Introduction

This preliminary hydrology analysis has been prepared for Hillwood Enterprises, L.P. The project is a new development of an industrial warehouse facility located on the east side of Almond Avenue between Arrow Route and Whitram Avenue in an unincorporated area of County of San Bernardino, California. The proposed building is approximately 185,600 square feet and on approximately 9.5 acres of mostly undeveloped land.

Purpose

The purpose of this report is to present the drainage concept for the project and to determine the design flow rates and storm drain sizes for the project site. The hydrology maps and calculations reflect the tributary areas and 100-year storm event runoff flows.

Existing Condition

The project site is rectangular-shaped and is mostly undeveloped. There is however a house at the northwest corner of the site. The project site generally slopes 1.4 % from the northeast property corner to the southwest corner of the property. The maximum site elevation, located at the northeast property corner, is $1187.1 \pm$ feet mean sea level (msl). The minimum site elevation located at the southeast right-of-way, is $1173.6 \pm$ feet msl. Runoff from the existing site flows from the northeast corner to the southwest corner and drains onto Almond Avenue. The adjacent properties to the north and east of the project drains on to the site.

Proposed Condition

During the proposed condition, the project area runoff will be directed to the on-site infiltration/detention basin located along the south property line. The basin will be sized to capture and retain the WQMP design capture volume as well as 100-year peak storm mitigation volume. Once the basin reaches capacity it will spill to Almond Avenue through a parkway drain. See Appendix A for proposed on-site hydrology map.

Site runoff from the northwest parking area and northwest building roof will be collected by catch basin No. 1. The collected runoff will then be conveyed through the proposed on-site storm drain Line A to the infiltration basin.

Site runoff from the northeast parking and northeast building roof will be collected by catch basin No. 2. The collected runoff will then be conveyed through the proposed on-site storm drain Line A to the infiltration basin.

Site runoff from the southeast truck court and southeast building roof will be collected by catch basin No. 3. The collected runoff will then be conveyed through the proposed on-site storm drain Line B to the infiltration basin.

Site runoff from the southwest truck court, southwest parking, and southwest building roof will drain to catch basin No. 4. The water will drain into storm drain Line C into the infiltration basin.

Off-site run-on from the property to the north of the project will be collected by a concrete U-channel located at the north property line and conveyed westerly to a parkway drain and discharged on to Almond Avenue.

Off-site run-on from the properties to the east of the project will be collected by a concrete U-channel located at the east property line. The flow will then be conveyed southerly along the east property line and then westerly along the south property line to a parkway drain and discharged on to Almond Avenue.

The overflow from the infiltration basin, in excess of the design capture volume of 35,308, will be allowed to overflow/discharge through proposed 4-foot parkway drain onto Almond Avenue.

Hydrologic Analysis

A hydrologic analysis was prepared using the methodology outlined in the San Bernardino County Flood Control District (SBCFCD) Hydrology Manual. A rational method analysis was completed for the proposed 100-year return event using Civild software.

Rainfall intensity rates were taken from the isohyetal maps in the County of San Bernardino Hydrology Manual. The hydrologic soils type for the site is "A" and was taken from the soil map in the Hydrology Manual (see Appendix E for reference maps). A "commercial" land use was used with an AMC of III. A unit area hydrograph analysis was completed for the 25-year and 100-year existing and proposed 100-year storm events using Civild software.

Peak Storm Mitigation

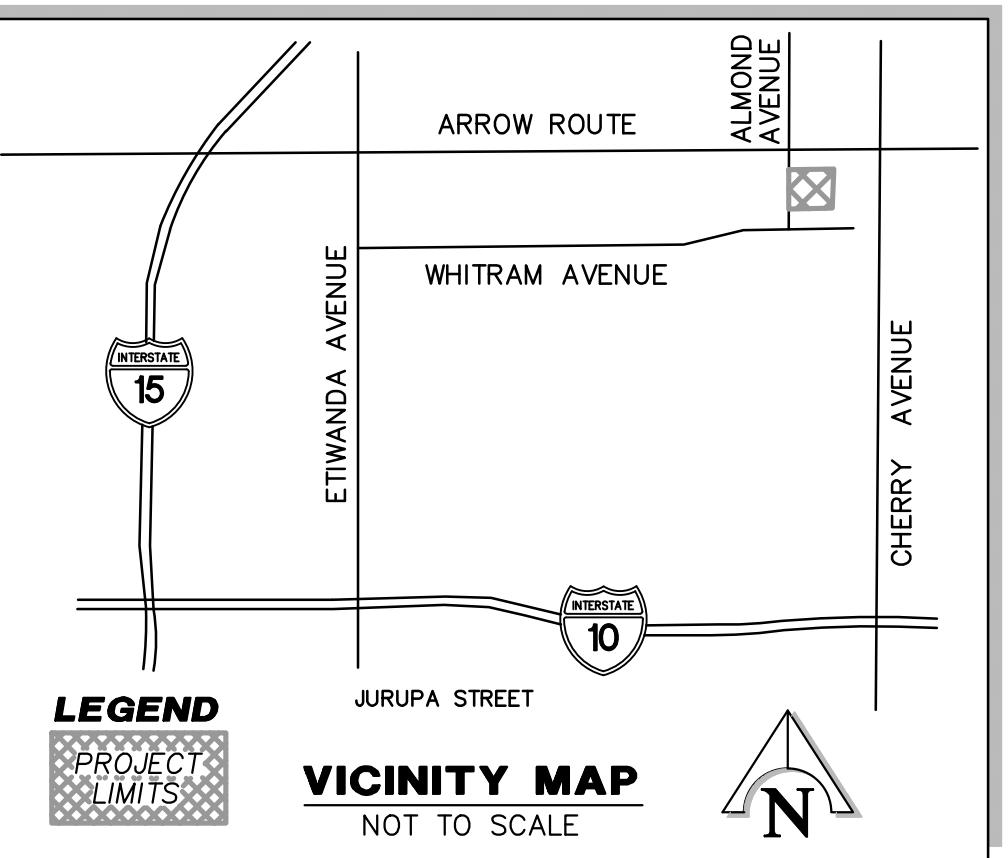

The proposed infiltration/detention basin has been designed to mitigate the peak flow increase to the downstream facilities from the proposed project. Once the infiltration basin reaches the basin outlet elevation of 1173.5, the basin will overflow through a 4-foot wide parkway drain on to Almond Avenue. The basin has been designed with two feet of gravel base with 40 percent voids to increase the capacity of the basin. The basin will store 0.81 acre-ft (35,308cf) of storm water and will reach elevation 1173.5 before any storm water is allowed to discharge from the project site. The excess capacity in the basin will be used for detention and peak storm mitigation. The basin routing calculations (in Appendix D) demonstrate that during a 100-year storm event the basin will discharge 8.2 cfs which is less than the historic existing 100-year 21.3 cfs and is also less than the existing 25-year 17.1 cfs.

Results

The results in this preliminary study demonstrate that the proposed basin has the capacity to serve as both, a water quality basin and a detention basin. All proposed drainage and storm drain facilities will be sized adequately for a 100-year storm event. Additional supporting calculations will be provided in the final drainage report including storm drain hydraulics, catch basin sizing and basin routing analysis for other storm events. The preliminary drainage design as proposed will fulfill project goals of capturing and conveying the onsite drainage. The peak discharge will be released at a controlled rate and will be less than the existing condition discharge rates.

DS

Storm Event Year = 100

Antecedent Moisture Condition = 3

English (in-lb) Input Units Used

English Rainfall Data (Inches) Input Values Used

English Units used in output format

Area averaged rainfall intensity isohyetal data:

Sub-Area (Ac.)	Duration (hours)	Isohyetal (In)
Rainfall data for year 100 9.50	1	1.40

Rainfall data for year 100
9.50 6 3.70

Rainfall data for year 100
9.50 24 8.10

+++++

***** Area-averaged max loss rate, Fm *****

SCS curve No.(AMCII)	SCS curve NO.(AMC 3)	Area (Ac.)	Area Fraction	Fp(Fig C6) (In/Hr)	Ap (dec.)	Fm (In/Hr)
67.0	84.6	9.50	1.000	0.290	0.100	0.029

Area-averaged adjusted loss rate Fm (In/Hr) = 0.029

***** Area-Averaged low loss rate fraction, Yb *****

Area	Area	SCS CN	SCS CN	S	Pervious
------	------	--------	--------	---	----------

(Ac.)	Fract	(AMC2)	(AMC3)	Yield	Fr
0.95	0.100	67.0	84.6	1.82	0.773
8.55	0.900	98.0	98.0	0.20	0.970

Area-averaged catchment yield fraction, Y = 0.951
 Area-averaged low loss fraction, Yb = 0.049
 User entry of time of concentration = 0.320 (hours)
 ++++++
 Watershed area = 9.50(Ac.)
 Catchment Lag time = 0.256 hours
 Unit interval = 5.000 minutes
 Unit interval percentage of lag time = 32.5826
 Hydrograph baseflow = 0.00(CFS)
 Average maximum watershed loss rate(Fm) = 0.029(In/Hr)
 Average low loss rate fraction (Yb) = 0.049 (decimal)
 VALLEY UNDEVELOPED S-Graph Selected
 Computed peak 5-minute rainfall = 0.518(In)
 Computed peak 30-minute rainfall = 1.061(In)
 Specified peak 1-hour rainfall = 1.400(In)
 Computed peak 3-hour rainfall = 2.541(In)
 Specified peak 6-hour rainfall = 3.700(In)
 Specified peak 24-hour rainfall = 8.100(In)

Rainfall depth area reduction factors:
 Using a total area of 9.50(Ac.) (Ref: fig. E-4)

5-minute factor = 1.000	Adjusted rainfall = 0.518(In)
30-minute factor = 1.000	Adjusted rainfall = 1.061(In)
1-hour factor = 1.000	Adjusted rainfall = 1.399(In)
3-hour factor = 1.000	Adjusted rainfall = 2.540(In)
6-hour factor = 1.000	Adjusted rainfall = 3.700(In)
24-hour factor = 1.000	Adjusted rainfall = 8.100(In)

DS

Storm Event Year = 100

Antecedent Moisture Condition = 3

English (in-lb) Input Units Used

English Rainfall Data (Inches) Input Values Used

English Units used in output format

Area averaged rainfall intensity isohyetal data:

Sub-Area (Ac.)	Duration (hours)	Isohyetal (In)
Rainfall data for year 100 9.50	1	1.40

Rainfall data for year 100 9.50	6	3.70
------------------------------------	---	------

Rainfall data for year 100 9.50	24	8.10
------------------------------------	----	------

+++++-----

***** Area-averaged max loss rate, Fm *****

SCS curve No.(AMCII)	SCS curve NO.(AMC 3)	Area (Ac.)	Area Fraction	Fp(Fig C6) (In/Hr)	Ap (dec.)	Fm (In/Hr)
67.0	84.6	9.50	1.000	0.290	0.100	0.029

Area-averaged adjusted loss rate Fm (In/Hr) = 0.029

***** Area-Averaged low loss rate fraction, Yb *****

Area	Area	SCS CN	SCS CN	S	Pervious
------	------	--------	--------	---	----------

(Ac.)	Fract	(AMC2)	(AMC3)	Yield	Fr
0.95	0.100	67.0	84.6	1.82	0.773
8.55	0.900	98.0	98.0	0.20	0.970

Area-averaged catchment yield fraction, Y = 0.951
 Area-averaged low loss fraction, Yb = 0.049
 User entry of time of concentration = 0.312 (hours)
 ++++++
 Watershed area = 9.50(Ac.)
 Catchment Lag time = 0.250 hours
 Unit interval = 5.000 minutes
 Unit interval percentage of lag time = 33.3868
 Hydrograph baseflow = 0.00(CFS)
 Average maximum watershed loss rate(Fm) = 0.029(In/Hr)
 Average low loss rate fraction (Yb) = 0.049 (decimal)
 VALLEY UNDEVELOPED S-Graph Selected
 Computed peak 5-minute rainfall = 0.518(In)
 Computed peak 30-minute rainfall = 1.061(In)
 Specified peak 1-hour rainfall = 1.400(In)
 Computed peak 3-hour rainfall = 2.541(In)
 Specified peak 6-hour rainfall = 3.700(In)
 Specified peak 24-hour rainfall = 8.100(In)

Rainfall depth area reduction factors:
 Using a total area of 9.50(Ac.) (Ref: fig. E-4)

5-minute factor = 1.000	Adjusted rainfall = 0.518(In)
30-minute factor = 1.000	Adjusted rainfall = 1.061(In)
1-hour factor = 1.000	Adjusted rainfall = 1.399(In)
3-hour factor = 1.000	Adjusted rainfall = 2.540(In)
6-hour factor = 1.000	Adjusted rainfall = 3.700(In)
24-hour factor = 1.000	Adjusted rainfall = 8.100(In)

*Using an orifice eqn for a 4' x 0.33' parkway drain

$$\text{Orifice Control Equation} = CA^*(2gh)^{1/2}$$

C = 0.6

Water is NOT released through the 4' parkway drain until 1173.5
Basin Routing Summary Table
100 YEAR STORM 24 Hour
Max. Q Out (CFS) 8.2
Max. Ponding 5.35
WSE 1174.85

Peak discharge of 8.2 CFS which is smaller than existing Q100 21.3 CFS.

Also less than the existing Q25 of 17.1 cfs

4-FT PARKWAY DRAIN CAPACITY
