ZNE	zero net energy

Executive Summary

The purpose of this technical report is to assess the potential air quality and greenhouse gas (GHG) emissions impacts associated with implementation of the proposed Sunbow Planning Area 23 & Preserve Project (Project). This assessment uses the significance thresholds in Appendix G of the California Environmental Quality Act (CEQA) Guidelines.

Project Overview

The proposed Project is development of 720 multi-family units on 44.2 acres, a 0.9-acre Community Purpose Facility site, and 5.9 acres of public streets, open space slopes, and water quality basins. Approximately 4.3 acres of Poggi Canyon Maintenance Facilities and 63.6 acres of Multiple Species Conservation Program (MSCP) open space preserve areas are also within the Project boundary. The Project 135.7-acre site is located south of Olympic Parkway, between Brandywine Avenue and Heritage Road in the City of Chula Vista (City), California.

Air Quality

The air quality impact analysis evaluated the potential for adverse impacts to air quality due to construction and operational emissions resulting from the Project. Impacts were evaluated for their significance based on the City's mass daily criteria air pollutant thresholds of significance. Criteria air pollutants are defined as pollutants for which the federal and state governments have established ambient air quality standards, or criteria, for outdoor concentrations to protect public health. Criteria air pollutants include ozone (O_3), nitrogen dioxide (NO_2), carbon monoxide (CO), sulfur dioxide (SO_2), particulate matter with an aerodynamic diameter less than or equal to 10 microns (PM_{10}), particulate matter with an aerodynamic diameter less than or equal to 2.5 microns ($PM_{2.5}$), and lead. Pollutants that are evaluated include volatile organic compounds (VOCs) (also referred to as reactive organic gases), oxides of nitrogen (NO_x), CO, sulfur oxides (SO_x), PM_{10}, and $PM_{2.5}$. VOCs and NO_x are important because they are precursors to O_3.

Air Quality Plan Consistency

If a project proposes development that is greater than that anticipated in the local plan and the San Diego Association of Governments (SANDAG) growth projections, the project might be in conflict with the State Implementation Plan (SIP) and Regional Air Quality Strategy (RAQS) and may contribute to a potentially significant cumulative impact on air quality. The Project site is zoned Limited Industrial; however, the Project proposes phased development of 165 multi-family residential units 2025, 127 units in 2026, 75 units in 2027, and 23 units in 2028. SANDAG Series 13 estimates housing would increase from 89,176 in 2020 to 101,188 in 2035. Thus, the phased Project development of multi-family residential units would provide balanced and diverse housing to the City and provide housing to accommodate the City's future growth projections. Therefore, the proposed Project would not stimulate population growth or a population concentration or housing above what is assumed in local and regional land use plans, or projections made by regional planning authorities. The criteria air pollutant emissions associated with operation of an Industrial Park land use would be greater than those for multi-family residential units, particularly since Industrial Park land use generates more truck trips than residential land use. Thus, the proposed Project would not result in emissions that are not accounted for in the RAQs. Based on these considerations, impacts related to the Project's potential to conflict with or obstruct implementation of the applicable air quality plan would be less than significant.

Cumulative Impacts

Construction Criteria Air Pollutant Emissions

Construction of the Project would result in the temporary addition of pollutants to the local airshed caused by on-site sources (e.g., off-road construction equipment, soil disturbance, and VOC off-gassing) and off-site sources (e.g., on-road haul trucks, vendor trucks, and worker vehicle trips). Maximum daily construction emissions would not exceed the City's significance thresholds for VOCs, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$ during construction in all construction years (2021 through 2028).

Operational Criteria Air Pollutant Emissions

Operational year 2028 was assumed following completion of Project construction. Operation of the Project would generate operational criteria air pollutants from mobile sources (vehicles), area sources (consumer product use, architectural coatings, and landscape maintenance equipment), and energy (natural gas). Maximum operational emissions would not exceed the City's operational significance thresholds for VOCs, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$.

The potential for the Project to result in a cumulatively considerable impact is based on the Project's potential to exceed the Project-specific daily thresholds. As discussed previously, maximum construction and operational emissions would not exceed the City's significance thresholds for VOCs, NO_x, CO, SO_x, PM_{10}, or $PM_{2.5}$. Therefore, the Project would not result in a cumulatively considerable increase in criteria air pollutants.

Exposure of Sensitive Receptors

Construction activities would not generate emissions in excess of the City's site-specific mass daily thresholds; therefore, site-specific construction impacts during construction of the Project would be less than significant. In addition, diesel equipment would also be subject to the California Air Resources Board's Airborne Toxic Control Measures for in-use off-road diesel fleets, which would minimize diesel particulate matter emissions.

As required by Policy E 6.10 in the City's General Plan Environmental Element, the siting of new sensitive receivers within 500 feet of highways resulting from development or redevelopment projects shall require the preparation of a health risk assessment (HRA) as part of the CEQA review of the project. The Project is located approximately 4,600 feet from Interstate 805; therefore, the Project is not subject to this requirement.

A HRA of the proximate Otay Landfill operation was prepared on the future sensitive residential receptors of the proposed Project. The HRA finds that the landfill-generated TAC emissions would result in a potential cancer risk at the maximally exposed residential receptor, chronic health risk, and acute health risk below the applicable SDAPCD significance thresholds. Furthermore, following closure of the Otay Landfill in 2030, the cancer risk, chronic health risk, and acute health risk impact from landfill fugitive and flare emissions would be further reduced.

The Project would not negatively affect the level of service of intersections on the Project site and would not significantly contribute to a CO hotspot. As such, potential Project-generated impacts associated with CO hotspots would be less than significant.

Other Emissions

Potential odors produced during construction would be attributable to concentrations of unburned hydrocarbons from tailpipes of construction equipment, architectural coatings, and asphalt pavement application, which would disperse rapidly from the Project site and generally occur at magnitudes that would not affect substantial numbers of people. Impacts associated with odors during construction would be less than significant. The Project is a residential development that would not include land uses with sources that have the potential to generate substantial odors, and impacts associated with odors during operation would be less than significant.

Greenhouse Gas Emissions

Global climate change is primarily considered a cumulative impact but must also be evaluated on a project level under CEQA. A project participates in this potential impact through its incremental contribution combined with the cumulative increase of all other sources of GHG emissions. GHGs are gases that absorb infrared radiation in the atmosphere. Principal GHGs regulated under state and federal law and regulations include carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O). GHG emissions are measured in metric tons (MT) of CO_2 equivalent (CO_2e), which account for weighted global warming potential factors for CH_4 and N_2O.

Project-Generated Construction and Operational Greenhouse Gas Emissions

Construction of the proposed Project would result in GHG emissions primarily associated with the use of off-road construction equipment, on-road hauling and vendor (material delivery) trucks, and worker vehicles. Total Project-generated GHG emissions during construction were estimated to be 12,928 MT CO_2e, or 431 MT CO_2e per year when amortized over 30 years.

The proposed Project would generate operational GHG emissions from area sources (landscape maintenance), energy sources (electricity consumption), mobile sources (vehicle trips), water supply and wastewater treatment, and solid waste. Estimated annual Project-generated operational GHG emissions at buildout in 2028 would be approximately 4,928 MT CO_2e per year.

Estimated annual Project-generated operational emissions in 2028, plus amortized Project construction emissions, would be approximately 5,359 MT CO_2e per year; with a service population of 2,321, the Project would have a GHG efficiency metric of 2.31 MT CO_2e per service population per year. The Project's efficiency metric would exceed the significance threshold efficiency metric of 1.37 MT CO_2e per service population. Therefore, the Project would be considered to have a significant and unavoidable impact with respect to GHG emissions with mitigation.

Consistency with Applicable Greenhouse Gas Reduction Plans

The proposed Project was shown to be consistent with SANDAG's Regional Plan, the City's Climate Action Plan, Senate Bill 32, and Executive Order (EO) S-3-05. Furthermore, the Project would provide pedestrian and bicycle connectivity to the neighborhood due to proximity to bicycle routes, provide pedestrian sidewalk connections. Furthermore, the Project would be located near MTS bus routes 703 and 704 and I-805. These Project characteristics would promote pedestrian and bicycle activity and alternate forms of transportation. However, the Project's efficiency metric would exceed the significance threshold efficiency metric; therefore, the Project would be considered to have a significant and unavoidable impact with respect to GHG emissions with mitigation.

INTENTIONALLY LEFT BLANK

1 Introduction

1.1 Report Purpose and Scope

The purpose of this technical report is to assess the potential air quality and greenhouse gas (GHG) emissions impacts associated with implementation of the proposed Sunbow Planning Area 23 & Preserve Project (Project). This assessment uses the significance thresholds in Appendix G of the California Environmental Quality Act (CEQA) Guidelines (14 CCR 15000 et seq.) and is based on the emissions-based significance thresholds recommended by the San Diego Air Pollution Control District (SDAPCD) and other applicable thresholds of significance.

This introductory chapter provides a description of the Project and the Project location. Chapter 2, Air Quality, describes the air-quality-related environmental setting, regulatory setting, existing air quality conditions, and thresholds of significance and analysis methodology and presents an air quality impact analysis per Appendix G of the CEQA Guidelines. Chapter 3, Greenhouse Gas Emissions, follows the same format as Chapter 2 and similarly describes the GHG-emissions-related environmental setting, regulatory setting, existing climate change conditions, and thresholds of significance and analysis methodology and presents a GHG emissions impact analysis per Appendix G of the CEQA Guidelines. Chapter 4, References Cited, includes a list of the references cited in this technical report. Chapter 5, List of Preparers, includes a list of those who prepared this technical report.

1.2 Project Description

The proposed Project consists of development of 720 multi-family residential units on 44.2 acres, a 0.9-acre Community Purpose Facility site, and 5.9 acres of public streets, open space slopes, and water quality basins. Approximately 4.3 acres of Poggi Canyon Maintenance Facilities and 63.6 acres of Multiple Species Conservation Program (MSCP) open space preserve areas are also within the Project boundary. The Project 135.7-acre site is located south of Olympic Parkway, between Brandywine Avenue and Heritage Road, in the City of Chula Vista (City), California (Figure 1, Project Location). The Project includes four unique multi-family attached residential product types with 15 unique floorplans, ranging in square footage from approximately 1,100 to 2,050 in two- and three-story units.

The Project includes a Chula Vista General Plan Amendment, Sunbow General Development Plan Amendment, Sunbow Sectional Planning Area Plan Amendment, a rezone, and a Tentative Map. The Project also includes a Chula Vista MSCP Boundary Adjustment that would implement minor adjustments to the Planning Area 23 development limits and the adjacent open space and MSCP open space preserve areas.

1.3 Project Design Features

To reduce construction and operational emissions to the extent feasible, the applicant (ACI Sunbow LLC) would incorporate the following project design features (PDFs) into the new facility:

PDF-AQ-1 **Fugitive Dust Control**. The applicant or its designee shall implement the following measures to minimize fugitive dust (PM_{10} and $PM_{2.5}$):

a. A non-toxic dust control agent shall be used on the grading areas or watering shall be applied at least three times daily.
b. Grading areas shall be stabilized as quickly as possible.
c. Chemical stabilizer shall be applied, a gravel pad shall be installed, or the last 100 feet of internal travel path within the construction site shall be paved prior to public road entry and for all haul roads.
d. Visible track-out into traveled public streets shall be removed with the use of sweepers, water trucks, or similar method at the end of the workday.
e. All soil disturbance and travel on unpaved surfaces shall be suspended if winds exceed 25 miles per hour.
f. On-site stockpiles of excavated material shall be covered.
g. A 15 mile per hour speed limit on unpaved surfaces shall be enforced.

PDF-AQ-2 **Architectural Coating.** The applicant or its designee shall use low or no-volatile organic compound (VOC) architectural coatings.

INTENTIONALLY LEFT BLANK

2 Air Quality

2.1 Environmental Setting

The Project area is located within the San Diego Air Basin (SDAB) and is subject to the SDAPCD guidelines and regulations. The SDAB is one of 15 air basins that geographically divide the State of California. The weather of the San Diego region, as in most of Southern California, is influenced by the Pacific Ocean and its semi-permanent high-pressure systems that result in dry, warm summers and mild, occasionally wet winters. The average temperature ranges (in degrees Fahrenheit) from the mid-40s to the high 90s. Most of the region's precipitation falls from November to April, with infrequent (approximately 10%) precipitation during the summer. The average seasonal precipitation along the coast is approximately 10 inches; the amount increases with elevation as moist air is lifted over the mountains to the east.

The topography in the San Diego region varies greatly, from beaches on the west to mountains and desert on the east. Along with local meteorology, the topography influences the dispersal and movement of pollutants in the SDAB. The mountains to the east prohibit dispersal of pollutants in that direction and help trap them in inversion layers, as described in the next section.

The interaction of ocean, land, and the Pacific High Pressure Zone maintains clear skies for much of the year and influences the direction of prevailing winds (westerly to northwesterly). Local terrain is often the dominant factor inland, and winds in inland mountainous areas tend to blow through the valleys during the day and down the hills and valleys at night.

2.1.1 Meteorological and Topographical Conditions

The SDAB lies in the southwest corner of California, comprises the entire San Diego region, covers approximately 4,260 square miles, and is an area of high air pollution potential. The SDAB experiences warm summers, mild winters, infrequent rainfalls, light winds, and moderate humidity. This usually mild climatological pattern is interrupted infrequently by periods of extremely hot weather, winter storms, or Santa Ana winds.

The SDAB experiences frequent temperature inversions. Subsidence inversions occur during the warmer months as descending air associated with the Pacific High Pressure Zone meets cool marine air. The boundary between the two layers of air creates a temperature inversion that traps pollutants. Another type of inversion, a radiation inversion, develops on winter nights when air near the ground cools by heat radiation and air aloft remains warm. The shallow inversion layer formed between these two air masses also can trap pollutants. As the pollutants become more concentrated in the atmosphere, photochemical reactions occur that produce ozone (O_3), commonly known as smog.

Light daytime winds, predominantly from the west, further aggravate the condition by driving air pollutants inland, toward the mountains. During the fall and winter, air quality problems are created due to carbon monoxide (CO) and oxides of nitrogen (NO_x) emissions. CO concentrations are generally higher in the morning and late evening. In the morning, CO levels are elevated due to cold temperatures and the large number of motor vehicles traveling. Higher CO levels during the late evenings are a result of stagnant atmospheric conditions trapping CO in the area. Since CO is produced almost entirely from automobiles, the highest CO concentrations in the basin are associated

with heavy traffic. Nitrogen dioxide (NO_2) levels are also generally higher during fall and winter days when O_3 concentrations are lower.

Under certain conditions, atmospheric oscillation results in the offshore transport of air from the Los Angeles region to San Diego County (the County). This often produces high O_3 concentrations, as measured at air pollutant monitoring stations within the County. The transport of air pollutants from the Los Angeles region to San Diego County has also occurred within the stable layer of the elevated subsidence inversion, where high levels of O_3 are transported.

The local climate in the southern part of the County is characterized as semi-arid with consistently mild, warmer temperatures throughout the year. The average summertime high temperature in the region is approximately 81°F, with highs approaching 80°F in August on average, and record highs approaching 104°F in August. The average wintertime low temperature is approximately 43.8°F, although record lows have approached 32°F in January. Average precipitation in the local area is approximately 9.7 inches per year, with the bulk of precipitation falling between December and March (WRCC 2017).

2.1.2 Pollutants and Effects

2.1.2.1 Criteria Air Pollutants

Criteria air pollutants are defined as pollutants for which the federal and state governments have established ambient air quality standards, or criteria, for outdoor concentrations to protect public health. The federal and state standards have been set, with an adequate margin of safety, at levels above which concentrations could be harmful to human health and welfare. These standards are designed to protect the most sensitive persons from illness or discomfort. Pollutants of concern include O_3, NO_2, CO, sulfur dioxide (SO_2), particulate matter with an aerodynamic diameter less than or equal to 10 microns (coarse particulate matter, or PM_{10}), particulate matter with an aerodynamic diameter less than or equal to 2.5 microns (fine particulate matter, or $PM_{2.5}$), and lead. These pollutants, as well as toxic air contaminants (TACs), are discussed in the following paragraphs.[1] In California, sulfates, vinyl chloride, hydrogen sulfide, and visibility-reducing particles are also regulated as criteria air pollutants.

Ozone. O_3 is a strong-smelling, pale blue, reactive, toxic chemical gas consisting of three oxygen atoms. It is a secondary pollutant formed in the atmosphere by a photochemical process involving the sun's energy and O_3 precursors. These precursors are mainly NO_x and VOCs. The maximum effects of precursor emissions on O_3 concentrations usually occur several hours after they are emitted and many miles from the source. Meteorology and terrain play major roles in O_3 formation, and ideal conditions occur during summer and early autumn on days with low wind speeds or stagnant air, warm temperatures, and cloudless skies. O_3 exists in the upper atmosphere O_3 layer (stratospheric ozone) and at the Earth's surface in the troposphere (ozone).[2] The O_3 that the U.S. Environmental Protection Agency (EPA) and the California Air Resources Board (CARB) regulate as a criteria air pollutant is produced close to the ground level, where people live, exercise, and breathe. Ground-level O_3 is a harmful air pollutant that causes numerous adverse health effects and is thus considered "bad" O_3. Stratospheric, or "good," O_3 occurs naturally in the upper atmosphere, where it reduces the amount of ultraviolet light (i.e., solar radiation) entering the Earth's

[1] The descriptions of each of the criteria air pollutants and associated health effects are based on the EPA's Criteria Air Pollutants (2016a) and the CARB Glossary of Air Pollutant Terms (2016a).

[2] The troposphere is the layer of the Earth's atmosphere nearest to the surface of the Earth. The troposphere extends outward about 5 miles at the poles and about 10 miles at the equator.

atmosphere. Without the protection of the beneficial stratospheric O_3 layer, plant and animal life would be seriously harmed.

O_3 in the troposphere causes numerous adverse health effects; short-term exposures (lasting for a few hours) to O_3 at levels typically observed in Southern California can result in breathing pattern changes, reduction of breathing capacity, increased susceptibility to infections, inflammation of the lung tissue, and some immunological changes (EPA 2013). These health problems are particularly acute in sensitive receptors such as sick people, elderly people, and young children.

Nitrogen Dioxide. NO_2 is a brownish, highly reactive gas that is present in all urban atmospheres. The major mechanism for the formation of NO_2 in the atmosphere is the oxidation of the primary air pollutant nitric oxide (NO), which is a colorless, odorless gas. NO_x plays a major role, together with VOCs, in the atmospheric reactions that produce O_3. NO_x is formed from fuel combustion under high temperature or pressure. In addition, NO_x is an important precursor to acid rain and may affect both terrestrial and aquatic ecosystems. The two major emissions sources are transportation and stationary fuel combustion sources, such as electric utility and industrial boilers.

NO_2 can irritate the lungs, cause bronchitis and pneumonia, and lower resistance to respiratory infections (EPA 2016b).

Carbon Monoxide. CO is a colorless, odorless gas formed by the incomplete combustion of hydrocarbon or fossil fuels. CO is emitted almost exclusively from motor vehicles, power plants, refineries, industrial boilers, ships, aircraft, and trains. In urban areas, such as the Project location, automobile exhaust accounts for the majority of CO emissions. CO is a nonreactive air pollutant that dissipates relatively quickly; therefore, ambient CO concentrations generally follow the spatial and temporal distributions of vehicular traffic. CO concentrations are influenced by local meteorological conditions—primarily wind speed, topography, and atmospheric stability. CO from motor vehicle exhaust can become locally concentrated when surface-based temperature inversions are combined with calm atmospheric conditions, which is a typical situation at dusk in urban areas from November to February. The highest levels of CO typically occur during the colder months of the year, when inversion conditions are more frequent.

In terms of adverse health effects, CO competes with oxygen, often replacing it in the blood, reducing the blood's ability to transport oxygen to vital organs. The results of excess CO exposure can include dizziness, fatigue, and impairment of central nervous system functions.

Sulfur Dioxide. SO_2 is a colorless, pungent gas formed primarily from incomplete combustion of sulfur-containing fossil fuels. The main sources of SO_2 are coal and oil used in power plants and industries; as such, the highest levels of SO_2 are generally found near large industrial complexes. In recent years, SO_2 concentrations have been reduced by the increasingly stringent controls placed on stationary source emissions of SO_2 and limits on the sulfur content of fuels.

SO_2 is an irritant gas that attacks the throat and lungs and can cause acute respiratory symptoms and diminished ventilator function in children. When combined with particulate matter, SO_2 can injure lung tissue, as well as reducing visibility and the level of sunlight. SO_2 can also yellow plant leaves and erode iron and steel.

Particulate Matter. Particulate matter pollution consists of very small liquid and solid particles floating in the air, which can include smoke, soot, dust, salts, acids, and metals. Particulate matter can form when gases emitted from industries and motor vehicles undergo chemical reactions in the atmosphere. $PM_{2.5}$ and PM_{10} represent fractions of particulate matter. Coarse particulate matter (PM_{10}) consists of particulate matter that is 10 microns or less in

diameter and is about 1/7 the thickness of a human hair. Major sources of PM_{10} include crushing or grinding operations; dust stirred up by vehicles traveling on roads; wood-burning stoves and fireplaces; dust from construction, landfills, and agriculture; wildfires and brush/waste burning; industrial sources; windblown dust from open lands; and atmospheric chemical and photochemical reactions. Fine particulate matter ($PM_{2.5}$) consists of particulate matter that is 2.5 microns or less in diameter and is roughly 1/28 the thickness of a human hair. $PM_{2.5}$ results from fuel combustion (e.g., from motor vehicles and power generation and industrial facilities), residential fireplaces, and woodstoves. In addition, $PM_{2.5}$ can be formed in the atmosphere from gases such as sulfur oxides (SO_x), NO_x, and VOCs.

$PM_{2.5}$ and PM_{10} pose a greater health risk than larger-size particles. When inhaled, these tiny particles can penetrate the human respiratory system's natural defenses and damage the respiratory tract. $PM_{2.5}$ and PM_{10} can increase the number and severity of asthma attacks, cause or aggravate bronchitis and other lung diseases, and reduce the body's ability to fight infections. Very small particles of substances such as lead, sulfates, and nitrates can cause lung damage directly or be absorbed into the bloodstream, causing damage elsewhere in the body. Additionally, these substances can transport adsorbed gases such as chlorides or ammonium into the lungs, also causing injury. Whereas PM_{10} tends to collect in the upper portion of the respiratory system, $PM_{2.5}$ is so tiny that it can penetrate deeper into the lungs and damage lung tissue. Suspended particulates also damage and discolor surfaces on which they settle and produce haze and reduce regional visibility.

People with influenza, people with chronic respiratory and cardiovascular diseases, and elderly people may suffer worsening illness and premature death as a result of breathing particulate matter. People with bronchitis can expect aggravated symptoms from breathing in particulate matter. Children may experience a decline in lung function due to breathing in PM_{10} and $PM_{2.5}$ (EPA 2009).

Lead. Lead in the atmosphere occurs as particulate matter. Sources of lead include leaded gasoline; the manufacturing of batteries, paints, ink, ceramics, and ammunition; and secondary lead smelters. Prior to 1978, mobile emissions were the primary source of atmospheric lead. Between 1978 and 1987, the phaseout of leaded gasoline reduced the overall inventory of airborne lead by nearly 95%. With the phaseout of leaded gasoline, secondary lead smelters, battery recycling, and manufacturing facilities are becoming lead-emissions sources of greater concern.

Prolonged exposure to atmospheric lead poses a serious threat to human health. Health effects associated with exposure to lead include gastrointestinal disturbances, anemia, kidney disease, and in severe cases, neuromuscular and neurological dysfunction. Of particular concern are low-level lead exposures during infancy and childhood. Such exposures are associated with decrements in neurobehavioral performance, including intelligence quotient performance, psychomotor performance, reaction time, and growth. Children are highly susceptible to the effects of lead.

Volatile Organic Compounds. Hydrocarbons are organic gases that are formed from hydrogen and carbon and sometimes other elements. Hydrocarbons that contribute to formation of O_3 are referred to and regulated as VOCs (also referred to as reactive organic gases). Combustion engine exhaust, oil refineries, and fossil-fuel power plants are major sources of hydrocarbons. Other sources of hydrocarbons include evaporation from petroleum fuels, solvents, dry-cleaning solutions, and paint.

The primary health effects of VOCs result from the formation of O_3 and its related health effects. High levels of VOCs in the atmosphere can interfere with oxygen intake by reducing the amount of available oxygen through displacement. Carcinogenic forms of hydrocarbons, such as benzene, are considered TACs. There are no separate health standards for VOCs as a group.

Sulfates. Sulfates are the fully oxidized forms of sulfur, which typically occur in combination with metals or hydrogen ions. Sulfates are produced from reactions of SO_2 in the atmosphere. Sulfates can result in respiratory impairment and reduced visibility.

Vinyl Chloride. Vinyl chloride is a colorless gas with a mild, sweet odor, which has been detected near landfills, sewage plants, and hazardous waste sites, due to the microbial breakdown of chlorinated solvents. Short-term exposure to high levels of vinyl chloride in the air can cause nervous system effects such as dizziness, drowsiness, and headaches. Long-term exposure through inhalation can cause liver damage, including liver cancer.

Hydrogen Sulfide. Hydrogen sulfide is a colorless and flammable gas that has a characteristic odor of rotten eggs. Sources of hydrogen sulfide include geothermal power plants, petroleum refineries, sewers, and sewage treatment plants. Exposure to hydrogen sulfide can result in nuisance odors, as well as headaches and breathing difficulties at higher concentrations.

Visibility-Reducing Particles. Visibility-reducing particles are any particles in the air that obstruct the range of visibility. Effects of reduced visibility can include obscuring the viewshed of natural scenery, reducing airport safety, and discouraging tourism. Sources of visibility-reducing particles are the same as for $PM_{2.5}$.

2.1.2.2 Non-Criteria Air Pollutants

Toxic Air Contaminants. A substance is considered toxic if it has the potential to cause adverse health effects in humans, including increasing the risk of cancer upon exposure, or acute and/or chronic non-cancer health effects. A toxic substance released into the air is considered a TAC. TACs are identified by federal and state agencies based on a review of available scientific evidence. In the State of California, TACs are identified through a two-step process that was established in 1983 under the Toxic Air Contaminant Identification and Control Act. This two-step process of risk identification and risk management and reduction was designed to protect residents from the health effects of toxic substances in the air. In addition, the California Air Toxics "Hot Spots" Information and Assessment Act, Assembly Bill (AB) 2588, was enacted by the legislature in 1987 to address public concern over the release of TACs into the atmosphere. The law requires facilities emitting toxic substances to provide local air pollution control districts with information that will allow an assessment of the air toxics problem, identification of air toxics emissions sources, location of resulting hotspots, notification of the public exposed to significant risk, and development of effective strategies to reduce potential risks to the public over 5 years.

Examples include certain aromatic and chlorinated hydrocarbons, certain metals, and asbestos. TACs are generated by a number of sources, including stationary sources, such as dry cleaners, gas stations, combustion sources, and laboratories; mobile sources, such as automobiles; and area sources, such as landfills. Adverse health effects associated with exposure to TACs may include carcinogenic (i.e., cancer-causing) and non-carcinogenic effects. Non-carcinogenic effects typically affect one or more target organ systems and may be experienced on either short-term (acute) or long-term (chronic) exposure to a given TAC.

Diesel Particulate Matter. Diesel particulate matter (DPM) is part of a complex mixture that makes up diesel exhaust. Diesel exhaust is composed of two phases, gas and particle, both of which contribute to health risks. More than 90% of DPM is less than 1 micrometer in diameter (about $1/70^{th}$ the diameter of a human hair) and, thus, is a subset of $PM_{2.5}$ (CARB 2016a). DPM is typically composed of carbon particles ("soot," also called black carbon) and numerous organic compounds, including more than 40 known cancer-causing organic substances. Examples of these chemicals include polycyclic aromatic hydrocarbons, benzene, formaldehyde, acetaldehyde, acrolein, and

1,3-butadiene (CARB 2016a). The CARB classified "particulate emissions from diesel-fueled engines" (i.e., DPM; 17 CCR 93000) as a TAC in August 1998. DPM is emitted from a broad range of diesel engines, including on-road diesel engines (trucks, buses, and cars) and off-road diesel engines (locomotives, marine vessels, and heavy-duty construction equipment, among others). Approximately 70% of all airborne cancer risk in California is associated with DPM (CARB 2000). To reduce the cancer risk associated with DPM, CARB adopted a diesel risk reduction plan in 2000 (CARB 2000). Because it is part of PM2.5, DPM also contributes to the same non-cancer health effects as $PM_{2.5}$ exposure. These effects include premature death; hospitalizations and emergency department visits for exacerbated chronic heart and lung disease, including asthma; increased respiratory symptoms; and decreased lung function in children. Several studies suggest that exposure to DPM may also facilitate development of new allergies (CARB 2016b). Those most vulnerable to non-cancer health effects are children, whose lungs are still developing, and elderly people, who often have chronic health problems.

Odorous Compounds. Odors are generally regarded as an annoyance rather than a health hazard. Manifestations of a person's reaction to odors can range from psychological (e.g., irritation, anger, or anxiety) to physiological (e.g., circulatory and respiratory effects, nausea, vomiting, and headache). The ability to detect odors varies considerably among the population and overall is subjective. People may have different reactions to the same odor. An odor that is offensive to one person may be perfectly acceptable to another (e.g., a coffee roaster). An unfamiliar odor is more easily detected and is more likely to cause complaints than a familiar one. In a phenomenon known as odor fatigue, a person can become desensitized to almost any odor, and recognition may only occur with an alteration in the intensity. The occurrence and severity of odor impacts depend on the nature, frequency, and intensity of the source; wind speed and direction; and the sensitivity of receptors.

Valley Fever. Coccidioidomycosis, more commonly known as "valley fever," is an infection caused by inhalation of the spores of the *Coccidioides immitis* fungus, which grows in the soils of the southwestern United States. When fungal spores are present, any activity that disturbs the soil, such as digging, grading, or other earthmoving operations, can cause the spores to become airborne and thereby increase the risk of exposure. The ecologic factors that appear to be most conducive to survival and replication of the spores are high summer temperatures, mild winters, sparse rainfall, and alkaline sandy soils.

Valley fever is not considered highly endemic to San Diego. Per the County Health and Human Services Agency, the 10-year average (2009–2018) for coccidioidomycosis cases in the County of San Diego is 5.5 cases per 100,000 people per year. The Project area is wholly contained within the 91911 zip code. For the 91911 zip code, there were 113 cases of coccidioidomycosis between 2009 and 2018, which is equivalent to a rate of 13.5 cases per 100,000 people (Nelson 2019). Statewide incidences in 2018 were 18.8 per 100,000 people (CDPH 2019).

Even if *Coccidioides immitis* is present at a site, earthmoving activities may not result in increased incidence of valley fever. Propagation of *Coccidioides immitis* is dependent on climatic conditions, with the potential for growth and surface exposure highest following early seasonal rains and long dry spells. *Coccidioides immitis* spores can be released when filaments are disturbed by earthmoving activities, although receptors must be exposed to and inhale the spores to be at increased risk of developing valley fever. Moreover, exposure to *Coccidioides immitis* does not guarantee that an individual will become ill—approximately 60% of people exposed to the fungal spores are asymptomatic and show no signs of an infection (USGS 2000).

2.1.3 Sensitive Receptors

Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. People most likely to be affected by air pollution include children, elderly people, athletes, and people with cardiovascular and chronic respiratory diseases. Facilities and structures where these air pollution-sensitive people live or spend considerable amounts of time are known as "sensitive receptors." Land uses where air-pollution-sensitive individuals are most likely to spend time include schools and schoolyards, parks and playgrounds, daycare centers, nursing homes, hospitals, and residential communities (sensitive sites or sensitive land uses) (CARB 2005). SDAPCD identifies sensitive receptors as those who are especially susceptible to adverse health effects from exposure to TACs, such as children, elderly people, and ill people. Sensitive receptors include schools (grades Kindergarten through 12), daycare centers, nursing homes, retirement homes, health clinics, and hospitals within 2 kilometers (1.2 miles) of the facility (SDAPCD 2019). The closest sensitive receptors to the proposed Project are residences located 1,040 feet north of the Project site. The Project would also introduce new on-site sensitive receptors to the area.

2.2 Regulatory Setting

2.2.1 Federal Regulations

2.2.1.1 Criteria Air Pollutants

The federal Clean Air Act (CAA), passed in 1970 and last amended in 1990, forms the basis for the national air pollution control effort. EPA is responsible for implementing most aspects of the CAA, including the setting of the National Ambient Air Quality Standards (NAAQS) for major air pollutants, HAP standards, approval of state attainment plans, motor vehicle emission standards, stationary source emission standards and permits, acid rain control measures, stratospheric O_3 protection, and enforcement provisions.

Under the CAA, NAAQS are established for the following criteria pollutants: O_3, CO, NO_2, SO_2, PM_{10}, $PM_{2.5}$, and lead. The NAAQS describe acceptable air quality conditions designed to protect the health and welfare of the citizens of the nation. The CAA requires EPA to reassess the NAAQS at least every 5 years to determine whether adopted standards are adequate to protect public health based on current scientific evidence. States with areas that exceed the NAAQS must prepare a State Implementation Plan (SIP) that demonstrates how those areas will attain the standards within mandated time frames.

2.2.1.2 Hazardous Air Pollutants

The 1977, federal CAA amendments required EPA to identify national emission standards for hazardous air pollutants (HAPs) to protect public health and welfare. HAPs include certain volatile organic chemicals, pesticides, herbicides, and radionuclides that present a tangible hazard, based on scientific studies of exposure to humans and other mammals. Under the 1990 CAA amendments, which expanded the control program for HAPs, 189 substances and chemical families were identified as HAPs.

2.2.2 State Regulations

2.2.2.1 Criteria Air Pollutants

The federal CAA delegates the regulation of air pollution control and the enforcement of the NAAQS to the states. In California, the task of air quality management and regulation has been legislatively granted to CARB, with subsidiary responsibilities assigned to air quality management districts and air pollution control districts at the regional and county levels. CARB, which became part of the California Environmental Protection Agency in 1991, is responsible for ensuring implementation of the California CAA of 1988, responding to the CAA and regulating emissions from motor vehicles and consumer products.

CARB has established California Ambient Air Quality Standards (CAAQS), which are generally more restrictive than the NAAQS. The CAAQS describe adverse conditions; that is, pollution levels must be below these standards before a basin can attain the standard. Air quality is considered "in attainment" if pollutant levels are continuously below the CAAQS and violate the standards no more than once each year. The CAAQS for O_3, CO, SO_2 (1-hour and 24-hour), NO_2, PM_{10}, $PM_{2.5}$, and visibility-reducing particles are values that are not to be exceeded. All others are not to be equaled or exceeded.

The NAAQS and CAAQS are presented in Table 1.

Table 1. Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards[a]	National Standards[b]	
		Concentration[c]	*Primary[c,d]*	*Secondary[c,e]*
O_3	1 hour	0.09 ppm (180 μg/m³)	—	Same as Primary Standard[f]
	8 hours	0.070 ppm (137 μg/m³)	0.070 ppm (137 μg/m³)[f]	
NO_2[g]	1 hour	0.18 ppm (339 μg/m³)	0.100 ppm (188 μg/m³)	Same as Primary Standard
	Annual arithmetic mean	0.030 ppm (57 μg/m³)	0.053 ppm (100 μg/m³)	
CO	1 hour	20 ppm (23 mg/m³)	35 ppm (40 mg/m³)	None
	8 hours	9.0 ppm (10 mg/m³)	9 ppm (10 mg/m³)	
SO_2[h]	1 hour	0.25 ppm (655 μg/m³)	0.075 ppm (196 μg/m³)	—
	3 hours	—	—	0.5 ppm (1,300 μg/m³)
	24 hours	0.04 ppm (105 μg/m³)	0.14 ppm (for certain areas)[g]	—
	Annual	—	0.030 ppm (for certain areas)[g]	—
PM_{10}[i]	24 hours	50 μg/m³	150 μg/m³	Same as Primary Standard
	Annual arithmetic mean	20 μg/m³	—	
$PM_{2.5}$[i]	24 hours	—	35 μg/m³	Same as Primary Standard
	Annual arithmetic mean	12 μg/m³	12.0 μg/m³	15.0 μg/m³
Lead[j,k]	30-day average	1.5 μg/m³	—	—

Table 1. Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards[a]	National Standards[b]	
		Concentration[c]	*Primary[c,d]*	*Secondary[c,e]*
	Calendar quarter	—	1.5 µg/m³ (for certain areas)[k]	Same as Primary Standard
	Rolling 3-month average	—	0.15 µg/m³	
Hydrogen sulfide	1 hour	0.03 ppm (42 µg/m³)	—	—
Vinyl chloride[j]	24 hours	0.01 ppm (26 µg/m³)	—	—
Sulfates	24 hours	25 µg/m³	—	—
Visibility reducing particles	8 hour (10:00 a.m. to 6:00 p.m. PST)	Insufficient amount to produce an extinction coefficient of 0.23 per kilometer due to the number of particles when the relative humidity is less than 70%	—	—

Source: CARB 2016b.

Notes: O_3 = ozone; ppm = parts per million by volume; µg/m³ = micrograms per cubic meter; — = no data available; NO_2 = nitrogen dioxide; CO = carbon monoxide; mg/m³= milligrams per cubic meter; SO_2 = sulfur dioxide; PM_{10} = particulate matter with an aerodynamic diameter less than or equal to 10 microns; $PM_{2.5}$ = particulate matter with an aerodynamic diameter less than or equal to 2.5 microns; PST = Pacific Standard Time.

[a] California standards for O_3, CO, SO_2 (1-hour and 24-hour), NO_2, suspended particulate matter (PM_{10}, $PM_{2.5}$), and visibility-reducing particles are values that are not to be exceeded. All others are not to be equaled or exceeded. CAAQS are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.

[b] National standards (other than O_3, NO_2, SO_2, particulate matter, and those based on annual averages or annual arithmetic mean) are not to be exceeded more than once per year. The O_3 standard is attained when the fourth-highest 8-hour concentration measured at each site in a year, averaged over 3 years, is equal to or less than the standard. For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m³ is equal to or less than 1. For $PM_{2.5}$, the 24-hour standard is attained when 98% of the daily concentrations, averaged over 3 years, are equal to or less than the standard.

[c] Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based on a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.

[d] National Primary Standards: The levels of air quality necessary, with an adequate margin of safety, to protect the public health.

[e] National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.

[f] On October 1, 2015, the national 8-hour O_3 primary and secondary standards were lowered from 0.075 to 0.070 ppm.

[g] To attain the national 1-hour standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 parts per billion (ppb). Note that the national 1-hour standard is in units of ppb. California standards are in units of ppm. To directly compare the national 1-hour standard to the California standards, the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.

[h] On June 2, 2010, a new 1-hour SO_2 standard was established, and the existing 24-hour and annual primary standards were revoked. To attain the national 1-hour standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 national standards (24-hour and annual) remain in effect until 1 year after an area is designated for the 2010 standard, except that in areas designated nonattainment of the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.

[i] On December 14, 2012, the national annual $PM_{2.5}$ primary standard was lowered from 15 µg/m³ to 12.0 µg/m³. The existing national 24-hour $PM_{2.5}$ standards (primary and secondary) were retained at 35 µg/m³, as was the annual secondary standard of

15 µg/m³. The existing 24-hour PM_{10} standards (primary and secondary) of 150 µg/m³ were also retained. The form of the annual primary and secondary standards is the annual mean averaged over 3 years.

[j] California Air Resources Board has identified lead and vinyl chloride as toxic air contaminants with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

[k] The national standard for lead was revised on October 15, 2008, to a rolling 3-month average. The 1978 lead standard (1.5 µg/m³ as a quarterly average) remains in effect until 1 year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.

2.2.2.2 Toxic Air Contaminants

A TAC is defined by California law as an air pollutant that may cause or contribute to an increase in mortality or an increase in serious illness, or which may pose a present or potential hazard to human health. Federal laws use the HAPs to refer to the same types of compounds that are referred to as TACs under state law. California regulates TACs primarily through the Tanner Air Toxics Act (AB 1807) and the Air Toxics Hot Spots Information and Assessment Act of 1987 (AB 2588).

AB 1807 sets forth a formal procedure for CARB to designate substances as TACs. This includes research, public participation, and scientific peer review before CARB can designate a substance as a TAC. Pursuant to AB 2588, existing facilities that emit air pollutants above specified level were required to (1) prepare a TAC emission inventory plan and report, (2) prepare a risk assessment if TAC emissions were significant, (3) notify the public of significant risk levels, and (4) if health impacts were above specified levels, prepare and implement risk reduction measures.

The following regulatory measures pertain to the reduction of DPM and criteria pollutant emissions from off-road equipment and diesel-fueled vehicles:

Idling of Commercial Heavy-Duty Trucks (13 CCR 2485)

In July 2004, CARB adopted an Airborne Toxic Control Measure (ATCM) to control emissions from idling trucks. The ATCM prohibits idling for more than 5 minutes for all commercial trucks with a gross vehicle weight rating over 10,000 pounds. The ATCM contains an exception that allows trucks to idle while queuing or involved in operational activities.

In-Use Off-Road Diesel-Fueled Fleets (13 CCR 2449 et seq.)

In July 2007, CARB adopted an ATCM for in-use off-road diesel vehicles. This regulation requires that specific fleet average requirements be met for NO_x emissions and for particulate matter emissions. Where average requirements cannot be met, Best Available Control Technology requirements apply. The regulation also includes several recordkeeping and reporting requirements.

In response to AB 8 2X, the regulations were revised in July 2009 (effective December 3, 2009) to allow a partial postponement of the compliance schedule in 2011 and 2012 for existing fleets. On December 17, 2010, CARB adopted additional revisions to further delay the deadlines, reflecting reductions in diesel emissions due to the poor economy and overestimates of diesel emissions in California. The revisions delayed the first compliance date until no earlier than January 1, 2014, for large fleets, with final compliance by January 1, 2023. The compliance dates for medium fleets were delayed until an initial date of January 1, 2017, and a final compliance date of January 1, 2023. The compliance dates for small fleets were delayed until an initial date of January 1, 2019, and a final compliance date of January 1, 2028. Correspondingly, the fleet average targets were made more stringent in future

compliance years. The revisions also accelerated the phaseout of equipment with older equipment added to existing large and medium fleets over time, requiring the addition of Tier 2 or higher engines starting on March 1, 2011, with some exceptions: Tier 2 or higher engines on January 1, 2013, without exception; and Tier 3 or higher engines on January 1, 2018 (January 1, 2023, for small fleets).

On October 28, 2011 (effective December 14, 2011), the Executive Officer approved amendments to the regulation. The amendments included revisions to the applicability section and additions and revisions to the definitions. The initial date for requiring the addition of Tier 2 or higher engines for large and medium fleets, with some exceptions, was revised to January 1, 2012. New provisions also allow for the removal of emission control devices for safety or visibility purposes. The regulation also was amended to combine the particulate matter and NO_x fleet average targets under one, instead of two, sections. The amended fleet average targets are based on the fleet's NO_x average, and the previous section regarding particulate matter performance requirements was deleted completely. The Best Available Control Technology requirements, if a fleet cannot comply with the fleet average requirements, were restructured and clarified. Other amendments to the regulations included minor administrative changes to the regulatory text.

In-Use On-Road Diesel-Fueled Vehicles (13 CCR 2025)

On December 12, 2008, CARB adopted an ATCM to reduce NO_x and particulate matter emissions from most in-use on-road diesel trucks and buses with a gross vehicle weight rating greater than 14,000 pounds. The original ATCM regulation required fleets of on-road trucks to limit their NO_x and particulate matter emissions through a combination of exhaust retrofit equipment and new vehicles. The regulation limited particulate matter emissions for most fleets by 2011, and limited NO_x emissions for most fleets by 2013. The regulation did not require any vehicle to be replaced before 2012 and never required that all vehicles in a fleet be replaced.

In December 2009, the CARB Governing Board directed staff to evaluate amendments that would provide additional flexibility for fleets adversely affected by the poor California economy. On December 17, 2010, CARB revised this ATCM to delay its implementation along with limited relaxation of its requirements. Starting on January 1, 2015, lighter trucks with a gross vehicle weight rating of 14,001 to 26,000 pounds with 20-year-old or older engines need to be replaced with newer trucks (2010 model year emissions equivalent, as defined in the regulation). Trucks with a gross vehicle weight rating greater than 26,000 pounds with 1995 model year or older engines needed to be replaced as of January 1, 2015. Trucks with 1996–2006 model year engines must install a Level 3 (85% control) diesel particulate filter starting on January 1, 2012, to January 1, 2014, depending on the model year, and then must be replaced after 8 years. Trucks with 2007–2009 model year engines have no requirements until 2023, at which time they must be replaced with 2010 model year emissions equivalent engines, as defined in the regulation. Trucks with 2010 model year engines would meet the final compliance requirements. The ATCM provides a phase-in option under which a fleet operator would equip a percentage of trucks in the fleet with diesel particulate filters, starting at 30% as of January 1, 2012, with 100% by January 1, 2016. Under each option, delayed compliance is granted to fleet operators who have complied or will comply with requirements before the required deadlines.

On September 19, 2011 (effective December 14, 2011), the Executive Officer approved amendments to the regulations, including revisions to the compliance schedule for vehicles with a gross vehicle weight rating of 26,000 pounds or less to clarify that *all* vehicles must be equipped with 2010 model year emissions equivalent engines by 2023. The amendments included revised and additional credits for fleets that have downsized; implemented early particulate matter retrofits; incorporated hybrid vehicles, alternative-fueled vehicles, and vehicles with heavy-duty pilot ignition engines; and implemented early addition of newer vehicles. The amendments included provisions for

additional flexibility, such as for low-usage construction trucks, and revisions to previous exemptions, delays, and extensions. Other amendments to the regulations included minor administrative changes to the regulatory text, including recordkeeping and reporting requirements related to other revisions.

California Health and Safety Code Section 41700

Section 41700 of the California Health and Safety Code states that a person shall not discharge from any source whatsoever quantities of air contaminants or other material that cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or that endanger the comfort, repose, health, or safety of any of those persons or the public, or that cause, or have a natural tendency to cause, injury or damage to business or property. This section also applies to sources of objectionable odors.

Building Energy Efficiency Standards (Title 24, Part 6; Title 24, Part 11)

As required by the 2019 Standards of Part 6 and Part 11 of the Title 24 of the California Code of Regulations, multi-family residential units are required to install high-efficiency return air filters on all heating, ventilation, and air conditioning (HVAC) systems. The air filtration system shall reduce at least 90% of particulate matter emissions, such as can be achieved with a Minimum Efficiency Reporting Value 13 (MERV 13) air filtration system installed on return vents in residential units.

2.2.3 Local Regulations

2.2.3.1 San Diego Air Pollution Control District

While CARB is responsible for the regulation of mobile emission sources within the state, local air quality management districts and air pollution control districts are responsible for enforcing standards and regulating stationary sources. The Project area is located within the SDAB and is subject to the guidelines and regulations of SDAPCD.

In the County, O_3 and particulate matter are the pollutants of main concern, since exceedances of the CAAQS for those pollutants are experienced here in most years. For this reason, the SDAB has been designated as a nonattainment area for the state PM_{10}, $PM_{2.5}$, and O_3 standards. The SDAB is also a federal O_3 attainment (maintenance) area for the 1997 8-hour O_3 standard, an O_3 nonattainment area for the 2008 8-hour O_3 standard, and a CO maintenance area (western and central part of the SDAB only, including the Project area).

Federal Attainment Plans

In December 2016, SDAPCD adopted an update to the Eight-Hour Ozone Attainment Plan for San Diego County (2008 O_3 NAAQS). The Final 2008 Eight-Hour Ozone Attainment Plan for San Diego County (2016 8-Hour O_3 Attainment Plan; SDAPCD 2016a) indicates that local controls and state programs would allow the region to reach attainment of the federal 8-hour O_3 standard (1997 O_3 NAAQS) by 2018. In this plan, SDAPCD relies on the Regional Air Quality Strategy (RAQS) to demonstrate how the region will comply with the federal O_3 standard. The RAQS details how the region will manage and reduce O_3 precursors (NO_x and VOCs) by identifying measures and regulations intended to reduce these pollutants. The control measures identified in the RAQS generally focus on stationary sources; however, the emissions inventories and projections in the RAQS address all potential sources, including

those under the authority of CARB and EPA. Incentive programs for reduction of emissions from heavy-duty diesel vehicles, off-road equipment, and school buses are also established in the RAQS.

Currently, the County is designated as moderate nonattainment for the 2008 NAAQS and maintenance for the 1997 NAAQS. As documented in the 2016 8-Hour O_3 Attainment Plan, the County has a likely chance of obtaining attainment due to the transition to low-emission cars, stricter new source review rules, and continuing the requirement of general conformity for military growth and the San Diego International Airport. The County will also continue emission control measures, including ongoing implementation of existing regulations in O_3 precursor reduction to stationary and area-wide sources, subsequent inspections of facilities and sources, and the adoption of laws requiring Best Available Retrofit Control Technology for control of emissions (SDAPCD 2016a).

State Attainment Plans

SDAPCD and the San Diego Association of Governments (SANDAG) are responsible for developing and implementing the clean air plans for attainment and maintenance of the ambient air quality standards in the SDAB. The RAQS for the SDAB was initially adopted in 1991 and is updated on a triennial basis, most recently in 2016 (SDAPCD 2016b). The RAQS outlines SDAPCD's plans and control measures designed to attain the CAAQS for O_3. The RAQS relies on information from CARB and SANDAG, including mobile and area source emissions, as well as information regarding projected growth in the County and the cities in the County, to forecast future emissions and then determine from that the strategies necessary for the reduction of emissions through regulatory controls. CARB mobile source emission projections and SANDAG growth projections are based on population, vehicle trends, and land use plans developed by the County and the cities in the County as part of the development of their general plans (SANDAG 2017a, 2017b).

In December 2016, SDAPCD adopted the revised RAQS for the County. Since 2007, the San Diego region reduced daily VOC emissions and NO_x emissions by 3.9% and 7.0%, respectively; SDAPCD expects to continue reductions through 2035 (SDAPCD 2016b). These reductions were achieved through implementation of six VOC control measures and three NO_x control measures adopted in SDAPCD's 2009 RAQS (SDAPCD 2009a); in addition, the SDAPCD is considering additional measures, including three VOC measures and four control measures to reduce 0.3 daily tons of VOC and 1.2 daily tons of NO_x, provided they are found to be feasible regionwide. In addition, SDAPCD has implemented nine incentive-based programs, has worked with SANDAG to implement regional transportation control measures, and has reaffirmed the state emission offset repeal.

In regard to particulate matter emissions reduction efforts, in December 2005, SDAPCD prepared a report titled "Measures to Reduce Particulate Matter in San Diego County" to address implementation of Senate Bill (SB) 656 in San Diego County (SB 656 required additional controls to reduce ambient concentrations of PM_{10} and $PM_{2.5}$) (SDAPCD 2005). In the report, SDAPCD evaluated implementation of source-control measures that would reduce particulate matter emissions associated with residential wood combustion; various construction activities including earthmoving, demolition, and grading; bulk material storage and handling; carryout and trackout removal and cleanup methods; inactive disturbed land; disturbed open areas; unpaved parking lots/staging areas; unpaved roads; and windblown dust (SDAPCD 2005).

SDAPCD Rules and Regulations

As stated previously, SDAPCD is responsible for planning, implementing, and enforcing federal and state ambient standards in the SDAB. The following rules and regulations apply to all sources in the jurisdiction of SDAPCD and would apply to the Project:

SDAPCD Regulation II: Permits; Rule 20.2: New Source Review Non-Major Stationary Sources. Requires new or modified stationary source units (that are not major stationary sources) with the potential to emit 10 pounds per day or more of VOC, NO_x, SO_x, or PM_{10} to be equipped with Best Available Control Technology. For those units with a potential to emit above Air Quality Impact Assessments Trigger Levels, the units must demonstrate that such emissions would not violate or interfere with the attainment of any national air quality standard (SDAPCD 2016b).

SDAPCD Regulation IV: Prohibitions; Rule 50: Visible Emissions. Prohibits discharge into the atmosphere from any single source of emissions whatsoever any air contaminant for a period or periods aggregating more than 3 minutes in any period of 60 consecutive minutes, which is darker in shade than that designated as Number 1 on the Ringelmann Chart, as published by the United States Bureau of Mines, or of such opacity as to obscure an observer's view to a degree greater than does smoke of a shade designated as Number 1 on the Ringelmann Chart (SDAPCD 1997).

SDAPCD Regulation IV: Prohibitions; Rule 51: Nuisance. Prohibits the discharge, from any source, of such quantities of air contaminants or other materials that cause or have a tendency to cause injury, detriment, nuisance, annoyance to people and/or the public, or damage to any business or property (SDAPCD 1969).

SDAPCD Regulation IV: Prohibitions; Rule 55: Fugitive Dust Control. Regulates fugitive dust emissions from any commercial construction or demolition activity capable of generating fugitive dust emissions, including active operations, open storage piles, and inactive disturbed areas, as well as track-out and carry-out onto paved roads beyond a project area (SDAPCD 2009b).

SDAPCD Regulation IV: Prohibitions; Rule 67.0.1: Architectural Coatings. Requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce VOC emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories (SDAPCD 2015). Construction and operation of the Project would include application of architectural coatings (e.g., paint and other finishes), which are subject to SDAPCD Rule 67.0.1.

SDAPCD Regulation XII: Toxic Air Contaminants; Rule 1200: Toxic Air Contaminants – New Source Review . Requires new or modified stationary source units with the potential to emit TACs above rule threshold levels to demonstrate that they will not increase the maximum incremental cancer risk above 1 in 1 million at every receptor location, or demonstrate that toxics Best Available Control Technology will be employed if maximum incremental cancer risk is equal to or less than 10 in 1 million, or demonstrate compliance with SDAPCD's protocol for those sources with an increase in maximum incremental cancer risk at any receptor location of greater than 10 in 1 million but less than 100 in 1 million (SDAPCD 2017a).

SDAPCD Regulation XII: Toxic Air Contaminants; Rule 1210: Toxic Air Contaminant Public Health Risks – Public Notification and Risk Reduction. Requires each stationary source required to prepare a public risk assessment to provide written public notice of risks at or above the following levels: maximum incremental cancer risks equal to or greater than 10 in 1 million, cancer burden equal to or greater than 1.0, total acute non-cancer health hazard

index equal to or greater than 1.0, or total chronic non-cancer health hazard index equal to or greater than 1.0 (SDAPCD 2017b).

2.2.3.2 San Diego Association of Governments

SANDAG is the regional planning agency for the County and serves as a forum for regional issues relating to transportation, the economy, community development, and the environment. SANDAG serves as the federally designated metropolitan planning organization for the County. With respect to air quality planning and other regional issues, SANDAG has prepared *San Diego Forward: The Regional Plan* (Regional Plan) for the San Diego region (SANDAG 2015). The Regional Plan combines the big-picture vision for how the region will grow over the next 35 years with an implementation program to help make that vision a reality. The Regional Plan, including its Sustainable Communities Strategy (SCS), is built on an integrated set of public policies, strategies, and investments to maintain, manage, and improve the transportation system so that it meets the diverse needs of the San Diego region through 2050.

In regard to air quality, the Regional Plan sets the policy context in which SANDAG participates in and responds to SDAPCD's air quality plans and builds off SDAPCD's air quality plan processes that are designed to meet health-based criteria pollutant standards in several ways (SANDAG 2015). First, it complements air quality plans by providing guidance and incentives for public agencies to consider best practices that support the technology-based control measures in air quality plans. Second, the Regional Plan emphasizes the need for better coordination of land use and transportation planning, which heavily influences the emissions inventory from the transportation sectors of the economy. This also minimizes land use conflicts, such as residential development near freeways, industrial areas, or other sources of air pollution.

On September 23, 2016, SANDAG's Board of Directors adopted the final 2016 Regional Transportation Improvement Program. The 2016 Regional Transportation Improvement Program is a multi-billion dollar, multi-year program of proposed projects for major transportation projects in the San Diego region. Transportation projects funded with federal, state, and TransNet (the San Diego transportation sales tax program) must be included in an approved regional transportation improvement program. The programming of locally funded projects also may be programmed at the discretion of the agency. The 2016 Regional Transportation Improvement Program covers five fiscal years and incrementally implements the Regional Plan (SANDAG 2016).

2.2.3.3 Chula Vista General Plan

In the Environmental Element of the Chula Vista General Plan, the City outlines in Chapter 3.1.6, Promoting Clean Air, the background of air quality in the region and the following objectives and policies related to air quality (City of Chula Vista 2005):

E6: Improve local air quality and reduce greenhouse gas emissions by minimizing the release of air pollutants and toxic air contaminants and limiting the exposure of people to such pollutants.

E6A: Explore opportunities for improving indoor air quality.

E6B: Prioritize greening efforts to keep air, water, and land clean.

The following policies related to air quality are found in Section 3.1.6 of the Environmental Element in the Chula Vista General Plan:

E6.1: Encourage compact development featuring a mix of uses that locate residential areas within reasonable walking distance to jobs, services, and transit.

E6.2: Promote and facilitate transit system improvements in order to increase transit use and reduce dependency on the automobile.

E6.3: Facilitate the use of alternative fuel and low- and zero-emission vehicles and equipment in the community.

E6.4: Do not site new or re-powered fossil-fueled baseload or peaking-type Electric Generating Facilities and other major toxic emitters within 1,000 feet of sensitive receptors, or site sensitive receptors within 1,000 feet of such facilities.

E6.5: Ensure Electrical Generating Facilities incorporate cleaner fuel sources and least polluting technologies in order to help transition the City to a less fossil fuel dependent future, while meeting Chula Vista's energy demand.

E6.6: Explore incentives to promote voluntary air pollutant reductions, including incentives for developers who go above and beyond applicable requirements and for facilities and operations that are not otherwise regulated.

E6.7: Encourage innovative energy conservation practices and air quality improvements in new development and redevelopment projects consistent with the City's Air Quality Improvement Plan Guidelines or its equivalent, pursuant to the City's Growth Management Program.

E6.9: Discourage the use of landscaping equipment powered by two-stroke gasoline engines within the City and promote less-polluting alternatives to their use.

E6.10: The siting of new sensitive receivers within 500 feet of highways resulting from development or redevelopment projects shall require the preparation of a health risk assessment as part of the CEQA review of the project. Attendant health risks identified in the HRA shall be feasibly mitigated to the maximum extent practicable, in accordance with CEQA, in order to help ensure that applicable federal and state standards are not exceeded.

E6.11: Develop strategies to minimize CO hot spots that address all modes of transportation.

E6.12: Promote clean fuel sources that help reduce the exposure of sensitive uses to pollutants.

E6.13: Encourage programs and infrastructure to increase the availability and usage of energy-efficient vehicles, such as hybrid electric vehicles, electric vehicles, or those that run on alternative fuels.

E6.14: Transition the City fleet to 100% "clean" vehicles by integrating hybrid and alternative fuel vehicles as current municipal fleet vehicles are replaced.

E6.15: Site industries and other stationary emitters in a way that minimizes the potential impacts of poor air quality on homes, schools, hospitals, and other land uses where people congregate, and disadvantaged populations.

E6.16: Encourage the use of bicycles through support of bike share opportunities, community bike programs, and the provision of bicycle parking opportunities such as bike racks and bike lockers.

E6.A.1: Continue to limit exposure to secondhand smoke by encouraging the creation of smoke free spaces and facilities in public spaces, and at all workplaces and multi-unit housing.

2.3 Regional and Local Air Quality Conditions

2.3.1 San Diego Air Basin Attainment Designation

Pursuant to the 1990 federal CAA amendments, EPA classifies air basins (or portions thereof) as "attainment" or "nonattainment" for each criteria air pollutant, based on whether the NAAQS have been achieved. Generally, if the recorded concentrations of a pollutant are lower than the standard, the area is classified as "attainment" for that pollutant. If an area exceeds the standard, the area is classified as "nonattainment" for that pollutant. If there is not enough data available to determine whether the standard is exceeded in an area, the area is designated as "unclassified" or "unclassifiable." The designation of "unclassifiable/attainment" means that the area meets the standard or is expected to be meet the standard despite a lack of monitoring data. Areas that achieve the standards after a nonattainment designation are re-designated as maintenance areas and must have approved maintenance plans to ensure continued attainment of the standards. The California CAA, like its federal counterpart, called for the designation of areas as "attainment" or "nonattainment," but based on the CAAQS rather than the NAAQS. Table 2 depicts the current attainment status of the Project site with respect to the NAAQS and CAAQS. The attainment classifications for the criteria pollutants are outlined in Table 2.

Table 2. San Diego Air Basin Attainment Classification

Pollutant	Designation/Classification	
	National Standards	*State Standards*
Ozone (O_3) – 1 hour	Attainment[a]	**Nonattainment**
O_3 (8-hour – 1997) O_3 (8-hour – 2008)	Attainment (maintenance) **Nonattainment (moderate)**	**Nonattainment**
Nitrogen Dioxide (NO_2)	Unclassifiable/attainment	Attainment
Carbon Monoxide (CO)	Attainment (maintenance)	Attainment
Sulfur Dioxide (SO_2)[a]	Attainment[b]	Attainment
Coarse Particulate Matter (PM_{10})	Unclassifiable/attainment	**Nonattainment**
Fine Particulate Matter ($PM_{2.5}$)	Unclassifiable/attainment	**Nonattainment**
Lead (Pb)	Unclassifiable/attainment	Attainment
Hydrogen Sulfide	No national standard	Attainment
Sulfates	No national standard	Unclassified
Visibility-Reducing Particles	No national standard	Unclassified
Vinyl Chloride	No national standard	No designation

Sources: EPA 2016c (federal); CARB 2016c (state).

Notes: Attainment = meets the standards; attainment/maintenance = achieve the standards after a nonattainment designation; nonattainment = does not meet the standards; unclassified or unclassifiable = insufficient data to classify; unclassifiable/attainment = meets the standard or is expected to be meet the standard despite a lack of monitoring data.
If nonattainment for federal standards, a clarifying classification will be provided indicating the severity of the nonattainment status.

[a] The federal 1-hour standard of 0.12 parts per million was in effect from 1979 through June 15, 2005. The revoked standard is referenced here, because it was employed for such a long period and because this benchmark is addressed in State Implementation Plans.

[b] EPA retaining current federal standard for SO_2 (84 FR 9866–9907).

In summary, the SDAB is designated as an attainment area for the 1997 8-hour O_3 NAAQS and as a nonattainment area for the 2008 8-hour O_3 NAAQS. The SDAB is designated as a nonattainment area for O_3, PM_{10}, and $PM_{2.5}$ CAAQS. The portion of the SDAB where the Project site is located is designated as attainment or unclassifiable/unclassified for all other criteria pollutants under the NAAQS and CAAQS.

2.3.2 Local Ambient Air Quality

CARB, air districts, and other agencies monitor ambient air quality at approximately 250 air quality monitoring stations across the state. Local ambient air quality is monitored by SDAPCD. SDAPCD operates a network of ambient air monitoring stations throughout the County, which measure ambient concentrations of pollutants and determine whether the ambient air quality meets the CAAQS and the NAAQS. The nearest SDAPCD-operated monitoring station is the Chula Vista monitoring station, which is located approximately 2.5 miles northwest of the Project site. This monitoring station was used to show the background ambient air quality for O_3, PM_{10}, $PM_{2.5}$, and NO_2. The closest monitoring site that measures CO and SO_2 is the First Street monitoring station in El Cajon, which is about 6.8 miles northwest of the Project site. The most recent background ambient air quality data and numbers of days exceeding the ambient air quality standards from 2016 to 2018 are presented in Table 3.

Table 3. Local Ambient Air Quality Data

Averaging Time	Unit	Agency/ Method	Ambient Air Quality Standard	Measured Concentration by Year			Exceedances by Year		
				2016	*2017*	*2018*	*2016*	*2017*	*2018*
Ozone (O_3) – Chula Vista									
Maximum 1-hour concentration	ppm	State	0.09	0.088	0.073	0.085	0	0	0
Maximum 8-hour concentration	ppm	State	0.070	0.066	0.068	0.074	0	0	1
		Federal	0.070	0.066	0.068	0.074	0	0	1
Nitrogen Dioxide (NO_2) – Chula Vista									
Maximum 1-hour concentration	ppm	State	0.18	0.049	0.054	0.057	0	0	0
		Federal	0.100	0.049	0.054	0.057	0	0	0
Annual concentration	ppm	State	0.030	0.010	0.009	0.009	—	—	—
		Federal	0.053	0.010	0.009	0.009	—	—	—
Carbon Monoxide (CO) – El Cajon									
Maximum 1-hour concentration	ppm	State	20	—	1.6	1.5	—	0	0
		Federal	35	—	1.6	1.5	—	0	0
Maximum 8-hour concentration	ppm	State	9.0	—	1.3	1.4	—	0	0
		Federal	9	—	1.3	1.4	—	0	0

Table 3. Local Ambient Air Quality Data

Averaging Time	Unit	Agency/ Method	Ambient Air Quality Standard	Measured Concentration by Year			Exceedances by Year		
				2016	*2017*	*2018*	*2016*	*2017*	*2018*
Sulfur Dioxide (SO_2) – El Cajon									
Maximum 1-hour concentration	ppm	Federal	0.075	0.0012	0.0006	0.0010	0	0	0
Maximum 24-hour concentration	ppm	Federal	0.14	0.0004	0.0002	0.0004	0	0	0
Annual concentration	ppm	Federal	0.030	0.0001	0.0008	0.0001	0	0	0
Coarse Particulate Matter (PM_{10})[a] – Chula Vista									
Maximum 24-hour concentration	µg/m³	State	50	39.0	45.0	48.0	0.0 (0)	0.0 (0)	0.0 (0)
		Federal	150	38.0	46.0	48.0	0.0 (0)	0.0 (0)	0.0 (0)

Fine Particulate Matter ($PM_{2.5}$)[a] – Chula Vista									
Maximum 24-hour concentration	µg/m³	Federal	35	33.5	23.9	42.7	0	0	1
Annual concentration	µg/m³	State	12	8.4	8.7	9.3	0	0	0
		Federal	12.0	8.4	8.7	9.3	0	0	0

Sources: CARB 2019b; EPA 2019c.

Notes: ppm = parts per million; — = no data available; µg/m³ = micrograms per cubic meter.

Data taken from CARB's iADAM (http://www.arb.ca.gov/adam) and EPA's AirData (http://www.epa.gov/airdata/) represent the highest concentrations experienced over a given year.

Daily exceedances for particulate matter are estimated days because PM_{10} and $PM_{2.5}$ are not monitored daily. All other criteria pollutants did not exceed federal or state standards during the years shown. There is no federal standard for 1-hour O_3, annual PM_{10}, or 24-hour SO_2, nor is there a state 24-hour standard for $PM_{2.5}$.

Chula Vista monitoring station is at 80 East J Street, Chula Vista, California.

El Cajon monitoring station is at Lexington Elementary School, at 533 First Street, El Cajon, California.

[a] Measurements of PM_{10} and $PM_{2.5}$ are usually collected every 6 days and every 1 to 3 days, respectively. Number of days exceeding the standards is a mathematical estimate of the number of days concentrations would have been greater than the level of the standard had each day been monitored. The numbers in parentheses are the measured number of samples that exceeded the standard.

2.4 Significance Criteria and Methodology

2.4.1 Thresholds of Significance

The significance criteria used to evaluate the Project impacts to air quality is based on the recommendations provided in Appendix G of the CEQA Guidelines (14 CCR 15000 et seq.). For the purposes of this air quality analysis, a significant impact would occur if the Project would:

1. Conflict with or obstruct implementation of the applicable air quality plan.
2. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard.
3. Expose sensitive receptors to substantial pollutant concentrations.
4. Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

Appendix G of the CEQA Guidelines indicates that, where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied on to determine whether a project would have a significant impact on air quality.

The City evaluates Project emissions based on the quantitative emission thresholds established by the South Coast Air Quality Management District (SCAQMD). SCAQMD sets forth quantitative emission significance thresholds below which a project would not have a significant impact on ambient air quality. It should be noted that the use of these significance thresholds is conservative, as SCAQMD's significance thresholds were originally based on the South Coast Air Basin's extreme O_3 nonattainment status for the 1-hour NAAQS, whereas the SDAB was designated as an attainment area for the 1-hour NAAQS. Project-related air quality impacts estimated in this environmental analysis would be considered significant if any of the applicable significance thresholds presented in Table 4 are exceeded.

Table 4. City of Chula Vista Air Quality Significance Thresholds

Criteria Pollutants Mass Daily Thresholds		
Pollutant	*Construction (Pounds per Day)*	*Operation (Pounds per Day)*
VOCs	75	55
NO_x	100	55
CO	550	550
SO_x	150	150
PM_{10}	150	150
$PM_{2.5}$	55	55
Lead[a]	3	3

Source: SCAQMD 2019.
Notes: VOC = volatile organic compound; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter.
GHG emissions thresholds for industrial projects, as added in the March 2015 revision to the SCAQMD Air Quality Significance Thresholds, were not included in this table, as they will be addressed within the GHG emissions analysis and not the air quality study.
[a] The phaseout of leaded gasoline started in 1976. Since gasoline no longer contains lead, the Project is not anticipated to result in impacts related to lead; therefore, it is not discussed in this analysis.

The thresholds listed in Table 4 represent screening-level thresholds that can be used to evaluate whether Project-related emissions could cause a significant impact on air quality. Emissions below the screening-level thresholds would not cause a significant impact. For nonattainment pollutants, if emissions exceed the thresholds shown in Table 4, the Project could have the potential to result in a cumulatively considerable net increase in these pollutants and thus could have a significant impact on the ambient air quality.

With respect to odors, SDAPCD Rule 51 (Public Nuisance) prohibits emission of any material that causes nuisance to a considerable number of persons or endangers the comfort, health, or safety of any person. A project that proposes a use that would produce objectionable odors would be deemed to have a significant odor impact if it would affect a considerable number of off-site receptors.

2.4.2 Approach and Methodology

2.4.2.1 Construction

Emissions from the construction phase of the Project were estimated using the California Emissions Estimator Model (CalEEMod) Version 2016.3.2 (CAPCOA 2017).

For the purposes of modeling, it was assumed that construction of the Project would commence in May 2021 and would last approximately 7 years, ending in May 2028. The analysis contained herein is based on the assumptions outlined in Table 5 (duration of phases is approximate). The Project schedule was based on information provided by the Project applicant.

Table 5. Construction Phasing Assumptions

Proposed Project Construction Phase	Construction Start Month/Year	Construction End Month/Year
Site preparation	5/2021	6/2021
Grading	6/2021	2/2022
Building construction	12/2021	5/2028
Paving	3/2022	9/2022
Architectural coating	12/2021	5/2028

Notes: See Appendix A for details.

The construction equipment mix used for estimating the construction emissions of the Project was generated by CalEEMod default and is shown in Table 6. For this analysis, it was assumed that heavy construction equipment would operate 5 days a week during Project construction.

Table 6. Construction Scenario Assumptions

Construction Phase	One-Way Vehicle Trips			Equipment		
	Average Daily Worker Trips	*Average Daily Vendor Truck Trips*	*Total Haul Truck Trips*	*Equipment Type*	*Quantity*	*Usage Hours*
Site preparation	18	0	0	Tractors/loaders/ backhoes	4	8
				Rubber-tired dozers	3	8
Grading	20	0	0	Excavators	2	8
				Graders	1	8
				Rubber-tired dozers	1	8
				Scrapers	2	8
				Tractors/loaders/ backhoes	2	8
Building construction	893	223	0	Cranes	1	7
				Forklifts	3	8
				Tractors/loaders/ backhoes	3	7

Table 6. Construction Scenario Assumptions

Construction Phase	One-Way Vehicle Trips			Equipment		
	Average Daily Worker Trips	*Average Daily Vendor Truck Trips*	*Total Haul Truck Trips*	*Equipment Type*	*Quantity*	*Usage Hours*
				Generator sets	1	8
				Welders	1	8
Paving	15	0	0	Pavers	2	8
				Rollers	2	8
				Paving equipment	2	8
Architectural coating	179	0	0	Air compressors	1	6

Notes: See Appendix A for details.

Construction-worker and vendor estimates by construction phase were generated by CalEEMod. As specified by the applicant, the Project would require 1,200,000 cubic yards of balanced cut and fill.

Construction of Project components would be subject to SDAPCD Rule 55, Fugitive Dust Control. This rule requires that construction of Project components include steps to restrict visible emissions of fugitive dust beyond the property line (SDAPCD 2009b). Compliance with Rule 55 would limit fugitive dust (PM_{10} and $PM_{2.5}$) that may be generated during grading and construction activities.

The application of architectural coatings, such as exterior/interior paint and other finishes, would also produce VOC emissions; however, the contractor is required to utilize architectural coatings in compliance with the requirements of SDAPCD Rule 67.0.1, Architectural Coatings. This rule requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce VOC emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories 50 grams per liter (g/L) for interior coating, 100 g/L for exterior architectural coating, and exterior architectural coatings and 250 g/L for parking coating (SDAPCD 2015). Implementation of **PDF-AQ-2** would ensure that the Project would use no-VOC paints; therefore, 5 grams per liter VOC content was assumed for interior and exterior architectural coating, which would be lower than the VOC content requirements of SDAPCD Rule 67.0.1.

A detailed depiction of the construction schedule—including information regarding subphases and equipment used during each subphase—is included in Appendix A, California Emissions Estimator Model Output Files, of this report. The information contained in Appendix A was used as CalEEMod model inputs.

2.4.2.2 Operation

Emissions from the operational phase of the Project were estimated using CalEEMod. Operational year 2028 was assumed, following completion of construction.

Area Sources

CalEEMod was used to estimate operational emissions from area sources, including emissions from consumer product use, architectural coatings, and landscape maintenance equipment. Emissions associated with natural gas

usage in space heating and water heating are calculated in the building energy use module of CalEEMod, as described in the following text. The proposed Project would not include any wood stoves or wood-burning or natural gas fireplaces.

Consumer products are chemically formulated products used by household and institutional consumers, including detergents; cleaning compounds; polishes; floor finishes; cosmetics; personal care products; home, lawn, and garden products; disinfectants; sanitizers; aerosol paints; and automotive specialty products. Other paint products, furniture coatings, and architectural coatings are not considered consumer products (CAPCOA 2017). Consumer product VOC emissions are estimated in CalEEMod based on the floor area of buildings and on the default factor of pounds of VOC per building square foot per day. The CalEEMod default values for consumer products were assumed.

VOC off-gassing emissions result from evaporation of solvents contained in surface coatings, such as in paints and primers used during building maintenance. CalEEMod calculates the VOC evaporative emissions from the application of surface coatings based on the VOC emission factor, the building square footage, the assumed fraction of surface area, and the reapplication rate. The VOC emissions factor is based on the VOC content of the surface coatings, and SDAPCD's Rule 67.0.1 (Architectural Coatings) governs the VOC content for interior and exterior coatings. This rule requires manufacturers, distributors, and end users of architectural and industrial maintenance coatings to reduce VOC emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories (SDAPCD 2015). The model default reapplication rate of 10% of the surface area per year is assumed. Consistent with CalEEMod defaults, it is assumed that the surface area for painting equals 2.7 times the floor square footage, with 75% assumed for interior coating and 25% assumed for exterior surface coating (CAPCOA 2017). The Project would use no-VOC paints, but CalEEMod defaults were assumed for the application of architectural coatings during operation, as that would not be controlled by the Project applicant.

Landscape maintenance includes fuel combustion emissions from equipment such as lawn mowers, rototillers, shredders/grinders, blowers, trimmers, chainsaws, and hedge trimmers. The emissions associated with landscape equipment use are estimated based on CalEEMod default values for emission factors (grams per square foot of building space per day) and number of summer days (when landscape maintenance would generally be performed) and winter days. For the County, the average annual number of summer days is estimated at 180 days (CAPCOA 2017).

Energy Sources

As represented in CalEEMod, energy sources include emissions associated with building electricity and natural gas usage. Electricity use would contribute indirectly to criteria air pollutant emissions; however, the emissions from electricity use are only quantified for GHGs in CalEEMod, since criteria pollutant emissions occur at the site of the power plant, which is typically off site.

Mobile Sources

Following the completion of construction activities, the Project would generate criteria pollutant emissions from mobile sources (vehicular traffic) as a result of the employees and visitors from the Project. The daily maximum weekday trip rates and trip distances were taken from the Traffic Impact Analysis for the Project (LLG 2020). The maximum weekday trip rate and VMT from the Traffic Impact Analysis is 5,760 trips per day and 28,780, respectively. CalEEMod was used to estimate emissions from proposed vehicular sources (refer to Appendix A).

CalEEMod default data, including temperature, trip characteristics, variable start information, and emissions factors, were conservatively used for the model inputs. Project-related traffic was assumed to include a mixture of vehicles in accordance with the associated use of light-duty vehicles for the employees and visitors. Emission factors representing the vehicle mix and emissions for 2028 were conservatively used to estimate emissions associated with vehicular sources.

2.4.2.3 Landfill Health Risk Assessment

A health risk assessment (HRA) was performed to assess the potential health risks of the proximate Otay Landfill to future sensitive receptors (residents) of the Project. The following discussion summarizes the dispersion modeling and HRA methodology; supporting HRA documentation is presented in Appendix B, Health Risk Assessment Report.

The landfill operations include a diesel generator, landfill gas (LFG) flares, LFG fugitive emissions, off-road equipment, haul truck travel and idling emissions, and fugitive dust from landfill operations. The HRA was prepared using information from the *Air Toxics Health Risk Assessment for Otay Ranch Village 3 North* (SCS 2013) and the *AB 2588 Health Risk Assessment for Otay Landfill* (SCS 2016). The LFG-derived TAC emissions were estimated using SDAPCD's default emission factors, EPA's AP-42 emission factors, CARB's EMFAC2017 emission factors, and EPA's Landfill Gas Emissions Model (LandGEM), which projected future LFG generation. Additional information regarding Otay Landfill was obtained per the public records request to SDAPCD, including the landfill's permit applications, engineering evaluations, emissions calculations, and past and current permits (Gould 2020). The following discussion summarizes the dispersion modeling and HRA methodology; supporting HRA documentation, including detailed assumptions, is presented in Appendix B.

Emission sources associated with operations of the landfill, including haul vehicles, equipment, and the generator, are not expected to operate after the landfill reaches capacity, which is expected to occur on February 28, 2030 (CalRecycle 2020). LFG-derived sources are expected to continue operating over the full exposure duration.

For risk assessment purposes, PM_{10} in diesel exhaust is considered DPM, originating mainly from diesel haul trucks traveling on site, truck idling, off-road equipment, and the diesel-fueled grinder generator. Haul truck travel and idling emission rates were obtained from EMFAC2017. The LFG-derived fugitive and flare TAC emissions were identified from EPA's AP-42 (EPA 1995). The speciated suspended dust TAC emissions from haul truck travel on paved and unpaved roads on site were from the soil samples collected for the Project site. The grinder generator TAC emissions were calculated using the Otay Landfill Title V permit (Title V Permit to Operate Number 971227). The off-road diesel equipment is subject to the Regulation for In-Use Off-Road Diesel-Fueled Fleets (13 CCR 2449 et seq.), and the equipment tier standards were updated to be in compliance with the Medium Fleet Average Best Available Control Technology (BACT) Requirements (CARB 2018).

The air dispersion modeling methodology was based on generally accepted modeling practices of SDAPCD (SDAPCD 2019). Air dispersion modeling was performed using EPA's American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD) Version 19191 modeling system (computer software) with the Lakes Environmental Software implementation/user interface, AERMOD View Version 9.8.3. The HRA followed the Office of Environmental Health Hazard Assessment (OEHHA) 2015 guidelines (OEHHA 2015) and SDAPCD guidance to calculate the health risk impacts at all proximate receptors, as further discussed below. The dispersion modeling included the use of standard regulatory default options. AERMOD parameters were selected consistent with the

SDAPCD, OEHHA, and EPA guidance and identified as representative of Otay Landfill operations. Based on the landfill operation schedule of 8 hours per day, 6 days per week, the variable emission factor of 4.5 was applied to off-road equipment and the grinder generator. Based on the haul truck schedule of 11 hours per day, 6 days per week, the variable emission factor of 3.27 was applied to the haul truck movement, paved and unpaved road dust, and haul truck idling. Variable emission factors more accurately assess the concentrations only certain hours of the day using those hours of meteorological data. The averaging time reflects the time during which a receptor would be exposed. Principal parameters of this modeling are presented in Table 7.

Table 7. AERMOD Principal Parameters

Parameter	Details
Meteorological data	AERMOD-specific meteorological data for the Chula Vista air monitoring station used for the dispersion modeling was provided by SDAPCD as the most recent, available, and representative meteorological data available for the site. A 3-year meteorological data set from 2010 through 2012 was provided by SDAPCD in a preprocessed format suitable for use in AERMOD.
Urban versus rural option	Based on the land use procedure, at least 50% of the land use within the 3-kilometer radius from the Landfill site is I1 (Heavy Industrial), I2 (Light-Moderate Industrial), C1 (Commercial), R1 (Common Residential), and R2 (Compact Residential). Therefore, the Urban dispersion option was selected (EPA 2015).
Terrain characteristics	The elevation of the site is 350 feet (107 meters) above sea level.
Elevation data	Digital elevation data were imported into AERMOD and elevations were assigned to receptors and emission sources, as necessary. Digital elevation data were obtained through the AERMOD View in the U.S. Geological Survey's National Elevation Dataset format with a resolution of 1/3 degree (approximately 10 meters [33 feet]), consistent with the SDAPCD guidance (SDAPCD 2019).
Source release characterizations	Consistent with the 2013 and 2016 SCS analysis (SCS 2013, 2016) and the SDAPCD Engineering Evaluation Letter (SDAPCD 2017c), the following sources were modeled: • Flare 1 and 2 were modeled as point sources with 50-foot and 30-foot release height, respectively; 13-foot and 6-foot inside stack diameter, respectively; 1,601°F exit gas temperature; and 2.899-meter per second (m/s) (or 9.511 foot per second [f/s]) exit gas velocity. • On-site truck travel was modeled as a line of adjacent volume sources with a plume height and width of 3 meters (9.8 feet) and release height of 1.5 meters (4.9 feet). • Unpaved and paved dust from truck travel was modeled as a line of adjacent volume sources with a plume height of 5.58 meters (18.31 feet), plume width of 8.51 meters (27.92 feet), and release height of 2.55 meters (8.37 feet). • Truck idling emissions were modeled as point sources with a release height of 4 meters (13.1 feet); inside stack diameter of 0.33 feet; 442°F exit gas temperature; and 49.0 m/s (160.8 f/s) exit gas velocity. • The grinder generator was modeled as a point source with a release height from the ground at 0 meters; inside stack diameter of 0.33 feet; 1,100°F exit gas temperature; and 0.001 m/s (0.003 f/s) exit gas velocity. • Off-road equipment was modeled as a line of adjacent volume sources with a plume height and width of 2.33 meters (7.64 feet) and release height of 5 meters (16 feet). • Landfill gas fugitive emissions were modeled as an area polygon source with a release height of 0 meters and initial vertical dimension of 0 meters.

Table 7. AERMOD Principal Parameters

Parameter	Details
	• The grinder generator was modeled as a building (50 feet in length, 12 feet in width, and 13.5 feet in height) to account for the grinder generator point source being affected by building downwash.

Notes: AERMOD = American Meteorological Society/Environmental Protection Agency Regulatory Model; SDAPCD = San Diego Air Pollution Control District; EPA = U.S. Environmental Protection Agency.
See Appendix B.

Regarding receptors, a Cartesian receptor grid with 25-meter (82-foot) spacing across the proposed Project site was used to establish the impact area and evaluate locations of maximum health risk impact.

The health risk calculations were performed using the Hotspots Analysis and Reporting Program Version 2 (HARP2) Air Dispersion and Risk Tool (ADMRT, dated 19121). AERMOD was run with all sources emitting unit emissions (1 gram per second) to obtain the necessary input values for HARP2. The line of volume sources was partitioned evenly based on the 1 gram per second emission rate. The unit emission rate of 1 gram per second was divided by the area of the area source to calculate the emission rate in units of grams per second per square meter. The ground-level concentration plot files were then used to estimate the long-term cancer health risk to an individual, and the non-cancer chronic and acute health indices.

Cancer risk is defined as the increase in probability (chance) of an individual developing cancer due to exposure to a carcinogenic compound, typically expressed as the increased chances in one million. Maximum Individual Cancer Risk is the estimated probability of a maximally exposed individual potentially contracting cancer as a result of exposure to The first Project residential unit would be occupied in 2022, Project buildout would occur in 2028, and the Otay Landfill would cease operation in 2030 (CalRecycle 2020). Thus, the HRA conservatively assumes that exposure would start in the third trimester through year 8 (from 2022 to 2030) for landfill operations, and assumes that exposure wold start in the third trimester through 30 years (from 2022 to 2052) for Otay Landfill fugitive and flare sources at all future sensitive receptor locations. The mandatory minimum pathways of exposure (i.e., inhalation, soils, dermal, mother's milk, and homegrown produce) were selected for the operation-generated TAC emissions. HARP2 then assessed resulting cancer and non-cancer risk at the future receptors from exposure to TAC emissions using the Risk Management Policy-derived calculation method (OEHHA 2015).

SDAPCD has also established non-carcinogenic risk parameters for use in HRAs since some TACs increase non-cancer health risk due to long-term (chronic) exposures and some TACs increase non-cancer health risk due to short-term (acute) exposures. Non-carcinogenic risks are quantified by calculating a hazard index, expressed as the ratio between the ambient pollutant concentration and its toxicity or reference exposure level (REL), which is a concentration at or below which health effects are not likely to occur. The Chronic Hazard Index is the sum of the individual substance chronic hazard indices for all TACs affecting the same target organ system, similarly calculated for Acute Hazard Index. A hazard index less of than one (1.0) means that adverse health effects are not expected.

2.5 Impact Analysis

2.5.1 Would the project conflict with or obstruct implementation of the applicable air quality plan?

As mentioned in Section 2.2.3, Local Regulations, SDAPCD and SANDAG are responsible for developing and implementing the clean air plans for attainment and maintenance of the ambient air quality standards in the basin—specifically, the SIP and the RAQS.[3] The federal O_3 maintenance plan, which is part of the SIP, was adopted in 2012. The most recent O_3 attainment plan was adopted in 2016. The SIP includes a demonstration that current strategies and tactics will maintain acceptable air quality in the SDAB based on the NAAQS. The RAQS was initially adopted in 1991 and is updated on a triennial basis (most recently in 2016). The RAQS outlines SDAPCD's plans and control measures designed to attain the state air quality standards for O_3. The SIP and RAQS rely on information from CARB and SANDAG, including mobile and area source emissions, as well as information regarding projected growth in the County as a whole and the cities in the County, to project future emissions and determine the strategies necessary for the reduction of emissions through regulatory controls. CARB mobile source emission projections and SANDAG growth projections are based on population, vehicle trends, and land use plans developed by the County and the cities in the County as part of the development of their general plans.

If a project proposes development that is greater than that anticipated in the local plan and SANDAG's growth projections, the project might be in conflict with the SIP and the RAQS and may contribute to a potentially significant cumulative impact on air quality. The City's General Plan Land Use Element designates the Project site as Limited Industrial (LI), which is intended for light manufacturing, warehousing, certain public utilities, auto repair, auto salvage yards, and flexible-use projects that combine these uses with associated office space (City of Chula Vista 2005). Furthermore, the Project proposes to redesignate the site from Industrial Park in the Sunbow General Development Plan (City of Chula Vista 1989) and Sunbow Sectional Planning Area (SPA) Plan (City of Chula Vista 1990) to 718[4] multi-family residential units phased over approximately 7 years. The criteria air pollutant emissions associated with operation of an Industrial Park land use would be greater than those for multi-family residential units, particularly since Industrial Park land use generates more truck trips than residential land use. Thus, the proposed Project would not result in emissions that are not accounted for in the RAQs.

The proposed Project would involve development of 720 multi-family residential units but would be developed in phases: 330 multi-family residential units would be operational in 2024, 165 units would be operational in 2025, 127 units would be operational in 2026, 75 units would be operational in 2027, and 23 units would be operational in 2028. Based on SANDAG's Series 13 forecast, the interpolated persons per household ratio in 2028 is 3.224. Thus, the Project would result in 2,321.47 persons (rounded to 2,321). SANDAG Series 13 estimates the population in the City would grow from 287,173 in 2020 to 326,625 in 2035. Furthermore, SANDAG Series 13 estimates that housing would increase from 89,176 units in 2020 to 101,188 units in 2035. Thus, the addition of 330 multi-family residential units in 2024, 165 units in 2025, 127 units in 2026, 75 units in 2027, and 23 units in 2028 would provide balanced and diverse housing to the City and would provide housing to accommodate the City's future growth projections. Therefore, the proposed Project would not stimulate population growth or a population concentration or housing above

[3] For the purpose of this discussion, the relevant federal air quality plan is the 2016 8-Hour O_3 Attainment Plan (SDAPCD 2016a). The RAQS is the applicable plan for purposes of state air quality planning. Both plans reflect growth projections in the SDAB.

[4] Note that this analysis assumed 720 proposed residential units for a conservative analysis.

what is assumed in local and regional land use plans, or projections made by regional planning authorities. Thus, impacts would be considered **less than significant**.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

Impacts resulting from the proposed Project would be less than significant.

2.5.2 Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is nonattainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?

Air pollution is largely a cumulative impact. The nonattainment status of regional pollutants is a result of past and present development, and the SDAPCD develops and implements plans for future attainment of ambient air quality standards. Based on these considerations, project-level thresholds of significance for criteria pollutants are relevant in the determination of whether a project's individual emissions would have a cumulatively significant impact on air quality. As described in this section, the Project would have a less-than-significant impact for short-term construction and long-term operations.

The SDAB is a nonattainment area for O_3 under the NAAQS and CAAQS. The poor air quality in the SDAB is the result of cumulative emissions from motor vehicles, off-road equipment, commercial and industrial facilities, and other emission sources. Projects that emit these pollutants or their precursors (i.e., VOCs and NO_x for O_3) potentially contribute to poor air quality. In analyzing cumulative impacts from a project, the analysis must specifically evaluate the project's contribution to the cumulative increase in pollutants for which the SDAB is designated as nonattainment for the CAAQS and NAAQS. However, a project would only be considered to have a significant cumulative impact if the project's contribution accounts for a significant proportion of the cumulative total emissions (i.e., it represents a "cumulatively considerable contribution" to the cumulative air quality impact).

Additionally, for the SDAB, the RAQS serves as the long-term regional air quality planning document for the purpose of assessing cumulative operational emissions in the SDAB to ensure that the SDAB continues to make progress toward NAAQS and CAAQS attainment status. As such, cumulative projects located in the San Diego region would have the potential to result in a cumulative impact to air quality if, in combination, they would conflict with or obstruct implementation of the RAQS. Similarly, individual projects that are inconsistent with the regional planning documents on which the RAQS is based would have the potential to result in cumulative operational impacts if they represent development and population increases beyond regional projections.

The SDAB has been designated as a federal nonattainment area for O_3 and a state nonattainment area for O_3, PM_{10}, and $PM_{2.5}$. The nonattainment status is the result of cumulative emissions from all sources of these air pollutants and their precursors within the SDAB. As discussed previously, the Project would not exceed significance

thresholds during construction or operation. As such, the Project would result in less-than-significant impacts to air quality relative to emissions.

Construction of the Project would result in the temporary addition of pollutants to the local airshed caused by on-site sources (i.e., off-road construction equipment, soil disturbance, and VOC off-gassing) and off-site sources (worker vehicle trips). Construction emissions can vary substantially day to day, depending on the level of activity, the specific type of operation, and for dust, the prevailing weather conditions.

Criteria air pollutant emissions associated with construction activity were quantified using CalEEMod. Default values provided by the CalEEMod were used where detailed Project information was not available. A detailed depiction of the construction schedule—including information regarding phasing, equipment used during each phase, haul trucks, vendor trucks, and worker vehicles—is included in Section 2.4.2.1, Construction. The information contained in Appendix A was used as CalEEMod inputs.

Implementation of the Project would generate air pollutant emissions from entrained dust, off-road equipment, vehicle emissions, and asphalt pavement application. Entrained dust results from the exposure of earth surfaces to wind from the direct disturbance and movement of soil, resulting in PM_{10} and $PM_{2.5}$ emissions. The Project is subject to SDAPCD Rule 55, Fugitive Dust Control (SDAPCD 2009b). This rule requires that the Project take steps to restrict visible emissions of fugitive dust beyond the property line. Compliance with Rule 55 would limit fugitive dust (PM_{10} and $PM_{2.5}$) generated during grading and construction activities. To account for dust control measures in the calculations, it was assumed that the active sites would be watered at least three times daily, resulting in an approximately 61% reduction of particulate matter (SCAQMD 2007).

Exhaust from internal combustion engines used by construction equipment and worker vehicles would result in emissions of VOCs, NO_x, CO, SO_x, PM_{10}, and $PM_{2.5}$. The application of asphalt pavement and architectural coatings would also produce VOC emissions.

Table 8 shows the estimated maximum daily construction emissions associated with construction of the Project without mitigation. Complete details of the emissions calculations are provided in Appendix A of this document.

Table 8. Estimated Maximum Daily Construction Criteria Air Pollutant Emissions

	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
Year	*Pounds per Day*					
2021	11.72	90.76	84.02	0.24	16.53	9.77
2022	10.68	79.77	79.63	0.24	16.01	6.77
2023	6.48	34.76	47.64	0.16	11.17	3.57
2024	6.17	33.31	45.80	0.16	11.07	3.48
2025	5.88	31.86	44.11	0.16	10.97	3.39
2026	5.73	31.50	42.77	0.15	10.97	3.39
2027	5.59	31.16	41.58	0.15	10.97	3.38
2028	5.43	30.87	40.57	0.15	10.96	3.38

Table 8. Estimated Maximum Daily Construction Criteria Air Pollutant Emissions

Year	VOC	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
	Pounds per Day					
Maximum Daily Emissions	**11.72**	**90.76**	**84.02**	**0.24**	**16.53**	**9.77**
Chula Vista Threshold	*75*	*100*	*550*	*150*	*150*	*55*
Threshold Exceeded?	**No**	**No**	**No**	**No**	**No**	**No**

Notes: VOC = volatile organic compound; NO_x = oxides of nitrogen; CO = carbon monoxide; SO_x = sulfur oxides; PM_{10} = coarse particulate matter; $PM_{2.5}$ = fine particulate matter.
See Appendix A for complete results.
The values shown are the maximum summer or winter daily emissions results from CalEEMod. Although not considered mitigation, these emissions reflect CalEEMod "mitigated" output, which accounts for the required compliance with SDAPCD Rule 55 (Fugitive Dust Control) and use of no-VOC architectural coatings.

As shown in Table 8, daily construction emissions would not exceed the City's significance thresholds. Therefore, impacts during construction would be less than significant.

Operation of the Project would generate VOC, NO_x, CO, SO_x, PM_{10}, and $PM_{2.5}$ emissions from mobile sources, including vehicle trips; area sources, including the use of consumer products and landscape maintenance equipment; and energy sources. As discussed in Section 2.4.2.2, Operation, pollutant emissions associated with long-term operations were quantified using CalEEMod. Project-generated mobile source emissions were estimated in CalEEMod based on Project-specific trip rates. CalEEMod default values were used to estimate emissions from the Project area and energy sources.

Table 9 presents the maximum daily area, energy, and mobile source emissions associated with operation (year 2028) of the Project. The values shown are the maximum summer or winter daily emissions results from CalEEMod. Details of the emission calculations are provided in Appendix A.

Table 9. Estimated Maximum Daily Operational Criteria Air Pollutant Emissions

See Appendix A for complete results.
Columns may not total precisely due to rounding.
The values shown are the maximum summer or winter daily emissions results from CalEEMod. These emissions reflect CalEEMod "mitigated" output, which accounts for compliance with Rule 67.0.1 (Architectural Coatings).

As shown in Table 9, the combined daily area, energy, and mobile source emissions would not exceed the City's operational thresholds for VOC, NO_x, CO, SO_x, PM_{10}, and $PM_{2.5}$. Regarding long-term cumulative operational emissions in relation to consistency with local air quality plans, the SIP and RAQS serve as the primary air quality

planning documents for the state and SDAB, respectively. The SIP and RAQS rely on SANDAG growth projections based on population, vehicle trends, and land use plans developed by the cities and the County as part of the development of their general plans. Therefore, projects that propose development that is consistent with the growth anticipated by local plans would be consistent with the SIP and RAQS and would not be considered to result in cumulatively considerable impacts from operational emissions. As stated previously, the Project site is designated as Industrial Park in the Sunbow General Development Plan (City of Chula Vista 1989 and Sunbow SPA Plan (City of Chula Vista 1990)). However, the criteria air pollutant emissions associated with operation of an Industrial Park land use would be greater than those for multi-family residential units, particularly since Industrial Park land use generates more truck trips than residential land use. Furthermore, the 720 multi-family residential uses would provide balanced and diverse housing to the City and would provide housing to accommodate the City's future growth projections. As a result, the Project would not result in a cumulatively considerable contribution to regional O_3 concentrations or other criteria pollutant emissions. Impacts associated with Project-generated operational criteria air pollutant emissions would be **less than significant**.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

The Project would have a less-than-significant impact.

2.5.3 Would the project expose sensitive receptors to substantial pollutant concentrations?

Air quality varies as a direct function of the amount of pollutants emitted into the atmosphere, the size and topography of the air basin, and the prevailing meteorological conditions. Air quality problems arise when the rate of pollutant emissions exceeds the rate of dispersion. Reduced visibility, eye irritation, and adverse health impacts on those persons termed "sensitive receptors" are the most serious hazards of existing air quality conditions in the area. Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. People most likely to be affected by air pollution, as identified by CARB, include children, elderly people, athletes, and people with cardiovascular and chronic respiratory diseases. As such, sensitive receptors include residences, schools, playgrounds, childcare centers, athletic facilities, long-term healthcare facilities, rehabilitation centers, convalescent centers, and retirement homes. The closest sensitive receptors to the Project site are existing residences adjacent to the western and northern property boundaries. The Project would also introduce new on-site sensitive receptors to the area.

Health Impacts of Toxic Air Contaminants

"Incremental cancer risk" is the net increased likelihood that a person continuously exposed to concentrations of TACs resulting from a project over a 9-, 30-, and 70-year exposure period would contract cancer based on the use of standard OEHHA risk-assessment methodology (OEHHA 2015). In addition, some TACs have non-carcinogenic effects. TACs that would potentially be emitted during construction activities would be DPM emitted from heavy-duty construction equipment and heavy-duty trucks. Heavy-duty construction equipment and diesel trucks are subject to CARB ATCMs to reduce DPM emissions. According to the OEHHA, HRAs should be based on a 30-year exposure

duration based on typical residency period; however, such assessments should be limited to the period/duration of activities associated with the project (OEHHA 2015). Thus, the duration of proposed construction activities (approximately 7 years) would only constitute a small percentage of the total long-term exposure period and would not result in exposure of proximate sensitive receptors to substantial TACs. Furthermore, the closest sensitive receptors to the proposed Project site are existing residences located 1,040 feet north of the Project site. The heavy-duty construction equipment is subject to a CARB ATCM for in-use diesel construction equipment to reduce diesel particulate emissions, and diesel trucks are subject to a CARB ATCM that limits idling of equipment and trucks during loading and unloading to 5 minutes and requires that electric auxiliary power units be used whenever possible. Also, construction equipment are subject to CARB In-Use Off-Road Diesel Regulation that requires specific fleet average requirements be met for particulate matter emissions, and apply Best Available Control Technology requirements. The future sensitive receptors of the Project would be exposed to the proposed construction activities from each phase of the Project. The duration of construction for each phase of the Project would be approximately 7 year and would therefore constitute only a small percentage of the total long-term exposure period and would not result in exposure of future sensitive receptors of the Project.

As required by Policy E 6.10 in the City's General Plan Environmental Element (City of Chula Vista 2005), the siting of new sensitive receivers within 500 feet of highways resulting from development or redevelopment projects shall require the preparation of an HRA as part of the CEQA review of the project. The Project residences would be located approximately 4,600 feet from Interstate 805 (I-805); therefore, the Project is not subject to this requirement. Impacts would be **less than significant**.

Landfill Health Risk

As discussed in Section 2.4.2.3, Landfill Health Risk Assessment, for informational purposes only, an HRA was performed to estimate the Maximum Individual Cancer Risk, the Chronic Hazard Index, and the Acute Hazard Index for the residential receptors as a result of emissions impacts from the Otay Landfill operation on future sensitive receptors of the Project. As required by the 2019 Title 24 Building Code and the 2019 California Green Building Standards Code (CALGreen) standards, the Project would install MERV 13-rated air filtration on all HVAC systems able to achieve a 90% reduction in particulate matter[5]. EPA conducted the National Human Activity Pattern Survey (NHAPS) to study where people spend their time. The results of the NHAPS showed that on average, people spend 87% of their time in enclosed buildings and 6% of their time in enclosed vehicles (Kleipeis et al. 2001). This assessment of risk includes accounting for time spent indoors (87% of the time) as identified in the NHAPS and time spent away from home as recommended by OEHHA (OEHHA 2015). Accounting for the actual time spent indoors and exposure related to the residents of the Project provides a more realistic exposure scenario from TAC emissions from the Otay Landfill operation. Results of the Landfill HRA are presented in Table 10.

Table 10. Landfill Health Risk Assessment Results – Unmitigated

Impact Parameter	Units	Project Impact	CEQA Threshold	Level of Significance
Maximum Individual Cancer Risk – Residential	Per million	7.70	10	Less than significant
Chronic Hazard Index – Residential	Index value	0.244	1.0	Less than significant
Acute Hazard Index – Residential	Index value	0.080	1.0	Less than significant

Source: SDAPCD 2019.
Notes: CEQA = California Environmental Quality Act.

[5] EPA reported that the MERV 13 filters remove 90% of particles ranging from 1 to 10 microns (EPA 2019a).

See Appendix B.

As shown in Table 10, the landfill operation would result in a Residential Maximum Individual Cancer Risk of 7.70 in 1 million, which would be less than the significance threshold of 10 in 1 million. Landfill operation would result in a Residential Chronic Hazard Index and Acute Hazard Index of 0.244 and 0.080, respectively, which are below the 1.0 significance threshold. These impact levels would be less than the SDAPCD significance threshold. Furthermore, following closure of the Otay Landfill in 2030, the cancer risk impact from LFG fugitive and flare emissions would be reduced to 6.61 in 1 million. In addition, chronic health risk and acute health risk would also be further reduced. As such, impacts would be **less than significant**.

Health Impacts of Carbon Monoxide

Mobile-source impacts occur on two basic scales of motion. Regionally, Project-related travel will add to regional trip generation and increase the vehicle miles traveled within the local airshed and the SDAB. Locally, Project traffic will be added to the City's roadway system. If such traffic occurs during periods of poor atmospheric ventilation, consists of a large number of vehicles cold-started and operating at pollution-inefficient speeds, and operates on roadways already crowded with non-Project traffic, there is a potential for the formation of microscale CO hotspots in the area immediately around points of congested traffic. Because of continued improvement in mobile emissions at a rate faster than the rate of vehicle growth and/or congestion, the potential for CO hotspots in the SDAB is steadily decreasing.

Projects contributing to adverse traffic impacts may result in the formation of CO hotspots. To verify that the Project would not cause or contribute to a violation of the CO standard, a screening evaluation of the potential for CO hotspots was conducted. A Traffic Impact Analysis evaluated the level of service (LOS) (i.e., increased congestion) impacts at intersections affected by the Project (LLG 2020). The potential for CO hotspots was evaluated based on the results of the traffic report. As the City does not have CO hotspot guidelines, the County of San Diego's Guidelines (County of San Diego 2007) CO hotspot screening guidance was followed to determine whether the Project would require a site-specific hotspot analysis. The County recommends that a quantitative analysis of CO hotspots be performed for intersections that are operating at or below an LOS of E and that have peak-hour trips exceeding 3,000 trips.

The Traffic Impact Analysis prepared for the Project (LLG 2020) analyzed Existing and Existing Plus Cumulative Projects Plus Project Near Term (2024) for nine existing intersections near the Project site. The results of the LOS assessment show that under Existing Plus Project conditions, two of the nine study intersections are forecast to operate at unacceptable LOS (LOS E or worse) during the peak hours, with a volume more than 3,000 trips. As shown in Appendix C, CO Hotspot Analysis, the two key study intersections according to the criteria above are (1) Olympic Parkway and I-805 Southbound Ramps (LOS F in PM peak hours) and (2) Olympic Parkway and I-805 Northbound Ramps (LOS F in AM peak hours). The remaining key intersections are projected to operate at acceptable LOS conditions in the Existing Plus Project scenario.

The screening evaluation presents LOS and whether a quantitative CO hotspots analysis may be required. According to the Caltrans CO Protocol (2010), there is a cap on the number of intersections that need to be analyzed for any one project. For a single project with multiple intersections, only the three intersections representing the worst LOS ratings of the project, and, to the extent they are different intersections, the three intersections representing the highest traffic volumes, need be analyzed. For each intersection failing a screening test as described in the CO Protocol, an additional intersection should be analyzed (Caltrans 2010).

Based on the CO hotspot screening evaluation (Appendix C), both failing intersections have 10 links and are signal-controlled intersections. The potential impact of the Project on local CO levels was assessed at these intersections with the Caltrans CL4 interface based on the California LINE Source Dispersion Model (CALINE4), which allows microscale CO concentrations to be estimated along each roadway corridor or near intersections (Caltrans 1998a).

The emissions factor represents the weighted average emissions rate of the local County vehicle fleet expressed in grams per mile per vehicle. Consistent with the traffic scenario, emissions factors for 2024, which is more conservative than the operational year 2028, were used. Emissions factors were predicted by EMFAC2017 based on a 5-mile-per-hour average speed for all of the intersections for approach and departure segments. The hourly traffic volume anticipated to travel on each link, in units of vehicles per hour, was based on information provided by the traffic consultant (LLG 2020) and modeling assumptions are outlined in Appendix C.

Four receptor locations were modeled at each intersection to determine CO ambient concentrations. A receptor was assumed on the sidewalk at each corner of the modeled intersections, to represent the future possibility of extended outdoor exposure. CO concentrations were modeled at these locations to assess the maximum potential CO exposure that could occur in 2024. A receptor height of 5.9 feet (1.8 meters) was used in accordance with Caltrans recommendations for all receptor locations (Caltrans 1998b).

The highest 1-hour measurement in the last 3 years was used as the projected future 1-hour CO background concentration for the analysis. A CO concentration of 1.6 parts per million by volume (ppm) was recorded in 2017 for the El Cajon monitoring station in San Diego and was assumed in CALINE4 for 2024 (EPA 2019c). To estimate an 8-hour average CO concentration, a persistence factor of 0.70 was applied to the output values of predicted concentrations in ppm at each of the receptor locations. Model input and output data are available in Appendix C.

The maximum CO concentration predicted for the 1-hour averaging period at the studied intersections would be 1.7 ppm, which is below the 1-hour CO CAAQS of 20 ppm (CARB 2014a). The maximum predicted 8-hour CO concentration of 1.37 ppm at the studied intersections would be below the 8-hour CO CAAQS of 9.0 ppm (CARB 2016b). Neither the 1-hour nor the 8-hour CAAQS would be equaled or exceeded at any of the intersections studied. Accordingly, the Project would not cause or contribute to violations of the CAAQS and would not result in exposure of sensitive receptors to localized high concentrations of CO. CO tends to be a localized impact associated with congested intersections. Therefore, the Project's CO emissions would not contribute to significant health effects associated with this pollutant. As such, Project operation would result in a **less-than-significant** impact to air quality with regard to potential CO hotspots.

Health Impacts of Other Criteria Air Pollutants

Construction and operation of the Project would not result in emissions that exceed the City's emission thresholds for any criteria air pollutants.

Some VOCs are associated with motor vehicles and construction equipment, while others are associated with architectural coatings, the emissions of which would not result in the exceedances of the SDAPCD's thresholds. Generally, the VOCs in architectural coatings are of relatively low toxicity. Additionally, SDAPCD Rule 67.0.1 restricts the VOC content of coatings for both construction and operational applications. Furthermore, with implementation of **PDF-AQ-2**, the Project would use no-VOC paints.

In addition, VOCs and NO_x are precursors to O_3, for which the SDAB is designated as nonattainment with respect to the NAAQS and CAAQS (the SDAB is designated by EPA as an attainment area for the 1-hour O_3 NAAQS and the 1997 8-hour NAAQS). The health effects associated with O_3, as discussed in Section 2.1.2, Pollutants and Effects, are generally associated with reduced lung function. The contribution of VOCs and NO_x to regional ambient O_3 concentrations is the result of complex photochemistry. The increases in O_3 concentrations in the SDAB due to O_3 precursor emissions tend to be found downwind from the source location to allow time for the photochemical reactions to occur. However, the potential for exacerbating excessive O_3 concentrations would also depend on the time of year that the VOC emissions would occur, because exceedances of the O_3 NAAQS and CAAQS tend to occur between April and October when solar radiation is highest.

The holistic effect of a single project's emissions of O_3 precursors is speculative due to the lack of quantitative methods to assess this impact. Nonetheless, the VOC and NO_x emissions associated with Project construction and operations could minimally contribute to regional O_3 concentrations and the associated health impacts. Due to the minimal contribution during construction and operation, as well as the existing good air quality in coastal San Diego areas, health impacts would be considered less than significant.

Regarding NO_2, according to the construction emissions analysis, construction of the proposed Project would not contribute to exceedances of the NAAQS and CAAQS for NO_2. As described in Section 2.1.2, NO_2 and NO_x health impacts are associated with respiratory irritation, which may be experienced by nearby receptors during the periods of heaviest use of off-road construction equipment. However, these construction activities would be relatively short term. Additionally, off-road construction equipment would operate at various portions of the site and would not be concentrated in one portion of the site at any one time. Construction of the proposed Project would not require any stationary emission sources that would create substantial localized NO_x impacts. Therefore, health impacts would be considered less than significant.

The VOC and NO_x emissions, as described previously, would minimally contribute to regional O_3 concentrations and its associated health effects. In addition to O_3, NO_x emissions would not contribute to potential exceedances of the NAAQS and CAAQS for NO_2. As shown in Table 3, the existing NO_2 concentrations in the area are well below the NAAQS and CAAQS standards. Thus, it is not expected that the Project's operational NO_x emissions would result in exceedances of the NO_2 standards or contribute to the associated health effects. CO tends to be a localized impact associated with congested intersections. The associated CO hotspots were discussed previously as a less-than-significant impact. Thus, the proposed Project's CO emissions would not contribute to significant health effects associated with this pollutant. PM_{10} and $PM_{2.5}$ emissions from the proposed Project would not contribute to potential exceedances of the NAAQS and CAAQS for particulate matter, would not obstruct the SDAB from coming into attainment for these pollutants, and would not contribute to significant health effects associated with particulates.

Based on the preceding considerations, health impacts associated with criteria air pollutants would be considered **less than significant**.

Valley Fever Exposure

As discussed in Section 2.1.2, valley fever is not highly endemic to San Diego, and within the County, the incidence rate in the Project area is below the County average and the statewide average. Construction of the Project would incorporate **PDF-AQ-1** and comply with SDAPCD Rule 55, which limits the amount of fugitive dust generated during construction. Strategies the Project would implement to comply with SDAPCD Rule 55 and control dust include

watering three times per day, using magnesium chloride for dust suppression on unpaved roads, and limiting speed on unpaved roads to 15 miles per hour.

Based on the low incidence rate of coccidioidomycosis in the County and the Project's implementation of dust control strategies, it is not anticipated that earthmoving activities during Project construction would result in exposure of nearby sensitive receptors to valley fever. Therefore, the Project would have a **less-than-significant** impact with respect to valley fever exposure for sensitive receptors.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

The Project would have a less-than-significant impact.

2.5.4 Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

The State of California Health and Safety Code, Division 26, Part 4, Chapter 3, Section 41700 and SDAPCD Rule 51, commonly referred to as public nuisance law, prohibits emissions from any source whatsoever in such quantities of air contaminants or other material that cause injury, detriment, nuisance, or annoyance to the public health or damage to property. Projects required to obtain permits from SDAPCD are evaluated by SDAPCD staff for potential odor nuisance, and conditions may be applied (or control equipment required) where necessary to prevent occurrence of public nuisance.

Section 19.66.090, Odors, of the Chula Vista Municipal Code requires that no emission shall be permitted of odorous gases or other odorous matter in such quantities as to be readily detectable at the points of measurement specified in Chula Vista Municipal Code 19.66.060(A). Any process that may involve the creation or emission of any odors shall be provided with an adequate secondary safeguard system of control, so that control will be maintained if the primary safeguard system should fail (City of Chula Vista 1969). SDAPCD Rule 51 (Public Nuisance) also prohibits emission of any material that causes nuisance to a considerable number of persons or endangers the comfort, health, or safety of any person. A project that proposes a use that would produce objectionable odors would be deemed to have a significant odor impact if it would affect a considerable number of off-site receptors. Odor issues are very subjective by the nature of odors themselves and due to the fact that their measurements are difficult to quantify. As a result, this guideline is qualitative and will focus on the existing and potential surrounding uses and the location of sensitive receptors.

The occurrence and severity of potential odor impacts depends on numerous factors: the nature, frequency, and intensity of the source; the wind speeds and direction; and the sensitivity of receiving location each contribute to the intensity of the impact. Although offensive odors seldom cause physical harm, they can be annoying, cause distress among the public, and generate citizen complaints.

Odors would be potentially generated from vehicles and equipment exhaust emissions during construction of the Project. Potential odors produced during construction would be attributable to concentrations of unburned

hydrocarbons from tailpipes of construction equipment, architectural coatings, and asphalt pavement application. Such odors would disperse rapidly from the Project site and generally would occur at magnitudes that would not affect substantial numbers of people. Therefore, impacts associated with odors during construction would be less than significant.

A nuisance analysis was prepared for the Project to evaluate the potential impacts of odors and fugitive dust emitted from the Otay Landfill on future residents of the Project. AERMOD was used to model odor and dust emissions from the landfill, with methodology consistent with that of the HRA (Appendix B) prepared as described in Section 2.4.2.3. The complete nuisance analysis is provided in Appendix D. The nuisance analysis showed that future residents of the Project would not experience odors in excess of the odor detection threshold and are not likely to be impacted by the landfill operations. Similarly, the dust analysis showed that concentrations of dust from landfill operations would not exceed thresholds established by the California Occupational Health and Safety Administration. As such, impacts from odor and dust to future residents from landfill operations would be less than significant.

Land uses and industrial operations associated with odor complaints include agricultural uses, wastewater treatment plants, food-processing plants, chemical plants, composting, refineries, landfills, dairies, and fiberglass molding facilities (SCAQMD 1993). The Project does not include any of the land uses typically associated with odor complaints. Therefore, Project operations would result in an odor impact that would be **less than significant**.

Mitigation Measures

No mitigation is required.

Level of Significance After Mitigation

The Project would have a less-than-significant impact.

INTENTIONALLY LEFT BLANK

3 Greenhouse Gas Emissions

3.1 Environmental Setting

3.1.1 Climate Change Overview

Climate change refers to any significant change in measures of climate, such as temperature, precipitation, or wind patterns, lasting for an extended period (decades or longer). The Earth's temperature depends on the balance between energy entering and leaving the planet's system. Many factors, both natural and human, can cause changes in Earth's energy balance, including variations in the Sun's energy reaching Earth, changes in the reflectivity of Earth's atmosphere and surface, and changes in the greenhouse effect, which affects the amount of heat retained by Earth's atmosphere (EPA 2017).

The greenhouse effect is the trapping and buildup of heat in the atmosphere near the Earth's surface (the troposphere). The greenhouse effect traps heat in the troposphere through a threefold process as follows: short-wave radiation emitted by the Sun is absorbed by the Earth; the Earth emits a portion of this energy in the form of long-wave radiation; and GHGs in the upper atmosphere absorb this long-wave radiation and emit it into space and toward the Earth. The greenhouse effect is a natural process that contributes to regulating the Earth's temperature and creates a pleasant, livable environment on the Earth. Human activities that emit additional GHGs to the atmosphere increase the amount of infrared radiation that gets absorbed before escaping into space, thus contributing substantially to the greenhouse effect and causing the Earth's surface temperature to rise.

The scientific record of the Earth's climate shows that the climate system varies naturally over a wide range of time scales and that, in general, climate changes prior to the Industrial Revolution in the 1700s can be explained by natural causes, such as changes in solar energy, volcanic eruptions, and natural changes in GHG concentrations. Recent climate changes, in particular the warming observed over the past century, however, cannot be explained by natural causes alone. Rather, it is extremely likely that human activities have been the dominant cause of that warming since the mid-20th century and that they are the most significant driver of observed climate change (IPCC 2013; EPA 2017). Human influence on the climate system is evident from the increasing GHG concentrations in the atmosphere, positive radiative forcing, observed warming, and improved understanding of the climate system (IPCC 2013). The atmospheric concentrations of GHGs have increased to levels unprecedented in the last 800,000 years, primarily from fossil fuel emissions and secondarily from emissions associated with land use changes (IPCC 2013). Continued emissions of GHGs will cause further warming and changes in all components of the climate system, which is discussed further in Section 3.3.2, Potential Effects of Climate Change.

3.1.2 Greenhouse Gases

A GHG is any gas that absorbs infrared radiation in the atmosphere; in other words, GHGs trap heat in the atmosphere. GHGs include, but are not limited to, carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), O_3, water vapor, hydrofluorocarbons (HFCs), hydrochlorofluorocarbons (HCFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6).[6] Some GHGs, such as CO_2, CH_4, and N_2O, occur naturally and are emitted to the atmosphere

[6] California Health and Safety Code 38505 identifies seven GHGs that CARB is responsible for monitoring and regulating to reduce emissions: CO_2, CH_4, N_2O, SF_6, HFCs, PFCs, and nitrogen trifluoride (NF_3).

through natural processes and human activities. Of these gases, CO_2 and CH_4 are emitted in the greatest quantities from human activities. Manufactured GHGs, which have a much greater heat-absorption potential than CO_2, include fluorinated gases, such as HFCs, HCFCs, PFCs, and SF_6, which are associated with certain industrial products and processes. A summary of the most common GHGs and their sources is included in the following text.[7] Also included is a discussion of other climate-forcing substances.

Carbon Dioxide. CO_2 is a naturally occurring gas and a by-product of human activities and is the principal anthropogenic GHG that affects the Earth's radiative balance. Natural sources of CO_2 include respiration of bacteria, plants, animals, and fungus; evaporation from oceans; volcanic out-gassing; and decomposition of dead organic matter. Human activities that generate CO_2 involve the combustion of fuels, such as coal, oil, natural gas, and wood, and changes in land use.

Methane. CH_4 is produced through both natural and human activities. CH_4 is a flammable gas and is the main component of natural gas. CH_4 is produced through anaerobic (without oxygen) decomposition of waste in landfills, flooded rice fields, animal digestion, decomposition of animal wastes, production and distribution of natural gas and petroleum, coal production, and incomplete fossil fuel combustion.

Nitrous Oxide. N_2O is produced through natural and human activities, mainly through agricultural activities and natural biological processes, although fuel burning and other processes also create N_2O. Sources of N_2O include soil cultivation practices (microbial processes in soil and water), especially the use of commercial and organic fertilizers, manure management, industrial processes (such as in nitric acid production, nylon production, and fossil-fuel-fired power plants), vehicle emissions, and using N_2O as a propellant (such as in rockets, race cars, and aerosol sprays).

Fluorinated Gases. Fluorinated gases (also referred to as F-gases) are synthetic, powerful GHGs emitted from many industrial processes. Fluorinated gases are commonly used as substitutes for stratospheric O_3-depleting substances (e.g., chlorofluorocarbons [CFCs], HCFCs, and halons). The most prevalent fluorinated gases include the following:

- **Hydrofluorocarbons:** HFCs are compounds containing only hydrogen, fluorine, and carbon atoms. HFCs are synthetic chemicals used as alternatives to O_3-depleting substances in serving many industrial, commercial, and personal needs. HFCs are emitted as byproducts of industrial processes and are used in manufacturing.
- **Perfluorocarbons:** PFCs are a group of human-made chemicals composed of carbon and fluorine only. These chemicals were introduced as alternatives, with HFCs, to the O_3-depleting substances. The two main sources of PFCs are primary aluminum production and semiconductor manufacturing. Since PFCs have stable molecular structures and do not break down through the chemical processes in the lower atmosphere, these chemicals have long lifetimes, ranging between 10,000 and 50,000 years.
- **Sulfur Hexafluoride:** SF_6 is a colorless gas soluble in alcohol and ether and slightly soluble in water. SF_6 is used for insulation in electric power transmission and distribution equipment, semiconductor manufacturing, the magnesium industry, and as a tracer gas for leak detection.

[7] The descriptions of GHGs are summarized from the IPCC Second Assessment Report (1995), IPCC Fourth Assessment Report (2007), CARB's Glossary of Terms Used in GHG Inventories (2015), and EPA's Glossary of Climate Change Terms (2016e).

- **Nitrogen Trifluoride:** NF_3 is used in the manufacture of a variety of electronics, including semiconductors, and flat panel displays.

Chlorofluorocarbons. CFCs are synthetic chemicals that have been used as cleaning solvents, refrigerants, and aerosol propellants. CFCs are chemically unreactive in the lower atmosphere (troposphere), and the production of CFCs was prohibited in 1987 due to the chemical destruction of stratospheric O_3.

Hydrochlorofluorocarbons. HCFCs are a large group of compounds with a structure very close to that of CFCs—containing hydrogen, fluorine, chlorine, and carbon atoms—but including one or more hydrogen atoms. Like HFCs, HCFCs are used in refrigerants and propellants. HCFCs were also used in place of CFCs for some applications; however, their use in general is being phased out.

Black Carbon. Black carbon is a component of fine particulate matter ($PM_{2.5}$), which has been identified as a leading environmental risk factor for premature death. It is produced from the incomplete combustion of fossil fuels and biomass burning, particularly from older diesel engines and forest fires. Black carbon warms the atmosphere by absorbing solar radiation, influences cloud formation, and darkens the surface of snow and ice, which accelerates heat absorption and melting. Black carbon is a short-lived species that varies spatially, which makes it difficult to quantify the global warming potential (GWP). DPM emissions are a major source of black carbon and are TACs that have been regulated and controlled in California for several decades to protect public health. In relation to declining DPM from CARB's regulations pertaining to diesel engines, diesel fuels, and burning activities, CARB estimates that annual black carbon emissions in California have reduced by 70% between 1990 and 2010, with 95% control expected by 2020 (CARB 2014a).

Water Vapor. The primary source of water vapor is evaporation from the ocean, with additional vapor generated by sublimation (change from solid to gas) from ice and snow, evaporation from other water bodies, and transpiration from plant leaves. Water vapor is the most important, abundant, and variable GHG in the atmosphere and maintains a climate necessary for life.

Ozone. Tropospheric O_3, which is created by photochemical reactions involving gases from both natural sources and human activities, acts as a GHG. Stratospheric O_3, which is created by the interaction between solar ultraviolet radiation and molecular oxygen (O_2), plays a decisive role in the stratospheric radiative balance. Depletion of stratospheric O_3, due to chemical reactions that may be enhanced by climate change, results in an increased ground-level flux of ultraviolet-B radiation.

Aerosols. Aerosols are suspensions of particulate matter in a gas emitted into the air through burning biomass (plant material) and fossil fuels. Aerosols can warm the atmosphere by absorbing and emitting heat and can cool the atmosphere by reflecting light.

3.1.3 Global Warming Potential

Gases in the atmosphere can contribute to climate change both directly and indirectly. Direct effects occur when the gas itself absorbs radiation. Indirect radiative forcing occurs when chemical transformations of the substance produce other GHGs, when a gas influences the atmospheric lifetimes of other gases, and/or when a gas affects atmospheric processes that alter the radiative balance of the Earth (e.g., affect cloud formation or albedo) (EPA 2016e). The Intergovernmental Panel on Climate Change (IPCC) developed the GWP concept to compare the ability of each GHG to trap heat in the atmosphere relative to another gas. The GWP of a GHG is defined as the ratio of

the time-integrated radiative forcing from the instantaneous release of 1 kilogram of a trace substance relative to that of 1 kilogram of a reference gas (IPCC 2014). The reference gas used is CO_2; therefore, GWP-weighted emissions are measured in metric tons (MT) of carbon dioxide equivalent (CO_2e).

The current version of CalEEMod (version 2016.3.2) assumes that the GWP for CH_4 is 25 (so emissions of 1 MT of CH_4 are equivalent to emissions of 25 MT of CO_2), and the GWP for N_2O is 298, based on the IPCC Fourth Assessment Report (IPCC 2007). The GWP values identified in CalEEMod were applied to the Project.

3.2 Regulatory Setting

3.2.1 Federal Regulations

Massachusetts v. EPA. In *Massachusetts v. EPA* (April 2007), the U.S. Supreme Court directed the EPA administrator to determine whether GHG emissions from new motor vehicles cause or contribute to air pollution that may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision. In December 2009, the administrator signed a final rule with the following two distinct findings regarding GHGs under Section 202(a) of the federal CAA:

- The administrator found that elevated concentrations of GHGs—CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6—in the atmosphere threaten the public health and welfare of current and future generations. This is the "endangerment finding."
- The administrator further found the combined emissions of GHGs—CO_2, CH_4, N_2O, and HFCs—from new motor vehicles and new motor vehicle engines contribute to the GHG air pollution that endangers public health and welfare. This is the "cause or contribute finding."

These two findings were necessary to establish the foundation for regulation of GHGs from new motor vehicles as air pollutants under the CAA.

Energy Independence and Security Act. The Energy Independence and Security Act of 2007 (December 2007), among other key measures, would do the following, which would aid in the reduction of national GHG emissions (EPA 2007):

- Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard requiring fuel producers to use at least 36 billion gallons of biofuel in 2022.
- Set a target of 35 miles per gallon for the combined fleet of cars and light trucks by model year 2020 and direct National Highway Traffic Safety Administration (NHTSA) to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for work trucks.

Prescribe or revise standards affecting regional efficiency for heating and cooling products and procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.

Federal Vehicle Standards. In response to the U.S. Supreme Court ruling discussed above, the Bush Administration issued Executive Order (EO) 13432 in 2007 directing the EPA, the Department of Transportation, and the Department of Energy to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. In 2009, NHTSA issued a final rule regulating fuel efficiency and GHG emissions

from cars and light-duty trucks for model year 2011, and in 2010, EPA and NHTSA issued a final rule regulating cars and light-duty trucks for model years 2012–2016 (75 FR 25324–25728).

In 2010, President Obama issued a memorandum directing the Department of Transportation, Department of Energy, EPA, and NHTSA to establish additional standards regarding fuel efficiency and GHG reduction, clean fuels, and advanced vehicle infrastructure. In response to this directive, the EPA and NHTSA proposed stringent, coordinated federal GHG and fuel economy standards for model years 2017–2025 light-duty vehicles. The proposed standards projected to achieve 163 grams/mile of CO_2 in model year 2025, on an average industry fleet-wide basis, which is equivalent to 54.5 miles per gallon if this level were achieved solely through fuel efficiency. The final rule was adopted in 2012 for model years 2017–2021 (77 FR 62624–63200), and NHTSA intends to set standards for model years 2022–2025 in a future rulemaking.

In addition to the regulations applicable to cars and light-duty trucks described above, in 2011, the EPA and NHTSA announced fuel economy and GHG standards for medium- and heavy-duty trucks for model years 2014–2018. The standards for CO_2 emissions and fuel consumption are tailored to three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. According to the EPA, this regulatory program will reduce GHG emissions and fuel consumption for the affected vehicles by 6%–23% over the 2010 baselines (76 FR 57106–57513).

In August 2016, EPA and NHTSA announced the adoption of the phase two program related to the fuel economy and GHG standards for medium- and heavy-duty trucks. The phase two program will apply to vehicles with model year 2018 through 2027 for certain trailers and model years 2021 through 2027 for semi-trucks, large pickup trucks, vans, and all types of sizes of buses and work trucks. The final standards are expected to lower CO_2 emissions by approximately 1.1 billion MT and reduce oil consumption by up to 2 billion barrels over the lifetime of the vehicles sold under the program (EPA and NHTSA 2016).

Clean Power Plan and New Source Performance Standards for Electric Generating Units. In October 2015, EPA published a final rule (effective December 2015) establishing the Carbon Pollution Emission Guidelines for Existing Stationary Sources: Electric Utility Generating Units (80 FR 64510–64660), also known as the Clean Power Plan. These guidelines prescribe how states must develop plans to reduce GHG emissions from existing fossil-fuel-fired electric generating units. The guidelines establish CO_2 emission performance rates representing the best system of emission reduction for two subcategories of existing fossil-fuel-fired electric generating units: (1) fossil-fuel-fired electric utility steam-generating units and (2) stationary combustion turbines. Concurrently, EPA published a final rule in October 2015 establishing Standards of Performance for Greenhouse Gas Emissions from New, Modified, and Reconstructed Stationary Sources: Electric Utility Generating Units (80 FR 64661–65120). The rule prescribes CO_2 emission standards for newly constructed, modified, and reconstructed affected fossil-fuel-fired electric utility generating units. Implementation of the Clean Power Plan has been stayed by the U.S. Supreme Court pending resolution of several lawsuits; additionally, President Trump has called on EPA to review the Clean Power Plan.

3.2.2 State Regulations

The statewide GHG emissions regulatory framework is summarized below by category: state climate change targets, building energy, renewable energy and energy procurement, mobile sources, solid waste, water, and other state regulations and goals. The following text describes EOs, legislation, regulations, and other plans and policies that would directly or indirectly reduce GHG emissions and/or address climate change issues.

State Climate Change Targets

EO S-3-05. EO S-3-05 (June 2005) established the following statewide goals: GHG emissions should be reduced to 2000 levels by 2010; GHG emissions should be reduced to 1990 levels by 2020; and GHG emissions should be reduced to 80% below 1990 levels by 2050.

AB 32 and CARB's Climate Change Scoping Plan. In furtherance of the goals established in EO S-3-05, the Legislature enacted AB 32, the California Global Warming Solutions Act of 2006. AB 32 requires California to reduce its GHG emissions to 1990 levels by 2020.

Under AB 32, CARB is responsible for and is recognized as having the expertise to carry out and develop the programs and requirements necessary to achieve the GHG emissions reduction mandate of AB 32. Under AB 32, CARB must adopt regulations requiring the reporting and verification of statewide GHG emissions from specified sources. This program is used to monitor and enforce compliance with established standards. CARB also is required to adopt rules and regulations to achieve the maximum technologically feasible and cost-effective GHG emission reductions. AB 32 also authorized CARB to adopt market-based compliance mechanisms to meet the specified requirements. Finally, CARB is ultimately responsible for monitoring compliance and enforcing any rule, regulation, order, emission limitation, emission reduction measure, or market-based compliance mechanism adopted.

In 2007, CARB approved a limit on the statewide GHG emissions level for year 2020 consistent with the determined 1990 baseline (427 million metric tons [MMT] CO_2e). CARB's adoption of this limit is in accordance with Health and Safety Code Section 38550.

Further, in 2008, CARB adopted the *Climate Change Scoping Plan: A Framework for Change* (Scoping Plan) in accordance with Health and Safety Code Section 38561. The Scoping Plan establishes an overall framework for the measures that will be adopted to reduce California's GHG emissions for various emission sources/sectors to 1990 levels by 2020. The Scoping Plan evaluates opportunities for sector-specific reductions, integrates all CARB and Climate Action Team early actions and additional GHG reduction features by both entities, identifies additional measures to be pursued as regulations, and outlines the role of a cap-and-trade program. The key elements of the Scoping Plan include the following (CARB 2008a):

1. Expanding and strengthening existing energy efficiency programs, as well as building and appliance standards.
2. Achieving a statewide renewable energy mix of 33%.
3. Developing a California cap-and-trade program that links with other Western Climate Initiative partner programs to create a regional market system and caps sources contributing 85% of California's GHG emissions.
4. Establishing targets for transportation-related GHG emissions for regions throughout California, and pursuing policies and incentives to achieve those targets.
5. Adopting and implementing measures pursuant to existing state laws and policies, including California's clean car standards, goods movement measures, and the Low Carbon Fuel Standard.
6. Creating targeted fees, including a public goods charge on water use, fees on high GWP gases, and a fee to fund the administrative costs of the State of California's long-term commitment to AB 32 implementation.

In the Scoping Plan, CARB determined that achieving the 1990 emissions level in 2020 would require a reduction in GHG emissions of approximately 28.5% from the otherwise projected 2020 emissions level; i.e., those emissions that would occur in 2020, absent GHG-reducing laws and regulations (referred to as "Business-As-Usual"). For purposes of calculating this percent reduction, CARB assumed that all new electricity generation would be supplied by natural gas plants; no further regulatory action would impact vehicle fuel efficiency; and building energy efficiency codes would be held at 2005 standards.

In the 2011 Final Supplement to the AB 32 Scoping Plan Functional Equivalent Document (CARB 2011a), CARB revised its estimates of the projected 2020 emissions level in light of the economic recession and the availability of updated information about GHG reduction regulations. Based on the new economic data, CARB determined that achieving the 1990 emissions level by 2020 would require a reduction in GHG emissions of 21.7% (down from 28.5%) from the Business-As-Usual conditions. When the 2020 emissions level projection also was updated to account for newly implemented regulatory measures, including Pavley I (model years 2009–2016) and the Renewables Portfolio Standard (RPS; CPUC 2015; 12%–20%), CARB determined that achieving the 1990 emissions level in 2020 would require a reduction in GHG emissions of 16% (down from 28.5%) from the Business-As-Usual conditions.

More recently, in 2014, CARB adopted the *First Update to the Climate Change Scoping Plan: Building on the Framework* (First Update). The stated purpose of the First Update is to "highlight California's success to date in reducing its GHG emissions and lay the foundation for establishing a broad framework for continued emission reductions beyond 2020, on the path to 80% below 1990 levels by 2050" (CARB 2014b). The First Update found that California is on track to meet the 2020 emissions reduction mandate established by AB 32 and noted that California could reduce emissions further by 2030 to levels squarely in line with those needed to stay on track to reduce emissions to 80% below 1990 levels by 2050 if the state realizes the expected benefits of existing policy goals.

In conjunction with the First Update, CARB identified "six key focus areas comprising major components of the state's economy to evaluate and describe the larger transformative actions that will be needed to meet the state's more expansive emission reduction needs by 2050" (CARB 2014b). Those six areas are: (1) energy, (2) transportation (vehicles/equipment, sustainable communities, housing, fuels, and infrastructure), (3) agriculture, (4) water, (5) waste management, and (6) natural and working lands. The First Update identifies key recommended actions for each sector that will facilitate achievement of EO S-3-05's 2050 reduction goal.

CARB's research efforts presented in the First Update indicate that it has a "strong sense of the mix of technologies needed to reduce emissions through 2050" (CARB 2014b). Those technologies include energy demand reduction through efficiency and activity changes; large-scale electrification of on-road vehicles, buildings, and industrial machinery; decarbonizing electricity and fuel supplies; and the rapid market penetration of efficient and clean energy technologies.

As part of the First Update, CARB recalculated the state's 1990 emissions level using more recent GWPs identified by IPCC. Using the recalculated 1990 emissions level (431 MMT CO_2e) and the revised 2020 emissions level projection identified in the 2011 Final Supplement, CARB determined that achieving the 1990 emissions level by 2020 would require a reduction in GHG emissions of approximately 15% (instead of 28.5% or 16%) from the Business-As-Usual conditions.

On January 20, 2017, CARB released the *2017 Climate Change Scoping Plan Update* (Second Update) for public review and comment (CARB 2017a). This update presents CARB's strategy for achieving the state's 2030 GHG

target as established in SB 32 (discussed below), including continuing the Cap-and-Trade Program through 2030, and includes a new approach to reduce GHGs from refineries by 20%. The Second Update incorporates approaches to cutting short-lived climate pollutants (SLCPs) under the Short-Lived Climate Pollutant Reduction Strategy (SLCP Reduction Strategy; CARB 2017b) and acknowledges the need for reducing emissions in agriculture and highlights the work underway to ensure that California's natural and working lands increasingly sequester carbon. During development of the Second Update, CARB held a number of public workshops in the Natural and Working Lands, Agriculture, Energy, and Transportation sectors to inform development of the Second Update (CARB 2017a). When discussing project-level GHG emissions reduction actions and thresholds, the Second Update states "achieving no net increase in GHG emissions is the correct overall objective, but it may not be appropriate or feasible for every development project. An inability to mitigate a project's GHG emissions to zero does not necessarily imply a substantial contribution to the cumulatively significant environmental impact of climate change under CEQA" (CARB 2017a). The Second Update was adopted by CARB's Governing Board on December 14, 2017.

EO B-30-15. EO B-30-15 (April 2015) identified an interim GHG reduction target in support of targets previously identified under S-3-05 and AB 32. EO B-30-15 set an interim target goal of reducing statewide GHG emissions to 40% below 1990 levels by 2030 to keep California on its trajectory toward meeting or exceeding the long-term goal of reducing statewide GHG emissions to 80% below 1990 levels by 2050 as set forth in S-3-05. To facilitate achievement of this goal, EO B-30-15 calls for an update to CARB's Scoping Plan to express the 2030 target in terms of MMT CO_2e. The EO also calls for state agencies to continue to develop and implement GHG emission reduction programs in support of the reduction targets. EO B-30-15 does not require local agencies to take any action to meet the new interim GHG reduction target.

SB 32 and AB 197. SB 32 and AB 197 (enacted in 2016) are companion bills that set a new statewide GHG reduction targets, make changes to CARB's membership and increase legislative oversight of CARB's climate change–based activities, and expand dissemination of GHG and other air quality-related emissions data to enhance transparency and accountability. More specifically, SB 32 codified the 2030 emissions reduction goal of EO B-30-15 by requiring CARB to ensure that statewide GHG emissions are reduced to 40% below 1990 levels by 2030. AB 197 established the Joint Legislative Committee on Climate Change Policies, consisting of at least three members of the Senate and three members of the Assembly, in order to provide ongoing oversight over implementation of the state's climate policies. AB 197 also added two members of the Legislature to CARB as nonvoting members; requires CARB to make available and update (at least annually via its website) emissions data for GHGs, criteria air pollutants, and TACs from reporting facilities; and requires CARB to identify specific information for GHG emissions reduction measures when updating the Scoping Plan.

SB 605 and SB 1383. SB 605 (2014) requires CARB to complete a comprehensive strategy to reduce emissions of SLCPs in the state, and SB 1383 (2016) requires CARB to approve and implement that strategy by January 1, 2018. SB 1383 also establishes specific targets for the reduction of SLCPs (40% below 2013 levels by 2030 for CH_4 and HFCs and 50% below 2013 levels by 2030 for anthropogenic black carbon) and provides direction for reductions from dairy and livestock operations and landfills. Accordingly, and as mentioned above, CARB adopted its SLCP Reduction Strategy in March 2017. The SLCP Reduction Strategy establishes a framework for the statewide reduction of emissions of black carbon, CH_4, and fluorinated gases.

Building Energy

Title 24, Part 6. Title 24 of the California Code of Regulations was established in 1978 and serves to enhance and regulate California's building standards. While not initially promulgated to reduce GHG emissions, Part 6 of Title 24 specifically establishes Building Energy Efficiency Standards that are designed to ensure that new and existing buildings in California achieve energy efficiency and preserve outdoor and indoor environmental quality. These energy efficiency standards are reviewed every few years by the Building Standards Commission and the California Energy Commission (CEC) (and revised if necessary) (California Public Resources Code, Section 25402[b][1]). The regulations receive input from members of industry, as well as the public, with the goal of "reducing of wasteful, uneconomic, inefficient, or unnecessary consumption of energy" (California Public Resources Code, Section 25402). These regulations are carefully scrutinized and analyzed for technological and economic feasibility (California Public Resources Code, Section 25402[d]) and cost effectiveness (California Public Resources Code, Sections 25402[b][2] and [3]). These standards are updated to consider and incorporate new energy-efficient technologies and construction methods. As a result, these standards save energy, increase electricity supply reliability, increase indoor comfort, avoid the need to construct new power plants, and help preserve the environment.

The 2016 Title 24 standards became effective on January 1, 2017. In general, single-family homes built to the 2016 standards are anticipated to use about 28% less energy for lighting, heating, cooling, ventilation, and water heating than those built to the 2013 standards, and nonresidential buildings built to the 2016 standards will use an estimated 5% less energy than those built to the 2013 standards (CEC 2015a).

The 2019 Standards will continue to improve upon the 2016 Standards for new construction of, and additions and alterations to, residential and nonresidential buildings. The 2019 Standards came into effect on January 1, 2020. Nonresidential buildings built under the 2019 Title 24 Standards would use about 30% less energy than those built under the 2016 Title 24 Standards due mainly to lighting upgrades (CEC 2018).

Title 24, Part 11. In addition to the CEC's efforts, in 2008, the California Building Standards Commission adopted the nation's first green building standards. The California Green Building Standards Code is commonly referred to as CALGreen and establishes minimum mandatory standards as well as voluntary standards pertaining to the planning and design of sustainable site development, energy efficiency (in excess of the California Energy Code requirements), water conservation, material conservation, and interior air quality. The CALGreen standards first took effect in January 2011 and instituted mandatory minimum environmental performance standards for all ground-up, new construction of commercial, low-rise residential and state-owned buildings and schools and hospitals. The updated CALGreen 2016 standards became effective on January 1, 2017. The mandatory standards require the following (CALGreen 2016):

- Mandatory reduction in indoor water use through compliance with specified flow rates for plumbing fixtures and fittings.
- Mandatory reduction in outdoor water use through compliance with a local water efficient landscaping ordinance or the California Department of Water Resources' Model Water Efficient Landscape Ordinance.
- 65% of construction and demolition waste must be diverted from landfills.
- Mandatory inspections of energy systems to ensure optimal working efficiency.
- Inclusion of electric vehicle charging stations or designated spaces capable of supporting future charging stations.

- Low-pollutant emitting exterior and interior finish materials, such as paints, carpets, vinyl flooring, and particle boards.

The CALGreen standards also include voluntary efficiency measures that are provided at two separate tiers and implemented at the discretion of local agencies and applicants. CALGreen's Tier 1 standards call for a 15% improvement in energy requirements, stricter water conservation, 65% diversion of construction and demolition waste, 10% recycled content in building materials, 20% permeable paving, 20% cement reduction, and cool/solar-reflective roofs. CALGreen's more rigorous Tier 2 standards call for a 30% improvement in energy requirements, stricter water conservation, 75% diversion of construction and demolition waste, 15% recycled content in building materials, 30% permeable paving, 25% cement reduction, and cool/solar-reflective roofs.

CPUC, CEC, and CARB also have a shared, established goal of achieving zero net energy (ZNE) for new construction in California. The key policy timelines include (1) all new residential construction in California will be ZNE by 2020 and (2) all new commercial construction in California will be ZNE by 2030 (CPUC 2013).[8] As most recently defined by CEC in its 2015 *Integrated Energy Policy Report*, a ZNE code building is "one where the value of the energy produced by on-site renewable energy resources is equal to the value of the energy consumed annually by the building" using CEC's Time Dependent Valuation metric (CEC 2015b).

Title 20. Title 20 of the California Code of Regulations requires manufacturers of appliances to meet state and federal standards for energy and water efficiency. Performance of appliances must be certified through CEC to demonstrate compliance with standards. New appliances regulated under Title 20 include refrigerators, refrigerator-freezers, and freezers; room air conditioners and room air-conditioning heat pumps; central air conditioners; spot air conditioners; vented gas space heaters; gas pool heaters; plumbing fittings and plumbing fixtures; fluorescent lamp ballasts; lamps; emergency lighting; traffic signal modules; dishwaters; clothes washers and dryers; cooking products; electric motors; low voltage dry-type distribution transformers; power supplies; televisions and consumer audio and video equipment; and battery charger systems. Title 20 presents protocols for testing for each type of appliance covered under the regulations, and appliances must meet the standards for energy performance, energy design, water performance, and water design. Title 20 contains three types of standards for appliances: federal and state standards for federally regulated appliances, state standards for federally regulated appliances, and state standards for non-federally regulated appliances.

SB 1. SB 1 (2006) established a $3 billion rebate program to support the goal of the state to install rooftop solar energy systems with a generation capacity of 3,000 megawatts through 2016. SB 1 added sections to the California Public Resources Code, including Chapter 8.8 (California Solar Initiative), that require building projects applying for ratepayer-funded incentives for photovoltaic systems to meet minimum energy efficiency levels and performance requirements. Section 25780 established that it is a goal of the state to establish a self-sufficient solar industry in which solar energy systems are a viable mainstream option for both homes and businesses within 10 years of adoption and to place solar energy systems on 50% of new homes within 13 years of adoption. SB 1, also termed "GoSolarCalifornia," was previously titled "Million Solar Roofs."

AB 1470. This bill established the Solar Water Heating and Efficiency Act of 2007. The bill makes findings and declarations of the Legislature relating to the promotion of solar water heating systems and other technologies that reduce natural gas demand. The bill defines several terms for purposes of the act. The bill requires the commission to evaluate the data available from a specified pilot program and, if it makes a specified determination, to design

[8] It is expected that achievement of the ZNE goal will occur via revisions to the Title 24 standards.

and implement a program of incentives for the installation of 200,000 solar water heating systems in homes and businesses throughout the state by 2017.

AB 1109. Enacted in 2007, AB 1109 required CEC to adopt minimum energy efficiency standards for general purpose lighting, to reduce electricity consumption 50% for indoor residential lighting and 25% for indoor commercial lighting.

Renewable Energy and Energy Procurement

SB 1078. SB 1078 (2002) established the RPS program, which requires an annual increase in renewable generation by the utilities equivalent to at least 1% of sales, with an aggregate goal of 20% by 2017. This goal was subsequently accelerated, requiring utilities to obtain 20% of their power from renewable sources by 2010.

SB 1368. SB 1368 (2006) requires CEC to develop and adopt regulations for GHG emission performance standards for the long-term procurement of electricity by local publicly owned utilities. These standards must be consistent with the standards adopted by CPUC. This effort will help protect energy customers from financial risks associated with investments in carbon-intensive generation by allowing new capital investments in power plants for which GHG emissions are as low as or lower than new combined-cycle natural gas plants by requiring imported electricity to meet GHG performance standards in California and by requiring that the standards be developed and adopted in a public process.

SB X1 2. SB X1 2 (2011) expanded the RPS by establishing that 20% of the total electricity sold to retail customers in California per year by December 31, 2013, and 33% by December 31, 2020, and in subsequent years be secured from qualifying renewable energy sources. Under the bill, a renewable electrical generation facility is one that uses biomass, solar thermal, photovoltaic, wind, geothermal, fuel cells using renewable fuels, small hydroelectric generation of 30 megawatts or less, digester gas, municipal solid waste conversion, landfill gas, ocean wave, ocean thermal, or tidal current and that meets other specified requirements with respect to its location. In addition to the retail sellers previously covered by the RPS, SB X1 2 added local, publicly owned electric utilities to the RPS.

SB 350. SB 350 (2015) further expanded the RPS by establishing that 50% of the total electricity sold to retail customers in California per year by December 31, 2030, be secured from qualifying renewable energy sources. In addition, SB 350 includes the goal of doubling the energy efficiency savings in electricity and natural gas final end uses (such as heating, cooling, lighting, or class of energy uses on which an energy-efficiency program is focused) of retail customers through energy conservation and efficiency. The bill also requires CPUC, in consultation with CEC, to establish efficiency targets for electrical and gas corporations consistent with this goal.

SB 100. SB 100 (2018) increased the standards set forth in SB 350 establishing that 44% of the total electricity sold to retail customers in California per year by December 31, 2024, 52% by December 31, 2027, and 60% by December 31, 2030, be secured from qualifying renewable energy sources. SB 100 states that it is the policy of the state that eligible renewable energy resources and zero-carbon resources supply 100% of the retail sales of electricity to California. This bill requires that the achievement of 100% zero-carbon electricity resources do not increase the carbon emissions elsewhere in the western grid and that the achievement not be achieved through resource shuffling.

Mobile Sources

AB 1493. In a response to the transportation sector accounting for more than half of California's CO_2 emissions, AB 1493 was enacted in July 2002. AB 1493 required CARB to set GHG emission standards for passenger vehicles, light-duty trucks, and other vehicles determined by the state board to be vehicles that are primarily used for noncommercial personal transportation in the state. The bill required that CARB set GHG emission standards for motor vehicles manufactured in 2009 and all subsequent model years. CARB adopted the standards in September 2004. When fully phased in, the near-term (2009–2012) standards will result in a reduction of about 22% in GHG emissions compared to the emissions from the 2002 fleet, while the mid-term (2013–2016) standards will result in a reduction of about 30%.

EO S-1-07. Issued on January 18, 2007, EO S-1-07 sets a declining Low Carbon Fuel Standard for GHG emissions measured in CO_2e grams per unit of fuel energy sold in California. The target of the Low Carbon Fuel Standard is to reduce the carbon intensity of California passenger vehicle fuels by at least 10% by 2020. The carbon intensity measures the amount of GHG emissions in the lifecycle of a fuel, including extraction/feedstock production, processing, transportation, and final consumption, per unit of energy delivered. CARB adopted the implementing regulation in April 2009. The regulation is expected to increase the production of biofuels, including those from alternative sources, such as algae, wood, and agricultural waste.

SB 375. SB 375 (2008) addresses GHG emissions associated with the transportation sector through regional transportation and sustainability plans. SB 375 required CARB to adopt regional GHG reduction targets for the automobile and light-truck sector for 2020 and 2035. Regional metropolitan planning organizations are then responsible for preparing an SCS within their Regional Transportation Plan (RTP). The goal of the SCS is to establish a forecasted development pattern for the region that, after considering transportation measures and policies, will achieve, if feasible, the GHG reduction targets. If an SCS is unable to achieve the GHG reduction target, a metropolitan planning organization must prepare an Alternative Planning Strategy demonstrating how the GHG reduction target would be achieved through alternative development patterns, infrastructure, or additional transportation measures or policies.

Pursuant to Government Code Section 65080(b)(2)(K), an SCS does not: (1) regulate the use of land; (2) supersede the land use authority of cities and counties; or (3) require that a city's or county's land use policies and regulations, including those in a general plan, be consistent with it. Nonetheless, SB 375 makes regional and local planning agencies responsible for developing those strategies as part of the federally required metropolitan transportation planning process and the state-mandated housing element process.

In 2010, CARB adopted the SB 375 targets for the regional metropolitan planning organizations. The targets for SANDAG are a 7% reduction in emissions per capita by 2020 and a 13% reduction by 2035.

SANDAG completed and adopted its 2050 RTP/SCS in October 2011 (SANDAG 2011). In November 2011, CARB, by resolution, accepted SANDAG's GHG emissions quantification analysis and determination that, if implemented, the SCS would achieve CARB's 2020 and 2035 GHG emissions reduction targets for the region.

After SANDAG's 2050 RTP/SCS was adopted, a lawsuit was filed by the Cleveland National Forest Foundation and others. The matter is pending before the California Supreme Court (Case No. S223603) for determination of whether an environmental impact report for an RTP must include an analysis of the plan's consistency with the GHG reduction goals reflected in EO S-3-05 to comply with CEQA.

Although the environmental impact report for SANDAG's 2050 RTP/SCS is pending before the California Supreme Court, in 2015, SANDAG adopted the next iteration of its RTP/SCS in accordance with statutorily mandated timelines, and no subsequent litigation challenge was filed. More specifically, in October 2015, SANDAG adopted the Regional Plan. Like the 2050 RTP/SCS, this planning document meets CARB's 2020 and 2035 reduction targets for the region (SANDAG 2015). In December 2015, CARB, by resolution, accepted SANDAG's GHG emissions quantification analysis and determination that, if implemented, the SCS would achieve CARB's 2020 and 2035 GHG emissions reduction targets for the region.

Advanced Clean Cars Program. In January 2012, CARB approved the Advanced Clean Cars program, a new emissions-control program for model years 2015 through 2025. The program combines the control of smog- and soot-causing pollutants and GHG emissions into a single coordinated package. The package includes elements to reduce smog-forming pollution, reduce GHG emissions, promote clean cars, and provide the fuels for clean cars (CARB 2011b). To improve air quality, CARB has implemented new emissions standards to reduce smog-forming emissions beginning with 2015 model year vehicles. It is estimated that, in 2025, cars will emit 75% less smog-forming pollution than the average new car sold before 2012. To reduce GHG emissions, CARB, in conjunction with EPA and NHTSA, has adopted new GHG standards for model year 2017 to 2025 vehicles; the new standards are estimated to reduce GHG emissions by 34% in 2025. The Zero-Emissions Vehicle (ZEV) program will act as the focused technology of the Advanced Clean Cars program by requiring manufacturers to produce increasing numbers of ZEVs and plug-in hybrid electric vehicles in the 2018 to 2025 model years. The Clean Fuels Outlet regulation will ensure that fuels such as electricity and hydrogen are available to meet the fueling needs of the new advanced technology vehicles as they come to the market.

EO B-16-12. EO B-16-12 (2012) directs state entities under the governor's direction and control to support and facilitate development and distribution ZEVs. This EO also sets a long-term target of reaching 1.5 million ZEVs on California's roadways by 2025. On a statewide basis, EO B-16-12 also establishes a GHG emissions reduction target from the transportation sector equaling 80% less than 1990 levels by 2050. In furtherance of this EO, the Governor convened an Interagency Working Group on ZEVs that has published multiple reports regarding the progress made on the penetration of ZEVs in the statewide vehicle fleet.

AB 1236. AB 1236 (2015) as enacted in California's Planning and Zoning Law, requires local land use jurisdictions to approve applications for the installation of electric vehicle charging stations, as defined, through the issuance of specified permits, unless there is substantial evidence in the record that the proposed installation would have a specific, adverse impact on public health or safety and there is no feasible method to satisfactorily mitigate or avoid the specific adverse impact. The bill provides for appeal of that decision to the planning commission, as specified. The bill requires local land use jurisdictions with a population of 200,000 or more residents to adopt an ordinance by September 30, 2016, that creates an expedited and streamlined permitting process for electric vehicle charging stations, as specified. Prior to this statutory deadline, in August 2016, the County Board of Supervisors adopted Ordinance No. 10437 (N.S.) adding a section to its County Code related to the expedited processing of electric vehicle charging stations permits consistent with AB 1236.

SB 350. In 2015, SB 350—the Clean Energy and Pollution Reduction Act—was enacted into law. As one of its elements, SB 350 establishes a statewide policy for widespread electrification of the transportation sector, recognizing that such electrification is required for achievement of the state's 2030 and 2050 reduction targets (see California Public Utilities Code, Section 740.12).

Solid Waste

AB 939 and AB 341. In 1989, AB 939, known as the Integrated Waste Management Act (California Public Resources Code, Sections 40000 et seq.), was passed because of the increase in waste stream and the decrease in landfill capacity. The statute established the California Integrated Waste Management Board, which oversees a disposal reporting system. AB 939 mandated a reduction of waste being disposed where jurisdictions were required to meet diversion goals of all solid waste through source reduction, recycling, and composting activities of 25% by 1995 and 50% by the year 2000.

AB 341 (2011) amended the California Integrated Waste Management Act of 1989 to include a provision declaring that it is the policy goal of the state that not less than 75% of solid waste generated be source-reduced, recycled, or composted by the year 2020 and annually thereafter. In addition, AB 341 required the California Department of Resources Recycling and Recovery (CalRecycle) to develop strategies to achieve the state's policy goal. CalRecycle has conducted multiple workshops and published documents that identify priority strategies that CalRecycle believes would assist the state in reaching the 75% goal by 2020.

Water

EO B-29-15. In response to the ongoing drought in California, EO B-29-15 (April 2015) set a goal of achieving a statewide reduction in potable urban water usage of 25% relative to water use in 2013. The term of the EO extended through February 28, 2016, although many of the directives have since become permanent water-efficiency standards and requirements. The EO includes specific directives that set strict limits on water usage in the state. In response to EO B-29-15, the California Department of Water Resources has modified and adopted a revised version of the Model Water Efficient Landscape Ordinance that, among other changes, significantly increases the requirements for landscape water use efficiency and broadens its applicability to include new development projects with smaller landscape areas.

Other State Regulations and Goals

SB 97. SB 97 (Dutton) (August 2007) directed the Governor's Office of Planning and Research to develop guidelines under CEQA for the mitigation of GHG emissions. In 2008, the Office of Planning and Research issued a technical advisory as interim guidance regarding the analysis of GHG emissions in CEQA documents. The advisory indicated that the lead agency should identify and estimate a project's GHG emissions, including those associated with vehicular traffic, energy consumption, water usage, and construction activities (OPR 2008). The advisory further recommended that the lead agency determine significance of the impacts and impose all mitigation measures necessary to reduce GHG emissions to a level that is less than significant. The California Natural Resources Agency adopted the CEQA Guidelines amendments in December 2009, which became effective in March 2010.

Under the amended CEQA Guidelines, a lead agency has the discretion to determine whether to use a quantitative or qualitative analysis or apply performance standards to determine the significance of GHG emissions resulting from a particular project (14 CCR 15064.4[a]). The CEQA Guidelines require a lead agency to consider the extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions (14 CCR 15064.4[b]). The Guidelines also allow a lead agency to consider feasible means of mitigating the significant effects of GHG emissions, including reductions in emissions through the implementation of project features or off-site measures. The adopted amendments do not establish a GHG emission threshold, instead allowing a lead agency to develop, adopt, and apply its own thresholds of

significance or those developed by other agencies or experts. The California Natural Resources Agency also acknowledges that a lead agency may consider compliance with regulations or requirements implementing AB 32 in determining the significance of a project's GHG emissions (CNRA 2009).

With respect to GHG emissions, the CEQA Guidelines state in Section 15064.4(a) that lead agencies should "make a good faith effort, to the extent possible on scientific and factual data, to describe, calculate or estimate" GHG emissions. The CEQA Guidelines note that an agency may identify emissions by either selecting a "model or methodology" to quantify the emissions or by relying on "qualitative analysis or other performance based standards" (14 CCR 15064.4[a]). Section 15064.4(b) states that the lead agency should consider the following when assessing the significance of impacts from GHG emissions on the environment: (1) the extent a project may increase or reduce GHG emissions as compared to the existing environmental setting; (2) whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project; and (3) the extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions (14 CCR 15064.4[b]).

EO S-13-08. EO S-13-08 (November 2008) is intended to hasten California's response to the impacts of global climate change, particularly sea-level rise. Therefore, the EO directs state agencies to take specified actions to assess and plan for such impacts. The final *2009 California Climate Adaptation Strategy* report was issued in December 2009 (CNRA 2009), and an update, *Safeguarding California: Reducing Climate Risk*, followed in July 2014 (CNRA 2014). To assess the state's vulnerability, the report summarizes key climate change impacts to the state for the following areas: Agriculture, Biodiversity and Habitat, Emergency Management, Energy, Forestry, Ocean and Coastal Ecosystems and Resources, Public Health, Transportation, and Water. Issuance of the *Safeguarding California: Implementation Action Plans* followed in March 2016 (CNRA 2016). Currently, a draft of the *Safeguarding California Plan: 2017 Update* is being prepared to communicate current and needed actions that the state government should take to build climate change resiliency (CNRA 2017).

2015 State of the State Address. In January 2015, Governor Brown in his inaugural address and annual report to the Legislature established supplementary goals that would further reduce GHG emissions over the next 15 years. These goals include an increase in California's renewable energy portfolio from 33% to 50%, a reduction in vehicle petroleum use for cars and trucks by up to 50%, measures to double the efficiency of existing buildings, and decreasing emissions associated with heating fuels.

2016 State of the State Address. In his January 2016 address, Governor Brown established a statewide goal to bring per capita GHG emissions down to 2 tons per person, which reflects the goal of the Global Climate Leadership Memorandum of Understanding to limit global warming to less than 2°C by 2050. The Global Climate Leadership Memorandum of Understanding agreement pursues emission reductions of 80% to 95% below 1990 levels by 2050 and/or reach a per capita annual emissions goal of less than 2 MT by 2050. A total of 187 jurisdictions representing 38 countries and 6 continents, including California, have signed or endorsed the Global Climate Leadership Memorandum of Understanding (Under 2 Coalition 2017).

3.2.3 Local Regulations

3.2.3.1 San Diego Air Pollution Control District

SDAPCD does not have established GHG rules, regulations, or policies.

3.2.3.2 City of Chula Vista

International Council of Environmental Initiatives Local Governments for Sustainability. In 1992, the City participated in the Cities for Climate Protection Program, which aimed at developing municipal action plans for the reduction of GHGs. This program was sponsored and developed by the International Council of Environmental Initiatives and the United Nations Environment Program in response to the United Nations Framework Convention on Climate Change, while recognizing that all local planning and development has direct consequences on energy consumption, and cities exercise key powers over urban infrastructure, including neighborhood design, and over transportation infrastructure, such as roads, streets, pedestrian areas, bicycle lanes, and public transport.

Chula Vista Carbon Dioxide (CO_2) Reduction Plan. Each participant in the International Council of Environmental Initiatives program was to create local policy measures to ensure multiple benefits to the City and, at the same time, identify a carbon reduction goal through the implementation of those measures. The carbon reduction goal was to fit within the realm of international climate treaty reduction goals.

In its CO_2 Reduction Plan, developed in 1996 and officially adopted in 2000, Chula Vista committed to lowering its CO_2 emissions by diversifying its transportation system and using energy more efficiently in all sectors. To focus efforts in this direction, Chula Vista adopted the international CO_2 reduction goal of returning to pre-1990 levels by 2010. In order to achieve this goal, eight actions were identified, which when fully implemented, were anticipated to save 100,000 tons of CO_2 each year.

As a result of the 2005 GHG Emissions Inventory Report, in May 2007, staff reported to the City Council that City-wide GHG emissions had increased by 35% (mainly due to residential growth) from 1990 to 2005, while emissions on a per capita basis and from municipal operations decreased by 17% and 18%, respectively. The City Council directed staff to convene a Climate Change Working Group to develop recommendations to reduce the community's GHGs in order to meet the City's 2010 GHG emissions reduction targets.

As a result of the 2012 GHG Emissions Inventory Report, staff reported to the City Council that citywide GHG levels are 1,011,481 MT CO_2e. Compared to 2005, Chula Vista's citywide GHG emissions have increased by 8%. However, 2012 per capita emissions are approximately 5% below 2005 levels and 33% below 1990 levels. Unlike the last two inventories, 2009 and 2010, there was a slight increase in City-wide energy consumption over the last couple of years due most likely to local economic recovery. As with past inventories, community transportation activity has continued increasing with 2012 vehicle miles traveled about 29% higher than in 2005. In order to reach the current community emissions reduction goal of 20% below 1990 emission levels, the City will have to reduce its GHG emissions by more than 359,332 MT CO_2e (35%); however, statewide initiatives are expected to help achieve some of these reductions by 2020.

Climate Change Working Group. The Climate Change Working Group, which is composed of residents, businesses, and community organization representatives, helps the City develop climate-related programs and policies. In 2008, the group reviewed more than 90 carbon reduction measures and ultimately chose 7 measures to recommend for adoption to the City Council, which the Council subsequently adopted. The measures were designed to reduce or mitigate climate change impacts by reducing GHG emissions within Chula Vista to 20% below 1990 levels, in keeping with its CO_2 Reduction Plan and United Nations Framework Convention on Climate Change goals.

In October 2009, the City Council directed the group to evaluate how the City could adapt to potential climate change impacts. The group met throughout 2011 to develop recommendations based on the City's vulnerabilities and risks to climate change. In May 2011, the group adopted the Climate Adaptation Strategies – Implementation Plans, described below, and in 2014, the group released the 2014 Climate Action Plan Update – Recommendations, described below.

Chula Vista Climate Adaptation Strategies – Implementation Plans. The Climate Adaptation Strategies – Implementation Plans document developed by the Climate Change Working Group includes 11 strategies to facilitate Chula Vista's adaptation to the potential impacts of global climate change related to energy and water supply, public health, wildfires, ecosystem management, coastal infrastructure, and local economy sectors. The strategies include cool paving, shade trees, cool roofs, local water supply and reuse, stormwater pollution prevention and reuse, education and wildfires, extreme heat plans, open space management, wetlands preservation, sea-level rise and land development codes, and green economy. For each strategy, the plans outline specific implementation components, critical steps, costs, and timelines. In order to limit the necessary staffing and funding required to implement the strategies, the plans were also designed to build on existing municipal efforts, rather than create new, stand-alone policies or programs. Initial implementation of all 11 strategies were phased over a 3-year period after adoption of the plan in 2011.

Chula Vista Climate Protection Measures. On July 10, 2008, the City Council adopted implementation plans for seven climate protection measures to reduce GHG emissions to 20% below 1990 levels by 2012. The implementation plans outline the detailed strategy for initiating, funding, and tracking the following measures:

1. **Clean Vehicle Replacement Policy for City Fleet:** When City fleet vehicles are retired, they will be replaced through the purchase or lease of alternative fuel or hybrid substitutes. In addition, the City fleet will begin to pursue installing new fuel tanks to allow heavy-duty vehicles to convert to biodiesel fuel immediately.
2. **Clean Vehicle Replacement Policy for City-Contracted Fleets:** As contracts for City-contracted fleet services (such as transit buses, trash haulers and street sweeper trucks) are renewed, the City will encourage contractors to replace their vehicles with alternative fuel or hybrid substitutes through the contract bid process. In addition, the City will pursue implementing two hydrogen vehicle demonstration projects.
3. **Business Energy Evaluations:** Businesses with storefronts or offices need to participate in a no-cost energy assessment of their facilities to help identify opportunities for them to reduce monthly energy costs. The business assessment will be integrated into the existing business licensing process and codified through a new municipal ordinance.
4. **Green Building Standard:** The City will implement a citywide, mandatory green building standard for new residential and non-residential construction projects and major renovations. The standard includes four components: 1) adopting a citywide Green Building Standard, 2) adopting a citywide Enhanced Energy Efficiency Standard, 3) launching a Green Building Awareness program for builders, permit applicants and the general public, and 4) developing design guidelines for sustainable development.
5. **Solar and Energy Efficiency Conversion Program:** The City will create a community program to provide residents and businesses with a streamlined, cost-effective opportunity to implement energy efficiency improvements and to install solar/renewable energy systems on their properties. The City will develop a funding mechanism to allow program participants to voluntarily choose to place the improvement costs on their property's tax rolls, thereby avoiding large upfront capital costs. In addition, the program will promote vocational training, local manufacturing, and retail sales opportunities for environmental products and services. To help stimulate the private-sector renewable market and lower the cost for installing renewable

energy systems on new homes, the City will require all new residential buildings to include pre-wiring and pre-plumbing for solar photovoltaic and solar hot water systems, respectively.

6. **Smart Growth Around Trolley Stations:** The City will continue to implement the smart growth design principles, which promote mixed-use and walkable and transit-friendly development, particularly in and around the E, H, and Palomar trolley stations. These principles were emphasized in the revised Chula Vista General Plan and the Urban Core Specific Plan. In particular, the City will initiate site planning, design studies and specific area plan development to further support smart growth development that complements GHG reductions.
7. **Turf Lawn Conversion Program:** The City will create a community program to provide residents and businesses with a streamlined, cost-effective opportunity to replace their turf lawns with water-saving landscaping and irrigation systems. Some municipal turf lawn areas (such as medians, fire stations and non-recreational park areas) will also be converted to act as public demonstration sites and to reduce monthly water costs. The City will establish the model for water-wise landscaping for new development through an update of the Chula Vista Municipal Landscape Ordinance and Water Conservation Plan guidelines.

Chula Vista Climate Protection Measures – 2013 Progress Report. Since 2000, Chula Vista has been implementing a "Climate Action Plan" (CO_2 Reduction Plan) to address the threat of climate change to the local community. This original plan has been revised to incorporate new climate mitigation (2008) and adaptation (2011) measures to strengthen the City's climate action efforts and to facilitate the numerous community co-benefits, such as utility savings, better air quality, reduced traffic congestion, local economic development, and improved quality of life. Based on available funding, staff has been implementing the 18 climate-related actions and their 57 associated components. Overall, 70% of the components have been successfully completed and/or are being implemented on an ongoing basis, which represents a 7% increase since the last reporting period. Another 26% are still being actively pursued, while only two components remain on hold (City of Chula Vista 2013).

2014 Climate Action Plan Update – Recommendations by the Climate Change Working Group. The Climate Change Working Group has been evaluating new opportunities to help reach the Chula Vista Climate Action Plan (CAP) GHG gas reduction goal of 30% below 2005 levels. As such, they have identified the following 12 action areas that could generate up to 166,000 MT in reductions by 2020, while improving local air quality, generating utility savings, reducing traffic congestion, and promoting a healthier community (City of Chula Vista 2014).

2017 Climate Action Plan. The latest version of the CAP was adopted on September 26, 2017, by the City Council and provides updated goals, policies, actions, and the latest City-wide inventory and projections. The CAP is not considered a CEQA "qualified" plan under CEQA Guidelines Section 15183.5, as it has not been adopted in a public process following environmental review. The Climate Change Working Group has been evaluating new opportunities to help reach the Chula Vista CAP's GHG gas reduction goals, which are based on the Second Update goals of 6 MT CO_2e per person by 2030 and 2 MT CO_2e per person by 2050. As such, they have identified the following 11 action areas that could generate up to 208,220 MT in reductions by 2020, while improving local air quality, generating utility savings, reducing traffic congestion, and promoting a healthier community (City of Chula Vista 2017):

Water Conservation & Reuse [Estimated Annual GHG Reductions = 12,357 MT CO_2e]

1. Water Education & Enforcement
   A) Expand education and enforcement [through fines] targeting landscape water waste

2. Water Efficiency Upgrades
   A) Update the City's Landscape Water Conservation Ordinance to promote more water-wise landscaping designs
   B) Require water-savings retrofits in existing buildings at a specific point in time (not point of sale)
3. Water Reuse Plan & System Installations
   A) Develop a Water Reuse Master Plan to maximize the use of storm water, graywater [recycled water] and onsite water reclamation
   B) Facilitate simple graywater systems for laundry-to-landscape applications
   C) Streamline complex graywater systems' permit review

Waste Reduction [Estimated Annual GHG Reductions = 38,126 MT CO_2e]

1. Zero Waste Plan
   A) Develop a Zero Waste Plan to supplement statewide green waste, recycling and plastic bag ban efforts

Renewable & Efficient Energy [Estimated Annual GHG Reductions = 70,763 MT CO_2e]

1. Energy Education & Enforcement
   A) Expand education targeting key community segments [e.g., do-it-yourselfers and Millennials] and facilitating energy performance disclosure (e.g., Green Leases, benchmarking and Home Energy Ratings)
   B) Leverage the building inspection process to distribute energy-related information and to deter unpermitted, low performing energy improvements
2. Clean Energy Sources
   A) Incorporate solar photovoltaic into all new residential and commercial buildings [on a project-level basis]
   B) Provide more grid-delivered clean energy (up to 100%) through Community Choice Aggregation or other mechanism
3. Energy Efficiency Upgrades
   A) Expand the City's "cool roof" standards to include re-roofs and western areas
   B) Facilitate more energy upgrades in the community through incentives [e.g., tax breaks and rebates), permit streamlining (where possible) and education [e.g., more local energy efficiency programming]
   C) Require energy-savings retrofits in existing buildings at a specific point in time (not at point of sale)
4. Robust Urban Forests
   A) Plant more shade trees to save energy, address heat island issues and improve air quality

Smart Growth & Transportation [Estimated Annual GHG Reductions = 86,974 MT CO_2e]

1. Complete Streets & Neighborhoods

A) Incorporate "Complete Streets" principles into municipal capital projects and plans [e.g., the Bicycle and Pedestrian Master Plans and Capital Improvement Program]

B) Encourage higher density and mixed-use development in Smart Growth areas, especially around trolley stations and other transit nodes

2. Transportation Demand Management
   A) Utilize bike facilities, transit access/passes and other Transportation Demand Management and congestion management offerings
   B) Expand bike-sharing, car-sharing and other "last mile" transportation options
3. Alternative Fuel Vehicle Readiness
   A) Support the installation of more local alternative fueling stations
   B) Designate preferred parking for alternative fuel vehicles
   C) Design all new residential and commercial buildings to be "Electric Vehicle Ready"

Chula Vista Green Building Standards. Consistent with Measure 4 of the Chula Vista Climate Protection Measures, the City Council adopted the Green Building Standards Ordinance (Ordinance No. 3140) on October 6, 2009, which became effective November 5, 2009. The Green Building Standards Ordinance includes standards for energy efficiency, pollutant controls, interior moisture control, improved indoor air quality and exhaust, indoor water conservation, stormwater management, and construction waste reduction and recycling.

Building permit applications are required to indicate on project construction plans and specifications the Green Building Standards measures that comply with the ordinance. Prior to final building approval or issuance of a certificate of occupancy, the Building Official reviews the information submitted by the applicant and determines whether the applicant has constructed the project in accordance with the permitted plans and documents, and whether the plans are in compliance with the Green Building Standards. In 2013, Chula Vista adopted CALGreen for residential and non-residential development effective January 1, 2014.

Chapter 15.12 Green Building Standards. Title 24, Part 11 (CALGreen), was adopted as the Green Building Code of the City for enhancing the design and construction of buildings, building additions, and alterations through the use of building concepts having a reduced negative impact or positive environmental impact and encouraging sustainable construction practices, excepting such portions as are hereinafter deleted, modified, or amended.

Chula Vista Increased Energy Efficiency Standards. On January 26, 2010, the City Council adopted the Increased Energy Efficiency Standards Ordinance (Ordinance No. 3149). This ordinance became effective February 26, 2010, as Section 15.26 of the Municipal Code. Permit applications are required to comply with these energy efficiency standards.

Chula Vista Municipal Code Section 15.26.030 requires permit applications to comply with increased energy efficiency standards that achieve 15% to 20% greater efficiency than the requirements of the Title 24 2008 standards, depending on climate zone. The City falls within two climate zones, Zone 7 and Zone 10. The Project site is within Zone 7. For Zone 7, the code requires the following:

- All new low-rise residential building or additions, remodels or alterations to existing low-rise residential buildings where the additions, remodels or alterations are greater than 1,000 square feet of conditional

floor area, shall use at least 15% less energy than the 2008 Title 24 Building Energy Efficiency Standards allow.

- All new non-residential, high-rise residential or hotel/motel buildings, or additions, remodels or alterations to existing non-residential, high-rise residential or hotel/motel buildings where the additions, remodels or alterations are greater than 10,000 square feet of conditioned floor area, shall use at least 15% less energy than the 2008 Title 24 Building Energy Efficiency Standards.

No city building permit shall be issued unless the permit application demonstrates to the Building Official compliance with the requirements of Section 15.26.030. Compliance is to be demonstrated based on a performance approach, using a CEC-approved energy compliance software program, as specified in the Title 24 2008 Building Energy Efficiency Standards.

In 2013, Chula Vista adopted the Energy Code for Residential and Non-Residential development, effective July 1, 2014. Energy efficiency measures adopted by the Chula Vista Municipal Code are as follows:

- **Section 15.26.010 – California Energy Code.** The California Energy Code is adopted as the energy code of the City for the purpose of regulating building design and construction standards to increase efficiency in the use of energy for new residential and nonresidential buildings.
- **Section 15.26.020 – Outdoor Lighting Zones.** The City has adopted an outdoor lighting zones map amending state default lighting zones as applied to certain areas of the City. The location of outdoor lighting zones in the City are per the adopted Outdoor Lighting Zones Map, dated September 2, 2005, and kept on file with the City Planning and Building Department.
- **Section 15.28.015 Solar Water Heater Pre-Plumbing (specific to the City).** All new residential units shall include plumbing specifically designed to allow the later installation of a system that utilizes solar energy as the primary means of heating domestic potable water. No building permit shall be issued unless the requirements of this section and the Chula Vista Solar Water Heater Pre-Plumbing Installation Requirements are incorporated into the approved building plans.
- **Section 15.24.065 Pre-Wiring for Photovoltaic (specific to the City).** All new residential units shall include electrical conduit specifically designed to allow the later installation of a photovoltaic system that utilizes solar energy as a means to provide electricity. No building permit shall be issued unless the requirements of this section and the Chula Vista Photovoltaic Pre-Wiring Installation Requirements are incorporated into the approved building plans.

Section 15.28.020 Residential Graywater Stub-out (specific to the City). All new detached single-family dwellings and duplexes shall include a single-source clothes washer graywater outlet and an outside stub-out to allow the later installation of a clothes washer graywater irrigation system that complies with the requirements of Section 1602.1.1 of the 2013 California Plumbing Code. The outlet and stub-out shall be installed in accordance with the Chula Vista Clothes Washer Graywater Pre-Plumbing and Stub-Out for New Residential Construction or an equivalent alternate method and/or material approved by the Building Official.

City of Chula Vista Mandatory Construction and Demolition Debris Recycling Ordinance. Section 8.25.095 of the Chula Vista Municipal Code requires that 90% of inert materials and a minimum of 50% of all other materials be recycled and/or reused from certain covered projects. Covered projects include the following:

- Any project requiring a permit for demolition or construction, which has a project valuation of $20,000 or more

- Housing subdivision construction or demolition and/or any sequenced development will be considered a project in its entirety and not a series of individual projects
- Tenant improvements greater than 1,000 square feet but less than 10,000 square feet and individual single-family home construction, remodel, addition or renovation, shall submit a Waste Management Report only (no deposit required)

All City projects

Covered projects must submit a waste management plan to the Chula Vista Public Works Department, Environmental Services Division, which must be reviewed and approved prior to the issuance of a demolition or building permit. The waste management plan will indicate how the applicant will recycle and/or reuse 90% of inert materials and at least 50% of the remaining construction and demolition debris generated from the project.

City of Chula Vista Clean Transportation Energy Roadmap (2012). The Clean Transportation Energy Roadmap ("Roadmap") can serve as a resource for the City as it continues to promote clean transportation measures, both in its municipal operations and in the community. The Roadmap identifies petroleum reduction measures and tools specific to the City that generally result in cost savings and benefits to the environment, including the following:

- An assessment of alternative fuel vehicles and fuel availability for the City's vehicle fleet
- Commuter programs, including vanpools, carpools, and teleworking that the City could promote to its employees
- Online tools to establish a baseline of petroleum consumed and GHGs emitted from employee commutes, as well as annual tracking tools
- Smart growth and active transportation policies that enhance local walking and biking options

Outreach materials on Clean Transportation programs that can be shared with local residents, schools, and businesses

The Roadmap also recognizes the significant steps that the City has taken already. Since 2000, Chula Vista has been implementing a "Climate Action Plan" (CO_2 Reduction Plan) that includes measures to reduce energy and fuel use at municipal facilities and throughout the community.

City of Chula Vista General Plan

The City General Plan (City of Chula Vista 2005) includes various policies related to reducing GHG emissions (both directly and indirectly). Applicable policies include the following:

Land Use and Transportation Element

- **Policy LUT-23.1:** Encourage the use of bicycles and walking as alternatives to driving.
- **Policy LUT-23.2:** Foster the development of a system of inter-connecting bicycle routes throughout the City and region.
- **Policy LUT-23.5:** Provide linkages between bicycle facilities that utilize circulation element alignments and open space corridors.
- **Policy LUT-23.8:** Provide and maintain a safe and efficient system of sidewalks, trails, and pedestrian crossings.
- **Policy LUT-23.14:** Require new development projects to provide internal bikeway systems with connections to the citywide bicycle networks.

Environmental Element

- **Policy E-6.1:** Encourage compact development featuring a mix of uses that locate residential areas within reasonable walking distance to jobs, services, and transit.
- **Policy E-6.5:** Ensure that plans developed to meet the City's energy demand use the least polluting strategies, wherever practical. Conservation, clean renewables, and clean distributed generation should be considered as part of the City's energy plan, along with larger natural gas-fired plants.
- **Policy E-6.7:** Encourage innovative energy conservation practices and air quality improvements in new development and redevelopment projects consistent with the City's Air Quality Improvement Plan Guidelines or its equivalent, pursuant to the City's Growth Management Program.
- **Policy E-6.8:** Support the use of alternative fuel transit, City fleet and private vehicles in Chula Vista.
- **Policy E-7.1:** Promote development of regulations and building design standards that maximize energy efficiency through appropriate site and building design and through the use of energy-efficient materials, equipment, and appliances.
- **Policy E-7.6:** Encourage the construction and operation of green buildings, considering such programs as the Leadership in Energy and Environmental Design (LEED) Green Building Rating System.
- **Policy E-7.8:** Ensure that residential and non-residential construction complies with all applicable City energy efficiency measures and other green building measures that are in effect at the time of discretionary permit review and approval or building permit issuance, whichever is applicable.
- **Policy E-8.1:** Promote efforts to reduce waste, minimize the need for additional landfills, and provide economically and environmentally sound resource recovery, management, and disposal facilities.

Policy E-8.3: Implement source reduction strategies, including curbside recycling, use of small collection facilities for recycling, and composting.

3.3 Greenhouse Gas Inventories and Climate Change Conditions

3.3.1 Sources of Greenhouse Gas Emissions

Global Inventory

Anthropogenic GHG emissions worldwide in 2012 (the most recent year for which data is available) totaled approximately 44,816 MMT CO_2e (WRI 2015). Six countries—China, the United States, the Russian Federation, India, Japan, and Brazil—and the European community accounted for approximately 65% of the total global emissions, approximately 29,300 MMT CO_2e (WRI 2015). Table 11 presents the top GHG-emissions-producing countries.

Table 11. Top Six Greenhouse Gas Producer Countries and the European Community

Emitting Countries/Entities	GHG Emissions (MMT CO_2e)
China	10,975.5
United States	6,235.1
European Union	4,399.2

Table 11. Top Six Greenhouse Gas Producer Countries and the European Community

Emitting Countries/Entities	GHG Emissions (MMT CO_2e)
India	3,013.8
Russian Federation	2,322.2
Japan	1,344.6
Brazil	1,012.6
Total	**29,302.9**

Source: WRI 2015.
Notes: GHG = greenhouse gas; MMT = million metric tons; CO_2e = carbon dioxide equivalent.
Total may not sum precisely due to rounding.

National and State Inventories

Per the EPA Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990–2017 (EPA 2019b), total U.S. GHG emissions were approximately 6,457 MMT CO_2e in 2017. The primary GHG emitted by human activities in the United States was CO_2, which represented approximately 81.6% of total GHG emissions (6,457 MMT CO_2e). The largest source of CO_2, and of overall GHG emissions, was fossil-fuel combustion, which accounted for approximately 93.2% of CO_2 emissions in 2017 (4,912 MMT CO_2e). Relative to 1990, gross U.S. GHG emissions in 2017 are higher by 1.3%, down from a high of 15.7% above 1990 levels in 2007. GHG emissions decreased from 2016 to 2017 by 0.5% (36 MMT CO_2e) and overall, net emissions in 2017 were 13% below 2005 levels (EPA 2019b).

According to California's 2000–2017 GHG emissions inventory (2019 edition), California emitted 424.10 MMT CO_2e in 2017, including emissions resulting from out-of-state electrical generation (CARB 2019a). The sources of GHG emissions in California include transportation, industrial uses, electric power production from both in-state and out-of-state sources, commercial and residential uses, agriculture, high-GWP substances, and recycling and waste. The California GHG emission source categories (as defined in CARB's 2008 Scoping Plan) and their relative contributions in 2017 are presented in Table 12.

Table 12. Greenhouse Gas Emissions Sources in California

Source Category	Annual GHG Emissions (MMT CO_2e)	Percent of Total
Transportation	169.86	40%
Industrial uses	89.40	21%
Electricity generation[a]	62.39	15%
Residential and commercial uses	41.14	10%
Agriculture	32.42	8%
High GWP substances	19.99	5%
Recycling and waste	8.89	2%
Totals	**424.10**	**100%**

Source: CARB 2019a.
Notes: GHG = greenhouse gas; GWP = global warming potential; MMT CO_2e = million metric tons of carbon dioxide equivalent.
Emissions reflect 2017 California GHG inventory.
Totals may not sum due to rounding.
[a] Includes emissions associated with imported electricity, which account for 23.94 MMT CO_2e.

According to the GHG inventory data compiled by the Energy Policy Initiative Center, in 2010, the County emitted 34.5 MMT CO_2e (EPIC 2013). As outlined in Table 13, on-road transportation created 42% of these emissions. Similar to emissions trends statewide, electricity generation is the second biggest emitter.

Table 13. San Diego County Greenhouse Gas Emissions by Sectors

Source Category	Annual GHG Emissions (MMT CO_2e)	Percent of Total
On-road transportation	14.4	42%
Electricity generation	8.3	24%
Natural gas end uses	2.9	8%
Off-road equipment and vehicles	1.4	4%
Civil aviation	1.9	5%
Industrial processes and products	1.8	5%
Waste	0.6	2%
Water-borne navigation	0.1	<1%
Rail	0.32	<1%
Other fuels	1.58	5%
Agriculture (livestock)	0.05	<1%
Wildfires	0.28	<1%
Development (loss of vegetation)	0.18	<1%
Sequestration from land cover	0.66	2%
Total	**34.5**	**100%**

Source: EPIC 2013.
Note: GHG = greenhouse gas; MMT CO_2e = million metric tons of carbon dioxide equivalent.
Totals may not sum precisely due to rounding.

The City prepared a GHG inventory in 2012 as part of its climate action program, which is summarized in Table 14.

Table 14. Chula Vista Greenhouse Gas Emissions by Sectors

Source Category	Annual GHG Emissions (MT CO_2e)	Percent of Total
Community Analysis		
Transportation	393,333	38.9
Energy Use	497,282	49.2
Solid Waste	62,504	6.2
Potable Water	40,643	4.0
Wastewater	17,719	1.8
Subtotal	*1,011,481*	*100*
Municipal Analysis		
Transportation	6,800	35.9
Energy Use	6,654	35.1
Solid Waste	3,106	16.4
Potable Water	2,371	12.5
Subtotal	*18,931*	*100*

Note: GHG = greenhouse gas; MT CO_2e = metric tons of carbon dioxide equivalent.
Totals may not sum precisely due to rounding.

3.3.2 Potential Effects of Climate Change

Globally, climate change has the potential to affect numerous environmental resources through uncertain impacts related to future air temperatures and precipitation patterns. The 2014 *Intergovernmental Panel on Climate Change Synthesis Report* indicated that warming of the climate system is unequivocal, and many of the observed changes since the 1950s are unprecedented. Signs that global climate change has occurred include warming of the atmosphere and ocean, diminished amounts of snow and ice, and rising sea levels (IPCC 2014).

In California, climate change impacts have the potential to affect sea-level rise, agriculture, snowpack and water supply, forestry, wildfire risk, public health, and electricity demand and supply (CCCC 2006). The primary effect of global climate change has been a 0.2°C (0.36°F) rise in average global tropospheric temperature per decade, determined from meteorological measurements worldwide between 1990 and 2005. Scientific modeling predicts that continued emissions of GHGs at or above current rates would induce more extreme climate changes during the twenty-first century than were observed during the twentieth century. A warming of about 0.2°C (0.36°F) per decade is projected, and there are identifiable signs that global warming could be taking place.

Although climate change is driven by global atmospheric conditions, climate change impacts are felt locally. A scientific consensus confirms that climate change is already affecting California. The average temperatures in California have increased, leading to more extreme hot days and fewer cold nights; shifts in the water cycle have been observed, with less winter precipitation falling as snow, and both snowmelt and rainwater running off earlier in the year; sea levels have risen; and wildland fires are becoming more frequent and intense due to dry seasons that start earlier and end later (CAT 2010).

An increase in annual average temperature is a reasonably foreseeable effect of climate change. Observed changes over the last several decades across the western United States reveal clear signals of climate change. Statewide average temperatures increased by about 1.7°F from 1895 to 2011, and warming has been the greatest in the Sierra Nevada (CCCC 2012). By 2050, California is projected to warm by approximately 2.7°F above 2000 averages, a threefold increase in the rate of warming over the last century. By 2100, average temperatures could increase by 4.1°F to 8.6°F, depending on emissions levels. Springtime warming—a critical influence on snowmelt—will be particularly pronounced. Summer temperatures will rise more than winter temperatures, and the increases will be greater in inland California, compared to the coast. Heat waves will be more frequent, hotter, and longer. There will be fewer extremely cold nights (CCCC 2012). Sierra snowpack, which accounts for approximately half of the surface water storage in California and much of the state's water supply, is predicted to decline by 30% to as much as 90% over the next 100 years (CAT 2006).

Model projections for precipitation over California continue to show the Mediterranean pattern of wet winters and dry summers with seasonal, year-to-year, and decade-to-decade variability. For the first time, however, several of the improved climate models shift toward drier conditions by the mid-to-late twenty-first century in Central California and, most notably, Southern California. By late-century, all projections show drying, and half of them suggest 30-year average precipitation will decline by more than 10% below the historical average (CCCC 2012).

A summary of current and future climate change impacts to resource areas in California, as discussed in *Safeguarding California: Reducing Climate Risk* (CNRA 2014), is provided below.

Agriculture. The impacts of climate change on the agricultural sector are far more severe than the typical variability in weather and precipitation patterns that occur year to year. The agriculture sector and farmers face some specific

challenges that include more drastic and unpredictable precipitation and weather patterns; extreme weather events that range from severe flooding and extreme drought to destructive storm events; significant shifts in water availably and water quality; changes in pollinator lifecycles; temperature fluctuations, including extreme heat stress and decreased chill hours; increased risks from invasive species and weeds, agricultural pests, and plant diseases; and disruptions to the transportation and energy infrastructure supporting agricultural production. These challenges and associated short-term and long-term impacts can have both positive and negative effects on agricultural production. Nonetheless, it is predicted that current crop and livestock production will suffer long-term negative effects, resulting in a substantial decrease in the agricultural sector if not managed or mitigated.

Biodiversity and Habitat. The state's extensive biodiversity stems from its varied climate and assorted landscapes, which have resulted in numerous habitats where species have evolved and adapted over time. Specific climate change challenges to biodiversity and habitat include species migration in response to climatic changes, range shift, and novel combinations of species; pathogens, parasites, and disease; invasive species; extinction risks; changes in the timing of seasonal life-cycle events; food web disruptions; and threshold effects (i.e., a change in the ecosystem that results in a "tipping point" beyond which irreversible damage or loss has occurs). Habitat restoration, conservation, and resource management across California and through collaborative efforts among public, private, and nonprofit agencies has assisted in the effort to fight climate change impacts on biodiversity and habitat. One of the key measures in these efforts is ensuring species' ability to relocate as temperature and water availability fluctuate as a result of climate change based on geographic region.

Energy. The energy sector provides California residents with a supply of reliable and affordable energy through a complex integrated system. Specific climate change challenges for the energy sector include temperature, fluctuating precipitation patterns, increasing extreme weather events, and sea-level rise. Increasing temperatures and reduced snowpack negatively impact the availability of a steady flow of snowmelt to hydroelectric reservoirs. Higher temperatures also reduce the capacity of thermal power plants, since power plant cooling is less efficient at higher ambient temperatures. Increased temperatures will also increase electricity demand associated with air conditioning. Natural gas infrastructure in coastal California is threatened by sea-level rise and extreme storm events.

Forestry. Forests occupy approximately 33% of California's 100 million acres and provide key benefits, such as wildlife habitat, absorption of CO_2, renewable energy, and building materials. The most significant climate-change-related risks to forests are accelerated risk of wildfire and more frequent and severe droughts. Droughts have resulted in more large-scale mortalities and, combined with increasing temperatures, have led to an overall increase in wildfire risks. Increased wildfire intensity subsequently increases public safety risks, property damage, fire suppression and emergency response costs, watershed and water quality impacts, and vegetation conversions. These factors contribute to decreased forest growth, geographic shifts in tree distribution, loss of fish and wildlife habitat, and decreased carbon absorption. Climate change may result in increased establishment of non-native species, particularly in rangelands where invasive species are already a problem. Invasive species may be able to exploit temperature or precipitation changes or quickly occupy areas denuded by fire, insect mortality, or other climate change effects on vegetation.

Ocean and Coastal Ecosystems and Resources. Sea-level rise, changing ocean conditions, and other climate change stressors are likely to exacerbate long-standing challenges related to ocean and coastal ecosystems in addition to threatening people and infrastructure located along the California coastline and in coastal communities. Sea-level rise, in addition to more frequent and severe coastal storms and erosion, is threatening vital infrastructure, such as roads, bridges, power plants, ports and airports, gasoline pipes, and emergency facilities,

as well as negatively impacting coastal recreational assets, such as beaches and tidal wetlands. Water quality and ocean acidification threaten the abundance of seafood and other plant and wildlife habitats throughout California and globally.

Public Health. Climate change can impact public health through various environmental changes and is the largest threat to human health in the twenty-first century. Changes in precipitation patterns affect public health primarily through potential for altered water supplies, and extreme events, such as heat, floods, droughts, and wildfires. Increased frequency, intensity, and duration of extreme heat and heat waves is likely to increase the risk of mortality due to heat-related illness, as well as exacerbate existing chronic health conditions. Other extreme weather events are likely to negatively impact air quality and increase or intensify respiratory illness, such as asthma and allergies. Additional health impacts that may be impacted by climate change include cardiovascular disease, vector-borne diseases, mental health impacts, and health deficits due to malnutrition. Increased frequency of these ailments is likely to subsequently increase the direct risk of injury and/or mortality.

Transportation. Residents of California rely on airports, seaports, public transportation, and an extensive roadway network to gain access to destinations, goods, and services. While the transportation industry is a source of GHG emissions, it is also vulnerable to climate change risks. In particular, sea-level rise and erosion threaten many coastal California roadways, airports, seaports, transit systems, bridge supports, and energy and fueling infrastructure. Increasing temperatures and extended periods of extreme heat threaten the integrity of the roadways and rail lines. High temperatures cause the road surfaces to expand, which leads to increased pressure and pavement buckling. High temperatures can also cause rail breakages, which could lead to train derailment. Other forms of extreme weather events, such as extreme storm events, can negatively impact infrastructure, which can impair movement of people and goods, or potentially block evacuation routes and emergency access roads. Increased wildfires, flooding, erosion risks, landslides, mudslides, and rockslides can all profoundly impact the transportation system and pose a serious risk to public safety.

Water. Water resources in California support residences, plants, wildlife, farmland, landscapes, and ecosystems and bring trillions of dollars in economic activity. Climate change could seriously impact the timing, form, amount of precipitation, runoff patterns, and frequency and severity of precipitation events. Higher temperatures reduce the amount of snowpack and lead to earlier snowmelt, which can impact water supply availability, natural ecosystems, and winter recreation. Water supply availability during the intense dry summer months is heavily dependent on the snowpack accumulated during the winter. Increased risk of flooding has a variety of public health concerns, including water quality, public safety, property damage, displacement, and post-disaster mental health problems. Prolonged and intensified droughts can also negatively affect groundwater reserves and result in increased overdraft and subsidence. Droughts can also negatively impact agriculture and farmland throughout the state. The higher risk of wildfires can lead to increased erosion, which can negatively impact watersheds and result in poor water quality. Water temperatures are also prone to increase, which can negatively impact wildlife that rely on a specific range of temperatures for suitable habitat.

In May 2017, the California Natural Resources Agency released the draft *Safeguarding California Plan: 2017 Update*, which is a survey of current programmatic responses for climate change and contains recommendations for further actions (CNRA 2017).

3.4 Significance Criteria and Methodology

3.4.1 Thresholds of Significance

The significance criteria used to evaluate the Project's GHG emissions impacts are based on the recommendations provided in Appendix G of the CEQA Guidelines (14 CCR 15000 et seq.). For the purposes of this GHG emissions analysis, the Project would have a significant environmental impact if it would:

1. Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment.
2. Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs.

Global climate change is a cumulative impact; a project participates in this potential impact through its incremental contribution combined with the cumulative increase of all other sources of GHGs. There are currently no established thresholds for assessing whether the GHG emissions of a project, such as the Project, would be considered a cumulatively considerable contribution to global climate change; however, all reasonable efforts should be made to minimize a project's contribution to global climate change. In addition, while GHG impacts are recognized exclusively as cumulative impacts (CAPCOA 2008), GHG emissions impacts must also be evaluated on a project level under CEQA.

The CEQA Guidelines do not prescribe specific methodologies for performing an assessment, do not establish specific thresholds of significance, and do not mandate specific mitigation measures. Rather, the CEQA Guidelines emphasize the lead agency's discretion to determine the appropriate methodologies and thresholds of significance consistent with the manner in which other impact areas are handled in CEQA (CNRA 2009). The State of California has not adopted emissions-based thresholds for GHG emissions under CEQA. The Governor's Office of Planning and Research's Technical Advisory "CEQA and Climate Change: Addressing Climate Change through California Environmental Quality Act Review" states that "public agencies are encouraged but not required to adopt thresholds of significance for environmental impacts. Even in the absence of clearly defined thresholds for GHG emissions, the law requires that such emissions from CEQA projects must be disclosed and mitigated to the extent feasible whenever the lead agency determines that the project contributes to a significant, cumulative climate change impact" (OPR 2008). Furthermore, the advisory document indicates that "in the absence of regulatory standards for GHG emissions or other scientific data to clearly define what constitutes a 'significant impact,' individual lead agencies may undertake a project-by-project analysis, consistent with available guidance and current CEQA practice." Section 15064.7(c) of the CEQA Guidelines specifies that "when adopting thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies, or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence" (14 CCR 15064.7[c]).

Neither the State of California, nor the City, nor SDAPCD has adopted emission-based thresholds of significance for GHG emissions under CEQA.

An efficiency threshold sets a per capita emissions limit. The total emissions from a given project are summed and divided by a project's service population (SP) to determine emissions per capita and are compared to the efficiency

threshold.[9] Efficiency thresholds have been proposed by various agencies and air districts, including both the Bay Area Air Quality Management District and SCAQMD. The Bay Area Air Quality Management District and SCAQMD have each developed an efficiency threshold of 6.6 MT CO_2e/SP for plan level developments. Additionally, the Bay Area Air Quality Management District suggested a project-level efficiency threshold of 4.6 MT CO_2e per SP, while SCAQMD suggested a project-level efficiency threshold of 4.8 MT CO_2e per SP. The fault in these proposed thresholds is that they rely on CARB's Scoping Plan reduction goal and statewide population for 2020. The California Supreme Court's decision on the *Center for Biological Diversity vs. California Department of Fish and Wildlife* determined that project-level analyses should not rely on statewide data. A more localized efficiency threshold must be developed based on the population at the city level. These thresholds were developed assuming compliance with AB 32's 2020 goals.

To develop an efficiency threshold that would satisfy the requirements of *Center for Biological Diversity vs. California Department of Fish and Wildlife* and EO B-30-15, the City's 1990 emissions inventory, less 40%, must be divided by the City's 2030 SP (residents and employees). Project level emissions can then be directly evaluated against a threshold based on local emission reduction goals and local population densities in accordance with the Court's decision on *Center for Biological Diversity vs. California Department of Fish and Wildlife*. It should be noted that the downward trajectory from AB 32 to SB 32 is greater than that from AB 32 to EO S-3-05, of 80% below 1990 by 2050 (CARB 2017a). By analyzing the project against the quantitative efficiency metric thresholds for the buildout year and for the milestone year for the next legislatively adopted target (2030), this analysis demonstrates that the Project would demonstrate progress toward, and be on the trajectory toward, helping the state comply with its long-term targets in EO S-3-05. Developing community-wide mass reduction goals using this approach is consistent with CARB recommendations to determine the targets "based on local emissions sectors" and to "develop community-wide GHG emissions reduction goals necessary to reach 2030 and 2050 climate goals" (CARB 2017a, pp. 100–101).

As provided in the City's *2012 Greenhouse Gas Emissions Inventory*, the City's 1990 GHG emissions inventory totals approximately 847,166 MT CO_2e. Based on the 1990 US Census (US Census Bureau 1992), the City's SP in 1990 was 235,344 (135,243 residents + 100,101 employees). Dividing the City's 1990 GHG emissions of 847,166 MT CO_2e by the 1990 SP gives an efficiency metric of 3.60 MT CO_2e per SP.

Consistent with EO B-30-15, the City's 2030 goal is 508,300 MT CO_2e (847,166 × [1−0.40]). Based on the SANDAG Series 13 model (SANDAG 2013), the City's SP in 2030 is estimated at 407,524 (313,474 residents + 94,050 employees).[10] Dividing the City's 2030 GHG emissions goal by the City's 2030 population results in an efficiency metric of 1.25 MT CO_2e per SP.

To develop an efficiency metric for the Project's buildout year of 2028, it is necessary to interpolate between the efficiency metrics in 1990 and 2030. Table 15 shows the calculated efficiency metric for 2028, which is consistent with EO B-30-15.

[9] Service population is defined as the number of residents plus the number of employees within the City.

[10] The SANDAG Series 13 model provides forecasts for years 2020 and 2035. The forecast for year 2030 was interpolated using the forecasts for 2020 and 2035.

Table 15. 2028 Interpolated Efficiency Metric

1990 Efficiency Metric (MT/SP/yr)	2030 Efficiency Metric (MT/SP/yr)	2028 Efficiency Metric[a] (MT/SP/yr)
3.60	1.25	1.37

Notes: MT = metric tons; SP = service population; yr = year.

[a] The 2028 efficiency metric was calculated as follows: {[(2030 Efficiency Metric − 1990 Efficiency Metric) ÷ (2030 − 1990)] × (2028 − 1990)} + (1990 Efficiency Metric).

As shown in Table 15, the calculated efficiency metric for 2028 based on the City's emissions inventory in 2012 and GHG emissions reduction goal for 2030 was 1.37 MT CO_2e per SP, based on the statewide targets. If the Project achieves the 2028 efficiency metric, it would not interfere with attainment of the 2030 and 2050 statewide emission reduction targets, and therefore would not interfere with the state's and the City's ability to achieve the mid-term and long-term GHG reduction targets in the City's CAP.

3.4.2 Approach and Methodology

As discussed in Section 3.1.2, Greenhouse Gases, and Section 3.1.3, Global Warming Potential, this analysis assumes that the GWP for CH_4 is 25 and the GWP for N_2O is 298, based on the IPCC Fourth Assessment Report (IPCC 2007).

3.4.2.1 Construction

CalEEMod Version 2016.3.2 was used to estimate potential Project-generated GHG emissions during construction. Construction of the Project would result in GHG emissions primarily associated with use of off-road construction equipment, on-road hauling and vendor (material delivery) trucks, and worker vehicles. All details for construction criteria air pollutants discussed in Section 2.4.2.1 are also applicable for the estimation of construction-related GHG emissions. As such, see Section 2.4.2.1 for a discussion of construction emissions calculation methodology and assumptions.

3.4.2.2 Operation

CalEEMod Version 2016.3.2 was used to estimate potential Project-generated operational GHG emissions from area sources (landscape maintenance), energy sources (natural gas and electricity), mobile sources, solid waste, water supply and wastewater treatment, and stationary sources. Emissions from each category are discussed in the following text with respect to the Project. For additional details, see Section 2.4.2.3 for a discussion of operational emission calculation methodology and assumptions, specifically for area, energy (natural gas), and mobile sources. Operational year 2028 was assumed, following completion of construction.

Energy Sources

As represented in CalEEMod, energy sources include GHG emissions associated with building electricity and natural gas usage. Electricity use would contribute indirectly to GHGs, since GHG emissions occur at the site of the power plant, which is typically off site. Emissions were calculated by multiplying the energy use by the utility's carbon intensity (pounds of GHGs per megawatt-hour for electricity or 1,000 British thermal units for natural gas) for CO_2 and other GHGs. Annual natural gas and electricity emissions were estimated in CalEEMod using the emissions factors for San Diego Gas & Electric Company (SDG&E), which would be the energy source provider for the

proposed Project. For the operational year 2028, the emission factors for SDG&E were adjusted to reflect SDG&E's compliance with the RPS. Therefore, the 2027 RPS goal of 52% was used.

CalEEMod default values for energy consumption for the residential land use were applied for the Project analysis. The energy use is calculated in CalEEMod based on the California Residential End-Use Survey database. The program uses data collected during the Residential Appliance Saturation Survey to develop energy intensity values (electricity and natural gas usage per square foot per year) for residential buildings. Energy use in buildings (both natural gas and electricity) is divided by the program into end use categories subject to Title 24 requirements (end uses associated with the building envelope, such as the HVAC system, water heating system, and integrated lighting) and those not subject to Title 24 requirements (such as appliances, electronics, and miscellaneous "plug-in" uses).

Title 24 of the California Code of Regulations serves to enhance and regulate California's building standards. The most recent amendments to Title 24, Part 6, referred to as the 2019 standards, became effective on January 1, 2020. The proposed Project would meet the 2016 California Building Energy Efficiency Standards (24 CCR, Part 6) at a minimum. Based on the Project's timeline, compliance with the 2019 Title 24 standards would be more likely. The Project operational energy emissions were adjusted to meet the 2019 Title 24 Standards, by assuming 53% less energy use than that under the 2016 standards (CEC 2018).

Solid Waste

The Project would generate solid waste and would therefore result in CO_2e emissions associated with landfill off-gassing. Solid waste generation was derived from the CalEEMod default rates for each land use type. Emission estimates associated with solid waste were estimated using CalEEMod. These rates, last updated in 2013, provide solid waste generation for different land use types prior to diversion (Qiguo, pers. comm. 2018). A solid waste diversion rate of 50% was assumed in accordance with AB 341 and AB 939.

Water Supply and Wastewater

Water supplied to the Project requires the use of electricity. Accordingly, the supply, conveyance, treatment, and distribution of water would indirectly result in GHG emissions through use of electricity. Annual water use for the Project and GHG emissions associated with the electricity used for water supply were calculated based on default water use estimates for the residential land use type, as estimated by CalEEMod and SDG&E factors.

Project Service Population

As previously discussed, a project's "service population" (SP) refers to a project's residents plus employees that would be generated by the project. To estimate the residents for the Project, the persons per household ratio for 2020 and 2035 from SANDAG's Series 13 forecast for the City were used to extrapolate the persons per household ratio for 2028, as shown in Table 16.

Table 16. 2020 and 2035 Calculated Persons per Household

Year	Population	Households	Persons per Household (Population/Household)
2020	287,173	89,176	3.220

Table 16. 2020 and 2035 Calculated Persons per Household

2035	326,625	101,188	3.228
2028	—	—	3.224[a]

Source: The population and household data are based on the household population and total housing units data in the in San Diego Association of Government's Series 13 Regional Growth Forecast (SANDAG 2013) for the City.

[a] The 2028 persons per household was calculated as follows: {[(2035 Persons per Household − 2020 Persons per Household) ÷ (2035 − 2020)] × (2028 − 2020)} + (2020 Persons per Household).

The interpolated persons per household ratio for 2028 based on the SANDAG data would be 3.224. Using the 2028 persons per household ratio of 3.224, as calculated above, and the 720 residential units, the estimated residential population of the Project would be 2,321.47, rounded to 2,321 residents. Since the Project would not have employees, the 2,321 residents accounts for the SP.

3.5 Impact Analysis

3.5.1 Would the project generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?

Construction Emissions

Construction of the Project would result in GHG emissions, which are primarily associated with use of off-road construction equipment, on-road hauling and vendor (material delivery) trucks, and worker vehicles. GHG emissions associated with temporary construction activity were quantified using CalEEMod. A detailed depiction of the construction schedule—including information regarding phasing, equipment used during each phase, haul trucks, vendor trucks, and worker vehicles—is included in Section 2.4.2.1 of this report.

Table 17 shows the estimated annual GHG construction emissions associated with the Project, as well as the amortized construction emissions over a 30-year project life.

Table 17. Estimated Annual Construction Greenhouse Gas Emissions

Year	CO_2	CH_4	N_2O	CO_2e
	Metric Tons			
2021	557.82	0.16	0.00	561.77
2022	2,235.46	0.22	0.00	2,240.93
2023	1,970.91	0.15	0.00	1,974.59
2024	1,945.56	0.14	0.00	1,949.18
2025	1,898.52	0.14	0.00	1,902.07
2026	1,863.72	0.14	0.00	1,867.21
2027	1,832.90	0.14	0.00	1,836.35
2028	595.08	0.05	0.00	596.21

Table 17. Estimated Annual Construction Greenhouse Gas Emissions

Year	CO_2	CH_4	N_2O	CO_2e
	Metric Tons			
			Total Emissions	12,928.31
			30-Year Amortized Emissions	**430.94**

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; CO_2e = carbon dioxide equivalent.
See Appendix A for complete results.

Total construction-related GHG emissions for the Project were 12,928 MT CO_2e. Estimated 30-year amortized Project-generated construction emissions would be approximately 431 MT CO_2e per year. However, because there is no separate GHG threshold for construction emissions alone, the evaluation of significance is discussed in the operational emissions analysis below.

Operational Emissions

Operation of the Project would generate GHG emissions through motor vehicle trips to and from the Project site; landscape maintenance equipment operation; energy use (natural gas and generation of electricity consumed by the Project); solid waste disposal; and generation of electricity associated with water supply, treatment, and distribution and wastewater treatment. CalEEMod was used to calculate the annual GHG emissions based on the operational assumptions described in Section 3.4.2.2, Operation. Although GHG emission reductions from implementation of **PDF-TRA-1** (see Section 4.4.8, Project Design Features, of the EIR) were not quantified, implementation of the following strategies would further reduce the project's vehicle miles traveled, which include providing ride share coordination services, coordinating with nearby schools to carpool to/from school, provide on-site transit opportunities information, and encourage bicycling by providing on-site bicycle infrastructure such as bike racks.

The estimated operational (year 2028) Project-generated GHG emissions from area sources, energy usage, motor vehicles, solid waste generation, and water usage and wastewater generation are shown in Table 18.

Table 18. Estimated Annual Operational Greenhouse Gas Emissions

Emission Source	CO_2	CH_4	N_2O	CO_2e
	Metric Tons per Year			
Area	8.74	0.01	0.00	8.95
Energy	1,150.05	0.04	0.01	1,155.24
Mobile	3,448.08	0.18	0.00	3,452.51
Solid waste	33.62	1.99	0.00	83.28
Water supply and wastewater	178.62	1.54	0.04	228.13
			Total	4,928.10
			Amortized Construction Emissions	430.94
			Operation + Amortized Construction Total	**5,359.05**

Notes: CO_2 = carbon dioxide; CH_4 = methane; N_2O = nitrous oxide; CO_2e = carbon dioxide equivalent.
See Appendix A for detailed results.
These emissions reflect CalEEMod "mitigated" output and operational year 2028.

As shown in Table 18, estimated annual Project-generated GHG emissions in 2028 would be approximately 4,928 MT CO_2e per year as a result of Project operations. Estimated annual Project-generated emissions in 2028 from area, energy, mobile, solid waste, water/wastewater, and amortized Project construction emissions would be approximately 5,359 MT CO_2e per year.

City-Specific Efficiency Metric

As discussed in Section 3.4.1, Thresholds of Significance, a quantitative analysis using a City-specific efficiency metric threshold for a post-2020 year (i.e., 2028) was developed. The efficiency metric calculated for 2028 (as shown in Section 3.4.1) is 1.37 MT CO_2e per SP.

As discussed in Section 3.4.2.2, the Project is anticipated to generate 2,321 residents. Using the estimated operational plus amortized construction emissions of 5,359 MT CO_2e and SP of 2,321, the Project would have a GHG efficiency metric of 2.31 MT CO_2e per SP. The Project's efficiency metric would exceed the significance threshold efficiency metric of 1.37 MT CO_2e per SP. Therefore, the Project would be considered to have a **potentially significant** impact with respect to GHG emissions without mitigation.

Mitigation

MM-GHG-1 **Greenhouse Gas Emissions Reduction Measures.** The following GHG emissions reduction measures shall be implemented:

- Off-road construction equipment with engines rated at 75 horsepower or greater shall meet at a minimum Tier 3 standard.
- Install purple pipes to provide reclaimed water for outdoor water use.
- Install low-flow water fixtures such as low-flow toilets, faucets, showers, etc.
- Two parking spaces shall be pre-wired to be electric vehicle (EV) capable and designated as preferential parking spaces shall be provided for carpool, shared, electric, and hydrogen vehicles.
- 718 parking garages shall be pre-wired to be EV capable.
- Energy-efficient lighting shall be used for all street, parking, and area lighting associated with the proposed project, including all on-site and off-site lighting.
- Energy-efficient design practices, such as high-performance glazing, Energy Star compliant systems and appliances, radiant heat roof barriers, insulation on all pipes, programmable thermostats, and sealed ducts, shall be implemented.
- Native species and drought-tolerant species shall be used for a minimum of 50% of the ornamental plant palette in non-turf areas to minimize water demand.
- Recycling of construction debris and waste shall be ensured through administration by an on-site recycling coordinator and presence of recycling/separation areas. Exceed the City of Chula Vista's Construction and Demolition Debris Waste Management Plan's 65% diversion of construction and demolition waste.
- Install cool roofs that meet the U.S. Green Building Council standards with a greater solar reflectivity to help conserve energy.

- Install 1,462-kilowatt solar photovoltaic system meeting the minimum 2019 Title 24 standards.
- Install bicycle racks.
- The project shall plant 600 trees and 40 acres of shrubs.

Level of Significance After Mitigation

Implementation of **MM-GHG-1** would minimize GHG emissions associated with Project construction and operations to the extent feasible. The Project would implement **PDF-TRA-1** (see Section 4.4.8, Project Design Features, of the EIR), which includes the following strategies that would further reduce the Project's vehicle miles traveled, including providing ride share coordination services, coordinating with nearby schools to carpool to/from school, provide on-site transit opportunities information, and encourage bicycling by providing on-site bicycle infrastructure such as bike racks. Furthermore, the Project would provide pedestrian and bicycle connectivity to the neighborhood due to proximity to bicycle routes, provide pedestrian sidewalk connections. Furthermore, the Project would be located near MTS bus routes 703 and 704 and I-805, and the East Palomar Transit Station is located approximately one mile from the Project site. The Project is located near commercial and employment centers in an urban setting. The Project would pre-wire two parking spots and the Project's 718 parking garages to be electric vehicle capable. In addition, the two pre-wired parking spots would be designated for carpool, shared, electric, and hydrogen vehicles. These Project characteristics would promote pedestrian and bicycle activity and encourage alternate forms of transportation. However, approximately 64% of the Project's annual GHG emissions are from mobile sources; therefore, to reduce GHG emissions to a less-than-significant level, the Project would need to reduce its total GHG emissions by approximately 65% to reduce the Project-generated GHG emissions below the City's efficiency threshold. Because the Project's SP-based emissions would be more than the City's efficiency metric of 1.37 MT CO_2e per SP, potential GHG emissions impacts would be considered **significant and unavoidable**.

3.5.2 Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

This section discusses the Project's consistency with the City's CAP, SANDAG's Regional Plan, and CARB's Scoping Plan.

Consistency with the CAP

The City's CAP is not considered a qualified GHG reduction plan in accordance with CEQA Guidelines Section 15183.5, as it has not been adopted in a public process following environmental review. Therefore, this consistency analysis is included for informational purposes only and will not be used to determine significance.

The Project includes several design features that will help reduce its GHG emissions in line with the City's CAP. Table 19 identifies the measures and goals within the CAP and the Project's consistency with them.

Table 19. City of Chula Vista Climate Action Plan Consistency Analysis

Category	Policy Objective or Strategy	Consistency Analysis
Water Conservation & Reuse		
Water Education & Enforcement	Expand education and enforcement [through fines] targeting landscape water waste	**Consistent.** The Project would not impair the ability of the City to expand education and enforcement targeting landscape water waste. Furthermore, as implemented by **MM-GHG-1,** native species and drought-tolerant species shall be used for a minimum of 50% of the ornamental plant palette in non-turf areas to minimize the Project's water demand. The Project would install purple pipes to use reclaimed water for irrigation.
Water Efficiency Upgrades	Update the City's Landscape Water Conservation Ordinance to promote more water-wise landscaping designs	**Consistent.** The Project would be consistent with the City's Landscape Water Conservation Ordinance. Furthermore, as implemented by **MM-GHG-1,** native species and drought-tolerant species shall be used for a minimum of 50% of the ornamental plant palette in non-turf areas to minimize the Project's water demand. The Project would install purple pipes to use reclaimed water for irrigation.
	Require water-savings retrofits in existing buildings at a specific point in time (not point of sale)	**Not applicable.** The Project would not impair the ability of the City to require water-savings retrofits for existing buildings.
Water Reuse Plan & System Installations	Develop a Water Reuse Master Plan to maximize the use of storm water, graywater [recycled water] and onsite water reclamation	**Consistent.** The Project would not impair the ability of the City to develop a Water Reuse Master Plan. As implemented by **MM-GHG-1,** the Project would install purple pipes to use reclaimed water for irrigation.
	Facilitate simple graywater systems for laundry-to-landscape applications	**Consistent**. As implemented by **MM-GHG-1,** the Project would install purple pipes to use reclaimed water for irrigation.
	Streamline complex graywater systems' permit review	**Not applicable.** The Project would not impair the ability of the City to streamline complex graywater systems permit review.

Table 19. City of Chula Vista Climate Action Plan Consistency Analysis

Category	Policy Objective or Strategy	Consistency Analysis
Waste Reduction		
Zero Waste Plan	Develop a Zero Waste Plan to supplement statewide green waste, recycling and plastic bag ban efforts	**Consistent**. The Project would not impair the ability of the City to develop a Zero Waste Plan. During both construction and operation of the Project, the Project would comply with all state regulations related to solid waste generation, storage, and disposal, including the California Integrated Waste Management Act, as amended. As implemented by **MM-GHG-1**, during construction, all wastes would be recycled to the maximum extent possible and exceed the City of Chula Vista's Construction and Demolition Debris Waste Management Plan's 65% diversion of construction and demolition waste.
Renewable & Energy Efficiency		
Energy Education & Enforcement	Expand education targeting key community segments [e.g., do-it-yourselfers and Millennials] and facilitating energy performance disclosure (e.g., Green Leases, benchmarking and Home Energy Ratings)	**Not applicable.** The Project would not impair the ability of the City to expand energy education.
	Leverage the building inspection process to distribute energy-related information and to deter unpermitted, low performing energy improvements	**Not applicable.** The Project would not impair the ability of the City to distribute energy-related information during the building inspection process.
Clean Energy Sources	Incorporate solar photovoltaic into all new residential and commercial buildings [on a project-level basis]	**Consistent.** The Project would install a 1,462-kW solar photovoltaic system meeting the minimum 2019 Title 24 requirement.
	Provide more grid-delivered clean energy (up to 100%) through Community Choice Aggregation or other mechanism	**Not applicable.** The Project would not impair the ability of the City to provide a Community Choice Aggregation of clean energy.
Energy Efficiency Upgrades	Expand the City's "cool roof" standards to include re-roofs and western areas	**Consistent**. The Project would install cool roof material, as implemented under **MM-GHG-1,** with a greater solar reflectivity to help conserve energy.
	Facilitate more energy upgrades in the community through incentives [e.g., tax	**Not applicable.** The Project would not impair the ability of the City to incentivize

Table 19. City of Chula Vista Climate Action Plan Consistency Analysis

Category	Policy Objective or Strategy	Consistency Analysis
	breaks and rebates], permit streamlining (where possible) and education [e.g., more local energy efficiency programming]	additional energy upgrades in the community.
	Require energy-savings retrofits in existing buildings at a specific point in time (not at point of sale)	**Not applicable.** The Project would not impair the ability of the City to require energy-savings retrofits for existing buildings.
Robust Urban Forests	Plant more shade trees to save energy, address heat island issues and improve air quality	**Consistent.** The Project would plant 600 shade trees on site to save energy and reduce heat island issues, consistent with the City's Shade Tree Policy No. 576-19.
Smart Growth & Transportation		
Complete Streets & Neighborhoods	Incorporate "Complete Streets" principles into municipal capital projects and plans [e.g., the Bicycle and Pedestrian Master Plans and Capital Improvement Program]	**Not applicable.** The Project would not impair the ability of the City to incorporate Complete Streets principles into the Bicycle and Pedestrian Master Plans and Capital Improvement Program. Furthermore, the Project would install bicycle racks.
	Encourage higher density and mixed-use development in Smart Growth areas, especially around trolley stations and other transit nodes	**Consistent.** The Project would be building on a site within the City and is located close to public transit and I-805 and install bicycle racks. The East Palomar Transit Station is located approximately one mile from the Project site. Furthermore, the project is located near commercial and employment centers in an urban setting.
Transportation Demand Management	Utilize bike facilities, transit access/passes and other Transportation Demand Management and congestion management offerings	**Consistent.** The Project would implement **PDF-TRA-1** (see Section 4.4.8, Project Design Features, of the EIR), which includes the following strategies that would further reduce the Project's vehicle miles traveled, including providing ride share coordination services, coordinating with nearby schools to carpool to/from school, provide on-site transit opportunities information, and encourage bicycling by providing on-site bicycle infrastructure such as bike racks.
	Expand bike-sharing, car-sharing and other "last mile" transportation options	**Consistent.** The Project would implement **PDF-TRA-1** (see Section 4.4.8, Project Design Features, of the EIR), which includes the following strategies that would further reduce the project's vehicle miles traveled, including providing ride share coordination services, coordinating

Table 19. City of Chula Vista Climate Action Plan Consistency Analysis

Category	Policy Objective or Strategy	Consistency Analysis
		with nearby schools to carpool to/from school, provide on-site transit opportunities information, and encourage bicycling by providing on-site bicycle infrastructure such as bike racks.
Alternative Fuel Vehicle Readiness	Support the installation of more local alternative fueling stations	**Consistent.** The Project would be in compliance with the current building standards. As implemented under **MM-GHG-1**, the Project would pre-wire two parking spots and the Project's 718 parking garages to be electric vehicle capable. Furthermore, the two pre-wired parking spots would be designated for carpool, shared, electric, and hydrogen vehicles.
	Designate preferred parking for alternative fuel vehicles	**Consistent.** As implemented under **MM-GHG-1**, the Project would pre-wire two parking spots and the Project's 718 parking garages to be electric vehicle capable. Furthermore, the two pre-wired parking spots would be designated for carpool, shared, electric, and hydrogen vehicles.
	Design all new residential and commercial buildings to be "Electric Vehicle Ready"	**Consistent.** As implemented under **MM-GHG-1**, the Project would pre-wire two parking spots and the Project's 718 parking garages to be electric vehicle capable.

Source: City of Chula Vista 2017.
Notes: City = City of Chula Vista; Project = Sunbow Planning Area 23 Amendment Project.

As shown in Table 19, the Project would be consistent with the applicable measures within the City's CAP.

Consistency with San Diego Forward: The Regional Plan

Regarding consistency with SANDAG's Regional Plan, the Project would include site design elements and PDFs developed to support the policy objectives of the RTP and SB 375.

Table 20 illustrates the Project's consistency with all applicable goals and policies of the Regional Plan (SANDAG 2015).

Table 20. San Diego Forward: The Regional Plan Consistency Analysis

Category	Policy Objective or Strategy	Consistency Analysis
The Regional Plan – Policy Objectives		
Mobility Choices	Provide safe, secure, healthy, affordable, and convenient travel	**Consistent.** The Project would provide pedestrian and bicycle connectivity to the neighborhood and install bicycle racks.

Table 20. San Diego Forward: The Regional Plan Consistency Analysis

Category	Policy Objective or Strategy	Consistency Analysis
	choices between the places where people live, work, and play.	Furthermore, the Project would be located near MTS bus routes 703 and 704 and I-805. The East Palomar Transit Station is located approximately one mile from the project site. The Project would implement PDF-TRA-1 (see Section 4.4.8, Project Design Features, of the EIR), which includes the following strategies that would encourage carpooling. Furthermore, the project is located near commercial and employment centers in an urban setting.
Mobility Choices	Take advantage of new technologies to make the transportation system more efficient and environmentally friendly.	**Not applicable.** The Project would not impair SANDAG's ability to employ new technologies to make travel more reliable and convenient.
Habitat and Open Space Preservation	Focus growth in areas that are already urbanized, allowing the region to set aside and restore more open space in our less developed areas.	**Consistent.** The Project would be located close to major urban centers, and the Project would provide housing to the area, while preserving adjacent open space as part of the Chula Vista MSCP Subarea Plan. Furthermore, the Project is located near commercial and employment centers in an urban setting.
Habitat and Open Space Preservation	Protect and restore our region's urban canyons, coastlines, beaches, and water resources.	**Not applicable.** The Project would not impair the ability of SANDAG to protect and restore urban canyons, coastlines, beaches, and water resources.
Regional Economic Prosperity	Invest in transportation projects that provide access for all communities to a variety of jobs with competitive wages.	**Not applicable.** The Project would not impair SANDAG's ability to invest in transportation projects available to all members of the community.
Regional Economic Prosperity	Build infrastructure that makes the movement of freight in our community more efficient and environmentally friendly.	**Not applicable.** The Project does not propose regional freight movement, nor would it impair SANDAG's ability to preserve and expand options for regional freight movement.
Partnerships/Collaboration	Collaborate with Native American tribes, Mexico, military bases, neighboring counties, infrastructure providers, the private sector, and local communities to design a transportation system that connects to the mega-region and national network, works for everyone, and fosters a high quality of life for all.	**Not applicable.** The Project would not impair SANDAG's ability to provide transportation choices to better connect the San Diego region with Mexico, neighboring counties, and tribal nations.
Partnerships/Collaboration	As we plan for our region, recognize the vital economic, environmental, cultural,	**Not applicable.** The Project would not impair SANDAG's ability to provide

Table 20. San Diego Forward: The Regional Plan Consistency Analysis

Category	Policy Objective or Strategy	Consistency Analysis
	and community linkages between the San Diego region and Baja California.	transportation choices to better connect the San Diego region with Mexico.
Healthy and Complete Communities	Create great places for everyone to live, work, and play.	**Consistent.** The Project would provide pedestrian and bicycle connectivity to the neighborhood and install bicycle racks. Furthermore, the Project would be located near MTS bus routes 703 and 704 and I-805. The East Palomar Transit Station is located approximately one mile from the project site. Furthermore, the Project is located near commercial and employment centers in an urban setting.
Healthy and Complete Communities	Connect communities through a variety of transportation choices that promote healthy lifestyles, including walking and biking.	**Consistent.** The Project would provide pedestrian and bicycle connectivity to the neighborhood and install bicycle racks. Furthermore, the Project would be located near MTS bus routes 703 and 704 and I-805. The East Palomar Transit Station is located approximately one mile from the project site. Furthermore, the Project is located near commercial and employment centers in an urban setting.
Environmental Stewardship	Make transportation investments that result in cleaner air, environmental protection, conservation, efficiency, and sustainable living.	**Consistent.** The Project would provide pedestrian and bicycle connectivity to the neighborhood and install bicycle racks. Furthermore, the Project would be located near MTS bus routes 703 and 704 and I-805. The East Palomar Transit Station is located approximately one mile from the Project site. Furthermore, the Project is located near commercial and employment centers in an urban setting. As implemented under **MM-GHG-1**, the project would pre-wire two parking spots and the Project's 718 parking garages to be electric vehicle capable. Furthermore, the two pre-wired parking spots would be designated for carpool, shared, electric, and hydrogen vehicles.
Environmental Stewardship	Support energy programs that promote sustainability.	**Consistent.** The Project would install a 1,462-kW solar photovoltaic system meeting the minimum 2019 Title 24 requirement.
Sustainable Communities Strategy – Strategies		
Strategy No. 1	Focus housing and job growth in urbanized areas where there is existing and planned transportation infrastructure, including transit.	**Consistent.** The Project would be located close to major urban centers, existing MTS transit service and the Project would provide housing to the area. The East

Table 20. San Diego Forward: The Regional Plan Consistency Analysis

Category	Policy Objective or Strategy	Consistency Analysis
		Palomar Transit Station is located approximately one mile from the Project site. Furthermore, the Project is located near commercial and employment centers in an urban setting.
Strategy No. 2	Protect the environment and help ensure the success of smart growth land use policies by preserving sensitive habitat, open space, cultural resources, and farmland.	**Consistent.** The Project would be located close to major urban centers, and the Project would provide housing to the area, while preserving on-site open space at part of the Chula Vista MSCP Subarea Plan. Furthermore, the Project is located near commercial and employment centers in an urban setting.
Strategy No. 3	Invest in a transportation network that gives people transportation choices and reduces greenhouse gas emissions.	**Consistent.** The Project would provide pedestrian and bicycle connectivity to the neighborhood. Furthermore, the Project would be located near MTS bus routes 703 and 704 and I-805. The East Palomar Transit Station is located approximately one mile from the Project site. The Project would implement PDF-TRA-1 (see Section 4.4.8, Project Design Features, of the EIR), which includes the following strategies that would further reduce the Project's vehicle miles traveled, including providing ride share coordination services, coordinating with nearby schools to carpool to/from school, provide on-site transit opportunities information, and encourage bicycling by providing on-site bicycle infrastructure such as bike racks. As implemented under **MM-GHG-1**, the Project would pre-wire two parking spots and the project's 718 parking garages to be electric vehicle capable. Furthermore, the two pre-wired parking spots would be designated for carpool, shared, electric, and hydrogen vehicles.
Strategy No. 4	Address the housing needs of all economic segments of the population.	**Consistent.** The Project would provide multifamily residential units that would expand the housing choices in the region.
Strategy No. 5	Implement the Regional Plan through incentives and collaboration.	**Not applicable.** The Project would not impair SANDAG's ability to implement the Regional Plan through incentives and collaboration.

Source: SANDAG 2015.
Notes: MTS = San Diego Metropolitan Transit System; Project = Sunbow Planning Area 23 Amendment Project; SANDAG = San Diego Association of Governments; MSCP = Multiple Species Conservation Program.

As shown in Table 20, the Project is consistent with all applicable Regional Plan policy objectives or strategies. Impacts would be less than significant.

Consistency with CARB's Scoping Plan

The Scoping Plan, approved by CARB on December 12, 2008, provides a framework for actions to reduce California's GHG emissions and requires CARB and other state agencies to adopt regulations and other initiatives to reduce GHGs. As such, the Scoping Plan is not directly applicable to specific projects. In the Final Statement of Reasons for the Amendments to the CEQA Guidelines, the California Natural Resources Agency observed that "[t]he [Scoping Plan] may not be appropriate for use in determining the significance of individual projects because it is conceptual at this stage and relies on the future development of regulations to implement the strategies identified in the Scoping Plan" (CNRA 2009). Under the Scoping Plan, however, there are several state regulatory measures aimed at the identification and reduction of GHG emissions. CARB and other state agencies have adopted many of the measures identified in the Scoping Plan. Most of these measures focus on area source emissions (e.g., energy usage, high-GWP GHGs in consumer products) and changes to the vehicle fleet (i.e., hybrid, electric, and more fuel-efficient vehicles) and associated fuels (e.g., Low Carbon Fuel Standard), among others. The Project would comply with all applicable regulations adopted in furtherance of the Scoping Plan to the extent required by law.

The Scoping Plan recommends strategies for implementation at the statewide level to meet the goals of AB 32 and establishes an overall framework for the measures that will be adopted to reduce California's GHG emissions. Table 21 highlights measures that have been developed under the Scoping Plan, including the recommended approaches for interim GHG thresholds under CEQA (CARB 2008b), and the Project's consistency with Scoping Plan measures. The table also includes measures in the 2017 Scoping Plan Update. To the extent that these regulations are applicable to the Project and its inhabitants or uses, the Project would comply with all applicable regulations adopted in furtherance of the Scoping Plan.

Table 21. Project Consistency with Scoping Plan Greenhouse Gas Emission Reduction Strategies

Scoping Plan Measure	Measure Number	Project Consistency
Transportation Sector		
Advanced Clean Cars	T-1	The Project's residents would purchase vehicles in compliance with CARB vehicle standards that are in effect at the time of vehicle purchase.
1.5 Million Zero-Emission and Plug-In Hybrid Light-Duty Electric Vehicles by 2025 (4.2 Million Zero-Emissions Vehicles by 2030)	N/A	As implemented under **MM-GHG-1**, the Project would pre-wire two parking spots and the Project's 718 parking garages to be electric vehicle capable. Furthermore, the two pre-wired parking spots would be designated for carpool, shared, electric, and hydrogen vehicles.
Low Carbon Fuel Standard	T-2	Motor vehicles driven by the Project's residents would use compliant fuels.
Low Carbon Fuel Standard (18% reduction in carbon intensity by 2030)	N/A	Motor vehicles driven by the Project's residents would use compliant fuels.

Table 21. Project Consistency with Scoping Plan Greenhouse Gas Emission Reduction Strategies

Scoping Plan Measure	Measure Number	Project Consistency
Regional Transportation-Related GHG Targets	T-3	The Project would provide pedestrian and bicycle connectivity to the neighborhood. Further, the Project would be located near MTS bus routes 703 and 704 and I-805. The East Palomar Transit Station is located approximately one mile from the project site. The Project would implement **PDF-TRA-1** (see Section 4.4.8, Project Design Features, of the EIR), which includes the following strategies that would further reduce the Project's vehicle miles traveled, including providing ride share coordination services, coordinating with nearby schools to carpool to/from school, provide on-site transit opportunities information, and encourage bicycling by providing on-site bicycle infrastructure such as bike racks. Furthermore, the Project is located near commercial and employment centers in an urban setting.
Advanced Clean Transit	N/A	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Last Mile Delivery	N/A	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Reduction in Vehicle Miles Traveled	N/A	The Project would provide pedestrian and bicycle connectivity to the neighborhood and install bicycle racks. Further, the Project site is located near MTS bus routes 703 and 704 and I-805. The East Palomar Transit Station is located approximately one mile from the Project site. The project would implement **PDF-TRA-1** (see Section 4.4.8, Project Design Features, of the EIR), which includes the following strategies that would further reduce the Project's vehicle miles traveled. Furthermore, the Project is located near commercial and employment centers in an urban setting.
Vehicle Efficiency Measures 1. Tire Pressure 2. Fuel Efficiency Tire Program 3. Low-Friction Oil 4. Solar-Reflective Automotive Paint and Window Glazing	T-4	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Ship Electrification at Ports (Shore Power)	T-5	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.

Table 21. Project Consistency with Scoping Plan Greenhouse Gas Emission Reduction Strategies

Scoping Plan Measure	Measure Number	Project Consistency
Goods Movement Efficiency Measures 1. Port Drayage Trucks 2. Transport Refrigeration Units Cold Storage Prohibition 3. Cargo Handling Equipment, Anti-Idling, Hybrid, Electrification 4. Goods Movement Systemwide Efficiency Improvements 5. Commercial Harbor Craft Maintenance and Design Efficiency 6. Clean Ships 7. Vessel Speed Reduction	T-6	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
California Sustainable Freight Action Plan	N/A	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Heavy-Duty Vehicle GHG Emission Reduction 1.Tractor-Trailer GHG Regulation 2.Heavy-Duty Greenhouse Gas Standards for New Vehicle and Engines (Phase I)	T-7	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Medium- and Heavy-Duty Vehicle Hybridization Voucher Incentive Project	T-8	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Medium and Heavy-Duty GHG Phase 2	N/A	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
High-Speed Rail	T-9	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Electricity and Natural Gas Sector		
Energy Efficiency Measures (Electricity)	E-1	The Project will comply with current Title 24, Part 6, of the California Code of Regulations energy efficiency standards for electrical appliances and other devices at the time of building construction. As implemented by **MM-GHG-1**, the Project would install energy-efficient lighting for all street, parking, and area lighting associated with the Project. Furthermore, energy-efficient design practices, such as high-performance glazing, Energy Star compliant systems and appliances, radiant heat roof barriers, insulation on all pipes, programmable thermostats, and sealed ducts, shall be implemented. The Project would install cool roof material with a greater solar reflectivity to help conserve energy. In addition, the Project would install a 1,462-kW solar photovoltaic system meeting the minimum 2019 Title 24 requirement.

Table 21. Project Consistency with Scoping Plan Greenhouse Gas Emission Reduction Strategies

Scoping Plan Measure	Measure Number	Project Consistency
Energy Efficiency (Natural Gas)	CR-1	The Project will comply with current Title 24, Part 6, of the California Code of Regulations energy efficiency standards for electrical appliances and other devices at the time of building construction.
Solar Water Heating (California Solar Initiative Thermal Program)	CR-2	The Project would not employ solar water heating. However, the Project would comply with the energy-efficient requirements of the current building codes.
Combined Heat and Power	E-2	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Renewables Portfolio Standard (33% by 2020)	E-3	The Project would use energy supplied by SDG&E, which is in compliance with the Renewables Portfolio Standard. In addition, the Project would install a 1,462-kW solar photovoltaic system meeting the minimum 2019 Title 24 requirement.
Renewables Portfolio Standard (50% by 2050)	N/A	The Project would use energy supplied by SDG&E, which is in compliance with the Renewables Portfolio Standard. In addition, the Project would install a 1,462-kW solar photovoltaic system meeting the minimum 2019 Title 24 requirement.
Senate Bill 1 Million Solar Roofs (California Solar Initiative, New Solar Home Partnership, Public Utility Programs) and Earlier Solar Programs	E-4	The Project would install a 1,462-kW solar photovoltaic system meeting the minimum 2019 Title 24 requirement.
Water Sector		
Water Use Efficiency	W-1	The Project's buildings would meet water use efficiency standards that are in effect at the time of construction. Furthermore, as implemented by **MM-GHG-1**, the Project shall install low-flow water fixtures such as low-flow toilets, faucets, showers, etc.
Water Recycling	W-2	As implemented by **MM-GHG-1,** the Project would install purple pipes to use reclaimed water for irrigation.
Water System Energy Efficiency	W-3	This is applicable for the transmission and treatment of water, but it is not applicable for the Project.
Reuse Urban Runoff	W-4	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Renewable Energy Production	W-5	Applicable for wastewater treatment systems. Not applicable for the Project.

Table 21. Project Consistency with Scoping Plan Greenhouse Gas Emission Reduction Strategies

Scoping Plan Measure	Measure Number	Project Consistency
Green Buildings		
State Green Building Initiative: Leading the Way with State Buildings (Greening New and Existing State Buildings)	GB-1	The Project would be constructed in compliance with state or local green building standards in effect at the time of building construction.
Green Building Standards Code (Greening New Public Schools, Residential and Commercial Buildings)	GB-2	The Project's buildings would meet green building standards that are in effect at the time of construction. As implemented by **MM-GHG-1**, the Project would install energy-efficient lighting for all street, parking, and area lighting associated with the Project. Furthermore, energy-efficient design practices, such as high-performance glazing, Energy Star compliant systems and appliances, radiant heat roof barriers, insulation on all pipes, programmable thermostats, and sealed ducts, shall be implemented. In addition, the Project would install a 1,462-kW solar photovoltaic system meeting the minimum 2019 Title 24 requirement
Beyond Code: Voluntary Programs at the Local Level (Greening New Public Schools, Residential and Commercial Buildings)	GB-3	The Project would be constructed in compliance with local green building standards in effect at the time of building construction. As implemented by **MM-GHG-1**, the Project would install energy-efficient lighting for all street, parking, and area lighting associated with the Project. Furthermore, energy-efficient design practices, such as high-performance glazing, Energy Star compliant systems and appliances, radiant heat roof barriers, insulation on all pipes, programmable thermostats, and sealed ducts, shall be implemented. In addition, the Project would install a 1,462-kW solar photovoltaic system meeting the minimum 2019 Title 24 requirement
Greening Existing Buildings (Greening Existing Homes and Commercial Buildings)	GB-4	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Industry Sector		
Energy Efficiency and Co-Benefits Audits for Large Industrial Sources	I-1	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Oil and Gas Extraction GHG Emission Reduction	I-2	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Reduce GHG Emissions by 20% in Oil Refinery Sector	N/A	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
GHG Emissions Reduction from Natural Gas Transmission and Distribution	I-3	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.

Table 21. Project Consistency with Scoping Plan Greenhouse Gas Emission Reduction Strategies

Scoping Plan Measure	Measure Number	Project Consistency
Refinery Flare Recovery Process Improvements	I-4	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan Measure.
Work with the Local Air Districts to Evaluate Amendments to Their Existing Leak Detection and Repair Rules for Industrial Facilities to Include Methane Leaks	I-5	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Recycling and Waste Management Sector		
Landfill Methane Control Measure	RW-1	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Increasing the Efficiency of Landfill Methane Capture	RW-2	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Mandatory Commercial Recycling	RW-3	During both construction and operation of the Project, the project would comply with all state regulations related to solid waste generation, storage, and disposal, including the California Integrated Waste Management Act, as amended. As implemented by **MM-GHG-1**, during construction, all wastes would be recycled to the maximum extent possible and exceed the City of Chula Vista's Construction and Demolition Debris Waste Management Plan's 65% diversion of construction and demolition waste.
Increase Production and Markets for Compost and Other Organics	RW-4	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Anaerobic/Aerobic Digestion	RW-5	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Extended Producer Responsibility	RW-6	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Environmentally Preferable Purchasing	RW-7	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Forests Sector		
Sustainable Forest Target	F-1	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.

Table 21. Project Consistency with Scoping Plan Greenhouse Gas Emission Reduction Strategies

Scoping Plan Measure	Measure Number	Project Consistency
High Global Warming Potential Gases Sector		
Motor Vehicle Air Conditioning Systems: Reduction of Refrigerant Emissions from Non-Professional Servicing	H-1	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
SF_6 Limits in Non-Utility and Non-Semiconductor Applications	H-2	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Reduction of Perfluorocarbons in Semiconductor Manufacturing	H-3	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Limit High Global Warming Potential Use in Consumer Products	H-4	The Project's employees would use consumer products that would comply with the regulations that are in effect at the time of manufacture.
Air Conditioning Refrigerant Leak Test During Vehicle Smog Check	H-5	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Stationary Equipment Refrigerant Management Program – Refrigerant Tracking/Reporting/Repair Program	H-6	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Stationary Equipment Refrigerant Management Program – Specifications for Commercial and Industrial Refrigeration	H-6	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
SF_6 Leak Reduction Gas Insulated Switchgear	H-6	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
40% Reduction in Methane and Hydrofluorocarbon Emissions	N/A	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
50% reduction in black carbon emissions	N/A	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.
Agriculture Sector		
Methane Capture at Large Dairies	A-1	This measure does not apply to the Project. The Project would not inhibit CARB from implementing this Scoping Plan measure.

Source: CARB 2008a, 2008b, 2017a.
Notes: Project = Sunbow Planning Area 23 Amendment Project; CARB = California Air Resources Board; N/A = not applicable; GHG = greenhouse gas; MTS = San Diego Metropolitan Transit System; SDG&E = San Diego Gas & Electric Company; SF_6 = sulfur hexafluoride.

In summary, the Project would be consistent with the applicable measures and policy goals as shown in Table 21. Because the proposed Project is consistent with the applicable plans, policies, and regulations adopted for regulation of GHG emissions, the Project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

The Project would provide pedestrian and bicycle connectivity to the neighborhood due to proximity to bicycle routes, provide pedestrian sidewalk connections. Furthermore, the Project would be located near MTS bus routes 703 and 704 and I-805. These Project characteristics would promote pedestrian and bicycle activity and alternate forms of transportation. However, because Project's SP-based emissions would be more than the City's efficiency metric of 1.37 MT CO_2e per SP, the proposed Project would potentially conflict with the state's ability to meet future GHG emission reductions. The Project's GHG emissions impact would be **potentially significant** without mitigation.

Mitigation Measures

Implementation of **MM-GHG-1** (see Section 3.5.1) would be required.

Level of Significance After Mitigation

The Project would provide bicycle parking facilities, connectivity for pedestrians, and located near transit, which would promote pedestrian and bicycle activity and alternate forms of transportation. The project would pre-wire two parking spots and the project's 718 parking garages to be electric vehicle capable. In addition, the two pre-wired parking spots would be designated for carpool, shared, electric, and hydrogen vehicles. The project would implement **PDF-TRA-1** (see Section 4.4.8, Project Design Features, of the EIR), which includes the following strategies that would further reduce the project's vehicle miles traveled, including providing ride share coordination services, coordinating with nearby schools to carpool to/from school, provide on-site transit opportunities information, and encourage bicycling by providing on-site bicycle infrastructure such as bike racks. Furthermore, the project would be located near MTS bus routes 703 and 704 and I-805, and the East Palomar Transit Station is located approximately one mile from the project site. In addition, the project is located near commercial and employment centers in an urban setting. These project characteristics would promote pedestrian and bicycle activity and encourage alternate forms of transportation.

GHG emissions associated with project would be minimize to the extent feasible with implementation of **MM-GHG-1,** which include installation of low-flow water fixtures, use of reclaimed water, pre-wiring for EV capable, installing energy-efficient appliances and design practices, installing cool roofs, and planting 600 trees and 40 acres of shrubs. Since the specific path to compliance for the state with regard to the long-term goals will likely require development of technology or other changes that are not currently known or available, specific additional mitigation measures for the proposed Project would be speculative and cannot be identified at this time.

Based on the preceding considerations, the proposed Project would conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. The proposed Project's GHG emissions would therefore result in a **significant and unavoidable** impact.

Sunbow Planning Area 23 Unmit

San Diego County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Other Asphalt Surfaces	16.84	Acre	16.84	733,550.40	0
Parking Lot	393.00	Space	3.54	157,200.00	0
Condo/Townhouse	720.00	Dwelling Unit	45.00	720,000.00	2059

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.6	**Precipitation Freq (Days)**	40
Climate Zone	13			**Operational Year**	2028
Utility Company	San Diego Gas & Electric				
CO2 Intensity (lb/MWhr)	427.49	**CH4 Intensity (lb/MWhr)**	0.017	**N2O Intensity (lb/MWhr)**	0.004

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Adjusted for RPS in 2028

Land Use -

Construction Phase - Construction phase dates provided by applicant.

Off-road Equipment - CalEEMod default assumptions.

Off-road Equipment - CalEEMod default assumptions.

Off-road Equipment - CalEEMod default assumptions.

Off-road Equipment - CalEEMod default assumptions.

Off-road Equipment - CalEEMod default assumptions.

Trips and VMT - CalEEMod default assumptions.

On-road Fugitive Dust - CalEEMod default assumptions.

Grading - Grading acreage provided by applicant. Balanced cut and fill onsite.

Architectural Coating - Project applicant confirmed would use no-VOC paints for interior and exterior. SDAPCD Rule 67.0.1 assumed for VOC for parking.

Vehicle Trips - Trip rates from traffic report.

Woodstoves - Applicant confirmed no fireplaces.

Consumer Products -

Area Coating - Project applicant confirmed would use no-VOC paints for interior and exterior. But SDAPCD Rule 67.0.1 assumed for VOC.

Energy Use - Assume 53% electricity reduction and 7% NG reduction

Construction Off-road Equipment Mitigation - Fugitive dust control measures.

Energy Mitigation -

Waste Mitigation - AB341 consistency.

Utility Company	San Diego Gas & Electric				
CO2 Intensity (lb/MWhr)	427.49	**CH4 Intensity (lb/MWhr)**	0.017	**N2O Intensity (lb/MWhr)**	0.004

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Adjusted for RPS in 2028

Land Use -

Construction Phase - Construction phase dates provided by applicant.

Off-road Equipment - CalEEMod default assumptions.

Off-road Equipment - CalEEMod default assumptions.

Off-road Equipment - CalEEMod default assumptions.

Off-road Equipment - CalEEMod default assumptions.

Off-road Equipment - CalEEMod default assumptions.

Trips and VMT - CalEEMod default assumptions.

On-road Fugitive Dust - CalEEMod default assumptions.

Grading - Grading acreage provided by applicant. Balanced cut and fill onsite.

Architectural Coating - Project applicant confirmed would use no-VOC paints for interior and exterior. SDAPCD Rule 67.0.1 assumed for VOC for parking.

Vehicle Trips - Trip rates from traffic report.

Woodstoves - Applicant confirmed no fireplaces.

Consumer Products -

Area Coating - Project applicant confirmed would use no-VOC paints for interior and exterior. But SDAPCD Rule 67.0.1 assumed for VOC.

Energy Use - Assume 53% electricity reduction and 7% NG reduction

Construction Off-road Equipment Mitigation - Fugitive dust control measures.

Energy Mitigation -

Waste Mitigation - AB341 consistency.

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Adjusted for RPS in 2028

Land Use -

Construction Phase - Construction phase dates provided by applicant.

Off-road Equipment - CalEEMod default assumptions.

Off-road Equipment - CalEEMod default assumptions.

Off-road Equipment - CalEEMod default assumptions.

Off-road Equipment - CalEEMod default assumptions.

Off-road Equipment - CalEEMod default assumptions.

Trips and VMT - CalEEMod default assumptions.

On-road Fugitive Dust - CalEEMod default assumptions.

Grading - Grading acreage provided by applicant. Balanced cut and fill onsite.

Architectural Coating - Project applicant confirmed would use no-VOC paints for interior and exterior. SDAPCD Rule 67.0.1 assumed for VOC for parking.

Vehicle Trips - Trip rates from traffic report.

Woodstoves - Applicant confirmed no fireplaces.

Consumer Products -

Area Coating - Project applicant confirmed would use no-VOC paints for interior and exterior. But SDAPCD Rule 67.0.1 assumed for VOC.

Energy Use - Assume 53% electricity reduction and 7% NG reduction

Construction Off-road Equipment Mitigation - Fugitive dust control measures.

Energy Mitigation -

Waste Mitigation - AB341 consistency.

INTENTIONALLY LEFT BLANK

Summary

The purpose of this health risk assessment (HRA) is to determine the potential cancer risk and non-cancer health impacts to future sensitive residential receptors of the proposed Sunbow II, Phase 3 Project (Project) due to toxic air contaminant emissions generated by operation of the Otay Landfill (Landfill).

Air dispersion modeling and health risk calculations were conducted using the American Meteorological Society/ Environmental Protection Agency Regulatory Model (AERMOD) Version 19191 and the Hotspots Analysis and Reporting Program Version 2 (HARP2). The San Diego Air Pollution Control District's 2019 Supplemental Guidelines for Submission of Air Toxics "Hot Spots" Program and the Office of Environmental Health Hazard Assessment's 2015 Air Toxics Hot Spots Program Risk Assessment Guidelines Guidance Manual for Preparation of Health Risk Assessments were used to prepare this HRA. For the residential health risk, this HRA assumes that exposure would start in the third trimester through year 8 (from 2022 to 2030) for the Landfill operations, and assumes exposure would start in the third trimester through 30 years (from 2022 to 2052) for Landfill fugitive and flare sources, at all future sensitive receptor locations.

The Landfill-generated TAC emissions are estimated to result in a potential cancer risk at the maximally exposed residential receptor of 7.70 in 1 million, potential chronic health risk of 0.244, and potential acute health risk of 0.080. Furthermore, following closure of the Landfill in 2030, the cancer risk impact, chronic health risk, and acute health risk from Landfill fugitive and flare emissions would be reduced to 6.61 in 1 million.

INTENTIONALLY LEFT BLANK

1 Introduction

1.1 Purpose

This Health Risk Assessment (HRA) modeling analysis was prepared to estimate health risk impacts to future sensitive receptors of the proposed Sunbow II, Phase 3 Project (Project) from exposure to toxic air contaminant (TAC) emissions from the proximate Otay Landfill (Landfill). The analysis in this HRA uses air dispersion modeling and the Hotspots Analysis and Reporting Program Version 2 (HARP2) to evaluate potential health risks associated with the Project. Results of the modeling analysis are compared with the most recent California Environmental Quality Act (CEQA) significance thresholds established by the San Diego Air Pollution Control District (SDAPCD). Per CEQA Guidelines, Appendix G (14 CCR 15000 et seq.), the HRA directly addresses question (c): Would the project expose sensitive receptors to substantial pollutant concentrations?

1.2 Project Description

The proposed Project consists of development of 718 multi-family units on 44.2 acres, a 0.9-acre Community Purpose Facility site, and 5.9 acres of public streets, 16.5 acres of open space slopes and water quality basins and 0.3 acres of conserved wetland resources. Approximately 4.3 acres of Poggi Creek Conservation Easements and 63.6 acres of Multiple Species Conservation Program (MSCP) open space preserve areas are also within the project boundary. The Project site is located south of Olympic Parkway, between Brandywine Avenue and Heritage Road in the City of Chula Vista (City), California. The Project includes four unique multi-family attached residential product types with 15 unique floorplans, ranging in square footage from approximately 1,100 to 2,050 in two- and three-story units.

The project includes a Chula Vista General Plan Amendment, Sunbow General Development Plan Amendment, Sunbow Sectional Planning Area Plan Amendment, a rezone and a Tentative Map. The project also includes a Chula Vista MSCP Boundary Adjustment that would implement minor adjustments to the Planning Area 23 development limits and the adjacent MSCP Preserve open space areas and an MSCP Minor Amendment to address off-site grading impacts.

As required by the 2019 Building Energy Efficiency Standards (24 CCR, Part 6) and the 2019 California Green Building Standards Code (CALGreen; 24 CCR, Part 11), the Project would install high-efficiency return air filters on all heating, ventilation, and air conditioning systems serving the Project. The air filtration system shall reduce at least 90% of particulate matter emissions, such as can be achieved with a Minimum Efficiency Reporting Value 13 (MERV 13) air filtration system installed on return vents in residential units.

1.3 Sensitive Receptors

Some land uses are considered more sensitive to changes in air quality than others, depending on the population groups and the activities involved. People most likely to be affected by air pollution include children, elderly people, athletes, and people with cardiovascular and chronic respiratory diseases. Facilities and structures where these

air-pollution-sensitive people live or spend considerable amounts of time are known as sensitive receptors. Land uses where air-pollution-sensitive individuals are most likely to spend time include schools and schoolyards, parks and playgrounds, daycare centers, nursing homes, hospitals, and residential communities (sensitive sites or sensitive land uses) (CARB 2005). SDAPCD identifies sensitive receptors as those who are especially susceptible to adverse health effects from exposure to TACs, such as children, elderly people, and ill people. Sensitive receptors include schools (grades Kindergarten through 12), daycare centers, nursing homes, retirement homes, health clinics, and hospitals within 2 kilometers (1.2 miles) of the facility (SDAPCD 2019). The Project is creating new sensitive residential receptors, which are evaluated in this HRA.

1.4 Toxic Air Contaminants

A substance is considered toxic if it has the potential to cause adverse health effects in humans, including increasing the risk of cancer upon exposure, or acute (short-term) and/or chronic (long-term) non-cancer health effects. A toxic substance released into the air is considered a TAC. Examples include certain aromatic and chlorinated hydrocarbons, diesel particulate matter (DPM), certain metals, and asbestos. TACs are generated by a number of sources, including stationary sources, such as dry cleaners, gas stations, combustion sources, and laboratories; mobile sources, such as automobiles; and area sources, such as landfills. Adverse health effects associated with exposure to TACs may include carcinogenic (i.e., cancer-causing) and non-carcinogenic effects. Non-carcinogenic effects typically affect one or more target organ systems and may be experienced either by acute or chronic exposure to a given TAC.

California's air toxics control program began in 1983 with the passage of the Toxic Air Contaminant Identification and Control Act, Assembly Bill (AB) 1807, better known as the Tanner Bill. The Tanner Bill established a regulatory process for the scientific and public review of individual toxic compounds. When a compound becomes listed as a TAC under the Tanner process, the California Air Resources Board (CARB) normally establishes minimum statewide emission-control measures to be adopted by air quality management districts and air pollution control districts. By 1992, 18 of the 189 federal hazardous air pollutants had been listed by CARB as state TACs. In April 1993, CARB added 171 substances to the state program to make the state TAC list equivalent to the federal list of hazardous air pollutants. In 1998, CARB designated diesel engine exhaust particulate matter (DPM) as a TAC (CARB 1998). The exhaust from diesel engines is a complex mixture of gases, vapors, and particles, many of which are known human carcinogens. DPM has established cancer risk factors and relative exposure values for long-term, chronic health hazard impacts. No short-term, acute relative exposure values are established for DPM.

The second major component of California's air toxics program, supplementing the Tanner process, was provided by the passage of AB 2588, the Air Toxics "Hot Spots" Information and Assessment Act of 1987. AB 2588 currently regulates over 600 compounds, including all of the Tanner-designated TACs.

Additionally, Proposition 65, passed by California voters in 1986, required that a list of carcinogenic and reproductive toxicants found in the environment be compiled; the discharge of these toxicants into drinking water be prohibited; and warnings of public exposure by air, land, or water be posted if a significant adverse public health risk is posed. The emission of any of the listed substances by a facility would require a public warning unless health risks could be demonstrated to be less than significant.

In 2000, CARB approved a comprehensive Diesel Risk Reduction Plan to reduce diesel emissions from both new and existing diesel-fueled vehicles and engines. The regulation is anticipated to result in an 80% decrease in statewide diesel health risk in 2020 compared with the diesel risk in 2000. Additional regulations apply to new trucks and diesel fuel, including the On-Road Heavy-Duty Diesel Vehicle (In-Use) Regulation, On-Road Heavy-Duty (New) Vehicle Program, In-Use Off-Road Diesel Vehicle Regulation, and New Off-Road Compression-Ignition (Diesel) Engines and Equipment Program. These regulations and programs have timetables by which manufacturers must comply and existing operators must upgrade their diesel-powered equipment. Several Airborne Toxic Control Measures reduce diesel emissions, including In-Use Off-Road Diesel-Fueled Fleets (13 CCR 2449 et seq.) and In-Use On-Road Diesel-Fueled Vehicles (13 CCR 2025).

1.5 Cancer Risk

Cancer risk is defined as the increase in lifetime probability (chance) of an individual developing cancer due to exposure to a carcinogenic compound, typically expressed as the increased probability in 1 million. The cancer risk from inhalation of a TAC is estimated by calculating the inhalation (and if applicable, ingestion and dermal) dose in units of milligrams per kilogram (mg/kg) body weight per day based on an ambient concentration in units of micrograms per cubic meter (µg/m^3), breathing rate, and exposure period and multiplying the dose by the inhalation cancer potency factor, expressed as (mg/kg body weight per day)$^{-1}$. Cancer risks are typically calculated for all carcinogenic TACs and summed to calculate the overall increase in cancer risk to an individual. The calculation procedure assumes that cancer risk is proportional to concentrations at any level of exposure and that risks due to different carcinogens are additive. This approach is generally considered a conservative assumption at low doses and is consistent with the current Office of Environmental Health Hazard Assessment (OEHHA) regulatory approach. Exposure to carcinogenic TACs does not imply that the exposed individual would contract cancer; rather, the cancer risk is a probability of developing cancer if other factors (e.g., heredity, exposure to environmental or workplace risks that compromise the immune system, overall health) would result in an increased susceptibility to developing cancer.

1.6 Acute and Chronic Non-Cancer Health Impacts

The non-cancer health impact of an inhaled TAC is measured by the hazard quotient, which is the ratio of the ambient concentration of a TAC in units of µg/m^3 divided by the reference exposure level (REL), also in units of µg/m^3. The REL is the concentration at or below which no adverse health effects are anticipated. The REL is typically based on health effects on a particular target organ system, such as the respiratory system, liver, or central nervous system. Hazard quotients of individual TACs are then summed for each target organ system to obtain a hazard index.

INTENTIONALLY LEFT BLANK

2 Guidance and Thresholds

2.1 Office of Environmental Health Hazard Assessment's Guidance

OEHHA's most recent guidance is the 2015 Risk Assessment Guidelines Manual (OEHHA 2015), which was adopted in 2015 to replace the 2003 HRA Guidance Manual. The Children's Environmental Health Protection Act of 1999 (Senate Bill 25), which requires explicit consideration of infants and children in assessing risks from air toxics, requires revisions of the methods for both non-cancer and cancer risk assessment and of the exposure assumptions in the 2003 HRA Guidance Manual. In response to Senate Bill 25, OEHHA released three technical support documents addressing RELs (OEHHA 2008), cancer potency (OEHHA 2009), and exposure assessment and stochastic analysis (OEHHA 2012) and adopted the 2015 Risk Assessment Guidelines Manual (OEHHA 2015). The technical support document for RELs and continuing work to reevaluate TACs to ensure adequate protection for infants and children has led to revisions of RELs for approximately 10 chemicals and chemical families. The basic methodology for evaluating acute and chronic health effects using the RELs otherwise remained the same as in the previous guidance manual. Moreover, RELs are designed to protect the most sensitive individuals in the population, including infants and children, by selecting appropriate toxicological data and including margins of safety. Accordingly, the evaluation methods are assumed to protect children and other sensitive subpopulations (groups of more highly susceptible individuals) from adverse health effects in the event of exposure (OEHHA 2008).

The cancer risk methodology described in the exposure assessment and stochastic analysis technical support document and the 2015 Risk Assessment Guidelines Manual accounts for the higher sensitivity of infants and children by applying age-specific daily breathing rates (DBRs) and age-sensitivity factors (ASFs). According to the technical support document, "Accounting for effects of early-in life exposure requires accounting for both the increased potency of early in life exposure to carcinogens and the greater exposure on a per kg [kilogram] body weight that occurs early in life due to behavioral and physiological differences between infants and children, and adults" (OEHHA 2012). In the absence of chemical-specific data, OEHHA recommends a default ASF of 10 for the third trimester to age 2 years and an ASF of 3 for ages 2 through 15 years to account for potential increased sensitivity to carcinogens during childhood (OEHHA 2015). The ASF for adults is 1. In addition to the ASFs, children have higher DBRs per unit of body weight than adults. The OEHHA guidance manual considers the age-specific breathing rates in the cancer risk calculations.

In addition, OEHHA and CARB evaluated information from activity patterns databases to estimate the fraction of time at home (FAH) during the day. From the third trimester to age <2 years, 85% of time is spent at home. From age 2 through <16 years, 72% of time is spent at home. From age 16 years and greater, 73% of time is spent at home. However, for facilities with any school within the 1 in a million or greater isopleth, OEHHA recommends using an FAH of 100% for children under 16 years old (OEHHA 2015). Cancer risk parameters, such as ASFs, DBRs, exposure period, FAH, and cancer potency factors were based on the values and data recommended by OEHHA as implemented in HARP2.

2.2 San Diego Air Pollution Control District Guidance

SDAPCD's *Supplemental Guidelines for Submission of Air Toxics "Hot Spots" Program: Health Risk Assessments* (SDAPCD 2019) provides guidance to perform HRAs within the San Diego Air Basin. Although the SDAPCD guidance is specifically targeted toward health risk from air toxic emissions from stationary source operations, the thresholds were adapted here for informational purposes. SDAPCD's current thresholds of significance for TAC emissions from the operations of permitted and non-permitted sources are presented in Table 1.

Table 1. SDAPCD TAC Emissions Thresholds

	Non-Carcinogens
Carcinogens	*Chronic and Acute*
Maximally exposed individual risk equals or exceeds 10 in 1 million	Hazard Index equals or exceeds 1 for the maximally exposed individual

Source: SDAPCD 2019.
Notes: SDAPCD = San Diego Air Pollution Control District; TAC = toxic air contaminant.

3 Modeling Methodology

3.1 Emission Calculation

The Landfill operation TAC emission sources include a diesel grinder generator, landfill gas (LFG) flares, LFG fugitive emissions, off-road equipment, haul truck travel and idling emissions, and fugitive dust from landfill operations. This HRA was prepared using information from the *Air Toxics Health Risk Assessment for Otay Ranch Village 3 North* (CalRecycle 2020) and the *AB 2588 Health Risk Assessment for Otay Landfill* (SCS 2016). Additional Landfill information was obtained per the public records request to SDAPCD, including the Landfill permit applications, engineering evaluations, emissions calculations, and past and current permits (Gould 2020a). The Landfill's LFG-derived TAC emissions were estimated using SDAPCD's default emission factors, the U.S. Environmental Protection Agency (EPA) AP-42 emission factors, CARB's EMFAC2017 emission factors, and the EPA Landfill Gas Emissions Model (LandGEM), which projected future LFG generation.

Emission sources associated with operation of the Landfill, including haul vehicles, equipment, and the grinder generator, are not expected to operate after the landfill reaches capacity, which is expected to occur on February 28, 2030 (CalRecycle 2020). LFG-derived sources, however, are expected to continue operating over the full exposure duration.

For risk assessment purposes, coarse particulate matter (PM_{10}; particulate matter with an aerodynamic diameter equal to or less than 10 microns) in diesel exhaust is considered DPM, which is assumed to be originating mainly from diesel haul trucks traveling on site, truck idling, off-road equipment and the diesel-fueled grinder generator. Haul truck travel and idling emission rates were obtained from EMFAC2017. The LFG-derived fugitive and flare TAC emissions were identified from EPA's AP-42 (EPA 1995). The speciated suspended dust TAC emissions from haul truck travel on paved and unpaved roads on site were from the soil samples collected for the site (SCS 2013, 2016). The grinder generator TAC emissions were calculated using the Landfill's Title V permit (Title V Permit to Operate Number 971227). The off-road diesel equipment is subject to the Regulation for In-Use Off-Road Diesel-Fueled Fleets, and the equipment tier standards were updated from the 2013 SCS analysis (SCS 2013) and assumed to be in compliance with the Medium Fleet Average Best Available Control Technology (BACT) Requirements (CARB 2018).

As required by the 2019 Building Code, the Project would include installation of MERV 13 air filtration systems on return vents in the proposed residential units. EPA reported that the MERV 13 filters remove 90% of particles ranging from 1 to 10 microns (EPA 2019). Accordingly, this HRA assumes a 90% particulate matter reduction from MERV 13 filters, which are required for residential construction in accordance with the 2019 Title 24 Building Code. EPA conducted the National Human Activity Pattern Survey (NHAPS) to study where people spend their time. The results of the NHAPS showed that on average people spend 87% of their time in enclosed buildings and 6% of their time in enclosed vehicles (Kleipeis et al. 2001). This HRA includes the accounting for time spent indoors as identified in the NHAPS and the time spent away from home as recommended by OEHHA (OEHHA 2015). Accounting for the actual time spent indoors and exposure related to the residents within the Project provides a more realistic exposure scenario from TAC emissions from the Otay Landfill operation. Detailed emissions data are provided in Appendix A, Emission Calculations.

3.2 Dispersion Model

Air dispersion models calculate the atmospheric transport and fate of pollutants from the emission source. The models calculate the concentration of selected pollutants at specific downwind ground-level points, such as residential receptors. The transformation (fate) of an airborne pollutant, its movement with the prevailing winds (transport), its crosswind and vertical movement due to atmospheric turbulence (dispersion), and its removal due to dry and wet deposition are influenced by the pollutant's physical and chemical properties and by meteorological and environmental conditions. Factors such as distance from the source to the receptor, meteorological conditions, intervening land use and terrain, pollutant release characteristics, and background pollutant concentrations affect the predicted air concentration of an air pollutant. Air dispersion models have the capability to take all of these factors into consideration when calculating downwind ground-level pollutant concentrations.

A dispersion modeling analysis of the Landfill operations on the Project site was conducted for this HRA. The air dispersion modeling methodology was based on the generally accepted modeling practices of SDAPCD (SDAPCD 2019) and OEHHA (OEHHA 2015). The dispersion modeling was performed using AERMOD, which is the model that EPA approved for atmospheric dispersion of emissions (EPA 2015). AERMOD is a steady-state Gaussian plume model that incorporates air dispersion based on planetary boundary layer turbulence structure and scaling concepts, including treatment of surface and elevated sources, building downwash, and simple and complex terrain. Principal parameters of AERMOD for the Landfill modeling included the following:

- **Dispersion Model:** The air dispersion model used was AERMOD Version 19191, with the Lakes Environmental Software implementation/user interface, AERMOD View Version 9.8.3 (Lakes Environmental 2019). A unit emission rate of 1.0 grams per second (g/s) was applied to each source (i.e., truck idling, grinder generator, flares). Unit emission rate of 1 g/s was divided by the area of the area source to calculate the emission rate in units of grams per second per square meter. Furthermore, a unit emission rate was normalized over the line of adjacent volume sources (i.e., truck travel and equipment operation) for the AERMOD run to obtain the "X/Q" values. X/Q is a dispersion factor that is the average effluent concentration normalized by source strength, and is used as a way to simplify the representation of emissions from many sources. The maximum concentrations were determined for the 1-hour and period averaging periods.
- **Meteorological Data:** AERMOD-specific meteorological data for the Chula Vista air monitoring station used for the dispersion modeling was provided by SDAPCD as the most recent, available, and representative meteorological data available for the site (Gould 2020b). A 3-year meteorological data set from 2010 through 2012 was provided by SDAPCD in a preprocessed format suitable for use in AERMOD. A wind rose is provided for this station on Figure 1.
- **Urban and Rural Options:** Based on the land use procedure, at least 50% of the land use within the 3-kilometer (1.9-mile) radius from the Landfill site is I1 (Heavy Industrial), I2 (Light-Moderate Industrial), C1 (Commercial), R1 (Common Residential), and R2 (Compact Residential). Therefore, the Urban dispersion option was selected.
- **Terrain Characteristics:** Digital elevation data were imported into AERMOD and elevations were assigned to receptors and emission sources, as necessary. Digital elevation data were obtained through the AERMOD View in the U.S. Geological Survey's National Elevation Dataset format with a resolution of 1/3 degree

(approximately 10 meters [33 feet]), consistent with the SDAPCD guidance (SDAPCD 2019). The elevation of the site is 350 feet (107 meters) above sea level.

- **Sensitive Receptors:** A 25-meter (82-foot) Cartesian receptor grid was applied across the proposed Project site to establish the impact area and evaluate locations of maximum health risk impact.
- **Source Release Scenario:** Consistent with the 2013 and 2016 SCS Engineers analysis (SCS 2013, 2016) and the SDAPCD Engineering Evaluation Letter (SDAPCD 2017), the following sources were modeled:
    - Flares 1 and 2 were modeled as point sources with 50-foot and 30-foot release height, respectively; 13-foot and 6-foot inside stack diameter, respectively; 1,601°F exit gas temperature; and 2.899-meter per second (m/s) (or 9.511 feet per second [f/s]) exit gas velocity.
    - On-site truck travel was modeled as a line of adjacent volume sources with a plume height and width of 3 meters (9.8 feet) and release height of 1.5 meters (4.9 feet).
    - Unpaved and paved dust from truck travel was modeled as a line of adjacent volume sources with a plume height of 5.58 meters (18.31 feet), plume width of 8.51 meters (27.92 feet), and release height of 2.55 meters (8.37 feet).
    - Truck idling emissions were modeled as point sources with a release height of 4 meters (13.1 feet); inside stack diameter of 0.33 feet; 442°F exit gas temperature; and 49.0 m/s (160.8 f/s) exit gas velocity.
    - The grinder generator was modeled as a point source with a release height from the ground at 0 meters; inside stack diameter of 0.33 feet; 1,100°F exit gas temperature; and 0.001 m/s (0.003 f/s) exit gas velocity.
    - Off-road equipment was modeled as a line of adjacent volume sources with a plume height and width of 2.33 meters (7.64 feet) and release height of 5 meters (16 feet).
    - Landfill gas fugitive emissions were modeled as an area polygon source with a release height of 0 meters and initial vertical dimension of 0 meters.
    - The grinder generator was modeled as a building (50 feet in length, 12 feet in width, and 13.5 feet in height) to account for the grinder generator point source being affected by building downwash.

3.3 Health Risk Assessment Methodology

In March 2015, OEHHA approved the 2015 Risk Assessment Guidelines Manual (OEHHA 2015). This HRA followed the SDAPCD methodology in conjunction with the 2015 Risk Assessment Guidelines Manual. Cancer and non-cancer health risk calculations were performed for the Project using ground-level unity emission concentration (X/Q) input from AERMOD. Based on the Landfill operation schedule of 8 hours per day, 6 days per week, the variable emission factor of 4.5 was applied to off-road equipment and the grinder generator. Based on the haul truck schedule of 11 hours per day, 6 days per week, the variable emission factor of 3.27 was applied to the haul truck movement, paved and unpaved road dust, and haul truck idling. This modeling established the emissions dispersion field to the future sensitive receptors from atmospheric influence of the Landfill TAC emissions. Plot files generated in AERMOD were then imported into HARP2, with ground level concentrations determined by multiplication of emission rates and X/Q values for the total sources of emissions. The cancer risk calculations were performed by multiplying the AERMOD-predicted TAC concentrations in $\mu g/m^3$ per unit g/s due to TAC emissions from the Landfill by the appropriate risk values. HARP2 then assessed resulting cancer and non-cancer risk at the future receptors

from exposure to TAC emissions using the Risk Management Policy-derived calculation method (OEHHA 2015). The mandatory minimum pathways of exposure (i.e., inhalation, soils, dermal, mother's milk, and homegrown produce) were selected for the operation-generated TAC emissions.

The first Project residential unit would be occupied in 2022, full Project buildout would occur in 2028, and the Landfill would cease operation in 2030 (CalRecycle 2020). Therefore, this HRA conservatively assumes exposure would start in the third trimester through year 8 for the Landfill operations (from 2022 to 2030), and assumes exposure would start in the third trimester through 30 years (from 2022 to 2052) for Landfill fugitive and flare sources at all future sensitive receptor locations. SDAPCD has also established non-carcinogenic risk parameters for use in HRAs because some TACs increase non-cancer health risk due to long-term (chronic) exposures and some TACs increase non-cancer health risk due to short-term (acute) exposures. Non-carcinogenic risks are quantified by calculating a hazard index, expressed as the ratio between the ambient pollutant concentration and its toxicity or REL, which is a concentration at or below which health effects are not likely to occur. The Chronic Hazard Index is the sum of the individual substance chronic hazard indices for all TACs affecting the same target organ system, similarly calculated for the Acute Hazard Index.

4 Health Risk Results

Landfill Health Risk Results

Table 2 summarizes the HRA results based on the HRA methodology described above and contained in Appendix B, AERMOD Input and HARP2 Output Files. The cancer risk contour can be found on Figure 2. Furthermore, following closure of the Landfill in 2030, the cancer risk impact from Landfill fugitive and flare emissions would be reduced to 6.61 in 1 million. In addition, chronic health risk and acute health risk would also be further reduced.

Table 2. Summary of Maximum Cancer, Chronic, and Acute Health Risks – Unmitigated

Impact Parameter	Units	Project Impact	CEQA Threshold	Level of Significance
Cancer Risk	Per million	7.70	10	Less than significant
Chronic Hazard Index	Index value	0.244	1.0	Less than significant
Acute Hazard Index	Index value	0.080	1.0	Less than significant

5 Conclusions

The results determined in this HRA reflect reasonable estimates of source emissions and exhaust characteristics, available meteorological data near the Project site, and the use of currently approved air quality models. Given the limits of available tools for such an analysis, the actual impacts may vary from the estimates in this HRA. However, the combined use of the AERMOD dispersion model and the health impact calculations required by OEHHA and SDAPCD tend to overpredict impacts, such that they produce conservative (i.e., health-protective) results. For this reason, the estimated cancer risks and non-cancer hazard indices reported in this analysis are likely upper-bound estimates for potential exposure to Project-related emissions. In addition, the estimated cancer risks and non-cancer hazard indices represent the maximum exposed individual resident and do not represent the risk over a broad area. Overall, the actual risks of cancer or non-cancer effects from the Landfill are likely to be lower than presented herein.

Potential health risk at future residential receptors from the Landfill would result in potential cancer health risk less than the applicable SDAPCD threshold. Chronic health risk and acute health risk from the Landfill would not exceed the applicable SDAPCD thresholds. Furthermore, following closure of the Landfill in 2030, the cancer risk impact, chronic health risk, and acute health risk from the Landfill would be further reduced.

NOTES:

(1) List of TACs and HAPs derived from California Code of Regulations 93000 and Title III Clean Air Act Ammendments and includes compound listed in AP-42 Table 2.4-1 and 2.4- 2.

(2) Average concentration of compounds found in LFG based on "Waste Industry Air Coalition Comparison of Recent Landfill Gas Analyses with Historic AP-42 Values." Mercury concentrations are based on the Revised EPA AP-42 Section 2.4 Table 2.4-1 (11/98).

(3) Based on concentrations shown and estimated highest 30-year average LFG generation rate for the landfill derived from LandGEM using site-specific k and Lo parameters (see Table 2-2 for model output).

(4) Collection efficiency of 75%

(5) NHAPS, people spend 6% in enclosed vehicles.

MODEL VARIABLES

Estimated landfill gas total flow from landfill: 5285 cfm

Estimated methane content of LFG: 50.0%

LFG Collection Efficiency 75.00% Collection Efficeincy per AP-42

Assume 2 trucks listed under off-road equipment operate 8 hours per day, 300 days per yea

Consistent with 2013 SCS HRA Report,Genral public emission factor assumes a typical mix of diesel and gasoline vehicles

Consistent with 2013 SCS HRA Report, transport vehicles assumed to be heavy duty diesel. Idle emissions assume 5 minutes of idling per trip

(1) EPA 2018, MERV 13 90% reduction in PM1 to PM10 and other TACs

(2) NHAPS, people spend 87% of time in enclosed buildings and 6% in enclosed vehicles.

Tier or emission factor assumed to be lowest required tier/highest allowed emission factor.

Equipment list from 2013 SCS HRA Report. Operating load obtained from CalEEMod Appendix A. Operating hours assumed to be 1 shift, 300 days/year.

(1) EPA 2018, MERV 13 90% reduction in PM1 to PM10 and other TACs

(2) NHAPS, people spend 87% of time in enclosed buildings and 6% in enclosed vehicles.

All Remaining Vehicles Exempt from this year's BACT Requirement:															
Actions taken on fleet between January 1, 2022 and December 31, 2022															
Total Fleet Horsepower	2023 Fleet Average Index	2023 Fleet Average Target	1/1/2023 Target Met	2023 BACT Requirement	BACT Credits Earned	1/1/2023 BACT Met	NOTE: after 2023, fleets must continue to turn over 10% of their fleet each year as per the BACT Requirement until their Fleet Average Index meets the 2023 Fleet Average Target. BACT Credit will no longer carry over from year to year, and so cannot be used to satisfy these future BACT Requirements.

HARP2 - HRACalc (dated 19044) 4/15/2020 9:32:03 AM - Output Log

GLCs loaded successfully
Pollutants loaded successfully
Pathway receptors loaded successfully
****
RISK SCENARIO SETTINGS

Receptor Type: Resident
Scenario: Cancer
Calculation Method: Derived

****
EXPOSURE DURATION PARAMETERS FOR CANCER

Start Age: -0.25
Total Exposure Duration: 8

Exposure Duration Bin Distribution
3rd Trimester Bin: 0.25
0<2 Years Bin: 2
2<9 Years Bin: 6
2<16 Years Bin: 0
16<30 Years Bin: 0
16 to 70 Years Bin: 0

****
PATHWAYS ENABLED

NOTE: Inhalation is always enabled and used for all assessments. The remaining pathways are only used for cancer and noncancer chronic assessments.

Inhalation: True
Soil: True
Dermal: True
Mother's milk: True
Water: False
Fish: False
Homegrown crops: False
Beef: False
Dairy: False
Pig: False
Chicken: False
Egg: False

****
INHALATION

Daily breathing rate: RMP

Worker Adjustment Factors
Worker adjustment factors enabled: NO

Fraction at time at home
3rd Trimester to 16 years: OFF
16 years to 70 years: ON

****
SOIL & DERMAL PATHWAY SETTINGS

Deposition rate (m/s): 0.02
Soil mixing depth (m): 0.01
Dermal climate: Mixed

****
TIER 2 SETTINGS

Tier2 adjustments were used in this assessment. Please see the input file for details.
Tier2 - What was changed: ED or start age changed|
Calculating cancer risk
Cancer risk breakdown by pollutant and receptor saved to: C:\Users\swang\Documents\1. Projects\12612.04 Lennar Sunbow Landfill HRA 2020.03\HARP2\8yrMERV13\hra\8yrCancerMERV13CancerRisk.csv
Cancer risk total by receptor saved to: C:\Users\swang\Documents\1. Projects\12612.04 Lennar Sunbow Landfill HRA 2020.03\HARP2\8yrMERV13\hra\8yrCancerMERV13CancerRiskSumByRec.csv

HARP2 - HRACalc (dated 19044) 4/15/2020 9:33:43 AM - Output Log

GLCs loaded successfully
Pollutants loaded successfully
Pathway receptors loaded successfully
****
RISK SCENARIO SETTINGS

Receptor Type: Resident
Scenario: Cancer
Calculation Method: Derived

****
EXPOSURE DURATION PARAMETERS FOR CANCER

Start Age: -0.25
Total Exposure Duration: 30

Exposure Duration Bin Distribution
3rd Trimester Bin: 0.25
0<2 Years Bin: 2
2<9 Years Bin: 0
2<16 Years Bin: 14
16<30 Years Bin: 14
16 to 70 Years Bin: 0

****
PATHWAYS ENABLED

NOTE: Inhalation is always enabled and used for all assessments. The remaining pathways are only used for cancer and noncancer chronic assessments.

Inhalation: True
Soil: True
Dermal: True
Mother's milk: True
Water: False
Fish: False
Homegrown crops: False
Beef: False
Dairy: False
Pig: False
Chicken: False
Egg: False

****
INHALATION

Daily breathing rate: RMP

Worker Adjustment Factors
Worker adjustment factors enabled: NO

Fraction at time at home
3rd Trimester to 16 years: OFF
16 years to 70 years: ON

****
SOIL & DERMAL PATHWAY SETTINGS

Deposition rate (m/s): 0.02
Soil mixing depth (m): 0.01
Dermal climate: Mixed

****
TIER 2 SETTINGS

Tier2 adjustments were used in this assessment. Please see the input file for details.
Tier2 - What was changed: ED or start age changed|
Calculating cancer risk
Cancer risk breakdown by pollutant and receptor saved to: C:\Users\swang\Documents\1. Projects\12612.04 Lennar Sunbow Landfill HRA 2020.03\HARP2\30yrMERV13\hra\30yrCancerMERV13CancerRisk.csv
Cancer risk total by receptor saved to: C:\Users\swang\Documents\1. Projects\12612.04 Lennar Sunbow Landfill HRA 2020.03\HARP2\30yrMERV13\hra\30yrCancerMERV13CancerRiskSumByRec.csv

HARP2 - HRACalc (dated 19044) 4/15/2020 9:46:13 AM - Output Log

GLCs loaded successfully
Pollutants loaded successfully
Pathway receptors loaded successfully
****
RISK SCENARIO SETTINGS

Receptor Type: Resident
Scenario: NCAcute
Calculation Method: Derived

****
EXPOSURE DURATION PARAMETERS FOR CANCER
Exposure duration are only adjusted for cancer assessments

****
PATHWAYS ENABLED

NOTE: Inhalation is always enabled and used for all assessments. The remaining pathways are only used for cancer and noncancer chronic assessments.

Inhalation: True
Soil: False
Dermal: False
Mother's milk: False
Water: False
Fish: False
Homegrown crops: False
Beef: False
Dairy: False
Pig: False
Chicken: False
Egg: False

****
INHALATION

Daily breathing rate: LongTerm24HR

Worker Adjustment Factors
Worker adjustment factors enabled: NO

Fraction at time at home
NOTE: Exposure duration (i.e., start age, end age, ED, & FAH) are only adjusted for cancer assessments.

****

TIER 2 SETTINGS

Tier2 adjustments were used in this assessment. Please see the input file for details.
Tier2 - What was changed: ED or start age changed|
Calculating acute risk
Acute risk breakdown by pollutant and receptor saved to:
C:\Users\swang\Documents\1. Projects\12612.04 Lennar Sunbow Landfill HRA 2020.03\HARP2\Acute\hra\AcuteMERV13NCAcuteRisk.csv
Acute risk total by receptor saved to: C:\Users\swang\Documents\1. Projects\12612.04 Lennar Sunbow Landfill HRA 2020.03\HARP2\Acute\hra\AcuteMERV13NCAcuteRiskSumByRec.csv
HRA ran successfully

HARP2 - HRACalc (dated 19044) 4/15/2020 9:37:39 AM - Output Log

GLCs loaded successfully
Pollutants loaded successfully
Pathway receptors loaded successfully
****
RISK SCENARIO SETTINGS

Receptor Type: Resident
Scenario: NCChronic
Calculation Method: Derived

****
EXPOSURE DURATION PARAMETERS FOR CANCER
Exposure duration are only adjusted for cancer assessments

****
PATHWAYS ENABLED

NOTE: Inhalation is always enabled and used for all assessments. The remaining pathways are only used for cancer and noncancer chronic assessments.

Inhalation: True
Soil: True
Dermal: True
Mother's milk: True
Water: False
Fish: False
Homegrown crops: False
Beef: False
Dairy: False
Pig: False
Chicken: False
Egg: False

****
INHALATION

Daily breathing rate: LongTerm24HR

Worker Adjustment Factors
Worker adjustment factors enabled: NO

Fraction at time at home
NOTE: Exposure duration (i.e., start age, end age, ED, & FAH) are only adjusted for cancer assessments.

****

SOIL & DERMAL PATHWAY SETTINGS

Deposition rate (m/s): 0.02
Soil mixing depth (m): 0.01
Dermal climate: Mixed

****
TIER 2 SETTINGS

Tier2 adjustments were used in this assessment. Please see the input file for details.
Tier2 - What was changed: ED or start age changed|
Calculating chronic risk
Chronic risk breakdown by pollutant and receptor saved to: C:\Users\swang\Documents\1. Projects\12612.04 Lennar Sunbow Landfill HRA 2020.03\HARP2\Chronic\hra\ChronicMerv13NCChronicRisk.csv
Chronic risk total by receptor saved to: C:\Users\swang\Documents\1. Projects\12612.04 Lennar Sunbow Landfill HRA 2020.03\HARP2\Chronic\hra\ChronicMerv13NCChronicRiskSumByRec.csv
HRA ran successfully
