Appendix C

CO Hotspot Analysis

To verify that the proposed Sunbow Planning Area 23 Amendment Project (Project) would not cause or contribute to a violation of the carbon monoxide (CO) standards, a screening evaluation of the potential for CO hotspots was conducted. The California Department of Transportation (Caltrans) and the U.C. Davis Institute of Transportation Studies *Transportation Project-Level Carbon Monoxide Protocol* (CO Protocol) (Caltrans 2010), and the South Coast Air Quality Management District (SCAQMD) *CEQA Air Quality Handbook* (SCAQMD 1993) were followed. CO hotspots are typically evaluated when (1) the level of service (LOS) of an intersection or roadway decreases to LOS E or worse, (2) signalization and/or channelization is added to an intersection, and (3) sensitive receptors such as residences, schools, and hospitals are located in the vicinity of the affected intersection or roadway segment.

According to the CO Protocol, there is a cap on the number of intersections that need to be analyzed for any one project. For a single project with multiple intersections, only the three intersections representing the worst LOS ratings of the project, and, to the extent they are different intersections, the three intersections representing the highest traffic volumes, need be analyzed. For each intersection failing a screening test as described in this protocol, an additional intersection should be analyzed (Caltrans 2010).

Table 1 shows a summary of the Project's LOS for all nine intersections evaluated for year 2024 cumulative conditions.

Table 1. Intersection Level of Service for Project Year 2024

Intersection	Control Type	Peak Hour	Existing + Project
			LOS
Olympic Parkway/I-805 Southbound Ramps	Signal	AM PM	D **F**
Olympic Parkway/I-805 Northbound Ramps	Signal	AM PM	**F** D
Olympic Parkway/Oleander Avenue	Signal	AM PM	C A
Olympic Parkway/Brandywine Avenue	Signal	AM PM	D D
Olympic Parkway/Project Driveway (West)	DNE / Signal	AM PM	B C
Olympic Parkway/Project Driveway (East)	DNE / Signal	AM PM	B B
Olympic Parkway/Heritage Road	Signal	AM PM	D D
Olympic Parkway/Santa Venetia Street	Signal	AM PM	B A
Olympic Parkway/La Media Road	Signal	AM PM	D D

Notes: LOS = level of service; DNE = do not enter.
Bold indicates an LOS of E or worse.

Ambient Air Quality Data*

Pollutant	Averaging Time	2017	Most Stringent AQ Standard	Monitioring Station***
CO	1 hour	1.6	20	El Cajon
CO	8 hour	1.3	9	El Cajon

*Data was taken from EPA AirData (http://www.epa.gov/airdata/) and represent the highest concentrations experienced over a given year. Data is presented in parts per million.

** The 2017 CO concentration represents the highest concentration experienced from 2016 to 2018 at the 533 First Street, El Cajon Monitoring Station; therefore, this background concentration was used as the background concentration in the Caline4 models.

*** The El Cajon Monitoring Station, is the nearest air-monitoring station to the project area, and 2018 is the year closest to the 2030 buildout year.

Nuisance Analysis

605 THIRD STREET
ENCINITAS, CALIFORNIA 92024
T 760.942.5147 F 760.632.0164

MEMORANDUM

To:	Bill Hamlin, ACI Sunbow, LLC
From:	Adam Poll, Dudek
Subject:	Nuisance Analysis for the Sunbow Planning Area 23 & Preserve Project Chula Vista, California
Date:	April 24, 2020
cc:	Brian Grover, Dudek
Attachment(s):	A – Emission Calculations B – AERMOD Output Files

1 Introduction

In support of the air quality technical report prepared for the Sunbow Planning Area 23 & Preserve Project (Project), the nuisance analysis was prepared to estimate impacts to future Project sensitive receptors from exposure to odors and nuisance dust from the Otay Landfill (Landfill). The analysis uses air dispersion modeling to evaluate potential impacts to future residents. Results of the modeling analysis are compared with applicable odor detection thresholds (ODT) and nuisance dust permitted limits.

1.1 Project Description

The Project includes 720 multi-family units on approximately 44.3 acres, a 0.9-acre Community Purpose Facility site, and 22.7 acres of public streets, open space slopes, and water quality basins. Approximately 3.8 acres of Poggi Canyon Maintenance Facilities and 64.1 acres of Multiple Species Conservation Program (MSCP) open space preserve areas are also within the project boundary. The Project includes four unique multi-family attached residential product types with 15 unique floorplans, ranging in square footage from approximately 1,100 to 2,050 in two- and three-story units. Each home includes two car garages and two to four bedrooms. The Project site is located south of Olympic Parkway, between Brandywine Avenue and Heritage Road in the City of Chula Vista. The project includes a Chula Vista General Plan Amendment, Sunbow General Development Plan Amendment, Sunbow Sectional Planning Area Plan Amendment, a rezone and a Tentative Map. The project also include a Chula Vista MSCP Boundary Adjustment that would implement minor adjustments to the Planning Area 23 development limits and the adjacent MSCP Preserve open space areas. The Project is located in proximity to the landfill.

1.2 Odorous Compounds

Odors are generally regarded as an annoyance rather than a health hazard. Manifestations of a person's reaction to odors can range from psychological (e.g., irritation, anger, or anxiety) to physiological (e.g., circulatory and respiratory effects, nausea, vomiting, and headache) (US Army Corps of Engineers 2006). The ability to detect odors varies considerably among the population and overall is subjective. People may have different reactions to the

same odor. An odor that is offensive to one person may be perfectly acceptable to another (e.g., a coffee roaster). An unfamiliar odor is more easily detected and is more likely to cause complaints than a familiar one. In a phenomenon known as odor fatigue, a person can become desensitized to almost any odor, and recognition may only occur with an alteration in the intensity. The occurrence and severity of odor impacts depend on the nature, frequency, and intensity of the source; wind speed and direction; and the sensitivity of receptors.

Characterization of odor emissions and quantitative determination of off-site impacts is a complex problem due to the often variable nature of emissions, changing source conditions and characteristics, and the subjective nature of perceived impacts (US Army Corps of Engineers 2006). Odors can exist at one concentration and not be offensive, but offensive odors are usually noticed even at minute concentrations. It is these odor events that heighten the public's awareness of an odor and hence the sensitivity, resulting in complaints.

Most odorous chemicals generated by biogenic processes are ammonia based or contain sulfur. Historically, odor panels have been used to determine the "strength" of an odor by a dilution to sensory threshold method (i.e. how many parts of odor per unit of air could be detected). This gives some information about the severity of an odor, but does not identify the individual chemical species responsible for the odor.

1.3 Dust

Nuisance dust, also called "biologically inert" dusts and "particulates not otherwise classified" (PNOC), are dusts from solid substances without specific occupational exposure standards. Exposure limits and guidelines for particles not otherwise classified or regulated (PNOC/R) evolved from several important studies of pneumoconiosis performed early in the 20th century (Watts et al. 2012). These studies indicated that exposure to dust concentrations of less than 50 million particles per cubic foot (mppcf) and with low crystalline silica concentrations did not appear to lead to the development of disabling lung disease. Consequently, dusts containing less than 5% crystalline silica were termed "nuisance dusts," and an exposure limit of 50 mppcf was recommended. With the advent of mass sampling technology and the ability to sample directly for respirable dust, exposure limits migrated to total and respirable nuisance dust exposure limits of 15 and 5 milligrams per cubic meter (mg/m^3), respectively, for dusts containing less than 1% crystalline silica. Regulatory exposure limits were established by incorporating these exposure guidelines that were in existence when the enabling legislation was enacted. Changes to regulatory limits have lagged behind threshold limit values adopted by the American Conference of Governmental Industrial Hygienists (ACGIH), which have been updated based on current research. Current ACGIH recommendations for inhalable and respirable dusts are 10 and 3 mg/m^3, respectively (Watts et al. 2012). Recent studies of ultrafine particulate and toxicological investigation of the pulmonary overload phenomena from exposure to PNOC/R indicate that exposure to these materials at sufficiently high concentrations can cause irreversible changes to the airways. The term "nuisance dust" was inaccurate, so the terminology of PNOC/R was substituted as a better descriptor for dusts without component-specific exposure limits. Further reductions in exposure limits and guidelines have been proposed for control of occupational exposure to PNOC/R. The proposals to reduce exposure limits are motivated by increasing recognition that clinically significant chronic airways obstruction is caused by occupational dust exposure.

2 Thresholds and Emissions

2.1 Odorous Compounds

Landfill gas (LFG)-derived odorous chemicals emitted from the Landfill were identified using the U.S. Environmental Protection Agency (EPA) Compilation of Air Pollutant Emission Factors (AP-42) (EPA 1995) and include the toxic air contaminants (TACs) identified in the Village 3 North Health Risk Assessment (HRA) and Nuisance Study conducted by SCS Engineers (SCS) in October 2013 (SCS 2013a, 2013b). Every TAC listed for landfills in AP-42 was included in the assessment. Landfill surface emissions were calculated using the estimated LFG generation rate and the concentration of each chemical in the LFG. No recent LFG analysis was available to provide site-specific TAC concentrations. The first choice for the concentration for each TAC was the Waste Industry Air Coalition (WIAC) Comparison of Recent Landfill Gas Analyses with Historic AP-42 Defaults. If the chemical was not included in the WIAC comparison, the AP-42 default concentration was used. All generated LFG not destroyed in the flare and engines were assumed to be emitted through the landfill surface and were included in this odor analysis. This odor analysis does not include diesel particulate matter (DPM), metals found in soils at the Landfill, and crystalline silica, which are not odorous chemicals and/or do not produce odors characteristic of landfills.

The potential odor for each LFG-derived chemical was determined by comparing the concentration of the chemical emitted from the Landfill to the published odor threshold. The odor threshold concentration represents the odor concentration that is detected by 50% of population. Nuisance levels typically occur at concentrations that are several multiples higher than the ODT (Kern County 2017). Thus, using the ODT as a threshold for nuisance should be overly conservative and is the approach taken in evaluating the model results. Individuals may be more or less sensitive to specific chemicals than the odor threshold. The odor threshold was typically obtained from Safety Data Sheets. Table 1 provides the odor threshold for each compound found within LFG and the resulting concentrations. The fourth column shows the resulting odor concentration, represented as the dilution to threshold ratio (D/T), calculated as the compound's concentration in LFG divided by the compound's odor detection threshold. D/T represents the ratio of the actual concentration to the concentration at which the chemical is detectable and is used to define odors from a source containing many odorous chemicals such as LFG. The odor concentration for each chemical is then summed to get the total odor concentration for each LFG-derived source and shown in the bottom row of each table. This odor concentration represents the strength of the total odor from the emission sources at the facility, but does not reflect the total odor emission rate, which includes the LFG emission rate.

Table 1. Landfill Gas Fugitive Odor Concentrations

Compound	Concentration in Landfill Gas (ppm)	Odor Threshold Concentration (ppm)	Odor Concentration (D/T)
1,1,1-Trichloroethane	0.17	22.4	0.01
1,1,2,2-Tetrachloroethane	0.07	6.17	0.01

Flares	7
Leachate Pond	35
Landfill Surface	351

Source: SCS 2013b.
Note: D/T = dilution to threshold ratio.

A weighted ODT of 49.61 parts per million by volume (ppm) was obtained from the various sources (based on the chemical composition within the mixture) and was applied to modeled data in order to produce an isopleth representative of the ODT for the mixture of odorous chemicals emitted from the Landfill. The American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD) produces concentrations in units of micrograms per cubic meter ($\mu g/m^3$) and the Lakes AERMOD View software contains a tool for converting results to other units. It was assumed that the average chemical weight for these compounds is 80.5 grams per gram-mole (g/g-mole). Using the chemical weight, the model results were converted to ppm. The ppm concentration of the mixture was then divided by the mixture ODT (49.61 ppm) to produce results normalized to the mixture ODT where a value of 1.0 is equal to the ODT, values lower than 1.0 are less than the ODT, and values greater than 1.0 exceed the ODT and are thus much more likely to be detected as odor.

2.2 Dust

The San Diego County Air Pollution Control District (SDAPCD) regulates stationary sources of air pollution and has established rules for particulate matter, including Rules 50 (Visible Emissions), 51 (Nuisance), 52 (Particulate Matter), 54 (Dust and Fumes), and 55 (Fugitive Dust Control). The Landfill has operating permits from the SDAPCD that regulate emissions of particulate matter or fugitive dust in accordance with these rules (Permit APCD2009-PTO-971112, SDAPCD 2019b). The limit for the Landfill for fugitive dust is to not exceed the Number 1 on the Ringelmann Chart (equivalent to 20% opacity) for a period of not more than 3 minutes in any 60 consecutive minutes. However, these limits are at the source and not the receptor.

The California Occupational Safety and Health Administration (Cal-OSHA) has established permissible exposure limits (PEL) for substances for employees over an 8-hour shift. The PEL for PNOC/R is 10 ppm or 5 ppm for the respirable fraction (typically less than 2.5 microns in diameter) (Cal-OSHA 2020). The PEL for PNOC/R is used as the significance threshold for this analysis.

Dust emissions were estimated from both combustion sources and fugitive sources at the Landfill. The combustion sources include vehicles and heavy-duty equipment. Fugitive sources include vehicle travel on paved and unpaved roads. Emission calculations were based on activity data from the 2013 HRA and nuisance analysis prepared by SCS (SCS 2013a, 2013b), permitting information for the Landfill (SDAPCD 2019b), and updated emission factors from the SDAPCD, CARB, and EPA. Detailed emission calculations are provided in Appendix A. A summary of the dust sources and emissions is shown in Table 3.

Table 3. Dust Emissions

Source	Emissions (g/s)
Flare 1	3.96
Flare 2	0.34
Grinder	0.00014
Haul Truck Exhaust – Moving	0.00019
Haul Truck Exhaust – Idling	0.0000081
Paved Road Fugitive Dust	1.06
Unpaved Road Fugitive Dust	8.06
Equipment Exhaust	0.046

Notes: g/s = grams per second.
See Appendix A for detailed calculations.

3 Receptors Used for Evaluating Modeled Impacts

Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. People most likely to be affected by air pollution include children, elderly people, athletes, and people with cardiovascular and chronic respiratory diseases. Facilities and structures where these air pollution-sensitive people live or spend considerable amounts of time are known as "sensitive receptors." Land uses where air-pollution-sensitive individuals are most likely to spend time include schools and schoolyards, parks and playgrounds, daycare centers, nursing homes, hospitals, and residential communities (sensitive sites or sensitive land uses) (CARB 2005). SDAPCD identifies sensitive receptors as those who are especially susceptible to adverse health effects from exposure to TACs, such as children, elderly people, and ill people. Sensitive receptors include schools (grades Kindergarten through 12), daycare centers, nursing homes, retirement homes, health clinics, and hospitals within 2 kilometers (1.2 miles) of the facility (SDAPCD 2019a). The Project would introduce on-site sensitive receptors to the area and are used for this analysis, approximately 240 feet from the landfill boundary.

4 Modeling Methodology

Air dispersion models calculate the atmospheric transport and fate of pollutants from the emission source. The models calculate the concentration of selected pollutants at specific downwind ground-level points, such as residential receptors. The transformation (fate) of an airborne pollutant, its movement with the prevailing winds (transport), its crosswind and vertical movement due to atmospheric turbulence (dispersion), and its removal due to dry and wet deposition are influenced by the pollutant's physical and chemical properties, and by meteorological and environmental conditions. Factors such as distance from the source to the receptor, meteorological conditions, intervening land use and terrain, pollutant release characteristics, and background pollutant concentrations affect the predicted air concentration of an air pollutant. Air dispersion models have the capability to take all of these factors into consideration when calculating downwind ground-level pollutant concentrations.

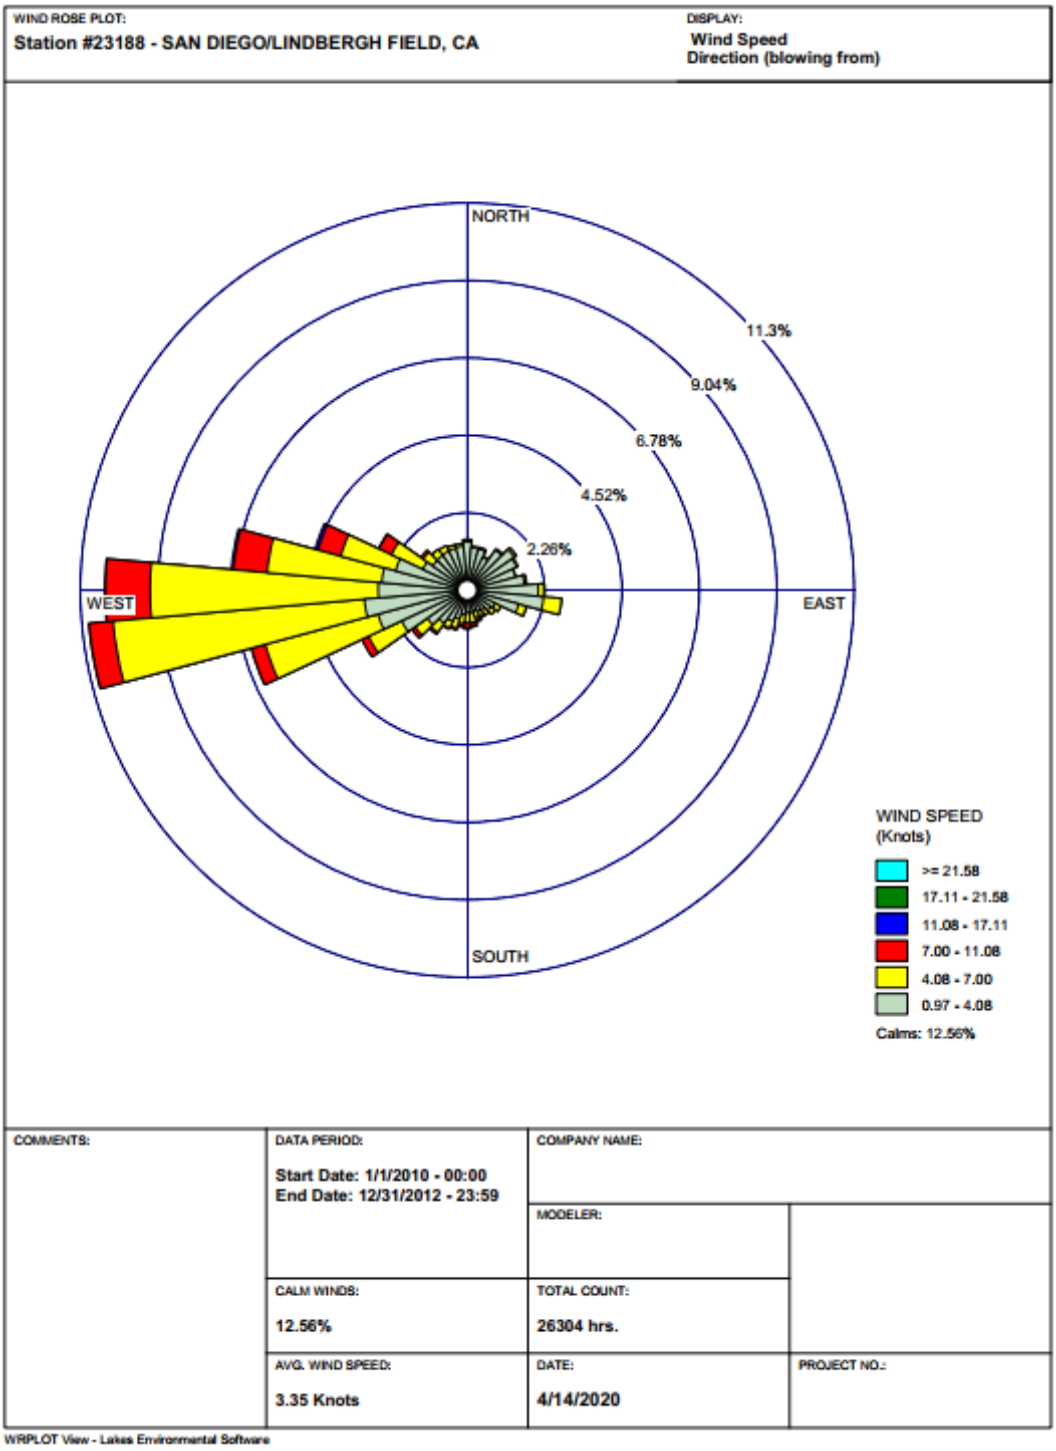
A dispersion modeling analysis was conducted for odorous TACs and dust emissions from the Landfill. Two separate model runs were conducted, one for each analysis (odor and dust). The dispersion modeling was performed using

AERMOD, which is the model that EPA approved and SDAPCD recommends for atmospheric dispersion of emissions. AERMOD is a steady-state Gaussian plume model that incorporates air dispersion based on planetary boundary layer turbulence structure and scaling concepts, including treatment of surface and elevated sources, building downwash, and simple and complex terrain. Principal parameters of AERMOD for the project operations included the following:

- **Dispersion Model:** The air dispersion model used was AERMOD, Version 19191, with the Lakes Environmental Software implementation/user interface, AERMOD View, Version 9.8.3. The emission rate for the odor analysis was determined in accordance with the D/T for each odor source. Similarly, the emission rate for the dust analysis utilized source-specific fugitive dust emission rates. The maximum concentrations were determined for the 1-hour, 8-hour, and period-averaging periods. Detailed source parameters for modeling emissions with AERMOD can be found within Appendix B. Source parameters were based on information contained within the SCS analysis (SCS 2013a), the 2016 AB2588 HRA for the Landfill (SCS 2016), and current permits for the Landfill (SDAPCD 2019b).

- **Meteorological Data:** AERMOD-specific meteorological data for the Chula Vista air monitoring station (CVA) was used for the dispersion modeling which was provided by SDAPCD as the most recent, available, and representative meteorological data available for the site. A 3-year meteorological data set from 2010 through 2012 was provided by the SDAPCD in a preprocessed format suitable for use in AERMOD. A wind rose is provided for this station in Figure 1.
- **Urban and Rural Options:** Typically, urban areas have more surface roughness and structures and low-albedo surfaces that absorb more sunlight, and thus, more heat, relative to rural areas. Based on the land use procedure, at least 50% of the land use within the 3-kilometer radius from the Landfill site is I1 (Heavy Industrial), I2 (Light-Moderate Industrial), C1 (Commercial), R1 (Common Residential), and R2 (Compact Residential). The urban dispersion option was selected based on the application of the land use procedure.
- **Terrain Characteristics:** Digital elevation model files were imported into AERMOD so that complex terrain features were evaluated as appropriate. The National Elevation Dataset (NED) dataset with resolution of 1/3 arc-second was used.
- **Sensitive Receptors:** A uniform Cartesian grid 25-meter spacing was created to cover the entire Project site. The grid was then converted into discrete Cartesian receptors.
- **Source Release Scenario:** Based on the Landfill operation schedule of 8 hours per day, 6 days per week, the variable emission factor of 4.5 was applied to off-road equipment and the grinder generator. Based on the haul truck schedule of 11 hours per day, 6 days per week, the variable emission factor of 3.27 was applied to haul trucks exhaust, dust from roads, and idling.
- **Buildings:** The grinder was also modeled as a building to account for downwash from that source. No other buildings were included.

Figure 1. Wind Rose of Meteorological Data



5 Nuisance Analysis Results

The nuisance analysis evaluated odorous and fugitive dust emission sources from the Landfill from various sources as described in Sections 2 and 4. The maximally exposed receptor would be the southeastern corner of the Project site. The results of the odor analysis are shown in Table 4. The normalized results in Table 4 represent the concentration at the maximally exposed receptor compared to the mixture ODT. Odor indices greater than one (1.0) indicate a greater than 50% likelihood that odor would be detected and indices less than one (1.0) indicates less than 50% likelihood that odor would be detected. Values that are lower than 1.0 are less than the ODT, and values greater than 1.0 exceed the ODT and are thus more likely to be detected as odor.

Table 4. Summary of Odor Analysis

Receptor Type	UTME (m)	UTMN (m)	Odor Index
MEIR	498962.5	3607637.5	0.068

Notes: m = meters; MEIR = maximally exposed individual resident; UTME = Universal Transverse Mercator East; UTMN = Universal Transverse Mercator North.
See Attachment B.

As shown in Table 4, the odor index for the Project site at the maximally exposed resident was less than 1.0. Therefore, odors are not likely to be detected by future residents at the Project site.

The results of the dust analysis prepared in accordance with Sections 2 and 4 are presented in Table 5. The threshold is based on the time-waited value for the PEL for PMOC established by the Cal-OSHA. As such, emissions over the 8-hour averaging time are appropriate to compare to the PEL. However, for information purposes the 1-hour averaging time results are also shown.

Table 5. Dust Analysis

Averaging Period	Concentration (ppm)	Threshold (ppm)
8-hour	0.05	10
1-hour	0.18	NA

Notes: ppm = parts per million; NA = not applicable.
See Attachment B.

As shown in Table 5, the results of the dust analysis would not exceed the 8-hour threshold established by the Cal-OSHA. Therefore, the Landfill is not expected to cause a nuisance at the Project site residential receptors based on the dust emitted during operations.

It should be noted that the Landfill is anticipated to cease operations in 2030 according to its current permit. At that time, emissions of equipment, trucks, and working face fugitive emissions would cease. As such, emissions of odorous compounds and dust emissions would be significantly reduced upon closure of the landfill.

6 Conclusions

The results determined in this analysis reflect reasonable estimates of source odors and dust characteristics, available meteorological data near the project site, and the use of currently approved air quality models. Given the limits of available tools for such an analysis, the actual impacts may vary from the estimates in this assessment. However, the combined use of the AERMOD dispersion model and the impact assessment methodology tend to overpredict impacts, such that they produce conservative (i.e., health-protective) results. For this reason, the estimated odor and dust results reported in this analysis are likely upper-bound estimates for potential exposure to project-related emissions. In addition, the estimated odor and dust results represent the maximum exposed individual (resident) and do not represent the risk over a broad area. The actual odor and dust impacts from the Landfill on the Project are likely to be lower than presented herein.

Given the range of odor indices at residences, detection of odor by Project residents is considered unlikely resulting in compliance with SDAPCD's Nuisance Rule. Based on this analysis, Landfill operations would not exceed the applied dust threshold and the Landfill is not expected to cause a nuisance at the Project site residential receptors.

NOTES:

(1) List of TACs and HAPs derived from California Code of Regulations 93000 and Title III Clean Air Act Ammendments and includes compound listed in AP-42 Table 2.4-1 and 2.4- 2.

(2) Average concentration of compounds found in LFG based on "Waste Industry Air Coalition Comparison of Recent Landfill Gas Analyses with Historic AP-42 Values." Mercury concentrations are based on the Revised EPA AP-42 Section 2.4 Table 2.4-1 (11/98).

(3) Based on concentrations shown and estimated highest 30-year average LFG generation rate for the landfill derived from LandGEM using site-specific k and Lo parameters (see Table 2-2 for model output).

(4) Collection efficiency of 75%

MODEL VARIABLES

Estimated landfill gas total flow from landfill: 5285 cfm

Estimated methane content of LFG: 50.0%

LFG Collection Efficiency 75.00% Collection Efficeincy per AP-42

Tier or emission factor assumed to be lowest required tier/highest allowed emission factor in accordance with CARB's In-Use Off-Road Diesel-Fueled Fleets Re

Operating load obtained from CalEEMod Appendix A. Operating hours assumed to be 1 shift, 300 days/year.

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
```

```
**NO GAS DEPOSITION Data Provided.
**NO PARTICLE DEPOSITION Data Provided.
**Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
**Model Uses NO WET DEPLETION.  WETDPLT  =  F

**Model Uses URBAN Dispersion Algorithm for the SBL for     8 Source(s),
  for Total of    1 Urban Area(s):
  Urban Population =   3325468.0 ;  Urban Roughness Length =  1.000 m

**Model Uses Regulatory DEFAULT Options:
        1. Stack-tip Downwash.
        2. Model Accounts for ELEVated Terrain Effects.
        3. Use Calms Processing Routine.
        4. Use Missing Data Processing Routine.
        5. No Exponential Decay.
        6. Urban Roughness Length of 1.0 Meter Assumed.

**Other Options Specified:
        ADJ_U*   - Use ADJ_U* option for SBL in AERMET
        CCVR_Sub - Meteorological data includes CCVR substitutions
        TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of:  ODOR

**Model Calculates  1 Short Term Average(s) of:   1-HR
    and Calculates PERIOD Averages

**This Run Includes:      8 Source(s);       9 Source Group(s); and     413 Receptor(s)

               with:      2 POINT(s), including
                          0 POINTCAP(s) and      0 POINTHOR(s)
                and:      0 VOLUME source(s)
                and:      6 AREA type source(s)
                and:      0 LINE source(s)
                and:      0 RLINE/RLINEXT source(s)
                and:      0 OPENPIT source(s)
                and:      0 BUOYANT LINE source(s) with      0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date:  18081

**Output Options Selected:
         Model Outputs Tables of PERIOD Averages by Receptor
         Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
         Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
         Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)
```

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
m for Missing Hours
b for Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) =   53.04 ; Decay Coef. =   0.000   ; Rot. Angle =   0.0
Emission Units = GRAMS/SEC   ; Emission Rate Unit Factor =   0.10000E+07
Output Units   = MICROGRAMS/M**3

**Approximate Storage Requirements of Model =   3.7 MB of RAM.

**Input Runstream File: aermod.inp
**Output Print File: aermod.out

**Detailed Error/Message File: HomeFed Landfill HRA.err
**File for Summary of Results: HomeFed Landfill HRA.sum
