Executive Summary

This report presents the results of the traffic impact analysis conducted for the proposed hotel development located at 1290 Coleman Avenue in Santa Clara, California. The site is on the southeast corner of the Brokaw Road and Coleman Avenue intersection. The project site is currently developed with restaurants and retail space with a surface parking lot. The proposed project would demolish the existing buildings and construct a 7-story, 396-room hotel with 284 parking spaces. Access to the project site would be provided via one driveway on Coleman Avenue and one driveway on Brokaw Road.

Scope of Study

This study was conducted for the purpose of identifying the potential traffic impacts related to the proposed development. Although the proposed project is located in the City of Santa Clara, the proposed project also would add traffic to facilities in San Jose. Thus, the impacts of the project were evaluated following the standards and methodologies set forth by the Cities of Santa Clara and San Jose and the Santa Clara Valley Transportation Authority (VTA). The VTA administers the County Congestion Management Program (CMP).

The traffic study includes an analysis of AM and PM peak-hour traffic conditions for eight signalized intersections. The study intersections were selected based upon the estimated number of project trips through the intersection (10 or more trips per lane per hour) and in coordination with the City of Santa Clara. The study also includes analyses of intersection vehicle queueing, site access and on-site circulation, potential impacts on bicycle, pedestrian, and transit facilities, and parking.

Project Trip Generation

Project trip estimates are based on trip generation rates obtained from the Institute of Transportation Engineers' (ITE's) *Trip Generation Manual*, 10th Edition, for "Hotel" (Land Use 310). Trips associated with the existing uses on the project site were subtracted from the road system. Based on the ITE trip generation rates and applicable reductions, it is estimated that the proposed project would generate 2,394 daily trips, with 156 trips (82 inbound and 74 outbound) occurring during the AM peak hour and 145 trips (86 inbound and 59 outbound) occurring during the PM peak hour.

Background Plus Project Intersection Levels of Service

Table ES-1 summarizes the results of the intersection level of service analysis under background plus project conditions. The results show that Coleman Avenue and Brokaw Road intersection located within

the City of Santa Clara would have an adverse effect by the project, according to applicable impact criteria. The proposed improvements to mitigate the impacts are described below.

Coleman Avenue and Brokaw Road

Improvement Measure. Change the signal control for Brokaw Road (the east and west legs of this intersection) from protected left-turn phasing to protected plus permissive phasing. Add a through lane to the east and west approaches within the existing right-of-way. The eastbound and westbound approaches will each have one left turn lane, one through lane, and one right turn lane. In addition, no U-turns would be allowed on northbound Coleman Avenue. A third southbound through lane on Coleman Avenue would also be needed by restriping the existing right turn lane into separate through and right-turn lanes. With implementation of these improvements and a cycle length of 140 seconds, the intersection would operate at an acceptable LOS E (average delay 72 seconds/vehicle) during the PM peak hour under background plus project conditions. This improvement does not require Brokaw Road to be widened. The improvement measure conditioned for approval of the Gateway Crossings development located on the west side of Coleman Avenue is one left turn lane, one shared left and through lane, and one right turn lane with split phase on the east and west legs and the addition of a third southbound through lane. The mitigation measure proposed for this project would require restriping of the shared left and through lane to an exclusive through lane on the east and west legs and change the signal control from split phase to protected plus permissive phasing.

Freeway Segment Capacity Analysis

The results of the CMP freeway segment analysis are summarized in Table ES-2. The results show that the project is not projected to add traffic volumes representing 1 percent or more of the freeway capacity. Based on CMP freeway impact criteria, none of the freeway segments would be impacted by the project.

Cumulative Plus Project Intersection Levels of Service

Table ES-1 summarizes the results of the intersection level of service analysis under Cumulative plus project conditions. The results show that the Coleman Avenue and Brokaw Road intersection located within the City of Santa Clara would have an adverse effect by the project, according to applicable impact criteria. The proposed improvements to mitigate the impacts are described below.

Coleman Avenue and Brokaw Road

Improvement Measure. The same improvement measures as described under Background + Project conditions would be needed for Cumulative conditions with the project. With implementation of these improvements, the intersection would operate at an acceptable LOS D (average delay 54.6 seconds/vehicle) during the AM peak hour and LOS F (average delay 141.4 seconds/vehicle) during the PM peak hour under cumulative plus project conditions, which is still better than cumulative no-project conditions.

Intersection Vehicle Queuing

The queuing analysis indicates that the maximum vehicle queues for the southbound left-turn pocket at the Coleman Avenue and Brokaw Road intersection would exceed the existing vehicle storage capacity under existing plus project and background plus project conditions during the AM peak hours by 25 feet, or 1 vehicle during AM peak hour and is not expected to block the through or the right turn traffic.

The queuing analysis indicates that the maximum vehicle queues for the westbound left-turn pocket at the Coleman Avenue and Brokaw Road intersection would exceed the existing vehicle storage capacity under existing, existing plus project, background, and background plus project conditions during both the AM and PM peak hours. The improvement measure at this intersection to address the level of service impact would change the lane striping on this leg by adding another through lane and change the left turn signal control to protected plus permissive phasing. This would provide additional time for left turn vehicles to clear the intersection and reduce the queue lengths.

Other Transportation Issues

The site plan shows adequate site access and circulation, and no significant traffic operational issues are expected to occur as a result of the project. The project would not have an adverse effect on the existing transit, pedestrian, or bicycle facilities in the study area.

Vehicle Miles Traveled

Pursuant to SB 743, the Governor's Office of Planning and Research (OPR) published the finalized updates to the CEQA Guidelines in November 2017. The Technical Advisory on Evaluating Transportation Impacts in CEQA published by OPR in December 2018 provided recommendations regarding VMT evaluation methodology, significance thresholds and screening thresholds for land use projects. The guidelines stated that Level of Service will no longer be considered to be an environmental impact under CEQA and considers vehicle-miles-travelled (VMT) the most appropriate measure of transportation impact. The OPR guidelines and City of Santa Clara VMT Policy state that transit supportive projects located within ½ mile of an existing major transit stop or an existing transit stop along a high quality transit corridor would have a less-than-significant impact on VMT and will not require a VMT analysis. Projects that do not meet the screening criteria for VMT analysis would have a less than significant impact if they result in a 15% VMT reduction compared to the baseline. The proposed project is located within 1,500 feet of the Santa Clara Caltrain station, which qualifies as a major transit stop, and the project would thus be presumed to have a less-than-significant impact on VMT per the City of Santa Clara guidelines.

Hexagon has the following recommendations resulting from the site access and circulation evaluation and the parking evaluation.

Recommendations

- Hexagon recommends that the island in the entry court (along Coleman Avenue) be removed. With the island removed, exiting vehicles could turn around in the court area to access the Brokaw Road driveway. Also, the valet drivers could turn vehicles around and access the garage from in front of the hotel.
- The project should provide four short term bicycle parking spaces near the building entrance based on the requirements in the VTA *Bicycle Technical Guidelines*.
- Hexagon recommends a “right turn only” sign at the Coleman Avenue driveway.

3. Level of service (LOS) of each segment are taken from VTA's 2018 CMP Monitoring Report.

Bold indicates a substandard level of service.

1. **Introduction**

This report presents the results of the traffic impact analysis conducted for the proposed hotel development located at 1290 Coleman Avenue in Santa Clara, California. The site is on the southeast corner of the Brokaw Road and Coleman Avenue intersection (see Figure 1). The project site is currently developed with restaurants and retail space with a surface parking lot. Among the three commercial buildings on the site, 312 Brokaw Road is occupied by the Airport Van Rental office, 1290 Coleman Avenue is occupied by the La Costa del Sol restaurant, and the 1240 Coleman Avenue restaurant is currently vacant. The proposed project would demolish the existing buildings and construct a 7-story, 396-room hotel with 284 parking spaces (see Figure 2). Access to the project site would be provided via one driveway on Coleman Avenue and one driveway on Brokaw Road.

Scope of Study

This study was conducted for the purpose of identifying the potential transportation impacts related to the proposed development. Although the proposed project is located in the City of Santa Clara, the project also would add traffic to facilities in San Jose. Thus, the impacts of the project were evaluated following the standards and methodologies set forth by the Cities of Santa Clara and San Jose and the Santa Clara Valley Transportation Authority (VTA). The VTA administers the County Congestion Management Program (CMP).

The study analyzes the traffic impacts of the project on the key intersections and freeways in the vicinity of the site during the weekday AM and PM peak hours of traffic. The AM peak hour of traffic is generally between 7:00 AM and 9:00 AM and the PM peak hour typically occurs between 4:00 PM and 6:00 PM on an average weekday. These are the peak commute hours during which most traffic congestion occurs on the roadways. The study also includes an analysis of the project's effects to transit, bicycle, and pedestrian facilities and a review of site access, on-site circulation, and parking.

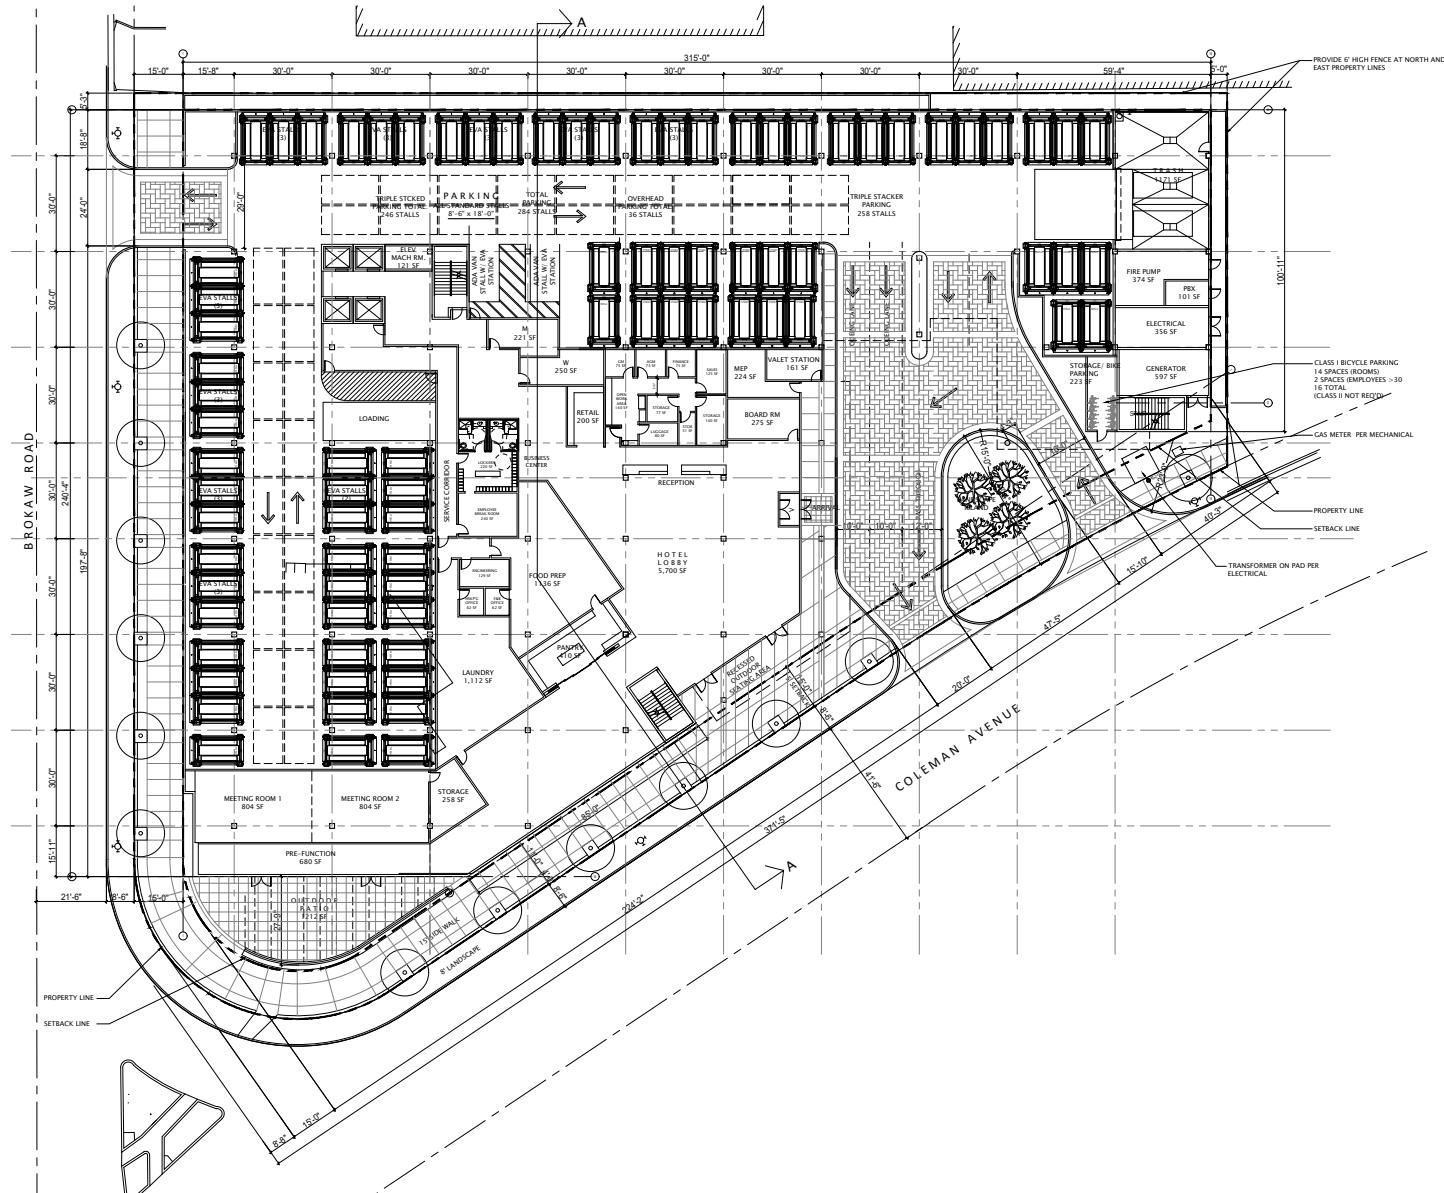

Figure 2
Site Plan

CEQA Transportation Analysis Policy

Historically, transportation analysis has utilized delay and congestion on the roadway system as the primary metric for the identification of traffic impacts and potential roadway improvements to relieve traffic congestion that may result due to proposed/planned growth. However, the State of California has recognized the limitations of measuring and mitigating only vehicle delay at intersections and in 2013 passed Senate Bill (SB) 743, which requires jurisdictions to stop using congestion and delay metrics, such as Level of Service (LOS), as the measurement for CEQA transportation analysis. With the adoption of SB 743 legislation, public agencies are required to base the determination of transportation impacts on VMT rather than level of service. This policy also establishes the requirement of a local transportation analysis to address transportation deficiencies resulting from a Project.

In adherence with SB 743, the City of San Clara has adopted a new Vehicle Miles Traveled Transportation Analysis Policy for Environmental Review. This policy requires all projects to evaluate and disclose transportation environmental impacts by measuring Vehicle Miles Traveled (VMT) per CEQA and also establishes Level of Service (LOS) as an operational measure of intersection efficiency, which is not defined as a transportation environmental impact per CEQA.

Study Intersections

The study intersections were selected in accordance with VTA's *Transportation Impact Analysis Guidelines* (October 2014) and in consultation with Santa Clara staff. The study includes those intersections that provide primary access to the project site and intersections that would experience a traffic increase of 10 or more peak-hour trips per lane. The study intersections are listed below and shown on Figure 1. All study intersections are signalized. Two of the study intersections are CMP intersections.

City of Santa Clara Intersections

1. Coleman Avenue and Brokaw Road
2. De La Cruz Boulevard and Reed Street
3. De La Cruz Boulevard and Martin Avenue
4. De La Cruz Boulevard and Central Expressway*

City of San Jose Intersections

5. Coleman Avenue and Aviation Avenue
6. Coleman Avenue and Newhall Drive
7. Coleman Avenue and Airport Boulevard
8. Coleman Avenue and I 880 (N)*

* Denotes CMP intersection

Intersection traffic conditions were evaluated for the following scenarios:

- **Existing Conditions.** Existing traffic volumes were obtained from the 2018 CMP count data, recently completed traffic studies, and new traffic counts conducted in October 2019.
- **Existing plus Project Conditions.** Existing plus project conditions represent existing peak-hour traffic volumes with the addition of traffic generated by the project. Existing plus project conditions were evaluated relative to existing conditions in order to identify potential deficiencies associated solely with the proposed project.
- **Background Conditions.** Background traffic volumes were estimated by adding to existing peak-hour volumes the projected volumes from approved but not yet constructed developments

in the study area. The added traffic from approved but not yet constructed developments was based on the list of approved projects provided by the City of Santa Clara and the approved project traffic data provided by the City of San Jose, which include Phase 1 of the North San Jose Development Policy. Background conditions represent the baseline conditions to which project conditions are compared for the purpose of determining project impacts.

- **Background plus Project Conditions.** Background plus project conditions were estimated by adding to the background traffic volumes the new traffic estimated to be generated by the project. Background plus project conditions were evaluated relative to background conditions in order to determine potential project impacts.
- **Cumulative No Project Conditions.** Cumulative conditions represent future traffic volumes on the future roadway network. Cumulative conditions include traffic growth projected to occur due to the approved development projects and other proposed but not yet approved (pending) development projects in the study area. The added traffic from pending projects was based on lists provided by Santa Clara and San Jose, which include traffic generated by Phases 1-3 of the City Place development and Phase 2 of the North San Jose Development Policy. Traffic volumes from pending projects were added to background conditions peak-hour volumes to obtain volumes for cumulative no project conditions.
- **Cumulative Plus Project Conditions.** Cumulative plus project conditions were estimated by adding to the cumulative no project traffic volumes the new traffic estimated to be generated by the project. Cumulative plus project conditions were evaluated relative to cumulative conditions in order to determine potential project impacts on cumulative conditions.

Study Freeway Segments

Per VTA's Guidelines, freeway segment level of service analysis should be conducted on all segments to which the project is projected to add one percent or more to the segment capacity. Based on the trip generation and trip distribution estimates included in Chapter 4, the project is not projected to add one percent to any freeway segments in the area. The percentage of traffic projected to be added by the project to freeway segments in the project area is summarized in Table 1. Since the number of project trips on the freeway segments would be less than the one-percent threshold, the project would not cause a significant increase in traffic on the freeway segments in the study area, and a freeway level of service analysis is not required.

Methodology

This section presents the methods used to determine the intersection traffic conditions and the traffic impacts of the project. It includes descriptions of the data requirements, the analysis methodologies, and the applicable level of service standards.

Data Requirements

The data required for the analysis were obtained from new traffic counts, previous traffic studies, the Cities of Santa Clara, San Jose, the CMP, and field observations. The following data were collected from these sources:

- Existing traffic volumes
- Existing lane configurations
- Signal timing and phasing
- A list of approved and pending projects

1. Number of lanes on each segment are taken from the Google Earth software.

2. Capacity is based on the capacities cited in VTA's *Transportation Impact Analysis Guidelines (2014)*.3. Level of service (LOS) of each segment are taken from VTA's *2018 CMP Monitoring Report*.**Bold** indicates a substandard level of service.

Intersection Level of Service Methodologies and Standards

Traffic conditions at the study intersections were evaluated using level of service (LOS). *Level of Service* is a qualitative description of operating conditions ranging from LOS A, or free-flow conditions with little or no delay, to LOS F, or jammed conditions with excessive delays.

The Cities of Santa Clara and San Jose evaluate level of service at signalized intersections based on the 2000 *Highway Capacity Manual (HCM)* level of service methodology using TRAFFIX software. The HCM method evaluates signalized intersection operations on the basis of average control delay time for all vehicles at the intersection. The correlation between average delay and level of service is shown in Table 2.

Table 2
Signalized Intersection Level of Service Definitions Based on Control Delay

Level of Service	Description	Average Control Delay Per Vehicle (sec.)
A	Signal progression is extremely favorable. Most vehicles arrive during the green phase and do not stop at all. Short cycle lengths may also contribute to the very low vehicle delay.	10.0 or less
B+	Operations characterized by good signal progression and/or short cycle lengths.	10.1 to 12.0
B	More vehicles stop than with LOS A, causing higher levels of average vehicle delay.	12.1 to 18.0
B-		18.1 to 20.0
C+	Higher delays may result from fair signal progression and/or longer cycle lengths.	20.1 to 23.0
C	Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant, though may still pass through the intersection without stopping.	23.1 to 32.0
C-		32.1 to 35.0
D+	The influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable signal progression, long cycle lengths, or high volume-to-capacity (V/C) ratios. Many vehicles stop and individual cycle failures are noticeable.	35.1 to 39.0
D		39.1 to 51.0
D-		51.1 to 55.0
E+	This is considered to be the limit of acceptable delay. These high delay values generally indicate poor signal progression, long cycle lengths, and high volume-to-capacity (V/C) ratios. Individual cycle failures occur frequently.	55.1 to 60.0
E		60.1 to 75.0
E-		75.1 to 80.0
F	This level of delay is considered unacceptable by most drivers. This condition often occurs with oversaturation, that is, when arrival flow rates exceed the capacity of the intersection. Poor progression and long cycle lengths may also be major contributing causes of such delay levels.	greater than 80.0

Source: Transportation Research Board, *2000 Highway Capacity Manual* (Washington, D.C., 2000) p10-16.
VTA Traffic Level of Service Analysis Guidelines (June 2003), Table 2.

Signalized study intersections that are not part of the CMP roadway network are subject to the local municipalities' level of service standards. The City of Santa Clara has set forth LOS D as the minimum

standard, except on CMP and expressway facilities, which have a standard of LOS E. The City of San Jose's level of service standard is LOS D or better for all signalized intersections, including CMP intersections.

Adverse Intersection Operations Effects

Adverse effect on intersections are based on the definitions and thresholds of the jurisdiction in which the intersection is located. For this analysis, adverse effects on intersections are based on the Cities of Santa Clara and San Jose, and the CMP level of service standards.

Project impacts on other transportation facilities, such as bicycle facilities and transit, were determined on the basis of engineering judgment.

City of Santa Clara Definition of Significant Intersection LOS Impacts

According to the City of Santa Clara level of service guidelines, a development is said to create a adverse effect on traffic conditions at a signalized intersection if for either peak hour:

1. The level of service at the intersection degrades from an acceptable level (LOS D or better at all city-controlled intersections and LOS E or better at all CMP and expressway intersections) under no-project conditions to an unacceptable level (LOS E or F at city-controlled intersections and LOS F at CMP and expressway intersections) under project conditions, or
2. The level of service at the intersection is an unacceptable level (LOS E or F at city-controlled intersections and LOS F at expressway intersections) under no-project conditions and the addition of project trips causes the average critical delay to increase by four (4) or more seconds *and* the volume-to-capacity ratio (V/C) to increase by one percent (0.01) or more.

An exception to this rule applies when the addition of project traffic reduces the amount of average delay for critical movements (i.e., the change in average delay for critical movements is negative). In this case, the threshold of significance is an increase in the critical V/C value by 0.01 or more.

An adverse effect by the City of Santa Clara standards is said to be satisfactorily mitigated when measures are implemented that would restore intersection level of service to an acceptable level or no worse than no-project conditions.

City of San Jose Definition of Adverse Intersection Operations Effects

In alignment with State of California Senate Bill 743 (SB 743), the City of San Jose's adopted a new Transportation Analysis Policy (Council Policy 5-1) to replace the Transportation Level of Service Policy (Council Policy 5-3). The new policy establishes the thresholds for transportation impacts under CEQA based on vehicle miles traveled (VMT) instead of intersection level of service. Therefore, intersection levels of service are no longer used to determine a project's transportation impacts, but are used to identify whether a project would cause adverse effects on intersection operations.

According to the City of San Jose's *Transportation Analysis Handbook* (2018), an adverse effect on intersection operations occurs if for either peak hour:

1. The level of service at the intersection degrades from an acceptable LOS D or better under background conditions to an unacceptable LOS E or F under background plus project conditions, or
2. The level of service at the intersection is an unacceptable LOS E or F under background conditions and the addition of project trips causes both the critical-movement delay at the intersection to increase by four (4) or more seconds *and* the volume-to-capacity ratio (V/C) to increase by one percent (.01) or more.

The *Transportation Analysis Handbook* does not require analyzing intersection operations under cumulative conditions. Therefore, the adverse effects on intersection operations under cumulative conditions was evaluated according to the City of Santa Clara criteria. An adverse effect on intersection operations occurs if during either the AM or PM peak hour:

1. The level of service at the intersection degrades from an acceptable LOS D or better under cumulative no-project conditions to an unacceptable LOS E or F under cumulative conditions, or
2. The level of service at the intersection is an unacceptable LOS E or F under cumulative no-project conditions and the addition of project trips causes both the critical-movement delay at the intersection to increase by four (4) or more seconds and the volume-to-capacity ratio (V/C) to increase by one percent (.01) or more.

An exception to this rule applies when the addition of project traffic reduces the amount of average stopped delay for critical movements (i.e., the change in average stopped delay for critical movements is negative). In this case, the adverse effect is an increase in the critical V/C value by 0.01 or more.

An adverse effect by City of San Jose standards is said to be satisfactorily mitigated when measures are implemented that would restore intersection level of service to no-project conditions or better.

CMP Definition of Significant Intersection LOS Impacts

The adverse effect at a CMP intersection is the same as for the City of Santa Clara, except that the CMP standards for acceptable level of service at a CMP intersection is LOS E or better. An adverse effect by CMP standards is said to be satisfactorily mitigated when measures are implemented that would restore intersection conditions to an acceptable level or no worse than no-project conditions.

Report Organization

The remainder of this report is divided into six additional chapters. Chapter 2 describes the existing roadway network, transit service, and existing bicycle and pedestrian facilities. Chapter 3 presents the intersection levels of service under background conditions with the addition of traffic from approved development projects. Chapter 4 describes the method used to estimate project traffic and the resulting traffic conditions expected under existing plus project conditions and presents traffic conditions, potential project impacts, and recommended improvement measures under background plus project conditions. Chapter 5 presents the traffic conditions in the study area under cumulative conditions with the addition of traffic from development projects that are not yet approved, and cumulative plus project conditions with the addition of project trips to the cumulative volumes. Chapter 6 presents the analysis of other transportation related issues, including impacts to transit, bicycle facilities, and vehicle miles traveled (VMT).

2.

Existing Conditions

This chapter describes the existing conditions of the transportation system within the study area of the project. It describes transportation facilities in the vicinity of the project site, including the roadway network, transit services, and pedestrian and bicycle facilities.

Existing Roadway Network

Regional access to the project site is provided via US 101, I-880, and SR 87.

US 101 is a north/south freeway with six mixed-flow lanes and two high-occupancy-vehicle (HOV) lanes through most of Santa Clara and San Jose. US 101 extends northward through San Francisco and southward through Gilroy. Access to and from the site is provided via interchanges at I-880 and De La Cruz Boulevard/Trimble Road.

I-880 is a north/south freeway providing regional access from East Bay cities to San Jose, where it ultimately becomes SR 17 and extends southward into Santa Cruz. Within the project vicinity, I-880 primarily is a six-lane freeway. Access to the project site from I-880 is provided via an interchange at Coleman Avenue.

SR 87 begins at its interchange with SR 85 and extends northward, terminating at its junction with US 101. SR 87 has two mixed-flow lanes and a HOV lane in each direction. Access to the site is provided via an interchange at Taylor Street.

Local access to the site is provided by Coleman Avenue, De La Cruz Boulevard and Brokaw Road.

Coleman Avenue is a four- to six-lane arterial that begins at its intersection with De La Cruz Boulevard in Santa Clara and terminates where it becomes North Market Street in San Jose. Adjacent to the project site, Coleman Avenue is a five- to six-lane facility. Coleman Avenue narrows from three lanes to two lanes in the northbound direction midway between Newhall Drive and Aviation Avenue, and then widens back to three lanes just north of Aviation Avenue. In the southbound direction, Coleman Avenue narrows from three lanes to two lanes at Brokaw Road and then widens back to three lanes just north of Aviation Avenue. The posted speed limit is 40 mph. Coleman Avenue has bicycle lanes from Santa Teresa Street to Taylor Street and from I-880 to Aviation Avenue. Coleman Avenue has sidewalks along both sides of the street. However, in the vicinity of the project site, there are discontinuous sidewalks on the project frontage. Coleman Avenue provides direct access to the project site.

De La Cruz Boulevard is a four-to-six lane roadway that extends from US 101 to Lewis Street, where it connects to Coleman Avenue. North of US 101, De La Cruz Boulevard transitions to Trimble Road to North San Jose. De La Cruz Boulevard has a posted speed limit of 40 mph. De La Cruz Boulevard has mostly discontinuous sidewalks throughout the segment. De la Cruz Boulevard provides direct access to the site via its connection to Coleman Avenue.

Brokaw Road is a two-lane east-west roadway that begins at the Caltrain railroad tracks and ends just east of Coleman Avenue, where it becomes Martin Avenue. Brokaw Road has a posted speed limit of 25 mph and mostly discontinuous sidewalks throughout the segment. Brokaw Road provides direct access to the project site.

Existing Pedestrian and Bicycle Facilities

Pedestrian facilities near the project site consist of sidewalks along the streets and crosswalks at the intersections in the study area. Sidewalks are found along both sides of Coleman Avenue with a short discontinuity just south of Brokaw Road. East of the project site, there is no sidewalk along Brokaw Road. Other pedestrian facilities in the project area include crosswalks and pedestrian push buttons at all signalized study intersections. The Coleman Avenue and Brokaw Road bus stop is located along the project frontage on Coleman Avenue. Overall, the existing network of sidewalks and crosswalks provides good connectivity and provides pedestrians with safe routes to transit services and other points of interest in the area.

Bicycle facilities are divided into three classes of relative significance. Class I bikeways are bike paths that are physically separated from motor vehicles and offer two-way bicycle travel on a separate path. Class II bikeways are striped bike lanes on roadways that are marked by signage and pavement markings. Class III bikeways are bike routes and only have signs to help guide bicyclists on recommended routes to certain locations.

There is a Class I bike path, which is part of the multi-use trail system that runs along the Guadalupe River and is shared between pedestrians and bicyclists and separated from motor vehicle traffic. The Guadalupe River trail is an 11-mile continuous Class I bikeway from Curtner Avenue in the south to Alviso in the north. This trail system can be accessed via Airport Boulevard in the project vicinity. Within the project vicinity, Class II bikeways are present on Coleman Avenue between Earthquake Way and SR 87 with a short discontinuity between Hedding Street and Taylor Street. There is a bicycle and pedestrian tunnel connection from the west end of Brokaw Road, under the Caltrain tracks, to the Santa Clara Caltrain station. The distance is about 1,500 from the project site. Bicycles are also permitted on Coleman Avenue and De La Cruz Boulevard. However, due to high speeds and traffic volumes, it is recommended for use only by bicyclists of advanced skills. The existing bicycle facilities within the study area are shown on Figure 3.

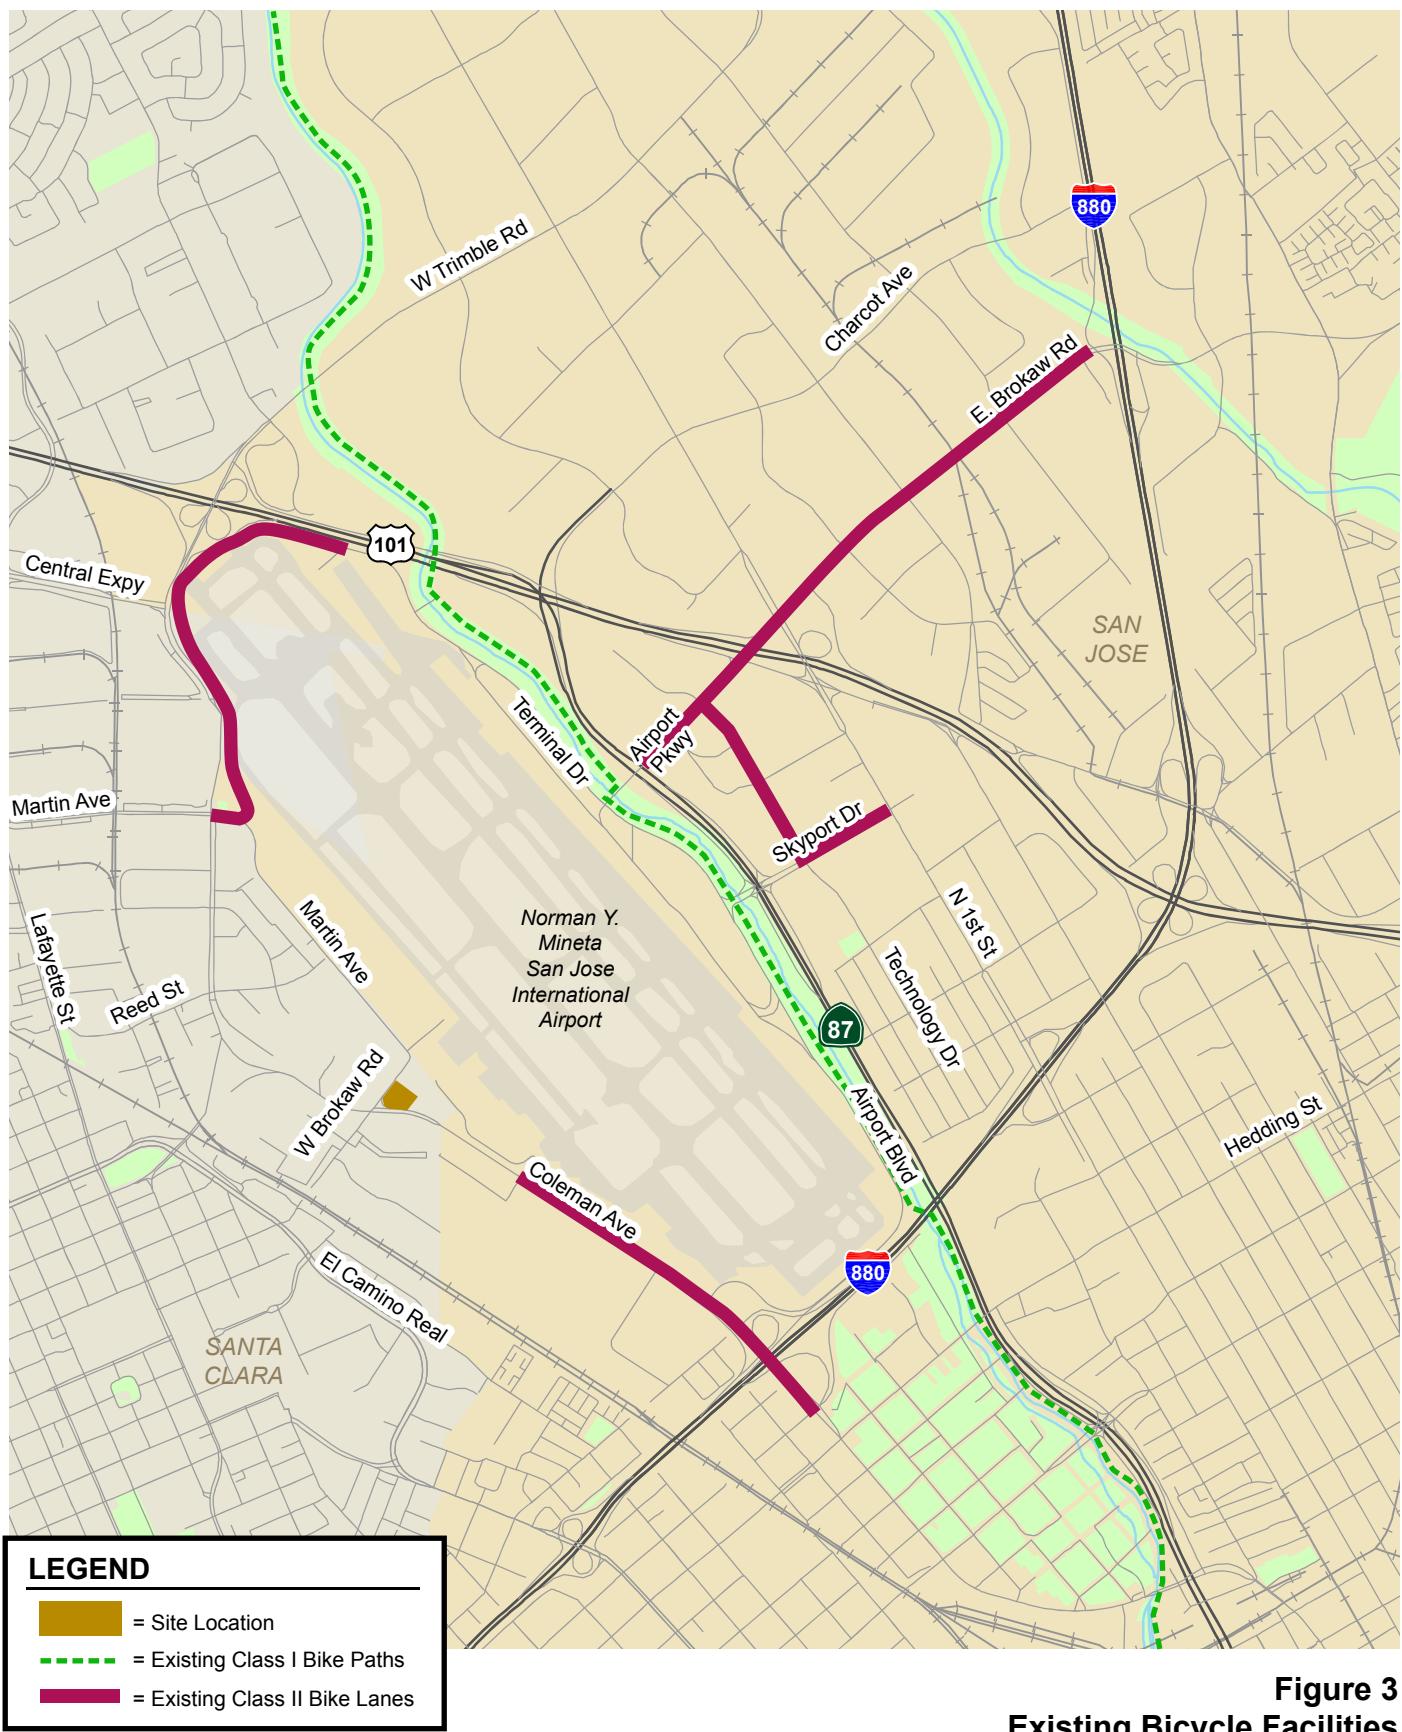

Figure 3
Existing Bicycle Facilities

Existing Transit Services

Existing transit service to the study area is provided by the VTA. Regional transit is provided by Caltrain, the Altamont Commuter Express (ACE) train service, and the Capitol Corridor train service. The Coleman and Brokaw VTA bus stop is the closest bus stop located along the project frontage. The Santa Clara Caltrain Station is located approximately 1,500 feet from the project site. The Santa Clara Transit Center is located on Railroad Avenue just across from the Caltrain Station. A pedestrian/bicycle undercrossing provides connection between Brokaw Road in proximity to the planned future BART station on the north side of the Caltrain tracks; providing access to the Santa Clara Transit Center on the south side of the Caltrain tracks. These services are described below and shown on Figure 4.

VTA Bus Service

The study area is served directly by VTA bus route 60 and other routes through the bus stop at the Santa Clara Transit Center. The VTA existing bus services are summarized in Table 3.

Table 3
VTA Bus Services in the Project Vicinity

Route ¹	Route Description
Frequent Route 60	Milpitas BART - Winchester Station via SJC Airport
Frequent Route 22	Palo Alto Transit Center - Eastridge Transit Center
Local Route 21	Stanford Shopping Center - Santa Clara Transit Center
Local Route 53	Sunnyvale Transit Center - Santa Clara Transit Center
Local Route 59	Valley Fair - Baypointe Station via Alviso
Frequent Rapid Route 522	Palo Alto Transit Center - Eastridge Center

Notes:
Source: VTA Service Schedule and Map, December 2019
1. Closest bus stop to bus route 60 is located at Brokaw Road and Coleman Avenue, along the project frontage and for all other routes are at the Santa Clara Transit Center, Railroad Avenue.

Figure 4
Existing Transit Services

Caltrain

Caltrain operates commuter rail service seven days a week between San Jose and San Francisco. During weekday commuting hours, Caltrain also serves the South County including Gilroy, San Martin and Morgan Hill. Caltrain provides shuttle service to businesses in the Silicon Valley and on the Peninsula.

The Santa Clara Caltrain Station is located on Railroad Avenue within the Santa Clara Transit Center. The Santa Clara Caltrain Station provides service to the Santa Clara area via connections with local bus routes 21, 53 and 59, frequent route 22 and frequent rapid route 522 described above, in addition to frequent route 60 and ACE/Capitol Corridor connections. Caltrain provides service with 15- to 30-minute headways during commute hours.

ACE

ACE provides commuter rail service between Stockton and San Jose. ACE shares the Santa Clara Caltrain Station at the Santa Clara Transit Center. ACE operates four westbound trains heading to San Jose in the morning and four eastbound trains heading to Stockton in the evening with 60-minute headways on weekdays.

Capitol Corridor

The Capitol Corridor train provides commuter rail service between Sacramento and San Jose. The Capitol Corridor train shares the Santa Clara Caltrain Station at the Santa Clara Transit Center. Capitol Corridor operates seven westbound and seven eastbound trains on weekdays with more westbound trains in the morning and more eastbound trains in the afternoon/evening. At the Santa Clara Station, there are two westbound trains during the AM commute periods and two eastbound train during the PM commute period with 60- to 90-minute headways.

Existing Intersection Lane Configurations

The existing lane configurations at the study intersections were determined by observations in the field and are shown on Figure 5.

Existing Traffic Volumes

Existing peak-hour traffic volumes (see Figure 6) were obtained from previously completed traffic studies, the 2018 CMP Annual Monitoring Report, and new traffic counts conducted in October 2019. Intersection turning-movement counts conducted for this analysis are presented in Appendix A and peak-hour intersection turning-movement volumes for all intersections and study scenarios are tabulated in Appendix B.

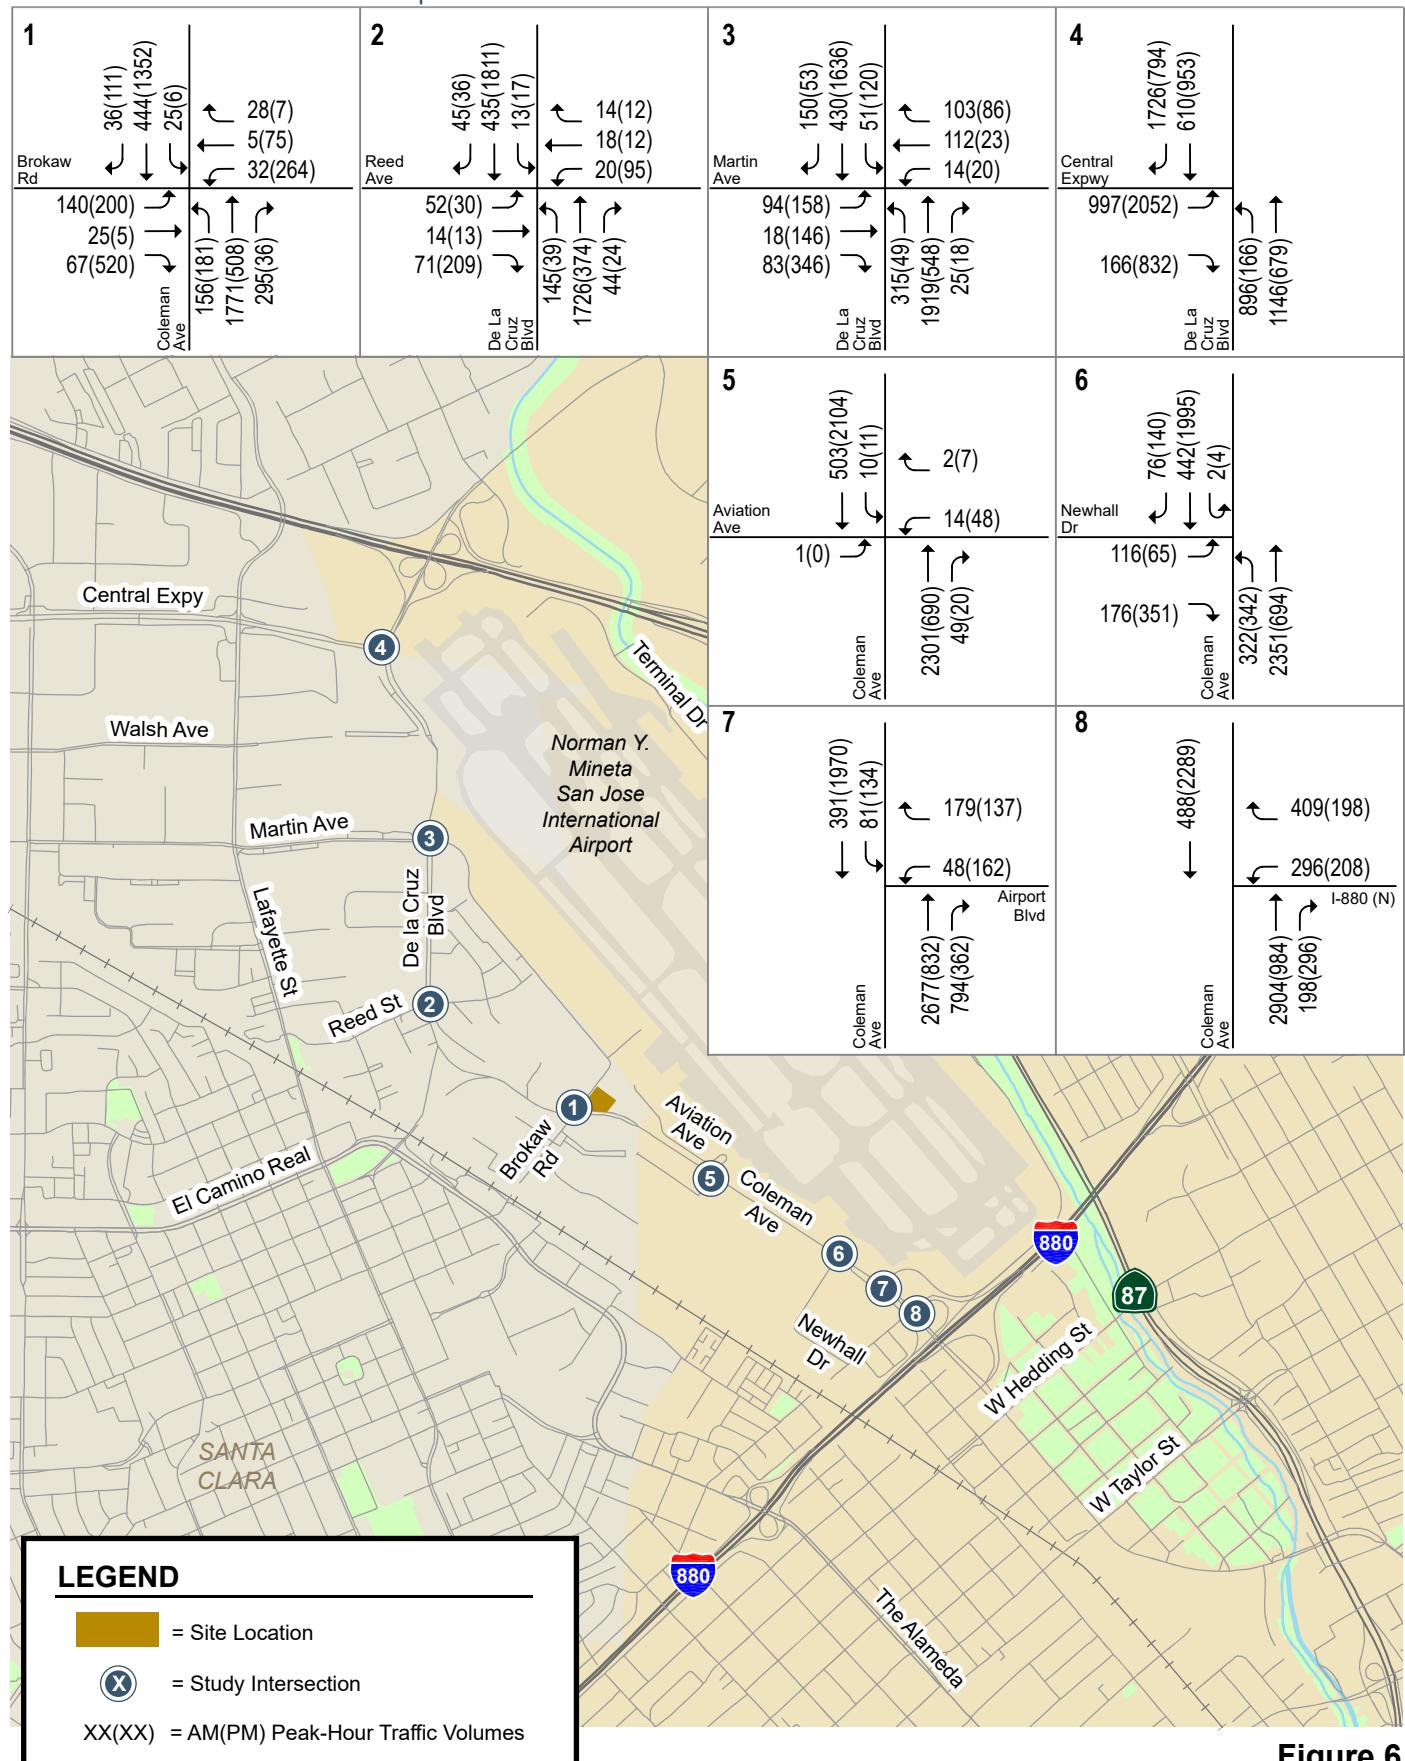

Figure 6
Existing Traffic Volumes

Existing Intersection Levels of Service

The results of the intersection level of service analysis under existing conditions are summarized Table 4. The results show that, measured against the applicable municipal and CMP level of service standards, the following two intersections currently operate at unacceptable levels of service during at least one peak hour under existing conditions.

City of Santa Clara Study Intersections

- Coleman Avenue and Brokaw Road – PM Peak Hour
- De La Cruz Boulevard and Central Expressway (CMP) – PM Peak Hour

The results of the analysis show that the remaining study intersections currently operate at acceptable levels of service during the AM and PM peak hours of traffic. The intersection level of service calculation sheets are included in Appendix C.

Table 4
Existing Intersection Levels of Service

Study Number	Intersection	Peak Hour	Count Date	Avg Delay	LOS
1	Coleman Avenue and Brokaw Road	AM	10/02/19	31.7	C
		PM	10/02/19	68.3	E
2	De La Cruz Boulevard and Reed Street	AM	10/02/19	13.1	B
		PM	10/02/19	18.4	B-
3	De La Cruz Boulevard and Martin Avenue	AM	11/27/18	28.3	C
		PM	11/27/18	29.1	C
4	De La Cruz Boulevard and Central Expressway *	AM	11/27/18	40.6	D
		PM	11/13/18	99.4	F
5	Coleman Avenue and Aviation Avenue	AM	10/02/19	7.3	A
		PM	10/02/19	5.2	A
6	Coleman Avenue and Newhall Drive	AM	10/02/19	14.8	B
		PM	10/02/19	22.8	C+
7	Coleman Avenue and Airport Boulevard	AM	10/02/19	14.1	B
		PM	10/02/19	14.2	B
8	Coleman Avenue and I-880 (N) *	AM	11/27/18	21.7	C+
		PM	12/11/18	9.9	A

Note:
Bold indicates a substandard level of service.
* Denotes the CMP designated Intersection

Observed Existing Traffic Conditions

Traffic conditions were observed in the field in order to identify existing operational conditions and to confirm the accuracy of calculated levels of service. The purpose of this effort was (1) to identify any existing traffic problems that may not be directly related to intersection level of service, and (2) to identify any locations where the level of service calculation does not accurately reflect level of service in the field.

Overall, most study intersections operated adequately during both the AM and PM peak hours of traffic, and the level of service analysis appears to accurately reflect actual existing traffic conditions. However, field observations showed that some operational problems currently occur during the peak commute hours. These issues are described below.

Central Expressway/De La Cruz Boulevard

During the AM peak hour, there was a long vehicle queue in the northbound left-turn lanes on De La Cruz Boulevard due to high traffic volume. Typically, the last one or two vehicles in the left turn queue were observed to take more than one cycle to get through the intersection. In addition, the northbound left-turn lanes exceed the maximum storage length.

During the PM peak hour, there were long vehicle queues in the eastbound left-turn lanes on Central Expressway due to high traffic volume. The eastbound left-turn traffic spilled back due to vehicles heading to the US 101 southbound on-ramp. However, there was enough green time given to allow the queued vehicles to cross through the intersection.

Coleman Avenue/Brokaw Road

During the PM peak hour, there was a long queue in the westbound left-turn lane on Brokaw Road. The long vehicle queue extended beyond the Brokaw Road/Martin Avenue bend. Typically, there were four to five vehicles that required more than one cycle to clear the intersection.

3.

Background Conditions

This chapter describes background traffic conditions. Background conditions are defined as conditions just prior to completion of the proposed development. Traffic volumes for background conditions comprise volumes from existing traffic counts plus traffic generated by other approved developments in the vicinity of the project site. This chapter describes the procedure used to determine background traffic volumes and the resulting traffic conditions.

Roadway Network Under Background Conditions

It is assumed that the transportation network under background conditions would include the following improvements identified by the Santa Clara Valley Transportation Authority (VTA) to be completed in the study area.

De La Cruz Boulevard and Central Expressway – The change will comprise the conversion of two exclusive left turn lanes and three through lanes on northbound De La Cruz Boulevard into three left turn lanes and two through lanes. Also, the addition of one more right turn lane on eastbound Central Expressway would change the lane configuration to three left turn lanes and two right turn lanes. Finally, the addition of one more right turn lane and one through lane on southbound De La Cruz Boulevard would change the lane configuration to two right turn lanes and three through lanes (see Appendix E).

Background Traffic Volumes

Background peak-hour traffic volumes (see Figure 7) were estimated by adding to existing volumes the estimated traffic from approved but not yet constructed developments. The added traffic from approved but not yet constructed developments in Santa Clara was estimated based on the list of approved projects provided by the City of Santa Clara. Hexagon considered both the location and size of the approved projects in order to eliminate those that were too far away or too small to affect traffic conditions at the selected study intersections. The approved project traffic provided by the City of San Jose in the form of the Approved Trips Inventory (ATI) was also included. The approved developments considered for the study are listed in Appendix D.

Vehicle trips from the approved developments were obtained from the City of Santa Clara's TRAFFIX network, which was updated with the latest list of approved projects based on the projects' TIA/environmental document (initial study or EIR), if available. For projects without a traffic study, trip estimates were developed using rates published in the *Trip Generation Manual*. The estimated trips were assigned to the study intersections according to distributions identified in the development traffic

studies, if available, or knowledge of the study area. Background conditions include trips associated with development of Phase 1 of the approved North San Jose Development Policy. A tabular summary of approved trips and background traffic volumes at each study intersection is contained in Appendix B.

Background Intersection Levels of Service

The results of the intersection level of service analysis under background conditions are summarized Table 5. The results show that the following two intersections that currently operate at unacceptable levels of service under existing conditions would have changed delay under background conditions. The delay at De La Cruz Boulevard and Central Expressway during both the AM and PM peak hours would be decreased under background conditions due to the change in lane configuration.

City of Santa Clara Study Intersections

- Coleman Avenue and Brokaw Road – PM Peak Hour
- De La Cruz Boulevard and Central Expressway (CMP) – PM Peak Hour

The results of the analysis show that the remaining study intersections currently operate at acceptable levels of service during the AM and PM peak hours of traffic. The intersection level of service calculation sheets are included in Appendix C.

Table 5
Background Intersection Levels of Service

Study Number	Intersection	Peak Hour	Existing		Background	
			Avg Delay	LOS	Avg Delay	LOS
1	Coleman Avenue and Brokaw Road	AM	31.7	C	49.5	D
		PM	68.3	E	126.7	F

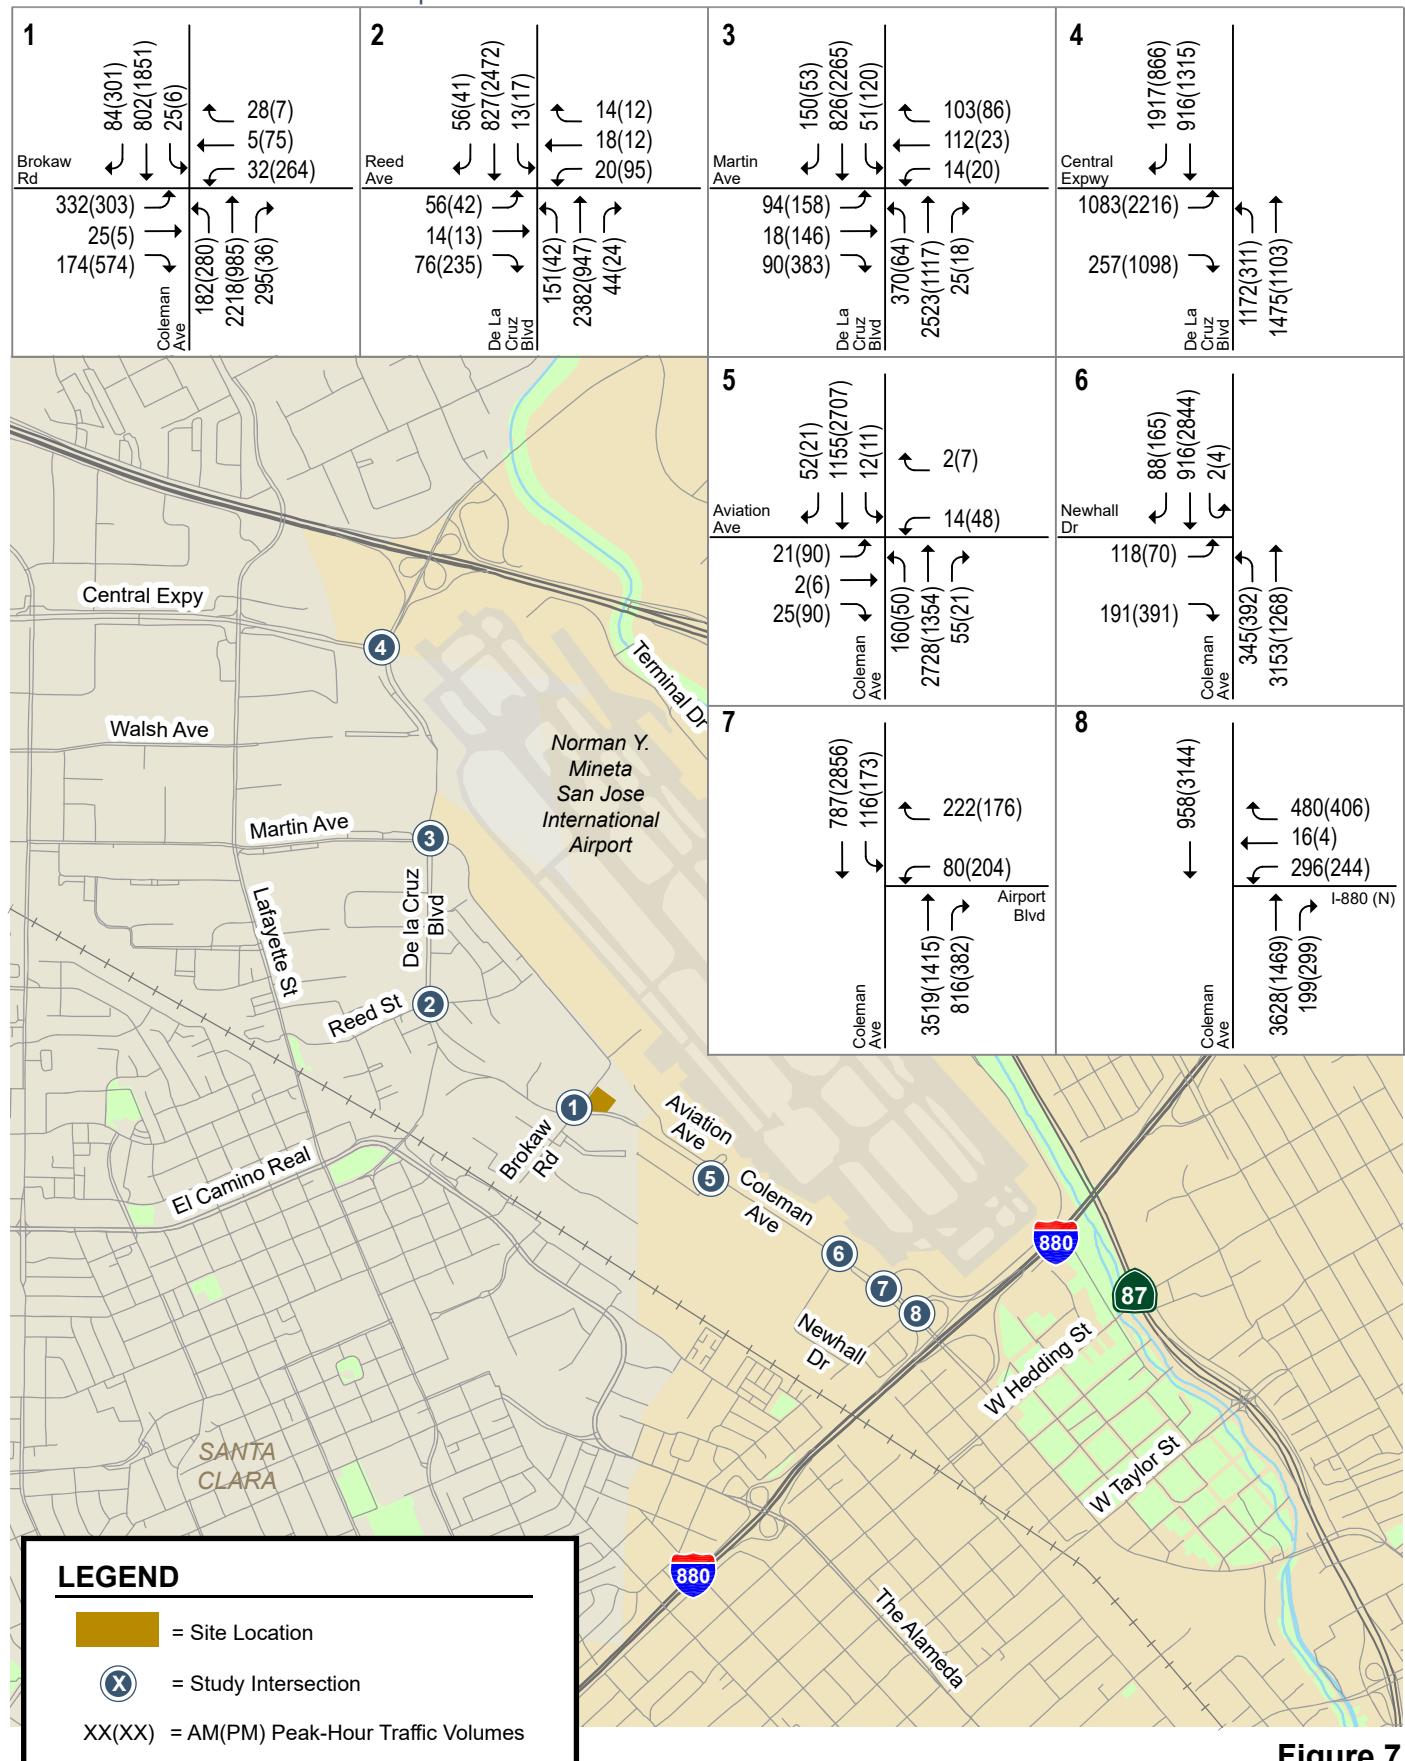

Figure 7
Background Traffic Volumes

4. **Project Traffic Conditions**

This chapter describes the method by which project traffic is estimated, the roadway traffic operations under existing plus project conditions and background plus project conditions, and any impacts caused by the project. Existing plus project traffic conditions could potentially occur if the project were to be occupied prior to the other approved projects in the area. However, it is unlikely that this traffic condition would occur, since some of the other approved projects expected to add traffic to the study area would likely be built and occupied during the time the project is going through the development review process.

Roadway Network Under Project Conditions

The roadway network under existing plus project conditions would be the same as described under existing conditions and background plus project conditions would be the same as background conditions because the project would not alter the existing intersection lane configurations.

Project Trip Estimates

The magnitude of traffic produced by a new development and the locations where that traffic would appear were estimated using a three-step process: (1) trip generation, (2) trip distribution, and (3) trip assignment. In determining project trip generation, the magnitude of traffic entering and exiting the site is estimated for the AM and PM peak hours. As part of the project trip distribution, an estimate is made of the directions to and from which the project trips would travel. In the project trip assignment, the project trips are assigned to specific streets and intersections. These procedures are described below.

Trip Generation

Through empirical research, data have been collected that show trip generation rates for many types of land uses. The research is compiled in the publication *Trip Generation, 10th Edition* by the Institute of Transportation Engineers' (ITE). Project trip generation was estimated by applying the average trip generation rates for Hotel (Land Use 310) from the ITE manual up to 400 rooms. Based on the ITE trip generation rates, it is estimated that the proposed project would generate 3,344 daily trips, with 188 trips (111 inbound and 77 outbound) occurring during the AM peak hour and 240 trips (122 inbound and 118 outbound) occurring during the PM peak hour (see Table 6).

Existing Land Use

The project site is currently developed with a van rental office and two restaurants, although one restaurant is vacant. Trips associated with the existing uses on the project site were subtracted from the roadway system. The trips generated by the existing buildings on the site were estimated based on driveway counts conducted in October 2019. Based on the driveway counts, existing uses at the project site generated 32 trips during the AM peak hour and 95 trips during PM peak hour.

Net Project Trip Generation

Based on the ITE trip generation rates, and credit for former use on the project site, it is estimated that the proposed project would generate an additional 2,394 daily trips, with 156 trips (82 inbound and 74 outbound) occurring during the AM peak hour and 145 trips (86 inbound and 59 outbound) occurring during the PM peak hour.

Table 6
Project Trip Generation Estimates

Land Use	Size	Unit	Daily		AM Peak Hour				PM Peak Hour									
			Rate ¹	Trips	Rate	In	Out	Total	Rate	In	Out	Total						
Proposed Uses																		
Hotel ²	400	rooms	8.36	3,344	0.47	111	77	188	0.60	122	118	240						
Existing Uses																		
Airport Van Rental ³	10.865	ksf	6.44	70	-	0	0	0	-	2	5	7						
1290 Coleman Avenue Restaurant ⁴	2.547	ksf	345.50	880	-	29	3	32	-	34	54	88

Total Project Trips			950		29		3	32	36		59	95						
Total Project Trips			2,394		82		74	156	86		59	145						
Notes:																		
¹ Rates expressed in trips per room or 1,000 square feet (ksf).																		
² Hotel (Land Use 310) daily and peak-hour average rates published in ITE's <i>Trip Generation Manual, 10th Edition, 2017</i> .																		
³ Daily trips were estimated assuming PM peak hour trips comprise 10% of daily trips; Peak-hour trips based on driveway counts and adjacent on-street parking usage on Brokaw Road counted on Tuesday, October 1 st , 2019.																		
⁴ Daily trips were estimated assuming PM peak hour trips comprise 10% of daily trips; Peak-hour trips based on driveway counts counted on Tuesday, October 1 st , 2019.																		
⁵ No trip credits for the vacant restaurant.																		

Trip Distribution and Assignment

The trip distribution pattern for the project was estimated based on existing travel patterns on the surrounding roadway network and the locations of complementary land uses. The peak-hour trips generated by the project were assigned to the roadway network in accordance with the project trip distribution pattern. The trip distribution pattern for the project is shown on Figure 8. Figure 9 shows the assignment of net project trips at each study intersection. In addition to the net project trips, trips generated by the valet parking service provided by the hotel would pass through the Coleman Avenue and Brokaw Road intersection. These are also shown on Figure 9. A detailed description of the planned valet parking operation is included in Chapter 6.

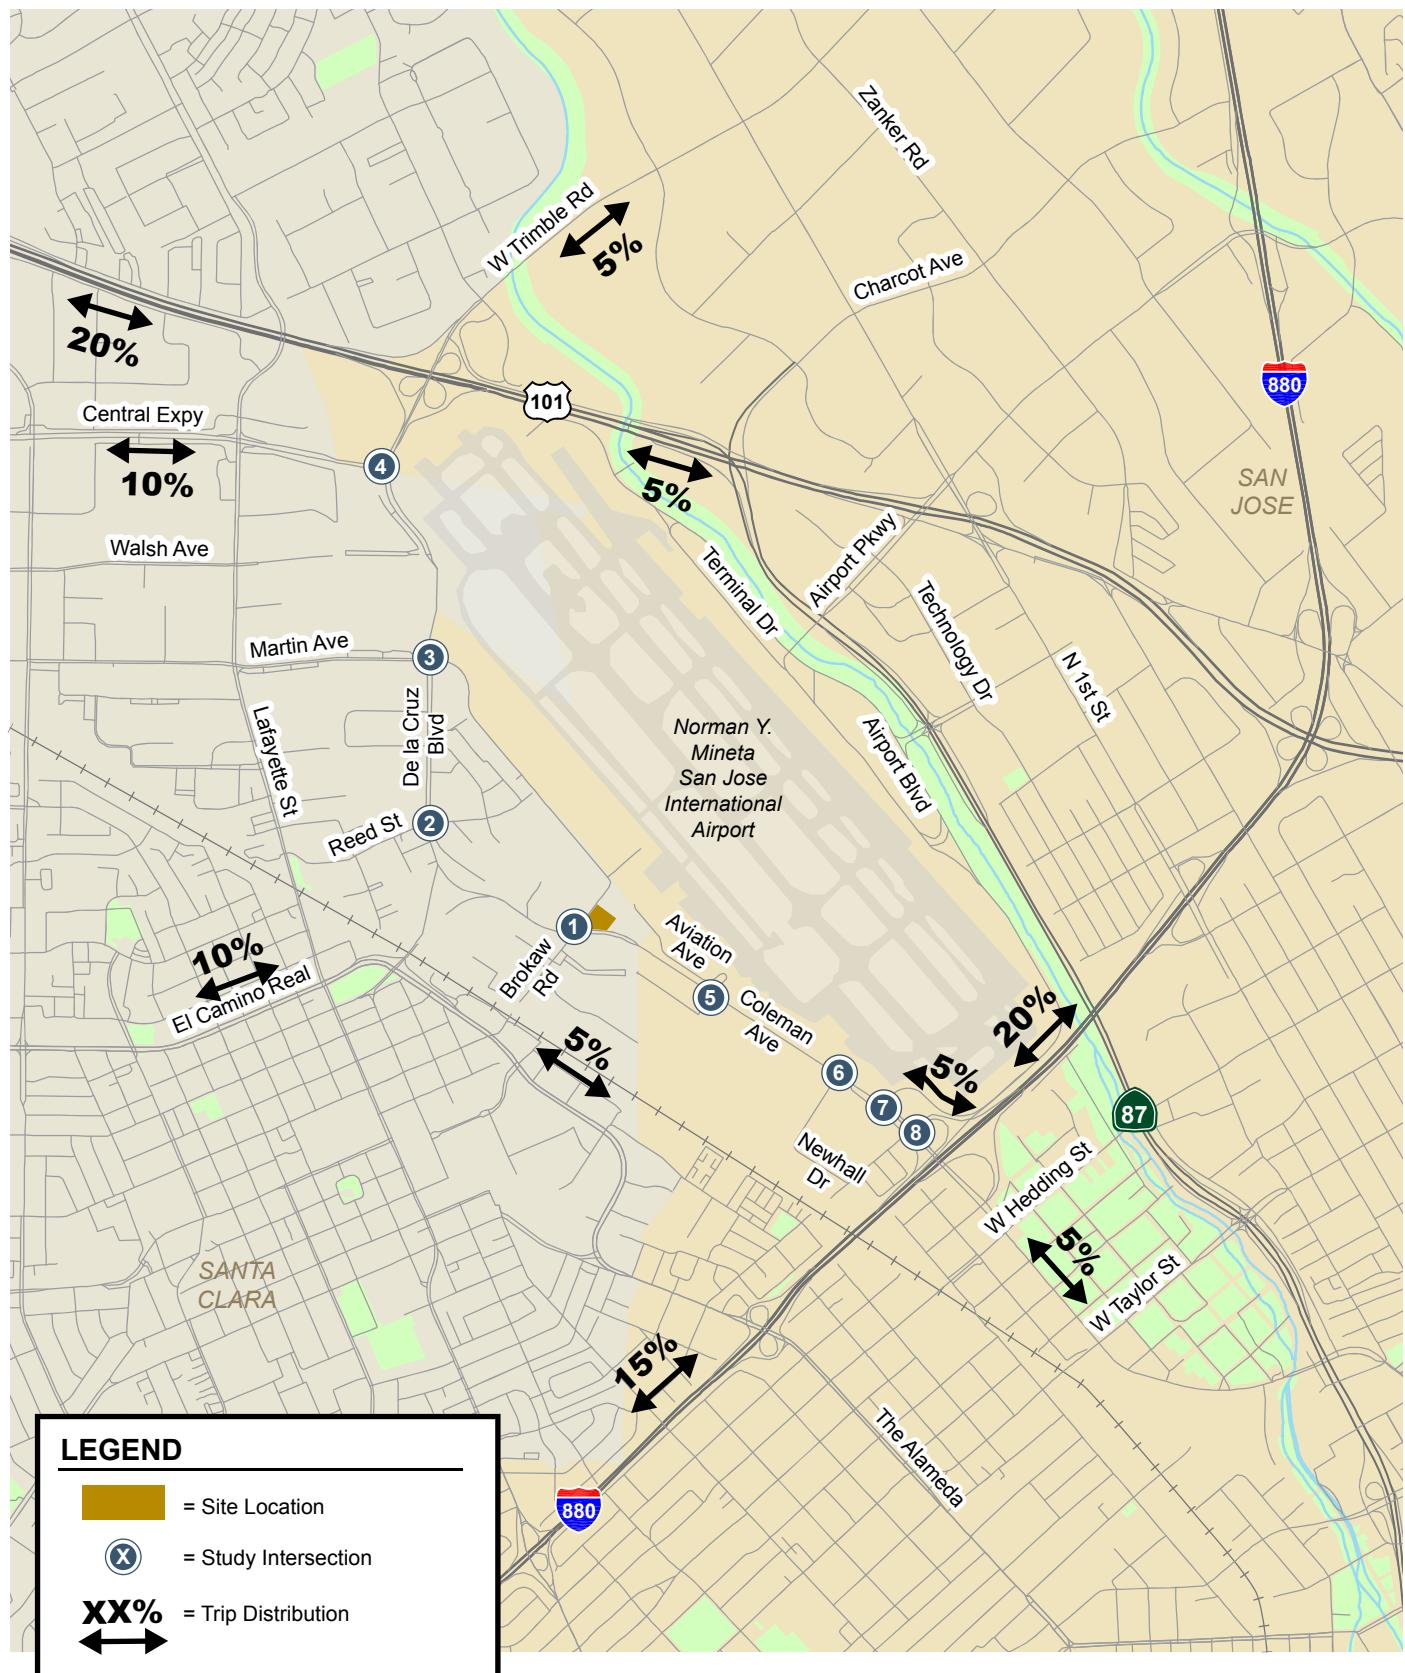

Figure 8
Project Trip Distribution

1290 Coleman Avenue Hotel Development TIA

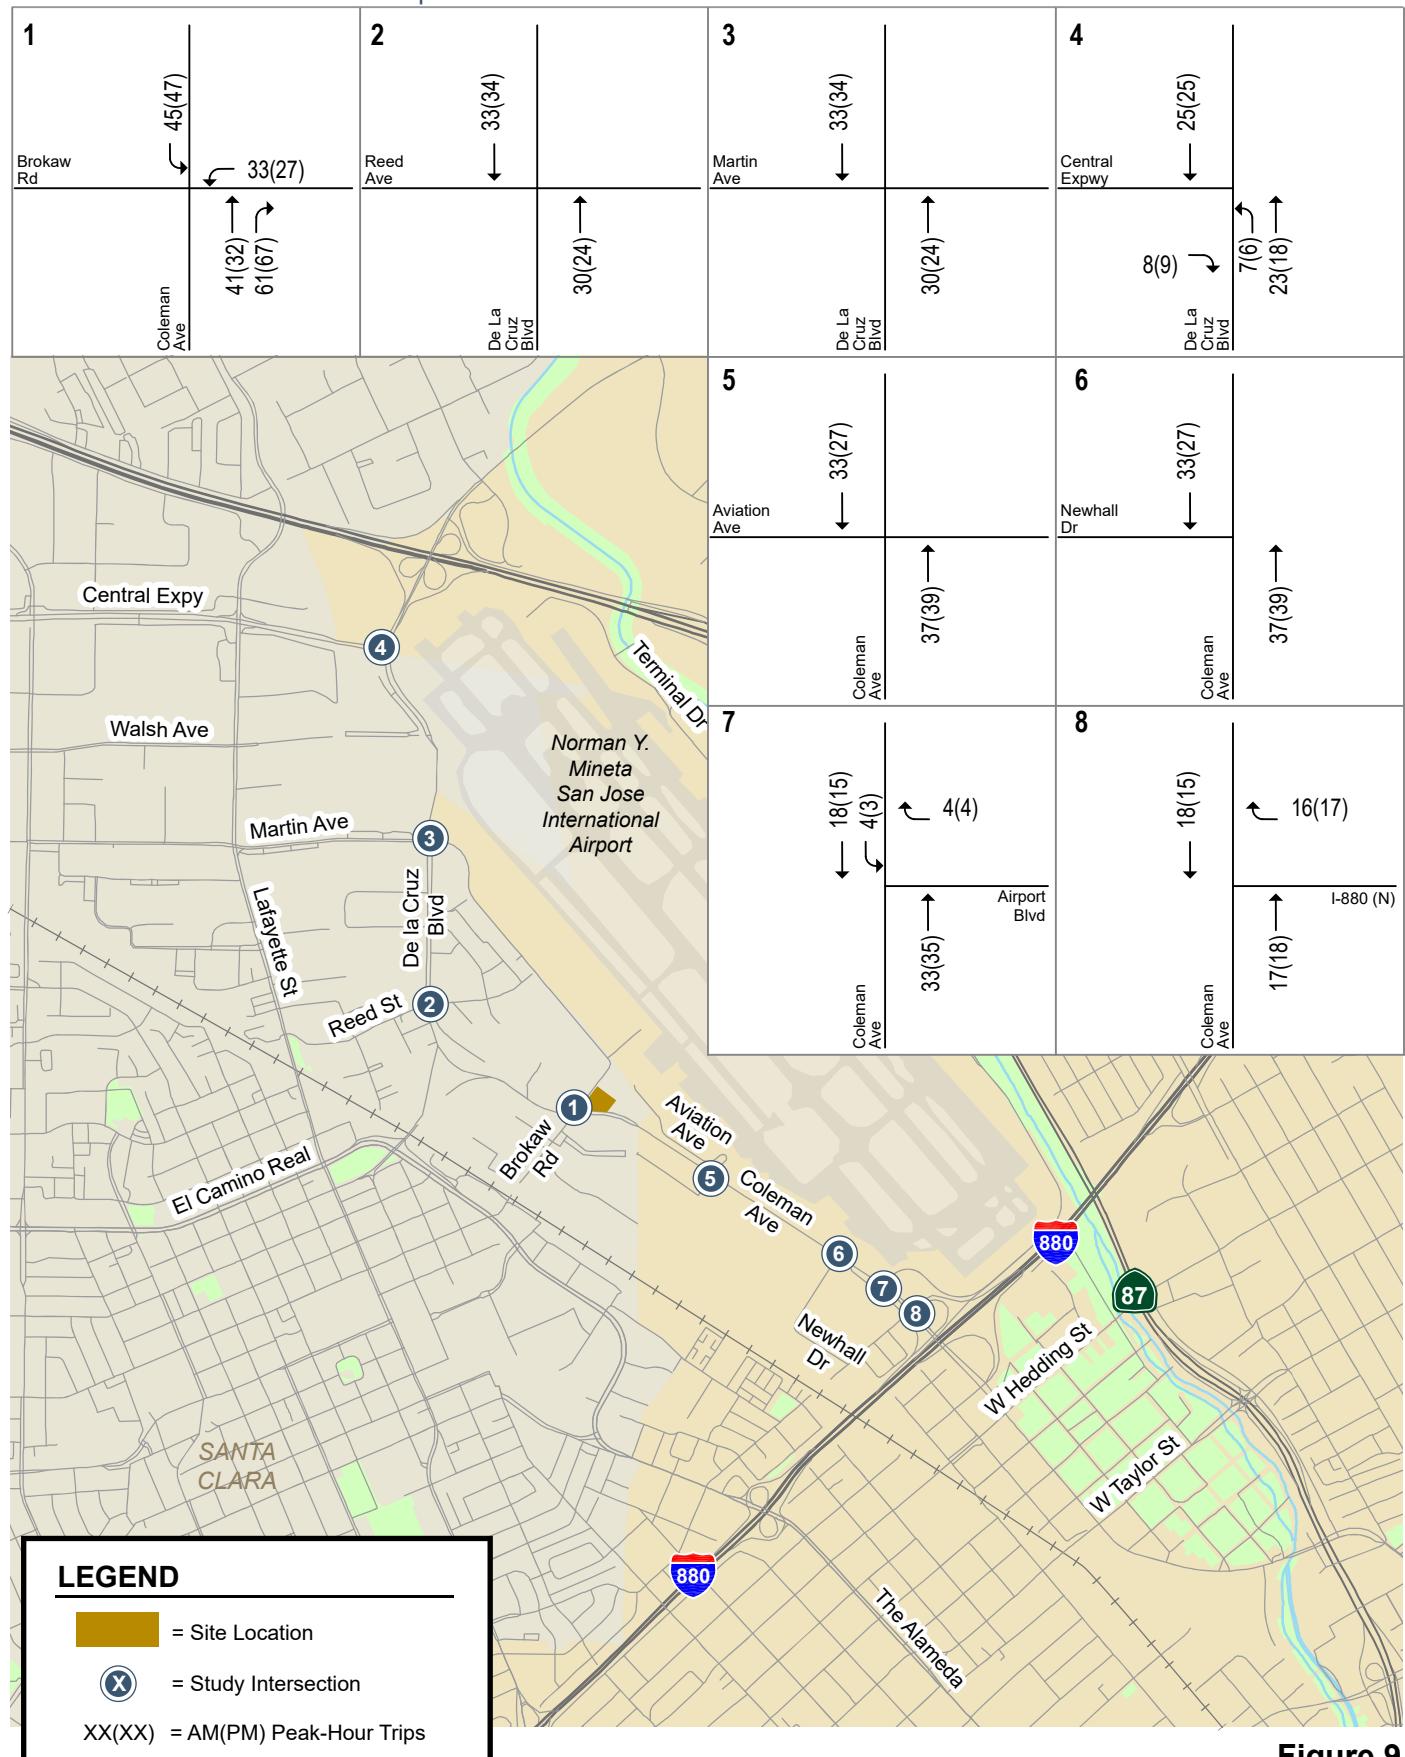

Figure 9
Project Trip Assignment

Existing and Background Plus Project Traffic Volumes

Project trips associated with the proposed project, as represented in the above project trip assignment, were added to the existing traffic volumes to obtain existing plus project traffic volumes (see Figure 10). And to the background traffic volumes to obtain background plus project traffic volumes (see Figure 11). Traffic volumes for all components of traffic are tabulated in Appendix B.

Existing Plus Project Intersection Levels of Service

The results of the intersection level of service analysis under existing plus conditions are summarized Table 7. The results show that the project would create an adverse effect at the intersection of Coleman Avenue and Brokaw Road. Improvement measures are described under background plus project conditions.

Level of service calculation sheets are included in Appendix C.

Table 7
Existing Plus Project Intersection Levels of Service

Study Number	Intersection	Existing			Existing + Project

Background Plus Project Intersection Levels of Service

The results of the intersection level of service analysis under background plus project conditions are summarized Table 8. The results show that the project would have an adverse effect at the same intersection as under existing conditions: Coleman Avenue and Brokaw Road. Level of service calculation sheets are included in Appendix C.

Improvement Measure

Coleman Avenue and Brokaw Road

Adverse Effect: This intersection would operate at LOS F during the PM peak hour under background conditions, and the added trips as a result of the proposed project would cause the intersection's critical-movement delay to increase by four or more seconds and the demand-to-capacity ratio (V/C) to increase by 0.01 or more during the PM peak hour. This constitutes an adverse effect based on the City of Santa Clara's level of service criteria.

Improvement Measure. Change the signal control for Brokaw Road (the east and west legs of this intersection) from protected left-turn phasing to protected plus permissive phasing. Add a through lane to the east and west approaches within the existing right-of-way. The eastbound and westbound approaches will each have one left turn lane, one through lane, and one right turn lane. In addition, no U-turns would be allowed on northbound Coleman Avenue. A third southbound through lane on Coleman Avenue would also be needed by restriping the existing right turn lane into separate through and right-turn lanes. With implementation of these improvements and a cycle length of 140 seconds, the intersection would operate at an acceptable LOS E (average delay 72 seconds/vehicle) during the PM peak hour under background plus project conditions. This improvement does not require Brokaw Road to be widened (see Figure 12). The improvement measure conditioned for approval of the Gateway Crossings development located on the west side of Coleman Avenue is one left turn lane, one shared left and through lane, and one right turn lane with split phase on the east and west legs and the addition of a third southbound through lane. The mitigation measure proposed for this project would require restriping of the shared left and through lane to an exclusive through lane along the east and west legs and change the signal control from split phase to protected plus permissive phasing.

5. **Cumulative Conditions**

This chapter describes the roadway traffic operations under cumulative no project conditions and cumulative plus project conditions. Cumulative conditions represent future traffic conditions with expected growth in the area. The expected future traffic growth conditions include approved and pending projects in Santa Clara and San Jose. Included in this chapter are the procedures used to determine cumulative traffic volumes and a description of the resulting traffic conditions and any impacts caused by the project. The analysis of cumulative conditions is required by the CMP and is in conformance with the California Environmental Quality Act (CEQA).

Roadway Network Under Cumulative Conditions

It is assumed in this analysis that the roadway network under cumulative conditions would be the same as described under background conditions.

Cumulative Traffic Volumes

Traffic volumes under cumulative conditions were estimated by adding the trips from proposed but not yet approved (pending) developments within the Cities of Santa Clara and San Jose to the background traffic volumes described in Chapter 3 and background plus project volumes described in Chapter 4. The pending projects considered for the study are listed in Appendix D. Cumulative conditions include trips associated with development of Phases 1– 3 of the approved City Place project and Phases 2 of the approved North San Jose Development Policy. Vehicle trips from the pending projects were estimated using the methods described in Chapter 3. Figures 13 and 14 show the cumulative no project and cumulative with project traffic volumes, respectively.

1290 Coleman Avenue Hotel Development TIA

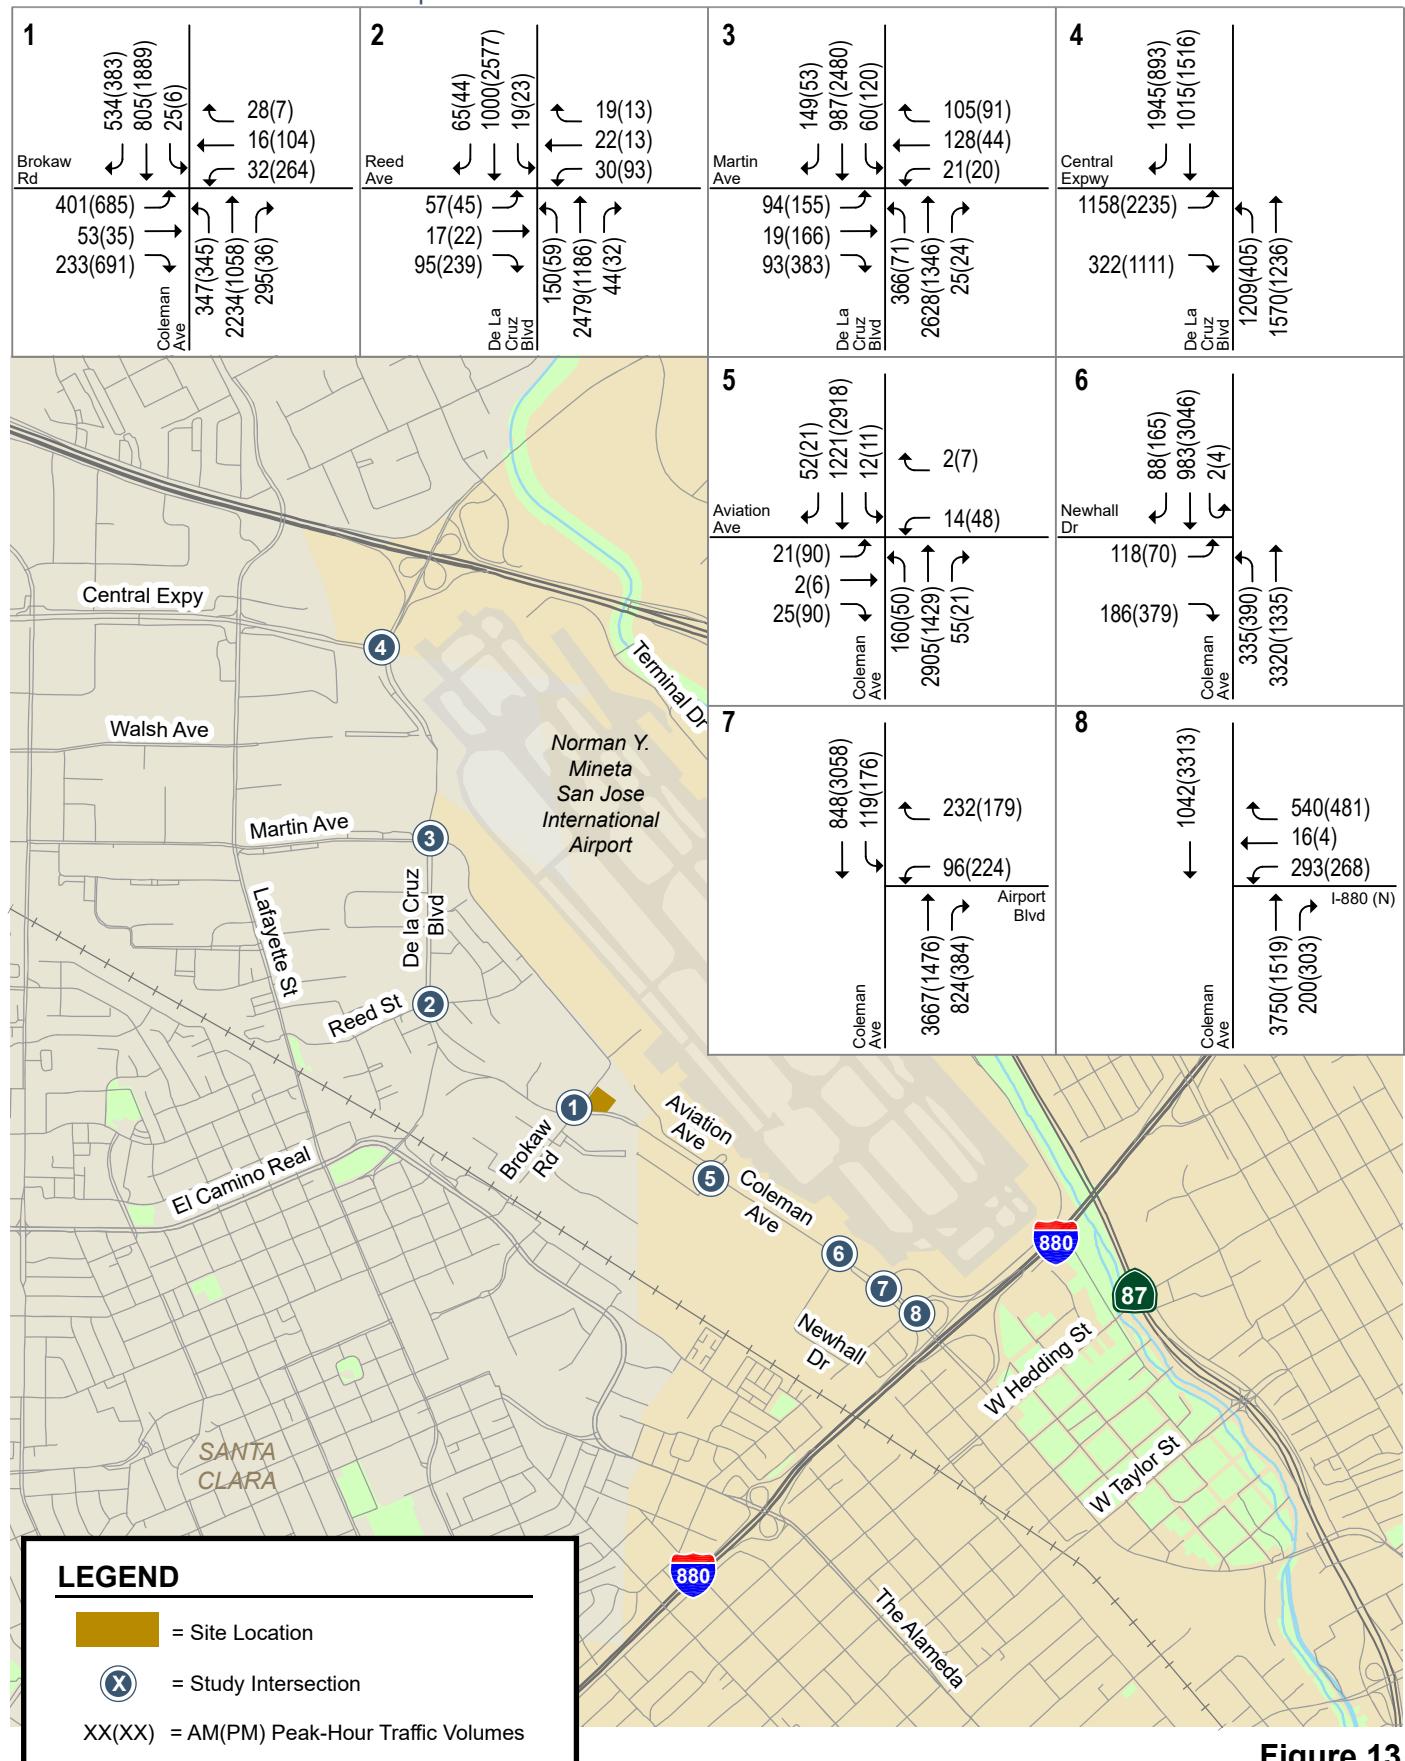

Figure 13
Cumulative Traffic Volumes

1290 Coleman Avenue Hotel Development TIA

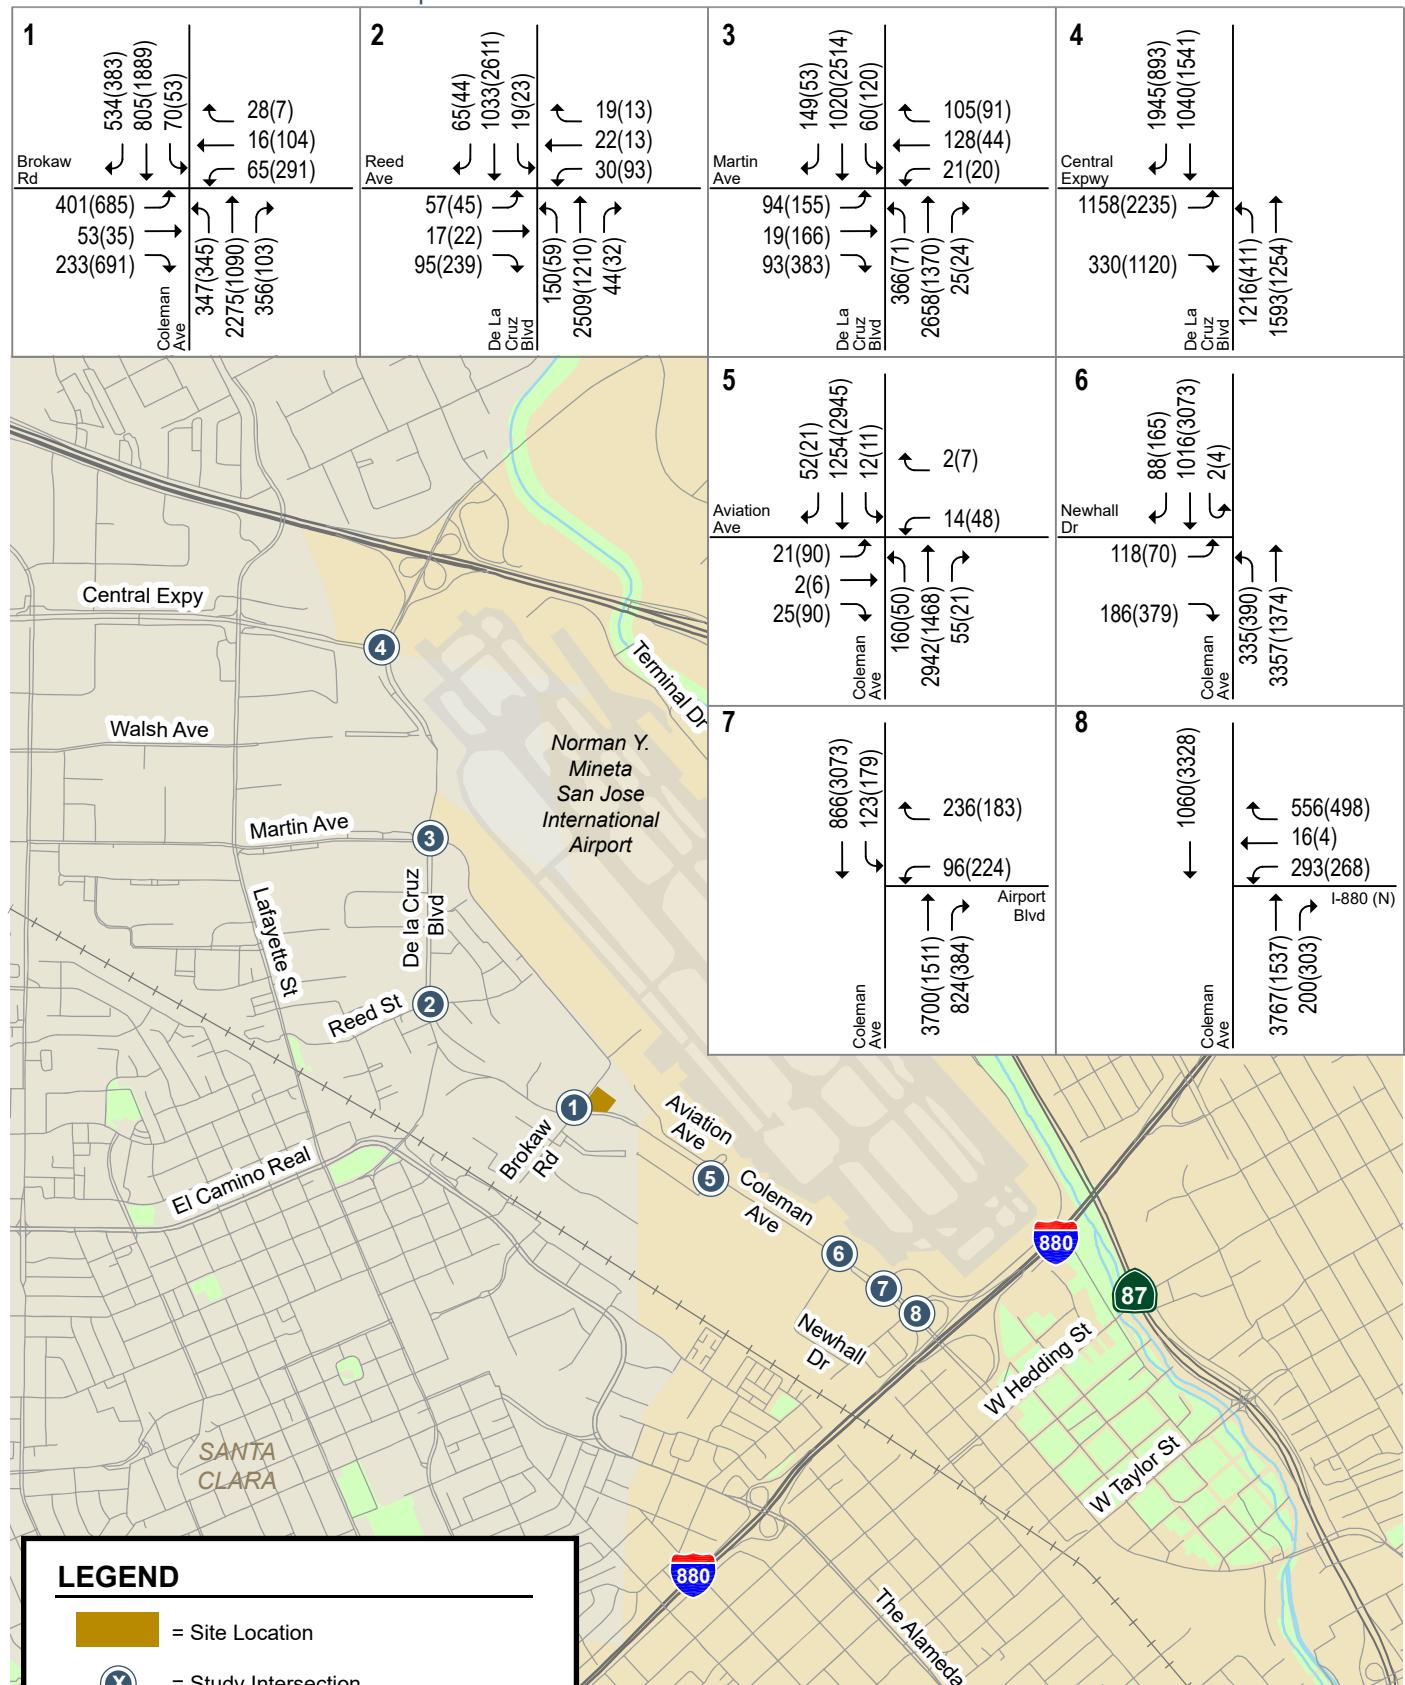

Figure 14
Cumulative Plus Project Traffic Volumes

Cumulative Intersection Levels of Service

Cumulative plus project conditions were evaluated relative to cumulative conditions in order to determine potential project impacts. Level of service results for cumulative conditions are summarized in Table 9. The results show that the project would have an adverse effect at the Coleman Avenue and Brokaw Road intersection during the AM and PM peak hours under cumulative conditions.

Bold indicates an adverse effect.

Cumulative Plus Project Effects and Improvement Measures

Described below is the possible intersection improvements for the cumulative adverse effects.

Coleman Avenue and Brokaw Road

Adverse Effect: This intersection would operate at LOS E during the AM peak hour and LOS F during the PM peak hour under cumulative conditions, and the added trips as a result of the proposed project would cause the intersection's critical-movement delay to increase by four or more seconds and the demand-to-capacity ratio (V/C) to increase by 0.01 or more during the AM and PM peak hours. This constitutes an adverse effect based on the City of Santa Clara's level of service criteria.

Improvement Measure. The same improvement measures as described under Background + Project conditions would be needed for Cumulative conditions with the project. With implementation of these improvements, the intersection would operate at an acceptable LOS D (average delay 54.6 seconds/vehicle) during the AM peak hour and LOS F (average delay 141.4 seconds/vehicle) during the PM peak hour under cumulative plus project conditions, which is still better than cumulative no-project conditions.

6. Other Transportation Issues

This chapter presents other transportation issues associated with the project site, including:

- Intersection queuing analysis
- Site access and circulation
- Potential impacts on pedestrian, bicycle, and transit facilities
- Parking
- Vehicle Miles Traveled

Unlike the level of service impact methodology, which is adopted by the City Council, the analyses in this chapter are based on professional judgment in accordance with the standards and methods employed by the traffic engineering community.

Intersection Queuing Analysis

The analysis of intersection levels of service was supplemented with a vehicle queuing analysis (see Table 10) at intersections where the project would add a substantial number of trips to the left-turn movements. The analysis provides a basis for estimating future left-turn pocket storage requirements at the intersections under existing, background, and project conditions. The queuing analysis is presented for informational purposes only, since neither the City of Santa Clara nor the CMP have defined any policies related to queuing. Vehicle queues were calculated using a Poisson probability distribution, which estimates the probability of "n" vehicles for a vehicle movement using the following formula:

$$P(x = n) = \frac{\lambda^n e^{-(\lambda)}}{n!}$$

Where:

P (x = n) = probability of "n" vehicles in queue per lane

n = number of vehicles in the queue per lane

λ = Average number of vehicles in the queue per lane (vehicles per hour per lane/signal cycles per hour)

The basis of the analysis is as follows: (1) the Poisson probability distribution is used to estimate the 95th percentile maximum number of queued vehicles per signal cycle for a particular movement; (2) the estimated maximum number of vehicles in the queue is translated into a queue length, assuming 25 feet per vehicle; and (3) the estimated maximum queue length is compared to the existing or planned available storage capacity for the movement. This analysis thus provides a basis for estimating future left-turn storage requirements at intersections. The 95th percentile queue length value indicates that

during the peak hour, a queue of this length or less would occur on 95 percent of the signal cycles. Likewise, a queue length longer than the 95th percentile queue would only occur on 5 percent of the signal cycles (about 3 cycles during the peak hour for a signal with a 60-second cycle length). Therefore, left-turn storage pocket designs based on the 95th percentile queue length would ensure that storage space would be exceeded only 5 percent of the time. The 95th percentile queue length is also known as the “design queue length”.

Based on the project trip generation and trip distribution pattern, the following movements were evaluated as part of the queuing analysis for this project:

- Coleman Avenue and Brokaw Road: southbound left turn and westbound left turn movements

Southbound Left Turn at Coleman Avenue and Brokaw Road

The queuing analysis indicates that the maximum vehicle queues for the southbound left-turn pocket at the Coleman Avenue and Brokaw Road intersection would exceed the existing vehicle storage capacity under existing plus project and background plus project conditions during the AM peak hours by 25 feet, or 1 vehicle during AM peak hour and is not expected to block the through or the right turn traffic.

Westbound Left Turn at Coleman Avenue and Brokaw Road

The queuing analysis indicates that the maximum vehicle queues for the westbound left-turn pocket at the Coleman Avenue and Brokaw Road intersection would exceed the existing vehicle storage capacity under existing, existing plus project, background, and background plus project conditions during both the AM and PM peak hours.

The westbound left-turn pocket currently provides only 50 feet of vehicle storage, which can accommodate only 2 vehicles. The estimated 95th percentile vehicle queue for the westbound left-turn movement is approximately 3 vehicles (or 75 feet) during the AM peak hour and 16 vehicles (or 400 feet) during the PM peak hour under existing and background conditions. Field observations confirm that westbound left turn vehicles queue out of the turn pocket during the PM peak hour. The improvement measures at this intersection to address the level of service impact would change the lane striping on this leg by adding another through lane and change the left turn signal control to protected plus permissive phasing. This would provide additional time for left turn vehicles to clear the intersection and reduce the queue lengths.

Site Access and Circulation

Site access and on-site circulation were evaluated using commonly accepted transportation planning principles. This review is based on the project site plan prepared by Jensen Design Architects dated February 28, 2020 (see Figure 2).

Site Access Evaluation

Vehicular access to the project site would be provided via one driveway along Coleman Avenue and one driveway along Brokaw Road (see Figure 15). Although nothing on Coleman Avenue would physically prevent left turns in and out of the project driveway, the traffic and queuing on Coleman Avenue would make these turns very difficult. Hexagon recommends a “right turn only” sign at the Coleman Avenue driveway on the project site. The driveway on Brokaw Road could accommodate all turning movements.

¹ Assumes 25 Feet Per Vehicle Queued.				
² Volume adjusted for prot+perm left turn control.				

According to the City of Santa Clara City Code, Chapter 18.74 (Parking Regulations), two-way driveways providing access to all properties other than residential should be at least a minimum width of 22 feet (20-feet pavement with one-foot clearance on each side) and one-way should be minimum width of at least 14 feet (12 feet of pavement with one foot clearance on each side). Based on the site plan, the one-way driveways on Coleman Avenue are measured to be approximately 15 feet and 10 inches wide and 20 feet wide, which satisfies the City requirements. The project driveway on Brokaw Road is measured to be approximately 24 feet wide, which also satisfies the City requirements.

The project driveways would be designed to be free and clear of any obstructions to optimize sight distance, thereby ensuring that exiting vehicles can see pedestrians on the sidewalk and other vehicles traveling on adjacent roadways. Any landscaping and signage would be located in such a way as to ensure an unobstructed view for drivers entering and exiting the site. Adequate corner sight distance (sight distance triangles) would be provided at all site access points in accordance with the City's standards. Sight distance triangles would be measured approximately in accordance with City standards. The Caltrans recommended stopping sight distance for Coleman Avenue is 360 feet and for Brokaw Road is 200 feet. On-street parking is not allowed along Coleman Avenue. Therefore, the proposed driveway on Coleman Avenue would have adequate sight distance to the south. On-street parking would be disallowed along the project frontage on Brokaw Road to provide queuing space at the Coleman Avenue signal and adequate sight distance at the Brokaw Road driveway.

Traffic Operations at Project Driveways

The estimated project-generated trips at the project driveways are shown on Figure 15. The new project-generated trips that are estimated to occur at the Coleman Avenue inbound driveway are 50 trips during the AM peak hour and 55 trips during the PM peak hour, which is one inbound vehicle every one minute during the AM and PM peak hour. There is approximately 95 feet of storage (room for 4 vehicles) available at the inbound driveway, which would be adequate for inbound queuing within the project site. Based on the trip distribution and assignment on the surrounding roadway network, the project would generate 42 outbound trips during the AM peak hour, and 65 outbound trips during the PM peak hour using the Coleman Avenue driveway (see Figure 15). In addition to that, there would be 61 outbound valet vehicles during the AM peak hour and 67 outbound valet vehicles during the PM peak hour. Including the valet vehicles, the project trips that would occur at the Coleman driveway would be 103 outbound trips during the AM peak hour and 132 outbound trips during the PM peak hour, which is about two outbound vehicles every minute during the AM and PM peak hours. There would be approximately 200 feet of storage (room for 8 vehicles) available at the outbound driveway, which would be adequate for outbound queuing within the project site.

The project-generated trips that are estimated to occur at the Brokaw Road driveway are 122 inbound trips and 134 inbound trips during the AM and PM peak hours, respectively, and 35 outbound trips 53 outbound trips during the AM and PM peak hours, respectively. Delay or queuing issues are not expected at the Brokaw Road driveway.

1290 Coleman Avenue Hotel Development TIA

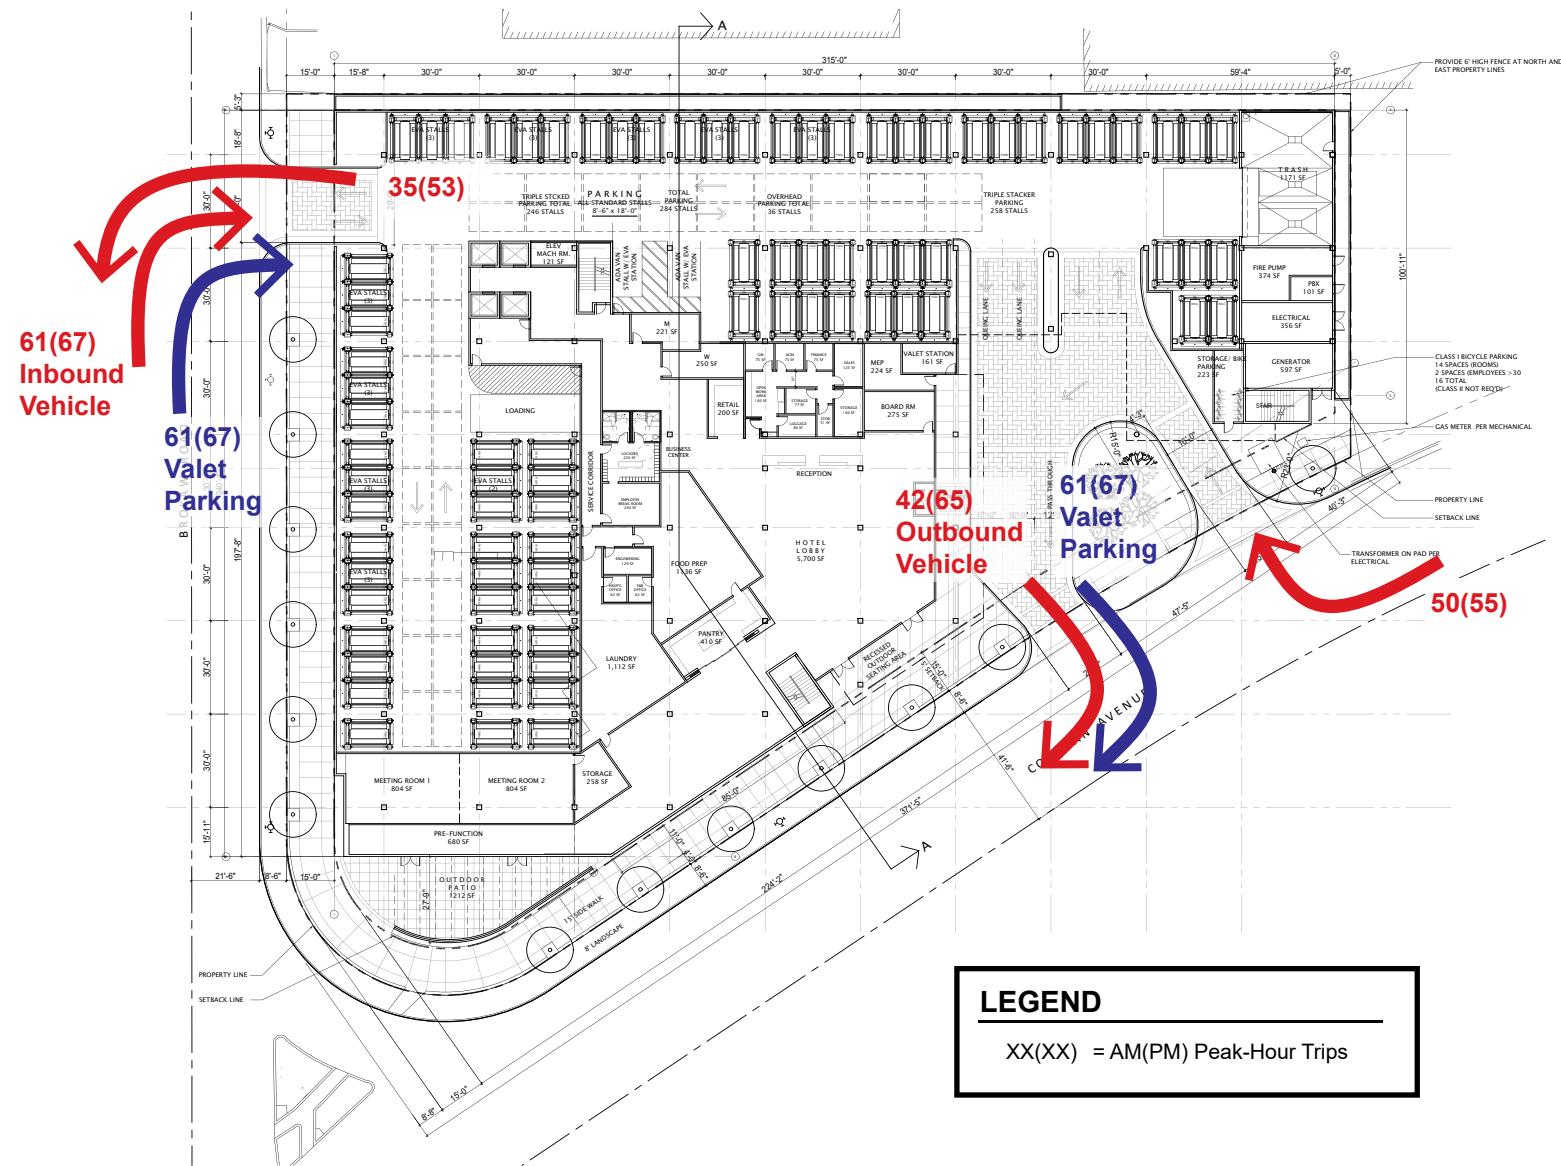

Figure 15
Trip Assignment to Driveways

On-Site Circulation

All parking for the hotel would be valet only; self-parking would not be provided, except the three surface parking spaces on-site. Except three surface parking spaces, all other parking spaces would be in mechanical lifts. Guests could enter the site from either Coleman Avenue or Brokaw Road and drop off their vehicles at the front entrance to the hotel building. Guests entering from Brokaw Road would need to drive through the garage to get to the valet station. Valets would move the vehicles from the valet station into the garage. When the owner returns to retrieve their vehicle, the valet team would drive it back to the valet station in front of the hotel.

The site plan shows an island in the entry court off Coleman Avenue. The island would prevent exiting vehicles from circling back to use the Brokaw Road driveway. Having all vehicles exit to Coleman Avenue would be problematic because of the difficulty southbound vehicles would have accessing the left turn pocket at Brokaw Road to make a U-turn. The project site plan was reviewed for U-turn access for passenger cars at the Coleman Avenue garage entrance from the passing lane and the queuing lane (see Figures 16 and 17). Based on the site plan configuration and turn around template, Hexagon recommends that the island in the entry court (along Coleman Avenue) be removed. With the island removed, exiting vehicles could turn around in the court area to access the Brokaw Road driveway. Also, the valet drivers could turn vehicles around and access the garage from in front of the hotel. The traffic study assumes that about half the valet trips by the valet drivers would turn around in the court area and half would exit to Coleman Avenue and drive “around the block” to enter the parking garage from Brokaw Road to avoid queuing issues in front of the Coleman Avenue garage entrance.

Pedestrian On-Site Circulation

The site plan shows sidewalks along the project site's frontage on Coleman Avenue and Brokaw connecting to all on-site facilities and facilitating pedestrian circulation within the site.

Passenger Loading

There are also many free and commercial applications offering carpooling or discounted taxi services. Some of the carpooling applications include Waze Carpool and Scoop and discounted taxi services include Uber and Lyft Valet. The valet parking area along Coleman Avenue provides a loading area for shuttles, rideshare and discounted taxi services.

Loading and Garbage Truck Access

Truck activities (e.g., deliveries and garbage collection) for the project are expected to occur within the garage. The project plans show the trash room located at the northeast corner of the parking garage. The garbage loading zone is designed such that Mission Trail trucks from both directions could enter and exit the loading zone from either the Brokaw Road driveway or the Coleman Avenue driveway. The site plan shows 16 feet of vertical clearance for the garbage trucks.

Truck loading and unloading is expected to occur within the proposed freight loading zone at the west side of the garage, with access to the elevators and the service corridor. The designated loading zone is shown to be 35 feet long, which would be adequate to serve all delivery trucks. The site plan shows 16 feet of vertical clearance for the loading trucks. The loading trucks would enter and exit through the Brokaw Road driveway. The project site plan was reviewed for truck access using truck turning-movement templates for a SU-30 (single-unit) truck type, which represents small- to medium-sized emergency vehicles, garbage trucks, delivery trucks and moving trucks (see Figures 18 and 19). Based on the site plan configuration, SU-30 trucks would have adequate space to maneuver in and out of the loading area.

Truck Turning Template (Inbound at Loading Zone)

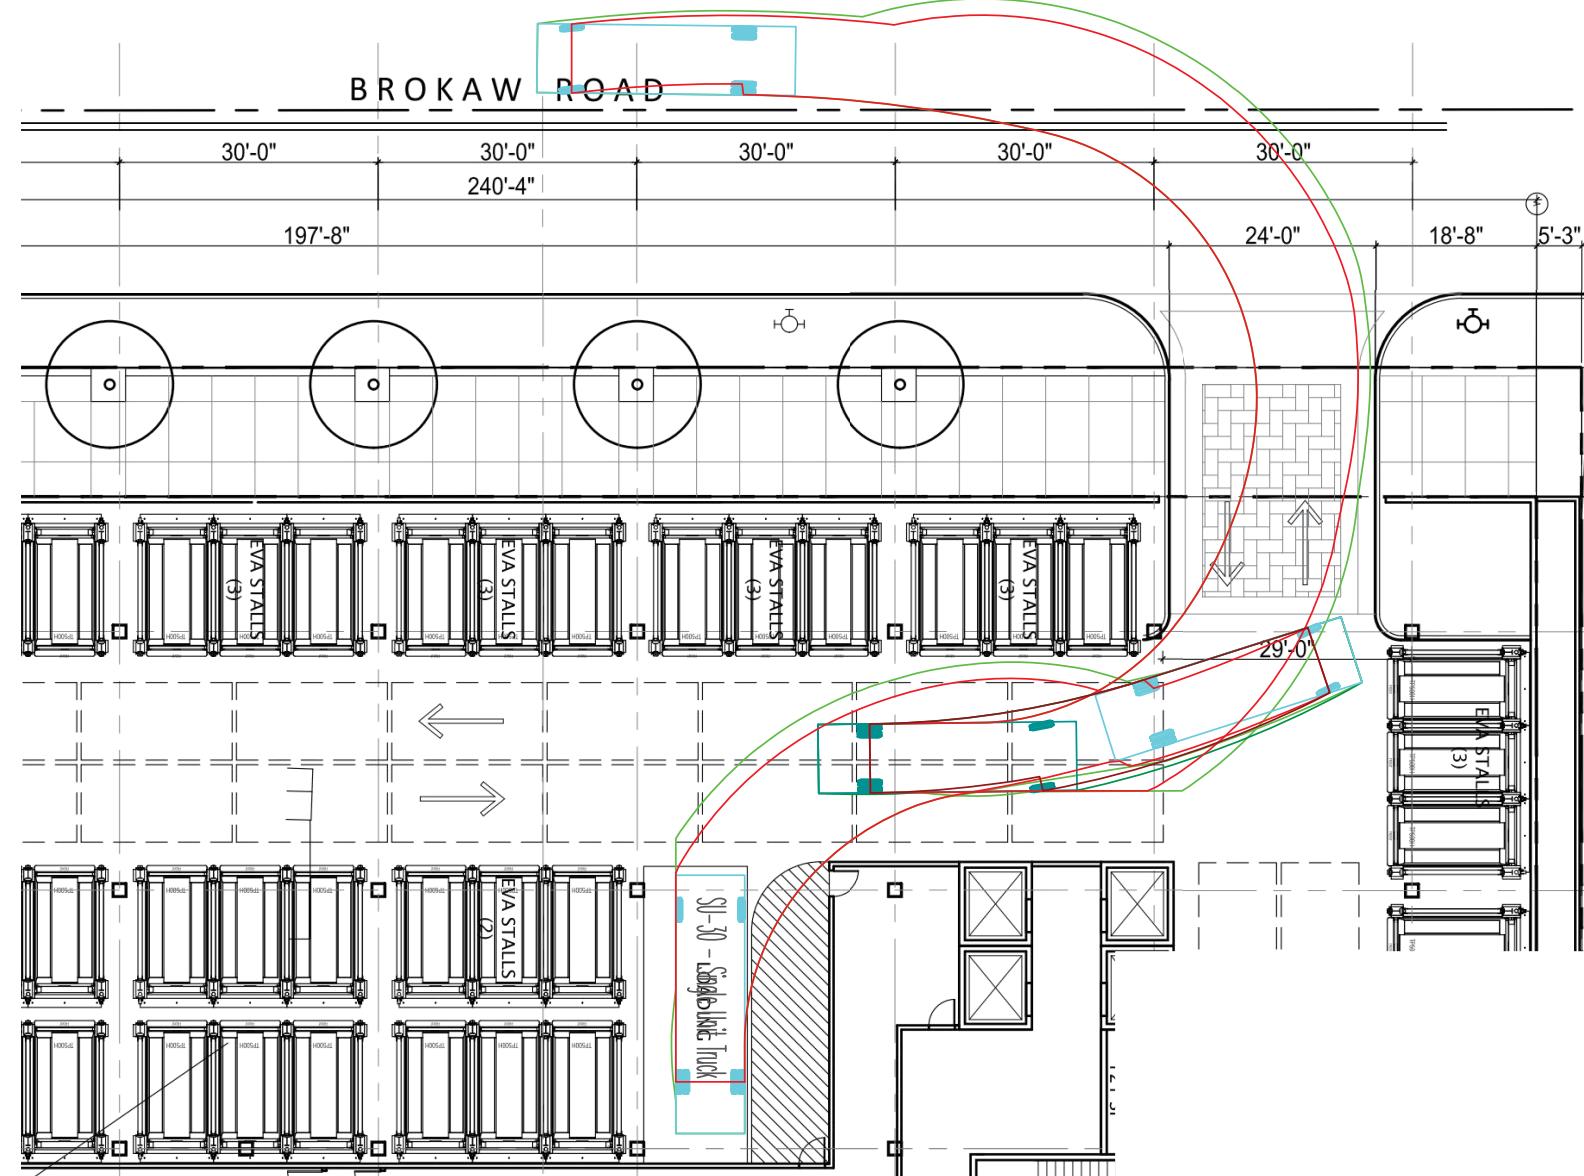

Figure 19
Truck Turning Template (Outbound at Loading Zone)

Potential Impacts to Pedestrians, Bicycles, and Transit

In the project vicinity, sidewalks are provided on the following roadways.

- West side of Coleman Avenue, between Aviation Avenue and De La Cruz Boulevard
- East side of Coleman Avenue, with the exception of a short segment south of Brokaw Road
- Both sides of Brokaw Road, west of Coleman Avenue
- South side of Brokaw Road, east of Coleman Avenue for approximately 250 feet

A pedestrian connection is present between Brokaw Road and the Santa Clara Transit Center (located on El Camino Real, west of the project site). It consists of an underground pedestrian pathway that begins at the western end of Brokaw Road and ends at the Transit Center, on the west side of the railroad tracks. This pedestrian connection provides a direct connection between the project site and the Transit Center and other existing services along El Camino Real.

Additionally, the intersection of Coleman Avenue and Brokaw Road provides marked crosswalks and pedestrian signal heads that would facilitate pedestrian access from the project site to the adjacent shopping center located north of the project site.

The project is not located near any existing bike lanes. However, the Cities of Santa Clara and San Jose bicycle plans identify bike lanes on Coleman Avenue and De La Cruz Boulevard that will connect to other existing bike lanes. With the planned bicycle improvements, the proposed project would be served directly by bicycle facilities. Santa Clara may also wish to stripe bike lanes on Brokaw Road to serve the future BART station. It should be noted that bikes can also use the Brokaw Road pedestrian underpass to access the Santa Clara Transit Center.

Transit Service

The project site is currently served directly by VTA bus route 60, with the nearest bus stops located at the intersection of Coleman Avenue/Brokaw Road. Additionally, with the pedestrian pathway that connects Brokaw Road to the Santa Clara Transit Center, the project site is served by all the bus lines and commuter rail services available at the Transit Center.

Project's Effect on Transit Services

Due to the proximity of airport, bus stops and the Caltrain Station to the project site, it is likely that hotel guests and employees would utilize the existing transit services. Assuming up to a 6 percent transit mode share (see Table 6), the project would generate up to 11 and 14 new transit riders during the AM and PM peak hours, respectively. Given that the project site is served by 3 local bus routes, one frequent rapid route, two frequent routes, Caltrain, ACE and Capitol Corridor, it is anticipated that the projected transit riders associated with the project could be accommodated by the existing transit services.

To assess the project's effect on transit vehicle delay, the delay experienced by each route running through the study intersections was estimated based on the average vehicle delay that is calculated as part of the intersection level of service analysis. Table 11 summarizes the bus travel times through the study area and the increase in transit vehicle delay with the addition of the project traffic. VTA does not have significance thresholds to determine impacts on transit vehicle delay. Therefore, this analysis is presented for information purposes only.

The results show that the project would result in minor increases in delay for some transit movements. The decreases in delay are attributed to the fact that the addition of the project traffic sometimes causes a reallocation of green time, which results in less delay for certain movements and more delay

for others. The maximum increase in travel time would be by less than 11 seconds, which would not be noticeable.

Table 11
Transit Vehicle Delay in the Study Area

Route #	Study Area Street(s)	Direction	Projected Increase in Transit Vehicle Delay (sec/veh)	
			AM	PM
60	Coleman Avenue and Brokaw Road	NB	-0.7	11.4
		SB	3.5	0.6

Notes:
Projected increase in transit delay based on a comparison of background vs. background plus project conditions intersection movement delays calculated by TRAFFIX.

Potential Future BART Station

The BART Phase II Extension Project will include a 5-mile-long subway tunnel through downtown San Jose and will extend the BART system from the future Phase I terminus for approximately six miles to the City of Santa Clara. The Santa Clara BART station is being proposed to be located adjacent to the Santa Clara Transit Center with access to a planned new parking garage on Brokaw Road. With implementation of the proposed BART extension project, the project site would be directly served by BART. Overall, the new BART station would offer another mode of travel and decrease the amount of traffic on the surrounding roadways due to the transportation demand mode shift from driving to taking BART.

Parking

The parking analysis for the proposed hotel development is based on the City of Santa Clara's zoning code requirements and the *VTA Bicycle Technical Guidelines*.

For hotels in the City of Santa Clara, the Zoning Ordinance requires parking to be provided at the rate of a minimum of 1 parking space for each room. The project proposes 396 hotel rooms. Thus, the project is required to provide a minimum of 396 parking spaces. The project site plan shows 282 parking spaces in mechanical stackers and 2 ADA van stalls for a total of 284 parking spaces, which does not meet the City code requirement. The project is planning to provide shuttle service to the airport and other local destinations. As per the 2010 Santa Clara Station Area Plan section 3-P-26, the project can request a parking reduction in conjunction with the shuttle program. The project is planning to request a reduction in the parking requirement to 0.71 stalls per room. The project is planning to provide valet parking. As shown on the site plan, the project is planning to provide two van accessible parking spaces. Since self-parking is not permitted, the ADA parking proposed at the site would be adequate.

Based on the VTA Bicycle Technical Guidelines bicycle parking requirements, the project should provide one class I bicycle parking space per 30 rooms and one class I bicycle parking space per 30 employees (long term parking). As per the VTA guidelines, the minimum number of required Class II bicycle parking spaces is 4 (short-term parking). Assuming that the project would have 30 to 60 employees, the project should provide 14 long term bicycle spaces for hotel guests, two long term

bicycle spaces for employees, and four short term bicycle spaces. The site plan shows a bicycle storage room with 16 long term spaces near the Coleman driveway entrance. The site plan does not show any short-term bicycle spaces. Four spaces should be provided near the building entrance.

Vehicle Miles Traveled

Pursuant to SB 743, the Governor's Office of Planning and Research (OPR) published the finalized updates to the CEQA Guidelines in November 2017. The Technical Advisory on Evaluating Transportation Impacts in CEQA published by OPR in December 2018 provided recommendations regarding VMT evaluation methodology, significance thresholds and screening thresholds for land use projects. The guidelines stated that Level of Service will no longer be considered to be an environmental impact under CEQA and considers vehicle-miles-travelled (VMT) the most appropriate measure of transportation impact. The OPR guidelines and City of Santa Clara VMT Policy state that transit supportive projects located within $\frac{1}{2}$ mile of an existing major transit stop or an existing transit stop along a high quality transit corridor would have a less-than-significant impact on VMT and will not require a VMT analysis. Projects that do not meet the screening criteria for VMT analysis will have a less than significant impact if they result in a 15% VMT reduction compared to the baseline. The proposed project is located within 1,500 feet of the Santa Clara Caltrain station, which qualifies as a major transit stop, and the project would thus be presumed to have a less-than-significant impact on VMT per City of Santa Clara guidelines.
