Biological Resource Assessment

April 9, 2020 8858.0014

Michael Baron El Dorado Irrigation District 2890 Mosquito Road Placerville, California 95667

Subject: Biological Resources Assessment for the Reservoir 2 and 2A Tank Recoating Project in El Dorado County,

California

Dear Mr. Baron:

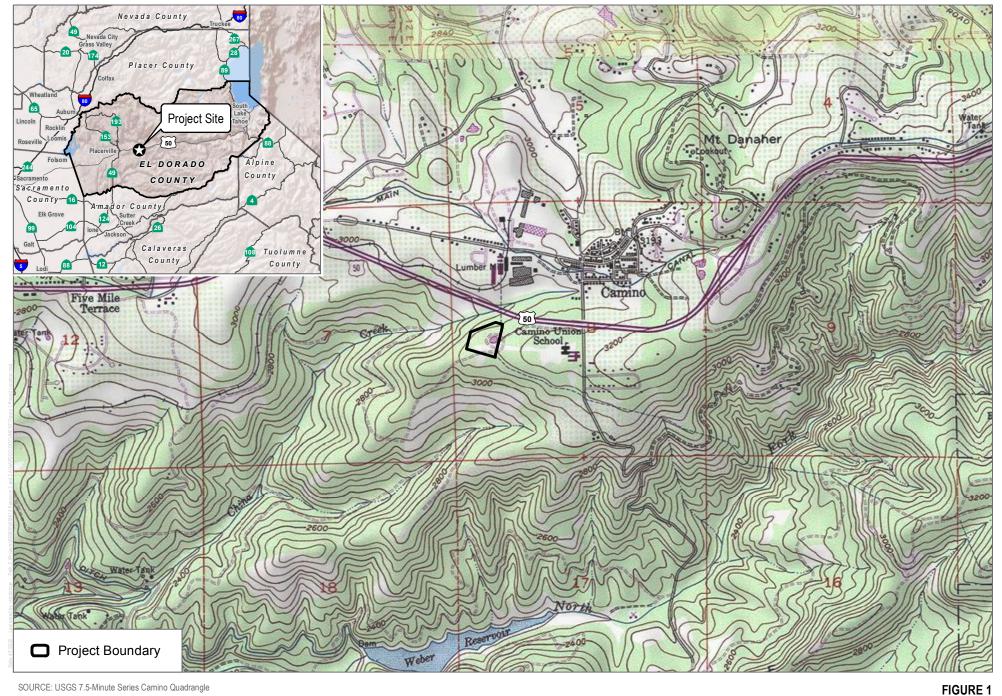

Dudek has prepared this letter report in association with El Dorado Irrigation District's proposed Reservoir 2 and 2A Tank Recoating Project (project) in El Dorado County, California (Figure 1, Project Location). The purpose of this Biological Resources Assessment is to identify and characterize existing on-site biological resources, with particular focus on the potential of the site to support special-status plant and wildlife species and other sensitive resources, such as wetlands and other aquatic features, as well as wildlife movement corridors. This Biological Resources Assessment also evaluates and provides a summary of potential impacts on these resources as a result of eventual implementation of the proposed project.

## 1 Site Location

The approximately 8.5-acre project site is located south of State Route 50 in in unincorporated community of Camino in El Dorado County, California. The site is mostly located in Section 08, Township 10 North, and Range 12 East of the "Camino, CA" U.S. Geological Survey 7.5-minute quadrangle. The approximate center of the project site corresponds to 38.733848° north latitude and -120.682833° west longitude.

The project site is located within the northern High Sierra Nevada geographic subdivision of the California Floristic Province (Jepson Flora Project 2019). The site is bordered by U.S. Route 50 to the north, Camino Elementary School to the east, and is generally surrounded by Sierran Mixed Conifer forest. Two existing large water storage tanks dominate the project site and the remainder of the site is generally developed for parking and access to the tanks. Elevations on the project site range from 3,110 to 3,145 feet above mean sea level. The tank pads and area immediately surrounding the tanks is generally level and the remainder of the site slopes moderately to the north and west; much of the hillslope has been subject to grading in the past. The region surrounding the project site receives approximately 39 inches of precipitation and 10 inches of snowfall annually. Average temperatures range from approximately 38°F to 90°F (WRCC 2020).

SOURCE: USGS 7.5-Minute Series Camino Quadrangle

**Project Location** 

EID Reservoir 2 and 2A Tank Re-Coating

## 2 Proposed Project

The proposed Reservoir 2 and 2A Tank Recoating Project consists of abrasively blasting and recoating 2 large tanks used for water storage and conveyance as part of operation and maintenance (O&M) activities. A part of the El Dorado Irrigation District's (District) main system, the two existing 5.5 million gallon welded steel drinking water storage tanks were constructed in 2003 and 2004. The interior and exterior of the tanks require recoating in order to prevent corrosion, and protect their structural integrity. Recoating of the interior in its entirety with either 100% solids polyurethane certified lining system or a three coat epoxy system is required in addition to the recoating of the exterior in its entirety with a fast cure epoxy which will require an abrasive blasting technique and pressure washing to remove deteriorating paint, clean, and prime tanks for repainting. The project is subject to CEQA review and the District is currently in the process of conducting CEQA analysis and preparing environmental documentation for the project. The expected duration of the project is approximately 18 months to 2 years. No ground disturbance is required as project activities require no expansion of existing facilities and will stage from the existing developed area on the tank site.

## 3 Regulatory Setting

## 3.1 Federal

## Federal Endangered Species Act

The federal Endangered Species Act (FESA) prohibits the taking, possession, sale, or transport of endangered species. Pursuant to the requirements of FESA, a federal agency reviewing a project within its jurisdiction must determine whether any federally listed threatened or endangered species could be present on the project site, and determine the extent to which the project would potentially have an effect on such species. In addition, federal agencies are required to determine whether a project is likely to jeopardize the continued existence of any species proposed to be listed under FESA, or if it would result in the destruction or adverse modification of critical habitat designated for such species (16 USC 1536[3]–[4]). Projects that would result in "take" of any federally listed threatened or endangered species are required to obtain authorization from the National Marine Fisheries Service (for marine fish species) and/or U.S. Fish and Wildlife Service (USFWS) (for all other species) through either Section 7 (interagency consultation) or Section 10(a) (incidental take permit) of the FESA, depending on whether the federal government is involved in permitting or funding the project.

## Migratory Bird Treaty Act

The Migratory Bird Treaty Act regulates or prohibits taking, killing, possession of, or harm to migratory bird species listed in Title 50, Section 10.13 of the Code of Federal Regulations. The Migratory Bird Treaty Act is an international treaty for the conservation and management of bird species that migrate through more than one country, and is enforced in the United States by USFWS. Hunting of specific migratory game birds is permitted under the regulations listed in Title 50, Section 20 of the Code of Federal Regulations. The Migratory Bird Treaty Act was amended in 1972 to include protection for migratory birds of prey (raptors). In late December 2017, the Department of Interior issued an opinion that interprets the above prohibitions as only applying to direct and purposeful actions the intent

of which is to kill, take, or harm migratory birds; their eggs; or their active nests. Incidental take of birds, eggs, or nests that are not the purpose of such an action, even if there are direct and foreseeable results, are not prohibited.

## Clean Water Act – Section 404

The objective of the Clean Water Act (CWA) is to restore and maintain the chemical, physical, and biological integrity of the nation's waters. Under Section 404 of the CWA, the U.S. Army Corps of Engineers (USACE) has the authority to regulate activities that could discharge fill or dredge material or otherwise adversely modify wetlands or other waters of the United States. USACE implements the federal policy embodied in Executive Order 11990, which is intended to result in no net loss of wetland values or function.

#### Clean Water Act – Section 401

The State Water Resources Control Board has authority over wetlands through Section 401 of the CWA, as well as the Porter–Cologne Act, California Code of Regulations Section 3831(k), and California Wetlands Conservation Policy. The CWA requires that an applicant for a Section 404 permit (to discharge dredge or fill material into waters of the United States) first obtain certification from the appropriate state agency stating that the fill is consistent with the state's water quality standards and criteria. In California, the authority to either grant certification or waive the requirement for permits is delegated by the State Water Resources Control Board to the nine regional boards. The Central Valley Regional Water Quality Control Board (RWQCB) has authority for Section 401 compliance in the project area. A request for certification is submitted to the RWQCB at the same time that an application is filed with USACE.

## 3.2 State

## California Endangered Species Act

Under the California Endangered Species Act (CESA), the California Fish and Game Commission has the responsibility of maintaining a list of threatened and endangered species. CESA prohibits the take of state-listed threatened or endangered animals and plants unless otherwise permitted pursuant to CESA. Species determined by the State of California to be candidates for listing as threatened or endangered are treated as if listed as threatened or endangered and are, therefore, protected from take. Pursuant to CESA, a state agency reviewing a project within its jurisdiction must determine whether any state-listed endangered or threatened species, or candidate species, could be potentially impacted by that project.

## California Department of Fish and Wildlife Special Plants

For the purposes of this analysis, special plant species are defined as plants that are legally protected or that are otherwise considered sensitive by federal, state, or local resource conservation agencies. These species fall into one or more of the following categories:

- Listed by the federal government under the Federal Endangered Species Act of 1973 or the State of California under the California Endangered Species Act of 1970 as endangered, threatened, or rare.
- A candidate for federal or state listing as endangered or threatened.

- Taxa that are biologically rare, very restricted in distribution, or declining throughout their range but not currently threatened with extirpation.
- Population(s) in California that may be peripheral to the major portion of a taxon's range but are threatened with extirpation in California.
- Taxa closely associated with a habitat that is declining in California at a significant rate (e.g., wetlands, riparian, vernal pools, old growth forests, desert aquatic systems, native grasslands, valley shrubland habitats).
- Taxa considered to be "rare, threatened, or endangered in California" as defined by the California
  Department of Fish and Wildlife (CDFW) and assigned a California Rare Plant Rank (CRPR). The CDFW
  system includes six rarity and endangerment ranks for categorizing plant species of concern, as follows:
  - CRPR 1A Plants presumed to be extinct in California
  - CRPR 1B Plants that are rare, threatened, or endangered in California and elsewhere
  - CRPR 2A Plants presumed to be extinct in California, but more common elsewhere
  - o CRPR 2B Plants that are rare, threatened, or endangered in California, but more common elsewhere
  - CRPR 3 Plants about which more information is needed (a review list)
  - CRPR 4 Plants of limited distribution (a watch list)

Plants ranked as CRPR 1A, 1B, 2A, or 2B may qualify as endangered, rare, or threatened species within the definition of California Environmental Quality Act (CEQA) Guidelines Section 15380. CDFW recommends that potential impacts to CRPR 1 and 2 species be evaluated in CEQA review documents. In general, CRPR 3 and 4 species do not meet the definition of endangered, rare, or threatened pursuant to State CEQA Guidelines Section 15380, but these species may be evaluated on a case-by-case basis.

## California Department of Fish and Wildlife Species of Special Concern

CDFW maintains a list of vertebrate animal species considered of "special concern" because declining population levels, limited ranges, and/or continuing threats have made them vulnerable to extinction. A Species of Special Concern is a species, subspecies, or distinct population of an animal native to California that currently satisfies one or more of the following (not necessarily mutually exclusive) criteria:

- Is extirpated from the state or, in the case of birds, is in its primary seasonal or breeding role
- Is listed as threatened or endangered federally, but not by the state
- Meets the state definition of threatened or endangered, but has not formally been listed
- Is experiencing, or formerly experienced, serious noncyclical population declines or range retractions (not reversed) that, if continued or resumed, could qualify it for threatened or endangered status by the state
- Has naturally small populations exhibiting high susceptibility to risk from any factor(s) that, if realized, could lead to declines that would qualify it for threatened or endangered status by the state

Species of Special Concern are typically addressed within the context of an Environmental Impact Report or other document prepared pursuant to CEQA.

Mr. Baron

Subject: Biological Resources Assessment for the Reservoir 2 and 2A Tank Recoating Project, El Dorado County,

California

## California Department of Fish and Wildlife Wetlands Protection Regulations

CDFW derives its authority to oversee activities that affect wetlands from state legislation. This authority includes Sections 1600–1616 of the California Fish and Game Code (Lake and Streambed Alteration Agreements), CESA (protection of state-listed species and their habitats, which could include wetlands), and the Keene–Nejedly California Wetlands Preservation Act of 1976 (states a need for an affirmative and sustained public policy program directed at wetlands preservation, restoration, and enhancement). In general, CDFW asserts authority over wetlands within the state through any of the following: review and comment on USACE Section 404 permits, review and comment on CEQA documents, preservation of state-listed species, or through Lake and Streambed Alteration Agreements.

## California Department of Fish and Wildlife Sensitive Natural Communities

Sensitive natural communities are communities that have a limited distribution and are often vulnerable to the environmental effects of projects. These communities may or may not contain special-status species or their habitats. For purposes of this assessment, sensitive natural communities include vegetation communities listed in CDFW's California Natural Diversity Database (CNDDB) and communities listed in the Natural Communities List with a rarity rank of S1, S2, or S3 (S1: critically imperiled; S2: imperiled; S3: vulnerable). Additionally, all vegetation associations within the alliances with ranks of S1–S3 are considered sensitive habitats. CEQA requires that impacts to sensitive natural communities be evaluated and mitigated to the extent feasible.

## California Fish and Game Code Section 1600 – Lake and Streambed Alteration Agreement

Under Sections 1600–1616 of the California Fish and Game Code, CDFW regulates activities that would alter the flow, bed, channel, or bank of streams and lakes. The limits of CDFW's jurisdiction are defined as the "bed, channel or bank of any river, stream, or lake designated by the department in which there is at any time an existing fish or wildlife resource or from which these resources derive benefit" (Section 1601). In practice, CDFW usually marks its jurisdictional limit at the top of the stream or bank, or at the outer edge of the riparian vegetation, whichever is wider.

## California Fish and Game Code – Sections 3503, 3511, 3513

Section 3503 of the California Fish and Game Code states that it is unlawful to take, possess, or needlessly destroy the nests or eggs of any bird, except as otherwise provided by this code or any regulation made pursuant thereto. Section 3503.5 protects all birds of prey (raptors) and their eggs and nests. Section 3511 states that fully protected birds or parts thereof may not be taken or possessed at any time. Section 3513 states that it is unlawful to take or possess any migratory non-game bird as designated in the Migratory Bird Treaty Act.

## California Fish and Game Code – Section 4150

California Fish and Game Code Section 4150 states that a mammal occurring naturally in California that is not a game mammal, fully protected mammal, or fur-bearing mammal is a non-game mammal. A non-game mammal may not be taken or possessed under Section 4150. All bat species occurring naturally in California are considered non-game mammals and are therefore prohibited from take, as stated in California Fish and Game Code Section 4150.

Mr. Baron

Subject: Biological Resources Assessment for the Reservoir 2 and 2A Tank Recoating Project, El Dorado County,

California

## Porter-Cologne Water Quality Control Act

The Porter–Cologne Water Quality Control Act established the State Water Resources Control Board and the RWQCBs as the principal state agencies responsible for the protection of water quality in California. The Porter–Cologne Water Quality Control Act provides that "all discharges of waste into the waters of the State are privileges, not rights." Waters of the state are defined in Section 13050(e) of the Porter–Cologne Water Quality Control Act as "any surface water or groundwater, including saline waters, within the boundaries of the state." All dischargers are subject to regulation under the Porter–Cologne Water Quality Control Act, including both point and nonpoint source dischargers. The Central Valley RWQCB (Region 5) has the authority to implement water quality protection standards through the issuance of permits for discharges to waters at locations within its jurisdiction, including the project site.

## California Environmental Quality Act

CEQA Guidelines Section 15380(b) provides that a species not listed on the federal or state list of protected species may be considered rare or endangered if the species can be shown to meet certain criteria. These criteria have been generally modeled after the definition in FESA and Chapter 1.5 of the California Fish and Game Code that addresses rare or endangered plants and animals. Appendix G of the CEQA Guidelines requires a lead agency to determine whether or not a project would "have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or U.S. Fish and Wildlife Service." CEQA Guidelines Section 15065 requires that a lead agency find an impact to be significant if a project would "substantially reduce the number or restrict the range of an endangered, rare, or threatened species."

## 4 Methods

Information regarding biological and potentially jurisdictional resources present within the project site was obtained through a review of pertinent literature, publically available natural resource databases, and other information, as well as a biological field survey; all are described in detail below.

## 4.1 Literature and Database Review

Special-status biological resources present or potentially present on the project site were identified through a literature search using the following sources: USFWS IPaC Trust Resource Report, CDFW's CNDDB, and the California Native Plant Society (CNPS) online Inventory of Rare and Endangered Vascular Plants. Dudek also reviewed current and historical aerial photography to identify any potentially jurisdictional wetlands or other waters based on aerial signatures, and reviewed the Natural Resources Conservation Service (USDA 2020a) Web Soil Survey to identify soil types mapped on the project site.

## 4.2 Biological Field Surveys

Dudek wildlife biologist Paul Keating performed a field survey of the approximately 8-acre project site on February 12, 2020 (Figure 1). The field survey included identifying, characterizing, and documenting on-site vegetation communities and land cover types; a preliminary evaluation of potentially jurisdictional wetlands or other waters;

and an assessment, based on field conditions, of the potential for special-status plant and animal species to occur within the project site boundaries. The survey was conducted on foot to visually cover the entire project site. Field notes, an aerial photograph (Google Earth 2020) with an overlay of the property boundary, and a Trimble Geo 7X GPS unit were used to map vegetation communities and record any sensitive biological resources while in the field. Representative site photographs are included in Attachment A, Photo Log.

All plant species encountered during the field survey were identified to the lowest taxonomic group possible and recorded directly into a field notebook. Common and scientific names for plant species with a CRPR (formerly CNPS List) follow the CNPS online Inventory of Rare, Threatened, and Endangered Plants of California (CNPS 2020). Nomenclature for all other plant species observed on the site follow The Jepson Manual, Vascular Plants of California, Second Edition (Jepson Flora Project 2019). Wildlife species detected during the field surveys by sight, calls, tracks, scat, or other signs were recorded directly into a field notebook. The site was scanned with and without binoculars to aid in the identification of wildlife. In addition to species detected during the surveys, expected wildlife use of the site was determined by known habitat preferences of local species and knowledge of their relative distributions in the area. Because the field survey was conducted outside the blooming period for special-status plant species potentially occurring on the site, and outside of the breeding season for special-status wildlife species potentially occurring on the site, focused protocol-level surveys for special-status species were not conducted.

Dudek also evaluated the potential for aquatic features potentially under state and/or federal jurisdiction to occur on the project site. Potentially jurisdictional waters include the following:

- Waters of the United States, including wetlands, under the jurisdiction of USACE pursuant to Section 404 of the federal CWA
- Waters of the State, including wetlands, under the jurisdiction of the RWQCB pursuant to Section 401 of the CWA and the Porter-Cologne Act
- Waters of the State under the jurisdiction of CDFW, pursuant to Section 1602 of the California Fish and Game Code

Pursuant to the federal CWA, USACE, and RWQCB, jurisdictional areas include those supporting all three wetlands criteria described in the USACE Manual: hydric soils, hydrology, and hydrophytic vegetation. Areas regulated by the RWQCB are generally coincident with the USACE areas, but may also include isolated features that have evidence of surface water inundation pursuant to the state Porter-Cologne Act. These areas generally support at least one of the three USACE wetlands indicators but are considered isolated through the lack of surface water hydrology/connectivity downstream. The extent of CDFW regulated areas typically includes areas supporting a predominance of hydrophytic vegetation (i.e., 50% cover or greater) where associated with a stream channel. During the field survey conducted by Dudek in February 2020, searches were conducted for any water features that potentially meet the criteria described above and for which a formal jurisdictional delineation would need to be conducted to confirm whether or not the features were under agency jurisdiction.

## 5 Results

## 5.1 Site Description

#### Soils

According to the Natural Resources Conservation Service (USDA 2020a), two soil types are mapped on the project site: Aiken loam, 3-9% slopes, eroded, and Cohasset loam, 9-15% slopes (Figures 2, Project Soils). Both the Aiken and Cohasset series consists of very deep, well drained soils formed in material weathered from basic volcanic rocks. Due to the extensive grading of the project site neither soils is likely to retain much of its natural substrate properties on the project site. Neither soil type mapped on site are included on the U.S. Department of Agriculture's list of hydric soils (USDA 2020b), which are commonly associated with wetlands or other waters.

## Hydrology

The National Wetlands Inventory identifies two potential waters of the U.S. or state on the project site, which are discussed in Section 5.5, Wetlands and Other Waters (USFWS 2020). No wetlands or other waters were observed on site during the field survey. Surface runoff on the project site generally flows to the north and west toward the China Creek drainage.

## Vegetation Communities and Land Cover Types

One natural vegetation community and two terrestrial land cover types exist on the project site: Sierra mixed conifer, disturbed/ruderal, and developed (Figure 4, Vegetation Communities and Land Cover Types). There are no aquatic land cover types, such as wetlands or other waters, on the project site. Vegetation communities and land cover types present on the project site are summarized in Table 1 and described further in the following text.

Table 1. Vegetation Communities and Land Cover Types on the Project Site

Vegetation Community/Land Cover Type	Acreage	
Sierra Mixed Conifer	.53	
Disturbed/Ruderal	5.37	
Developed	2.6	
Total	8.5	

Sierra Mixed Conifer (0.53 acres). This vegetation community generally surrounds the project site and encroaches onto the project site in several areas along the boundaries of the site. Along the southern boundary a row of incense cedar appears to have been planted, likely for screening purposes. This planted row of trees is included in the Sierra Mixed Conifer landcover type since the species are native and consistent with vegetation present in the other areas on the project site and the surrounding vicinity. The over-story varies from slight to moderately dense and is dominated by incense cedar (*Calocedrus decurrens*), likely due to planting, with some Ponderosa pine (*Pinus*)

ponderosa) and Douglas fir (*Pseudotsuga menziesii*). The shrub layer is sparse to absent, with the exception of scattered incense cedar saplings, and the herbaceous layer is mostly dominated by a thick layer of duff. Where present, vegetation includes Sierran mountain misery (*Chamaebatia foliolosa*) and common snowberry (*Symphoricarpos albus*). Sparse native species, such as buckbrush (*Ceanothus cuneatus* var. *cuneatus*) and manzanita (*Archtostaphylus* spp.), are present intermittently along the north side of the project site.

**Disturbed/Ruderal (5.37 acres).** This land cover type is dominant within the tank site, as significant grading has occurred and a majority of the site is maintained to limit vegetation and allow for vehicle access to the tank site. Much of this cover type is either barren of vegetation or dominated by non-native plant species indicative of disturbed sites, such as field hedgeparsley (*Torilis arvensis*), yellow star-thistle (*Centaurea solstitialis*), and oat (*Avena spp.*). Vegetation is absent in some areas within this landcover type.

**Developed (2.6 acres).** Developed areas are those that have been completely altered by human activities. Within the project site, this land cover type includes the access road, existing accessory buildings, and the tanks. Vegetation is largely absent from these areas.

## Common Plant and Wildlife Species Observed

Dudek's biologist recorded 16 vascular plant species on the project site during the February 2020 field survey. The field assessment was outside the growing season, at a time when many plants are not evident and identifiable. As such, floristic surveys conducted at the appropriate time of the growing season would likely yield a greater number of identifiable species.

The Dudek biologist directly observed, or documented via scat, sign, or call, five wildlife species on the project site during the field survey. Observed wildlife included resident and migratory bird species such as red-tailed hawk (*Buteo jamaicensis*) and American robin (*Turdus migratorius*). The site is surrounded by chain link fence and dominated by disturbed and developed habitat; no scat or sign was observed. Many wildlife species common to the region are mobile, cryptic, and/or active during limited periods of day, and could therefore be easily missed during a single daytime survey. A list of plant and wildlife species detected during the field survey is included as Attachment B, List of Species Observed on Site.

## 5.2 Special-Status Plants

Results of USFWS, CNDDB, and CNPS database searches revealed 11 special-status plant species that have potential to occur or that are known to occur in the project site region (see Figure 3, and Attachment C, Special-Status Plants Potential to occur). Of these, nine special-status plant species were removed from consideration due to lack of suitable habitat within or adjacent to the project site, or due to the site being outside of the species' known geographic or elevation range. The remaining two special-status plant species have some potential to occur on the project site; however, the proposed project is confined to existing developed areas and will not impact any vegetative landcover where special-status plants have potential to occur. Special-status plant species are therefore not discussed further.

California

## 5.3 Special-Status Wildlife

Results of the USFWS, CNDDB, and USFS Region 5 searches revealed 18 special-status wildlife species as present or potentially present in the project region (see Attachment D, Special-Status Wildlife Potential to Occur). Of these,14 species were removed from consideration due to lack of suitable habitat on or adjacent to the project site, ordue to the site being outside of the species' known geographic or elevation range. The remaining 4 special-statuswildlife species have some potential to occur on the project site and are discussed further below.

Native and migratory birds (potentially including Northern Goshawk and Bald Eagle) are present on site. Native birds of prey are protected by California Fish and Game Code Section 3503.5, and migratory bird species are protected by the federal Migratory Bird Treaty Act and Section 3503 of the California Fish and Game Code. Trees, shrubs, and human-made structures in or adjacent to the project site provide potential nesting habitat for several local and migratory bird species. Several common and migratory birds were detected during the February 2020 field survey, but no active nests were observed. A focused survey for nesting birds and birds of prey was not conducted during the field survey. The field survey was conducted at the start of the generally recognized nesting season (February 1 through August 31), no nests or nesting activity was observed during the February 2020 survey. The potential for special status birds to utilize the site for nesting is generally low given the low quality habitat for these species and human presence associated with intensive land uses and busy roads in the vicinity of the project site.

Native bats (including pallid bat, and fringed myotis) have a low potential to occur on site. Native bats are protected by California Fish and Game Code Section 4150. Potential roosting habitat on the project site is generally limited or of poor quality due to human disturbance in the area and general lack of suitable roosting structures. Trees within the site are subject to site maintenance and are generally in good health and provide low quality roosting habitat. Trees in declining health or snags with exfoliating bark and crevices on lands adjacent to the project site would have the greatest potential to provide roosting habitat for native bats, including pallid bat and fringed myotis, though potential for bat roosts to be found on or adjacent to the project site is considered low as roosting habitat is the area provides marginal habitat quality. No roosting bats or their sign were identified during the field survey. However, neither a focused survey for roosting bats nor a formal habitat assessment for bats was conducted.

## 5.4 Sensitive Natural Vegetation Communities

There are no sensitive natural vegetation communities on the project site, which consists primarily of graded and developed areas.

## 5.5 Wetlands and Other Waters

According to the USFWS National Wetland Inventory (USFWS 2020), two potential waters of the U.S. or state occur on the project site. However, both of these features are listed as freshwater ponds and generally coincide with the location of the two tanks. It is assumed that these tanks may have replaced open reservoirs which were commonly used for water storage throughout the foothills region prior to being replaced with tanks.

A formal jurisdictional delineation of the project site was not conducted during the field survey. However, no areas containing a dominance of wetland plants or linear features with an ordinary high water mark were observed in or

Mr. Baron

Subject: Biological Resources Assessment for the Reservoir 2 and 2A Tank Recoating Project, El Dorado County,

California

adjacent to the project site. The site generally drains toward the west and a culvert drains water from one potential holding area just west of the two tanks.

## 5.6 Wildlife Movement Corridors and Habitat Linkages

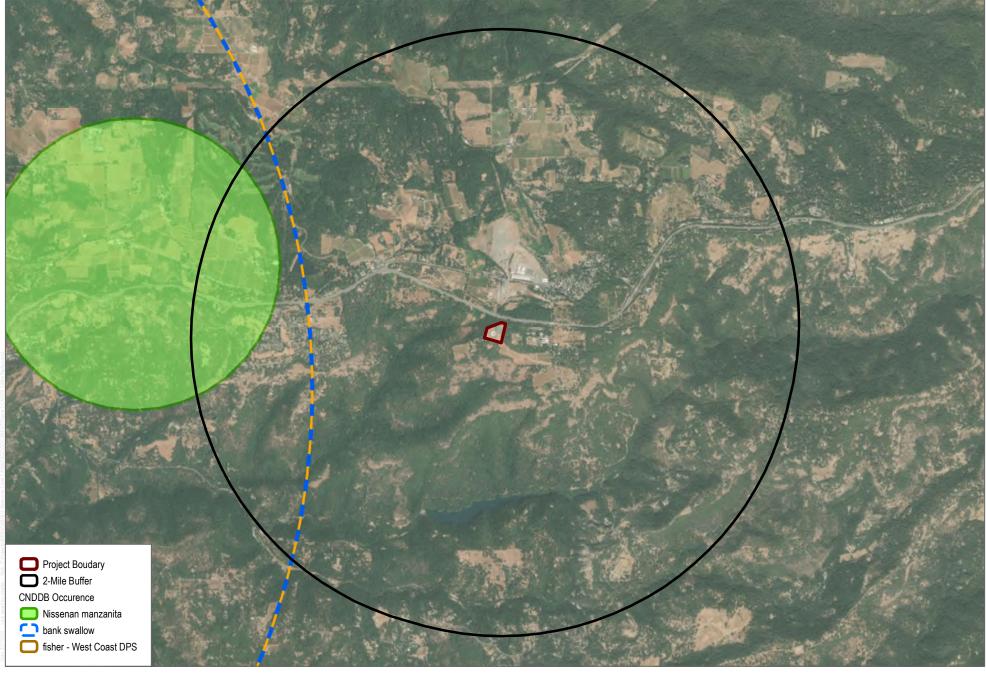

Wildlife corridors are landscape features, usually linear in shape, that facilitate the movement of animals over time between two or more patches of otherwise disjunct habitat. Corridors can be small and even human made (e.g., highway underpasses, culverts, bridges), narrow linear habitat areas (e.g., riparian strips, hedgerows), or wider landscape-level extensions of habitat that ultimately connect larger core habitat areas. Depending on the size and extent, wildlife corridors can be used during animal migration, foraging events, and juvenile dispersal. They ultimately serve to facilitate genetic exchange between core populations, provide avenues for plant seed dispersal, enable increased biodiversity and maintenance of ecosystem integrity within habitat patches, and help offset the negative impacts of habitat fragmentation (Hilty et al. 2006). The site is located adjacent to US Highway 50 which poses a barrier to wildlife movement; additionally, the existing infrastructure facility is surrounded by an 8-foot-tall fence topped with barbed wire. The site does not currently function as a movement corridor and implementation of the proposed project would not result in any further impediments to wildlife movement.

## 6 Potential Impacts/Mitigation Recommendations

## 6.1 Definition of Impacts

This section identifies the types of potential impacts that may occur as a result of implementation of the proposed project, including direct permanent impacts, direct temporary impacts, and indirect impacts.

Direct permanent impacts refer to the absolute and permanent physical loss of a biological resource due to clearing and grading associated with implementation of a project. Direct permanent impacts are analyzed in four ways: (1) permanent loss of vegetation communities and land covers that serve as habitat for special-status species occurring or potentially occurring on a site, (2) direct harm or mortality to individuals of special-status plant and wildlife species, (3) permanent loss of sensitive resources such as jurisdictional wetlands/waters, or (4) permanent loss of wildlife movement and habitat connectivity in an area.

Direct temporary impacts refer to a temporal loss of vegetation communities and land covers resulting from vegetation and land cover clearing and grading associated with implementation of a project. The main criterion for direct temporary impacts is that impacts would occur for a short period but would be reversible over time.

Indirect impacts are reasonably foreseeable effects caused by project implementation on remaining or adjacent biological resources outside the direct disturbance zone that may occur during grading or maintenance activities (i.e., short-term construction-related indirect impacts) or later in time as a result of the project (i.e., long-term, or operational, indirect impacts). Short-term indirect impacts can include dust, human activity, pollutants (including potential erosion), and noise that extend beyond the identified construction area. Long-term indirect impacts can include changes to hydrology, introduction of invasive species, dust, and noise that are operations-related and occur over the long term.

Potential impacts from project implementation on various special-status biological resources occurring or potentially occurring on the project site are discussed below and recommendations to avoid/minimize these impacts are identified.

## 6.2 Impacts to Special-Status Plants

The potential for special-status plants to occur on the project site is generally low, since the project site consists primarily of developed and disturbed habitat. Additionally, implementation of the proposed project will utilize existing developed areas of the project site (existing roads and building) and will not directly or indirectly impact any potential special-status plant species present on the site; therefore, no impacts to special-status plants are anticipated.

## 6.3 Impacts to Special-Status Wildlife

Native and Migratory Birds (including Northern Goshawk and Bald Eagle) The proposed project does not include any tree or vegetation removal and it is unlikely that special-status birds with a low potential to occur on site would be directly impacted by the project; however, indirect effects primarily from increased noise from blasting the tanks during paint removal could lead to distress and nest abandonment if active nests are in or adjacent to the project

site. Implementation of the following measures would ensure that any potential impacts to nesting birds would be avoided:

• If construction activities are scheduled during the bird nesting season (February 1 to August 31), a qualified biologist shall conduct a nesting bird survey within 1 week prior to said activities to determine if any birds are nesting on or near the project site (including a 500-foot buffer for raptors). If any active nests are observed during surveys, a suitable avoidance buffer from the nests shall be determined and flagged by a qualified biologist based on species, location, and planned construction activities. Consultation with CDFW may be required to determine appropriate buffer distances. These nests shall be avoided until the chicks have fledged and the nests are no longer active, as determined by the qualified biologist.

If project activities associated with rehabilitation of the tanks need to occur within an established buffer around an active nest, then a nest monitoring protocol shall be implemented to ensure that adverse impacts would not occur to the active nest. The protocol would include the following:

- Just prior to the initiation of project activities within the nest buffer, a qualified biologist will conduct observations, over the course of 1 to 2 days, of adult bird behavior associated with the nest to establish baseline behavioral conditions (e.g., frequency and type of bird vocalizations, frequency of nest departures/arrivals by adults, flight behavior and patterns). The biologist will then set thresholds of disturbance based on observations documented during the baseline survey, on known breeding behaviors of the species, and on best professional judgement and practicable experience.
- Once the project activities have commenced, the biologist shall be onsite in proximity to active nests and shall monitor adult bird behavior for the duration of the project activity. The biologist will specifically look for and document signs of agitation including but not limited to angry or anxious vocalizations, leaving and quickly returning to the nest or an area near the nest, flying in small circles, wing fluttering while perched, extended periods of time away from the nest, and any other behaviors indicative of agitation or disturbance for that species of bird. The biologist will have the authority to stop work if continued evidence of bird agitation occurs and, in the opinion of the biologist, could result in nest abandonment. Work may resume after the biologist has determined that the bird is no longer agitated and nest viability will be ensured. If the biologist determines that the project activity cannot be conducted without continued disturbance to the nest, the activity will be postponed until after the nest is no longer active, as determined by the biologist.
- Upon completion of the project activity, the biologist will prepare a brief letter report documenting the methods and results of the monitoring and submit the letter report to EID.

Native Bats (including Fringed Myotis). The proposed project would rehabilitate existing tanks within an existing developed site that is frequently subject to disturbance related to operations and maintenance activities. Since the proposed project would not remove any trees that could support bat roosts on or adjacent to the project site, and since there is low potential for bat roosts to occur on or adjacent to the project site due to low habitat suitability, impacts associated with project disturbance of native bats and roosts would be less than significant.

California

## 6.4 Impacts to Sensitive Vegetation Communities

Construction of the proposed project is not expected to result in direct impacts to special-status vegetation communities, since none are present on site.

## 6.5 Impacts to Wetlands and Other Waters

As discussed in Section 5.5, Wetlands and Other Waters, there are no wetlands or other waters in or immediately adjacent to the project site and the project would occur entirely within existing developed areas that are presently used during routine operations and maintenance activities on the project site. Therefore, no impacts to wetlands or other waters are expected to occur as a result of project implementation.

## 6.6 Impacts to Wildlife Movement Corridors and Habitat Linkages

As discussed in Section 5.6, Wildlife Movement Corridors and Habitat Linkages, no substantial direct impacts to local or regional wildlife movements are expected to occur as a result of project implementation.

Special-Status Plants Potential to Occur

Scientific Name	Common Name	Status (Federal/State/CRPR)	Primary Habitat Associations, Life Form, Blooming Period, and Elevation Range	Potential to Occur
Arctostaphylos nissenana	Nissenan manzanita	USFS/None/1B.2	Perennial evergreen shrub found on open, rocky shale ridges in closed-cone coniferous forest or chaparral habitats from approximately 1,475 to 3,610 feet above mean sea level. Blooms February through March and sometimes in June (CNPS 2020; Jepson Flora Project 2020).	Not expected to occur. The project site lacks open shale ridge habitat and was not observed during 2020 survey. The nearest documented occurrence is within 2 miles of the project site (CDFW 2020).
Calochortus clavatus var. avius	Pleasant Valley mariposa lily	USFS/None/1B.2	Perennial bulbiferous herb found on Josephine silt loam and volcanic soils in lower montane coniferous forest from approximately 1,000 to 5,905 feet above mean sea level. Blooms May through July (CNPS 2020).	Moderate potential to occur. While the site is mostly disturbed suitable habitat there is suitable habitat and volcanic soils present. Several nearby documented occurrences (CDFW 2020).
Calystegia vanzuukiae	Van Zuuk's morning-glory	None/None/1B.3	Perennial rhizomatous herb found in open areas in chaparral, cismontane woodland from approximately 1640–3870 amsl; Found in Gabbro, serpentine soils and blooms from May to August.	Not expected to occur. The project site lacks appropriate soils.
Carex cyrtostachya	Sierra arching sedge	None/None/1B.2	Perennial herb found on mesic areas of lower montane coniferous forest, meadows and seeps, marshes and swamps, and riparian forest margins from approximately 2,000 to 4,460 feet above mean sea level. Blooms March through August (CNPS 2020).	Not expected to occur. The project site lacks mesic microhabitats.
Chlorogalum grandiflorum	Red Hills soaproot	None/None/1B.2	Perennial bulbiferous herb found on serpentine, gabbroic, or other soils in chaparral, cismontane woodland, and lower montane coniferous forest from approximately 800 to 5,545 feet above mean sea level. Blooms May through June (CNPS 2020). The Jepson Flora Project (2020) describes habitat as "serpentine outcrops, open shrubby or wooded hills."	Moderate potential to occur. Suitable habitat present. Nearest occurrence is approximately 5 miles North (CDFW 2020).

Scientific Name	Common Name	Status (Federal/State/CRPR)	Primary Habitat Associations, Life Form, Blooming Period, and Elevation Range	Potential to Occur
Diplacus pulchellus	yellow-lip pansy monkeyflower	None/None/1B.2	Annual herb found in lower montane coniferous forest, Meadows and seeps in clay soils from approximately 1965- 6560 feet above mean sea level. Blooms April through July (CNPS 2020).	Not expected to occur. No suitable clay soils present. No occurrences within 15 miles of project site (CDFW 2020).
Horkelia parryi	Parry's horkelia	USFS/None/1B.2	Perennial herb found on lone formations or other soils in chaparral and cismontane woodland in clay soils from approximately 260 to 3,510 feet above mean sea level. Blooms April through September (CNPS 2020).	Not expected to occur. No suitable clay soils present.
Lewisia serrata	saw-toothed lewisia	USFS/None/1B.1	Perennial herb found in mesic areas of rocky slopes of broadleafed upland forest, lower montane coniferous forest, and riparian forest from approximately 2,525 to 4,710 feet above mean sea level. Blooms May through June (CNPS 2020).	Not expected to occur. No suitable mesic rocky slopes present.
Packera layneae	Layne's ragwort	FT/SR/1B.2	Perennial herb found in chaparral, Cismontane woodland. Grows in serpentinite or gabbroic soils from approximately 655-3560 feet above mean sea level.	Not expected to occur. No suitable serpentinite or gabbroic soils present.
Phacelia stebbinsii	Stebbins' phacelia	USFS/None/1B.2	Annual herb found in cismontane woodland, lower montane coniferous forest, and meadows and seeps on rock outcrops or gravelly soil from approximately 2,000 to 6,595 feet above mean sea level. Blooms May through July (CNPS 2020).	Not expected to occur. No suitable habitat present.
Rhynchospora capitellata	brownish beaked-rush	None/None/2B.2	Perennial herb found in mesic areas of lower and upper montane coniferous forest, meadows and seeps, and marshes and swamps from approximately 145 to 6,560 feet above mean sea level. Blooms July through August (CNPS 2020).	Not expected to occur. No suitable mesic habitat present.

CRPR = California Rare Plant Rank; USFS = United States Forest Service

#### Status Legend:

USFS: U.S. Forest Service Sensitive Species

CRPR 1B: Plants rare, threatened, or endangered in California and elsewhere

CRPR 2B: Plants rare, threatened, or endangered in California but more common elsewhere

## ATTACHMENT C

## SPECIAL-STATUS PLANTS POTENTIAL TO OCCUR

CRPR 3: Review List: Plants about which more information is needed

CRPR 4: Watch List: Plants of limited distribution

CBR: Considered but rejected (no CRPR)

- .1 Seriously threatened in California (over 80% of occurrences threatened/high degree and immediacy of threat)
- .2 Moderately threatened in California (20–80% occurrences threatened/moderate degree and immediacy of threat)
- .3 Not very threatened in California (<20% of occurrences threatened/low degree and immediacy of threat or no current threats known)

## Attachment D

Special-Status Wildlife Potential to Occur

Scientific Name	Common Name	Status (Federal/State)	Habitat	Potential to Occur
Invertebrates	Common Name	(i ederal/State)	Habitat	Potential to occur
Bombus occidentalis	western bumble bee	USFS/PSE	Meadows and grasslands with abundant floral resources. Historically known throughout the mountains and northern coast of California. Currently found in high-elevation sites and a few records on the Northern California coast. Requires suitable nesting sites for colonies, nectar, and pollen resources available through spring, summer, and fall, and suitable overwintering sites. Typically nests in underground cavities in open west/southwest-facing slopes bordered by trees. Occasionally found in above-ground locations such as logs. Common host plant genera include Cirsium, Erigonum, Solidago, Aster, and Ceanothus (Xerces 2018).	Not expected to occur. The project site lacks open areas with abundant floral resources. Most of the project site has been graded or developed and lacks soils suitable for underground cavities.
Fishes				
Hypomesus transpacificus	Delta smelt	FT/SE	Euryhaline species (tolerant of a wide salinity range) that is confined to the San Francisco Estuary, principally in the Delta and Suisun Bay. Occurs in the Delta primarily below Isleton on the Sacramento River side and below Mossdale on the San Joaquin River side. Found seasonally throughout Suisun Bay and in small numbers in larger sloughs of Suisun marsh. Moves into sloughs and channels of the western Delta (e.g., Lindsey Slough) when spawning (usually March through April). Can be washed into San Pablo Bay during high-outflow periods, but do not establish permanent populations there (Moyle 2002).	Not expected to occur. The project site is outside of the species' known geographic range and lacks aquatic habitat.
Amphibians				
Ambystoma macrodactylum sigillatum	southern long-toed salamander	None/SSC	Occurs in the Sierra Nevada from the vicinity of the Stanislaus River north through the mountains of California. Found primarily in yellow pine, mixed conifer, and red fir forests associated with	Not expected to occur. The project site is outside of the species' known geographic range and there

Scientific Name	Common Name	Status (Federal/State)	Habitat	Potential to Occur
Scientific Name	Common Name	(redetal/State)	mountain meadows from near sea level to approximately 9,180 feet. Adults are mostly subterranean except during breeding migrations. Mostly nocturnal on the surface. Breeds primarily in temporary ponds formed by winter and spring rains and snowmelt. Higher-elevation populations may require permanent ponds due to slow larvae development (CDFW 2020b).	is no potential aquatic habitat present.
Rana boylii	foothill yellow-legged frog	USFS/SSC, PST	Found in or near rocky streams in a variety of habitats, including valley-foothill hardwood, valley-foothill hardwood-conifer, valley-foothill riparian, Ponderosa pine, mixed conifer, coastal scrub, mixed chaparral, and wet meadows from near sea level to approximately 6,370 feet in the Sierra Nevada. Egg clusters are attached to gravel or rocks in moving water near stream margins. Species is rarely encountered far from permanent water (CDFW 2020b).	Not expected to occur. No potential aquatic habitat present in or adjacent to the project site.
Rana draytonii	California red-legged frog	FT/SSC	Inhabits ponds, quiet pools of streams, marshes, and riparian areas with dense, shrubby, or emergent vegetation from near sea level to approximately 5,200 feet above mean sea level, although most sightings occur below 3,500 feet. Requires permanent or nearly permanent pools for larval development (CDFW 2020b). May use ephemeral water bodies for breeding if permanent water is nearby (Thomson et al. 2016). Probably extirpated from the floor of the Central Valley before 1960 (USFWS 2002).	Not expected to occur. Site lacks suitable upland cover and is absent aquatic habitat. CNDDB occurrences associated with North Fork Weber Creek; Weber reservoir is located approximately 1 mile south. (CDFW 2020a).
Rana sierrae	Sierra Nevada yellow-legged frog	USFS, FE/ST, WL	Occurs above 4,500 feet elevation in the Sierra Nevada from Plumas County south to the ridge dividing the middle and south forks of Kings River in Fresno County. Associated with streams, lakes, and ponds in montane riparian, lodgepole pine, sub-alpine conifer, and wet meadow habitat types.	Not expected to occur. The project site lacks potential aquatic habitat and is below its known elevation range.

Scientific Name	Common Name	Status (Federal/State)	Habitat	Potential to Occur
			Always encountered within a few feet of water (CDFW 2020b).	
Reptiles				
Emys marmorata	western pond turtle	USFS/SSC	Highly aquatic species found in a broad range of aquatic habitats, including rivers and streams, permanent lakes, ponds, reservoirs, settling ponds, marshes, and other inundated wetlands. May use brackish, semi-permanent, or ephemeral features when inundated. Requires basking sites and loose soil in surrounding uplands suitable for nest excavation. Occurs throughout non-desert California from near sea level to approximately 6,700 feet. Isolated populations are known from the Mojave River, Susan River, Truckee River, Carson River, and Klamath Basin (Thomson et al. 2016).	Not expected to occur. The project site lacks potential aquatic habitat and upland nesting or overwintering habitat. CNDDB occurrences associated with North Fork Weber Creek; Weber reservoir is located approximately 1 mile south. (CDFW 2020a).
Birds				
Accipiter gentilis	northern goshawk	USFS/SSC	Prefers nesting in middle- and higher-elevation immature, dense conifer forests. Habitat requirements include meadows and riparian habitat. Usually nests near water on north slopes in the densest parts of vegetation stands, staying close to openings (CDFW 2020b). Nest stands consistently have larger trees, greater canopy cover, and relatively more open understories than stands lacking nests (Shuford and Gardali 2008). Generally does not nest near areas of human habitation or paved roads (USFWS 2001).	Low potential to occur. The project site is largely developed/disturbed and nesting habitat is mostly confined to two small patches of trees on site.
Haliaeetus leucocephalus	tricolored blackbird	None/SSC	Nests near freshwater, emergent wetland with cattails or tules, but also in Himalayan blackberrry; forages in grasslands, woodland, and agriculture.	Not expected to occur. The project site lacks suitable habitat.
Haliaeetus leucocephalus	bald eagle	USFS, FDL, BCC/FP, SE	Occurs along coasts, rivers, and large, deep lakes and reservoirs in California. More widespread as a winter migrant. Requires large bodies of water or free-flowing rivers with abundant fish and perching	Low potential to occur. The project site is largely developed/disturbed and nesting habitat is mostly

Scientific Name	Common Name	Status (Federal/State)	Habitat	Potential to Occur
			sites. Nests in large old growth and dominant live trees with open branchwork. Favors Ponderosa	confined to two small patches of trees on site.
Dinaria rinaria	hank awallaw	None /CT	pine (CDFW 2020b).	Not expected to peour The project
Riparia riparia	bank swallow	None/ST	In California, primarily found west of deserts in riparian and other lowland habitats during the spring and fall. In summer, restricted to riparian, lacustrine, and coastal areas with vertical banks, bluffs, and cliffs with fine textured sandy soils, into which it digs nesting holes. Approximately 75% of the breeding population in California occurs along banks of the Sacramento and Feather Rivers in the northern Central Valley. Other colonies are known from the central coast from Monterey to San Mateo Counties, and in northeastern California in Shasta, Siskiyou, Lassen, Plumas, and Modoc Counties. Breeding colonies can have between 10 and 1,500, but typically between 100 and 200, nesting pairs (CDFW 2020b).	Not expected to occur. The project site lacks riparian nesting habitat. CNDDB occurrence within 2 miles of the site is over a century old (CDFW 2020a).
Strix nebulosa	great gray owl	USFS/SE	Occurs in the Sierra Nevada in the vicinity of Quincy in Plumas County south to Yosemite from approximately 4,500 to 7,500 feet above mean sea level. Occasionally reported in Northwestern California in winter and in the Warner Mountains in summer. Breeds in old-growth red fir, mixed conifer, and lodgepole pine habitats in proximity to wet meadows. Uses trees in dense forest stands for roosting cover and small trees and snags in or bordering meadows for hunting perches. Nests in large, broken-topped snags with a diameter at standard height of at least 24 inches. May also use old hawk or eagle nests (CDFW 2020b).	Not expected to occur. The project site is below the typical elevation range, and lacks suitable habitat.
Strix occidentalis ssp. occidentalis	California spotted owl	USFS/SSC	Occurs in dense, old-growth conifer forests with multiple canopy layers. May move into oak habitats in winter, or reside in oak habitats in Southern California. Roosts most often in dense canopy on north-facing slopes, usually within 1,000 feet of	Not expected to occur. No suitable habitat present.

Scientific Name	Common Name	Status (Federal/State)	   Habitat	Potential to Occur
			permanent water. Resides mostly in the southern Cascade Range of Northern California, along the west slope of the Sierra Nevada, and in the mountains of central and Southern California south to the Mexican border (Shuford and Gardali 2008).	
Mammals				
Antrozous pallidus	pallid bat	USFS/SSC	Occurs in open, dry habitats with rocky areas for roosting. Day roosts in caves, crevices, mines, and sometimes in buildings and hollow trees that protect them from high temperatures. Night roosts may be more open, such as porches and open buildings. Sensitive to roosting site disturbance. Occurs throughout California except in the high Sierra Nevada from Shasta to Kern Counties, and the northwest corner of California from Del Norte and western Siskiyou Counties to northern Mendocino County (CDFW 2020b).	Low potential to occur. The project site is largely developed/disturbed and roosting habitat is mostly absent.
Aplodontia rufa californica	Sierra Nevada mountain beaver	None/SSC	Uncommon in the Sierra Nevada. Occurs in dense riparian-deciduous and open brushy stages of most forest types. Typical habitat in the Sierra Nevada is montane riparian. Frequents open and intermediate-canopy coverage with a dense understory near water. Deep, friable soils and a cool, moist microclimate are required for burrowing. Feeds on vegetative parts of plants, mostly thimbleberry, salmonberry, blackberry, dogwood, salal, ferns, lupines, willows, and grasses. Vegetation is stored near a burrow entrance or in underground chambers. Burrows are located in deep soils in dense thickets, preferably near a stream or spring (CDFW 2020b).	Not expected to occur. No riparian habitat present.
Corynorhinus townsendii	Townsend's big- eared bat	USFS/SSC	Found throughout California in all but subalpine and alpine habitats, and may be found at any season throughout its range. Most abundant in mesic habitats. Requires caves, mines, tunnels,	<b>Not expected to occur.</b> The project site lacks roosting habitat for this species.

		Status		
Scientific Name	Common Name	(Federal/State)	buildings, or other human-made structures for roosting. May use separate sites for night, day, hibernation, and maternity roosts. Hibernation sites are located in cold, but not freezing, environments. Maternity roosts are located in warm environments. Gleans from brush and trees, or feeds along habitat edges. Extremely sensitive to disturbance of roosting sites. Shows high site	Potential to Occur
Myotis thysanodes	fringed myotis	USFS/None	fidelity if undisturbed (CDFW 2020b).  Widespread in California, excluding the Central Valley and deserts. Found in a variety of habitats from approximately 0 to 9,350 feet above mean sea level. Optimal habitat includes pinyon-juniper, valley foothill hardwood and hardwood-conifer from 4,000 to 7,000 feet above mean sea level. Roosts in caves, mines, buildings, snags, and crevices. Easily disturbed at roosting sites (CDFW 2020b).	Low potential to occur. The project site is largely developed/disturbed and roosting habitat is mostly absent.
Pekania pennanti	fisher – West Coast Distinct Population Segment	USFS/SSC, ST	Uncommon permanent resident of Sierra Nevada, Cascades, Klamath Mountains, and the north Coast Range. Occurs above 3,200 feet in the Sierra Nevada and Cascades (Jameson and Peeters 2004). Prefers coniferous or deciduous riparian habitats with intermediate to large trees and closed canopies. Canopy closure must be greater than 50% to be suitable habitat. Dens in a variety of protected cavities, brush piles, logs, and upturned trees. Hollow logs, trees, and snags are especially important (CDFW 2010).	Not expected to occur. The species' current distribution in California is represented by two populations: northwestern California and southern Sierra Nevada. Fishers apparently no longer inhabit the area between the Pit River in the northern Sierra Nevada/Cascades to the Merced River in the southern Sierra Nevada, a separation of approximately 270 miles. CNDDB occurrence within 2 miles is over a century old (CDFW 2020).

Noise Analysis

#### TECHNICAL MEMORANDUM

To:

From: Michael Carr, INCE

**Subject:** EID Reservoirs 2 and 2A Recoating – Noise Analysis

**Date:** March 24, 2020

Attachment(s): Appendices A through C

El Dorado Irrigation District (EID) is proposing to recoat two existing reservoir tanks in El Dorado County, California. This memorandum provides a summary of the potential noise impacts related to the proposed Reservoir 2 and 2A Recoating project (Project). Appendix A provides an introduction to acoustical fundamentals and terminology used throughout this memorandum.

## 1 Project Information

Reservoir 2 and 2A (project site) are located just west of the Camino School, located at 3060 Snows Road, Camino, in El Dorado County, California. The project site is bounded to the north by Highway 50, to the east by the Camino School, and rural residential to the south and west. The project location is shown in Figure 1.

The project would strip the existing finish coating from the existing reservoir tanks, prepare the surface and apply a new coating. The recoating process would require the use of air compressors, media blasters, generators, truck and material handling equipment. As such, the project would result in new temporary noise sources in the existing ambient noise environment.

## 2 Regulatory Setting

El Dorado County has developed and adopted goals and policies with the intent of controlling and reducing environmental noise and to protect its inhabitants from exposure to excessive noise levels. Noise standards applicable to the proposed Project are contained in the El Dorado County General Plan and El Dorado County Code of Ordinances.

#### The El Dorado County General Plan

The Public Health, Safety, and Noise Element of the El Dorado County General Plan includes objectives, goals, and policies related to acceptable noise levels. The policies relevant to this project listed in the General Plan are provided below:

**Policy 6.5.1.2** Where proposed non-residential land uses are likely to produce noise levels exceeding the performance standards of Table 6-2 [Table 1 in this report, below] at existing or planned noise-sensitive uses, an acoustical analysis shall be required as part of the environmental review process so that noise mitigation may be included in the project design.

Table 1

Noise Level Performance Protection Standards for Noise Sensitive Land Uses Affected by Non
Transportation Sources\*[Table 6-2 in Noise Element]

	Daytime 7 a.m.–7 p.m.		Evening 7 p.m.–10 p.m.		Night 10 p.m.–7 a.m.	
Noise Level Descriptor	Community	Rural	Community	Rural	Community	Rural
Hourly Leq, dB	55	50	50	45	45	40
Maximum level (Lmax), dB	70	60	60	55	55	50

#### Notes:

Each of the noise levels specified above shall be lowered by 5 dB for simple tone noises, noises consisting primarily of speech or music, or for recurring impulsive noises. These noise level standards do not apply to residential units established in conjunction with industrial or commercial uses (e.g., caretaker dwellings).

The County can impose noise level standards which are up to 5 dB less than those specified above based upon determination of existing low ambient noise levels in the vicinity of the project site.

In Community areas the exterior noise level standard shall be applied to the property line of the receiving property. In Rural Areas the exterior noise level standard shall be applied at a point 100 feet away from the residence. The above standards shall be measured only on property containing a noise sensitive land use as defined in Objective 6.5.1. This measurement standard may be amended to provide for measurement at the boundary of a recorded noise easement between all affected property owners and approved by the County.

- \* For the purposes of the Noise Element, transportation noise sources are defined as traffic on public roadways, railroad line operations, and aircraft in flight. Control of noise from these sources is preempted by federal and state regulations. Control of noise from facilities of regulated public facilities is preempted by California Public Utilities Commission regulations. All other noise sources are subject to local regulations. Non-transportation noise sources may include industrial operations, outdoor recreation facilities, HVAC units, schools, hospitals, commercial land uses, other outdoor land use, etc.
  - **Policy 6.5.1.3** Where noise mitigation measures are required to achieve the standards of Tables 6-1 and 6-2 [Table 1 in this report, above], the emphasis of such measures shall be placed upon site planning and project design. The use of noise barriers shall be considered a means of achieving the noise standards only after all other practical design-related noise mitigations measures have been integrated into the project and the noise barriers are not incompatible with the surroundings.
  - **Policy 6.5.1.7** Noise created by new proposed non-transportation noise sources shall be mitigated so as not to exceed the noise level standards of Table 6-2 [Table 1 of this report] for noise-sensitive uses.
  - **Policy 6.5.1.11** The standards outlined in [Additional] Tables [included in the Noise Element] shall not apply to those activities associated with actual construction of a project as long as such construction occurs between the hours of 7 a.m. and 7 p.m., Monday through Friday and 8 a.m. and 5 p.m. on weekends, and on federally-recognized holidays.
  - **Policy 6.5.1.13** When determining the significance of impacts and appropriate mitigation to reduce those impacts for new development projects, including ministerial development, the following criteria shall be taken into consideration:
    - **A.** In areas which ambient noise levels are in accordance with the standards in Table 6-2 [Table 1 of this report], increases in ambient noise levels caused by new non-transportation noise sources that exceed 5 dBA shall be considered significant; and
    - **B.** In areas in which ambient noise levels are not in accordance with the standards in Table 6-2, increases in ambient noise levels caused by new non-transportation noise sources that exceed 3 dBA shall be considered significant.

#### The El Dorado County Code of Ordinances

The El Dorado County Code of Ordinances includes Chapter 9.16, Noise, which provides a subjective means of maintaining the ambient noise environment within the County. As Chapter 9.16 contains no quantitative standards or thresholds, it is not employed within this analysis.

Section 130.37 of the Zoning Ordinance reiterates the standards and thresholds that are contained within the El Dorado County General Plan, Public Health, Safety and Noise Element. The Zoning Code provides exemptions to the Zoning Code standards within Section 130.37.020. The exemptions that are potentially applicable to the project are as follows:

- **F.** Noise sources associated with work performed by public or private utilities in the maintenance or modification of its facilities.
- I. Construction (e.g., construction, alteration or repair activities) during daylight hours provided that all construction equipment shall be fitted with factory installed muffling devices and maintained in good working order.

### 3 Existing Noise Environment

The existing ambient noise environment in the project vicinity is dominated primarily by noise generated from vehicular traffic on U.S. Highway 50 (US 50). The El Dorado County General Plan provides a 60 dBA Ldn/CNEL future 2025 traffic noise contour in Attachment B-8 of the General Plan, which is provided as a reference in Appendix B. The 2025 traffic 60 dBA Ldn traffic noise level contour is approximately 940 feet from the centerline of US 50 and encompasses the majority of the project site and the adjacent Camino School.

To assess the existing traffic noise levels in the project vicinity, Dudek performed traffic noise modeling based on the Federal Highway Administration Traffic Noise Model algorithms Federal Highway Administration (FHWA) Highway Traffic Noise Model (TNM) prediction methodologies (FHWA 1998). Annual Average Daily Traffic (AADT) volumes and Monthly Average Daily Traffic (MADT) volumes for US 50 were taken from the most current Caltrans vehicle traffic counts (Caltrans 2020).

The FHWA TNM incorporates state-of-the-art sound emissions and sound propagation algorithms, based on well-established theory and accepted international standards. The acoustical algorithms contained within the FHWA TNM have been validated with respect to carefully conducted noise measurement programs, and show excellent agreement in most cases for sites with and without noise barriers. The noise modeling accounted for factors as vehicle volume, speed, vehicle type, roadway configuration, distance to the receiver, and propagation over different types of ground (acoustically soft and hard ground).

Based on the 2018 Caltrans traffic count data, modeled existing traffic noise levels would range from 66.2 dBA to 66.9 dBA Ldn at a distance of approximately 350 feet from the US 50 center median, respectively for the AADT and the MADT traffic data. The distance to the 60 dBA noise contour is modeled to range from a distance of 885 feet to 985 feet from the US 50 center median for the AADT and MADT traffic data, which is reasonably consistent with the future traffic noise contours presented in the General Plan.

### 4 Project Analysis

The project would strip the existing finish coating from the existing reservoir tanks, perform an inspection, and repair any maintenance issues that are present prior to application of new coating. The recoating process would require the use of air compressors, media blasters, generators, hand tools, trucks and material handling equipment. The interior of the reservoirs will be accessed by cutting a 20-foot by 20-foot opening into the side of the tank; which will be welded back in place upon completion of the project.

The project timeline is currently estimated to occur over a two-year period beginning in 2020, with each project task occurring over a 4-month period during the summer and winter periods. The project is anticipated to be active up to nine hours per day during daytime hours, 5-days per week (Monday through Friday).

#### 4.1 Source Noise Characterization

In order to quantify the sound pressure levels (SPLs) generated from the proposed operations, Dudek performed sound pressure measurements of media blasting that was being performed by an EID contractor at a different location. Dudek performed the monitoring survey on December 12<sup>th</sup>, 2019 to document source levels generated by activities and equipment that would be employed for the project. During the monitoring period, detailed observations and measurements were cataloged for the media blasting, air compressor, generator, dehumidifier and pressure pot/media tank. Monitoring data is presented in presented in Table 2.

During the monitoring period media blasting was being performed on the interior of the reservoir/tank. Discussions of the operations with the contractor indicate that the sound pressure levels generated by media blasting on the interior of the reservoir/tank are similar to those produced while blasting the exterior of the tank. This is largely due to the dust and debris containment tents/shrouds that are used while blasting is occurring on the exterior of the reservoirs. At the end of the measurement period the pressure pot/media tank release valve was triggered, initiating a "blow-off." Discussions with the contractor indicated that a blow-off is conducted at the end of each operational period or at the end of each working period (i.e., for lunch break and end of shifts).

Table 2
Noise Measurement Summary, December 12, 2019

	Measurement		Approx. Distance	Sound Pressu	re Levels, dBA
No.	Description	Time	to Source	Leq	Lmax
1	Ingersoll Rand HP 915 Air Compressor	11:05 AM	20 feet	73.9	75.9
2	Media Blasting	11:27 AM	10 feet	73.7	76.1
3	Arid-Dry MS-7500 Dehumidifier	11:35 AM	10 feet	77.2	79.8
4	"Blow Off" release from pressure pot/media tank	11:45 AM	20 feet	75.7	82.7

Notes: dBA - A-Weighted decibel; Leq - Hourly average equivalent level; Lmax - Maximum noise level.

EID has also provided specifications on an air compressor and generator that typically is used on previous media blasting and recoating projects. The generator is a MQ Power WhisperWatt 125, the manufacturer specifications state that the generator has a sound level of 65 dBA at 23 feet, when driven at full load. The air compressor is a Sullair 900 iT4 with a manufacturer stated sound level of 72 dBA at a distance of 7 meters (23 feet).

#### 4.2 Discussion

The project would be performed in stages for both the interior and the exterior of the reservoirs, such as media blasting, repair, surface preparation, and recoating. Each of the project stages would involve small variations in the equipment employed. The most significant noise sources associated with the project are anticipated to be the media blasting and metal repair work that may be necessary. Media blasting is assumed to include noise sources such as an air compressor, a generator, a pressure pot, a dehumidifier, a forklift for material handling, and the noise from the blasting media impacting the reservoir surfaces. Sound pressure levels for the media blasting operations, based on the levels cataloged during the measurement survey and normalized to a 50-foot reference distance, are presented in Table 3. As shown, SPLs associated with equipment assumed to be used during the media blasting operations ranges from 58 to 74 dBA Leq and 61 to 83 dBA Lmax at a reference distance of 50 feet. If all noise sources associated with the operation are assumed to be operational at a given time, the media blasting operations would result in a combined SPL of approximately 78 dBA Leq, with a maximum noise level of 83 dBA at 50 feet.

Table 3
Project Noise Source Levels – Media Blasting

	Source	Sound Pressure Levels at 50-feet, dBA		
No.	Description	Leq	Lmax	
1	Air Compressor	74	76	
2	Generator	58	61	
3	Dehumidifier	63	66	
4	"Blow Off" release from pressure pot/media tank	68	75	
5	Media Blasting	60	62	
6	Material Handling (Gradall)	73	83	
	Total combined media blasting noise	78	83	

Notes: dBA – A-Weighted decibel; Leq – Hourly average equivalent level; Lmax – Maximum noise level.

Metal repair work is assumed to include cutting, welding, and grinding metalwork. Sound pressure levels for metal repair work is presented in Table 3. Sound pressure levels for the air compressor are based on the noise measurement survey, the generator SPLs are based on the supplied manufacturer reference level, SPLs for welding, grinding and cutting are based on empirical reference data (BBN 1982). As shown, SPLs associated with equipment assumed to be used during the metal repair operations ranges from 58 to 80 dBA Leq and 61 to 80 dBA Lmax at a reference distance of 50 feet. If all noise sources associated with the operation are assumed to be operational at a given time, the metal repair operations would result in a combined SPL of approximately 80 dBA Leq, with a maximum noise level of 80 dBA at 50 feet.

Table 4
Project Noise Source Levels – Metal Repair Work

	Source	Sound Pressure Levels at 50-feet, dBA		
No.	Description	Leq	Lmax	
1	Air Compressor	74	76	
2	Generator	58	61	
3	Welder	73	73	
4	Metal Grinding/Cutting	80	80	
	Total combined media blasting noise	82	80	

Notes: dBA - A-Weighted decibel; Leq - Hourly average equivalent level; Lmax - Maximum noise level.

To assess noise levels associated with the various equipment types and operations, construction equipment can be considered to operate in two modes, mobile and stationary. Mobile equipment sources move around a construction site performing tasks in a recurring manner (e.g., loaders, graders, dozers). Stationary equipment operates in a given location for an extended period of time to perform continuous or periodic operations. Thus, it is necessary to determine the location of stationary sources during specific phases, and the effective acoustical center of operations for mobile equipment during various phases of the construction process. The effective acoustical center is the idealized point from which the energy sum (combination) of all construction activity noise near and far would appear to originate. For this project all of the associated equipment assumed to be in use are considered stationary noise sources which may be located at any point around the project site depending on the current project stage. As such, the effective acoustical center from which the project noise was assumed to be the geometric center of the project site.

Based on the distance from the acoustical center to the nearest noise-sensitive receptor the sound levels generated by the project will attenuate (lessen) over distance. Typical sound attenuation rate for localized point sources (e.g., heavy construction equipment, mobile-source construction noise, stationary-source construction noise) is 6 dB per doubling of distance (DD) between the noise source and the receptor.

The nearest noise-sensitive receptor in the project vicinity would be the Camino School. According to maps obtained from El Dorado County Surveyor/GIS website, provided in Appendix C, the project site, school, and surrounding area are outside of the community area/rural central boundaries. As such, the El Dorado County non-transportation noise standards are applied 100 feet from the residence/noise-sensitive structure. The Camino school structure that is nearest the project site is located approximately 1,020 feet east of the northern-most reservoir, making the non-transportation noise standards applicable at a distance of approximately 920 feet. Applying the 6 dB/DD attenuation rate, project noise levels generated by the media blasting operations would be approximately 52 dBA Leq and 57 dBA Lmax. Project noise levels generated by the metal repair work would attenuate to approximately 56 dBA Leq and 55 dBA Lmax. Therefore, additional mitigation measures would be necessary to comply with the El Dorado County non-transportation noise standards if construction operations are performed outside of the exempted timeframe (7 AM to 7 PM Monday through Friday, and 8 AM to 5 PM on weekends and holidays).

The following measures shall be implemented as part of construction activities associated with the project in order to reduce the effects of noise levels generated from construction operations.

- Construction operations and related activities shall comply with the operational hour limitations for construction as outlined in the El Dorado County General Plan. Construction shall be limited to the weekday hours of 7:00 AM to 7:00 PM and the weekend or holiday hours of 8:00 AM to 5:00 PM. If construction activities are to be conducted outside of the exempted construction operational hours, the additional mitigation measures provided below shall be implemented.
- Construction equipment and vehicles shall be fitted with efficient, well-maintained mufflers that reduce
  equipment noise emission levels at the project site. Internal combustion powered equipment shall be
  equipped with properly operating noise suppression devices (e.g., mufflers, silencers, wraps) that meet
  or exceed the manufacturer's specifications. Mufflers and noise suppressors shall be properly
  maintained and tuned to ensure proper fit, function and minimization of noise.
- Pumps that are not submerged and above-ground conveyor systems shall be located such that the line
  of sight between the noise generating equipment and nearby noise-sensitive receptors is completely
  obscured or located within acoustically treated enclosures.
- Portable and stationary site support equipment (such as generators, compressors, etc.) shall be located
  as far as possible from nearby noise-sensitive receptors in the line of sight between the noise
  generating sources and noise-sensitive receptors shall be limited as much as possible. Such as locating
  noise generating equipment on the opposite side of the reservoir from the noise-sensitive receptors.
- Impact tools shall have the working area/impact area shrouded or shielded, with intake and exhaust
  ports on power equipment muffled or suppressed. This may necessitate the use of temporary or
  portable, application specific noise shields or barriers.
- Construction equipment shall not be idled for extended periods (e.g., 5 minutes or longer) of time in the immediate vicinity of noise-sensitive receptors.

Application of the noise control techniques affecting and controlling the construction noise at the source (i.e., heavy equipment, pumps) set forth in the above mitigation measures can obtain reductions of 3 to 6 dBA; noise control techniques implemented along the path of the noise (i.e., temporary noise barriers, enclosures, relocation of equipment) has been shown to reduce construction noise levels between 2 to 7 dBA (Wu & Keller 2007). The overall noise level reduction achieved through implementation of these mitigation measures is expected to range from 5 to 13 dBA. Through the application of the above outlined measures and effective management of project noise levels the proposed project would comply with the El Dorado County non-transportation noise level standards.

### 5 Conclusion

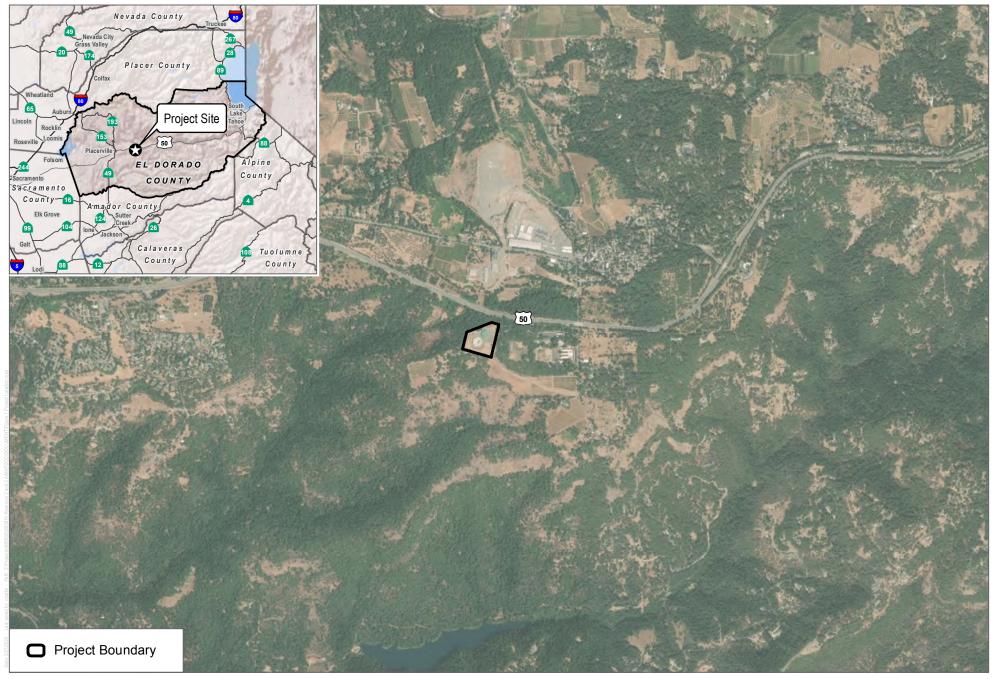

EID is proposing to recoat existing reservoir tanks located near the community of Camino in El Dorado County, California. The project would strip the existing finish coating from the existing reservoir tanks, prepare the surface, and apply a new coating. Dudek performed an acoustical analysis to address concerns with the proposed project's effect on the existing noise environment and surrounding noise-sensitive receptors.

As part of the analysis, Dudek conducted a noise monitoring survey to quantify source noise levels from recoating operations being performed by an EID contractor at a different location. The media blasting operations and associated equipment that were documented as part of the noise monitoring survey had sound pressure levels

ranging from approximately 63 to 74 dBA Leq at a reference distance of 50-feet. Additional noise source reference data was provided by EID for an air compressor and generator that are often employed during recoating operations. Empirical noise level data for metal repair work was sourced from published reference materials (BBN 1982).

The El Dorado County General Plan and Code of Ordinances provides exemptions for construction operations performed between 7 AM and 7 PM, Monday through Friday and between 9 AM and 5 PM on weekends and holidays. Additionally the other El Dorado County Zoning Code provides an exemption for noise sources associated with maintenance or modification of utility facilities. However, if it is determined that the exemptions are not applicable to the project and the project activities are taking place outside of the construction operation hours established by El Dorado County, the project would be required to comply with the El Dorado County non-transportation noise level standards, presented in Table 1.

Dudek performed an analysis of the potential noise sources associated with the project, based on noise measurement survey and reference noise level data. With the nearest noise-sensitive receptor being the western-most building of the Camino School, the project operations would be approximately 920 feet from the point where the El Dorado County criteria is applicable. Assuming a six dBA attenuation rate per doubling of distance, project noise levels generated by the media blasting operations would be approximately 52 dBA Leq and 57 dBA Lmax. Project noise levels generated by the metal repair work would attenuate to approximately 56 dBA Leq and 55 dBA Lmax. Therefore, additional mitigation measures would be necessary to comply with the El Dorado County non-transportation noise standards if construction operations were performed outside of the exempted timeframe (7 AM to 7 PM M-F, and 8 AM to 5 PM on weekends and holidays). Through the application of the outlined measures and effective management of project noise levels the proposed project would comply with the El Dorado County non-transportation noise level standards.

Acoustic Fundamental and Terminology

#### **Acoustic Fundamentals**

Acoustics is the scientific study that evaluates perception, propagation, absorption, and reflection of sound waves. Sound is a mechanical form of radiant energy, transmitted by a pressure wave through a solid, liquid, or gaseous medium. Sound that is loud, disagreeable, unexpected, or unwanted is generally defined as noise; consequently, the perception of sound is subjective in nature, and can vary substantially from person to person. Common sources of environmental noise and relative noise levels are shown in Figure A-1.

A sound wave is initiated in a medium by a vibrating object (e.g., vocal chords, the string of a guitar, the diaphragm of a radio speaker). The wave consists of minute variations in pressure, oscillating above and below the ambient atmospheric pressure. The number of pressure variation cycles occurring per second is referred to as the frequency of the sound wave and is expressed in hertz (Hz), which is equivalent to one complete cycle per second.

Directly measuring sound pressure fluctuations would require the use of a very large and cumbersome range of numbers. To avoid this and have a more useable numbering system, the decibel (dB) scale was introduced. Sound level expressed in decibels (dB) is the logarithmic ratio of two like pressure quantities, with one pressure quantity being a reference sound pressure and the second pressure being that of the sound source of concern. For sound pressure in air, the standard reference quantity is generally considered to be 20 micropascals, which directly corresponds to the threshold of human hearing. The use of the decibel is a convenient way to handle the million-fold range of sound pressures to which the human ear is sensitive. A decibel is logarithmic; it does not follow normal algebraic methods and cannot be directly added. For example, a 65 dB source of sound, such as a truck, when joined by another 65 dB source results in a sound amplitude of 68 dB, not 130 dB (i.e., doubling the source strength increases the sound pressure by 3 dB). A sound level increase of 10 dB corresponds to 10 times the acoustical energy, and an increase of 20 dB equates to a 100-fold increase in acoustical energy.

The loudness of sound perceived by the human ear depends primarily on the overall sound pressure level and frequency content of the sound source. The human ear is not equally sensitive to loudness at all frequencies in the audible spectrum. To better relate overall sound levels and loudness to human perception, frequency-dependent weighting networks were developed. The standard weighting networks are identified as A through E. There is a strong correlation between the way humans perceive sound and A-weighted sound levels (dBA). For this reason, the dBA can be used to predict community response to noise from the environment, including noise from transportation and stationary sources. Sound levels expressed as dB in this section are A-weighted sound levels, unless noted otherwise.

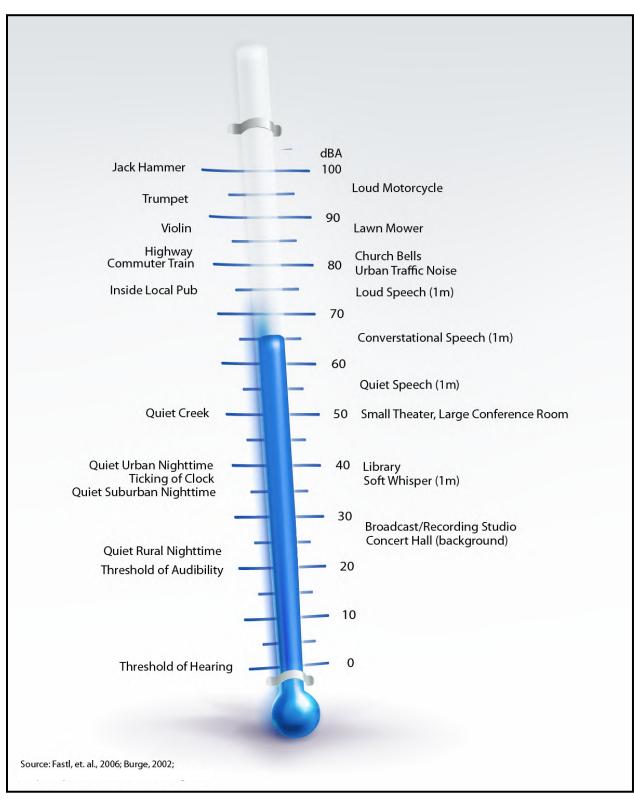

Figure A-1 -Common Noise Sources and Levels.

Noise can be generated by a number of sources, including mobile sources (transportation noise) such as automobiles, trucks, and airplanes and stationary sources (non-transportation noise) such as construction sites, machinery, and commercial and industrial operations. As acoustic energy spreads through the atmosphere from the source to the receiver, noise levels attenuate (decrease) depending on ground absorption characteristics, atmospheric conditions, and the presence of physical barriers (e.g., walls, building façades, berms). Noise generated from mobile sources generally attenuate at a rate of 3dBA (typical for hard surfaces, such as asphalt) to 4.5 dBA (typical for soft surfaces, such as grasslands) per doubling of distance, depending on the intervening ground type. Stationary noise sources spread with more spherical dispersion patterns that attenuate at a rate of 6 to 7.5 dBA per doubling of distance for hard and soft sites, respectively.

Atmospheric conditions such as wind speed, turbulence, temperature gradients, and humidity may additionally alter the propagation of noise and affect levels at a receiver. Furthermore, the presence of a large object (e.g., barrier, topographic features, and intervening building façades) between the source and the receptor can provide significant attenuation of noise levels at the receiver. The amount of noise level reduction or "shielding" provided by a barrier primarily depends on the size of the barrier, the location of the barrier in relation to the source and receivers, and the frequency spectra of the noise. Natural barriers such as berms, hills, or dense woods as well as man-made features such as buildings, berms and walls may be effective barriers for the reduction of source noise levels.

#### **Noise Level Descriptors**

The intensity of environmental noise levels can fluctuate greatly over time and as such, several different descriptors of time-averaged noise levels may be used to provide the most effective means of expressing the noise levels. The selection of a proper noise descriptor for a specific source depends on the spatial and temporal distribution, duration, and fluctuation of both the noise source and the environment near the receptor(s). Noise descriptors most often used to describe environmental noise are defined below.

*Lmin (Minimum Noise Level):* The minimum noise level during a specific period of time, while accounting for the appropriate weighting curve and response setting (i.e., A-weighted, slow).

Lmax (Maximum Noise Level): The maximum instantaneous noise level during a specific period of time, while accounting for the appropriate weighting curve and response setting (i.e., A-weighted, slow).

**SEL (Sound Exposure Level):** The cumulative exposure to sound energy over a stated period of time.

Ln (Statistical Descriptor): The noise level exceeded "n"% of a specific period of time. For example, L50 is the median noise level, or level exceeded 50% of the time (typically equated to the noise level exceeded 30-minutes out of the hour).

**Leq (Equivalent Noise Level):** The energy-average noise level or exposure, from all noise events that occur in a specified period; such as one-minute, one-hour, 24-hours, etc. Leq can be used to report results of short-term noise measurements, usually ranging between 15 minutes and 1 hour, to supplement longer term measurements.

Ldn (Day-Night Average Noise Level): The 24-hour Leq with a 10-dBA "penalty" for noise events that occur during the noise-sensitive hours between 10 p.m. and 7 a.m. In other words, 10 dBA is "added" to noise events that occur in the nighttime hours, and this generates a higher reported noise level when determining compliance with noise standards. The Ldn attempts to account for the fact that noise during this specific period of time is a potential source of disturbance with respect to normal sleeping hours.

**CNEL (Community Noise Equivalent Level):** The CNEL is similar to the Ldn described above, but with an additional 5-dBA "penalty" added to noise events that occur during the noise-sensitive hours between 7 p.m. and 10 p.m., which are typically reserved for relaxation, conversation, reading, and television. When the same 24-hour noise data are used, it is typical for the reported CNEL to be approximately 0.5 dBA higher than the Ldn.

Community noise is commonly described in terms of the ambient noise level which is defined as the allencompassing noise level associated with a given noise environment. A common statistical tool to measure the ambient noise level is the average, or equivalent sound level (Leq)which corresponds to the steadystate A-weighted sound level containing the same total energy as the time-varying signal over a given time period (usually one hour). The Leq is the foundation of the composite noise descriptors such as Ldn and CNEL, as defined above, and shows very good correlation with community response to noise. Use of these descriptors along with the maximum noise level occurring during a given time period provides a great deal of information about the ambient noise environment in an area.

#### **Effect of Noise on Humans**

Excessive and chronic exposure to elevated noise levels can result in auditory and non-auditory effects on humans. Auditory effects of noise on people are those related to temporary or permanent hearing loss caused by loud noises. Non-auditory effects of exposure to elevated noise levels are those related to behavioral and physiological effects. The non-auditory behavioral effects of noise on humans are associated primarily with the subjective effects of annoyance, nuisance and dissatisfaction, which lead to interference with activities such as communications, sleep and learning. The non-auditory physiological health effects of noise on humans have been the subject of considerable research attempting to discover correlations between exposure to elevated noise levels and health problems, such as hypertension and cardiovascular disease. The mass of research infers that noise-related health issues are predominantly the result of behavioral stressors and not a direct noise-induced response. The extent to which noise contributes to non-auditory health effects remains a subject of considerable research, with no definitive conclusions.

The degree to which noise results in annoyance and interference is highly subjective and may be influenced by several non-acoustic factors. The number and effect of these non-acoustic environmental and physical factors vary depending on individual characteristics of the noise environment such as sensitivity, level of activity, location, time of day, and length of exposure. One key aspect in the prediction of human response to new noise environments is the individual level of adaptation to an existing noise environment. The greater the change in the noise levels that are attributed to a new noise source, relative to the environment an individual has become accustomed to, the less tolerable the new noise source will be to an individual.

With respect to how humans perceive and react to changes in noise levels, a 1 dBA increase is generally imperceptible outside of a laboratory environment, a 3 dBA increase is barely perceptible, a 6 dBA increase is clearly noticeable, and a 10-dBA increase is subjectively perceived as approximately twice as loud (Egan 1988). These subjective reactions to changes in noise levels was developed on the basis of test subjects' reactions to changes in the levels of steady-state, pure tones or broad-band noise and to changes in levels of a given noise source. Perception and reaction to changes in noise levels in this manner is thought to be most applicable in the range of 50 to 70 dBA, as this is the usual range of voice and interior noise levels.

#### **Vibration Fundamentals**

Vibration is similar to noise in that it is a pressure wave traveling through an elastic medium involving a periodic oscillation relative to a reference point. Vibration is most commonly described in respect to the excitation of a structure or surface, such as in buildings or the ground. Human and structural response to different vibration levels is influenced by a number of factors, including ground type, distance between source and receptor, duration, and the number of perceived vibration events. Sources of vibration include natural phenomena (e.g., earthquakes, volcanic eruptions, sea waves, landslides) and those introduced by human activity (e.g., explosions, machinery, traffic, trains, construction equipment). Vibration sources may be continuous, (e.g., operating factory machinery) or transient in nature (e.g., explosions, impacts). Vibration levels can be depicted in terms of amplitude and frequency; relative to displacement, velocity, or acceleration.

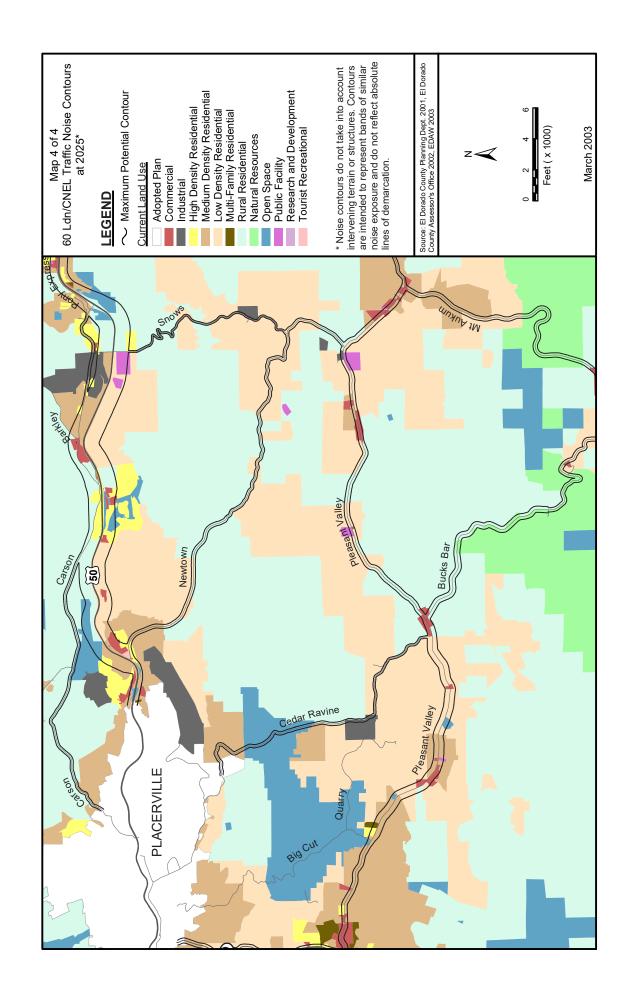

Vibration amplitudes are commonly expressed in peak particle velocity (PPV) or root-mean-square (RMS) vibration velocity. PPV is defined as the maximum instantaneous positive or negative peak of a vibration signal, or the quantity of displacement measured from peak to trough of the vibration wave. Root-mean-square is defined as the positive and negative statistical measure of the magnitude of a varying quantity. The RMS of a signal is the average of the squared amplitude of the signal, typically calculated over a period of one second. PPV is typically used in the monitoring of transient and impact vibration and has been found to correlate well to the stresses experienced by buildings (Federal Transit Administration [FTA] 2006, California Department of Transportation [Caltrans] 2004). PPV and RMS vibration velocity are nominally described in terms of inches per second (in/sec). However, as with airborne sound, vibration velocity can also be expressed using decibel notation as vibration decibels (VdB). The logarithmic nature of the decibel serves to compress the broad range of numbers required to describe vibration and allow for the presentation of vibration levels in familiar terms.

Although PPV is appropriate for evaluating the potential for building damage, it is not always suitable for evaluating human response. Human response to vibration has been found to correlate well to average vibration amplitude; therefore, vibration impacts on humans are evaluated in terms of RMS vibration velocity.

Typical outdoor sources of perceptible groundborne vibration include construction equipment, steel-wheeled trains, and traffic on rough roads. Although the effects of vibration may be imperceptible at low levels, effects may result in detectable vibrations and slight damage to nearby structures at moderate and high levels, respectively. At the elevated levels of vibration, damage to structures is primarily architectural (e.g., loosening and cracking of plaster or stucco coatings) and rarely results in damage to structural components. The range of vibration relevant to this analysis occurs from approximately 60 VdB, which is the typical background vibration-velocity level; to 100 VdB, which is the general threshold where minor damage can occur in fragile buildings (FTA 2006).
