1. Introduction

This report presents the results of a local transportation analysis (LTA) conducted for the proposed industrial development (Project) at 1000 Gibraltar Drive in Milpitas, California. The purpose of the LTA is to identify potential adverse effects of the proposed Project on the surrounding transportation system. Adverse effects were evaluated following guidelines from the Santa Clara Valley Transportation Authority (VTA), the congestion management agency for Santa Clara County, as well as direction from City staff. The LTA report is prepared to address specific circulation metrics as part of the City's development application purposes and is not prepared for CEQA purposes.

The LTA presents "traditional" intersection level of service analysis at the site access driveways and at key intersections which will serve project traffic, as requested by City staff, as well as CMP intersections per VTA requirements. The LTA also includes an evaluation of bicycle and pedestrian conditions at and near the Project site, effects of Project traffic on transit travel times, and an evaluation of on-site circulation.

Project Description

The Project site is located within the south-central portion of the City of Milpitas and is surrounded by light industrial and commercial uses. The site is bounded by South Milpitas Boulevard to the east, Gibraltar Drive to the south and west, and by an existing multi-tenant office building to the north, as shown in the site plan on **Figure 1**. The proposed Project will demolish all existing on-site buildings, parking lots, and associated improvements and construct a new 491,040 square feet (SF) industrial building with two supporting offices at the northwest and southeast corners as well as surface parking on all sides of the building. There are five access points to the Project site. One signalized intersection at South Milpitas Boulevard/Ames Avenue and one driveway on South Milpitas Boulevard north of Ames Avenue will provide access on the east side of the site. Three driveways along Gibraltar Drive will provide access to the west and south sides of the site. The Project may serve a variety of potential industrial uses, but the expected use is a logistics/fulfillment center.

1.1 Relevant Regulatory Agencies and Plans

This section describes the relevant transportation regulatory agencies for the purposes of this LTA. This includes regional and local agencies and their programs and plans relevant to the Project.

1.1.1 Regional Plans

The City of Milpitas is part of Santa Clara County and the greater Bay Area. The following plans provide policy guidelines affecting land use and transportation planning decisions within the Bay Area relevant to the City of Milpitas:

Site Plan Source: WRA Environmental Consultants, 4/2/20

Figure 1

Project Site Plan

1.1.1.1 Plan Bay Area 2040

Plan Bay Area is overseen by MTC and ABAG. It serves as the region's Sustainable Community Strategy (SCS) pursuant to SB 375 and the 2040 RTP (preceded by Transportation 2035), integrating transportation and land use strategies to manage greenhouse gas emissions and plan for future population growth. The RTP and SCS include policies that call for shifting more travel demand to transit and accommodating growth along transit corridors in "Priority Development Areas (PDAs)." In July 2013, Plan Bay Area was adopted by ABAG and the MTC. The update to Plan Bay Area, known as Plan Bay Area 2040, was subsequently developed by MTC and adopted in July 2017.

Major transit projects included in Plan Bay Area 2040 include a BART extension to San José/Santa Clara, Caltrain electrification, enhanced service along the Amtrak Capitol Corridor, and improvements to local and express bus services.

1.1.1.2 Valley Transportation Authority Congestion Management Program (CMP)

As the Congestion Management Agency for Santa Clara County, VTA is responsible for maintaining the county's Congestion Management Program (CMP). The intent is to develop a comprehensive transportation improvement program among local jurisdictions that will reduce traffic congestion and improve land use decision-making and air quality. The CMP includes chapters with respective policies regarding the Technical Guidelines, Complete Streets Program, Bicycle Program, and Pedestrian Program.

1.1.1.3 Valley Transportation Plan (VTP) 2040

As the Congestion Management Agency for Santa Clara County, VTA is responsible for the development of a long-range countywide transportation plan, called Valley Transportation Plan (VTP) 2040. VTP 2040 provides programs, projects, and policies for roadways, transit, Intelligent Transportation Systems (ITS) and Systems Operations Management, bicycle facilities, pedestrian facilities, and the integration of land use and transportation. VTP 2040 projects serve as VTA's recommendations for the RTP known as Plan Bay Area. VTP 2040 was adopted by the VTA Board of Directors in September of 2014.

1.1.2 Relevant City Plans

The City of Milpitas has jurisdiction over the local transportation network including City streets and City-operated traffic signals, as well as over land use and zoning policies. The City of Milpitas also has adopted several plans that provide guidance for managing the City's transportation system. The following describes plans related to the Project:

1.1.2.1 City of Milpitas General Plan

The City's General Plan (*City of Milpitas General Plan*) identifies a long-term vision for the City, including goals, policies, and strategies. The Circulation Element of the General Plan aims to create accessible multimodal transportation network that meets the needs of all residents, workers, and visitors; to implement transportation demand management measures that increase transit use and other non-motorized travel modes; to promote active transportation; and to comply with other City and regional

plans. The General Plan includes guiding principles and implementing policies to ensure that the overall goals are achievable.

The last comprehensive update to the General Plan was in 1994, and a new update process is currently underway.

1.1.2.2 Milpitas Transit Area Specific Plan

The *Milpitas Transit Area Specific Plan* was adopted in June 2008 and amended in December 2011. It plans for the redevelopment of an approximately 437-acre area in the southern portion of the City. The preferred plan currently proposes redevelopment of this area with 7,109 dwelling units, 993,843 square feet of office space, 340 hotel rooms, and 287,075 square feet of retail spaced centered around the Milpitas BART station and the VTA Light Rail System. The Specific Plan creates a structure for a walkable, transit-oriented area with a mix of land uses to encourage physical and transit transportation and minimize vehicle trips. Design guidelines, land use designations, and transportation goals are defined in this document. The Project site is not within the Specific Plan area, but some study intersections are within the Specific Plan area. Therefore, the level of service goals in the Specific Plan are applied to this study analysis.

1.1.2.3 City of Milpitas Bikeway Master Plan

The *City of Milpitas Bikeway Master Plan* was adopted on December 8, 2003 and updated in 2009. A new update is currently in progress. The Bikeway Master Plan aims to strengthen the City's bicycle transportation system as it relates to alternative transportation modes. The Bikeway Master Plan includes the City's existing bicycle inventory, proposed bicycle improvements and plans, guiding principles, and implementing policies.

1.2 Report Organization

The following chapters are included in this report to meet City requirements for evaluating transportation impacts of the Project:

Chapter 1. Introduction includes the Project description, the relevant regulatory agencies and plans, and an overview of the report.

Chapter 2. Analysis Methodology outlines the scope of the study and analysis methods, including a description of the analysis scenarios included in the report.

Chapter 3. Existing Conditions describes the transportation system near the Project site including the surrounding roadway network, existing transit, bicycle, and pedestrian facilities, morning and evening peak period intersection turning movement volumes, and intersection levels of service.

Chapter 4. Project Characteristics presents the Project trip generation estimates, distribution, and assignment.

Chapter 5. Existing with Project Conditions presents the intersection operations analysis with the addition of Project traffic to existing (2020) traffic volumes.

Chapter 6. Near-Term Conditions presents traffic volumes and intersection operations in approximately 2022, when the Project is expected to be constructed and operational. Near-term without Project and Near-term with Project conditions are presented.

Chapter 7. Cumulative Conditions presents traffic volumes and intersection operations in 2040, including regional and local traffic growth as reflected in the VTA Countywide Travel Demand Model. Cumulative without Project and Cumulative with Project conditions are presented.

Chapter 8. Transit Access and Vehicle Delay Analysis presents an evaluation of the Project's access to transit and the effect of Project traffic volumes on bus transit travel times, for routes affected by Project traffic.

Chapter 9. Bicycle Circulation Evaluation presents a description of the conditions for bicyclists and pedestrians along the Project frontages and connecting to key off-site destinations, such as the Milpitas BART station.

Chapter 10. Pedestrian Circulation Evaluation

Chapter 11. Queueing Analysis presents an assessment of vehicle queue lengths as compared to available storage at dedicated turn lanes where the Project adds ten or more trips.

Chapter 12. Parking Evaluation presents an evaluation of the Project's vehicle parking supply and comparison to City of Milpitas Municipal Code requirements.

Chapter 13. Site Circulation presents an evaluation of the internal Project circulation for autos/vans, trucks, bicyclists, and pedestrians.

Chapter 14. Conclusions summarizes the findings and recommendations of the above analyses and evaluations.

2. Analysis Methodology

The City of Milpitas adheres to the guidelines set forth in the Santa Clara Valley Transportation Authority (VTA) *Transportation Impact Analysis (TIA) Guidelines* in addition to the City's practices. This chapter includes a summary of technical assumptions that form the basis of the LTA.

2.1 Analysis Scenarios

Intersection traffic operations will be evaluated during the AM and PM weekday peak hours for the scenarios listed in **Table 1**.

Table 1: Analysis Scenarios

Scenario	Description
Scenario 1: Existing Conditions	Existing volumes obtained from traffic counts collected in September 2016 for the City of Milpitas General Plan Existing Conditions Report and from PM peak hour counts in the 2018 CMP Monitoring Report, updated to reflect 2020 (pre-COVID) conditions. Where recent count data is not available, StreetLight data was used to estimate pre-COVID peak hour intersection volumes. The new Milpitas BART station trips were not reflected in previous count data or StreetLight data, so manual assignment of BART station trip generation estimates was added to the roadway network.
Scenario 2: Existing with Project Conditions	Volumes from Scenario 1 with Project traffic.
Scenario 3: Near-Term Conditions	Volumes estimated for year 2022, using a straight-line growth assumption between the 2020 volumes in Scenario 1 and the 2040 volumes in Scenario 5.
Scenario 4: Near-Term with Project Conditions	Volumes from Scenario 3 with Project traffic.
Scenario 5: Cumulative Conditions	Volumes from Scenario 1 plus traffic growth to the year 2040, developed using the VTA Travel Demand Model. Note that the 2040 model includes the VTA's planned widening of Montague Expressway from 6 lanes to 8 lanes between I-880 and Great Mall Parkway/East Capitol Avenue. The widening in the eastbound direction extends the full length of this section, while the widening in the westbound direction ends at Oakland Road/South Main Street.
Scenario 6: Cumulative with Project Conditions	Volumes from Scenario 5 with Project traffic.

Source: Fehr & Peers, October 2020.

2.2 Existing Intersection Vehicle Volumes

As noted above, the existing intersection vehicle volumes were based on the September 2016 counts conducted for the City of Milpitas General Plan Existing Conditions Report (ECR), factored up to represent 2020 (pre-COVID) conditions. An annual global growth factor of 2.5% (1% on constrained turning movements) was developed using 2016 ECR and 2018 CMP count data. This global growth factor was applied to intersections with available 2016 ECR count data. At the study intersections where count data was not available, Fehr & Peers used StreetLight data and volume balancing between intersections with available data to estimate 2020 (pre-COVID) AM and PM peak hour turn movements.

The Milpitas BART station began operation on June 13, 2020. Because the StreetLight data and previous count data did not capture any Milpitas BART trips, Fehr & Peers developed BART station trip generation estimates using the ITE Trip Generation Manual (Land Use Code 90 – Park-and-Ride Lot), based on the station's 1,631 parking spaces. The estimated BART station trips were assigned proportionally to the roadway network based on existing directional roadway segment volume distribution.

Following standard practice for transportation analysis in Santa Clara County, 2018 CMP PM peak hour count data was used for the CMP intersections, with exceptions for intersections with existing lane geometries that do not match the CMP Traffix database or where BART trips were manually added.

2.3 Study Intersections and Freeway Segments

The estimated Project-generated trips were assigned to the roadway network based on the distribution above. Study intersections were selected based on City staff direction and the criteria in the VTA TIA Guidelines. As described below, no freeway segments met the criteria for inclusion in the analysis.

2.3.1 Intersections

The VTA guidelines indicate Congestion Management Program (CMP) intersections shall be included in the study if any one of the following conditions apply:

- The proposed Project is expected to add 10 or more peak hour vehicles per lane to any intersection movement
- The intersection is adjacent to the Project
- Lead agency staff determines that the intersection should be included in the analysis

Based on the above criteria, the following intersections and driveways were selected for analysis. 'City' indicates the City requested the intersection to be studied, and 'CMP' indicates the intersection meets the 10 trips per lane test per the VTA Guidelines. The five Project driveway intersections are indicated by the label 'Project Intersection'. The intersections are also shown on **Figure 2**.

1. I-880 Southbound Ramp & Calaveras Boulevard (City)
2. I-880 Northbound Ramp & Calaveras Boulevard (City)
3. Abel Street & Calaveras Boulevard (City and CMP)

4. Milpitas Boulevard & Calaveras Boulevard (City and CMP)
5. Calaveras Boulevard & Hillview Drive (City)
6. South Milpitas Boulevard & Yosemite Drive (City)
7. South Milpitas Boulevard & Ames Avenue/South Project Driveway (Project intersection)
8. Main Street/Oakland Road & Montague Expressway (CMP)
9. McCandless Drive/Trade Zone Boulevard & Montague Expressway (CMP)
10. Great Mall Parkway/Capitol Avenue & Montague Expressway (CMP)
11. South Milpitas Boulevard & Montague Expressway (City and CMP)
12. South Milpitas Boulevard & North Project Driveway (Project Intersection)
13. Gibraltar Drive & West Project Driveway (Project Intersection)
14. Gibraltar Drive & Southwest Project Driveway (Project Intersection)
15. Gibraltar Drive & South Project Driveway (Project Intersection)

2.3.2 Freeway Segments

VTA guidelines indicate freeway segments shall be included in the study if any one of the following conditions apply:

- The proposed Project is expected to add traffic equal to or greater than one percent of the freeway segment's capacity
- The proposed Project is adjacent to one of the freeway segment's access or egress points
- Lead agency staff determines that the freeway segment should be included in the analysis

The freeway segment trip assignment and criteria testing are shown in **Table 2**. Based on the above criteria, local area freeway segments will not be adversely affected by Project traffic, and therefore no further freeway analysis is included in this report.

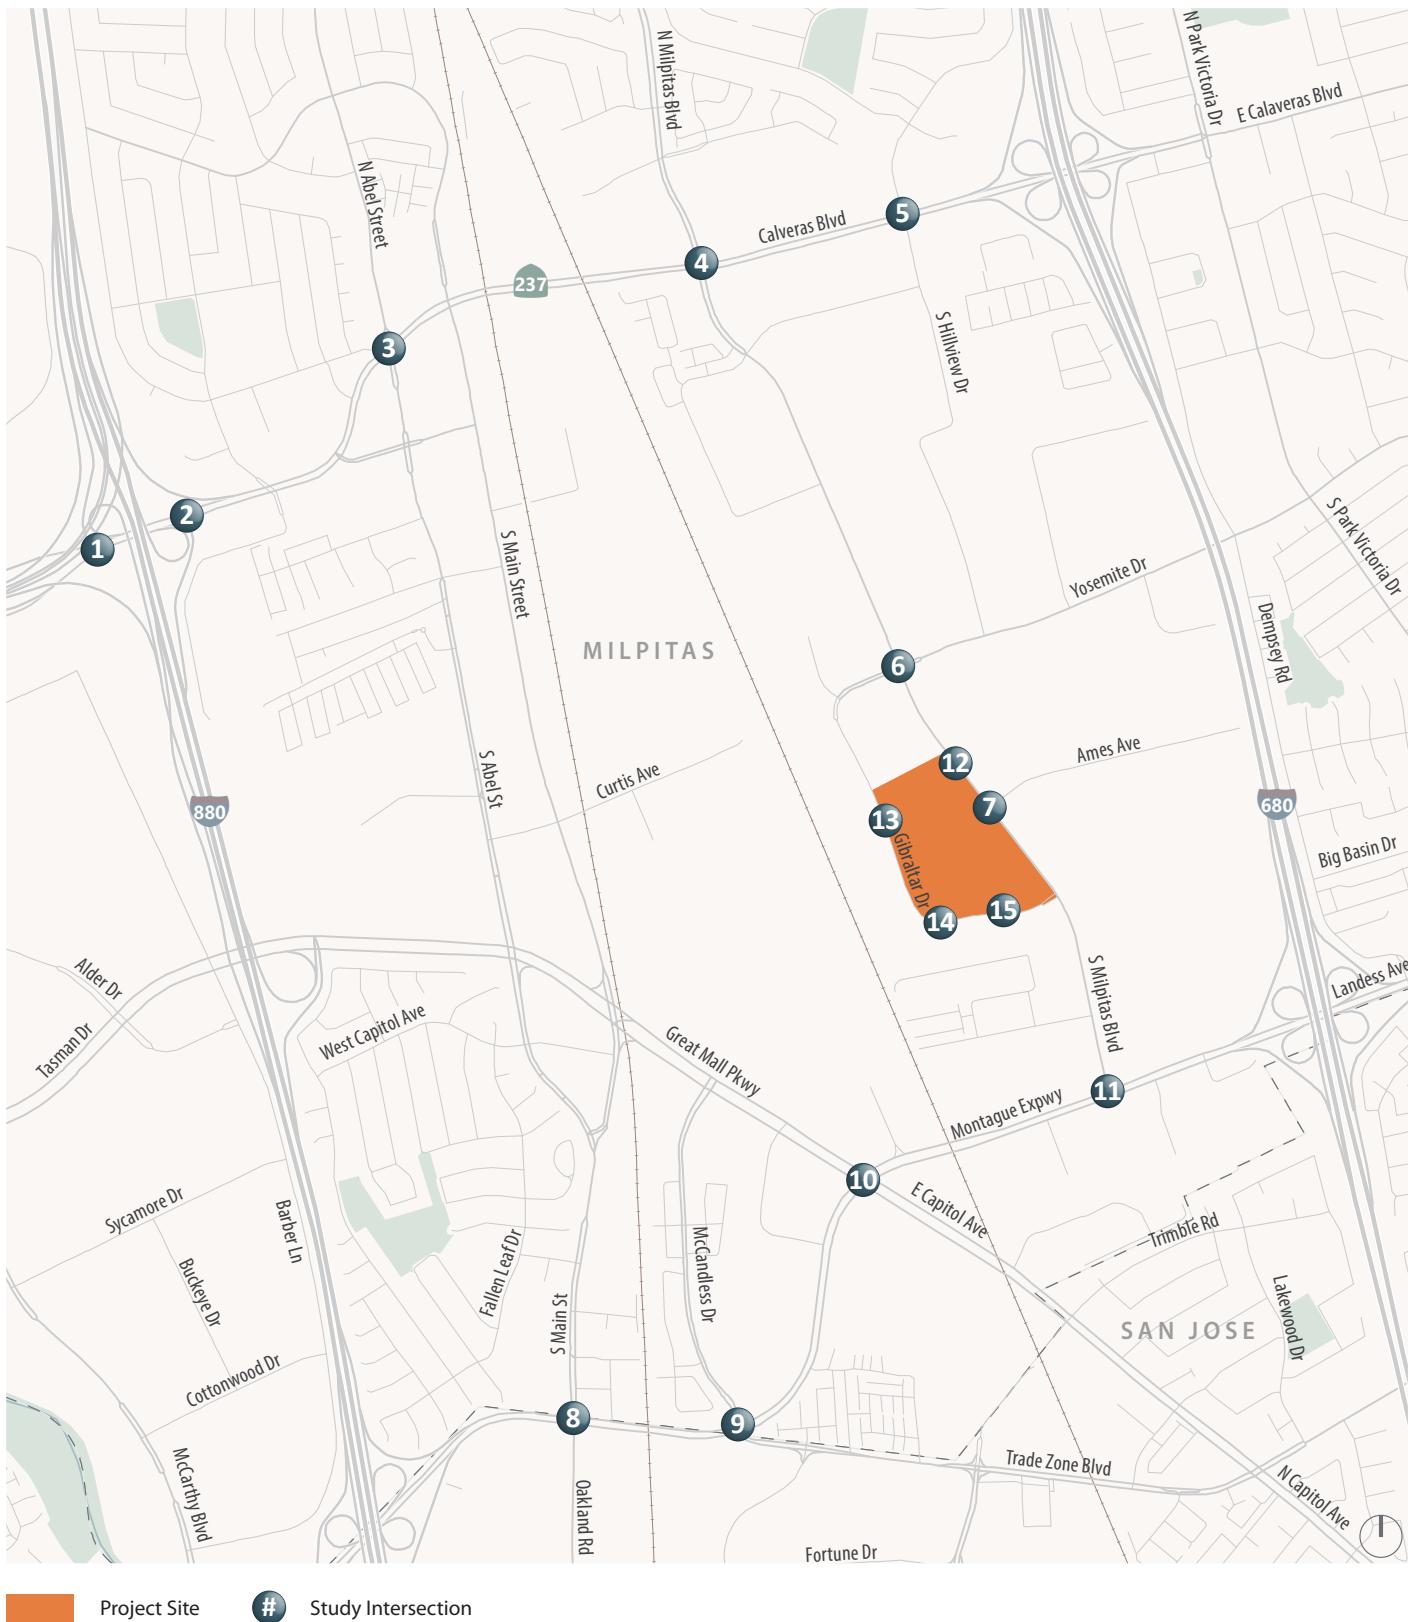

Table 2: Project Trips on Freeway Segments Near the Project Site

Freeway	Segment	Direction	Peak Hour	Lanes	Capacity	Project Trips	<1%? ¹
SR-237	McCarthy Boulevard to I-880	EB	AM	2	4,600	12	No
	McCarthy Boulevard to I-880	EB	PM	2	4,600	3	No
	I-880 to McCarthy Boulevard	WB	AM	2	4,600	11	No
	I-880 to McCarthy Boulevard	WB	PM	2	4,600	3	No
I-680	Capitol Avenue to Montague Expressway	NB	AM	4	9,200	60	No
	Capitol Avenue to Montague Expressway	NB	PM	4	9,200	15	No
	Calaveras Boulevard/SR-237 to Jacklin Road	NB	AM	3	6,900	14	No
	Calaveras Boulevard/SR-237 to Jacklin Road	NB	PM	3	6,900	4	No
	Montague Expressway to Capitol Avenue	SB	AM	4	9,200	53	No
	Montague Expressway to Capitol Avenue	SB	PM	4	9,200	16	No
	Jacklin Road to Calaveras Blvd/SR-237	SB	AM	3	6,900	15	No
	Jacklin Road to Calaveras Blvd/SR-237	SB	PM	3	6,900	4	No
I-880	E. Brokaw Road to Montague Expressway	NB	AM	3	6,900	15	No
	E. Brokaw Road to Montague Expressway	NB	PM	3	6,900	4	No
	SR-237 to Dixon Landing Road	NB	AM	3	6,900	15	No
	SR-237 to Dixon Landing Road	NB	PM	3	6,900	5	No
	Montague Expressway to E. Brokaw Road	SB	AM	3	6,900	14	No
	Montague Expressway to E. Brokaw Road	SB	PM	3	6,900	4	No
	Dixon Landing to Rd SR-237	SB	AM	3	6,900	17	No
	Dixon Landing to Rd SR-237	SB	PM	3	6,900	4	No

1. Threshold for analysis is whether the Project peak hour trip assignment constitutes more than one percent of the segment's hourly capacity. Note: HOV lane segments are not included in the table and are considered screened out based on the mixed-flow segment analysis.

Study Area and Analysis Locations

2.4 Analysis Methods and Deficiency Criteria

2.4.1 Intersection Operations

The operations of roadway facilities are described with the term level of service (LOS), a qualitative description of traffic flow based on such factors as speed, travel time, delay, and freedom to maneuver. Six levels are defined from LOS A, as the best operating conditions, to LOS F, or the worst operating conditions. LOS E represents "at-capacity" operations. When traffic volumes exceed the intersection capacity, stop-and-go conditions result, and operations are designated as LOS F.

2.4.1.1 Signalized Intersection Operations

The method described in Chapter 16 of the *2000 Highway Capacity Manual* (HCM) (Special Report 209, Transportation Research Board) was used to prepare the level of service calculation for the study intersections. This level of service method, which is approved by the City of Milpitas and VTA, analyzes a signalized intersection's operation based on average control delay per vehicle. Control delay includes the initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. The average control delay is calculated using the TRAFFIX analysis software and is correlated to an LOS designation as shown in **Table 3**.

Table 3: Signalized Intersection Level of Service Definitions Using Average Control Vehicular Delay

Level of Service	Description	Average Control Delay Per Vehicle (Seconds)
A	Operations with very low delay occurring with favorable progression and/or short cycle lengths.	≤ 10.0
B+ B B-	Operations with low delay occurring with good progression and/or short cycle lengths.	10.1 to 12.0 12.1 to 18.0 18.1 to 20.0
C+ C C-	Operations with average delays resulting from fair progression and/or longer cycle lengths. Individual cycle failures begin to appear.	20.1 to 23.0 23.1 to 32.0 32.1 to 35.0
D+ D D-	Operations with longer delays due to a combination of unfavorable progression, long cycle lengths, and high V/C ratios. Many vehicles stop and individual cycle failures are noticeable.	35.1 to 39.0 39.1 to 51.0 51.1 to 55.0
E+ E E-	Operations with high delay values indicating poor progression, long cycle lengths, and high V/C ratios. Individual cycle failures are frequent occurrences.	55.1 to 60.0 60.1 to 75.0 75.1 to 80.0
F	Operations with delays unacceptable to most drivers occurring due to over-saturation, poor progression, or very long cycle lengths.	> 80.0

Source: *Traffic Level of Service Analysis Guidelines*, October 2014; VTA Congestion Management Program, December 2017; *Highway Capacity Manual*, Transportation Research Board, 2000.

2.4.1.2 Unsignalized Intersection Operations

The operations of the unsignalized intersections were evaluated using the method contained in Chapter 17 of the *2000 HCM*. LOS ratings for stop-sign-controlled intersections are based on the average control delay expressed in seconds per vehicle. At two-way or side-street-controlled intersections, the average control delay is calculated for each stopped movement, not for the intersection as a whole. For approaches composed of a single lane, the control delay is computed as the average of all movements in that lane. **Table 4** summarizes the relationship between delay and LOS for unsignalized intersections.

Table 4: Unsignalized Intersection Level of Service Definitions Using Average Control Vehicular Delay

Level of Service	Description	Average Control Delay Per Vehicle (Seconds)
A	Little or no delay.	≤ 10.0
B	Short traffic delays.	10.1 to 15.0
C	Average traffic delays.	15.1 to 25.0
D	Long traffic delays.	25.1 to 35.0
E	Very long traffic delays.	35.1 to 50.0
F	Extreme traffic delays with intersection capacity exceeded.	> 50.0

Source: *Traffic Level of Service Analysis Guidelines*, October 2014; VTA Congestion Management Program, December 2017; *Highway Capacity Manual*, Transportation Research Board, 2000.

2.4.1.3 Deficiency Criteria

The determination of transportation system operational deficiency is based on applicable policies, regulations, goals, and guidelines defined by the City of Milpitas and Santa Clara County. The detailed deficiency criteria presented below pertains to roadway system operations.

2.4.1.3.1 Santa Clara County Congestion Management Program

The LOS standard for Santa Clara County expressway and CMP intersections is LOS E. Traffic deficiencies at these intersections would occur when the addition of traffic associated with a Project causes:

- Intersection operations to deteriorate from an acceptable level (LOS E or better) to an unacceptable level (LOS F); or
- Exacerbation of unacceptable operations by increasing the average critical delay by 4.0 seconds or more and increasing the critical volume-to-capacity (V/C) ratio by 0.01 or more; or
- Increases in the V/C ratio of 0.01 or more at an intersection with unacceptable operations when the change in critical delay is negative (i.e., decreases). This can occur if the critical movements change.

2.4.1.3.2 City of Milpitas

The City of Milpitas adheres to the Santa Clara County CMP level of service (LOS) standards for CMP intersections, and the Milpitas General Plan does not cite separate LOS standards for non-CMP intersections. However, a LOS standard of D was used for non-CMP intersections in the Transit Area Specific Plan EIR; based on this precedent, this standard for non-CMP intersections is used in this study. The same deficiency thresholds as applied to CMP intersections, above, would apply to the City intersections, with LOS D being deemed acceptable as opposed to LOS E.

2.4.1.3.3 Intersection LOS Standards

As discussed above, signalized intersection operations and impacts were evaluated based on the appropriate jurisdiction's LOS standards as summarized **Table 5**. The City of Milpitas General Plan Circulation Element Policy 3.a-G-1 guides transportation analysis and adverse effects for the City of Milpitas. Milpitas's minimum threshold for acceptable signalized intersection operations is LOS D. For CMP intersections under VTA's jurisdiction, the minimum threshold for acceptable intersection operations is LOS E. Since all study intersections are under City jurisdiction, the City's minimum threshold of LOS D were applied.

Table 5: Intersection LOS Standards

Intersection Type	LOS Standard
City of Milpitas Intersections ¹	LOS D
Santa Clara County CMP Intersections ²	LOS E

Notes:

1. City of Milpitas, General Plan Circulation Element Policy 3.a-G-1.
2. VTA Congestion Management Program, 2017.

2.4.2 Transit Service

The VTA TIA Guidelines Section 9.2 requires analysis of transit network performance including transit access and facilities, and transit vehicle delay. The Guidelines state that the transit vehicle delay analysis should include the following components:

- **A qualitative assessment** of additional transit vehicle delay caused by any roadway or intersection geometry changes proposed by a project, taking into account unique considerations of transit vehicles compared to autos (e.g., pulling into and out of stops, longer gaps needed for left turns). These qualitative considerations may also inform the assessment of transit vehicle delay caused by auto congestion;
- **A quantitative estimate** of additional seconds of transit vehicle delay that will result from automobile congestion caused by a project and any changes to signal operations proposed by that project. This analysis may utilize information produced by the intersection Auto Level of Service (LOS) analysis or other sources, if available.

The Project does not propose an off-site roadway or intersection changes that would affect transit vehicle delay.

With regard to transit delay caused by added traffic congestion, there is not a well-established national methodology for quantitatively evaluating transit network performance due to roadway congestion. Increased roadway congestion can affect transit vehicle travel time/speed and service reliability. For the purposes of this study, transit network performance is analyzed during the AM and PM peak hour based on the average transit vehicle delay associated with congestion at signalized intersections along a specified corridor with and without the Project. The change in average transit vehicle delay will be determined using the following process:

- Review TRAFFIX 8.0 analysis software output for intersection delay. The average delay, by movement, at each intersection within a study corridor in the transit vehicle path of travel will be determined.
- The transit vehicle average delay due to congestion at intersections will be determined by summing the movement delay for each signalized intersection along the study transit corridor.
- Without and With Project average transit vehicle delay associated with congestion at intersections will be compared. Note that the transit vehicle dwell time at transit stops is not included in the analysis.

This analysis methodology determines changes in transit delay based on the delay at the intersections evaluated in this report. Not every intersection along each transit route is included in the transit delay calculation. In addition, the transit delay analysis does not account for additional delays including bus pull-out time or dwell time for boardings and alightings. Such additional delays are not anticipated to be substantial relative to delays at the major intersections studied in the traffic impact analysis.

Per the VTA TIA Guidelines, if increased transit vehicle delay is found, the Lead Agency (the City of Milpitas) should work with VTA to identify feasible transit priority measures near the affected facility and include contributions to any applicable projects that improve transit speed and reliability in the TIA.

2.4.2.1 Deficiency Criteria

As described in the CEQA Guidelines, the Project may cause a significant impact to transit facilities and services if an element of the Project would:

- Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadways, bicycle and pedestrian facilities.
- While the VTA TIA Guidelines call out the potential need for performing a transit capacity analysis, there is no CEQA specific threshold of significance. The California Governor's Office of Planning and Research (OPR) *Technical Advisory on Evaluating Transportation Impacts in CEQA* states that a project that blocks access to a transit stop or blocks a transit route may interfere with transit functions. By contrast, when evaluating multimodal transportation networks OPR advises:

- *[L]ead agencies generally should not treat the addition of new users as an adverse impact. Any travel-efficient infill development is likely to add riders to transit systems, potentially slowing transit vehicle mobility, but also potentially improving overall destination proximity. Meanwhile, such development improves regional vehicle flow generally by loading less travel onto the regional network than if that development were to occur elsewhere.*
- OPR recognizes that increased demand throughout a region may cause a cumulative impact requiring new or additional transit infrastructure. However, OPR states such impacts may be best addressed through a fee program that fairly allocates the cost of improvements not just to projects that locate near transit, but rather across a region to all projects that impose burdens on the entire transportation system.

2.4.3 Bicycle and Pedestrian Facilities

The VTA TIA Guidelines Section 9.3 requires analysis of bicycle and pedestrian modes under project conditions. The analysis shall address project effects on existing bicyclists and pedestrians as well as the effects and benefits of site development and associated roadway improvements on bicycle/pedestrian infrastructure, circulation, Quality of Service (QOS), and conformance to existing plans and policies.

Because the Project does not propose roadway network changes beyond the project driveway improvements, and no intersection improvements are identified to address level of service deficiencies in this report, the bicycle and pedestrian evaluation in this report is based on an evaluation of the existing facilities along the Project frontages, including the Project's proposed frontage improvements.

2.4.3.1 Deficiency Criteria

A deficiency would be identified if the Project design creates an obstruction or otherwise adversely affects bicycle or pedestrian circulation along the Project frontages, including at the five Project driveways.

3. Existing Conditions

This section describes transportation facilities in the Project study area, including the surrounding roadway network, transit, pedestrian, and bicycle facilities in the Project site vicinity. Existing intersection operations are also described.

3.1 Existing Roadway Facilities

Regional access to the study area is provided by Interstate 680 (I-680), Interstate 880 (I-880), State Route 237 (SR-237). Local and direct access are provided by Abel Street, Ames Avenue, Calaveras Boulevard, Gibraltar Drive, Great Mall Parkway, Main Street, Montague Expressway, South Hillview Drive, South Milpitas Boulevard, Trade Zone Boulevard, and Yosemite Drive. The City of Milpitas classifies streets according to their function and access, as shown in **Table 6**. The roadways within the study area that would provide access to the site and are most likely to experience direct changes in traffic patterns, if any, from the Project are described below.

Table 6: Street Classifications

Classification	Function	Access
Freeway	Provides for intra- and inter- regional mobility.	Restricted to primary arterials and expressways via interchanges.
Expressway	Provide for movement of through-traffic.	Limited accesses to abutting properties; varies according to situation.
Arterial	Collect and distribute traffic from freeways and expressways to collector streets, and vice versa.	Varies according to situation.
Collector	Serves as connectors between local and arterial streets and provide direct access to parcels.	Driveways and/or intersecting streets or collector streets should be no closer than 300-400 feet apart.
Local Street	Provide access to parcels.	Access is not restricted.

Source: City of Milpitas General Plan Circulation Element.

3.1.1 Regional Roadways

I-680 is a freeway north-south freeway extending north from San Jose to the I-80 in Fairfield. It has four general purpose lanes in each direction within the study area. Access to I-680 from the study area is provided via East Calaveras Boulevard and Montague Expressway.

I-880 is a north-south freeway extending north from the I-280/I-880/SR-17 interchange in San José to Oakland. It has three general purpose lanes and one HOV lane in each direction. Access to I-880 from the study area is provided via West Calaveras Boulevard, Great Mall Parkway, or Montague Expressway.

SR-237 is an east-west freeway that runs from El Camino Real in Mountain View to I-680 in Milpitas. It has two general purpose lanes and one HOV express lane in each direction. Access to SR-237 from the study area is provided via West Calaveras Boulevard.

3.1.2 Local Roadways

Abel Street-Main Street is a north-south collector roadway primarily serving residential and commercial land uses west of the Project site. It provides access to the major arterial Calaveras Boulevard north of the Project site and to Montague Expressway south of the site. Abel Street-Main Street has two travel lanes in each direction with a two-way left turn lane on some segments and a physical center median on other segments. The posted speed limit is 35 miles per hour (MPH). On-street parking is not permitted. Sidewalks and bicycle facilities are provided on both sides of the roadway.

Ames Avenue is an east-west local street that provides direct access to the Project site and to commercial, office, and light industrial land uses east of the Project site. It has one travel lane in each direction. The posted speed limit is 35 MPH. On-street parking is permitted east of the railroad tracks. Discontinuous sidewalks are provided on either side of the roadway. Bicycle facilities are not provided.

Calaveras Boulevard is an east-west arterial that provides access to I-680 and I-880 freeways north of the Project site. It is divided by a median and has three travel lanes in each direction west of Abel Street to SR-237 and two travel lanes in each direction east of Abel Street. The posted speed limit is 40 MPH. On-street parking is not permitted. Sidewalks are provided on both sides of the street, except between Milpitas Boulevard and Abel Street where a sidewalk is provided only on the north side. Bicycle facilities are not provided.

Gibraltar Drive is a north-south local street with a portion of the street oriented in the east-west direction. Gibraltar Drive provides direct access to the Project site and to industrial and office land uses west of the Project site. It has one travel lane in each direction, with a two-way left-turn lane on the east-west oriented portion. The posted speed limit is 30 MPH. On-street parking is not permitted. Sidewalks are provided on both sides of the street. Bicycle facilities are not provided.

Great Mall Parkway-Capitol Avenue is a northwest-southeast oriented arterial that provides access to residential, commercial, and office uses in the southwestern area of the City. It has three travel lanes in each direction with the VTA rail tracks in the middle. The posted speed limit is 40 MPH. On-street parking is not permitted. Sidewalks and striped bike lanes are provided on both sides of the street.

Montague Expressway is an east-west expressway to the south of the Project site. It is divided by a center median. There are three general travel lanes and one carpool lane (weekdays between 6 AM to 9AM) in each direction between Montague Court and Great Mall Parkway and three general travel lanes in each direction west of Great Mall Parkway. The posted speed limit is 45 MPH. On-street parking is not permitted. Discontinuous sidewalks are provided on either side of the street and bicycle facilities are not provided.

South Hillview Drive is a north-south collector roadway to the northeast of the Project site. It has one travel lane in each direction. The street is divided by a two-way left-turn lane between East Calaveras Boulevard and Los Coches Street. There is no median south of Los Coches Street. South Hillview Drive provides access to office, commercial, and industrial uses near the Project site. The posted speed limit is 35 MPH. On-street parking is permitted on some segments of the street. Sidewalks are provided on both sides of the street between East Calaveras Boulevard and Los Coches Street and on one side south of Los Coches Street. Bicycle facilities are not provided.

South Milpitas Boulevard is a north-south collector roadway that provides direct access to the Project site. There is a center two-way left-turn lane between Los Coches Street and Gibraltar Drive for access to office, industrial, and commercial use driveways along and a median on the rest of the street. It has two travel lanes in each direction. The posted speed limit is 40 MPH. On-street parking is not permitted. Sidewalks are provided on both sides of the street and continuous pedestrian paths are disrupted by landscaped building frontages. Striped bike lanes are provided on both sides of the street.

Trade Zone Boulevard-McCandless Drive is a collector roadway southwest of the Project site. Trade Zone Boulevard south of Montague Express way is east-west oriented and McCandless Drive north of Montague Expressway is north-south oriented. It provides access to residential, commercial, and office uses. Trade Zone Boulevard has two travel lanes in each direction with a physical center median with a posted speed limit of 35 MPH. McCandless Drive has one travel lane in each direction with a median with a posted speed limit of 25 MPH. On-street parking is not permitted. Sidewalks and bicycle facilities are provided on both sides of the roadway.

Yosemite Drive is an east-west local street to the northeast of the Project site. It is a divided street with two travel lanes in each direction. Yosemite Drive provides access to office, industrial, and commercial uses within the study area. The posted speed limit is 40 MPH. On-street parking is not permitted. Sidewalks and striped bike lanes are provided on both sides of the street.

3.1.3 Truck Routes

The City of Milpitas identifies primary truck routes for the safe and adequate circulation of trucks entering and leaving the City. Further information about policies pertaining to goods movement can be found in the General Plan Circulation Element. Truck routes providing direct access or connection to direct access routes to the Project site are listed below:

- Ames Avenue
- Calaveras Boulevard
- Gibraltar Drive
- Great Mall Parkway-Capitol Avenue
- Landess Avenue
- Los Coches Street
- Montague Expressway
- South Abel Street
- South Hillview Drive
- South Main Street
- South Milpitas Boulevard
- SR-237
- Trade Zone Boulevard-McCandless Drive
- Yosemite Avenue

Existing primary truck routes in the vicinity of the Project study area are shown on **Figure 3**.

3.2 Existing Transit Services

The study area is served by a variety of transit services provided by the Santa Clara Valley Transportation Authority (VTA), Alameda-Contra Costa (AC) Transit, and Bay Area Rapid Transit (BART). These services include local bus and light rail transit services and inter-city rail services. The existing transit routes and stops in the study area are shown on **Figure 4**.

The Project site is directly served by AC Transit bus route 217 with bus stops on South Milpitas Boulevard, one south of Ames Avenue on the west side and one north of Ames Avenue on the east side. VTA provides bus service within the study area including local bus routes 44, 47, and 71, frequent bus routes 60, 66, 70 and 77, and express bus route 104. The LRT Orange Line also serves the study area. BART service was extended to the Milpitas Station starting June 13, 2020. These transit routes, operating hours, and peak headways are summarized in **Table 7**.

Table 7: Existing Transit Service

Route	From	To	Weekday		Weekends	
			Operating Hours ¹	Peak Headway (minutes) ¹	Operating Hours ¹	Peak Headway (minutes) ¹

3.3 Existing Bicycle Facilities

Bikeway planning and design in California typically relies upon guidelines and design standards established by the California Department of Transportation (Caltrans) in the *Highway Design Manual* (Chapter 1000: Bikeway Planning and Design). Caltrans provides four distinct types of bikeway facilities, as described below and shown in the accompanying figures. The City's existing and proposed bicycle facilities near the Project site are identified below and illustrated on **Figure 5** and summarized below.

3.3.1 Class I Bikeways (Shared-Use Path)

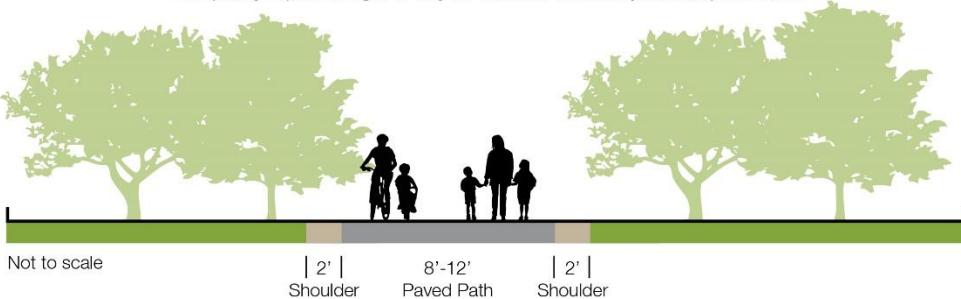

Class I Bikeways (Shared-Use Paths) provide separate right-of-way and are designated for the exclusive use of bicycles and pedestrians, with vehicle and pedestrian crossflow minimized. In general, bike paths serve corridors when on-street facilities are not feasible or where sufficient right-of-way exists to allow them to be constructed.

Existing Class I Bikeways are not present on the Project study roadways. The Santa Clara Countywide Bike Plan (updated 2018) identifies a proposed Class I Bikeway on Hillview Drive.

SHARED-USE PATH (CLASS I)

Completely separated right-of-way for exclusive use of bicycles and pedestrians

3.3.2 Class II (Bicycle Lane)

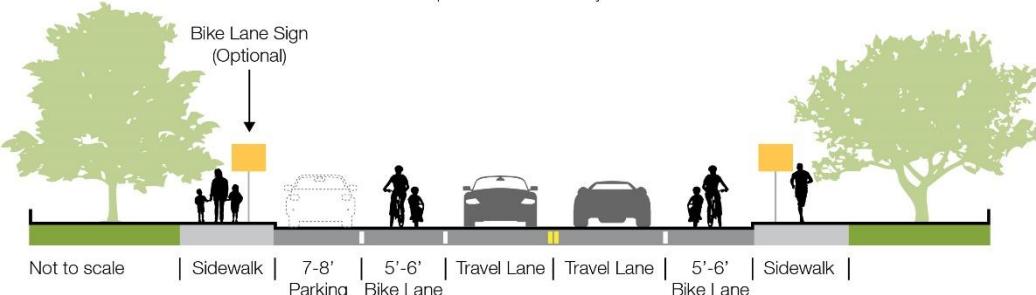

Class II Bikeways (Bicycle Lanes) are dedicated lanes for bicyclists generally adjacent to the outer vehicle travel lanes. These lanes have special lane markings, pavement legends, and signage. Bicycle lanes are typically five feet wide. Adjacent vehicle parking and vehicle/pedestrian crossflow are permitted.

Within the Project vicinity, existing Class II Bikeways are provided on:

- Abel-Main Street south of Calaveras Boulevard
- Great Mall Parkway
- Capitol Avenue
- South Milpitas Boulevard
- Trade Zone Boulevard-McCandless Drive
- Yosemite Drive

BICYCLE LANE (CLASS II)

On-street striped lane for one-way bike travel

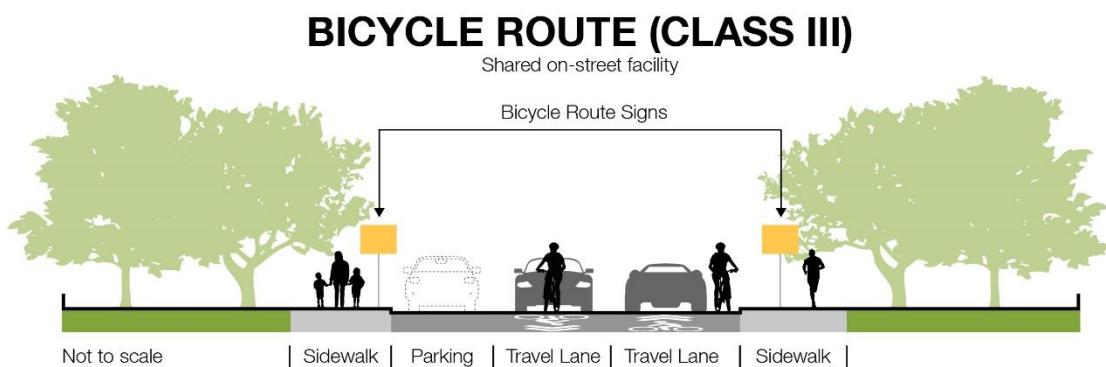

3.3.3 Class III (Bicycle Route)

Class III Bikeways (Bicycle Routes) are designated by signs or pavement markings for shared use with pedestrians or motor vehicles but have no separated bike right-of-way or lane striping. Bike routes serve either to a) provide a connection to other bicycle facilities where dedicated facilities are infeasible, or b) designate preferred routes through high-demand corridors.

Within the Project vicinity, Class III Bikeways are provided on:

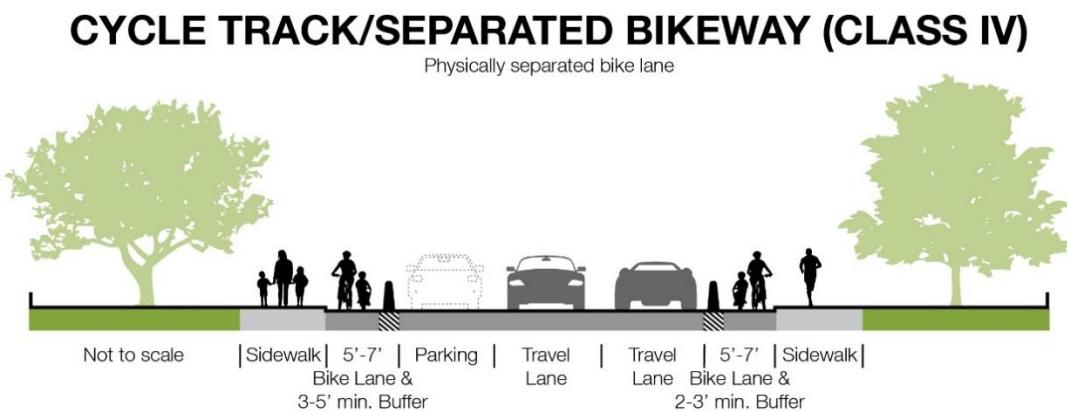

- Calaveras Boulevard
- Abel Street north of Corning Avenue

3.3.4 Class IV (Cycle Track/Separated Bikeway)

Class IV Bikeways (cycle tracks or "separated" bikeways) provide a right-of-way designated exclusively for bicycle travel within a roadway and are protected from other vehicle traffic by physical barriers including, but not limited to, grade separation, flexible posts, and inflexible vertical barriers such as raised curbs or parked cars.

There are no existing or proposed Class IV Bikeways in the Project study area.

3.4 Existing Pedestrian Facilities

Pedestrian facilities including sidewalks, crosswalks, curb ramps, and pedestrian signals are provided throughout the Project vicinity, as shown on **Figure 6**. Sidewalks are generally provided on at least one side along all surface roadways in the study area. Pedestrian signals, pushbuttons, and crosswalks are provided at all signalized study intersections. Crosswalks are provided at unsignalized intersections within the Project vicinity. Curb ramps are also provided at all the study intersections.

3.5 Existing Intersection Traffic Volumes

Existing (2020) AM and PM peak hour intersection vehicle volumes were developed as described in Chapter 2.2. The existing traffic volumes and lane configurations are presented on **Figure 7**.

3.6 Existing Intersection Level of Service

Existing intersection lane configurations and peak hour turning movement volumes were input into the Traffix software program to calculate the levels of service for the study intersections during each peak hour. The existing conditions peak hour intersection LOS results are presented in **Table 8**. Detailed intersection LOS calculation worksheets are presented in the Technical Appendix.

Under existing conditions, the intersection of Main Street and Montague Expressway operates at LOS F, which is below the relevant standard, LOS E, in the AM peak hour. All other intersections operate acceptably.

Table 8: Existing Conditions Peak Hour Intersection LOS Summary

Intersection	Control ¹	LOS Threshold ²	Peak Hour ³	Delay ⁴	LOS
1. I-880 WB Ramp & Calaveras Boulevard	Signal	D (Milpitas)	AM PM	10.9 9	B+ A
2. I-880 EB Ramps & Calaveras Boulevard	Signal	D (Milpitas)	AM PM	13.7 26.9	B C
3. Abel Street & Calaveras Boulevard	Signal	E (CMP)	AM PM	41.9 72.1	D E
4. South Milpitas Blvd & Calaveras Boulevard	Signal	E (CMP)	AM PM	49.2 42.6	D D
5. Hillview Drive & Calaveras Boulevard	Signal	D (Milpitas)	AM PM	20 31	C+ C
6. South Milpitas Boulevard & Yosemite Drive	Signal	D (Milpitas)	AM PM	29.7 35	C D+
7. South Milpitas Boulevard & Ames Avenue	Signal	D (Milpitas)	AM PM	26.1 23.9	C C
8. Main Street & Montague Expressway	Signal	E (CMP)	AM PM	91.6 66.8	F E
9. Trade Zone Boulevard & Montague Expressway	Signal	E (CMP)	AM PM	64.8 55.2	E E+
10. Great Mall Parkway & Montague Expressway	Signal	E (CMP)	AM PM	51.7 56.4	D- E+
11. South Milpitas Boulevard & Montague Expressway	Signal	E (CMP)	AM PM	42.7 54.6	D D-
12. South Milpitas Boulevard & North Project Driveway	SSSC	D (Milpitas)	AM PM	-	-
13. Gibraltar Drive & West Project Driveway	SSSC	D (Milpitas)	AM PM	-	-
14. Gibraltar Drive & Southwest Project Driveway	SSSC	D (Milpitas)	AM PM	-	-
15. Gibraltar Drive & South Project Driveway	SSSC	D (Milpitas)	AM PM	-	-

Notes:

Bold text indicates unacceptable operations.

1. Intersection traffic control type (Signal = Signalized; SSSC = Side-Street Stop-Controlled)
2. Lowest acceptable LOS threshold between acceptable and unacceptable level of service (criteria jurisdiction).
3. AM = Weekday morning peak hour, PM = Weekday evening peak hour
4. Delay calculated per HCM 2000 methodologies.

4. Project Characteristics

This chapter discusses Project trip generation estimates, distribution, and assignment.

4.1 Project Description

The proposed Project at 1000 Gibraltar Drive in Milpitas, California will demolish all existing on-site buildings and construct a new 491,040 square foot industrial building with two supporting offices at the northwest and southeast corners, as well as surface parking on all sides of the building. There are five proposed access driveways to the Project site. One signalized intersection at South Milpitas Boulevard/Ames Avenue and one driveway on South Milpitas Boulevard north of Ames Avenue will provide access on the east side of the site. Three driveways along Gibraltar Drive provide access to the west and south sides of the site. The driveway at South Milpitas Boulevard/Ames Avenue and the two western-most driveways on Gibraltar Drive will accommodate larger trucks, and the other two driveways will be used only by automobiles and smaller trucks/vans.

The Project may serve a variety of potential industrial uses, but the expected use is a logistics/fulfillment center.

4.2 Project Trips

The amount of traffic added to the roadway system by a proposed development is estimated using a three-step process: (1) trip generation, (2) trip distribution, and (3) trip assignment. The first step estimates the amount of traffic added to the roadway network. The second step estimates the directions of travel to and from the project site. The third step assigns new vehicle trips to specific street segments and intersection turning movements. The results of this process for the proposed Project are described in the following sections.

4.2.1 Trip Generation Estimates

Project trips were estimated using custom trip generation rates developed from driveway count data from an Amazon fulfillment center in Newark, California. Peak hour driveway counts were conducted on three mid-week days (April 21, 22, and 23). An additional 24-hour driveway count was conducted on Tuesday, June 2, 2020. All four days of counts were averaged and used to develop peak hour trip generation rates. The daily trip generation rate was developed using the 24-hour count data.

The trip generation rates are shown in **Table 9**. The Project trips are broken down into passenger vehicles, delivery vans, and heavy trucks. Trucks are larger than regular cars and vans and take up more roadway capacity. Therefore, truck trips were converted to "passenger car equivalents" (PCEs) using a factor of two (i.e., one truck is the equivalent of two passenger cars).

Table 10 presents the Project trip generation based on the above noted rates as total vehicles and as PCEs. In total vehicle trips (cars, vans and large trucks), the Project is expected to add approximately 3,303 daily trips, 348 AM peak hour trips, and 88 PM peak hour trips. In terms of PCEs, the Project is expected to add approximately 3,680 daily PCE trips, 359 AM peak hour PCE trips and 101 PM peak hour PCE trips. The PCE trips are used in the operations analysis.

Table 9: Trip Generation Rates

Vehicle Class	Daily Rate	AM Rates		PM Rates	
		In	Out	In	Out
Passenger Vehicle	5.005	0.355	0.316	0.066	0.067
Van	0.953	0.006	0.009	0.008	0.012
Heavy Truck	0.767	0.013	0.010	0.012	0.014

Note:

1. Rate per 1,000 square feet.

Source: Fehr & Peers, October 2020; based on counts obtained in April and June 2020 at the Newark, CA Amazon facility.

Table 10: Project Trip Generation Estimate

Land Use	Size ¹	Vehicle Class (PCE Factor)	Daily Trips	AM Peak Hour Trips			PM Peak Hour Trips			
				Total	In	Out	Total	In	Out	
Vehicles										
Light Logistics Center	491.04 KSF	Passenger Vehicle	2,458	329	174	155	65	32	33	
		Van	468	8	3	5	10	4	6

Note:

1. KSF = 1,000 square feet

Source: Fehr & Peers, October 2020.

4.2.2 Trip Distribution

The directions of approach and departure of Project trips were derived from the Santa Clara County VTA Travel Demand Model, which takes into account the locations of complementary land uses as well as existing and future travel patterns in the area, as well as input from the Project applicant regarding the

likely regional distribution of heavy trucks. **Figure 8** shows the distribution of Project passenger vehicle traffic along the roadway network. **Figure 9** shows the distribution of Project truck traffic along the roadway network and the designated truck routes to the Project site. **Table 11** shows the trip distribution for each relevant segment in the roadway network.

Table 11: Project Trip Distribution

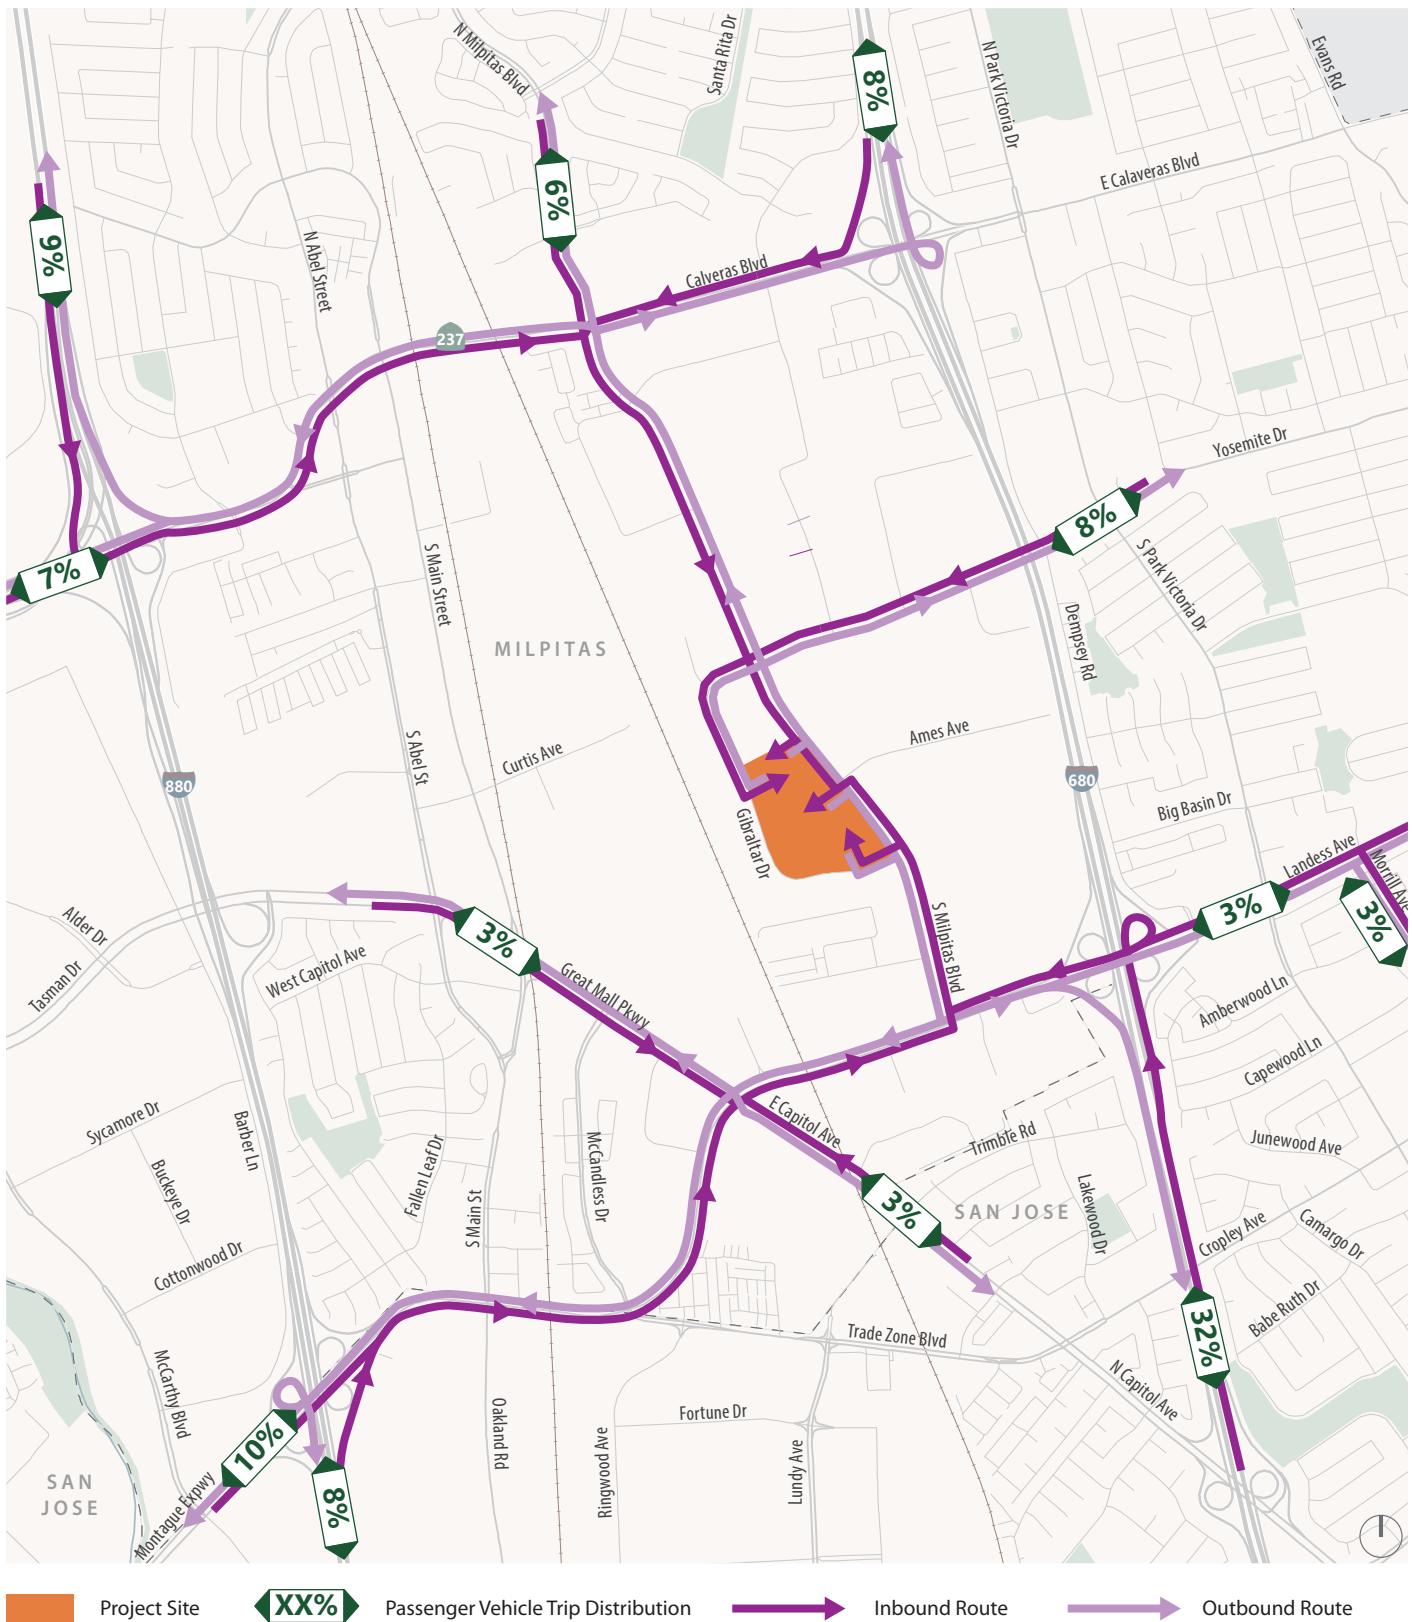

Destination	Passenger Vehicle and Van Distribution	Heavy Truck Distribution
I-680 south of Project site	32%	55%
I-680 north of Project site	8%	15%
I-880 north of Project site	9%	15%

WC20-3694_X_Volumes

5. Existing with Project Conditions

This section presents the results of the intersection level of service calculations for the study intersections under Existing with Project conditions.

5.1 Existing with Project Traffic Volumes

The Project traffic volumes on Figure 10 were added to the Existing traffic volumes on Figure 7 to develop Existing with Project traffic volumes shown on **Figure 11**.

5.2 Intersection Operations Analysis

Existing with Project intersection lane configurations and peak hour turning movement volumes were inputted into the Traffix software program to calculate the levels of service for the study intersections during each peak hour. The Existing with Project conditions peak hour intersection LOS results are presented in **Table 12**. Detailed intersection LOS calculation worksheets are presented in the Technical Appendix.

Under Existing with Project conditions, the intersection of Main Street and Montague Expressway operates unacceptably at LOS F in the AM peak hour based on the LOS standards. All other intersections operate acceptably. Overall, the addition of Project traffic to existing conditions traffic is expected to:

- Increase average vehicle delay at study intersections
- Maintain acceptable intersection operations at all intersections, except Main Street & Montague Expressway (which already operates at LOS F under existing conditions)
- Not exacerbate existing unacceptable intersection operations based on the City and County's deficiency criteria

Table 12: Existing Conditions Peak Hour Intersection LOS Summary

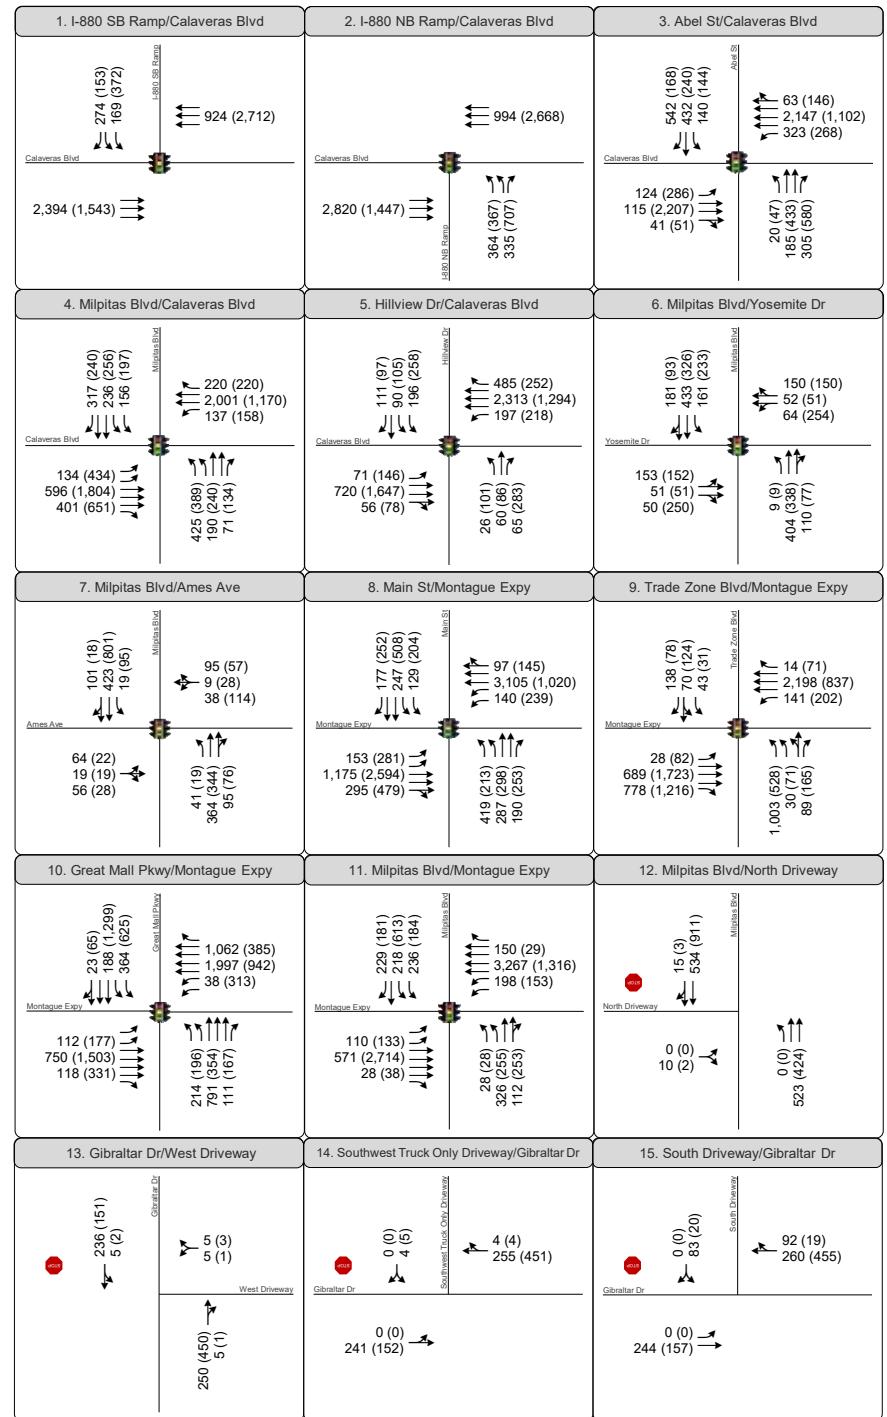

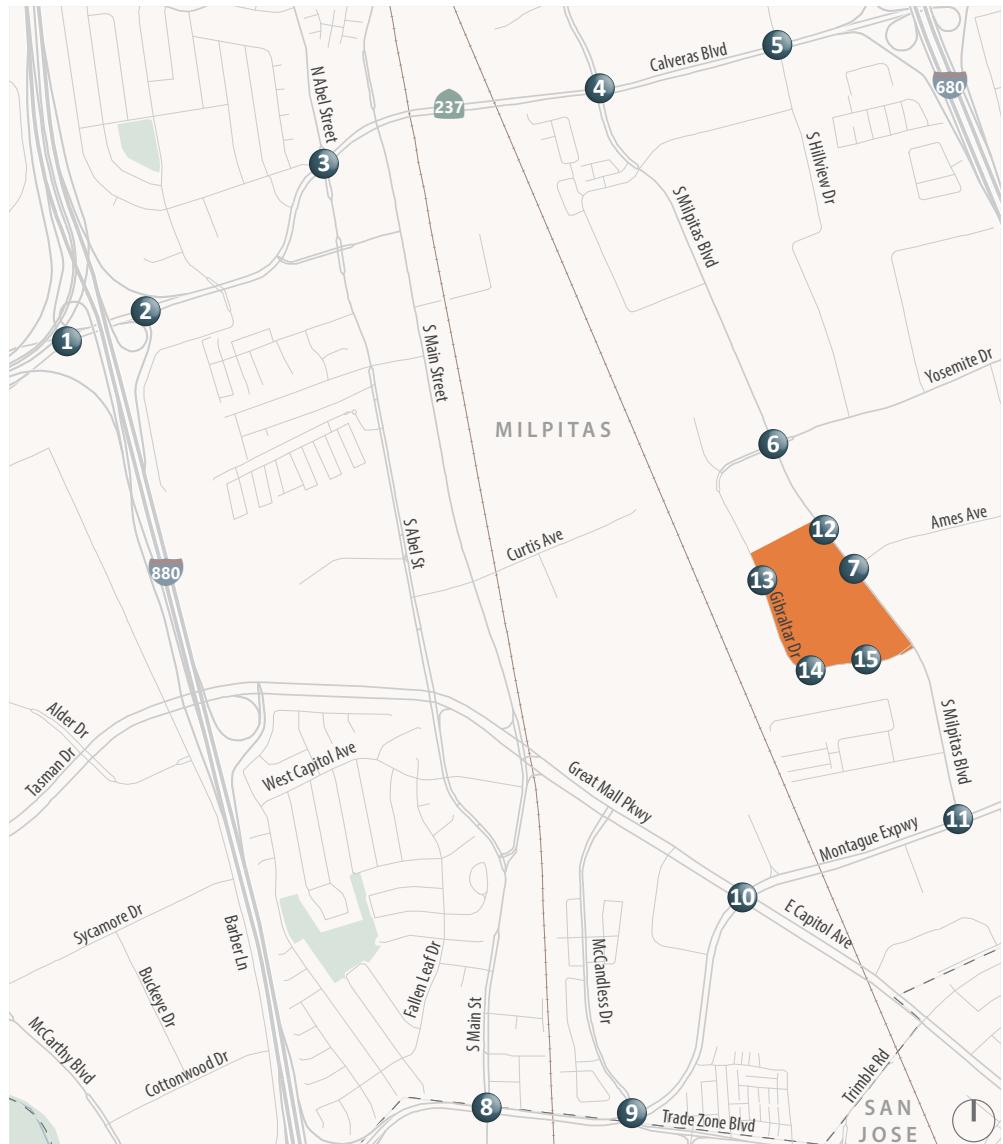

Figure 11
Existing with Project Peak Hour
Intersection Traffic Volumes

6. Near-Term Conditions

This section presents the results of the intersection level of service calculations for the study intersections under Near-Term and Near-Term with Project conditions.

6.1 Near-Term Volumes

Near-Term volumes were developed for the year 2022 when the Project is anticipated to be built and occupied. Volumes were developed using a straight-line interpolation between Existing (2020) conditions and 2040 conditions developed with the VTA Travel Demand Model as described in Chapter 7. As part of this analysis, the City of Milpitas planned development list was reviewed and determined to be similar to the level of land use growth in the VTA Travel Demand Model, validating the use of the interpolation approach for development of Near-Term volumes.

Near-Term without Project volumes are shown on **Figure 12**. Project-generated traffic shown on Figure 10 were added to the volumes on Figure 12 to produce Near-Term with Project volumes, as shown on **Figure 13**.

6.2 Intersection Operations Analysis

Near-Term without and with Project intersection lane configurations and peak hour turning movement volumes were inputted into the Traffix software program to calculate the levels of service for the study intersections during each peak hour. The Near-Term without and with Project conditions peak hour intersection LOS results are presented in **Table 13**. Detailed intersection LOS calculation worksheets are presented in the Technical Appendix.

Under Near-Term and Near-Term with Project conditions, the intersection of Main Street and Montague Expressway is projected to continue to operate unacceptably at LOS F in the AM peak hour based on the LOS standards, as it does under Existing conditions. All other intersections are projected to operate acceptably. Overall, in the Near-Term condition, the addition of Project traffic is expected to:

- Increase average vehicle delay at study intersections
- Maintain acceptable operations, except for Main Street/Montague Expressway
- Not exacerbate unacceptable intersection operations based on the City and County's deficiency criteria

7. Cumulative Conditions

This section presents the results of the intersection level of service calculations for the study intersections under Cumulative (2040) and Cumulative with Project conditions.

7.1 Cumulative Volumes

Cumulative volumes were developed using the 2040 traffic forecasts for the study intersections developed using the VTA Travel Demand Model. The 2040 VTA Travel Demand Model includes VTA's planned widening of Montague Expressway from:

- 6 lanes to 8 lanes between Main Street/Oakland Road and Great Mall Parkway/Capitol Avenue with a HOV lane in both directions
- 3 to 4 lanes in the eastbound direction between I-880 and Main Street/Oakland Road

Cumulative without Project volumes are shown on **Figure 14**. Project-generated traffic on Figure 10 were added to volumes on Figure 14 for Background with Project volumes, as shown on **Figure 15**.

7.2 Intersection Operations Analysis

Cumulative without and with Project intersection lane configurations and peak hour turning movement volumes were inputted into the Traffix software program to calculate the levels of service for the study intersections during each peak hour. The Cumulative without and with Project conditions peak hour intersection LOS results are presented in **Table 14**. Detailed intersection LOS calculation worksheets are presented in the Technical Appendix.

Under Cumulative without Project conditions, all intersections operate acceptably based on the LOS standards, except for the following:

- Abel Street & Calaveras Boulevard: LOS F in the PM peak hour
- South Milpitas Boulevard & Calaveras Boulevard: LOS F in the AM peak hour
- Main Street and Montague Expressway: LOS F in the AM and PM peak hours
- Trade Zone Boulevard & Montague Expressway: LOS F in the AM and PM peak hours

Overall, the addition of Project traffic is expected to:

- Increase average vehicle delay at study intersections
- Maintain Cumulative conditions acceptable intersection operations
- Not exacerbate Cumulative conditions unacceptable intersection operations based on the City and County's deficiency criteria

8. Transit Vehicle Delay Analysis

This section uses the methodology and criteria described in Chapter 2 to estimate and assess any additional transit vehicle delay caused Project-related trips or roadway changes. The following bus routes identified in Chapter 3.2 were analyzed:

- AC Transit Route 217: Fremont BART – Milpitas BART
- VTA Route 44: Milpitas BART – McCarthy Ranch via Tasman & Alder
- VTA Route 47: Milpitas BART – McCarthy Ranch via Park Victoria
- VTA Route 71: Milpitas BART – Capitol Station
- VTA Frequent Route 60: Milpitas BART – Winchester Station via SJC Airport
- VTA Frequent Route 66: North Milpitas – Kaiser San José
- VTA Frequent Route 70: Milpitas BART – Eastridge via Jackson
- VTA Frequent Route 77: Milpitas BART – Eastridge via King
- VTA Express Route 104: Milpitas BART – Stanford Research Park
- The Project-added transit vehicle delay under Existing, Background, and Cumulative conditions are summarized in **Table 15**.

Table 15: Project Added Transit Vehicle Delay

Bus Route	Peak Hour	Additional Route Average Delay with Project (seconds) ¹					
		Existing with Project		Near-Term with Project		Cumulative with Project	
		NB/EB	SB/WB	NB/EB	SB/WB	NB/EB	SB/WB
AC 217	AM	9.8	NC	8.8	NC	69.3	NC
	PM	NC	NC	NC	NC	NC	NC

	PM	NC	NC	NC	NC	NC	NC
VTA 104	AM	NC	NC	NC	NC	NC	NC
	PM	NC	NC	NC	NC	NC	NC

Note:

1. NC = No change. The Project was considered to have no change if the increase in travel time was fewer than five seconds or the travel time improved slightly (due to changes in critical movement changes, lane geometry changes, etc.).

Source: Fehr & Peers, October 2020.

The Project adds transit vehicle delay to the AC 217 morning northbound route under Existing, Near-Term, and Cumulative conditions of about 10, 9, and 70 seconds, respectively. Under Cumulative conditions, the Project is expected to increase transit vehicle delay for bus route VTA 47 in the morning eastbound direction by about 6 seconds. All other routes are expected to experience Project-added transit vehicle delay of fewer than five seconds.

The City of Milpitas should work with VTA and AC Transit to identify feasible transit priority measures along AC Transit route 217. A Project contribution toward identified improvements may be negotiated with the Project applicant, or fees paid to the City may be allocated toward such improvements.

9. Bicycle Circulation Evaluation

This chapter describes bicycle access to and from the Project site, and conditions for bicyclists travelling along the Project frontages.

Class II bicycle lanes are provided along South Milpitas Boulevard, connecting Milpitas BART to the south to Calaveras Boulevard to the north, and continuing northward. Bicycle lanes are also provided on Yosemite Drive and Great Mall Parkway/East Capitol Avenue/North Capitol Avenue, and Calaveras Boulevard is a designated Class III bicycle route. There are no bicycle facilities on Gibraltar Drive; this is a lower-traffic volume roadway as compared to South Milpitas Boulevard, and would be more comfortable for bicyclists to traverse without a designated bicycle facility. The existing bicycle network will serve employees who choose to commute by bicycle to the Project site, whether from residences in the surrounding neighborhoods or from Milpitas BART, located about a mile to the south of the Project site.

The Project will relocate and reconfigure some of the driveways serving the Project site, but does not propose changes to the traffic control; South Milpitas Boulevard/Ames Avenue/Project Driveway will remain traffic signal-controlled, and the remaining driveways will have stop control on the driveway approach only. The Project does not propose any other off-site roadway changes that would obstruct bicyclists or adversely affect bicycle circulation.

It is expected that the Project driveways will be constructed to City of Milpitas design standards, including provision of adequate sight distance between vehicles exiting the driveways and autos and bicyclists travelling on the adjacent roadways. The driveways should be clearly marked and signed so that they are visible to drivers and bicyclists, and landscaping should be designed and maintained so as to not interfere with sightlines.

10. Pedestrian Circulation Evaluation

This chapter describes pedestrian access to and from the Project site, and conditions for pedestrians walking along the Project frontages.

The Project site plan maintains the current sidewalk design along the South Milpitas Boulevard and Gibraltar Drive Project frontages. The sidewalk would need to be reconstructed where driveway relocations and re-configurations would occur. The current sidewalk width is five feet (typical). The Project site design plans do not indicate a striping or design treatment for the pedestrian crossings at each driveway. It is recommended that a striped crossing or other pavement treatment be considered during the City's engineering review, to enhance pedestrian visibility to drivers entering and exiting the driveways.

The Project does not propose any other off-site roadway changes that would obstruct pedestrians or adversely affect pedestrian circulation.

11. Queuing Analysis

This chapter presents the localized access and queuing analysis results for the study intersection turning movements where the Project adds ten or more trips. The analysis evaluates the adequacy of turn lane storage capacity under Existing Conditions, Near-Term Conditions, and Cumulative Conditions, as presented in **Table 16**.

At most intersections with dedicated turn lanes to which the Project adds ten or more trips, the addition of Project traffic does not cause any turn lane queue to exceed available storage where it does not without Project traffic. However, several turn pocket lengths are exceeded under Existing, Near-Term, and Cumulative Conditions, both without and with the Project, and the Project increases some of these queue lengths, as shown in Table 16. Turn pocket queue lengths exceeding available storage length under no Project and with Project Conditions include:

- Intersection 4 – South Milpitas Boulevard & Calaveras Boulevard:
- Northbound left in the AM peak hour
- Eastbound right in the AM peak hour
- Westbound left in the AM peak hour
- Intersection 11 – South Milpitas Boulevard & Montague Expressway
- Southbound left in the AM and PM peak hours

The only turn pocket queue length that is exceeded due to the addition of Project traffic is the westbound right turn lane at South Milpitas Boulevard & Montague Expressway in the AM peak hour. The Project adds about 100 feet, or 4 vehicles, to the queue under Existing and Near-Term Conditions, and adds about 125 feet, or 5 vehicles, to the queue under Cumulative Conditions.

Table 16: Queue Analysis

Intersection	Movement ¹	Available Storage Length (feet) ²	Peak Hour	Number of Project Trips Added	Projected Queue Length (feet) ³		
					Existing (Existing with Project)	Near-Term (Near-Term with Project)	Cumulative (Cumulative with Project)
1. I-880 WB Ramp & Calaveras Boulevard	SBL	550	AM	18	100 (125)	125 (125)	150 (175)
2. I-880 EB Ramps & Calaveras Boulevard	WBR	375	AM	16	0 (0)	0 (0)	0 (0)

	EBL	625	PM	10	200 (200)	200 (225)	225 (250)
	WBR	175	AM	74	125 (225)	150 (250)	350 (475)
	WBR	175	PM	20	25 (50)	25 (50)	25 (75)

Notes:

1. NBL = northbound left-turn; SBL = southbound left-turn, EBL = eastbound left-turn WBL = westbound left-turn, NBR = northbound right-turn, SBR = southbound right-turn, EBR = eastbound right-turn, WBR = westbound right-turn.
2. Maximum storage length for dedicated turn lane.
3. 95% queue length for turn pocket with longest queue based on Traffix analysis results. Assumes 25 feet per vehicle in queue.

Bold text indicated available storage is exceeded.

Source: Fehr & Peers, October 2020.

To address potential queue spillback at the intersections identified in Table 16, intelligent transportation system improvements, such as adaptive signal control, advanced signal loop detectors or video image detectors, could be implemented to improve signal operations and queuing. The westbound right turn storage length at the intersection of South Milpitas Boulevard/Montague Expressway cannot feasibly be extended due to the presence of a driveway just upstream of the current turn lane transition.

12. Parking Evaluation

This chapter compares the Project's proposed parking supply to the City of Milpitas parking supply requirements.

12.1 Off-Street Parking Supply Requirements

The City of Milpitas Municipal Code Title XI Chapter 10 Section 53 defines the vehicle parking supply requirements for the Project. Table 53.09 defines the parking supply for distribution, manufacturing, and warehouse uses at one space per 1,500 square feet and one space per 350 square feet for office space within an industrial building. Minimum truck parking supply requirements are not provided. The Project includes approximately 486,000 square feet of distribution, manufacturing, and warehouse space and 4,900 square feet of office space. The minimum total parking supply requirement is 338 spaces. The Project proposes to provide 346 parking spaces and 101 truck parking spaces. Therefore, the Project proposed parking provision will exceed the City's minimum parking supply requirements.

12.2 Bicycle Parking Requirements

The City of Milpitas Municipal Code does not contain a bicycle parking requirement for industrial uses. The Project's bicycle parking supply has not been defined. It is recommended that the Project provide bicycle parking at a rate of one space per 10,000 square feet, or 49 spaces. This would facilitate more than ten percent of the anticipated Project workforce – 330 employees – to commute by bicycle. Bicycle parking should be located inside the building in a secure area. Given the size of the proposed Project building, two or more bicycle parking sites within the building may be desirable to maximize convenience for bicycling employees.

13. Site Circulation Evaluation

This chapter presents an assessment of the on-site circulation for autos, trucks, bicyclists and pedestrians.

As described in Chapter 4, the Project site will provide vehicle access at two driveways on South Milpitas Boulevard and three driveways on Gibraltar Drive. All site driveway intersections were found to operate at acceptable levels of service in Chapters 5, 6 and 7.

The on-site vehicle circulation dimensions meet City of Milpitas Municipal Code requirements, with 24-foot circulation aisles in the automobile parking areas. The Project application plan set contains sheets demonstrating that the site accommodates large truck turning radius requirements at the driveways which will serve larger trucks (the driveway opposite Ames Avenue on South Milpitas Boulevard, and the west and southwest driveways on Gibraltar Drive). Automobile parking space dimensions meet City of Milpitas Municipal Code requirements:

- Standard spaces: 9 feet wide and 18 feet long
- Compact spaces: 7.5 feet wide and 15 feet long

The Project application plan set indicates walkways along the sides of the building directly abutting the auto parking areas, as well as a connecting path between the office space on the southeast corner of the building and the sidewalk along South Milpitas Boulevard. No additional pedestrian or bicycle circulation striping or infrastructure is indicated on the plan set. The connecting path noted above is well located, as some pedestrians travelling to and from the site may come from the Milpitas BART station to the south; however, an additional path connection through the site from South Milpitas Boulevard near Ames Avenue may be useful, to connect commuters using AC Transit route 217 which has stops at South Milpitas Boulevard/Ames Avenue. This potential connection would traverse the truck parking lot along the east side of the Project building, and therefore would need to be carefully designed to ensure pedestrians are highly visible to truck drivers.

It may be useful to provide bicycle wayfinding signs and potentially "sharrow" markings to direct bicyclists to the appropriate building entries closest to the recommended secure interior bike storage. As with any new pedestrian path connections, the design of any sharrow connections should take into consideration potential conflicts with truck and auto movements.

14. Conclusions

14.1 LOS Analysis

The addition of Project traffic would increase intersection average delays but would not result in adverse effects on intersection operations under Existing, Near-Term, and Cumulative Conditions.

14.2 Transit Vehicle Delay Analysis

The Project adds transit vehicle delay to the AC 217 morning northbound route under Existing, Near-Term, and Cumulative conditions of about 10, 9, and 70 seconds, respectively. Under Cumulative conditions, the Project is expected to increase transit vehicle delay for bus route VTA 47 in the morning eastbound direction by about 6 seconds. It is recommended that the City of Milpitas work with VTA and AC Transit to identify feasible transit priority measures along AC Transit route 217. A Project contribution toward identified improvements may be negotiated with the Project applicant, or fees paid to the City may be allocated toward such improvements.

14.3 Bicycle Circulation Evaluation

The Project does not propose any off-site roadway changes that would obstruct bicyclists or adversely affect bicycle circulation. It is expected that the Project driveways will be constructed to City of Milpitas design standards, including provision of adequate sight distance between vehicles exiting the driveways and autos and bicyclists travelling on the adjacent roadways. The driveways should be clearly marked and signed so that they are visible to drivers and bicyclists, and landscaping should be designed and maintained so as to not interfere with sightlines.

14.4 Pedestrian Circulation Evaluation

The Project site plan maintains the current sidewalk design along the South Milpitas Boulevard and Gibraltar Drive Project frontages. The sidewalk would need to be reconstructed where driveway relocations and re-configurations would occur. The current sidewalk width is five feet (typical). The Project site design plans do not indicate a striping or design treatment for the pedestrian crossings at each driveway. It is recommended that a striped crossing or other pavement treatment be considered during the City's engineering review, to enhance pedestrian visibility to drivers entering and exiting the driveways.

The Project does not propose any other off-site roadway changes that would obstruct pedestrians or adversely affect pedestrian circulation.

14.5 Queueing Analysis

The only turn pocket queue length that is exceeded due to the addition of Project traffic is the westbound right lane at South Milpitas Boulevard & Montague Expressway in the AM peak hour. The Project adds about 100 feet, or 4 vehicles, to the queue under Existing and Near-Term Conditions, and adds about 125 feet, or 5 vehicles, to the queue under Cumulative Conditions. To address potential queue spillback at this intersection, and the other intersections where the Project traffic increases queues that would already exceed storage without Project traffic, intelligent transportation system improvements, such as adaptive signal control, advanced signal loop detectors or video image detectors, could be implemented to improve signal operations and queuing. The westbound right turn storage length at the intersection of South Milpitas Boulevard/Montague Expressway cannot feasibly be extended due to the presence of a driveway just upstream of the current turn lane transition.

14.6 Parking Evaluation

As discussed in Chapter 12, the minimum total parking supply requirement for the Project site is 338 spaces. The Project proposes to provide 346 parking spaces and 101 truck parking spaces. Therefore, the Project proposed parking provision will exceed the City's minimum auto parking supply requirements.

The City of Milpitas Municipal Code does not contain a bicycle parking requirement for industrial uses. The Project's bicycle parking supply has not been defined. It is recommended that the Project provide bicycle parking at a rate of one space per 10,000 square feet, or 49 spaces. This would facilitate more than ten percent of the anticipated Project workforce – 330 employees – to commute by bicycle. Bicycle parking should be located inside the building in a secure area. Given the size of the proposed Project building, two or more bicycle parking sites within the building may be desirable to maximize convenience for bicycling employees.

14.7 Site Circulation Evaluation

The Project application plan set meets City of Milpitas Municipal Code requirements for parking lot aisle widths and auto parking space dimensions and demonstrates the adequacy of the truck maneuvering space at the site's driveways which would serve trucks.

While one connecting pedestrian path between South Milpitas Boulevard and the southeast corner of the Project building is shown on the plan set, an additional path connection through the site from South Milpitas Boulevard near Ames Avenue may be useful, to connect commuters using AC Transit route 217 which has stops at South Milpitas Boulevard/Ames Avenue. This potential connection would traverse the truck parking lot along the east side of the Project building, and therefore would need to be carefully designed to ensure pedestrians are highly visible to truck drivers.

With regard to bicycle circulation, it may be useful to provide bicycle wayfinding signs and potentially "sharrow" markings to direct bicyclists to the appropriate building entries closest to the recommended

secure interior bike storage. As with any new pedestrian path connections, the design of any sharrows should take into consideration potential conflicts with truck and auto movements.

TECHNICAL APPENDIX

Appendix A:

Existing Traffic Volume Sources

As noted in Section 2.2 of the report, the existing intersection volumes were based on the September 2016 counts conducted for the City of Milpitas General Plan Existing Conditions Report (ECR). A rate developed using 2016 ECR and 2018 CMP data was used to factor up ECR 2016 counts to represent 2020 (pre-COVID) volumes. Per standard practice for VTA traffic studies, 2018 CMP TRAFFIX PM peak hour volumes were used for CMP study intersections in the PM peak hour. The CMP intersection at South Milpitas/Montague Expressway did not use 2018 CMP data because the south leg of the intersection built to connect to the new Milpitas BART Station was missing. At study intersections with no existing data, StreetLight data volumes and volume balancing between intersections with available data were used to develop peak hour volumes. Below is a summary of the study intersection peak hour traffic volume sources:

Existing Conditions Traffic Volumes		Source/Method ¹	
Study Int #	Name	AM	PM
1	I-880 SB/Calaveras	Counts factor	
2	I-880 NB/Calaveras	Counts factor	
3	Abel/Calaveras	Counts factor	CMP 2018
4	Milpitas/Calaveras	Counts factor	CMP 2018

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER

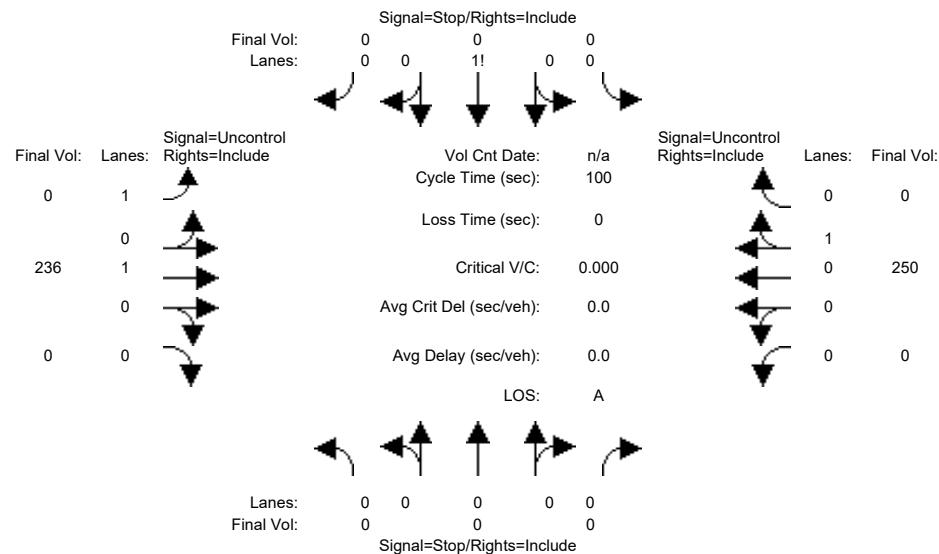

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

ApproachDel:	xxxxxx	xxxxxx	xxxxxx	xxxxxx

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

ApproachDel:	xxxxxx	xxxxxx	xxxxxx	10.8

Approach[westbound][lanes=1][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=0.0]

FAIL - Vehicle-hours less than 4 for one lane approach.

Signal Warrant Rule #2: [approach volume=10]

FAIL - Approach volume less than 100 for one lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=522]

FAIL - Total volume less than 650 for intersection
with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Delay Signal Warrant Report

Intersection #13 Gibraltar Dr/East Dwy

Future Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R
Control:	Uncontrolled	Uncontrolled	Stop Sign	Stop Sign
Lanes:	0 0 0 1 0	0 1 0 0 0	0 0 0 0 0	0 0 1! 0 0
Initial Vol:	0 462	1 2 157	0 0 0	0 1 0 3
ApproachDel:	xxxxxx	xxxxxx	xxxxxx	11.5

Approach[westbound][lanes=1][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=0.0]

FAIL - Vehicle-hours less than 4 for one lane approach.

Signal Warrant Rule #2: [approach volume=4]

FAIL - Approach volume less than 100 for one lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=626]

FAIL - Total volume less than 650 for intersection
with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Delay Signal Warrant Report

Intersection #15 South Dwy/Gibraltar Dr

Future Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound	South Bound	East Bound	West Bound
Movement:	L - T - R	L - T - R	L - T - R	L - T - R
Control:	Stop Sign	Stop Sign	Uncontrolled	Uncontrolled
Lanes:	0 0 0 0 0	1 0 0 0 0	1 0 1 0 0	0 0 0 1 0
Initial Vol:	0 0 0	20 0 0	0 216 0	0 575 19
ApproachDel:	xxxxxx	15.7	xxxxxx	xxxxxx

Approach[southbound][lanes=1][control=Stop Sign]

Signal Warrant Rule #1: [vehicle-hours=0.1]

FAIL - Vehicle-hours less than 4 for one lane approach.

Signal Warrant Rule #2: [approach volume=20]

FAIL - Approach volume less than 100 for one lane approach.

Signal Warrant Rule #3: [approach count=3][total volume=830]

SUCCEED - Total volume greater than or equal to 650 for intersection with less than four approaches.

SIGNAL WARRANT DISCLAIMER

This peak hour signal warrant analysis should be considered solely as an "indicator" of the likelihood of an unsignalized intersection warranting a traffic signal in the future. Intersections that exceed this warrant are probably more likely to meet one or more of the other volume based signal warrant (such as the 4-hour or 8-hour warrants).

The peak hour warrant analysis in this report is not intended to replace a rigorous and complete traffic signal warrant analysis by the responsible jurisdiction. Consideration of the other signal warrants, which is beyond the scope of this software, may yield different results.

Peak Hour Volume Signal Warrant Report [Urban]

Intersection #15 South Dwy/Gibraltar Dr

Future Volume Alternative: Peak Hour Warrant NOT Met

Approach:	North Bound	South Bound	East Bound	West Bound
