**Subject: 1095 Rollins Road Apartment Development IS-MND, Greenhouse Gas Letter Report,
1095 Rollins Road, Burlingame, California, 94010**

Dear Mr. Metzger:

This letter report analyzes the potential greenhouse gas (GHG) impacts of the proposed apartment development at 1095 Rollins Road in Burlingame, California. Rincon Consultants, Inc. (Rincon) prepared this letter report under contract to Circlepoint to support California Environmental Quality Act (CEQA) documentation for a Mitigated Negative Declaration (IS-MND). This analysis considers both temporary and long-term GHG impacts and demonstrates that project construction and operation would not result in a significant GHG impact. This assessment is based on significance thresholds and methodologies in the California 2017 Scoping Plan Update.

Project Location

The project site is a 1.08-acre property comprising two assessor's parcels, located at 1095 Rollins Road in Burlingame, California (Assessor Parcel Numbers 026-231-250 and 026-231-260). The project site currently contains a restaurant on the western portion of the site and elevated tennis courts located on top of a parking structure on the eastern portion of the site. The project site is bound by a gas station to the west, Rollins Road and U.S. 101 (Bayshore Freeway) to the north, a City utility station to the east, and a multi-family residential complex (Northpark Apartments) to the south and east.

Project Description

The project would include demolition of all existing structures on-site and construction of a six-story, 150-unit multi-family residential apartment building. Ten percent of units would be designated as affordable housing for moderate-income households. The building would also include a one-level subterranean garage with 192 parking spaces in traditional and stacked parking configurations. The building would include multiple roof decks with barbeques and fire pits, a programmed courtyard with bocce ball court, a fitness center, clubhouse, bicycle parking, and on-site storage. Access to the site would be provided via an entrance and exit along Rollins Road. See Attachment A for the project site plan.

Climate Change and Greenhouse Gases

Gases that absorb and re-emit infrared radiation in the atmosphere are called greenhouse gases (GHGs). The gases that are widely seen as the principal contributors to human-induced climate change include carbon dioxide (CO_2), methane (CH_4), nitrous oxides (N_2O), fluorinated gases such as hydrofluorocarbons (HFCs) and perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6). Water vapor is excluded from the list of GHGs because it is short-lived in the atmosphere, and its atmospheric concentrations are largely determined by natural processes, such as oceanic evaporation.

GHGs are emitted by both natural processes and human activities. Of these gases, CO_2 and CH_4 are emitted in the greatest quantities from human activities. Emissions of CO_2 are largely by-products of fossil fuel combustion, whereas CH_4 results from off-gassing associated with agricultural practices and landfills.

Man-made GHGs, many of which have greater heat-absorption potential than CO_2 , include fluorinated gases and SF_6 .¹ Different types of GHGs have varying global warming potentials (GWP). The GWP of a GHG is the potential of a gas or aerosol to trap heat in the atmosphere over a specified timescale (generally, 100 years). Because GHGs absorb different amounts of heat, a common reference gas (CO_2) is used to relate the amount of heat absorbed to the amount of the gas emissions, referred to as “carbon dioxide equivalent” (CO_2e), and is the amount of a GHG emitted multiplied by its GWP. Carbon dioxide has a 100-year GWP of one. By contrast, methane CH_4 has a GWP of 25, meaning its global warming effect is 25 times greater than carbon dioxide on a molecule per molecule basis (Intergovernmental Panel on Climate Change [IPCC]).²

Regulatory Setting

Assembly Bill 32

California’s major initiative for reducing GHG emissions is outlined in Assembly Bill 32 (AB 32), the “California Global Warming Solutions Act of 2006,” which was signed into law in 2006. AB 32 codifies the statewide goal of reducing GHG emissions to 1990 levels by 2020 and requires the California Air Resources Board (CARB) to prepare a Scoping Plan that outlines the main State strategies for reducing GHGs to meet the 2020 deadline. In addition, AB 32 requires CARB to adopt regulations to require reporting and verification of statewide GHG emissions. Based on this guidance, CARB approved a 1990 statewide GHG level and 2020 limit of 427 million metric tons of carbon dioxide-equivalent (MMT CO_2e). The Scoping Plan was approved in 2008 and included measures to address GHG emission reduction strategies related to energy efficiency, water, recycling and solid waste. CARB has approved two updates to the Scoping Plan in 2014 and 2017. These set the groundwork to reach post-2020 statewide goals.³

³ California Air Resources Board (CARB). 2019. AB 32 Scoping Plan. Updated January 2018. Accessed August 2019 at <https://ww3.arb.ca.gov/cc/scopingplan/scopingplan.htm>

Senate Bill 32

On September 8, 2016, the governor signed Senate Bill 32 (SB 32) into law, extending AB 32 by requiring the State to further reduce GHGs to 40 percent below 1990 levels by 2030 (the other provisions of AB 32 remain unchanged). On December 14, 2017, CARB adopted the 2017 Scoping Plan, which provides a framework for achieving the 2030 target.⁴ The 2017 Scoping Plan relies on the continuation and expansion of existing policies and regulations, such as the Cap-and-Trade Program, as well as implementation of recently adopted policies and policies, such as SB 1383 for solid waste reduction. The 2017 Scoping Plan also puts an increased emphasis on innovation, adoption of existing technology, and strategic investment to support its strategies. As with the 2013 Scoping Plan Update, the 2017 Scoping Plan does not provide project-level thresholds for land use development. Instead, it recommends that local governments adopt policies and locally-appropriate quantitative thresholds consistent with statewide per capita goals of 6 MT CO₂e by 2030 and 2 MT CO₂e by 2050.⁵ As stated in the 2017 Scoping Plan, these goals may be appropriate for plan-level analyses (city, county, subregional, or regional level), but not for specific individual projects because they include all emissions sectors in the state.⁶

Senate Bill 100

Adopted on September 10, 2018, SB 100 supports the reduction of GHG emissions from the electricity sector by accelerating the state's Renewables Portfolio Standard Program, which was last updated by SB 350 in 2015. SB 100 requires electricity providers to increase procurement from eligible renewable energy resources to 33 percent of total retail sales by 2020, 60 percent by 2030, and 100 percent by 2045.

Executive Order B-55-18

On September 10, 2018, the governor issued Executive Order B-55-18, which established a new statewide goal of achieving carbon neutrality by 2045 and maintaining net negative emissions thereafter. This goal is in addition to the existing statewide GHG reduction targets established by SB 375, SB 32, SB 1383, and SB 100.

Methodology

Calculations of CO₂, CH₄, and N₂O emissions are provided to identify the magnitude and nature of the project's potential GHG emissions and environmental effects. The analysis focuses on CO₂, CH₄, and N₂O because these make up 98.9 percent of all GHG emissions by volume and are the GHG emissions that the project would emit in the largest quantities.⁷ Fluorinated gases, such as HFCs, PFCs, and SF₆, were also considered for the analysis. However, since fluorinated gases are primarily associated with industrial processes, and the proposed project involves a residential use, the quantity of fluorinated gases would not be significant. Small amounts of other GHGs (such as chlorofluorocarbons [CFCs]) would also be emitted; however, these other GHG emissions would not substantially add to the total GHG emissions. Emissions of all GHGs are converted into their equivalent GWP in MT of CO₂e. Calculations

⁶ CARB. 2017.

⁷ IPCC. 2007.

are based on the methodologies discussed in the California Air Pollution Control Officers Association (CAPCOA) *CEQA and Climate Change* white paper.⁸ GHG emissions associated with the project were calculated using the California Emissions Estimator Model (CalEEMod) version 2016.3.2 (see Attachment B for CalEEMod worksheets).

Construction Emissions

Construction activities emit GHGs primarily through combustion of fuels (mostly diesel) in the engines of off-road construction equipment and through combustion of diesel and gasoline in on-road construction vehicles and in the commute vehicles of construction workers. Smaller amounts of GHGs are also emitted indirectly through the energy use embodied in any water use for fugitive dust control and lighting for construction activity. Every phase of the construction process, including demolition, grading, paving, and building, emits GHG emissions in volumes proportional to the quantity and type of construction equipment used. Heavier equipment typically emits more GHGs per hour of use than lighter equipment due to greater fuel consumption and engine design.

Although construction activity is addressed in this analysis, CAPCOA does not discuss whether any of the suggested threshold approaches adequately address impacts from temporary construction activity. As stated in the *CEQA and Climate Change* technical advisory, “more study is needed to make this assessment or to develop separate thresholds for construction activity”⁹. The Association of Environmental Professionals (AEP) Climate Change Committee white paper *Beyond Newhall and 2020* recommends evaluating construction emissions using one of two methods¹⁰:

1. **Using Best Management Practices (BMPs).** Construction-related emissions would be less than significant if a project implements all feasible BMPs, including using alternatively-fueled vehicles, reducing worker trips, and sourcing construction materials from local sources when possible (without substantial cost implications).
2. **Amortizing Construction Emissions over the Operational Lifetime.** Construction-related emissions are quantified and amortized over the lifetime of a project. The amortized construction emissions are added to the operational emissions to calculate the total annual emissions. If the annual emissions are below quantitative thresholds, construction-related GHG emissions would be less than significant.

This analysis utilizes the second option for evaluating construction emissions. Neither the City nor the regional air district (Bay Area Air Quality Management District [BAAQMD]) have an adopted threshold of significance for construction-related GHG emissions, although the BAAQMD recommends quantifying emissions and disclosing GHG construction emissions.¹¹ Therefore, construction-related GHG emissions were amortized over a 30-year period as recommended by the South Coast Air Quality Management

District (SCAQMD) to determine the annual construction-related GHG emissions over the life of the project.

Operational Emissions

CalEEMod calculates operational emissions of CO₂, CH₄, and N₂O associated with energy use, area sources, waste generation, water use and conveyance. CalEEMod also calculates emissions of CO₂ and CH₄ generated by project-generated vehicle trips (i.e., mobile sources). However, CalEEMod does not calculate N₂O emissions from mobile sources; therefore, N₂O emissions were quantified separately using guidance from CARB (see *Mobile Source Emissions* for a detailed discussion of methodology).

Energy Use Emissions

Project design features such as use of energy efficient appliances, high efficiency lighting, smart irrigation systems and low flow fixtures have been incorporated into CalEEMod in conformance with the 2016 CalGreen Building Standards. New energy and water reduction requirements were not incorporated in CalEEMod, including residential energy efficiency improvements and indoor water use efficiency improvements per the 2016 Title 24 Building Energy Efficiency Standards. Similarly, ten electric vehicle spaces planned for the project parking area are not incorporated in CalEEMod. Therefore, energy, water, and transportation emissions are a conservative estimate.

The project would be served by Pacific Gas and Electric (PG&E). Therefore, PG&E's specific energy intensity factors (i.e., the amount of CO₂, CH₄, and N₂O per kilowatt-hour) are used in the calculations of GHG emissions. PG&E had renewable energy procurement of 14.1 percent in 2009.¹² Per SB 100, the statewide Renewable Portfolio Standard (RPS) Program requires electricity providers to increase procurement from eligible renewable energy sources to 33 percent by 2020, 44 percent by 2024 and 60 percent by 2030. However, the default energy intensity factors included in CalEEMod are based on data from 2009. Therefore, the 2009 PG&E intensity factor of 641 pounds per megawatt hour (MWh) for CO₂e was used to calculate energy intensity in 2030 in compliance with the RPS Program (see Attachment C). This 2030 energy factor was included in CalEEMod for the proposed project scenario.

Mobile Source Emissions

N₂O emissions were quantified using guidance from CARB (see Attachment D for calculations).¹³ CalEEMod does not list the percentage breakdown of gasoline and diesel vehicles used in the model's fleet mixes. To determine this percentage, the CARB Emissions Factors (EMFAC) 2014 Emissions Inventory obtained in a spreadsheet output for the San Mateo County region for the operational year¹⁴, using EMFAC 2011 categories.¹⁵ The vehicle population totals for gasoline and for diesel vehicles were separately summed, and the total for each was divided by the overall total vehicles to determine their percentage. The percentage of gasoline vehicles was multiplied by the NO_x emissions output from CalEEMod. This result was then multiplied by 4.16 percent and converted to MT to result in MT of N₂O

¹⁴ 2030, the project operational year for evaluating consistency with SB 32, as described in *Methods* above.

¹⁵ CARB. 2019. EMFAC 2014 Web Database. Available at: <https://www.arb.ca.gov/emfac/2014/>

per year from gasoline vehicles.¹⁶ For diesel vehicles, miles per gallon were converted to MT of N₂O per year for diesel vehicles by multiplying 0.3316 grams of N₂O per gallon and the yearly VMT (multiplied by the percentage of diesel vehicles compared to total vehicles).¹⁷ Finally, the MT of N₂O per year for gasoline and diesel vehicles were added together and converted into CO₂e by using the global warming potential of N₂O of 298¹⁸, and then added to the mobile source emissions for CO₂ and CH₄ outputted in CalEEMod.

Service Population

The project's service population is estimated at 429 residents based on CalEEMod defaults for the project's land use types. This is a conservatively high estimate because the California Department of Finance (DOF) estimates average household size in the City of Burlingame to be 2.4 persons in 2019, which would result in approximately 360 residents (2.4 persons/household x 150 units).¹⁹ The project's service population includes only residents and no employees, as the project would not contain commercial land use types.

Thresholds

The vast majority of individual projects do not generate sufficient GHG emissions to directly influence climate change. However, physical changes caused by a project can contribute incrementally to cumulative effects that are significant, even if individual changes resulting from a project are limited. The issue of climate change typically involves an analysis of whether a project's contribution towards an impact would be cumulatively considerable. "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, other current projects, and probable future projects (*CEQA Guidelines*, Section 15064[h][1]).

To determine whether a project would have a significant GHG impact, Appendix G to the *CEQA Guidelines* requires consideration of whether a project would result in:

1. Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment; or
2. Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

In addition, *CEQA Guidelines* Section 15064.4(b) states that a lead agency should consider the following factors, among others, when assessing the significance of impacts from GHG emissions on the environment:

- The extent to which the project may increase or reduce GHG emissions as compared to the existing environmental setting;
- Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project; and

¹⁶ CARB. 2019.

¹⁷ CARB. 2019.

¹⁸ IPCC. 2007.

¹⁹ California Department of Finance (DOF). 2019. Population and Housing Estimates for Cities, Counties, and the State, January 1, 2011-2019. Available at: <http://www.dof.ca.gov/Forecasting/Demographics/E-5/>

- The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions. Such requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project's incremental contribution of GHG emissions.

Regional Reduction Plan Threshold

According to the *CEQA Guidelines* and guidance provided in the California Air Pollution Control Officers Association (CAPCOA) white paper *CEQA & Climate Change*, the significance of GHG emissions may be evaluated based on locally adopted quantitative thresholds or consistency with a regional GHG reduction plan (such as a Climate Action Plan). The City adopted the Burlingame Climate Action Plan (CAP) in June 2009 with the goal of reducing the City's GHG emissions in line with Assembly Bill (AB) 32 targets for 2020.²⁰ However, the Burlingame CAP is not a qualified CAP under CEQA because it does not reflect state regulations beyond 2020. Similarly, the Bay Area Air Quality Management District (BAAQMD) is currently updating its GHG thresholds to reflect new GHG legislation and case law.²¹ As of August 2019, the City is completing a 2030 CAP Update alongside the General Plan Update. The 2030 CAP is designed to conform with recent state emissions reduction legislation including Executive Order (EO) S-03-05, establishing a GHG reduction target of 80 percent below 1990 levels by 2050, EO B-30-15 and Senate Bill (SB) 32, establishing an interim statewide GHG emission reduction target of 40 percent below 1990 GHG levels by 2030. However, the 2030 CAP Update has not yet been adopted by the City and is therefore not a qualified CAP from which to establish a quantitative emissions threshold.

Project-Specific Efficiency Threshold

Efficiency thresholds are quantitative thresholds based on a measurement of GHG efficiency for a given project, regardless of the amount of mass emissions. Efficiency thresholds identify the emission level below which new development would not interfere with attainment of statewide GHG reduction targets. A project that attains such an efficiency target, with or without mitigation, would result in less than significant GHG emissions.²² A locally-appropriate 2030 project-specific threshold is derived from the California Air Resources Board (CARB)'s recommendations in the 2017 Climate Change Scoping Plan Update, as discussed below.

The State has codified a target of reducing emissions to 40 percent below 1990 emissions levels by 2030 (SB 32) and has developed the 2017 Climate Change Scoping Plan Update to demonstrate how the State will achieve the 2030 target and make substantial progress toward the 2050 goal of an 80 percent reduction in 1990 GHG emission levels set by EO S-3-05. In the recently signed EO B-55-18, which identifies a new goal of carbon neutrality by 2045 and supersedes the goal established by EO S-3-05, CARB has been tasked with including a pathway toward the EO B-55-18 carbon neutrality goal in the next Scoping Plan update.

With the release of the 2017 Climate Change Scoping Plan Update, CARB recognized the need to balance population growth with emissions reductions and in doing so, provided a new local plan level

²⁰ City of Burlingame. 2009. Climate Action Plan. Available at: https://www.burlingame.org/document_center/Sustainability/2009%20Climate%20Action%20Plan.pdf

²¹ BAAQMD. 2018. CEQA Guidelines Update Underway. Accessed August 2019 at <http://www.baaqmd.gov/plans-and-climate/california-environmental-quality-act-ceqa/updated-ceqa-guidelines>

²² AEP. 2016.

methodology for target setting that provides consistency with state GHG reduction goals using per capita efficiency thresholds. A project-specific efficiency threshold can be calculated by dividing statewide GHG emissions by the sum of statewide jobs and residents. However, not all statewide emission sources would be impacted by the proposed land use (e.g., agriculture and industrial). Accordingly, consistent with the concerns raised in the *Golden Door Properties v. County of San Diego* (2018) and *Center for Biological Diversity v. California Department of Fish and Wildlife* ("Newhall Ranch" case, 2015) decisions regarding the correlation between state and local conditions, the 2030 statewide inventory target was modified with substantial evidence provided to establish a locally-appropriate, evidence-based, commercial project-specific threshold consistent with the SB 32 target.

To develop the project-specific efficiency threshold, land use areas in the City of Burlingame General Plan were first evaluated to determine emissions sectors that are present and would be directly affected by potential land-use changes. A description of major sources of emissions that are included in the 2017 State Scoping Plan emissions sectors and representative sources in the City of Burlingame are shown in Table 1.

According to the City's General Plan Land Use Map, there are no agricultural land uses within the City.²³ Therefore, the Agricultural Emissions Sector was considered locally inappropriate and was removed from the State 2030 emissions forecast. Furthermore, Industrial Sector source emissions (i.e., oil, gas, and hydrogen production; refineries; general fuel use; and mining operations) would not be directly impacted by the proposed land uses; therefore the Industrial Emissions Sector was removed from the State 2030 emissions forecast to retain a more conservative locally-appropriate target.²⁴ Finally, Cap and Trade emissions reductions occur independent of any local jurisdictional land use decisions and were also excluded from the locally-appropriate target.

After removing Agricultural, Industrial, and Cap and Trade emissions, the remaining emissions sectors with sources within the City of Burlingame planning area were then summed to create a locally-appropriate emissions total for a residential project in Burlingame. This locally-appropriate emissions total was divided by the statewide 2030 service person population to determine a locally-appropriate, project-level threshold of 3.2 MT of CO₂e per service population that is consistent with SB 32 targets, as shown in Table 1 and Table 2.

²³ City of Burlingame. 2000. General Plan Land Use Map. The Land Use Map contained in the 2019 Draft General Plan Update similarly includes no agricultural uses. Available at:

https://www.burlingame.org/departments/planning/general_and_specific_plans.php

²⁴ Light and general industrial land uses are present in Burlingame; however, these land uses are considered part of the Commercial sector rather than the Industrial sector for the purposes of the 2017 Scoping Plan.

Table 1 SB 32 Scoping Plan Emissions Sector Targets

GHG Emissions Sector ¹	2030 State Emissions Target (MMT) ¹	Locally Appropriate ²	Project Specific	Major Sources ³
Residential and Commercial	38	Yes	Yes	Natural gas end uses, including space and water heating of buildings
Electric Power	53	Yes	Yes	Electricity uses, including lighting, appliances, machinery and heating
High Global Warming Potential	11	Yes	Yes	Sulfur hexafluoride (SF ₆) from power stations, HFCs from refrigerants and air conditioning ⁴
Recycling and Waste	8	Yes	Yes	Waste generated by residential, commercial, and other facilities
Transportation	103	Yes	Yes	Passenger, heavy duty, and other vehicle emissions
Industrial	83	No	No	Oil, gas, and hydrogen production, refineries, general fuel use, and mining operations do not occur substantially within the City
Agriculture	24	No	No	Enteric fermentation, crop residue burning, and manure management do not occur substantially within the City
Cap and Trade Reductions	-60	No	No	Reductions from facilities emitting more than 10,000 MT CO ₂ e per year ⁶
Scoping Plan Target (All Sectors)	260	No	No	All emissions sectors
Locally Inapplicable Sector (Industrial)	-83	No	No	Oil, gas, and hydrogen production, refineries, general fuel use, and mining operations ⁵
Locally Inapplicable Sector (Agriculture)	-24	No	No	Enteric fermentation, crop residue burning, and manure management
Locally Inapplicable Sector (Cap and Trade)	60	No	No	Reductions from facilities emitting more than 10,000 MT CO ₂ e per year ⁶
2030 Locally Applicable Emissions Sectors	213	Yes	Yes	Emissions applicable to the local planning area

MMT = million metric tons

¹ All State targets in MMT CO₂e. See the 2017 Climate Change Scoping Plan, page 31 for sector details (CARB 2017).

² Locally-appropriate is defined as having significant emissions in Scoping Plan Categorization categories within the Burlingame General Plan land use areas.

³ See CARB GHG Emissions Inventory Scoping Plan Categorization for details, available at:

<https://www.arb.ca.gov/cc/inventory/data/data.htm>

⁴ SF₆ is used primarily as an insulator in electrical substations while HFCs can be found in many residential and commercial refrigeration and air conditioning units. HFCs are in the process of being phased out through 2036 in most developed countries.

⁵ The majority of this sector is not applicable to the local planning area, and any potential applicable subsectors cannot be disaggregated due to CARB accounting methods. Therefore, the entire sector has been removed to ensure a more conservative target.

⁶ Cap and Trade is excluded as reductions will occur independent of local project land use decisions and are therefore not locally appropriate.

Table 2 SB 32 Locally-Appropriate Project-Specific Threshold

Threshold Source	Threshold Determination Variable	
California 2017 Climate Change Scoping Plan	California 2030 Population (persons) ¹	43,939,333
	California 2030 Employment Projection (persons) ²	23,459,500
	Service Population (persons)	67,398,833
Locally-Appropriate Project Threshold	2030 Locally-Appropriate Emissions Sectors (MT of CO ₂ e)	213,000,000 ³
	2030 California Service Population (persons)	67,398,833
	2030 Service Person Target (MT of CO ₂ e per Service Person)	3.2 ⁴

¹ California Department of Finance 2019. State Population Projections. Available at:
<http://www.dof.ca.gov/Forecasting/Demographics/Projections/>

² Average of employment range projections under implementation scenario. See CARB 2017 Climate Change Scoping Plan Update, page 55 (CARB 2017).

³ See Table 1 above.

⁴ Total of 3.16 has been rounded up per Scoping Plan general methodology. Lead agencies may determine this threshold in consistence with Scoping Plan and State GHG reduction goals as they deem appropriate, as noted in the Climate Change Scoping Plan (page 102, CARB 2017).

While State and regional regulators of energy and transportation systems, along with the State's Cap and Trade program, are designed to be set at limits to achieve most of the reductions needed to hit the State's long-term targets, local governments can do their fair share toward meeting the State's targets by siting and approving projects that accommodate planned population growth and projects that are GHG-efficient. The AEP Climate Change Committee recommends that CEQA GHG analyses evaluate project emissions in light of the trajectory of state climate change legislation and assess their "substantial progress" toward achieving long-term reduction targets identified in available plans, legislation, or EO^s.²⁵ Consistent with AEP Climate Change Committee recommendations, GHG impacts are analyzed in terms of whether the anticipated development would impede "substantial progress" toward meeting the reduction goal identified in SB 32 and EO B-55-18. As SB 32 is considered an interim target toward meeting the 2045 State goal, consistency with SB 32 would be considered contributing substantial progress toward meeting the State's long-term 2045 goals. Avoiding interference with, and making substantial progress toward, these long-term State targets is important because these targets have been set at levels that achieve California's fair share of international emissions reduction targets intended to stabilize global climate change effects and avoid the adverse environmental consequences, as noted in the Scoping Plan.²⁶

Impact Analysis

Threshold 1: Would the project generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Emissions

Project-related construction emissions are confined to a relatively short period in relation to the overall life of the project. As noted in *Methodology* above, construction-related GHG emissions were amortized

²⁵ AEP. 2016.

²⁶ CARB. 2017.

over a 30-year period to determine the annual construction-related GHG emissions over the life of the project.²⁷ Table 3 shows the project construction would result in an average of approximately 16.2 MT of CO₂e per year. GHG emissions associated with construction were computed to be 486 MT of CO₂e for the total construction period.

Table 3 Estimated Construction GHG Emissions

Construction Year	Project Emissions MT/yr CO ₂ e ¹
2020	179.1
2021	256.1
2022	50.4
Total	485.6
Total Amortized over 30 Years	16.2

¹ Construction emissions are a conservative estimate as they do not reflect air quality mitigation measures AQ-1 noted in the project's Air Quality Letter Report. These include extension of the construction hauling phase and using Best Available Control Technology on diesel equipment.

See Attachment B for CalEEMod worksheets.

Operational Emissions

Operational emissions include area sources (consumer products, landscape maintenance equipment, and painting), energy use (electricity and natural gas), solid waste, electricity to deliver water, and transportation emissions. Project operational emissions are shown in Table 4.

²⁷ SCAQMD. 2008. Draft Guidance Document – Interim CEQA Greenhouse Gas (GHG) Significance Threshold. Available at: [http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-\(ghg\)-ceqa-significance-thresholds/ghgattachmente.pdf](http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-(ghg)-ceqa-significance-thresholds/ghgattachmente.pdf)

Table 4 Combined Annual Emissions of GHGs

Emission Source	Annual Emissions (MT CO ₂ e)
Construction	16.2
Operational	
Area	2.6
Energy	177.1
Solid Waste	34.7
Water	19.2
Mobile	
CO ₂ and CH ₄	258.8
N ₂ O	3.5
Total	495.1
Service Population	429
Emissions per Service Population (MT CO₂e/SP/year)	1.2
Project-Specific Efficiency Threshold (MT CO ₂ e/SP/year)	3.2
Exceed Project-Specific Threshold?	No

See Attachment B for CalEEMod worksheets. See Attachment C for the utility's expected energy emissions factor in 2030 used to estimate operational energy emissions. See Attachment D for N₂O mobile calculations.

Values are rounded to the nearest tenth.

¹ Service population based on CalEEMod estimate of 429 residents.

As shown in Table 4, total emissions associated with the project are estimated to be approximately 495 MT of CO₂e per year. Given an estimated 429 building residents, GHG emissions would be approximately 1.2 MT CO₂e per service person per year. This is a conservative estimate, as it does not account for emissions from the current site use that would be replaced by the project to reflect net change in emissions. This per service person emissions level would not exceed the locally-appropriate, project-specific threshold of 3.2 MT of CO₂e per service person per year described under *Thresholds* above. Therefore, net new GHG emissions associated with the project would not conflict with SB 32's emission reduction target or the State 2017 Scoping Plan and impacts would be less than significant.

Threshold 2: Would the project conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

The project would be subject to the most recent requirements under rule making developed at the State and local levels regarding GHG emissions. Local thresholds include the BAAQMD May 2017 *CEQA Air Quality Guidelines* for GHG emissions and the 2009 Burlingame CAP. These regulations identify emissions levels for which the project would not be expected to substantially conflict with existing California legislation adopted to reduce statewide GHG emissions.

The project would comply with the BAAQMD's updated *CEQA Air Quality Guidelines*. As noted in *Methods: Operational Emissions*, BAAQMD has not adopted a threshold of significance for construction-related GHG emissions; however, construction emissions were calculated for transparency, as preferred under the guidelines, and estimated over the lifetime of the project. The guidelines are currently being

updated to reflect new state legislation and case law. The current guidelines include evaluating project-level GHG impact significance by using one of three thresholds, including that of 4.6 MT CO₂e per service person per year. As noted above, project emissions are expected to be in conformance with this threshold. However, BAAQMD notes that thresholds do not reflect newer legislation and should be used for informational purposes. Adjusting the 2017 Scoping Plan efficiency threshold based on land uses local to the project area is intended to provide a more appropriate project-level efficiency threshold in line with state GHG reduction goals. Further, by utilizing the more stringent project-level efficiency threshold, the project would not conflict with thresholds included in the current guidelines.

As mentioned in *Regional Reduction Plan Threshold* above, the 2009 City of Burlingame CAP included a 2020 GHG reduction target in conformance with AB 32 of 15% below the 2005 emissions level in 2020. As the project-level GHG efficiency threshold is based on the longer term and more stringent Scoping Plan GHG target for 2030, the project would be in compliance with the 2009 City CAP if it demonstrates conformance with the Scoping Plan-based project-level efficiency threshold. The project's per service person emissions are expected to be below the Scoping Plan project-level efficiency threshold; therefore, the project would not conflict with the emissions reduction plan of the City's 2009 CAP.

Also noted previously, the City of Burlingame's 2030 CAP Update and General Plan Update are being reviewed as of August 2019. The project would be subject to policies in the updated CAP and General Plan if the plans are adopted before project permitting is complete. However, emissions targets identified in the CAP Update are reflective of SB 32 and Scoping Plan emissions targets and supportive of the state's reach newer long-term emission goals. Therefore, by applying a Scoping Plan-based project-level efficiency threshold, the project is expected to conform with the 2030 CAP Update emissions target.

In addition, there are twenty identified GHG reduction measures in the draft 2030 CAP and the project design would meet several of these measures including: green building practices and standards, energy efficiency, residential solar power, water conservation, electric vehicle infrastructure and construction best management practices.²⁸ The project is intended to comply with 2016 CalGreen Building Standards; use energy efficient LED controls, low-flow water fixtures, drought-tolerant landscape plants, low-water irrigation and Energy Star-rated appliances; prepare at least 15 percent of roof area with electric conduit for future photovoltaic installation; include ten electric vehicle charging spaces, 75 bicycle spaces and a bicycle maintenance and repair space; and recycle or salvage at least 65 percent of construction and demolition waste.

Similarly, the project incorporates several features supportive of the Climate Policy Portfolio of actions outlined in the State Scoping Plan Update. Portfolio actions include doubling building efficiency, incorporating 50 percent renewable power, using zero- or low-emission vehicles and creating walkable and bikeable communities with transit.²⁹ As noted, the project is intended to comply with CalGreen Building Standards, utilize various energy and water efficiency controls and fixtures, prepare for future rooftop photovoltaic installation, support the local electric vehicle network with ten charging stations and the local bicycling network with 75 spaces and a maintenance space. Given the project's

²⁸ City of Burlingame. 2019. 2030 Climate Action Plan Update. Available at: https://www.burlingame.org/document_center/Sustainability/Burlingame_CAP_20190412_low_res.pdf

²⁹ CARB. 2017.

conformance with local and state GHG thresholds and emission reduction measures, project implementation would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs, and any impacts would be less than significant.

Conclusions and Recommendations

Construction and operational greenhouse gas impacts would be less than significant in conformance with the 2017 Scoping Plan efficiency threshold. Therefore, no mitigation measures are recommended additional to the project design features.

Sincerely,
Rincon Consultants, Inc.

1095 Rollin Roads - San Mateo County, Annual

Project Characteristics - Per RPS 2030 requirement of 60% renewable procurement based on 2009 PG&E factors (CPUC 2011).

Land Use - Source: planning submittal 9.14.18; building gross sf = 195,000 sf (-parking sf); site area = 46,829 sf (1.075 acres); although there are 192 parking spots 175 are stackers stalls, parking garage sf provided by applicant. See site plans for details.

Construction Phase - Applicant provided construction schedule

Off-road Equipment - Provided by applicant; hours/day = avg hours per day

Off-road Equipment - Provided by applicant; hours/day = avg hours per day

Off-road Equipment - Provided by applicant; hours/day = avg hours per day

Off-road Equipment - Provided by applicant; hours/day = avg hours per day

Off-road Equipment - Provided by applicant; hours/day = avg hours per day

Off-road Equipment - Provided by applicant; hours/day = avg hours per day

Trips and VMT - Applicant provided number of worker round trips per work day

Demolition - Applicant provided.

Grading - Applicant provided: total cubic yards of soil exported = 23,500 cy

Architectural Coating - BAAQMD Regulation 8 Rule 3: Architectural coatings (applied to interior, exterior and "traffic marking coatings" for parking)

Vehicle Trips - Applicant provided traffic study: avg dail trip rate = 5.44; avg trip length = 5.26 miles

Woodstoves - Applicant provided = 1 natural gas fireplace, 1 natural gas fire pit, 4 natural gas BBQ (all included under # gas fireplaces)

Area Coating - BAAQMD Regulation 8 rule 3

Construction Off-road Equipment Mitigation - DPM mitigation

Mobile Land Use Mitigation - Applicant provided information for LUT-1 (150 dwellings/1.075 acres) and LUT-6;
<https://ww3.arb.ca.gov/cc/capandtrade/auctionproceeds/kml/jobcentermap.htm> for LUT-4 and google maps for LUT-5

Area Mitigation - Architectural coating already reduced per BAAQMD regulation 8 rule 3

Energy Mitigation - Applicant plans include Energy Star-rated appliances installed at amenties clubhouse and in all apartment units.

Water Mitigation - Applicant provided information indicates that all plumbing fixtures will meet CalGreen and/or EPA's WaterSense low flow fixture rates.
Landscaping with be drought tolerante and smart programmable controllers will be used for irrigation

Energy Use -

Attachment D

Nitrous Oxide (N₂O) Mobile Source Emissions Calculation

N2O Operational GHG Emission Mobile Calculations

Project Code & Title: 18-06879 Crclpt, 1095 Rlins Rd Tech Stds

Vehicle Population Breakdown*	
658683	Gasoline vehicles
18378	Diesel vehicles
97.3%	Gasoline vehicle %
2.7%	Diesel vehicle %

VMT per Vehicle Type	
690,152	Project VMT (CalEEMod output)
671419	Gasoline vehicle VMT
18733	Diesel vehicle VMT

Gasoline Vehicles	
97.3%	Gasoline vehicle %
0.315	Tons per year mobile NOX emissions (annual output in CalEEMod)
0.31	Gasoline vehicle tons per year NOX emissions
4.16%	Percentage to convert NOX emissions to N2O **
0.0127	Tons per year N2O emissions for gasoline vehicles
0.0116	Metric tons per year N2O emissions for gasoline vehicles

Diesel Vehicles	
0.3316	grams N2O per gallon of fuel for diesel vehicles**
26.46	Diesel average miles per gallon*
0.01253	grams per mile N2O for diesel vehicles
234.7	grams per year N2O for diesel vehicles
0.0002347	Metric tons per year N2O emissions for diesel vehicles

CO2E Emissions from N2O	
0.0118	Metric tons per year from gasoline + diesel vehicles
298	GWP of N2O***
3.5	CO2E emissions per year from N2O emissions from gasoline + diesel vehicles
