According to the property owner, fill material was imported and placed in the upper 10 feet across the Site as a cover over the sump material. Three soil samples will be collected in the upper 10 feet across the Site and analyzed for CAM 17 metals using EPA method 6010B/7471A, organochlorine pesticides using EPA method 8081A, polychlorinated biphenyls using EPA method 8082, and semi-volatile organic compounds using EPA method 8082 as described in the Remedial Investigation Work Plan.

July 5, 2006 DTSC Human and Ecological Risk Division Comments

There were five general comments. The five general comments are summarized below in italics followed by LFR's response.

1. *HERD recommends that LFR submit a risk assessment work plan to evaluate potential risk and hazard to people and ecological organisms that could be exposed to contaminants at the site once site characterization is complete.*

   Once site characterization is complete, LFR will prepare a risk and exposure assessment work plan to the DTSC for approval.

2. *If significant volumes of soils and sump materials will be excavated, treated and returned to the excavated areas for compaction to meet engineering requirements, HERD recommends that a post remedial risk assessment be conducted in addition to the baseline risk assessment.*

   Once the approach to remediate the site has determined, LFR will prepare a post remedial exposure assessment work plan for DTSC approval.

3. *Since significant concentrations of VOCs were detected in the soil matrix, HERD recommended that a soil gas investigation be conducted. The investigation should identify VOCs and their respective concentration distributions throughout the soil and sump materials at the site. This information is needed for evaluating potential risk to human health from potential migration of VOCs to indoor air. Because of the high levels of methane detected in a previous investigation, HERD recommends that soil gas samples also be evaluated for methane concentrations. To facilitate this investigation, HERD recommends that a soil gas sampling work plan be prepared for DTSC approval prior to conducting field work.*

   LFR has included a soil gas sampling work plan in the Remedial Investigation Work Plan. LFR is proposing that soil gas samples be collected at multiple depths at fifteen locations on the Site. Samples will be analyzed for VOCs and methane. Details of the soil gas sampling work plan are in the Remedial Investigation Workplan.

   Any necessary mitigation measures would be incorporated into the design of the proposed development to control potential migration of methane and VOCs.

4. *HERD recommends that if feasible, background soil samples be collected from the same parent materials as found on the site and analyzed for concentrations of metals to compare with on site concentrations.*

   In the Remedial Investigation Work Plan prepared by LFR, background soil samples will be collected at a city park and along the street to the east of the Site and analyzed for metals. This area has experienced significant urbanization and industrial use. Given this, native materials are more difficult to identify. Although it is unlikely that these background soil samples will be collected from the same parent material as found on the Site, given that the Site consists of sump material and imported fill, but at least site concentrations can be compared with local soils.

5. *HERD recommends that a risk assessment work plan be submitted that follows the USEPA Risk Assessment Guidance documents using California Office of Environmental Health Hazard Assessment exposure values and toxicity values when available. In addition, HERD recommends that a minimum, the risk assessment work plan include the using specific approaches. These approaches are detailed in the attached memorandum.*

   Once site characterization is complete, LFR will prepare an exposure assessment for DTSC approval prior to conducting field work.

If you have any questions, please contact either Tony Marino or Charlie Robinson at (714) 444-0111.

Sincerely,

Tony Marino

APPENDIX C

Historical Review

March 7, 2007 002-10231-01

Mr. Steve Sukut
Sukut Development, Inc.
4010 West Chandler Avenue
Santa Ana, California 92704

Subject: Historical Review of CRG Properties Former Oil Operators' North Site, Long Beach, California

Dear Mr. Sukut:

On behalf of CRG Properties (CRG), LFR Inc. (LFR) has prepared this letter report to transmit the results of a historical review for the former Oil Operators' North Site, located at 3701 Pacific Place, Long Beach, California ("the Site"). Figures 1 and 2, attached, illustrate the Site location and layout.

Historical aerial photographs and historical USGS topographical maps provided by Environmental Data Resources, Inc. (EDR) were examined to identify former land use in the Site and vicinity. In addition, LFR reviewed State of California, Department of Conservation, Division of Oil, Gas & Geothermal Resources (DOGGR) records in Cypress, California. Copies of selected DOGGR well records are included in Appendix A. The following sections provide details of the review of those documents.

Aerial Photographs

Aerial photographs dated 1928, 1947, 1956, 1968, 1976, 1989, 1994, and 2002 were obtained from EDR. The photographs consisted of low-altitude, black-and-white and color photographs. Brief descriptions of the Site and vicinity, as observed in the aerial photographs, are included below.

1928

Sumps are present at the Site and to the immediate south (Figure 3a). The sumps appear to be bounded by dirt roads. Several small structures on the northwest portion of the Site, adjacent to the largest sump, are probably associated with the sumps. The Los Angeles River is adjacent to the Site on the west, in a natural state including a meandering stream bed and stream deposits. A rail line that trends northwest-southeast forms the eastern

Offices Nationwide
www.lfr.com

Site boundary. A second rail line extends through the center of the Site, joining with the first rail line at the northeast portion of the Site. The eastern portion of the Site between the rail lines appears undeveloped, with the exception of a few dirt roads crisscrossing the area.

North of the Site, the vicinity is undeveloped. Improved roads have been constructed east of the Site. Some housing is present there; a housing development appears to be in progress. One large round structure, possibly a water tank, is adjacent to this development. Property to the southeast of the Site appears to be undeveloped, with the exception of a few structures that may be associated with on-Site and off-Site sumps. West of the Site, beyond the Los Angeles River, is another rail line trending north-south; beyond that, land appears to be either undeveloped or agricultural.

1947

The Site appears to be relatively unchanged from the 1928 photograph (Figure 3b), with some exceptions. Two additional sumps appear to have been added on the western portion of the Site. Also, additional structures have appeared on the eastern portion of the Site. It is not clear if these structures are residences or related to the Site. Finally, the rail line running through the center of the Site appears to have been removed.

The Los Angeles River appears to have been channeled (possibly with levees) north of the Site. The rail lines east and west of the Site are still present. East, southeast, and southwest of the Site, residential development has increased significantly. The large structure (possible water tank) adjacent to the residential development is no longer present. West of the Site beyond the rail line, the land appears to be agricultural.

1956

The Site appears as in the 1947 photograph (Figure 3c), with the following exceptions. On the eastern portion of the Site, the structures are no longer present. Two small round structures, possibly oil storage tanks, are still present in this area. On the north and northwest Site boundary and on the eastern and southeastern portions of the Site, numerous drilling rigs are present. An area previously used as a sump on the western Site boundary does not appear to be used for that purpose any longer.

Immediately west of the Site, the Los Angeles River has been transformed into concrete channels. Beyond the river, the rail line has been removed. Multi-lane roadways are now present west of the Site (I-710) and southwest of the Site (Wardlow Road).

Commercial/industrial development has filled in the space between the sumps (on-Site and off) and the housing development to the southeast of the Site. East of the Site across the rail line, housing development has filled in, and a multi-building complex (Los Cerritos School) has been constructed. South of the Site, one of the sumps has been replaced by one circular skimming tank. Other structures on the western side of the off-

Site sumps are present, and may be associated with the water treatment plant that was reportedly built in this area.

1968

The Site sumps appear to be either drying out or not as deep as previously, as they are no longer very dark as in previous photographs (Figure 3d). Drilling rigs appear only in the southeastern corner of the Site. The Site has been separated from the southern sumps by a multi-lane roadway (I-405). An access road from westbound I-405 to northbound I-710 is at the southern Site boundary. The rail line still forms the eastern Site boundary. Additional housing development has taken place north of the Site, beyond the rail line. No significant changes have taken place east of the Site. South of the Site, four additional circular skimming tanks are located in the sump area. Again, the sumps themselves do not appear as before, but may be either drying out or shallower. West of the Site, between the Los Angeles River channel and I-710, some commercial/industrial development appears to be in progress.

1976

The Site appears to be essentially as it was in the 1968 photograph, except that the darker area in the northwestern portion of the Site has shrunk in size (Figure 3e). Northeast of the Site, beyond the rail line, additional housing has been developed, as well as an apartment/condo complex to the southeast. A golf course is located north of the residential housing. No changes are apparent to the south or west, with the exception that one of the southern sumps appears to be dry and vacant. The development between I-405 and the Los Angeles River first observed in the 1968 photograph appears to include a flood control basin.

1989

The Site appears to have been left to develop natural vegetation, which appears sparse (Figure 3f). No structures appear to remain on the Site, with the possible exception of the southeastern corner. Due to the quality of the photograph, it is difficult to determine what is present in that location. The Site vicinity appears as it did in the 1976 photograph, except that the previous farmlands west of I-710 appear to be developing, in part.

1994 - 2002

The northern portion of the Site appears to have been graded (Figures 3g and 3h). The southeastern portion of the Site appears as in the 1989 photograph, with some structures present (more clearly seen in this photograph). No changes appear to the north, east, or south; west of the Site, beyond I-710, the area has been developed with what appears to be very large industrial buildings.

In the 2002 photograph, the Site vicinity is the same as in the 1994 photograph. The Site, however, has been developed into what appears to be putting greens with sand traps, and associated structures and parking on the southern portion.

Topographic Maps

Topographic maps dated 1902, 1930, 1947, 1951, 1964, 1972, and 1981 were reviewed by LFR.

1902

The USGS 15-Minute Series Downey Quadrangle for 1902 (Figure 4a) shows the Site as vacant land at the base of a rise approximately 75 feet high and sloping southwest toward the Site (the Site appears to be at an elevation of approximately 25 feet above mean sea level [msl]). The Los Angeles River is located adjacent to the Site on the west. Scattered residences are located in Watson Crossing, to the southwest, and Signal Hill, to the southeast. The Southern Pacific rail line passes to the west of the Site, running north-south. The San Pedro rail line passes to the east of the Site, also running north-south. Scattered light-duty roads cross the area, leading to various communities, the largest of which is Long Beach, approximately 3.5 miles south-southeast of the Site. Marshy areas lie scattered to the northeast, southeast, and south-southwest of the Site, including a large tidal marsh west of Long Beach. The Pacific Ocean lies south of the Site, beyond the marsh and Long Beach.

1947

The USGS 15-Minute Series Downey Quadrangle for 1947 (Figure 4b) shows the Site containing an unimproved road on the northwestern portion. Several wells (not water) are located on or adjacent to the southern portion of the Site. The Site is bounded to the east by the Pacific Electric rail line. A rail line runs through the center of the Site before joining up with the Pacific Electric line. To the west, the Los Angeles River appears to have been channeled along its length on this map.

Beyond the Los Angeles River, a spur of the Union Pacific runs along the river, joining up with the main line north of the Site. No features appear to adjacent to the southern portion of the Site, with the exception of the abovementioned wells and one tank. Further south and adjacent to the eastern Site boundary beyond the rail line, residential development has occurred. A school is located east of the Site. Residential development is also increasing northwest, west, and southwest of the Site across the river. Power lines are located across the river from the Site, running north-south. A large well field and associated tanks lies southeast of the Site, beyond the residential development.

1951

The USGS 7.5-Minute Series Long Beach Vicinity Quadrangle for 1951 shows the Site with oil sumps on the northwestern portion and to the south of the Site (Figure 4c). Three wells (not water) are visible in the central portion of the Site. The rail line is gone. In the Site vicinity, residential development has approached the Site south of the southeastern corner and to the southwest, across the Los Angeles River. Southeast of the

Site, some residential development has given way to well (not water) development, although scattered houses appear to remain. Virginia Country Club appears northeast of the Site, beyond the residential development. The Long Beach Freeway follows the Los Angeles River on the west side of the river. A military reservation, with rail yard, is located beyond the residential developments west and southwest of the Site.

1964

The USGS 7.5-Minute Series Long Beach Quadrangle for 1964 (Figure 4d) shows the Site unchanged from 1951, with the exception of a light duty road running along the eastern and southern Site boundaries, and several non-water wells added to the northwestern Site boundary. South of the Site, oil sumps appear to have been removed. A number of tanks, including a water tower, are located where one of the southern sumps once appeared. East of the Site, across the rail line, residential development has encroached on the well fields. South of the Site, the San Diego Freeway (I-405) crosses from east to west. An entrance ramp to the northbound Long Beach Freeway (I-710) forms most of the southern Site boundary. The military reservation west of the Site has been replaced by a drag strip. Residential development has increased to the west.

1972 - 1981

The USGS 7.5-Minute Series Long Beach Quadrangles for 1964, photorevised in 1972 (Figure 4e) and 1981 (Figure 4f), show no significant changes to the Site from the 1964 map. The Site vicinity also exhibits little change, with the following exceptions. Residential development has increased north of the Site across the rail line. Northwest of the Site, beyond I-710 and the Dominguez residential development, industrial development has begun by 1972, and has rapidly increased by 1981.

DOGGR Information

According to the California Department of Conservation's Division of Oil, Gas, and Geothermal Resources (DOGGR) District 1 map (dated July 6, 2006) for the Long Beach Oil Field (Map #137), the following wells are located at the Site:

- One plugged and abandoned dry hole (Sun Exploration & Production Co. 'NWBLU' 8-5;
- Five plugged and abandoned oil wells ('NWLBU' 5-1, 6-1, 6-2, 8-1, 8-2);
- One idle oil well ('NWBLU' 9-6); and
- Ten completed oil wells ('NWBLU' 5-2, 5-3, 5-4, 8-3, 8-4, 8-7, 9-2, 9-3, 9-4, and 9-5).

An excerpt of the DOGGR map showing Site well locations is included in Appendix A along with copies of selected records obtained from the DOGGR office in Cypress, California. A site plan showing the approximate oil well locations is attached as Figure 5.

Reports of Well Plugging and Abandonment

The following five wells were plugged and abandoned between 1993 and 1997: NWBLU' 5-1, 6-1, 6-2, 8-1, and 8-2. The Reports of Well Plugging and Abandonment are included in Appendix A. "NWLBU'8-5 was abandoned in 1981. According to DOGGR records the well never produced and was never injected. The Report of Well Abandonment is included in Appendix A.

Reports of Property and Well Transfer

Ownership of the one idle oil well and the ten completed oil wells were transferred from Pacific Energy Resources to C.R.G. Properties, Ltd. on July 26, 2000. The Reports of Property and Well Transfer are included in Appendix A.

Reports of Cancellation

Notices to abandon wells"NWBLU'5-2, 5-3, 5-4 in 1996 were canceled by the DOGGR in 2005 because the work will not be done. Copies of the Report of Cancellation are included in Appendix A.

Conclusions

On-Site

Based on a review of historical aerial photographs and topographic maps, the Site was vacant land in the early 1900's, but by 1928 had been developed into a sump, located on the northwestern portion of the Site. A rail line ran in a north-south direction through the center of the Site from at least 1928, but was gone by 1947. In 1947, the sump area had increased to incorporate the entire western portion of the Site.

By 1951, the Site contains a number of wells, presumably oil or gas wells. The numbers of these wells increase until at least 1964. According to DOGGR, the following wells are located at the Site:

- One plugged and abandoned dry hole (Sun Exploration & Production Co. "NWBLU'8-5;
- Five plugged and abandoned oil wells ("NWLBU'5-1, 6-1, 6-2, 8-1, 8-2);
- One idle oil well ("NWBLU'9-6); and
- Ten completed oil wells ("NWBLU'5-2, 5-3, 5-4, 8-3, 8-4, 8-7, 9-2, 9-3, 9-4, and 9-5).

By 1968, the on-Site sump areas have shrunk in depth, and by 1976 these areas have also shrunk in lateral extent. By 1989, the Site appears to have been left to develop natural vegetation, although it is sparse. A golf facility has been developed on the Site by 2002, with associated buildings and parking areas on the southern portion.

Off-Site

The immediate Site vicinity was undeveloped until at least 1928, when sumps apparently associated with the on-Site sumps appear. These off-Site sumps appear to have been in operation until at least 1956, when they began to be replaced by skimming tanks. A water tower was also constructed on the former southern sump property. By 1976, one of the southern sumps appears to be dry and vacant.

Improved and light-duty roads cross the vicinity, with some housing development in progress by 1928 to the east of the Site. Rail lines pass to the east and west of the Site; the eastern rail line is adjacent to the Site boundary. The Los Angeles River is located adjacent to the western Site boundary. It has been channeled by 1947 and concreted by 1956. Power lines are located west of the Site across the river, running north-south with the river. The Long Beach Freeway (I-710) was in place by 1951 (west of the Site across the river), and the San Diego Freeway (I-405) was in place by 1964. Residential development to the east, southeast, south, and southwest approached the Site and was essentially complete by 1976. Industrial development northwest of the Site, beyond the Long Beach Freeway, was in progress by 1972 and developed into its present configuration by 1994.

REPORT OF PROPERTY AND WELL TRANSFER

Field or County		District
Long Beach		District 1 (Cypress, California)
Former owner		Date
Pacific Energy Res.	P0252	July 26, 2000

Well Name	API Number	Section Township Range
"Nwlbu" 5-2	037-00397	Sec. 13-4S-13W
"Nwlbu" 5-3	037-09796	Sec. 13-4S-13W
"Nwlbu" 5-4	037-09797	Sec. 13-4S-13W
"Nwlbu" 8-3	037-06496	Sec. 13-4S-13W
"Nwlbu" 8-4	037-06415	Sec. 13-4S-13W
"Nwlbu" 8-7	037-22512	Sec. 13-4S-13W
"Nwlbu" 9-2	037-13525	Sec. 13-4S-13W
"Nwlbu" 9-3	037-09791	Sec. 13-4S-13W
"Nwlbu" 9-4	037-00392	Sec. 13-4S-13W
"Nwlbu" 9-5	037-00142	Sec. 13-4S-13W
"Nwlbu" 9-6	037-00393	Sec. 13-4S-13W

Description of the land upon which the well (s) is (are) located.
See above

Date of transfer			Type of organization
May 9, 2000	New owner	C.R.G. Properties, Ltd. C0250	Corp./Ltd.
	Address:	15332 Antioch Street, Suite 338 Pacific Palisades, CA 90272	Telephone (310) 808-9071
Reported by	OG34A received 6/2/2000 signed by both parties		
Confirmed by	Same as above		
New operator new status PA	Designation of Agent Mark Pender		
Old operator new status PA	Remarks See operator file for C.R.G. Properties, Ltd. for details		

OPERATOR STATUS ABBREVIATIONS

PA – Producing Active
NPA- No potential, Active
PI- Potential Inactive
NPI-No potential, Inactive
Ab-Abandoned or No More Wells

Notice of Intention to Drill New Well

This notice must be given before drilling begins

037-06496

General Exploration Co. Santa Fe Springs Cal. Oct. 28, 1937

MR. E. HUGUENIN

Deputy State Oil and Gas Supervisor

Los Angeles, Cal. PI-31535

DEAR SIR:

In compliance with Section 17, Chapter 718, Statutes of 1915, as amended, notice is hereby given that it is our intention to commence the work of drilling well No. "Oil Operators" 3 Oil Operators #3, Sec. 13, T. 4-S, R. 13-W, S.B. B. & M., Long Beach Oil Field Los Angeles County. C&B

Lease consists of 982 feet N.W.'ly along the center line of the Pacific Electric Railway Right of Way from the center line of Bixby Road projected and thence 271 feet south-

The well is 355 ~~N'ly along the center line of San Antonio from the center line of Del Mar~~ feet ~~XXXXX~~, and ~~XXXXXXXXXXXXXXX Ave. and thence 929 N'ly at right angles~~
(Give location in distance from section corners or other corners of legal subdivision)

~~Will be determined later~~ westerly at right angles. (Correction letter 11-24-37)

The elevation of the derrick floor above sea level is ~~53.88~~ feet. ~~approx. 56 ft.~~

We propose to use the following strings of casing, either cementing or landing them as herein indicated:

Size of Casing, Inches	Weight, Lb. Per Foot	New or Second Hand	Depth	Landed or Cemented
13-3/8"	46	New	700'	Cmtd.
8-5/8"	36	New	4000	Cmtd.
6-5/8"	Perforated liner	New	4100'	Landed

Well is to be drilled with ~~cable~~ rotary tools.

It is understood that if changes in this plan become necessary we are to notify you before cementing or landing casing.

We estimate that the first productive oil or gas sand should be encountered at a depth of about 4000 feet, more or less.

Respectfully yours

Address Santa Fe Springs, Calif.

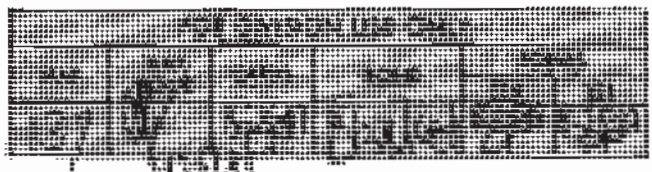
EXEMPT ☐ CLASS____	NEG. DEC. ☒ S.C.H. NO. 64-77	E.I.R. ☐ S.C.H. NO.____	DOCUMENT NOT REQUIRED BY LOCAL JURISDICTION ☐
See Reverse Side			



In compliance with Section 3203, Division 3, Public Resources Code, notice is hereby given that it is our intention to commence drilling well NW LONG BEACH UNIT #8-7, API No. 037-22512 (Assigned by Division)

Sec. 13, T. 4S, R. 13W, SB B. & M., Long Beach Field, Los Angeles County.

Legal description of mineral-right lease, consisting of 149 acres, is as follows: (Attach map or plat to scale)

see attached

Do mineral and surface leases coincide? Yes____ No X If answer is no, attach legal description of both surface and mineral leases, and map or plat to scale.

Location of well 487 feet North (Direction) ~~along section/property line~~ (Cross out one) and 779 feet West (Direction)

at right angles to said line from the ~~corner of section/property~~ (Cross out one)

intersection of centerline of San Antonio Drive & Del Mar Avenue

Is this a critical well according to the definition on the reverse side of this form? Yes ☐ No ☒

If well is to be directionally drilled, show proposed coordinates (from surface location) at total depth: 463 feet North (Direction) and 100 feet West (Direction)

Elevation of ground above sea level 45.5 feet.

All depth measurements taken from top of Kelly Bushing (Derrick Floor, Rotary Table, or Kelly Bushing) that is +10 feet above ground.

PROPOSED CASING PROGRAM

SIZE OF CASING INCHES API	WEIGHT	GRADE AND TYPE	TOP	BOTTOM	CEMENTING DEPTHS	CALCULATED FILL BEHIND CASING
13 3/8"	54.5#	K-55; BT & C	Surface	1100'	1100'	1528 CF=200% to surf
9 5/8"	36#	K-55; ST & C	Surface	2900'	2900'	705 CF=125% to 13 3/8" shoe
7"	26#	K-55; ST & C	2700'	5900'	5900'	1473 CF=125% to 9 5/8" shoe

(A complete drilling program is preferred and may be submitted in lieu of the above program.)

Intended zone(s) of completion Lower Alamitos @ 3946' TVD; Brown @ 4626' TVD; Marine @ 5196' TVD; Pressure = 800 PSI (Name, depth, and expected pressure) Estimated total depth 5826' TVD

It is understood that if changes in this plan become necessary we are to notify you immediately.

Gentlemen:

This will acknowledge receipt of and thank you for your letter of August 9, 1940, correcting the location of well No. "Mixed Control" 4, Sec.13, T. 4 S., R. 13 W., S. B. B. & M., Long Beach field, to read as follows:

"The well is located from intersection of center line of San Antonio Drive and Northeast boundary of the Pacific Electric right-of-way, 1043' northwesterly parallel to said boundary, and 251' southwesterly at right angles thereto."

Our records have been corrected accordingly.

Yours truly,

Deputy Supervisor

Report on Proposed Operations

No. P 1-31974

Los Angeles, Calif. February 3, 1938

Mr. C. H. Willis,

Los Angeles, Calif.

Agent for HILLDON OIL COMPANY

121

Dear Sir:

Your proposal to drill Well No. "FLOOD CONTROL" 2, Section 13, T. 4S., R. 13W., S. B. B. & M., Long Beach Field, Los Angeles County, dated Jan. 31, 1938, received Feb. 2, 1938, has been examined in conjunction with records filed in this office.

Present conditions as shown by the records and the proposal are as follows:

THE NOTICE STATES:

"The well is 605.1 feet from the center line of San Antonio Drive northwesterly along the northeast line of the Pacific Electric Right of Way (Long Beach City Boundary) and 523.3 feet southwesterly from and measured normal to said line. (This point is 284.1 feet southerly from Hilldon #Flood Control 1 on a line 40 feet westerly from and parallel to the 1 degree curve forming the East boundary of the Flood Control Channel.)
The elevation of the derrick floor above sea level is about 46 feet.
We estimate that the first productive oil or gas sand should be encountered at a depth of about 4000 feet."

PROPOSAL:

"We propose to use the following strings of casing, either cementing or landing them as herein indicated:

Size of Casing	Weight	Grade and Type	Depth	Landed or Cemented
13"	45#	New - O	700	Cem.
9"	45#	New - O	4000	"
6-5/8"	26#	New - O	4100	Landed

Well is to be drilled with rotary tools.
It is understood that if changes in this plan become necessary we are to notify you before cementing or landing casing."

DECISION:

THE PROPOSAL IS APPROVED PROVIDED THAT:

1. (a) Mud fluid consistent with good drilling practice shall be used in the drilling of the well and the column of mud fluid shall be maintained at all times to the surface, particularly while pulling the drill pipe.
   (b) Adequate blow-out prevention equipment shall be provided and ready for operation at all times.
2. Any hole to be sidetracked in any oil zone shall be completely filled with cement, if possible.
3. This division shall be notified to examine cores and/or electrical log before running the 9" casing.
4. THIS DIVISION SHALL BE NOTIFIED TO WITNESS:
   (a) The cementing of the 13" casing.
   (b) A test of the effectiveness of the 9" shut-off.

REPORT OF WELL PLUGGING AND ABANDONMENT

Long Beach, California

November 27, 1996

Steve Graner, President
NORTH SIDE OIL CORPORATION
P. O. Box 16007
LONG BEACH CA 90807

Your report of the plugging and abandonment of well **Pacific Energy Resources/NWLBU 6-2**, A.P.I. No. **037-09789**, Section **13**, T. **4S**, R. **13W**, S.B. B.& M., **Long Beach** Field, **Los Angeles** County, dated **November 1996**, received **November 22, 1996**, has been examined in conjunction with operations witnessed and records filed in this office. We have determined that all of the requirements of this Division have been fulfilled relativa to plugging and abandonment of the well, removal of well equipment and junk, and the filing of well records.

NOTES:
1. Surface plugging completed on **10-21-96.**
2. Surface inspection made and approved **11-26-96.**

Notice of Intention to Drill New Well

This notice must be given before drilling begins

LOS ANGELES, CALIFORNIA

037-09789

GENERAL Exploration Co.

Long Beach Cal. Aug. 21 1937

MR. E. Huguenin

Deputy State Oil and Gas Supervisor

Los Angeles Cal.

DEAR SIR:

"Amebco" 2

In compliance with Section 17, Chapter 718, Statutes of 1915, as amended, notice is hereby given that it is our intention to commence the work of drilling well No. "Amelia M.E.Bixby Company"2, Sec. 13, T. 4 S., R. 13 W., S.B. B. & M., Long Beach Oil Field Los Angeles County.

Lease consists of ~~475' S.W. ly from c/l Delmar Ave at rtl Ln. and 300' S. from c/l Bixby Rd. produced~~

The well is feet N. or S., and feet E. or W. from

(Give location in distance from section corners or other corners of legal subdivision) See correct location on Reverse side this sheet.

The elevation of the derrick floor above sea level is 45 feet.

See location as given in correction letter 12-20-37

We propose to use the following strings of casing, either cementing or landing them as herein indicated:

Size of Casing, Inches	Weight, Lb. Per Foot	New or Second Hand	Depth	Landed or Cemented
13"	45	New	700	Cem.
9"	45	New	4000	Cem.
6-5/8	26	New	4050	Landed

Well is to be drilled with rotary / cable tools.

It is understood that if changes in this plan become necessary we are to notify you before cementing or landing casing.

We estimate that the first productive oil or gas sand should be encountered at a depth of about 4000 feet, more or less.

Respectfully yours

San Francisco, California

See letters on "Bixby Core Hole" 1, API 037-25192, Long Beach /-

Dear Sir

This is in reply to your letter of November 8th asking for the location of six shallow core holes drilled in the Los Cerritos area, Long Beach. The locations are as follows:

Bixby #1	1440' N. and 1240' E.
Bixby 2A	2785' N. and 505' E.
Bixby 3	350' N. and 1283' E.
Bixby 4	2085' N. and 208' E.
Bixby 5	768' N. and 320' E.
Bixby 6	3035' N. and 990' E.

These coordinates are from the intersection of the center lines of Wardlow Road and Golden Avenue. This intersection is approximately 2120 feet west of the intersection of the center line of Wardlow Road and the west track of the Pacific Electric Railway.

Very truly yours,

SHELL OIL COMPANY

Notice of Intention to Drill New Well

037-09796

This notice must be given and surety bond filed before drilling begins

General Exploration Co.

Los Angeles Calif. April 26, 1938

DIVISION OF OIL AND GAS

Los Angeles Calif.

"Pool" 3

In compliance with Section 17, Chapter 718, Statutes of 1915, as amended, notice is hereby given that it is our intention to commence the work of drilling well No. Pool #3, Sec. 13, T. 4 S, R. 13-W, S. B. B. & M., Long Beach Field, Los Angeles County. SHR.

Lease consists of

The well is located feet N. or S., and feet E. or W. from
(Give location in distance from section corners or other corners of legal subdivision)

The elevation of the derrick floor above sea level is approx. 55 feet.

We estimate that the first productive oil or gas sand should be encountered at a depth of about 4050 feet.

We propose to use the following strings of casing, either cementing or landing them as herein indicated:

Size of Casing, Inches	Weight, Lb. Per Foot	Grade and Type	Depth	Landed or Cemented
13"	45#	New - C	700	Cemented
9"	45#	" "	4050	"
6-5/8"	26#	" "	4150	Landed

Well is to be drilled with rotary tools.

It is understood that if changes in this plan become necessary we are to notify you before cementing or landing casing.

Address 215 W. 7th Street, Los Angeles

Telephone number MU-2156

Hilldon Oil Company
(Name of Operator)

Report on Proposed Operations

No. P 1-31536

Los Angeles, Calif. November 4, 1937.

Mr. W. Fusten, Jr.,
Los Angeles, Calif.

Agent for UNION OIL COMPANY OF CALIFORNIA

DEAR SIR:

Your proposal to drill Well No. "OIL OPERATORS" 8,
Section 13, T. 4 S., R. 13 W., S.B. B. & M., Long Beach Field, Los Angeles County,
dated Oct. 28, 1937, received Oct. 29, 1937, has been examined in conjunction with records filed in this office.

Present conditions as shown by the records and the proposal are as follows:

THE NOTICE STATES:

"~~The well is 580' N'ly along center line of San Antonio from the center line of Del Mar and thence 115' E'ly at right angles~~ * The elevation of the derrick floor above sea level ~~will be determined later (Approx. 55')~~ 56.97
We estimate that the first productive oil or gas sand should be encountered at a depth of about 4000 feet, more or less."

PROPOSAL:

"We propose to use the following strings of casing, either cementing or landing them as herei indicated:

Size of Casing	Weight	New or Second Hand	Depth	Landed or Cemented
13-3/8	46	New	700'	Cmtd.
8-5/8	36	New	4000	Cmtd.
6-5/8 Perforated liner		New	4100	Landed

Well is to be drilled with rotary tools.

It is understood that if changes in this plan become necessary we are to notify you before c menting or landing casing."

DECISION:

THE PROPOSAL IS APPROVED PROVIDED THAT:

1. (a) Mud fluid of not less than 70 lb. per cubic foot shall be used in the drilling of the well and the column of mud fluid shall be maintained at all times to the surface, particularly while pulling the drill pipe.
   (b) Adequate blow-out prevention equipment shall be provided and ready for operation at all times.
2. Any hole to be sidetracked at any time during the drilling of this well shall be completely filled with cement.
3. The formations to be left back of the 8-5/8" casing shall be mudded by open circulation until the loss is not more than 5 bbl. per hr.
4. THIS DIVISION SHALL BE NOTIFIED TO WITNESS:
   (a) The cementing of the 13-3/8" surface casing.
   (b) Final mudding operations before cementing the 8-5/8" casing.
   (c) A test of the effectiveness of the 8-5/8" shut-off.

cc- H. E. Winter
Long Beach

RE: CI#6751, South Site and CI#6775, North Site

Dear Mr. Gonzales:

As a follow up to our phone conversation of October 17, 1990, I am enclosing copies of letters sent to Mr. Jim Ross requesting that monitoring requirements on the above noted locations be changed from quarterly to annually. The reason for the request was/is the consistant lack of variation in previous test results on the site(s).

We have no record of a response to either of our requests. The lack of response was taken as implied consent to our request to annual testing. It would be appreciated if we could at this time receive formal acknowledgement of and consent to our request for annual, instead of quarterly, monitoring.

Your attention to, and assistance in, this matter is very much appreciated.

Thank you,

Sheri Johnson

RECEIVED
AUG 31 1989
SUKUT CONSTRUCTION, INC.

SUBJECT: RESULTS OF POST EXCAVATION SOIL SAMPLING

REFERENCE: OIL OPERATORS- NORTH SITE

Dear Mr. Pender:

On August 1, 4, 17 and 18, 1989 exploratory excavations were conducted by personnel from Sukut Construction at the referenced site. Personnel from Jack K. Bryant & Associates, Inc. were also on hand on those dates to perform random soil sampling as needed.

A total of fourteen soil samples (E1 to E11, S1 and S2) were collected for analysis. All of them were analyzed for the presence of Total Recoverable Petroleum Hydrocarbons. Further, of these, only one soil sample (E1) was subjected to more extensive analysis for detection of other hazardous constituents. Samples E1 to E11 were taken on August 1 and 4 while S1 and S2 were taken on August 18. No samples were taken on August 17.

The results of the Total Recoverable Petroleum Hydrocarbons (TRPH) analysis through EPA method 418.1 are tabulated below. All the formal laboratory results are attached for your records.

Sample	TRPH, mg/kg = ppm
[redacted]	[redacted]
[redacted]	[redacted]
E3	3,400
E4	750
E5	3,500
E6	190
[redacted]	[redacted]
E8	16
[redacted]	[redacted]
[redacted]	[redacted]
[redacted]	[redacted]
E11	5,100
S1	120
S2	Not detected

460 CARSON PLAZA DRIVE, SUITE 106, CARSON, CA 90746 • (213) 769-0900 • FAX: (213) 769-0055

As can be seen, the bulk of the TRPH results are high. This would be reasonable as it is known that crude oil sludge is present on site. Further the high values indicate that the soil is amenable to biodegradation.

The soil sample E1 following extensive analysis exhibits the presence of the following volatile organics: benzene, ethylbenzene, tetrachloroethane, toluene and xylene. These are common petroleum constituents. The soil further appears to be slightly alkaline in nature with a pH of 7.6. Bioremediation typically needs an optimum pH range of 6-8. Also, semivolatile organics have been detected in the sample and include phenol, naphthalene, methylnaphthalene and acenaphthene. The analysis also indicates that the soil sample from excavation E1 is devoid of pesticides and PCBs. However, the soil sample has metallic constituents which include arsenic, barium, cadmium, chromium, cobalt, copper, lead, molybdenum, nickel, vanadium and zinc. These are known to be bacterial growth inhibitors but at only at certain concentrations.

In response to our request for a six months extension on the Rule 1150 permit, the South Coast Air Quality Management District has informed us that the said permit would be valid till November 1, 1989. The permit is however conditioned for further extension requests.

If you should have any queries, please do call me at (213) 769-0900.

With best regards.

Yours truly,

April 19, 1989

Ref: E-8801

RECEIVED APR 2 1 1989

Mr. Robert R. Pease, P.E.
Senior Air Quality Engineering Manager
South Coast Air Quality Management District
9150 Flair Drive
El Monte, California 91731

SUBJECT: OIL OPERATORS, INC.
RULE 1150 PERMIT NO. 157742

Dear Mr. Pease:

Reference is made to the meeting in the District Office on April 12, 1989. Attending the meeting were:

NAME	ORGANIZATION	PHONE NO.
Stacey M.K. Ebiner	SCAQMD	(818) 572-6318
Robert Pease	SCAQMD	(818) 572-6174
Jay Chen	SCAQMD	(818) 572-6193
Elliott Sernel (AQMD Attorney)	SCAQMD	(818) 572-2050
Mark Pender	Pender Properties	(213) 490-0077
Bill Smiland (Pender Attorney)	Donnelly, Clark etal	(213) 626-0211
Richard Young	Oil Operators	(213) 426-1912
Jack Bryant	JKB & A	(213) 769-0900
Don Best	JKB & A	(213) 769-0900
Stanley Che	JKB & A	(213) 769-0900

Following discussion it is our understanding that the District will extend Permit No. 157742. The conditions of the extended permit will be amended to limit the time period of the permit to any such time as 100,000 cubic yards of the material containing 20,000 ppm of oil or greater have been processed. At any such time the permit will again be extended provided that the material encountered has an absolute vapor pressure below 36 mm of mercury.

460 CARSON PLAZA DRIVE, SUITE 106, CARSON, CA 90746 • (213) 769-0900 • FAX: (213) 769-0055

BACKGROUND

Oil Operators, Inc. a California corporation operated as a cooperative for treating and disposing of oil field waste water has maintained a sump on approximately 14 acres of property located at the northeast quadrant of the intersection of the 110 and 405 freeways. This sump containing some 500,000 cu. yds. of material defined as clay and dirt containing upwards of 90,000 ppm of crude oil has existed since the 1920's.

In 1971-73 Oil Operators, Inc. biodegraded approximately 300,000 cu. yds. of the material. Due to financial limitations, the biodegradation was not completed. The residual material was covered with the processed material and has remained in this condition for the past 15 years.

Extensive testing, initial excavation and correspondence has taken place during the past two years and Oil Operators, Inc. through Pender Properties is now ready to proceed with the soil remediation.

It is now proposed to complete excavation of the processed material, biodegrade the unprocessed material and to replace all the material in a compacted state, thus creating a buildable site.

A remediation test and other work have been conducted as required by Title 22.

Also legal arguments have been presented relating to the extension of Permit No. 157742 and compliance with Rule 1166.

Test data has been submitted showing exemption from Rule 1166. The some 60 years of the sumps existence has permitted the light hydrocarbons to volatilize leaving a heavy material containing crude oil with a vapor pressure below the 36 limit established by Rule 1166.

We trust our request, supported with the appendixed data, will result in the extension of the Rule 1150 Permit upon the conditions discussed at our meeting.

Sincerely,

JACK K. BRYANT AND ASSOCIATES, INC.

Jack K. Bryant

Jack K. Bryant, P.E.
President

JKB/DB/sw-DBS-216

A P P E N D I X

LAND USE

The site is bounded on the northeast by the Pacific Electric Railroad, on the west by the Los Angeles County Flood Control Channel, and on the south by the San Diego Freeway. The Caltrans Pacific Place Maintenance Station lies in the southeast corner. An open area along the western boundary is used for horse riding trails. Los Cerritos Park, used for public recreation, lies directly to the east.

The western edge of the site lies approximately 200 feet east of the berm of the Los Angeles County Flood Control Channel (Los Angeles River), a partial concrete structure. Natural hill slopes on the site have been eliminated by grading and leveling. the west side of the property has an elevation of about 50 feet.

There are several operating oil wells and storage tanks to the northwest of the site. A functioning well is also located on the south side. The southwest area is currently used for pipe and equipment storage. Most of the site is overlain by material that formerly constituted an oil waste sump.

SITE CHARACTERIZATION

A site characterization study was conducted in August 1986. Copies of the report were submitted to SCAQMD, CRWQCB and DOHS.

Ten gas migration probes were drilled on the site and two adjacent to the site in August to assess both the gas being generated and to characterize the sump material. Samples were categorized into six types as determined by their physical characteristics. These are presented below:

Type 1 - Low to medium oil content in a dark silty or sandy clay

Type 2 - Medium to high oil content, with some samples showing liquid oil, in a black silty to sandy clay

Type 3 - Extremely high oil content in an toothpast-like consistency

Type 4 - Very low oil content in a dry blue clay

Type 5 - Very low oil content in a dry grey sand

Type 6 - None to very low oil content in a brown silty sand. These samples were taken from the Los Angeles County Flood Control and Pacific Electric Railroad easements adjacent to the site.

Prior to 1981, the entire parcel was similar to the type 3 material, extremely high oil content in a toothpaste-like consistency. Oil Operators, Inc. had previously embarked on a program to eliminate the sump. A major portion of the material originally constituting the sump has been treated and essentially stabilized. the remaining untreated material constitutes a wedge of wastes underlying the southwestern one-third of the site of the original sump. This wedge is more than 20 feet in thickness at the western side decreasing in thickness toward the southeastern side. Several scattered pockets of oil are also present. Proposed plans call for this untreated material to be mixed with soil and reclaimed as soil using appropriate proven soil stabilization techniques.

Four soil samples were collected with a backhoe and submitted for chemical analysis on April 28, 1986. The chemical analyses ordered included volatile organic hydrocarbons (including benzene, toluene, and xylene), total non-volatile organic hydrocarbons, organic lead, and polychlorinated biphenyls. While no benzene or toluene were found in the samples, low levels of xylene were detected (93 ppm average). Other volatile organic hydrocarbons average 11,158 ppm while non-volatiles averaged 130,200 ppm. Organic lead averaged 3.21 ppm and PCB levels were so low as to be not clearly identifiable. Results are presented in Table 1.

A water sample was obtained from a pocket of perched water located at an 8 foot depth. This sample was analyzed for total petroleum hydrocarbons, PCB's, BTXx, halogenated hydrocarbons, and six separate metals. Results of these analyses are presented in Table 2.

Gas analyses included field testing for lower explosive level concentrations and probe pressures, and laboratory analyses for major gases, GC/halogenated compounds, and BTX. For those probes located on the site, methane concentrations ranged from 12.1 to 83.6 percent with an average lower explosive level typically exceeded 100 percent and the average probe pressure was 0.3 inches of water pressure.

TABLE 1

Lead (total)	=	16	mg/l
Zinc	=	18	mg/l

Most recently, a test plot was prepared to demonstrate the feasibility of the biodegradation effort. Raw sump material was analyzed for total petroleum hydrocarbons (EPA Method 418.1), BTXEe (EPA Mmethod 8020), volatile organics (EPA Method 8240), semi-volatile organics, (EPA Method 8270), PCB's pH (EPA 9040), flash point (EPA 1010), CAM metals, and a CAM fish bioassay. All levels for all parameters fell below those specified by the USEPA. Table 3 lists the results of these analyses.

SOIL ATTENUATION PROCESS

Our goal is to reduce the current hydrocarbon contaminants to levels acceptable to the CRWQCB. The first phase will consist of digging out the soil sump material with a front loader and, if necessary, a backhoe, clamshell, or drag line. Strips of material will be removed until clean sand is encountered. This sand will also be removed and used for dilution. The sump material will be moved to an adjacent area for treatment. The clean underlying sand will be piled up in a stockpile area. In the second phase the sump materials will be spread to a depth of approximately 6 inches and serated with a Caterpillar SS-250 In-Place Soil Stabilizer to aerate the material. Fertilizer and oil utilizing bacteria will be added to the material while aerating to stimulate microbial growth. Aeration will continue until the material becomes friable. At this point laboratory analysis will be performed to determine the total residual oil content left in the treated material. If this residual level is greater than what is acceptable by the CRWQCB, clean fill sand which was previously stockpiled will be mixed in with the treatment material to attain this limit. The third phase will consist of replacement of this treated material into the original excavation.

RULE 1150 PERMIT NO. 157742 SUBSTANTIVE CONDITIONS

The above referenced permit provided for 34 conditions of implementation. Of those conditions the following are substative conditions to the issues.

19. Prior to the start of excavation, a minimum of three (3) ambient air sampling stations shall be installed and operational at the locations approved by the District.

20. Ambient air samples shall be collected using the District approved samplers at least once a week over a minimum of an 8-hour period while excavation activities are in progress. Each sample collected shall be

TABLE 3

LABORATORY ANALYSES FOR RAW MATERIAL SAMPLES

properly identified with an ID number and the sampling location, date and time. Each sample shall be analyzed for benzene, toluene, xylenen and halogenated hydrocarbons speciated and quantified by gas chromatography/mass spectrometry within 72 hours of collection. The weather conditions and wind speed and direction during sampling shall also be recorded.

21. All exposed sump material shall be covered with either a minimum of 6 inches of clean soil, approved foam or approved foam and heavy-duty plastic sheeting whenever the excavation is not actively in progress, and at the end of each working day. Foam by itself shall not be used as a night cover if it is raining or rain is predicted by the National Weather Service prior to the next scheduled day of excavation.

22. During excavation, if a considerable number of complaints are received, all work shall cease and the approved mitigation measures shall be implemented immediately. Other mitigation measures which are deemed appropriate by SCAQMD personnel to abate a nuisance condition shall be implemented upon request.

25. During excavation, monitoring for organics as methane using an organic vapor analyzer (OVA) or a TLV sniffer shall be conducted continuously at the property line directly downwind of the excavation and at the working face.

SUBJECT: RESULTS OF TEST PLOT AT OIL OPERATORS NORTH SITE

Dear Mr. Liu:

This document outlines the procedures used in the construction, operation, sampling, and analyses of a test plot at the referenced site. The plot was used to demonstrate the feasibility of biodegrading the hydrocarbon contaminated soil found at the site.

A. Analytical Results for the Land Treatment Area

At this point we have performed a test plot to demonstrate the biodegradation of waste constituents.

On May 31, the area for the test plot was cleared and leveled. Figure 1 shows the location of the test plot within the boundries of the parcel. A TLV combustible vapor detector was used to monitor the soil gas emitted during this operation. All vapor readings were taken at a distance less than 3 inches from the soil surface. Readings were typically less than 10 ppm with the highest readings being about 40 ppm. A system of sprinklers to keep the area moist was constructed.

Six "cells" of approximately 8 feet wide by 50 feet long were laid out with stakes. A rototiller was then used to breakup the soil. Ammonium nitrate and phosphate were broadcast over the cells and tilled into the soil.

On June 3 composite soil samples were obtained from each cell (Figure 2). Following this, oil utilizing bacteria were applied to the plot. Commercially available bacteria were added to warm water (approximately 90 to 100 F) and agitated for 6 hours as per the distributor's instructions. This mixture was added to a 1,000 gallon water tank and sprayed onto cells A through E. Though none was intentionally sprayed on cell F, the breeze carried a minor quantity onto this cell also. The cells were then rototilled and watered so as to blend the bacteria with the soil.

On June 6, a backhoe was used to excavate about 20 cubic yards of oil contaminated soil from the site. Soil was removed to a depth of about 12 to 15 feet. This raw material was mixed with surface soil in approximately a 1:1 ratio. Downwind samples taken at a point about 10 feet from the pile of raw material and about 70 feet from the area where the raw material was being mixed with surface material gave readings of 10 to 30 ppm. Downwind readings taken near the property boundaries showed concentrations of 4 to 6 ppm with no noticeable

10701 Los Alamitos Blvd., Suite 200, Los Alamitos, CA 90720 (213) 596-2755

odor. These low value downwind readings may have been due to the mixing operations but were more probably due to freeway traffic and instrument drift.

The material was then spread on each of the cells and rototilled into the existing soil. Approximately 5 inches of this material was applied to cell A, 3 inches to cells B and C and 6 inches to cells D, E, and F. The oil content of A, B, and C appeared heavier then D, E, and F, however F had a large quantity of asphalt in the soil and E had a lesser quantity. The plot was then rototilled to mix the material into the underlying soil. The effective depth of the rototiller, however, precluded a good mix. Composite samples were then obtained from each cell (Figure 3). Laboratory results are reported in Table 1.

The operation schedule specifies that cells A and D be mixed twice daily, B and E four time daily, and C and F six times daily. This procedure was carried out on June 6 with the rototiller, and on June 8, 9, and 10 with a Caterpillar SS-250 In-Place Soil Stabilizer. Composite soil samples from each cell were taken on June 9, 10, and 13 (Figures 4, 5, and 6). All samples were obtained about 6 inches beneath the surface. Samples were analyzed for total petroleum hydrocarbons using EPA Method 418.1. Laboratory results are presented in Table 1.

TABLE 1

LABORATORY ANALYSES FOR COMPOSITE SOIL SAMPLES

	Times Mixed Daily	*June 3	June 6	June 9	June 10	June 13
TP-A	2	840	800	2,300	770	770
TP-B	4	140	970	530	510	390
TP-C	6	680	1,700	910	480	180
TP-D	2	46	130	140	220	160
TP-E	4	44	1,900	3,100	3,000	1,000
TP-F	6	31,000	3,200	12,000	8,700	1,300

*Before oil sludge was added to the test plot.

It should be noted that cell F contained a large quantity of crushed asphalt and cell E had a lesser quantity.

The results of the test plot show that the treatment process works most effectively with more mixing. While the cells mixed twice daily (A and D) show little if any improvement, the cells mixed twice daily (B and E) showed marked improvement and the cells mixed six times daily (C and F) show improvement by an order of magnitude even in the asphalt contaminated cells.

Test cells E and F show higher concentrations of hydrocarbon on June 9 and 10 then on June 6, most likely because the mixer pulverized the asphalt in the soil. After pulverization the asphalt chunks could not be removed from the sample. However, even the asphalt degraded with continued mixing. The high reading on June 9 for cell A may have also been due to asphalt or an unmixed piece of oil sludge. Formal laboratory results are included in Appendix A.

Results of the test are positive and clearly show the benefits of mixing and aeration.

B. **Analytical Results for Sump Soil Monitoring**

The pile of raw material was sampled for analyses. Samples were taken in laboratory supplied jars and a 3 gallon sealable bucket. Samples in jars were then placed in an ice chest with Blue Ice. All samples were delivered to State certified laboratory the same day for analyses. The analyses included total petroleum hydrocarbons (EPA 418.1), BTXE, volatile organics, semi-volatile organics, PCB's, pH, flash point, CAM metals, and a fish bioassay. Analyses results for those parameters detected are presented in Table 2.

TLV combustible vapor reading were taken for this raw material also. The probe was held directly (less than 1/2 inch) up to the mound of excavated material at various locations. Vapor readings were on the order of 200 to 300 ppm.

If you need further information please contact us at (213) 596-2755.

CRWQCB FILE # 87-54
JAYKIM REF: 68033.01

Mr. Jim Ross
California Regional Water Quality Control Board
Los Angeles Region
107 South Broadway, Suite 4027
Los Angeles, CA 90012-4596

SUBJECT: 72-HOUR NOTICE TO PROCEED WITH LANDFARMING ACTIVITIES AT OIL OPERATORS NORTH SITE IN LONG BEACH

Dear Mr. Ross:

In response to the regulatory requirement to notify appropriate agencies 48-72 hours in advance of proceeding with landfarming activities at Oil Operators North Site in Long Beach, the following information is submitted in compliance with this specification.

Oil Operators, Inc. is located at 712 West Baker Street in Long Beach. Appropriate permits and variances have been attained to land treat oily soil from sumps north of the premises in order to reclaim and reuse the soil on site for future development.

The land treatment operation is to commence at the facility on May 31, 1988. The attached grid, Figure 1, indicates how the operation will proceed and a schedule of activities.

The first phase of the treatment program is to conduct a test plot of the proposed treatment to ensure the adequacy of the method on the contaminated soil. The test plot will be comprised of six individual 8 foot by 50 foot test plots to encompass a total area size of approximately 50 feet by 50 feet. Each plot will consist of a 6 inch layer of clean soil with varying quantities of sludge mixed in it. Nitrogen sulfate and nitrogen phosphate were added to the test plots, beneath the clean soil on May 31, 1988. Oil utilizing bacteria were applied to each plot (except F which is used as a control plot), also beneath the contaminated soil, on June 3. The oily contaminated sludge will be added atop this mixture of fertilizer, bacteria, and clean soil. The mixture will be disked daily, the number of times per day varying per plot.

The following table summarizes the test plot study:

Plot	Size (ft)	Sludge Layer (in)	Disking Times/Day
A	8 X 50	5	2
B	8 X 50	3	4
C	8 X 50	3	6
D	8 X 50	6	2
E	8 X 50	6	4
F	8 X 50	6	4

Mr. Fred Tornatore
State Department of Health Services
Toxic Substances Control Division
Alternative Technology
400 P Street, 4th Floor
Sacramento, CA 95814

SUBJECT: LONG BEACH - BIOREMEDIATION OF CRUDE OIL CONTAMINATED SOIL

Dear Mr. Tornatore:

In accordance with your verbal approval given in a telephone conversation, we are proceeding with the test biodegradation plot at the Oil Operators North Site in the City of Long Beach. Land preparation (without the addition of oil) will begin on Tuesday, May 31, 1988.

The land plot to be utilized for the test will be located as shown on the enclosed map. There are to be 6 sections measuring 8 ft. X 50 ft. each with 5 feet of separation between each section.

The initial preparation of the earth will consist of rototilling the soil in each section to a depth of six inches, adding water, adding nutrients and finally adding freeze dried commercially available bacteria. These preparations will take 7 days.

On Tuesday, June 7, 1988, it is planned to excavate a limited amount of the oily material, spread this material in varying amounts onto each of the individual sections and rototill the spread material into the underlying prepared soil. Each section will receive varying rototilling efforts.

Samples for laboratory analysis will be taken at intervals to test for total petroleum hydrocarbons and bacterial activity.

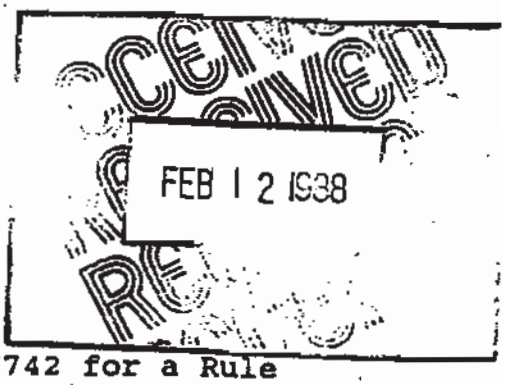
Oil Operators, Inc.
712 West Baker Street
Long Beach, CA 90806



Attention: Mr. Elton Oliver

Gentlemen:

Rule 1150 Excavation Permit

Reference is made to your Application No. 157742 for a Rule 1150 Excavation Permit for the removal, landfarming and backfilling of waste oil sump material at the North Site at 712 West Baker Street, Long Beach, CA. 90806. Please be advised that this Excavation Permit is granted under Rule 1150 of the Rules and Regulations of the South Coast Air Quality Management District and is subject to the following conditions:

1. THIS EXCAVATION SHALL BE CONDUCTED IN COMPLIANCE WITH ALL PLANS AND SPECIFICATIONS SUBMITTED WITH THE APPLICATION UNDER WHICH THIS PERMIT IS ISSUED UNLESS OTHERWISE NOTED BELOW.

2. FOR PURPOSES OF THIS PERMIT, EXCAVATION SHALL INCLUDE EXCAVATION, LANDFARMING AND BACKFILLING OPERATIONS, EXCEPT CONDITION NUMBERS 25, 26 AND 27.

3. THIS EXCAVATION PERMIT IS VALID UNTIL FEBRUARY 10, 1989. AN EXTENSION MAY BE GRANTED UPON WRITTEN REQUEST. SUCH A REQUEST WILL INCLUDE THE REASONS THE EXTENSION IS REQUIRED, THE LENGTH OF THE EXTENSION, AND THE STATUS OF THE EXCAVATION TO DATE.

4. THE SCAQMD SHALL BE NOTIFIED IN WRITING WHEN THE EXCAVATION COMMENCES AND WHEN IT IS COMPLETED. SUCH NOTIFICATIONS SHALL OCCUR AT LEAST TWO DAYS PRIOR TO THE COMMENCEMENT AND WITHIN FIVE DAYS AFTER THE COMPLETION OF THE EXCAVATION.

5. THIS EXCAVATION PERMIT IS VALID ONLY FOR THE REMOVAL AND LANDFARMING OF APPROXIMATELY 700,000 CUBIC YARDS OF EXCAVATED MATERIAL INCLUDING APPROXIMATELY 200,000 CUBIC YARDS OF UNTREATED WASTE OIL SUMP MATERIAL.

6. EXCAVATION SHALL NOT BE CONDUCTED BETWEEN THE HOURS OF 6 P.M. AND 7 A.M. OR ON SATURDAYS, SUNDAYS AND LEGAL HOLIDAYS.

7. EXCAVATION SHALL NOT BE CONDUCTED ON DAYS WHEN THE SCAQMD FORECASTS SECOND OR THIRD STAGE EPISODES FOR AREA NUMBER 4. EPISODE FORECASTS FOR THE FOLLOWING DAY CAN BE OBTAINED BY CALLING (800) 445-3826 OR (800) 242-4666.

8. EXCAVATION SHALL NOT BE CONDUCTED ON DAYS WHEN THE SCAQMD REQUIRES COMPANIES IN AREA NUMBER 4 TO IMPLEMENT THEIR SECOND OR THIRD STAGE EPISODE PLANS. AREA NUMBERS REQUIRED TO IMPLEMENT THEIR EPISODE PLANS CAN BE DETERMINED FOR THE NEXT DAY BY CALLING (800) 445-3826 OR (800) 242-4666.

9. EXCAVATION SHALL NOT BE CONDUCTED WHEN THE WIND SPEED IS GREATER THAN 15 M.P.H. AVERAGE (OVER 15 MINUTES) OR THE WIND SPEED INSTANTANEOUSLY EXCEEDS 25 M.P.H.

10. DURING EXCAVATION, ALL WORKING AREAS, EXCAVATED MATERIAL AND UNPAVED ROADWAYS SHALL BE WATERED DOWN UNTIL THE SURFACE IS MOIST AND THEN MAINTAINED IN A MOIST CONDITION TO MINIMIZE DUST.

11. EXCAVATED MATERIAL EXCEPT REFUSE SHALL NOT BE TRANSPORTED OFFSITE. ALL WASTE OIL SUMP MATERIAL SHALL BE TREATED AND BACKFILLED ONSITE. EXCAVATED REFUSE NOT SUITABLE FOR ON-SITE TREATMENT SHALL BE PROPERLY DISPOSED OF AT A LEGAL DISPOSAL SITE.

12. ALL EXCAVATED REFUSE TO BE HAULED OFFSITE SHALL BE TRANSPORTED IN TRUCK BEDS OR TRAILERS WHICH ARE COVERED WITH AN IMPERMEABLE COVER, WITH SUCH COVERS TIED DOWN. ALL SEAMS AND OTHER AREAS SHALL BE SEALED TO PREVENT ANY MATERIAL FROM ESCAPING DURING TRANSPORTATION.

13. WHEN LOADING IS COMPLETED AND DURING TRANSPORT, NO MATERIAL SHALL BE EXTENDED ABOVE THE SIDES OR REAR OF THE TRUCK OR TRAILER WHICH WILL HAUL THE EXCAVATED REFUSE.

14. THE EXCAVATED ODOROUS REFUSE SHALL NOT BE STOCKPILED ON SITE. THIS MATERIAL SHALL BE DEPOSITED DIRECTLY INTO THE TRUCKS WHICH WILL HAUL IT OFF-SITE.

15. FOR PURPOSES OF THIS PERMIT, REFUSE IS DEFINED AS HOUSEHOLD/COMMERCIAL TRASH, UNCONTAMINATED INERT SOLIDS, AND OTHER MATERIAL THAT CANNOT BE LANDFARMED AS APPROVED BY THE DISTRICT.

16. ALL CONSTRUCTION EQUIPMENT AND TRUCKS (INCLUDING TIRES) COMING IN CONTACT WITH THE EXCAVATED MATERIAL SHALL BE CLEANED OFF PRIOR TO LEAVING THE EXCAVATION SITE.

17. THE EXCAVATION, LANDFARMING, AND BACKFILLING OPERATIONS SHALL BE CONDUCTED IN ACCORDANCE WITH THE GRID LOCATIONS(FIGURE 3) AND THE OPERATING SCHEDULE(FIGURE 4) OF THE REVISED EXCAVATION MANAGEMENT PLAN UNLESS OTHERWISE APPROVED BY THE DISTRICT. ALL LANDFARMING OPERATIONS SHALL ONLY BE CONDUCTED ON GRID AREAS B, D, F AND H.

18. DURING EXCAVATION, WIND SPEED AND DIRECTION SHALL BE CONTINUOUSLY MONITORED AND RECORDED AT A SITE APPROVED BY THE DISTRICT.

19. PRIOR TO THE START OF EXCAVATION, A MINIMUM OF THREE(3) AMBIENT AIR SAMPLING STATIONS SHALL BE INSTALLED AND OPERATIONAL AT THE LOCATIONS APPROVED BY THE DISTRICT.

20. AMBIENT AIR SAMPLES SHALL BE COLLECTED USING THE DISTRICT APPROVED SAMPLERS AT LEAST ONCE A WEEK OVER A MINIMUM OF AN 8-HOUR PERIOD WHILE EXCAVATION ACTIVITIES ARE IN PROGRESS. EACH SAMPLE COLLECTED SHALL BE PROPERLY IDENTIFIED WITH AN ID NUMBER AND THE SAMPLING LOCATION, DATE AND TIME. EACH SAMPLE SHALL BE ANALYZED FOR BENZENE, TOLUENE, XYLENE AND HALOGENATED HYDROCARBONS SPECIATED AND QUANTIFIED BY GAS CHROMATOGRAPHY/MASS SPECTROMETRY WITHIN 72 HOURS OF COLLECTION. THE WEATHER CONDITIONS AND WIND SPEED AND DIRECTION DURING SAMPLING SHALL ALSO BE RECORDED.

21. ALL EXPOSED SUMP MATERIAL SHALL BE COVERED WITH EITHER A MINIMUM OF 6 INCHES OF CLEAN SOIL, APPROVED FOAM OR APPROVED FOAM AND HEAVY-DUTY PLASTIC SHEETING WHENEVER THE EXCAVATION IS NOT ACTIVELY IN PROGRESS, AND AT THE END OF EACH WORKING DAY. FOAM BY ITSELF SHALL NOT BE USED AS A NIGHT COVER IF IT IS RAINING OR RAIN IS PREDICTED BY THE NATIONAL WEATHER SERVICE PRIOR TO THE NEXT SCHEDULED DAY OF EXCAVATION.

22. DURING EXCAVATION, IF A CONSIDERABLE NUMBER OF COMPLAINTS ARE RECEIVED, ALL WORK SHALL CEASE AND THE APPROVED MITIGATION MEASURES SHALL BE IMPLEMENTED IMMEDIATELY. OTHER MITIGATION MEASURES WHICH ARE DEEMED APPROPRIATE BY SCAQMD PERSONNEL TO ABATE A NUISANCE CONDITION SHALL BE IMPLEMENTED UPON REQUEST.

23. IF HAZARDOUS MATERIALS ARE ENCOUNTERED DURING THE EXCAVATION, THE EXCAVATION SHALL CEASE IMMEDIATELY AND ALL EXPOSED MATERIALS SHALL BE COVERED WITH A MINIMUM OF 12 INCHES OF CLEAN SOIL. THE EXCAVATION SHALL NOT RECOMMENCE UNTIL AFTER MITIGATION MEASURES FOR HANDLING THE HAZARDOUS WASTE HAVE BEEN SUBMITTED TO AND APPROVED BY THE DISTRICT AND OTHER APPROPRIATE GOVERNMENTAL AGENCIES.

24. ALL MATERIALS THAT ARE LISTED AS HAZARDOUS BY A FEDERAL OR STATE AGENCY SHALL BE CONSIDERED "HAZARDOUS MATERIALS" FOR THE PURPOSE OF THIS PERMIT.

25. DURING EXCAVATION, MONITORING FOR ORGANICS AS METHANE USING AN ORGANIC VAPOR ANALYZER (OVA) OR A TLV SNIFFER SHALL BE CONDUCTED CONTINUOUSLY AT THE PROPERTY LINE DIRECTLY DOWNWIND OF THE EXCAVATION AND AT THE WORKING FACE.

26. IF THE OVA OR TLV SNIFFER SHOWS A SUSTAINED (GREATER THAN 2 MINUTES) READING OF 2000 PPMV OR GREATER AT THE WORKING FACE, THE AREA GENERATING THE EMISSIONS SHALL IMMEDIATELY BE COMPLETELY COVERED WITH A MINIMUM OF 6 INCHES OF CLEAN DIRT OR AN APPROVED FOAM AND THE FOLLOWING ACTIONS IMPLEMENTED:

    A. EXCAVATION OF THE AFFECTED AREA SHALL NOT RECOMMENCE UNTIL THE ORGANIC READINGS ARE BELOW 500 PPMV.

    B. EXCAVATION OF THE AFFECTED AREA SHALL BE CONDUCTED IN SUCH A MANNER AS TO LIMIT THE WORKING FACE TO LESS THAN 2000 SQUARE FEET OR OTHER SMALLER AREA DEEMED APPROPRIATE BY SCAQMD PERSONNEL TO REDUCE NUISANCE POTENTIAL.

27. IF THE OVA OR TLV SNIFFER SHOWS A SUSTAINED (GREATER THAN 2 MINUTES) READING OF 200 PPMV OR GREATER AT THE PROPERTY LINE, THE EXCAVATION SHALL CEASE AND THE APPROVED MITIGATION MEASURES IMPLEMENTED IMMEDIATELY. THE EXCAVATION SHALL NOT RESUME UNTIL THE READINGS ARE BELOW 100 PPMV.

28. THE ENTIRE SURFACE OF THE AFFECTED LANDFARMING MATERIAL SHALL BE MONITORED USING AN OVA OR TLV SNIFFER WITHIN ONE(1) HOUR AFTER SPREADING, DISKING, MIXING AND OTHER LANDFARMING OPERATIONS. IN CONDUCTING THE SURFACE MONITORING, THE SAMPLING PROBE SHALL BE PLACED WITHIN THREE(3) INCHES ABOVE THE LANDFARMING MATERIAL.

29. IF THE OVA OR TLV SNIFFER MONITORING OF THE LANDFARMING AREA SHOWS A READING OF 200 PPM OR GREATER, THE APPROVED MITIGATION MEASURES SHALL BE IMPLEMENTED FOR THE AFFECTED AREA IMMEDIATELY. THE LANDFARMING OPERATIONS SHALL NOT RESUME AT THE AFFECTED AREA UNTIL THE READINGS ARE BELOW 200 PPM.

30. ALL LIMITS SPECIFIED IN CONDITION NUMBERS 26, 27 AND 29 MAY BE RE-EVALUATED AND MODIFIED BY AN SCAQMD REPRESENTATIVE.

31. ALL MONITORS SHALL BE CALIBRATED DAILY OR EACH DAY THEY WILL BE OPERATED USING A METHOD APPROVED BY THE DISTRICT.

32. IF A DISTINCT ODOR (LEVEL III OR GREATER) RESULTING FROM THE EXCAVATION IS DETECTED AT OR BEYOND THE PROPERTY LINE, THE EXCAVATION SHALL CEASE AND THE APPROVED MITIGATION MEASURES IMPLEMENTED IMMEDIATELY. ODOR LEVELS WILL BE DETERMINED BY SCAQMD PERSONNEL OR ON-SITE SAFETY COORDINATOR IN THE ABSENCE OF SCAQMD PERSONNEL.

33. WITHIN TWO(2) WEEKS AFTER THE START OF EXCAVATION AND MONTHLY THEREAFTER, A MONTHLY PROGRESS REPORT SHALL BE SUBMITTED TO THE DISTRICT. THE PROGRESS REPORT SHALL INCLUDE, BUT NOT BE LIMITED TO, THE FOLLOWING INFORMATION:

    A. WORK COMPLETED DURING THE REPORT PERIOD,
    B. WORK PLANNED FOR THE FOLLOWING REPORT PERIOD,
    C. RESULTS OF THE AMBIENT AIR SAMPLING AND ANALYSES INCLUDING ALL SAMPLE IDENTIFICATION DATA AND WEATHER AND WIND DATA DURING SAMPLING.
    D. INCIDENTS WHEN THE OVA OR TLV MONITORING EXCEEDED THE SPECIFIED ACTION LEVELS AND ODOR INCIDENTS, AND THE MITIGATION MEASURES IMPLEMENTED. RECORDS SHALL INDICATE CONCENTRATION, DATE, TIME AND LOCATION; AND ACTIVITY DURING EACH EXCEEDANCE.

34. MITIGATION MEASURES, OTHER THAN THOSE INDICATED IN THESE CONDITIONS, WHICH ARE DEEMED APPROPRIATE BY SCAQMD PERSONNEL AS NECESSARY TO PROTECT THE COMFORT, REPOSE, HEALTH OR SAFETY OF THE PUBLIC, SHALL BE IMPLEMENTED UPON REQUEST.

Other governmental agencies may require approval before any excavation begins. It shall be the responsibility of the applicant to obtain that approval. The South Coast Air Quality Management District shall not be responsible or liable for any losses because of measures required or taken pursuant to the requirements of this approved Excavation Management Plan.

If you have any questions concerning this Permit, please call Mr. Jay Chen at (818) 572-6193.

Very truly yours,

William J. Dennison

PROPOSED RULE 1166 - VOLATILE ORGANIC COMPOUND EMISSIONS FROM DECONTAMINATION OF SOIL

(a) **Applicability**

This rule limits the emission of Volatile Organic Compounds (VOC) from soil contaminated with such VOC as a result of leakage from storage and transfer facilities, from accidental spillage, or other deposition.

(b) **Definitions**

(1) VOC-contaminated Soil is a soil which ~~a contains~~ registers 50 ppm or greater of Volatile Organic Compound when measured at a distance of up to three inches from the surface with an organic vapor analyzer (calibrated as hexane).

(2) VOC-contaminated Soil Mitigation Measures are those in which VOC is removed from VOC-contaminated soil by any process or such soil is removed from the site.

(3) Volatile Organic Compound (VOC) is any volatile compound of carbon, excluding methane, carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates , ammonium carbonate, 1,1,1-trichloroethane, methylene chloride, trifluoromethane (FC-23), trichlorotrifluoroethane (CFC-113), dichlorodifluoromethane (CFC-112), trichlorofluoromethane (CFC-11), chlorodifluoromethane (CFC-22), dichlorotetrafluoroethane (CFC-114), and chloropentafluoroethane (CFC-115).

~~(4) Volatile Organic Compound Content is the measured concentration in parts of VOC by weight per million parts of soil by weight (PPM WT) of organic compounds volatilized from a composite soil sample collected~~

RECEIVED
MAY 05 1988

~~and analyzed using EPA methods described in SW-846, September 1986, or equivalent. Specific Environmental Protection Agency (EPA) methods include: 5030 purge and trap for extraction of VOC from contaminated soil, 8010 8015, and 8020 for VOC content determination.~~

(c) Requirements

A person treating or handling VOC-contaminated soil ~~after (60 days after date of adoption)~~ shall:

(1) Notify the Executive Officer by telephone within 24 hours of detection of VOC-contaminated soil

(2) Implement VOC-contaminated soil mitigation measures, as approved by the Executive Officer, to include, but not limited to, at least one of the following:

(A) Install and operate, an underground VOC collection and disposal system ~~prior to excavation in accordance with Rules 1150, 1150.1, and 1150.2~~.

(B) Excavate VOC-contaminated soil and transport to:

(i) a facility for incineration of VOC at an off-site location.

(ii) an appropriate landfill ~~for containment of VOC contaminated soil~~.

(C) Collect and ~~destroy~~ dispose of the VOC from the excavated soil on-site using equipment approved by the Executive Officer.

(D) Install and operate a biological degradation system approved by the Executive Officer.

(E) Perform an equivalent VOC-contaminated soil mitigation measure previously approved by the Executive Officer.

In no case will these methods include on-site or off-site spreading of

con. ~~ti~~inated soil to enhance uncontroll. evaporation of VOC to the atmosphere , except as provided in subparagraph (d)(7).

(d) Exemptions

(1) Treatment of less than one (1) cubic yard of contaminated soil.

(2) ~~Evaporation from~~ Soil ~~containing~~ ~~of volatile~~ organic compounds that have initial boiling points of 302°F or greater provided that soil is not heated.

(3) Soil removed for sampling purposes.

(4) Accidental spillage of five (5) gallons or less of VOC.

(5) Emergency soil decontamination excavation performed by, under the jurisdiction of, or pursuant to the requirements of, an authorized health officer, agricultural commissioner, fire protection officer, or other authorized agency officer. Whenever possible, the Executive Officer shall be notified prior to commencing such excavation.

(6) Soil which is contaminated by VOC from oil and gas wells ~~and~~ or other sources which exist in nature such as natural seepage.

(7) Landfarming and landspreading operations provided that no VOC or VOC-bearing material is deposited.

(8) Soil containing ~~volatile~~ organic compounds having a Reid vapor pressure (RVP) less than 80 mm HGg (1.55 pounds per square inch), or an absolute vapor pressure (AVP) less than 36 mm Hg (0.7 psi) at 20°C.

Mr. Elton Oliver
Oil Operators, Inc.
712 West Baker Street
Long Beach, CA 90801

SUBJECT: REVISIONS TO THE RULE 1150 EXCAVATION PERMIT FOR LANDFARMING THE NORTH SITE

Dear Elton:

On January 20, 1988 I contacted Jay Chen of the South Coast Air Quality Management District regarding the conditions stated in the draft of the Rule 1150 Excavation Permit. Mr. Chen contacted me on January 22 to state that the District has made some concessions to our operation. I have addressed these below. Please refer to your copy of the permit when reviewing these changes.

5. The acceptable hours of excavation have now been extended until 6 p.m. (formerly 5 p.m.). Weekends and holidays are still not permissible.

6&7. First stage smog alerts have been removed from each of these conditions.

8. I was not able to change wind speed conditions. The District's reasoning is that 1) the wind rarely maintains an average velocity greater than 15 mph, 2) they feel that very little time will be lost due to the rare occurrences of the wind exceeding the referenced speeds, and 3) they feel that if the wind does exceed the referenced speeds there will be dust generated.

10. The District is modifying the permit to allow for the removal of debris.

17. If a considerable number of complaints (three) are received, an inspector from the District will come to the site and evaluate the conditions.

21, 22, &24. Sniffer reading limitations may be adjusted at the discretion of the District if we find them to be intolerable during actual operations.

21B. In the event that the sniffer exceeds the specified limit, the working face will be limited to 2,000 square feet.

10701 Los Alamitos Blvd., Suite 200, Los Alamitos, CA 90720 (213) 596-2755

Mr. Chen would like the draft to be finalized as soon as possible. I informed him that we needed a few days to review these changes and I would contact him on Tuesday, January 26.

Please review these changes and get back to me before this time. If you have any questions, please call me at (213) 596-2755.

Sincerely,

JAYKIM ENGINEERS, INC.

1.0 INTRODUCTION

1.1 General

This report presents the results of a geotechnical investigation performed by GEOFON for the proposed State Wide Business Park. The project site encompasses approximately 14 acres of land on the north side of the San Diego freeway west of the Los Angeles River Flood Control Channel in Long Beach. The general site location is shown on Figure 1.

1.2 Proposal Development

The proposed project will be a light industrial development consisting of nine one-story structures. The total building floor area will be about 285,000 square feet. Other site developments will include paved access streets and parking areas as well as utility lines. Structural information was not available at the time our investigation was performed. For our evaluations we assumed maximum column loads of 60 kips and maximum wall loads of 3 kips per lineal foot.

1.3 Site History

We understand that the site was used as a sump in the past to store drilling mud and other waste materials generated from oil production operations. The configuration of the sumps was changed over the years. In the late 1970's, a partial clean-up operation was undertaken. Land farming methods were applied to neutralize the oil, reduce the moisture content, and compact the sump materials. Detailed records are not available for either the sump modifications or the clean-up operations.

1.4 Previous Geotechnical Studies

Two preliminary geotechnical investigations were previously performed by Earth Technology Corporation (reports dated August 1983 and January 1984). These investigations were aimed at assessing the feasibility of supporting light industrial structures on the sump materials. The results of these two studies indicated that the majority of sump materials were too compressible to directly support structures. Data from these two studies have been used in the preparation of this report.

1.5 Purpose of Investigation

The primary purpose of this investigation is to provide a thorough evaluation of the subsurface conditions at the site described herein in relation to the design and construction of the proposed business park development.

1.6 Exclusions

This report does not include any environmental assessments related to the sump materials at the site. We understand that environmental evaluations related to impacts from gases and chemical substances that may be present at the site are being performed by others. Our geotechnical evaluations and recommendations are based on the assumption that the sump materials will not be considered hazardous or toxic from an environmental point of view.

2.0 SCOPE OF WORK

Our scope of work for this investigation consisted of field exploration, laboratory testing, engineering analysis, and the preparation of this report.

Hollow stem auger borings were used to obtain soil samples for laboratory testing, to visually classify soil types, level of oil contamination, and to confirm the depth of sump materials. Twelve borings were drilled at the site to depths ranging from 21.5 to 41.5 feet below existing grades. Borings B-1 through B-10 were drilled within the sump area. Borings B-11 and B-12 were drilled beyond the sump boundary. The approximate locations of these borings are shown in Figure 2, Site Plan. A description of the field procedures and logs of the borings are presented in Appendix A.

Laboratory soil tests were performed on selected representative samples as an aid in classification and to evaluate the engineering properties of the soils. The laboratory testing program included determinations of natural moisture content/dry density, optimum moisture content and maximum dry density (modified proctor compaction), Atterberg Limits, compressibility characteristics (consolidation), and chemical characteristics (soluble sulfate and total soluble salt contents). Laboratory testing procedures and results are summarized in Appendix B.

Engineering evaluations were performed to provide earthwork criteria, foundation design parameters, and preliminary pavement sections. As part of these evaluations, we reviewed historical aerial photographs and old topographic maps provided by Oil Operators. The results of our evaluations are presented in the remainder of this report.

3.0 SITE CONDITIONS

3.1 Surface Conditions

At the time of our field investigation the ground surface at the site was relatively flat, with the exception of a few soil piles located near the central parts of the site. The ground surface over most of the site was devoid of vegetation and had evidence of oil seeps. Localized areas at the site had shallow vegetative growth consisting mostly of weeds and grasses. The topographic conditions existing at the time of our field investigation are depicted on the Site Plan (Figure 2). The topographic base map was prepared by JAYKIM Engineers.

3.2 Subsurface Materials

The subsurface materials at the site consist of oil sump materials and fills overlying native soils.

The sump materials consist primarily of bentonitic muds that have engineering characteristics similar to clayey soils. These muds are mixed with highly variable amounts of salty water (brine) and oily wastes. For discussion purposes, the sump materials can be divided into three categories with different degrees of processing (landfarming and compaction).

Class I sump materials generally have low oil content (not visible but could be smelled), relatively low moisture, and moderate strength (stiff soil-like consistency). These materials are typically found at relatively shallow depths (upper 15 feet). Apparently these materials were processed, partly mixed with site soils, and compacted to variable degrees.

Class II sump materials have the consistency of soft to medium stiff soil. These materials apparently have been partially (incompletely) processed. They contain variable amounts of oil, sometimes concentrated in localized pockets that are randomly scattered in the fill. These fills contain variable amounts of soil.

Class III sump materials are unprocessed and consist primarily of muds with relatively high oil content. These materials are very soft (nearly liquid-like consistency). Localized oil pockets were detected within these sump materials.

Over the years, embankments were constructed to contain the liquid sump materials. Based on examination of aerial photographs of the site, it appears that the configuration of these embankments was modified as the site was developed. Where encountered in our borings, embankment fills appear to be mixtures of soils and sump materials, lightly to moderately compacted. In many cases these fills could not be distinguished from Class II sump materials.

The native soils beneath and on the sides of the sump consist primarily of dense silty sands with some layers of clayey sands and hard clayey silts. In general, these materials can be expected to be much less compressible than the sump materials.

The approximate distribution of the various classes of subsurface materials at the site is presented in the Simplified Subsurface Sections (Figures 3 and 4). It should be noted that the actual distribution of materials is more complex and variable than can be simply presented graphically. However, from the data available in preparing these cross-sections, the following general observations can be made:

The very soft, unprocessed sump materials typically occur in the lowest levels of the sump (below elevations of 24 to 34 feet MSL). The largest continuous body of very soft sump material occurs in the south-central portions of the site. This zone of sump material is estimated to be approximately 450 feet long (N-S direction) by 300 feet wide (E-W direction) by 15 feet deep, comprising about 75,000 (±5000) cubic yards. Another large body of unprocessed sump material occurs over the northern most corner of the site. Based on old air photos of the site, this sump is believed to be triangular shaped and have a depth on the order of 7 to 10 feet. The total volume of this material is estimated to be approximately 7000 cubic yards. Smaller pockets of unprocessed sump material were also detected in our explorations. These are believed to be the result of incomplete processing during the previous landfarming operations. Additional small bodies of unprocessed sump materials may also be present in parts of the site not explored. Overall, the total volume of unprocessed sump material is estimated to be in the range of 80,000 to 100,000 cubic yards.

The lightly processed sump materials comprise approximately half of all fills at the site. The total volume of the lightly processed sump materials and embankment fills having similar properties are estimated to be in the range of 200,000 to 250,000 cubic yards.

The moderately compacted sump materials typically found near the ground surface comprise an additional 110,000 to 140,000 cubic yards.

The total volume of all sump fills is estimated to be in the range of 390,000 to 490,000 cubic yards.

Average moisture contents and dry densities for sump materials indicated by laboratory tests are as follows:

Material Type	Moisture (%)	Dry Density (pcf)	Estimated Relative Compaction (%)
Class I	16	105	87
Class II	20	90	74
Class III	66	58	48

The moisture contents encompass all liquids, including oil. Considering the highly variable nature of the sump materials, these average values should be used with caution. Actual field values could vary from these values.

3.3 Groundwater

Groundwater was encountered only in one of our borings (B-4) at a relatively shallow depth of about 8 feet. This is believed to be a localized perched condition because the native sands at greater depths were not found to be saturated. Groundwater was not found in any of our other borings even though some of the borings extended to depths on the order of 40 feet. Based on a geologic map of the area (Randell et al, 1983) general groundwater levels are expected to be well below the base of the sump. Due to the low permeability of the sump materials, perched conditions could exist within the sump.

3.4 Seismic Considerations

Based on existing published information The Cherry Hill Fault (part of the active Newport-Inglewood Fault Zone) runs approximately along the northeastern property line. As such, the site is within an Alquist-Priolo Special Studies Zone and will need to be investigated, based on site-specific field exploration, for the potential for ground rupture. We recommend that these studies be performed prior to finalizing the site layouts, because, as a minimum, the building locations may need to be modified to allow sufficient offset distances from the mapped traces of the fault. The site could also experience strong earthquake shaking, particularly since it is located close to a potentially active fault. The seismic potential should be evaluated based on the results of the recommended site-specific geologic investigation.

Our foundation investigation did not disclose any natural soils at the site that would be susceptible to liquefaction, a condition whereby loose sandy soils lose part or all their strength when subjected to earthquake shaking. On the other hand, the soft sump materials (in their existing condition) could be weakened further when subjected to earthquake shaking. The site in its present condition is likely to experience lurching, cracking, and uneven settlement as a result of strong earthquake shaking.

4.0 CONCLUSIONS AND RECOMMENDATIONS

4.1 General

Based on the results of this investigation, it is our opinion that the existing subsurface conditions at the site are not suitable for supporting structures on shallow foundations. The sump materials, in their current state, have highly variable engineering properties and, in general, are too compressible for supporting structures or fills. Once moisture-conditioned and compacted, however, these materials would provide adequate support for structures and fills. Laboratory testing on representative samples of sump materials indicate that treated sump materials when compacted to dry densities equal to at least 90 percent of maximum density exhibit only about one tenth the compressibility of the untreated materials.

Based on these observations we recommend that the existing sump materials be completely excavated, dried to moisture contents near optimum, and compacted in lifts as recommended in the "Earthwork" section of this report. We have also evaluated the option of treating only the very soft sump materials and supporting the structures on piles. While this option is theoretically feasible it would not necessarily be more economical than the recommended option because of two reasons:

a. The costliest part of the earthwork is related to the treatment of the very soft sump materials typically found in the lower portions of the sump. To gain access to these materials, a large volume of treated sump materials will also need to be excavated.

b. The cost of re-working already treated sump materials in building areas is likely to be comparable to or lower than the cost of piles.

Complete removal and re-compaction of sump materials will also result in better foundation conditions for supporting fills that may be needed to improve drainage conditions at the site.

After the recommended earthwork is completed the ground surface will be approximately 4 to 5 feet below the existing levels. We recommend that non-expansive imported soil be used in the upper 3 feet of fills because the compacted sump materials exhibit expansive characteristics and would provide poor subgrade conditions for floor slabs and pavements. Additionally, the sump materials have very high soluble salt contents and would be corrosive to metallic utility lines.

Our detailed evaluations and recommendations are presented in the remainder of this report.

4.2 Earthwork

The earthwork anticipated at the project site will consist of clearing and grubbing, excavations, subgrade preparation and the placement and compaction of fill.

4.2.1 Clearing and Stripping

Prior to grading, the areas to be developed should be stripped of any vegetation and cleared of all debris. All deleterious material generated during the clearing operations should be removed from the site. At the conclusion of the clearing operations, the Geotechnical Engineer should observe and accept the site prior to any excavating or fill placement.

4.2.2 Excavations

The recommended earthwork will involve excavations to maximum depths on the order of 35 feet. Temporary excavations that do not extend below the processed materials found in the upper 10 to 15 feet are expected to remain stable with side slopes on the order of 3/4 to 1 (horizontal to vertical). Excavation into the softer, unprocessed sump materials will need to have much flatter slopes. Our slope stability analyses indicate that deep cuts extending into the soft sump materials will need to have 2 to 1 slopes within 15 feet of existing grades and 4 to 1 slopes through the soft sump materials below a depth of 15 feet. These slope estimates are provided herein for construction planning purposes. Considering the variability of sump materials at the site, the excavations should be closely monitored in the field during construction and cut slopes adjusted as necessary to maintain safe conditions.

The exposed slope faces should be kept moist (but not saturated) during construction to reduce local sloughing. No surcharge loads should be permitted within a horizontal distance equal to the height of cut from the toe of the excavation or 5 feet from the top of the slopes, whichever is greater, unless the cut is properly shored. Excavations that extend below an imaginary plane inclined at 45 degrees below the edge of any adjacent existing site facilities should be properly shored to maintain support of the adjacent elements. All excavations and shoring systems should meet the minimum requirements given in Article 6 of the State of California Occupational Safety and Health Standards.

In general, excavations into the processed sump materials should be readily accomplished by conventional soil excavation equipment such as loaders, scrapers, or dozers. The Class II sump materials contain localized soft spots that may cause poor subgrade conditions for rubber tired equipment. The soft, unprocessed (Class III) sump materials do not have adequate bearing capacity for supporting rubber-tired equipment. A major portion of the sump materials found below an approximate depth of 15 feet is too soft to support even track mounted equipment. Therefore, these materials may need to be excavated by dragline/clamshell equipment.

4.2.3 Subgrade Preparation

Prior to placing any fills, the subgrade soils exposed at the base of excavation should be scarified to a depth of 6 inches, moisture conditioned, and compacted to at least 90 percent of maximum dry density in accordance with ASTM D-1557. In areas to receive asphalt or concrete pavement, a minimum 12-inch zone of compacted fill should be provided for the support of the pavement.

4.2.4 Material for Fill

From a geotechnical point of view, the sump materials may be re-used in compacted fills provided they are moisture-conditioned properly. In general, the sump materials have in-place moisture contents above optimum. Therefore, these materials will need to be stockpiled in thin lifts, disked, and allowed to dry to a moisture content near optimum before they are used in fills. The already processed sump materials found at relatively shallow depths typically have moisture contents that are only a few percent above optimum. Therefore, these materials

will require minimal moisture conditioning. The softer, unprocessed sump materials have moisture contents that are much higher than optimum; spreading and disking may not be adequate to substantially lower the moisture content of these materials in a timely fashion. Therefore, we recommend that these materials be blended with drier soil in the process of being stockpiled.

We recommend that earthwork operations for this project be performed during the dry season. The earthwork operations at this site can be severely complicated by rain.

Compacted sump materials are expansive and should not be used within 3 feet of finish subgrade level. Granular soil should be used in the upper 3 feet of fill. Imported fill material should be predominately granular, non-expansive and contain no more than 40 percent fines (portion passing No. 200 sieve). The Geotechnical Engineer should be notified at least 72 hours in advance of the location of any soils proposed for import. Each proposed import source should be sampled, tested and accepted for use prior to delivery of the soils to the site. Soils imported prior to acceptance by the Geotechnical Engineer may be rejected if not suitable.

Both imported and existing on-site soils, to be used as fill, should be free of debris and any pieces larger than 6 inches in greatest dimension.

4.2.5 Placement and Compaction Fills

All fill soils should be placed in horizontal lifts, moisture-conditioned, and mechanically compacted to at least 90 percent of maximum dry density in accordance with ASTM D-1557. The optimum lift thickness will depend on the compaction equipment used and can best be determined in the field. The following uncompacted lift thickness can be used as preliminary guidelines.

Plate compactors	4-6 inches
Small sheepsfoot rollers (5-ton±)	6-8 inches
Scrapers and heavy loaders	8-10 inches
Heavy vibratory (20-ton) or static (30-ton) rollers	10-12 inches

The maximum lift thickness should never be greater than 12 inches. Sheeps-foot or pad-foot rollers are best suited for compacting processed sump materials.

The moisture content of the fill materials should be within 2 percent of optimum to readily achieve the required degree of compaction.

During backfill of excavations, the fill should be properly benched into the construction slopes as it is placed in lifts.

4.2.6 Shrinkage and Subsidence

Shrinkage is the loss of soil volume caused by compaction of fills to a higher density than before grading. For earthwork volume estimating purposes, an average shrinkage value of 22 percent may be assumed for the sump materials overall. The shrinkage of processed sump materials is expected to be approximately 2/3 of the above value while the shrinkage of unprocessed materials may be up to twice this average value. These values are estimates only. Actual shrinkage and subsidence should be determined during grading.

Subsidence is the settlement of in-place subgrade soils caused by loads generated by large earthmoving equipment. Subsidence in the native soils underlying the fills is expected to be less than 0.2 feet.

4.2.7 Observation and Testing

A representative of GEOFON, Inc. should observe all excavations, subgrade preparations and fill placement activities. Sufficient in-place field density tests should be performed during fill placement to evaluate the overall compaction of the soils. Soils that do not meet minimum compaction requirements should be reworked and tested prior to placement of any additional fill.

4.3 Foundations

4.3.1 Foundation Type

The proposed structures may be supported on conventional isolated and/or continuous shallow spread footings provided the subsurface materials have been prepared in accordance with the recommendations given in this report. All footings should be supported by either competent natural soils or properly compacted fill.

4.3.2 Allowable Bearing Pressures

Based on the assumption that granular soils will be used in the upper 3 feet of fills, a static allowable bearing pressure of 3000 pounds per square foot may be used for footing design for the support of the warehouse/office buildings. An allowable bearing pressure of 1500 pounds per square foot may be used for other minor structures, such as small retaining walls or transformer pads.

These bearing pressures are for dead load-plus-live load and assume minimum foundation sizes as discussed below. The allowable pressures may be increased one-third for short term, transient, wind and seismic loading. The maximum edge pressures induced by eccentric loading or overturning moments should not be allowed to exceed these recommended values.

4.3.3 Minimum Footing Size

The widths of footings should not be less than 15-inches even if the actual bearing pressures are less than the allowable pressures presented above.

4.3.4 Minimum Footing Embedment

Footings should be founded a minimum of 18 inches below the lowest adjacent finished grade.

4.3.5 Estimated Settlements

Based on analysis of consolidation data, total foundation settlements under sustained column loads of 60 kips are estimated to be less than one-half inch. Differential settlements between interior and exterior footings and between similarly loaded exterior footings are expected to be less than 1/4 inch.

Additional deep seated settlements may be experienced at the site due to long term compression of fills. Such settlements are expected to be fairly uniform across building sites and not to affect foundation performance.

The above estimates are based on the assumption that the recommended earthwork will be performed and that the footings will be sized in accordance with our recommendations.

4.3.6 Lateral Load Resistance

Soil resistance to lateral loads will be provided by a combination of frictional resistance between the bottom of footings and the underlying soils and by passive soil pressures acting against the embedded sides of the footings. For frictional resistance, a coefficient of friction of 0.35 may be used for design. In addition, an allowable lateral bearing pressure equal to an equivalent fluid weight of 300 pounds per cubic foot may be used, provided the footings are poured tight against undisturbed natural or compacted fill soils. These values may be used in combination without reduction.

4.3.7 Foundation Concrete

Results of laboratory testing of the on-site materials indicate soluble sulfate contents on the order of 0.03 percent by weight (300 parts per million). Therefore, the potential for sulfate corrosion of the concrete is considered to be low. Ordinary Type I or Type II Portland cement may be used in the construction of concrete structures in contact with the subgrade soils. The sulfate content of imported soil fills should be checked during construction to verify that it is within tolerable limits.

4.4 Building Floor Slabs

Slab-on-grade floors should be supported on granular, non-expansive soils compacted as discussed in the "Compacted Fill" section.

A vapor/moisture barrier should be placed under any slabs that are to be covered with moisture-sensitive floor coverings (parquet, vinyl tile, etc.). The vapor barrier should consist of a polyethylene sheet (visqueen) having a minimum thickness of 6 mils. This material should be covered by a layer of clean sand having a minimum thickness of 2 inches. The function of the sand layer is to protect the vapor barrier during construction and to aid in the uniform curing of the concrete.

A gas collection and venting system may also need to be installed under the slabs. An evaluation of gas control requirements is being performed by JAYKIM Engineers.

For elastic design of slabs supporting concentrated loads, a modulus of subgrade reaction (k) of 150 pounds per cubic inch (pounds per square inch per inch of deflection) may be used.

4.5 Lateral Earth Pressures

Based on information available to us at the time this report was prepared, no basements or major retaining walls are anticipated for this project. The following recommendations are for minor walls or buried portions of structures that do not extend more than 5 feet below the existing ground surface.

Active earth pressures can be used for designing walls that can yield at least 1/4 inch laterally under the imposed loads. The magnitude of active pressures are equivalent to the pressures imposed by a fluid weighing 30 pounds per cubic foot (pcf). This pressure may also be used for the design of temporary excavation support.

At-rest pressures should be used for restrained walls that remain rigid enough to be essentially non-yielding. At-rest pressures are equivalent to the pressures imposed by a fluid weighing 55 pounds per cubic foot.

Walls subject to surcharge loads should be designed for an additional uniform lateral pressure equal to one-third and one-half the anticipated surcharge pressure for unrestrained and restrained walls, respectively. The wall backfill should be well-drained to relieve possible hydrostatic pressure or designed to withstand these pressures. Wall footings should be designed as discussed in the "Foundations" section.

4.6 Drainage

Positive surface gradients should be provided adjacent to all structures so as to direct surface water run-off and roof drainage away from foundations and slabs toward suitable discharge facilities. Long term ponding of surface water should not be allowed on pavements or adjacent to buildings. Good drainage is particularly critical at this site because the compacted sump materials are susceptible to volume change when subjected to moisture variations.

4.7 Corrosion Potential for Metallic Utility Lines

The sump materials have very high soluble salt contents and can be expected to be very corrosive to metallic utility lines or other buried structures. Therefore, we recommend that either the use of metallic utility lines be avoided at this site or such lines be equipped with protective coatings or a cathodic protection system. A corrosion specialist should be consulted if the latter option is chosen.

4.8 Trench/Wall Backfill

Utility trench and wall backfill consisting of imported sand should be mechanically compacted in lifts. Lift thickness should not exceed those values given in the "Compacted Fill" section of this report. Jetting or flooding of backfill materials should not be permitted. The Geotechnical Engineer should observe and test all trench and wall backfills as they are placed.

In backfill areas where mechanical compaction of soil backfill is impractical due to space constraints, sand-cement slurry may be substituted for compacted backfill. The slurry should contain one sack of cement per cubic yard and have a maximum slump of 5 inches. When set, such a mix typically has the consistency of compacted soil.

4.9 Exterior Concrete and Masonry Flatwork

Exterior concrete and masonry flatwork should be supported on a zone of non-expansive, compacted fill. Prior to placement of concrete, the subgrade should be prepared as recommended in "Subgrade Preparation". The use of the clayey soils in the slab subgrade should not be permitted.

4.10 Paved Areas

Preliminary pavements design has been based on an assumed R-Value of 30, which is typical for surficial soils in the area. The California Division of Highways Design Method was used for design of the recommended preliminary pavement sections. These recommendations are based on the assumption that the pavement subgrades will consist of non-expansive import soils. Should the finish subgrade consist of processed sump material, much thicker sections will be required. Final pavement design should be based on R-value testing performed near the conclusion of rough grading. The following pavement sections are recommended.

LOCATION	THICKNESS (INCHES) ASPHALT CONCRETE	CLASS II BASE COURSE
Parking Spaces	3	5
Driveways	3	7

The pavement subgrade underlying Class II Base should be properly prepared and compacted in accordance with the recommendations outlined under "Subgrade Preparation".

The pavement base course should be compacted to at least 95 percent of maximum density (ASTM D-1557). Aggregate base should conform to the requirements of Section 26 of the California Department of Transportation Standard Specifications for Class II aggregate base (3/4" maximum) or Section 200-2 of the Standard Specifications for Public Works Construction (Green Book) for untreated base materials.

The above recommendations are based on the assumption that the base course will be properly drained. The design of paved areas should incorporate measures to prevent moisture build-up within the base course which can otherwise lead to premature pavement failure. For example, curbing adjacent to landscaped areas should be deep enough to act as a barrier to infiltration of irrigation water into the adjacent base course.

4.11 Post-Report Geotechnical Input

The successful completion of the project will be due in part of the proper interpretation of our recommendations by the designers, the translation of our recommendations into construction specifications, and the proper implementation of the specifications by the contractors. Post-report geotechnical services will be required as detailed design information is generated, as construction preparations are made, and as construction activities proceed. Representatives from GEOFON should provide these required post-report geotechnical services to ensure that our recommendations are properly interpreted and utilized.

The Geotechnical Engineer should be present to observe the soil conditions encountered during construction, to verify the applicability of the recommendations presented in this report to the soil conditions encountered, and to recommend appropriate changes in design and construction procedures if conditions differ from those described herein.

5.0 LIMITATIONS

The report, exploration logs, and other materials resulting from GEOFON's efforts were prepared exclusively for use by State Wide Investors and their consultants in designing the proposed development. The report is not intended to be suitable for reuse on extensions or modifications of the project or for use on any project other than the currently proposed development as it may not contain sufficient or appropriate information for such uses. If this report or portions of this report are provided to contractors or included in specifications, it should be understood that they are provided for information only.

Subsurface materials may vary in type, strength, and many other important properties between points of exploration due to non-uniformity of the geologic formations or to man-made cut and fill operations. While we cannot evaluate the consistency of the properties of materials in areas not explored, the conclusions drawn in this report are based on the assumption that the data obtained in the field and laboratory are reasonably representative of field conditions and are conducive to interpolation and extrapolation.

Furthermore, our recommendations were developed with the assumption that a proper level of field observation and construction review will be provided during grading, excavation, and foundation construction. If field conditions during construction appear to be different than is indicated in this report, we should be notified immediately so that we may assess the impact of such conditions on our recommendations.

Our investigation and evaluations were performed using generally accepted engineering approaches and principles available at this time and the degree of care and skill ordinarily exercised under similar circumstances by reputable geotechnical engineers practicing in this area. No other representation, either expressed or implied, is included or intended in our report.

Respectfully submitted,
GEOFON, Inc.

Appendix A

APPENDIX A

EXPLORATORY BORING RESULTS

The subsurface conditions at the site were investigated by drilling and sampling twelve (12) exploratory borings, B-1 to B-12, to depths ranging from 21.5 to 41.5 feet using a truck-mounted hollow stem rig. Borings locations are shown on the site plan, Figure 2.

The field explorations were performed under the continuous technical supervision of a GEOFON Geotechnical Engineer who visually inspected the site, maintained detailed logs of the borings, classified the soils encountered, and obtained relatively undisturbed and bulk samples for examination and laboratory testing. The soils encountered were classified in the field and through further examination in the laboratory in accordance with the Unified Soil Classification System (Figure A-1). Relatively undisturbed soil samples were obtained with a 2.42-inch inside diameter ring sampler. The soil sampler was driven with a 140 pound down-holehammer falling 30 inches. Standard Penetration Tests (SPT) (ASTM D1586) were also performed in selected borings. Detailed logs of the borings are presented in Figures A-2 through A-13.

Upon completion of drilling, gas monitoring probes were installed in eleven of the twelve borings (all except B-4). Six of the gas monitoring probes had single pipes for monitoring a single depth zone. The other five installations had double pipes for monitoring two separate depth zones.

Typical gas probe installations are shown in Figure A-14. The details for each installation are summarized in Table A-1. Sampling and evaluation of gases at these installations was performed by JAYKIM Engineers.

EXECUTIVE SUMMARY

A preliminary site characterization study was conducted for Statewide Investors' 14 acre parcel located in Long Beach, California. The parcel was formerly used as an oil and drill cutting fluid waste sump by Oil Operators, Incorporated.

Geotechnical and environmental conditions were examined, and information concerning local soil and groundwater conditions was assembled and analyzed.

Twelve bores were drilled and soil samples were obtained for analysis of both geophysical properties and chemical constituents. These bores were converted to gas monitoring probes through the installation of PVC piping. Gas pressures and lower explosive limit levels were monitored over the course of a week.

The volume of fill material to be reprocessed is approximately 400,000 to 500,000 cubic yards. About 2/3 of this fill material has been previously processed and has a relatively low oil content and soil-like properties. This material can be removed, replaced, and compacted with relative ease. The remaining 1/3 has a high oil content and variable consistancy. This protion will be mixed with clean fill dirt, replaced, and compacted.

1.1.4 Basin Clearance Program

Oil Operators, Incorporated had previously embarked on a program to eliminate the sump. A major portion of the material originally constituting the sump has been treated and essentially stabilized. The remaining untreated material constitutes a wedge of wastes underlying the southwestern one-third of the site of the original sump. This wedge is more than 20 feet in thickness at the western side decreasing in thickness toward the southeastern side. Several scattered pockets of oil are also present. This untreated material is overlain by roughly 15 feet of stabilized material. Proposed plans call for this untreated material to be mixed with soil and reclaimed as soil using appropriate proven soil stabilization techniques.

SECTION 2

SITE CHARACTERISTICS

2.1 REGIONAL SITE INFORMATION

2.1.1 Site Location

Situated within the city limits of Long Beach, California, the Statewide Investors' site (formerly Oil Operators, Incorporated) is located near the intersection of the Long Beach Freeway (Interstate 710) and the San Diego Freeway (Interstate 405). The site is bounded on the northeast by the Pacific Electric Railroad, on the west by the Los Angeles County Flood Control Channel, and on the south by the San Diego Freeway. The Caltrans Pacific Place Maintenance Station lies at the southeast corner (Figure 1).

At the present time access to the site is from Pacific Place.

2.1.2 Climate

The City of Long Beach is located on the Los Angeles Coastal Plain, which has a mediterranean climate with mild temperatures and low rainfall. Mean monthly temperatures range from 50 to 65 degrees Fahrenheit.

Average annual rainfall is 10 inches, most of which falls between the months of November and March. Average net evaporation in the site vicinity is 50 inches per year.

2.1.3 Land Use

An open area along the western boundary is used for horse riding trails. Los Cerritos Park, used for public recreation, lies directly to the east.

The western edge of the site lies approximately 200 feet east of the berm of the Los Angeles County Flood Control Channel (Los Angeles River), a concrete structure. Natural hill slopes on the site have been eliminated by grading and leveling. The west side of the property has an elevation of about 55 feet gently sloping off toward the east to about 50 feet mean sea level.

There are several operating oil wells and storage tanks in the northwest part of the referenced site. There is also a functioning well on the south side. The southwest area is currently used for pipe and equipment storage. Most of the site is overlain by material that formerly constituted an oil waste sump. A site plan is presented in Figure 2.

2.2 SUBSURFACE CHARACTERISTICS

2.2.1 General Description of Subsurface Conditions

The Statewide Investors' site is situated on the coastal portion of the Los Angeles Basin, a large geographical area underlain by alluvial fill several thousand feet deep. The specific site rests immediately on deposits of the Pleistocene Lakewood formation, which consists of a mixture of uplifted marine and continental sediments. Interlayered deposits within the Lakewood formation range in composition from loose gravel to hard clay.

Because the site has been extensively graded, it is impossible to ascertain whether some parts of the existing ground surface have been cut or filled. Four to ten feet of fine to medium sand, ranging in color from light to darker brown, constitute the surficial layer. Beneath this lies clay in a variety of colors. In some areas the clay is mixed with sand or dissected by shallow layers of sand in a manner typical of mixed uplifted marine and continental sediments.

2.2.2 Ground Water Aquifer Uses

In terms of ground water occurrence, the site lies at the southern edge of the West Coast Basin, a ground water basin underlying the southwestern portion of the Los Angeles Coastal Plain. Ground water in this region is contained in a series of aquifers interlayered with thick clay strata which act as hydraulic barriers, or aquicludes.

Two aquifers exist which might be termed shallow. The most shallow is the surficial Gaspur aquifer which at its easternmost point lies about 1/4-mile to the west of the site. The semi-perched aquifer is the uppermost aquifer lying directly beneath the site. Found at a depth of between 50 and 65 feet, the aquifer consists of a sequence of layers of gravelly marine sands, interspersed with layers of silts and silty clays. Within this sequence three, and locally four, thin aquifer units may exist. The semi-perched aquifer is underlain by the Bellflower aquiclude, which separates the shallow ground water systems from deeper aquifers. Regionally, the Bellflower aquiclude is breached in several areas, and is only moderately effective in breaking hydraulic continuity between the shallow and deep aquifers.

As reported in the fall 1975, the surface of the ground water table of the semi-perched aquifer ranged in elevation from -20 to -30 feet below sea level in the vicinity of the site (Los Angeles Flood Control District). Based on historic levels in wells, ground water flow within the shallow aquifers is to the west-southwest. Some disruption of the regional ground water flow pattern occurs along the Cherry Hill fault, located along the northeast boundary of the parcel. Ground water levels are approximately 10 feet lower east of the fault due to structural disruption of aquifer units.

2.2.3 Regional Ground Water Quality

Regional ground water quality has been closely monitored in the West Coast Basin of Long Beach for approximately the last 10 years, as part of Los Angeles County's sea water intrusion barrier project. Early records (pre 1900) show a seaward gradient within shallow coastal aquifers which resulted in continuous flushing of the entire formation by fresh water. By 1932 heavy inland pumpage had resulted in a reversal of the seaward gradient and invasion of the entire Basin by sea water. In 1962 the following water quality observations were made regarding the semi-perched or "200-foot sand" aquifer which underlies the site (Los Angeles County Flood Control District (LACFCD), Dominquez Gap Barrier Project Geologic Investigation, March 1962, pgs 17-21):

a. Water within the "200-foot sand" aquifer (semi-perched aquifer) is moderately to grossly saline throughout the Long Beach area.

b. South of Pacific Coast Highway (2-1/2 miles south of the site) sea water from the Gaspur aquifer is moving directly into the "200-foot sand."

c. Industrial wastes, particularly brine disposal, have locally affected the aquifer. Industrial wastes have invaded the Gaspur aquifer through percolation from surface disposal at localities north of Wardlow Road at the Los Angeles River.

Little use is made of water from shallow aquifers as the result of regional impacts of scattered brine holding ponds, industrial liquid disposal pits, and saline surface runoff in the Los Angeles River Channel. Chloride concentrations in the shallow semi-perched aquifer locally have often exceeded 500 mg/l. In 1961, LACFCD reported chloride concentrations as high as 18,000 mg/l in scattered locations in the Long Beach area. The U.S. Environmental Protection Agency has established a limit of 250 mg/l chloride for drinking water, but concentrations over 175 mg/l are considered unsatisfactory for most industrial uses (California State Water Resource Control Board, Publication 3-A). Chloride in concentrations greater than 350 mg/l is toxic to many plants.

A review of records at the California Department of Water Resources, Water Masters Office in Los Angeles revealed that, for the most part, active wells in the vicinity draw water from aquifers at depths greater than 400 feet. Such aquifers are less vulnerable to surface-introduced contamination. No active shallow wells are located within 2-1/2 miles downgradient of the site.

Local background water quality data for the shallow aquifer underlying the site are scarce. The most extensive water quality data available are from a now abandoned LACFCD monitoring well (designated both as well 28R73 and DE-6) located approximately 1-1/2 miles south of the site near the intersection of Willow Street and the Los Angeles River. A complete chemical analysis by the LACFCD is available for a ground water sample tested in 1965 and yearly chloride concentrations are available for the years 1970-78. In 1965, the ground water had an electroconductivity (EC) of 4810 micromhos and chloride concentration of 1140 mg/l. By 1978, the chloride concentration had gradually decreased to 640 mg/l, but was still at a level well above the U.S. Environmental Protection Agency's limit of 250 mg/l for drinking water.

In order to more clearly establish background water quality in the vicinity of the site, four monitoring wells which were constructed both up and downgradient of the parcel were assessed. Analytical test results found the following (see Figure 3):

1. Chloride concentrations immediately downgradient of the site (Boring 12) to be 1150 mg/l. An anomalously high TOC concentration of 374 mg/l was also found at this point.

2. Chloride concentrations approximately 1/2 mile upgradient of the site (Boring 15) to be 50 mg/l and TOC 110 mg/l.

3. Other downgradient chloride concentrations to range from 900 mg/l in Boring 14, 1/2 mile south of the site to 150 mg/l in Boring 16, approximately 1-1/2 miles southwest of the site.

It should be pointed out that all downgradient wells are also strongly influenced by the storage basins at the Oil Operators' facility immediately south of the site.

2.2.4 Faults and Seismicity

The Los Angeles Coastal Basin is transected by a series of northwest-southeast trending faults collectively referred to as the Newport-Inglewood Fault Zone. The Cherry Hill Fault, part of the Newport-Inglewood Fault Zone, will have to be assessed before construction can begin.

The Long Beach area is situated in a seismically active zone. The Long Beach earthquake of 1933 had a magnitude of 6.3 on the Richter Scale and caused major damage to structures throughout the Long Beach area. The earthquake had an epicenter located 24 miles southeast of the site along the Newport-Inglewood Fault Zone.

Several additional moderate (magnitude 5.3 to 6.8) seismic events have been recorded in 1933, 1941, and 1944 along the Newport-Inglewood Fault Zone within 5 miles of the site.

The maximum credible earthquake on the Newport-Inglewood Fault Zone may have a magnitude as great as 7.0. The repeatable high ground acceleration at the site is anticipated to be 0.32g; for the maximum credible earthquake: maximum ground acceleration may approach 0.5g.

3.0 FIELD AND LABORATORY TESTING

3.1 PRIOR TESTING

3.1.1 Field Testing

Field tests, consisting of electronic cone penetrometer explorations, were made and are described in a report by the Earth Technology Corporation dated January, 1984. In these tests, the cone penetrometer test electrical conductivity tool was used to measure relative conductivity variations in the subsurface sump materials. Compression tests were also conducted on two of the samples.

The tests showed that the subsurface sump materials encountered in the eastern portion of the site were somewhat stronger than those in the western portion of the site. The variable conditions revealed in the investigation indicate that the existing state of the sump materials would not provide adequate uniform support for shallow foundations. If foundations were to be placed on these materials, differential foundation settlement is likely to be excessive.

For potential development possibilities, the site was considered as two separate areas. The western portion was considered relatively unfavorable for development while the eastern portion was relatively favorable. For test locations and detailed test results, see Appendix A.

3.1.2 Organics in the Soil

Four soil samples were taken with a backhoe and submitted for chemical analysis on April 28, 1986. Analyses included volatile organic hydrocarbons (including benzene, toluene, and xylene), total nonvolatile organic hydrocarbons, organic lead, and polychlorinated biphenyls. While no benzene or toluene were found in the samples, low levels of xylene were (93 ppm average). Other volatile organic hydrocarbons averaged 11,158 ppm while non-volatiles averaged 130,200 ppm. Organic lead averaged 3.21 ppm and PCB levels were so low as to be not clearly identifiable. Appendix B gives a complete listing of these lab results.

3.2 RECENT TESTING

Jaykim Engineers, Inc. and Geofon, Inc. performed an investigative study to generate data for general feasibility of supporting foundations of industrial structures on the existing sump materials. The focus of this study was to further qualify and quantify the extent of the remaining untreated sump materials. Involved were the drilling of 12 bores in and adjacent to the site, and the installation of gas monitoring probes within these bores.

3.2.1 Probe Bores

Twelve bores were drilled in and adjacent to the site between August 22 and 26, 1986. Drilling was performed by the Datum Corporation. The drill rig was a Mobile Drill, Model B47 and utilized a 6-3/4 inch continuous flight hollow stem auger. Probe locations are shown in Figure 4.

Samples obtained for soil structure were taken at 2 feet, 5 feet, and every 5 feet thereafter to the bottom of each bore. For the 2 foot sample, 5 pounds of soil was shoveled into a plastic bag. All other samples were taken using either a 1 or 2-1/2 inch I.D. split barrel sampler. These samples were immediately placed in plastic bags. Samples obtained for chemical analysis were typically taken at 5 feet and every 10 feet thereafter except in bore No. 1 where they were taken every 5 feet. These samples were taken undisturbed using 2-1/2 inch I.D. stainless steel sampling tubes and utilized aluminum foil within the end caps.

A perched water layer was encountered at 8 feet while drilling bore No. 4. At the termination of drilling the bore, this water level had risen to 7 feet. A water sample was obtained for analysis.

Geofon's drill logs are presented in Appendix C. TLV (combustable vapor) readings were taken on all of the samples. Readings taken on the 2 foot sample and all 1 inch I.D. samples were obtained by placing the TLV probe directly into the plastic bags. Readings taken on the 2-1/2 inch I.D. samples were obtained by pushing the TLV's probe through a hole cut in an end cap attached to the sample tube. TLV data are also presented in Appendix C.

All samples for chemical analysis were immediately placed in an ice chest with blue ice to lessen the potential for volatilization. Samples were transferred to a refrigerator at the end of each day. All samples were delivered to a DOHS certified laboratory on August 27.

3.2.2 Probe Installation and Monitoring

Gas monitoring probes were installed to determine both the gas quality and internal pressure within the site. Probes were constructed of 1 inch diameter PVC pipe with a slotted section surrounded by sand. Probe logs are presented in Appendix D. No probe could be installed in bore No. 4 which watered in. Probe pressures and lower explosive limit levels were monitored using a water manometer and TLV combustable vapor meter once per day on August 28 and 29 and September 2 through 5. Probe No. 1 continually gave zero pressure readings indicating a probable blockage of the slotline during installation. No TLV readings were obtained on September 4 due to a malfunction in the unit.

Gas samples for chemical analysis were obtained on September 3 for each probe bore. Samples were obtained using evacuated glass bulbs. Bilevel probes were sampled simultaneously in the same bulb using a "T" connector. All samples were transported to a DOHS certified lab for analysis on the following day. All samples were analyzed for major gases. In addition, the samples from bores No. 2 and 9 were analyzed for GC/halogenated and BTX constituents.

3.3 RESULTS OF RECENT TESTING

3.3.1 Soils Analysis

Samples were catagorized into six types as determined by their physical characteristics. These are as presented below:

Type 1 - Low to medium oil content in a dark silty or sandy clay

Type 2 - Medium to high oil content, with some samples showing liquid oil, in a black silty to sandy clay

Type 3 - Extremely high oil content in a toothpaste-like consistancy

Type 4 - Very low oil content in a dry blue clay

Type 5 - Very low oil content in a dry grey sand

Type 6 - None to very low oil content in a brown silty sand. These samples were taken from the Los Angeles County Flood Control and Pacific Electric Railroad easements adjacent to the site.

Soils of similar types were composited to yield a total of six samples to be analyzed. Samples (except Type 6) were analyzed for total petroleum hydrocarbons, PCB's, BTX, halogenated hydrocarbons, and six separate metals. The Type 6 composite was only analyzed for total petroleum hydrocarbons. The results of these analyses are presented in Table 1.

3.3.2 Water Analysis

A water sample was obtained from the perched water layer located at an 8 foot depth in bore No. 4. This sample was analyzed for total petroleum hydrocarbons, PCB's, BTX, halogenated hydrocarbons, and six separate metals. Results of these analyses are presented in Table 2.

3.3.3 Gas Analysis

Gas analyses included field testing for lower explosive level concentrations and probe pressures, and laboratory analyses for major gases, and on bores No. 2 and 9, GC/halogented compounds and BTX. For those probes located on the site, methane concentrations ranged from 12.1 to 83.6 percent with an average of 34 percent (standard deviation = 26, N=9). The average lower explosive level typically exceeded 100 percent and the average probe pressure was 0.3 inches of water pressure. Table 3 lists the results of the laboratory's gas analysis while Table 4 lists the results of the field observations.

SECTION 4

EVALUATION AND RECOMMENDATIONS

4.1 RECOMMENDATIONS

4.1.1 Earthwork

As the previously processed materials have variable density and include pockets of oil, they cannot be used for supporting structures. This material will have to be removed and recompacted along with the unprocessed sump material bringing the total volume of fill to be reprocessed to approximately 400,000 to 500,000 cubic yards. About 2/3 of this volume has been previously processed and has a relatively low oil content and soil-like properties. This material can be removed, replaced, and compacted with relative ease. The remaining 1/3 has a high oil content and variable consistancy. This portion will be mixed with clean fill dirt, replaced, and compacted.

Conventional earthmoving equipment such as scrapers and loaders can be used to excavate the previously processed material. Unprocessed sump materials are too soft to support rubber-tired equipment and are marginal for track-mounted equipment. Portions of the sump material may need to be excavated with a clamshell or dragline.

Most temporary excavations into processed sump materials are likely to be stable with fairly steep slopes (on the order of 3/4 horizontal to 1 vertical). The slopes of the excavations into the unprocessed materials will need to be much flatter

The site should be compacted to a dry density of at least 90 percent of maximum density (ASTM-D1557). Shrinkage due to this compaction is expected to average about 20 percent. This value will be somewhat higher for unprocessed material and lower for processed material.

The recompacted sump materials will have expansive properties and therefore should not be used within 3 feet of the finish subgrade surface. Nonexpansive imported soil will be needed in the upper portions of the fill.

4.1.2 Foundations

With a 90 percent compaction achieved and 3 feet of imported soil used for the upper portion, structures may be supported on shallow foundations. The allowable bearing pressure under static loads is 3,000 pounds per square foot provided the structures are supported on recompacted fill material. A 1/3 increase in allowable bearing pressure may be realized under seismic or wind loads.

Structures should use a minimum footing of 15 inches with a minimum depth of 18 inches to the base of the footing. Slabs should require no special reinforcement for expansive soils if the site is prepared as recommended. A vapor barrier with gas abatement system is recommended due to the generation of methane gas within the fill.

Pavement section will depend on the quality of the imported soil which is placed in the upper 3 feet of subgrade. Therefore, the final section will need to be determined based on R-value testing on samples of the "as graded" subgrade soils.

Proper drainage is very critical due to the presence of expansive sump materials. Positive drainage away from all structures is essential.

OIL SUMP SITE DEVELOPMENT
SUPPLEMENTAL INVESTIGATION
SAN DIEGO FREEWAY AND PACIFIC PLACE
LONG BEACH, CALIFORNIA

1.0 INTRODUCTION

This report presents the results of our supplemental geotechnical investigation related to the feasibility of developing an existing oil sump site for industrial facilities. The site is located north of the San Diego Freeway, east of the Los Angeles River Channel, and west of the Southern Pacific Railroad. The site location is shown in Figure 1.

It is our understanding that the site was used in the past as a sump for oil drilling operation wastes. A partial clean-up/treatment operation was conducted in the late 1970's. Some of the sump was removed, treated and replaced. Detailed records of the operation are not available.

A previous investigation study was performed by Earth Technology (report dated August 25, 1983) to generate data for general feasibility of supporting foundations of industrial structures (warehouses) on the existing sump materials. The results of the previous study indicated that the western portion of the site appeared unfavorable for foundation support while several locationa in the eastern portion appeared only marginally favorable.

The purpose of this supplemental study was to further delineate the portion of the site which may be favorable for industrial development.

2.0 SCOPE OF WORK

The scope of our supplemental work consisted of field subsurface explorations, laboratory tests, engineering evaluations, and report preparation.

Field explorations consisted of ten electronic cone penetrometer tests (CPT's). The CPT's are designated as C-7 through C-16. Six CPT's were performed for the previous investigation (C-1 through C-6). Locations of the CPT's are shown on Figure 2. The CPT electrical conductivity tool was used to measure relative conductivity variations in the subsurface sump materials. Individual logs of the CPT's and conductivity measurements are prescribed in Appendix A.

Several undisturbed soil samples were obtained using the CPT sampling device. Two single laboratory compression tests were performed on two samples to help assess the compression characteristics of soft sump materials.

Engineering evaluations consisted of compiling three subsurface profiles based on CPT results to help delineate the portion of the site which may be favorable for development. Subsurface profiles are presented in Figures 3 through 5. Conclusions and recommendations are presented in Section 4.

3.0 SUBSURFACE CONDITIONS

Subsurface conditions revealed by the supplemental CPT's indicate that the subsurface materials are primarily sump materials of varying degrrees of compactness. The high degree of variability indicates that the recompaction operation was not well controlled from a foundation support viewpoint.

Subsurface profiles were compiled using the supplemental CPT results plus results from several CPT's of the previous study. The orientation of profiles are shown on Figure 2. Subsurface profiles are presented on Figures 3 through 5.

Although subsurface conditions are quite variable, four general zones were detected. These zones are shown on the subsurface profiles and are briefly described as follows:

Zone 1

Moderately compact (stiff) sump material with relatively high to moderate oil content. Materials appear to have been treated and recompacted. The sump material contains clay and sandy clay soil with occasional sand near the ground surface.

Zone 2

Lightly compact (firm to soft) sump material with moderate to low oil content. Materials may have been lightly treated and replaced. The soil portion appears to be primarily clay and silt. These sump materials are very compressible. The two soil samples obtained within this zone had moderate oil content with strong aromatic vapors.

Zone 3

Untreated and uncompacted (very soft) sump material. Materials are highly compressible and appear to be water saturated, with the consistancy of mud. This material apperas to be clayey in nature.

Zone 4

Moderate to well compacted materials, possibly natural soils with some moderately recompacted sump material near the top of this zone. Materials are primarily sand soils with silt near the top.

Individual logs of the CPT's and conductivity measurements are presented in Appendix A. The cone resistance values on the CPT logs give an indication of soil consistency (relative degree of compaction) and soil strength. High cone resistance values indicate treated or compacted sump materials while low values indicate untreated sump materials. The electrical conductivity values give a general indication of the presence of oil or water in the subsurface. High conductivity values would tend to indicate water-saturated sump materials (muds) while low conductivity values would tend to indicate oily or dry sump materials.

4.0 CONCLUSIONS AND RECOMMENDATIONS

In general, subsurface sump materials encountered in the eastern portion of the site were somewhat stronger than in the western portion of the site. However, the variable conditions revealed in this supplemental investigation indicate that the existing state of the sump materials would not provide adequate uniform support for shallow foundations. If foundations were to be placed on these materials, ~~excessive~~ differential foundation settlements are likely to be excessive.

For potential development possibilities, the site can be considered as two separate areas. The western portion (Area 1) is relatively unfavorable for development while the eastern portion (Area 2) is relatively favorable (See Figure 2). Foundation support schemes are discussed for each area (See Figure 2).

AREA 1 (Western Portion)

To support industrial buildings in this area, pile foundations would be necessary. This area contains relatively thick zones of extremely soft or semi-liquid sump materials. Driven piles would have to extend through the sump materials to adequate bearing soils found at depths on the order of 30 feet. Overexcavation and recompaction may be needed for the upper 3 feet to provide adequate support conditions for building floor slabs; some soft near surface zone exist in this area. Relatively high ground settlements are likely to occur outside the buildings in this area due to the compression of the soft sump zones under the overburden weight. This is likely to cause problems for any pavements or other facilities. This ground settlement may also cause the building floor slabs to undergo relatively large undersireable settlements. The settlement problem could be avoided by considering an alternative scheme of removing, treating, and recompacting the sump materials. Shallow foundations could be used if good compaction is achieved. However, the cost and environmental complications of developing the site in this manner may be prohibitive.

AREA 2 (Eastern Portion)

To support industrial buildings in this area a combination of shallow and pile foundations can be utilized. The extremely soft sump materials were not encountered in this area. The majority of this area contains

relatively thick zones of lightly compacted compressible sump material. Driven piles would have to extend through these zones to adequate bearing soils found at depths on the order of 20 to 30 feet. The extreme eastern part of the area may be capable of supporting shallow foundations as evident by good shallow bearing materials found at CPT location C-16. Overexcavation and recompaction for supporting floor slabs does not appear necessary because of the thicker zone of near surface moderately compact material. Relatively amall settlements are likely to occur in areas outside the buildings.

Common types of driven piles are precast concrete and timber. Since structural loads are expected to be relatively light, treated timber piles might be an economical choice for foundations.

The soft sump material may be currently settling and may continue to settle under the existing overburden weight. This may present a long term settlement if a development is placed on such unstable material. We recommend that a settlement monitoring program be established as soon as possible. The program would involve placing a few settlement monuments at strategic locations on site and periodically making elevation readings at each monument. The data from the readings would establish if the site is currently settling and if so, accurate predictions could be made on the future settlement behavior of the sump materials. The program is simple, inexpensive to set up, and readings could be made by oil operators' personnel on their regular visits to the site.

5.0 FURTHER DEVELOPMENT CONSIDERATIONS

Should the results of this foundation support investigation prove favorable for industrial development, other geotechnical factors must be considered for development feasibility. These considerations involve safety and environmental concerns which may, in themselves, ultimately determine the feasibility of developing the site.

- The Cherry Hill Fault that runs approximately along the eastern boundary of the site will have to be geologically investigated; the site lies within an Alquist-Priolo Special Studies Zone. The geologic fault investigation is a mandatory state requirement for developmental permits. The purpose of the investigation is to determine the fault hazard and ground surface rupture potential in seismically active areas.

- The chemical composition of the petroleum based sump components will need to be determined to assess the potential toxicity and the potential for gas accumulation and possible explosions. This information will be a critical factor when considering covering the existing sump materials with buildings; petroleum based gases can accumulate directly beneath and permeate buildings. Aromatic vapors indicative of a high aromatic fraction were detected in the soil samples collected during the field explorations.

Summary of Groundwater Conditions

LFR ENVIRONMENTAL MANAGEMENT & CONSULTING ENGINEERING

July 9, 2008 002-10231-04

Mr. Greg Holmes
California Department of Toxic Substances Control
5796 Corporate Ave
Cypress, California 90603

Subject: Summary of Groundwater Conditions, Request for Clarification of Expectations of Groundwater Consideration for the RI and FS for the Former Oil Operators North Site (Long Beach Industrial Park) 3701 Pacific Place, Long Beach, California

Dear Mr. Holmes:

On behalf of CRG Properties Ltd. (CRG), LFR Inc. (LFR) has prepared this summary of groundwater conditions at the former Oil Operators, Inc. (OOI) North Site located at 3701 Pacific Place, Long Beach, California ("the Site"). Based on our June 4, 2008 meeting, it was decided that LFR would prepare this summary for the joint consideration of DTSC and the Los Angeles Regional Water Quality Control Board. At your discretion, a meeting was discussed for a brief presentation of data by LFR for both agencies. The primary purpose of this effort is to gain insight and direction on the overall intent of Cal-EPA to pursue groundwater issues at the Site. Since our last meeting, we have found additional data that further reinforce our overall interpretation of the region's salt impacted groundwater. References are attached as Appendix A.

SITE BACKGROUND

The approximately 18-acre Site (Figure 1) was formerly owned by OOI, a non-profit cooperative organization that functioned as a central brine water treatment facility serving member oil companies (AEMC, 1991). Beginning in 1926, oil brine (drilling mud and other waste materials generated from oil production operations) was pumped to sumps on the OOI property, of which the Site was the northernmost portion. Most of the Site was utilized as a treatment sump. After the water evaporated or infiltrated the aquifer from the sumps, the remaining sludge was either drummed or left in the treatment sumps. The site was divided into two portions referred to as the north site (Site) that we are writing about and have interest in, and the south site with the construction of the 405 freeway. We understand that the south site is being remediated in cooperation with the City of Long Beach. When a water treatment plant, including evaporation ponds, was built on the south site in the mid-1950s, evaporation activities ceased at the Site sumps.

A partial cleanup/treatment operation was conducted at the Site in the 1970s, which involved the removal, treatment, and replacement of a portion of the sump materials (ETC, 1984). However, detailed records of the treatment operation are not available.

Offices Nationwide
www.lfr.com

Additional investigations were conducted in the 1980s, culminating in a land farming operation that was begun in 1989 (AEMC, 1991) under the direction of the RWQCB. Details of the investigations conducted at this time are included in Section 2.1 of the RI. The land farming operation was halted when public complaints were received by the South Coast Air Quality Management District (SCAQMD).

Under the direction of the RWQCB and in connection to the land farming effort, a groundwater monitoring program for the Site and southern adjacent property was implemented in 1987, according to Monitoring and Reporting Program No. 6775 for OOI (Land Treatment File No. 86-66). According to records available to LFR, annual monitoring at three groundwater wells (MW-2, MW-3, and MW-4) was ongoing as of 1997 (OOI, 1997).

The Site was capped with an unengineered fill, and is currently being used as a golf learning center. Improvements include a paved parking lot, several structures, and a large grassy area.

On behalf of CRG, LFR submitted a Voluntary Cleanup Program (VCP) application for the Site to the DTSC on March 24, 2005. Approval of the VCP application was granted on December 20, 2005.

LFR prepared a Characterization Data Report dated April 4, 2006 to describe current and historical investigation and remediation activities at the Site. In a letter dated July 12, 2006, the DTSC raised numerous issues that needed to be addressed as a remedial investigation prior to approval of the report. In general, the DTSC believed that data gaps existed, that the Site had not been fully characterized, and that the Characterization Data Report should be used in conjunction with further research and investigation to develop a remedial investigation workplan. The DTSC also made 19 specific comments to the Characterization Data Report. The DTSC's Human and Ecological Risk Division (HERD) also provided comments to the Characterization Data Report in a memorandum dated July 5, 2006.

LFR's responses to DTSC comments, along with an historical review of the Site, were submitted on March 12, 2007. The historical review included historical aerial photographs, topographic maps, and a review of California Department of Oil, Gas, and Geothermal Resources records.

On August 29, 2007, in conjunction with various meetings and other communications, LFR submitted a remedial investigation workplan for the Site that was subsequently approved by the DTSC on September 6, 2007. LFR submitted a Remedial Investigation Report for the Site to the DTSC on March 4, 2008. As part of the investigation, groundwater samples were collected from four on-site groundwater monitoring wells in December 2007 and analyzed for total petroleum hydrocarbons with carbon chain identification (TPH-cc) by EPA Method 8015 Modified, volatile organic compounds (VOCs) by EPA Method 8260B, Title 22 metals by EPA Method 6010, and semivolatile organic compounds (SVOCs) by EPA Method 8270C.

In March 2008, LFR collected groundwater samples from the four on-site monitoring wells for TPH-cc, VOCs, Title 22 metals, SVOCs, and for total dissolved solids (TDS).

LFR

HYDROGEOLOGY

The Site lies within the southern portion of the Coastal Plain of Los Angeles County, which gently slopes down to the south-southwest. The Site is located within the West Coast Basin, although it is adjacent to the boundary of the Central and West Coast Basins. The Los Angeles River is located along the western boundary of the Site and flows southward, where it discharges into the Pacific Ocean at San Pedro Bay. The Site is located along the Newport Inglewood Fault Zone (NIFZ), which forms the boundary between the Central and West Coast subbasins and acts as partial barrier to groundwater movement in the area. The NIFZ offsets, thins, and folds many of the aquifers. Due to the proximity of the Site to the NIFZ, aquifer depths, thicknesses, and potential for interconnections may vary significantly across the Site.

Named aquifers beneath the Site in order of increasing depth are the Gaspur, Gage, Lynwood, Silverado, and Sunnyside (California Department of Water Resources [CDWR] 1961). The Lakewood Formation contains the Gaspur and Gage aquifers, and the lower aquifers are in the San Pedro Formation.

The Bellflower aquitard immediately underlies the Site at approximately 5 to 50 feet bgs. Shallow groundwater was encountered at 8 feet bgs at one boring location (GB-4) during soil sampling activities in 1986. This was believed to be a localized perched condition because native sands at greater depths were not saturated and no other borings on site encountered perched groundwater.

The uppermost portion of the Lakewood Formation is designated as the Gaspur aquifer, which is present beneath the Site from approximately 50 to 70 feet bgs as sand and gravel. The Gaspur aquifer is believed to be the water-bearing zone encountered during the well installation by LFR and subsequently sampled and analyzed. On December 16, 2007, groundwater was found beneath the Site from 32.6 to 49.32 feet bgs, with a shallow gradient flowing in a southerly direction.

In the vicinity of the subject property, the Gage aquifer has a base at approximately 180 feet bgs and is approximately 35 feet thick. Deposits in this aquifer vary from silty sand to minor gravel (CDWR, 1961). Groundwater in both aquifers of the Lakewood Formation has been reported to be of inferior chemical quality as a result of elevated salt content from salt water intrusion.

The lower Pleistocene San Pedro Formation unconformably underlies the Lakewood Formation and is known to contain numerous aquifers of varying quality; however, the deep Silverado aquifer is the only significant water-producing zone. The Lynwood aquifer has a base at approximately 600 feet bgs and is approximately 400 feet in thickness. In this location, the Silverado aquifer joins the Lynwood aquifer at approximately 600 feet bgs and continues to over 1,000 feet bgs. The City of Long Beach obtains groundwater from more than 1,000 feet bgs within the Silverado aquifer.

Groundwater beneath the Site is considered of beneficial use by the RWQCB (AEMC, 1991). However, the regional groundwater is highly degraded due to salt water intrusion and industrial waste disposal (EMCON, 1981). The Site lies within an area of poor groundwater quality, at least in part due to historical oil and gas production activities in the site vicinity (Jaykim, 1986). Salts released during the production of oil appear to have degraded the regional groundwater to be non-potable, with TDS concentrations exceeding State Water Resources Control Board (SWRCB) Resolution 88-63 of 3,000 mg/L.

According to the hydrologic records maintained by the County of Los Angeles Department of Public Works (LADPW), groundwater well 896E is located approximately 0.5 mile north and upgradient of the Site. The well is inactive, and the last depth to water measurement was recorded at 81.2 feet bgs on May 6, 1996. Groundwater well 897KK, located approximately 50 feet southwest and cross-gradient of the Site, was destroyed in 1999. The last depth to water measurement was recorded at 50.4 feet bgs on April 19, 1995. Another groundwater well, 906D, is located approximately 0.75 mile northeast and cross-gradient of the Site at the Virginia Country Club. The groundwater is listed has having no reported use, and the most recent depth to groundwater was recorded at 112.5 feet bgs on June 16, 2007. Approximately 1 mile north and upgradient of the Site are two active wells, 906A and 906E. The listed usage for 906A is domestic and stock supply; 906E is used for irrigation. The most recent depth to water measurement for 906A was 69.1 feet bgs on April 30, 2006. The most recent depth to water measurement for 906E was 70.7 feet bgs on October 19, 2005 (LADPW, 2008).

So, while some local wells exist and are used for monitoring and agriculture uses, to our knowledge none are used for potable purposes.

GROUNDWATER MONITORING AT THE SITE BY OTHERS (1987 – 1997)

In a letter from the RWQCB to OOI dated May 5, 1987, approval was given for waste discharge requirements (Order No. 87-54) for the Oil Operators land treatment at the Site (File No. 86-66), effective April 27, 1987. This included a requirement for monthly groundwater elevation measurement and quarterly groundwater quality monitoring. LFR has reviewed the following documents relating to groundwater monitoring at the Site:

- **Letters dated November 7, 1989 and October 24, 1990** requesting that quarterly groundwater monitoring as required by RWQCB Order No. 87-54 be changed to annual monitoring, as monitoring results did not show variations from previous test results.

- **1995 Groundwater Monitoring Report for Oil Operators North Site dated February 1, 1996, prepared by Jack K. Bryant Engineers (JB)**. This was an annual report that presented the results of monitoring and sampling of wells MW-2, MW-3, and MW-4 that took place on January 10, 1996 (well locations are shown on

Figure 2). Groundwater elevations at the time ranged from 39.3 feet bgs (MW-4) to 50.6 feet bgs (MW-2). Analytical results included the following:

- The pH of the monitoring wells ranged from 6.45 to 6.65 units.
- Concentrations of TDS ranged from 2,690 milligrams per liter (mg/l) (MW-4) to 10,800 mg/l (MW-2).
- TRPH was detected in well MW-2 at a concentration of 1,400 µg/l.
- TPH was not detected in any of the monitoring wells.
- Ethylbenzene and total xylenes were detected in MW-3 at concentrations of 0.9 µg/l and 2.4 µg/l, respectively. Toluene was detected in monitoring well MW-4 at a concentration of 0.5 µg/l.
- Lead, chromium, and nickel were not detected in any of the monitoring wells. Zinc was detected at concentrations ranging from 20 µg/l (MW-3) to 120 µg/l (MW-2). Copper was detected at concentrations ranging from 74 µg/l (MW-4) to 80 µg/l (MW-2).

- **RWQCB File Number 86-66, Annual Groundwater Monitoring Report 1996, for Oil Operators North Site, Pacific Place, Long Beach, CA dated March 17, 1997, prepared by JB.** Monitoring and sampling of wells MW-2, MW-3, and MW-4 took place on February 17, 18, and 19, 1997. The following results were reported:

  - Groundwater depths ranged from 42.43 feet bgs (MW-4) to 61.95 feet bgs (MW-2). Increases in groundwater depth were attributed to grading and other earthmoving activities at the Site.
  - The pH ranged between 6.34 and 6.78.
  - TDS concentrations ranged from 2,030 to 11,800 mg/l.
  - TRPH and TPH were not detected in any of the wells.
  - Benzene was detected in two wells (MW-2 and MW-3) at concentrations of 0.6 and 88 µg/l, respectively. Toluene, ethylbenzene, and xylenes were detected in well MW-3 at concentrations ranging from 1.6 to 15 µg/l.
  - Zinc was detected at concentrations ranging from 100 µg/l (MW-4) to 200 µg/l (MW-2); lead was detected at concentrations ranging from 130 µg/l (MW-4) to 280 µg/l (MW-3); and nickel was detected in MW-3 at a concentration of 65 µg/l.

No other quarterly or annual groundwater monitoring reports were available for review. It is unclear whether additional groundwater sampling was conducted at the Site. LFR believes that the monitoring was associated with the land farming efforts, and as they had stopped, so did the monitoring.

LFR

GROUNDWATER MONITORING AT THE SITE BY LFR

November 2003 and May 2004

Under the direction of and in cooperation with the DTSC, analytical results collected from MW-3 in November 2003 and from MW-3, MW-5, and MW-6 in May 2004 are included in Tables 1 through 5 and summarized below.

Metals were analyzed using EPA Method 6010B and 7470A. Nine metals were detected above laboratory reporting limits:

- Antimony (22 µg/l at MW-6)
- Arsenic (72 µg/l and 15 µg/l in MW-3 in November 2003 and May 2004, respectively)
- Barium (ranging from 97 µg/l [MW-5] to 290 µg/l [MW-3])
- Lead (16 µg/l in MW-5)
- Mercury (4.8 and 160 µg/l in MW-3 in November 2003 and May 2004, respectively, and 12 µg/l in MW-6)
- Molybdenum (24 µg/l in MW-3)
- Selenium (52 µg/l in MW-6)
- Silver (84 µg/l in MW-3)
- Vanadium (59 µg/l in MW-6)

California MCLs (per CCR Title 22, September 12, 2003) were exceeded for five of these metals:

- Antimony at 22 µg/l in MW-6 exceeded the MCL of 6 µg/l
- Arsenic at 72 µg/l and 15 µg/l in MW-3 in 2003 and 2004 exceeded the MCL of 10 µg/l
- Mercury at 12 µg/l in MW-6 and at 4.8 µg/l and 160 µg/l in MW-3 exceeded the MCL of 2 µg/l
- Lead at 16 µg/l in MW-5 exceeded the MCL of 15 µg/l
- Selenium at 52 µg/l in MW-6 exceeded the MCL of 50 µg/l
- Vanadium, an unregulated chemical requiring monitoring, and detected at 59 µg/l in MW-6, exceeded its action level of 50 µg/l

TPH was not detected at concentrations above laboratory reporting limits in any of the groundwater samples collected at the Site.

VOCs were not detected at concentrations above laboratory reporting limits in any of the groundwater samples collected at the Site.

SVOCs were not detected at concentrations above laboratory reporting limits in any of the groundwater samples collected at the Site.

December 2006

Analytical results collected from MW-3, MW-5, and MW-6 in December 2006 are included in Tables 1 through 5 and summarized below.

Metals were analyzed using EPA Methods 6010B and 7470A. Seven metals were detected at concentrations above laboratory reporting limits:

- barium (ranging from 100 µg/l [MW-5 and MW-6] to 140 µg/l [MW-3])
- calcium (ranging from 3,200 µg/l [MW-5] to 5,200 µg/l [MW-3])
- copper (ranging from 55 µg/l [MW-5] to 400 µg/l [MW-3])
- magnesium (ranging from 750 µg/l [MW-5] to 2,100 µg/l [MW-3])
- mercury (0.82 µg/l in MW-3 and 7.3 µg/l in MW-6)
- silver (62 µg/l in MW-3)
- sodium (ranging from 5,100 µg/l [MW-5] to 24,000 µg/l [MW-3]).

Arsenic was detected above the laboratory method detection limit (MDL) in MW-3 at 7.8 µg/l and at 12 µg/l in both MW-5 and MW-6.

California MCLs (per CCR Title 22, September 12, 2003) were exceeded for mercury (7.3 µg/l in MW-6); the MCL for mercury is listed at 2 µg/l.

TPH was not detected at concentrations above laboratory reporting limits in the groundwater samples collected at the Site, with the exception of TPH gasoline range organics (C_6-C_{12}). Concentrations of TPH (C_6-C_{12}) ranged from 0.05 µg/l in MW-5 to 0.38 µg/l in MW-6.

VOCs were not detected at concentrations above laboratory reporting limits in any of the groundwater samples collected at the Site.

SVOCs were not detected at concentrations above laboratory reporting limits in any of the groundwater samples collected at the Site.

EC was detected at concentrations ranging from 1,700 microsiemens per centimeter (µs/cm) to 7,740 µs/cm. California Secondary MCLs – recommended ranges (per CCR Title 22, September 12, 2003) were exceeded for EC (1,700 µs/cm in MW-5, 3,660 µs/cm in MW-6, and 7,740 µs/cm in MW-3); the recommended secondary MCL for EC is listed as 900 µs/cm.

California Secondary MCLs – recommended ranges were exceeded for chloride (1,100 mg/l in MW-6 and 3,270 mg/l in MW-3); the recommended secondary MCL for chloride is listed as 250 mg/l.

Detected TDS concentrations ranged from 900 mg/l in MW-5 to 4,710 mg/l in MW-3.

December 2007

Analytical results for groundwater samples collected from MW-3, MW-5, MW-6, and MW-7 in December 2007 are discussed below. Groundwater analytical results are summarized in Tables 1 through 5 and shown on Figure 21.

Three metals were detected at concentrations above laboratory reporting limits:

- barium (ranging from 86 µg/l and 100 µg/l in MW-5 and MW-6, respectively, to 1,100 µg/l in MW-7)
- mercury (0.74 µg/l in MW-3 and 5.6 µg/l in MW-6)

  arsenic (210 µg/l in MW-7)

Cadmium was detected at 29 µg/l in Well MW-3 which is above the method detection limit [MDL] but below the laboratory reporting limit of 50 µg/l. The MCL for cadmium is 5 µg/l.

California MCLs (per CCR Title 22, June 27, 2007) were exceeded for mercury and barium. Mercury was detected in MW-6 at a concentration of 5.6 µg/l; the MCL for mercury is 2 µg/l. Barium was detected in MW-7 at a concentration of 1,100 µg/l; the MCL for barium is 1,000 mg/l. Analytical results for metals are summarized in Table 1.

TPH was not detected at concentrations above laboratory reporting limits in the groundwater samples collected at the Site, with the exception of TPHd. TPHd was detected in MW-7 at a concentration of 1.1 mg/l. A summary of historical TPH analytical results is provided in Table 2.

No VOCs or SVOCs were detected at concentrations above laboratory reporting limits in any of the groundwater samples collected at the Site. Historical summaries of the analytical results for VOCs and SVOCs are shown in Tables 3 and 4, respectively.

March 2008

On June 6, 2008, LFR submitted the Groundwater Monitoring Report for the First Quarter 2008 to the DTSC. Groundwater samples were collected from four groundwater monitoring wells on March 25, 2008 and analyzed for TPH-cc, VOCs, Title 22 metals, SVOCs and TDS analyses.

Analytical results for groundwater samples collected from MW-3, MW-5, MW-6, and MW-7 in March 2008 are discussed below. Groundwater analytical results are summarized in Tables 1 through 5, and shown on Figure 3.

Four metals were detected at concentrations above the laboratory reporting limits. Lead was detected above the method detection limits [MDL] but below the laboratory reporting limit:

- arsenic (420 µg/l in MW-7); concentration of arsenic has doubled when compared to the previous sampling event
- barium (ranging from 50 µg/l to 120 µg/l in MW-3, MW-5 and MW-6, and 1,700 µg/l in MW-7); there is a general increasing trend in barium concentrations from all wells when compared to the previous sampling events
- lead (24 µg/l [MDL result]in MW-7); lead was detected for the first time in MW-7
- mercury (2 µg/l in MW-3 and 7 µg/l in MW-6); concentrations were slightly greater than the previous sampling event, but exhibited a general decreasing trend over the past five years of sampling activities
- zinc (74 µg/l in MW-7); concentrations were well below MCL.

ANALYTICAL RESULTS FOR CHLORIDE AND TDS IN GROUNDWATER SAMPLES COLLECTED AT THE OIL OPERATOR'S SOUTH SITE LOCATED AT 712 WEST BAKER STREET (1987 – 1988)

The analytical results for chloride and TDS concentrations detected in groundwater samples collected from monitoring wells at the OOI South Site are presented below and shown on Figure 2.

Chloride

March 1987 - Chlorides were detected at 2,830 mg/L (MW-3), 17,000 mg/L (JK-1), and 11,700 mg/L (MW-4).

July 1987 - Chlorides were detected at 2,600 mg/L (MW-3), 10,400 mg/L (JK-1), and 15,700 mg/L (MW-4).

September 1987 - Chlorides were detected at 5,290 mg/L (MW-3), 18,170 mg/L (JK-1), and 30,690 mg/L (MW-4).

December 1987 - Chlorides were detected at 2,450 mg/L (MW-3), 9,080 mg/L (JK-1), and 17,180 mg/L (MW-4).

February 1988 – Chlorides were detected at 2,720 mg/L (MW-3), 10,400 mg/L (JK-1), and 16,600 mg/L (MW-4).

January 1996 – Chloride was detected in MW-1 at 3,090 mg/L, MW-2 at 1,380 mg/L, MW-3 at 1,540 mg/L, and in MW-4 at 1,970 mg/L.

TDS

March 1987 - TDS was detected at 5,550 mg/L (MW-3), 29,300 mg/L (JK-1), and 21,000 mg/L (MW-4).

July 1987 - TDS was detected at 5,190 mg/L (MW-3), 17,000 mg/L (JK-1), and 27,600 mg/L (MW-4).
September 1987 - TDS was detected at 6,020 mg/L (MW-3), 18,540 mg/L (JK-1), and 29,830 mg/L (MW-4).

December 1987 - TDS was detected at 1,500 mg/L (MW-3), 5,100 mg/L (JK-1), and 23,000 mg/L (MW-4).

February 1988 – TDS was detected at 5,760 mg/L (MW-3), 19,000 mg/L (JK-1), and 30,000 mg/L (MW-4).

January 1996 – TDS was detected in MW-1 at 9,250 mg/L, MW-2 at 4,270 mg/L, MW-3 at 3,790 mg/L, and in MW-4 at 4,360 mg/L.

LOS ANGELES COUNTY DEPARTMENT OF PUBLIC WORKS (LADPW) DOMINGUEZ GAP CHLORIDE CONCENTRATIONS

Analytical results collected form LADPW groundwater observations wells to monitor chloride concentrations in the Dominguez Gap are summarized below and are presented in Table 6 and shown on Figure 4.

In a well approximately 0.8 mile south of the Site (29J'54), chloride levels measured in 2005, 2006, and 2008 ranged from 680 to 775 mg/L in samples collected at an elevation of 56 feet amsl or 79.6 feet below the ground surface.

In a well approximately 2.5 miles south of the Site (28B'82), chloride levels measured in 2008 were at 2,000 mg/L in a sample collected at an elevation of -65 feet amsl or 75.4 feet below the ground surface.

In a well located at Burnett Street and Fashion Avenue (28K'62), chloride was measured in 2008 at 430 mg/L approximately 0.36 mile to the southwest , chloride levels increase to 5,600 mg/L.

In a well (27R'64) approximately 3 miles SSW of the site, chloride levels were measured at 18, 800 mg/L in February 2008.

Approximately 2 ¼ miles SSW of the Site, chloride was measured at 5,600 mg/L (28C'49).

At the Site, chloride levels increase from 240 mg/L in MW-5 to 3,270 mg/L over a ¼ mile stretch.

DTSC COMMENTS TO REMEDIAL INVESTIGATION REPORT

LFR submitted a Remedial Investigation Report for the Site to the DTSC on March 4, 2008. DTSC reviewed the report and provided comments in a letter dated April 23, 2008. The Geological Services Unit (GSU) was concerned that the waste material at the Site contributes to groundwater degradation. The GSU comments in regards to groundwater are presented below.

Comment #2: GSU is concerned that waste is in contact with groundwater at the site and will continue to degrade groundwater for the foreseeable future. The contractor should propose to address this condition.

Comment #4: GSU does not concur that regional groundwater degradation can account for the groundwater contamination at the Site. There is clear evidence of onsite releases of arsenic, barium, mercury, and total dissolved solids. There is, in addition, a credible threat to groundwater from TPH, VOCs, and SVOCs originating at the site. The contractor should include these analytes as contaminants of concern at the site

Comment #5: GSU does not concur that increased TDS at the site is likely to be a result of seawater intrusion. The site was used to handle brine, which is a far more likely source of the TDS. The degradation of groundwater by TDS is a concern at the site.

Comment #8: GSU points out that the water sample taken at MW-3 in February 2008, downgradient of the former main sumps, contained 29 µg/L of cadmium. The MCL for cadmium is 5 µg/L. The contractor should discuss this observation.

CONCLUSIONS

In January 1996, concentrations of TDS ranged from 2,690 mg/l (MW-4) to 10,800 mg/l (MW-2). In 2006, TDS ranged from 900 mg/l (MW-5) to 4,710 mg/l (MW-3). Although TDS appears to have increased across the Site, historically the Gaspur aquifer has been intruded by an influx of seawater during low water conditions in an inland direction to areas beyond the Site. In addition, numerous salt sources may have existed as part of the historical oil production in the area.

Metals in groundwater for MW-7 are generally consistent with the metals detected in December 2007. The federal MCL was exceeded for arsenic. California MCLs (per CCR Title 22, June 27, 2007) were exceeded for barium, lead and mercury. MW-7 had a concentration of arsenic at 420

µg/l; the federal MCL for arsenic is 10 µg/l. Barium was detected at a concentration of 1,700 µg/l in MW-7; the MCL for barium is 1,000 µg/l. Mercury was detected at concentrations of 2 µg/l and 7 µg/l in MW-3 and MW-6 respectively; the MCL for mercury is 2 µg/l. Lead was detected at a concentration of 24 µg/l using the MDL in MW-7; the MCL for lead is 15 µg/l. Historical analytical results for metals are summarized in Table 2 and first quarter 2008 analytical results are shown on Figure 3. During this round of sampling, cadmium was not detected below the MDL of 1.9 µg/l in any of the samples. Cadmium was not detected above the laboratory detection limit of 50 µg/l in the water sample collected from MW-3 in December 2007; however, it was above the MDL at 29 µg/l of cadmium. The MCL for cadmium is 5 µg/l.

TPH-cc was not detected at concentrations above laboratory reporting limits in the groundwater samples collected from MW-3 and MW-5.

TPHg (total petroleum hydrocarbon as gasoline, C6-C12) was detected in MW-6 at a concentration of 0.93 mg/l. TPHd (total petroleum hydrocarbon as diesel, C12-C28) was detected in MW-7 at a concentration of 2.3 mg/l. A summary of historical TPH analytical results is provided in Table 3.

No VOCs or SVOCs were detected at concentrations above laboratory reporting limits in any of the groundwater samples collected at the Site. Historical summaries of the analytical results for VOCs and SVOCs are shown in Tables 4 and 5, respectively.

TDS was measured at 1,000 mg/l and 2,000 mg/l in MW-5 and MW-6, respectively. Higher concentrations of TDS were measured in MW-3 and MW-7 with 6,200 mg/l and 7,800 mg/l, respectively. Historical summaries of the results for TDS and other geochemical parameters are shown in Table 5. Elevated measurements of TDS at the Site indicated inferior quality of groundwater in the shallow aquifer, not suitable for drinking water use. Concentrations of TDS in the groundwater increase in the downgradient direction. It is unknown whether the elevated concentrations are due to natural processes or human activity. However, the Gaspur aquifer has historically been intruded by an influx of seawater during low water conditions in an inland direction to areas beyond Carson Street (located north of the Site) toward the crest of the Newport-Inglewood uplift (Poland 1959). Based on the concentrations of TDS detected during this sampling event, groundwater enters the Site classified as slightly saline water (1,000 to 3,000 mg/l), and exits the Site classified as moderately saline (3,000 to 10,000 mg/l).

Higher levels of TDS and chloride than those found at the Site have been detected in the Gaspur aquifer south of the Site. As observed on Figures 2 and 4, there is no clear regional trend to the groundwater chloride concentrations.

Historically, TPHcc, VOCs, and SVOCs in groundwater samples have either not been detected or are well below MCLs. Given the regional area's degraded surficial aquifers from historical oil production, while some degradation was observed at the Site, the conditions appear to be in general accordance with the regional degradation of groundwater quality. Lead has been historically observed, but recent analyses find no significant impact. Arsenic, barium, and

mercury slightly exceed the MCL. TDS appears to increase from potential historical Site activities, but regional degradation limits these concerns.

Given the above, LFR believes the following provide reasonable conclusions:

1. Groundwater in the area is degraded from numerous and complex interactions of nature as well as historical man-caused activities that date back numerous decades. The Site is likely part of this, but does not appear to be the sole or even primary cause of water degradation.

2. Remedial consideration of historical Site activities would be highly problematic within this environment, and would do little to remedy potential historical discharges within the context of the regions degraded groundwater. Salt is not easily remedied, and pump and treat options would pose highly costly challenges and could exacerbate the regional condition.

As a result of these observations, we request some agency concurrence with these opinions in order to consider if the Brownfield effort continues to be viable at this Site.

If you have any questions, please contact either Tony Marino or Charlie Robinson at (714) 444-0111.

µg/L = micrograms per liter
< = Not detected above laboratory reporting limit indicated, except for antimony, arsenic, beryllium, cadmium, lead and thallium where the method detection limit (MDL) is shown for sampling date 3/25/2008; arsenic, cadmium and lead for sampling date 12/03/2007
SunStar = SunStar Laboratories Inc., Tustin, CA.
STS = Southland Technical Services, Inc., Montebello, CA.
MCLs = Maximum Contaminant Levels
-- = Not available
* = Secondary MCL
** = Action Level (AL) for unregulated chemical requiring monitoring.
J = Detected below the standard reporting limit; the result is an estimated concentration.
Note - Groundwater analysis from 2004 has a lower method detection limit.

PRESENTATION OF CONE PENETRATION TEST DATA

1.0 INTRODUCTION

This report presents the results of a Cone Penetration Testing (CPT) program carried out at the Long Beach Golf Learning Center site located in Long Beach, CA. The work was performed on November 20th, 2003. The scope of work was performed as directed by LFR personnel.

2.0 FIELD EQUIPMENT & PROCEDURES

The Cone Penetration Tests (CPT) were carried out by GREGG IN SITU, INC. of Signal Hill, CA using an integrated electronic cone system. The CPT soundings were performed in accordance with ASTM standards (D 5778-95). A 20 ton capacity cone was used for all of the soundings (figure 1). This cone has a tip area of 15 cm^2 and friction sleeve area of 225 cm^2. The cone is designed with an equal end area friction sleeve and a tip end area ratio of 0.85.

The cones used during the program recorded the following parameters at 5 cm depth intervals:

- Tip Resistance (qc)
- Sleeve Friction (fs)
- Dynamic Pore Pressure (U)

The above parameters were printed simultaneously on a printer and stored on a computer diskette for future analysis and reference.

The pore water pressure element was located directly behind the cone tip. The pore water pressure element was 5.0 mm thick and consisted of porous plastic. Each of the elements were saturated in silicon oil under vacuum pressure prior to penetration. Pore pressure dissipations were recorded at 5 second intervals when appropriate during pauses in the penetration.

A complete set of baseline readings was taken prior to each sounding to determine temperature shifts and any zero load offsets. Monitoring base line readings ensures that the cone electronics are operating properly.

The cones were pushed using GREGG IN SITU's CPT rig, having a down pressure capacity of approximately 20 tons. Two CPT soundings were performed. The penetration tests were carried to depths of approximately 80 feet below ground surface. Test locations and depths were determined in the field by LFR personnel.

The CPT sample holes were grouted using our support rig. The grouting procedure consists of pushing a hollow CPT rod with a "knock out" plug back down the hole to the test hole termination depth. Grout is then pumped under pressure as the tremie pipe is pulled from the hole.

3.0 CONE PENETRATION TEST DATA & INTERPRETATION

The cone penetration test data is presented in graphical form. Penetration depths are referenced to existing ground surface. This data includes CPT logs of measured soil parameters and a computer tabulation of interpreted soil types along with additional geotechnical parameters and pore pressure dissipation data.

The stratigraphic interpretation is based on relationships between cone bearing (qc), sleeve friction (fs), and penetration pore pressure (U). The friction ratio (Rf), which is sleeve friction divided by cone bearing, is a calculated parameter which is used to infer soil behavior type. Generally, cohesive soils (clays) have high friction ratios, low cone bearing and generate large excess pore water pressures. Cohesionless soils (sands) have lower friction ratios, high cone bearing and generate little in the way of excess pore water pressures.

Pore Pressure Dissipation Tests (PPDT's) were taken at various intervals in order to measure hydrostatic water pressures and approximate depth to groundwater table. In addition, the PPDT data can be used to estimate the horizontal permeability (k_h) of the soil. The correlation to permeability is based on the time required for 50 percent of the measured dynamic pore pressure to dissipate (t_{50}). The PPDT correlation figure (figure 2) is provided in the Appendix.

The interpretation of soils encountered on this project was carried out using recent correlations developed by Robertson et al, 1990. It should be noted that it is not always possible to clearly identify a soil type based on qc, fs and U. In these situations, experience and judgement and an assessment of the pore pressure dissipation data should be used to infer the soil behavior type. The soil classification chart (figure 3) used to interpret soil types based on qc and Rf is provided in the Appendix.

Interpreted output requires that depth of water be entered for calculation purposes, where depth to water is unknown an arbitrary depth in excess of 10 feet of the deepest sounding is entered as the groundwater depth.

Interpretation Output - Release 1.00.19e
Run No: 03-1124-0955-1057
Job No: 03-312sh
Client: LFR
Project: CPT SITE INVESTIGATION
Site: L.B. GOLF CTR.
Location: CPT-01
Engineer: C. NARDI
CPT Date: 03/21/11
CPT Time: 00:01
CPT File: 312C01.COR
Northing (m): 0.000
Easting (m): 0.000
Elevation (m): 0.000

Water Table (m): 9.14 (ft): 30.0
Su Nkt used: 12.50
Averaging Increment (m): 0.15
Phi Method : Robertson and Campanella, 1983
Dr Method : Jamiolkowski - All Sands
State Parameter M: 1.20
Used Unit Weights Assigned to Soil Zones
Values of 1.0E9 or UnDef are printed for parameters that are not valid for the material type (SBT)

Interpretation Output - Release 1.00.19e
Run No: 03-1124-0955-1123
Job No: 03-312sh
Client: LFR
Project: CPT SITE INVESTIGATION
Site: L.B. GOLF CTR.
Location: CPT-02
Engineer: C. NARDI
CPT Date: 03/20/11
CPT Time: 22:42
CPT File: 312C02.COR
Northing (m): 0.000
Easting (m): 0.000
Elevation (m): 0.000

Water Table (m): 10.36 (ft): 34.0
Su Nkt used: 12.50
Averaging Increment (m): 0.15
Phi Method : Robertson and Campanella, 1983
Dr Method : Jamiolkowski - All Sands
State Parameter M: 1.20
Used Unit Weights Assigned to Soil Zones
Values of 1.0E9 or UnDef are printed for parameters that are not valid for the material type (SBT)

Gregg In Situ, Inc.
Interpretation Output - Release 1.00.19e
Run No: 03-1124-0955-1123
Job No: 03-312sh
Client: LFR
Project: CPT SITE INVESTIGATION
Site: L.B. GOLF CTR.
Location: CPT-02
Engineer: C. NARDI
CPT Date: 03/20/11
CPT Time: 22:42
CPT File: 312C02.COR
Northing (m): 0.000
Easting (m): 0.000
Elevation (m): 0.000

Water Table (m): 10.36 (ft): 34.0
Su Nkt used: 12.50
Averaging Increment (m): 0.15
Phi Method : Robertson and Campanella, 1983
Dr Method : Jamiolkowski - All Sands
State Parameter M: 1.20
Used Unit Weights Assigned to Soil Zones
Values of 1.0E9 or UnDef are printed for parameters that are not valid for the material type (SBT)

Interpretation Output - Release 1.00.19e
Run No: 03-1124-0955-1123
Job No: 03-312sh
Client: LFR
Project: CPT SITE INVESTIGATION
Site: L.B. GOLF CTR.
Location: CPT-02
Engineer: C. NARDI
CPT Date: 03/20/11
CPT Time: 22:42
CPT File: 312C02.COR
Northing (m): 0.000
Easting (m): 0.000
Elevation (m): 0.000

Water Table (m): 10.36 (ft): 34.0
Su Nkt used: 12.50
Averaging Increment (m): 0.15
Phi Method : Robertson and Campanella, 1983
Dr Method : Jamiolkowski - All Sands
State Parameter M: 1.20

Used Unit Weights Assigned to Soil Zones
Values of 1.0E9 or UnDef are printed for parameters that are not valid for the material type (SBT)

Gregg In Situ, Inc.
Interpretation Output - Release 1.00.19e
Run No: 03-1124-0955-1123
Job No: 03-312sh
Client: LFR
Project: CPT SITE INVESTIGATION
Site: L.B. GOLF CTR.
Location: CPT-02
Engineer: C. NARDI
CPT Date: 03/20/11
CPT Time: 22:42
CPT File: 312C02.COR
Northing (m): 0.000
Easting (m): 0.000
Elevation (m): 0.000

Water Table (m): 10.36 (ft): 34.0
Su Nkt used: 12.50
Averaging Increment (m): 0.15
Phi Method : Robertson and Campanella, 1983
Dr Method : Jamiolkowski - All Sands
State Parameter M: 1.20
Used Unit Weights Assigned to Soil Zones
Values of 1.0E9 or UnDef are printed for parameters that are not valid for the material type (SBT)

Gregg In Situ CPT Interpretations as of January 7, 1999 (Release 1.00.19)

Gregg In Situ's interpretation routine should be considered a calculator of current published CPT correlations and is subject to change to reflect the current state of practice. The interpreted values are not considered valid for all soil types. The interpretations are presented only as a guide for geotechnical use and should be carefully scrutinized for consideretion in any geotechnical design. Reference to current literature is strongly recommended.

The CPT interpretations are based on values of tip, sleeve friction and pore pressure averaged over a user specified interval (typically 0.25m). Note that Qt is the recorded tip value, Qc, corrected for pore pressure effects. Since all Gregg In Situ cones have equal end area friction sleeves, pore pressure corrections to sleeve friction, Fs, are not required.

The tip correction is: $Qt = Qc + (1-a) \bullet Ud$

where: *Qt* is the corrected tip load
Qc is the recorded tip load
Ud is the recorded dynamic pore pressure
a is the Net Area Ratio for the cone (typically 0.85 for Gregg In Situ cones)

Effective vertical overburden stresses are calculated based on a hydrostatic distribution of equilibrium pore pressures below the water table or from a user defined equilibrium pore pressure profile (this can be obtained from CPT dissipation tests). The stress calculations use unit weights assigned to the Soil Behavior Type zones or from a user defined unit weight profile.

Details regarding the interpretation methods for all of the interpreted parameters is given in table 1. The appropriate references referred to in table 1 are listed in table 2.

The estimated Soil Behavior Type is based on the charts developed by Robertson and Campanella shown in figure 1.

Table 1 CPT Interpretation Methods

Interpreted Parameter	Description	Equation	Ref
Depth	mid layer depth		
AvgQt	Averaged corrected tip (Qt)	$AvgQt = \frac{1}{n}\sum_{i=1}^{n} Qt_i$	
AvgFs	Averaged sleeve friction (Fs)	$AvgFs = \frac{1}{n}\sum_{i=1}^{n} Fs_i$	
AvgRf	Averaged friction ratio (Rf)	$AvgRf = 100\% \bullet \frac{AvgFs}{AvgQt}$	
AvgUd	Averaged dynamic pore pressure (Ud)	$AvgUd = \frac{1}{n}\sum_{i=1}^{n} Ud_i$	
SBT	Soil Behavior Type as defined by Robertson and Campanella		1

U.Wt.	Unit Weight of soil determined from: 1) uniform value or 2) value assigned to each SBT zone 3) user supplied unit weight profile		
TStress	Total vertical overburden stress at mid layer depth	$TStress = \sum_{i=1}^{n} \gamma_i h_i$ where γ_i is layer unit weight h_i is layer thickness	
EStress	Effective vertical overburden stress at mid layer depth	$EStress = TStress - Ueq$	
Ueq	Equilibrium pore pressure determined from: 1) hydrostatic from water table depth 2) user supplied profile		
Cn	SPT N_{60} overburden correction factor	$Cn=(\sigma_v')^{-0.5}$ where σ_v' is in tsf $0.5 < C_n < 2.0$	
N_{60}	SPT N value at 60% energy calculated from Qt/N ratios assigned to each SBT zone		3
$(N1)_{60}$	SPT N_{60} value corrected for overburden pressure	$N1_{60} = Cn \bullet N_{60}$	3
$\Delta(N1)_{60}$	Equivalent Clean Sand Correction to $(N1)_{60}$	$\Delta(N1)_{60} = \frac{K_{SPT}}{1 - K_{SPT}} \bullet (N1)_{60}$ Where: K_{SPT} is defined as: 0.0 for FC < 5% 0.0167 • (FC - 5) for 5% < FC < 35% 0.5 for FC > 35% FC - Fines Content in %	7
$(N1)_{60cs}$	Equivalent Clean Sand $(N1)_{60}$	$(N1)_{60cs} = (N1)_{60} + \Delta(N1)_{60}$	7
Su	Undrained shear strength - Nkt is use selectable	$Su = \frac{Qt - \sigma_v}{N_{kt}}$	2
k	Coefficient of permeability (assigned to each SBT zone)		6
Bq	Pore pressure parameter	$Bq = \frac{\Delta u}{Qt - \sigma_v}$	2
Qtn	Normalized Qt for Soil Behavior Type classification as defined by Robertson, 1990	$Qtn = \frac{Qt - \sigma_v}{\sigma_v'}$	4
Rfn	Normalized Rf for Soil Behavior Type classification as defined by Robertson, 1990	$Rfn = 100\% \bullet \frac{f_s}{Qt - \sigma_v}$	4
SBTn	Normalized Soil Behavior Type (slightly modified from that published by Robertson, 1990. This version includes all the soil zones of the original non-normalized SBT chart - see figure 1)		4
Qc1	Normalized Qt for seismic analysis	$qc1 = qc \bullet (Pa/\sigma_v')^{0.5}$ where: Pa = atm. pressure	5
Qc1N	Dimensionless Normalized Qt1	qc1N = qc1 / Pa where: Pa = atm. pressure	

CPT Interpretations

ΔQc1N1	Equivalent clean sand correction	$\Delta qc1N = \frac{K_{CPT}}{1 - K_{CPT}} \bullet qc1N$ Where: K_{CPT} is defined as: 0.0 for FC < 5% 0.0267 • (FC - 5) for 5% < FC < 35% 0.5 for FC > 35% FC - Fines Content in %	5
Qc1Ncs	Clean Sand equivalent Qc1N	$qc1Ncs = qc1N + \Delta qc1N$	5
Ic	Soil index for estimating grain characteristics	$Ic = [(3.47 - logQ)^2 + (log F + 1.22)^2]^{0.5}$	5
FC	Fines content (%)	$FC=1.75(Ic^{3.25}) - 3.7$ $FC=100$ for $Ic > 3.5$ $FC=0$ for $Ic < 1.26$ $FC = 5\%$ if $1.64 < Ic < 2.6$ AND $Rfn<0.5$	8
PHI	Friction Angle	Campanella and Robertson Durunoglu and Mitchel Janbu	1
Dr	Relative Density	Ticino Sand Hokksund Sand Schmertmann 1976 Jamiolkowski - All Sands	1
OCR	Over Consolidation Ratio		1
State Parameter			9
CRR	Cyclic Resistance Ratio		7

WELL PERMIT

Permit # 0991

Date: May 5, 2004

All work must be completed in accordance with Water Well Bulletin 74-81 and 74-90

Site Address:	3701 Pacific Place
Owner:	CRG Properties, Inc.
Owner Address:	Santa Ana, Ca
Consulting Firm:	LFR
Consulting Firm Address:	3150 Bristol St. Ste 250
Drilling Company:	BC2 Environmental
Drilling Company Address:	1835 E. Dawn Way Ste. B
Method of Construction/Destruction:	see attached
Number of Wells/Borings:	2 constructions

This permit valid for one year from date above

Steven Nakauchi, REHS IV
Cross-Connection/Water Program

Drilling Company: BC² Environmental

Address: 1835 E. Dawn Way Ste. B

City: Fullerton, CA

Phone: 714 449-2990

Proposed Start Date:

5/6/04

Construction/Destruction Method
Type of casing, method of sealing, etc.
(Use additional sheet or attachments)

2" schedule 40 PVC casing, 0.020" slot screen, 25' screen, #2/12 silica sand extends 3' above slotted casing, hydrated bentonite chips 3' above sand pack, grout to surface, locking well monument, concrete.

To be done in accordance with Water Well Bulletin 74-81 & 74-90

I hereby agree to comply in every respect will all regulations of the Long Beach Department of Health and Human Services and with all ordinances and laws of the City of Long Beach and of the State of California pertaining to well construction, reconstruction and destruction. Upon completion of well and within ten days thereafter, I will furnish the Long Beach Department of Health and Human Services with a complete log of the well, giving date drilled, depth of well, all perforations in casing, and any other data deemed necessary by other City agencies.

Laboratory Reports Prepared for LFR

LABORATORY REPORT FOR DECEMBER 2003

SunStar Laboratories, Inc.

31 December 2003

Derrick Willis
LFR Levine-Fricke
3150 Bristol Street #250
Costa Mesa, CA 92626

RE: Oil Operators/CRG Properties

Enclosed are the results of analyses for samples received by the laboratory on 12/19/03 12:37. If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Ben Beauchaine
Laboratory Supervisor

Notes and Definitions

J	Detected but below the Standard Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag).
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

Notes and Definitions

S-LOW	Low surrogate recovery confirmed as a matrix effect by a second analysis.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

Notes and Definitions

D-12	Results in the Gasoline Range are primarily due to overlap from a heavier fuel hydrocarbon product.
O-04	This sample was analyzed outside the EPA recommended holding time.
O-05	This sample was extracted outside of the EPA recommended holding time.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
S-02	The surrogate recovery for this sample cannot be accurately quantified due to interference from coeluting organic compounds present in the sample extract.
S-HI	High surrogate recovery was confirmed as a matrix effect by a second analysis.
S-LOW	Low surrogate recovery confirmed as a matrix effect by a second analysis.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

Notes and Definitions

O-04	This sample was analyzed outside the EPA recommended holding time.
O-05	This sample was extracted outside of the EPA recommended holding time.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
S-02	The surrogate recovery for this sample cannot be accurately quantified due to interference from coeluting organic compounds present in the sample extract.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

Notes and Definitions

QR-02	The RPD result exceeded the QC control limits; however, both percent recoveries were acceptable. Sample results for the QC batch were accepted based on percent recoveries and completeness of QC data.
QM-4X	The spike recovery was outside of QC acceptance limits for the MS and/or MSD due to analyte concentration at 4 times or greater the spike concentration. The QC batch was accepted based on LCS and/or LCSD recoveries within the acceptance limits.
QM-07	The spike recovery and or RPD was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
QM-03	Multiple analyses indicate the percent recovery exceeds the Quality Control acceptance criteria due to a matrix effect.
QB-01	The method blank contains analyte at a concentration above the MRL; however, concentration is less than 10% of the sample result, which is negligible according to method criteria.
J	Detected but below the Standard Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag).
D-03	The result for the hydrocarbon range is due to the presence of a single analyte peak in the quantitation range. It does not resemble the requested pattern.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

APPENDIX I

Remedial Investigation Workplan and DTSC Approval Letter

August 29, 2007 002-10231-02

Ms. Loni Adams
Department of Toxic Substances Control
5796 Corporate Avenue
Cypress, California 90630

Subject: Remedial Investigation Workplan, Former Oil Operators North Site, 3701 Pacific Place, Long Beach, California

Dear Ms. Adams:

On behalf of CRG Properties, LFR Inc. (LFR) is pleased to submit this Remedial Investigation Workplan to the Department of Toxic Substances Control for the Former Oil Operators North Site, located at 3701 Pacific Place, Long Beach, California (Site, Figure 1). The approximately 18-acre Site consists of three contiguous properties: Portion 1 is owned by CRG Properties, Ltd., and is designated by Los Angeles County assessor parcel numbers (APNs) 7140-014-019 and 7140-014-020; Portion 2 is owned by John B. McDonald/Family J.B. McDonald and is designated by APNs 7140-014-021, 7140-014-022, 7140-014-023, and 7140-014-027. Portion 3 is owned by Victor R. Tookey and Evelyn M. Tookey and is designated by APN 7140-014-025. Portion 1 is roughly triangular-shaped. Portion 2 is irregular-shaped and is situated east of Portion 1. Portion 3 is situated in the south central portion of the Site.

The Site is located in a mixed residential and industrial area of Long Beach. The site is bounded on the northeast by a light rail line, followed by a residential development; on the south by Interstate 405; and on the west by the Los Angeles River flood control channel (Figure 2). CRG Properties wants to prepare the Site for other commercial/industrial uses.

Based on these proposed development plans, the Site appears to be well-suited for the leaving the existing soils in place. Geotechnical evaluation will be given to stabilizing the soils at the Site and mitigating any potential migration of methane or other gases.

Background

Historical

Based on LFR's historical research, the Site was formerly owned by Oil Operators, Inc., a non-profit cooperative organization that functioned as a central brine water treatment facility serving member oil companies (AEMC, 1991). Beginning in 1926, oil brine (drilling mud

714.444.0111 m

Costa Mesa, California 92626-7324
Offices Nationwide
www.lfr.com

and other waste materials generated from oil production operations) was pumped to sumps at the Oil Operators property, of which the Site was the northernmost portion. Most of the Site was utilized as a treatment sump. After the water evaporated or infiltrated from the sumps, the remaining sludge was either drummed or left in the treatment sumps. When a water treatment plant, including evaporation ponds, was built south of the Site in the mid-1950s, Site sump use was curtailed.

A historical review of the Site including historical aerial photographs and topographic maps is attached as Appendix B of the Revised Characterization Data Report.

The 1968 aerial photograph shows that the 405 Freeway bisected the Site, with portions of the historical sumps apparently removed and filled to accommodate the construction.

A partial cleanup/treatment operation was conducted at the Site in the 1970s, which involved the removal, treatment, and replacement of a portion of the sump materials (ETC, 1984). However, detailed records of the treatment operation are not available.

Additional investigations were conducted in the 1980s, culminating in a land farming operation that was begun in 1989 (AEMC, 1991). Details of the investigations conducted at this time are included in Section 2.1. The land farming operation was halted when public complaints about odors were received by the South Coast Air Quality Management District (SCAQMD).

A groundwater monitoring program for the Site and southern adjacent property was implemented in 1987, according to Monitoring and Reporting Program No. 6775 for Oil Operators (Land Treatment File No. 86-66). According to records available to LFR, annual monitoring at three groundwater wells (MW-2, MW-3, and MW-4) was ongoing as of 1997 (Oil Operators, 1997).

LFR prepared a Characterization Data Report dated April 4, 2006 to describe current and historical investigation and remediation activities at the Site. In a letter dated July 12, 2006, the DTSC raised several issues that will need to be addressed prior to approval of the report. In general, the DTSC believed that data gaps exist, that the Site has not been fully characterized, and that the Characterization Data Report should be used in conjunction with further research and investigation to develop a Remedial Investigation Workplan. The DTSC also made nineteen specific comments to the Characterization Data Report, which is attached as Appendix B. LFR's response to the DTSC comments is attached as Appendix C.

Discussions with DTSC have been focused on adequate characterization to evaluate remedial options with the understanding that source control and exposure pathway control appear to be obvious considerations within a Brownfield redevelopment context for commercial and/or industrial use.

Current Site Conditions

The Site is currently operated as the Long Beach Golf Learning Center which consists of a practice driving range, a maintenance building, and a golf shop. The historic industrial sludge material is beneath a soil fill material, approximately seven or more feet in depth. Public access to the Site is controlled by the golf operation and Site location, adjacent to major freeways and the flood control easement.

The Site has three monitoring wells: MW-3, MW-5, and MW-6.

Public Participation

LFR has developed a Community Profile to consider potential community interests and concerns regarding the investigation of the Site. This document identifies key community, city, and government contacts; identifies past public participation activities; and proposes future public participation activities intended to involve and inform the local community. The Community Profile was approved by Ms. Stacey Lear, Public Participation Specialist for the DTSC, on July 18, 2007. Community profile documents will be prepared and sent to the public prior to conducting Site field activities.

Soil Sampling and Analysis

Impacted soil beneath the Site predominantly consists of TPH (C_{12}–C_{40}) and TPHg (C_4–C_{12}). The areas of deepest impact are in two locations in the central and northern portions of the CRG property (the northernmost part of the Site). The largest area extends from LFR boring B3 northward to GEOFON boring GB10, and extends vertically to at least 30 feet bgs. The second largest concentration of impacted soil, located north of the first area, is centered on LFR borings B7 and CPT2, and extends vertically to approximately 50 feet bgs. Analysis of soil samples collected in November 2003 indicated that lower-range carbon chain concentrations (C_{12}-C_{28}) ranged from 350 to 20,000 mg/kg, and higher-range carbon chain concentrations (C_{28}-C_{40}) ranged from 280 to 22,000 mg/kg. Gasoline-range hydrocarbons, tested in three locations at the Site (B3, B4, and B5), were found at concentrations ranging from 0.680 to 53 mg/kg.

Analytical results for metals in soil samples collected in November 2003 were below the United States USEPA iPRGs for all metals with the exception of arsenic, which was detected at concentrations ranging from 5.8 to 24 mg/kg in borings B1, B2, B3, B5, and B7. The iPRG for arsenic is 0.25 mg/kg. Arsenic is a naturally-occurring trace metal that has been found in California soils at concentrations ranging between 0.6 and 11.0 mg/kg (Kearney, 1996) and in native U.S. alluvial soils ranging from 2.1 to 22 mg/kg (Kabata-Pendias and Pendias, (1984). Concentrations of arsenic in all the samples where it was detected exceed the iPRG, and in three locations (B1, B3, and B7) the concentrations exceed expected background levels for California soils. As part of this work plan, LFR will be collecting soil samples near the Site to establish background concentrations for metals.

Benzene, ethylbenzene, toluene, and total xylenes were detected above laboratory reporting limits, but none of these VOC concentrations exceeded iPRGs for those compounds. LFR will evaluate all organic chemicals detected above health based detection limits as iPRGs are not appropriate screening criteria. Concentrations in soil gas will be evaluated using OEHHA CHHSLs. PCBs were not detected at concentrations above the laboratory reporting limit in any boring at a depth of 50 feet bgs. As part of this work plan, LFR will be collecting additional soil samples for PCB, SVOC, and TPH. In addition, select soil samples will be collected for TPH analysis that will be reported according to categories of aliphatic chain length and aromatic carbon numbers. The iPRGs for SVOCs were not exceeded for those compounds that have iPRGs, with the exception of benzo(a)pyrene in sample B7-50 at 400 µg/kg. The iPRG for benzo(a)pyrene is 210 µg/kg.

Groundwater Sampling and Analysis

Depth to groundwater was measured at wells MW-3, MW-5, and MW-6 on December 18, 2006. Depths to groundwater ranged from 28.43 (MW-6) to 47.77 (MW-3) feet below the top of the well casings with a shallow gradient flowing in a southerly direction as indicated on Figure 3. Groundwater elevations ranged from 0.51 feet above mean sea level (msl) in MW-3 to 2.05 feet above msl in MW-5. The groundwater surface gradient is approximately 0.003 foot per foot (ft/ft) across the Site. The estimated flow direction and gradient measured during this monitoring event are consistent with those measured during previous monitoring.

During the latest groundwater sampling event, laboratory analytical results indicated concentrations of each constituent analyzed was below MCLs, with one exception. Mercury was detected in MW-6 at a concentration of 7.3 µg/l, which is above the MCL currently listed at 2 µg/l. Mercury concentrations in groundwater samples collected during this sampling event decreased when compared with the previous sampling event, in wells MW-3 (from 160 µg/l to 0.82 µg/l) and MW-6 (from 12 µg/l to 7.3 µg/l).

Concentrations of TPH in the C_6-C_{12} carbon chain range were detected in groundwater samples from each of the three wells sampled during this sampling event, with concentrations ranging from 0.05 mg/l in MW-5 to 0.38 mg/l in MW-6. This is the first detection of TPH in the C_6-C_{12} carbon chain range in these wells.

VOCs and SVOCs were not detected in the groundwater above laboratory detection limits during this sampling event, which is consistent with the previous sampling event.

California Secondary MCLs – recommended ranges (per CCR Title 22, September 12, 2003) for EC were exceeded at 1,700 microsiemens per centimeter (µs/cm) in MW-5, 3,660 µs/cm in MW-6, and 7,740 µs/cm in MW-3, with the secondary MCL recommended range listed at 900 µs/cm.

California Secondary MCLs – recommended ranges for chloride were exceeded at 1,100 mg/l in MW-6 and 3,270 mg/l in MW-3, with the secondary MCL recommended range listed at 250 mg/l.

Concentrations of TDS and EC in the groundwater increase in the downgradient direction. Based on the concentrations of TDS detected during the latest sampling event, groundwater enters the site classified as slightly saline water and exits the site classified as moderately saline. It is unknown whether the elevated concentrations are due to natural processes or human activity. However the Gaspur aquifer has historically been intruded by an influx of seawater during low water conditions in an inland direction to areas beyond Carson Street [located north of the site] toward the crest of the Newport-Inglewood uplift (Poland, J.F., 1959). State Water Resources Control Board Resolution 88-63 stipulates that groundwater in excess of 3000 ppm TDS is no longer considered potable, suggesting that the groundwater at the Site is of marginal quality, but remaining potable in accordance with the RWQCB Basin Plan. The closest body of water is the Los Angeles River, which is a concrete channel adjacent to the Site.

Workplan for Additional Site Characterization

Pre-Field Activities

Prior to the field activities, LFR will coordinate field activities with the golf practice center operator and will notify CRG and DTSC.

LFR has prepared a site-specific Health and Safety Plan (HSP) for all LFR personnel and subcontractors in accordance with applicable federal and state regulations (29 CFR 1910.120 and 8 CCR 5192, respectively) and was reviewed and approved by an LFR Certified Health Professional. The HSP, included as Attachment A, addresses the potential for exposure to hazardous constituents, and delineates the general safety procedures required for the safe operation of mechanical equipment to be used while conducting field operations at the site. All proposed sampling locations will be marked as required by Underground Service Alert (USA). LFR will contact USA at least three days before commencement of the field work to obtain a utility clearance ticket number. LFR may also subcontract with a subsurface utility locator to screen the proposed sampling locations.

LFR has prepared a Quality Assurance Project Plan (QAPP) to detail field protocol, which is included as Attachment B.

Additional Soil and Soil Gas Investigation

Additional soil and soil gas sampling will be necessary to complete site characterization and provide information for the Human Health Risk Assessment (HHRA), which will also consider exposure pathways that may be eliminated because of past or future mitigation and

remediation. Soil samples will be collected from approximately 10 locations in the site vicinity, if accessible and representative of native soils, to be analyzed for Title 22 metals including arsenic to establish background concentrations. Soil samples will be collected in the vicinity of borings B-6 and B-7 and analyzed for TPH, PCBs, SVOCs, and metals. Soil gas samples will be collected at approximately sixteen locations across the site and analyzed for VOCs. methane, oxygen, carbon dioxide, and hydrogen sulfide concentrations.

Off-site Soil Sampling for Background Conditions

LFR will advance soil borings using a hand auger from various locations in the site vicinity for Title 22 metals including arsenic analysis to establish background conditions. The number, location, and depth of background soil samples to be collected will depend on property accessibility and representation of soils to native conditions. Upon obtaining permission from the city of Long Beach, LFR will collect background soil samples from Los Cerritos Park at 3750 Del Mar Avenue and along Del Mar Avenue, which is located adjacent to and east of the Site (Figure 4).

On-site Soil Sampling

LFR will advance borings using a direct-push drill-rig in the vicinity of borings B-6 and B-7 to collect soil samples for metals, TPH, PCBs, VOCs, and SVOCs to characterize the subsurface (Figure 4). Based on analytical results at the B-6 location, additional soil samples should be collected for TPH to a depth of 15, 20, and 25 feet bgs to assess the vertical extent of impacted soil. Based on analytical results at the B-7 location, samples should be collected at depths of 5, 10, 20, 30, 40 and 50 feet bgs and analyzed for arsenic, lead, mercury, VOCs (including naphthalene), SVOCs (including benzo(a)pyrene), and TPH to assess the vertical extent of impacted soil. Based on previous soil sampling in this area, the total metal concentrations for lead and arsenic exceeded ten times their respective soluble threshold limit concentration (STLC). If laboratory results indicate any concentration of metal exceeding ten times their respective STLC, then a waste extraction test using deionized water to simulate actual Site pH conditions will be performed.

Three worst-case samples will be selected for additional analysis using the Synthetic Precipitation Leaching Procedure (SPLP) and for TPH. The extraction fluid for the SPLP is an aqueous solution (of sulphuric and nitric acids) intended to simulate rain water. Consequently, the SPLP would provide a more conservative evaluation than deionized water, and evaluate the buffering capacity of Site materials from effects from acid rain. The TPH will be reported according to categories of aliphatic chain lengths and aromatic carbon numbers.

Fill Material Soil samples will be collected at six locations at approximately 0.5-, 5- and 10-foot depths from the fill material that was placed as an estimated 10-foot cover over the sump. Soil samples will be analyzed for CAM 17 metals using EPA method 6010B/7471A, organochlorine pesticides using EPA method 8081A, PCBS using EPA method 8082, and SVOCs using EPA method 8082.

Soil Gas Sampling

Soil gas samples will be collected and analyzed for VOCs, methane, oxygen, carbon dioxide, and hydrogen sulfide in accordance with the most recent version of DTSC guidance for soil gas investigations and as described in the attached QAPP. Borings will be placed at depths of approximately 5 and 10 feet bgs within the fill material and above the sludge material. Soil gas sampling locations SG15 and SG16 will be placed near former borings GB4 and C7, respectively (Figure 5).

Borings located in native soil outside the sump materials will be advanced to depths of 5 and 10 feet bgs. All soil cuttings will be collected in 55-gallon drums, labeled, and secured on Site. All waste material generated during field activities will be properly disposed of in accordance with local, state, and federal regulations.

Groundwater Monitoring Well – Installation, Survey, and Sampling

One additional groundwater monitoring well will be installed in a downgradient position and sampled for TPH, VOCs, SVOCs, and metals (Figure 3). During installation, soil samples will be collected at five-foot intervals beginning at 5 feet bgs. Soil samples will be analyzed for TPH, VOCs, SVOCs, and metals at the 5- and 10-foot depths. The remainder of the soil samples will be placed on hold pending the results of the 5- and 10-foot samples unless field indicators warrant laboratory analysis. If the analytical results indicate that the concentrations are below regulatory cleanup goals, then groundwater monitoring may be conducted to demonstrate that the concentrations in groundwater remain below regulatory cleanup goals.

LFR will provide personnel to sample the three existing wells and one newly installed well for analysis and submit reports to the DTSC on a quarterly basis for a period of one year. After one year, the wells will be sampled annually. The wells will be sampled for TPH, VOCs, SVOCs, and metals. A groundwater sample will be collected from each of the groundwater monitoring wells on the Site. LFR personnel will measure and record groundwater quality parameters (temperature, pH, conductivity, and turbidity) during well purging activities.

The purge water from groundwater sampling will be temporarily contained on site in 55-gallon drums and disposed of at an appropriate licensed facility. The volumes of purged water will be recorded on field logs and documented for the summary report. All waste material generated during field activities will be properly disposed of in accordance with local, state, and federal regulations.

Reporting

LFR will submit a report to the DTSC summarizing the investigation and the results of the laboratory analysis. LFR's intention is to perform this work in a timely manner such that we can implement a remedial plan to allow for the future development of the Site. LFR will contact the DTSC prior to implementing the scope of work described in this workplan. LFR

and CRG Properties will be happy to meet with DTSC staff to discuss the program presented in this work plan. If you have any questions, please contact either Tony Marino or Charlie Robinson at (714) 444-0111.

Sincerely,

Darren P. Burgett

APPENDIX A

QUALITY ASSURANCE PROJECT PLAN

Pre-Sampling Activities

A site-specific Health and Safety Plan (HSP) will be prepared for the sampling activities. All LFR employees at the Site, as well as subcontractors and regulatory personnel, will be required to read and sign the HSP in order to familiarize themselves with the safety procedures and protocols to be maintained while performing work at the Site. A copy of the HSP will be available on-site during field activities for reference and review by regulatory or site personnel.

All proposed sampling locations will be marked as required by Underground Service Alert (USA). LFR will contact USA at least three days before commencement of the field work to obtain a utility clearance ticket number. LFR may also subcontract with a subsurface utility locator to screen the proposed sampling locations.

Drilling of Soil Borings

Collection of soil samples at the Site will be performed using the following methods:

- **Hand-auger** – Shallow soil samples (up to 2.5 feet bgs) in brass or stainless steel sleeves using a hand auger or slide-hammer sampling device
- **Truck-mounted Geoprobe drill -** A Geoprobe drill with a 1-inch diameter hollow tube and 4-foot acetate sleeves fitted into the hollow tube
- **Hollow-stem auger** – a truck-mounted drill rig with variable diameter hollow augers; stainless steel or brass sleeves fitted into sampler

Prior to drilling activities, hand-auger equipment will be used to advance a pilot boring to a depth of approximately 5 feet bgs. The pilot boring will be used to assess whether underground utilities are present.

The sampling equipment will be cleaned between each sampling point and soil boring. The sampler will be washed between sampling intervals using a steam cleaner followed by an Alconox solution (an inorganic detergent); followed by a tapwater rinse. The sampler will be dried by air and/or with a paper towel prior to sampling. Augers will be advanced to the desired sample interval and removed.

Collection of Soil Samples

A core-barrel sampler will be used to collect shallow soil samples at the required interval. The core-barrel sampler will be lined with clean brass or stainless steel sleeves fitted into the end of the sampler. The sampler will be driven into the soils to obtain relatively undisturbed soil samples.

Immediately upon collection of the sample, the soil-filled sampling tube will be removed from the sampling tool and the ends of the tube will be capped with Teflon sheets, plastic end caps, and silicone-based tape. Following collection, the samples will be labeled, placed in locking bags, and then placed in a light-occlusive thermostatically controlled preservation device (i.e., a cooler containing ice) until they are transferred to the analytical laboratory. The cooler will be kept at a temperature of 4 degrees Celsius (plus or minus 2 degrees Celsius). To reduce the potential for cross contamination between borings, hand auger and sampling equipment will be cleaned prior to use at each drilling location. Strict chain-of-custody protocol will be followed throughout all phases of the sample handling process.

Sample container labels will include a unique sample identification number, the name of the person collecting the sample, the time the sample was collected, project identification, sample location, analytical parameters, date sampled, and any preservative added to the sample.

Sample Selection

The selection of soil samples to be submitted for chemical analysis will be based on the work plan, and may be augmented based on field observations such as VOC or total petroleum hydrocarbon (TPH) emission measurements using the flame ionization detector (FID) or photoionization detector (PID), lithology, and soil staining. The FID or PID will be calibrated prior to use. One soil sample from each sampling interval will be placed in a plastic bag, broken apart, and allowed to stand for a minimum of 5 minutes prior to screening. The concentration of emissions in the resultant “head space” gas will then be measured with the FID or PID and recorded. Lithology will be evaluated to select samples with finer grain size for VOC analysis.

LFR Soil Sample Collection Procedures for VOCs Using EPA Method 5035

Discrete soil samples collected for VOC analysis will be obtained using EPA Method 5035. Soil samples can be preserved in the field or by the laboratory. Discrete soil samples for VOC analysis will be collected assuming that the concentrations are unknown. Soil samples will be obtained by either collecting soil from a sampling sleeve using a syringe, or by thrusting the En Core™ sampler into the soil until it is full. Descriptions of the syringe method and En Core™ sampler method are provided below.

If soil samples are collected from a syringe, they will be preserved in the field. For soil samples preserved in the field, each soil sample will consist of two subsamples (soil collected with a clean syringe and extracted into laboratory-provided vials that contain

preweighed amounts of methanol or sodium bisulfate). If soil samples are preserved in the laboratory, each soil sample will consist of either two clean 5-gram En Core™ samplers or one clean 25-gram En Core™ sampler.

The sample containers will be placed in a sealable plastic bag in a portable cooler. The samples will be placed immediately on ice and will be kept cooled and on ice or in a refrigerator until transport to the laboratory (at 4°C ±2°C). Sample collection, handling, and custody procedures will be documented in the field logbook. Soil sample collection requirements for EPA Method 5035 are attached. Samples collected for analytical testing will be maintained under strict chain-of-custody protocol.

Procedures for Collecting Soil Samples Using the Syringe Method

Before going to the field:

1 Discuss the analytical requirements for the project with the analytical laboratory. Obtain pre-weighed clean VOAs from the laboratory. The laboratory will provide separate VOAs containing methanol and sodium bisulfate preservative.

2 Determine from the laboratory the mass of soils that should be placed in each VOA, as well as the number of VOAs to be filled in the field for the required number of analyses. The mass of soil is proscribed by the laboratory when the laboratory specifies the size of the syringe to use and the number of syringe volumes to be placed in the VOA.

In the field:

1 For each sampling depth, drive samplers containing clean sleeves into the soils at the desired depth. Evaluate the soils in the sleeve using a PID, FID or by visual evidence to select the soils that are finer grained for VOC analysis and/or have higher volatile emissions.

2 Using a new clean syringe, remove the specified mass of soils from the sleeve and inject it into the VOA. Seal the VOA and clean off any excess soil from the outside of the VOA.

3 Label the VOA with all the required sampling information and place the VOA in the chilled cooler for delivery to the laboratory.

Procedures for Collecting Soil Samples with the En Core™ Sampler

Before taking sample:

1 Hold the clean coring body and push the plunger rod down until the small O-ring rests against the tabs. This will assure that the plunger moves freely.

2 Depress the locking lever on the En Core™ T-Handle. Place the coring body, plunger end first, into the open end of the T-Handle, aligning the two slots on the coring body with the two locking pins in the T-Handle. Twist the coring body clockwise to lock the pins in the slots. Check to ensure that the sampler is locked in place. The sampler is now ready for use.

Taking sample:

1 Turn the T-Handle with the T up and the coring body down. This positions the plunger bottom flush with the bottom of the coring body (ensure that the plunger bottom is in position). Using the T-Handle, push the Sampler into soil until the coring body is completely full. When full, the small o-ring will be centered in the T-Handle viewing hole. Remove the Sampler from soil. Wipe excess soil from the coring body exterior.

2 Cap coring body while it is still on the T-handle. Push cap over the flat area of the ridge and twist to lock the cap in place. The cap must be seated to seal the sampler.

3 Clean the coring body and plunger using the triple rinse procedure.

Preparing Sampler for Shipment:

1 Remove the capped Sampler by depressing the locking lever on the T-Handle while twisting and pulling the Sampler from the T-Handle.

2 Lock the plunger by rotating the extended plunger rod fully counter-clockwise until the wings rest firmly against the tabs.

3 Attach completed circular label (from En Core™ Sampler bag) to the cap on the coring body. Label the En Core™ Sampler with all the required sampling information, and place the sampler in the chilled cooler for delivery to the analytical laboratory.

4 Return the full En Core™ Sampler to the zipper bag. Seal the bag and put it on ice.

Collection of Soil Gas Samples

Soil gas sampling will be conducted in general accordance with the most recent version of the DTSC guidance for soil gas investigations, as clarified in discussions with DTSC below. Soil gas tubing will be Teflon or some other chemical resistant tubing. Prior to sample collection of samples to be analyzed by EPA Method 8260B, the first five dead volumes of gas shall be discarded to flush the sample tubing and fill it with in situ soil gas, and the appropriate purge volume will be selected.

The purge volume or “dead space volume” can be estimated based on a summation of the volume of the sample container (e.g., glass bulbs), internal volume of tubing used, and

annular space around the probe tip. Summa canisters, syringe, and Tedlar bags are not included in the dead space volume calculation. The Agency recommends step purge tests of one (1), three (3) and seven (7) purge volumes be conducted as a means to determine the purge volume to be applied at all sampling points.

The appropriate purge volume should be selected based on the highest concentration for the compound(s) of concern detected during the step purge tests. The purge volume should be optimized for the compound(s) of greatest concern in accordance with Section 2.2 of the AGSI.

If VOCs are not detected in any of the step purge tests, a default of three (3) purge volumes should be extracted prior to sampling.

The step purge tests and purging should be conducted at the same rate soil gas is to be sampled.

The purge test data (e.g., calculated purge volume, rate and duration of each purge step) should be included in the report to support the purge volume selection.

Additional purge volume tests should be performed to ensure appropriate purge volumes are extracted if: (1) widely variable or different site soils are encountered; or (2) the default purge volume is used and a VOC is newly detected.

Purge volumes from the gas probes will be collected by capping the probe and drawing a vacuum through a coupling on the cap. The purge flow rate will be approximately 100 milliliters (ml) per minute. Soil gas samples will be collected by filling a glass sample syringe from an unbroken length of 1/4 –inch polyethylene tubing in the gas probe. The glass syringe will be wrapped with foil in order to protect the soil gas sample from UV sunlight. Per DTSC requirements, a tracer gas (isopropyl alcohol or propane) will be released at the surface immediately adjacent to the probe/soil interface and at the top of the probe to determine if ambient air has broken through and diluted the soil-gas sample. The tracer gas will be added to the list of analytes reported by the laboratory. A lack of the leak test compound detected in the samples will be an indication that the fittings and probe were sealed and were not conduits for ambient air to be drawn into the sampling assembly. At least 10 percent of the soil-gas samples will be checked for tracer gas. A portable photoionization detector (PID) will be used in the field to ensure adequate venting of soil vapor during investigative activities.

Soil gas samples will be collected in clean (new) syringes and directly injected into the analytical instrument. The volume for the gas-tight soil-gas syringe samplers used is approximately 5 ml or 10 ml (two different sizes are used).

Methane. Soil gas samples will also be collected in Tedlar bags for off-site analysis for methane using a GC equipped with a Flame Ionization Detector (FID). Standard reporting limits of 10 ppmv will be used.

On-Site Monitoring for Oxygen, Carbon Dioxide, Methane and Hydrogen Sulfide. O_2, CO_2, CH_4, and H_2S will be collected in Tedlar bags for on site monitoring using a Landtec GEM 2000 Plus portable gas analyzer or similar gas analyzer.

Sample Intervals

Soils gas samples will be sampled at the intervals specified in the Workplan, or at the discretion of the geologist based on field observations such as changes in lithology, visual observations of staining or measurements of volatile emissions.

The presence of moisture in soil decreases the rate of vapor intrusion by decreasing soil airspace and inhibiting vapor movement. Thus soil gas sampling after a significant precipitation event where the ground is saturated is not recommended. In the event that saturated soil is found when soil borings are made for soil gas collection no soil gas sample will be collected in a saturated zone.

Drilling of Boring for Groundwater Monitoring Well

The borings drilled to install the groundwater monitoring wells will be drilled using a truck-mounted drill rig equipped with a hollow-stem auger. Drilling services will be provided by a State-licensed C-57 drilling contractor.

The augers will be steam-cleaned prior to the drilling. Soil cuttings from the drilling operations will be monitored during drilling activities for stains, odors, and photoionization detector (PID) readings. Based on the analytical results of the soil samples collected during drilling, the soils will either be left on site or transported off site to an appropriate disposal facility. All waste material generated will be properly disposed of in accordance with local, state, and federal regulations.

Soil descriptions, in general accordance with the Unified Soil Classification System, sample type and depth, and related drilling information, will be recorded on a boring log under the supervision of a State-professional geologist from LFR. Soil samples will be collected during drilling activities in a manner consistent with the procedures described in the preceding paragraphs. The borings will be used to install groundwater monitoring wells.

Groundwater Monitoring Well Installation and Development Procedures

Monitoring well installation permits will be obtained at the Los Angeles County Department of Health Services. The wells will be constructed of flush-jointed 2-inch inside-diameter threaded screen and blank Schedule 40 PVC casing. Machine-slotted 0.020-inch screen width will be installed at a depth interval which encounters the top of the groundwater table. Blank PVC casing will be used to construct the remainder of the

well to the ground surface. The well casing will be installed inside the hollow-stem augers.

Prior to beginning the placement of the filter pack, the casing will be suspended in the annulus of the auger, a few feet of sand filter pack material will be poured into the annulus, the augers will be lifted 2 to 4 feet, and a few feet of sand filter pack material will be poured into the annulus again. The augers will be lifted in 2- to 4-foot segments and sand filter pack material placed each time until the sand backfill is approximately 1.5 feet above the top of the screen.

Prior to the placement of the pelletized bentonite zone, the well will be surged with a surge block for approximately one-half hour to enable settling of the filter pack. Additional filter pack will be added. An approximate 3-foot-thick, pelletized bentonite zone will be placed immediately above the sand filter pack and will be hydrated with clean water. Bentonite grout will be placed in the annulus above the pelletized bentonite zone to a depth of approximately 1.5 feet bgs. A traffic-rated well housing will be placed above the well casing and set in concrete. The well housing will be raised approximately 1 to 2 inches above the ground surface.

Prior to development, depth to groundwater in the wells will be recorded to the nearest 0.01 foot using a conductance probe. Following installation, the wells will be developed by surging with a surge block and bailing using the drill rig. Development will continue until a minimum of three well volumes of water are removed or the water from the well becomes clear, whichever occurred first. The well will be developed at or near to the recovery rate in an attempt to minimize the likelihood of cascading water.

Water recovered from the well will be stored in DOT-approved 55-gallon drums on site until analysis of the initial water samples had been completed. The water depth measuring points on the well casings will be noted with a small notch in the casing and marked with indelible ink.

Purge Method Groundwater Sample Collection Procedures

Field activities and equipment utilization will be recorded on groundwater sampling field data sheets. The water level and depth to the bottom of each well will be measured using a conductance probe; the measurements will be recorded to the nearest 0.01 foot. Prior to use, the probe will be rinsed in an Alconox solution (an inorganic detergent), followed by two deionized-water rinses.

The volume of water (in gallons) contained in the well casings will be estimated using the following equation:

$$\text{Casing Volume (gallons)} = \pi \times h \times 7.5 \times r_1^2$$

Where r_1 equals the radius of the well casing, h equals the height of the water in the well, $\pi = 3.14$ and 7.5 is equal to gallons per 1 cubic foot of water.

Prior to initiating a sampling program, the wells will be purged of standing water. A water sample will be collected following the removal of a minimum of three casing volumes of water and/or stabilization of pH, temperature, and electrical conductivity readings to within 5 percent of each other for three subsequent measurements. A 55-gallon drum will be used to measure the volume of water removed. Disposable bailers will be used for sampling the wells. New string will be used on the sampling bailers for each well.

Water samples will be collected by lowering the bailer approximately 2 to 4 feet below the static groundwater level, and raising the bailer slowly in order to minimize agitation of the water sample in the bailer. Water will be discharged from the bailer through a bottom discharge valve placed on the bottom of the sample container. Discharge to the sample container will be conducted at a rate slow enough to minimize bubbling or significant agitation of the liquid. The sample container will be filled to the top (from the bottom up) and overfilled leaving no remaining headspace. Samples will be collected in laboratory-approved containers.

Sample Handling

The samples retained for chemical analyses will be placed in plastic bags and stored in an ice chest cooled, using ice, to a temperature of approximately 40 degrees Fahrenheit.

The samples will be delivered to and analyzed by a State-certified hazardous waste laboratory within 24 hours of collection. Sample handling, transport, and delivery to the laboratory will be documented using chain-of-custody procedures, including the use of chain-of-custody forms.

Field Logbook Recordings

The LFR field technician will record sampling activities, sampling locations, site observations, and other pertinent information on field service forms. Information to be recorded in the field logbooks includes: date, starting time, site identification, meteorological conditions, sample identification numbers, location and description of sampling points, number of samples collected, time of sample collection, photo log, deviations from work plan, field personnel protection, level of personnel protection, field observations and parameters, problems encountered and actions taken to resolve problems, and the signature of the person making the entry. Information will be recorded in permanent ink. If an error is made, corrections must be made by crossing a line through the error and entering the correct information. Changes will be initialed.

Boring Logs

Soil lithology will be logged by an experienced field geologist under the supervision of a California Professional Geologist. Recovered soil samples will be field screened for evidence of contamination using an organic vapor analyzer along with visual senses.

Information to be recorded on the boring logs include: Registered Professional (PE or PG) responsible for the boring log (stamp, signature, license number, and expiration date), boring location (survey coordinates or identification number), surface elevation if known, outside boring diameter, total depth, depth to groundwater (during drilling and static), sample identification, interval, percent recovery in sample tubes, USCS soil classification group name and symbol, major and minor soil constituents and their relative percentages, soil color, soil moisture, odor, observations regarding the possible presence of contaminants, grain size and shape, field estimation of moisture content, field instrumentation readings, sampling intervals, and other pertinent details.

Lithologic Description

Soil samples will be lithologically described and classified using the Unified Soil Classification System (USCS). A lithologic log will be prepared for each boring. Blow counts will be recorded at each sampling interval to evaluate consistency of the soils. Drilling and logging will be performed under the direction of an LFR California Professional Geologist.

Borehole Abandonment

After samples are collected from the boring, the boring will be completely filled with clean soil and/or grout/bentonite to within 6 inches of the ground surface. The upper 6 inches of each boring will then be filled to the ground surface with clean soil and/or cement slurry. Hand auger locations will be backfilled with bentonite chips and/or clean soil.

Decontamination Procedures

To reduce the potential for cross contamination, soil sampling equipment will be properly cleaned prior to use at each sampling location. Sampling equipment will either be steam cleaned or washed with a laboratory grade non-phosphate detergent solution and double-rinsed with deionized water. Equipment that comes into contact with potentially contaminated soil will be decontaminated consistently to assure the quality of samples collected. Disposable equipment intended for one-time use will not be decontaminated, but will be packaged for appropriate disposal. Decontamination will occur prior to and after each use of a piece of equipment.

All drilling and sampling devices used at the Site will be decontaminated using the following procedures:

- non-phosphate detergent and tap water wash, in a 5-gallon plastic bucket, using a brush
- initial deionized/distilled water rinse, in a 5-gallon plastic bucket
- final deionized/distilled water rinse, in a 5-gallon plastic bucket

Equipment will be decontaminated in a pre-designated area on plastic sheeting, and clean bulky equipment will be stored on plastic sheeting in uncontaminated areas. Cleaned small equipment will be stored in plastic bags. Materials that will be stored more than a few hours will also be covered.

Chain-of-Custody Records

A chain-of-custody record will accompany all sample shipments. Chain-of-custody forms will be completed and sent with each shipment for each laboratory. If multiple coolers are sent to a single laboratory on a single day, a chain-of-custody form will be completed for each cooler. The chain-of-custody record will identify the contents of each shipment and maintain the custodial integrity of the samples. Generally, a sample is considered to be in someone's custody if it is either in someone's physical possession, in someone's view, locked up or kept in a secured area that is restricted to authorized personnel. Until the samples are received by the laboratory, sample custody will be the responsibility of the sample collector. Sample container labels will include a unique sample identification number, the name of the person collecting the sample, the time the sample was collected, project identification, sample location, analytical parameters, date sampled, and any preservative added to the sample.

Sample Transfers

Strict chain-of-custody protocol will be followed throughout all sample transfers. A chain-of-custody document will be completed in triplicate. One copy will accompany the samples to the laboratory, one will be retained by the sampler, and the third will be forwarded to the LFR data management system.

Field QA/QC Procedures

Field QA/QC procedures performed at the Site will consist of the following measures:

- Chain-of-custody forms will be used for sample submittal to the laboratory.
- Daily information regarding soil sample collection will be recorded in field logbooks dedicated to this project. Sample types, soil descriptions, sample identification numbers, and sample times will be collected and recorded on field data sheets and in the field logbooks. Pages will be numbered, dated, and signed by the person performing data entry.

Field QA/QC samples will be collected and submitted for analysis along with the discrete soil samples, using the following sampling frequency:

- equipment blanks – one equipment rinseate blank per field day
- field blanks – one field blank sample per field day

- field duplicates – one duplicate for every ten discrete samples
- travel blanks – one travel blank per field day for all soil samples

Equipment Rinsate Blanks

An equipment rinsate blank (equipment blank) will be collected from the final water rinsed over equipment after cleaning activities have been performed. The equipment blank will be collected from non-dedicated (reusable) sampling equipment such as soil sampling tools and sampling equipment. The equipment blank will be analyzed using the same analytical method used on the unique soil samples.

To collect an equipment blank sample, distilled water will be carefully poured over or through the recently cleaned equipment, and collected directly into an appropriated sample container held over a bucket. Equipment blank samples will be stored and processed in the same manner as all other samples.

Field Blanks

Field blank samples will consist of a sample of the distilled deionized water that was used to wash sampling equipment during equipment cleaning activities. The purpose of the field blank sample is to evaluate the water for COCs. A field blank sample will be collected by pouring distilled water into the appropriate sample container. The field blank samples will be stored and processed in the same manner as all other aqueous samples.

Field Duplicate Sample

Duplicate soil samples will be collected to evaluate the analytical procedures and methods employed by the laboratory. The field duplicate sample will be collected immediately after collecting the original soil sample. One field duplicate will be collected for every ten soil samples collected.

Travel Blanks

Travel blank samples will be utilized to determine cross contamination of COCs during travel. One travel blank per field day will be utilized for all soil samples.

Investigation-Derived Wastes

Waste soils and water produced during sampling activities will be contained in DOT-approved drums, labeled, and temporarily stored on site pending receipt of the analytical data and evaluation of appropriate disposal options.

The volume of investigation-derived wastes is estimated to be relatively small. All soil cuttings and purged groundwater will be collected in a 55-gallon drum, labeled, and secured on the Site. The Office of Emergency and Remedial Response (OERR) Directive 9345.3-02 (May 1991), which provides guidance for the management of investigation-derived wastes, will be followed. Liquids generated from the proposed sampling activities (estimated to be less than 20 gallons) will be collected in a 55-gallon drum, labeled, and secured on the Site. All waste material generated will be properly disposed of in accordance with local, state, and federal regulations.

Field Measurements

Field measurements will include use of a PID and/or FID to measure volatile emissions from soils and to monitor concentrations of volatiles in air. Soil samples will also have pH measurements obtained by mixing 50 percent soil and 50 percent water in a beaker and measuring the pH of the solution with litmus paper. For the syringe method, the mass of soil to place in the laboratory-provided VOA is measured by the number of syringe volumes used.

QA/QC

One duplicate soil sample for every ten soil samples collected will be taken for laboratory analysis. The duplicate sample will be given a different identifier for laboratory analytical purposes.

Other QA/QC measures include obtaining equipment blanks (one per day), field blanks (one per day), and travel blanks (one per day) for laboratory analysis. These samples will be immediately placed in a chilled cooler to avoid loss of VOCs. Preservatives will also be used in the VOAs or En Core™ samplers to avoid loss of VOCs.

Housekeeping/Cleanliness

Sampling equipment will be triple rinsed prior to collection of each sample to avoid cross contamination. The equipment will first be cleaned by scrubbing with a mixture of deionized water and non-phosphate detergent. A primary rinse of the equipment will then be conducted. After the primary rinse, the equipment will be given a final clean rinse with deionized water. Disposable equipment, including gloves, will be replaced between sampling locations.

Analytical Methods and Preservation

The analytical methods used for this project are EPA-approved methods. These documents may be reviewed by LFR's QA staff during laboratory audits to verify that project specifications are met. The analytical procedures described below are carried out

by the laboratory. Detection limits for these methods are attached to the end of this Appendix.

The following are the analyses that may be conducted during this project:

- California Code of Regulations (CCR) Title 22 Metals using EPA 6010/7000 Series Methods
- total petroleum hydrocarbons (TPH) using EPA Method 8015M
- VOCs using EPA Method 5035/8260B
- SVOCs using EPA Method 8270

Internal Standards

Internal standards are measured amounts of method-specified compounds added after preparation or extraction of a sample. Internal standards are added to samples, controls, and blanks in accordance with method requirements to identify column injection losses, purging losses, or viscosity effects.

Acceptance limits for internal standard recoveries are set forth in the applicable method. If the internal standard recovery falls outside of acceptance criteria, the instrument will be checked for malfunction and the sample will be reanalyzed after any problems are resolved.

Method Detection Limits

The Method Detection Limit (MDL) is the minimum concentration of an analyte or compound that can be measured and reported with 99 percent confidence that the concentration is greater than zero. MDLs are established for each method, matrix, and analyte, and for each instrument used to analyze project samples. MDLs are derived using the procedures described in 40 Code of Federal Regulations (CFR) 136, Appendix B (EPA 1990a). The EPA requires that MDLs be established on an annual basis. MDLs must be less than the applicable reporting limits for each target analyte and should be below screening level health based criteria for unrestricted use and for ecological receptors.

To the extent feasible, the MDL will be less than or equal to screening criteria such as the National Ambient Water Quality Criteria and the Maximum Contaminant Levels (MCLs). The analytical reporting limit may vary, depending on sample dilution. Efforts will be made to use the lowest reporting limit as technically feasible.

A summary table showing type of media, all known COPCs, detection limits for each COPC, PRGs, MCLs, and CHHCLs for each applicable COPC is attached.

SUMMARY TABLE OF KNOWN CHEMICALS OF POTENTIAL CONCERN

Known Chemicals of Potential Concern	MCLs mg/L	iPRG Industrial Soil (mg/kg)	Indoor Air Human Health Screening Levels (µg/m³) Commercial/Industrial Land Use Only	Shallow Soil Gas Human Health Screening Levels (µg/m³) Commercial/Industrial Land Use Only	Laboratory Detection Limit			Highest Known Concentration		
					Soil	Air	Water	Soil	Air	Water
Antimony	0.006	4.1 E+02	NA	NA	3.0mg/kg	NA	50µg/L	<5.0mg/kg	NA	22µg/L

Notes:

MCL – Maximum contaminant level (California Department of Health Services, 2007)
iPRG – Preliminary remediation goal for industrial soil (EPA Region 9, October 2004)
mg/L – Milligrams per liter
mg/kg - milligrams per kilogram
µg/m^3 – micrograms per meter cubed
ppmv - parts per million by volume
µg/kg– micrograms per kilogram
µg/l – micrograms per liter
♦ - Federal MCL (U.S. EPA, January 2006)
NA – Not applicable
° ° only total xylenes were reported
* - Calculation of a screening number for the chemical has been postponed until the toxicity criterion currently being developed by OEHHA is published as a final document (CHHSLS, January 2005)

Laboratory Instrument Calibration

Analytical instruments will be calibrated in accordance with the procedures specified in the applicable method. All analytes that are reported should be present in the initial and continuing calibrations, and these calibrations must meet the acceptance criteria specified in the reference method. Records of standard preparation and instrument calibration will be maintained. Records should unambiguously trace the preparation of standards and their use in calibration and quantization of sample results. Calibration records will be traceable to standard materials.

At the onset of analysis, instrument calibrations will be checked using all of the analytes of interest. This applies equally to multi-response analytes. At a minimum, calibration criteria will satisfy method requirements. Analyte concentrations can be determined with either calibration curves or response factors, as defined in the method. Guidance provided in SW-846 should be considered to determine appropriate evaluation procedures (EPA 1996).

Mobile-Laboratory Calibration

An initial calibration curve is performed for all target compounds as follows:

- at the start of the project
- when the gas-chromatograph column or operating conditions have changed
- when the daily mid-point calibration check cannot meet the specified requirements

A linearity check of the calibration curve for each compound is performed by computing a correlation coefficient and an average response factor. If a correlation coefficient of 0.99 or a percent relative standard deviation of ±20 percent (±30 percent for vinyl chloride) is obtained, an average response factor is used over the entire calibration range. If the linearity criteria are not obtained, quantization for that analyte can be performed using a calibration curve.

Continuing calibration standards are analyzed at the beginning of each day. Acceptable continuing calibration agreement is set at ±20 percent to the average response factor from the calibration curve, except for vinyl chloride, which requires a 30 percent agreement. When calibration checks fall outside this acceptable range for analytes detected on the Site, the on-site chemist will perform a corrective action consisting of verification of the standard and/or a new calibration curve for the analytes out of specifications. The continuing calibration includes all compounds expected at the Site and compounds specified in the workplan.

Evaluation of Tentatively Identified Compounds

No tentatively identified VOCs ("tentatively identified compounds," or TICs) are anticipated to be detected during sample analysis. However, should TICs be reported by the laboratory, depending on the reported concentrations of the TICs identified, LFR will either address TICs in the data evaluation (EPA 1989) or, if a significant number of TICs are identified during the investigation, the use of these data in the data evaluation will be discussed with the regulatory toxicologist for the project, should one be designated.

Quality Objectives and Criteria for Measurement Data

The following sections describe the outputs of the Data Quality Objective (DQO) planning process and the performance or acceptance criteria established for the project data.

Identification of Data Uses and Definition of Project DQOs

Decisions will be made based on data obtained from sampling and analysis programs. Data collected through implementation of this QAPP should satisfy federal, state, and local data quality guidelines. These data may be used to characterize the nature and extent of affected soil gas, soil, surface water, groundwater, and ambient air to support the evaluation of corrective/remedial action, and/or to assist in determining the need for additional actions.

The presence of environmental contaminants will be established by the extent of valid detectable concentrations of the chemicals of potential concern (COPCs). DQOs have been developed to ensure that the data quality meets project objectives.

The work will be conducted and documented so that the data collected are of sufficient quality for their intended use (U.S. EPA 1998). DQOs specify the data type, quality, quantity, and uses needed to make decisions, and are the basis for designing data collection activities. DQOs have been used to design the data collection activities presented in the work orders. The DQOs for the project are discussed below.

The project DQOs developed specifically for the planned sampling and analysis program have been determined based on U.S. EPA's seven-step DQO process (U.S. EPA 1994a). The Project Manager will evaluate the project DQOs to establish if the quantitative and qualitative needs of the sampling and analysis program have been met. The project definition associated with each step of the DQO process can be summarized as follows:

1. State the Problem: Previous investigations indicated that soil gas, soil, and groundwater in the site vicinity have been affected by COPCs. Additional sampling programs should provide additional characterization in addition to subsequent sampling programs to provide confirmation that remediation activities have been completed and remaining soils meet project RAOs.

2. Identify the Decision: The data will be used to evaluate the soil gas, soil, and groundwater, to evaluate risk, and provide confirmation that remedial activities meet project RAOs or to assist in determining the need for other actions to be conducted at the Site. Data will also be used to determine the source(s) of contamination as well as the nature and extent of contaminants found.

3. Identify Inputs to the Decision: Inputs to the decision will include results of analytical testing of soil gas, soil, and groundwater samples from selected locations at the project site and the data validation results. Each of these matrices will be tested for the specified analytes as presented in an activity specific field sampling and analysis plans, work plans or monitoring plans.

4. Define the Study Boundaries: The boundaries of the field sampling and analysis program will be the perimeter of the project Site.

5. Develop a Decision Rule: Decisions will be based on laboratory results for the target constituents for each respective matrix tested. If no valid detectable concentrations of target compounds are reported for the given samples, a decision will be made whether or not the Site has been fully characterized/remediated with respect to the compounds tested and no further sampling will be required as part of this assessment. The method reporting limit will be reviewed for each target compound to establish if it is sufficiently low to make an accurate determination. If target compounds are detected above analytical reporting limits, then a decision will be made as to the validity of the analytical results. Other observations will be used in conjunction with analytical results to establish whether sufficient number or location of samples has been collected.

6. Specify Limits on Decision Error: All analytical testing results will be subjected to data validation. Data are considered valid if the specified limits on precision, accuracy, representativeness, comparability, and completeness are achieved. The results of detected target constituents will be considered in evaluating the need for additional sampling of site soil gas, soil, and groundwater.

7. Optimize the Design: Field sampling programs are designed to provide the type and quantity of data needed to satisfy each of the aforementioned objectives. Separate field sampling plans, work plans and monitoring plans provide the specifications for the data collection activities, including the numbers of samples, respective locations, and sampling techniques. The quality of the data will be assessed through the procedures further described in this QAPP.

The quality of the field data, which will be generated using portable instruments that must be calibrated following the procedures described in this QAPP, must be sufficient to allow proper evaluation of the results. The quality of the laboratory data will be such that the data can be evaluated using the process defined in the *Risk Assessment Guidance for Superfund* (EPA 1989) and *Laboratory Data Validation Functional Guidelines* (EPA 1994a and 1994b). Using this process will allow data quality to be evaluated for all of the uses identified above.

Data Acceptance Criteria

The laboratory data generated during the project implementation will be evaluated for precision, accuracy, completeness, comparability, and representativeness. Precision and accuracy are the primary parameters used in evaluating the quality of the data. Data evaluation will be conducted in accordance with the guidance entitled *Laboratory Data Validation Functional Guidelines* (EPA 1994a and 1994b).

Precision and Accuracy

Precision criteria allow evaluation of the reproducibility of measurements under a given set of conditions. They quantitatively measure the variability of a group of measurements. Data precision is measured by calculating relative percent differences (RPDs) of the analytical results for field and laboratory splits.

Analytical precision is a measurement of the variability associated with duplicate or replicate analyses of the same sample in the laboratory, and is determined by analysis of laboratory QC samples, such as duplicate control samples, matrix spike duplicates, or sample duplicates. If the recoveries of analytes in the specified control samples are comparable within established control limits, then precision is within limits.

Total precision is a measurement of the variability associated with the entire sampling and analytical process. It is determined by analysis of duplicate or replicate field samples, and measures variability introduced by both the laboratory and field operations. Field duplicate samples are analyzed to assess field and analytical precision.

Duplicate results are assessed using the RPD between duplicate measurements. If the RPD for laboratory QC samples exceeds established laboratory RPD criteria, data will be qualified as described in the applicable validation procedure. If the RPD between primary and duplicate field samples exceeds 30 percent for groundwater or 100 percent for soil, data will be qualified as described in the applicable validation procedure. The RPD will be calculated as follows:

$$RPD = 100 \times \frac{|X_2 - X_1|}{\frac{X_2 + X_1}{2}}$$

where:

X_1 and X_2 are the two observed values

Accuracy is a statistical measurement of correctness and includes components of random error (variability because of imprecision) and systematic error. It reflects the total error associated with a measurement. A measurement is accurate when the value reported does not differ from the true value or known concentration of the spike or standard.

Accuracy of laboratory analyses will be assessed by laboratory control samples, surrogate standards, matrix spikes, and initial and continuing calibrations of instruments. Laboratory accuracy is expressed as the percent recovery (%R). Accuracy limits are statistically generated by the laboratory or required by specified U.S. EPA methods. If the percent recovery is determined to be outside of acceptance criteria, data will be qualified as described in the applicable validation procedure. The calculation of %R is provided below:

$$\%R = 100 \times \frac{X_s - X}{T}$$

where:

X_S is the measured value of the spiked sample
X is the measured value of the unspiked sample
T is the true value of the spike solution added

Field accuracy will be assessed through the analysis of field equipment and trip blanks. Analysis of blanks will monitor errors associated with the sampling process, field contamination, sample preservation, and sample handling. The DQO for field equipment and trip blanks is that all values are less than the reporting limit for each target constituent. If contamination is reported in the field equipment or trip blanks, data will be qualified as described in the applicable validation procedure.

Because the precision and accuracy of any data obtained will depend on the type of measurement and the type of medium sampled (solid, liquid, or vapor), the data acceptance criteria for precision and accuracy should be site- and measurement-specific. Initially, laboratory data acceptance criteria for precision and accuracy will be based on control limits used by the analytical laboratory.

If deemed necessary, site-specific data acceptance criteria will be developed after sufficient data are collected to perform valid statistical calculations to determine project data-based acceptance criteria. The results of the precision and accuracy evaluation of the initial data will be used to assess the appropriateness of the initial data acceptance criteria. Corrective action to be taken if precision and accuracy data acceptance criteria are not met may include additional sampling and/or reanalysis.

Representativeness

Representativeness is the degree to which data accurately and precisely represent selected characteristics of the media sampled. Representativeness of data collection is addressed by careful preparation of sampling and analysis programs. This QAPP, together with the WORKPLAN, addresses representativeness by specifying the numbers and locations of samples; incorporating appropriate sampling methodologies; specifying proper sample collection techniques and decontamination procedures; selecting appropriate laboratory

methods to prepare and analyze soil gas, soil, and groundwater; and establishing proper field and laboratory QA/QC procedures.

Comparability

Comparability is an expression of confidence with which one data set can be compared to another. The objective of comparability is to verify that data developed during the investigation are comparable to site knowledge and adequately address applicable criteria or standards established by the U.S. EPA and California Department of Health Services (DHS). This QAPP addresses comparability by specifying laboratory methods that are consistent with the current standards of practice as approved by the U.S. EPA and DHS.

Special Training Requirements/Certification

All project staff working on the site must be health and safety trained and must follow requirements specified in the HSP for the project. The HSP describes the specialized training required for personnel on this project and the documentation and tracking of this training.

Documentation and Records

The most current QAPP will be included in the WORKPLAN. Updates and modifications will be incorporated in the QAPP as necessary. The Project QA/QC officer will be responsible for distributing the updates and modification to the analytical laboratory and Project Manager.

Data Reporting Format

Analytical records will include standard operating procedures for sample receipt, preparation, analysis and report generation as well as the actual data reports with all specified supporting information (e.g. run logs, case narratives). The amount of supporting information is determined by data validation needs and the need for the documents to stand alone. Analytical QA/QC issues that should be documented include standard traceability, frequency, and results of QC samples such as method and instrument blanks, spiked samples, replicates, calibration check standards and detection limit studies.

Data Management Plan

LFR maintains a document management policy that supports project activities by creating and retaining records that document project activities in an accurate and transparent manner that will allow for reviews and data usability assessments. These records will include the following as a minimum:

- LFR will maintain training and certification records, which include enough detail to verify the suitability and relevance of the training and certifications. Training files will contain enough detail to support a demonstration of competency of all personnel performing project-related activities.
- Sample collection records will include sampling procedures, the names of the persons conducting the activity, sample number, sample collection points, maps and diagrams, equipment/method used, climatic conditions, and unusual observations. Bound notebooks, pre-printed forms, or computerized notebooks can serve as the recording media.
- COC records document the progression of samples as they travel from the original sampling location to the laboratory and finally to their disposal or archival. These records should contain the project name, signatures of the sample collector, the lab custodian and other custodians. The records should document any sample anomalies.
- Quality control records will include documentation on field QA/QC issues such as field, trip, and equipment rinsate blanks, collocated and field-spiked samples, and sample preservation.

Office Documentation

Samples will be tracked and data archived at LFR's Costa Mesa office. LFR's QA/QC Officer will be responsible for ensuring that documentation is in order and that all results are obtained for the analyses requested on the COC and that sample identifications on the laboratory reports match those on the COCs. The project file will be used in data tracking and documentation, as discussed below.

The project file is the common location for all information required in data evaluation and report preparation. It contains documents including work plans, sampling plans, assessment reports, correspondence, field activities logbooks, COCs, and sampling information forms. The file is organized for easy retrieval and long-term storage of information (two years or more). The LFR project manager will direct the maintenance of the project file.

Laboratory Custody

The fixed laboratory will designate a sample custodian who will accept custody of the shipped samples and check that the information on the sample labels matches that on the COC. The custodian will then enter the appropriate data into the laboratory's sample tracking system. The custodian will use the sample number on the sample label or will assign a unique laboratory number to each sample. As a record of sample receipt, the analytical laboratory will return a copy of the COC, with the assigned laboratory numbers, to the sampler. The custodian will then transfer the sample(s) to the proper analyst(s) or store the sample(s) under refrigeration until they are analyzed.

The samples designated for field analyses will be handed directly to the on-site chemist immediately after collection. The on-site chemist will document receipt of the sample and prior to analysis. The on-site chemist will maintain analytical records including data and time of analysis, sampler's name, chemist's name, sample identification number, sample depth, concentrations of compounds detected, calibration data, and any unusual conditions.

Both fixed and mobile laboratory personnel are responsible for the care and custody of samples from the time they are received until the sample is exhausted or disposed. Disposal of unused samples must comply with all applicable federal, state, and local environmental regulations. Data sheets and laboratory records will be retained as permanent documentation.

Quality Control

This section presents QC requirements relevant to the analysis of environmental samples that will be followed during all project analytical activities. The purpose of the QC program is to produce data of known quality that satisfy the project objectives and that meet or exceed the requirements of the standard methods of analysis. This program provides a mechanism for ongoing control and evaluation of data quality measurements through the use of QC materials.

The chemical data to be collected for this effort will be used to assess the potential extent of affected media, to assess possible remedial action(s) that may be necessary, or to assist in determining the need for other actions to be conducted at the Site. As such, it is critical that the chemical data be of the highest confidence and quality. Consequently, the following strict QA/QC procedures will be adhered to:

- strict protocols for field sampling and decontamination procedures
- collection and laboratory analysis of appropriate field equipment blanks to monitor for contamination of samples in the field or the laboratory
- collection and laboratory analysis of matrix spike, matrix spike duplicate, and blind split samples to evaluate analytical precision and accuracy
- attainment of completeness goals

Standards

Current laboratory standards will be used to calibrate laboratory equipment or to prepare samples and will be certified by National Institute of Standards and Technology, U.S. EPA, or other equivalent source. The expiration date will be established by the manufacturer, or based on chemical stability, the possibility of contamination, and environmental and storage conditions. Standards will be labeled with expiration dates, and will reference primary standard sources if applicable. The laboratory will discard expired standards.

Holding Time Compliance

Sample preparation and analysis will be completed within the required method holding time (Table 1). Holding time begins at the time of sample collection. If holding times are exceeded and the analyses are performed, the associated results will be qualified as described in the applicable validation procedure. The following definitions of extraction and analysis compliance are used to assess holding times:

- preparation or extraction completion: completion of the sample preparation process as described in the applicable method, before any necessary extract cleanup
- analysis completion: completion of all analytical runs, including dilutions, second-column confirmations, and any required re-analyses

Preventive Maintenance

The LFR Field Manager is responsible for documenting the maintenance of all field equipment prescribed by the manufacturer's specifications. Scheduled maintenance will be performed by trained personnel. The analytical laboratory is responsible for all analytical equipment calibration and maintenance as described in its laboratory QA plan. Subcontractors are responsible for maintenance of all equipment needed to implement subcontracted duties.

Organic Vapor Meter

Field measurements may be collected using portable organic vapor meters that feature hydrocarbon detection by photoionization (e.g., Mini-RAE 2000 PID) or flame ionization (e.g., Thermo TVA1000B FID). The PID and FID is used to measure organic gases and vapors in soil gas as well as in ambient air.

In addition, O_2, CO_2, CH_4, and H_2S will be collected in Tedlar bags for on site monitoring using a Landtec GEM 2000 Plus portable gas analyzer or similar gas analyzer.

With the PID or FID and gas analyzer, manufacturer-supplied calibration standard span gas will be used for calibration. Calibration of the PID or FID and gas analyzer will be performed before each day's sampling activities begin and as needed throughout the day if irregularities in the readings become apparent.

LFR will maintain a logbook containing calibration data for each PID and gas analyzer, including time and date of the previous calibration, who performed the calibration, and how it was performed.

Supplies and Consumables

Supplies will be checked before they are used in the field or laboratory. The descriptions for sample collection and analysis are presented in the activity specific sampling plans and will be used as a guideline for establishing the acceptance criteria for supplies. A current inventory and appropriate storage system for these materials will verify their integrity before use. Efficiency and purity of supplies will be monitored through the use of standards and blank samples.

PERFORMANCE AND SYSTEM AUDITS

Audit programs are established and directed by the LFR QA staff to verify that field and laboratory activities are performed in compliance with project controlling documents. This section describes responsibilities, requirements, and methods for scheduling, conducting, and documenting audits of field and laboratory activities.

Field Audits

Field audits focus on appropriateness of personnel assignments and expertise, availability of field equipment, adherence to project controlling documents for sample collection and identification, sample handling and transport, use of QA samples, COC procedures, equipment decontamination, and documentation. Field audits are not required, but may be performed in the event that significant discrepancies are identified that warrant evaluation of field practices.

Laboratory Audits

Laboratory audits include reviews of sample handling procedures, internal sample tracking, standard operating procedures, analytical data documentation, QA/QC protocols, and data reporting. Any selected mobile or off-site (stationary) laboratory will be licensed by the State of California as a certified testing laboratory, and will participate in the Water Pollution and Water Supply Performance Program for hazardous waste, wastewater, and drinking water analyses.

QAPP MODIFICATIONS

Changes to procedures described in this QAPP will be reported as an addendum this QAPP. The addendum will be distributed to project and laboratory personnel as appropriate.

FINAL REMEDIAL INVESTIGATION (RI) WORKPLAN FOR FORMER OIL OPERATORS NORTH SITE, 3701 PACIFIC PLACE, LONG BEACH

Dear Mr. Robinson:

The Department of Toxic Substances Control (DTSC) has reviewed the subject document for the Former Oil Operators Site in the City of Long Beach, California. DTSC approves the Final RI Workplan dated August 29, 2007.

Additional investigations may be required to collect a sufficient number of samples that are statistically valid for soil and groundwater, in order to assure that all the potential "hot spot" areas are fully investigated.

Please notify us at least 72 hours prior to the field work, such that we can arrange for DTSC staff to be present to witness the sampling events. Please submit a schedule of work along with your notice. If you have any questions, please contact me at (714) 484-5461, or the project manager Ms. Loni Adams at (714) 484-5324.

Sincerely,

Greg Holmes, Unit Chief
Southern California Cleanup Operations Branch – Cypress

Well Permit, Field Reports, Non-Hazardous Waste Manifest, and Survey Data

CITY OF LONG BEACH

DEPARTMENT OF HEALTH & HUMAN SERVICES

2525 Grand Avenue Long Beach, CA 90815-1765 (562) 570-4134 FAX (562) 570-4038

WELL PERMIT

Permit # 1399

Date: October 5, 2007

All work must be completed in accordance with Water Well Bulletin 74-81 and 74-90

Site Address:	3701 Pacific Place, Long Beach, CA
Owner:	CRG Properties, Ltd.
Owner Address:	4010 W Chandler Ave., Santa Ana, CA
Consulting Firm:	LFR, Inc.
Consulting Firm Address:	3150 Bristol St., Suite 250, Costa Mesa, CA 92626 714-444-0111
Drilling Company:	Gregg Drilling & Testing
Drilling Company Address:	2726 Walnut Ave., Signal Hill, CA 90755
Method of Construction/Destruction:	see attached
Number of Wells/Borings:	Monitoring

This permit valid for one year from date above

American Integrated Services, Inc.
P.O. Box 92316
Long Beach, CA 90809-2316

Transporter's Phone #: (310) 522-1168
Person to Contact: Wolfgang Hertegen
Fax #: (310) 552-0474
Transporter's US EPA ID No.: CAR000148238
Transporter's DOT No.:
Customer Account Number with TPST: 7704001

Description of Soil	Moisture Content	Contaminated by	Approx. Qty.	Description of Delivery	Gross Weight	Tare Weight	Net Weight
Sand ☐ Organic ☐ Clay ☐ Other ☐	0 - 10% ☐ 10 - 20% ☐ 20% + over ☐	Gas ☐ Diesel ☐ Other ☐	5 CM	Solids	2600	LBS	
Sand ☐ Organic ☐ Clay ☐ Other ☐	0 - 10% ☐ 10 - 20% ☐ 20% + over ☐	Gas ☐ Diesel ☐ Other ☐			2040	2680	360

Delivery manifest or bills of lading #: ASI Project # 29001-31

Total Tonnage: 51.02 Tons

Generator's and/or consultant's certification: I/We certify that the soil represented herein is taken entirely from those soils described in the Soil Data Sheet completed and certified by me/us for the Generation Site herein above and nothing has been added or done to such soil that would alter it in any way.

Name of Preparer: John Walker — Generator ☐ Consultant ☐ — Signature and date: — Month 11 Day 8 Year 07

Transporter

Transporter's certification: I/We acknowledge receipt of the soil described above and certify that said soil is being delivered as exactly the same condition as when received. I/We further certify that this soil is being directly transported from the Generation Site to the Designated Facility without off-loading, adding to, subtracting from or mixing any shipping delivery to said site.

Print or Type Name: Esperanza Valencia — Signature and Date: — Month 11 Day 08 Year 07

Recycling Facility

Designated:

Recycling Facility certifies the receipt of the soil covered by this manifest except as noted above.

Notes and Definitions

QM-Hi	Spike recovery was high for specified analyte. Data was accepted because samples associated with batch were non detect for analyte in question.
QM-07	The spike recovery and or RPD was outside acceptance limits for the MS and/or MSD. The batch was accepted based on acceptable LCS recovery.
J	Detected but below the Standard Reporting Limit; therefore, result is an estimated concentration (CLP J-Flag).
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

RE: 3701 Pacific Place, Long Beach

Enclosed are the results of analyses for soil gas samples received by Environmental Support Technologies, Inc. laboratory on 11/12/07 17:00-11/14/07 16:41. The analyses were performed according to the prescribed method as outlined by EPA. If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Ragi W. Abraham

Ragi W. Abraham
Laboratory Director

Environmental Support Technologies, Inc. laboratories are certified by the California Department of Health Services (CDHS), Environmental Laboratory Accreditation Program (ELAP) No's. 1996, 2511, and 2631.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

LFR Levine Fricke, Inc. 3150 Bristol Street, Suite 250 Costa Mesa, California 92626-7234	Project: 3701 Pacific Place, Long Beach Project Number: EST2694 Project Manager: Tony Marino	**Reported:** 27-Nov-07 14:32

Notes and Definitions

QR-04	The RPD result for this analyte in the sample exceeded the QC control limits; however, the RPD for other analytes were within the QC control limits.
QM-01	The spike recovery for this QC sample is outside of established control limits due to sample matrix interference.
QL-H	The spike recovery was out high for the LCS and/or the LCSD; however the analyte was not detected in any of the analyzed samples.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

RE: 3701 Pacific Place, Long Beach

Enclosed are the results of analyses for samples received by the laboratory on 11/14/07 17:42. The samples were received by Environmental Support Technologies, Inc. laboratory with a chain of custody record. The analyses were performed according to the prescribed method as outlined by EPA. If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Ragi W. Abraham

Ragi W. Abraham
Laboratory Director

Environmental Support Technologies, Inc. laboratories are certified by the California Department of Health Services (CDHS), Environmental Laboratory Accreditation Program (ELAP) No's. 1996, 2511, and 2631.

RE: Long Beach Golf Center / #2694

Dear Ragi:

The following report includes analytical results for the samples received on November 16, 2007. The samples were received intact and in good condition. Ace Laboratories, Inc is certified by the State of New York ELAP, Cert.# 11849, for the analytes listed in Appendix A. All analyses were performed following quality control requirements of Ace Laboratories, Inc., and each analytical method. For your convenience, your project has been assigned Analytical Request number A07111602. Please let us know if there is any additional information you may need.

Sincerely,

Stuart Sigman
Project Chemist

Comments * Trip Blank Received Not Listed on C.O.C. (SN# 2268)
Added per R. Abraham 11/20/07

Initials: SS Date: 11/16/07

Appendix A

New York ELAP Certified Analyte List For Method TO-15

Chloromethane
Vinyl Chloride
Bromomethane
Chloroethane
1,1-Dichloroethene
Methylene Chloride
trans-1,2-Dichloroethene
Methyl-tert-Butyl Ether
Vinyl Acetate
1,1-Dichloroethane
2-Butanone
Hexane
cis-1,2-Dichloroethene
Chloroform
1,1,1-Trichloroethane
1,2-Dichloroethane
Benzene
Carbon Tetrachloride
2,2,4-Trimethylpentane
Trichloroethene
1,2-Dichloropropane
cis-1,3-Dichloropropene
4-Methyl-2-Pentanone
trans-1,3-Dichloropropene
Toluene
1,1,2-Trichloroethane
Tetrachloroethene
Chlorobenzene
Ethylbenzene
m,p-Xylenes
Styrene
o-Xylene
Bromoform
1,1,2,2-Tetrachloroethane
Benzyl Chloride
1,4-Dichlorobenzene
1,2-Dichlobenzene
1,2,4-Trichlorobenzene
Hexachlorobutadiene
Formaldehyde

LAB REQUEST 200999
REPORTED 12/03/2007
RECEIVED 11/13/2007

PROJECT CRG - LBGLC
#002-10231-03

SUBMITTER Client

COMMENTS

This laboratory request covers the following listed samples which were analyzed for the parameters indicated on the attached Analytical Result Report. All analyses were conducted using the appropriate methods as indicated on the report. This cover letter is an integral part of the final report.

Order No.	Client Sample Identification
848022	EQ-1
848023	FB-1
848024	Travel Blank
848025	Laboratory Method Blank

Thank you for the opportunity to be of service to your company. Please feel free to call if there are any questions regarding this report or if we can be of further service.

ASSOCIATED LABORATORIES by,

Edward S. Behare, Ph.D.
Vice President

NOTE: Unless notified in writing , all samples will be discarded by appropriate disposal protocol 30 days from date reported.

The reports of the Associated Laboratories are confidential property of our clients and may not be reproduced or used for publication in part or in full without our written permission. This is for the mutual protection of the public, our clients, and ourselves.

SAMPLE ACCEPTANCE CHECKLIST

Section 1
Client: LFR Project: _____
Date Received: 11-13-07
Sample(s) received in cooler: (Yes) No (Skip Section 2)

Section 2
Was the cooler packed with: X Ice ___ Ice Packs ___ Bubble Wrap ___ Styrofoam ___ Paper ___ None ___ Other _____
Cooler or box temperature: _____
(Acceptance range is 2 to 6 Deg. C.) 3.7

Section 3	YES	NO	N/A
Was a COC received?	✓		
Were custody seals present?		✓	
If Yes – were they intact?	✓		
Were all samples sealed in plastic bags?	✓		
Did all samples arrive intact? If no, indicate below.	✓		
Did all bottle labels agree with COC? (ID, dates and times)	✓		
Were correct containers used for the tests required?	✓		
Was a sufficient amount of sample sent for tests indicated?	✓		
No head space in VOA vials?		✓	
Were the correct preservatives used?	✓		
Were the samples scanned for presence of radioactivity?		✓	
Was total residual chlorine measured (Fish Bioassay samples only)? *			✓

*: If the answer is no, please inform Fish Bioassay Dept. immediately.

Section 4
Explanations/Comments

Section 5
Was Project Manager notified of discrepancies: Y / N N/A

Completed By: _____ Date: 11/13/07

APPENDIX O

Response to DTSC Comments – LFR Letter Dated October 10, 2008

LFR ENVIRONMENTAL MANAGEMENT & CONSULTING ENGINEERING

October 10, 2008 002-10231-05

Mr. Greg Holmes
Unit Chief
Southern California Cleanup Operations, Cypress Branch
California Department of Toxic Substances Control (DTSC)
5796 Corporate Avenue
Cypress, California 90630

Subject: Response to Department of Toxic Substances Control's Comments dated April 23, 2008 and Request for Remedial Investigation Approval to Commence Work on a Health Risk Assessment and Feasibility Study for the Former Oil Operators North Site, Long Beach, California

Dear Mr. Holmes:

On behalf of CRG Properties, LFR submits this letter to facilitate remedial consideration of the subject Site. As we discussed in our September 10, 2008 telephone conversation with Tony Marino and Dave Murchison, LFR Inc. (LFR) is writing this letter to summarize the understandings reached to further progress on the Remedial Investigation (RI) and Feasibility Study (FS) for the Former Oil Operators North Site in Long Beach, California ("the Site"). Based on our conversation, we hope to gain the Department of Toxic Substances Control's (DTSC) concurrence that sufficient characterization has been completed on the Site to conduct a Human Health Risk Assessment (HHRA) and FS for the subject property. The final RI will integrate DTSC comments and responses contained herein and provided previously, as well as any additional data generated through the on-going monitoring, proposed groundwater treatability studies, and the HHRA, as requested by DTSC, with submission of this document at the completion of the HHRA and groundwater treatability study.

In addition to the original RI dated March 4, 2008, in partial response to DTSC's April 23, 2008 RI comments, LFR submitted a July 9, 2008 Summary of Groundwater Conditions and met with yourself and David Backarowski of the Regional Water Quality Control Board (RWQCB) on July 23, 2008 to discuss groundwater issues. This letter summarizes understandings reached in those discussions, and directs the focus of the FS within the overall context of the DTSC's April 23, 2008 comments on the RI.

DTSC's comments are presented below, followed by LFR's responses.

DTSC Human and Ecological Risk Division (HERD) Comments dated April 23, 2008

1. *The method detection limits for water sample analyses by Sun Star (electronic file T701575 CRG rev-02) for antimony, arsenic, thallium, vinyl chloride exceed the MCLs. HERD also notes that the reporting limits for analysis of ground water samples (electronic file gw) exceed the MCLs for most metals. The RI states that while ground water is not currently being used primarily due to high salinity and total dissolved solids, the Regional Water Quality Control Board has designated the ground water for beneficial uses.*

LFR Response: Groundwater sampling will continue in the future, and will use methods to attain MCLs or lower for detection limits.

2. *HERD had recommended that if feasible, background soil samples be collected from the same parent materials as found on the site and analyzed for concentrations of metals to compare to on site concentrations, The revised RI indicates that 10 soil samples were collected and analyzed for metals to establish site specific background concentrations. The revised RI does not include tables or figures showing the sample results and sample locations. HERD recommends that tables and figures be included.*

LFR Response: The requested tables and figures will be included in the Final RI and HHRA Work Plan. Please note that Dave Murchison's opinion concurred that Dooley's Hardware Mart soils data provided representative background soil data to evaluate metals (see 9. below).

3. *Risk Assessment Work Plan recommendations*

LFR will incorporate DTSC's recommendations for implementation of a HHRA into the requested work plan and into the HHRA.

DTSC's Geologic/Hydrogeologic Response Comments dated April 23, 2008

1. *GSU is concerned that the vertical and lateral extent of petroleum hydrocarbons, arsenic, lead, naphthalene, and 2-methylnaphthalene are not characterized in the vicinity of boring B-7/B7A in the northwestern part of the site. Concentrations of these analytes are substantially above probable ARARs from 25 to 50 feet bgs, and the extent of these contaminants is not defined by the available data. The contractor should propose additional soil matrix sampling to find the extent of these contaminants in this area of the site.*

LFR Response: LFR and DTSC discussed this comment, and agreed that further characterization of the sludge materials would likely not provide information of value, given that the Site will likely be capped and the nature of the sludge. Sludge materials are largely heterogeneous, making

additional characterization of limited value. Subsequent submittals to DTSC will consider the nature of the sludge with assumptions that include the inherent uncertainty of the sludge characterization.

2. *GSU is concerned that waste is in contact with groundwater at the site, and will continue to degrade groundwater for the foreseeable future. The contractor should propose to address this condition.*

LFR Response: LFR, DTSC, and the RWQCB discussed the nature of the sludge, the regional water quality degradation, the nature of degradation from past Site operations, and the objective to minimize future degradation. LFR also included additional regional groundwater information in the July 9, 2008 submittal which demonstrated the regional complexity of water quality. Preliminary discussions indicate general agreement that limited degradation may be occurring periodically, while options to eliminate all degradation appear limited. Within the overall context of regionally degraded water quality, and the remedial limitations posed by the Site, control of future groundwater degradation will be considered in the FS.

Ongoing monitoring will allow observation of water quality, and should significant future degradation be observed, CRG appreciated that DTSC could elect to have additional evaluation and mitigation implemented to address associated water quality concerns.

3. *GSU concurs that methane mitigation will probably be required at the site.*

LFR Response: Methane mitigation will be incorporated into the FS.

4. *GSU does not concur that regional groundwater degradation can account for the groundwater contamination at the site. There is clear evidence of onsite releases of arsenic, barium, mercury, and total dissolved solids. There is, in addition, a credible threat to groundwater from TPH, VOCs, and SVOCs originating at the site. The contractor should include these analytes as contaminants of concern at the site.*

LFR Response: LFR, DTSC, and the RWQCB discussed the nature of the sludge, the regional water quality degradation, the nature of degradation from past Site operation, and the objective to minimize any future degradation. LFR also included additional regional groundwater quality information in the July 9, 2008 submittal. Based on preliminary discussions, there is general agreement that degradation appears to be occurring periodically, while options to eliminate all degradation appear limited given the regionally degraded water quality; however, control of groundwater degradation will be considered in the FS. In addition, ongoing groundwater monitoring will serve to facilitate recognition of when and if groundwater quality degrades significantly further, and allow consideration of additional abatement measures, as appropriate. Lastly, the FS will include an evaluation and/or treatability study of remedial measures including, but not limited to:

- Capping of the Site to minimize infiltration and associated leaching and

- Potential application of potentially applicable chemical injection reagents which could affect groundwater chemistry and minimize future Site releases.

5. *GSU does not concur that increased TDS at the site is likely to be a result of seawater intrusion. The site was used to handle brine, which is a far more likely source of the TDS. The degradation of groundwater by TDS is a concern at the site.*

LFR Response: LFR and DTSC discussed the interpretation of the historic saline and other releases at the Site as a result of the on-site oil decanting operation. It was agreed that options to eliminate all future releases are limited, but still need evaluation, with full excavation of the affected materials highly problematic as well as costly. It was also agreed that the presumed remedy of capping the Site to limit future infiltration would likely minimize future leaching of salts and other compounds of concern. Given the regional salt water degradation from other sources, the parties agreed that the presumptive capping remedy would be expected to significantly diminish future Site impacts to water quality; therefore, while other remedies should still be considered, capping appears reasonable and appropriate for the overall Site condition, and will be considered more fully in the FS. Lastly, given the proposed remedy, the California Environmental Protection Agency (Cal-EPA) agreed to not pursue additional enforcement of historic discharges, with abatement of any current releases the objective moving forward.

6. *GSU is concerned that the predominance of fine-grained organic-rich soils and high methane concentrations at the site may have masked the detection of VOCs in the soil gas survey of the site. See next comment.*

LFR Response: LFR believes that the dominant waste product, petroleum, would not be expected to contain high levels of VOCs, and because of the age of the discharge, that VOCs would be expected to have degraded to low levels. While this is in itself non-definitive, given the nature of any potential threat, as well as the presumptive capping remedy with vapor mitigation, risks that may be present would essentially be mitigated.

7. *GSU is concerned that soil matrix sampling found VOCs in shallow soil at boring B3, 10 feet bgs. The sample contained a variety of gasoline-range VOCs including benzene, ethylbenzene, toluene, xylenes, and trimethylbenzenes. In addition, field photoionization detector readings were very high, above 1000 ppm VOCs. GSU defers to HERD on matters of risk, but points out that the sampling performed to date may be under-estimating the actual concentrations of VOCs present in the subsurface.*

LFR Response: LFR believes that the dominant waste product, petroleum, would not be expected to contain high levels of VOCs, and because of the age of the discharge, that VOCs would be

expected to have degraded to low levels. While limited pockes of sludge may contain VOCs, these would be attenuated into the petroleum matrix. While this is in itself non-definitive, given the nature of any potential threat, as well as the presumptive capping remedy with vapor mitigation, any risks that may be present would essentially be mitigated.

8. *GSU points out that the water sample taken at MW-3 in February 2008, downgradient of the former main sumps, contained 29 µg/L of cadmium. The MCL for cadmium is 5 µg/L. The contractor should discuss this observation.*

LFR Response: The presumptive remedy would minimize future infiltration and any future leaching, which would in turn minimize and control future cadmium and other metal releases.

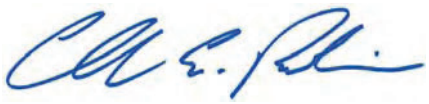
9. *GSU concurs with the decision to use soil analysis from the former Dooley's Hardware Mart site to provide background metal concentration data.*

LFR Response: With DTSC's concurrence, LFR will employ soil data from the former Dooley's Hardware Mart site in the Final RI and HRA for the Former Oil Operators North Site.

LFR hopes that our responses to DTSC's comments on the RI for the Site are sufficient to gain DTSC's concurrence that adequate characterization has been completed to conduct a HHRA and FS for the Site.

If you have any further questions, please contact me at 714-444-0111.

Sincerely,



Charles E. Robinson, P.E.

RESPONSE TO LFR LETTER DATED OCTOBER 10, 2008 FOR FORMER OIL OPERATORS NORTH SITE (AKA LONG BEACH INDUSTRIAL PARK), 3701 PACIFIC PLACE, LONG BEACH, LOS ANGELES COUNTY, CALIFORNIA

Dear Mr. Robinson:

The Department of Toxic Substances Control (DTSC) has reviewed your letter dated October 10, 2008 in response to DTSC comments dated April 23, 2008 and Request for Remedial Investigation Approval to Commence Work on a Health Risk Assessment and Feasibility Study for the above site.

DTSC accepts the responses presented in your letter. Please submit a final version of the RI report within sixty (60) days, and a draft Feasibility Study and Health Risk Assessment (HRA) within ninety (90) days. If you would like to discuss the HRA approach before starting work on it, please let me know.

If you have any questions, please contact me at (714) 484-5461.

Sincerely,

Greg Holmes
