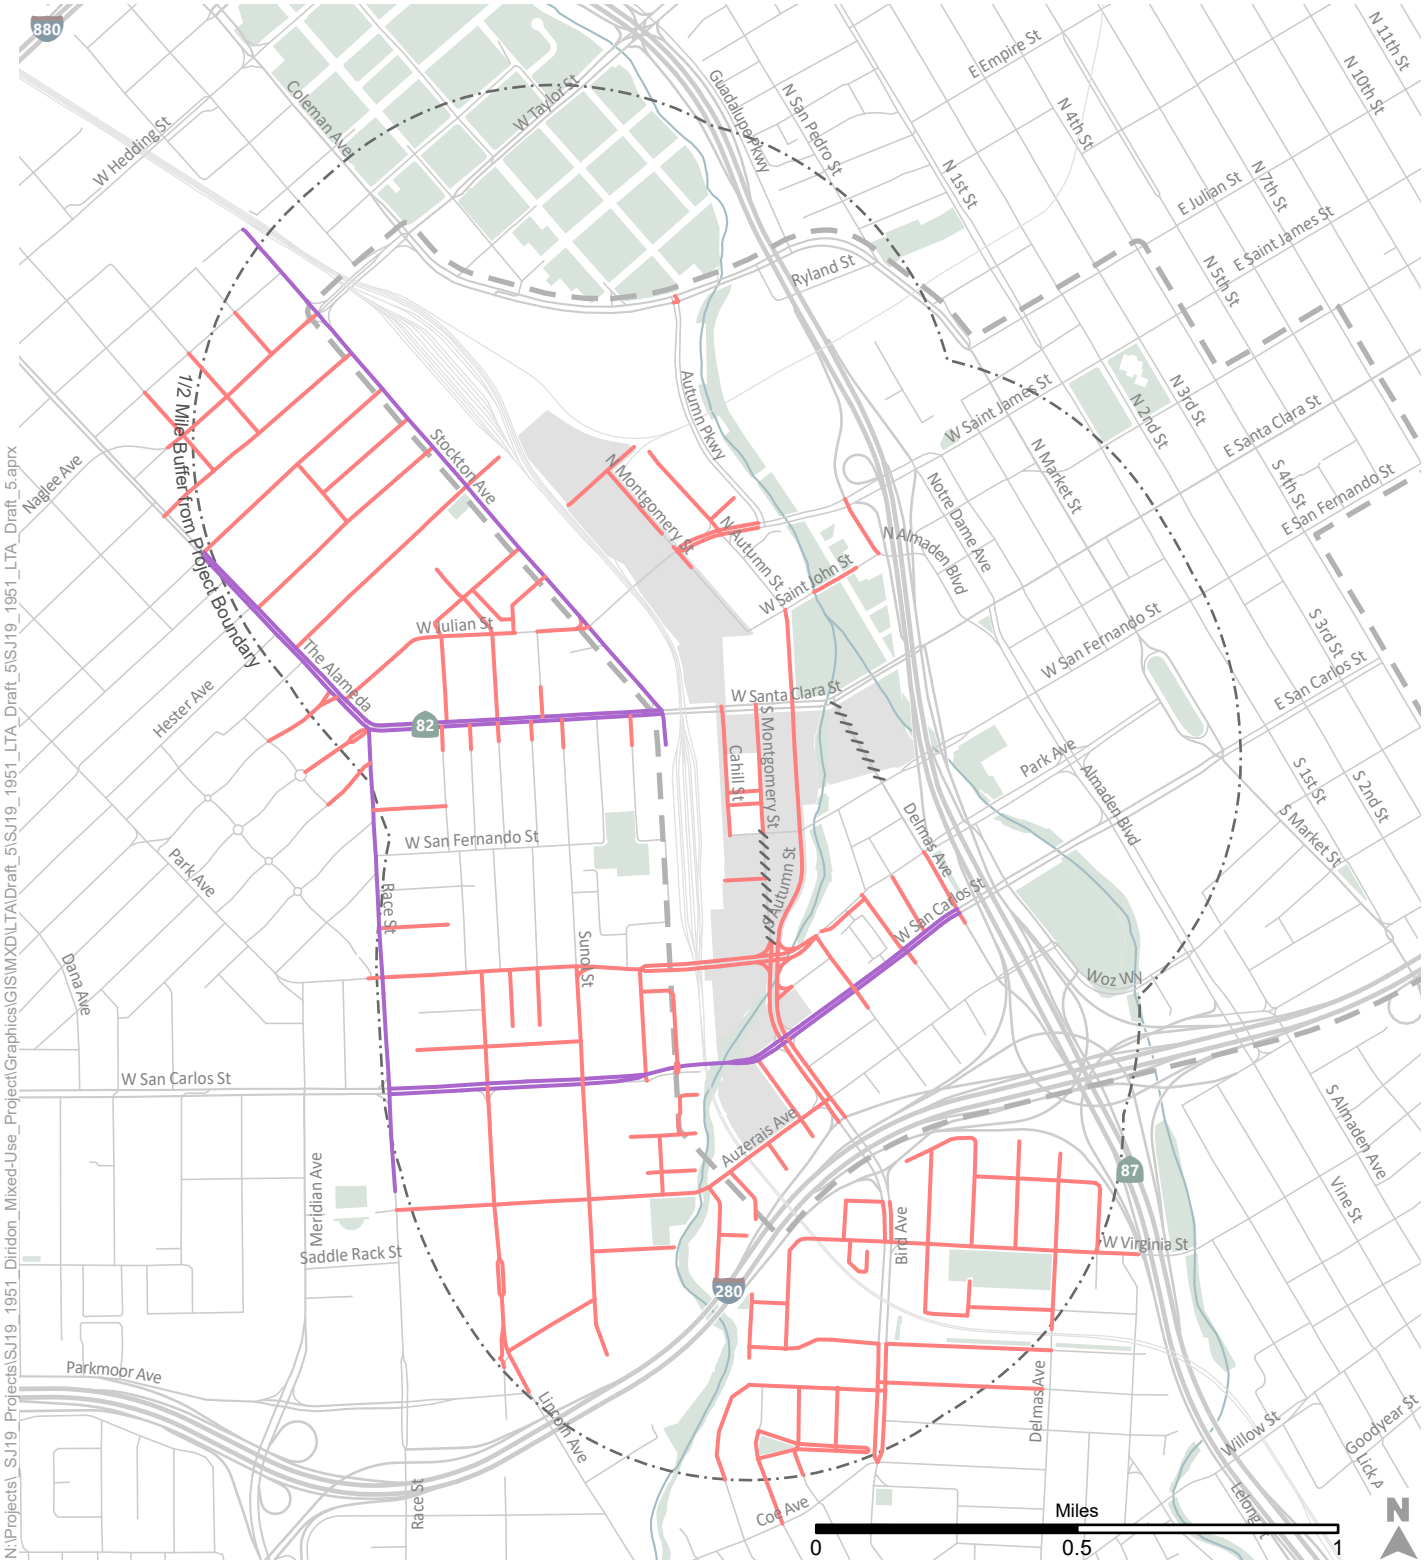
- **Baseline counts** should be conducted after Project approval and before construction begins, which would likely be in 2020 or 2021. Baseline counts would periodically need to be reestablished as major changes to the background conditions occur that would potentially increase neighborhood traffic intrusion from other uses, such as after Caltrain Electrification, BART to Diridon station, or construction of other major developments in the area. Baseline counts should be conducted at the likely parking spillover locations identified on **Figure 40**. Data to be collected include the parked vehicles, the number of legal on-street parking spaces (parking inventory) for each street segment within monitoring area.
- **Interim post-occupancy counts:** The Project is expected to take several years to be fully constructed. If parking spillover becomes a concern before the Project is complete, an interim set of counts could be conducted when Phase 1b of the Project is 75 percent occupied.
- **Post-occupancy counts** should be conducted after the Project has been completed and occupied for six to 12 months. These counts should be conducted at the same monitoring locations shown on **Figure 40**.

For the post-occupancy counts, the data should also include license plate inventory from the peak periods compared to the inventory from the non-peak periods. To identify parking intrusion, vehicles recorded during a non-peak period are assumed to belong to a neighborhood resident.

The post-occupancy counts may determine that parking spillover is occurring, but it is difficult to determine whether this is the result of the Project or of other future development. Therefore, the Project would be responsible for the monitoring program and for a proportional share of the management strategies cost, as needed.

The parking surveys should be 48-hour occupancy and turnover surveys for two consecutive weeks each. To best capture typical conditions, counts should be conducted on a Tuesday, Wednesday, or Thursday in the spring or fall when schools are in session during a week without holidays.

Based on the parking survey results, the City's Department of Transportation may recommend the implementation of a parking plan. This may include establishment of an RPP, installation of parking control signs, and other parking management strategies. The Project would be responsible for a proportional share of the recommended parking management strategies cost. **Table 64** includes potential parking management strategies that could help reduce parking intrusion from the Project's residents and visitors.



11.3.3.2 Thresholds

San José has not documented a threshold for parking spillover from a new development. For the purposes of the Project's parking intrusion monitoring plan, we recommend the following thresholds:

- On-street parking occupancy is 75 percent or higher and parking intrusion from outside the neighborhood is at least 50 percent, or
- On-street parking occupancy is 85 percent or higher on at least 60 percent of street segments of a neighborhood

The establishment of an RPP would generally only occur if there is an adequately-sized zone of a minimum of 150 households in a quarter-mile radius area that is within a half-mile radius from the Project site and after adequate outreach to determine neighborhood support.

11.3.4 Parking Intrusion Management Strategies

The City of San José has not adopted formal parking management guidelines. However, parking management strategies such as time limits, metering, and residential parking programs have been implemented in San José and other cities to efficiently manage on-street parking spaces. To identify potential approaches to managing spillover parking near the Project, best practices and strategies for parking management were pulled from several documents:

- SANDAG, (2014), Regional Parking Management Toolbox
- Metropolitan Transportation Commission (2007), Reforming Parking Policies to Support Smart Growth
- Bay Area Rapid Transit District (2000), Parking Management Toolkit, Strategies for Action in BART Station Areas

11.3.4.1 Strategies

The following is a description of each parking management strategy included in **Table 64** below.

Time Limits & Restrictions: Time-based parking restrictions prohibit parking for certain periods to preserve roadway capacity during peak commuting periods and to save parking resources for particular user groups. In residential areas adjacent to commercial areas, parking time limits are used to discourage long-term parking by employees of the businesses in the commercial areas. In commercial areas, typically by petition of the business/property owners, time limits are used to encourage turnover of parking spaces to provide short-term parking for visitors to the commercial areas.

Parking Charges: A system of differentiated parking meter rates is a key element in encouraging drivers to use parking efficiently by directing long-term parking to less convenient spaces and gaining the most productivity from the most attractive on-street spaces. There are many alternatives for collecting on-street parking charges ranging from traditional parking meters to centralized parking machines, to smart meters with debit card systems. Rates can be set or variable based on occupancy and peak demand periods.

Parking Benefit District: This strategy is a variation of an on-street parking charge scheme for residential areas. Instead of prohibiting non-resident parking in neighborhoods, as occurs with a residential permit parking program, non-resident parking could be allowed with an appropriate parking charge. Revenues from the nonresident parking can flow back to the community for neighborhood or transportation improvements.

Urban Design/Signage: Urban design features can make more distant on-street parking spaces known to commuters and enhance pedestrian connections to those spaces. Good signage can direct parkers quickly and efficiently to available spaces.

Parking Permits: Permits are issued to regulate who can park by time, day, or location restrictions. These can be residential or commercial. Permitting can be monitored electronically through online registration and license plate recognition enforcement, or through traditional enforcement.

Commercial Vehicle Parking: Specific parking spaces for commercial activity can be provided through time of day restrictions, time restrictions, or commercial vehicle permits. This allows curb space for loading and unloading activities and can reduce illegal parking and vehicles circling for a parking space.

Residential Parking Program: Preferential or permit parking districts restrict parking for all motorists, but area residents and their guests are exempt from the special parking restrictions if they have and display parking permits. Permit parking can also be applied to on-street parking in commercial districts to provide unrestricted access to parking for residents and employees who have businesses in a parking district. The Project would be responsible for the costs associated with conducting an initial study and installing improvements for the expanded RPP zone, in cooperation with the City.

Enforcement: Parking Enforcement usually involves writing and issuing parking citations or warnings relating to violation of codes, laws, regulations, and validation programs for on-street parking. This can be accomplished by enforcement officers or technology such as license plate recognition software.

Comprehensive Curb Lane Management Policy: A comprehensive policy for curb lane management helps City staff establish priorities for different curb uses such as parking, bike lanes, or freight loading zones on each section of street. This can help with balancing the needs of all users, efficiently managing the curb space, and City decision making.

TDM Strategies: Transportation Demand Management strategies are programmatic strategies and policies that encourage the use of other modes of transportation besides single-occupancy vehicles (SOV). There are many different types of TDM strategies but some that can influence parking demand are:

- Incentives for using non-SOV modes such as walking, bicycling, transit, and shared vehicles
- Outreach and education about using non-SOV modes
- Unbundled parking
- Parking cash out

Table 64: Parking Management Strategies

Strategy Type	Strategy Name	Potential Issues this Strategy Addresses						
		Use		Non-Compliance	Congestion due to Circulation	Inefficient Curb Use	Uneven Parking Patterns	Extended Parking Times
		Residential	Commercial

Bay Area Rapid Transit District (2000), Parking Management Toolkit, Strategies for Action in BART Station Areas

11.4 Summary

Due to its size, the Project has the potential to generate cut-through traffic, speeding, and parking spillover on nearby neighborhood streets. To address local concerns, the Project would be required to adopt a Neighborhood Traffic Intrusion Monitoring Plan and a Parking Intrusion Monitoring Plan that implement the framework plans presented in this chapter; although specific monitoring locations, methods, and thresholds may be modified based on observed condition or new technologies. If the Project adds traffic and parking demand that exceeds the performance thresholds identified in the final monitoring plans, it would contribute a proportional share to the costs of managing cut-through traffic, speeding, and parking intrusion, including the costs of expanding the Residential Parking Permit program.

12. Construction Management Plan

This chapter outlines plans and best practices to implement during the construction of the Project. The Project construction will take place over several years and affect the transportation network within and around the Project area at various locations throughout the construction of the Project. Steps should be taken to minimize those effects as much as possible during construction to provide for the safe and efficient movement of all modes of transportation including walking, bicycling, vehicular, and transit. The sections in this chapter detail construction management recommendations for each transportation mode in addition to emergency access, loading and unloading, and parking. The sections are organized by City best practices, which specifies City guidance (as available), and additional best practices, which outlines supplementary guidance and resources for consideration as the Project sponsor develops its construction management plan for the Project.

12.1 Construction Phasing

Construction of the Project's proposed buildings, street network changes, and infrastructure would occur in three primary phases. Construction would begin in 2021 and may continue through a horizon year of 2040. The duration of each phase would vary; however, on average, each phase would last approximately five years, with the end of one phase and the start of the subsequent phase potentially overlapping one another. Actual phased implementation would likely be constrained by external factors such as construction staging for the BART Downtown extension, and thus would extend over a longer period.

Table 65 summarizes the Project's proposed construction phases, which are also shown on **Figure 13**. The Project's construction phasing is different than the phasing analyzed as part of the LTA in the previous chapters. **Table 65** summarizes how the LTA analysis phases relate to the overall development.

Table 65: Project Construction Phasing

Development Program Phases	Phase 1	Phase 2	Phase 3	Total
LTA Analysis Phases	Phase 1		Phase 2	Buildout
Land Uses				
Residential (dwelling units)	3,130	1,410	1,360	***5,900***
Active Uses (e.g., retail) (gsf)	370,000	107,000	23,000	***500,000***
Hotel (rooms)	0	0	300	***300***
Limited-Term Corporate Accommodation (rooms)	530	190	80	***800***
Office (gsf)	4,170,000	2,465,000	665,000	***7,300,000***
Event/Conference Center (gsf)	100,000	0	0	***100,000***
Central Utilities Plant	87,000	43,000	0	***130,000***
Logistics/Warehouse	50,000	50,000	0	***100,000***

Notes:
gsf = gross square feet
Source: Data provided by Google LLC in 2019

12.2 Construction Management

This section outlines the City's general guidance on construction management along with additional sources that should be considered as the Project sponsor develops its construction management plan.

12.2.1 City Best Practices

The City of San José has a *Recommended Temporary Traffic Control Plan* (RTTCP) that was developed in accordance with Section 21400 of the California Vehicle Code. The RTTCP provides high-level guidance on construction management and approves various devices that can be used on a construction site.

According to the RTTCP, warning signs, barricades, cones/delineators, guards, flags, flares, reflectors, and lights at night should be used to assist all modes of travel to navigate the construction zone. All these features should be installed and properly maintained wherever hazards exist due to moving or stationary vehicles, open excavations, construction and maintenance operations, and similar work. Barricades, channeling devices, and flashing arrow signs should be used in adherence with Part 6 of the *Manual on Uniform Traffic Control Devices* (MUTCD). Before any new detour or temporary route is opened to traffic, all necessary signs should be in place. All traffic control devices should be removed as soon as practical when they are no longer needed. When work is suspended for short periods of time, traffic devices that are no longer appropriate should be removed or covered.[23] Flaggers should also be used in situations where signs or barricades do not provide adequate traffic control, specifically,

- At all locations where warning and control devices cannot adequately control the moving traffic.
- Where the job requires the use of one lane for two directions of traffic (one flagger is required for each direction of traffic). Additional information on the use of flaggers is available in Caltrans' *Flagging Instruction Handbook*.[24]

12.2.2 Additional Best Practices

Part 6 of the MUTCD outlines the following seven fundamental principles of Temporary Traffic Control (TTC):

1. General plans or guidelines should be developed to provide safety for motorists, bicyclists, pedestrians, workers, enforcement/emergency officials, and equipment.
2. Road user movement should be inhibited as little as practical.
3. Motorists, bicyclists, and pedestrians should be guided in a clear and positive manner while approaching and traversing TTC zones and incident sites.

[23] U.S. Department of Transportation, Federal Highway Administration, 2009. *Manual on Uniform Traffic Control Devices for Streets and Highways*, 2009 Edition (pg. 550). Available online at: https://mutcd.fhwa.dot.gov/. Accessed February 8, 2020.

[24] Caltrans, 2015. *Flagging Instruction Handbook*. Available online at: https://dot.ca.gov/-/media/dot-media/programs/construction/documents/construction-compliance/safety-traffic/flagging-handbook.pdf. Accessed February 15, 2020.

4. To provide acceptable levels of operations, routine day and night inspections of TTC elements should be performed.
5. Attention should be given to the maintenance of roadside safety during the life of the TTC zone.
6. Each person whose actions affect zone safety, from upper-level management to field workers, should receive training appropriate to the job decisions everyone is required to make. Only those individuals who are trained in proper TTC practices and have a basic understanding of the principles (established by applicable standards and guidelines, including those of this Manual) should supervise the selection, placement, and maintenance of TTC devices used for TTC zones and for incident management.
7. Good public relations should be maintained.

These principles will be required consideration throughout the construction of the Project.

12.3 Temporary Traffic Control Plan Elements

The RTTCP specifies that work area planning should be done any time the normal function of a roadway is suspended. Temporary traffic control planning must provide for continuity of movement for traffic, pedestrians, bicyclists, transit operations, and access to property/utilities. The location where the normal function of the roadway is suspended is defined as the workspace. The workspace is that portion of the roadway closed to traffic, including sidewalks and bike lanes, and set aside for workers, equipment, and material. Sometimes there may be several workspaces within the Project limits. Each workspace should be signed to inform users of what to expect. Effective temporary traffic control must provide for the workers and all roadway users, while facilitating a productive work environment for the efficient completion the of activity that suspended normal use of the roadway.[25]

The RTTCP also specifies that additional information on work area accommodation can be found in the MUTCD. According to MUTCD Part 6, TTC planning should be done when the normal function of the roadway, or a private road open to public travel, is suspended. TTC planning provides for continuity of motor vehicle, bicycle, and pedestrian traffic (including accessible passage) movement; transit operations; and access (and accessibility) to property and utilities.[26]

All this information should be detailed in a Construction Management Plan, or Temporary Traffic Control Plan (TTCP), specific to the Project and location. The City outlines the following checklist of considerations necessary in a TTCP:

- Estimated time required to complete the job in order to determine short-term or long-range operations
- Volume and speed of traffic

[25] City of San José. City of San José Recommended Temporary Traffic Control Plan (pg. iii). Available online at https://www.sanJoséca.gov/home/showdocument?id=19947. Accessed on February 8, 2020.
[26] U.S. Department of Transportation, Federal Highway Administration, 2009. *Manual on Uniform Traffic Control Devices for Streets and Highways*, 2009 Edition (pg. 547). Available online at: https://mutcd.fhwa.dot.gov/. Accessed February 8, 2020.

- Changes in traffic conditions during the operation
- Ordinances and permit requirements
- Set up shall always start with the advance warning sign and work back to the job site
- Determination of the number and types of safety devices, cones/delineators, signs, flags, flashers, barricades, flashing arrow signs, etc., required for the job
- Flaggers, while setting up protection and during the job operation, if required (see "Overarching Construction Effects" section of this chapter for additional information on flaggers)
- Effective utilization of utility vehicles for maximum protection

To reduce potential conflicts between construction activities and pedestrians, bicyclists, transit, and autos during construction activities, the Project sponsor will require construction contractor(s) to prepare a traffic control plan for major phases of construction (e.g., demolition and grading, construction, or renovation of individual buildings). The Project sponsor and their construction contractor(s) will be required to meet with relevant City agencies to coordinate feasible measures to reduce traffic congestion. The Plan shall include consideration of SAP Center ingress and egress for event days and allow for efficient movement and safe conditions for patrons of the arena.

The Project construction has the possibility to overlap with the construction of BART Phase II, the new Diridon Station, and other nearby developments. In the event that the construction timeframes of the major phases and other development projects adjacent to the Project area overlap, the Project sponsor will be required to coordinate with City agencies through the adjacent developers to minimize the severity of any disruption to adjacent land uses and transportation facilities from overlapping construction transportation effects. The Project sponsor, in conjunction with the adjacent developer(s), will be required to propose a construction traffic control plan that includes measures to reduce potential construction traffic conflicts, such as coordinated material drop-offs, collective worker parking, SAP Center ingress/egress, transit to job site, and other measures.

12.3.1 Traffic Construction Management

The Project would have an adverse effect if it would cause traffic hazards, delays or disruptions. The following section outlines the City's best practices for managing traffic effects in construction areas, and additional best practices for consideration throughout the construction of the Project.

12.3.1.1 City Best Practices

According to the RTTCP, vehicular circulation should be maintained to the greatest extent possible, depending on the work area. Care should be taken to ensure drivers are made aware of any traffic pattern changes well in advance of the deviation. This should be done using signs, flaggers, barricades, flags, flashers, or traffic cones. A combination of treatments may be necessary depending on the circumstances and visibility. The three overarching goals of creating an environment that gives drivers enough reaction time outlined in the RTTCP are as follows:

- Drivers must be warned sufficiently in advance to allow time to think and react.
- Drivers must have time to regulate their speed, to allow them to pass through the guidance pattern with safety and ensure an even flow of traffic.
- The need for decision making must be reduced to a minimum. This can be done with a planned guidance pattern.

12.3.1.2 Additional Best Practices

Part 6 of the MUTCD outlines the components of TTC zones and specifies the need to break the zones into four components for driver clarity. Those recommended areas are as follows:

- Advance warning area: the advance warning area is the section of highway where road users are informed about the upcoming work zone.
- Transition area: a section of highway where road users are redirected out of their normal path.
- Activity area: a section of the highway where the work activity takes place.
- Termination area: the termination area is the section of the highway where road users are returned to their normal driving path.

The construction management plan for the Project will be required to address the needs of each TTC zone and make appropriate recommendations.

The Project sponsor will be required to work with the City on a detailed TTC plan for vehicular circulation. It will include the aforementioned components and will aim to address the major themes of timely driver warning with conspicuous sign location, speed regulation, and appropriate barricades depending on the circumstance.

12.3.2 Transit Construction Management

The Project would cause direct effects to the operation of VTA bus and light rail within the Project area. Specifically, the construction would affect the Green Line (light rail), and bus routes 17, 64A, 22, and Rapid 522. The following section outlines the City's best practices for managing transit effects in construction areas, and additional best practices for consideration during construction of the Project.

12.3.2.1 City Best Practices

According to the City's RTTCP, "special plan preparation and coordination with transit… will be needed to receive input and support."[27] This statement suggests VTA should be notified of the Project and a plan should be developed to accommodate the affected stations and stops within the construction area. The RTTCP also recommends adhering to the recommendations outlined the Part 6 – Temporary Traffic Control, of the MUTCD.

[27] City of San José. City of San José Recommended Temporary Traffic Control Plan. Available online at https://www.sanJoséca.gov/home/showdocument?id=19947. Accessed on February 8, 2020.

12.3.2.2 Additional Best Practices

Most directly related to transit, the MUTCD outlines the importance of bus and transit circulation in the affected area as part of the TTC. The MUTCD also indicates that transit stops affected by the work activity should have pedestrian and vehicular access provided and maintained throughout the duration of the activity.

The Project sponsor will be required to coordinate with VTA and the City to incorporate the appropriate transit management practices into the Project's TTCPs. The creation of conspicuous and accessible transit stops and stations will be required.

12.3.3 Pedestrian Construction Management

The Project would cause direct effects to the sidewalks and walking paths throughout the Project area. The following section outlines the City's best practices for considering pedestrians in construction areas, and additional best practices for consideration during construction of the Project.

12.3.3.1 City Best Practices

According to the City's RTTCP, "when the work area encroaches upon a sidewalk, walkway, or crosswalk area, adequate protection for the safety of pedestrians must be provided."[28] There are three threshold considerations in planning for pedestrians in temporary traffic control zones on highways and streets:

- Pedestrians should not be led into direct conflicts with work site vehicles, equipment, or operations.
- Pedestrians should not be led into direct conflicts with mainline traffic moving through or around the work site.
- Pedestrians should be provided with a convenient travel path that replicates as nearly as possible the most desirable characteristics of sidewalks or footpaths.[29]

The City's RTTCP also specifies that the needs of persons with disabilities must be considered when designing and implementing detoured routes. Signing should be used to direct pedestrians to newly established street crossings as part of the construction, and those crossings should be at intersections – mid-block crossings should be avoided. Warning of sidewalk closures should be communicated well in advance of the closure to allow pedestrians to adjust their route when it is safe to do so. When overhead work is being performed, the pedestrian passage area below must be rerouted or protected.

[28] City of San José. City of San José Recommended Temporary Traffic Control Plan (pg. viii). Available online at https://www.sanJoséca.gov/home/showdocument?id=19947. Accessed on February 8, 2020.
[29] City of San José. City of San José Recommended Temporary Traffic Control Plan (pg. viii). Available online at https://www.sanJoséca.gov/home/showdocument?id=19947. Accessed on February 8, 2020.

While not preferable, if pedestrian movement directly through a work site is necessary, a separate footpath without substantial grade changes or terrain should be provided. Movement by work vehicles and equipment across designated pedestrian paths should be minimized and controlled by flaggers.

In places where pedestrians are especially vulnerable to impact by errant vehicles, all foot traffic should be separated and protected by longitudinal barrier systems. Where a barrier is clearly needed, it should have enough strength and low deflection characteristics to keep vehicles from intruding into the pedestrian space.

12.3.3.2 Additional Best Practices

Part 6 of the MUTCD states that, "When existing pedestrian facilities are disrupted, closed, or relocated in a TTC zone, the temporary facilities shall be detectable and include accessibility features consistent with the features present in the existing pedestrian facility. Where pedestrians with visual disabilities normally use the closed sidewalk, a barrier that is detectable by a person with a visual disability traveling with the aid of a long cane shall be placed across the full width of the closed sidewalk."[30]

The Project sponsor will be required to coordinate with the City of San José to incorporate the appropriate pedestrian management practices into the Project's TTCPs, such as planning for adequate and accessible walkways and roadway crossings, appropriate sidewalk coverage if the sidewalk is exposed to construction from above, and clear signage and wayfinding where appropriate.

12.3.4 Bicycle Construction Management

The Project would cause direct effects to bike routes throughout the Project area. Bike routes most likely to be affected include those on Cahill Street, Montgomery Street, Crandall Street, Autumn Street, Santa Clara Street, and San Fernando Street; though there could be others. There is also a Bay Wheels bike sharing station on Crandall Street. The following section outlines the City's best practices for considering bicyclists in construction areas, and additional best practices for consideration during construction of the Project.

12.3.4.1 City Best Practices

The City's RTTCP states that whenever possible bicycle lanes should be maintained throughout a construction area. The guidance goes on to state bicycle warning signs should be installed where appropriate, and where a striped bicycle lane exists, the sign "Bikes Share the Lane" should be added to the Temporary Traffic Control Signs used in the construction area.

According to the RTTCP there are several considerations in planning for bicyclists in temporary traffic control zones on highways and streets:

[30] U.S. Department of Transportation, Federal Highway Administration, 2009. *Manual on Uniform Traffic Control Devices for Streets and Highways*, 2009 Edition (pg. 563). Available online at: https://mutcd.fhwa.dot.gov/. Accessed February 8, 2020.

- A travel route that replicates the most desirable characteristics of a wide paved shoulder or bikeway through or around the traffic control zone is desirable for bicyclists.
- If the traffic control zone interrupts the continuity of an existing bikeway system, signs directing bicyclists through or around the zone and back to the bikeway is desirable.
- Unless a separate bike path through or around the traffic control zone is provided, adequate roadway lane width to allow bicyclists and motor vehicles to travel side by side through or around the zone is desirable.
- Bicyclists shall not be led into direct conflicts with mainline traffic, work site vehicles, or equipment moving through or around the traffic control zone.[31]

12.3.4.2 Additional Best Practices

Part 6 of the MUTCD indicates that if a signed bicycle route is closed due to construction an adequate alternative route should be provided. Bicyclists should not be directed to a sidewalk or side path due to conflicts that may create with pedestrians.

The Project sponsor will be required to coordinate with the City to develop a component of the TTC plan that address bicycle routes. If a bicycle route is disrupted during the Project construction, the Project sponsor will be required to provide a reasonable and accessible alternative and create clear wayfinding to the alternative route.

12.3.5 Loading Construction Management

For the purposes of this study the term "loading" is considered freight and delivery truck circulation in the construction area. This section does not include loading in the context of the construction site. However, construction site loading and unloading should be addressed in detail in the construction management plan. The Project would cause direct effects to the loading throughout the Project area. The following section outlines the City's best practices for considering loading in construction areas, and additional best practices for consideration during construction of the Project.

12.3.5.1 City Best Practices

The City's RTTCP does not offer much detail on loading, unloading, and goods movement as it relates to construction areas. It does state that, "during temporary traffic control activities, commercial vehicles may need to follow a different route from automobiles because of bridge, weight, clearance, or geometric restriction."[32] This statement suggests freight and delivery should be accommodated in a construction area by way of alternative routes, if necessary. Additional details on freight will be required in the construction management plan. And as part of that planning process a detailed inventory of merchants in the Project area will be required to assess freight needs, schedules, and locations.

---

[31] City of San José. City of San José Recommended Temporary Traffic Control Plan. Available online at https://www.sanJoséca.gov/home/showdocument?id=19947. Accessed on February 8, 2020.

[32] City of San José. City of San José Recommended Temporary Traffic Control Plan. Available online at https://www.sanJoséca.gov/home/showdocument?id=19947. Accessed on February 8, 2020.

12.3.5.2 Additional Best Practices

According the best practices found in the City's complete streets design guide, the Project sponsor will be required to include designated freight loading zones in front of commercial buildings where possible. Loading zones minimize double parking, and time restrictions help to limit heavy truck travel during the peak periods.

12.3.6 Parking Construction Management

This study considers parking effects to both on-street and off-street parking. The Project would cause direct effects to on-street parking availability and off-street parking lots. Specifically, Autumn Street on-street parking, and the Diridon Station off-street lots located directly east of the station. The following section outlines the City's best practices for considering parking in construction areas, and additional best practices for consideration during the Project construction.

12.3.6.1 City Best Practices

The City does not have guidance on parking accommodation within construction zones. The construction management plan developed for the Project will be required to include a plan for accommodating parking during construction, both for the construction workers and for people wishing to access the area's amenities, including the SAP Center and transit.

12.3.6.2 Additional Best Practices

There is limited guidance on parking in Part 6 of the MUTCD. The guidance that exists is specific to using proper signage to indicate removal of parking and regulating vehicle parking in newly established pedestrian or bicycle routes.

The Project sponsor will be required to consider parking during the Project construction. The sponsor will work with the City to determine the locations and amounts of parking that need to be created and maintained throughout construction.

12.3.7 Emergency Access Construction Management

Emergency access is defined as the ability for emergency vehicles to move into, out of, and throughout the construction area. The Project would cause direct effects to emergency vehicle access. The following section outlines the City's best practices for considering emergency vehicle access in construction areas, and additional best practices for consideration during the Project construction.

12.3.7.1 City Best Practices

The only reference to emergency vehicles in the City's RTTCP is as follows: "Special plan preparation and coordination with transit and other highway agencies, police and other emergency units, utilities, schools, railroads, etc. will be needed to receive input and support for advising motorists of potential traffic

operation situations."[33] The construction management plan developed for the Project will be required to include a plan for maintaining emergency vehicle access during construction.

12.3.7.2 Additional Best Practices

Part 6 of the MUTCD outlines guidance and standards for accommodating emergency vehicles in construction areas.

While some traffic incidents might be anticipated and planned for, emergencies and disasters might pose more severe and unpredictable problems. The ability to quickly install proper temporary traffic controls might greatly reduce the effects of an incident, such as secondary crashes or excessive traffic delays. An essential part of fire, rescue, spill clean-up, highway agency, and enforcement activities is the proper control of road users through the traffic incident management area in order to protect responders, victims, and other personnel at the site. These operations might need corroborating legislative authority for the implementation and enforcement of appropriate road user regulations, parking controls, and speed zoning. It is desirable for these statutes to provide enough flexibility in the authority for, and implementation of, TTC to respond to the needs of changing conditions found in traffic incident management areas.[34]

The Project sponsor will be required to address emergency access to and from the construction site throughout Project construction. Coordination with local emergency agencies will be required and the TTC plan will outline how emergency vehicles will access the site.

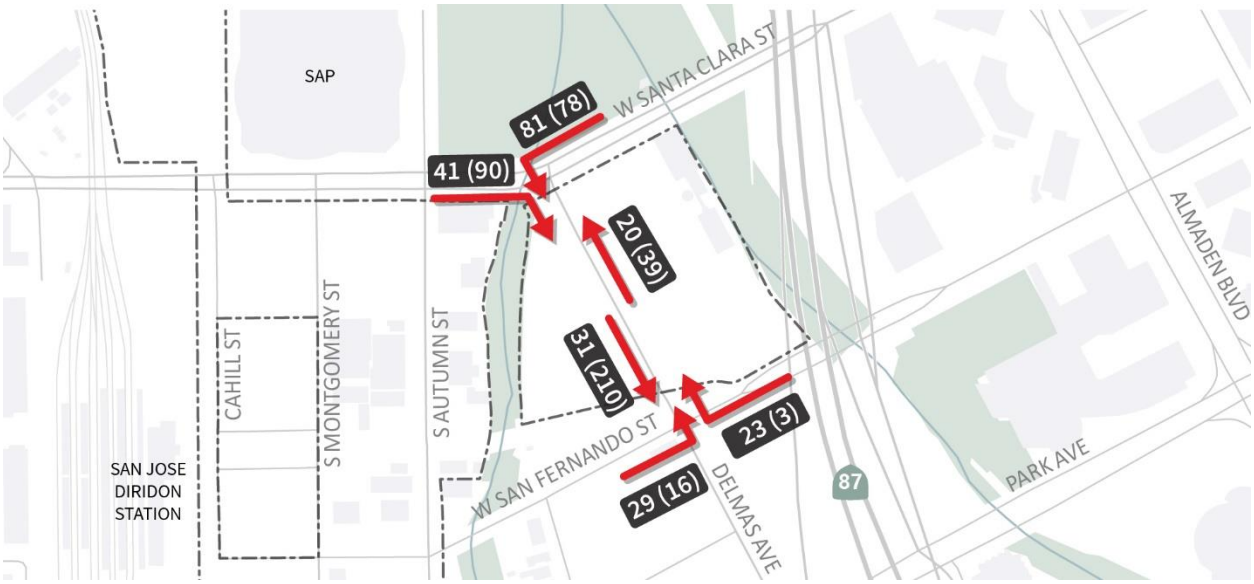
12.4 Summary

In summary, the Project sponsor will be required to collaborate and coordinate with the City of San José to develop a robust TTC plan for each major phase that is coordinated with adjacent construction activities, as appropriate, and holistically address vehicular, bicycle, pedestrian, transit, parking, loading, and emergency vehicle access and circulation.

[33] City of San José. City of San José Recommended Temporary Traffic Control Plan. Available online at https://www.sanJoséca.gov/home/showdocument?id=19947. Accessed on February 8, 2020.

[34] U.S. Department of Transportation, Federal Highway Administration, 2009. *Manual on Uniform Traffic Control Devices for Streets and Highways*, 2009 Edition (pg. 726). Available online at: https://mutcd.fhwa.dot.gov/. Accessed February 8, 2020.

13. Roadway Network Changes



As part of the Downtown West Redevelopment Project, Delmas Avenue between West Santa Clara Street and San Fernando Street as well as Montgomery Street between San Fernando Street and Park Avenue will be closed. These two street segments are part of the City's Transportation Diagram and require additional evaluation to determine the roadway system effects of the roadway closures.

13.1 Delmas Avenue Closure

Delmas Avenue currently is a two-lane roadway that runs west of and parallel to SR-87 between West Santa Clara Street and Auzerais Street. As proposed, the Project would eliminate vehicle through access for the approximately 700-foot segment of Delmas Avenue between West Santa Clara Street and San Fernando Street. Through access would be provided for pedestrians and bicyclists only. The southern portion of the removed segment of Delmas Avenue would be reconfigured as a private street/driveway from West San Fernando Street. This new private street would connect with two new private streets between West San Fernando Street and West Santa Clara. These new streets would provide parking access to the proposed development on the portion of the Project area between Los Gatos Creek and the Guadalupe River.

Currently, the segment of Delmas Avenue between Santa Clara Street and San Fernando Street primarily provides access to the surface parking lots on the east and west sides of the roadway. As shown on **Figure 41**, about 80 vehicles in each the morning and evening peak hours access Delmas Avenue via the westbound left-turn from West Santa Clara Street, and up to 90 vehicles access it from the eastbound right-turn from West Santa Clara Street. In the morning only about 30 morning peak hour vehicles travel through Delmas Avenue to San Fernando Street, which indicates that this segment of Delmas Avenue is not used for through traffic in the morning peak hour. While in the evening about 200 vehicles approach San Fernando Street from this segment of Delmas Avenue, field observation indicated that the majority of these vehicles are exiting from the parking lots and not actual through traffic. Through traffic was mainly observed to come from the eastbound right-turn lane from Santa Clara Street onto Delmas Avenue; though with the conversion of Autumn Parkway to a two-way street, Delmas Avenue will have little to no demand for through traffic.

Figure 41: Delmas Avenue Existing (pre-COVID 19) Traffic Volumes

Vehicles from downtown San José east of SR 87 generally access Delmas Avenue south of the proposed closure via West San Fernando Street or San Carlos Street, the shortest paths of travel. For vehicles accessing Delmas Avenue from Diridon Station, most generally use Montgomery Street to West San Fernando Street. Thus, the closure of the segment of Delmas Avenue between West Santa Clara Street and West San Fernando Street would not be considered to have an adverse effect, since it generally functions as an access roadway to the fronting parcels and not as a roadway that provides through access.

Any of the nominal through traffic that currently exists could either use Autumn Street (which will be converted to two-way as part of the project) or Almaden Boulevard.

While the data indicates that the closure of Delmas Avenue would not result in any through traffic diversion, it should be noted that the Project includes a neighborhood traffic intrusion plan (**Chapter 12**) that would address any neighborhood cut-through traffic concerns.

13.2 Montgomery Street Closure

Montgomery Street is currently a southbound two-lane roadway that operates as a one-way couplet with Autumn Street. As proposed Montgomery Street would be closed to through traffic for the 950-foot segment between San Fernando Street and Park Avenue. Driveway access to individual buildings would still be maintained for the first 200 feet at the northern part of the South Montgomery Street removal, and the southern part would function as a park. Bicycle and pedestrian access would be provided via several pathways.

The removal of this segment of South Montgomery is offset by the extension of two-way Cahill Street to the west and two-way conversion of Autumn Street to the east. The Project would be required to comply with the City's Complete Streets Design Standards and Guidelines and the Downtown West Design

Standards and Guidelines that would allow for adequate vehicle access to the Project area or surrounding areas. Design requirements deemed necessary by the City would be incorporated into the final design of each roadway.

13.3 Delmas Avenue Light Rail Crossing

The light rail tracks cross Delmas Avenue immediately north of West San Fernando Street. The closure of Delmas Avenue between Santa Clara Street and San Fernando Street would eliminate the at-grade crossing of a public street of the light rail tracks; however, the Project is proposing to provide garage access on the current alignment of Delmas Avenue that crosses the light rail tracks. The Project applicant would fund a study to evaluate the operational conflict due to the closure of Delmas Avenue and the garage access interface with the at-grade light-rail crossing.

13.4 Summary

The Project would be required to comply with the City's Complete Streets Design Standards and Guidelines and the Downtown West Design Standards and Guidelines. Compliance would be governed by Council policy 5-1, which will require subsequent focused LTAs that evaluate internal roadway circulation in detail to ensure adequate lanes are provided, while balancing the needs for bicycle and pedestrian travel and activities. City review of the future focused LTAs would ensure that all proposed roadway network changes (i.e., additions or removals of street segments) would allow for adequate vehicle access to the Project area or surrounding areas. Design requirements deemed necessary by the City would be incorporated into the final design of each roadway.

14. Conclusions

The results of the local transportation analysis for the proposed Downtown West Mixed-Use Rezoning and Development Plan are summarized below. Improvements required to address adverse effects are include in **Table 2**.

- **Transit Demand**: Model results indicate the Project will utilize both local and regional transit during all phases of development. While analysis of Project buildout conditions shows the Project would potentially result in crowding of key transit services if there is no increase in those services, cumulative conditions show that Project-generated transit trips would use around 15 percent of total daily transit capacity, and up to 20 percent of peak hour transit capacity. The Project would continue to provide access to Diridon Station and bus stops to help facilitate this growth in transit demand. In short, while the Project would contribute many peak hour riders to all transit services in its vicinity, those increases in ridership would not themselves create barriers to transit use. The Project would maintain and support public transit use, and as such would not have an adverse effect on transit access or demand**.**
- **Transit Delay**: The added vehicular traffic from the Project would result in an adverse effect to transit delay. To address the adverse effect and to support the Project's multimodal and TDM goals, the Project applicant will fund a study to evaluate the feasibility of a dedicated public service lane along Santa Clara Street/The Alameda between 17th Street and I-880.
- **Bicycle Network**: The Project would not have an adverse effect on the bicycle network. The Project proposes a bicycle network that would connect to and complement the City's existing and proposed bike network to optimize multimodal options to create a network for all users, with renewed emphasis on bicycle and pedestrian travel within the Project area. The Project includes several proposed bike network changes to provide bicycle connectivity within the Project area and the following select bike network improvements that implement or complement the City's Better Bike Plan 2025.
    - A multi-use path parallel to the light rail tracks between South Montgomery Street and West San Fernando Street.
    - Off-street path connections along Los Gatos Creek within the Project boundary will fill in gaps in the existing trail, with an off-street path connection (Class I) running along the western edge of the Los Gatos Creek between Auzerais Avenue and Park Avenue, as well as along the eastern edge of the creek from San Fernando to Santa Clara. These trail segments will be connected by on-street protected bikeways (Class IV) along Autumn Street between Park Avenue and the VTA tracks.
    - On-street bicycle facilities (Class IV or Class II) along Park Avenue, West San Fernando Street, West St. John Street, West Julian Street, South Autumn Street, North Montgomery Street, and Cahill Street

- Shared public streets that would have traffic calming, low speeds, and potential restrictions to auto travel along South Montgomery Street between West San Fernando Street and West Santa Clara Street, and Post Street between Cahill Street and South Autumn Street.
- An additional network of private streets, most of which would be generally accessible to the public and some of which would predominantly provide service and loading access. Generally accessible private streets would include a new street extending west and north from North Montgomery Street to the rear (west) of the northern most parcel (Block A1) connecting to Lenzen Avenue; a dead-end street extending west from North Montgomery Street between West Julian and West St. John Streets (within Block C1); an L-shaped street along the alignment of Delmas Avenue north of the light rail tracks and turning east to reach the Guadalupe River; and an L shaped street linking Royal Avenue and Auzerais Street (between Blocks H3 and H4). Limited-access private streets would include a service street that would run north of West San Fernando Street and parallel to Delmas Avenue at the eastern border of the project site and a service connection between Cahill Street and South Autumn Street north of Park Avenue (through Block F1).

- **Bicycle Level of Stress**: The implementation of the City's' Better Bike Plan 2025 bike network is contingent upon improvements to implement through private development, as well as, capital and grant funded projects. The LTS analysis reflects that the proposed bike facility improvements which fill in gaps in the existing network will reduce traffic stress across multiple roadways. In addition to the bicycle improvements identified above that the Project applicant will construct, the Project will contribute to a pedestrian and bicycle accommodating bridge over the creek north of San Fernando Street between Gifford Avenue and Autumn Street.
- **Pedestrian Network**: Downtown West will provide pedestrian enhancements within the Project area, but there are no proposed pedestrian improvements along the pedestrian corridors studied in this LTA. However, some of the improvements identified as part to the LOS analysis will provide additional pedestrian improvements.
- **Pedestrian Capacity Analysis**: Based on the pedestrian throughway capacity analysis, all the sidewalks are sufficient to meet the expected pedestrian volumes. Overall, the Project-generated pedestrian trips will be accommodated by the surrounding pedestrian infrastructure, as the average LOS remains at A for all scenarios, with only the platoon LOS going down to B, even with the growth in 15-min pedestrian volumes.
- **City-Guideline Required Intersection Operations Analysis**:

  - *Coleman Avenue/Taylor Street (Intersection #2)*: The Phase 1, Project Buildout, and Goal-Based Project Buildout scenarios would degrade acceptable intersection operations at Coleman Avenue/Taylor Street to unacceptable levels and meet the City's adverse effect threshold during the PM peak hour. To support the Project's multimodal and TDM goals, the project applicant would provide improvements at the Coleman Avenue/West Taylor Street intersection to enhance bicycle connectivity along West Taylor Street from Walnut Street to Stockton Avenue. Improvements to the pedestrian walkway, removal of corner islands, and widening within the existing rail undercrossing could also be included.

- *De La Cruz Boulevard/Central Expressway (Intersection #13)***:** The Goal-Based Project Buildout scenario would exacerbate unacceptable intersection operations and meet the county's adverse effect threshold during the AM peak hour. No improvements are identified for this intersection.

- **Localized Access and Queuing Analysis – Intersections**:
    - *Auzerais Avenue/SR 87 Southbound On-Ramp (Intersection #25)*: At the Auzerais Avenue/SR 87 Southbound On-Ramp, the vehicle queues for the southbound through lane on Delmas Avenue (that access the southbound SR 87 on-ramp) frequently extend back to Park Avenue, causing excessive delays along Delmas Avenue. The Project applicant will construct multimodal intersection improvement at the Auzerais Avenue/SR 87 Southbound On-Ramp intersection. Improvements include signal modifications at the intersection and widening of the Auzerais north sidewalk beneath SR 87 freeway to provide for a continues sidewalk that is not interrupted by the existing pillars from SR 87 freeway overcrossing.
- **Localized Access and Queuing Analysis – Turn-Pocket Queuing**: Several turn pocket lengths are exceeded in future volume conditions with both the Project Buildout and Goal-Based Project Buildout scenarios based on the left-turn and right-turn storage analysis. Consistent with the City's multimodal goals and the Project's TDM goals, the vehicle capacity enhancing improvements are not recommended. The Project applicant would contribute to the Bird Avenue/I-80 Bicycle-Pedestrian multimodal connection from Diridon Station area to the Gardner community.
- **Localized Access and Queuing – Off-Ramps**: All off-ramps would need additional storage capacity to minimize queue spillback onto the freeway mainline during the AM peak hour. During the PM peak hour, only the SR 87 off-ramps at Park Avenue (southbound ramp) and Woz Way (northbound ramp) would need additional storage capacity to minimize queue spillback. As an off-setting improvement consistent with the Project's multimodal and TDM goals, the project applicant will contribute to planned pedestrian and bicycle improvements at Bird Avenue/I-80 Bicycle-Pedestrian multimodal connection from Diridon Station area to the Gardner community.
- **Localized Access and Queuing – On-Ramps:** The southbound on-ramps at Julian Street, Auzerais Avenue, and Bird Avenue, as well as the northbound on-ramp at Park Avenue, would exceed the maximum capacity under the Background Plus Project Buildout scenario and queue onto the surface streets. The results under the Goal-Based scenario show that the maximum capacities meet project demand at all on-ramps. No improvements are identified for the on-ramp queuing.
- **CMP Intersection Operations Analysis**:
    - *First Street/Alma Avenue (Intersection #47)*: Project Buildout scenario would exacerbate unacceptable intersection operations and meet the VTA's adverse effect threshold during the AM peak hour under Background Conditions. No feasible improvements are identified for this intersection.
    - *The Alameda/Hedding Street (Intersection #38)*: The Goal-Based Project Buildout scenario would exacerbate unacceptable intersection operations and meet the VTA's adverse effect threshold during the PM peak hour under Cumulative Conditions. No feasible improvements are identified for this intersection.

- *The Alameda/Naglee Street (Intersection #39)*: The Goal-Based Project Buildout scenario would exacerbate unacceptable intersection operations and meet the VTA's adverse effect threshold during the PM peak hour under Cumulative Conditions. No feasible improvements are identified for this intersection.
- *Taylor Street/SR 87 (Intersection #42)*: The Goal-Based Project Buildout scenario would exacerbate unacceptable intersection operations and meet the VTA's adverse effect threshold during the AM peak hour under Cumulative Conditions. The Project will contribute to the City/Caltrans programmed signal and bikeway improvements at the Taylor Street/SR 87 interchange.
- *First Street/Goodyear Street (Intersection #46):* The Goal-Based Project Buildout scenario would exacerbate unacceptable intersection operations and meet the VTA's adverse effect threshold during the PM peak hour under Cumulative Conditions. To support the Project's multimodal and TDM goals, the Project applicant will contribute to the multimodal intersection improvements identified in the Story-Keyes Complete Streets Corridor project for the First Street/Goodyear Street intersection.

- **CMP Freeway Analysis:** Based on the CMP freeway segment analysis, the Project has freeway adverse effects at ten locations under Existing Plus Phase 1 conditions and at thirteen locations under Existing Plus Project Buildout conditions. Complete improvement of freeway impacts is considered beyond the scope of an individual development project, due to the inability of any individual project or City to fully fund a major freeway mainline improvement. Thus, consistent with the Project's multimodal and TDM goals, no feasible improvements are identified for this intersection.
- **Vehicle Parking**: The Project will provide 2,104 fewer parking spaces than required by the City of San José's current Parking Code. However, the City's current Parking Code does not reflect the City's vision for Downtown. Specifically, the Project area would need to have 75 percent non-SOV mode split, to support the citywide goal of at least 60 percent of commute trips completed by walking, biking, transit, and carpool. Since the availability of parking encourages driving, providing less parking will encourage more trips to be completed via alternative modes and support the City's ambitious multimodal access/non-SOV goal.
- **Bicycle Parking**: The Project would provide at least 3,292 bicycle parking spaces: 1,552 for the office uses, 1,475 for the residential uses, and 265 spaces for the remaining land uses, as required by the Municipal Code.
- **Neighborhood Traffic and Parking Intrusion Monitoring Plan**: To address local transportation concerns, the Project would be required to adopt a monitoring plan as outlined in Chapter 12 and to implement pre- and post-occupancy monitoring, although specific monitoring locations may be modified based on observed conditions. If the Project adds traffic and parking demand that exceeds the performance thresholds identified here, it would contribute a proportional share to the costs of managing cut-through traffic, speeding, and parking intrusion
- **Construction Management Plan**: The Project sponsor will be required to collaborate and coordinate with the City of San José to develop a robust temporary traffic control plan for each

major phase that is coordinated with adjacent construction activities, as appropriate, and holistically address vehicular, bicycle, pedestrian, transit, parking, loading, and emergency vehicle access and circulation

- **Roadway Closures**: Delmas Avenue between West Santa Clara Street and San Fernando Street as well as Montgomery Street between San Fernando Street and Park Avenue will be closed. These two street segments are part of the City's Transportation Diagram and are further evaluated.
    - *Delmas Avenue*: The closure of the segment of Delmas Avenue between West Santa Clara Street and West San Fernando Street would not be considered to have an adverse effect, since it generally functions as an access roadway to the fronting parcels and not as a roadway that provides through access.
    - *Montgomery Street*: The removal of this segment of South Montgomery is offset by the extension of two-way Cahill Street to the west and two-way conversion of Autumn Street to the east.
    - Delmas Avenue Light Rail Crossing: The light rail tracks cross Delmas Avenue immediately north of West San Fernando Street. The closure of Delmas Avenue between Santa Clara Street and San Fernando Street would eliminate the at-grade crossing of a public street of the light rail tracks; however, the Project is proposing to provide garage access on the current alignment of Delmas Avenue that crosses the light rail tracks. The Project applicant would fund a study to evaluate the operational conflict due to the closure of Delmas Avenue and the garage access interface with the at-grade light-rail crossing.

For the roadway closures, the Project would be required to comply with the City's Complete Streets Design Standards and Guidelines and the Downtown West Design Standards and Guidelines. Compliance would be governed by Council policy 5-1, which will require subsequent focused LTAs that evaluate internal roadway circulation in detail to ensure adequate lanes are provided, while balancing the needs for bicycle and pedestrian travel and activities. City review of the future focused LTAs would ensure that all proposed roadway network changes (i.e., additions or removals of street segments) would allow for adequate vehicle access to the Project area or surrounding areas. Design requirements deemed necessary by the City would be incorporated into the final design of each roadway.

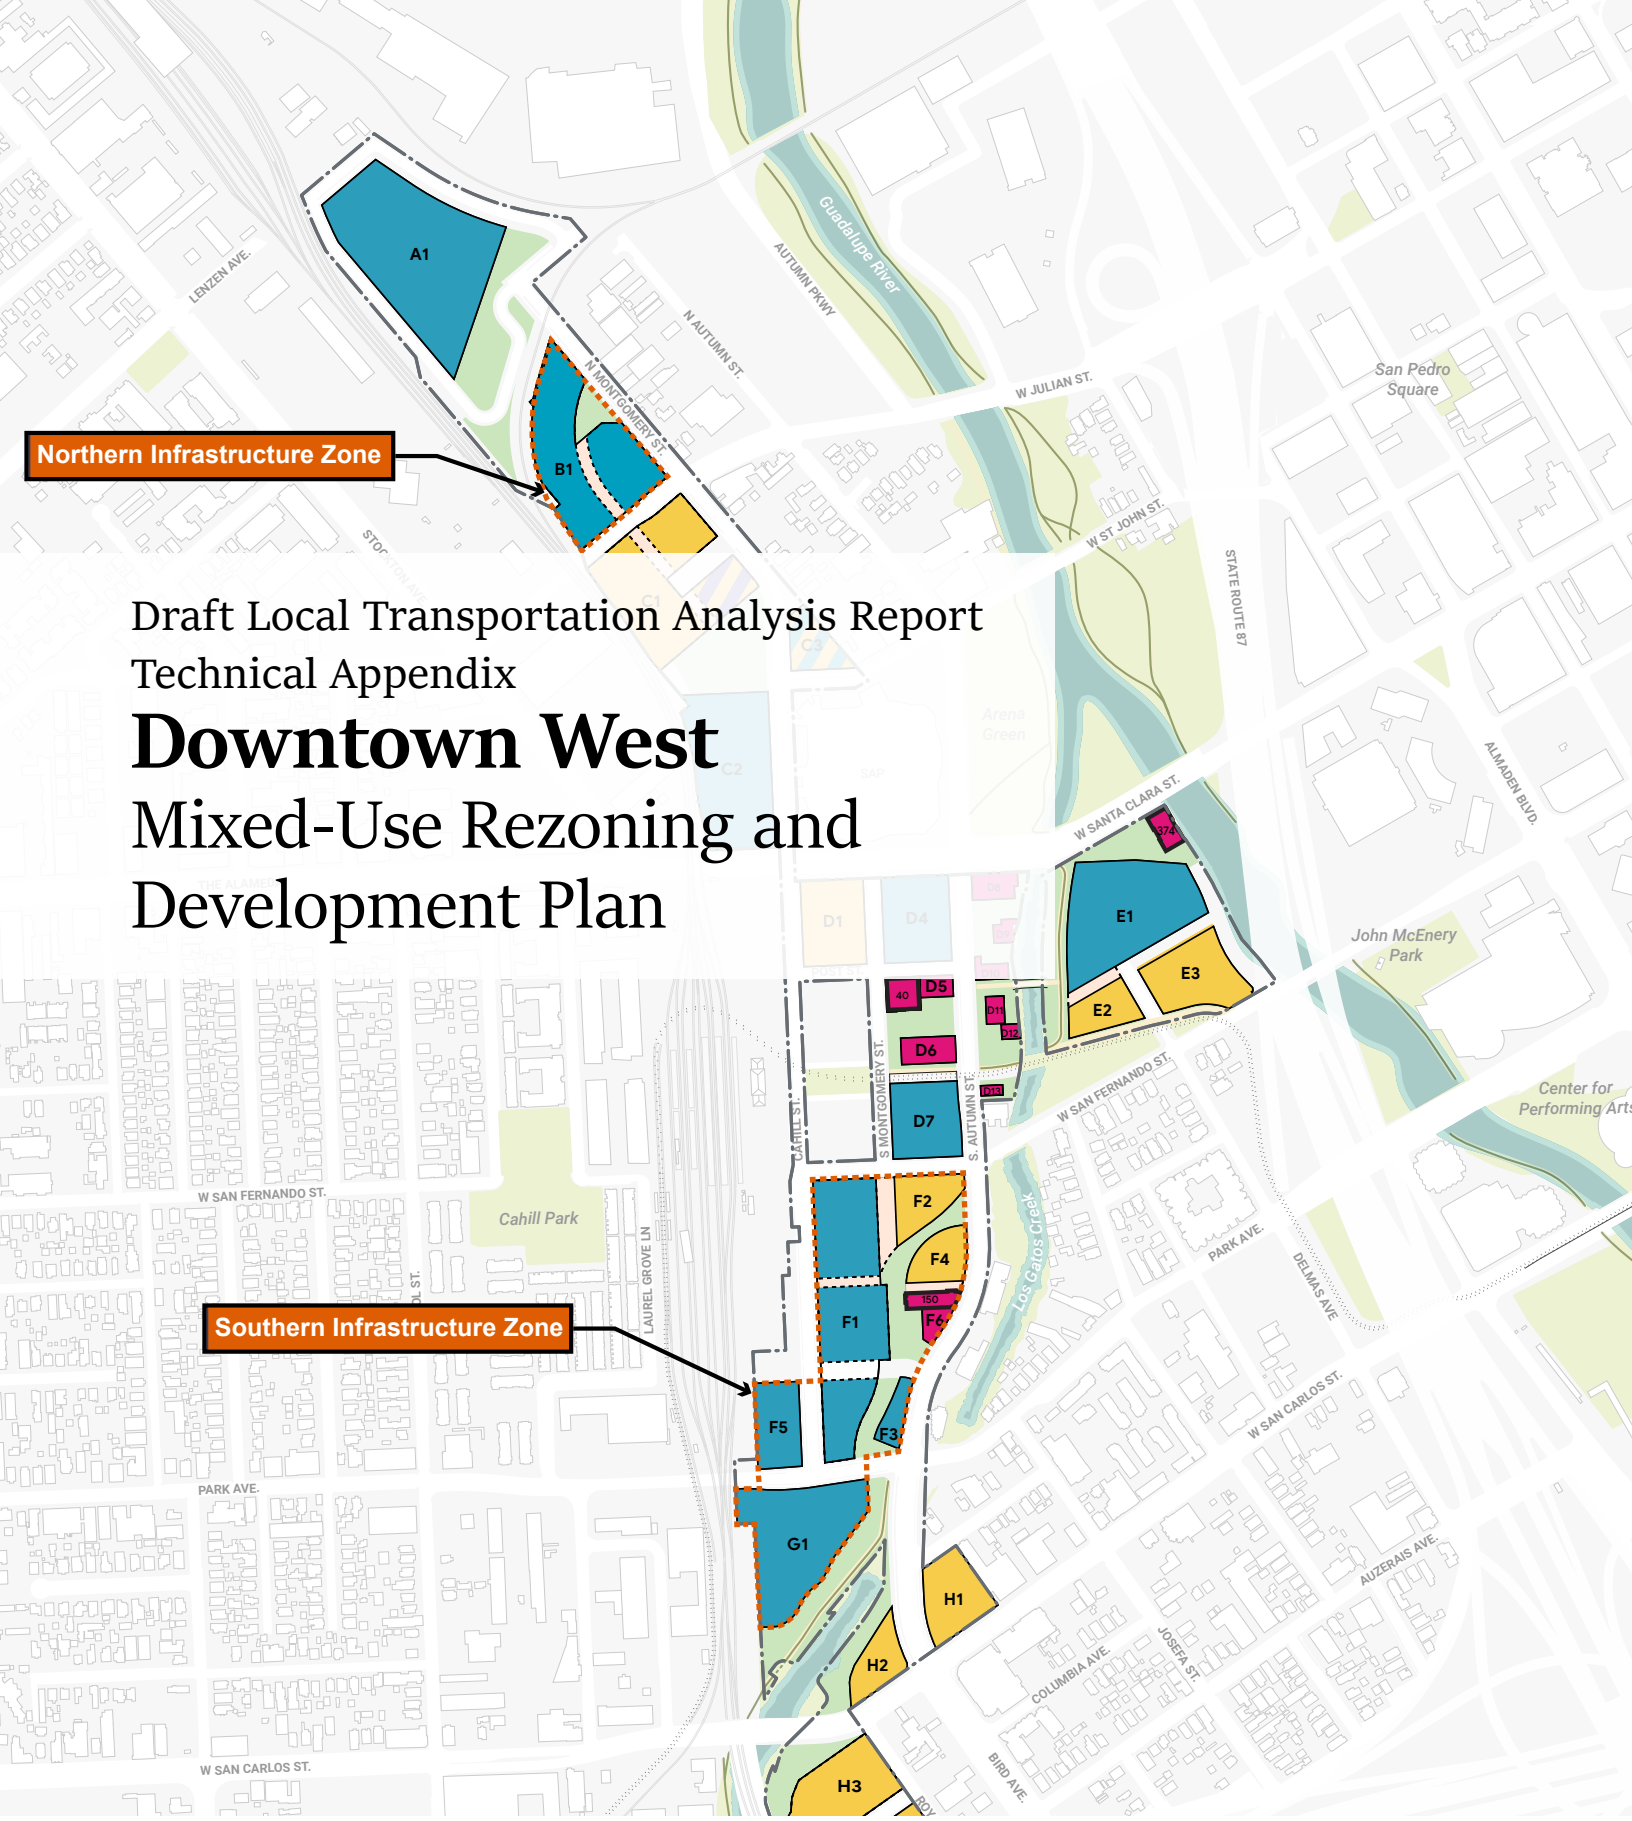


Table 66: Project Provided Improvements

Type of Improvement	Description
LTA Adverse Effect Required Improvement	
Transit	Fund a study to evaluate the feasibility of a dedicated public service lane along Santa Clara Street/The Alameda between 17th Street and I-880
Transit	Contribute to a study to explore transit improvements in the area, including exploring alignment and operational improvements along the light-rail corridor in Downtown, and in particular, the evaluation of the light-rail operations at Delmas Avenue, as well as new transit opportunities including a connector between the San Jose International Airport and Diridon Station that continues to Stevens Creek Boulevard.
Bicycle	Construct a footbridge over Los Gatos Creek north of San Fernando Street between Delmas Avenue and Autumn Street
Bicycle	Construct a trail at-grade signalized crossing at Santa Clara Street. (or contribution to potential future grade separation)
Bicycle	Contribute to protected bikeway improvements along Auzerais Avenue between the Los Gatos Creek Trail and Bird Avenue
Intersection (City of San Jose)	Enhance bicycle and pedestrian connectivity along West Taylor Street from Walnut Street to Stockton Avenue including improvements to the pedestrian walkway, removal of corner islands, and widening within the existing rail undercrossing could also be included.
Intersection (City of San Jose)	Contribute to First/Goodyear intersection improvements per Story-Keyes Complete Streets Corridor
Intersection (County of Santa Clara)	Construct multimodal intersection improvement at the Auzerais Avenue/SR 87 Southbound On-Ramp intersection. Improvements include signal modifications at the intersection and widening of the Auzerais north sidewalk beneath SR 87 freeway to provide for a continuous sidewalk that is not interrupted by the existing pillars from SR 87 freeway overcrossing.
Intersection (CMP)	Contribute to the City/Caltrans programmed signal and bikeway improvements at the Taylor Street/SR 87 interchange.
Localized Access and Queuing Analysis	Contribute to the Bird Avenue/I-280 Bicycle-Pedestrian multimodal connection from Diridon Station area to the Gardner community.
Project Features Constructed by Project	
Extend, repave, and restripe public streets along project frontage including along Auzerais Avenue, Royal Avenue, West San Carlos Street, Bird Avenue, Park Avenue, South Autumn Street, Cahill Street, West San Fernando Street, South Montgomery Street, West Post Street, West St. John Street, North Montgomery Street, West Julian Street, and Cinnabar Street.	
Provide protected bikeways and mature street trees along project frontage including Class IV bicycle facilities along Auzerais Avenue, Bird Avenue, Park Avenue, South Autumn Street, Cahill Street, West San Fernando Street, West St. John Street, North Montgomery Street, and West Julian Street	

Table 66: Project Provided Improvements

Type of Improvement	Description
Construct off-street trail connections to connect gaps in the existing Los Gatos Creek Trail including: • Construct the Los Gatos Creek Trail along the west side of the creek between Park Avenue at the City's proposed grade separation at San Carlos and the Caltrain tracks just north of San Fernando where this transitions to a multi-use path running east-west. • Construct the Los Gatos Creek Trail along the east side of the creek between Santa Clara Street and the VTA light rail bridge • Construct a "Diridon to Downtown" shared-use path along the north side of the VTA light rail corridor between S Montgomery Street and San Fernando Street.	
Reconnect the street grid including the extension of Cahill between West Santa Clara Street and North Montgomery Street in the North and between San Fernando Street and Park Street in the south to provide continuous north-south connectivity. In addition to a new street between Cinnabar Street and Lenzen Avenue at the northern parcel, an east-west extension of Post Street between South Montgomery Street and Autumn Street, and the extension of West St. John Street to connect to the new Cahill Street extension.	
Extend the pedestrian network to allow for enhanced circulation and access including midblock passageways and a footbridge crossing Los Gatos Creek	
Extend the public realm including extended active street realms, the use of dynamic lanes for furniture, landscaping, and other non-vehicular uses. In addition to the designation of shared streets that have traffic calming, low speeds, and potential restrictions to auto travel along South Montgomery between West San Fernando Street and West Santa Clara Street
