LIST OF FIGURES

EXECUTIVE SUMMARY

The purpose of this report is to provide an assessment of the noise impacts associated with development and operation of the proposed Winchester at Jean Nicholas Commercial project and to identify mitigation measures that may be necessary to reduce those impacts. The noise issues related to the proposed land use and development have been evaluated in light of applicable federal, state and local policies, including those of the County of Riverside.

Although this is a technical report, effort has been made to write the report clearly and concisely. A list of acronyms and glossary are provided in Appendix A and Appendix B of this report to assist the reader with technical terms related to noise analysis.

PROJECT LOCATION

The proposed project is located at the northwest corner of Winchester Road (SR-79) and Jean Nicholas Road in the unincorporated French Valley community of Riverside County. The site is currently vacant. The existing land use designation is Light Industrial; therefore, a General Plan Amendment is assumed to be required.

PROJECT DESCRIPTION

The approximately 2.9-acre project site is proposed to be developed with 2,627 square feet of coffee shop with drive-thru land use and a 16 fueling position super convenience market/gas station.

PROJECT IMPACTS

Construction Impacts

Modeled unmitigated construction noise levels when combined with existing measured noise levels could reach 61.2 dBA L_{eq} at the nearest residential property lines to the north, 56.2 dBA L_{eq} at the nearest residential property lines to the northeast, 58.4 dBA L_{eq} at the nearest residential property lines to the east and southeast, 67.1 dBA L_{eq} at the nearest residential property lines to the south, and up to 74.2 dBA L_{eq} at the nearest residential property lines to the west and southwest of the project site.

Construction noise sources are regulated within the County of Riverside Ordinance 847 which prohibits construction activities other than between the hours of 6:00 AM to 6:00 PM during the months of June through September and between the hours of 7:00 AM and 6:00 PM during the months of October through May.

The County of Riverside has not adopted a numerical threshold that identifies what a substantial increase would be. For purposes of this analysis, the Federal Transit Administration (FTA) Transit Noise and Vibration Impact Assessment (2006) criteria will be used to establish significance thresholds. For residential uses, the daytime noise threshold is 80 dBA L_{eq} averaged over an 8-hour period ($L_{eq\ (8\text{-}hr)}$; and the nighttime noise threshold is 70 dBA $L_{eq\ (8\text{-}hr)}$. For commercial uses, the daytime and nighttime noise threshold is 85 dBA $L_{eq\ (8\text{-}hr)}$. In compliance with the County's Code, it is assumed that construction would not occur during the noise-sensitive nighttime hours.

Impacts related to construction noise will be further minimized with adherence to applicable Municipal Ordinances and implementation of the measures presented in Section 8 of this report. Impacts would be less than significant.

Noise Impacts to Off-Site Receptors Due to Project Generated Trips

Existing and Existing Plus project noise levels along acoustically significant area roadways were modeled utilizing the FHWA Traffic Noise Prediction Model FHWA-RD-77-108 in order to quantify the proposed project's contribution to increases in ambient noise levels.

For off-site project generated noise, increases in ambient noise along affected roadways due to project generated vehicle traffic is considered substantial if they result in an increase of at least 5 dBA CNEL and: (1) the existing noise levels already exceed the applicable land use compatibility standard for the affected sensitive receptors set forth in the Noise Element of the County's General Plan; or (2) the project increases noise levels by at least 5 dBA CNEL and raises the ambient noise level from below the applicable standard to above the applicable standard.

Per the noise modeling, all of the modeled roadway segments are anticipated to change the noise a nominal amount (approximately 0.05 to 1.84 dBA CNEL). Therefore, a change in noise level would not be audible and would be considered less than significant.

Transportation Noise Impacts to the Proposed Project

Roadways that may generate enough traffic noise under buildout conditions to affect the proposed commercial uses include Highway 79 and Jean Nicholas Road.

Per the County of Riverside General Plan Noise Element, commercial land uses are considered to be "normally acceptable" in environments where the exterior noise level reaches up to 70 dBA CNEL and "conditionally acceptable" in environments where the exterior noise level reaches up to 77.5 dBA CNEL.

The exterior noise levels at the proposed project site are anticipated to fall within the County's conditionally acceptable exterior noise standards for commercial uses. Impacts related to future traffic noise impacts to the proposed project would be less than significant.

Noise Impacts to Off-Site Receptors Due to On-Site Operational Noise

The SoundPLAN noise model was utilized to estimate project peak hour operational noise at first floor/yard and second floor receptors in order to determine if it is likely to exceed the County's noise thresholds at sensitive receptors. A description of each noise source and model parameters are discussed in Section 5 of this report. As shown on Figures 6 and 7. Peak hour project operation is expected to range between 47.4 and 62.3 dBA Leq at the nearest sensitive receptors and is not expected to exceed the County's exterior daytime noise threshold of 65 dBA L_{eq}.

Nighttime noise levels associated with the proposed project were also modeled assuming no car wash or vacuuming activities would occur between 10:00 PM and 7:00 AM. Nighttime operational noise levels are expected to range between 30.5 and 48.6 dBA L_{eq} at modeled sensitive receptors. Second floor noise levels at proposed adjacent residential land uses to the east may exceed the nighttime exterior noise standard of 45 dBA L_{eq}. However, residential construction typically provides an exterior to interior noise reduction of 20 dB with a windows closed condition. The proposed adjacent residential units are expected to be provided with air conditioning which will allow a closed window condition, considering their proximity to State Route 79. Project operational noise levels would be considered less than significant. No mitigation is required.

Groundborne Vibration Impacts

Construction equipment is anticipated to be located at a distance of at least 135 feet or more from any receptor. Temporary vibration levels associated with project construction would be less than significant. Therefore, impacts associated with construction activities would be less than significant. No mitigation is required.

Impacts to the Proposed Residential Uses to the North

The proposed residential development TR37078 is located adjacent to the north of the proposed project. Per the County of Riverside General Plan Land Use Map the current land use designations at this proposed residential use are Commercial Retail and Light Industrial. Although this project has not yet been approved by the County and the current County land use designations for this project site are not residential, in order to anticipate any potential future noise related impacts an additional noise analysis at this proposed use has been provided.

Construction Impacts

This construction analysis assumes the proposed residential project to the north is approved by the County and is already constructed and operational.

Modeled unmitigated construction noise levels when combined with existing measured noise levels could reach 79.3 dBA L_{eq} at the nearest proposed residential property line to the north of the project site.

Construction noise sources are regulated within the County of Riverside Ordinance 847 which prohibits construction activities other than between the hours of 6:00 AM to 6:00 PM during the months of June through September and between the hours of 7:00 AM and 6:00 PM during the months of October through May.

The County of Riverside has not adopted a numerical threshold that identifies what a substantial increase would be. For purposes of this analysis, the Federal Transit Administration (FTA) Transit Noise and Vibration Impact Assessment (2006) criteria will be used to establish significance thresholds. For residential uses, the daytime noise threshold is 80 dBA L_{eq} averaged over an 8-hour period ($L_{eq\ (8\text{-}hr)}$; and the nighttime noise threshold is 70 dBA $L_{eq\ (8\text{-}hr)}$. In compliance with the County's Code, it is assumed that construction would not occur during the noise-sensitive nighttime hours.

Impacts related to construction noise will be further minimized with adherence to applicable Municipal Ordinances and implementation of the measures presented in Section 8 of this report. Impacts would be less than significant.

Noise Impacts to Off-Site Receptors Due to On-Site Operational Noise

The SoundPLAN noise model was utilized to estimate project peak hour operational noise at the proposed residential first floor/yard and second floor receptors in order to determine if it is likely to exceed the County's noise thresholds at the proposed sensitive receptors to the north. As shown above on Figures 6 and 7, peak hour project operation is expected to range between 48.8 and 63.7 dBA Leq at the proposed sensitive receptors to the north and is not expected to exceed the County's exterior daytime noise threshold of 65 dBA L_{eq}. Nighttime noise levels associated with the proposed project were also modeled assuming no car wash or vacuuming activities would occur between 10:00 PM and 7:00 AM. As shown above on Figures 9 and 10, nighttime operational noise levels are expected to range between 38.7 and 47.3 at modeled proposed sensitive receptors to the north and would be expected to exceed the nighttime exterior noise standard of 45 dBA L_{eq}. However, as shown in Table 2, the lowest measured nighttime noise level was 49.9 dBA L_{eq}. Therefore, the nighttime noise associated with the proposed project would not be anticipated to be noticeable over nighttime ambient conditions. Residential construction typically provides an exterior to interior noise reduction of 20 dB with a windows closed condition. Project operation is not expected to exceed the County's interior noise level standards of 45 dBA L_{eq} (daytime) and 40 dBA L_{eq} (nighttime). Project operational noise levels would be considered less than significant. No mitigation is required.

Groundborne Vibration Impacts

This vibration analysis assumes the proposed residential project to the north is approved by the County and already constructed.

Use of a vibratory roller or other similar vibratory equipment would clearly be highly annoying to these adjacent residential receptors. However, annoyance is expected to be short-term, occurring only during site grading and preparation. Temporary vibration levels associated with project construction would not be anticipated to result in architectural damage and would be less than significant. Therefore, impacts associated with construction activities would be less than significant.

CONSTRUCTION NOISE REDUCTION MEASURES

In addition to adherence to the County of Riverside Municipal Code which limits the construction hours of operation, the following measures are recommended to reduce construction noise and vibrations, emanating from the proposed project:

1. During all project site excavation and grading on-site, construction contractors shall equip all construction equipment, fixed or mobile, with properly operating and maintained mufflers, consistent with manufacturer standards.

2. The contractor shall place all stationary construction equipment so that emitted noise is directed away from the noise sensitive receptors nearest the project site.

3. Equipment shall be shut off and not left to idle when not in use.

4. The contractor shall locate equipment staging in areas that will create the greatest distance between construction-related noise/vibration sources and sensitive receptors nearest the project site during all project construction.

5. Jackhammers, pneumatic equipment and all other portable stationary noise sources shall be shielded and noise shall be directed away from sensitive receptors.

6. The project proponent shall mandate that the construction contractor prohibit the use of music or sound amplification on the project site during construction.

7. The construction contractor shall limit haul truck deliveries to the same hours specified for construction equipment.

1. INTRODUCTION

This section describes the purpose of this noise impact analysis, project location, proposed development, and study area. Figure 1 shows the project location map and Figure 2 illustrates the project site plan.

PURPOSE AND OBJECTIVES

The purpose of this report is to provide an assessment of the noise impacts resulting from development of the proposed Winchester at Jean Nicholas Commercial project and to identify mitigation measures that may be necessary to reduce those impacts. The noise issues related to the proposed land use and development have been evaluated in light of applicable federal, state and local policies, including those of the County of Riverside.

Although this is a technical report, effort has been made to write the report clearly and concisely. A list of acronyms and glossary are provided in Appendix A and Appendix B of this report to assist the reader with technical terms related to noise analysis.

PROJECT LOCATION

The proposed project is located at the northwest corner of Winchester Road (SR-79) and Jean Nicholas Road in the unincorporated French Valley community of Riverside County. The site is currently vacant. The existing land use designation is Light Industrial; therefore, a General Plan Amendment is assumed to be required. A vicinity map showing the project location is provided on Figure 1.

PROJECT DESCRIPTION

The approximately 2.9-acre project site is proposed to be developed with 2,627 square feet of coffee shop with drive-thru land use and a 16 fueling position super convenience market/gas station. Figure 2 illustrates the project site plan.

2. NOISE AND VIBRATION FUNDAMENTALS

NOISE FUNDAMENTALS

Sound is a pressure wave created by a moving or vibrating source that travels through an elastic medium such as air. Noise is defined as unwanted or objectionable sound. The effects of noise on people can include general annoyance, interference with speech communication, sleep disturbance, and in extreme circumstances, hearing impairment.

Commonly used noise terms are presented in Appendix B. The unit of measurement used to describe a noise level is the decibel (dB). The human ear is not equally sensitive to all frequencies within the sound spectrum. Therefore, the "A-weighted" noise scale, which weights the frequencies to which humans are sensitive, is used for measurements. Noise levels using A-weighted measurements are written dB(A) or dBA.

From the noise source to the receiver, noise changes both in level and frequency spectrum. The most obvious is the decrease in noise as the distance from the source increases. The manner in which noise reduces with distance depends on whether the source is a point or line source as well as ground absorption, atmospheric effects and refraction, and shielding by natural and manmade features. Sound from point sources, such as air conditioning condensers, radiates uniformly outward as it travels away from the source in a spherical pattern. The noise drop-off rate associated with this geometric spreading is 6 dBA per each doubling of the distance (dBA/DD). Transportation noise sources such as roadways are typically analyzed as line sources, since at any given moment the receiver may be impacted by noise from multiple vehicles at various locations along the roadway. Because of the geometry of a line source, the noise drop-off rate associated with the geometric spreading of a line source is 3 dBA/DD.

Decibels are measured on a logarithmic scale, which quantifies sound intensity in a manner similar to the Richter scale used for earthquake magnitudes. Thus, a doubling of the energy of a noise source, such as a doubled traffic volume, would increase the noise levels by 3 dBA; halving of the energy would result in a 3 dBA decrease. Figure 3 shows the relationship of various noise levels to commonly experienced noise events.

Average noise levels over a period of minutes or hours are usually expressed as dBA L_{eq}, or the equivalent noise level for that period of time. For example, $L_{eq(3\text{-}hr)}$ would represent a 3-hour average. When no period is specified, a one-hour average is assumed.

Noise standards for land use compatibility are stated in terms of the Community Noise Equivalent Level (CNEL) and the Day-Night Average Noise Level (DNL). CNEL is a 24-hour weighted average measure of community noise. CNEL is obtained by adding five decibels to sound levels in the evening (7:00 PM to 10:00 PM), and by adding ten decibels to sound levels at night (10:00 PM to 7:00 AM). This weighting accounts for the increased human sensitivity to noise during the evening and nighttime hours. DNL is a very similar 24-hour average measure that weights only the nighttime hours.

It is widely accepted that the average healthy ear can barely perceive changes of 3 dBA; that a change of 5 dBA is readily perceptible, and that an increase (decrease) of 10 dBA sounds twice (half) as loud. This definition is recommended by the California Department of Transportation's Technical Noise Supplement to the Traffic Noise Analysis Protocol (2013).

VIBRATION FUNDAMENTALS

The way in which vibration is transmitted through the earth is called propagation. Propagation of earthborn vibrations is complicated and difficult to predict because of the endless variations in the soil through which waves travel. There are three main types of vibration propagation: surface, compression and shear waves. Surface waves, or Raleigh waves, travel along the ground's surface. These waves carry most of their energy along an expanding circular wave front, similar to ripples produced by throwing a rock into a pool of water.

Compression waves, or P-waves, are body waves that carry their energy along an expanding spherical wave front. The particle motion in these waves is longitudinal (i.e., in a "push-pull" fashion). P-waves are analogous to airborne sound waves. Shear waves, or S-waves, are also body waves that carry energy along an expanding spherical wave front. However, unlike P-waves, the particle motion is transverse or "side-to-side and perpendicular to the direction of propagation".

As vibration waves propagate from a source, the energy is spread over an ever-increasing area such that the energy level striking a given point is reduced with the distance from the energy source. This geometric spreading loss is inversely proportional to the square of the distance. Wave energy is also reduced with distance as a result of material damping in the form of internal friction, soil layering, and void spaces. The amount of attenuation provided by material damping varies with soil type and condition as well as the frequency of the wave.

Vibration amplitudes are usually expressed as either peak particle velocity (PPV) or the root mean square (RMS) velocity. The PPV is defined as the maximum instantaneous peak of the vibration signal in inches per second. The RMS of a signal is the average of the squared amplitude of the signal in vibration decibels (VdB), ref one micro-inch per second. The Federal Railroad Administration uses the abbreviation "VdB" for vibration decibels to reduce the potential for confusion with sound decibel.

PPV is appropriate for evaluating the potential of building damage and VdB is commonly used to evaluate human response. Decibel notation acts to compress the range of numbers required in measuring vibration. Similar to the noise descriptors, L_{eq} and L_{max} can be used to describe the average vibration and the maximum vibration level observed during a single vibration measurement interval. Figure 4 illustrates common vibration sources and the human and structural responses to ground-borne vibration. As shown in the figure, the threshold of perception for human response is approximately 65 VdB; however, human response to vibration is not usually substantial unless the vibration exceeds 70 VdB. Vibration tolerance limits for sensitive instruments such as magnetic resonance imaging (MRI) or electron microscopes could be much lower than the human vibration perception threshold.

3. EXISTING NOISE ENVIRONMENT

EXISTING LAND USES AND SENSITIVE RECEPTORS

The project site is bordered by vacant land to the north and east, Winchester Road (SR-79) to the south and east, and Jean Nicholas Road to the west.

The State of California defines sensitive receptors as those land uses that require serenity or are otherwise adversely affected by noise events or conditions. Schools, libraries, churches, hospitals, single and multiple-family residential, including transient lodging, motels and hotel uses make up the majority of these areas. Sensitive land uses that may be affected by project noise include the existing single-family detached residential dwelling units located approximately 115 feet southwest (across Jean Nicholas Road), 285 feet south (across the intersection of Jean Nicholas Road/Skyview Road and Winchester Road (SR-79), 710 feet north, and 960 feet east of the project site.

There is also a residential subdivision currently under consideration for approval (TR37078) located adjacent to the north of the proposed project. Although this residential project has not yet been approved by the County and the current County designations of the site are not residential, this study includes analysis of this potential sensitive receptor as a courtesy.

AMBIENT NOISE MEASUREMENTS

An American National Standards Institute (ANSI Section S1.4 2014 Class 1) Larson Davis model LxT sound level meter was used to document existing ambient noise levels. In order to document existing ambient noise levels in the project area, five (5) 15-minute daytime noise measurements were taken between 10:40 AM and 1:49 PM on January 27, 2020. In addition, one (1) long-term 24-hour noise measurement was also taken from January 27, 2020 to January 28, 2020. Field worksheets and noise measurement output data are included in Appendix C.

As shown on Figure 5, the noise measurements were taken near the multi-family and single-family residential uses to the northeast of the project site (across Highway 79) (NM1), near the single-family detached residential dwelling units to the east of the project site (along Via Del Paso) (NM2), near the single-family residential dwelling units located to the south of the project site (at the southern side of Skyview Road) (NM3), near the single-family residential dwelling units located to the northwest of the project site (southern side of Jean Nicholas Road) (NM4), near the single-family detached residential dwelling units located to the north of the project site (north of Ron Roberts Way) (STNM5), and at the western project boundary (adjacent to Jean Nicholas Road) (LTNM1). Table 1 provides a summary of the short-term ambient noise data. Table 2 provides hourly interval ambient noise data from the long-term noise measurement. Short-term ambient noise levels were measured between 43.1 and 64.5 dBA L_{eq}. Long-term hourly noise measurement ambient noise levels ranged from 49.9 to 62.7 dBA L_{eq}. The dominant noise sources were vehicles traveling along Highway 79 (Winchester Road), Jean Nicholas Road, Elliot Road, and other surrounding roadways.

Table 1
Short-Term Noise Measurement Summary (dBA)

Daytime Measurements[1,2]								
Site Location	Time Started	Leq	Lmax	Lmin	L(2)	L(8)	L(25)	L(50)
NM1	10:40 AM	51.6	61.0	36.1	57.5	55.1	52.9	50.1
NM2	11:18 AM	43.1	57.6	33.9	49.1	46.1	43.5	41.3
NM3	12:05 PM	63.7	75.0	45.3	70.9	67.4	64.8	61.7
NM4	1:04 PM	64.5	83.9	40.1	72.9	67.0	62.5	55.2
NM5	1:34 PM	52.8	68.4	34.8	63.9	57.0	48.4	44.0

Notes:
(1) See Figure 5 for noise measurement locations. Each noise measurement was performed over a 15-minute duration.
(2) Noise measurements performed on January 27, 2020.

Table 2
Long-Term Noise Measurement Summary (dBA)

24-Hour Ambient Noise[1,2]								
Hourly Measurements	Time Started	Leq	Lmax	Lmin	L(2)	L(8)	L(25)	L(50)
Overall Summary	5:00 PM	59.2	87.0	28.3	66.9	63.9	59.4	54.1
1	5:00 PM	62.2	81.6	42.4	68.8	66.1	63.1	59.0
2	6:00 PM	60.7	75.8	44.1	66.9	64.8	61.5	58.4

4. REGULATORY SETTING

FEDERAL REGULATION

Federal Noise Control Act of 1972

The U.S. Environmental Protection Agency (EPA) Office of Noise Abatement and Control was originally established to coordinate federal noise control activities. After its inception, EPA's Office of Noise Abatement and Control issued the Federal Noise Control Act of 1972, establishing programs and guidelines to identify and address the effects of noise on public health, welfare, and the environment. In response, the EPA published Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare with an Adequate Margin of Safety (Levels of Environmental Noise). The Levels of Environmental Noise recommended that the Ldn should not exceed 55 dBA outdoors or 45 dBA indoors to prevent significant activity interference and annoyance in noise-sensitive areas.

In addition, the Levels of Environmental Noise identified five (5) dBA as an "adequate margin of safety" for a noise level increase relative to a baseline noise exposure level of 55 dBA Ldn (i.e., there would not be a noticeable increase in adverse community reaction with an increase of five dBA or less from this baseline level). The EPA did not promote these findings as universal standards or regulatory goals with mandatory applicability to all communities, but rather as advisory exposure levels below which there would be no risk to a community from any health or welfare effect of noise.

In 1981, EPA administrators determined that subjective issues such as noise would be better addressed at lower levels of government. Consequently, in 1982 responsibilities for regulating noise control policies were transferred to State and local governments. However, noise control guidelines and regulations contained in EPA rulings in prior years remain in place by designated Federal agencies, allowing more individualized control for specific issues by designated Federal, State, and local government agencies.

STATE REGULATIONS

State of California General Plan Guidelines 2017

Though not adopted by law, the State of California General Plan Guidelines 2017, published by the California Governor's Office of Planning and Research (OPR) (OPR Guidelines), provides guidance for the compatibility of projects within areas of specific noise exposure. The OPR Guidelines identify the suitability of various types of construction relative to a range of outdoor noise levels and provide each local community some flexibility in setting local noise standards that allow for the variability in community preferences. Findings presented in the Levels of Environmental Noise Document (EPA 1974) influenced the recommendations of the OPR Guidelines, most importantly in the choice of noise exposure metrics (i.e., Ldn or CNEL) and in the upper limits for the normally acceptable outdoor exposure of noise-sensitive uses.

The OPR Guidelines include a Noise and Land Use Compatibility Matrix which identifies acceptable and unacceptable community noise exposure limits for various land use categories. Where the "normally acceptable" range is used, it is defined as the highest noise level that should be considered for the construction of the buildings which do not incorporate any special acoustical treatment or noise mitigation. The "conditionally acceptable" or "normally unacceptable" ranges include conditions calling for detailed acoustical study prior to the construction or operation of the proposed project. The County of Riverside has adopted their own version of the State Land Use Compatibility Guidelines for land use planning and to assess potential transportation noise impacts to proposed land uses (see Table 3).

California Environmental Quality Act

The California Environmental Quality Act Guidelines (Appendix G) establishes thresholds for noise impact analysis. This noise study includes analysis of noise and vibration impacts necessary to assess the project in light of the following Appendix G Checklist Thresholds.

Would the project result in:

a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Substantial increases in ambient noise levels are usually associated with project construction noise (temporary) and project operational noise (permanent).

Project Construction Noise: Construction noise sources are regulated within the County of Riverside Ordinance 847 which prohibits construction activities other than between the hours of 6:00 AM to 6:00 PM during the months of June through September and between the hours of 7:00 AM and 6:00 PM during the months of October through May.

Although construction activity may be exempt from the noise standards in the County's Code, CEQA requires that potential noise impacts still be evaluated for significance.

The County of Riverside has not adopted a numerical threshold that identifies what a substantial increase would be. For purposes of this analysis, the Federal Transit Administration (FTA) Transit Noise and Vibration Impact Assessment (2018) criteria will be used to establish significance thresholds. The FTA provides reasonable criteria for assessing construction noise impacts based on the potential for adverse community reaction. For residential uses, the daytime noise threshold is 80 dBA L_{eq} averaged over an 8-hour period ($L_{eq\ (8\text{-}hr)}$; and the nighttime noise threshold is 70 dBA $L_{eq\ (8\text{-}hr)}$. For commercial uses, the daytime and nighttime noise threshold is 85 dBA $L_{eq\ (8\text{-}hr)}$. In compliance with the County's Code, it is assumed that construction would not occur during the noise-sensitive nighttime hours.

Project Operational Noise (permanent): The proposed project has the potential to generate on-site and off-site noise. For on-site generated noise, Policy N 2.3 of the County of Riverside General Plan applies. This policy establishes that the project may not cause exterior noise levels at residential land uses to exceed 65 dBA Leq (10-minute) and interior noise levels to exceed 55 dBA Leq (10-minute) during the hours of 7:00 AM to 10:00 PM. Further, exterior noise levels may not exceed 45 dBA Leq (10-minute) and interior noise levels may not exceed 40 dBA Leq (10-minute) during the hours of 10:00 PM to 7:00 AM (see Table 4).

For off-site project generated noise, increases in ambient noise along affected roadways due to project generated vehicle traffic is considered substantial if they result in an increase of at least 5 dBA CNEL and: (1) the existing noise levels already exceed the applicable land use compatibility standard for the affected sensitive receptors set forth in the Noise Element of the County's General Plan; or (2) the project increases noise levels by at least 5 dBA CNEL and raises the ambient noise level from below the applicable standard to above the applicable standard.

b) Generate excessive groundborne vibration or groundborne noise levels?

As shown in Table 10, the threshold at which there is a risk to "architectural" damage to historic and some older buildings is a peak particle velocity (PPV) of 0.25, at older residential structures a PPV of 0.3, and at new residential structures a PPV of 0.5. Table 11 shows that a PPV of 0.04 is the threshold at which groundborne vibration becomes distinctly perceptible in regards to annoyance. Impacts would be significant if construction activities result in groundborne vibration of 0.25 PPV or higher at a sensitive receptor.

California Department of Transportation (Caltrans)

The California Department of Transportation has published one of the seminal works for the analysis of ground-borne noise and vibration relating to transportation- and construction-induced vibrations and although the project is not subject to these regulations, it serves as useful tools to evaluate vibration impacts. These guidelines recommend that a standard of 0.25 inches per second (in/sec) PPV not be exceeded for the protection of historic and some old buildings (California Department of Transportation, 2020).

LOCAL REGULATIONS

County of Riverside General Plan

The County of Riverside has adopted a modified version of the State of California Noise Land Use Compatibility Matrix (see Table 3). This Matrix establishes standards for outdoor noise levels that are normally acceptable, conditionally acceptable, normally unacceptable and clearly unacceptable for a variety of land uses. For commercial uses noise levels of up to 70 dBA CNEL are "normally acceptable" and levels up to 77.5 dBA CNEL are "conditionally acceptable". These standards apply to the proposed project itself. Additional County of Riverside General Plan Policies which apply to the proposed project are presented below.

Policy N 1.1: Protect noise-sensitive land uses from high levels of noise by restricting noise-producing land uses from these areas. If the noise-producing land use cannot be relocated, then noise buffers such as setbacks, landscaping, or block walls shall be used.

Policy N 1.3: Consider the following uses noise-sensitive and discourage these uses in areas in excess of 65 CNEL: schools, hospitals, rest homes, long term care facilities, mental care facilities, residential uses, libraries, passive recreation uses, and places of worship.

Policy N 1.5: Prevent and mitigate the adverse impacts of excessive noise exposure on the residents, employees, visitors, and noise-sensitive uses of Riverside County.

Policy N 1.6: Minimize noise spillover or encroachment from commercial and industrial land uses into adjoining residential neighborhoods or noise sensitive uses.

Policy N 2.3: Mitigate exterior and interior noises to the levels listed in Table 4, to the extent feasible, for stationary sources.

Policy N 4.1: Prohibit facility-related noise, received by any sensitive use, from exceeding the following worst-case noise levels:

a. 45 dBA-10-minute L_{eq} between 10:00 PM and 7:00 AM [nighttime standard].
b. 65 dBA-10-minute L_{eq} between 7:00 AM and 10:00 PM [daytime standard].

Policy N 4.3: Ensure any use determined to be a potential generator of significant stationary noise impacts be properly analyzed and ensure that the recommended mitigation measures are implemented.

Policy N 4.5: Encourage major stationary noise-generating sources throughout the County of Riverside to install additional noise buffering or reduction mechanisms within their facilities to reduce noise generation levels to the lowest extent practicable prior to the renewal of conditional use permits or business licenses or prior to the approval and/or issuance of new conditional use permits for said facilities.

Policy N 4.8: Require that the parking structures, terminals, and loading docks of commercial or industrial land uses be designed to minimize the potential noise impacts of vehicles on the site as well as on adjacent land uses.

Policy N 6.3: Require commercial or industrial truck delivery hours be limited when adjacent to noise-sensitive land uses unless there is no feasible alternative or there are overriding transportation benefits.

Policy N 9.3: Require development that generates increased traffic and subsequent increases in the ambient noise level adjacent to noise-sensitive land uses to provide for appropriate mitigation measures.

Policy N 9.4: Require that the loading and shipping facilities of commercial and industrial land uses, which abut residential parcels be located and designed to minimize the potential noise impacts upon residential parcels.

Policy N 8.6: Require that all future exterior noise forecasts use Level of Service C, and be based on designed road capacity or 20-year projection of development (whichever is less) for future noise forecasts.

Policy N 13.1: Minimize the impacts of construction noise on adjacent uses within acceptable practices.

Policy N 13.2: Ensure that construction activities are regulated to establish hours of operation in order to prevent and/or mitigate the generation of excessive or adverse noise impacts on surrounding areas.

Policy N 13.3: Condition subdivision approval adjacent to developed/occupied noise-sensitive land uses (see policy N 1.3) by requiring the developer to submit a construction-related noise mitigation plan to the County for review and approval prior to issuance of a grading permit. The plan must depict the location of construction equipment and how the noise from this equipment will be mitigated during construction of this project, through the use of such methods as:

a. Temporary noise attenuation fences;
b. Preferential location of equipment; and
c. Use of current noise suppression technology and equipment.

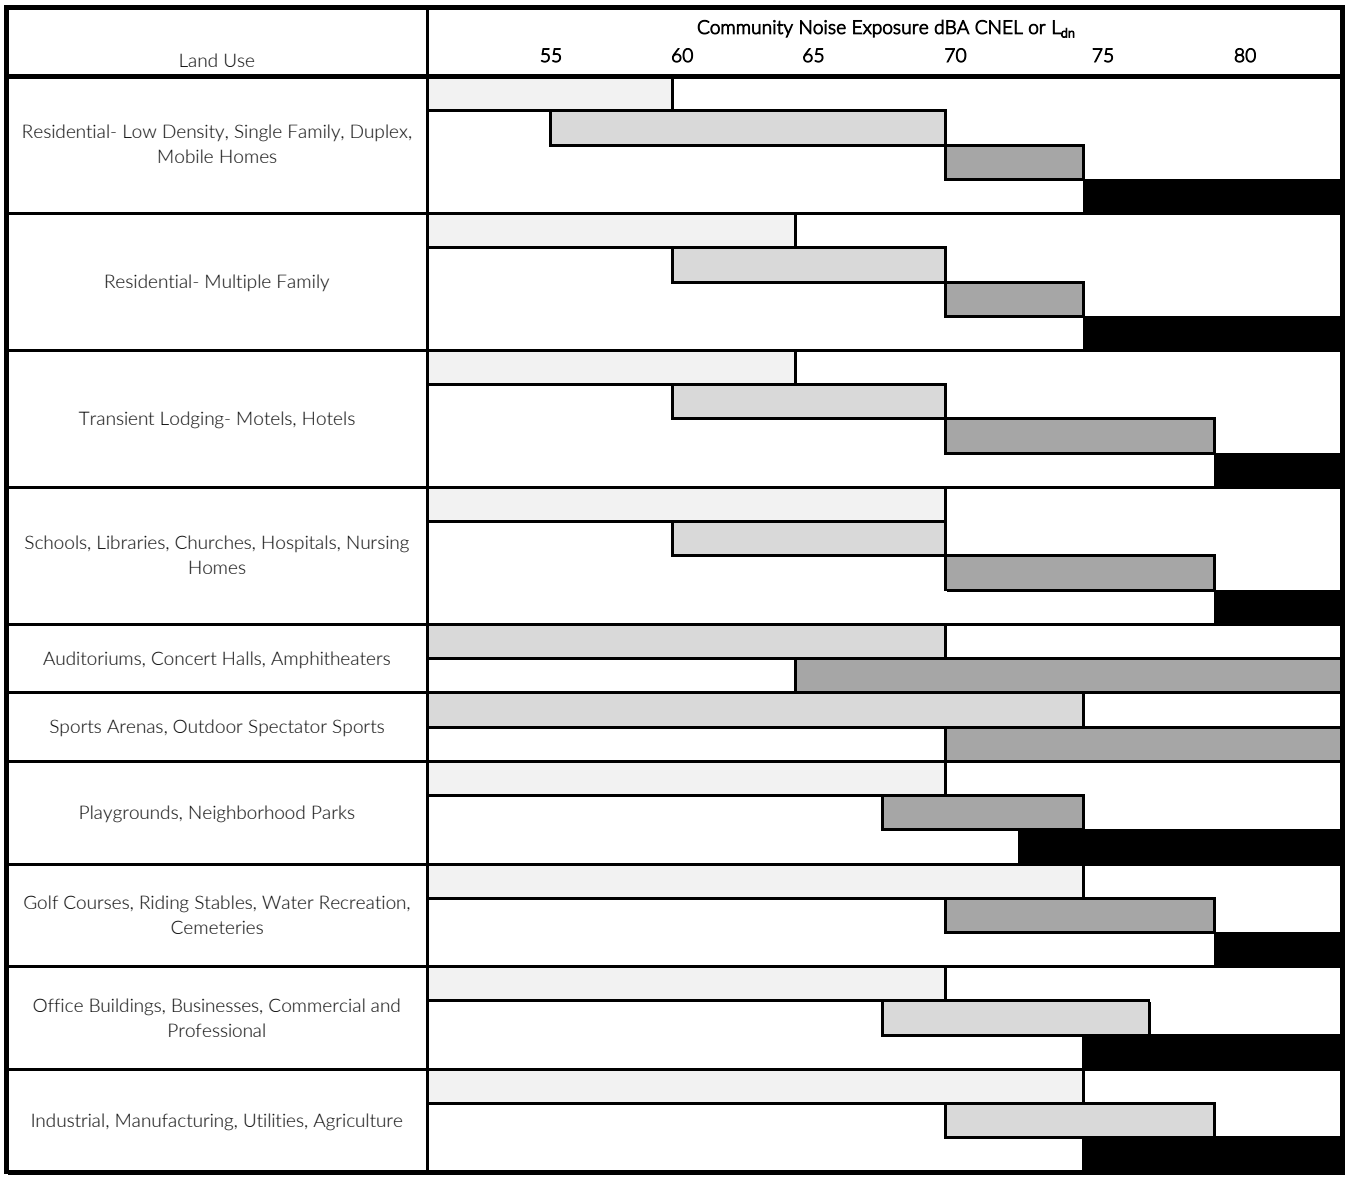
Policy N 13.4: Require that all construction equipment utilizes noise reduction features (e.g., mufflers and engine shrouds) that are no less effective than those originally installed by the manufacturer.

Policy N 16.2: Consider the following land uses sensitive to vibration: hospitals, residential areas, concert halls, libraries, sensitive research operations, schools, and offices.

County of Riverside Code

Ordinance 847 exempts construction noise from County noise standards as long as long as it is limited to the hours of 6:00 AM to 6:00 PM during the months of June through September and between the hours of 7:00 AM and 6:00 PM during the months of October through May (Sec 2.i.1,2).

Table 3
County of Riverside Land Use Compatibility for Community Noise Exposure



Notes:

Source: County of Riverside General Plan Noise Element Table N-1, 2015.

	Normally Acceptable:	Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction, without any special noise insulation requirements.
	Conditionally Acceptable:	New construction or development should be undertaken only after a detailed analysis of the noise reduction requirements is made and needed noise insulation features included in the design. Conventional construction, but with closed windows and fresh air supply systems or air conditioning will normally suffice. Outdoor environment will seem noisy.
	Normally Unacceptable:	New construction or development should generally be discouraged. If new construction or development does proceed, a detailed analysis of the noise reduction requirements must be made with needed noise insulation features included in the design. Outdoor areas must be shielded.
	Clearly Unacceptable:	New construction or development should generally not be undertaken. Construction cost to make the indoor environment acceptable would be prohibitive and the outdoor environment would not be usable.

Table 4
County of Riverside Stationary Source Land Use Noise Standards[1,2]

Residential Land Use	Interior Standards	Exterior Standards
10:00 PM to 7:00 AM	40 Leq (10 minute)	45 Leq (10 minute)
7:00 AM to 10:00 PM	55 Leq (10 minute)	65 Leq (10 minute)

Notes:
(1) Source: County of Riverside General Plan Noise Element.
(2) These are only preferred standards; final decision will be made by the Riverside County Planning Department and Office of Public Health.

5. ANALYTICAL METHODOLOGY AND MODEL PARAMETERS

This section discusses the analysis methodologies used to assess noise impacts.

CONSTRUCTION NOISE MODELING

Construction noise associated with the proposed project was calculated at the sensitive receptor locations, utilizing methodology presented in the Federal Transit Administration (FTA) Transit Noise and Vibration Impact Assessment Manual (2018) together with several key construction parameters including: distance to each sensitive receiver, equipment usage, percent usage factor, and baseline parameters for the project site. Distances to receptors were based on the acoustical center of the project site. The equipment used to calculate the construction noise levels for each phase were based on the assumptions provided in the CalEEMod modeling in the Air Quality, Global Climate Change, TAC, and Energy Impact Analysis prepared for the proposed project (Ganddini Group, Inc., 2020). For construction noise purposes, the distance measured from the project site to sensitive receptors was assumed to be the acoustical center of the project site to the property line of residential properties with existing residential buildings. Construction noise worksheets are provided in Appendix D.

FEDERAL HIGHWAY ADMINISTRATION (FHWA) TRAFFIC NOISE PREDICTION MODEL

Existing and Existing Plus project traffic noise levels were modeled for roadways affected by project generated traffic utilizing the FHWA Traffic Noise Prediction Model FHWA-RD-77-108 in order to quantify the proposed project's contribution to increases in ambient noise levels. Future traffic noise levels were modeled to assess potential traffic related impacts to the proposed project.

The FHWA Traffic Noise Prediction Model arrives at a predicted noise level through a series of adjustments to the Reference Energy Mean Emission Level (REMEL). Adjustments are then made to the REMEL to account for: total average daily traffic volumes, roadway classification, width, speed and truck mix, roadway grade and site conditions (hard or soft ground surface). Surfaces adjacent to all modeled roadways were assumed to have a "hard site" to predict worst-case, conservative noise levels. A hard site, such as pavement, is highly reflective and does not attenuate noise as quickly as grass or other soft sites. Possible reductions in noise levels due to intervening topography and buildings were not accounted for in this analysis.

Roadway parameters utilized in the noise model include location, traffic volume, speed and vehicle mix (autos, medium trucks, and heavy trucks). It is important to evaluate potential impacts of the noisiest possible future conditions. These conditions occur when the maximum amount of vehicles pass at the greatest speed. This scenario usually corresponds to Level of Service C (LOS C) Conditions, or about 75% of buildout capacity. The County of Riverside General Plan Southwest Area Plan identifies Winchester Road (SR-79) as an Expressway (128 foot to 220 foot right-of-way) roadway and Jean Nicholas Road as a Secondary (100 foot right-of-way) roadway. Per the County of Riverside Industrial Hygiene Guidelines for Determining and Mitigating Traffic Noise Impacts to Residential Structures and County of Riverside General Plan, Chapter 4, Figure C-3 "Link Volume Capacities/Level of Service for Riverside County Roadways" revised March 2001, future buildout noise levels associated with these roadways were modeled using average daily traffic volume Level of Service "C" design capacities (also known as future build-out daily traffic volumes). Winchester Road (SR-79) is expected to accommodate up to 32,700 vehicles per day at Level of Service C and Jean Nicholas Road is expected to accommodate up to 20,700 vehicles per day at Level of Service C. The D/E/N splits for use in acoustical studies published by the Riverside County Department of Industrial Hygiene were utilized for noise modeling. Existing Plus project vehicle mixes were calculated by adding the proposed project trips to existing conditions.

Existing and Existing Plus Project vehicle mix were obtained from the project's traffic study (Ganddini Group 2020). Existing Plus Project vehicle mixes were calculated by adding the proposed project trips to existing conditions. FHWA spreadsheets are included in Appendix E.

SOUNDPLAN NOISE MODEL

The SoundPLAN acoustical modeling software was utilized to model project operational worst-case stationary noise impacts from the proposed project to adjacent sensitive uses (e.g., residences). SoundPLAN is capable of evaluating stationary noise sources (e.g., parking lots, drive-thru menus, carwash equipment, vacuums, etc.) and much more. The SoundPLAN software utilizes algorithms (based on the inverse square law) to calculate noise level projections. The software allows the user to input specific noise sources, spectral content, sound barriers, building placement, topography, and sensitive receptor locations. In addition to the information provided below, noise modeling input and outputs assumptions are provided in Appendix F.

Peak hour operational noise levels were modeled utilizing representative sound levels in the SoundPLAN model. Modeled noise sources include car wash equipment, vacuum equipment, queuing, fueling area and parking lot noise, drive-thru speaker, and HVAC equipment. All noise sources were modeled to be in full operation for an entire hour. This is a conservative modeling effort, given that in actuality, several of the noise sources are not in operation continuously for an entire hour. A nighttime version of project operation was also modeled. This version of the model run assumed that no car wash or vacuuming activity would occur between the hours of 10:00 PM and 7:00 AM.

Car Wash Equipment Noise

The car wash drying system is by far the loudest noise source associated with the car wash tunnel. A representative sound level of 93.1dBA L_{eq}[1] at the tunnel exit was utilized to model the propagation of car wash noise in the SoundPLAN noise model. A point noise source was placed 5 feet from the opening of the end of the car wash tunnel at a height of 8 feet to represent dryer noise.

Vacuum Equipment Noise

Producers are the loudest elements of a vacuum system. Producers will be located in the equipment room. Manufacturer data for two Vacutech 20 HP producers show that noise levels can be expected to reach 77.8 in a closed door condition at a distance of 10 feet. The specific location of the system has not been identified so a representative sound level of 77.8 dBA L_{eq}[2] was applied to the entire exterior surface of the equipment room. This is a very conservative assumption.

A hose system will extend from these housed systems and hose ends will be available within the parking/vacuum area. A point noise source with a sound pressure level of 76.8 dB was assigned to each vacuum station to represent noise associated with general vacuuming activities. This noise level was collected at a Fast Five Car Wash in the City of Murrieta, California on November 7th, 2017. The measured 76.8 dB at 3 feet noise level is an average of three (3) five-minute noise measurements taken while cleaning the front seat area of a car[3]. This modeling methodology is very conservative as it assumes that all vacuum stations are being utilized at the same time continuously for an entire hour.

Queuing, Parking Lot Noise and Fueling Area

Parking lot noise was calculated using SoundPLAN methodology. Specifically, the traffic volume of the parking lot is entered with the number of moves per parking, the hour and the number of parking bays. The user defines whether the parking lots are for automobiles, motorcycles, or trucks, and the emission level of a

[1] Representative Noise Measurement of 12 MacNeil Tech-21 15 HP Dryers at tunnel exit taken at Scrub Bot Express Wash 3965 W. Ray Rd. Chandler, AZ 85226 provided by the equipment manufacturer.

[2] Representative Noise Measurements of 2 Autovac 20 HP Producers at a distance of 10 feet from enclosure provided by the equipment manufacturer.

[3] 2017 Noise Measurements, Fast Five Car Wash. City of Murrieta, November 7. Kunzman Associates.

parking lot is automatically adjusted accordingly. The values for the number of parking moves for each time slice is the number of parking moves per reference unit (most often per parking bay), averaged for the hour[4].

SoundPLAN utilizes parking lot noise emission levels from the 6th revised edition of the parking lot study "Recommendations for the Calculation of Sound Emissions of Parking Areas, Motorcar Centers and Bus Stations as well as of Multi-Story Car Parks and Underground Car Parks" published by the Bavarian Landesamt für Umwelt provides calculation methods to determine the emissions of parking lots.

The parking lot emission table documents the reference level (Lw,ref) from the parking lot study.

Lw, ref = Lw0 + KPA + KI + KD + KStrO + 10 log(B) [dB(A)]

With the following parameters:

Lw0 = Basic sound power, sound power level of one motion / per hour on P+R areas = 63 dB(A)
KPA = Surcharge parking lot type
KI = Surcharge for impulse character
KD = Surcharge for the traffic passaging and searching for parking bays in the driving lanes 2,5 * lg (f * B - 9)
f = Parking bays per unit of the reference value
B = Reference value
KStrO = Surcharge for the road surface
B = Reference value

A line noise source with a sound pressure level of 50 dB L_{eq} every square meter was utilized to represent vehicle drive-thru queuing.

The fueling area was modeled as an area noise source with a sound power level of 65 dBA L_{eq} per square meter to represent normal to loud speech.

In order to model anticipate nighttime operational conditions, the car wash and vacuums were assumed to be non-operational, parking movements were reduced by 50% and the fueling area sound reference level was modeled at 55 dBA/square meter.

Drive Thru Speaker Noise

Modern drive-thru speakers are adjustable to be readily audible over existing ambient noise levels. A sound level of 75 dBA Leq at a distance of 3 feet was utilized for modeling purposes.

Mechanical Equipment (HVAC Units) Noise

A noise reference level of 67.7 dBA at 3 feet (sound power level of 78.7 dB) was utilized to represent rooftop 5 Ton Carrier HVAC units[5]. A rooftop HVAC plan is not available at the time of this analysis so the exact location and number of units per building were estimated. A total of 17 rooftop units were modeled on the proposed rooftops. The noise source height for each HVAC unit was assumed at 1 meter above the roof top. Roof top is assumed to be approximately 6 meters (~18.3 feet) above grade.

6. IMPACT ANALYSIS

This impact discussion analyzes the potential for noise and/or groundborne vibration impacts to cause the exposure of a person to, or generation of, noise levels in excess of established County of Riverside standards related to: construction, operation, and transportation noise related impacts to, or from, the proposed project.

IMPACTS RELATED TO CONSTRUCTION NOISE

The existing single-family detached residential dwelling units located to the southwest, south, north, and east of the project site may be affected by short-term noise impacts associated with construction noise. Construction noise will vary depending on the construction process, type of equipment involved, location of the construction site with respect to sensitive receptors, the schedule proposed to carry out each task (e.g., hours and days of the week) and the duration of the construction work.

The construction phases for the proposed project are anticipated to include: grading, building construction, paving and architectural coating. A summary of noise level data for a variety of construction equipment compiled by the U.S. Department of Transportation is presented in Table 5. Typical operating cycles for these types of construction equipment may involve one or two minutes of full power operation followed by three to four minutes at lower power settings.

Construction noise associated with the proposed project was calculated utilizing methodology presented in the Federal Transit Administration (FTA) Transit Noise and Vibration Impact Assessment Manual (2018) together with several key construction parameters including: distance to each sensitive receiver, equipment usage, percent usage factor, and baseline parameters for the project site. Distances to receptors were based on the acoustical center of the proposed construction activity. Construction noise levels were calculated for each phase. Anticipated noise levels during each construction phase are presented in Table 6. Worksheets for each phase are included as Appendix D.

A comparison of existing noise levels and existing plus project construction noise levels are presented in Table 6. STNM5 was chosen to represent noise levels at the property line of the single-family residential uses to the north, STNM1 was chosen to represent noise levels at the multi-family residential property line to the northeast of the project site, STNM2 was chosen to represent the single-family residential property lines of properties to the east and southeast of the project site, STNM3 was chosen to represent the single-family residential property lines of the properties to the south of the project site, and STNM4 was chosen to represent the single-family residential property lines of properties to the west and southwest of the project site.

Modeled unmitigated construction noise levels when combined with existing measured noise levels reached 61.2 dBA L_{eq} at the nearest residential property lines to the north, 56.2 dBA L_{eq} at the nearest residential property lines to the northeast, 58.4 dBA L_{eq} at the nearest residential property lines to the east and southeast, 67.1 dBA L_{eq} at the nearest residential property lines to the south, and up to 74.2 dBA L_{eq} at the nearest residential property lines to the west and southwest of the project site.

As discussed earlier, construction noise sources are regulated within the County of Riverside Ordinance 847 which prohibits construction activities other than between the hours of 6:00 AM to 6:00 PM during the months of June through September and between the hours of 7:00 AM and 6:00 PM during the months of October through May.

As stated previously, per FTA daytime construction noise levels should not exceed 80 dBA L_{eq} for an 8-hour period at residential uses and 85 dBA L_{eq} for an 8-hour period at commercial uses. Therefore, project construction would not be anticipated to exceed the FTA thresholds for residential uses. Further, with compliance with the County's Code, it is assumed that construction would not occur during the noise-sensitive nighttime hours.

Impacts related to construction noise will be further minimized with adherence to the above Municipal Ordinances and implementation of the measures presented in Section 8 of this report.

NOISE IMPACTS TO OFF-SITE RECEPTORS DUE TO PROJECT GENERATED TRIPS

During operation, the proposed project is expected to generate approximately 5,185 average daily trips with 290 trips during the AM peak-hour and 218 trips during the PM peak-hour. A worst-case project generated traffic noise level was modeled utilizing the FHWA Traffic Noise Prediction Model - FHWA-RD-77-108. Traffic noise levels were calculated at the right of way from the centerline of the analyzed roadway. The modeling is theoretical and does not take into account any existing barriers, structures, and/or topographical features that may further reduce noise levels. Therefore, the levels are shown for comparative purposes only to show the difference in with and without project conditions. Roadway input parameters including average daily traffic volumes (ADTs), speeds, and vehicle distribution data is shown in Table 7. The potential off-site noise impacts caused by an increase of traffic from operation of the proposed project on the nearby roadways were calculated for the following scenarios:

Existing Year (without Project): This scenario refers to existing year traffic noise conditions and is demonstrated in Table 7.

Existing Year (With Project): This scenario refers to existing year plus project traffic noise conditions and is demonstrated in Table 7.

As shown in Table 8, modeled Existing traffic noise levels range between 57-78 dBA CNEL at the right-of-way of each modeled roadway segment; and the modeled Existing Plus Project traffic noise levels range between 57-78 dBA CNEL at the right-of-way of each modeled roadway segment.

As stated previously, for purposes of this project, increases in ambient noise along affected roadways due to project generated vehicle traffic is considered substantial if they result in an increase of at least 5 dBA CNEL and: (1) the existing noise levels already exceed the applicable land use compatibility standard for the affected sensitive receptors set forth in the Noise Element of the County's General Plan; or (2) the project increases noise levels by at least 5 dBA CNEL and raises the ambient noise level from below the applicable standard to above the applicable standard.

All modeled roadway segments are anticipated to change the noise a nominal amount (between approximately 0.05 to 1.84 dBA CNEL). Therefore, a change in noise level would not be audible and would be considered less than significant. No mitigation is required.

TRANSPORTATION NOISE IMPACTS TO THE PROPOSED PROJECT

Per the County of Riverside General Plan, noise levels of up to 70 dBA CNEL are "normally acceptable" and levels up to 77.5 dBA CNEL are "conditionally acceptable" for commercial uses (see Table 3).

Roadway parameters utilized in the noise model include location, traffic volume, speed and vehicle mix (autos, medium trucks, and heavy trucks). It is important to evaluate potential impacts of the noisiest possible future conditions. These conditions occur when the maximum amount of vehicles pass at the greatest speed. This scenario usually corresponds to Level of Service C (LOS C) Conditions, or about 75% of buildout capacity. The County of Riverside General Plan Southwest Area Plan identifies Winchester Road (SR-79) as an Expressway (128 foot to 220 foo right-of-way) roadway and Jean Nicholas Road as a Secondary (100 foot right-of-way) roadway. Per the County of Riverside Industrial Hygiene Guidelines for Determining and Mitigating Traffic Noise Impacts to Residential Structures and County of Riverside General Plan, Chapter 4, Figure C-3 "Link Volume Capacities/Level of Service for Riverside County Roadways" revised March 2001, future buildout noise levels associated with these roadways were modeled using average daily traffic volume Level of Service "C" design capacities (also known as future build-out daily traffic volumes). Winchester Road (SR-79) is

expected to accommodate up to 32,700 vehicles per day at Level of Service C and Jean Nicholas Road is expected to accommodate up to 20,700 vehicles per day at Level of Service C. The D/E/N splits for use in acoustical studies published by the Riverside County Department of Industrial Hygiene were utilized for noise modeling. Existing Plus project vehicle mixes were calculated by adding the proposed project trips to existing conditions.

Future buildout traffic noise levels from each of these roadways were modeled utilizing the FHWA Traffic Noise Prediction Model - FHWA-RD-77-108. Future buildout traffic noise levels could reach up to approximately 74.5 dBA CNEL at the nearest proposed commercial building to Winchester Road (SR-79), approximately 155 feet west of the centerline of the roadway, and up to approximately 70.8 dBA CNEL at the nearest proposed commercial building to Jean Nicholas Road, approximately 71 feet northeast of the centerline of the roadway. Modeling spreadsheets are presented in Appendix E.

Therefore, exterior noise levels at the proposed project site are anticipated to fall within the County's conditionally acceptable exterior noise standards for commercial uses. Impacts related to future traffic noise impacts to the proposed project would be less than significant.

NOISE IMPACTS TO OFF-SITE RECEPTORS DUE TO ON-SITE OPERATIONAL NOISE

As discussed previously, sensitive land uses that may be affected by project noise include the existing single-family detached residential dwelling units located approximately 115 feet southwest (across Jean Nicholas Road), 285 feet south (across the intersection of Jean Nicholas Road/Skyview Road and Winchester Road (SR-79), 710 feet north, and 960 feet east of the project site.

The SoundPLAN noise model was utilized to estimate project peak hour operational noise at first floor/yard and second floor receptors in order to determine if it is likely to exceed the County's noise thresholds at sensitive receptors. A description of each noise source and model parameters are discussed in Section 5 of this report. As shown on Figures 6, 7, and 8, daytime peak hour project operation is expected to range between 47.4 and 64.5 dBA Leq at the nearest sensitive receptors and is not expected to exceed the County's exterior daytime noise threshold of 65 dBA L_{eq}. Nighttime noise levels associated with the proposed project were also modeled assuming no car wash or vacuuming activities would occur between 10:00 PM and 7:00 AM. Nighttime operational noise levels are expected to range between 30.5 and 48.6 dBA Leq at modeled sensitive receptors. Second floor noise levels at proposed adjacent residential land uses to the east may exceed the nighttime exterior noise standard of 45 dBA L_{eq}. However, residential construction typically provides an exterior to interior noise reduction of 20 dB with a windows closed condition. The proposed adjacent residential units are expected to be provided with air conditioning which will allow a closed window condition, considering their proximity to State Route 79. Project operational noise levels would be considered less than significant. No mitigation is required.

GROUNDBORNE VIBRATION IMPACTS

There are several types of construction equipment that can cause vibration levels high enough to annoy persons in the vicinity and/or result in architectural or structural damage to nearby structures and improvements. For example, as shown in Table 9, a vibratory roller could generate up to 0.21 PPV at a distance of 25 feet; and operation of a large bulldozer (0.089 PPV) at a distance of 25 feet (two of the most vibratory pieces of construction equipment). Groundborne vibration at sensitive receptors associated with this equipment would drop off as the equipment moves away. For example, as the vibratory roller moves further than 100 feet from the sensitive receptors, the vibration associated with it would drop below 0.0026 PPV. It should be noted that these vibration levels are reference levels and may vary slightly depending upon soil type and specific usage of each piece of equipment.

Annoyance to Persons

The primary effect of perceptible vibration is often a concern. However, secondary effects, such as the rattling of a china cabinet, can also occur, even when vibration levels are well below perception. Any effect (primary perceptible vibration, secondary effects, or a combination of the two) can lead to annoyance. The degree to which a person is annoyed depends on the activity in which they are participating at the time of the disturbance. For example, someone sleeping or reading will be more sensitive than someone who is running on a treadmill. Reoccurring primary and secondary vibration effects often lead people to believe that the vibration is damaging their home, although vibration levels are well below minimum thresholds for damage potential. (California Department of Transportation, 2020)

As shown in Table 10, vibration becomes distinctly perceptible to people in buildings at a PPV of 0.04.

At 135 feet, which is the distance to the closest off-site building, use of a vibratory roller would be expected to generate a PPV of 0.017 and a bulldozer would be expected to generate a PPV of 0.007. Use of either a vibratory roller or a bulldozer would not be considered annoying to nearby sensitive receptors.

Architectural Damage

Vibration generated by construction activity generally has the potential to damage structures. This damage could be structural damage, such as cracking of floor slabs, foundations, columns, beams, or wells, or cosmetic architectural damage, such as cracked plaster, stucco, or tile. (California Department of Transportation, 2020)

Table 11 identifies a PPV level of 0.25 as the threshold at which there is a risk to "architectural" damage to historic and some old buildings. Temporary vibration levels associated with project construction would be less than significant. No mitigation is required. Vibration worksheets are provided in Appendix G.

7. IMPACT ANALYSIS TO THE PROPOSED RESIDENTIAL USE

The proposed residential development TR37078 is located adjacent to the north of the proposed project. Per the County of Riverside General Plan Land Use Map the current land use designations at this proposed residential use are Commercial Retail and Light Industrial. Although this project has not yet been approved by the County and the current County land use designations for this project site are not residential, in order to anticipate any potential future noise related impacts an additional noise analysis at this proposed use has been provided below.

IMPACTS RELATED TO CONSTRUCTION NOISE

This construction analysis assumes the proposed residential project to the north is approved by the County and is already constructed and operational.

The proposed residential dwelling units located to the north of the project site may be affected by short-term noise impacts associated with construction noise. Construction noise will vary depending on the construction process, type of equipment involved, location of the construction site with respect to sensitive receptors, the schedule proposed to carry out each task (e.g., hours and days of the week) and the duration of the construction work.

As stated above, the construction phases for the proposed project are anticipated to include: grading, building construction, paving and architectural coating. A summary of noise level data for a variety of construction equipment compiled by the U.S. Department of Transportation is presented in Table 5. Typical operating cycles for these types of construction equipment may involve one or two minutes of full power operation followed by three to four minutes at lower power settings.

As discussed above, construction noise associated with the proposed project was calculated utilizing methodology presented in the Federal Transit Administration (FTA) Transit Noise and Vibration Impact Assessment Manual (2018) together with several key construction parameters including: distance to each sensitive receiver, equipment usage, percent usage factor, and baseline parameters for the project site. Distances to receptors were based on the acoustical center of the proposed construction activity. Construction noise levels were calculated for each phase. Anticipated noise levels during each construction phase are presented in Table 12. Worksheets for each phase are included as Appendix D.

A comparison of existing noise levels and existing plus project construction noise levels are presented in Table 12. LTNM1 was chosen to represent noise levels at the property line of the proposed residential use to the north. Modeled unmitigated construction noise levels when combined with existing measured noise levels reached 79.3 dBA L_{eq} at the nearest proposed residential property line to the north of the project site.

As discussed earlier, construction noise sources are regulated within the County of Riverside Ordinance 847 which prohibits construction activities other than between the hours of 6:00 AM to 6:00 PM during the months of June through September and between the hours of 7:00 AM and 6:00 PM during the months of October through May.

As stated previously, per FTA daytime construction noise levels should not exceed 80 dBA L_{eq} for an 8-hour period at residential uses. Therefore, project construction would not be anticipated to exceed the FTA threshold for residential uses. Further, with compliance with the County's Code, it is assumed that construction would not occur during the noise-sensitive nighttime hours.

Impacts related to construction noise will be further minimized with adherence to the above Municipal Ordinances and implementation of the measures presented in Section 8 of this report.

Therefore, if the proposed residential project to the north is approved and operational during project construction, no additional construction mitigation would be required.

NOISE IMPACTS TO PROPOSED OFF-SITE RECEPTORS DUE TO ON-SITE OPERATIONAL NOISE

If the proposed adjacent residential use located to the north is approved it may be affected by noise generated by the proposed project. Per the proposed residential development's site plan a 6-foot barrier is to be located along the southern property line adjacent to the proposed project (i.e., along the proposed project's northern property line). As shown on Figures 6 through 11, this proposed barrier has been incorporated into the modeling for the proposed project and it has been assumed that it is a solid barrier with no holes or cracks.

The SoundPLAN noise model was utilized to estimate project peak hour operational noise at the proposed residential first floor/yard and second floor receptors in order to determine if it is likely to exceed the County's noise thresholds at proposed sensitive receptors. A description of each noise source and model parameters are discussed in Section 5 of this report. As shown on Figures 6, 7 and 8, peak hour project operation is expected to range between 50.0 and 64.5 dBA L_{eq} at the proposed sensitive receptors to the east and is not expected to exceed the County's exterior daytime noise threshold of 65 dBA L_{eq}. Nighttime noise levels associated with the proposed project were also modeled assuming no car wash or vacuuming activities would occur between 10:00 PM and 7:00 AM. As shown above on Figures 9, 10, and 11, nighttime operational noise levels are expected to range between 37.8 and 48.6 dBA Leq at modeled proposed sensitive receptors to the east. Second floor noise levels at proposed adjacent residential land uses to the east may exceed the nighttime exterior noise standard of 45 dBA L_{eq}. Residential construction typically provides an exterior to interior noise reduction of 20 dB with a windows closed condition. The proposed adjacent residential units are expected to be provided with air conditioning which will allow a closed window condition, considering their proximity to State Route 79. Project operational noise levels would be considered less than significant. No mitigation is required.

GROUNDBORNE VIBRATION IMPACTS

This vibration analysis assumes the proposed residential project to the north is approved by the County and already constructed.

There are several types of construction equipment that can cause vibration levels high enough to annoy persons in the vicinity and/or result in architectural or structural damage to nearby structures and improvements. For example, as shown in Table 9, a vibratory roller could generate up to 0.21 PPV at a distance of 25 feet; and operation of a large bulldozer (0.089 PPV) at a distance of 25 feet (two of the most vibratory pieces of construction equipment). Groundborne vibration at sensitive receptors associated with this equipment would drop off as the equipment moves away. For example, as the vibratory roller moves further than 100 feet from the sensitive receptors, the vibration associated with it would drop below 0.0026 PPV. It should be noted that these vibration levels are reference levels and may vary slightly depending upon soil type and specific usage of each piece of equipment.

Annoyance to Persons

The primary effect of perceptible vibration is often a concern. However, secondary effects, such as the rattling of a china cabinet, can also occur, even when vibration levels are well below perception. Any effect (primary perceptible vibration, secondary effects, or a combination of the two) can lead to annoyance. The degree to which a person is annoyed depends on the activity in which they are participating at the time of the disturbance. For example, someone sleeping or reading will be more sensitive than someone who is running on a treadmill. Reoccurring primary and secondary vibration effects often lead people to believe that the vibration is damaging their home, although vibration levels are well below minimum thresholds for damage potential. (California Department of Transportation, 2020)

As shown in Table 10, vibration becomes distinctly perceptible to people in buildings at a PPV of 0.04.

At 20 feet, which is the approximate distance to the closest proposed off-site residential building to the north, use of a vibratory roller would be expected to generate a PPV of 0.273 and a bulldozer would be expected to generate a PPV of 0.116. Therefore, use of either a vibratory roller or a bulldozer would clearly be highly annoying to these adjacent sensitive receptors. Annoyance is expected to be short-term, occurring only during site grading and preparation. Mitigation measures to reduce potential impacts related to annoyance are presented in Section 8 of this report.

Architectural Damage

Vibration generated by construction activity generally has the potential to damage structures. This damage could be structural damage, such as cracking of floor slabs, foundations, columns, beams, or wells, or cosmetic architectural damage, such as cracked plaster, stucco, or tile. (California Department of Transportation, 2020)

Table 11 identifies a PPV level of 0.5 as the threshold at which there is a risk to "architectural" damage to new residential buildings. Temporary vibration levels associated with project construction would be less than significant. No mitigation is required. Vibration worksheets are included in Appendix G.

Table 12
Construction Noise Levels at the Proposed Residential Use to the North (L_{eq})

Phase	Receptor Location	Existing Ambient Noise Levels (Leq)[1]	Construction Noise Levels (Leq)[2]	Combined Noise Levels (Leq)	Increase (dB)
Grading	Proposed Residential to North	59.2	79.3	79.3	20.1
Building Construction	Proposed Residential to North	59.2	78.1	78.2	19.0
Paving	Proposed Residential to North	59.2	78.3	78.4	19.2
Architectural Coating	Proposed Residential to North	59.2	68.8	69.3	10.1

Notes:
(1) Per measured existing ambient noise levels. LTNM1 used for receptors to the north.
(2) Construction noise worksheets are provided in Appendix D.

8. MEASURES TO REDUCE IMPACTS

CONSTRUCTION NOISE REDUCTION MEASURES

In addition to adherence to the County of Riverside Municipal Code which limits the construction hours of operation, the following measures are recommended to reduce construction noise and vibrations, emanating from the proposed project:

1. During all project site excavation and grading on-site, construction contractors shall equip all construction equipment, fixed or mobile, with properly operating and maintained mufflers, consistent with manufacturer standards.

2. The contractor shall place all stationary construction equipment so that emitted noise is directed away from the noise sensitive receptors nearest the project site.

3. Equipment shall be shut off and not left to idle when not in use.

4. The contractor shall locate equipment staging in areas that will create the greatest distance between construction-related noise/vibration sources and sensitive receptors nearest the project site during all project construction.

5. Jackhammers, pneumatic equipment and all other portable stationary noise sources shall be shielded and noise shall be directed away from sensitive receptors.

6. The project proponent shall mandate that the construction contractor prohibit the use of music or sound amplification on the project site during construction.

7. The construction contractor shall limit haul truck deliveries to the same hours specified for construction equipment.

APPENDICES

APPENDIX A

LIST OF ACRONYMS

Term	Definition
ADT	Average Daily Traffic
ANSI	American National Standard Institute
CEQA	California Environmental Quality Act
CNEL	Community Noise Equivalent Level
D/E/N	Day / Evening / Night
dB	Decibel
dBA or dB(A)	Decibel "A-Weighted"
dBA/DD	Decibel per Double Distance
dBA L_{eq}	Average Noise Level over a Period of Time
EPA	Environmental Protection Agency
FHWA	Federal Highway Administration
L_{02},L_{08},L_{50},L_{90}	A-weighted Noise Levels at 2 percent, 8 percent, 50 percent, and 90 percent, respectively, of the time period
DNL	Day-Night Average Noise Level
$L_{eq(x)}$	Equivalent Noise Level for '"x" period of time
L_{eq}	Equivalent Noise Level
L_{max}	Maximum Level of Noise (measured using a sound level meter)
L_{min}	Minimum Level of Noise (measured using a sound level meter)
LOS C	Level of Service C
OPR	California Governor's Office of Planning and Research
PPV	Peak Particle Velocities
RCNM	Road Construction Noise Model
REMEL	Reference Energy Mean Emission Level
RMS	Root Mean Square

APPENDIX B

DEFINITIONS OF ACOUSTICAL TERMS

Term	Definition
Ambient Noise Level	The all-encompassing noise environment associated with a given environment, at a specified time, usually a composite of sound from many sources, at many directions, near and far, in which usually no particular sound is dominant.
A-Weighted Sound Level, dBA	The sound level obtained by use of A-weighting. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound in a manner similar to the frequency response of the human ear.
CNEL	Community Noise Equivalent Level. CNEL is a weighted 24-hour noise level that is obtained by adding five decibels to sound levels in the evening (7:00 PM to 10:00 PM), and by adding ten decibels to sound levels at night (10:00 PM to 7:00 AM). This weighting accounts for the increased human sensitivity to noise during the evening and nighttime hours.
Decibel, dB	A logarithmic unit of noise level measurement that relates the energy of a noise source to that of a constant reference level; the number of decibels is 10 times the logarithm (to the base 10) of this ratio.
DNL, Ldn	Day Night Level. The DNL, or Ldn is a weighted 24-hour noise level that is obtained by adding ten decibels to sound levels at night (10:00 PM to 7:00 AM). This weighting accounts for the increased human sensitivity to noise during the nighttime hours.
Equivalent Continuous Noise Level, L_{eq}	A level of steady state sound that in a stated time period, and a stated location, has the same A-weighted sound energy as the time-varying sound.
Fast/Slow Meter Response	The fast and slow meter responses are different settings on a sound level meter. The fast response setting takes a measurement every 100 milliseconds, while a slow setting takes one every second.
Frequency, Hertz	In a function periodic in time, the number of times that the quantity repeats itself in one second (i.e., the number of cycles per second).
L_{02}, L_{08}, L_{50}, L_{90}	The A-weighted noise levels that are equaled or exceeded by a fluctuating sound level, 2 percent, 8 percent, 50 percent, and 90 percent of a stated time period, respectively.
L_{max}, L_{min}	L_{max} is the RMS (root mean squared) maximum level of a noise source or environment measured on a sound level meter, during a designated time interval, using fast meter response. L_{min} is the minimum level.
Offensive/ Offending/ Intrusive Noise	The noise that intrudes over and above the existing ambient noise at a given location. The relative intrusiveness of sound depends on its amplitude, duration, frequency, and time of occurrence, and tonal information content as well as the prevailing ambient noise level.
Root Mean Square (RMS)	A measure of the magnitude of a varying noise source quantity. The name derives from the calculation of the square root of the mean of the squares of the values. It can be calculated from either a series of lone values or a continuous varying function.

Noise Measurement
Field Data

Project Name: Winchester at Jean Nicolas Commercial Project, County of Riverside **Date:** January 27, 2020

Project #: JN 19-0221

Noise Measurement #: NM1 Run Time: 15 minutes (1 x 15 minutes) **Technician:** Ian Gallagher

Nearest Address or Cross Street: 35007 Corte de Oro, Winchester, California.

Site Description (Type of Existing Land Use and any other notable features): Project site: Vacant with vegetation, Highway 79 (Winchester Rd) runs SW to NE along SE side of site, Jean Nicolas Road adjacent to west, & vacant land adjacent to north.
Noise Measurement Site: Multi-family residential to NE, single-family residential to SE, vacant land to west with Highway 79 further west.

Weather: About 5% high white cloud, filtered sun. Sunset 5:16 PM **Settings:** SLOW FAST

Temperature: 59 deg F **Wind:** 5-10 mph **Humidity:** 60% **Terrain:** Hilly

Start Time: 10:40 AM **End Time:** 10:55 AM **Run Time:**

Leq: 51.6 dB **Primary Noise Source:** Traffic ambiance from Highway 79 (Winchester Road).

Lmax 61 dB

L2 57.5 dB **Secondary Noise Sources:** Overhead choppers, aircraft both jet and propeller, bird song, residential

L8 55.1 dB ambiance, sporadic electric power tool (drill) being used off in the distance.

L25 52.9 dB

L50 50.1 dB

APPENDIX D

CONSTRUCTION NOISE MODELING

Receptor - Resdiential to North

Construction Phase Equipment Item	# of Items	Item Lmax at 50 feet, dBA[1, 2]	Distance to Receptor[3]	Item Usage Percent	Receptor Item Lmax, dBA	Receptor Item Leq, dBA	Required Mitigation	Mitigated Noise Level	Reduction (dBA Leq)
Grading									
Grader	1	85	1010	40	58.9	54.9	Muffler (10 dB Reduction)	44.9	
Rubber Tired Dozers	1	85	1010	40	58.9	54.9	Muffler (10 dB Reduction)	44.9	10.0
Tractors/Loaders/Backhoes	2	84	1010	40	57.9	56.9	Muffler (10 dB Reduction)	46.9	
					Log Sum	60.5		50.5	
Building Construction									
Cranes	1	83	1010	16	56.9	48.9	Muffler (10 dB Reduction)	38.9	
Forklifts [2]	3	64	1010	40	37.9	38.7	n/a	38.7	
Generator Set	1	81	1010	50	54.9	51.9	Enclosure or Acoustic Tent (10 dB Reduction)	41.9	6.7
Welders	4	74	1010	40	47.9	49.9	n/a	49.9	
Tractors/Loaders/Backhoes	2	84	1010	40	57.9	56.9	Muffler (10 dB Reduction)	46.9	
					Log Sum	59.2		52.5	
Paving									
Cement and Mortar Mixers	1	85	1010	40	58.9	54.9	Muffler (10 dB Reduction)	**44.9**	
Pavers	1	77	1010	50	50.9	47.9	Muffler (10 dB Reduction)	37.9	
Paving Equipment	1	85	1010	20	58.9	51.9	Muffler (10 dB Reduction)	41.9	10.0
Rollers	2	80	1010	20	53.9	49.9	Muffler (10 dB Reduction)	39.9	
Tractors/Loaders/Backhoes	1	84	1010	40	57.9	53.9	Muffler (10 dB Reduction)	43.9	
					Log Sum	59.4		49.4	
Architectural Coating									
Air Compressors	1	80	1010	40	53.9	49.9	Enclosure or Acoustic Tent (10 dB Reduction)	39.9	10.0
					Log Sum	49.9		**39.9**

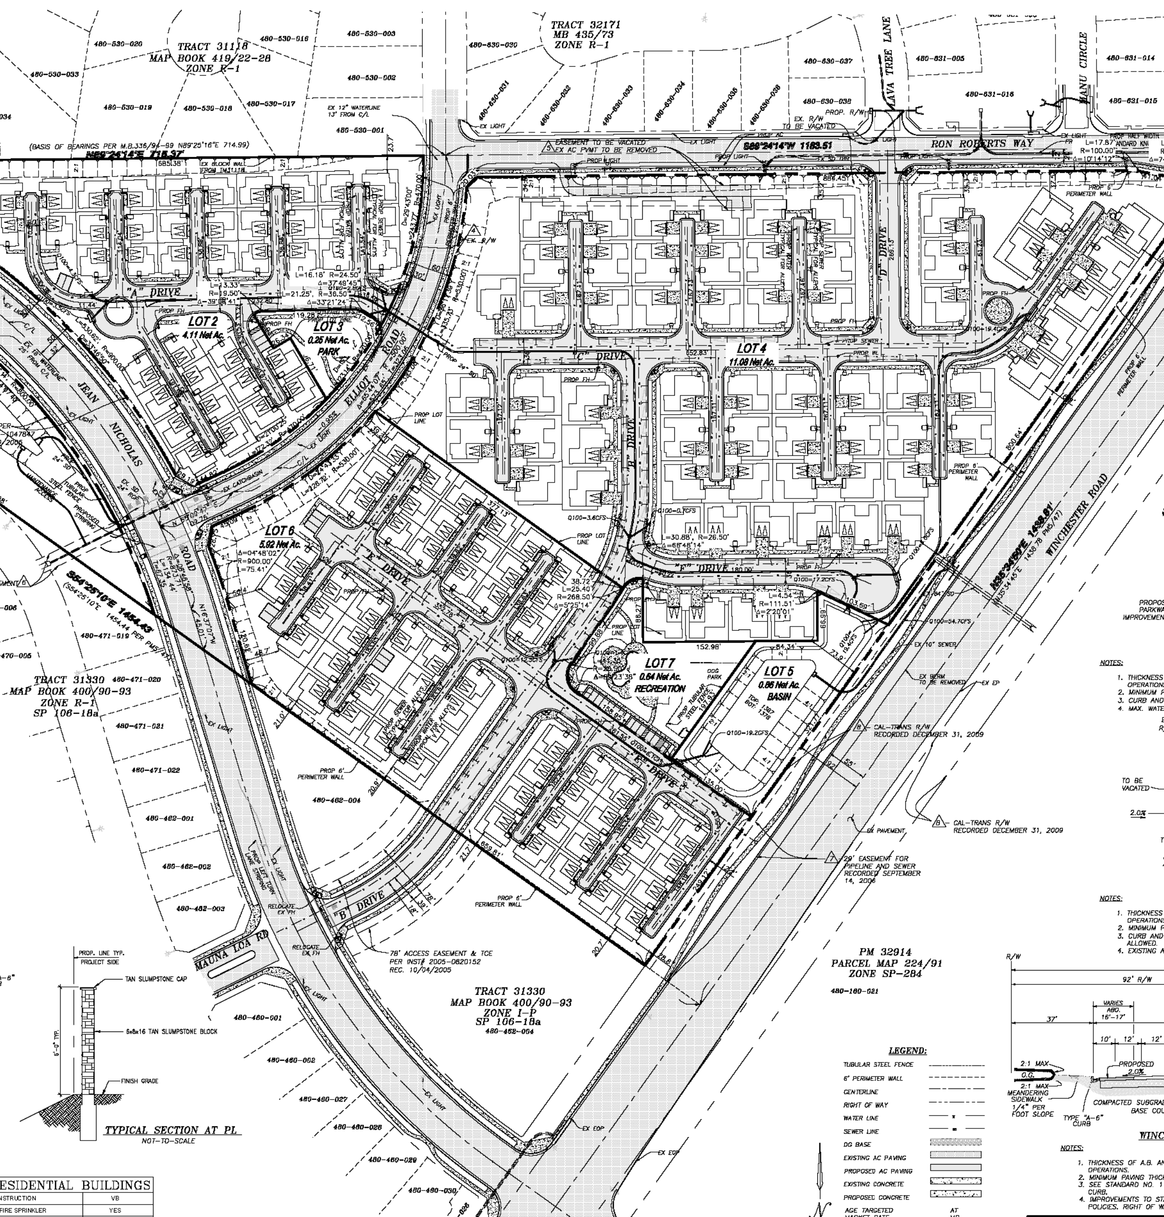
VICINITY MAP
NOT TO SCALE
THOMAS GUIDE 2014
PAGE 899, GRID D-5
SEC. 32, T.6S, R.2W



SCALE: 1"= 60'

GENERAL NOTES

1. **LEGAL DESCRIPTION**
   A PORTION OF PARCEL 2 AS SHOWN BY MAP ON FILE IN BOOK 5, PAGE 47 OF PARCEL MAPS, IN THE OFFICE OF THE COUNTY RECORDER OF RIVERSIDE COUNTY, CALIF.
2. **TOTAL ACREAGE**
   30.62 ACRES (GROSS)
   LOT 1; 1.52 AC. (NET)
   LOT 2; 4.11 AC. (NET)
   LOT 3; 0.25 AC. (NET)
   LOT 4; 11.08AC. (NET)
   LOT 5; 0.86 AC. (NET)
   LOT 6; 5.92 AC. (NET)
   LOT 7; 0.64 AC. (NET)
3. **EXISTING ZONING:**
   C-P-S, R-5, I-P, C-O
4. **PROPOSED ZONING:**
   R-3
5. **EXISTING LAND USE:**
   VACANT
6. **PROPOSED LAND USE:**
   RESIDENTIAL
7. **METHOD OF SEWAGE DISPOSAL**
   SANITARY SEWER
8. **UTILITIES:**
   WATER – EASTERN MUNICIPAL WATER DISTRICT
   SEWER – EASTERN MUNICIPAL WATER DISTRICT
   NATURAL GAS – SOUTHERN CALIFORNIA GAS CO.
   ELECTRIC – THE EDISON COMPANY
   TELEPHONE – FRONTIER
   CABLE – FRONTIER
9. **SCHOOL DISTRICT:**
   MURRIETA UNIFIED SCHOOL DISTRICT
10. **COMMUNITY SERVICES AREA:**
    NOT WITHIN A COMMUNITY SERVICE AREA
11. **ASSESSORS PARCEL NO.:**
    480-160-023
12. **2014 THOMAS BROS. GUIDE:**
    PAGE 899, GRID D-5
13. **SITE PLAN PREPARED:**
    MARCH 2018
14. **UNIFORM BUILDING CODE:**
    N/A
15. **NOTE:**
    ALL PROPOSED DRAINAGE FACILITIES SHALL BE DESIGNED TO ACCOMODATE 100 YEAR STORM FLOWS. ALL Q"S ARE APPROX.
    THIS PROJECT IS WITHIN A SPECIFIC PLAN DUTCH VILLAGE SP 106. LAND USE DESIGNATION INDUSTRIAL PARK / OFFICE COMMERCIAL SURROUNDING LAND USE DES. MED. DENSITY RESIDENTIAL.
    ALL SLOPE ARE 2:1 UNLESS NOTED.
16. **FEMA FLOOD PLAIN:**
    NOT IN A FLOOD ZONE.
17. **GEOLOGICAL HAZARD:**
    A SMALL PORTION OF THE SUBJECT ALONG WINCHESTER ROAD SHOWS A LOW POTENTIAL OF LIQUEFACTION AND SUBSIDENCE.
18. **SPECIFIC PLAN:**
    DUTCH VILLAGE
    PLAN NUMBER: #106
    PLANNING AREA: 18a
    ADOPTED DATE: 10/14/1986
19. **EXISTING LAND USE DESIGNATION:**
    OS-C, CO, CR, LI
20. **PROPOSED LAND USE DESIGNATION:**
    HDR
21. THIS TRACT MAP INCLUDES THE ENTIRE CONTIGUOUS OWNERSHIP OF THE LAND DIVIDER

EASEMENT NOTES

1. WATER RIGHTS,CLAIMS OR TITLE TO WATER, WHETHER OR NOT SHOWN BY HE PUBLIC RECORDS. (NOT PLOTTABLE FROM PUBLIC RECORDS).
2. AN EASEMENT FOR AVIGATION AND INCIDENTAL PURPOSES, RECORDED JUNE 25, 1991 AS INSTRUMENT NO. 1991-214567 OF OFFICIAL RECORDS. (BLANKET IN NATURE).
   IN FAVOR OF: ....THE COUNTY OF RIVERSIDE
   AFFECTS: ....A PORTION OF SAID LAND
3. THE TERMS AND PROVISIONS CONTAINED IN THE DOCUMENT ENTITLED "GRADING AND DRAINAGE AGREEMENT" RECORDED JULY 30, 2003 AS INSTRUMENT NO.03-572028 OF OFFICIAL RECORDS. (BLANKET IN NATURE).
4. AN EASEMENT FOR PUBLIC ROAD, DRAINAGE PURPOSES AND PUBLIC UTILITIES AND INCIDENTAL PURPOSES, RECORDED DECEMBER 20, 2005 AS INSTRUMENT NO. 2005-1047847 OF OFFICIAL RECORDS.
   IN FAVOR OF: ....THE COUNTY OF RIVERSIDE
   AFFECTS: ....SAID LAND
5. AN EASEMENT FOR STORM DRAIN PURPOSES AND INCIDENTAL PURPOSES, RECORDED AUGUST 22, 2006 AS INSTRUMENT NO. 2006-0616526 OF OFFICIAL RECORDS.
6. AN EASEMENT FOR STORM DRAIN PURPOSES AND INCIDENTAL PURPOSES, RECORDED SEPTEMBER 11, 2006 AS INSTRUMENT NO. 2006-0669514 OF OFFICIAL RECORDS.
   IN FAVOR OF: ....THE COUNTY OF RIVERSIDE
   AFFECTS: ....SAID LAND
7. AN EASEMENT FOR PIPELINE AND SEWAGE TRANSMISSIONS AND INCIDENTAL PURPOSES, RECORDED SEPTEMBER 14, 2006 AS INSTRUMENT NO. 2006-0682431 OF OFFICIAL RECORDS.
   IN FAVOR OF: ....THE COUNTY OF RIVERSIDE
   AFFECTS: ....SAID LAND
8. A DEED FOR FREEWAY AND PUBLIC UTILITY PURPOSES RECORDED DECEMBER 31, 2009, AS INSTRUMENT NO. 2009-0670974 OF OFFICIAL RECORDS.
   IN FAVOR OF: ....THE STATE OF CALIFORNIA
   AFFECTS: ....SAID LAND

HWY 79 POLICY AREA - HDR MID DENSITY = 11.0 DU/AC 11.0 DU/AC X 9% REDUCTION = 10.0 DU/AC ALLOWED			

MR RESIDENTIAL BUILDINGS

TYPE OF CONSTRUCTION		VB	
AUTOMATIC FIRE SPRINKLER		YES	
OCCUPANCY TYPE		R3	
ALLOWABLE AREA		1,610-2,050 SF	
PLAN 1 #OF BLDG/SF/NO. STORIES		39/1,610 SF/2 STORIES	
PLAN 2 #OF BLDG/SF/NO. STORIES		16/1,764 SF/2 STORIES	
PLAN 2X #OF BLDG/SF/NO. STORIES		14/1,653 SF/2 STORIES	
PLAN 3 #OF BLDG/SF/NO. STORIES		30/2,027 SF/ 2 STORIES	
NO. BUILDINGS		99	
NET AREA	10.0 AC	DENSITY	9.9 DU/AC
HWY 79 POLICY AREA - HDR MID DENSITY = 11.0 DU/AC 11.0 DU/AC X 9% REDUCTION = 10.0 DU/AC ALLOWED			

PARKING MATRIX

USE	RATIO	ADDITIONAL SPACES REQ'D	SPACES PROV'D
MARKET RATE RESIDENTIAL	0.5/ UNIT (99 UNITS x 0.50)	50	28 (STALLS) 56 (PARALLEL)
AGE TARGETED RESIDENTIAL	SELF SUFFICIENT	0	0 (STALLS) 54 (PARALLEL)
REQUIRED ACCESSIBLE SPACES (26-50)		2	5

THE "STALLS" ARE DESIGNATED PARKING SPACES, THE "PARALLEL" IS STREET PARKING AVAILABILITY PER THE SECTION LABELED "PRIVATE DRIVEWAYS "A" THRU "F"

THIS MAP IS BASED ON RECORD DATA AND SHOULD NOT BE RELIED UPON FOR ACCURATE SURVEY INFORMATION. ALL MEASUREMENTS SHALL BE FIELD VERIFIED BY PERSONS AUTHORIZED TO PERFORM SUCH WORK. ANY DESIGN INFORMATION SHOWN ON THIS PLAN IS CONCEPTUAL IN NATURE AND SHALL NOT BE RELIED ON FOR CONSTRUCTION PURPOSES.

NO.	DATE	REVISION
1	5/17/18	REVISIONS PER 1ST PLAN CHECK COMMENTS
2	10/11/18	REVISIONS PER 2ND PLAN CHECK COMMENTS
3	12/11/18	REVISED LOT LINES, REMOVED LOT

APPENDIX G

VIBRATION WORKSHEETS

GROUNDBORNE VIBRATION ANALYSIS

Project:	19-0221 Winchester at Jean Nicolas	Date:	1/27/20
Source:	Large Bulldozer		
Scenario:	Unmitigated		
Location:	Residential to southwest		
Address:			

PPV = PPVref(25/D)^n (in/sec)

INPUT

Equipment Type =	2	Large Bulldozer	INPUT SECTION IN GREEN
PPVref =	0.089	Reference PPV (in/sec) at 25 ft.	
D =	135.00	Distance from Equipment to Receiver (ft)	
n =	1.50	Vibration attenuation rate through the ground	

Note: Based on reference equations from Vibration Guidance Manual, California Department of Transportation, 2006, pgs 38-43.

RESULTS

PPV =	0.007	IN/SEC	OUTPUT IN BLUE

GROUNDBORNE VIBRATION ANALYSIS

Project:	19-0221 Winchester at Jean Nicolas	Date:	1/27/20
Source:	Vibratory Roller		
Scenario:	Unmitigated		
Location:	Residential to southwest		
Address:			

PPV = PPVref(25/D)^n (in/sec)

INPUT

Equipment Type =	1	Vibratory Roller	INPUT SECTION IN GREEN
PPVref =	0.21	Reference PPV (in/sec) at 25 ft.	
D =	135.00	Distance from Equipment to Receiver (ft)	
n =	1.50	Vibration attenuation rate through the ground	

Note: Based on reference equations from Vibration Guidance Manual, California Department of Transportation, 2006, pgs 38-43.

RESULTS

PPV =	0.017	IN/SEC	OUTPUT IN BLUE

GROUNDBORNE VIBRATION ANALYSIS

Project:	19-0221 Winchester at Jean Nicolas	Date:	6/17/20
Source:	Large Bulldozer		
Scenario:	Unmitigated		
Location:	Proposed Residential to North		
Address:			

PPV = PPVref(25/D)^n (in/sec)

INPUT

Equipment Type =	2	Large Bulldozer	INPUT SECTION IN GREEN
PPVref =	0.089	Reference PPV (in/sec) at 25 ft.	
D =	21.00	Distance from Equipment to Receiver (ft)	
n =	1.50	Vibration attenuation rate through the ground	

Note: Based on reference equations from Vibration Guidance Manual, California Department of Transportation, 2006, pgs 38-43.

RESULTS

PPV =	0.116	IN/SEC	OUTPUT IN BLUE

GROUNDBORNE VIBRATION ANALYSIS

Project:	19-0221 Winchester at Jean Nicolas	Date:	6/17/20
Source:	Vibratory Roller		
Scenario:	Unmitigated		
Location:	Proposed Residential to North		
Address:			

PPV = PPVref(25/D)^n (in/sec)

INPUT

Equipment Type =	1	Vibratory Roller	INPUT SECTION IN GREEN
PPVref =	0.21	Reference PPV (in/sec) at 25 ft.	
D =	21.00	Distance from Equipment to Receiver (ft)	
n =	1.50	Vibration attenuation rate through the ground	

Note: Based on reference equations from Vibration Guidance Manual, California Department of Transportation, 2006, pgs 38-43.

RESULTS

PPV =	0.273	IN/SEC	OUTPUT IN BLUE
