**Subject: 1570 Brookhollow Drive, Tapestry Hotel Project, Energy Letter Report
1570 Brookhollow Drive, Santa Ana, California, 92701**

Dear Ms. Archer:

This letter report analyzes the potential energy impacts of the Tapestry Hotel Project (project) proposed at 1570 Brookhollow Drive in Santa Ana, California. Rincon Consultants, Inc. (Rincon) prepared this letter report for use by the City of Santa Ana in support of the environmental documentation being prepared pursuant to the California Environmental Quality Act (CEQA). This analysis considers both temporary impacts that would result from project construction and long-term energy impacts associated with operation of the project.

Project Location

The project site is a 2.8-acre property comprising three assessor's parcels, located at 1570 Brookhollow Drive in Santa Ana, California (Assessor Parcel Numbers 016-221-27, 016-221-28, and 016-221-29). The project site is currently vacant but was previously developed as a restaurant/bar and parking area. The project site is bound by commercial, business park and light industrial properties to the north, south, and northwest, across South Grand Avenue. Directly across South Grand Avenue to the west are seven other hotels within an approximately one-mile radius. The Costa Mesa Freeway abuts the eastern portion of the project site.

Project Description

Development of the project would entail construction of a six-story, 79,375 square-foot hotel with 139 rooms, a pool, gym, roof deck and two natural gas fireplaces. A separate 2,000 square foot free-standing single-story restaurant would be constructed at the southwest corner of the lot next to Grand Avenue. The building footprint would be approximately 13,400 square feet. In addition, 142 parking spaces would be provided on site in paved, surface lots. Of these spaces, six would be reserved for handicapped parking (two for the restaurant and four for the hotel). Additionally, ten bicycle spaces would be provided separate from the vehicle parking lot (four for the restaurant and six for the hotel). The total construction area would include 100,738 square feet of impervious surface composing 82 percent of the project site (See Attachment 1).

Background

Electricity and Natural Gas

In 2018, California used 285,488 gigawatt-hours (GWh) of electricity, of which 31 percent were from renewable resources.¹ California also consumed approximately 12,638 million U.S. therms (MMthm) of natural gas in 2018. Electricity and natural gas for the project site would be provided by Southern California Edison (SCE) and SoCalGas. Table 1 and Table 2 show SCE’s total electricity consumption and SoCalGas natural gas consumption for its service areas as well as consumption by sector. In 2018, SCE provided approximately 29.9 percent of the total electricity. In 2018, SoCalGas provided approximately 40.8 percent of the total natural gas usage in California.

Petroleum

In 2018, approximately 28 percent of the state’s energy consumption was used for transportation.⁴ Californians presently consume over 19 billion gallons of motor vehicle fuels per year. Although California’s population and economy are expected to continue to grow, gasoline demand is projected to decline from roughly 15.8 billion gallons in 2017 to between 12.3 billion and 12.7 billion gallons in 2030, a 20 to 22 percent reduction. This forecast decline is due to both increasing use of electric vehicles and improved fuel economy for new gasoline vehicles.⁵

Methodology

The project's construction and operational energy usage were estimated using the California Emissions Estimator Model (CalEEMod), version 2016.3.2 (see Attachment 2). CalEEMod uses project-specific information, including the project's land uses, square footages for different uses (e.g., mid-rise apartments), and location, to estimate a project's construction and operational emissions and energy consumption. Consumption factors were drawn from CalEEMod for project natural gas and electricity consumption. Energy demand for off-road construction equipment is based on anticipated equipment, usage hours, horsepower, load factors, and construction phase duration provided by the CalEEMod output, as well as Exhaust and Crankcase Emission Factors for Nonroad Compression Ignition Engines.⁶

Operational energy demand considers transportation-based fuel consumption as well as electricity and natural gas consumption associated with the project. Transportation fuel demand for operation of the project was estimated based on the annual vehicle miles travelled (VMT) generated following project buildout and fuel efficiency was based upon the California Air Resources Board's (CARB's) EMFAC2014 data.⁷ Electricity and natural gas consumption were also based on CalEEMod outputs and compared to existing consumption in the SCE and SoCalGas service areas.

Thresholds

CEQA Thresholds

To determine whether a project would have a significant impact to energy, Appendix G of the *CEQA Guidelines* requires consideration of whether a project would:

1. Result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy, or wasteful use of energy resources, during project construction or operations, or
2. Conflict with or obstruct a state of local plan for renewable energy or energy efficiency.

Impact Analysis

Threshold 1: Would the project result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy, or wasteful use of energy resources, during project construction or operations?
--

Construction Energy Demand

Construction activity would use energy in the form of petroleum-based fuels used to power off-road construction vehicles and equipment on the project site, construction worker travel to and from the

⁶ United States Environmental Protection Agency (USEPA). 2018. Exhaust and Crankcase Emission Factors for Nonroad Compression-Ignition Engines in MOVES2014b. July 2018. Available at: <https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockkey=P100UXEN.pdf>

project site, and vehicles used to deliver materials to the site. The project would require site preparation and grading, including hauling material off-site; pavement and asphalt installation; building construction; architectural coating; and landscaping and hardscaping.

The total consumption of gasoline and diesel fuel during project construction was estimated using the assumptions and factors from CalEEMod (Attachment 2). Table 3 summarizes the estimated construction energy consumption for the project. Construction equipment operation, haul trips, and vendor trips, would consume an estimated 67,091 gallons of diesel fuel over the project construction period. Worker trips would consume an estimated 11,883 gallons of petroleum during project construction.

Table 3 Estimated Fuel Consumption during Construction

Fuel Type	Gallons of Fuel	MIMBtu
Diesel Fuel (Construction Equipment) ¹	26,301	3,352
Diesel Fuel (Hauling & Vendor Trips) ²	40,790	5,199
Other Petroleum Fuel (Worker Trips) ³	11,883	1304
Total	78,974	9,855

Source: Fuel demand rates for construction equipment, hauling and vendor trips, and worker trips are derived from CalEEMod outputs. See Attachment 2 for calculations and analysis.

The construction energy estimates represent a conservative estimate as the construction equipment used in each phase of construction was assumed to be operating every day of construction. Construction equipment would be maintained to all applicable standards as required and construction activity and associated fuel consumption and energy use would be temporary and typical for construction sites. It is also reasonable to assume that contractors would avoid wasteful, inefficient, and unnecessary fuel consumption during construction to reduce construction costs. Therefore, the proposed project would not involve the inefficient, wasteful, and unnecessary use of energy during construction, and the construction-phase impact related to energy consumption would be less than significant.

Operational Energy Demand

Operation of the project would require energy use in the form of electricity, natural gas, and gasoline consumption. Natural gas and electricity would be used for heating and cooling systems, lighting, appliances, water use, and the overall operation of the project. Gasoline consumption would be attributed to vehicular travel associated with guests and employees traveling to and from the project site. The project’s estimated number of average daily trips from CalEEMod is used to determine the energy consumption associated with fuel use from project operation. According to the CalEEMod calculations, the project would result in 1,953,784 annual VMT. Based upon the project’s VMT and the fleet mix and fuel economy estimates in CalEEMod, total gasoline consumption associated with project operation is estimated at 67,356 gallons annually and an annual total diesel consumption of approximately 21,106 gallons (Attachment 3).

The project's electricity demand would be served by SCE, which provided 85,275 GWh of electricity in 2018. Operation of the project would consume approximately 0.015 GWh of electricity per year, which would be less than 0.01 percent of SCE's current electricity demand (electricity use provided in the CalEEMod output of Attachment 2). The project's natural gas demand would be serviced by SoCalGas, which provided approximately 4,795 MMthm per year in 2018. Estimated natural gas consumption for the project would be approximately 0.048 MMthm per year, which would be less than 0.01 percent of SoCalGas' current natural gas demand (natural gas use provided in the CalEEMod output of Attachment 2). Given the above considerations, the project would have a negligible impact to overall demand for SCE and SoCalGas. .

The project would be required to comply with all standards set in California Building Code (CBC) Title 24, which would minimize the wasteful, inefficient, or unnecessary consumption of energy resources during operation. California's Green Building Standards Code (CALGreen; California Code of Regulations, Title 24, Part 11) requires implementation of energy efficient light fixtures and building materials into the design of new construction projects. Furthermore, the 2019 Building Energy Efficiency Standards (CBC Title 24, Part 6) requires newly constructed buildings to meet energy performance standards set by the Energy Commission. These standards are specifically crafted for new buildings to result in energy efficient performance so that the buildings do not result in wasteful, inefficient, or unnecessary consumption of energy. The standards are updated every three years and each iteration establishes stricter energy efficiency standards than the previous. For example, according to the CEC, residences built with the 2019 standards will use about seven percent less energy due to energy efficiency measures versus those built under the 2016 standards, or 53 percent less energy with rooftop solar, and nonresidential buildings will use about 30 percent less energy due mainly to lighting upgrades.⁸ Furthermore, the project would continue to reduce its use of nonrenewable energy resources as electricity generated by renewable resources provided by SCE continues to increase to comply with state requirements through Senate Bill 100, which requires electricity providers to increase procurement from eligible renewable energy resources to 33 percent of total retail sales by 2020, 60 percent by 2030, and 100 percent by 2045.

To help achieve and surpass Title 24 reduction targets, the project applicant proposes to incorporate several energy efficient features into overall project design. Energy efficient design features include solar energy infrastructure, energy efficient appliances, low flow plumbing fixtures, and water efficient features throughout the project site. Approximately five percent of the project's total parking would be allocated to electric vehicle (EV) stations. The hotel would include six bicycle parking spaces along with the restaurant allocating four bicycle parking spaces. Additionally, the project would provide Vanpool service to help encourage the reduction of single use vehicles.

In conclusion, energy demand associated with project construction would be temporary and typical of similar projects, and would not result in the wasteful, inefficient, or unnecessary consumption of energy. While project operation would involve the consumption of fuel, natural gas, and electricity, the project's energy usage would be in conformance with the latest version of California's Green Building Standards

Code and the Building Energy Efficiency Standards. In addition, SCE has sufficient supplies to serve the project and project impacts to regional electricity and natural gas demand would be negligible. Therefore, the project would have a less than significant impact.

<p>Threshold 2: Would the project conflict with or obstruct a state of local plan for renewable energy or energy efficiency?</p>

As mentioned above, SB 100 mandates 100 percent clean electricity for California by 2045. Because the project would be powered by the existing electricity grid, it would eventually be powered by renewable energy mandated by SB 100 and would not conflict with this statewide plan. Additionally, as discussed above, the project would be subject to energy efficiency standards pursuant to CCR Title 24 requirements and has a target to exceed Title 24 targets by ten percent.

The Santa Ana Climate Action Plan (CAP) was adopted by the City in December of 2015 and contains emissions-reduction measures that the City may implement, several of which are energy-related. The City's CAP contains greenhouse gas (GHG) emissions reduction strategies, addresses the community's potential vulnerability to climate change impacts, and provides clear implementation and monitoring programs to direct climate action in Santa Ana.

The City's existing CAP includes numerous policies broken down by Community Wide Energy Measures and Municipal Operations Energy Measures. Table 4 and Table 5 compare the project to applicable City CAP and General Plan policies. The project would be consistent with measures and actions from the both the CAP and General Plan.

<p>Property Assessed Clean Energy (PACE) Financing for Commercial Properties</p> <p>PACE is an energy efficiency financing program operated by private contractors in many communities in California. PACE financing is available for a wide range of energy and water saving measures, and for renewable energy generation. Repayment of loans through the program is made on the property tax bill for the property. Communities must opt into the program, the Santa Ana program began January 2015. PACE makes it easier for owners of commercial property to implement energy efficiency and renewable energy projects that can save them money, make their properties more valuable, and create local jobs. The program is offered by private entities. Many cities and counties in California have already opted into the program.</p>	<p>Consistent</p> <p>This measure is incentive based and the project applicant ay decide to implement energy efficiency and renewable energy projects financed through the PACE program. The project would include green building features that include solar energy, water efficient features, low flow plumbing fixtures, energy efficient appliances, and EV stations. The project would not preclude the proponent from participating in this incentive-based program.</p>
<p>Southern California Edison Small and Medium Business Direct Install</p> <p>The California Public Utilities Commission authorizes certain energy efficiency programs through Southern California Edison (SCE). SCE sends trained energy efficiency contractors to help small businesses, up to 199 kW, identify ways to save electricity. SCE provides free upgrades to customers that may include energy efficient lighting, signage, sensors, refrigeration, sun-block window film, and programmable thermostats. These are provided through the Small and Medium Direct Install program at no cost to the City or to the customer. The current program provides up to \$10,000 for business from 0-99 kW and \$15,147 for business from 100-199 kW.</p>	<p>Consistent</p> <p>This measure is incentive based and the project proponent may decide to work with SCE to identify ways to save electricity during construction. The project would not preclude the proponent from participating in this incentive based program.</p>
<p>Solar Photovoltaic Systems— New Private Installs</p> <p>This measure accounts for the impact of new private installations of solar Photovoltaic (PV) systems in Santa Ana. Rebates or incentive payments for installation of solar PV are available as part of the California Solar Incentive program, which is administered by the California Energy Commission. For a limited time, the City is offering solar incentives which may include permit fee waiver, free plan check services, and free building inspection for solar PV systems.</p>	<p>Consistent</p> <p>This measure is incentive based and the project proponent may decide to take advantage of the California Solar Incentive program or the City’s solar incentive program, if still available. Solar energy features would be included in the design of this project. The project would not preclude the proponent from participating in this incentive based program.</p>
<p>Title 24 Energy Efficiency Standards – Commercial</p> <p>Title 24 is the energy code that establishes the minimum energy efficiency for new construction in California. The code is set by the State and enforced locally by the City of Santa Ana through the building permit review and inspection process. Amended standards went into effect January 1, 2014. This measure reflects the expected savings from those amended standards in projected new commercial construction in the City.</p>	<p>Consistent</p> <p>Title 24 established the minimum energy efficiency for new construction in California. Reduce land use-related energy consumption by requiring energy efficient planning of new development and by encouraging higher density mixed use development.	Consistent The project would be required to comply with Title 24 and the California Building Code. Additionally, the project would include design features such solar infrastructure, EV stations, low flow plumbing, and energy efficient appliances to reduce overall land-use related energy consumption.
Reduce energy consumption in construction and occupancy of buildings by enforcement and strengthening of existing building codes	Consistent Title 24 established the minimum energy efficiency in the California Building Code for new construction in California. The code is set by the State and enforced locally by the City of Santa Ana. The project would exceed Title 24 standards by 10%.

Conclusions and Recommendations

Construction and operational energy impacts would be less than significant. Additionally, the project would be consistent with both the City’s General Plan Energy Strategies as well as the CAP’s Energy measures. Therefore, no measures are recommended.

- ALL ACCESSIBLE ENTRANCES, IN COMMON AREAS, SHALL BE IDENTIFIED WITH AT LEAST ONE STANDARD SIGN AND WITH ADDITIONAL DIRECTIONAL SIGNS, AS REQUIRED, VISIBLE FROM APPROACHING PEDESTRIAN WAY.
- LATCHING AND LOCKING DOORS THAT ARE HAND ACTIVATED AND WHICH ARE IN A PATH OF TRAVEL, SHALL BE OPERABLE WITH A SINGLE EFFORT BY LEVER TYPE HARDWARE, PANIC BARS, PUSH-PULL ACTIVATING BARS, OR OTHER HARDWARE DESIGNED TO PROVIDE PASSAGE WITHOUT REQUIRING THE ABILITY TO GRASP THE OPENING HARDWARE.
- HAND ACTIVATED DOOR OPENING HARDWARE SHALL BE CENTERED BETWEEN 33" AND 44" ABOVE THE FLOOR.
- THE FLOOR OR LANDING ON EACH SIDE OF AN ENTRANCE OR PASSAGE DOOR IN COMMON AREAS SHALL BE LEVEL AND CLEAR. THE LEVEL AND CLEAR AREA SHALL HAVE A LENGTH IN THE DIRECTION OF THE DOOR SWING OF AT LEAST 60" AND THE LENGTH OPPOSITE THE DIRECTION OF THE DOOR SWING OF 44" AS MEASURED AT RIGHT ANGLES TO THE PLANE OF THE DOOR IN ITS CLOSED POSITION.
- THE WIDTH OF THE LEVEL AND CLEAR AREA ON THE SIDE TO WHICH THE DOOR SWINGS, IN COMMON AREAS, SHALL EXTEND 24" PAST THE STRIKE EDGE OF THE DOOR FOR EXTERIOR DOORS AND 18" PAST THE STRIKE EDGE FOR INTERIOR DOORS.
- THE FLOOR OR LANDING SHALL NOT BE MORE THAN 1/2" LOWER THAN THE THRESHOLD OF THE DOORWAY. CHANGE IN LEVEL BETWEEN 1/4" AND 1/2" SHALL BEVELED WITH A SLOPE NO GREATER THAN 1:2.
- THE BOTTOM 10" OF ALL DOORS EXCEPT AUTOMATIC AND SLIDING SHALL HAVE A SMOOTH UNINTERIOR SURFACE TO ALLOW THE DOOR TO BE OPENED BY A WHEELCHAIR FOOTREST WITHOUT CREATING A TRAP OR HAZARDOUS CONDITION. WHERE NARROW FRAME DOORS ARE USED, A 10" HIGH SMOOTH PANEL SHALL BE INSTALLED ON THE PUSH SIDE OF THE DOOR, WHICH WILL ALLOW THE DOOR TO BE OPENED BY A WHEELCHAIR FOOTREST WITHOUT CREATING A TRAP OR HAZARDOUS CONDITION.
- MAXIMUM EFFORT TO OPERATE DOORS SHALL NOT EXCEED 8-1/2 LBS FOR EXTERIOR DOORS AND 5 LB. FOR INTERIOR DOORS. SUCH FULL OR PUSH EFFORT BEING APPLIED AT RIGHT ANGLES TO HINGED DOORS AND AT THE CENTER PLANE OF SLIDING OR FOLDING DOORS. COMPENSATING DEVICES OR AUTOMATIC DOOR OPERATORS MAY BE UTILIZED TO MEET THE ABOVE STANDARDS. WHEN FIRE DOORS ARE REQUIRED, THE MAXIMUM EFFORT TO OPERATE THE DOOR MAY BE INCREASED NOT TO EXCEED 15 LB.
- STREET ADDRESSES MUST BE PROVIDED ON FRONT OF OF THE BUILDING. NUMBERS MUST BE VISIBLE FROM THE STREET, MUST BE OF A COLOR WHICH CONTRASTS WITH THE BACKGROUND AND MUST BE AT LEAST 4-INCHES IN HEIGHT AND 2-INCHES IN WIDTH. SEC. 502 AND P.A.C. CHAPTER 12.20.
- PROVIDE EXIT SIGNS AND DIRECTIONAL EXIT SIGNS WITH MINIMUM 6" HEIGHT BY 3/4" STROKE BLOCK LETTERS ON A CONTRASTING BACKGROUND AT ALL REQUIRED COMMON AREAS PER PLAN.
- EXIT SIGNS SHALL BE LIGHTED SO THAT THEY ARE CLEARLY VISIBLE.
- THIS PROJECT IS REQUIRES TO HAVE AUTOMATIC FIRE SPRINKLERS THROUGHOUT ALL AREAS OF THE STRUCTURE PER PMC 14.25.050.

For St. 1 foot = 304.8 mm.
 a. Roof supports: Fire-resistance ratings of primary structural frame and bearing walls are permitted to be reduced by 1 hour where supporting a roof only.
 b. Except in Group A, E, F-1, H, I, L, M, R-1, R-2, R-2.1 and S-1 occupancies, high-rise buildings, and other applications listed in Section 1.11 regulated by the Office of the State Fire Marshal, fire protection of structural members shall not be required, including protection of roof framing and decking where every part of the roof construction is 20 feet or more above any floor immediately below. Fire-retardant-treated wood members shall be allowed to be used for such unprotected members.
 b.2 For Group A, E, I, L, R-1, R-2 and R-2.1 occupancies, high-rise buildings, and other applications listed in Section 1.11 regulated by the Office of the State Fire Marshal, fire protection of members other than the structural frame shall not be required, including protection of roof framing and decking where every part of the roof construction is 20 feet or more above any floor immediately below. Fire-retardant-treated wood members shall be allowed to be used for such unprotected members.
 b.3 For one-story portions of Group A and E assembly occupancies the roof-framing system of Type II A or Type III A construction may be of unprotected construction when such roof-framing system is open to the assembly area and does not contain concealed spaces.
 c. In all occupancies, heavy timber shall be allowed where a 1-hour or less fire-resistance rating is required.
 d. An approved automatic sprinkler system in accordance with Section 903.3.1.1 shall be allowed to be substituted for 1-hour fire-resistance-rated construction, provided such system is not otherwise required by other provisions of the code or used for an allowable area increase in accordance with Section 506.3 or an allowable height increase in accordance with Section 504.2. The 1-hour substitution for the fire resistance of exterior walls shall not be permitted.
 e. Not less than the fire-resistance rating required by other sections of this code.
 f. Not less than the fire-resistance rating based on fire separation distance (see Table 602).
 g. Not less than the fire-resistance rating as referenced in Section 704.10
