EXHIBIT C-1

Prepared by David A. Steiner
CPESC, CPSWQ
December 11, 2018

The purpose of this investigation is to determine whether or not a proposed 15.9 acre vineyard development project will increase peak flow/runoff on the referenced site, on a ridge separating the Lake Hennessey and Napa River watersheds, east of St. Helena, California. The two subwatersheds are analyzed separately. The investigation was carried out by David Steiner, at the request of Mike Muelrath, principal engineer at Applied Civil Engineering, Inc.

This analysis was performed using WinTR-55, a Windows application based on USDA Technical Release 55, Small Watershed Hydrology. The protocol for this method requires plotting watersheds that encompass the project and drain to applicable "points of interest" or outlets. The analysis includes pre- and post-project examination of Land Use, Hydrologic Condition, soil type and Hydrologic Soil Group (HSG); these factors are combined to determine Runoff Curve Numbers (CN), which are entered, along with acreage, into the application's appropriate data entry fields. Each subwatershed's Time of Concentration (Tc) is calculated from its hydrologically most remote point to its outlet, based on slope, roughness, and a determination as to the type of flow (sheet, shallow concentrated, or channel). 24-hour storm data for the site's 2, 5, 10, 25, 50, and 100-year precipitation depths, as well as distribution curves for CA-1 storm types--per NOAA Atlas 14--are entered into the application's appropriate fields. Results are displayed on the accompanying printouts of the two WinTR-55 runs, pre- and post-project. Descriptions of the various entries are as follows: (Please refer also to the accompanying pre- and post-project watershed maps, which include polygons drawn to delineate the various land uses and hydrologic conditions described.)

Hennessey Watershed Part (46.3 Acres)

Curve Number, Pre-Project Conditions:

- Nearly half of this area is already devoted to vineyard, characterized as equivalent to “**Annual grass, good condition**” in the application’s Custom CN field. 15.2 acres HSG C, CN=75; 5.2 acres HSG D, CN=81. The Curve Number for these non-tilled vineyards, with cover levels of at least 75%, was selected from a California-specific table found in the NRCS Engineering Field Handbook.*
- Most of the area above the Hennessey portion of the proposed vineyard is characterized as “**Brush, weeds, grass, with brush a major component**” in fair hydrologic condition. (Limited soil depth and exposed bedrock reduce the surface cover level to below 75%.) 5.7 acres HSG C, CN=70; 4.5 acres HSG D, CN=77.
- Most of the proposed vineyard area in the Hennessey watershed portion of the site is located upwind (northeast) of the owner’s residence, and has been subjected to fuel load management activity in the past few years. It is thus characterized as “**Herbaceous, with brush not a major part**” in fair hydrologic condition. (Again, limited soil depth and exposed bedrock reduce the surface cover level to below 75%.) 1.8 acres HSG C, CN=81; 2.0 acres HSG D, CN=89.
- The project is partially surrounded by “**Woods**” in good condition. 3.0 acres HSG C, CN=70; 8.1 acres HSG D, CN=77.
- Existing access roads in the area are characterized as “**Paved, with open ditches.**” .025 acres HSG C, CN=92; .05 acres HSG D, CN=93.
- The area includes one residential homesite, characterized as “**Farmstead.**” .5 acre, HSG D, CN=86.
- The pre-project **Weighted Curve Number** of the Hennessey watershed area is 76.

Curve Number, Post-Project Conditions:

- The proposed non-tilled vineyard development of approximately 6 acres (“**Annual grass, good condition**”) in the Hennessey watershed will increase the totals in that category as follows: 16.8 acres HSG C, CN=75; 9.6 acres HSG D, CN=81.
- The “**Brush, weeds, grass, fair condition**” component will be reduced by 2.0 acres. 2.5 acres HSG D, CN=77.
- The entire 3.8 acres of “**Herbaceous**”, fair condition will be replaced by vineyard.
- The area of “**Woods**”, good condition will be reduced by .2 acres to 7.9 acres, HSG D, CN 77.
- The post-project **Weighted Curve Number** of the Hennessey watershed area remains at 76.

Time of Concentration, T_c will not change under post-project conditions, as no surface drainage improvements, which might accelerate flows, are proposed.

As shown in the accompanying printouts of the pre- and post-project WinTR-55 runs, no increase in peak flows is anticipated as a result of the proposed vineyard development on the Hennessey watershed part of the site.

_____*Engineering Field Handbook, Part 650, Chapter 2, Supplement 1, USDA/NRCS, Oct 2008.

Napa River Watershed Part (84.7 Acres)

Curve Number, Pre-Project Conditions:

- A significant area of this watershed is managed as non-tilled vineyard with at least 75% cover, characterized as equivalent to “**Annual grass**”, good condition. (Data for this area was entered into the application’s “Custom CN” field.) Please see footnote in Hennessey watershed analysis. 17.3 acres, HSG D, CN=81.
- Additional existing vineyard acreage appears to be tilled, therefore characterized appropriately as “**Annual grass**”, *fair* condition. However, as the “Custom CN” field was already in use, this data was entered as an equivalent land use with the same CN, characterized as “**Open Space, grass cover**”, fair condition. 4.8 acres, HSG D, CN=84.
- The majority of this subwatershed is dominated by “**Brush, weeds, grass**”, in fair hydrologic condition. 53.4 acres HSG D, CN=77.
- However two small areas are nearly bare, and must be considered to be in “poor” condition. 1.8 acres HSG D, CN=83.
- Scattered oak woodlands are characterized as “**Woods**”, good condition. 4.7 acres HSG D, CN=77.
- Two hilltop homesites are entered as “**Farmsteads**.” 1.2 acres HSG D, CN=86.
- Several hundred feet of access roads are entered as “**Paved with open ditches**.” 1.5 acres HSG D, CN=93.
- The pre-project **Weighted Curve Number** for the Napa River watershed side of the site is 79.

Curve Number, Post-Project Conditions:

- An additional 9.9 acres of non-tilled vineyard is proposed for planting on the Napa River side of the watershed divide. Entered as “**Annual Grass**”, good condition in the Custom CN field: 27.2 acres HSG D, CN=81.
- Clearing for the vineyard will remove 8.4 acres of “**Brush, weeds, grass**”, fair condition, leaving 45 acres HSG D, CN=77.
- The vineyard clearing will also remove 1.5 acres of “**Woods**”, good condition, leaving 3.2 acres HSG D, CN=77.
- All other components of the post-project CN analysis remain unchanged.
- The post-project **Weighted Curve Number** for the Napa River watershed side of the site remains at 79.

Time of Concentration, T_c will not change under post-project conditions, as no surface drainage improvements, which might accelerate flows, are proposed.

As shown in the accompanying printouts of the pre- and post-project WinTR-55 runs, no increase in peak flows is anticipated as a result of the proposed vineyard development on the Napa River watershed part of the site.

¹ Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS). Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

Warning: Soil Ratings Map may not be valid at this scale.

You have zoomed in beyond the scale at which the soil map for this area is intended to be used. Mapping of soils is done at a scale of 1:24,000. The design of map units and the level of detail shown in the resulting soil map are dependent on that map scale. Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil information that could have been shown at a more detailed scale.
