

## TECHNICAL MEMORANDUM

DATE September 1, 2020  
TO Pamela P. Smith, Assistant Superintendent of Business Services  
Sierra Sands Unified School District  
113 W. Felspar Avenue  
Ridgecrest, California 93555  
FROM Steve Bush, P.E., Senior Engineer  
SUBJECT Richmond Elementary School Replacement  
Health Risk Assessment Technical Memorandum  
SSSD-06

### 1. Introduction

PlaceWorks prepared a health risk assessment for the Sierra Sands Unified School District (District) for the proposed new location for Richmond Elementary School (project). The Health Risk Assessment (HRA) was conducted as required by Public Resources Code Section 21151.8 and Education Code Section 17213 and in accordance with relevant and appropriate procedures of the U.S. Environmental Protection Agency (USEPA), California Environmental Protection Agency (CalEPA), and Office of Environmental Health and Hazard Assessment (OEHHA).

#### 1.1 PROJECT LOCATION

The project site is northwest of the intersection of Richmond Road and Ridgecrest Boulevard in the City of Ridgecrest, in the northeast corner of Kern County, California. The site is outside of the Naval Air Weapons Station (NAWS) China Lake secured area. The project site is bordered by Gold Canyon Street to the north, Richmond Road to the east, Ridgecrest Boulevard to the south, and Gateway Boulevard to the west. The site and surrounding area are shown in Figure 1.

### 2. Health Risk Assessment

#### 2.1. SOURCE IDENTIFICATION

No freeways or busy traffic corridors were identified within a quarter-mile (1,320 feet).<sup>1</sup> The Eastern Kern Air Pollution Control District (EKAPCD) was contacted to assist in the identification of

---

<sup>1</sup> PlaceWorks, 2020. Geologic and Environmental Hazards Assessment for Richmond Elementary School Replacement Project. Dated August 2020. A freeway or busy traffic corridor is defined as “Roadways with an average daily traffic in excess of 50,000 vehicles in a rural area and 100,000 daily vehicles in an urban area” (Education Code Section 17213(d)(9); Public Resources Code Section 21151.8(b)(9))

potential emission sources within a quarter-mile radius (1,320 feet) of the site. Only one site was identified by EKAPCD as a potential emission source:

- » Minit Shop #349 – gasoline storage and dispensing facility at 843 E. Ridgecrest Boulevard<sup>2</sup>

No non-permitted emission sources or other mobile sources (i.e., railroad) were identified within the ¼-mile radius. Figure 1, Project Locations, shows the location of the gas station with respect to the project site

## 2.2. SOURCE CHARACTERIZATION

Gasoline stations emit volatile organic compounds (VOCs) during underground tank loading, storage tank venting due to temperature and pressure changes, refueling at the vehicle/nozzle interface, and spillage. Per California Air Resources Board (CARB) and California Air Pollution Control Officers Association (CAPCOA) recommendations, benzene is the most critical substance driving health risks from gasoline service stations.<sup>3</sup> <sup>4</sup> The emissions of toluene, xylene and other compounds do not begin to cause adverse acute health effects until the health risks from benzene emissions exceed air district cancer risk thresholds by more than 2 orders of magnitude. Therefore, health risks from benzene exposure were the focus of the evaluation. The limiting factor for the inclusion of a compound was the availability of published exposure factors and other toxicity data enabling risks to be quantified and, where appropriate, target organs identified

Appendix A contains the emission rate calculations for each source considered in the assessment

## 2.3. AIR DISPERSION MODELING

Air quality modeling using the AERMOD atmospheric dispersion model was performed to assess the impact of emitted compounds on individuals who may work and/or attend the school. The model is a steady state Gaussian plume model and is recommended by EKAPCD for estimating ground level impacts from point and fugitive sources in simple and complex terrain. The model requires additional input parameters, including terrain data and local meteorology. Meteorological data obtained from CARB for the nearest representative meteorological station (China Lake) with the latest available years (2009-2013) of record were used to represent local weather conditions and prevailing winds.

---

<sup>2</sup> Eastern Kern Air Pollution Control District (EKAPCD), 2019. Correspondence between Mr. Gary Ray, Jr., Air Quality Administrative Manager, EKAPCD, and Mr. Mike Watson, PG, Associate Geologist, PlaceWorks on August 20, 2019.

<sup>3</sup> California Air Pollution Control Officers Association (CAPCOA), 1997. *Air Toxics “Hot Spots” Program: Gasoline Service Station Industrywide Risk Assessment Guidelines*. Dated November 1997.

<sup>4</sup> California Air Resources Board (CARB), 2013. *Revised Emission Factors for Gasoline Marketing Operations at California Gasoline Dispensing Facilities*. Dated December 23, 2013.

The modeling analysis also considered the spatial distribution and elevation of each emitting source in relation to the receptors. To accommodate the model's Cartesian grid format, direction-dependent calculations were obtained by identifying the Universal Transverse Mercator (UTM) coordinates for each source location. In addition, digital elevation model (DEM) data for the area were obtained and included in the model runs to account for complex terrain. The model's By-Day-of-Week (HRDOW) scalar option was invoked to predict ground-level concentrations during typical school hours (i.e., Monday to Friday 8:00AM to 4:00PM).

Appendix A contains a representation of the air dispersion model setup and wind rose for the meteorological data. The air dispersion model output is presented in Appendix B.

### **2.3. CARCINOGENIC RISK**

A threshold of ten in a million ( $10 \times 10^{-6}$ ) has been established as a level posing no significant risk for exposures to carcinogens. Health risks associated with exposure to carcinogenic compounds can be defined in terms of the probability of developing cancer as a result of exposure to a chemical at a given concentration. The cancer risk probability is determined by multiplying the chemical's annual concentration by its cancer potency factor (CPF), a measure of the carcinogenic potential of a chemical when a dose is received through the inhalation pathway. It is an upper-limit estimate of the probability of contracting cancer as a result of continuous exposure to an ambient concentration of one microgram per cubic meter ( $\mu\text{g}/\text{m}^3$ ) over a lifetime of 70 years.

Recent guidance from OEHHA recommends a refinement to the standard point estimate approach with the use of age-specific breathing rates and age sensitivity factors (ASFs) to assess risk for susceptible subpopulations. For the inhalation pathway, the procedure requires the incorporation of several discrete variates to effectively quantify dose for each age group. Once determined, contaminant dose is multiplied by the cancer potency factor in units of inverse dose expressed in milligrams per kilogram per day ( $\text{mg}/\text{kg}/\text{day}$ )<sup>-1</sup> to derive the cancer risk estimate. Therefore, to accommodate the unique exposures associated with the school-based receptors, the following dose algorithm was used.

$$\text{Dose}_{(\text{AIR}, \text{per age group})} = (\text{C}_{\text{air}} \times \text{EF} \times [\text{BR}/\text{BW}] \times \text{A} \times \text{CF})$$

Where:

$\text{Dose}_{\text{AIR}}$ =	dose by inhalation ( $\text{mg}/\text{kg}\text{-day}$ ), per age group/receptor
$\text{C}_{\text{air}}$ =	concentration of contaminant in air ( $\mu\text{g}/\text{m}^3$ )
$\text{EF}$ =	exposure frequency (number of days/365 days)
$\text{BR}/\text{BW}$ =	daily breathing rate normalized to body weight ( $\text{L}/\text{kg}\text{-day}$ )
$\text{A}$ =	inhalation absorption factor (default = 1)
$\text{CF}$ =	conversion factor ( $1 \times 10^6$ , $\mu\text{g}$ to $\text{mg}$ , $\text{L}$ to $\text{m}^3$ )

The inhalation absorption factor (A) is a unitless factor that is only used if the cancer potency factor included a correction for absorption across the lung. The default value of 1 was used for this assessment. To represent the unique characteristics of the school population, the assessment

employed the USEPA's guidance to develop viable dose estimates based on reasonable maximum exposure, defined as the "highest exposure that is reasonably expected to occur" for a given receptor population. Lifetime risk values for the student population were adjusted to account for an exposure of 180 days per year for 6 years (kindergarten through 5th grade). In addition, the calculated risk for students is multiplied by an ASF weighting factor of 3 (for children ages 5 to 11 years) to account for early life sensitivity to pollutant exposures.<sup>5</sup> To assess staff-related risk, exposures were adjusted to account for an employment period of 250 days per year for 25 years.

To calculate the overall cancer risk, the risk for each receptor type is calculated per the following equation:

$$\text{Cancer Risk}_{\text{AIR}} = \text{Dose}_{\text{AIR}} \times \text{CPF} \times \text{ASF} \times \frac{\text{ED}}{\text{AT}}$$

Where:

Dose <sub>AIR</sub>	=	dose by inhalation (mg/kg-day), per age group/receptor type
CPF	=	cancer potency factor, chemical-specific (mg/kg-day) <sup>-1</sup>
ASF	=	age sensitivity factor, per age group
ED	=	exposure duration (years)
AT	=	averaging time period over which exposure duration is averaged (70 years)

The CPFs used in the assessment were obtained from OEHHA guidance. The cancer risk is calculated separately for the students and staff, because of age differences in sensitivity to carcinogens and age differences in intake rates. The final step converts the cancer risk in scientific notation to a whole number that expresses the cancer risk in "chances per million" by multiplying the cancer risk by a factor of  $1 \times 10^6$  (i.e. 1 million).

CARB's Hotspots Analysis and Reporting Program (HARP2), Risk Assessment Standalone Tool was used to calculate the cancer risk values.<sup>6</sup> The calculated results are provided in Appendix C.

## 2.4. NON-CARCINOGENIC HAZARDS

An evaluation was conducted for the potential non-cancer effects of chronic and acute chemical exposures. Adverse health effects are evaluated by comparing the annual receptor ground level or flagpole level concentration of each chemical compound with the appropriate reference exposure limit (REL). Available RELs promulgated by OEHHA were considered in the assessment.

---

<sup>5</sup> Office of Environmental Health Hazard Assessment (OEHHA), 2015. *Air Toxics Hot Spots Program Risk Assessment Guidelines – Guidance Manual for Preparation of Health Risk Assessments*. Dated February 2015

<sup>6</sup> California Air Resources Board (CARB), 2019. Hotspots Analysis and Report Program (HARP2), Risk Assessment Standalone Tool (RAST), Version 19044.

The hazard index approach was used to quantify non-carcinogenic impacts. The hazard index assumes that chronic sub-threshold exposures adversely affect a specific organ or organ system (toxicological endpoint). Target organs presented in regulatory guidance were used for each discrete chemical exposure. Each chemical concentration or dose is divided by the appropriate toxicity value to calculate the hazard index. A health hazard is presumed to exist where the total equals or exceeds one. CARB's HARP2 Risk Assessment Standalone Tool was used to calculate the chronic, acute (1-hour), and 8-hour health risk values (CARB, 2019), and the determined hazard indices are provided in Appendix C.

## 2.5. RESULTS

The summary results of the HRA are provided in Table 1. The excess cancer risk was calculated to be 0.8 per million for adult school staff and 1.1 per million for students. In comparison to the threshold level of 10 in a million, carcinogenic risks are below the significance threshold value for both school staff and students. For chronic, acute (1-hour), and 8-hour non-carcinogenic effects, the hazard index identified for each toxicological endpoint totaled less than one at the project site. Therefore, non-carcinogenic hazards are also below the significance threshold.

**Table 1 Health Risk Assessment Summary**

EMISSION SOURCES	CANCER RISK (PER MILLION)		CHRONIC HAZARDS	ACUTE (1-HR) HAZARDS	8-HOUR HAZARDS
	STAFF	STUDENTS			
Minit Shop #349	0.8	1.1	0.002	0.029	0.002
EKAPCD Threshold	10	10	1.0	1.0	1.0
Exceeds Threshold?	No	No	No	No	No

## 3. Conclusions

Based on a comparison to the carcinogenic and non-carcinogenic thresholds established under the California Safe Drinking Water and Toxic Enforcement Act (Proposition 65) and OEHHA, hazardous air emissions generated from nearby emission sources are not anticipated to pose an actual or potential endangerment to occupants of the proposed school and no mitigation measures are required.

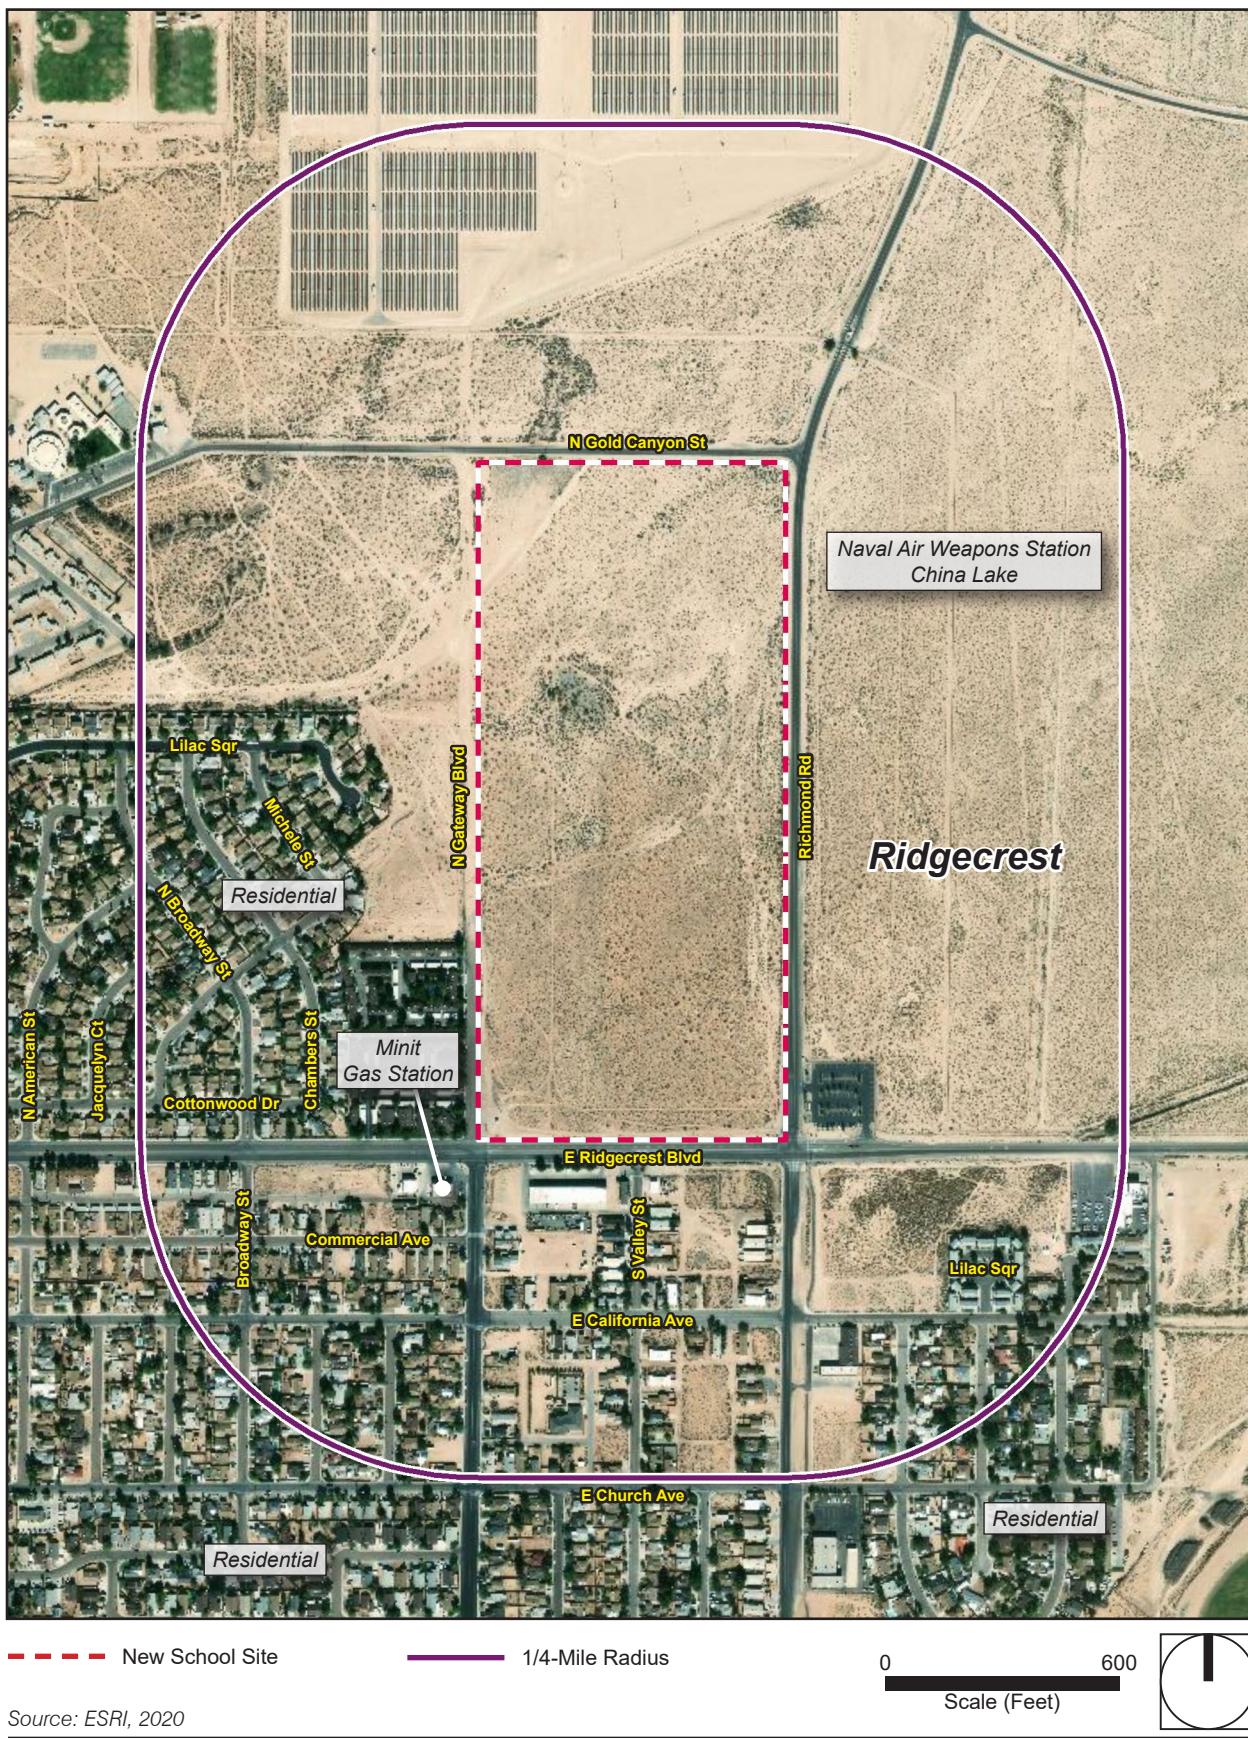

Respectfully submitted,

PlaceWorks

Steve Bush, PE  
Senior Engineer

----- Summary of Total Messages -----

A Total of                0 Fatal Error Message(s)  
A Total of                0 Warning Message(s)  
A Total of                14394 Informational Message(s)

A Total of                43872 Hours Were Processed

A Total of                9878 Calm Hours Identified

A Total of                4516 Missing Hours Identified ( 10.29 Percent)

CAUTION!: Number of Missing Hours Exceeds 10 Percent of Total!  
Data May Not Be Acceptable for Regulatory Applications.  
See Section 5.3.2 of "Meteorological Monitoring Guidance  
for Regulatory Modeling Applications" (EPA-454/R-99-005) .
