List of Acronyms

Acronym	Definition
Ah	Amp hour
APCD	Air Pollution Control District
ARB	Air Resources Board
BMS	Battery Management System
BSS	Battery Storage System
CalARP	California Accidental Release Prevention Program
CAPCOA	California Air Pollution Control Officers Association
CFC	California Fire Code
CGA	Compressed Gas Association
CPUC	California Public Utilities Commission
EPA	Environmental Protection Agency
ERPG	Emergency Response Planning Guidelines: Developed by the American Industrial Hygiene Association. ERPG-2 is the maximum airborne concentration below which nearly all individuals could be exposed for up to 1 hour without experiencing or developing irreversible or other serious health effects or symptoms which could impair an individual's ability to take protective action. ERPG-3 is the maximum airborne concentration below which nearly all individuals could be exposed for up to 1 hour without experiencing or developing life-threatening health effects.
ESS	Energy Storage Systems
HVAC	Heating Ventilation and Air Conditioning
IDLH	Immediately Dangerous to Life and Health: developed by National Institute for Occupational Safety and Health (NIOSH)
IEEE	Institute of Electrical and Electronics Engineers
LFP	Lithium-Iron Phosphate
LMO	Lithium Manganese Oxide
LTO	Lithium Titanate Oxide
MWhr	Megawatt hour
NCA	Lithium Nickel Cobalt Aluminum
NMC	Lithium Nickel Manganese Cobalt
NFPA	National Fire Protection Association
NIOSH	National Institute for Occupational Safety and Health
OEHHA	Office of Environmental Health Hazard Assessment
PV	Photovoltaic
REL	Reference Exposure Level
TS	Toxic Score
UL	Underwriters Laboratory
UPS	Uninterruptable Power Supply
SBCAPCD	Santa Barbara County Air Pollution Control District
SOC	State of Charge
Whr	Watt hour

1.0 Introduction

Orni 34, LLC. proposes to install a battery storage system with an approximate capacity of 10 MW near the City of Carpinteria, CA. The Facility would be a battery storage system that is owned and operated by Orni 34, LLC. The Project would provide additional capacity to the electrical grid during periods when sources of electrical generation are not generating power. The Project would provide increased electrical reliability and stability to the local grid by storing electricity in the battery systems from grid-based electrical generation systems and then releasing the power into the grid during peak periods when electricity is needed, thereby reducing the need to operate fossil-fuel-powered power systems and reducing the consumption of fossil-fuels and the emissions of greenhouse gasses.

This report examines the potential upset and malfunction scenarios that could occur at the facility that could result in health risk and flammable gas production and potential resulting impacts on public receptors.

The facility would not have any health risk or flammable impacts during normal battery operations. Potential impacts to onsite personnel or emergency response personnel are outside the scope of this analysis.

2.0 Project Description

The Project site would be located at 5134 Foothill Road in Carpinteria, CA. The proposed Project would be located immediately north of Foothill Road with residential areas along Seacoast Way, Concord Place and Foothill Road on the immediate south side of Foothill Road; located south of agricultural space (Acquistapace Nursery); east of the Family Baptist Church located on the corner of Foothill Road and Linden Avenue as well as east of the Southern California Edison substation and the Carpinteria High School; and west of agricultural/nursery areas. Figure 1 shows the location of the proposed battery storage facility. The site is currently an empty area.

The Project would involve the installation of self-contained energy storage and management cabinets (called Megapacks), containing battery modules designed and manufactured by Tesla or equivalent. Each cabinet would hold 17 modules of batteries, with each module holding about 12,636 battery cells. An electrical switchgear and other electrical equipment as well as electrical connections to the existing overhead power lines, would also be installed at the Project site. The cabinets would be placed at the site outdoors. There will be no walk-in or habitable facilities in the proposed Project design.

The proposed battery cell type would be Lithium Nickel Manganese Cobalt (NMC) manufactured by Tesla. This analysis assumed an NMC-type battery.

The facility would be equipped with inverters to convert the DC electricity of the battery systems into AC current used by the electrical grid. There would also be a liquid thermal cooling system integrated into the cabinets to provide cooling to the batteries and power electronics.

Fire prevention systems would include proposed cabinets designed to limit or eliminate the threat of the spread of fire from one cabinet to another. The closest fire hydrants are located on Foothill Road immediately south of the site and at the corner of Concord Place and Seacoast Way.

The Battery Management System (BMS) incorporated into the cabinets would monitor all cell voltages, currents and temperatures and shut down equipment if unsafe conditions are detected.

3.0 Environmental and Regulatory Setting

There are a number of different lithium battery types including the following:

- Lithium Nickel Cobalt Aluminum (NCA)
- Lithium Nickel Manganese Cobalt (NMC)
- Lithium Manganese Oxide (LMO)
- Lithium Titanate Oxide (LTO)
- Lithium-Iron Phosphate (LFP)

This study assumed the use of the Lithium Nickel Manganese Cobalt (NMC) battery type.

Battery Testing Requirements and Regulations
Batteries are subject to several codes and standards. Some of the relevant ones are discussed below.

UL9540A: Test Method for Evaluating Thermal Runaway Fire Propagation in Battery Energy Storage Systems – this test methodology evaluates the fire characteristics of a battery energy storage system that undergoes thermal runaway. The data generated can be used to determine the fire and explosion protection required for an installation of a battery energy storage system

UL1973: Standard for Batteries for Use in Stationary, Vehicle Auxiliary Power and Light Electric Rail (LER) Applications - These requirements cover battery systems as defined by this standard for use as energy storage for stationary applications such as for photovoltaic (PV), wind turbine storage or for uninterruptable power supply (UPS), and other applications. This standard evaluates the battery system's ability to safely withstand simulated abuse conditions. This standard evaluates the system based upon the manufacturer's specified charge and discharge parameters. Requires that an Energy Storage System (ESS) is not allowed to be an explosion hazard when exposed to an external fire source and that a single cell failure will not result in a cascading thermal runaway of cells.

IEEE C2: This Code covers basic provisions for safeguarding of persons from hazards arising from the installation, operation, or maintenance of (1) conductors and equipment in electric supply stations, and (2) overhead and underground electric supply and communication lines. It also includes work rules for the construction, maintenance, and operation of electric supply and communication lines and equipment. The Code is applicable to the systems and equipment operated by utilities, or similar systems and equipment, of an industrial establishment or complex under the control of qualified persons.

California Fire Code 608 and International Fire Code: Specifies minimum size requiring permits (Lithium, all types, 20 kWh), specifies maximum limits on sizing for battery systems (Lithium all type, 50 kwh each array), seismic and structural design, spacing (minimum 3 feet separation of arrays), vehicle impact protection, testing, maintenance and repairs, maximum quantities within a building (Lithium of 600 kwh), battery management systems (BMS),

shutdown and notification requirements, automatic smoke detector requirements, automatic fire sprinkler systems, ventilation specifications.

NFPA 1: The General NFPA Fire Code addressing extracts from other NFPA codes.

NFPA 13: Standard for the Installation of Sprinkler Systems, addresses sprinkler system design approaches, installation, and component options.

NFPA 70: National Electrical Code, addresses electrical design, installation, and inspection.

NFPA 550: Guide to Fire Safety Concepts Tree for Protecting Energy Systems - addresses issues such as utilizing BMS and compatible equipment, ventilation as needed, fire resistive separation, array spacing, signage.

NFPA 855: Standard for the Installation of Stationary Energy Storage Systems - establishes criteria for minimizing the hazards associated with ESS (under development, draft version published).

Health Protective Regulations

The California Air Pollution Control Officers Association (CAPCOA) in consultation with the California Air Resources Board (ARB) and Office of Environmental Health Hazard Assessment (OEHHA) implements the Air Toxics "Hot Spots" Information and Assessment Act of 1987 (Air Toxics "Hot Spot" Act, Health and Safety Code §44344.4(c).). The Hot Spots regulation requires the assessment of the potential acute, chronic and cancer health risks associated with facilities. OEHHA also publishes the reference exposure levels (REL) for a range of pollutants, which defines the concentration levels at which pollutants start to generate health effects. The SBCAPCD provides guidance and a spreadsheet tool associated with a facility prioritization protocol.

The National Institute for Occupational Safety and Health (NIOSH) defines the immediately dangerous to life and health (IDLH) standard for pollutants. The American Industrial Hygiene Association has defined Emergency Response Planning Guidelines (ERPGs) to define the levels at which toxic pollutants may cause harm.

The County of Santa Barbara has adopted CEQA thresholds that are used to assist the County in classifying the significance of impacts to public safety. The thresholds employ quantitative measures of risk. If a proposed project has the potential to expose the public to toxic or flammable pollutants, then a risk assessment must be undertaken. The thresholds are applicable to a number of industry types including the "use" of specified quantities of regulated substances pursuant to Title 19 of the CCR (the CalARP regulations), or materials that could vaporize or evaporate quickly upon release and could cause risk to the public. Although this project does not "use" any of the substances on the Title 19 list, a number of toxic and flammable substances on the Title 19 list could be emitted if the batteries were to experience a malfunction, including hydrogen chlorine, hydrogen fluoride, nitrogen oxide, phosphine and sulfur dioxide (see below). Therefore, if a battery malfunction could cause the release of these pollutants and the release could impact the public, a detailed risk analysis should be performed.

In 2016, a technical working group comprised of utility and industry representatives worked with the California Public Utilities Commission Safety & Enforcement Division's Risk Assessment and Safety Advisory (RASA) section to develop a set of guidelines for documentation and safe practices at ESS co-located at electric utility substations, power plants or other facilities (CPUC 2017). The guidelines require a safety plan and inspection procedures.

Public Receptors

There are a number of public receptors located near the proposed project site. These are listed below.

Table 1 Distance to Receptors

Receptor	Distance to Battery Cabinets, feet
Agricultural Areas to the North	145
Foothill Road	160
Family Baptist Church property line	175
Family Baptist Church property play structure	190
Family Baptist Church property building	210
Residences on Concord	220
Agricultural Areas to the East	360
Carpinteria High School	870

4.0 Assessment Methodology

There will be no pollutant emissions from the battery systems associated with the Project during normal operation.

However, in the unlikely event of a battery cell malfunction, such as a runaway reaction or external impact event, the Project could emit pollutants to the atmosphere. During a runaway reaction, if the temperature exceeds a critical level, thermal runaway can occur when the battery initiates an unstoppable chain reaction. The temperature rises rapidly, and the energy stored in the battery is suddenly released. For these types of battery cell malfunctions, pollutant emissions could be generated due to elevated temperatures within a single storage cell or group of storage cells caused by a runaway reaction. Pollutant emissions could include either toxic materials or flammable materials.

This analysis is limited to a reasonable worst-case event. A catastrophic event, such as an airplane impact, run-away vehicle impact, terrorist incident or nearby construction equipment collapse causing impact, could cause multiple megapacks to be destroyed, causing substantial emissions associated with a large-scale fire. A reasonable worst-case event is more limited in scope, defined as a control system failure or a puncture of a module, similar to that conducted as part of the UL 1973 testing, which could cause a runaway reaction in a group of cells. Generally, a reasonable worst-case scenario is more appropriate for a planning scenario as any development project could produce substantial fires and cause impacts to neighboring facilities under a catastrophic scenario.

The Battery Storage System (BSS) will be equipped with monitoring and control systems that will prevent and/or control battery cell malfunctions. However, to determine an unlikely, but reasonable worst-case public health impacts for this analysis, it is assumed that these control systems fail and do not control the battery cell malfunction. For this unlikely event, it is assumed that the battery cell malfunction continues until the Fire Department arrives onsite.

Different manufacturers have developed various studies examining the potential scenarios related to battery malfunctions, although most of these studies are proprietary. Some studies have been independently performed for agencies, including by Det Norske Veritas (DNVGL 2017) conducted for the New York State Energy Research & Development Authority (NYSERDA) and Consolidated Edison. Other studies include Anderson 2015, Blum 2016, Larsson 2017 and LG Chem (another battery manufacturer) where batteries were exposed to external heat sources and off gases were measured. In addition, the battery manufacturer Tesla, has conducted some testing by DNVGL (DNVGL 2019 proprietary) where external heat was added and forced a burn of the entire enclosure of a similar battery system (a PowerPack).

Different battery cell malfunctions could produce emissions. These include: (1) an elevated temperature situation due to a runaway reaction with no combustion (venting with no combustion); (2) combustion of the battery due to an elevated temperature situation from a runaway. Studies have shown (Rincon 2017 and proprietary UL9540A testing) that a localized runaway reaction with combustion produces the greatest emissions and is therefore the reasonable worst-case scenario and the scenario analyzed in this report.

The BSS will be enclosed in cabinets that have venting and temperature control. It is assumed that the emissions caused by these malfunction scenarios will be vented during the malfunction scenario. As per the DNVGL 2019 testing, emissions occurred over a period of a few hours. However, for all malfunction scenarios, it is assumed that the release of pollutants to the atmosphere would occur all within one hour as a reasonable worst case.

In addition, as part of the UL 1973 requirements, battery malfunctions and punctures are required to have limited cascading capabilities by designing the battery configurations to minimize the ability of a runaway reaction to propagate to other battery cells. It is highly unlikely that an entire module or groups of modules would be involved in a single event. Therefore, as a reasonable worst-case, it is assumed that only 10 percent of the cells in a single module would be involved in the battery malfunction. Tesla's historical experience with battery cell malfunctions indicate that this is a very conservative scenario that has not occurred to date with their batteries.

Battery malfunctions can result in the release of toxic materials and/or the release of a flammable gas mixture and subsequent flammable gas vapor cloud with subsequent fire or explosion.

Toxic Pollutants

Toxic pollutants emitted from battery malfunctions are partially dependent on the battery type. For lithium ion batteries, studies indicate that the primary toxic pollutants could be any of the following:

Table 2 Potential Toxic Pollutants from Battery Malfunctions

Pollutant	OEHHA Reference Exposure Level (REL), µg/m3 (ppm)	IDLH (Immediately Dangerous to Life and Health)	ERPG-3 (Emergency Response Planning Guidelines)	ERPG-2 (Emergency Response Planning Guidelines)
Carbon monoxide (CO)	23,000/26.7	1,200 ppm	500 ppm	350 ppm
Hydrogen Chloride (HCL)	2100/3.2	50 ppm	150 ppm	20 ppm
Hydrogen Cyanide (HCN)	340/0.4	50 ppm	25 ppm	10 ppm
Hydrogen Fluoride (HF)	240/0.2	30 ppm	50 ppm	20 ppm
Methanol (CH_3OH)	28,000/37	6,000 ppm	5,000 ppm	1,000 ppm
Nitrogen Oxide (NO_x)	470/0.9	13 ppm	30 ppm	15 ppm
Phosphine (PH_3)**	400/0.6	50 ppm	5 ppm	0.5 ppm
Phosphorous Pentafluoride (PF_5)	240/0.2*	50 ppm***	-	-
Phosphoryl Fluoride (POF_3)	240/1.0*	50 ppm	-	-
Styrene	21,000/90	700 ppm	1000 ppm	250 ppm
Sulfur Dioxide (SO_2)	660/1.8	100 ppm	25 ppm	3 ppm
Toluene	37,000/140	500 ppm	1,000 ppm	300 ppm

* Utilized the acute REL for hydrogen fluoride as per OEHHA REL tables for Fluorides chronic are very similar
** OEHHA does not have REL for acute PH3. Estimated based on NIOSH values.
*** The National Institute for Occupational Safety and Health (NIOSH) does not have a listing for PF_5. PF_5 and POF_3 estimated based on general fluorides.
Sources: See Table 3.

Generally, the battery cell will start to off gas if the temperature exceeds 120 ^oC (DNVGL 2017).

Several studies have examined the emissions of toxic pollutants from battery off gassing situations, with some studies examining only the concentration of toxic pollutants and others also examining emission rates. The relevant studies are listed in Table 3.

Table 3 Studies on Emissions from Battery Malfunctions

Study	Description	Results
Anderson 2015	Exposure of battery to heat source, off gasses tested. LFP battery, 1.2 kg, 35 Ah	HF: 30-50ppm peak POF_3: 1-2ppm peak HF Rate: 0.01 g/s
Blum 2016	Modules tested with heat exposure until thermal runaways. 100kwh unit by Tesla.	HF: 100 ppm peak
CATL	UL 9540A testing (proprietary)	Composition of off gassing: primary pollutants only. Up to 153.5 L off gas per cell

Table 3 Studies on Emissions from Battery Malfunctions

Study	Description	Results
Larsson 2017	External propane burner used to heat batteries, measured toxic gasses. Examined different battery types	HF: up to 145 ppm peak HF rate: 50 mg/s peak HF rate: 200mg/whr peak POF_3 rate: 22 mg/whr peak
LG Chem	Proprietary data on LFP and NMC battery types.	HF-0.2ppm PH_3-1.0ppm HF rate: 4.7e-7 g/hr PH_3 rate: 2.4e-4 g/hr Up to 244 L off gas per cell
DNVGL 2017	Measured characteristics of a wide range of battery types and failures	release rates per kg of battery weight: HF rate: 1.7e-7 kg/s-kg
DNVGL 2019	Measure characteristics of a Tesla powerpack thermal runaway scenario (proprietary)	Maximum Values: HCL: 538 ppm HF: 183 ppm HCN: 67 ppm
Tesla	Proprietary studies	HF: 500 ppm HCL: 1,000 ppm HCN: 1,600 ppm Methanol: 32 ppm Styrene: 1 ppm Toluene: 3,500 ppm

Some of the key findings from these studies include the following:

- HF was found to be produced by all battery types.
- For NMC batteries, HCL, HF and HCN are produced (DNVGL 2019).
- PH_3 was only identified by LG Chem for the NMC battery type at low levels.
- PF_5 rapidly decomposes to HF and was therefore generally not detected (Anderson 2013).

It was also found that the average emission rate of HF in a plastics fire can be higher than the average emission rate of a battery fire (DNVGL 2017), indicating that potentially a majority of the toxic emissions from a battery fire are a result of the combustion of the plastic components.

Flammable Components and Flammability

Flammable components are also emitted from a battery malfunction. Based upon the studies listed in Table 3, the flammable components could include the following:

Table 4 Potential Flammable Components from Battery Off Gassing

Component	Lower Flammability Limit (LFL), vol%
Acetylene (C_2H_2)	2.5
Butanes (C_4)	1.8
Carbon monoxide (CO)	12.5
Ethane (C_2H_6)	3.0
Ethylene (C_2H_4)	2.7
Hydrogen (H_2)	4.0
Methane (CH_4)	5.0
Pentanes (C_5)	1.4
Propane (C_3H_8)	2.1
Propene (C_3H_6)	2.0

Sources: See Table 3

Depending on the combination of these flammable materials, the off gasses could have varying degrees of flammability.

The Tesla manufacturer provided information on the composition of battery off gassing as part of battery testing (DNVGL 2019). These are shown below:

Table 5 Tesla Manufacturer Battery Off Gassing Primary Flammable Components

Component	Mole Percent
Hydrogen (H_2)	24
Carbon monoxide (CO)	34
Methane (CH_4)	4
Ethylene (C_2H_4)	5
Propane (C_2H_8) +	< 1

Note: based on Tesla proprietary testing, worst-case level encountered (most flammable), for single cell level testing. Other components, such as nitrogen and carbon dioxide, are also produced but are not shown due to not being flammable.

The Compressed Gas Association (CGA) Publication P-23 provides algorithms for estimating the level of flammability of gas mixtures. The application of this technique to the off gassed materials as provided by the manufacturer as part of the testing (shown in Table 5) indicates that the released vapor/gas would be flammable, with a Q factor (a factor used in the CGA publication P-23 which defines the level of flammability of a mixture of gasses, or the total normalized flammable component concentration. A Q factor greater than 1.0 for a mixture of flammable gasses is defined as a flammable mixture) of over 6.6 and an estimated lower flammability limit of 5.6 percent. This exceeds the Q factor flammability limit of 1.0, established by the CGA, indicating the off gassed material is flammable. See Attachment A, page A-10 (CGA 2015).

Screening and Modeling

In order to estimate the impacts of the off gassing from toxic and flammable emissions, both a screening and a modeling approach were used. The Santa Barbara County APCD prioritization approach (SBCAPCD 1990) for health risks was used for the acute impact of toxic emissions. The screening approach uses the prioritization method developed by the California Air Pollution Control Officers Association (CAPCOA) in consultation with the California Air Resources Board (ARB) and Office of Environmental Health Hazard Assessment (OEHHA) as part of the implementation of the Air Toxics "Hot Spots" Information and Assessment Act of 1987 (Air Toxics "Hot Spot" Act, Health and Safety Code §44344.4(c).). The criteria used by the prioritization method are based on a Total Score (TS) for acute impacts. These score thresholds are as follows:

- High priority facilities with TS greater than 10.0
- Intermediate priority facilities with TS between 1.0 and 10.0
- Low priority facilities with TS less than 1.0

The criteria are based on the application of several conservative air dispersion modeling scenarios coupled with air pollutant toxicities as reported by OEHHA and the Environmental Protection Agency (EPA). For scores falling in the High or Intermediate Priority category, other factors that should be considered that could affect the results may include:

- Population density near the facility,
- Proximity of sensitive receptors to the facility,
- Receptor proximity less than 50 meters,
- Elevated receptors/complex terrain,
- Frequency of nuisance violations,
- Importance of non-inhalation pathway for substance(s) emitted by the facility,
- Presence of non-stack (fugitive) emissions, and
- Stack temperatures and release source terms.

The prioritization approach utilized guidelines developed by the SBCAPCD (SBCAPCD 1990). For intermediate and high priority facilities, additional analysis utilizing modeling with source and receptor specific factors may be required.

In addition, the Canary© model was run examining the downwind distance to the IDLH and the ERPG levels at 6 feet height (the "flagpole" height). The Canary© model is a computerized model developed by Quest Consulting to estimate the thermodynamic properties of gas mixtures and estimate impact distances of thermal exposure, explosions, vapor clouds and toxic effects.

The AERMOD modeling program was also run with 5 years of meteorological data from the SBCAPCD with the emission source as a point source, taking into account the thermal buoyancy due to elevated temperatures associated with a runaway release. The AERMOD modeling program allows an examination of a wide range of meteorological conditions in order to access a reasonable worst-case impact. This additional modeling was conducted in order to thoroughly access the potential for offsite toxic impacts.

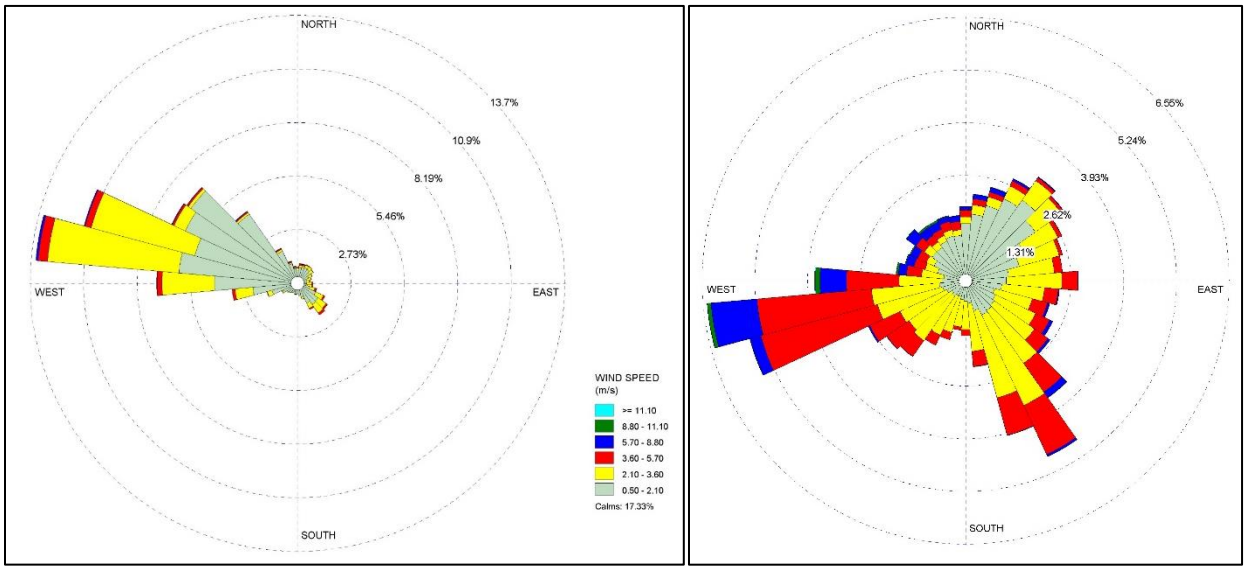
For flammable impacts, the Canary© model was used to determine the distances that flammable vapor clouds could travel with a resulting battery malfunction scenario under different meteorological conditions. The Canary© model was also used to examine explosion impacts to 1 psi overpressure.

For thermal impacts due to a fire, the DNVGL 2019 testing results were utilized.

Meteorological Data

The meteorological data shown in Figure 2 represent the meteorological conditions near the site and show the conditions at the APCD Carpinteria monitoring station located along Gobernador Canyon Road (about 3.1 miles to the east from the project site) for the years 2012-2016. The wind rose shows the predominant wind is from the west, which would generally be away from the nearby sensitive receptors. However, as this meteorological station is located within Gobernador Canyon, which runs west to east, wind flows may be channeled by the canyon. Also shown in Figure 2 is the wind rose from the Santa Barbara Airport, located along the coast without canyon influences, like the project site. The Santa Barbara Airport site indicates predominantly winds from the west, but also winds from the south/south-east as well with somewhat higher speeds. This location is also somewhat similar to the Santa Barbara Downtown (SB National Guard) meteorological station site as well, which sits inland although somewhat influenced by nearby, coastal topography. The winds at the project site would most likely be a combination of these two wind measurements, with the predominant wind direction being from the west with periods of winds from the south to southeast.

Figure 2 Meteorological Wind Rose



Carpinteria Gobernador Canyon *Santa Barbara Airport*

Note: For the years 2012-2016. Wind Rose shows the wind based on the direction the wind is from.

5.0 Environmental Consequences

The consequences associated with battery malfunctions are discussed below based on the methodology presented above.

5.1 Exposure Assessment

Project emissions to the air would consist of combustion and vent products from the burning and/or venting of the battery cells due to a battery cell malfunction under the reasonable worst-case scenario. Inhalation is the main pathway by which toxic air pollutants could potentially cause public health impacts.

Flammable impacts could be produced by vapor cloud fires or explosions for the reasonable worst-case scenario, or from thermal exposure to fires.

5.2 Significance Criteria

A prioritization method was defined by the SBCAPCD guidelines (SBCAPCD 1990) and associated spreadsheet and used here to assess the potential impacts associated with toxic emissions based on Total Score (TS) for acute impacts. A TS of below 1.0 is considered less than significant, with a TS of above 1.0 requiring additional analysis in order to determine significance.

For Canary© and AERMOD modeling assessments, impacts offsite that could impact the public would require additional analysis for areas that have sensitive receptors in order to determine significance utilizing a quantitative risk assessment as discussed above for the CEQA thresholds.

Flammable impacts are determined to be less than significant if vapor cloud fires or explosions do not impact sensitive receptors or offsite areas, with additional analysis required to determine significance if flammable vapors could impact sensitive receptors. If impacts do affect receptors, a more detailed analysis should be implemented utilizing a quantitative risk assessment as discussed above for the CEQA thresholds.

5.3 Toxic Impacts

Potential human health impacts associated with the Project stem from exposure to air emissions from the battery cell malfunction reasonable worst-case scenario discussed above. The reasonable worst-case scenario would involve the battery malfunctions associated with off gassing and combustion. The battery manufacturer provided information on primary and toxic pollutants from the battery combustion malfunction, and that information was utilized for the analysis. It is assumed for a worst-case analysis that these emissions are released over a period of 1 hour.

Detailed calculations are provided in Attachment A. Included in Attachment B is a copy of the Emergency Response Guide provided by the battery vendor Tesla. The compounds and the associated mass emission rates were determined by proprietary testing performed by the battery vendor.

As per UL1973 tests, in the event of a single cell undergoing thermal runaway there was no propagation to surrounding cells. In addition, the tests showed that when an entire module was force-ignited, there was no propagation to surrounding modules. The entire BSS will be comprised of many modules (there are 17 modules per cabinet with 15 cabinets proposed at the site), and the malfunction events discussed above are unlikely to occur. If such an event does occur, it will only likely occur within a single or limited number of battery cells as demonstrated per UL1973. Therefore, this analysis conservatively assumed that only 10 percent of the cells within a module would be affected as a reasonable worst-case analysis (i.e. a multicell malfunction). Note that manufacturer testing as part of UL1973 involving external punctures indicated that propagation of thermal runaway involved substantially fewer than 10% of cells within a module. Therefore, a 10 percent rate of cell involvement in thermal runaway is considered a reasonable worst-case.

Because the emissions would occur over a short period of time, only the public health impacts associated with acute exposure to short term releases were analyzed for the reasonable worst-case battery cell malfunction. The acute impact prioritization scores for the reasonable worst-case battery cell malfunction scenario are provided in Table 6, and detailed calculations can be found in Attachment A. Each score is below a TS of 1.0, indicating that all of the modeled release scenarios receive a low priority classification.

Table 6 SBCAPCD Health Risk Screening Prioritization Results

Scenario	SBCAPCD Guidelines Total Score (TS)
Single Cell malfunction, reasonable worst case	0.0005
Multiple Cell malfunction (10% of cells), reasonable worst case	0.69

Modeling conducted utilizing the Canary© software indicated that the plume rapidly rises due to the elevated temperature of the off gassed materials, with ERPG and IDLH values remaining either onsite or elevated. Because the plume is elevated, higher concentrations of toxic materials would not be realized near the ground level where there is a potential to impact receptors. None of the receptors in the area are elevated (such as tall buildings or located uphill). AERMOD modeling indicated that the maximum exposed concentration offsite of toxic materials would remain below the ERPG-2 and the IDLH levels at receptor heights that would be experienced near ground level.

Therefore, the public health impacts from toxic pollutants associated with the reasonable worst-case battery cell malfunction would be less than significant.

Table 7 shows the results of the analysis for the elevated plume impacts, which are impacts that would not occur at receptor heights.

Table 7 Modeling Toxic Materials Results for Elevated Receptors

Pollutant	IDLH Downwind Distance, feet	ERPG-3 Downwind Distance, feet	ERPG-2 Downwind Distance, feet
Carbon monoxide (CO)	86	145	178
Hydrogen Chloride (HCL)	6	14	26
Hydrogen Cyanide (HCN)	20	32	60
Hydrogen Fluoride (HF)	8	12	16
Toluene	3	6	9

Notes: based on Canary modeling. See Attachment A. Plume centerline heights are 15 feet at the farthest distance. Based on Table 3 Tesla Studies, Styrene and Methanol are low concentrations and do not generate offsite impacts.

The closest receptor to the battery compartments is the Family Baptist Church, with the property line being located at ground level about 175 feet from the closest battery cabinet, the play structure 190 feet and the buildings on the Church site 210 feet from the closest battery cabinet. The agricultural areas to the north of the battery cabinets are located at ground level and have a low population density. Given that the plume would be elevated (by about 15 feet), and the Church facilities would be outside the distance to the injury levels of concern (ERPA-2) even of the elevated plume, impacts would be less than significant.

5.4 Flammable Impacts

The off gassed materials could generate a flammable vapor cloud and may produce a flammable gas mixture (see above). The Canary© computer model was utilized to estimate the distance that the flammable vapor cloud could reach (see Attachment A for the Canary© model outputs and assumptions). The lower flammability limit (LFL) and the ½ LFL are used as an estimate of the potential impacts from flammable vapors. Distances for the LFL and the ½ LFL are estimated to be 9 and 15 feet, respectively. Explosion distances to a 1 psi overpressure assumed a high level of material reactivity (due to the presence of hydrogen) and a high obstacle density (due to the location of multiple cabinets together), thereby increasing the potential for an explosion, under a conservative scenario. Vapor cloud explosion impacts are estimated to be less than the ½ LFL distance of 15 feet.

Thermal impacts of a fire could extend for a far as 20 feet based on the DNVGL 2019 testing (to thermal radiation levels for injury of 5 kw/m2). Thermal radiation levels that could produce fatalities therefore would not extend offsite.

Because the distances for flammable vapors would not extend outside of the Project site boundaries, the impacts would be less than significant.

6.0 Recommendations

Recommendations related to siting and megapack installation would help to ensure that the potential for significant events are minimized. These would include the following:

1. All batteries shall be discharged to below 30% state of charge (SOC) during the construction/installation phases.

2. Any replacement or maintenance of batteries requiring the use of heavy construction equipment, such as cranes or forklifts, shall be conducted only on batteries discharged to below 30% SOC and nearby batteries that could be affected shall also be discharged to below 30% SOC.

3. Vehicle impact bollards or equivalent shall be installed to reduce the potential for vehicle impacts to the battery cabinets (as per NFPA 855 section 4.3.7).

4. The facility shall be equipped with monitoring equipment to detect fires and off gassed materials and shall alarm to a central, manned location and initiate an audible and visual signal. Detection equipment should be placed between the battery cabinets and the closest sensitive receptor (the Church) and should include the use of a fire/flame detector, such as a Det-Tronics x3302 and a gas detector, such as a Det-Tronic CGS gas detector, as recommended by Det-Tronics for battery installations.

Studies have shown (Golubkov 2015) that the potential for thermal runaway is a strong function of the level of charge of the batteries, with batteries that are charged below 50% exhibiting a lower potential for runaway and lower levels of offgassed volume given an external accident scenario. Therefore, when construction equipment is operating onsite, batteries that could be affected should be discharged to less than 30% SOC in order to reduce the potential for thermal-runaway accidents.

In addition, ensuring all batteries are protected from vehicle impacts would reduce the potential for accident scenarios associated with vehicle impacts.

Although the impact zones as determined from modeling indicate that the closest sensitive receptors are located at or beyond the impact zones, the areas to the north and south of the proposed project site are located within the injury impact zones of the elevated plume. In addition, the site would not have personnel onsite, and a runaway scenario could extend for a long period of time before being noticed, particularly at night. Therefore, the installation of monitoring systems is appropriate. In addition, Tesla indicates that "*for jurisdictions that require it, Tesla recommends multispectral IR*" as a form of detection.

Although NFPA 855 detection and monitoring requirements may not apply to outdoor, cabinet installations, the NFPA does require detection and monitoring for a number of battery installation situations. NFPA 855 section 4.4.3 classifies the proposed project site as a "remote location" as it would be more than 100 feet from buildings, lot lines and public ways. NFPA 855 section 4.9.3 requires some systems be supervised by a central station or initiate an audible and visual signal at a constantly attended location and that cabinets be protected by an approved gas detection system. NFPA Section 4.9 may not apply to outdoor systems, as indicated in section 4.4.3, or to lithium-ion systems, as per section 9.2, but the use of fire and gas detection is

recommended for some battery installations as an additional means of upset protection based on NFPA 855.

7.0 Summary of Impacts and Conclusions

Results from the analysis indicate that the reasonable worst-case battery cell malfunction scenarios would result in impacts below the significant thresholds. Recommendations would help to ensure that the battery systems do not suffer malfunctions from external events and malfunction events at the un-occupied facility are detected in a timely manner. Therefore, the impacts for the battery facility are considered less than significant.

Overall Source Prioritization Score: 0.0 **Source Priority Designation: Low Priority**

Instructions: Enter source-specific data in the highlighted cells below. The resulting prioritization scores are calculated in bold at the bottom of the table.

Stationary Source Name: Battery Storage- MultiCell RP = 1 Shortest distance from an emitting source to the fenceline: 44 meters

Pollutant Name	Pollutant ID	Multipathway?	Multipathway multiplier	Annual Emissions lb/yr	Unit Risk $(\mu g/m^3)^{-1}$	Cancer Score	Annual Emissions lb/hr	Chronic REL $\mu g/m^3$	Chronic Score	Max Emissions lb/hr	Acute REL $\mu g/m^3$	Acute Score	Non-Cancer Score

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F

 **Model Uses RURAL Dispersion Only.

 **Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.

 **Model Accepts FLAGPOLE Receptor Heights.

 **The User Specified a Pollutant Type of:  OTHER

 **Model Calculates  1 Short Term Average(s) of:   1-HR
     and Calculates PERIOD Averages

 **This Run Includes:      1 Source(s);       1 Source Group(s); and    2601 Receptor(s)

                with:      1 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:      0 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with      0 line(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
         Model Outputs Tables of PERIOD Averages by Receptor
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing Hours
                                                                 b for Both Calm and Missing Hours

 **Misc. Inputs:  Base Elev. for Pot. Temp. Profile (m MSL) =    14.00 ;  Decay Coef. =    0.000     ;  Rot. Angle =     0.0
                  Emission Units = GRAMS/SEC                                ;  Emission Rate Unit Factor =   0.10000E+07
```

Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.8 MB of RAM.

**Input Runstream File: aermod.inp
**Output Print File: aermod.out

**Detailed Error/Message File: C:\HARP2\Projects\MEGAPACK\MEGAPACK_AERMOD.ERR

Emergency Response Guide

TESLA	**LITHIUM-ION BATTERY EMERGENCY RESPONSE GUIDE** **Tesla Powerpack System, Powerwall, and Subassemblies, All Sizes**		
	Released: Oct 22, 2018	Document Number TS-0004027	Revision 05

Rechargeable Lithium Ion Batteries: Tesla Products

The products referenced herein are exempt articles and are not subject to OSHA's Hazard Communication Standard requirements for preparation of Safety Data Sheets (SDS).

SDS

Safety Data Sheets (SDS) are a sub-requirement of the Occupational Safety and Health Administration (OSHA) Hazard Communication Standard, 29 CFR Subpart 1910.1200. This Hazard Communication Standard does not apply to various subcategories including anything defined by OSHA as an "article." OSHA has defined "article" as a manufactured item other than a fluid or particle; (i) which is formed to a specific shape or design during manufacture; (ii) which has end use function(s) dependent in whole or in part upon its shape or design during end use; and (iii) which under normal conditions of use does not release more than very small quantities (e.g., minute or trace amounts) of a hazardous chemical, and does not pose a physical hazard or health risk to employees.

Tesla battery products meet the OSHA definition of "article." Thus, they are exempt from the requirements of the Hazardous Communication Standard therefore, a SDS is not required.

1. Identification of Products and Company

Product	Rechargeable lithium-ion Powerpack Systems and Powerwalls for residential, commercial, and industrial Tesla applications, and modules and sub-assemblies that can be installed in Powerpack Systems and Powerwalls (Tesla Energy Products). Specific part numbers are listed below.

LITHIUM-ION BATTERY EMERGENCY RESPONSE GUIDE
Tesla Powerpack System, Powerwall, and Subassemblies, All Sizes

Tesla Powerpack Systems and Powerwalls contain battery subassemblies made up of rechargeable lithium-ion cells. Tesla Powerpack Systems and Powerwalls and their respective battery subassemblies are covered by this document (Tesla Energy Products).

Tesla Energy Products contain sealed lithium-ion battery cells (cells) that are similar to rechargeable batteries in many consumer electronic products. Cells are individually, hermetically sealed cylinders approximately 18-21 mm in diameter and 65-70 mm in length. These cylinders each contain lithium-ion electrodes and electrolyte (approximate composition listed below). THE CELLS AND BATTERIES DO NOT CONTAIN METALLIC LITHIUM. Individual cells have nominal voltages of approximately 3.6 V.

Materials/Ingredients of Battery Cells	Approx. % by wt.
The lithium-ion cell positive electrodes can be composed of: Lithium Nickel Cobalt Aluminum Oxide (NCA material), $LiNi_xCo_yAl_zO_2$; Lithium Nickel, Manganese, Cobalt Oxide (NMC material) $LiNi_xMn_yCo_zO_2$; Lithium Nickel, Manganese Oxide (NMO material), $LiNi_xMn_yO_2$ Lithium Cobalt Oxide, $LiCoO_2$; or a mixture of these compounds	33
Carbon	21
Iron	12
Copper	7
Aluminum	5
Nickel	<1
Organic electrolyte (mainly composed of alkyl carbonate)*	10
Polypropylene	3
Polyethylene Terephthalate	<1
Other	8

**An acceptable exposure concentration of electrolyte has not been identified by the American Council of Governmental Industrial Hygienists (ACGIH). In case of electrolyte leakage from the battery, the oral (rat) LD50 is greater than 2 g/kg (estimated).*

Tesla Powerpack systems and Powerwalls also include sealed thermal management systems containing coolants and refrigerants.

Non-Cell Materials Found in Powerpack Systems and Powerwalls	Approximate Quantity
Ethylene glycol 50/50 mixture with water	Powerwall 1: 1.6 L of 50/50 mixture Powerwall 2: 2.3 L of 50/50 mixture Powerpack 1: 22 L of 50/50 mixture Powerpack 2: 26 L of 50/50 mixture Tesla Inverter: 11 L of 50/50 mixture
R134a: 1,1,1,2-Tetrafluoroethane refrigerant	Powerwall 1, 2: none Powerpack 1, 2: 400 g

LITHIUM-ION BATTERY EMERGENCY RESPONSE GUIDE
Tesla Powerpack System, Powerwall, and Subassemblies, All Sizes

Individual lithium-ion cells are connected to form modules. Pods are installed in a Powerpack or Powerwall. Approximate specifications of lithium-ion based modules, pods, Powerwalls, and Powerpacks are listed below. Modules and pods are battery sub-assemblies.

Part Number (Reman Number if available)	Description	Voltage – as shipped (V)	Nominal Voltage – as installed (V)	Max Voltage – as installed (V)	Weight (kg)	Height (cm)	Width (cm)	Depth (cm)
Powerwall 1 Versions								
1050100-x*y*-z*	POWERWALL, 2KW, 7KWH	<30 (DC)	400 (DC)	450 (DC)	95 (210 lb)	130 (51 in)	86 (34 in)	18 (7 in)
1067000- x*y*-z*	POWERWALL, 3.3KW, 7KWH	<30 (DC)	400 (DC)	450 (DC)	95 (210 lb)	130 (51 in)	86 (34 in)	18 (7 in)
1068000-x*y*-z*	POWERWALL, 6.6KW, 10KWH	<30 (DC)	400 (DC)	450 (DC)	101 (223 lb)	130 (51 in)	86 (34 in)	18 (7 in)
Powerwall 2 Versions								
1092170-x*y*-z*	AC POWERWALL	<30 (DC)	208, 240, 277 (AC)	300 (AC)	122 (269 lb)	112 (44 in)	74 (29 in)	14 (5.5 in)
1112170-x*y*-z*	DC POWERWALL	<30 (DC)	450 (DC)	550 (DC)	115 (254 lb)	112 (44 in)	74 (29 in)	14 (5.5 in)
Powerpack 1 Versions								
1047404-x*y*-z*	POWERPACK (2hr continuous net discharge)	<30 (DC)	400 (DC)	450 (DC)	1680 (3700 lb)	219 (86 in)	97 (38 in)	132 (52 in)
1060119-x*y*-z*	POWERPACK (4hr continuous net discharge)	<30 (DC)	400 (DC)	450 (DC)	1665 (3670 lb)	219 (86 in)	97 (38 in)	132 (52 in)
1121229-x*y*-z*	POWERPACK (4hr continuous net discharge)	<30 (DC)	400 (DC)	450 (DC)	2160 (4765 lb)	219 (86 in)	97 (38 in)	132 (52 in)
Powerpack 1.5 Version								
1089288-x*y*-z*	POWERPACK 1.5 C/2 SYSTEM	<30 (DC)	900 (DC)	920 (DC)	1622 (3575 lb)	219 (86 in)	131 (51.5 in)	82 (32.5 in)
Powerpack 2 Versions								
1083931-x*y*-z* (1130518-x*y*-z*)	POWERPACK 2,C/4 SYSTEM	<30 (DC)	900 (DC)	920 (DC)	2160 (4765 lb)	219 (86 in)	131 (51.5 in)	82 (32.5 in)

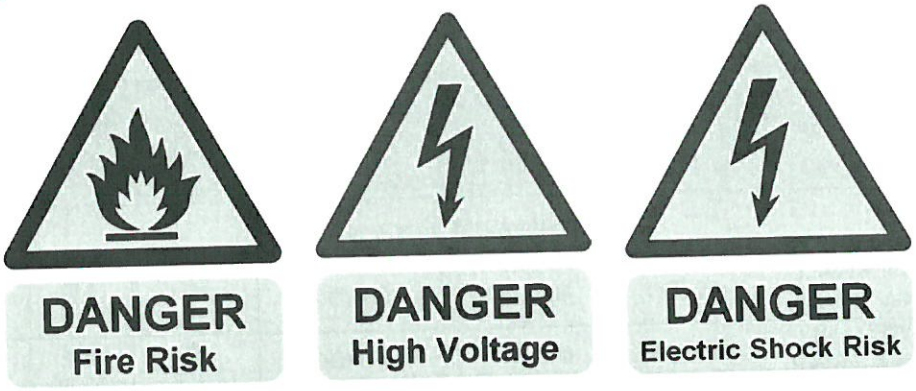
** Note that the 8th or 9th digit could be any number or letter and the 10th digit could be any letter.*

2. Handling and Use Precautions/ Identification of Hazards



The products described by this document are dangerous if mishandled. Injury to property or person, including loss of life is possible if mishandled.

Tesla Energy Products contain lithium-ion batteries. **A battery is a source of energy**. Do not short circuit, puncture, incinerate, crush, immerse, force discharge or expose to temperatures above the declared operating temperature range of the product. An internal or external short circuit can cause significant overheating and provide an ignition source resulting in fire, including surrounding materials or materials within the cell or battery. Under normal conditions of use, the electrode materials and electrolyte they contain are not exposed, provided the battery integrity is maintained and seals remain intact. Risk of exposure may occur only in cases of abuse (mechanical, thermal, electrical).

a. High Voltage Hazards

Under normal conditions of use, provided that a Tesla Energy Product enclosure remains closed, handling the product does not pose an electrical hazard. Numerous safeguards have been designed into Tesla Energy Products to help ensure that the high voltage battery is kept safe and secure as a result of a number of expected abuse conditions. All of the constituent component battery cells are sealed within the pack as sub-groups in metal enclosures (Pods). The exterior of each Pod is isolated from internal components and connectors are touch-safe. Pods are then installed in a rigid metal enclosure, which is isolated from high voltage.

A Tesla Energy Product may pose a significant high voltage and electrocution risk if the outer enclosure, Pod enclosures, and/or safety circuits have been compromised or have been significantly damaged. **A battery pack, even in a normally discharged condition is likely to contain substantial electrical charge and can cause injury or death if mishandled.** If a Tesla Energy Product has been significantly visibly damaged or its enclosure compromised, then practice appropriate high-voltage preventative measures until the danger has been assessed (and dissipated if necessary).

WARNING: NEVER CUT INTO A SEALED TESLA ENERGY PRODUCT ENCLOSURE due to the high voltage and electrocution risks.

For proper installation / removal instructions please contact the Tesla Service team:

- PowerpackSupport@tesla.com
- (650) 681-6060

b. Hazards Associated with Mechanical Damage

Mechanical damage to Tesla Energy Products can result in a number of hazardous conditions (discussed below) including:

- Leaked battery pack coolant (see Section 2D)
- Leaked refrigerant (Powerpack systems only see Section 2E)
- Leaked cell electrolyte (see Section 2F)
- Rapid heating of individual cells due to exothermic reaction of constituent materials (cell thermal runaway), venting of cells, and propagation of self-heating and thermal runaway reactions to neighboring cells.
- Fire

To prevent mechanical damage to Tesla Energy Products, these items should be stored in their original packaging when not in use or prior to being installed (see Section 6 below).

c. Hazards Associated with Elevated Temperature Exposure

The Tesla Powerpack system and Powerwall are designed to withstand operating temperatures up to 50°C (122°F), with up to 100% operating humidity (condensing), and storage temperatures up to 60°C (140°F) and <95% relative humidity (non-condensing) for up to 24 hours.

Exposure of Tesla Energy Products to elevated temperatures can drive battery cells into thermal runaway and result in a fire.

- Storage for more than 24 hours at temperatures above approximately 80°C (176°F) could result in cell thermal runaway reactions and should be avoided.
- Storage for more than a few minutes at temperatures above approximately 150°C (302°F) could result in cell thermal runaway reactions and should be avoided.

Exposure of battery packs to localized heat sources such as flames could result in cell thermal runaway reactions and should be avoided.

d. Hazards Associated with Leaked Coolant

Thermal management of Tesla Energy Products is achieved via liquid cooling using a 50/50 mixture of ethylene glycol and water. A typical Powerpack system includes about 26 L of coolant (Powerpack 2) or about 22 L of coolant (Powerpack 1). A typical Powerwall system includes about 1.6 L of coolant (Powerwall 1) or about 2.3 L of coolant (Powerwall 2). The Tesla Inverter (fully populated) includes about 11 L of coolant. Mechanical damage of a Tesla Energy Product that has been installed could result in leakage of the coolant. The fluid is blue in color and does not emit a strong odor.

For information regarding the toxicological hazards associated with ethylene glycol, as well as ecological effects and disposal considerations, refer to the specific Safety Data Sheet (SDS) for battery coolant.

Extended exposure of a Tesla Energy Product to leaked coolant could cause additional damage to the product such as corrosion and compromise of protection electronics.

e. Hazards Associated with Leaked Refrigerant (Powerpack Only)

The Powerpack thermal management system includes 400g of R134a: 1,1,1,2-Tetrafluoroethane refrigerant in a sealed system. Mechanical damage of a Powerpack could result in a release of the refrigerant. Such a release would appear similar to the emission of smoke.

For information regarding the toxicological hazards associated with R134a, as well as ecological effects and disposal considerations, refer to the specific Safety Data Sheet (SDS) for R134a.

f. Hazards Associated with Leaked Electrolyte

The electrolyte within constituent cells includes a volatile hydrocarbon-based liquid and a dissolved lithium salt (which is a source of lithium ions) such as lithium hexafluorophosphate. The electrolyte is largely absorbed in electrodes within

individual sealed cells. Under normal usage conditions battery electrolyte should not be encountered by anyone handling a Tesla Energy Product.

Severe mechanical damage (e.g., severe crushing) can cause a small quantity of electrolyte (up to approximately 1 g) to leak out of a cell. For the electrolyte liquid to come into contact with a user of a Tesla Energy Product, the Powerpack system or Powerwall external enclosure, the Pod enclosure, and the cell would have to be mechanically damaged.

The possibility of a spill of electrolyte from a Tesla Powerpack system and Powerwall is very remote. Electrolyte can be extracted from a single cell using a centrifuge, or under some extreme abuse conditions such as a severe crush. However, it is very difficult to mechanically damage cells in such a way as to cause leakage of electrolyte. Even if a single cell were damaged in a manner that could cause electrolyte leakage, it is extremely difficult to cause a leak from more than a few cells due to any incident. Furthermore, cells are connected into modules which are placed within a sealed steel, compartmentalized enclosure. Each compartment has the capacity to contain liquid from a large number of individual cells.

Any released electrolyte liquid is likely to evaporate rapidly, leaving a white salt residue. Evaporated electrolyte is flammable and will contain alkyl-carbonate compounds. Leaked electrolyte is colorless and characterized by a sweet odor. If an odor is obvious, evacuate or clear the surrounding area and ventilate the area. **WARNING: AVOID CONTACT WITH ELECTROLYTE.**

Leaked electrolyte solution is flammable and corrosive / irritating to the eyes and skin. If a liquid is observed that is suspected electrolyte, ventilate the area and avoid contact with the liquid until a positive identification can be made and sufficient protective equipment can be obtained (eye, skin, and respiratory protection). Chemical classifier strips can be used to identify the spilled liquid (electrolyte will contain petroleum/organic solvent and fluoride compounds).

In case of an electrolyte leak, the following protective equipment is recommended: an air purifying respirator with organic vapor/acid gas cartridges, safety goggles or a full face respirator, and safety gloves (Butyl rubber or laminated film (e.g., Silver Shield)). Protective clothing should be worn. Use a dry absorbent material to clean up a spill.

g. Hazards Associated with Vented Electrolyte

Lithium-ion cells are sealed units, and thus under normal usage conditions, venting of electrolyte should not occur. If subjected to abnormal heating or other abuse conditions, electrolyte and electrolyte decomposition products can vaporize and be vented from cells. Accumulation of liquid electrolyte is unlikely in the case of abnormal heating. Vented gases are a common early indicator of a thermal runaway reaction – an abnormal and hazardous condition.

If gases or smoke are observed escaping from a Tesla Energy Product, evacuate the area and notify a first responder team and/or the local fire department. Gases or smoke exiting a lithium-ion battery pack are likely flammable and could ignite unexpectedly as the condition that led to cell venting may also cause ignition of the vent gases. A venting Tesla Energy Product should only be approached with extreme caution by trained first responders equipped with appropriate personal protective equipment (PPE), as discussed in Section 3.

Cell vent gas composition will depend upon a number of factors, including cell composition, cell state of charge, and the cause of cell venting. Vent gases may include volatile organic compounds (VOCs) such as alkyl-carbonates, methane, ethylene, and ethane; hydrogen gas; carbon dioxide; carbon monoxide; soot; and particulates containing oxides of nickel, aluminum, lithium, copper, and cobalt. Additionally, phosphorus pentafluoride, POF_3, and HF vapors may form.

WARNING: AVOID CONTACT WITH VENTED GASES. Vented gases may irritate the eyes, skin, and throat. Cell vent gases are typically hot; upon exit from a cell, vent gas temperatures can exceed 600°C (1,110°F). Contact with hot gases can cause thermal burns. Vented electrolyte is flammable, and may ignite on contact with a competent ignition source such as an open flame, spark, or a sufficiently heated surface. Vented electrolyte may also ignite on contact with cells undergoing a thermal runaway reaction.

3. Firefighting Measures

Responding to a Venting Tesla Energy Product: Smoke emanating from a Tesla Energy Product is an indication of an abnormal and hazardous condition. Smoke will always be the first sign of a thermal runaway event. The smoke is likely flammable and may ignite at any time. If fire or smoke is observed emanating from a Tesla Energy Product at any time, the following should be performed:

1. If possible, shut off the unit/system (see instructions below)
2. Evacuate the area
3. Notify appropriately trained first responders and the local fire department

WARNING: When responding to a smoke or fire event with the Powerpack system, do not approach the Powerpack units from the front (door-side). Perform all incident response from the sides or rear of the unit.

How to Shut Off the Powerpack System or Powerwall in an Emergency:

Powerpack System:

1. If an E-Stop button is present on the inverter door, engage the E-Stop
2. Open the AC disconnect installed upstream of the system
3. Open the DC disconnect switch on the inverter door

Powerwall: Open the AC disconnect installed upstream of the unit.

WARNING: Shutting off power to the Tesla Energy Product does not de-energize the battery, and a shock hazard may still be present.

The Tesla Energy Product should then be monitored for evidence of continued smoke venting. Application of high volumes of water from a safe distance may help cool the unit and prevent further reaction or a fire from developing. If a fire develops and visible flames appear, the Incident Commander should determine whether an attempt will be made to suppress the fire (aggressive firefighting) or allow the battery to burn until it self-extinguishes, while protecting surrounding materials (defensive firefighting). Tesla recommends that copious volumes of water be used to fight a fire involving Tesla Energy Products. Virtually all fires involving lithium-ion batteries can be controlled with water. To date, water has been found to be the most effective agent for controlling lithium-ion battery fires. Water will suppress flames and can cool cells, limiting propagation of thermal runaway reactions. If water is used, electrolysis of water (splitting of water into hydrogen and oxygen) may contribute to the flammable gas mixture formed by venting cells, burning plastic, and burning of other combustibles.

Gaseous agents such as CO_2 or Halon, or dry chemical suppressants may temporarily suppress flaming of lithium-ion battery packs, but they will not cool lithium-ion batteries and will not limit the propagation of cell thermal runaway reactions. Metal fire suppressants such as LITH-X, graphite powder, or copper powder are not appropriate agents for suppressing fires involving lithium-ion battery packs as they are unlikely to be effective.

A battery fire may continue for several hours and it may take 24 hours or longer for the battery pack to cool. A lithium-ion battery fire that has been extinguished can re-ignite due to the exothermic reaction of constituent materials from broken or damaged cells. To avoid this, remove sources of ignition and cool the burned mass by flooding with water.

Aggressive Firefighting: If a decision is made to aggressively fight a fire involving a Tesla Energy Product, then copious amounts of water should be applied from a safe distance. The water may not suppress all cell thermal runaway reactions within the battery pack, but it may cool cells and control the spread of the fire. When responding to a fire event with the Powerpack system, do not approach the Powerpack units from the front (door-side). Perform all incident response from the sides or rear of the unit. If possible, direct the application of water towards openings in the battery pack enclosure, if any have formed, with the intent of flooding the pack enclosure. The objective is to contact the surfaces of the affected and surrounding individual battery pods and cells with water.

Defensive Firefighting If a decision is made to fight a Tesla Energy Product fire defensively, then the fire crew should pull back a safe distance and allow the battery to burn itself out. Fire crews may choose to utilize a water stream or fog pattern to protect exposures or control the path of smoke. When responding to a fire event with the Powerpack system, do not approach the Powerpack units from the front (door-side). Perform all incident response from the sides or rear of the unit. A battery fire may continue for several hours and may result in multiple re-ignition events. It may take 24 hours or longer for the battery pack to cool.

Firefighter PPE. Firefighters should wear self-contained breathing apparatus (SCBA) and fire protective turnout gear. Cells or batteries may flame or leak potentially hazardous organic vapors if exposed to excessive heat, fire or over voltage conditions. These vapors may include volatile organic compounds (VOCs), hydrogen gas, carbon dioxide, carbon monoxide, soot, and particulates containing oxides of nickel, aluminum, lithium, copper, and cobalt. Additionally, phosphorus pentafluoride, POF3 and HF vapors may form.

4. First Aid Measures

Electric Shock / Electrocution: Seek immediate medical assistance if an electrical shock or electrocution has occurred (or is suspected).

Contact with Leaked Electrolyte: The constituent battery cells are sealed. Contents of an open (broken) constituent battery cell can cause skin irritation and/or chemical burns. If materials from a ruptured or otherwise damaged cell or battery contact skin, flush immediately with water and wash affected area with soap and water. If a chemical burn occurs or if irritation persists, seek medical assistance.

For eye contact, flush with significant amounts of water for 15 minutes without rubbing and see physician at once.

Inhalation of Electrolyte Vapors: If inhalation of electrolyte vapors occurs, move person into fresh air. If not breathing give artificial respiration. Seek immediate medical assistance.

Vent Gas Inhalation: The constituent battery cells are sealed and venting of cells should not occur during normal use. If inhalation of vent gases occurs, move person into fresh air. If not breathing give artificial respiration. Seek immediate medical assistance.

5. Storage Precautions

Powerpack systems, Powerwalls, and sub-assemblies should be stored in approved packaging prior to installation.

Do not store Tesla Energy Products in a manner that allows terminals to short circuit (do not allow the formation of an electrically-conductive path).

Elevated temperatures can result in reduced battery service life. Powerpack systems and Powerwalls can withstand temperatures of -40°C to 60°C for up to 24 hours. However, Tesla Energy Products stored for longer than one month should be stored at temperatures between -20°C and 30°C (-4°F and 86°F), at humidity <95%, and protected from condensation. Extended, longer-term storage (more than a month) at temperatures outside the recommended range can result in degradation of product lifetime. Storage in areas where temperatures routinely approach or exceed 80°C (176°F) could result in a hazardous condition. Do not store Tesla Energy Products near heating equipment.

Ideally, a Tesla Energy Product should be stored at 50% state of charge (SOC) or less. Tesla Energy Products should not be stored for extended periods either at a full SOC or completely discharged since both conditions adversely impact battery life. Tesla Energy Products should not be stored untended for longer than twelve months since battery service life likely will be adversely impacted.

The storage area should be protected from flooding.

Long-term storage areas should be compliant with the appropriate local fire code requirements.

Acceptable storage density of battery packs and storage height of battery packs will be defined by the local authority having jurisdiction (AHJ). Requirements and limits will be based upon a number of factors including the structural and fire protection characteristics of the storage area and recommendations for fire protection promulgated by the National Fire Protection Association (NFPA) and similar organizations. At the time of this writing, no Commodity Classification has been defined for lithium-ion cells or battery packs (see 2016 NFPA 13: Standard for the Installation of Sprinkler Systems). Until a Commodity Classification has been defined based on testing by NFPA or a similar organization, Tesla recommends treating lithium-ion cells and batteries in packaging as equivalent to a Group A Plastic Commodity.

6. Installation Precautions

Elevated temperatures can result in reduced battery service life, or a hazardous condition.

The allowed installation temperature range for Tesla Powerpack Systems and Powerwalls is between -30°C and 50°C (-22°F and 122°F). Installation in areas with ambient temperatures over 50°C (122°F) is not recommended as this can result in degradation of product lifetime or a hazardous condition.

Installation in areas where temperatures routinely approach or exceed 80°C (176°F) is not permitted, as this could result in a hazardous condition. Do not install batteries near heating equipment.

The installation area should be protected from the risk of flooding. If the equipment is installed in areas below the floodplain where flooding can occur, active or passive flood prevention shall be installed to prevent more than 5 cm. (~2 in.) of standing water for a maximum of 30 minutes.

Installation areas should be compliant with the appropriate local fire code requirements.

7. Handling, Storage, and Transportation of Damaged Tesla Energy Products

If a Tesla Energy Product has been damaged (battery enclosure has been dented or compromised), it is possible that heating is occurring that may eventually lead to a fire. Damaged or opened cells/batteries can result in rapid heating (due to exothermic reaction of constituent materials), the release of flammable vapors, and propagation of self-heating and thermal runaway reactions to neighboring cells.

Before handling or transporting a damaged Tesla Energy Product, wait at least one hour. Smoke may be an indication that a thermal reaction is in progress. If no smoke, flame, leakage of electrolyte, leakage of coolant, or signs of heat has been observed for one hour, the Tesla Energy Product may be disconnected and moved into a safe location. To obtain specific instructions for evaluating, disconnecting, and preparing a damaged Tesla Energy Product for transport, please contact the Tesla Service team:

- PowerpackSupport@tesla.com
- (650) 681-6060

A damaged Tesla Energy Product should be monitored during storage for evidence of smoke, flame, leakage of electrolyte, leakage of coolant, or signs of heat. If full-time monitoring of the Product is not possible (for example during extended storage), the Product should be moved to a safe storage location.

A safe storage location for a damaged battery will be free of flammable materials, accessible only by trained professionals, and 50 feet downwind of occupied structures. For example, a fenced, open yard may be an appropriate safe location. **DO NOT STORE DAMAGED TESLA ENERGY PRODUCTS ADJACENT TO UNDAMAGED TESLA ENERGY PRODUCTS.** It is possible that a damaged battery may sustain further damage during transportation, and may lead to a fire. To further reduce this risk, handle the damaged battery with extreme caution.

8. Disposal Procedures

Tesla Energy lithium-ion batteries do not contain heavy metals such as lead, cadmium, or mercury.

Tesla Energy Products should be disposed of or recycled in accordance with local, state, and federal regulations. Note that regulations regarding disposal of batteries vary by jurisdiction. In the United States, batteries are classified as Universal Waste, and in addition, many individual states have specific regulations regarding disposal of battery packs. For example, in California, all batteries must be taken to a Universal Waste handler or authorized recycling facility.

Tesla Energy Products contain recyclable materials. Tesla strongly encourages recycling. At this time, when a Tesla product must be decommissioned, we request that it be returned to a Tesla facility for disassembly and further processing.

If disposing without return to Tesla, please consult with local, state and/or federal authorities on the appropriate methods for disposal and recycling. Tesla has confirmed that at least two recycling processors are capable of recycling Tesla battery products in North America and three in the Europe, the Middle East and Africa (EMEA) region.

9. Maintenance or Repair

Tesla requests all maintenance, service, and repairs of Tesla Energy Products be performed by Tesla approved service personnel or Tesla authorized repair facilities. This includes all proactive and corrective maintenance over the lifetime of a Tesla Energy Product. Improper service or repair by personnel not approved nor authorized by Tesla could void the Powerpack 2 System Limited Warranty, lead to failure of the Tesla Energy product, and potentially result in development of an unsafe condition and unexpected electrical events.

10. Transport Information

Lithium-ion batteries are regulated as Class 9 Miscellaneous dangerous goods (also known as "hazardous materials") pursuant to the International Civil Aviation Organization (ICAO) Technical Instructions for the Safe Transport of Dangerous Goods by Air, International Air Transport Association (IATA) Dangerous Goods Regulations, the International Maritime Dangerous Goods (IMDG) Code, European Agreements concerning the International Carriage of Dangerous Goods by Rail (RID) and Road (ADR), and applicable national regulations such as the USA's hazardous materials regulations (see 49 CFR 173.185). These regulations contain very specific packaging, labeling, marking, and documentation requirements. The regulations also require that individuals involved in the preparation of dangerous goods for transport be trained on how to properly package, label, mark and prepare shipping documents.

UN Number	3480
Proper Shipping Name	Lithium Ion Batteries
Hazard Classification	Class 9 Miscellaneous
Packing Group	N/A

NOTICE: The information and recommendations set forth are made in good faith and believed to be accurate as of the date of preparation. TESLA, INC. makes no warranty, expressed or implied, with respect to this information.

Revision Log

Revision #	Date	Description
01	14-July-2015	ERG for Tesla Powerpack systems, Powerwalls, and Sub-assemblies
02	3-Sept-2015	Added part numbers, updated weights, voltages, and temperatures, clarified hazards associated with spilled electrolyte, updated storage requirements, updated warning label icons, updated packing group.
03	3-Oct-2016	Added part numbers, minor edits
04	30-June-2017	Added fire ground operations response for Powerpack 2, including approach; exhaust gases; and safety. Updated general product information and contacts, as well as part numbers and reman numbers
05	22-Oct 2018	Reformatted for ease of use and translation; removed Confidential status; corrected phone number for CHEMTREC
