

II. Responses to Comments

II. Responses to Comments

A. Introduction

Sections 21091(d) and 21092.5 of the Public Resources Code (PRC) and CEQA Guidelines Section 15088 govern the lead agency's responses to comments on a Draft EIR. CEQA Guidelines Section 15088(a) states that "[t]he lead agency shall evaluate comments on environmental issues received from persons who reviewed the draft EIR and shall prepare a written response. The lead agency shall respond to comments raising significant environmental issues received during the noticed comment period and any extensions and may respond to late comments." In accordance with these requirements, this section of the Final EIR provides the responses prepared by the City of Los Angeles Department of City Planning (City) to each of the written comments received regarding the Draft EIR. Section II.B, Matrix of Comments Received on the Draft EIR, includes a table that summarizes the environmental issues raised by each commenter regarding the Draft EIR.

Topical responses have been prepared to address commonly raised topics. These topical responses are provided in Section II.C, Topical Responses, of this section of the Final EIR and include the following:

Topical Response No. 1: Clearly Defined Project Description and Specific Plan

Topical Response No. 2: Definition of Floor Area is Appropriate

Topical Response No. 3: Permitted On-Site Uses

Topical Response No. 4: Appropriateness of Economic Objective

Topical Response No. 5: Historical Resources

Topical Response No. 6: Wilshire Community Plan Update

Topical Response No. 7: Mobility Hub

Topical Response No. 8: Vehicle Miles Traveled

Topical Response No. 9: Neighborhood Traffic Management Plan

Topical Response No. 10: Trip Generation

Topical Response No. 11: Transportation Demand Management

Topical Response No. 12: Safety and Congestion

Topical Response No. 13: Parking

Topical Response No. 14: Construction Vehicle Impacts

Topical Response No. 15: Transportation Improvement Program

Topical Response No. 16: Project Alternatives Analysis

Section II.D, Responses to Comments, provides the City's responses to each of the written comments raised in the comment letters received on the Draft EIR. Copies of the original comment letters are provided in Appendix FEIR-1.

III. Responses to Comments

C. Topical Responses

Topical Response No. 1. Clearly Defined Project Description and Specific Plan

As stated consistently throughout the Initial Study, Draft EIR, and Final EIR, the TVC 2050 Project (Project) is a studio project. The Project includes the establishment of the TVC 2050 Specific Plan (Specific Plan) to continue the existing studio use and modernize and expand production facilities within Television City. The purpose of the proposed Specific Plan is to implement the Project or a Project alternative as described in the EIR or a modified Project. An approved site plan will be included as Exhibit A to the approved Specific Plan. As discussed below, the Project Description in the Draft EIR includes all information required by CEQA and fulfills CEQA's purpose as an informational document that allows for meaningful public participation. Neither CEQA nor City policy requires a draft of a proposed specific plan or sign district to be included in an EIR. Nevertheless, in response to comments on the Draft EIR, the current draft of the proposed Specific Plan (also referred to herein as the Preliminary Draft Specific Plan) has been made publicly available for informational purposes on the Department of City Planning website prior to the release of this Final EIR. Additionally, the proposed Sign District (also referred to herein as the Preliminary Draft Sign District), will be made publicly available for informational purposes on the Department of City Planning website prior to the first public hearing held for the Project. Please note that any documents referred to as drafts are not final and have not been approved or adopted by City decision-makers.

A. The Project Description Conforms with CEQA

Commenters state that the Draft EIR does not include a description of the Project, or that the Project description is incomplete or inadequate. Commenters also state that the Project Description does not include sufficient detail, or that information about the Project is difficult to find within the Draft EIR. However, as stated on the first page of Section II, Project Description, of the Draft EIR (page II-1) and throughout the Draft EIR:

The TVC 2050 Project (Project) would establish the TVC 2050 Specific Plan (Specific Plan) to allow for the continuation of an existing studio use and the modernization and expansion of media production facilities within the approximately 25-acre Television City studio located at 7716–7860 West Beverly Boulevard in Los Angeles, California (Project Site). The proposed

Specific Plan would permit a total of up to a maximum of 1,874,000 square feet of sound stage, production support, production office, general office, and retail uses within the Project Site upon buildout, as well as associated circulation improvements, parking, landscaping, and open space.

A detailed description of the Project is included on pages II-12 to II-35 of the Draft EIR. Table II-2 on page II-13 of the Draft EIR, replicated below, provides a land use and floor area breakdown of the proposed development program that was analyzed in the Draft EIR. The massing and locations of the proposed buildings are depicted on the Conceptual Site Plan included as Figure II-4 on page II-14 of the Draft EIR and are consistent with the architectural plans on file with the City. Project plans are part of the administrative record and are available on the Department of City Planning's website, <https://planning.lacity.org/pdiscaseinfo/>, by searching the Project's entitlement case number, *CPC-2021-4089-AD-GPA-ZC-SN-SP*.

**Draft EIR Table II-2

Retail	0	0	0	20,000	20,000	+20,000
Total	743,680	495,860	247,820	1,626,180	1,874,000	1,130,320
<i>sf = square feet</i> <i>Source: TVC 2050 Draft EIR, July 2022.</i>						

Further, the proposed Specific Plan would include a regulatory framework for implementation of the Project, including, among other things, review processes by the City for implementation of the proposed Project. Future changes that are substantially different than the Project or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, as well as potential CEQA compliance review.

Contrary to commenters' assertions, the Project Description in the Draft EIR includes all information required by CEQA. With respect to an EIR project description, four

items are mandatory under CEQA Guidelines Section 15124: (1) the precise location and boundaries of the proposed project shown on a detailed map, preferably topographic, and on a regional map; (2) a statement of the objectives sought by the proposed project, which should include the underlying purpose of the project and may discuss the project benefits; (3) a general description of the project's technical, economic, and environmental characteristics, considering the principal engineering proposals if any and supporting public service facilities; and (4) a statement briefly describing the intended uses of the EIR. Aside from these four items, the CEQA Guidelines advise that the project description should not "supply extensive detail beyond that needed for evaluation and review of the [project's] environmental impact."¹

In accordance with CEQA Guidelines Section 15124, the Project Description includes the following:

- (1) The precise location and boundaries of the proposed Project is shown on a detailed map, Figure II-2, Aerial Photograph of the Project Vicinity, in Section II, Project Description, of the Draft EIR. The location of the Project also appears on a regional map in Figure II-1, Project Location Map.
- (2) A clearly written statement of the objectives sought by the proposed Project begins on page II-10 in Section II, Project Description, of the Draft EIR. As noted on page II-10, the statement of objectives includes the underlying purpose of the Project.
- (3) A general description of the Project's technical, economic, and environmental characteristics is included in Section II, Project Description, of the Draft EIR.
- (4) A statement briefly describing the intended uses of the EIR that includes a list of the agencies that are expected to use the EIR in their decision making and a list of permits and other approvals required to implement the project, and a list of related environmental review and consultation requirements required by federal, state, or local laws, regulations, or policies is included in Section 6, Requested Permits and Approvals, on page II-35 of the Draft EIR.

As such, the Project Description includes all information required by CEQA Guidelines Section 15124.

¹ CEQA Guidelines § 15124.

B. The Project Description Includes Sufficient Information and Detail to Evaluate the Project's Environmental Impacts

Comments state that the Draft EIR does not include sufficient information or details about the Project and that therefore the Draft EIR failed to analyze the environmental impacts of the Project. CEQA requires a “general description” of the Project’s technical, economic and environmental characteristics. “General” means involving only the main features of something rather than details or particulars.² CEQA Guidelines Section 15124 specifically provides that a project description “should not supply extensive detail beyond that needed for evaluation and review of the environmental impact.” Rather, the project description need only disclose the nature of the project and its main features. This is consistent with CEQA Guidelines Section 15161, which provides that a project EIR like the TVC EIR “should focus primarily on the changes in the environment that would result from the development project.”

The nature of the Project is the modernization and expansion of an existing studio pursuant to the proposed Specific Plan, which will permit five land uses (i.e., sound stage, production support, production office, general office, and retail).³ Section II, Project Description, of the Draft EIR sufficiently describes the proposed Project and provides additional information such as the requested entitlements, including the proposed Specific Plan and Sign District, among others. The Project Description also discusses permitted and proposed floor area; proposed development program; Land Use Exchange Program; design and architecture; height zones; frontage areas (similar to setbacks); building setbacks; other design elements including screening and fencing; historic preservation elements; open space; landscaping; public realm enhancements; access; circulation; parking; lighting; signage; site security; sustainability features; anticipated construction schedule; earthwork activities; and haul routes. Additional information about the Project is

² The “general description” requirement for the technical attributes of a project is consistent with other CEQA mandates to make the EIR a user-friendly document. For example, CEQA Guidelines Section 15140 states that EIRs must be written in plain language so that decision makers and the public can rapidly understand them. The general description requirement also fosters the principle that EIRs should be prepared early enough in the planning stages of a project to enable environmental concerns to influence the project’s design.” A general description of a project element can be provided earlier in the process than a detailed engineering plan and is more amenable to modification to reflect environmental concerns.

³ These uses are defined in the Preliminary Draft Specific Plan.

included in the impact analysis sections where relevant to a particular environmental topic and impact analysis.⁴

As discussed above, the Project includes height zones, building setbacks, and frontage areas that will dictate the location, orientation, mass, and height of potential future buildings. Specific details about potential future buildings are unknown at this time but would not change the overall development limits set forth in the Project Description and those in the proposed Specific Plan. The Specific Plan would only allow for development consistent with the parameters described in the Draft EIR and would require future review by the City for conformance with the Certified EIR and the Specific Plan. The Specific Plan will outline, among other things, the required process for future review by the City.

In accordance with CEQA, all environmental aspects of the Project (i.e., all aspects that may cause a physical impact on the environment), including, among other Project approvals, the proposed Specific Plan and Sign District, were fully disclosed and analyzed in the Draft EIR, including an assessment of the maximum potential impacts of Project buildout. For example, a discussion of the elements of the proposed Specific Plan and Sign District that are relevant to the land use impact analysis is included in Section IV.H, Land Use and Planning, of the Draft EIR. Specifically, the relevant proposed Specific Plan regulations are discussed on pages IV.H-20 through IV.H-30 of the Draft EIR, including permitted land uses; Land Use Exchange Program; height zones; design regulations, including regulations related to frontage areas, building setbacks, screening of rooftop equipment and outdoor storage areas, fencing, parking structures, and Project Site access points; historic preservation regulations; parking; alcohol sales; and childcare facilities. The relevant proposed Sign District elements, as well as the 23-page Historic Sign Guidelines for the Primary Studio Complex, which is included in Appendix C of the Draft EIR, are discussed on pages IV.H-30 through IV.H-31 of the Draft EIR. In addition, the public realm improvements proposed as part of the Project, which are also relevant to the land use analysis, are discussed on pages IV.H-31 through IV.H-37 of the Draft EIR. Regarding the proposed Development Agreement, the component of the Development Agreement that is relevant to the environmental analysis is the 20-year term, which could extend buildout of

⁴ For example, relevant to commenters' concern that the Project Description lacks sufficient information about the Project's transportation impacts, the Draft EIR includes a transportation section (Section IV.K) and an appendix (i.e., Appendix M) that includes the Los Angeles Department of Transportation (LADOT)-approved transportation assessment, the LADOT transportation assessment letter for the transportation assessment, the supplemental vehicle miles traveled (VMT analysis memo, the LADOT assessment letter for the supplemental VMT analysis memo, and the LADOT haul route approval letter. The Project characteristics that are relevant to the transportation impact analysis, including the proposed development program, Land Use Exchange Program, construction timeline, vehicular and pedestrian access, circulation, parking, Transportation Demand Management (TDM) Program and Mobility Hub, are discussed on pages IV.K-41 through IV.K-45 as well as throughout the impact analysis on pages IV.K-45 through IV.K-83.

the Project to approximately 2043. The Draft EIR conservatively assumed a 32-month construction duration that includes overlapping activities and construction phases and more intense activities on a daily basis. In addition, to be comprehensive and account for all potential impacts associated with the Project, an analysis of the impacts associated with a 20-year buildout is also included for each of the environmental topics studied in the Draft EIR.

For further information, please refer to the Comparison Chart of Draft EIR and the Preliminary Draft Specific Plan included as Appendix FEIR-2, which includes a comparison of the Project elements disclosed in the Draft EIR with the proposed Specific Plan.

C. Level of Detail Required for a Specific Plan Project EIR

A specific plan is a “regulatory land use ordinance” that provides “regulatory controls or incentives for the systematic execution of the General Plan.”⁵ The main purpose of a specific plan is to provide a supplemental layer of development regulations that are more responsive and tailored to the existing conditions of a site than the base zoning regulations. Specific plans go beyond the underlying zoning to establish additional regulations that enhance and preserve the unique characteristics of a distinct site or community. Per the California Governor’s Office of Planning and Research (OPR), a specific plan “effectively establishes a link between implementing policies of the general plan and the individual development proposals in a defined area. A specific plan may be as general as setting forth broad policy concepts, or as detailed as providing direction to every facet of development from the type, location, and intensity of uses to the design and capacity of infrastructure; from the resources used to finance public improvements to the design guidelines of a subdivision.”⁶

“In unique areas and developments, a specific plan can provide zoning regulations where conventional zoning districts may not achieve the desired planning results. In some circumstances, the proposed specific plans may be less restrictive than the current code but in some circumstances they are more restrictive.”⁷

⁵ LAMC § 11.5.7(A) [13B.4.1(A)(1)].

⁶ California Governor’s Office of Planning and Research, The Planner’s Guide to Specific Plans, January 2001, www.ca-ilg.org/sites/main/files/file-attachments/resources__specific_plans_0.pdf?1350954879, accessed May 31, 2023.

⁷ NBC Universal Evolution Plan Final Impact Report (Case No. ENV-2007-0254-EIR dated July 2012), Section III, Responses to Comments.

Under CEQA, the level of detail required in an EIR is dependent upon the underlying project. Per CEQA Guidelines Section 15146, “[t]he degree of specificity required in an EIR will correspond to the degree of specificity involved in the underlying activity which is described in the EIR.” Accordingly, less detail is required for a specific plan project than an individual building development project. Section 15146(a) states that “[a]n EIR on a construction project will necessarily be more detailed in the specific effects of the project than will be an EIR on the adoption of a local general plan or comprehensive zoning ordinance because the effects of the construction can be predicted with greater accuracy.” Per OPR’s The Planner’s Guide to Specific Plans dated January 2001 (OPR Guide), “[a]s the name implies, a specific plan EIR should contain analyses specific enough to reflect the level of detail in the plan (CEQA Guidelines § 15146).”⁸ As stated in the OPR Guide, the “information contained in this document is meant to provide direction and references to planning practitioners for the development of specific plans.”⁹ The Draft EIR discusses all of the physical elements of the proposed Specific Plan in the same amount of detail as the Preliminary Draft Specific Plan and complies with CEQA requirements.¹⁰

D. CEQA and City Policy Do Not Require the Proposed Specific Plan or Sign District to be Included in the EIR

Comments claim that because the proposed Specific Plan and Sign District were not included in the Draft EIR, the Draft EIR failed to adequately define the Project and analyze its environmental impacts. However, these comments misconstrue CEQA’s definition of a “project.” CEQA defines the “project” to be analyzed in the EIR as the “physical change in the environment,” not the regulatory document describing that change.¹¹ CEQA Guidelines Section 15378(c) states that “[t]he term ‘project’ refers to the activity which is being approved and which may be subject to several discretionary approvals by governmental agencies. The term ‘project’ does not mean each separate governmental approval.” This is consistent with the OPR Guide, which states that, “[t]o the extent feasible, the process of preparing the specific plan and the environmental analysis should proceed concurrently because both documents require many of the same studies and resulting information. The information in the EIR provides decision makers with the insight necessary to guide policy

⁸ OPR Guide, p. 23.

⁹ OPR Guide, p 3.

¹⁰ Please refer to the Comparison Chart of Draft EIR and the Proposed Specific Plan included as Appendix FEIR-2, which includes a comparison of the Project elements disclosed in the Draft EIR with the Preliminary Draft Specific Plan that confirms that all necessary Project elements were discussed and analyzed in the Draft EIR.

¹¹ Public Resources Code § 21065. Per CEQA Guidelines § 15378(a), “project” means “the whole of an action, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment.”

development, thereby ensuring the plan's policies will address and provide the means by which to avoid potential impacts to the environment.”¹² Further, pursuant to CEQA Guidelines Section 15358, the environmental “effects” and “impacts” analyzed under CEQA “must be related to a physical change.” Under this definition of a project, the lead agency must describe the project to encompass the entirety of the activity that is proposed for approval, which ensures that all potential impacts of the proposed project will be examined before it is approved.¹³ The Draft EIR fully complies with this requirement. As described on page I-1 in Section I, Executive Summary, of the Draft EIR, “[t]his Draft EIR serves as the environmental document for all actions associated with the Project.” The environmental topics analyzed in the Draft EIR include air quality; cultural resources; energy; geology and soils; greenhouse gas (GHG) emissions; hazards and hazardous materials; hydrology and water quality; land use and planning; noise; public services (including fire protection and police protection); transportation; tribal cultural resources; and utilities and service systems (including water supply and infrastructure, wastewater, and electric power, natural gas, and telecommunications infrastructure).¹⁴

The Draft EIR analyzed all potentially significant environmental impacts of the proposed Project as required by CEQA, including the components of each entitlement that could have a physical impact on the environment. As stated above, per CEQA Guidelines Section 15161, the EIR “should focus primarily on the changes in the environment that would result from the development project.” Although CEQA requires that a project description include a list of the entitlements sought, CEQA does not require the entitlements themselves to be included in the EIR; rather, what CEQA requires is an analysis of all physical environmental impacts associated with a project. The Draft EIR lists the Specific Plan and Sign District, among others, as entitlements associated with the Project, and the Draft EIR comprehensively analyzes the potential environmental impacts associated with all proposed entitlements.

Although not required by CEQA or City policy, a Preliminary Draft Specific Plan has been made publicly available on the Department of City Planning’s website prior to the release of this Final EIR. Additionally, a Preliminary Draft Sign District will be made publicly available for informational purposes on the Department of City Planning website prior to the first public hearing held for the Project. Please note that any documents referred to as drafts are not final and have not been approved or adopted by City decision-makers.

¹² OPR Guide, p. 23.

¹³ CEQA Guidelines § 15378.

¹⁴ Please refer to Appendix FEIR-3, Maximum Impact Scenario, which discusses the maximum impact scenarios that were analyzed for each environmental topic.

E. Land Use Exchange Program

The Land Use Exchange Program will be included in the Specific Plan and will be consistent with the Project Description and analysis in the EIR. As shown in Table II-2 on page II-13 of the Draft EIR and replicated on page II-62 of this Topical Response, the proposed development program includes 350,000 square feet of sound stages, 104,000 square feet of production support, 700,000 square feet of production office, 700,000 square feet of general office, and 20,000 square feet of retail for a total of 1,874,000 square feet. Under the Land Use Exchange Program, the amount of sound stage may be increased up to a maximum of 450,000 square feet, and production support may be increased up to a maximum of 450,000 square feet, in exchange for an equivalent decrease in the floor area of any of the other permitted land uses (individually or in combination). The Land Use Exchange Program would not allow for increases in production office, general office, or retail floor area. Please note that the sound stage and production support floor area would likely not both be maximized at 450,000 square feet each in practice, because this would not allow for an operationally feasible amount of production office and general office space. The Land Use Exchange Program analyzed in the Draft EIR is identical to the program in the Preliminary Draft Specific Plan, except that, in response to comments, the program in the Final EIR and Preliminary Draft Specific Plan were clarified to limit production support floor area to a maximum of 450,000 square feet (there was no maximum limit in the Draft EIR). Therefore, the Land Use Exchange Program in the Preliminary Draft Specific Plan, which limits sound stage and production support floor area to a maximum of 450,000 square feet each, is more restrictive than the program analyzed in the Draft EIR. This change does not affect any of the environmental analyses or impact conclusions in the Draft EIR.

The Draft EIR's environmental analysis accounts for the maximum potential environmental impacts associated with Project buildout. For each environmental topic, as applicable, in addition to analyzing the impacts of the proposed development program, the Draft EIR also analyzes the maximum impact scenario; i.e., the development scenario under the Land Use Exchange Program that would generate the maximum impact for each environmental topic. Please refer to Appendix FEIR-3, Maximum Impact Scenario, which discusses the maximum impact scenarios that were analyzed for each environmental topic. For example, as discussed in Section IV.A, Air Quality, of the Draft EIR, with regard to air quality impacts during construction, the overall square footage of development and earthwork activities would remain the same with the proposed development program and any potential buildout scenario under the proposed Specific Plan Land Use Exchange Program; as such, the construction emissions associated with the proposed development program, which are included on page IV.A-63 of the Draft EIR, are representative of all potential development scenarios under the proposed Specific Plan. However, with respect to air quality impacts during operation, the proposed development program does not represent the greatest potential impacts. Rather, the maximum air quality impacts during

operations would be generated by a buildout scenario that exchanges 100,000 square feet of production support for 100,000 square feet of sound stages under the Land Use Exchange Program, which is what was analyzed in the Draft EIR (see Tables IV.A-7 and IV.A-10 on pages IV.A-64 and IV.A-70 of the Draft EIR, respectively). Further, any land use exchange scenario would be required to comply with all other Specific Plan regulations, including, among others, height limitations, frontage and setback requirements, and the project parameters for construction on or adjacent to the Primary Studio Complex (Project Design Feature CUL-PDF-1, discussed in Topical Response No. 5, Historical Resources).

Under the proposed Specific Plan, a future development proposal that involves a land use exchange would require additional discretionary City review and approval and potential CEQA compliance review. The maximum potential impacts of the Project were evaluated in the Draft EIR and represent the measure against which future land use exchange proposals may be considered.

F. The Project Description Is Accurate, Stable and Finite

Comments state that the Project fails to meet CEQA's requirement of an accurate, stable and finite description of the Project.

However, the Project Description in the Draft EIR is indeed accurate, stable and finite, and contains all necessary data to evaluate and determine the potential environmental impacts of the proposed Project.¹⁵ The Project is intended to allow for the continuation and modernization of a working studio that is over 70 years old; there is no uncertainty that this site will remain a studio use, and all of the elements of the proposed Project are intended to support this overarching goal. Precise architectural drawings for individual buildings, building floor plans, landscape plans and building material specifications are details that are not currently available and are not required to be included as part of a draft EIR for a specific plan project. In fact, technical drawings may well supply extensive detail beyond that needed for evaluation and review of the environmental impact in violation of CEQA Guidelines Section 15124. Notwithstanding, Project information specific to individual issue area analyses is appropriately located in the corresponding EIR sections or technical appendices of the Draft EIR.

¹⁵ Please refer to the Comparison Chart of Draft EIR and the Proposed Specific Plan included as Appendix FEIR-2 for a comparison of the Project elements disclosed in the Draft EIR with the Preliminary Draft Specific Plan that confirms that all necessary Project elements were discussed and analyzed in the Draft EIR.

A project EIR for a long-range development plan that included a conceptual development scenario rather than precise building plans is consistent with CEQA and City policy, as an EIR cannot be faulted for not providing detail that, due to the nature of the Project, simply does not now exist. The nature of the Project is a proposed specific plan and the Draft EIR evaluated a conceptual development scenario, as a specific development plan did not exist when the Draft EIR was prepared. As discussed above, the Draft EIR includes a description of all aspects of the proposed Specific Plan, proposed Sign District, and other Project components which are relevant to the environmental analysis, including an assessment of the maximum potential impacts of Project buildout. Under CEQA, a project description is adequate where the basic characteristics of the project remained accurate, stable and finite (i.e., the integral components of the project have not changed in any material way). Accordingly, the Project Description is accurate, stable, and finite in compliance with CEQA requirements.

***Millennium* is Distinguishable**

Commenters attempt to equate the Project with the project in *Stopthemillennium hollywood.com v. City of Los Angeles* (2019) 39 Cal.App.5th 1 (“*Millennium*”). However, the project at issue in the *Millennium* case is not similar to the Project because *Millennium* involved an individual building development project rather than a specific plan project. In addition, the Project Description is distinguishable in all material respects from the project description at issue in *Millennium*.

The Draft EIR in *Millennium* described a “mixed-use development” that would include “some combination of residential dwelling units, luxury hotel rooms, office and associated uses, restaurant space, health and fitness center uses, and retail establishments.”¹⁶ The *Millennium* project description did not specify what uses would be built or the square footage or location of such uses. The court ruled that the *Millennium* project description did not include “any description or detail regarding what *Millennium* intended to build,” and the “lack of detail about what [the project] would look like and what uses would be built continued throughout the environmental review process.”¹⁷

The Draft EIR, on the other hand, clearly and consistently states that the Project is a studio specific plan project that will include sound stage, production support, production office, general office, and retail uses. The *Millennium* project did not include any limit on the size of the various permitted uses that could be built. The proposed Specific Plan, in contrast, includes maximum limits on the size of the five permitted land uses, in addition to

¹⁶ *Millennium*, 39 Cal.App.5th at 6; Hollywood Center Project Draft EIR (Case No. ENV-2018-2116-EIR), Section I, Introduction/Summary, p. I-5.

¹⁷ *Millennium*, 39 Cal.App.5th at 8.

the overall floor area limitation of 1,874,000 square feet. Specifically, consistent with the Project Description in the Draft and Final EIR, the Preliminary Draft Specific Plan limits the floor area of the five permitted studio land uses as follows:

- Sound stage would be limited to a maximum of 350,000 square feet, which could be increased up to 450,000 square feet under the Land Use Exchange Program.
- Production support would be limited to a maximum of 104,000 square feet, which could be increased up to 450,000 square feet under the Land Use Exchange Program.
- Production office would be limited to a maximum of 700,000 square feet.
- General office would be limited to a maximum of 700,000 square feet.
- Retail would be limited to a maximum of 20,000 square feet.
- Total Project floor area would be limited to 1,874,000 square feet or a floor area ratio (FAR) of 1:75.

Further, even though the Project is not an individual building project like the *Millennium* project, the EIR provides plans and information beyond what CEQA requires for a specific plan project EIR and far beyond what was provided in the *Millennium* EIR. Unlike in *Millennium*, a detailed discussion of the Project is included on pages II-12 to II-35 of the Draft EIR. Table II-2 on page II-13 of the Draft EIR, replicated on page II-62 of this Topical Response for reference, provides the land use and floor area breakdown of the proposed development program that was analyzed in the Draft EIR. The massing and locations of the proposed buildings are depicted on the Conceptual Site Plan included as Figure II-4 on page II-14 of the Draft EIR and are consistent with the architectural plans on file with the City. Project plans are part of the administrative record and are available on the Department of City Planning's website, <https://planning.lacity.org/pdiscaseinfo/>, by searching the Project's entitlement case number, *CPC-2021-4089-AD-GPA-ZC-SN-SP*.

Unlike in *Millennium*, the Project is not seeking flexibility with respect to the nature of the Project, what uses may be built, and the overall size of the Project, as the proposed studio uses and the overall size of the Project are defined and fixed elements of the Project. The Project would allow for limited flexibility in the size and placement of the permitted studio uses, as is typical with a studio specific plan. Even for an individual building project, changes in the size and siting of a defined set of proposed land uses within a defined development footprint do not render a project description unstable.

Commenters claim that, as in *Millennium*, the TVC 2050 Draft EIR merely analyzed a set of environmental impact envelopes in violation of CEQA, which is incorrect. In

Millennium, the draft EIR described a mixed-use project that would consist of an undisclosed combination of various commercial and/or residential uses, and project development would be regulated based on environmental impact envelopes rather than specific development standards. As the Second District Court of Appeal in *Millennium* stated, “[a]nalyzing a ‘set of environmental impact limits,’ instead of analyzing the environmental impacts for a defined project, was not consistent with CEQA.” By contrast, the TVC 2050 Draft EIR analyzed the environmental impacts of the Project.

The TVC 2050 Draft EIR analyzed the “proposed development program” (Conceptual Site Plan) with the five permitted land uses set forth in Table II-2 on page II-13, replicated on page II-62 of this Topical Response. As discussed in Section E, above, the Draft EIR also analyzed maximum impact scenarios, in which the Land Use Exchange Program would enable a potential land use mix that would have a greater environmental impact than the Conceptual Site Plan, specific to the maximum impact per environmental impact category; e.g., transportation, energy, air quality, etc. Therefore, in accordance with CEQA, the EIR’s focus on the maximum impacts expected to occur at full buildout promotes informed decision making, and evidences a good faith effort at forecasting what is expected to occur if the Project is approved. As such, the Draft EIR comprehensively evaluated and disclosed the maximum potential impacts of the Project.

Further, unlike in *Millennium*, future development of the Project Site will be subject to the review procedures under the proposed Specific Plan and Los Angeles Municipal Code (LAMC) Section 11.5.7[13B.4]. As required, any future development that is substantially different than the proposed Project, or which is beyond the scope of the impacts evaluated in the EIR, would be subject to additional discretionary City review and approval, as well as additional CEQA compliance review.

Contrary to commenters’ claims, detailed and technical plans are not required for purposes of a specific plan project EIR, and illustrative and conceptual plans are the only plans that could meaningfully be provided when a draft EIR is prepared. As discussed above, a CEQA project description need only disclose the nature of the project and its main features. In addition, [t]he degree of specificity required depends on the type of project. There must be sufficient information to understand the environmental impacts of the proposed project. The EIR must achieve a balance between technical accuracy and public understanding. The fact that the site plan and other figures in the Project Description are labeled as “conceptual” and/or “illustrative” does not render the Project Description unstable or not finite. There is no provision under CEQA that requires a conceptual site plan for a specific plan project to identify the precise location and use of each building as requested by the commenters, and the detailed construction plans for future development under the Specific Plan will not be created until after the adoption of the Specific Plan during the building permit process.

Any plans included in an EIR or other CEQA document are inherently conceptual, and approved plans would be further finalized during the building permit process, which would occur after a project's EIR is certified. A general description of project elements in the EIR, followed by detailed design plans once a project is approved, is consistent with CEQA. The Draft and Final EIR for the Project provides the detail required by CEQA, and the Project is subject to mandated review processes by the City for future implementation. Further, the label given to a plan set has no bearing on how much detail is provided.

Contrary to commenters' assertions, under CEQA, flexibility with respect to the size of the proposed uses does not render a project description unstable where the basic characteristics of the Project remain the same. This is true even for individual building project EIRs. For example, an individual building project EIR that includes various alternative compositions for a proposed residential and commercial mixed-use project all within a defined project footprint, where the only changes involve the building composition and ratio of the residential to commercial footprint, but the overall size of the project and the project site remain the same, is accurate, stable, and finite. Further, even if the project that was ultimately approved had a different mix of residential and commercial uses than the project and project alternatives studied in the EIR, the project description would still be stable if the final project was not so significantly different from the project and project alternatives analyzed in the EIR, and CEQA would not require recirculation or an opportunity for the public to comment on the actual specific project that was approved but not included in the EIR circulated for comment. Thus, even if an approved project contains a different mix of uses than the permutations studied in the EIR, under the example above, the project definition is sufficiently accurate and stable because the approved project retained the same basic components within the same maximum analyzed parameters.

Commenters incorrectly claim that the proposed Land Use Exchange Program renders the Project Description inaccurate and unstable. The Land Use Exchange Program described in the Draft EIR and detailed in the Preliminary Draft Specific Plan demonstrates that if sound stage and/or production support floor area is added, then an equivalent amount of floor area from another permitted land use(s) is subtracted. Further, sound stage and production support uses are symbiotic; that is, sound stages require production support, so increases in sound stages means increases in production support area. Accordingly, like the example discussed above, even though the mix of the proposed uses may vary, the Project includes the same basic components within the maximum parameters analyzed in the EIR.

The Draft EIR analyzed the proposed development project, as well as the maximum impact scenarios to account for the full range of impacts under the Project. This range of impact analyses for a mix of project scenarios will account for the impacts of any final project that was not specifically analyzed in the Draft EIR because such a project would be sufficiently similar to the programs analyzed in the Draft EIR, will conform with the Land

Use Exchange Program evaluated in the EIR, and would not exceed the impacts identified in the EIR.

The Draft EIR disclosed and analyzed all physical elements of the Project that would be implemented by the proposed Specific Plan. The proposed Specific Plan would allow for limited flexibility in the placement and massing of future buildings consistent with the Conceptual Site Plan and the EIR, while providing clearly defined development parameters that would limit permitted land uses, floor area, building heights and setbacks, among many other things. The Draft EIR detailed the basic characteristics of the Project and analyzed the maximum scope of potential impacts of the Project. As discussed above, the proposed Specific Plan requires that future discretionary City review and approval and subsequent CEQA compliance review be conducted for any substantial changes to the proposed Project.

G. Environmental Review Is Not Premature

Comments state that environmental review is premature because there is no draft Specific Plan or Sign District. These comments, however, misrepresent CEQA's purpose. A fundamental principle of CEQA is that EIRs should be prepared as early as feasible in the planning process.¹⁸ CEQA requires a "general description" of the project, which fosters the principle that EIRs should be prepared early enough in the planning stages of a project to enable environmental concerns to influence the project's design. As such, not all project details can be determined at this time, particularly with a long-range development plan which is to be carried out under a specific plan. A general description of a project element can be provided earlier in the process than a detailed engineering plan and is more amenable to modification to reflect environmental concerns raised during the public comment process.

Per the OPR Guide, a specific plan is typically drafted concurrently with the environmental review process and is not required to be included in the Draft EIR. This allows for comments on the Draft EIR and any potential revisions, corrections, and clarifications in the Final EIR to be reflected in the specific plan. "To the extent feasible, the process of preparing the specific plan and the environmental analysis should proceed concurrently because both documents require many of the same studies and resulting information. The information in the EIR provides decision makers with the insight

¹⁸ CEQA Guidelines § 15004(b).

necessary to guide policy development, thereby ensuring the plan's policies will address and provide the means by which to avoid potential impacts to the environment.”¹⁹

The assertion that a specific plan needs to be fully drafted prior to environmental review undermines CEQA's informational purpose coupled with the importance of public participation and feedback. The reasons not to require early circulation of the specific plan are in fact exemplified by the concerns expressed by the commenters. In accordance with CEQA, a specific plan must incorporate the environmental analysis in the EIR, rather than be developed in advance and set in stone before the EIR analysis is complete and the public has an opportunity to comment. This is consistent with CEQA and the OPR Guide. The concerns of the community as expressed in comments on the Draft EIR have been addressed through Project modifications outlined in the Final EIR.

For example, pages II-15 to II-16 of the Draft EIR list the uses that would be permitted under the proposed Specific Plan, which included “all other uses permitted in the C2 zone unless expressly prohibited in the Specific Plan.” Based on input received on the Draft EIR, the Preliminary Draft Specific Plan substantially narrows the permitted uses consistent with the studio-related objective of the proposed Project, including, among other things, removal of the C2 zone text referenced above. Refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR. The Preliminary Draft Specific Plan only permits five land uses: sound stage, production support, production office, general office, and retail, as well as related ancillary and supportive uses, all of which were fully disclosed and analyzed in the Draft EIR. Refer to Topical Response No. 4, Permitted On-Site Uses, for details about the permitted uses.

¹⁹ OPR Guide, p. 23.

Topical Response No. 2. Definition of Floor Area is Appropriate

Commenters discussed concerns about the definition of floor area under the proposed Specific Plan (the definition is first stated on page II-1 in Section II, Project Description, of the Draft EIR). Specifically, commenters state that the proposed floor area definition excludes more areas than the LAMC definition and underestimates the size of the Project, and, therefore, environmental impacts have been understated and were not adequately analyzed in the Draft EIR. Commenters also state that the definition is artificially narrow and inaccurate, and therefore the Draft EIR failed to account for impacts associated with certain areas below Project Grade, such as basecamp areas. Inasmuch as the commenters are concerned with potential environmental impacts resulting from elements of the Project that will be regulated by the definition of floor area, this topical response addresses those environmental issues. Contrary to the incorrect assertions made in the comments, the EIR has analyzed the full scope of the physical impacts on the environment from the Project in accordance with CEQA regardless of how floor area is defined.

As identified on page II-36 of Section II, Project Description, of the Draft EIR, the Applicant is requesting, among other Project approvals, “adoption of the TVC 2050 Specific Plan to provide regulatory controls and the systematic execution of the General Plan within the TVC 2050 Specific Plan geographic area.” Consistent with the approach taken by other specific plans in the City, the proposed Specific Plan would supersede, where applicable, the LAMC. The proposed Specific Plan’s floor area definition is based on the LAMC definition, with a few additional clarifications to account for the unique nature of studio uses and functions, as has been done in other approved specific plans for studios in Los Angeles.

The EIR’s analysis accounted for the potential physical environmental impacts of all proposed uses, areas, and activities, regardless of whether they are considered to be within the definition of floor area. CEQA requires an analysis of all physical environmental impacts, regardless of how something is defined or classified in a land use regulation (e.g., noise impacts from an above-ground parking structure must be analyzed under CEQA even though a parking structure is not considered floor area under the LAMC). Accordingly, even though basecamp areas and the Mobility Hub are not counted as floor area pursuant to the proposed Specific Plan, these areas and activities were accounted for in the EIR’s environmental analysis. For example, refer to Tables IV.M.1-5 and IV.M.1-6 of Section IV.M.1, Utilities and Service Systems—Water Supply and Infrastructure, and Tables IV.M.2-2 and IV.M.2-3 of Section IV.M.2, Utilities and Service Systems—Wastewater, of the Draft EIR regarding the impacts of basecamp and the Mobility Hub on water supply and wastewater. Further, this Final EIR updates the air quality, GHG, and energy impacts to specifically account for basecamp areas and the Mobility Hub. The

updated analysis confirmed that impacts associated with basecamp and the Mobility Hub were accounted for and, therefore, no change to the Draft EIR's conclusion is warranted as there are no new significant impacts to those impact areas.

In response to comments regarding the specific exclusions under the proposed Specific Plan definition and how it compares to the LAMC definition, a discussion of the definition of floor area under the LAMC as compared to the Preliminary Draft Specific Plan, is included below for informational purposes.

LAMC Section 12.03 defines floor area as:

The area in square feet confined within the exterior walls of a Building, but not including the area of the following: exterior walls, stairways, shafts, rooms housing Building-operating equipment or machinery, parking areas with associated driveways and ramps, space dedicated to bicycle parking, space for the landing and storage of helicopters, and basement storage areas.

The Preliminary Draft Specific Plan, which, as discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, has been made publicly available for informational purposes in response to comments on the Draft EIR, defines floor area as:

Floor area shall be as defined in accordance with LAMC Section 12.03, with the following exceptions: areas related to the Mobility Hub; basecamp, outdoor eating areas (covered or uncovered); trellis and shade structures; covered walkways and circulation areas (including the existing marquee structure); and all temporary uses (e.g., Sets/Facades).²⁰

The proposed floor area definition is generally consistent with the LAMC definition as well as the studio definition precedent set by other approved studio specific plans.

The following clarifications to the definition of floor area in the Preliminary Draft Specific Plan are discussed below for informational purposes in response to comments:

- LAMC Section 12.03 specifically excludes “parking areas with associated driveways and ramps” from the definition of floor area. The Mobility Hub components are equivalent to “parking areas” where people can access various

²⁰ Refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR for refinements made to match this definition and to remove elements of the definition of floor area expressly listed/identified within LAMC Section 12.03.

modes of transportation. Accordingly, the exclusion of the specific term Mobility Hub from the definition of floor area in the proposed Specific Plan provides definitional clarity and ensures standardized and clear regulatory compliance.

- Section II, Project Description, of the Draft EIR describes basecamps as areas at, near, or within a filming location where critical production activities can be coordinated. These areas provide for a variety of uses that are non-permanent, ancillary to and necessary for production activities in a studio and include primarily circulation, loading, craft service, parking, storage of mobile facilities and support vehicles and wardrobe, hair, and make-up equipment/services. The exclusion of these basecamp areas from the proposed floor area definition is consistent with approved studio specific plans and the LAMC Section 12.03 definition. The LAMC definition of floor area expressly excludes areas used for parking, circulation and storage. Similarly, the basecamp areas at Project Grade would not qualify as floor area under the LAMC definition because these areas are not confined within the exterior walls of a building. Further, no active production activities would occur in the basecamp areas below Project Grade. The proposed exclusion is intended to provide clarity and is consistent with the LAMC definition. The proposed basecamp areas would be located at two levels (one at Project Grade and one below Project Grade), as shown in Figures II-4(d) and II-4(e) in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, to provide access, circulation, parking, staging, loading, and connectivity between active production and supporting uses throughout the Project Site. Further, the Paramount Pictures Specific Plan (City of Los Angeles Ordinance No. 184,539) similarly clarified elements related to studio supportive space, such as outdoor production areas, production trailers, and sets/facades to be excluded from the definition of floor area. Similarly, the Preliminary Draft Specific Plan includes studio-specific clarifications to the LAMC definition of floor area based on the unique nature of a studio use. Thus, basecamp areas are consistent with the elements excluded from the definition of floor area in LAMC Section 12.03 and other approved studio specific plans, and are explicitly excluded from the proposed Specific Plan definition to provide definitional clarity and ensure standardized and clear regulatory compliance.
- The Project includes pedestrian bridges, covered canopies, trellises, and shade structures, which are external to the Project's buildings (i.e., "not confined within the exterior walls of a Building" per LAMC Section 12.03) and as such should not be counted as floor area. Further, excluding these areas from the definition of floor area is similar to recent City ordinances which encourage the provision of these types of elements as a way of encouraging pedestrian movement and connectivity. As such, excluding the area required for these trellis and shade structures and covered walkways is consistent with the LAMC and provides definitional clarity to ensure standardized and clear regulatory compliance.

Based on the above, the definition of floor area set forth in the Preliminary Draft Specific Plan is consistent with the EIR analyses, the LAMC definition and the precedent

established by the City for a studio specific plan. Furthermore, the EIR adequately analyzed the impacts of all elements of the Project, inclusive of all proposed uses, areas, and activities regardless of whether they are considered floor area or not.

Topical Response No. 3. Permitted On-Site Uses

Comments on the Draft EIR expressed concern about the range of uses that would be permitted by the proposed Specific Plan. In particular, commenters stated that permitting “C2” (Commercial) uses set forth by the LAMC would allow “more than 100” uses within the Project Site that are not evaluated in the Draft EIR. Commenters expressed concern that these C2 uses would also include non-studio uses, such as a sports arena, hospital, etc. Commenters also stated that the list of permitted uses within Section II, Project Description, of the Draft EIR would not promote the stated goals of the proposed Specific Plan, which focus on the need for Television City’s expansion and modernization. In addition, commenters raised questions regarding special events as a permitted use within the Project Site.

As discussed in Section II, Project Description, of the Draft EIR, the majority of the Project Site and surrounding properties, including The Grove and The Original Farmers Market to the immediate south, the Broadcast Center Apartments to the immediate west, as well as other neighborhood-serving commercial uses along Beverly Boulevard, Fairfax Avenue, and 3rd Street, are currently zoned C2. Recognizing the existing C2 zoning of most of the Project Site and immediate Project vicinity, pages II-15 and II-16 of Section II, Project Description, of the Draft EIR state that “[w]ith respect to permitted land uses, a number of production-related uses and associated accessory or ancillary uses would be allowed, as defined in the Specific Plan” and that the proposed Specific Plan would also allow “all uses set forth in the C2 Zone unless expressly prohibited in the Specific Plan.” The inclusion of C2 uses was intended to provide the opportunity to develop a small portion of publicly facing retail uses that would be complementary to existing retail/commercial uses along the shared commercial frontages and further enhance and encourage pedestrian activity along Fairfax Avenue or a portion of Beverly Boulevard.

To address the commenters’ concerns, clarifications to Section II, Project Description, of the Draft EIR have been made that include a refined list of permitted uses within the Project Site that corresponds with the proposed set of uses outlined in the Preliminary Draft Specific Plan. In particular, as set forth in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, the text in Section II, Project Description, of the Draft EIR that refers to the proposed Specific Plan allowing all uses within the C2 Zone has been deleted. As such, no uses such as sports arenas or hospitals would be permitted. In addition, permitted retail uses have been clarified to include a limited list of Neighborhood Retail uses consistent with LAMC Section 13.07 C. Other uses such as fueling stations, vehicle repair and warehouses have also been removed.

As set forth in the clarifications to the Project Description included in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, all uses allowed within the Project Site would be consistent with five studio land uses: sound stage, production

support, production office, general office, and retail. The Project would continue to allow for ancillary sitewide uses such as parking, communication facilities, childcare, and facilities equipment and infrastructure supporting the studio and the five permitted land uses. Refer to the list of permitted uses in the proposed Specific Plan, which, as discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, has been made publicly available for informational purposes in response to comments on the Draft EIR. Collectively, the permitted uses help facilitate and support the studio and the primary studio land uses that already occur on-site (refer to pages II-5 and II-7 of the Draft EIR) with the exception of childcare facilities and retail uses, which are new uses proposed under the Specific Plan. The permitted uses would also promote the Project's studio-related objectives included on pages II-10 through II-13 of Section II, Project Description, of the Draft EIR and the stated goals of the Preliminary Draft Specific Plan. All of the permitted uses have been fully accounted for in the impact analyses within the EIR.

With regard to special events, as described in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, temporary, non-regular events that have occurred on the Project Site prior to the adoption of the proposed Specific Plan, including production-related and non-production related events, such as premieres, charitable events, community events, commercial events, and non-commercial events, and other special events defined in LAMC Section 41.20.1(a), would continue to be governed by the LAMC consistent with existing conditions. No deviation or modification to the existing Temporary Special Event permit process through the Department of Building and Safety, the Division 5 review process overseen by the City of Los Angeles Fire Department, or any other potential review by the Department of City Planning, Bureau of Street Services, or the Los Angeles Police Department is allowed under the proposed Specific Plan.

In conclusion, the list of permitted uses within the Project Site has been clarified to limit the uses to those consistent with the studio-related objectives of the Project. These uses are fully accounted for in the impact analyses in the EIR.

Topical Response No. 4. Appropriateness of Economic Objective

Commenters expressed concerns that one of the Project objectives related to the Project's projected financial return is inappropriate. These comments are referring to the following Project objective, which is included on pages II-11 to II-12 of Section II, Project Description, of the Draft EIR: "Permit a reasonable, risk-adjusted return on investment commensurate with the Applicant's fiduciary responsibilities and allow for sustained economic viability and growth in an evolving entertainment market, while generating tax and property revenues to the City." Comments state that the Draft EIR includes no evidence that the Project meets this objective, and that additional information, such as the Applicant's proforma, is required to adequately assess whether the Project meets this objective.

CEQA does not prohibit a public agency from adopting an economic project objective. The requirement to identify project objectives is set forth in CEQA Guidelines Section 15124(b), which provides that an EIR shall contain "[a] statement of the objectives sought by the proposed project," including "the underlying purpose of the project," but does not impose any substantive limitations on those objectives.²¹ CEQA Guidelines Section 15124(b) states that "[a] clearly written statement of objectives will help the lead agency develop a reasonable range of alternatives to evaluate in the EIR and will aid the decision makers in preparing findings or a statement of overriding considerations, if necessary." As such, including an economic objective is appropriate under CEQA, and it accurately discloses the reality of any private development project, namely that the project must be economically viable so that its development is feasible. CEQA (Public Resources Code Section 21061.1) generally defines "feasible" as being "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors." Furthermore, including an economic objective, thereby demonstrating that economic viability is an underlying purpose of the Project, assists the decision-maker and the public in evaluating the relative capability of the Project, and its alternatives, to "feasibly" meet the rest of the Project objectives. Specific to the Project's alternatives, CEQA Guidelines Section 15126.6(f) provides that an "EIR need examine in detail only the [alternatives] that the Lead Agency determines could feasibly attain most of the basic objectives of the project" and lists the factors that the lead agency should consider in determining the "feasibility" of an alternative, which include but are not limited to "economic viability."

²¹ Further, CEQA explicitly states that courts "shall not interpret [CEQA] in a manner which imposes procedural or substantive requirements beyond those explicitly stated in this division or in the state guidelines" (Public Resources Code § 21083.1).

Under CEQA, project objectives play an important role in creating an EIR that gives the public and government agencies the information needed to make informed decisions, thus protecting not only the environment but also informed self-government. Twelve Project objectives are included in Section 4 (commencing on page II-10) of Section II, Project Description, of the Draft EIR. In addition to those Project objectives, Section 4 states that the underlying purpose of the Project “is to maintain Television City as a studio use and to modernize and enhance production facilities within the Project Site to meet both the existing unmet and anticipated future demands of the entertainment industry, keep production activities and jobs in Los Angeles, upgrade utility and technology infrastructure, and create a cohesive studio lot.” In accordance with CEQA Guidelines Section 15126.6, all Project objectives are broad enough to allow for a reasonable consideration of alternatives that reduce environmental impacts. The City, as the lead agency in this case, satisfied that obligation by preparing a Draft EIR that analyzed a feasible range of alternatives as required by CEQA and, based on that analysis, properly determined if the alternatives would meet the Project objectives to the same extent as the Project. See Topical Response No. 16, Project Alternatives Analysis, for a detailed discussion of the alternatives analyzed in the Draft EIR.

Further, the Project objective concerning a reasonable rate of return that will allow for the Project’s “economic viability” so that development of the Project is feasible.

As detailed by the Applicant in the Economic Considerations Memorandum included as Appendix FEIR-4, the Project has been designed to feasibly achieve all of the Project objectives, including but not limited to the objective to develop and economically viable project.

Finally, commenters requested financial information from the Applicant in light of the Project objective. However, CEQA does not require the EIR itself to provide any evidence of the feasibility of those alternatives, nor an economic or cost analysis of the various project alternatives and mitigating measures identified by the EIR. Instead, it requires the lead agency to make findings and determinations as to the feasibility of such alternatives or mitigation measures with respect to each significant environmental impact which the EIR identifies, based on substantial evidence set forth anywhere in the record. Further, the Project’s decision-makers would review the feasibility of each Project alternative studied in the EIR to meet all or a portion of the Project objectives, based on the evidence in the whole of the record. As such, the Project objectives and alternatives analysis in the Draft EIR comply with CEQA and the CEQA Guidelines.

Topical Response No. 5. Historical Resources

A. Existing Evaluation and Designation of the Primary Studio Complex

Several comments question the existing historic evaluation of CBS Television City (Television City) and assert that the Project Site must be completely re-evaluated for compliance with CEQA. These comments suggest that the period of significance that was determined for Television City (1952–1963) was “artificially limited,” and the identified physical features that contribute to the property’s historic significance were therefore undercounted. Specifically, comments suggest that the existing historic evaluation of the Project Site failed to identify the 1969 Mill Addition and the 1976 Support Building as worthy of historic designation.

The assertion that the Project Site must be re-evaluated is not supported by substantial evidence and is contrary to CEQA guidance and practice. Under CEQA, a property designated under a local preservation ordinance is presumed to be a historical resource.²² In addition, requirements for CEQA historical resource assessment reports established by the Los Angeles Office of Historic Resources (OHR) clearly state that if a property is already designated, an assessment of eligibility is not required. Instead, the report should summarize the property’s significance pursuant to the designation documentation.²³ As such, the Draft EIR and supporting Historical Resources Technical Report (Historic Report) prepared by Historic Resources Group (HRG), which is included in Appendix C of the Draft EIR, were prepared in accordance with these requirements. As discussed below, the Historic-Cultural Monument (HCM) designation for Television City is limited to the original 1952 Primary Studio Complex. Furthermore, the designation documentation for Television City was reviewed by HRG for the accuracy of the information, consistency with National Park Service (NPS) guidance, and for physical changes that may have occurred to the property since the designation. HRG determined that the designation documentation was in conformance with best practices in historic preservation and that the property had not been altered since the designation. Thus, HRG concurred that the designation made the appropriate findings.

As discussed in the Draft EIR and Historic Report, the Primary Studio Complex, consisting of the 1952 Service Building and Studio Building, is a historical resource because it was formally designated as HCM No. 1167 by the City Council on June 26, 2018

²² Public Resources Code § 5024.1 and Title 14 California Code of Regulations § 4850 & § 15064.5(a)(2).

²³ Department of City Planning, Office of Historic Resources, Requirements for Historical Resource Assessment Reports, updated July 2017.

(CHC-2018-476-HCM). That designation was supported by a comprehensive historic resources assessment dated April 11, 2018 and prepared by Architectural Resources Group (ARG) (2018 Historic Resource Assessment).²⁴ Notably, the 2018 Historic Resource Assessment concluded that the period of significance was 1952 to 1963 and that “extensive research did not indicate that any of Television City’s post-1963 additions contribute to its historic significance. These include the 1969 eastern expansion of the Service Building, the 1976 addition of the Support Building west of the Studio Building; the 1992 East Studio Building which stands wholly independent of the Primary Studio Complex; the addition of all of the site’s ancillary buildings and structures; and the site’s overall hardscape/landscape as it exists today.”²⁵

The 2018 Historic Resource Assessment provided the baseline analysis for the HCM nomination and was part of the administrative record that was before the Cultural Heritage Commission and the City Council when they considered the nomination.²⁶ The proposed nomination and supporting documents in the record was subject to several public hearings. These included regular meetings of the Cultural Heritage Commission on March 1 and May 3 of 2018, the Planning and Land Use Management Committee on June 19, 2018, and the City Council on June 26, 2018. Thus, these findings were reviewed and discussed in public hearings of the Cultural Heritage Commission, the Planning and Land Use Management Committee, and the City Council where no objections were raised by historic preservation professionals, advocates, interested parties, or the public.²⁷ Consistent with the 2018 Historic Resource Assessment, the Cultural Heritage Commission did not recommend the designation of the 1969 Mill Addition or the 1976 Support Building. Instead, the Commission recommended the adoption of a resolution that limited the HCM to: (1) the original 1952 Service Building; (2) the original 1952 Studio Building; (3) the enclosure of the Service Building’s north façade in 1959; and (4) the addition of a small compressor room to that building’s east façade, which are collectively referred to as the Primary Studio Complex. The City Council adopted the HCM findings (HCM Findings) based upon the recommendation of the Cultural Heritage Commission.²⁸

²⁴ A copy of the 2018 Historic Resource Assessment is attached to the Historic Report, which is provided at Appendix C.1 of the Draft EIR.

²⁵ 2018 Historic Resource Assessment, p. 60.

²⁶ The findings of the 2018 Historic Resource Assessment, including the conclusion as to the period of significance, were specifically brought to the attention of the Cultural Heritage Commission in a letter dated April 17, 2018, by Gibson, Dunn & Crutcher. The letter is included in the agenda packet for the HCM designation, which is included in Appendix C of the Historic Report.

²⁷ See Council File No. 18-0491.

²⁸ The adopted HCM designation, including the HCM Findings, is included in Appendix C of the Historic Report.

Accordingly, the historic significance of the property, its period of significance, and the physical elements that convey its historic significance were determined, reviewed, approved, and formally adopted by the Los Angeles City Council. Further, in preparing the Historic Report, HRG thoroughly reviewed the 2018 Historic Resource Assessment for consistency with industry standards. Additionally, HRG conducted Project Site visits in April and May of 2021 and research to account for physical changes that may have occurred and new information that may have come to light since 2018. As stated on page 12 of the Historic Report, based on a comprehensive review of all relevant materials, HRG concurred with the 2018 Historic Resource Assessment evaluation. The evaluation of significance and integrity from the 2018 Historic Resource Assessment, which is included in Appendix D of the Historic Report, is summarized on pages IV.B-24 to IV.B-27 of the Draft EIR. The adopted HCM Findings are included in Appendix C of the Historic Report. By reviewing, confirming, and incorporating the existing evaluation and approved findings of historic significance for the Project Site, the Draft EIR is in conformance with standard CEQA practice and City of Los Angeles requirements for the analysis of impacts to historical resources under CEQA.

Public comments assert that the existing evaluation did not properly assess the Project Site for historic significance, but this is not substantiated by the facts and no substantial evidence is provided to support this assertion. The 2018 Historic Resource Assessment identified Television City's original Primary Studio Complex, consisting of the 1952 Service Building and Studio Building, to be individually eligible for listing in the National Register, California Register, and as an HCM. The period of significance for Television City was defined as 1952–1963, beginning with the year the original Primary Studio Complex was constructed and ending with the year that CBS ended its vision of a single unified production facility and moved its filmed programming operations to the CBS Studio Center lot in Studio City. As stated above, the 2018 Historic Resource Assessment provided the baseline information for the HCM nomination and was appended to the nomination packet for consideration by the Cultural Heritage Commission and City Council. Concurring with the 2018 Historic Resource Assessment, the resulting nomination identified the 1952 Primary Studio Complex (including alterations through 1963) as eligible for designation. The 1969 Mill Addition, the 1976 Support Building and any other buildings and structures constructed after 1963 were not included in the nomination. Furthermore, HRG concurred the designation made the appropriate findings based on a comprehensive review of all relevant materials as well as additional field surveys and archival research.

Commenters contend that the 1952–1963 period of significance for the Television City property is too narrow and that the appropriate period is the “span of time when the property actively contributed to the growth and popularity of commercial television, which ended no earlier than 1979.” Justification for extending the period of significance through “at least” 1979 appears to rest on the recognition that CBS continued to produce television programs on the Project Site after 1963. The assertion that the period of significance

needs to be expanded to accommodate years of additional television production incorrectly conflates continued use with historic significance. Likewise, the assertion inaccurately presumes, without evidence, that the property has ceased to actively contribute “to the growth and popularity of commercial television.”

NPS guidance for determining a period of significance states that “[c]ontinued use or activity does not necessarily justify continuing the period of significance. The period of significance is based upon the time when the property *made the contributions or achieved the character on which significance is based*” (emphasis added).²⁹ As identified in the 2018 Historic Resource Assessment, the Primary Studio Complex is not historically significant simply for its “contribution to the growth and popularity of commercial television” as some commenters have suggested. That description could be applied to any number of studio properties throughout Los Angeles where television programming was and continues to be produced. The historic significance of Television City rests in its specific associations with the maturation of commercial television in the post-World War II period during which television use expanded exponentially, and the concurrent evolution of CBS into one of the nation’s three largest and most powerful television networks. CBS’ construction of Television City—“the first large-scale, all new facility in the nation designed to meet the mass production of television programming”³⁰—marked CBS’ ascendance. The program and function of Television City—a seminal design by the lauded architectural firm of William Pereira and Charles Luckman—represented state-of-the-art thinking regarding television production as it was understood in the early 1950s. Significant to its design was the “intentional divergence from the familiar film studio property type” traditionally conceived as a disparate collection of individual building types and sets arranged on a large walled lot. Instead, Television City was conceived as a single, integrated, and self-contained building complex.³¹

As explained in the 2018 Historic Resource Assessment, the utility of specialized, purpose-built television production facilities had come into question by the late 1950s, as pre-filmed television production overcame the live and taped methods that purpose-built facilities like Television City were optimized for. By 1963, CBS had ended its original concept for Television City and became the primary tenant of the former Republic Pictures

³⁰ Historic-Cultural Monument Nomination Form for CBS Television City, Section 7B Statement of Significance, December 11, 2017. The nomination form is included in the agenda packet for the HCM designation, which is included in Appendix C of the Historic Report.

³¹ Architectural Resources Group, CBS Television City, Los Angeles, Historic Resource Assessment, April 11, 2018, p. 31.

film studio lot in Studio City, changing its name to CBS Studio Center and moving its filmed production there. Thus, the 1963 end date for the period of significance was not arbitrary. Rather, it was based upon the history of Television City, the historic context in which it was evaluated, and the appropriate application of NPS guidance.

Comments also assert that the 2018 Historic Resource Assessment and HCM Findings did not acknowledge the contributions of master architect Gin Wong, who joined the firm in 1950 and served as project coordinator, in the early stages of his career, for the initial design of the Primary Studio Complex by Pereira & Luckman. Under the auspices of his own firm, Gin Wong Associates, founded in 1973, he would subsequently be responsible for the 1976 Support Building addition and 1993 East Studio Building at Television City. Refer to pages IV.B-22 to IV.B-23 of the Draft EIR and pages 30 to 31 of the Historic Report for a discussion of the Support Building and East Studio Building. Wong's contributions to the design and construction of Television City are appropriately acknowledged in the 2018 Historic Assessment and recognized in the HCM nomination. NPS guidance, however, states that not every property designed by a master architect is necessarily significant. To be eligible, the property "must express a particular phase in the development of the master's career, an aspect of his or her work, or a particular idea or theme in his or her work."³² The improvements at Television City directly credited to Wong are simple additions constructed after 1963, outside the period of significance. They do not represent an architectural achievement and did not play an important role in Wong's career. Therefore, the 1976 Support Building addition and 1993 East Studio Building are not eligible as historical resources in and of themselves or character-defining features of Television City because they were designed by Wong.

For the reasons discussed above, the period of significance was correctly defined as 1952–1963, beginning with the year the original Primary Studio Complex was constructed and ending with the year CBS ended its vision of a single unified production facility and moved its filmed programming operations to Studio City. This span of time includes the maturation of commercial television as the primary media form for entertainment and information in the United States, the ascendance of CBS as a leading television network, and the "Golden Age" of live and taped television programming for which Television City was specifically designed. By 1963, television was well-established as the preeminent American entertainment and information medium. And because so much of television programming had switched to a pre-filmed format by 1963, the original master plan and design for Television City no longer guided its development. Television production, including filmed production, continued at Television City in the decades after 1963, but Television City itself became just one of many locations that hosted television production

³² Patrick Andrus and Rebecca Shrimpton, National Register Bulletin #15: How to Apply the National Register Criteria for Evaluation (Washington D.C.: U.S. Department of the Interior, 1997), p. 20.

throughout the Los Angeles area. Based upon NPS guidance for selecting the period of significance, the period of significance of 1952 to 1963 is justified because that is the period the resource achieved the character on which significance is based, which is reflected in the HCM Findings.³³

B. Historic Structure Report and the Future Preservation of the Primary Studio Complex

Public comments assert that the completion of a Historic Structure Report (HSR), included as Project Design Feature CUL-PDF-2, is required to support the impact analysis regarding the Primary Studio Complex. These assertions are incorrect and are not consistent with City of Los Angeles regulations for the treatment of designated HCMs as well as the standard purpose and use of an HSR.

Before reviewing those regulations, it is important to note that the Draft EIR contained an in-depth evaluation of whether the proposed physical changes to the Primary Studio Complex would constitute a significant impact to the Primary Studio Complex, a designated HCM and a historical resource under CEQA. Accordingly, the preparation of an HSR in the future does not defer the analysis of potential impacts to the historical resource. Instead, the HSR provides an additional process that will complement the City's regulations aimed at protecting and managing the historical resource.

As discussed in Section IV.B, Cultural Resources, of the Draft EIR, the City has adopted several ordinances, codified in the LAMC and Los Angeles Administrative Code (LAAC), to preserve and protect designated historical resources like the Primary Studio Complex. The Cultural Heritage Ordinance (Ordinance No. 185,472; LAAC Section 22.171) pertains to historical resources designated as HCMs. As stated on page IV.B-53 of the Draft EIR, the Project would comply with Section 22.171.14 of the Cultural Heritage Ordinance. The determination for the approval of a permit for substantial alteration to a designated HCM is based upon compliance with the Secretary of the Interior's Standards for Rehabilitation (Rehabilitation Standards). Thus, mitigation is not required because compliance with the Rehabilitation Standards would be ensured by OHR, which would review permit applications and construction documents prior to the issuance of building

³³ The claim that the period of significance should extend to "at least" 1979 is also contrary to NPS guidance for another reason. That guidance states that "[f]ifty years ago is used as the closing date for periods of significance where activities begun historically continued to have importance and no more specific date can be defined to end the historic period." Notably, if in 2018 the Cultural Heritage Commission (or the review of the 2018 Historic Resource Assessment conducted for the Draft EIR Historic Report) had determined that the period of significance concluded at 50 years before Television City's HCM designation, the end date for the period of significance would have been 1968, meaning the 1969 Mill Addition and the 1976 Support Building would still have been excluded.

permits, pursuant to the Cultural Heritage Ordinance. As stated on page IV.B-53 of the Draft EIR, although not required by the Cultural Heritage Ordinance, the Applicant would retain a historic preservation professional meeting the Secretary of the Interior's Professional Qualifications Standards for historic architecture or architectural history with at least five years of demonstrated experience in applying the Rehabilitation Standards to such projects. The professional would create a technical memorandum at each phase of the architectural design process (including schematic design, design and development, and construction documents). In the event the plans do not comply with the Rehabilitation Standards, the memorandum would make recommendations for changes to bring the plans into compliance. The professional would then submit the memorandum to OHR for review and concurrence. Pursuant to the Cultural Heritage Ordinance, building permits may only be issued after OHR has confirmed that the plans comply with the Rehabilitation Standards. Therefore, the Draft EIR correctly concluded that impacts to the Primary Studio Complex would be less than significant as a result of regulatory compliance.³⁴

In addition, per Project Design Feature CUL-PDF-2, an HSR would be prepared to further document the Primary Studio Complex and guide its rehabilitation in compliance with the Rehabilitation Standards. An HSR provides documentary, graphic, and physical information about a historical resource and existing conditions. Broadly recognized as an effective part of preservation planning, an HSR may also address the management and maintenance of the historical resource. The purpose of an HSR is not the analysis of project impacts. Instead, an HSR is prepared to inform and guide development of the specific architectural and engineering plans necessary for permitting. An HSR is not required by the Cultural Heritage Ordinance but is included as Project Design Feature CUL-PDF-2 to facilitate OHR's review of construction documents. As stated on page IV.B-40 of the Draft EIR, the HSR would be completed prior to the development of the architectural and engineering plans for Project work that has any relation to the Primary Studio Complex. The HSR would set forth the most appropriate approach to treatment and outline a scope of recommended work before the commencement of any such construction. As such, the HSR would serve as an important guide for the rehabilitation of the Primary Studio Complex and would provide detailed information and instruction above and beyond what is typically available prior to the rehabilitation of a historical resource.

The claim that an HSR is required to properly analyze potential impacts to the Primary Studio Complex is incorrect as neither the State of California nor the City of Los Angeles requires an HSR as baseline information for the CEQA review of historical resources. Moreover, the Applicant has voluntarily incorporated an HSR as a Project Design Feature (PDF), which would be prepared to inform the rehabilitation of the Primary Studio Complex. In addition, pursuant to Section 22.171.14 of the Cultural Heritage

³⁴ See CEQA Guidelines Section 15064.5(b)(3).

Ordinance, the Project plans would be thoroughly reviewed by OHR for compliance with the Rehabilitation Standards prior to the issuance of any building permits. Further, although not mitigation measures, all PDFs, including the HSR, would be included in the Mitigation Monitoring Program for the Project to ensure their implementation.

C. Potential New Construction North of the Primary Studio Complex

Public comments question potential new construction in the Viewshed Restoration Area located north of the Primary Studio Complex that was established by the HCM Findings. The Viewshed Restoration Area is defined in the HCM Findings as extending approximately 430 linear feet along Beverly Boulevard from 7811 Beverly Boulevard on the west to Genesee Avenue on the east and extending southward toward the Primary Studio Complex. Commenters raise objections to Height Zone A (see Figure II-5 in Section II, Project Description, of the Draft EIR), which corresponds to the Viewshed Restoration Area, as defined in the HCM Findings, and would allow for buildings up to 58 feet in height, and assert that buildings at this height would block views of the Primary Studio Complex from Beverly Boulevard resulting in significant impacts to the Primary Studio Complex. The Project's restoration of the viewshed along Beverly Boulevard, described below, would be ensured by the historic regulations and procedures discussed in the Draft EIR and set forth in the Preliminary Draft Specific Plan, and the 58-foot height limit is only one of the regulations that future development in the Viewshed Restoration Area would be required to comply with. Additionally, any new construction would be limited by the HCM designation, the HCM Findings, and the Cultural Heritage Ordinance. The HCM Findings make clear that construction within the Viewshed Restoration Area is limited and subject to review by the City. Any proposal in the Viewshed Restoration Area would also be subject to review by the City for compliance with the Viewshed Restoration Area objectives outlined in the HCM Findings and would be codified in the proposed Specific Plan.

As discussed in the Draft EIR, the proposed Specific Plan would further codify the HCM designation and HCM Findings by establishing Height Zone A and the Viewshed Restoration Area objective standards. The 58-foot height limit on new construction within Height Zone A, which is approximately two-thirds of the 88-foot height of the existing Primary Studio Complex, is taken directly from the HCM Findings. The HCM Findings state that "it is assumed that [buildings within the Viewshed Restoration Area] would not exceed two-thirds the height of the existing Primary Studio Complex, and that one-story buildings would be acceptable throughout the Viewshed Restoration Area[,] but this "does not absolutely prohibit structures that are higher than the two-thirds limit, so long as such structures do not interfere with the mandated view corridors." In addition, the 58-foot height limit in Height Zone A is also subject to the HCM Findings for future development within the Viewshed Restoration Area. As discussed on pages V-4 to V-5 and V-13 in Section V, Alternatives, of the Draft EIR, any development in the Viewshed Restoration Area would be

limited by the HCM designation, and alternatives that would introduce substantial development within the Viewshed Restoration Area were eliminated from consideration since they would be inconsistent with the HCM designation.³⁵ This is consistent with the Project's objective to "[r]ehabilitate and preserve the integrity of the Primary Studio Complex consistent with the HCM designation and restore the currently obstructed public views of the HCM consistent with the HCM designation[.]" stated on page II-10 in Section II, Project Description, of the Draft EIR. As stated on page IV.H-43 in Section IV.H, Land Use and Planning, of the Draft EIR, "[u]ltimately, compliance with the Specific Plan's historic preservation regulations would allow for the rehabilitation and preservation of the integrity of the Primary Studio Complex, consistent with the HCM designation."

Commenters misconstrue the maximum height limit with permitted height. However, even if a proposed building in the Viewshed Restoration Area is less than 58 feet, it may nevertheless not be permitted if it fails to comply with the HCM Findings relating to the viewshed, as discussed below. For example, a proposal that includes a 58-foot building across the entire Height Zone A area, as shown in the massing examples included in public comments, would be inconsistent with the HCM Findings and the Viewshed Restoration Area objective standards of the proposed Specific Plan.

In addition to the 58-foot height limit, any development in the Viewshed Restoration Area would be required by the HCM Findings to restore the currently obstructed character-defining viewshed features of the Primary Studio Complex as seen from adjacent public areas along Beverly Boulevard. As discussed in Section IV.B, Cultural Resources, of the Draft EIR, the Project would open up the currently obstructed views of the Primary Studio Complex from Beverly Boulevard, thereby restoring an important character-defining viewshed feature that has been compromised. Views from the public right-of-way along Beverly Boulevard are currently obstructed by security fencing planted with dense shrubs and climbing vines, as well as existing solar canopies and miscellaneous structures. The distinctive entry bridge generally cannot be seen from Beverly Boulevard, and only the very top portion of the Primary Studio Complex is visible. The Project would include more visually transparent fencing along the northern perimeter and enforce height restrictions between Beverly Boulevard and the Primary Studio Complex so that the currently obstructed views of the Primary Studio Complex, including the main entry bridge, would be restored.

The HCM Findings set forth the character-defining viewshed features of the Primary Studio Complex as seen from adjacent public areas along Beverly Boulevard. The character-defining features from the HCM Findings are listed on pages IV.B-25 through

³⁵ See Topical Response No. 16, Project Alternatives Analysis, for a discussion of the Draft EIR's Project alternatives analysis.

IV.B-27 of the Draft EIR. The HCM Findings state that “if alterations are proposed to the Primary Studio Complex in the future, restoration of the historic viewshed from Beverly Boulevard in a manner that incorporates appropriate security measures for the property’s use is strongly encouraged.” Per Project Design Feature CUL-PDF-1, which is included on pages IV.B-39 through IV.B-40 in Section IV.B, Cultural Resources, of the Draft EIR, the Project would “[p]reserve the existing character-defining features of the Primary Studio Complex, as detailed in the designated Historic-Cultural Monument (HCM) No. 1167 (CHC-2018-476-HCM), and restore those character-defining features which, in some cases, have been compromised in the past (prior to this Project).” Accordingly, any future development in the Viewshed Restoration Area would be required to restore and maintain meaningful views of the Primary Studio Complex and the character-defining viewshed features set forth in the HCM Findings.

Further, the proposed Specific Plan would codify the viewshed restoration measures discussed in the HCM Findings and Draft EIR. Specifically, any Project within the Viewshed Restoration Area shall preserve meaningful views of the Primary Studio Complex from the adjacent public right-of-way along Beverly Boulevard.

Accordingly, in addition to complying with the 58-foot maximum height limit and restoring the character-defining viewshed features, development in the Viewshed Restoration Area greater than one story in height would require discretionary approval, as outlined in the Preliminary Draft Specific Plan, in addition to CEQA compliance review.

The Draft EIR analyzed the proposed development program (Conceptual Site Plan) described in Section II, Project Description, of the Draft EIR (refer to Table II-2, Proposed Development Program, on page II-13 and Figure II-4, Conceptual Site Plan, on page II-14 of the Draft EIR). Under the proposed Specific Plan, future proposals in and around the HCM and Viewshed Restoration Area that are substantially different than the Conceptual Site Plan or are beyond the scope of impacts evaluated in the EIR would require a discretionary approval, including review by OHR and the Department of City Planning, and CEQA compliance review. As shown in Figure II-4, Conceptual Site Plan, of the Draft EIR, new construction north of the Primary Studio Complex would be limited to single story bungalows, and largely unobstructed views of the Primary Studio Complex looking southeast from Beverly Boulevard would be maintained. The HCM Findings expressly state that “one-story buildings would be acceptable throughout the Future Viewshed Restoration Area.” As analyzed in the Draft EIR, the Conceptual Site Plan would not result in significant impacts to the Primary Studio Complex as defined by CEQA. Although Height Zone A would establish a maximum height limit of 58 feet, the Draft EIR only analyzed one-story buildings in the Viewshed Restoration Area as shown in the Conceptual Site Plan, and, therefore, any future proposal that includes a building greater than one story in height in the Viewshed Restoration Area would require a discretionary approval through the

Project Compliance process pursuant to LAMC Section 11.5.7[13B.4.2] and additional CEQA review.

Notwithstanding the 58-foot height limit in Height Zone A, any new construction would be limited by the HCM designation, the HCM Findings, and the Cultural Heritage Ordinance. Consistent with the HCM Findings, the Draft EIR states that all new construction located within the Viewshed Restoration Area would require review by the Director of City Planning. As discussed in Section B above, any substantial alteration to a designated HCM would require OHR review and compliance with the Rehabilitation Standards pursuant to Section 22.171.14 of the Cultural Heritage Ordinance. Restoration of the character-defining views to the Primary Studio Complex would be ensured by the procedures and requirements under the proposed Specific Plan and Cultural Heritage Ordinance, which are consistent with the procedures and requirements described in the Draft EIR. As such, any proposal for new construction within the Viewshed Restoration Area would be required to meet the objectives of the HCM Findings, conform with the Rehabilitation Standards, and would not result in significant impacts to the Primary Studio Complex as defined by CEQA. Thus, the Draft EIR correctly concluded that, based on the Conceptual Site Plan, the impact from potential new construction within the Viewshed Restoration Area (Height Zone A) would be less than significant.

D. Analysis of Impacts to the Primary Studio Complex

Commenters question the analysis of impacts to the Primary Studio Complex and claim, contrary to the findings in the Draft EIR, that the Project would diminish the integrity of the Primary Studio Complex such that its eligibility for listing as a historical resource would be threatened.

Commenters cite the fact that the 1969 Mill Addition and 1976 Support Building would be removed, reiterating assertions that these structures are “likely” historically significant. As discussed above and in Section IV.B, Cultural Resources, of the Draft EIR, Television City’s original Primary Studio Complex was formally designated as HCM No. 1167, and that designation did not include the 1969 Mill Addition or the 1976 Support Building. As such, the physical elements that contribute to the historic significance of the Primary Studio Complex have been determined by the City of Los Angeles. There is no requirement to re-evaluate the findings of the HCM designation under CEQA. Furthermore, as discussed on pages 12 and 13 of the Historic Report, HRG concurred the designation made the appropriate findings based on a comprehensive review of all relevant materials as well as additional field surveys and archival research. (For more information on existing evaluations and the designation of the Primary Studio Complex as an HCM, see Section A above.)

As analyzed in the Draft EIR, removal of the 1969 Mill Addition and 1976 Support Building would not diminish the integrity of the Primary Studio Complex. Because the 1969 Mill Addition and 1976 Support Building are both non-historic, post-1963 additions, their removal would restore the Primary Studio Complex closer to its original construction. Removal of the 1976 Support Building would also reveal the remaining portions of the west wall of the original Studio Building, which would improve, not diminish, the integrity of the Primary Studio Complex. Moreover, all of the character-defining features of the HCM as set forth in the 2018 Historic Resource Assessment, the HCM Findings, and the Draft EIR would be retained and restored as part of the Project.

In addition, several comments assert that potential impacts from the proposed rooftop addition to the Primary Studio Complex were not adequately analyzed and could, in fact, result in significant impacts to the Primary Studio Complex. To bolster this claim, several comment letters contain massing studies showing a hypothetical rooftop addition of multiple stories constructed on top of the Primary Studio Complex. The hypothetical massing studies ignore the Project Parameters that are established in Project Design Feature CUL-PDF-1 which limit the height and placement of any rooftop addition to ensure that the integrity of the Primary Studio Complex is retained.

Potential impacts from any rooftop addition were thoroughly analyzed in Section IV.B, Cultural Resources, of the Draft EIR (page IV.B-50) and Historic Report (pages 65–68). As stated above, any rooftop addition to the Primary Studio Complex would comply with the Project Parameters set forth in Project Design Feature CUL-PDF-1 on pages IV.B-38 to IV.B-40 of the Draft EIR. Per Project Design Feature CUL-PDF-1, any rooftop addition would consist of a single rectangular volume (a separate and distinct volume rather than an extension of the Primary Studio Complex), be limited to 36 feet in height above the top of the parapet of the Studio Building, and be set back a minimum of 55 feet from the north façade of the Studio Building. This would set back any rooftop addition approximately 167 feet from the north façade of the Service Building. Additionally, any rooftop addition would be structurally engineered such that it could be removed without impairing the essential form and integrity of the Primary Studio Complex, consistent with Rehabilitation Standard 10. As discussed on page IV.B-50 of the Draft EIR and in the Historic Report, any rooftop addition would be subordinate in size and scale to the Primary Studio Complex, consistent with NPS's Preservation Brief 14, New Exterior Additions to Historic Buildings: Preservation Concerns, with the addition approximately 25 percent of the size of the Primary Studio Complex in overall volume and less than half its height. It would also be set back from the primary (north) façade of the Primary Studio Complex to further reduce its visual presence when viewed from the north. The rectangular form of any rooftop addition would also be compatible with the International Style architecture of the Primary Studio Complex so that the overall form, massing, and configuration of the Primary Studio Complex would not be adversely affected. For these reasons, any rooftop addition would not materially impair the physical characteristics that convey the historical

significance of the Primary Studio Complex, nor its integrity. Thus, impacts from the construction of any rooftop addition would be less than significant as defined by CEQA.

More broadly, comments assert that the Draft EIR and Historic Report “downplay or ignore” the Project’s overall impacts to the integrity of the Primary Studio Complex, and that, contrary to the findings in the Draft EIR, new construction would “result in a significant loss of integrity with respect to setting, feeling, and association” resulting in significant impacts to the Primary Studio Complex.³⁶

The Draft EIR and Historic Report included a full analysis of integrity after implementation of the Project (refer to Draft EIR pages IV.B-54 to IV.B-55 and Historic Report pages 76 to 81). To be conservative, the analysis in the Draft EIR assumed full buildout (i.e., 1,874,000 square feet of floor area). This analysis concluded that integrity of association would be retained but the integrity of feeling for the Primary Studio Complex would be adversely affected. In addition, the integrity of setting has already been lost prior to this Project. As explained on page 80 of the Historic Report, NPS guidance states, “to retain historic integrity a property would always possess several, and usually most of the (seven) aspects” of integrity.³⁷ The integrity analysis included in the Draft EIR and Historic Report found that after the Project is constructed, the Primary Studio Complex would retain most of the aspects of integrity, including location, design, materials, workmanship, and association. Retaining five out of seven of the aspects of integrity—one of which was already compromised prior to the Project—would qualify as retaining “most.”

As discussed on pages IV.B-54 to IV.B-55 of the Draft EIR and pages 76 to 81 of the Historic Report, the integrity of setting for the Primary Studio Complex has already been lost over time due to later additions and related new construction as well as the replacement of the original front lawn with surface parking and miscellaneous structures. The integrity of feeling would be compromised by the Project. However, the Primary Studio Complex would still be able to convey its overall historic character, appearance, and association with its historical period when it became the first large-scale, purpose-built television facility. Moreover, to support the preservation of the Primary Studio Complex and maintain its overall integrity, the Project would include an HSR as a PDF to guide the rehabilitation of the Primary Studio Complex in compliance with the Rehabilitation

³⁶ Setting is the physical environment of an historic property, constituting topographic features, vegetation, manmade features, and relationships between buildings or open space; Feeling is a property’s expression of the aesthetic or historical sense of a particular period of time; and Association is the direct link between an important historic event or person and a historic property as defined in National Register Bulletin #15, pp. 44–45. The definitions of the seven aspects of integrity are included on pages 22–23 of the Historic Report.

³⁷ Ibid., p. 44.

Standards. Mitigation is not required because compliance with the Rehabilitation Standards would be ensured by OHR, who would review the construction documents prior to approving the building permits pursuant to the Section 22.171.14 of the Cultural Heritage Ordinance.

E. Impacts to Historical Resources in the Vicinity of the Project Site

Comments were received on the Draft EIR regarding the Project's potential impacts to historical resources located outside of the Project Site. As discussed on page IV.B-27 of the Draft EIR, in addition to analyzing the Project Site itself, the Historic Report defined an area surrounding the Project Site where potential direct or indirect impacts could reasonably be expected to occur (i.e., the Project Site vicinity). In determining the Project Site vicinity, the Historic Report considered three factors: (1) the existing setting of the Project Site; (2) the scale and nature of the proposed Project; and (3) the impacts the Project could have on historical resources, if such resources exist. The Historic Report defined the Project Site vicinity as all parcels immediately adjacent to the Project Site, as well as all parcels located directly across the street from the Project Site. Properties beyond the Project Site vicinity were not analyzed because the Project would have no potential to directly or indirectly impact those properties or their immediate surroundings based upon the thresholds in Appendix G of the CEQA Guidelines.

In addition to designated HCMs, properties identified as appearing eligible for national, state, or local landmark or historic district designation through SurveyLA were treated as historical resources in the Historic Report. To provide a conservative analysis, the Historic Report did not refute any recent survey findings regarding the eligibility of these properties, and the properties were not researched or re-evaluated on an intensive level to independently determine or disprove their eligibility as potential historical resources. Five historical resources were identified in the Project Site vicinity, including the Rancho La Brea Adobe,³⁸ The Original Farmers Market,³⁹ Fairfax Theater, Chase Bank, and Air Raid Siren No. 25. The analysis of the potential impacts to these resources is included on pages IV.B-27 to IV.B-31 of the Draft EIR.

What constitutes a significant impact to a historical resource is defined in Appendix G of the CEQA Guidelines. As explained in the Draft EIR and Historic Report, the analysis of impacts under CEQA is focused on whether there would be a "substantial adverse

³⁸ The Rancho La Brea Adobe is also known as the Gilmore Adobe.

³⁹ The Rancho La Brea Adobe and The Original Farmers Market are separate properties that were designated together as HCM No. 543.

change” to a historical resource as a result of a project. Pursuant to CEQA Guidelines Section 15064.5(b), “substantial adverse change” is defined as “physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired.” This section further states that “[t]he significance of an historical resource is materially impaired when a project demolishes or materially alters in an adverse manner those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion in, or eligibility for, the California Register of Historical Resources...or a local register of historical resources.” As explained and analyzed in the Draft EIR and Historic Report, all demolition, alteration, and new construction associated with the Project would be contained within the Project Site. As demonstrated in the Draft EIR, the Project would not physically alter any of the identified historical resources in the vicinity of the Project Site.

No evidence of material alteration of any of the historical resources in the vicinity of the Project Site was identified by the commenters. Instead, their criticism of the analysis focuses on visual and scenic impacts, including the need for a viewshed study. Under CEQA, impacts to aesthetics are based on different criteria and thresholds than those used for historical resources. As set forth in Appendix G of the CEQA Guidelines and in the Initial Study for the Project included as Appendix A of the Draft EIR, aesthetic impacts under CEQA include the consideration of: scenic vistas; scenic resources (including historical resources) within a scenic highway; for urban projects, consistency of the project with applicable regulations regarding scenic quality; and light and glare. Thus, the analysis of aesthetics considers the experiences of people who may view a scenic resource, while the analysis of historic impacts considers whether a project would adversely affect the integrity of an historical resource. As discussed in the Initial Study included as Appendix A to the Draft EIR, in accordance with Senate Bill (SB) 743 and PRC Section 21099(d)(1), the Project is an “employment center project” located within a transit priority area. As such, the Project’s aesthetic impacts shall not be considered significant impacts on the environment and therefore do not require evaluation under CEQA.

Because the Project Site is located outside the parcel boundaries of the identified historical resources in the vicinity, the Project would not impact their integrity of immediate setting. The analysis of indirect impacts on historical resources in the Draft EIR considered the following:

- Why is the historical resource significant?
- What are the physical characteristics of the historical resource that conveys its significance?
- Specifically, is the broad setting a character-defining feature of the historical resource?

- If so, is the broad setting intact from the historical resource's period of significance or is the broad setting already disrupted?
- How and to what degree is the broad setting diminished by the visibility of the Project from the historical resource?

The public comments do not express why the broad setting of the nearby historical resources is essential to conveying their significance, do not recognize that the broad setting has already been altered by subsequent development, and do not explain how changes to the urban landscape would diminish their integrity. For example, Comment No. 26-E.2-8 and Comment No. 35-75 claim that “any interruption of the existing horizon line would have an obstructive effect on the historic properties by altering the character, setting, feeling and viewshed that make them eligible for listing in NRHP and the CRHR,” but no attempt is made to explain how the character, setting, feeling, and viewshed would be altered, or how these attributes contribute to the resources in the vicinity of the Project Site being eligible for historic listing.⁴⁰ Indeed, the broad settings of all the nearby historical resources have been subject to continual change and alteration over time as is typical of urban environments. As such, the physical aspects of these resources that are critical to conveying their historic significance are largely contained to their respective properties. No alteration to a hypothetical viewshed or the broad setting of these resources would diminish their integrity such that their eligibility for historic listing is threatened.

Ultimately, the commenters imply that the visibility of new construction alone would somehow adversely affect the integrity of nearby resources and threaten their eligibility for historic listing. However, none of the comments demonstrate how the visibility of new construction would result in a substantial adverse change to any historical resources in the Project Site vicinity. Mere visibility of a new building, structure, or feature from various vantage points alone would not result in a significant impact to any of the historical resources located in the vicinity of the Project Site. For a significant impact to occur, the integrity of the historical resource would have to be diminished to the degree that it would no longer be able to convey its significance.⁴¹ The Draft EIR and Historic Report correctly considered the impact the Project could have on the integrity of the historical resources in the vicinity, including their integrity of setting, and concluded that any impacts would be less than significant.

⁴⁰ U.S. Department of the Interior, National Park Service, National Register Bulletin 15: How to Apply the National Register Criteria for Evaluation, (Washington, DC: 1990; revised for Internet, 2002), www.nps.gov/subjects/nationalregister/upload/NRB-15_web508.pdf, accessed October 3, 2023.

⁴¹ CEQA Guidelines Section 15064.5(b)(2).

Three historical resources located in the vicinity of the Project Site were called out for particular concern by the commenters, including the Rancho La Brea Adobe located immediately south of the Project Site; The Original Farmers Market located south of the Project Site at the northeastern corner of Fairfax Avenue and 3rd Street; and the Beverly Fairfax Historic District located north of the Project Site. These resources are discussed below.

Rancho La Brea Adobe (Gilmore Adobe)

Comments claim that direct impacts from vibration due to construction activity were not properly analyzed in the Draft EIR and vibration from construction has the potential to directly impact the Rancho La Brea Adobe (also referred to as the Gilmore Adobe) given its fragile adobe construction. Potential vibration impacts from construction activity were, in fact, analyzed in Section IV.I, Noise, of the Draft EIR with the Rancho La Brea Adobe specifically called out among the off-site historical resources included in the analysis. Vibration levels associated with the Project were found to be below the threshold for potential damage.

In addition to potential direct impacts from construction vibration, commenters also claim that the Project has the potential to result in significant indirect impacts to the Rancho La Brea Adobe by altering its immediate surroundings. The broad setting of the Rancho La Brea Adobe has been completely transformed since its original construction in the 19th century, as all the surrounding ranch land was developed and redeveloped over time. Construction of The Grove shopping and entertainment center, which opened in 2002 and includes a seven-story parking garage immediately east of the Rancho La Brea Adobe, is only the most recent example. Today, the Rancho La Brea Adobe is almost entirely enclosed by more recent retail and restaurant development (including back of house operations that are immediately adjacent to the Project Site) associated with The Grove, none of which reflects the scale, architecture, and historic characteristics of the Rancho La Brea Adobe. Therefore, the broader setting of the Rancho La Brea Adobe does not contribute to its historic significance given the existing condition.

Commenters claim that potential new construction associated with the Project, which would take place on a separate property, separated by an approximately 28-foot alley, north of the Rancho La Brea Adobe, would result in significant impacts because it would be “out-of-scale,” and “overshadow” this historical resource. However, as noted above, the comments do not provide any explanation as to what aspects of the immediate surroundings are instrumental in conveying the historic significance of this historical resource or how new construction located north of the Rancho La Brea Adobe would diminish its integrity. Instead, the commenters imply that the visibility of new construction alone would somehow adversely affect the integrity of the Rancho La Brea Adobe and threaten its eligibility for historic listing. However, none of the comments demonstrate how

the visibility of new construction would result in a substantial adverse change of the Rancho La Brea Adobe. Mere visibility of a new building, structure, or feature from various vantage points alone would not result in a significant impact to the Rancho La Brea Adobe. For a significant impact to occur, the integrity of the Rancho La Brea Adobe would have to be diminished to the degree that it would no longer be able to convey its significance.⁴² The Draft EIR and Historic Report correctly considered the impact the Project could have on the integrity of the Rancho La Brea Adobe, including its integrity of setting, and concluded that any impacts would be less than significant (refer to Draft EIR page IV.B-55 and Historic Report pages 87–88).

Commenters assert that taller, new construction north of the Rancho La Brea Adobe would constitute a significant impact under CEQA; however, this assertion is not substantiated by facts or analysis and is not based on the threshold in Appendix G of the CEQA Guidelines noted above. The commenters do not demonstrate how new construction constitutes a substantial adverse change that will materially impair the significance of the Rancho La Brea Adobe as CEQA requires. As demonstrated in the Draft EIR, the Rancho La Brea Adobe, including its component buildings, structures and associated outdoor spaces, would remain physically unchanged after implementation of the Project and the Rancho La Brea Adobe would continue to convey its historic significance. Therefore, impacts to the Rancho La Brea Adobe would be less than significant as defined by CEQA.

The Original Farmers Market

Comments claim that new construction associated with the Project would adversely affect The Original Farmers Market, which dates from 1934 and was largely completed by 1949. Commercial development constructed from roughly 1961 to 2012 has significantly altered the immediate surroundings of The Original Farmers Market. For example, The Grove project demolished the 1948 warehouse and 1953 tower building, both of which contributed to the historic setting of The Original Farmers Market. Further, the clock tower atop the tower building, a symbol of The Original Farmers Market, was removed and reconstructed at another location within the site.⁴³ As such, the broad setting of The Original Farmers Market does not contribute to its historic significance.

Commenters incorrectly assert that new construction at the Project Site, located over 500 feet to the north, would adversely affect the broad setting of The Original Farmers Market, despite the continued alteration of its immediate surroundings. The commenters

⁴² CEQA Guidelines Section 15064.5(b)(2).

⁴³ See The Grove at Farmers Market Addendum to Final Environmental Impact Report dated July 15, 1999 (EIR No. 87-515-SUB(ZV)(YV)(ZC); State Clearinghouse No. 87102102).

assert that the visibility of new construction alone would adversely affect the integrity of The Original Farmers Market and threaten its eligibility for historic listing. However, none of the comments demonstrate how the visibility of new construction would result in a substantial adverse change such that the physical characteristics of The Original Farmers Market that justify its inclusion in, or eligibility for, historic listing would be materially impaired. The broad setting of this historical resource has already been disrupted, most recently by development associated with The Grove.

The Draft EIR and Historic Report correctly considered the impact the Project could have on the integrity of The Original Farmers Market, including its integrity of setting, and concluded that impacts would be less than significant.

Beverly Fairfax Historic District

Commenters claim that the Draft EIR failed to disclose adverse historical resource impacts to the National Register-listed Beverly Fairfax Historic District which is located north of Beverly Boulevard. As stated on page IV.B-31 of the Draft EIR and pages 41–42 of the Historic Report, the Beverly Fairfax Historic District is located north of Beverly Boulevard and does not include any parcels fronting Beverly Boulevard directly across the street from the Project Site. Therefore, there would be no potential for impacts as defined by CEQA due to the over 200-foot distance between the southern boundary of the Beverly Fairfax Historic District and the northern boundary of the Project Site, as well as the physical separation by the intervening buildings and Beverly Boulevard. A discussion of the Beverly Fairfax Historic District is included on page IV.B-31 of the Draft EIR.

As noted above, no evidence of material alteration of any of the contributing buildings within the Beverly Fairfax Historic District was identified by the commenters. Instead, criticism of the analysis focuses on potential aesthetic impacts. However, the introduction of a new visual feature in the vicinity of the Beverly Fairfax Historic District would not diminish its integrity of setting. The immediate setting would remain unchanged, and the broad setting is not a character-defining feature of the Beverly Fairfax Historic District. Thus, the mere visibility of a new building that may be constructed as part of the Project from certain vantage points within the Beverly Fairfax Historic District alone would not result in an impact. The Beverly Fairfax Historic District would not be materially impaired by the Project because it would continue to retain all of its character-defining features, convey its significance, and remain eligible for listing in the National Register and California Register and for designation as an HPOZ.

Comments suggesting that impacts to the setting of the Beverly Fairfax Historic District would be significant represent a lack of understanding of districts and how they are defined. NPS defines a district as “a significant concentration, linkage, or continuity of sites, buildings, structures, or objects united historically or aesthetically by plan or physical

development.”⁴⁴ Thus, a district derives its significance as a single unified entity. Boundaries for districts are selected to encompass the single area of land containing the significant concentration of buildings, sites, structures, or objects that contribute to the historic significance of the district and delineate the district from immediately surrounding areas of a different historic character or development pattern. NPS guidance on defining district boundaries state that boundaries should be drawn by observing the following:

- Visual barriers that mark a change in the historic character of the area or that break the continuity of the district, such as new development, highways or development of a different character.
- Visual changes in the character of the area due different architectural styles, types or periods, or to a decline in the concentration of contributing resources.
- Boundaries at a specific time in history such as the original city limits, or the legally recorded boundaries of a housing subdivision, estate, or ranch.
- Clearly differentiated patterns of historic development, such as commercial versus residential or industrial.⁴⁵

These tenets can be observed in the boundaries of the Beverly Fairfax Historic District, which exclude areas of different historic development patterns such as commercial development or areas of later development not associated with the period of significance for the Beverly Fairfax Historic District. In this manner, features associated with the historic significance of the Beverly Fairfax Historic District are necessarily included within the district boundaries. The broad setting (located outside the Beverly Fairfax Historic District boundaries) was appropriately not considered character-defining or important to the integrity of the Beverly Fairfax Historic District.

As stated above, the northern edge of the Project Site is located over 200 feet from the southern boundary of the Beverly Fairfax Historic District and no physical alterations or changes within the Beverly Fairfax Historic District boundaries are contemplated by the Project. As such, the Project cannot physically alter or change the setting of the Beverly Fairfax Historic District as all the setting features that contribute to the significance of the Beverly Fairfax Historic District are contained within its boundaries.

Finally, commenters claim that the potential cut-through trips “will result in significant and adverse land use impacts” and that the “excessive traffic burden” identified for several

⁴⁴ National Register Bulletin #15, p. 5.

⁴⁵ U.S. Department of the Interior, National Park Service, National Register Bulletin Defining Boundaries for National Register Properties, Washington D.C., revised 1997, p. 12.

streets that traverse the Beverly Fairfax Historic District in Section IV.K, Transportation, of the Draft EIR may result in “diminished integrity” and “disinvestment, decay and degradation of the physical environment” of the Beverly Fairfax Historic District. However, historical impacts and transportation impacts are analyzed separately, have different thresholds, and are not equivalent in their definition of integrity. No explanation is provided as to how increased trips through the Beverly Fairfax Historic District might translate to physical demolition, destruction, relocation, or alteration such that the significance of the Beverly Fairfax Historic District would be materially impaired, which is the threshold for significant impacts on historical resources in Appendix G of the CEQA Guidelines. While the transportation analysis makes clear that a potential result of the Project, which would include a Neighborhood Traffic Management Plan and would not result in significant transportation impacts under CEQA, is more vehicle trips within the Beverly Fairfax Historic District, no evidence has been identified to suggest that a potential increase of vehicle trips would result in the substantial adverse change of the physical characteristics of the Beverly Fairfax Historic District that convey its historic significance and that justify its inclusion in, or eligibility for, listing as a historical resource as defined by CEQA.⁴⁶

⁴⁶ The Neighborhood Traffic Management Plan is discussed in Topical Response No. 9.

Topical Response No. 6. Wilshire Community Plan Update

Commenters state that the Project should not be permitted because the Wilshire Community Plan, which is the applicable General Plan land use element for the Project Site, was adopted in 2001 and needs to be updated. Specifically, commenters state that the proposed General Plan Amendment is impermissible “spot-zoning” and “upzoning” that should not be considered outside of the context of a long-overdue update to the Wilshire Community Plan, and that the proposed General Plan Amendment represents a major change to the identity of the area and its future growth potential that should occur in the context of comprehensive planning (i.e., an update to the Wilshire Community Plan).

However, CEQA requires an evaluation of a project’s consistency with existing land use plans, and that evaluation is not affected by possible changes to an existing land use plan that may be adopted in the future. In accordance with CEQA Guidelines Section 15125, the Draft EIR for the Project properly relied on information that is currently available to establish baseline conditions and, as such, used information from the existing Wilshire Community Plan, satisfying the requirement under CEQA Guidelines Section 15125(d) that an EIR “discuss any inconsistencies between the proposed project and applicable general plans, specific plans, and regional plans.” An “applicable” plan is a plan that has already been adopted and thus legally applies to a project; draft plans need not be evaluated—an existing land use plan does not become “inapplicable” because of the passage of time. Statutory law contains no requirement that a general plan’s land use element—which is the City’s Wilshire Community Plan—be updated at any given interval or in connection with any given event (such as the approval of a new development project). Further, unlike certain General Plan elements such as the Housing Element, state law does not require that local jurisdictions regularly update their land use element within certain timeframes.⁴⁷

For these reasons, an “applicable” plan under CEQA is a plan that has already been adopted and thus legally applies to a project; draft plans need not be evaluated. The Wilshire Community Plan is not currently being updated, nor has the City publicly notified or

⁴⁷ For informational purposes only (and not relevant to the Draft EIR’s evaluation of the Project’s consistency with the existing Wilshire Community Plan), please note that Chapter 1 of the City’s General Plan Framework Element states that, “[l]ike all general plan elements, community plans are comprehensively updated on a periodic basis through a city-initiated process. However, given the size and complexity of the City, the process of updating all of them takes time.” Chapter 1 of the General Plan Framework Element further states that “[s]ubject to availability of funding, all comprehensive updates of the citywide elements and the community plans for the purpose of implementing the Framework Element shall be initiated within five years of adoption of the Framework Element. Phasing of such updates may be made in accordance with Objective 3.3. and Policies 3.3.1 and 3.3.2 based on the monitoring of population, development, and infrastructure and service capacities as recommended through the Annual Report on Growth and Infrastructure.”

initiated an update to the Wilshire Community Plan, and the timing of such an update is unknown. In any instance where a community plan has yet to be updated and adopted, a draft plan would not be applicable under CEQA. Accordingly, comments that the Wilshire Community Plan is in need of an update are not relevant to the environmental analysis of the Project. In fact, consideration of an unknown future community plan update would be contrary to CEQA, which prohibits speculation and conjecture.⁴⁸ Further, there would be no legal basis and it would be contrary to City policy for the City to require that an individual project be delayed until the completion of an update to a community plan which has not yet commenced publicly and will take numerous years to complete.

⁴⁸ CEQA Guidelines § 15187(d).

Topical Response No. 7. Mobility Hub

This Topical Response has been prepared to address questions and comments regarding the Project's proposed Mobility Hub. Commenters requested an explanation of the proposed activities to be provided in the Mobility Hub, as well as the potential air quality and noise impacts. Commenters also expressed concern that the Mobility Hub would serve as a point of congregation for loitering. For informational purposes and in response to comments on the Draft EIR, this Topical Response provides an explanation of the form and functions, as well as additional details, of the proposed Mobility Hub.

The Draft EIR concluded that the Project's transportation impacts would be less than significant during both Project construction and operation (see Section IV.K, Transportation, of the Draft EIR). Nevertheless, the Applicant has committed to implementing a robust and extensive Transportation Demand Management (TDM) Program as Project Design Feature TR-PDF-2 to reduce dependency on individual car trips and encourage alternative modes of transportation.⁴⁹ One of the key elements of the Project's TDM Program is the inclusion of a multi-modal Mobility Hub on the Project Site. The Mobility Hub functions that will be provided as part of the Project are discussed in Section II, Project Description, and Section IV.K, Transportation, of the Draft EIR. As discussed therein, the Mobility Hub functions would support first/last mile connections; encourage employee and visitor use of public transit through the provision of a shuttle service, carpooling, vanpooling, and biking/scooter to work; and support other modes of travel and TDM strategies that are likely to evolve over time. These features would be promoted and incentivized through programs administered by an on-site TDM coordinator and one or more transportation information kiosks, including within the Mobility Hub itself.

First/last mile services would include personal transportation options such as motorized and non-motorized scooters, skateboards, and bicycles, both personally owned and as short-term rentals (e.g., bike share services). The Mobility Hub would also provide an off-street area for Project employees and visitors to access passenger pick-up/drop-off zones, carpools, vanpools, shuttles, ride-share services, taxis, and other commercial and non-commercial vehicles, as well as the temporary parking of shuttle and private subscription buses. In particular, the Mobility Hub would support shuttle service between the Metro D (Purple) Line Wilshire/Fairfax Station, currently under construction, and the Project Site, as well as future shuttle services connecting to other existing and/or future transit stations (e.g., the Metro B (Red) Line or Metro K (Crenshaw/LAX) Line North Extension). Furthermore, the Mobility Hub would accommodate support uses, storage, maintenance, staging facilities, bike share, and ridership amenities. Such amenities would

⁴⁹ All PDFs are included in the Mitigation Monitoring Program for the Project, included as Section IV of this Final EIR, to ensure their implementation.

include a transportation information center providing real-time transit information via digital bulletin boards, wayfinding information for nearby transit stops, and bicycle-related services such as valet service, repair stands, showers, and lockers. The primary Mobility Hub would also be one of the main locations for pedestrian and audience entry into the Project Site and would allow for their efficient and secure entry. Additional functions to be provided at the Mobility Hub are detailed in the proposed TDM Program set forth in Project Design Feature TR-PDF-2 on pages IV.K-37 to IV.K-40 of the Draft EIR.

Consistent with the City's guidance on the development of Mobility Hub amenities, activities, and programs to support multi-modal connectivity and access, the proposed Mobility Hub functions are flexible. The City's Mobility Hubs Reader's Guide states that "[t]he ability of the Hub to function successfully depends on flexibility. It is the interaction and balance between transportation, land use, and placemaking functions. Flexibility for change should be incorporated in developing Mobility Hubs to accommodate possible future growth, expansion, and changes as new technologies evolve."⁵⁰

Location

The primary Mobility Hub functions are currently proposed in the southwest corner of the Project Site, near the intersection of Fairfax Avenue and 1st Street. A new traffic signal would be installed at this intersection as part of the Project, which would allow vehicles to access the Fairfax Avenue corridor more easily and safely. This location would provide a direct connection to the planned Metro D (Purple) Line Wilshire/Fairfax Station, currently under construction, and could also potentially provide a connection to the Metro K (Crenshaw/LAX) Line if the proposed extension along Fairfax Avenue is selected. The Fairfax Avenue corridor has a high concentration of pedestrian destinations, so it would be beneficial to locate the Mobility Hub transportation functions in this area.

Figure II-1, Mobility Hub Conceptual Plan, on page II-110 shows the layout of the at-grade Mobility Hub on the Project Site immediately adjacent to the intersection of Fairfax Avenue and 1st Street. Direct access from the signalized intersection of Fairfax Avenue and 1st Street would provide entry and exit for shuttle buses and areas for visitor/audience pick-up and drop off, as well as rideshare pick-up and drop off areas. Bicycle facilities would also be provided. This design was presented in the Transportation Assessment (Appendix M.1 of the Draft EIR). Figure II-2, Mobility Hub Rendering, on page II-111 shows a rendering of the Mobility Hub as viewed from the west side of Fairfax Avenue at 1st Street. The Mobility Hub is intended to be built at the ground level along Fairfax Avenue and incorporated into the office building or stage building built above it.

⁵⁰ Los Angeles Department of City Planning Urban Design Studio, *Mobility Hubs: A Reader's Guide*, p. 5.

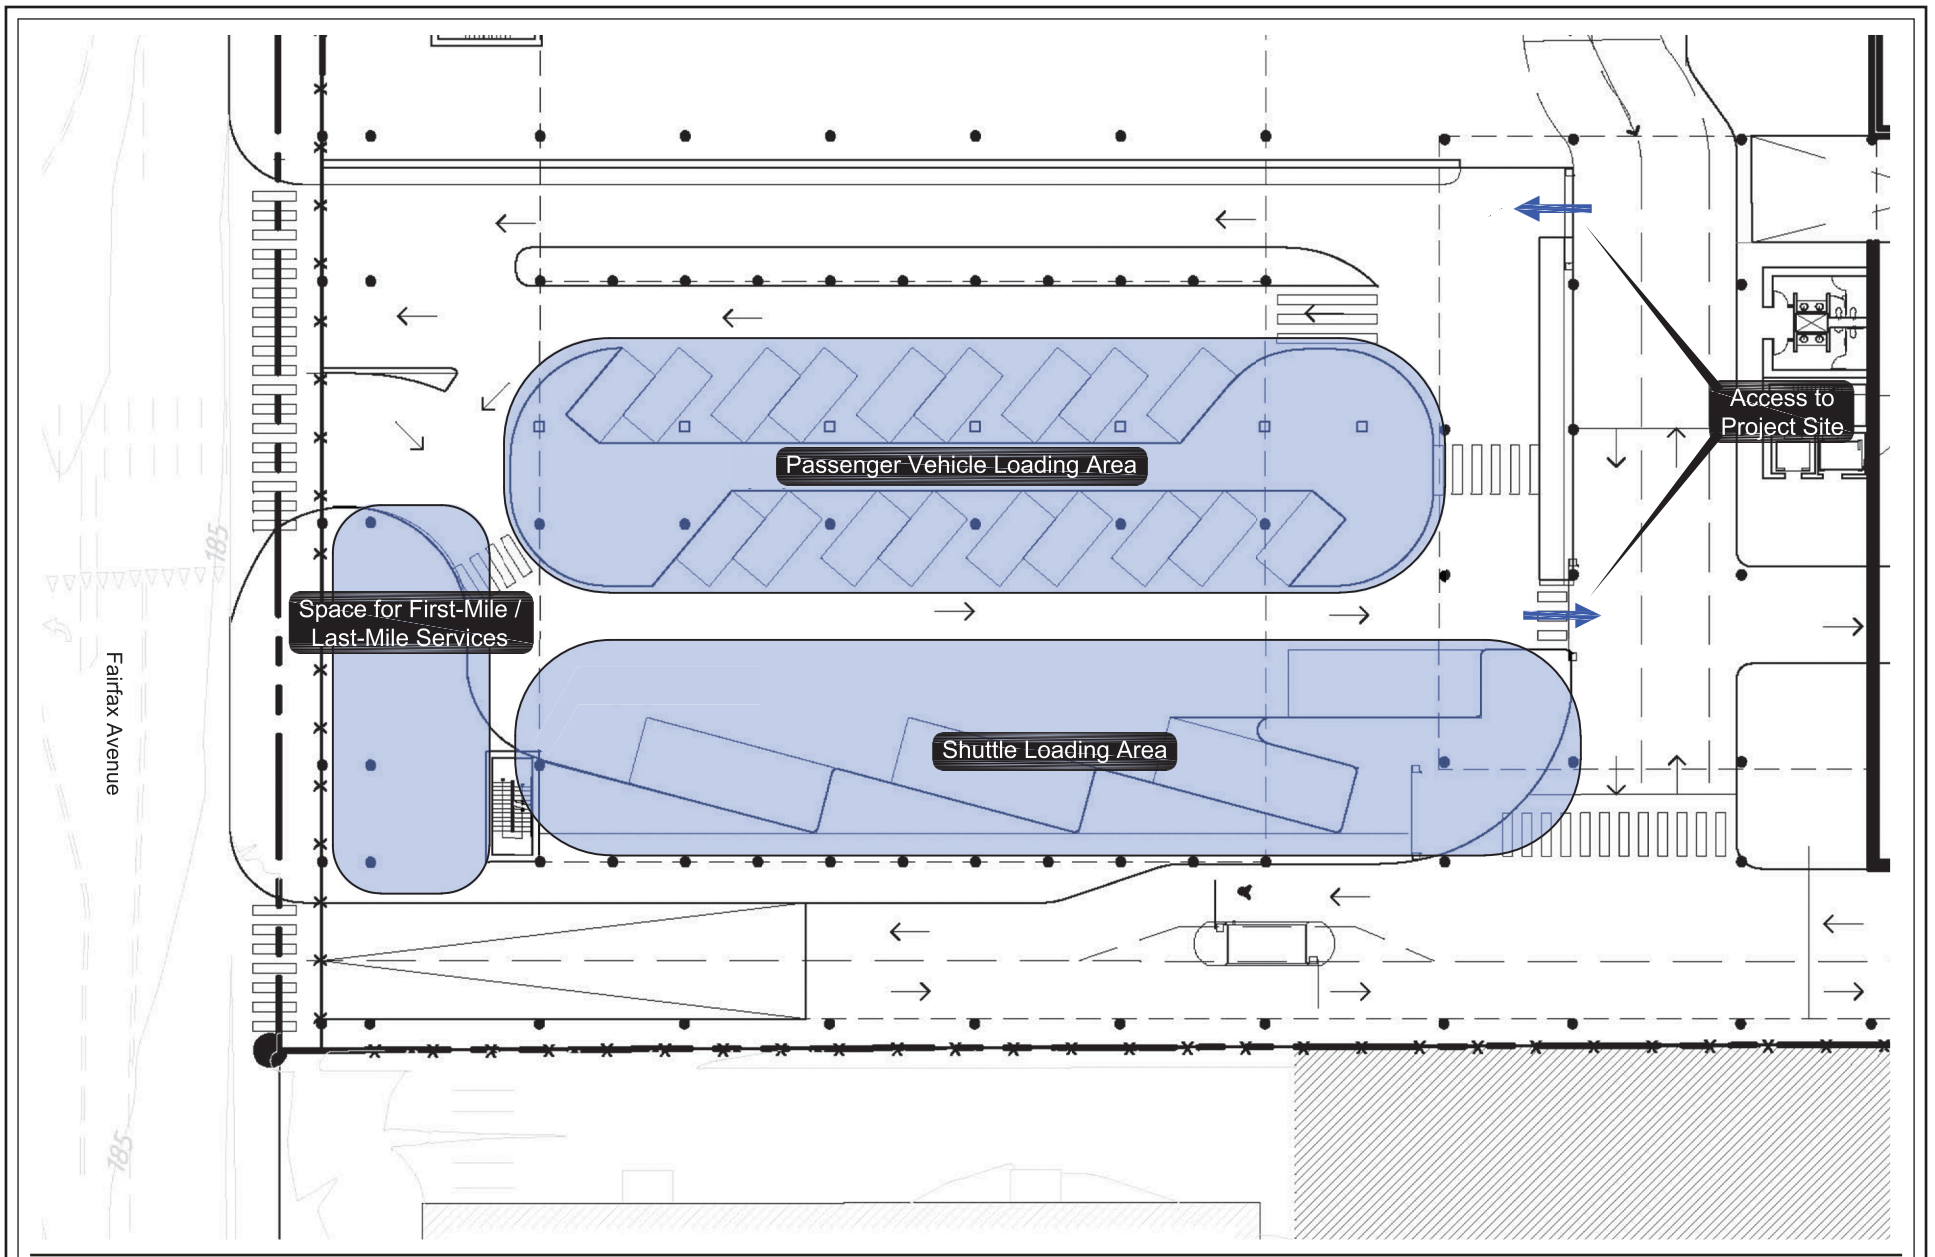

Figure II-1
 Mobility Hub
 Conceptual Plan Layout

Figure II-2
Mobility Hub Rendering

While the primary location for the Metro D (Purple) Line Wilshire/Fairfax Station shuttle bus service would likely remain in the southwest portion of the Project Site, a portion of the bicycle, rideshare, and visitor drop-off functions may be distributed across the Project Site to directly link mobility uses with primary destinations.

Implementation Overview

If the Project is built in a single phase, the Mobility Hub would be incorporated into the design of the building in the southwest portion of the Project Site as shown in the Conceptual Site Plan, with ancillary mobility functions located along the circulation system in the central and/or eastern portions of the Project Site. All key functions of the Mobility Hub would be available with the initial re-occupancy of the Project Site.

If the Project is constructed in multiple phases, the functions of the Mobility Hub would begin with the first phase of the Project regardless of the type of studio land use(s) being newly constructed. Under the long-term buildout scenario, the Mobility Hub would be located in the southwest portion of the Project Site, served by the new traffic signal at Fairfax Avenue and 1st Street. As shown in Figure II-1 and Figure II-2 on pages II-110 and II-111, the Mobility Hub would be constructed at the grade level of Fairfax Avenue with access directly from the proposed traffic signal at Fairfax Avenue and 1st Street. If the building in the southwest corner of the Project Site is not constructed during the initial construction phase, the Mobility Hub functions would be temporarily located within the internal circulation network within the Project Site, but in a location still served by the signalized Fairfax Avenue/1st Street Project Site entrance. Once the southwest building is complete, the Mobility Hub would move to its ultimate location on the ground floor of the building in the southwest portion of the Project Site.

Regardless of the format or location of the Mobility Hub, the key Mobility Hub functions would be offered to Project employees and visitors from the beginning of occupancy of the multi-phase construction.

- TDM elements like bicycle parking, rideshare pick-up/drop off, a transit information center and visitor drop off that could ultimately be located in the permanent Mobility Hub would be located at different locations throughout the Project Site, beginning with the first phase of the development process, in order to get these early elements closer to the initial developments, as necessary.
- Shuttle bus connections to the Metro D (Purple) Line Wilshire/Fairfax Station would begin with the development of net new sound stages, production office, or general office⁵¹ of at least 100,000 square feet.

⁵¹ Production support and retail uses would not trigger construction of the Mobility Hub.

Operation and Design

Figure II-1 and Figure II-2 on pages II-110 and II-111 show the location and basic layout of the proposed Mobility Hub as well as the view of the facility from Fairfax Avenue. Figure 3 and Figure 4 on pages 14 and 15 of the Transportation Assessment (Appendix M.1 of the Draft EIR) show the pedestrian connections between Fairfax Avenue and the entrances to the Project Site. The Mobility Hub would include internalized secure pedestrian entrances to the Project Site where employees and visitors could check in through a security gate. This pedestrian entrance would connect to all the areas of the Project Site. During off-peak times, including nights and weekends, it is anticipated that gate controls and other security measures would be utilized to secure the Project Site boundary and maintain a high level of safety.

The Mobility Hub would be open during the primary hours of operation for the Project. Shuttle buses from the Project Site to the Metro D (Purple) Line Wilshire/Fairfax Station would be most active during the primary commute hours in the morning (from approximately 6 A.M. to 9 A.M.) and afternoon (from approximately 3 P.M. to 7 P.M.) peak hours. During the mid-day hours, a more limited service would be provided. Limited evening service could be offered on those days when evening audience shows were taping. While the Project Site would continue to operate 24 hours a day, the activity at the Mobility Hub is expected to be minimal during the nighttime hours and may even be closed for security purposes.

Commenters expressed concern that the Mobility Hub would serve as a congregation point for loitering. However, this would not be the case. The Mobility Hub would serve the employees and visitors to the Project Site and would not be open to the general public without authorized access. The Mobility Hub would be located on private property that would have 24/7 security. Further, the primary location of the Mobility Hub immediately adjacent to the security check point for the Fairfax Avenue entrance to the Project Site would provide the Mobility Hub area with a high degree of security coverage by campus security. The Mobility Hub would incorporate other safety features (e.g., strategic lighting; security personnel; security cameras; etc.) and would have the ability to be fully secured if needed in response to an emergency event.

Commenters expressed concern about potential noise impacts from the Mobility Hub on adjacent properties. However, the primary Mobility Hub in the southwest portion of the Project Site is intended to be located on the ground floor of a sound stage or office building within the building envelope which would greatly minimize any noise impacts. Figure II-2 shows the location of the proposed Mobility Hub on the ground floor of an office or stage building. The Mobility Hub itself would be partially open to the outside with driveways and pedestrian connections from the Fairfax Avenue sidewalk and from the Project Site into the Mobility Hub. The Mobility Hub would be located at the grade level of Fairfax Avenue with

direct pedestrian, bicycle, and vehicular connections to Fairfax Avenue. The potential noise from the functions of the Mobility Hub would be effectively contained within the Project Site and would be shielded by new structures/walls to the north, east and south. The western portion of the Mobility Hub along Fairfax Avenue would include screening/landscaping along those areas not dedicated to vehicular, bicycle and pedestrian access. As shown in Figure II-2 on page II-111, much of the Mobility Hub's western façade would be partially open to the air and would also include air quality controls in accordance with all existing applicable regulatory requirements. For those portions of the TDM functions that are spread throughout the Project Site, the Project would not operate bus or shuttle loading/unloading within 75 feet of the Broadcast Center Apartments without a noise barrier, in order to address concerns from the residents about potential noise impacts (refer to Project Design Feature TR-PDF-2 in Section III, Revisions, Clarifications, and Corrections to the Draft EIR).

Topical Response No. 8. Vehicle Miles Traveled

Comments questioned the validity of the Vehicle Miles Traveled (VMT) analysis presented in the Draft EIR and suggested that the Draft EIR's VMT analysis conceals a significant impact by excluding Project components. However, the analysis was conducted appropriately, as described in this Topical Response. Pursuant to SB 743, the transportation impact analysis required under CEQA was changed from vehicular delay (i.e., Level of Service [LOS]) to VMT. Accordingly, the Project's transportation analysis and potential impacts were assessed in the Draft EIR using VMT methodology in accordance with CEQA and the City of Los Angeles Department of Transportation (LADOT). As discussed on pages IV.K-72 through IV.K-77 of the Draft EIR, the Project would have a less than significant VMT impact. Although no longer a CEQA transportation impact, the Transportation Assessment (Appendix M.1 of the Draft EIR) contains an operational evaluation of LOS of key intersections in the vicinity of the Project Site.

A. Appropriateness of Using VMT Calculator

Public comments claimed that the City's VMT Calculator tool should not have been used to analyze VMT for the Project. The primary objection was that the VMT Calculator is not suitable for analyzing specific plans or entertainment projects. Other objections included that the Project would have such an effect on population and workforce distribution that it would invalidate the VMT Calculator's internal model and that the VMT analysis should have been conducted using empirical trip length data. However, each of these claims are incorrect for the reasons discussed below:

Specific Plan

The claim that the City's VMT Calculator documentation recommends against the use of the VMT Calculator to analyze specific plans, and thus should not have been used to analyze the Project, is incorrect. The VMT Calculator is designed to analyze development projects as defined in LADOT's *Transportation Assessment Guidelines* (August 2022) (TAG), including those that would be implemented through a specific plan. The City recommends the use of the VMT Calculator for projects like the Project, and LADOT approved this methodology for the Project as part of the approved Memorandum of Understanding (MOU), which is included as Appendix A of the Transportation Assessment (Appendix M.1 of the Draft EIR).

As stated on page 1 of the *City of Los Angeles VMT Calculator User Guide Version 1.3* (LADOT, May 2020) (VMT Calculator User Guide), "[t]he VMT Calculator tool is specifically designed and intended to be used to develop project-specific daily household VMT per capita and daily work VMT per employee metrics for residential and office land use development projects in the City of Los Angeles. It implements the methodologies,

screening criteria, and impact significance thresholds described in Section 2.2 of LADOT's Transportation Assessment Guidelines for residential and employment projects." The VMT Calculator calculates the following six categories of trips for every combination of land uses on a proposed project, to the extent that each type of trip is applicable to that project:

- Home-Based Work Productions
- Home-Based Other Productions
- Non-Home-Based Productions
- Home-Based Work Attractions
- Home-Based Other Attractions
- Non-Home-Based Attractions

The cumulative total of these trip types represents the 24-hour average daily trip (ADT) generation of the Project and therefore the ADT trip totals for the Project calculated by the VMT Calculator includes all trips generated by the proposed Project (employment, visitor, audience, production vehicles, deliveries, etc. in the case of the Project). These ADT trip totals, based on all six categories of trips, are used in the air quality, noise and GHG analyses in the EIR. However, the transportation impacts of a potential project are based on a more focused evaluation of a subset of the six trip categories, as described below.

For the CEQA transportation impact analysis, pursuant to the City of Los Angeles VMT Calculator Documentation, VMT impacts are evaluated by comparing the daily household VMT per capita and/or the daily work VMT per employee with the City of Los Angeles VMT impact criteria for the applicable Area Planning Commission (APC) area. Not all trip types are used in the VMT per capita calculations. For a project with a residential component, the VMT Calculator calculates the household VMT per resident by adding the Home-Based Work Production VMT and the Home-Based Other Production VMT and dividing by the total resident population. For a project with an employment component, the VMT Calculator calculates the work VMT per employee by dividing the Home-Based Work Attraction VMT by the number of employees. The other three trip types—Home-Based Other Attractions and Non-Home-Based Productions and Attractions—are not factored into the VMT analysis for the purposes of assessing CEQA transportation impacts. This is consistent with the recommended VMT analysis methodology in the *Technical Advisory on Evaluating Transportation Impacts in CEQA* (OPR Technical Advisory), which suggests

that, for employment-based projects, “the focus can be on home-based work trips.”⁵² The other trip types are considered by the OPR Technical Advisory to be a relatively small component of overall VMT, and the focus of VMT-reduction efforts are on trips between home and work.

The VMT Calculator then compares those numbers to the VMT impact thresholds for the applicable APC area. The Project Site is located in the Central APC area, which has a daily work VMT per employee threshold of 7.6. The Project does not include residential uses; therefore, the daily household VMT per capita threshold is not applicable to the Project. As stated in Table IV.K-5, Project VMT Analysis Summary, on page IV.K-76 of the Draft EIR, the Project would generate a total of approximately 13,454 daily vehicle trips and a total of approximately 95,865 daily VMT. However, as stated on page 19 of the VMT Calculator Documentation, the Project’s VMT impact is calculated based on the Home-Based Work Attraction VMT, consistent with the methodology used to develop the City’s daily work VMT per employee impact threshold. As stated in Table IV.K-5, the VMT Calculator measured a total of approximately 52,194 work VMT generated by approximately 7,832 employees, for an average of 6.7 work VMT per employee. This is below the VMT impact threshold of 7.6 work VMT per employee for the Central APC area. Therefore, as stated in Section IV.K, Transportation, of the Draft EIR, the Project’s VMT impact would be less than significant. The VMT analysis is summarized in Section IV.K, Transportation, and Appendix M of the Draft EIR (Table 13 and presented in more detail in Appendix E of the Transportation Assessment [Appendix M.1]).

The VMT Calculator User Guide states on page 2 that “[the VMT Calculator] is not designed to...evaluate VMT impacts of land use plans (e.g., general plans, community plans, and specific plans).” It does not say individual development projects proposing a new specific plan should not be analyzed. The LADOT guidance makes a distinction between land use plans that cover large areas of the City and multiple property owners. For example, in the case of the Wilshire Community Plan, approximately 8,954 acres (or about 14 square miles); in the case of the Mobility Element of the City’s General Plan, 502 square miles; or in the case of the LAX Specific Plan, approximately 3,500 acres (or about 5.5 square miles), versus individual development sites such as studio campuses where the VMT Calculator has been utilized with LADOT’s concurrence. As described below, LADOT has approved the use of the VMT Calculator for several large projects similar to the Project.

The VMT Calculator User Guide only holds up a specific plan as one example of something that *could potentially be* a land use plan but is not *necessarily* so. Section 2.2 of the TAG clearly differentiates a land use plan from a development project, which it defines

⁵² OPR, Technical Advisory on Evaluating Transportation Impacts in CEQA, December 2018, https://opr.ca.gov/docs/20190122-743_Technical_Advisory.pdf, accessed September 6, 2023.

as “any proposed land use project that changes the use within an existing structure, creates an addition to an existing structure, or new construction, which includes any occupied floor area” (emphasis added). The Project is clearly a development project as defined in the TAG, implemented within the regulations defined by a specific plan, which creates specialized zoning and other regulations on a certain parcel or set of parcels. Even the OPR Technical Advisory states on page 18 that “analysis of specific plans may employ the same thresholds described above for projects.”

The VMT Calculator User Guide recommends against using the VMT Calculator for analysis of a large-scale land use plan, as noted above, because the VMT Calculator is not designed to analyze such a plan that could have a major effect on regional or sub-regional demographics and traffic patterns, as explained below. As noted in several of the comments, the VMT Calculator is based on a static model, meaning it does not model changes in regional demographics or travel patterns that could result from the project it is analyzing. Therefore, a project that is of such a scale that it could change those regional demographics in a meaningful way could potentially be inaccurately analyzed using the VMT Calculator. An example of this type of demographic change would be an employment project adding tens of thousands of jobs to a remote rural or suburban area that would cause thousands of people to move their place of residence. Similarly, a project that may result in major transportation infrastructure changes (as can be the case with a major transportation infrastructure project like a new rail line or large-scale land use plan located in a remote suburban area) could not be accurately analyzed using the VMT Calculator. None of these circumstances apply to the Project because the Project is an infill land use project located on a single block in an urban area that is supported by the existing and new transportation infrastructure under construction in the area. The Project is simply not large enough to change the regional or sub-regional demographics of this existing urbanized and dense Central APC area of the City, nor would it result in potentially substantial transportation system infrastructure changes that would alter regional travel patterns compromising the suitability of the VMT Calculator for its analysis. The fact that a development project as defined in the TAG is implemented through a specific plan does not undermine its suitability for analysis using the VMT Calculator. The TAG contemplates that a project will qualify as either a development project or a land use plan, but not both. Where, as here, the Project fits within the definition of “development project,” the VMT Calculator is properly applied regardless of whether the Project is to be implemented by a specific plan.

The Project proposes to modernize and expand the existing studio by building new sound stages, production support, production office, general office, and retail uses. The general studio use of the Project Site would remain unchanged. The only new land uses that do not exist on the Project Site today are up to 20,000 square feet of retail space, as well as a potential ancillary childcare use. Though it would be new to the Project Site, retail

space is common along the arterial streets in the vicinity of the Project Site, including directly across the street on both Beverly Boulevard and Fairfax Avenue.

The Project would not result in changes to transportation infrastructure or the types of employees and visitors at the Project Site (except the retail space, which, as noted, is a common use in the vicinity). There is also no prescribed limit on the maximum size of development that may be analyzed using the VMT Calculator, and the Project is certainly not of such a scale as to change any of the fundamental assumptions built into the VMT Calculator. Nor is the Project large enough to change the regional or sub-regional demographics or the transportation infrastructure in the Central APC area. The VMT Calculator has already been used to analyze several other large projects in Los Angeles where, despite their size, LADOT determined that the VMT Calculator was the appropriate tool for the analysis, as these projects would not change the demographic or the travel patterns in the area. These include, but are not limited to, the following projects:

- 670 Mesquit Street near downtown, a mixed-use development constructing a net of approximately 1,790,000 square feet of residential, office, hotel, commercial, and event space.
- Angels Landing Project, a transit-oriented mixed-use development constructing up to approximately 1,270,000 square feet of residential, hotel, and commercial space.

The VMT Calculator has been approved by LADOT for use in several studio projects approved in the City of Los Angeles including:

- Sunset Gower Studios in Hollywood will have 1.1 million square feet of studio and production space on a 17.4-acre site. It was approved for expansion in 2021.
- 8th and Alameda Studios, which includes the renovation and construction of approximately 832,190 square feet of floor area for studio uses on a 26-acre site, was approved in 2022.

Nothing about the type of development or size of development proposed at the Project Site precludes the use of the VMT Calculator. As shown above, LADOT has already approved the VMT Calculator for use in large and smaller studio projects within the City.

The comments that the level of visitor traffic and the presence of audience trips precludes the use of the VMT Calculator is not consistent with previous decisions by LADOT, as evidenced by the number of times LADOT has approved the VMT Calculator for use in studio projects. As described below in Topical Response No. 10, Trip

Generation, the visitor and audience trips make up a small percentage of the total trips to/from the Project Site. Importantly, per the OPR Technical Advisory, the VMT analysis is based on the employee VMT from their homes to the Project Site. Thus, the small number of non-employee trips does not affect the VMT per employee calculations and conclusions.

Some comments objected to the use of the VMT Calculator because the proposed Specific Plan would allow a shift in land uses and, if that occurred, the Project could produce greater VMT impacts than were analyzed in the Draft EIR. This concern will not materialize because the Draft EIR's transportation analysis, which is included in Section IV.K, Transportation, and Appendix M of the Draft EIR, encompasses the maximum potential transportation impacts of the Project and therefore presents the most conservative analysis of future development under the Specific Plan. The transportation analysis assumed buildout of the maximum area that would be permitted under the Specific Plan (1,874,000 square feet), including the maximum amount of general office and production office that would be permitted under the Specific Plan (700,000 square feet each), which have higher employee and trip generating characteristics per square foot of development than sound stages and production support space (which, under the Specific Plan, are allowed to be increased by decreasing the amount of the other permitted land uses, as discussed below). The transportation analysis also assumed high-generating uses for the 20,000 square feet of retail space, which was conservatively input in the VMT Calculator as 100-percent high-turnover restaurant.

As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the proposed Specific Plan would include a Land Use Exchange Program that provides limited flexibility in the size of certain studio uses.⁵³ Specifically, the Land Use Exchange Program would permit limited increases in sound stage and production support floor area in exchange for equivalent decreases in the size of the other permitted land uses (the Project's five land uses include sound stage, production support, production office, general office, and retail). In addition to analyzing the proposed development program (i.e., Conceptual Site Plan), which is set forth in Table II-2 on page II-13 and Figure II-4 on page II-14 in Section II, Project Description, of the Draft EIR, the transportation analysis also analyzed two land use scenarios that would be permitted under the Land Use Exchange Program and represent the most impactful land use scenarios by certain metrics (i.e., total VMT or work VMT per employee) due to the number of employees and number of trips these scenarios would generate (these two scenarios are referred to herein as the "maximum transportation impact scenarios"). This analysis is provided in the Draft EIR on pages IV.K-75 through IV.K-77 and includes a sound stage–

⁵³ The Land Use Exchange Program is included in the Preliminary Draft Specific Plan, which has been made publicly available prior to the publication of this Final EIR; refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan.

heavy scenario and a production support–heavy scenario. As with the proposed development program, the maximum transportation impact scenarios assumed the maximum permitted office floor area and used the high-turnover restaurant rate for the retail use. Table II-2 on page II-122 includes the square footage breakdowns of the land use scenarios that were evaluated in the Draft EIR’s transportation analysis.⁵⁴

The maximum transportation impact scenarios were analyzed in order to provide a comprehensive and conservative analysis. Although these scenarios would be permitted under the Land Use Exchange Program set forth in the Preliminary Draft Specific Plan, they do not represent likely or viable development scenarios, as a balance of sound stages and production support uses are necessary for a functioning studio campus and in order to meet the Project objectives set forth in Section II, Project Description, of the Draft EIR. However, these scenarios were analyzed because they would result in certain greater VMT impacts than the proposed development program. As discussed on page IV.K-77 of the Draft EIR, maximum transportation impact scenario 1 would result in higher total VMT (but lower work VMT per employee) than the proposed development program, and maximum transportation impact scenario 2 would result in higher work VMT per employee (but lower total VMT) than the proposed development program. Nevertheless, as detailed in the Supplemental VMT Memo included in Appendix M.3 of the Draft EIR, the maximum transportation impact scenarios would not exceed the City’s CEQA significance threshold of 7.6 work VMT per employee for the Central APC area. As such, the maximum possible VMT impact associated with the Project would be less than significant.

⁵⁴ Please refer to Appendix FEIR-3, Maximum Impact Scenario, for a discussion of the maximum impact scenarios that were analyzed for each environmental topic.

Table II-2
Draft EIR Proposed Development Project and Maximum Transportation Impact Scenarios

	Proposed Development Project	Maximum Transportation Impact Scenario 1	Maximum Transportation Impact Scenario 2
Sound Stage	350,000 sf	450,000 sf	0 sf
Production Support	104,000 sf	4,000 sf	454,000 sf ^a
Production Office	700,000 sf	700,000 sf	700,000 sf
General Office	700,000 sf	700,000 sf	700,000 sf
Retail (high-turnover restaurant)	20,000 sf	20,000 sf	20,000 sf
Total Work VMT	52,194	52,762	50,203
Work VMT per Employee	6.7	6.4	7.6
Impact Threshold	7.6	7.6	7.6
Significant Impact	No	No	No
^a The Land Use Exchange Program analyzed in the Draft EIR did not include a maximum limit on production support floor area; rather, only sound stage floor area was limited (to a maximum of 450,000 square feet). The Draft EIR analyzed maximum transportation impact scenario 2 including 454,000 square feet of production support floor area. However, in response to comments on the Draft EIR, the Land Use Exchange Program was subsequently revised to limit production support floor area to a maximum of 450,000 square feet. This change would not alter the significance of the maximum transportation impact scenario analysis. Source: Gibson Transportation Consulting, Inc., 2022.			

Event Center/Regional-Serving Entertainment

Comments claim that the Project is an “event center” or “entertainment project” and thus cannot be analyzed by the VMT Calculator. However, event center and entertainment uses are different than the existing studio uses and the proposed continuation of those studio uses. Section 2.2.4 of the TAG states, “[t]rips associated with [event centers and regional-serving entertainment venues] are typically discretionary trips made by individuals” (emphasis added) as opposed to the employment-based land uses proposed on the Project Site. Unlike an event center, the Project’s five land uses (i.e., sound stage, production support, production office, general office, and retail) would not attract substantial levels of discretionary visitor trips from members of the public. The vast majority of daily trips would be by employees to and from the Project Site. As described on page II-10 of the Draft EIR, the purpose of the Project is to maintain Television City as a studio use and to modernize and enhance production facilities within the Project Site. Further, the specific objectives outlined in that section of the Draft EIR clearly focus on developing a studio campus centered around the production of media for entertainment, rather than providing entertainment directly to the public. Project objectives include:

- “[Retain] the Project Site’s land use as a studio facility”;
- “Provide maximum opportunity for productions to be filmed in the region”;
- “[Provide] new technologically advanced sound stages combined with an adequate and complementary mix of state-of-the-art production support facilities and production offices”; and
- “Create multiple production basecamps to allow for the flexible and efficient staging of vehicles needed for film and television productions.”

The distinction between an event or entertainment project open to the public as defined in the TAG and an entertainment and media-creation project such as the proposed studio Project is an important one. The TAG is clear that event or entertainment projects are not suitable for analysis using the VMT Calculator because most of the trips they generate are visitor trips, which the VMT Calculator is not designed to model. Unlike an event center or regional-serving entertainment venue, production studio uses do not attract regional visitor-based trips in significant quantities and frequencies. While the Project proposes to develop production stages and supporting uses which could be used in limited capacities for studio audiences or for occasional, City-permitted special events, the vast majority of Project trips (over 97 percent as identified in Topical Response No. 10, Trip Generation) would be generated by studio employees. While the visitor and audience trips were accounted for in the development of the daily trip volumes, and were therefore included in the air quality, noise and transportation operational analyses, the VMT Calculator is specifically designed to analyze VMT associated with employees throughout the City because those are the types of trips that are analyzed as part of the CEQA transportation evaluation for employment centers.

More information on visitor and audience trips can be found in Topical Response No. 10, Trip Generation.

B. Range of Allowable Land Uses in Specific Plan

Public comments claimed that the proposed Specific Plan would allow a wide range of land uses that were not analyzed in the VMT analysis, especially those uses which include a visitor component (audience shows, special events, e-sports events, and other uses permitted in the C2 zone). These comments incorrectly imply that the Specific Plan would permit land uses that would attract thousands of daily visitors. The Specific Plan would permit the uses that are proposed by the Project and are detailed in Section II, Project Description, of the Draft EIR. The list of allowable uses has been clarified in Section III, Revisions, Clarifications, and Corrections to the Draft EIR. As described therein, the Project’s uses are comprised of sound stages, production support, production office, general office, and retail uses, as well as ancillary and related sitewide uses that

support the studio and the five studio land uses (i.e., automobile parking and storage, basecamps that are ancillary to the sound stages, communication facilities, etc.). The retail uses that would be permitted under the Specific Plan would be limited to a maximum of 20,000 square feet (less than 2 percent of the total permitted floor area), as described in the Draft EIR Project Description. Thus, the land uses that would be permitted under the Specific Plan are consistent with the existing land uses with the exception of retail, which is intended to activate the frontage along Beverly Boulevard and/or Fairfax Avenue, as well as to potentially provide internal serving ancillary retail (i.e., TVC gift shop) for studio visitors. Refer to Topical Response No. 3, Permitted On-Site Uses.

As discussed above, the primary purpose of the Project is to continue the existing studio use and to modernize and enhance production facilities within the Project Site. The concerns expressed by the commenters center around the misconception that by developing under a specific plan, the Project would be able to shift land uses away from those studied in the Draft EIR and instead develop any land uses that are permitted under the existing zoning for the Project Site. If this were the case, the concern is that the VMT analysis presented in the Draft EIR may not be valid for an adjusted set of land uses. This concern is unfounded for two reasons. First, as described above, the proposed Specific Plan would limit the permitted land uses to those analyzed in the Draft EIR (sound stage, production support, production office, general office and retail uses), and the transportation analysis accounts for all permitted land uses. Second, under the Specific Plan, any future development proposal that substantially differs from the proposed Project analyzed in the EIR, and proposals that involve a land use exchange, would require a future discretionary review, including potential future CEQA compliance review.

The transportation analysis in Section IV.K, Transportation, of the Draft EIR accounted for all permitted land uses and relied upon conservative assumptions. It analyzed both the proposed development project, as well as land use exchange scenarios that would generate the maximum potential transportation impact, and, thus, the Draft EIR analyzed and disclosed the full range of potential transportation impacts associated with the Project. The comments have expressed concern about large visitor-attracting land uses like sports arenas and 3,000-seat auditoriums, but none of these uses would be allowed by the proposed Specific Plan. The analysis of the 20,000 square feet of retail space in the Project was evaluated as high-turnover restaurant space, one of the highest trip generating categories of retail/commercial land uses. Thus, the Draft EIR has conservatively evaluated very high trip-generating uses for the 20,000 square feet of retail. The retail land use, which would be limited to less than 2 percent of the total permitted floor area, was accounted for and analyzed throughout the Draft EIR. The TAG considers retail space under 50,000 square feet to be local-serving and thus would not attract regional trips that could increase VMT. Also refer to Topical Response No. 4, Permitted On-Site Uses, for details regarding the Draft EIR's analysis of all permitted on-site uses.

C. Assumptions in the VMT Analysis

Employee Trip Length

The VMT analysis results for the Project are provided in Table IV.K-5 in the Draft EIR. As shown therein, the Project is estimated to generate an average 6.7 work VMT per employee,⁵⁵ which is below the significant impact threshold of 7.6 work VMT per employee. Several comments appear to interpret this result as meaning that employees on average live 3.35 miles from the Project Site (half of 6.7 miles, which is the average work VMT per employee). However, the “work VMT per employee” is more than simply the calculation of the distance between the employee’s home and workplace. First, the average work VMT per employee is calculated based on the “home-based work attraction” trip types, which are one-way trips. In other words, 6.7 miles is the average *one-way* VMT. Second, the calculation of the work VMT per employee also takes into account the employee mode split (the number of employees that utilize carpool, transit, bike or walk).

As an example a sample VMT calculation is presented in Table II-3 on page II-126 to help demonstrate the relationship between employee trip length and VMT. The VMT calculation shows the employee trip distribution characteristics for a business with 10 employees. These 10 employees are spread out throughout the metropolitan region, living within 20 miles from their workplace. These employees live on average 8.7 miles away from their workplace.

When VMT is calculated from the average employee trip length, the mode of travel and the vehicle occupancy is taken into account. For example, Table II-3 shows that eight of the 10 employees get to work in an automobile (with six driving and two as passengers). One employee takes the bus to work and the employee who lives the closest to the workplace walks or takes their bike to work. The VMT is generated by the employees that drive their cars to work. The two employees that are carpool riders, the bus rider, and the bicyclist do not generate VMT because they are not driving a vehicle to work. Thus, in this example, the 10 employees live a total of 87 miles from work (at an average of 8.7 miles each), but they generate an average of only 5.9 work VMT per employee for their cumulative home-to-work morning trip.

⁵⁵ “Work VMT per employee” measures the average home-to-work one-way driving trip for the total employees of a project, but the calculation also includes factors such as carpooling, transit, walking, and biking. It is not a simple calculation of the average distance the employees live from work. See the example discussed below that helps demonstrate this calculation.

**Table II-3
Employee VMT Example**

Employee	Distance Home to Work (miles)	Travel Mode	Vehicle Miles Traveled
1	13	Drive	13
2	2	Drive	2
3	13	Car Passenger	0
4	1	Walk/Bike	0
5	8	Drive	8
6	6	Drive	6
7	4	Bus	0
8	10	Car Passenger	0
9	20	Drive	20
10	10	Drive	10
Total	87		59
Average	$87/10 = 8.7$		$59/10 = 5.9$
<hr/> <i>Source: Gibson Transportation Consulting, Inc., 2023.</i>			

In the case of the Project, as discussed in Section IV.K, Transportation, of the Draft EIR, the Project would generate an average of 6.7 work VMT per employee, which is less than the threshold of 7.6 VMT per employee for the Central APC area. The Project's VMT analysis was conservative in numerous respects, including by assuming high trip generating uses.

Further, although the Project would include an extensive TDM Program, which is discussed in Topical Response No. 11, Transportation Demand Management, the VMT analysis in the Draft EIR did not account for most of the Project's TDM measures and is therefore conservative. The additional TDM measures not accounted for in the VMT analysis, such as the shuttle to the Metro D (Purple) Line Wilshire/Fairfax Station, bike share stations (or similar), and traffic calming measures as part of the Project's transportation improvement program, would further reduce total VMT and work VMT per employee.

A supplemental VMT analysis was conducted which incorporates all TDM strategies proposed by the Project that can be evaluated as part of the built-in TDM strategies in the VMT Calculator, which is included in Appendix E of the Transportation Assessment (Appendix M.1 of the Draft EIR). As shown therein, the Project would generate an average 4.9 work VMT per employee with the proposed TDM measures. Please refer to Topical

Responses No. 11, Transportation Demand Management, and No. 10, Trip Generation, regarding the Project's TDM Program and trip generation estimates, respectively.

Empirical Data

Commenters state that various other data sources suggest that existing employment trip lengths in the vicinity are longer than those reported by the VMT Calculator. Specific citations were made to the U.S. Census Bureau's "OnTheMap" feature and data analytics firms StreetLight Data and Placer, and comments assert that empirical data from the existing studio should have been used to conduct the VMT analysis. However, this assertion is incorrect, as none of these alternative data sources are approved for VMT analysis in the City, and the use of these sources for the VMT analysis would be inconsistent with the City's adopted TAG thresholds of significance and OPR Technical Advisory, as explained below.

As stated on page 113 of the Transportation Assessment, which was approved by LADOT, the VMT Calculator determines a project's VMT based on trip length information from the City's travel demand forecasting model, consistent with the OPR Technical Advisory. Likewise, the VMT Calculator uses only employee data to calculate work trip VMT per employee in accordance with LADOT and OPR guidance, and a data sample that includes visitors and audience member trips makes any resulting calculations meaningless when compared to the work trip VMT per employee thresholds for the Central APC area. The travel demand forecasting model considers the traffic analysis zone within 0.125 mile of the Project to determine the trip lengths and trip types that factor into the calculations of the Project's VMT. None of the three data sources identified in the comments are approved sources of data for VMT analysis in the City, as LADOT utilizes the City of Los Angeles VMT Calculator or the City of Los Angeles Travel Demand Forecast model, which is based on the Southern California Association of Governments (SCAG) Travel Demand Forecast Model.

Furthermore, each alternative source identified by the commenters is based on a small, non-representative sample of traffic in the vicinity of the Project Site and extrapolated up to represent the whole campus. The data from the U.S. Census Bureau and Placer both show bands of trips that suggest that half or more of the trips are less than 10 miles, but the next band shows between 10 and 24 miles (Census) or 10 and 30 miles (Placer), which tells very little about average trip lengths because the range of the bands is too large to calculate a meaningful average. In the case of the StreetLight Data, records are noted to include not just employees but also visitors, including studio audience members, and thus are not representative of the data needed to calculate employee work trip VMT. Thus, the alternate methodologies suggested are not valid mathematically nor are they even based on comparable base data. The VMT Calculator uses only employee data to calculate work trip VMT per employee in accordance with LADOT and OPR

guidance, and a data sample that includes visitors and audience member trips makes any resulting calculations meaningless when compared to the work trip VMT per employee thresholds for the Central APC.

Importantly, there is nothing in the VMT Calculator User Guide, the TAG, or the OPR Technical Advisory recommending use of alternative VMT information to forecast future VMT for the purpose of the CEQA transportation analysis. The VMT Calculator relies on data from the City's validated travel demand forecasting model, which is also consistent with the SCAG regional travel demand forecasting model.⁵⁶ The City's analysis guidelines and the VMT Calculator are fully compliant with CEQA requirements and the recommendations from the OPR Technical Advisory.

Furthermore, consistent with the OPR Technical Advisory, the thresholds of significance established by LADOT are based on the same data used to develop the VMT Calculator (i.e., the City's travel demand forecasting model). Per the OPR Technical Advisory, in determining potential significant impacts, it is critical to make an "apples-to-apples" comparison between Project-generated VMT and the thresholds of significance. The OPR Technical Advisory states on page 5 that "[m]odels and methodologies used to calculate thresholds, estimate project VMT, and estimate VMT reduction due to mitigation should be comparable. For example: Where a travel demand model is used to determine thresholds, the same model should also be used to provide trip lengths as part of assessing project VMT." Similarly, the OPR Technical Advisory states on page 30 that "[w]hen using models and tools [for establishing thresholds of significance and estimating VMT reduction attributable to mitigation measures and project alternatives], agencies should use comparable data and methods, in order to set up an 'apples-to-apples' comparison between thresholds, VMT estimates, and VMT mitigation estimates." The City's threshold of significance for work VMT per employee in the Central APC area (7.6 work VMT per employee) was established as 15 percent lower than the average work VMT per employee in the Central APC area based on the same metrics as used by the VMT Calculator to determine that the Project would generate average work VMT per employee of 6.7. If an alternative data source were to be used to determine Project-related work VMT per employee, whether empirical data or one of the three sources noted in the comments, it could not be validly compared to the City's established VMT thresholds of significance. The only way a valid comparison could be made would be if that same alternative data methodology were applied to the geographic area of the entire Central APC and used by the City to establish new thresholds of significance. Rather, a key purpose of the VMT Calculator is to provide a common basis for both significance thresholds and project-related VMT analysis such that localized variations in socio-demographic and built environment factors can be used to compare project-related VMT to

⁵⁶ LADOT, Transportation Assessment Guidelines, August 2022, pp. 2-9 through 2-11.

area-wide baseline conditions. Therefore, it was both appropriate and required to use the VMT Calculator to evaluate Project VMT according to LADOT and OPR guidance.

Topical Response No. 9. Neighborhood Traffic Management Plan

This Topical Response addresses comments related to the Project's potential effect on cut-through trips, defined as vehicles that bypass a congested arterial or intersection and instead opt to travel along a residential street. Cut-through trips are not environmental impacts under CEQA (CEQA Guidelines § 15064.3, subd. (a) [except for roadway capacity projects, "a project's effect on automobile delay shall not constitute a significant environmental impact."]). However, pursuant to the TAG, a residential street cut-through evaluation is required as part of the non-CEQA transportation analysis.⁵⁷ Therefore, as a non-CEQA transportation measure, the Project is required to contribute to and implement a Neighborhood Traffic Management Plan (NTMP) to minimize potential cut-through trips on the residential streets surrounding the Project Site, as discussed in Section IV.K, Transportation, and Appendix M.1, Transportation Assessment, of the Draft EIR. The Project's residential cut-through analysis is included in Section 5C of the Transportation Assessment. However, as stated above, any cut-through effects on residential streets caused by the Project are not considered impacts pursuant to CEQA, and measures that minimize any such effects are not CEQA mitigation measures but rather circulation measures required by LADOT. Accordingly, the comments that state that the residential cut-through analysis and NTMP constitute deferred mitigation under CEQA are incorrect.

A. Deferred Mitigation

Comments claim that the Draft EIR improperly deferred mitigation of cut-through traffic, which is incorrect. Although not required under CEQA, the Project would fund the implementation of an NTMP in order to minimize potential residential cut-through trips generated by the Project in accordance with the TAG. Contrary to public comments, the discussion of the NTMP in the Draft EIR does not represent "deferred mitigation," because the potential cut-through effects on the six residential streets identified in the Transportation Assessment do not constitute impacts under CEQA and therefore no mitigation is required. Further, as described in more detail below, the analysis included in the Draft EIR and Transportation Assessment is consistent with the TAG and LADOT policies regarding the preparation of an NTMP associated with a proposed development project in the City of Los Angeles.

Section 5C of the Transportation Assessment follows the procedures outlined in the TAG to identify the local residential streets that could potentially be affected by the Project.

⁵⁷ Transportation Assessment Guidelines, Los Angeles Department of Transportation, Los Angeles, August 2022, Section 3, Chapter 3.5, pages 3-18 to 3-22.

As stated on page 1 of the Transportation Assessment, the methodology and base assumptions used in the analysis were approved by LADOT. In accordance with the TAG, the Transportation Assessment evaluated 11 residential streets in the Project's adjacent neighborhoods, directly north and west of the Project Site, which could be used as cut-through routes to avoid arterial congestion.⁵⁸ As stated on page 169 of the Transportation Assessment, a local residential street would be considered to be excessively affected by Project trips based on an increase in the projected ADT on the street as follows:

Projected ADT with Project (Final ADT)	Project-Related Increase in ADT
1 to 999	120 or more
1,000 to 1,999	12% or more of final ADT
2,000 to 2,999	10% or more of final ADT
3,000 or more	8% or more of final ADT

The Project's daily vehicle trips, shown in Table IV.K-5 of the Draft EIR, are determined using the VMT Calculator estimates, which are included as Appendix E of the Transportation Assessment. Due to the COVID-19 pandemic and resulting shelter-in-place orders throughout the State during the preparation of the Transportation Assessment, representative and meaningful existing ADT counts could not be collected because travel patterns were disrupted by the pandemic. Instead, these counts will be collected after traffic conditions return to a more typical level prior to the occupancy of any portion of the Project. These new traffic counts on the residential streets would be conducted to establish a "before Project" base condition, closer to the time of actual occupancy of the Project. In the meantime, the Transportation Assessment conservatively assumed potential Project trip increases on each street segment based on the most stringent threshold; i.e., 120 or more Project ADT, which is the threshold if the street segments carry fewer than 999 daily trips despite the fact that the street segments may carry more than 999 daily trips. Detailed estimates of the Project's potential cut-through trips were prepared for the adjacent neighborhoods and further for each of the individual street segments, as discussed on pages 169–173 of the Transportation Assessment. Based on these estimates and conservative application of threshold assumptions, the Transportation Assessment concluded that the Project could potentially add more than 120 daily trips to six residential streets. In order to minimize these potential cut-through effects, the Project would fund two neighborhood traffic management studies and contribute toward the implementation of NTMP measures for the two areas identified in Figure 26 on page 176 of Appendix M.1, the Transportation Assessment, of the Draft EIR.

⁵⁸ See Section B of this Topical Response for a discussion of the methodology and scope of the residential cut-through analysis.

The Project's NTMP would be developed pursuant to LADOT requirements and procedures in coordination with LADOT, City Council District 5 staff, and affected neighborhood residents, and would include an implementation plan that sets forth key milestones and a process for the selection and approval of NTMP measures. The Applicant would work closely with LADOT and the residents in the two areas during the development of the NTMP to identify potential adverse local street conditions (e.g., cut-through trips, speeding, stop sign violations) and evaluate the measures available to minimize these issues. LADOT has a specific process in place, described in Section 3.5.5 of the TAG, that allows the neighbors most directly affected by a project's potential cut-through effects to be directly involved in the development, evaluation, and implementation of measures to minimize these types of issues. Because the implementation of NTMP measures requires the input and approval of the neighbors, it is not possible to specifically identify the type and locations of these neighborhood measures as part of the Draft EIR process. Given the non-CEQA nature of this analysis, it is also not required for CEQA purposes during the EIR process. The procedure for developing the NTMP involves community meetings between the potentially affected residents and LADOT, during which a mutually acceptable plan would be formed. Therefore, the preparation of the NTMP for the Project would occur after the Project has received final approval from the Los Angeles City Council, consistent with established LADOT and CEQA practice.

Typical NTMP physical measures may include, but are not limited to, traffic circles, speed humps, installation of barriers, speed tables, chicanes, chokers, roadway narrowing effects (raised medians, etc.), landscaping features, roadway striping changes, and/or operational measures such as turn restrictions, speed limits, and installation of stop signs. After a trial period, the neighbors can evaluate the effectiveness of the measures and modify the measures as necessary to better address their concerns. The NTMP process would be formalized through an agreement between the Applicant and LADOT prior to the issuance of any certificates of occupancy for the Project. Grading and construction permits may be issued while the NTMP studies are in process, again consistent with LADOT policy. This is consistent with the LADOT NTMP process, as described in Section 3.5.5 of the TAG.

Thus, the NTMP measures do not represent "deferred mitigation." Rather, these measures are non-CEQA measures consistent with the policies and procedures of LADOT. The requirement to prepare an NTMP for the two areas identified in the Draft EIR, in cooperation with the potentially affected neighbors, would be incorporated as a condition of approval for the Project as outlined on pages 8 and 9 of the LADOT Assessment Letter dated November 16, 2021 (Appendix M.2 of the Draft EIR).

B. Cut-Through Effects on Adjacent Neighborhoods

Commenters stated their concerns that Project trips could result in cut through traffic added to their local residential streets. As described in the TAG and summarized in the Draft EIR Transportation Assessment, an increase in ADT volumes on a local residential street can adversely affect the character and function of those streets. The objective of the residential street segment analysis included in the TAG (Section 3, Chapter 3.5) is to determine the Project's potential to add cut-through trips to the residential streets in the vicinity of the Project Site.

In consultation with LADOT, the Transportation Assessment discusses in detail the potential for cut-through trips and identifies five Local Streets and one Collector Street that might be subject to such trips, including the following:

North Neighborhood

- Genesee Avenue
- Stanley Avenue
- Rosewood Avenue—Collector Street
- Oakwood Avenue

West Neighborhood

- Edinburgh Avenue
- West 1st Street

The purpose of the NTMP process is to address the concerns of the neighbors regarding traffic and parking effects in the neighborhoods. The three problems most often cited by neighbors are cut-through traffic, speeding cars, and parking overflow.

The NTMP process is discussed in Section A, Deferred Mitigation, above. As stated therein, the Applicant would work closely with LADOT and the residents in the two neighborhoods during the development of the NTMP to identify potential adverse local street effects and evaluate the measures available to minimize such effects. As part of ongoing outreach prior to the formal commencement of the NTMP process, the Applicant will continue to identify NTMP concepts.

Impacts on Historic Neighborhood Designation

Please refer to Section E, Impacts to Historical Resources in the Vicinity of the Project Site, of Topical Response No. 5, Historical Resources, for a discussion of why potential cut-through trips would not result in a significant impact on the Beverly Fairfax Historic District.

C. Boundaries of the NTMP Areas

Commenters have suggested that the boundaries of the two NTMP areas should be expanded. Streets within these areas were identified based on the LADOT criteria for potential residential street cut-through impacts. Streets beyond the limits of the two areas identified are not expected to meet the criteria. The rationale for the selection of the areas to be studied for cut-through effects was reviewed and approved by LADOT in their November 16, 2021 Assessment Letter (Appendix M.2 of the Draft EIR).

The two residential areas located to the north and west of the Project Site that were identified in the non-CEQA portion of the Transportation Assessment (Appendix M.1 of the Draft EIR) meet the LADOT criteria for the evaluation of potential cut-through trips. The Transportation Assessment was prepared pursuant to LADOT's TAG, which establishes the guidelines and methodology for assessing transportation impacts for development projects. As discussed above in Section A, Deferred Mitigation, the evaluation of residential cut-through trips is a non-CEQA analysis required under the TAG. Regarding the criteria for evaluation, per Chapter 3.5 of the TAG, when selecting residential street segments for analyses during the Transportation Assessment scoping process, all of the following conditions must be present:

- “The project is located along a currently congested Boulevard or Avenue and adds trips that may lead to trip diversion to parallel routes along residential Local Streets. The congestion level of the Boulevard or Avenue can be determined based on the estimated peak hour LOS under project conditions of the study intersection(s). LOS E and F are considered to represent congested conditions;
- “The project is projected to add a significant amount of automobile traffic to the congested Boulevard(s), Avenue(s), or Collector(s) that could potentially cause a shift to alternative route(s); and
- “Nearby local residential street(s) (defined as Local streets as designated in the City's General Plan passing through a residential neighborhood) provide motorists with a viable alternative route. A viable alternative route is defined as one which is parallel and reasonably adjacent to the primary route as to make it

attractive as an alternative to the primary route. LADOT has discretion to define which routes are viable alternative routes, based on, but not limited to, features such as geography and presence of existing traffic control devices, etc.”⁵⁹

Vehicular access to the Project Site would be provided along the Project perimeter on Fairfax Avenue, Beverly Boulevard, and The Grove Drive, all of which are designated Avenues or Collector Streets in the City’s Mobility Plan. Additional access would also be provided along the Southern Shared Access Drive. Residential uses are located in areas to the north of Beverly Boulevard, to the east of the Project Site, and in areas to the west of Fairfax Avenue. Residential uses are also located south of the Project Site, but are generally separated by local and regional commercial, entertainment, and cultural land uses. The residential streets provide connectivity to major streets in the vicinity and provide potential alternatives to Crescent Heights Boulevard, Fairfax Avenue, La Brea Avenue, Melrose Avenue, Beverly Boulevard, and West 3rd Street.

As discussed in Section 5C of the Transportation Assessment, the residential streets in the west and north neighborhoods of the Project Site were examined for the availability of parallel local streets that could be used as a cut-through route to avoid arterial congestion.

The residential neighborhood to the northeast of the Project Site between Beverly Boulevard and Melrose Avenue was also investigated for potential cut-through effects, but the north-south residential streets east of the Project Site do not offer the same travel time savings as do the selected streets. Figure 19 on pages 69–72 of the Transportation Assessment shows the assignment of Project trips through each of the 28 study intersections analyzed in the report.⁶⁰ Of the approximately 9,733 net new daily trips⁶¹ generated by the Project, a total of 3 percent of the daily trips would be generated within the 40-block neighborhood bounded by Melrose Avenue, La Brea Avenue, Beverly Boulevard, and Curson Avenue. These approximately 292 trips ($9,733 \times 0.03 = 292$ daily trips) would be spread out among the 10 north-south residential streets serving the neighborhood, and these trips would not be considered “cut-through” trips because they

⁵⁹ LADOT, Transportation Assessment Guidelines, August 2022, page 3-19. These criteria are identical to those included in the previous version of the TAG dated July 2020, which is the TAG version used in the preparation of the Transportation Assessment for the Project.

⁶⁰ Figure 19 specifies trip distribution for the studio-related uses (i.e., all except retail uses). For the purposes of this supplemental neighborhood analysis, the studio-related distribution from Figure 19 was assumed to apply to trips generated by all land uses. This is a conservative assumption, as the retail trips are assumed to be local-serving, with shorter trip lengths that are less likely to cut through neighborhoods.

⁶¹ As used in Section 5C and shown in Table 13 of the Transportation Assessment. This includes both studio-related and retail trips.

would have originated within the neighborhood itself. A cut-through trip through the northeast neighborhood would have to be a diversion from the La Brea Avenue corridor. Figure 19 shows that 10 percent of the trips are assigned through the La Brea Avenue corridor north of Beverly Boulevard. The La Brea Avenue corridor north of Beverly Boulevard would handle approximately 973 net new Project trips per day, and with 10 north-south local residential streets west of La Brea Avenue, more than half of the La Brea Avenue trips would have to cut through the neighborhood for multiple local streets to reach the cut-through traffic threshold, which is highly unlikely. After intersection and traffic signal system improvements in the Beverly Boulevard corridor, Table 18 on pages 162 and 163 of the Transportation Assessment shows that the Future with Project performance of the Beverly Boulevard corridor would be at LOS B and C. This performance level would not provide the travel time savings to make a diversion through the neighborhood worthwhile. Thus, diversion through the northeast neighborhood is not expected to occur at the levels that would meet City thresholds.

The neighborhood to the east of the Project Site is separated from the Project Site by Pan Pacific Park. Approximately 20 percent of the Project trips would travel to and from the Project Site via 3rd Street. However, Table 18 shows that Future with Project performance levels along 3rd Street are generally LOS A–C, so there is very little reason to cut through the neighborhood between 3rd Street and Beverly Boulevard when a faster trip could be completed via 3rd Street and The Grove Drive.

The potential for cut-through effects south of the Project Site is minimal because the private residential streets within Park La Brea are gated, only allowing residents and approved guests in or through.

Thus, in accordance with the TAG, a total of 11 residential street segments in the north and west neighborhoods were selected for detailed analysis. These street segments are shown in Figure 26 on page 176 of the Transportation Assessment and include all nearby residential street segments classified as Local Streets (and one Collector Street) where Project trips could travel because it provides a viable alternative to a major street. Other residential streets may carry sporadic Project trips, but not in great enough volume to potentially meet City thresholds for excessive effects.

The trip estimates for the residential streets that met the TAG criteria are included in Tables 21 and 22 on pages 177 and 178 of the Transportation Assessment. The Transportation Assessment acknowledges that the existing, pre-Project traffic conditions along both Beverly Boulevard and Fairfax Avenue adjacent to the Project Site are congested, and the Project would add trips to these corridors. In accordance with the TAG, the Transportation Assessment identified certain streets within the adjacent residential neighborhoods that might serve as alternative routes to these two arterial streets. Therefore, the Applicant would be required to fund and coordinate the implementation of an

NTMP for the two areas identified in the Transportation Assessment. Consistent with LADOT and the City's practice, the NTMP would be developed after Project approval and with the coordination and participation of the affected neighbors, as described in LADOT's Assessment Letter dated November 16, 2021.

Topical Response No. 10. Trip Generation

A. Empirical Data

Commenters suggested that the use of empirical trip generation data developed at a different studio campus in Los Angeles should not have been applied to the Project, and that the Transportation Assessment undercounts Project trip generation. However, the use of the rates in question as the basis of the analysis in the Draft EIR was valid and consistent with LADOT and CEQA policy and precedent. As described throughout the Draft EIR, the Project consists of five land uses, each with distinct trip-generating characteristics: sound stages, production support, production office, general office and retail. As discussed in Section IV.K, Transportation, and the Transportation Assessment, included as Appendix M.1, of the Draft EIR, the trip generation rates for sound stages, production support, and production office were based on empirical studies of trip generation at other existing and approved modern studios in Los Angeles, because standard publications, such as the Institute of Transportation Engineers Trip Generation Manual, do not provide data for studio-related uses. These rates are found in the *Transportation Study for the NBC Universal Evolution Plan Environmental Impact Report* (Gibson Transportation Consulting, Inc. and Raju Associates, Inc., March 2010) and have been used in a variety of more recent analyses for production studios in Los Angeles, including the *Transportation Study for the Paramount Pictures Master Plan* (Gibson Transportation Consulting, 2015). These reports were prepared by Gibson Transportation Consulting, a traffic engineering firm in Los Angeles with substantial experience evaluating the trip profile of studio properties, who also prepared the Transportation Assessment for the Project. The trip generation rates were also evaluated and approved for use in the Draft EIR by LADOT as part of the MOU process as documented in Appendix A of the Transportation Assessment (Appendix M.1 of the Draft EIR).

Project trip generation estimates for the general office and retail land uses were prepared using rates from the *Trip Generation Manual, 10th Edition* (Institute of Transportation Engineers, 2017) per LADOT guidelines, while locally developed rates were used for the sound stages, production support, and production office land uses. The 10th Edition of the Trip Generation Manual was the latest approved version in use when the Draft EIR was published. It should be emphasized that the trip generation rates derived from empirical data collected at the other Southern California studio sites or the trip generation rates included in the Institute of Transportation Engineers *Trip Generation Manual, 10th Edition* both include all vehicular movements to/from the subject sites or land uses. The trip generation rates include the total movements generated by automobiles, vans, large trucks, and small trucks. The Project trip generation estimates summarized in Tables 6 and 7 on pages 81 and 82 of the Transportation Assessment (Appendix M.1 of the Draft EIR) therefore include the total vehicular trips of all types of vehicles. The use of empirically developed rates from another studio is fully consistent with the TAG and CEQA.

The TAG states, “[u]nique types of development may require trip generation studies of similar facilities in order to establish a trip rate for use in the analysis. These developments may include land uses for which trip generation rates are not available in the ITE Trip Generation manual,” referring to the latest approved version of the *Trip Generation Manual* by the Institute of Transportation Engineers.⁶²

The trip generation rates used for the proposed studio uses were established in 2009 as part of the NBC Universal Vision Plan Project Trip Generation Model (NBCU Trip Model) and have been used in a variety of more recent analyses for production studios in Los Angeles. Trip counts were conducted at all the driveways serving the NBC Universal site and the volumes were compared to the square footage totals of the various studio land uses on the site. By comparing the total volume of vehicles using each driveway to the land use types and amounts of development served by each driveway, a trip rate by land use was developed. The driveway volumes and trip rates were independently verified by LADOT who conducted their own driveway trip counts.

NBC Universal is a larger studio than Television City currently, with over 1,600,000 square feet of studio-related uses at the time the rates were developed, as compared to less than 600,000 square feet of existing studio-related uses at the Project Site. As such, the rates developed at NBC Universal were based on much larger samples and are therefore more statistically valid. NBC Universal had similar features to the Project Site (both the existing studio and as proposed with the Project), including sound stages (including studio audience participation, which is discussed in detail below), production support, production office, and general office. The NBCU Trip Model developed rates for peak hour and daily trips for sound stages, production support, and production office uses and recommended the use of the Trip Generation Manual for general office uses. These rates were reviewed and approved by LADOT for use in traffic studies and environmental analyses for NBC Universal,⁶³ Paramount Pictures,⁶⁴ Sunset Gower Studios,⁶⁵ and other studios.

⁶² The Transportation Assessment used the 10th Edition of Trip Generation Manual published in 2017. The 11th Edition was published in September 2021, less than one month prior to the final draft of the Transportation Assessment, and long after the analysis results were finalized. Nonetheless, the trip generation rates for general office in the 11th Edition are lower than those in the 10th Edition, so the use of the older rates results in higher Project trip generation estimates and a more conservative analysis.

⁶³ Gibson Transportation Consulting and Raju Associates, Transportation Study for the NBC Universal Evolution Plan EIR, March 2010.

⁶⁴ Gibson Transportation Consulting, Transportation Study for the Paramount Pictures Master Plan, August 2015.

⁶⁵ Gibson Transportation Consulting, Transportation Impact Study for Sunset Gower Studios Preservation and Enhancement Plan, October 2018.

The applicability of the NBCU Trip Model rates to the Project was tested by applying the rates to the existing on-site land uses within the Project and comparing those results to empirical driveway counts collected at the Project Site driveways over multiple days. For informational purposes and to address comments on the Draft EIR, Table II-4 beginning on page II-141 summarizes the trips counted at the Project Site driveways (surveyed over three weekdays in September 2019, prior to the COVID-19 pandemic, and provided in Appendix FEIR-5, TVC Driveway Counts) compared with the estimates of trip generation from existing uses using the established NBCU Trip Model rates described above. As shown in Table II-4, the total daily trip estimate using the established NBCU Trip Model rates exceeds the three-day average driveway trip generation for the Project Site by nearly 11 percent. The afternoon peak-hour estimate using the established NBCU Trip Model rates exceeds the three-day average driveway trip generation for the Project Site by nearly 20 percent. (The inbound trip estimate substantially exceeds the three-day average trip generation, showing that the NBCU Trip Model assumed more late afternoon arrivals—such as for studio audience visits—than actually occur at the Project Site.) The morning peak-hour estimate using the established NBCU Trip Model rates is lower than the three-day average driveway trip generation for the Project Site by less than 10 percent. Therefore, the NBCU Model predicts higher Project trips for five of the seven directional traffic flow patterns tested. Of the two directional flows where the model underestimates the actual traffic volumes, much of the difference could be attributed to the transit/walk-in adjustments taken for the existing land uses. Without the adjustments applied to these two land uses, the model predictions and the actual driveway counts would be within approximately 4.8 percent for the morning inbound and an exact match for the afternoon outbound flow. While the transit/walk-in adjustments are appropriate for future conditions with the Project when the Metro D (Purple) Line Wilshire/Fairfax Station currently under construction is open and in light of the Project's TDM Program that would include shuttles buses connecting the Project Site to the station, this adjustment may overstate the effectiveness of transit for the existing site. Thus, the NBCU Trip Model rates are indeed appropriate, if not conservatively high, for use in the estimation of future Project trips. Therefore, the studio trip generation rates from the NBCU Trip Model were approved by LADOT for use in the Project's Transportation Assessment.

However, even if the trip generation rates were adjusted to exactly align with the driveway counts, this would not affect any of the impact conclusions presented in the Draft EIR. Five environmental impact areas depend to some degree on trip generation estimates:

- The transportation analysis presented in Section IV.K is based on VMT, the analysis of which is based solely on the conservative daily trip generation estimates using the NBCU Trip Model rates.
- The air quality analysis presented in Section IV.A is based on the conservative daily trip generation estimates using the NBCU Trip Model rates.

- The energy analysis presented in Section IV.C is based on the conservative daily trip generation estimates using the NBCU Trip Model rates.
- The GHG emissions analysis presented in Section IV.E is based on the conservative daily trip generation estimates using the NBCU Trip Model rates.
- The noise analysis presented in Section IV.I accounts for peak-hour trip generation estimates using the NBCU Trip Model rates.

Four of the five environmental impact areas above only use daily trip generation estimates for the CEQA analysis, and, as shown in Table II-4 beginning on page II-141, the NBCU Trip Model rates estimated higher daily trips than were actually counted at the Project Site driveways. As discussed above, the Draft EIR calculated Project trips based on the NBCU Trip Model rates and, therefore, the analyses that used the daily trip estimate are conservative. The noise analysis used an average of morning and afternoon peak-hour trip generation to estimate the daily trips at analyzed roadway intersections to evaluate off-site vehicle noise. If the morning peak-hour trip generation estimate were to be increased by 9.5 percent (the difference of 45 A.M. peak-hour trips shown in Table II-4), it would increase the total estimate of off-site vehicle trips by approximately 5 percent (due to averaging the morning and afternoon peak-hour trip generation estimates). The noise increase due to the 5-percent increase in off-site vehicle trip generation would be approximately 0.2 dBA. However, the overall noise levels increase at the off-site roadway segments would be less than 0.1 dBA, when taking into account the existing vehicle trips. Based on the results of the noise impact analyses in Table IV.I-16 through Table IV.I-18 in Section IV.I, Noise, of the Draft EIR, the maximum noise increase due to Project traffic would be 1.0 dBA CNEL (along The Grove Drive). As such, the estimated slight increase in vehicle trips (5-percent increase) would result in a maximum noise level increase of 1.1 dBA CNEL (along The Grove Drive), which would not change the findings of no significant impacts due to roadway traffic noise (Table IV.I-16 and Table IV.I-17) or composite noise (Table IV.I-18).

Similar to other studio campuses, the Project Site hosts production-related events on a regular basis. Small events hosted by productions utilizing the studio space may include meet-and-greets and other small-scale events that occur in the normal course of a studio production. They are typically hosted within the stages used by a given production, often on weekday evenings. There are also infrequent larger production-related events, such as production finale parties, production-related experiences, and studio dedications. Historically, these larger events have hosted up to approximately 300 attendees and have occurred approximately five times per year at the Project Site, typically on nights or weekends.

These production-related events are not separately accounted for in the trip generation estimates because they occur regularly (i.e., they are considered to be inherent

in the NBCU Trip Model). Nonetheless, these events are typically held outside of the peak time periods for the Project Site (i.e., they are typically held on nights and weekends) and thus would not affect peak-hour traffic conditions on the adjacent streets. Parking for these events can be accommodated within the Project Site. These events also do not affect the VMT analysis in the Draft EIR because the VMT analysis focuses on home-to-work employee trips. Trips from infrequent larger production-related events are not relevant for purposes of the CEQA VMT analysis because these trips are not home-based work attraction trips and would not affect the daily work VMT per employee calculation that is used to determine the Project's VMT impact.

B. Visitor Trips

Contrary to the claims made by commenters, visitor trips, including those from studio audience visitors, were accounted for in the Project trip generation and VMT estimates. As described above, the trip generation estimates were based on the rates from the NBCU Trip Model, which has been approved by LADOT for use in several traffic studies in recent years for studio projects in Los Angeles. These rates are based on empirical data collected at NBC Universal Studios and account for all of the operations that occur at a typical studio campus, including studio employee trips, third-party production employee trips, all production-related and production support vehicles including trucks, and both office visitor trips and studio audience visitor trips. NBC Universal, like the existing Project Site, operates studios that have audience members, and audience participation trips were explicitly incorporated into the NBCU Trip Model (it included daily and afternoon peak-hour trips).⁶⁶

Unless otherwise specified, references to trip generation and travel mode throughout the Draft EIR referred to employee and visitor trips, which were presented together (see, for example, page IV.K-35 of the Draft EIR). The information presented below adds detail to the visitor and audience information presented in the Draft EIR in response to comments requesting such information. The level of detail presented below is typically not included in a transportation assessment report even though the visitor trips themselves are included in the detailed CEQA analyses of the Project's air quality, noise, and transportation operational impacts. Therefore, there is no new information presented herein that would affect the conclusions and results presented in the Draft EIR.

The comments express concerns about the numbers of daily visitors, and many of these comments incorrectly state that there would be over 5,000 visitors and audience members per day with the Project. However, the actual number of visitors and audience

⁶⁶ Gibson Transportation Consulting and Raju Associates, Transportation Study for the NBC Universal Evolution Plan EIR, March 2010, Appendix I—Project Trip Generation, Page I-2 and Table A-5.

members under the Project would be far less; based on empirical data and historic trends collected by the studio, the number of daily trips associated with studio audiences and other visitors would be a small fraction of the Project's total trips, as discussed below.

Currently, there are six shows filmed at the Project Site that use studio audiences. These shows are summarized in Table II-5 on page II-146, including the pre-COVID attendance numbers and schedules.⁶⁷ As shown in Table II-5, these shows range from approximately 100 audience members to approximately 450 audience members per taping. There is an inverse correlation between the size of the audience and the number of times a particular show is filmed per year—the three shows with 300 or more audience members only film eight to 10 times per year. The three shows with 150 or fewer audience members film a combined total of approximately 424 times per year (including 28 full-audience rehearsal days and 28 live tapings for *Real Time*).

The existing shows tape during different times of the day and the taping generally occurs between noon and 7 P.M. These shows tape on varying days of the week, though only one show tapes on the weekend and that show only tapes eight times per year. These shows may also film during different times of the year, as every show is different and has its own unique needs. Spring and fall tend to be the most active time for the taping of audience shows.

As shown in Table II-5, over an entire year, there are a total of approximately 59,100 audience visitors, including approximately 55,500 on weekdays and approximately 3,600 on weekends. Table II-6 on page II-147 summarizes the average audience totals by time of day and weekend vs. weekday. As shown therein, there are approximately 161 audience members on average at the Project Site on typical weekdays during the day, bringing approximately 73 vehicles to and from the Project Site (assuming an industry-wide average of 2.2 visitors per vehicle)⁶⁸ on approximately 260 days of the year.⁶⁹ There are an average of approximately 149 audience members on approximately 92 weekday evenings per year bringing in an additional approximately 68 vehicles on those days. On eight weekend evenings per year there are approximately 450 audience members bringing

⁶⁷ Current audience levels in 2023 on the *Late Late Show*, *Real Time*, and *The Price is Right* are approximately 40 percent lower than the pre-COVID levels.

⁶⁸ Vehicle occupancy counts at event centers and entertainment venues across Southern California consistently show average occupancy levels between two and three persons per vehicle. Similarly, the vast majority of studio audience members arrive in groups of two or more people, including many groups of four traveling together. Therefore, an average vehicle occupancy of 2.2 was conservatively assumed for the conversion of audience participants into vehicle trips and parking demand.

⁶⁹ There are approximately 260 weekdays in a year. On many of those days multiple shows with studio audiences would be filmed, and on some days none would be filmed.

**Table II-5
Existing Audience Participation Shows**

Show Name	Maximum Audience per Show	Shows per Year	Days Filmed	Times Filmed	Total Maximum Annual Audience Members
<i>Late Late Show</i>	125	152	M–Th	Afternoon	19,000
<i>Real Time^a</i>	150	56	Th–F	Afternoon	8,400
<i>The Price is Right</i>	100	216	M–W	Morning, Afternoon, Evening	21,600
<i>Dancing with the Stars</i>	350	10	M	Evening	3,500
<i>So You Think You Can Dance</i>	300	10	Th	Evening	3,000
<i>American Idol</i>	450	8	Su	Evening	3,600
Total					59,100
<p><i>Data represents audience levels in 2019 prior to the COVID-19 pandemic.</i></p> <p><i>^a The 56 annual shows represents 28 rehearsals and 28 live tapings. The rehearsals occurred on Thursdays and the live filming occurred on Fridays, both with full audiences.</i></p> <p><i>Source: Interview with Michael Klausman, President, Television City.</i></p>					

approximately 205 vehicles. There are no audience members on the Project Site during the weekend days. The vast majority of audience trips occur outside of the morning and afternoon peak hours due to the times of day these audience shows are recorded and the typical requirement for audience members to arrive very early (thus, even evening recordings have arrival times earlier than the afternoon peak hour and typically have departure times later than the afternoon peak hour).

While studio audience shows have been an important part of the existing studio operations for many years, the shows summarized in Table II-5 only use approximately half of the existing stage space at the Project Site, and much of that space is only used for such shows for a portion of the year.

The Project would include the development of new sound stages, and, therefore, the number of studio audience shows is expected to increase as compared to existing conditions. Assuming the maximum permitted sound stage floor area (450,000 square feet) is constructed, it is estimated that the amount of studio audience shows within the Project Site would approximately double from current levels.⁷⁰ As such, and as shown in

⁷⁰ Estimate provided by the Applicant and its affiliate MBS, Inc., the largest operator of studios in the nation and in the world. Television City has been known throughout its history for live broadcast television, so (Footnote continued on next page)

**Table II-6
Existing Daily Average Audience Totals**

Time Period	Maximum Total Audience per Year	Approximate Filming Days per Year	Maximum Average Audience per Filming Day	Maximum Average Audience Vehicles^a
Weekday Daytime ^b	41,800	260	161	73
Weekday Evening ^c	13,700	92	149	68

Table II-7 on page II-148, there would be a weekday daytime average of approximately 427 audience members and 194 vehicles (388 total daily trips) associated with studio audiences with the Project. The busiest day would be a weekday that served all audience shows with daytime taping (i.e., *The Late Late Show*, *Real Time*, and *The Price is Right*). Therefore, the assertion that the Project would attract over 5,000 daily visitors/audience members is not supported by any of the current activity levels or the future plans for the Project Site. The CEQA analysis in the Draft EIR is based on work VMT per employee and audience trips (as minor peripheral and intermittent trips) do not typically enter into the CEQA VMT analysis for employment centers, just as office visitors for business purposes (another type of minor peripheral and intermittent trip) are not separately analyzed. However, as noted above, the NBCU Trip Model directly accounted for the trips associated with studio audiences and was used to calculate the daily Project trip generation used as a custom land use input to the VMT Calculator.

audience shows covet the opportunity to shoot at Television City. However, the proposed sound stages would be modern sound stages dimensioned for a range of production types including single-camera shows and feature films. The estimate of audience activity doubling is based on the increase in total sound stage square footage and the history of live television and other production types at Television City.

Similarly, the NBCU Trip Model incorporated audience trips into the afternoon peak-hour rates which were used in the non-CEQA operational analysis. Very few audience trips occur during the peak commute hours, and they add little to the congestion in the area.

C. Special Events

Commenters claim that special events were not accounted for in the trip generation estimates. However, regular production-related events were accounted for in the trip generation estimates, as discussed above. Further, non-regular special events would continue to occur as they do under existing conditions. These events would continue to be governed by the LAMC and existing applicable regulations, and thus these events do not need to be analyzed in the EIR.⁷¹ Historically, the Project Site has hosted approximately

⁷¹ See CEQA Guidelines Section 15125, which states that the existing environmental setting “will normally constitute the baseline physical conditions by which a lead agency determines whether an impact is significant.”

three non-production-related special events per year with up to 5,000 attendees. These events typically occur on nights or weekends when studio-related activity is minimal.⁷² They are often charity-related and require special event permits that generally require approval from the Los Angeles Department of Building and Safety, Department of City Planning, Bureau of Street Services, Los Angeles Fire Department (LAFD) and Los Angeles Police Department (LAPD). These events are evaluated on a case-by-case basis consistent with existing applicable City policies and requirements by the various City departments, and the proposed Specific Plan would not provide the Project with additional authority related to special events in any way, nor does it propose any change in regulations with regard to special events. Because there would be no change compared to existing conditions, no additional analysis is required as part of this EIR.

D. Basecamp Trips

Commenters claim that trip generation for production basecamp space was not accounted for in the trip generation estimates for the Project. However, production basecamp space is ancillary to the sound stages and is common to all studio uses. A production basecamp is an inherent component of the studio campus and studios in general. As stated on page II-7 in Section II, Project Description, of the Draft EIR, production activities occur both indoors and outdoors within the Project Site and include basecamp areas where mobile facilities such as trucks and support vehicles related to production are temporarily staged. Many of the production vehicles using basecamp space do not arrive and depart on a daily basis, but are parked for the duration of a production, often weeks or months. As is typical of studio environments, the land uses are centered around production operations, including associated parking, loading, storage and related basecamp activities. Basecamps are defined areas at, near, or within a filming location where production activities can be coordinated. These basecamp areas include, but are not limited to, loading, wardrobe, hair, makeup, craft service, parking, storage of mobile facilities, and support vehicles all related to production activities. All of these basecamp activities support production and are necessary for a studio to function. The amount of basecamp space is proportional to the amount of stage space and is intended to allow for efficient production operations and internal circulation. Importantly, basecamp activities do not generate any external vehicular trips or impacts themselves; rather, the primary studio uses encompass all related production activities that occur within the basecamp areas. In the same manner, a parking structure serving an office building does not generate its own trips, but rather serves the trips generated by the office building itself. The trips in/out of the parking garage are included in the trip generation rate for the office building and the parking garage is simply an ancillary use to the office building. The same relationship occurs between the basecamp areas and the sound stages/production support space. In

⁷² Interview with Michael Klausman, President, Television City.

other words, the basecamp trips were included in the trips associated with the sound stages and production support space. The independent variable in calculating the number of trips in all studio transportation analyses has been the square footage of sound stage and production support space and not the amount of basecamp space. Trip counts conducted at other studio campuses all included the trips in/out of the basecamp areas within the various studio campuses studied.

Therefore, the trips associated with the basecamp space are already included in the trip generation rates and estimates for the sound stage and production support uses included in Section IV.K, Transportation, of the Draft EIR.

E. Truck Trips

There were several comments claiming that truck trips were not included in the trip generation estimates and questions about how many truck trips the Project would generate. Truck trip estimates were based on counts of existing truck activity collected at the Project Site over three days in 2019, as provided in the Truck Trips Memorandum included as Appendix FEIR-6. These counts were collected along with the counts included in Appendix B of the Transportation Assessment (Appendix M.1 of the Draft EIR). Although these counts were not separately included as an appendix in the Draft EIR, they were used in the Draft EIR to confirm that the NBCU Trip Model produced trip generation estimates that are consistent with existing vehicle counts at the Television City driveways and to evaluate truck activity. The counts identified “heavy” and “light” trucks, with the distinction that heavy trucks had a trailer while light trucks were fixed-frame or “single-unit.” The information presented below adds detail to the truck information presented in the Draft EIR in response to comments requesting such information. The level of detail presented below is typically not included in a CEQA transportation assessment even though the truck trips themselves are included in the comprehensive CEQA analyses of the Project’s air quality, noise, and transportation operational impacts. Information about the truck trip generation estimates may be found in Appendix FEIR-6.

Currently, most trucks access the Project Site via the driveway on Beverly Boulevard at Genesee Avenue. The largest trucks, which only arrive and depart on an infrequent basis (weekly or less), use the driveway on Fairfax Avenue at the southwest corner of the Project Site. With the Project, trucks would have the ability to enter the Project Site from Fairfax Avenue, Beverly Boulevard, and The Grove Drive, and internally traverse the Project Site to get to a specific location.

The existing site counts are summarized in Table II-8 on page II-151 and provided in Appendix FEIR-6. As shown therein, there were between 55 and 80 light truck trips per day, for an average of 65 trips per day representing approximately 33 trucks. There was an average of 13 heavy truck trips per day representing approximately seven trucks.

**Table II-8
Existing Daily Truck Trips at Project Site**

Day	Heavy Trucks	Light Trucks	Light Truck Split	
			5-Ton	10-Ton
Day 1 (September 10, 2019)	11	55	18	37
Day 2 (September 11, 2019)	16	60	20	40
Day 3 (September 12, 2019)	12	80	27	53
Average	13	65	22	43
<i>Truck trips shown are the sum of inbound and outbound trips. Source: Gibson Transportation, Inc., 2023.</i>				

Based on supplemental data provided by MBS, Inc.,⁷³ approximately one third of light trucks for studio uses tend to be five-ton trucks and the remaining two thirds are 10-ton trucks, so Table II-8 further breaks down the light truck trip totals using those proportions.

The Project increases the size of the on-site development envelope and also increases the proportion of office space within the resulting land use mix. Therefore, the existing truck trips were used as a basis to estimate Project truck trips. The existing and proposed land use mix are summarized in Table II-9 on page II-152.

Based on the increases in total on-site development, the light truck activity at the Project Site is estimated to approximately double with completion of the Project, while heavy truck activity would approximately triple. The resulting truck trip estimates with full buildout of the Project are shown in Table II-10 on page II-152. The total number of trucks generated by the Project was included in the analysis in the Draft EIR, but the additional detail in terms of the breakdown of trucks by size as shown in Table II-10 is included herein in response to specific comments from the public on the Draft EIR.

The truck trip forecasts are daily forecasts. Based on the existing counts from September 2019, truck trips occur as early as 4:00 A.M. and as late as 9:00 P.M., with the highest concentration between approximately 8:00 A.M. and 2:00 P.M. As a result, truck trips are dispersed throughout the day and do not tend to concentrate in any particular hour.

⁷³ MBS, Inc., an affiliate of the Applicant, is the largest operator of sound stage and studio campuses in the nation and in the world. MBS, Inc. provided the breakdown of truck types and sizes of trucks servicing studio campuses. The heavy truck totals for TVC were based on actual counts at the Project driveways, and the MBS data was used to split the light truck driveway counts into 5-ton and 10-ton truck categories.

**Table II-9
Existing and Proposed Land Use Mix**

Land Use Mix	Existing		Project	
	Total (sf)	Percent	Total (sf)	Percent
Sound Stage	95,540	13%	350,000	19%
Production Support	325,450	44%	104,000	6%
Production Office	163,090	22%	700,000	37%
General Office	159,600	21%	700,000	37%
Retail	0	0%	20,000	1%
Total	743,680		1,874,000	
_____ <i>sf = square feet</i> <i>Source: Gibson Transportation, Inc., 2023.</i>				

**Table II-10
Existing and Project Daily Truck Trip* Estimates**

Scenario	Heavy Trucks	5-Ton	10-Ton	Total
Existing	13	22	43	78
Existing plus Project	36	44	86	166
Net New	23	22	43	88
_____ <i>*Truck trips shown are the sum of inbound and outbound trips.</i> <i>Source: Gibson Transportation, Inc., 2023.</i>				

In summary, the gross trip generation upon completion of the Project would be approximately 13,454 trips per day (see Table 13 of the Transportation Assessment [Appendix M.1 of the Draft EIR]) of which approximately 166 daily trips would be truck trips (Table II-10). These truck trips make up approximately 1.2 percent of the total Project Site daily trip generation and are already included in the Project trip generation levels studied in the Draft EIR.

Topical Response No. 11. Transportation Demand Management

Commenters expressed concern that the Project's transportation analysis took too much trip-reduction credit resulting from the application of TDM techniques and that transit ridership estimates were unrealistically high. The TDM trip reductions were applied in two instances:

1. Daily Trips. The City of Los Angeles' VMT Calculator estimates the level of trip reduction that is likely for each project proposed in the City. The VMT Calculator uses the land use mix of the proposed project, its location within the region, and the level of transit existing and proposed in the vicinity of the site to determine the appropriate level of trip reduction for each project. The VMT Calculator is equally applied to every project in the City of Los Angeles and the trip-reducing characteristics of individual projects are calculated within the model and are not subject to outside adjustments.
2. Peak Hour. The peak-hour traffic analyses used in the non-CEQA operational analysis of potential Project traffic impacts utilized a 15-percent transit/walk-in trip adjustment, consistent with LADOT policy on TDM reductions.

Comments suggested that a high estimate of transit ridership was assumed in order to make the Project's transportation impacts look smaller. That is not the case. Both the daily and the peak-hour trip estimates assumed a similar 15-percent adjustment, which is the level approved by LADOT for a major project in a comparable location in the City.⁷⁴

A more extensive TDM Program was outlined in the Transportation Assessment (Appendix M.1 of the Draft EIR on pages 114 to 118) but the effects of this more extensive program were conservatively not applied to the Project trip levels analyzed in the Draft EIR. Thus, while the more extensive TDM Program is a Project requirement, as outlined on pages 4 to 6 of the LADOT Assessment Letter (Appendix M.2 of the Draft EIR), no trip reductions resulting from the full TDM Program were applied to the Project trip levels evaluated in the Draft EIR.

The technical analyses covering air quality, GHG, noise, and energy appropriately include the 15-percent adjustment or the VMT Calculator trip reduction depending on whether these analyses used daily or peak-hour traffic levels.

⁷⁴ Los Angeles Department of Transportation, Transportation Assessment Guidelines, August 2022, page 3-11.

A. TDM Effects on Trip Generation

Commenters have questioned the validity of the assumption in the Transportation Assessment, which is included in Appendix M.1 of the Draft EIR, that 15 percent of trips to and from the Project Site would be made by public transit and/or walk-in trips. However, the trip generation estimates in the Draft EIR, including the 15-percent transit/walk-in adjustment, were approved by LADOT and comply with the TAG and CEQA.

The TAG identifies the transit and walk-in adjustment based on trip generation studies conducted in Los Angeles in comparison to the national research database found in the *Trip Generation Manual, 10th Edition*.⁷⁵ Because data for most of the land uses in the *Trip Generation Manual* is based on suburban projects, LADOT recommends adjustments to those rates based on the urban setting in the City of Los Angeles and based on a particular project's proximity to transit. The TAG allows the following adjustments to trip generation rates:⁷⁶

LADOT encourages project applicants to design and construct transit-friendly Projects that create safe and walkable site design and facilities that connect Project patrons to and from transit stations and stops. Consistent with City policy goals to promote the use of transit and walking, LADOT, at its discretion, may allow up to a 25% transit/walk trip generation reduction, subject to the following guidelines, on a case by case basis:

- Developments above or adjacent to a Metro Rail, Metrolink, or Orange Line station, or to a similar dedicated transit line station with convenient pedestrian access to the station may qualify for a maximum 25% trip generation adjustment. The actual adjustment provided should be determined by an analysis of the transit service frequency and density at the specified transit station.
- Developments within a 1/4-mile walking distance of a transit station, or of a stop serving a Metro Next Gen Tier 1 service line, may qualify for up to a 15% trip generation adjustment. The actual adjustment provided will be determined by an analysis of the transit

⁷⁵ Institute of Transportation Engineers, *Trip Generation Manual*, 10th Edition, 2017.

⁷⁶ Transportation Assessment Guidelines, Los Angeles Department of Transportation, August 2022, pages 3-10 and 3-11. The analysis in the TAG is based on well-developed and detailed research into the effectiveness of TDM strategies as applied to Southern California and City of Los Angeles developments. That research is described in the technical documentation for the LADOT VMT Calculator which can be found at www.ladot.lacity.org. See: City of Los Angeles Travel Demand Model, Fehr & Peers, Model Development Report, February 2018; City of Los Angeles VMT Calculator Documentation, Version 1.3, May 2020; and Attachment G TDM Strategies in LADOT VMT Calculator.

service frequency and density at the specified transit station or a stop serving a Metro Next Gen Tier 1 service line.

- If the development project is not within ¼-mile walking distance of a transit station or a stop serving a Metro Next Gen Tier 1 service line but is within a ¼-mile walking distance of other public bus stops, the project may still qualify for up to 10% trip generation adjustment. The actual adjustment provided will be determined by an analysis of the transit service frequency and density at the nearby bus stop(s).

Transit trip adjustment will not be automatically granted to development projects located in an area with infrequent transit service. However, all reasonable efforts by the developer to promote the use of public transit or walking will be considered for transit adjustments on a case-by-case basis.

The Project qualifies for the 15-percent trip generation adjustment based on the existing and future transit service in the vicinity of the Project Site as articulated in the second bullet point above. As shown in Figure 12 on page 43 of the Transportation Assessment, the Project Site is directly served by Metro Rapid Line 80, Metro Local Lines 14, 217, and 218, as well as LADOT DASH and Citywide local buses. In addition, the LADOT Assessment Letter dated November 16, 2021 (page 5) requires the Project to connect the Project Site to the planned Metro D (Purple) Line Wilshire/Fairfax Station currently under construction approximately 0.8 mile south of the Project Site via a shuttle bus system. The Wilshire/Fairfax Station is scheduled to be open prior to the buildout of the Project. Even without the Project's TDM Program or without the opening of the Wilshire/Fairfax Station, the Project would still qualify for the 15-percent adjustment due to the nature and frequency of the existing bus transit service immediately adjacent to the Project Site. The 15-percent adjustment is therefore conservative given the Project's additional TDM measures and the forthcoming opening of the new Wilshire/Fairfax Station.

Based on the location of the Project in the densely populated Central APC area and the high level of bus transit service in the vicinity of the Project, the 15-percent trip generation adjustment was applied to the trip generation estimates for the sound stage, production support, production office and general office uses. This adjustment was approved by LADOT as part of the MOU established prior to commencement of the analysis. LADOT's approval of the adjustment is set forth in both the MOU, which is included as Appendix A in the Transportation Assessment for the Project (Appendix M.1 of the Draft EIR) and in LADOT's final Assessment Letter approving the Transportation Assessment dated November 16, 2021, and included in the Draft EIR in Appendix M.2.

Trip generation rates for sound stages, production support, and production office uses were developed empirically from other studios in Los Angeles, as discussed in Topical Response No. 10, Trip Generation.

In consultation with LADOT as part of the MOU process, trip generation estimates for the sound stage, production support, and production office uses in the NBC Universal Studios Evolution Plan and other subsequent studio development plans also included the 15-percent transit/walk-in adjustment based on a studio's location in proximity to major transit (bus and/or rail) and their locations in denser areas of the City. As demonstrated in Topical Response No. 10, Trip Generation, those rates were found to be applicable to the Project even when including the 15-percent transit and walk-in adjustment.

The 15-percent adjustment is applied in Tables 6 and 7 of the Transportation Assessment, which show net new Project trip generation estimates and gross total Project Site trip generation estimates, respectively. As shown therein, by adding together the adjustment associated with proposed new development and existing space to remain, the 15-percent adjustment represents a total of approximately 192 trips during the morning peak hour and approximately 207 trips during the afternoon peak hour.⁷⁷ These adjustments were only applied to the peak-hour trip generation estimates used in the non-CEQA transportation analysis for the Project, and, therefore, do not affect CEQA transportation impact conclusions. Daily Project trip generation estimates for use in the VMT Calculator's Custom Land Use feature did not include the transit and walk-in adjustments because the VMT Calculator internally calculates those adjustments based on the location of the Project within the metropolitan area and the level of transit nearby. The 15-percent adjustment was not applied to the VMT Calculator's Custom Land Use feature and there was no double counting of this adjustment, as commenters incorrectly asserted.

The 15-percent adjustment in peak-hour vehicular trips used in the non-CEQA transportation operational analysis is based on trip generation studies and traffic counts conducted in Southern California and is consistent with LADOT and CEQA policies and procedures. The TAG's allowable transit trip adjustments are employed where applicable in transportation assessments prepared for projects throughout the City. The 15-percent adjustment represents a conservative estimate given the location of the Project, the amount of existing and future transit service to the Project Site, and the TDM Program that would be implemented by the Project. Further, although the Project includes a robust TDM Program aimed at reducing individual vehicle trips, the VMT analysis in the Draft EIR conservatively excluded most of the TDM measures for the purpose of determining whether

⁷⁷ These transit adjustments are calculated by adding the total peak-hour adjustments for proposed new construction from Table 6 of the Transportation Assessment and existing uses to remain from Table 7 of the Transportation Assessment.

the Project could have a significant impact on VMT. The Draft EIR concluded that the Project's transportation impacts would be less than significant.

Project TDM Program

Comments requested clarification of the additional TDM measures that would be added by the Project beyond the minimum TDM strategies needed to achieve the 15-percent trip adjustment level. As previously stated, although the Project would include the TDM Program, the effects of this program were not considered in the transportation analysis in the Draft EIR (including the non-CEQA analysis of intersection operating conditions) in order to present a more conservative (i.e., higher) estimate of Project impacts.

The Project proposes to incorporate several TDM features to help reduce VMT and vehicle trips to and from the Project Site consistent with City and State of California (State) transportation and GHG policies and objectives. Some of the TDM measures are inherent in the Project design and some additional TDM measures would be incorporated into the Project's operation. The following measures, among others, would be included in the Project's TDM Program to reduce VMT:

- Educational Program/On-Site TDM Coordinator
- Transportation Information Center/Kiosks via Mobility Hub
- Bicycle Parking and Amenities
- Pedestrian Amenities
- Shuttle Service
- Ride-Share Matching and Carpool/Vanpool Program
- Neighborhood Enhancements
- First-Mile/Last-Mile Options
- Carpool/Vanpool Parking and Loading via Mobility Hub
- Guaranteed Ride Home Program
- Transit Infrastructure Improvements

These features are discussed in detail in Section 4B of the Transportation Assessment on pages 115–118 and on pages 5–6 of the LADOT Assessment Letter dated November 16, 2021. The effectiveness of these TDM measures is discussed below.

Trip Reductions from the TDM Program

The Transportation Assessment assumed a 15-percent transit/walk-in adjustment on peak-hour trip generation estimates used for the non-CEQA analysis of intersection operations, as allowed by LADOT. That analysis conservatively did not assume additional trip reductions from the Project's TDM measures. Similarly, the Project's VMT analysis presented in Section IV.K, Transportation, of the Draft EIR assumed the VMT reductions inherent in the VMT Calculator based on the Project's location and employment profile, but conservatively excluded the effects of the Project's TDM measures. Based on published research and City policy, both the non-CEQA and CEQA transportation analyses could have accounted for substantial additional trip and VMT reductions due to the Project's TDM Program.

Quantifying Greenhouse Gas Mitigation Measures: A Resource for Local Government to Assess Emission Reductions from Greenhouse Gas Mitigation Measures (CAPCOA Report) (California Air Pollution Control Officers Association, 2021) provides, among other things, detailed analysis into quantifying how effective various TDM measures are at reducing VMT with a focus on project-level VMT reduction. The data provided in the CAPCOA Report is based on extensive research and technical analysis of empirical data collected at many sites employing one or more TDM measures. In response to comments about the potential effectiveness of TDM measures, the key measures to be integrated into the Project TDM Program are shown in Table II-11 beginning on page II-159, along with the CAPCOA Report calculations of their ranges of effectiveness. As shown therein, many of the proposed TDM measures have the potential, on their own, to reduce VMT by more than the 15-percent transit and walk-in adjustment assumed in the Transportation Assessment.

The LADOT VMT Calculator report provides guidance on maximum effectiveness of TDM programs when multiple measures are combined. The Project's location within the Central APC area would be classified as a "compact infill" setting (defined as within the central city or inner-ring suburb with high-frequency transit service). The VMT Calculator report identifies a maximum TDM reduction of 40 percent for compact infill sites. As shown in Table II-11, the TDM Program has the potential to reduce VMT between 6.9 percent and 40 percent, thus supporting the estimate of a 15-percent adjustment for transit and walk-in trips. The TDM Program is required per Project Design Feature TR-PDF-2 (see pages IV.K-37 to IV.K-40), which is included in the Mitigation Monitoring Program for the Project included as Section IV of this Final EIR.

Table II-11
Effectiveness of Transportation Demand Management Measures

CAPCOA Code and Measure Name		Measure Description	Range of VMT Reduction	Project Support
Quantified GHG Reduction Measures				
T-3	Provide Transit-Oriented Development	Locate a project in a walkable area with a mix of uses and access to transit.	6.9–31.0%	Proximity to bus lines on Beverly Boulevard, Fairfax Avenue, and 3rd Street, and the proposed Mobility Hub, which will include, among other things, a shuttle service to the Metro D (Purple) Line Wilshire/Fairfax Station. <i>Implementation requirement: LADOT Assessment Letter</i>
T-7	Implement Commute Trip Reduction Marketing	Use marketing strategies, promotions, and new employee orientations to encourage use of TDM programs.	0–4%	Quarterly newsletters, new-hire orientations, and events and promotions including financial incentives. <i>Implementation requirement: TDM Program</i>
T-8	Provide Ridesharing Program	Promote ridesharing with designated parking, loading and unloading areas, and offer ride-matching services	0–8%	Ride-matching and designated parking as well as financial incentives. <i>Implementation requirement: TDM Program</i>
T-10	Provide End-of-Trip Bicycle Facilities	Provide bicycle parking, showers, and lockers for employee use.	0.1–4.4%	Bicycle parking, including secure bike storage and repair services. <i>Implementation requirement: Regulatory</i>
T-18	Provide Pedestrian Network Improvements	Provide a pedestrian access network linking areas of the Project site to encourage walking instead of driving.	0.0–6.4%	Site plan includes pedestrian walkways and bridges. <i>Implementation requirement: Project Design Feature</i>
T-25	Extend Transit Network Coverage or Hours	Add or modify existing transit service or extend operating hours to enhance service near the Project Site.	0.0–4.6%	The proposed Mobility Hub, which will include, among other things, a new shuttle service to the Metro D (Purple) Line Wilshire/Fairfax Station. <i>Implementation requirement: Project Design Feature</i>
Overall Range of VMT Reduction			6.9%–40%^a	

Table II-11 (Continued)
Effectiveness of Transportation Demand Management Measures

CAPCOA Code and Measure Name	Measure Description	Range of VMT Reduction	Project Support
Non-Quantified GHG Reduction Measures			
T-32 Orient Project Toward Transit, Bicycle, or Pedestrian Facility	Minimize distance between the project and planned or existing transit, bicycle, and pedestrian corridors.		The proposed Mobility Hub, which will include, among other things, a shuttle service to the Metro D (Purple) Line Wilshire/Fairfax Station. <i>Implementation requirement: Project Design Feature</i>
T-34 Provide Bike Parking	Provide short-term and long-term bicycle parking facilities for employees and visitors.		Bicycle parking, including secure bike storage and repair services. <i>Implementation requirement: Regulatory</i>
T-35 Provide Traffic Calming Measures	Include pedestrian/bicycle safety and traffic calming measures on surrounding roadways.		Project will work with the neighbors to analyze and provide traffic calming measures in the adjacent north and west neighborhoods. <i>Implementation requirement: LADOT Assessment Letter</i>
Other Project Features That Could Reduce VMT			
T-2 Increase Job Density	Increased employment density results in shorter and fewer trips by single-occupant vehicles.		Project would increase employee concentration at the Project Site, which is surrounded by commercial and residential uses. <i>Implementation requirement: Project Design Feature</i>
T-19A Construct or Improve Bike Facility	Construct or improve a bicycle lane that connects to a larger bicycle network.		Proposed neighborhood bikeway and traffic calming improvements on Rosewood Avenue. <i>Implementation requirement: LADOT Assessment Letter</i>

Consistency with LAMC Section 12.26 J (TDM Ordinance) and with the Proposed TDM Ordinance

LAMC Section 12.26.J, the City's TDM Ordinance (1993), establishes TDM requirements for non-residential projects greater than 25,000 square feet, which would include the Project. Key requirements of the TDM Ordinance, as applied to the Project, include providing a bulletin board or display case of transportation information, carpool/vanpool loading and designated parking areas, access from external circulation system to LAMC-required bicycle parking areas, pathways, or safe routes from development buildings to public sidewalks, and, if determined necessary by LADOT or the local transit agency, improved bus stops.

Commenters asked what mechanism would be used to ensure that the TDM Program would be both effective and ongoing. An updated TDM Ordinance is currently under evaluation and pending adoption by the City Council which currently includes provisions to require annual progress reports on the status and the effectiveness of a TDM program and annual reporting on the average vehicle ridership of the vehicles entering a project site. These annual reports will address the commenters' concerns regarding both the effectiveness and the continuity of the TDM Program.

Furthermore, the Project would comply with the requirements of the updated TDM Ordinance through the Project's design and TDM Program, which is discussed in detail in Section IV.K, Transportation, of the Draft EIR. The Project is consistent with LAMC Section 12.26.J as demonstrated in the consistency analysis summarized in Table 8 on page 97 of the Transportation Assessment (Appendix M.1 of the Draft EIR).

As previously described, the proposed TDM Ordinance is currently under consideration by the Los Angeles City Council and may be revised prior to final adoption. The Project meets the current requirements of the proposed TDM Ordinance. Page 5 of the LADOT Assessment Letter dated November 16, 2021 (Appendix M.2 of the Draft EIR) specifies that a final TDM Program for the Project must be approved by LADOT prior to the first certificate of occupancy for the Project. The final TDM Program would need to be in conformance with the TDM Ordinance in effect at the time of the certificate of occupancy.

Summary

The trip generation rates used in the Transportation Assessment account for the 15-percent transit and walk-in trip adjustment that LADOT has found to be applicable for projects in locations such as the Project Site. Thus, the trips estimated in the Transportation Assessment assume an adjustment of approximately 192 morning and approximately 207 afternoon trips when considering the gross Project Site trip generation. The full effects of the proposed TDM Program are not included in the non-CEQA

transportation analysis because the TDM effects only account for a 15-percent reduction in Project trips while the full effects of the proposed TDM Program are likely to reduce trips to a level lower than the trip estimates in the Draft EIR. Thus, the Transportation Assessment analysis is conservative.

B. Transit and TDM Effectiveness

Commenters suggest that the adjustment of Project trip generation by 15 percent may not be realistic for the Project. As described above in Section A, TDM Effects on Trip Generation, the 15-percent adjustment is estimated in the Transportation Assessment to reduce total Project Site vehicular trip generation by approximately 192 morning and 207 afternoon peak-hour trips due to a mode switch to transit and walking. This is based on the standard adjustment allowed by LADOT for all projects in Los Angeles located in an urban area served by a similar level of transit as in the vicinity of the Project Site.

As discussed in Section IV.K, Transportation, of the Draft EIR, the Project has committed to an extensive TDM Program as Project Design Feature TR-PDF-2 to encourage employees and visitors to use alternate means of transportation and reduce vehicle trips to and from the Project Site. All PDFs, including the TDM Program, would be included in the Mitigation Monitoring Program for the Project to ensure their implementation; refer to Section IV, Mitigation Monitoring Program. It is estimated that the TDM Program could reduce the Project's overall drive-alone automobile trips by an amount greater than the 15-percent adjustment taken in the non-CEQA operational analysis presented in the Draft EIR as supported by TDM research provided in the *Trip Generation Handbook, 3rd Edition*.

As stated on page 5 of the LADOT Assessment Letter (Appendix M.2 of the Draft EIR), a preliminary TDM Program would be prepared and provided to LADOT for review prior to the issuance of the first building permit for the Project, and a final TDM Program approved by LADOT is required prior to the issuance of the first certificate of occupancy for the Project. The Project's TDM Program would be implemented in a graduated manner with appropriate transportation options provided beginning with the first phase of the Project and continuing through ultimate completion.

Comments suggested that the assumed non-automobile use level outlined in the Project's Draft EIR was unachievable. However, there are many examples where the 15-percent level assumed for the Project was met and exceeded. NBC Universal, for example, worked with Metro to institute the business transit access pass (BTAP pass) as part of the E-Pass system that offers employees discounted or free transit rides with seven different transit agencies. Tax-free transportation incentives and programs like the shuttle bus connection to a subway station have decreased the single-occupant vehicle trips from

59 percent of peak-hour employee arrivals to 14 percent of employees in the initial pilot of this program.⁷⁸

As described above, the Project's TDM Program, which would be reviewed annually by LADOT and the Department of City Planning, has the potential to meet and exceed the automobile trip reduction levels evaluated in the Draft EIR.

⁷⁸ Interview with Joy Forbes, NBC Universal.

Topical Response No. 12. Safety and Congestion

Commenters expressed concern regarding the effects of Project trips on the roadway system serving the Project Site, particularly in the areas of increased congestion, and effects on traffic and pedestrian safety.

As discussed in Topical Response No. 8, Vehicle Miles Traveled, pursuant to SB 743, the transportation impact analysis required under CEQA was changed from vehicular delay (i.e., LOS) to VMT. Accordingly, the Project's transportation analysis and resulting impacts were assessed in the Draft EIR using VMT methodology in accordance with CEQA and LADOT policy. In addition, SB 743 requires that projects be evaluated on the basis of consistency with existing local and regional plans, traffic safety (including emergency vehicle access), and geometric design hazards as part of the CEQA transportation analysis. As part of the non-CEQA transportation analysis, the Transportation Assessment, which is included as Appendix M.1 of the Draft EIR, includes a non-CEQA analysis of Project Site access, traffic operations, and circulation.

Therefore, the information below is provided for informational purposes only to respond to commenters' concerns and not as the basis for determining (or mitigating) potentially significant environmental impacts under CEQA.

A. Queuing at Project Driveways

Project Site Access

Commenters were concerned with the number of Project driveways and their potential effects on pedestrians using the sidewalks around the Project Site. They were also concerned about the potential for entering Project vehicles to queue at the Project driveways and back up into the public streets.

Access to the Project Site would be through controlled lanes in accordance with standard security procedures for studio lots. Employees would receive an identification badge to allow them to enter the Project Site through any lane at the vehicular gates. Visitors would be directed to a specific lane at each of the three signalized entrances where security will check their identification and issue a pass and directions to parking.

Employees and studio vehicles would be able to enter and exit through any gate, while visitors to the Project Site would be required to enter at one of the three signalized entrances.

Audience members would receive instructions with their tickets, coordinated between individual productions within the Project Site, advising them which of the three signalized entrances to use to enter the Project Site, and they would be directed to park in a specific parking location within the Project Site.

Queuing at Project Driveways

Queue lengths at the Project driveways were evaluated and summarized in Section 5B of the Transportation Assessment as part of the non-CEQA transportation analysis. This analysis was conservatively assessed without consideration of trip reductions as a result of the proposed TDM Program. Public comments expressed concern that vehicles entering the Project Site driveways could back up onto the public streets and become a safety hazard if the inbound gate controls were placed too close to the arterial streets or if the processing time at the inbound gates was excessive. LADOT requires the analysis of queuing at controlled Project driveways to ensure that Project vehicles would not back up into the public streets, thereby potentially becoming a public safety issue. The analysis of Project queuing also falls under CEQA Threshold XVII.c, related to geometric design, in Appendix G of the CEQA Guidelines.

The inbound queues at the Project driveways were extensively analyzed, and the inbound and outbound control points have been located to minimize the potential for vehicle back-ups onto the adjacent public street system. LADOT requires a minimum distance between the adjacent street and any inbound parking gates of 60 feet for any driveway serving more than 300 parking spaces.⁷⁹ In all cases at the Project Site, the location of the inbound gates exceeds the LADOT distance criteria to minimize the chance of inbound Project vehicles backing up across the public sidewalk or backing out into the street.

As discussed in Section IV.K, Transportation, and shown in Figure IV.K-3 on page IV.K-43 of the Draft EIR, vehicular access to the Project Site would be provided via nine vehicular access points: three driveways along Beverly Boulevard, including one entry/exit driveway and two right-in/right-out driveways; three driveways along Fairfax Avenue, including one entry/exit driveway and two right-in/right-out driveways; one entry/exit driveway on The Grove Drive; and two right-in/left-out entry/exit driveways along the Southern Shared Access Drive, accessed from The Grove Drive. Any new driveways would be designed in accordance with the standards set forth in the LADOT Manual of Policies and Procedures and subject to the approval of LADOT and the Los Angeles Bureau of Engineering.

⁷⁹ LADOT Manual of Policies and Procedures, Section 321, 2020.

Figure 22 in the Transportation Assessment shows the morning and afternoon peak-hour traffic volumes entering and leaving the Project Site at each driveway. These volumes include automobile and truck trips generated by employees, visitors, audience members, and service vehicles. The volumes shown in Figure 22 of the Transportation Assessment include the pre-COVID vehicle flow in and out of each driveway and the projected volume from the full buildout of the Project Site.

Detailed LOS and queuing analysis worksheets are provided in Appendix G of the Transportation Assessment.

Although not required by LADOT or the TAG, to validate that the proposed vehicular entrance gate locations and queuing areas are adequate in response to comments, new inbound queuing data was collected at three Southern California studios (i.e., Television City, Radford Studio Center, and The Culver Studios) in June 2022 to record accumulated queues and inbound processing time at the vehicular entrances to these three studios. The data found that different types of inbound trips required varying amounts of processing time before a vehicle was allowed to enter the studio. The upper end of the processing time range for each vehicle type is shown in Table II-12 on page II-168.

These processing times were used to test queue lengths that would be generated by the entering volumes found in Figure 22 in the Transportation Assessment. A random arrival pattern based on the Poisson Distribution⁸⁰ was used to generate the hourly pattern of arrivals over the course of the morning and afternoon peak hours. Two hours of arrivals were tested for each peak hour to calculate the queue lengths at the entry gates based on the volume and type of entering vehicles and the number of entry gates available to service the entering volume. A simulation was conducted testing the random arrival patterns generated by the Poisson Distribution, and the simulation was conducted a total of 1,000 times to determine the queue length patterns. Table II-13 on page II-168 shows the results, provided in detail in the Processing Time and Queuing Memorandum included as Appendix FEIR-7, indicating the queues at the three signalized entrances to the Project Site.

⁸⁰ The Poisson Distribution is a mathematical distribution that expresses the probability of a given number of events occurring in a fixed interval of time, which is used as the industry standard for testing queue requirements. It was used to turn average vehicle arrival rates into a randomized arrival pattern in order to determine the statistical probability that a given queue length would occur during a peak hour. The result of a Poisson Distribution is reported in percentiles; i.e., the 95th percentile queue length means that this length would only be exceeded in 5 percent of the peak hours. For the Project, the 95th percentile queue length was used as the criteria for establishing minimum storage areas for the inbound gates.

Table II-12
Queuing Processing Time

Vehicle Type	Average Processing Time (seconds/vehicle)^a
Employee	9
Visitor/Audience	60
Truck	30
^a Empirical data from field studies of inbound gate queues and processing times at Television City, Radford Studio Center, and The Culver Studios during the morning and afternoon peak inbound times, collected by Gibson Transportation Consulting, Inc. in June 2022.	

Table II-13
Maximum Inbound Queues at Signalized Project Driveways

Hourly Period	Maximum Number of Vehicles in Queue (per Lane)					
	Fairfax Avenue		Beverly Boulevard		The Grove Drive	
	85th Percentile	95th Percentile	85th Percentile	95th Percentile	85th Percentile	95th Percentile
A.M. (8–10 A.M.)	3	4	2	2	2	3
P.M. (4–6 P.M.)	1	2	1	1	1	1

The 95th percentile queue means that the line of vehicles will be equal to or less than this number 95 percent of the time during the peak hours and is the industry design standard for queuing considerations.

The 95th percentile queue lengths⁸¹ and indoor gate storage dimensions at the three signalized driveways are as follows:

Location	95th Percentile Queue Length	Inbound Gate Storage
Fairfax Avenue	100 feet	100 feet
Beverly Boulevard	50 feet	125 feet
The Grove Drive	75 feet	160 feet

⁸¹ Based on 25 feet per vehicle.

Accordingly, adequate storage is provided at each gate to accommodate even the 95th percentile queue length anticipated.

As shown in Figure 22 in the Transportation Assessment, the inbound demands at the unsignalized driveways are far less than any of the three signalized driveways. The placement of the inbound gates at these driveways would follow LADOT gate control requirements (i.e., would not be located closer than 60 feet from the property line).

Overall, adequate queuing storage would be provided at each Project driveway to minimize the potential for vehicles to back out into the adjacent arterial streets.

Access to The Grove Drive

Commenters suggested that the Project should not include access to/from The Grove Drive and that all Project Site access points should be located along Fairfax Avenue and Beverly Boulevard. The Project Site has approximately 400 feet of frontage on The Grove Drive, a public street which is used almost exclusively by automobiles, and has the same right to access the street as any other adjacent property. This suggestion conflicts with the need to minimize pedestrian/vehicular conflicts because the amount of existing and expected future pedestrian traffic along the sidewalks on Fairfax Avenue and Beverly Boulevard is far higher than the amount of pedestrian traffic along The Grove Drive. Further, from an operational standpoint, The Grove Drive has more available operating capacity than either Fairfax Avenue or Beverly Boulevard.

LADOT's *Manual of Policies and Procedures* (2020) provides driveway location planning guidance in Section 321.V, which calls for "the minimum number of driveways, consistent with street and lot capacity, *located on streets with the least traffic volume*, when there is a choice" (emphasis added). It also requires the "minimum potential for pedestrian and bicycle facility conflicts and traffic accidents." Therefore, locating a driveway on The Grove Drive is not only operationally preferable, but is required for compliance with LADOT policies.

Eliminating Project vehicular access on The Grove Drive would cause increased congestion along all surrounding streets as well as increase pedestrian/vehicle conflicts. Contrary to public comments, allowing Project vehicular access along The Grove Drive would reduce potential adverse operational effects along Fairfax Avenue and Beverly Boulevard and reduce pedestrian conflicts along the adjacent arterial streets. Additionally, in accordance with LADOT's TAG, this analysis is a non-CEQA transportation analysis, and these effects are not considered transportation impacts under CEQA.

Queuing at Adjacent Study Intersections

LADOT requires an analysis of turning movement queue lengths at study intersections as part of the non-CEQA operational analysis. In the case of the Project, there were intersections where future queue lengths are projected to exceed the available turn lane storage length. Commenters asked about potential solutions for these instances.

Table 19 of the Transportation Assessment (Appendix M.1 of the Draft EIR) summarizes the Project's effect on turn lane queuing, and states that there would be up to eight intersections where Project trips would result in queues exceeding the available turn lane lengths. Three of these intersections have queue exceedances at multiple turn lanes, as described in Table 19 and on pages 164 and 165 of the Transportation Assessment. Consistent with LADOT policies, measures to help alleviate these conditions have been included in the Project's transportation improvement program (described in Topical Response No. 15, Transportation Improvement Program, below and in Tables 23 and 24 on pages 190 and 191 of the Transportation Assessment) in the form of TDM strategies and traffic signal and operational improvements along the High Injury Network (HIN) corridors.

B. Level of Service

Driveways

Commenters suggest that the Project driveways would be congested and interfere with the operation of the public streets adjacent to the Project Site. However, in accordance with LADOT's TAG, this analysis is a non-CEQA transportation analysis, and these effects are not considered transportation impacts under CEQA. LOS and vehicle delay cannot be considered significant environmental impacts under CEQA as a matter of state law. For informational purposes, the LOS at each driveway around the Project Site was tested for Future with Project conditions, and these results are summarized in Table 20 of the Transportation Assessment. As detailed in the LOS and queuing analysis worksheets provided in Appendix G of the Transportation Assessment, operation of the Project driveways indicates an acceptable LOS performance (LOS C or better) and is not expected to cause congestion along the arterial streets adjacent to the Project Site.

Intersections

Commenters incorrectly refer to the Project's LOS effects, including those on intersections, as CEQA impacts. However, any Project effects related to increased congestion are no longer considered to be CEQA-related impacts requiring mitigation and under state law LOS and vehicle delay cannot be considered significant environmental impacts as a matter of law.

As part of the non-CEQA transportation analysis, Section 5B of the Transportation Assessment details the LOS operations at the 31 study intersections selected for operational evaluation.

The CEQA Guidelines allow cities to study the effects of new projects on the operation of the transportation system, but the addition of roadway capacity as the primary means to deal with increased congestion is discouraged because increased capacity generally leads to increased VMT.⁸²

As an alternate to the continuation of widening roadways to increase capacity, the TAG recommends that proposed non-CEQA improvement measures or corrective actions should support improvements that increase safety and reduce GHG emissions by reducing the use of single-occupant vehicle trips, encourage developers to construct transit and pedestrian-friendly projects with safe and walkable sidewalks, and promote other modes of travel. The TAG recommends that project improvement programs be consistent with the City's policies and procedures to implement various TDM strategies as part of a comprehensive TDM Program.

Thus, the Project does not need to provide any capacity mitigations because, by the required evaluation criteria, LOS changes are not considered CEQA environmental impacts nor are capacity-enhancing improvements encouraged or even permitted.

C. Traffic Safety vs. Congestion

Commenters expressed concerns that Project trips will lead to increased congestion which in turn will lead to increases in traffic collisions.

Although congestion and collisions are not CEQA impacts, this Topical Response discusses the balance between safety improvements and congestion relief. Again, Project effects related to increased congestion are no longer considered to be CEQA-related impacts requiring mitigation and, under state law, LOS and vehicle delay cannot be considered significant environmental impacts as a matter of law.

Acceptable Response to Increased Congestion

The CEQA Guidelines allow cities to study the effects of new projects on the operation of the transportation system, but the addition of roadway capacity as the primary

⁸² OPR, Technical Advisory on Evaluating Transportation Impacts in CEQA, December 2018, Appendix 2.

means to deal with increased congestion is discouraged because increased capacity generally leads to increased VMT.⁸³

As described above in Section B, Level of Service, street widening is no longer an acceptable transportation improvement because it can lead to an increase in overall VMT. Rather, per State and City requirements, project improvement programs should focus on implementing various TDM strategies as part of a comprehensive TDM program.

As discussed in Topical Response No. 7, Mobility Hub, the Project would include an on-site Mobility Hub to promote alternative travel modes and various TDM measures to improve the overall pedestrian and bicycle environment with wider sidewalks, landscape elements, improved transit facilities, and funding for bicycle infrastructure in the vicinity. The proposed TDM Program and additional improvements would reduce single occupancy vehicle trips to and from the Project Site, improve circulation in the vicinity, and encourage multi-modal mobility options. A full list of TDM strategies to be implemented by the Project is detailed in Section 4B of the Transportation Assessment.

Additionally, the Applicant would implement various improvements in the vicinity of the Project Site. These improvements, detailed in Chapter 6 of the Transportation Assessment and included in the LADOT Assessment Letter, include Vision Zero safety upgrades, and traffic signal controller, sensor, and monitoring upgrades for the City's Automated Traffic Surveillance and Control (ATSAC) system. These improvements are required by Project Design Features TR-PDF-3 and TR-PDF-4 (see pages IV.K-40 to IV.K-41 of the Draft EIR) and are included in the Mitigation Monitoring Program included in Section IV of this Final EIR. The Project's contributions would help complete the implementation and upgrades of the ATSAC system along key corridors around the Project Site, including Fairfax Avenue, Beverly Boulevard, and The Grove Drive. These improvements increase safety for users by improving the vehicular flow of traffic and enabling the implementation of advanced pedestrian safety features.

Vision Zero

The City's Vision Zero program is a traffic safety program that promotes strategies to eliminate traffic deaths in Los Angeles. Vision Zero has identified the HIN, a network of streets based on the collision data from the last five years, where strategic investments will have the biggest impact in reducing death and severe injury. As shown in Figure 11 of the Transportation Assessment, the Project Site is located adjacent to Fairfax Avenue,

⁸³ OPR, Technical Advisory on Evaluating Transportation Impacts in CEQA, December 2018, Appendix 2.

Beverly Boulevard, and within the vicinity of West 3rd Street, which are all included in the City's HIN.

The focus of LADOT's approach to improving traffic safety along the HIN is to reduce injury collisions and eliminate fatalities. As discussed in Section IV.K, Transportation, of the Draft EIR, the Project includes Project Design Feature TR-PDF-3 to implement certain off-site Vision Zero safety improvements and provide a financial contribution toward the funding of pedestrian facilities and safety improvements within the Study Area. The Project's improvements to the pedestrian environment would not preclude future Vision Zero safety improvements by the City—an expressed concern of commenters. These improvements, along with the TDM Program, which is discussed in Topical Response No. 11, Transportation Demand Management, would reduce trips to/from the Project Site and would advance the transportation safety goals of the Vision Zero program.

D. Emergency Access

Commenters expressed concern regarding the adequacy of emergency access and emergency response times.

Emergency Site Access

As detailed in the Draft EIR on pages IV.K-80 and IV.K-82 to IV.K-83 in Section IV.K, Transportation, of the Draft EIR, the Project's impacts related to emergency access would be less than significant, and therefore no mitigation would be required under CEQA. The Conceptual Site Plan includes both access and internal circulation components that would enhance emergency access to the Project Site. New and redesigned Project driveways would provide increased emergency access to the Project Site with new signalized driveways provided along both Fairfax Avenue and The Grove Drive and a redesigned signalized driveway along Beverly Boulevard. Thus, as further discussed below, emergency access to the Project Site via Beverly Boulevard, 3rd Street, and Fairfax Avenue would be maintained and improved.

The new signalized access driveway along The Grove Drive would provide additional emergency vehicles access to the Project Site that does not exist today. Emergency vehicles approaching from the east on Beverly Boulevard or on 3rd Street would be able to use the new driveway on The Grove Drive to access the Project Site. Emergency access on the west side of the Project Site is available through the new signalized driveway at Fairfax Avenue and 1st Street.

The unsignalized driveways along Fairfax Avenue, Beverly Boulevard (one to the east and one to the west of the existing Genesee Avenue driveway), and along the

Southern Shared Access Drive would increase the accessibility of the Project Site for emergency vehicles.

In addition, as discussed on pages IV.K-42 through IV.K-44 of the Draft EIR, adequate circulation roads/paths would be provided within the Project Site to accommodate the production activity and emergency access throughout the campus. The Project's internal circulation system, described on page IV.K-42 of the Draft EIR and shown in Figure IV.K-3 on page IV.K-43 of the Draft EIR, shows that emergency vehicles can enter the Project Site at any of the three major signalized driveways and reach any part of the Project Site to deal with an emergency situation. Pages IV.K-42 to IV.K-44 of the Draft EIR describes the multi-level internal circulation plan that would be provided to allow emergency vehicles to reach any part of the Project Site to handle emergencies.

Emergency Response Times

Commenters expressed concern that the addition of Project trips to the roadways serving the Project Site would cause an unacceptable increase in emergency vehicle response times in the area.

On the external streets serving the Project Site and the surrounding neighborhoods, pursuant to California Vehicle Code (CVC) Section 21806, emergency vehicles are generally able to avoid or maneuver through traffic in the event of an emergency by using lights and sirens to clear a path of travel or by driving in the travel lanes of opposing traffic.

As discussed in Section IV.J.1, Public Services—Fire Protection, of the Draft EIR, the two closest fire stations to the Project Site are:

- Fire Station #61—5821 W. 3rd Street
- Fire Station #41—1439 N. Gardner Street

Three other fire stations are also available to serve emergencies at the Project Site, but these two are the closest stations. See pages IV.J.1-14 to IV.J.1-16 in Section IV.J.1, Public Services—Fire Protection, of the Draft EIR for a more detailed discussion of the available station locations and services.

Intersection LOS along the fire service routes for Fire Stations #61 and #41 are shown in Figure II-3 on page II-175.

Fire Station #61 is the closer of the two located approximately 1.2 miles southeast of the Project Site along 3rd Street. It is designated as the “first-in” station in the event of an emergency. The trip from the station to the Project Site would take approximately 5 minutes under mid-day traffic conditions.

An alternate route from Fire Station #61 would be 3rd Street to The Grove Drive to the signalized driveway along The Grove Drive. This would allow the responding fire truck to utilize Fairfax Avenue for less time and likely reduce their response time to the Project Site.

Fire Station #41, designated as the secondary station in the event of an emergency, is located approximately 1.9 miles north of the Project Site. The primary route from the station to the Project Site would be along Fountain Avenue to Fairfax Avenue to the Project Site. This trip would take approximately 10 minutes under mid-day traffic conditions.

An alternate route from Fire Station #41 would be straight south on Gardner Street to Beverly Boulevard with a left turn into the Project Site at Genesee Avenue.

As discussed above and in Section IV.K, Transportation, Section IV.J.1, Public Services—Fire Protection, and Section VI, Other CEQA Considerations, of the Draft EIR, and evaluated in the Initial Study prepared for the Project, included as Appendix A of the Draft EIR, the Project would provide adequate emergency access. Therefore, the Draft EIR correctly concluded that the Project’s impact on emergency access and fire-related services would be less than significant.

E. Pedestrian Safety at Project Driveways

Commenters requested that the Project include fewer driveways in order to minimize pedestrian and vehicular conflicts at each driveway and the potential bicycle conflicts along the perimeter of the Project Site.

The Project would include nine driveways along the four streets surrounding the Project Site as outlined in Figure IV.K-3 on page IV.K-43 and described on pages IV.K-41 to IV.K-45 of Section IV.K, Transportation, of the Draft EIR and in Section II, Project Description, of the Draft EIR. Of this total, two driveways along Fairfax Avenue and one active driveway along Beverly Boulevard already exist. As such, the approximately 744,000 square feet of existing development on the Project Site is served by three driveways, which, for approximation purposes, each could serve approximately 250,000 square feet of development.

The proposed access plan for the Project Site includes three signalized driveways and six unsignalized driveways to serve the proposed 1,874,000 square feet of development, or approximately 208,000 square feet of development per driveway, which is an approximately 15-percent reduction in the driveway service rate from the existing studio. As such, the increase in the number of driveways is proportional to the increase in the size of the development. This analysis is based on the driveway layout shown in Figure II-7, Illustrative Vehicular Site Access, in Section II, Project Description, of the Draft EIR.

There are several potential disadvantages to decreasing the total number and consolidating the driveways for the Project Site:

1. Consolidating driveways could require specific types of vehicles to mix in a way that jeopardizes safety and/or creates queuing issues.
2. Consolidating driveways would increase the vehicular activity levels at the remaining driveways, which would mean more vehicles on the three main entrances and a greater mixing of trucks with employee and visitor automobiles. It could also result in the need for wider driveways which would conflict with the Los Angeles Department of City Planning Citywide Design Guidelines.
3. More vehicles at the remaining driveways would increase queues at the Project driveways and the potential for backing out onto the public streets. Fewer driveways would create longer inbound and outbound queues.
4. Fewer driveways would force more vehicles to the three signalized driveways, which would in turn mean longer portions of the traffic signal cycle would have to be allocated to the traffic entering/leaving the Project Site, thereby increasing delays along the main streets.
5. The number and location of the Project driveways were specifically designed to minimize potential queuing and traffic along the key arterials.

Typically, the design of a project's access and circulation system is primarily a non-CEQA operational issue. In summary, the number and location of the Project driveways has been carefully planned to balance pedestrian safety with operational effects. The detailed design of each of these driveways would be approved by LADOT as part of the design and construction process, and safety issues like safe sight distance and pedestrian control across the signalized locations would be included in the detailed driveway designs.

Topical Response No. 13. Parking

Comments regarding the Project's parking supply expressed concern that the overall parking supply for the Project was not sufficient to keep spillover parking out of their neighborhoods. However, pursuant to SB 743, the adequacy of a new development's parking supply is not a CEQA consideration.⁸⁴ (Public Resources Code § 21099, subd. (b)(3) ["the adequacy of parking for a project shall not support a finding of significance pursuant to this section."].) As such, this Topical Response has been prepared for informational purposes only and is not the basis of determining or mitigating environmental impacts under CEQA.

Parking ratios for the various uses set forth under LAMC Section 12.21 A do not include studio or production-related uses. Under LAMC Section 12.21 A.4.c, the general commercial and industrial parking ratio of two parking spaces per 1,000 square feet of floor area would apply to most of the existing and proposed studio uses on the Project Site. However, this generalized ratio does not reflect the actual parking demands of the existing and proposed studio uses.

The LAMC specifies a parking requirement for various land uses within the City by establishing a parking ratio that should be provided when a new project is proposed or an existing building is modified (either in size or in land use). These parking ratios are generally based on the parking demand experience at other similar types of land uses throughout the City. Parking ratios also change as a result of new transportation opportunities being added to areas of the City. Parking requirements in downtown Los Angeles (DTLA), for example, are lower⁸⁵ than those in suburban areas because more transit availability allows employees and residents to travel to and from DTLA without needing a parking space.

While the LAMC contains parking requirements for many land uses, there are specific land uses that are not covered, including sound stages and production support uses.

Accordingly, the parking regulations detailed in the Preliminary Draft Specific Plan were developed based on a studio-specific parking analysis that utilized empirical data

⁸⁴ See CEQA Guidelines § 15064.3, which describes specific considerations for evaluating a project's transportation impacts.

⁸⁵ See LAMC Section 12.21.A.4.i providing exceptions to off-street parking requirements for the DTLA Business District.

from the existing studio as well as other studio campuses in Los Angeles, described further below.

The Project would provide sufficient on-site parking to meet the needs of employees and visitors to the Project Site. As stated on page IV.K-44 in Section IV.K, Transportation, of the Draft EIR, consistent with the Project Description and environmental analysis provided in the EIR, the proposed Specific Plan would establish parking requirements for each of the permitted land uses (i.e., sound stage, production support, production office, general office, and retail), ranging from two to three parking spaces per 1,000 square feet of floor area, for a sitewide total of approximately 5,300 parking spaces upon full buildout of the total floor area permitted under the proposed Specific Plan.⁸⁶

As discussed on page IV.K-44 of the Draft EIR, vehicles may be parked in tandem or by valet or attendants, depending on the specific parking layout. In addition, the proposed Specific Plan would set forth a process for the approval and implementation of a reduced/shared parking plan, as long as an adequate parking supply is maintained. Parking would be provided on-site and would be located in above-ground structures, subterranean structures, and/or surface spaces and would be designed to accommodate traditional, semi-automated, and/or fully automated parking operations. Refer to Figure 1, Conceptual Site Plan, of the Transportation Assessment (Appendix M.1 of the Draft EIR), which shows the proposed parking locations. The parking locations shown therein are consistent with the Project's plans, which are publicly available on the Department of City Planning website. Internal vehicular roadways and pedestrian paths would be utilized throughout the Project Site to facilitate efficient circulation and access to all buildings and parking areas from the various Project driveways. Additionally, on-site parking for production vehicles would be provided adjacent to the proposed sound stages and in other dedicated basecamp areas. Lastly, existing uses and facilities may be maintained without changes in their respective existing parking requirements.

A. Parking Supply

Commenters expressed concern over the total amount of on-site parking proposed by the Project. Public comments suggested that the Project should provide less parking as an incentive to encourage studio employees and visitors to utilize alternate means of transportation, while others expressed concern that the Project is not proposing enough on-site parking spaces, which could result in spillover parking into the adjacent neighborhoods or the adjacent commercial properties.

⁸⁶ Please note that the Draft EIR stated that one to three parking spaces would be required, which has been corrected to two to three parking spaces; refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR.

The Project's proposed parking, which is not a CEQA transportation impact consideration, were independently developed from proprietary empirical parking demand data collected over the past 20 years at the Project Site and other studios in Southern California, including but not limited to NBC Universal, Paramount Pictures, The Culver Studios, and Sony Pictures. This demand data, as it is not a CEQA transportation impact consideration, is not publicly available. As previously mentioned, parking demand rates have been separated into the components of a studio campus (i.e., sound stage, production support, production office, general office, etc.) based on the empirical parking study data collected. These component rates were used to develop the proposed parking requirements for the Project.

The two primary parking objectives of the Project are: (1) to provide sufficient parking on-site to meet the demands of the proposed Project and prevent spillover parking; and (2) to encourage and support alternative transportation modes and to support trip and emission reduction goals. To address the first objective, as discussed below, parking requirements were analyzed for each of the five permitted land uses. To address the second objective, the Project would implement a TDM Program discussed in detail in Topical Response No. 11, Transportation Demand Management, which would include measures to reduce parking demand.

The parking analysis for the Project analyzed the demand for parking on-site from three different perspectives:

- LAMC Requirements
- Employee and Visitor Parking Needs
- Shared Parking Among the Various On-Site Land Uses

These three considerations are discussed below.

LAMC Parking Regulations

Assembly Bill (AB) 2097, which became effective on January 1, 2023, is a new State law that prohibits public agencies and cities from imposing a minimum automobile parking requirement on most development projects located within a one-half mile radius of a major transit stop. This bill would apply to the Project Site. Accordingly, the parking requirements discussed in the Draft EIR that would be implemented under the proposed Specific Plan have been clarified to be the proposed parking ratios to meet the studio's peak parking demands.

The LAMC includes specific parking ratios for off-street parking for various land uses. For the Project, however, three of the five permitted land uses are not included in the LAMC land use descriptions: sound stage, production support, and production office uses. Applying the most applicable land use categories to the Project under LAMC Section 12.21 A, and as shown in Table II-14 on page II-182, the Project would need a total of approximately 5,236 parking spaces.

Employee/Visitor Population

Commenters have questioned how the number of employees on-site, in addition to visitors and audience members, can be served by 5,300 parking spaces. However, requiring a 1:1 ratio of employees/visitors to parking spaces would result in far more parking spaces than needed to satisfy demand, would exceed LAMC ratios, and would not take into account the implementation of AB 2097.⁸⁷ Like other studio campuses, the actual ratio of parking demand to employees/visitors is always lower than 1:1 and is substantially less than the number of people on-site at any given point, which is also generally less than the total number of people employed at the Project Site (depending on the number of visitors and audience members at any given time).

An analysis of the on-site visitors and employees confirms that the Project could be fully served by a parking supply of approximately 5,243 spaces on a peak weekday. On a weekday evening, the parking demand would be approximately 1,160 spaces, or approximately one-quarter of the weekday daytime demand because of the substantial reduction in employee evening parking demand.

Similarly, the weekend parking demand at the Project Site would be dramatically lower than weekday demand because most of the studio and office space would be lightly used on weekends.

Shared Parking

The proposed Specific Plan parking ratios were developed based on the results of the proprietary parking demand analyses conducted on the Project Site and other studios in Southern California as discussed above.⁸⁸ In order to validate and verify these ratios, a

⁸⁷ AB 2097 prohibits a public agency from imposing or enforcing any minimum automobile parking requirement on any residential, commercial, or other development project that is within one-half mile of a Major Transit Stop.

⁸⁸ Shared parking analyses and the resulting parking demand ratios by land use typically represent data closely held by studio owners and operators. The data used in the Project analysis is based on parking occupancy counts and shared parking analyses reported in public Draft EIRs and Shared Parking (Footnote continued on next page)

**Table II-14
LAMC Parking Ratios for the Proposed Development Program**

Use	Square Feet	LAMC Parking Rate Analysis	
		Required Parking	Parking Ratio
General Office	700,000 sf	1,400 sp	Commercial and Industrial Buildings—LAMC 12.21 A.4.c (2 per 1,000 sf)
Production Office	700,000 sf	1,400 sp	Commercial and Industrial Buildings—LAMC 12.21 A.4.c (2 per 1,000 sf)
Sound Stage (No Audience)	250,000 sf	500 sp	Commercial and Industrial Buildings—LAMC 12.21 A.4.c (2 per 1,000 sf)
Sound Stage (Audience)	100,000 sf	1,714 sp	General Auditorium, Theatre, or other similar place of assembly—LAMC 12.21 A.4.e (1 per 35 sf) *reduced by 40 percent based on "Assembly Area" vs. "Accessory Areas."
Production Support	104,000 sf	22 sp	Warehouse—LAMC 12.21 A.4.c.1 (2 per 1,000 sf for first 10,000 sf + 1 per 5,000 sf for space over 10,000 sf)
Retail	20,000 sf	200 sp	Restaurants and Bars, General—LAMC 12.21 A.4.c.3 (10 per 1,000 sf)
Total	1,874,000 sf	5,236 sp

Childcare use assumed to be 100 percent Internal Capture.</i> <i>Source: Gibson Transportation Consulting, Inc., 2023.</i></p>			

shared parking analysis was conducted for the Project Site under existing and future conditions, and the results were compared to the proposed Specific Plan parking requirements. A shared parking analysis adjusts the projected parking demand at the Project Site based on seasonal, hourly, monthly, and weekday vs. weekend experience patterns at the Project Site. Rather than simply adding the peak parking demand for each separate land use together to calculate the aggregate peak demand, the shared parking model accounts for the temporal differences in these peaks to determine how many parking spaces can effectively be shared between multiple land uses that have different peak times. By applying the peak adjustment factors to each individual land use within the Project Site, the actual overall peak demand can be determined.

analyses prepared for Television City, NBCUniversal, Paramount Picture Studios, and other studio locations in Southern California.

The shared parking analysis calculated the parking demand of the five permitted land uses on an hour-by-hour basis to demonstrate the adequacy of the overall parking supply to meet the peak parking demand. Table II-15 through Table II-20 on pages II-184 through II-190, respectively, show the results of a shared parking analysis using the shared parking model developed by the Urban Land Institute (ULI) and the National Parking Association (NPA).⁸⁹ This model represents the national standard for calculating the shared parking demand in mixed-use developments.

Table II-17 and Table II-18 on pages II-187 and II-188 show the weekday and weekend peak parking demands, respectively, for each month of the year. The peak parking demand at the Project Site would occur in January through May and again in the fall when filming and audience shows are most active. Industry standards call for a parking surplus of approximately 5 percent for employment-based parking supplies to accommodate peak fluctuations in parking demand. The difference between the peak demand of 5,081 and the proposed 5,300 space supply reflects this recommended surplus.

Finally, Table II-19 and Table II-20 on pages II-189 and II-190 show the hourly parking demand throughout the day on the peak weekday and peak weekend day of the year (in March). The peak weekday parking demand is the greatest in the morning hours, with the demand dropping in the afternoon and evening hours. As shown in Table II-20, the peak weekend parking demand is less than 1,200 spaces at any given time.

Parking Supply Summary

The proposed parking ratios in the Preliminary Draft Specific Plan are developed based on the various factors discussed above, which would allow the Project Site to provide sufficient parking on-site to meet the peak day Project demands and prevent spillover parking. Spillover parking is discussed further below in Section C, Parking Spillover into the Adjacent Neighborhoods and Properties.

⁸⁹ Urban Land Institute, International Council of Shopping Centers, National Parking Association, Shared Parking, 3rd Edition, 2020.

Table II-20
Peak Month Daily Parking Demand by Hour (Weekend)

B. Off-Site Parking

Commenters expressed concern regarding a potential off-site parking program by the Project and the possibility of an agreement with the City regarding off-site parking. These comments are referring to the statement on page IV.K-44 in Section IV.K, Transportation, of the Draft EIR that parking may be located off-site upon submittal of an off-site parking agreement or covenant satisfactory to the Director of the Department of City Planning.

As discussed above, pursuant to SB 743, the adequacy of a new development's parking supply is not a CEQA consideration. As described in Section A of this Topical Response, the Project would construct sufficient on-site parking to accommodate the peak parking demand of the Project. Therefore, this on-site parking supply would be sufficient to serve visitor and audience parking.

Thus, the Project is not required to, nor does it intend to implement, an off-site parking program or negotiate an agreement with the City regarding off-site parking. The Project does not need off-site parking to meet its peak parking demands and therefore is not proposing such a program. Accordingly, as discussed in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, the off-site parking agreement language referenced above was deleted from the Draft EIR.

One of the elements of the Project's NTMP, which would be developed with the participation of neighbors as discussed in Topical Response No. 9, Neighborhood Traffic Management Plan, would be the consideration of parking controls to prohibit and control Project parking within the neighborhoods. If desired by the neighbors and approved by the neighbors and LADOT, a residential parking permit system could be implemented (or modified) to keep non-resident parking out of the neighborhoods. Residential vehicle passes, time of day restrictions, time duration limits, and other techniques could be evaluated as part of the NTMP to control non-residential parking. Parking fines and even tow-away actions for repeat offenders could also be evaluated as part of the NTMP, if so desired by the neighbors.

C. Parking Spillover into the Adjacent Neighborhoods and Properties

As discussed above in Section A, Parking Supply, of this Topical Response, the Project would provide convenient and sufficient on-site parking to its employees and visitors to meet its peak demand. Project employees and visitors would be provided temporary or long-term parking credentials. Audience members would be pre-screened and provided with access to parking facilities for the duration of their visit to the Project. Retail customers would be provided a time-limited grace period, and would require further validation or provision of an additional fee beyond the initial time period. Accordingly, there would be no reason for employees or visitors to seek parking in the adjacent residential neighborhoods or within adjacent properties.

Comment letters cited current spillover parking occurring in the residential neighborhoods; however, the commenters do not provide any substantial evidence that the current spillover parking occurs due to employees and visitors to the Project Site.

In the unlikely event that the Project employees and/or visitors seek outside parking, there are measures available to protect the adjacent properties. The Grove and The Original Farmers Market currently charge for parking and use an escalating fee structure to discourage long-term parking. Studio employees or visitors who choose to park in the commercial properties to the south would face a high charge for daily parking which could be adjusted upward by The Grove and The Original Farmers Market to further discourage possible parking by Project Site employees or visitors. In the case of the residential

neighborhoods, elimination of long-term parking can most easily be accommodated by the institution of a residential parking permit district whereby only local residents and their guests are allowed to park on the public streets within a parking district. Sometimes the non-permit parking is restricted to specific hours of the day. The neighborhoods to the north and west of the Project Site already have residential parking permit systems. Under the NTMP that is proposed as a condition of approval for the Project, this system could be further evaluated and expanded with neighborhood input. Strategies that could assist in addressing neighborhood concerns include modifying the time limits or the process for obtaining a permit, maintaining consistent enforcement, and/or making the permit system more effective.

In summary, the provision of a convenient and sufficient parking supply on the Project Site, available to all employees and visitors, in addition to the bolstering of neighborhood parking restrictions are the most effective safeguards to prevent spillover parking. Therefore, spillover parking into the adjacent residential neighborhoods and commercial properties is not anticipated.

As discussed above, this Topical Response has been prepared for informational purposes only and is not the basis of determining or mitigating environmental impacts under CEQA because the adequacy of a new project's parking supply is not a CEQA issue.

Topical Response No. 14. Construction Vehicle Impacts

Comments were received regarding construction vehicles and potential construction traffic impacts associated with the Project. These comments focused primarily on the amount of trips that would be generated by construction activities and how such trips were accounted for in the Draft EIR, potential impacts to emergency access due to construction activities, and the sufficiency of Project Design Feature TR-PDF-1 (the development of a Construction Traffic Management Plan [CTMP]). Refer to Appendix FEIR-8, Details of Buildout and Construction, for a detailed summary of construction assumptions, including construction hours, construction equipment, and duration of construction, that were used in the impact analyses within the Draft EIR. As discussed in Section IV.K, Transportation, of the Draft EIR, transportation impacts were comprehensively analyzed and determined to be less than significant during construction of the Project.

Construction Trip Generation

Comments claimed that the Draft EIR did not provide sufficient information about the number of truck trips and other trips during construction. However, truck trips by construction phase were discussed in detail in Table IV.I-11 of the Draft EIR, and worker trips were described in the Transportation Assessment (Appendix M.1 of the Draft EIR). Specifically, as discussed on pages 179 through 182 of the Transportation Assessment, the two busiest construction subphases associated with daily construction activity include:

1. The excavation/foundation subphase, which would result in the most daily truck activity due to the export of up to approximately 772,000 cubic yards of fill material to construct foundations and subterranean parking structures; and
2. The building finishes (also referred to as architectural coating/finishing) subphase, which would require the most on-site workers.

As stated on page IV.I-41 and Table IV.I-11 on page IV.I-42 in Section IV.I, Noise, of the Draft EIR, the excavation/foundation subphase is anticipated to include up to approximately 640 total truck trips per day (320 truck trips in and 320 truck trips out of the Project Site), including 300 haul trucks and 20 delivery trucks, resulting in up to approximately 107 truck trips per hour on average, as shown in Table IV.I-11 of the Draft

EIR. This subphase would include up to approximately 245 workers on-site on the busiest day.⁹⁰

The building finishes subphase would include up to approximately 60 daily delivery truck trips (30 in, 30 out) and up to 970 on-site workers on the busiest day.⁹¹

In addition to the subphases described above, there would be approximately five total days following excavation and grading during which concrete would be poured for the mat foundations. On these days, there would be approximately 1,000 concrete delivery truck trips per day (500 in, 500 out) along with up to 50 on-site workers.⁹²

Typically, on-site workers would arrive early in the morning (typically before 7:00 A.M.) and depart early in the afternoon (typically before 4:00 P.M.). Hauling and delivery activities are permitted between the hours of 9:00 A.M. and 3:30 P.M., and could occur between the hours of 7:00 A.M. and 4:00 P.M. on weekdays and between 8:00 A.M. and 4:00 P.M. on Saturdays with additional approvals from the Bureau of Engineering District Engineer. For further information, refer to the LADOT Haul Route Approval Letter provided in Appendix M.5 of the Draft EIR.

The number of trips generated by these activities is substantially lower than the trips currently generated by day-to-day activities at the Project Site, both when considering daily trips and peak hour trips. As shown in Table II-21 on page II-195 and on Table 13 of the Transportation Assessment (Appendix M.1 of the Draft EIR), the Project Site currently generates approximately 3,721 daily trips, including approximately 410 morning peak hour trips and approximately 421 afternoon peak hour trips. A total of approximately 80 of those daily trips are truck trips (approximately 40 in and 40 out) as shown in Table II-7 of Topical Response No. 10, Trip Generation. While many of the daily trips generated by construction activities would be truck trips, they would be spread out throughout the approved hauling

⁹⁰ See Draft EIR Appendix B, pdf page 32 (CalEEMod Output Files, Section 3.0 Construction Detail). Note that page 181 of Transportation Assessment provided in Appendix M.1 of the Draft EIR has been revised to reflect 245 construction workers on-site instead of 295 construction workers on-site. Refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR.

⁹¹ The number of delivery trucks during the building finishes phase is included on pdf page 32 of Appendix B of the Draft EIR (CalEEMod Output Files, Section 3.0 Construction Detail). Note that the number of construction workers is 970 (not 740). This updated number is included in the updated air quality model runs included in the Confirmatory Air Quality, GHG, and Energy Analysis in Response to Public Comments provided in Appendix FEIR-9. Thus, this updated number does not change any of the significance conclusions in the air quality analysis or any other analyses in the Draft EIR.

⁹² The number of concrete delivery trucks and workers is included in Table IV.I-11 of Section IV.I, Noise, of the Draft EIR and on pdf page 32 of Appendix B of the Draft EIR (CalEEMod Output Files, Section 3.0 Construction Detail).

Table II-21
Maximum Construction Subphase Trip Generation Compared to Operation

Description	Estimated Trips		
	Daily	A.M. Peak Hour	P.M. Peak Hour
Operational Project Site Trips^a

F. Paving/Landscape			
<i>Truck Trips^c</i>	10	2	2
<i>Worker Trips^d</i>	100	10	20
Total Construction Trips for Subphase F	110	12	22
^a Trip generation estimates are from Tables 6, 7, and 13 in the Transportation Assessment (Appendix M.1 of the Draft EIR). ^b Trip generation estimates are from Appendix B of the Draft EIR. Assumes single-phase construction over a period of 32 months. ^c Construction truck trips by subphase (daily and hourly) are from Table IV.I-11 in Section IV.I, Noise, of the Draft EIR. Note that hourly truck trips may not occur during peak commuter hours; however, they were conservatively assumed to occur for the purposes of this analysis. ^d Construction worker trips by subphase (daily only) are from pages 30–32 of Appendix B of the Draft EIR (CalEEMod Output Files, Section 3.0 Construction Detail). Peak-hour trips are conservatively			

Table II-21 (Continued)
Maximum Construction Subphase Trip Generation Compared to Operation

Description	Estimated Trips		
	Daily	A.M. Peak Hour	P.M. Peak Hour
<i>assumed to be: (a) 10 percent of daily total (20 percent of inbound total) during the morning peak hour (most workers arrive prior to 7:00 A.M.); and (b) 20 percent of the daily total (40 percent of the outbound total) during the afternoon peak hour (most workers depart by 4:00 P.M.).</i> ^e <i>Note that the architectural coatings/finishes workers was inadvertently input into CalEEMod as 740 instead of 920. This is corrected here and in Section III, Revisions, Clarifications, and Corrections to the Draft EIR.</i> <i>Source: Gibson Transportation Consulting, Inc., 2023.</i>			

and delivery window, and therefore would have a limited effect on peak hour operating conditions.

During the potential 32-month construction period of a single-phase development, the Project Site would not be operational, and, therefore, the approximately 3,721 daily trips generated by the existing land uses on-site, as summarized in Table II-21 on page II-195, would not occur. Accordingly, trip volumes during each subphase of Project construction would range between approximately 110 and 1,900 and would be lower than the existing operational trips. Certain of the construction subphases shown in Table II-21 may overlap in a limited fashion, such as paving and landscaping occurring simultaneously with architectural coatings and finishings. However, under no condition would all construction subphases occur simultaneously.

In the long-term buildout scenario in which the Project Site were developed in phases, or phased development, there would be periods with operational trips and construction trips occurring at the same time. For example, an initial phase of development of the Project could consist of the construction of the parking structure in the southeast corner of the Project Site, an area which currently primarily houses production support uses that generate relatively less operational activity. Thus, the majority of the existing Project Site operations could continue uninterrupted during construction, potentially resulting in more trips to and from the Project Site than under existing conditions. Similarly, after one or more Project development phases are completed, a portion of the Project would be operational, and subsequent phases of development and their associated construction would occur alongside those new Project Site operations. In either of these scenarios, however, the total trips to and from the Project Site (including operational trips and construction trips) would be less than the proposed Project at full buildout. This is both because phased development would result in less construction trips than single-phase development (simultaneous construction Project Site-wide) and because construction trip

activity is generally less intensive than the operational trips once the construction phase is completed.

Therefore, under either development scenario (single or multi-phase construction), Project Site trip generation during construction would be less than the Project when fully operational, and thus would have a lesser effect on traffic than the Project as analyzed in the Transportation Assessment and the Draft EIR.

Construction VMT

Comments stated that transportation impacts associated with construction activities, particularly haul and concrete trucks, were not analyzed. As set forth on page IV.K-1 of Section IV.K, Transportation, of the Draft EIR, based on the updated CEQA Guidelines, transportation impacts shall be evaluated based on VMT rather than LOS or any other measure of a project's effect on automobile delay. Furthermore, CEQA does not require a VMT analysis of construction traffic; CEQA Guidelines Section 15064.3, subdivision (b) notes, "for many projects, a qualitative analysis of construction traffic may be appropriate." The City does not require an analysis—quantitative or qualitative—of VMT impacts during construction based on the TAG. Regardless, the qualitative analysis conducted in Section 5D of the Transportation Assessment and the trips shown in Table II-21 on page II-195 demonstrate that there would be fewer trips to and from the Project Site during construction than currently generated on the Project Site. Though construction trips may, on average, be longer than those generated by Project Site employees, given how many fewer construction trips there would be, they would generate fewer overall VMT than the proposed Project land uses. Note that the subphases would not occur all at once, and therefore the maximum trips generated by subphase would not be cumulative in nature.

Emergency Access

As described in the Draft EIR, construction activities would primarily be contained within the Project Site, including on-site staging of construction equipment and vehicles. Nonetheless, limited off-site construction activities, such as utility connection, curb reconstruction, and signal and striping upgrades, may occur within adjacent street rights-of-way during certain periods of the day, which could potentially require temporary lane closures. As described on page IV.K-80 of the Draft EIR, these activities would be conducted in accordance with the Project's CTMP, which would require the posting of street closure information, detour plans, haul routes, and staging plans, subject to review by LADOT and the Los Angeles Bureau of Street Services prior to commencing construction. Such lane closures would be temporary and at no time would full closure of any street be required. Therefore, two-way vehicular access would be maintained on all streets at all times during construction, allowing the continuous and unimpeded passage of emergency vehicles. Temporary construction-related lane closures are common in urban

environments such as the Project vicinity, and emergency response personnel are experienced at navigating such conditions on a regular basis. Additionally, pursuant to CVC Section 21806, all vehicles are required to yield to emergency vehicles and pull to the side of the road, thereby allowing emergency vehicles to pass unimpeded. The Project's effects on emergency access are further described in Section C, Emergency Access, of Topical Response No. 12, Safety and Congestion.

Safety

Comments express concerns about pedestrian and bicycle safety during Project construction. As discussed below, Project construction would be subject to the conditions of the CTMP, which would include specific measures to promote pedestrian and bicycle safety, including the implementation of alternative routing, protective barriers and temporary traffic controls designed for pedestrian and bicycle safety. With such measures in place, Project construction would not result in unsafe conditions for pedestrians and bicycles on the adjacent streets and sidewalks.

Additionally, Topical Response No. 12, Safety and Congestion, provides a more detailed discussion of safety and congestion. As summarized above, Project construction would generate less daily and peak hour traffic than existing Project Site operations, and therefore would have less effect on congestion than existing Project operations.

Construction Traffic Management Plan

Comments claim that the CTMP under Project Design Feature TR-PDF-1 represents an inappropriate deferral of critical information needed in the Draft EIR for environmental review by the public. However, the major elements of the CTMP—including many of the specific conditions limiting the effects of Project construction on surrounding neighborhoods—were identified in the Draft EIR as Project Design Feature TR-PDF-1. As discussed above, transportation impacts were comprehensively analyzed and determined to be less than significant during construction of the Project, and, therefore, no mitigation measures are required under CEQA. The analysis included in the Draft EIR and Transportation Assessment is consistent with the TAG and LADOT policies regarding the preparation of an CTMP associated with a proposed development project in the City of Los Angeles. As discussed on pages IV.K-36 and IV.K-37 in Section IV.K, Transportation, of the Draft EIR, Project Design Feature TR-PDF-1 would require the Applicant to prepare and submit a detailed CTMP to the City for review and approval prior to commencing construction. The CTMP would include street closure information, a detour plan, haul routes, and a staging plan. The CTMP will formalize how Project construction will be carried out and identify specific actions that will reduce traffic-related effects on the surrounding community. City staff, including staff from LADOT and the Department of

Building and Safety, have oversight authority in the preparation, review, implementation, and monitoring of the CTMP.

Haul Routes

Comments claimed that construction truck haul routes would result in hazards and other impacts to nearby uses, including transportation, noise, and air quality impacts. As discussed on pages II-34 to II-35 in Section II, Project Description, of the Draft EIR, the Project has identified three haul route options for exporting excavated materials and delivery truck routes. In each case, the routes are defined between the Project Site and the Santa Monica Freeway (I-10), from which the trucks could access other freeways in the regional transportation network. These haul route options include use of Fairfax Avenue and the Washington Boulevard interchange to and from I-10; use of Fairfax Avenue, San Vicente Boulevard, and La Brea Avenue to and from I-10; and use of Beverly Boulevard and La Brea Avenue to and from I-10. The haul routes are described in full in Appendix FEIR-8, Details of Buildout and Construction.

These proposed haul routes have been reviewed and approved by LADOT (refer to Appendix M.5 of the Draft EIR). The haul route and associated construction activities would adhere to the Project's conditions of approval and, prior to construction, would be required to obtain permit clearance by the Department of City Planning and LADOT. Typical of construction in an urban area, these routes pass sensitive land uses (e.g., schools and residential neighborhoods). The noise and air quality effects of the construction truck trips on these sensitive uses have been fully studied in the Draft EIR. Specifically, Section IV.I, Noise, of the Draft EIR concluded that off-site construction noise impacts associated with the use of haul trucks would be significant along the haul route segment of Fairfax Avenue and that potential impacts from the haul trucks along the other segments of the haul routes would be less than significant (refer to pages IV.I-40 through IV.I-43 of Section IV.I, Noise, of the Draft EIR). Section IV.I, Noise, of the Draft EIR also concluded that potential vibration impacts associated with building damage along the haul routes would be less than significant and that potential vibration impacts associated with human annoyance at the residential and motel uses along Fairfax Avenue, Beverly Boulevard, La Brea Avenue, San Vicente Boulevard, Normandie Avenue, and Vermont Avenue would be significant and unavoidable (refer to pages IV.I-63 through IV.I-65 of Section IV.I, Noise, of the Draft EIR). With regard to localized air quality impacts associated with use of the haul trucks, Section IV.A, Air Quality, of the Draft EIR concluded that with implementation of Mitigation Measure AIR-MM-2 (which requires the use of 2010 model year or newer engines that meet CARB's 2010 engine emission standards for haul trucks associated with demolition and grading/excavation activities and concrete delivery trucks during concrete mat foundation pours), peak localized air quality impacts associated with haul truck activities would be less than significant (refer to pages IV.A-66 and IV.A-74 of Section IV.A, Air Quality, of the Draft EIR).

Topical Response No. 15. Transportation Improvement Program

Commenters expressed confusion in regard to the specific improvements that are included in the Project's Transportation Improvement Program. The Transportation Improvement Program includes the TDM Program, which is discussed in detail in Topical Response No. 11, Transportation Demand Management, as well as a number of other transportation improvements discussed below.

The Transportation Assessment, included as Appendix M.1 of the Draft EIR, discusses the Transportation Improvement Program on pages 186–189. The list of transportation improvements is summarized in Table 23 on page 190, and the implementation schedule is included on page 191 of the Transportation Assessment. This information is repeated here in Table II-22 on page II-201.

These improvements were developed as a result of the non-CEQA analysis required by LADOT. The Project would not result in any significant transportation impacts under CEQA, and therefore no CEQA mitigation is required of the Project. The transportation improvements listed in Table II-22 are listed as non-CEQA Project requirements in the LADOT Assessment Letter dated November 16, 2021 (Appendix M.2 of the Draft EIR).

Table II-22
Proposed Project Transportation Improvement Program

Transportation Improvements	Improvement Cost
Project Features^a	
Estimated Mobility Hub Construction Costs	\$50,000,000
Project-Adjacent Reconstruction and Improvement Costs ^b	\$4,000,000
Estimated Annual Transportation Demand Management (TDM) Operating Costs	\$2,000,000
Total Project Contribution	\$54,000,000 one-time \$2,000,000 annually
Off-Site Improvements	
Vision Zero Safety Improvements	\$130,000
Transportation Systems Management (TSM)	\$1,340,000
Traffic Signal Upgrades/Left-Turn Signal Phasing	\$400,000
Neighborhood Traffic Management Plan (NTMP) and Bicycle Improvements	\$250,000
Total Project Contribution	\$2,120,000 one-time
Overall Total Project Contribution	\$56,120,000 one-time \$2,000,000 annually

Topical Response No. 16. Project Alternatives Analysis

Commenters questioned the overall adequacy of the alternatives analysis, the Project objectives, and the analysis of alternatives compared to the Project, while they expressed support for greater consideration of the alternatives, including Alternative 2 and Alternative 5, and requested the consideration of additional alternatives, such as Project alternatives that are located on a different site, provide housing, and/or include alternative circulation and parking plans.

Alternatives Analysis Fully Complies with CEQA Requirements

The alternatives analysis included in Section V, Alternatives, of the Draft EIR fully complies with CEQA. As set forth in Section V, Alternatives, the analysis of alternatives was guided by CEQA Guidelines Section 15126.6(a), which states:

An EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives. An EIR need not consider every conceivable alternative to a project. Rather it must consider a reasonable range of potentially feasible alternatives that will foster informed decision making and public participation. An EIR is not required to consider alternatives which are infeasible.

There are no requirements governing the nature or scope of the “reasonable range” of alternatives to be discussed, other than the “rule of reason” (CEQA Guidelines Section 15126.6(a) & (f)). What constitutes a “reasonable range” of alternatives will vary with the facts of each project and should be guided only by the purpose of offering substantial environmental advantages over the project proposal which may be feasibly accomplished in a successful manner considering the economic, environmental, social, and technological factors involved (PRC Sections 21002, 21061.1; CEQA Guidelines Section 15364).

Based on the detailed analyses in Section IV, Environmental Impact Analysis, of the Draft EIR, the Project would result in temporary significant impacts during construction in two environmental categories: (1) air quality and (2) noise and vibration. Specifically, Project construction would result in significant and unavoidable Project-level impacts with respect to regional emissions of nitrogen oxides (NOx) and on- and off-site noise and vibration (human annoyance). Cumulative impacts associated with regional construction-related NOx emissions, on- and off-site noise during construction, and off-site vibration (human annoyance) during construction would also be significant and unavoidable. In

addition, Project-level and cumulative impacts associated with regional emissions of NO_x and volatile organic compounds (VOC) would be significant and unavoidable under a potential long-term buildout scenario due to concurrent construction and operation of the Project.

Section V, Alternatives, of the Draft EIR considered several alternatives to substantially reduce or avoid the significant construction noise and vibration impacts at receptor location R1 (Broadcast Center Apartments), and these alternatives were rejected as infeasible, as discussed further below. In accordance with the CEQA Guidelines, a reasonable range of potentially feasible alternatives were selected to address the significant impacts while also considering the Project objectives included in Section II, Project Description, of the Draft EIR. The selection of Project alternatives also necessarily took into consideration the physical development constraints on the Project Site due to the existing Historic-Cultural Monument (HCM) on-site. The original Primary Studio Complex, which is located generally in the center of the Project Site and includes two attached buildings (the Service Building on the east and the Studio Building on the west), was designated- as HCM No. 1167 on June 26, 2018 (CHC-2018-476-HCM).⁹³ In accordance with the CEQA Guidelines, the following alternatives were selected for analysis:

- **Alternative 1—No Project/No Build Alternative:** Under Alternative 1, the Project would not be approved, no new permanent development would occur within the Project Site, and the existing environmental setting would be maintained.
- **Alternative 2—Development in Accordance with Existing Zoning Alternative:** Alternative 2 would involve buildout of the Project Site in accordance with the existing zoning and land use regulations for the Project Site. Alternative 2 would include the construction of an estimated 856,986 square feet of new studio-related general office uses and the retention of an estimated 743,680 square feet of existing development with a FAR of 1.49:1. No demolition would occur under Alternative 2. New development would include a 15-story office building (maximum height of 203 feet above Project Grade⁹⁴) with four levels of subterranean parking and three levels of above-ground parking, and a six-level parking structure, with two levels of subterranean parking, and a maximum height of 66 feet. Alternative 2 would require approximately 315,000 cubic yards of export.

⁹³ Refer to Section IV.B, Cultural Resources, of the Draft EIR for a detailed discussion of the Primary Studio Complex.

⁹⁴ Project Grade is defined as 201 feet AMSL, consistent with the method used to measure building height for the Project. Refer to Figure II-3(c) which has been added to Section II, Project Description, in Section III, Revisions, Clarifications, and Corrections to the Draft EIR.

- Alternative 3—Reduced Density Alternative:** Alternative 3 would involve a 20-percent reduction in the Project’s proposed development program. Alternative 3 consists of the same general site plan as the Project but with certain reduced building heights and square footages. Alternative 3 would include a total of an estimated 1,499,200 square feet of development (FAR of 1.4:1), including an estimated 280,000 square feet of sound stages, 83,200 square feet of production support, 560,000 square feet of production office, 560,000 square feet of general office, and 16,000 square feet of retail uses. Alternative 3 would involve the construction of an estimated 1,251,380 square feet of new development, the demolition of 495,860 square feet of existing studio-related uses and the retention of an estimated 247,820 square feet of existing studio-related uses. Alternative 3 would require approximately 772,000 cubic yards of export.
- Alternative 4—Mixed-Use Alternative:** Alternative 4 would involve a mixed-use development with studio, residential, and retail uses. Alternative 4 would be developed in accordance with the existing zoning and land use designations for the Project Site and would seek a maximum FAR of up to 3.75:1 per Transit Oriented Communities (TOC) Tier 3. Alternative 4 would include a total of 3,696,370 square feet of development (FAR of 3.45:1), including approximately 2,772,000 square feet of residential uses (3,680 units within three residential towers, of which 14 percent or 516 units would be affordable units for Very Low-Income households). In addition to residential uses, this alternative would include 36,000 square feet of sound stages, 41,400 square feet of production support, 138,000 square feet of general office uses, and 60,000 square feet of retail uses. The residential towers would be located along the western side of the Project Site, fronting Fairfax Avenue, and would consist of 30 stories over a six-level parking podium (maximum height of 400 feet above Project Grade), with ground floor retail uses and four levels of subterranean parking. New development on the eastern portion of the Project Site would include a six-story office building (maximum height of 90 feet) with two levels of subterranean parking, a four-story production support building (maximum height of 60 feet) connected to two single-story sound stages (maximum height of 60 feet), and a four-level parking structure (maximum height of 45 feet) with three levels of subterranean parking. Alternative 4 would require approximately 505,000 cubic yards of export.
- Alternative 5—Above-Ground Parking Alternative:** Alternative 5 has been designed to eliminate subterranean parking in order to reduce excavation and export. Alternative 5 would include the same development program, square footages, FAR, and general layout as the Project, except that all parking would be located in above-ground structures. As a result, building heights would increase. Alternative 5 would require approximately 154,000 cubic yards of export.

A more detailed description of each of these alternatives is included in Section V, Alternatives, of the Draft EIR. These alternatives represent a reasonable range of alternatives to avoid or substantially lessen the significant impacts of the Project while

focusing on attaining the Project objectives. In addition to the No Project Alternative, these alternatives include a range of different land use types, different land use configurations and densities, and shifting of building heights. Specifically, Alternative 2 represents development in accordance with the existing zoning and land use regulations, with a corresponding reduction in floor area and reduction in the amount of grading and export to address the construction-related impacts of the Project. Alternative 3 represents a further reduction in overall development and parking above grade and an associated overall reduction in above-grade construction activity. Alternative 4 includes a mix of uses, including residential uses, taller buildings oriented along Fairfax Avenue, and a reduced amount of grading and export. Alternative 5 includes the same overall amount of development and uses as the Project but with a substantially reduced amount of grading and export. As such, a reasonable range of alternatives has been considered to address the construction-related impacts of the Project.

In accordance with CEQA Guidelines Section 15126.6(d), an analysis of each of these alternatives compared to the Project is provided for each of the environmental topics evaluated in the Draft EIR. Also, in accordance with CEQA Guidelines Section 15126.6(a), a review of each of the alternative's ability to meet the Project objectives is included for each of the alternatives. As discussed in Section V of the Draft EIR, other than Alternative 1 (No Project Alternative), none of the alternatives would avoid or substantially lessen all of the Project's significant and unavoidable impacts. In addition, Alternative 1 would not achieve the Project's purpose or any of the associated Project objectives.

In accordance with the CEQA Guidelines requirement to identify an Environmentally Superior Alternative other than the No Project Alternative, Table V-2 on pages V-16 to V-18 and the supporting text on pages V-19 through V-155 in Section V, Alternatives, of the Draft EIR includes an evaluation of the remaining alternatives compared to the Project, and the Draft EIR appropriately concluded that Alternative 5, the Above-Ground Parking Alternative, would be the Environmentally Superior Alternative. Although Alternative 5 would not avoid all of the Project's significant and unavoidable impacts, Alternative 5 would reduce the Project-level and cumulative regional air quality impacts related to NO_x emissions during the overlap of construction and operation from a significant and unavoidable level to a less-than-significant level with mitigation by eliminating subterranean parking, thereby substantially reducing excavation, grading and the export of soil. Alternative 5 would also reduce the Project-level and cumulative air quality impacts related to concurrent construction and operations and would substantially lessen the Project's offsite construction noise impact, although these impacts would remain significant and unavoidable. However, Alternative 5 would not meet a number of the Project's objectives to the same extent as the Project. Alternative 5 would also result in substantially increased building massing on-site due to several multi-level parking podiums needed to accommodate above-ground parking. This increased massing would further contribute to and/or exacerbate non-CEQA issues that have been raised in public comments regarding

the Project's scale; impact of views, light, and shade; building heights; and the pedestrian experience.

In summary, the alternatives analysis considers a reasonable range of alternatives. The alternatives analysis in the Draft EIR is comprehensive and fully complies with CEQA and the purpose of an alternatives analysis.

Project Objectives

In accordance with Section 15124(b) of the CEQA Guidelines, a statement of Project objectives, including the underlying purpose of the Project, is provided on pages II-10 through II-12 of Section II, Project Description, of the Draft EIR. As indicated therein, the underlying purpose of the Project "is to maintain Television City as a studio use and to modernize and enhance production facilities within the Project Site to meet both the existing unmet and anticipated future demands of the entertainment industry, keep production activities and jobs in Los Angeles, upgrade utility and technology infrastructure, and create a cohesive studio lot." The Project's specific objectives address maintaining the Project Site as a studio facility; rehabilitating and preserving historical resources; promoting economic growth; contributing to Los Angeles' status as a creative capital; optimizing an underutilized site; concentrating development and height toward the center of the Project Site; providing adequate access, staging and parking; providing for basecamp areas; providing multi-modal transportation solutions; creating a model for environmental sustainability; providing an architecturally distinct development; and permitting a reasonable return on investment while generating tax and property revenues to the City. These objectives address a range of issues and are not impermissibly narrow.

Furthermore, the Project objectives do not impede the development and evaluation of a reasonable range of alternatives in conformance with the requirements of CEQA. Rather, as discussed above, the Draft EIR includes an analysis of five alternatives to the Project, as well as a discussion of why other alternatives were rejected as infeasible and not subject to additional analysis. In accordance with CEQA Guidelines Section 15126.6 (b), the five alternatives that were evaluated were chosen because they were determined to be potentially capable of avoiding or substantially lessening significant effects of the Project while still accomplishing most of the Project objectives.

Analysis of Alternatives Compared to the Project

As discussed above, Section V, Alternatives, of the Draft EIR provides an analysis of the Project's impacts compared to those of the five alternatives. Several comments regarding the Draft EIR state that the Project's significant impacts are not disclosed and, thus, the alternatives analysis fails to include an adequate analysis of the alternatives compared to the Project. The Project's significant impacts have been fully evaluated and

disclosed in the Draft EIR. Furthermore, as demonstrated by the response to comments in this Final EIR, there are no new significant impacts that were not already disclosed in the Draft EIR. As such, the assertion that the analysis of alternatives in the Draft EIR is inadequate due to significant impacts not being disclosed is unsupported.

Alternatives Considered but Rejected as Infeasible

Section 3 on pages V-11 to V-14 in Section V, Alternatives, of the Draft EIR discusses alternatives that were considered and rejected as infeasible and explains the reasons for their rejection in accordance with CEQA Guidelines Section 15126.6(c). The alternatives that were rejected as infeasible include an alternative site; alternatives that remove or substantially modify the Primary Studio Complex; alternatives that substantially reduce or avoid the temporary significant on-site noise and vibration construction impacts; and a TOC Tier 3 alternative with maximum residential FAR.

Alternative Site

As discussed on pages V-11 to V-12 of the Draft EIR, the objectives of the proposed Project are closely tied to the need to improve existing operations on the Project Site by creating a cohesive and integrated studio campus environment with new technologically advanced facilities. To meet the Project's objective to provide an expandable, flexible, and operationally seamless production ecosystem that is able to respond to evolving market demands, support content creation, and maximize studio production capabilities, the Applicant has identified improvements that are needed to bring the existing studio in line with modern production techniques and trends and to meet the significant and unmet demand for production space in Los Angeles. To this end, a central guiding principle behind the Project is to increase the number of sound stages on-site, combined with an adequate and complementary mix of production support facilities and production offices in order to meet the existing unmet and anticipated future demands of the entertainment industry. This goal is influenced by the inherent challenges posed by the existing development on-site, including the age and layout of the existing facilities, as well as the need to rehabilitate and preserve the integrity of the Primary Studio Complex consistent with the HCM designation. Many of the existing production facilities on-site have been developed in an ad hoc manner over the years, resulting in inefficiencies and space constraints. Additionally, several of the existing sound stages on the Project Site are too small and outdated for the needs of the current market and technology.

Modern production techniques call for more integrated, campus-like settings with additional spaces, including gathering, support, office, and post-production spaces, as much of the production work today is performed during post-production using specialized digital facilities for editing and adding digital effects, graphics, special effects, sound, etc. Modern production space also requires production-related land uses in different ratios than

in the past due to the changing nature of the production process. Production facilities now use high-tech equipment and techniques to enhance quality and substitute virtual space for what was previously done with physical models or other cinematic techniques. Also, new media is continuously being created to enhance the entertainment experience, such as virtual media, online entertainment, and video games. Modern media production calls for new types of post-production spaces, increased office space, and integrated gathering spaces that foster collaboration and information exchange across the multitude of disciplines that comprise the modern studio.

Development on an alternative site would result in no changes to existing on-site conditions, which would therefore provide no potential to achieve the Project objectives related to: modernizing and enhancing production facilities within Television City; rehabilitating the Primary Studio Complex and restoring the currently obstructed public views of the HCM; optimizing the currently underutilized Project Site to address past ad hoc building additions; and enhancing the identity of the Project Site as an iconic entertainment and production facility. Furthermore, development on an alternative site would split studio operations into two locations, which would substantially reduce operational efficiency and functionality and increase VMT and related air quality and GHG impacts.

As all of the Project's significant and unavoidable impacts are related to construction activities, development on another site would not avoid or substantially lessen the Project's significant impacts. It is anticipated that development on an alternative site would also produce similar significant construction-related air quality, noise and vibration impacts as the Project, albeit in a different location. Moreover, depending on localized and site-specific conditions, development at another location could result in additional significant impacts, such as new traffic impacts in an area where transit options are not as plentiful or readily available. Finally, the Applicant already owns the Project Site, and it is not reasonable to assume that Television City's operations could be feasibly divided and transferred to another site.

Based on the above, an alternative site is not considered feasible as it would fail to achieve the Project objectives related to modernizing the Project Site, providing new environmentally friendly and state-of-the-art sustainable facilities on the Project Site, creating an integrated, studio campus environment with a synergistic mix of uses, rehabilitating and preserving the integrity of the HCM, and enhancing the role of the Project Site in the entertainment industry. In addition, the development of an alternative site would not avoid or substantially lessen the Project's significant impacts. Thus, in accordance with Section 15126.6(f) of the CEQA Guidelines, this alternative was rejected from further consideration.

Alternatives that Remove or Substantially Modify the Primary Studio Complex

As discussed on page V-13 of the Draft EIR, given that the Primary Studio Complex is designated as an HCM, any alternative that would remove or substantially alter the HCM such that its historic integrity and eligibility would be compromised was rejected as infeasible. Similarly, alternatives that would introduce substantial development within the Viewshed Restoration Area were eliminated from consideration since they would be inconsistent with the HCM designation. Thus, any alternatives that would compromise the HCM were rejected as infeasible.

Alternatives that Avoid the Project's Significant On-Site Construction Noise and Vibration Impacts

As discussed on page V-13 of the Draft EIR, an analysis was performed to determine whether the Project's significant impacts related to on-site construction noise and on-site vibration could be substantially reduced or avoided through an alternative development program. As shown in Table IV.I-10 in Section IV.I, Noise, of the Draft EIR, all stages of Project construction would cause a significant noise impact affecting the adjacent residential use (R1) given its proximity to on-site construction activities. In order to avoid this significant impact, construction activities would need to be moved approximately 700 feet westerly from the Shared Eastern Property Line; in other words, new development could not occur on over half of the Project Site. Accordingly, this alternative was rejected as infeasible.

Another alternative that was considered involved moving construction activities away from the adjacent residential building combined with the use of a tall sound wall. However, if development were moved approximately 100 feet westerly from the Shared Eastern Property Line, a substantial portion of the Project Site could not be developed. Therefore, this alternative was rejected from further consideration. With respect to on-site vibration, as discussed in Section IV.I, Noise, of the Draft EIR and shown in Table IV.I-21 therein, Project construction activities involving a large bulldozer, caisson drilling, jackhammer, or loaded trucks would exceed the vibration threshold with respect to human annoyance at the adjacent residential building (R1). As ground-borne vibration generated by human activities attenuates rapidly with distance from the vibration source, this impact could be reduced to a less-than-significant level by moving construction activities using heavy equipment at least 80 feet westerly from the Shared Eastern Property Line. While the Project's significant and unavoidable vibration impact would be reduced to a less-than-significant level, this alternative would render a substantial portion of the Project Site undevelopable, and a significant construction-related noise impact would continue to occur. As such, this alternative was rejected from further consideration.

An operationally feasible balance of studio uses and carefully planned circulation and basecamp areas are necessary for a functioning studio campus and in order to meet the Project objectives set forth in Section II, Project Description, of the Draft EIR. Sound stages have somewhat fixed dimensions and require adjacent circulation areas to service and support the sound stages. Given that much of the central portion of the Project Site is undevelopable due to the HCM and Viewshed Restoration Area, a 100- or 80-foot setback would render most of the eastern and central portions of the Project Site undevelopable and prevent the Project from providing the requisite mix and distribution of production uses for the studio.

TOC Tier 3 Alternative Use with Maximum FAR

As discussed on page V-14 of the Draft EIR, the Project Site is located in TOC Tier 3, which allows a maximum FAR of 3.75:1. Based on a site area of 1,071,011 square feet, this would allow 4,016,291 square feet of development, including over 4,500 residential units (TOC Tier 3 allows a 70 percent density bonus). The building heights, parking needs, and other space constraints associated with this maximum FAR scenario would yield both building massing and an overall density that would be greater than the surrounding predominantly low- and mid-rise land uses and would result in substantial increases in environmental impacts (e.g., operational air quality impacts, public services and utilities impacts, etc.). Therefore, this alternative was rejected from further consideration.

Suggested Alternatives

While an EIR must describe a range of reasonable alternatives that avoid or reduce a project's significant impacts, it "need not consider every conceivable alternative to a project." (CEQA Guidelines Section 15126.6(a).) CEQA establishes no categorical legal imperative as to the scope of the alternatives to be analyzed in the EIR. Several commenters have suggested that the EIR should include additional alternatives to the Project that are less impactful. As discussed above, the Project's significant impacts are associated with regional air quality, noise and vibration all during construction of the Project. CEQA does not require the City to analyze alternatives proposed by members of the public that are merely variations of alternatives already evaluated in the EIR that would have the same unavoidable effects.

Several commenters suggest that alternative parking and access plans be considered that reduce the use of The Grove Drive. As analyzed in Section IV.K, Transportation, of the Draft EIR, the Project's transportation impacts would be less than significant during construction and operation. As stated in CEQA Guidelines Section 15126.6(f), "alternatives shall be limited to ones that would avoid or substantially lessen any of the significant effects of the project." As there would be no significant transportation

impacts, consideration of such an alternative is not required under CEQA. Refer to Topical Response No. 12, Safety and Congestion, regarding access along The Grove Drive.

A housing alternative has also been suggested by several commenters. As discussed above, a housing component is included as part of Alternative 4 in the alternatives analysis within the Draft EIR, and another alternative that maximizes residential FAR with TOC Tier 3 was considered and rejected as infeasible. These housing alternatives would not substantially reduce or avoid the significant regional air quality, noise, and vibration impacts associated with construction of the Project as these impacts are based on the amount of excavation and grading and the proximity of construction activities to the sensitive receptors and not on the proposed uses. Likewise, these alternatives would further contribute to and/or exacerbate non-CEQA issues that have been raised in public comments regarding the Project's scale; impact of views, light, and shade; building heights; and pedestrian experience.

Public Support for Specific Alternatives

As discussed above, each of the five alternatives evaluated in Section V, Alternatives, has been given full consideration in the Draft EIR. The EIR will not approve the Project or any of the alternatives. Rather, the City will consider the EIR as part of the decision-making process for the approval of the Project or any of the alternatives. Several commenters support the alternatives evaluated in Section V, Alternatives, of the Draft EIR, including Alternatives 2 and 5. These comments of support for various alternatives within the Draft EIR will be noted for the administrative record and will be forwarded to the decision-makers for consideration prior to any action on the Project.

Comment No. 1-1

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to comment on the above-mentioned document. The City of Los Angeles is the California Environmental Quality Act (CEQA) Lead Agency for the Proposed Project. The following comments include recommended revisions to the project-level air quality mitigation measures, health risk impacts during operation, and information about South Coast AQMD permits that the Lead Agency should include in the Final EIR.

South Coast AQMD Staff's Summary of Project Information in the DEIR

Based on the DEIR, the Lead Agency proposes the continuation of an existing studio use and the modernization and expansion of media production facilities within an approximately 25-acre Television City studio¹. The Project is located at 7716–7860 West Beverly Boulevard in Los Angeles². The Proposed Project consists of up to a maximum of 1,874,000 square feet of sound stage, production support, production office, general office, retail uses, associated circulation improvements, parking, landscaping, and open space³. More specifically, the Project includes up to 1,626,180 square feet of new development, the retention of up to 247,280 square feet of existing uses, and the demolition of up to 495,860 square feet of existing media production facilities⁴. Based on a review of aerial photographs, South Coast AQMD staff finds that the nearest sensitive receptor (e.g., residence) is within 25 feet east of the Proposed Project. The Project could take place in one phase over a 32-month period, which could begin in 2023 and end as soon as 2026, or could occur in phases over multiple years⁵. A Development Agreement is sought with a term of 20 years, extending the full buildout year to approximately 2043⁶.

Response to Comment No. 1-1

This comment serves as an introduction to the commenter's letter regarding the Draft EIR for the Project and summarizes the Project Description (Section II, Project Description, of the Draft EIR). Specific comments regarding the Draft EIR are addressed below.

Comment No. 1-2

South Coast AQMD Staff's Comments on the DEIR

Additional Recommended Project-Level Air Quality Mitigation Measures

Based on the DEIR, the Project construction, even with the incorporation of feasible mitigation measures⁷, is expected to result in a significant impact on NOx emissions when compared to the South Coast AQMD Regional Air Quality Significant Thresholds. In addition, Table IV.A-12: Estimated Maximum Daily Regional Emissions from Project Concurrent Construction (Mitigated) and Operations shows that regional NOx and VOC would also exceed the South Coast AQMD regional operational significance thresholds⁸. To reduce the construction emissions, the Lead Agency proposes mitigation measures, including the mitigation measure AIR-MM-1, that off-road diesel-powered equipment shall meet the USEPA Tier 4 Final standards⁹. However, as mentioned in the DEIR, the Proposed Project is seeking a Development Agreement with a term of 20 years, which could extend the full buildout year to approximately 2043¹⁰. It is reasonably foreseeable that Tier 4 Final might not be the cleanest technology when construction occurs later during the 20-year Development Agreement. According to the California Air Resource Board (CARB) Strategies for Reducing Emissions from Off-Road Construction Equipment, the implementation of off-road Tier 5 starting in 2027/2028 and the Governor's Executive order in September 2020 requires CARB to develop and propose a full transition to Zero Emissions (ZE) by 2035, wherever feasible¹¹. Therefore, South Coast AQMD staff recommends that the Lead Agency revise the AIR-MM-1 to commit to using the cleanest technology for construction during the Development Agreement period, if available and feasible, and includes the revision in the Final EIR. If the revisions are not included in the Final EIR, the Lead Agency should provide reasons for not having them supported by substantial evidence in the record.

Response to Comment No. 1-2

The Draft EIR concluded in Table IV.A-8, Estimated Maximum Regional Project Daily Construction (Mitigated) Emissions, that the Project is expected to result in a significant regional NO_x impact during proposed construction activities. In addition, Table IV.A-12, Estimated Maximum Daily Regional Emissions from Project Concurrent Construction (Mitigated) and Operations, of the Draft EIR shows that regional NO_x and VOC would also exceed the South Coast Air Quality Management District (SCAQMD) regional significance thresholds. The City concurs that it is reasonably foreseeable that Tier 4 Final might not be the cleanest technology if construction were to occur later during the 20-year term of the Development Agreement. On November 3, 2021, CARB held remotely the first public workshop on the development of Tier 5 emission standards that will seek to further reduce NO_x by 50 percent and PM emissions by 90 percent from off-road engines—in comparison to Tier 4 Final emission standards—depending on the engine power category—in the 2028–2030 timeframe. CARB has not yet released a formal Tier 5 proposal—rather, a number of concepts have been presented with the intention to solicit feedback from engine manufacturers and other stakeholders. Page 13 of the SCAQMD presentation referenced in this comment acknowledges that electrification/hybridization requirements could be included within Tier 5 emission standards, which would support the Governor’s Executive Order (directing CARB to develop and propose a full transition to Zero Emissions [ZE] by 2035, wherever feasible). Consistent with SCAQMD’s recommendation, the City has revised Mitigation Measure AIR-MM-1 to commit to using Tier 5 construction equipment, where commercially available. Refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR.

Comment No. 1-3

Health Risk Impacts during Project Operation

CEQA Guidelines §15126.2 and §15126.4 require an EIR to include a description of the significant environmental effects of a proposed project, significant environmental effects which cannot be avoided, significant irreversible environmental changes, growth-inducing impacts, and mitigation measures proposed to minimize the significant adverse impacts. An impact is considered significant under CEQA if it leads to a “substantial, or potentially substantial, adverse change in the environment.” The Proposed Project is to build and

expand the use of the facility to more than 1.8 million square feet area. In addition to the air quality impacts from the criteria pollutants and greenhouse gases, the adverse air quality health risk impacts associated with increased emissions of toxic air contaminants (TACs) from all sources (including but not limited to existing and future permitted stationary sources, mobile sources, and other emission sources) during the operation phases of the Proposed Project will need to be appropriately evaluated using qualitative and/or quantitative approaches in this EIR to justify whether the Proposed Project has potentially substantial adverse impacts or not.

In the Air Quality Section in the DEIR, the Lead Agency mentions, “*The primary sources of potential TACs associated with Project operations include diesel particulate matter from delivery and production trucks and, to a lesser extent, facility operations (e.g., natural gas-fired boilers). However, these activities and the land uses associated with the Project, are not considered land uses that generate substantial TAC emissions.*”¹² However, based on the South Coast AQMD Facility Information Detail (F.I.N.D) database¹³, it appears that the Proposed Project has more than ten permitted sources on-site (e.g., emergency diesel engines, boilers, and spray booths) and is also applying for additional nine permitted units (e.g., boilers and internal combustion engines). With the expansion of the use of the facility in the future, it is also expected that more new and modified equipment will be needed to use on site. The incremental uses from the new and modified stationary sources and their net increase of criteria pollutant emissions and TACs emissions are potentially substantial, but they are not evaluated and discussed in the DEIR. Therefore, it is also unclear if the primary sources of TACs associated with Project operations are the diesel particulate matters from the trucks.

¹² DEIR. Page IV.A-72.

¹³ South Coast AQMD Facility Information Detail (F.I.N.D) can be found at: <http://www.aqmd.gov/nav/FIND>.

Response to Comment No. 1-3

The Draft EIR provided a qualitative evaluation of health risk during the operation phase of the Project. As discussed on page IV.A-72 in Section IV.A, Air Quality, of the Draft EIR, “The primary sources of potential TACs associated with Project operations include diesel particulate matter from delivery and production trucks and, to a lesser extent, facility operations (e.g., natural gas fired boilers). However, these activities, and the land uses associated with the Project, are not considered land uses that generate substantial TAC emissions.” The SCAQMD states that the SCAQMD Facility Information Detail (FIND) database identifies that the Project Site includes permitted on-site sources and that the Project would include additional permitted sources. For clarification purposes, the FIND database identifies six emergency generators, six natural gas fired boilers, and four spray paint booths. All but one of the emergency generators would be decommissioned as part of the Project. It is unclear how the SCAQMD has determined that the Project would require

application for an additional nine permitted units. Further clarification is provided below regarding the permitted sources (a description of each of these sources and how the Draft EIR qualitatively addressed the TAC emissions is provided below).

Table IV.A-10 on page IV.A-70 in Section IV.A, Air Quality, of the Draft EIR shows that diesel particulate matter (DPM) emissions from emergency generators would decrease under the Project. However, the emergency generator calculation sheet was inadvertently omitted from Appendix B, Air Quality and Greenhouse Gas Emissions, of the Draft EIR. This worksheet is included in Section III, Revisions, Clarifications, and Corrections to the Draft EIR. As shown therein, existing DPM emissions were provided based on Television City's 2021 Annual Emissions Report (AER) and reflect the actual number of hours each of the six emergency generators were operated. See the Confirmatory Air Quality, GHG, and Energy Analysis in Response to Public Comments included as Appendix FEIR-9 of this Final EIR. With the exception of one emergency generator (ID 618456 [i.e., Big Blue]), all existing emergency generators will be decommissioned and replaced with new emergency generators. Since the seven new generators could be located within 50 meters (approximately 170 feet) of residential uses, the Project will be required to comply with the new requirements in Table 1 of SCAQMD Rule 1470. A new PDF (i.e., Project Design Feature AIR-PDF-2) is included in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, requiring all new generators to meet the new emission standards included in Table 1 of SCAQMD Rule 1470 and USEPA Tier 4 Final standards regardless of whether the generator is within 50 meters of sensitive land uses. While the emergency generators will likely be permitted for 200 hours per year consistent with SCAQMD Rule 1470, it is conservative to limit the usage in the analysis to historical annual hours of use (Television City's 2019–2021 AERs provide the fuel consumption for each emergency generator based on engine maintenance logs and fuel usage and shows approximately nine hours of runtime per existing emergency generator on an annual basis) since future emissions from new generators will substantially decrease in comparison to existing emergency generators (i.e., resultant DPM emission factors substantially decrease for future Rule 1470-compliant generators in comparison to existing older generators). Analysis of both existing and proposed generators at the maximum permitted hours (200 hours per year), rather than actual hours, would over-estimate the reduction in future incremental DPM emissions and reduce the Project's potential incremental health risk impacts for hours of generator usage that would typically not occur on an annual basis. The average DPM emission factor for the five existing emergency generators that will be decommissioned is 0.40 g/hp-hr and would decrease to 0.02 g/hp-hr for the new generators. The existing generators result in approximately 41.8 lbs/yr of DPM based on historical annual hours of use or approximately 837.5 lbs/yr at 200 hours. Under the Project, the seven new emergency generators combined with the Big Blue generator would result in approximately 8.2 lbs/yr of DPM based on historical annual hours of use or approximately 140.5 lbs/yr at 200 hours. The ratio of Project versus existing generators based on historical hours is 5.1 and is 5.9 at 200 hours per year. Thus, the difference in Project versus existing emissions increases with

increased use of the emergency generators, and it is, therefore, more conservative to analyze generator usage based on historical annual hours of operation. Based on this information, potential TAC emissions from proposed emergency generators would substantially decrease in comparison to the existing emergency generators.

Footnote b in Table IV.A-7 on page IV.A-64 of the Draft EIR shows that existing paint spray booths (four permitted sources) will be removed as part of the Project. The emission inventory from these sources is also provided in AERs on file with SCAQMD. The AER emission inventory data from the existing spray booths is included in Appendix FEIR-9 of this Final EIR. As further discussed in footnote b of Table IV.A-7 of the Draft EIR, given the nature and logistics of production activities in newer studio facilities and how spray paint booths are operated at Manhattan Beach Studios, an affiliate of the Applicant, spray paint booth usage is assumed not to increase as a result of the Project despite the future expansion of production and support uses. Therefore, as stated in the Draft EIR, spray paint booth usage would not increase in comparison to existing conditions. Furthermore, any new spray paint booths at the Project Site would include the most up-to-date equipment, which would comply with applicable SCAQMD regulatory requirements (e.g., more efficient paint sprayers and high efficiency particulate air [HEPA] filtration) and SCAQMD permit conditions. Based on this information, potential TAC emissions from any future spray paint booths would not be expected to exceed existing spray paint booth emissions on the Project Site.

Natural gas usage (e.g., boilers) on the Project Site was calculated within CalEEMod and presented in Table IV.A-7 on page IV.A-64 of the Draft EIR. As shown in Table IV.A-7 of the Draft EIR, the Project would result in a minimal increase in natural gas emissions and resultant TACs. TAC emissions from natural gas are not a substantial contributor to health risk impacts in comparison to DPM, as reflected in SCAQMD's MATES-V study. As discussed on page IV.A-24 of the Draft EIR, the MATES-V study estimated the cancer risk from toxic air emissions throughout the South Coast Air Basin (Air Basin) by conducting a comprehensive monitoring program, an updated emissions inventory of TACs, and a modeling effort to fully characterize health risks for those living in the Air Basin. The MATES-V study concluded that approximately 50 percent of the risk is attributed to diesel particulate emissions, approximately 25 percent to other toxics associated with mobile sources (including benzene, butadiene, and carbonyls), and approximately 25 percent of all carcinogenic risk is attributed to stationary sources (which include large industrial operations, such as refineries and metal processing facilities, as well as smaller businesses, such as gas stations and chrome plating). While the Draft EIR accounted for and analyzed natural gas usage associated with the Project, after the publication of the Draft EIR, the City of Los Angeles subsequently passed an all-electric buildings ordinance (Ordinance No. 187714), which does not allow installation of new natural gas-powered equipment, with certain exceptions. The Project would comply with the new ordinance.

Comment No. 1-4

Moreover, the Air Quality Section in the DEIR, the Lead Agency, also mentions, “SCAQMD recommends that HRAs be conducted for substantial individual sources of diesel particular matter (e.g., trucks stops and warehouse distribution facilities that generate more than 100 trucks per day or more than 40 trucks with operating transport refrigeration units)”¹⁴, and the Lead Agency references it as from South Coast AQMD Health Risk Assessment Guidance¹⁵. However, this written language is likely to be taken from CARB Air Quality and Land Use Handbook: A Community Health Perspective, under Table 1-1: Recommendations on Sitting New Sensitive Land Uses, and specifically for Distribution Centers¹⁶. The above statement and Table 1-1 are meant for advisory recommendations on sitting new sensitive land uses (e.g., residences, schools) near distribution centers and other land use types. The Lead Agency may misunderstand the above advisory recommendations from CARB Air Quality and Land Use Handbook because the Proposed Project is not a distribution facility, nor are there any sitting new sensitive receptors near the Project site. Therefore, not including an HRA based on the above statement is misused and is not reasonably explained.

Based on Table 6 in Appendix M—Transportation Section, The [sic] Lead Agency mentions that the total net Project new trips are 787 and 855 in the morning and the afternoon peak hour trips, respectively. However, it is unclear if the net increased daily trips included how many daily truck trips are involved in the operations. If trucks are used in the Proposed Project’s operational activities (e.g., delivering equipment), the Lead Agency should identify the number of daily trucks traveled from and to the site (e.g., number of one-way trucks per day) and state that in the EIR. However, the Lead Agency did not mention the number of trucks used for daily operations in the DEIR. South Coast AQMD staff recommends that the Lead Agency revise and identify the number of trucks potentially involved in the operational activities and include them in the Final EIR. If it is not included in the Final EIR, the Lead Agency should provide reasons for not having it supported by substantial evidence in the record.

The operation of the Proposed Project will attract heavy-duty, diesel-fueled vehicular trips (e.g., trucks for delivering equipment) that emit Diesel Particulate Matter (DPM), which is an air toxic and carcinogen. Furthermore, the Proposed Project is close to the local residences and exposes existing (e.g., the apartment is within 25 ft east of the Project site) and future sensitive receptors to potential adverse health impacts from carcinogenic emissions generated by diesel-mobile sources. However, based on the DEIR and technical appendices review, South Coast AQMD staff found that the Lead Agency did not perform a mobile source HRA during operation.

Response to Comment No. 1-4

The SCAQMD has recommended use of SCAQMD's Guidance Document and the CARB Handbook for evaluation of TAC emissions sources in other SCAQMD comment letters. As an example, in 2017 the SCAQMD provided a comment letter on the MND for the Proposed Inland Center Gas Station Project.⁹⁵ As described in the comment letter, the Lead Agency proposed to construct a new gas station with twelve pumps adjacent to existing residential dwellings to the south. The SCAQMD provided the following guidance:

Guidance Regarding Gasoline Dispensing Facilities Site Near Sensitive Receptors

SCAQMD staff recognizes that there are many factors Lead Agencies must consider when making local planning and land use decisions. To facilitate stronger collaboration between Lead Agencies and the SCAQMD to reduce community exposure to source-specific and cumulative air pollution impacts, the SCAQMD adopted the Guidance Document for Addressing Air Quality Issues in General Plan and Local Planning in 2005. Additionally, the California Air Resources Board's (CARB) Air Quality and Land Use Handbook: A Community Health Perspective recommended in 2005 to avoid the siting of housing within 300 feet of a large gas station or 50 feet from a typical gas station. In April 2017, CARB released a Technical Advisory as a supplement to this Handbook. These Guidance documents provide recommended policies that local governments can use in their General Plans or through local planning to prevent or reduce potential air pollution impacts and protect public health. The SCAQMD staff recommends that the Lead Agency review and consider these Guidance documents when making local planning and land use decisions.

The SCAQMD provided direction to consider the guidance documents in the Lead Agency's decision to locate a potential TAC emissions source (in that case a gasoline station) near sensitive land uses and included referenced siting distances in the CARB Air Quality and Land Use Handbook. Furthermore, SCAQMD's Guidance Document for

⁹⁵ SCAQMD, Mitigated Negative Declaration (MND) for the Proposed Inland Center Gas Station Project, May 24, 2017, www.aqmd.gov/docs/default-source/ceqa/comment-letters/2017/mnd-inlandcenter-052417.pdf?sfvrsn=6, accessed September 25, 2023.

Addressing Air Quality Issues in General Plan and Local Planning (Guidance Document) provides the following information regarding the siting of new facilities on page 2-3.

The potential impacts of new facilities on sensitive sites will depend on a variety of factors including the amount and toxicity of pollutants emitted, the type of air pollution control equipment at the facility, design features of the facility, the distance from the source of emissions to the sensitive receptor, and local meteorology. All these factors should be carefully evaluated when siting a source of air pollution. Typically, the siting process followed by land use agencies to avoid the location of sensitive sites (e.g., residences, health clinics, etc.) near sources of air pollution does not involve the AQMD. The potential for public health impacts remains unchanged when siting sensitive receptors near a pollution source or a pollution source near a sensitive receptor.

Page 1-6 of the SCAQMD's Guidance Document provides CARB recommended minimum separation distances between new sensitive land uses and eight categories of existing sources (Table 1-1 in CARB's Handbook) which include: (1) high-traffic freeways and roads; (2) distribution centers; (3) rail yards; (4) ports; (5) refineries; (6) chrome plating facilities; (7) perchloroethylene dry cleaners; and (8) large gasoline stations. The Project would not include any of these substantial TAC sources. As discussed on page IV.A-72 in Section IV.A, Air Quality, of the Draft EIR, the primary sources of potential TACs associated with Project operations include DPM from delivery trucks (e.g., truck trips on local streets) and, to a lesser extent, facility operations (e.g., natural gas fired boilers). However, these activities, and the land uses associated with the Project, are not considered land uses that generate substantial TAC emissions based on the above referenced guidance documents. As discussed above, the Draft EIR accounted for and analyzed natural gas usage associated with the Project, and the City of Los Angeles subsequently passed an all-electric buildings ordinance, which does not allow installation of new natural gas-powered equipment, with certain exceptions. The Project would comply with the new ordinance. Moreover, as shown in Table IV.A-7 on page IV.A-64 in Section IV.A, Air Quality, of the Draft EIR, emissions of DPM (i.e., PM₁₀) from emergency generators would be reduced relative to existing conditions during Project operations, and the Project will also result in operational reductions relative to the existing conditions of stationary energy (natural gas) emissions and area (on-site equipment) emissions through building and on-site equipment electrification, thus leaving truck trips as the only meaningful source of incremental operational TAC emissions.

SCAQMD does not provide clarification in SCAQMD's Guidance Document or in this comment regarding what level of diesel truck activity from a typical land use development project would require a Health Risk Assessment (HRA). However, the CARB Handbook does recommend to avoid siting new sensitive land uses within 1,000 feet of a distribution

center that accommodates more than 100 trucks per day or more than 40 trucks with operating transport refrigeration units per day (Table 1-1 of the ARB Handbook). Given that page 2-3 of the SCAQMD Guidance Document states that “the potential for public health impacts remains unchanged when siting sensitive receptors near a pollution source or a pollution source near a sensitive receptor,” the City as Lead Agency has elected to use the siting distances in Table 1-1 of the CARB Handbook for evaluating health risk impacts from both TAC sources and sensitive uses. Based on this guidance, the Project is not the type of project that would result in substantial trucks trips as contemplated by the CARB Handbook, and the Draft EIR concluded that truck trips would not require additional analysis.

Per the SCAQMD’s recommendation in this comment letter, this Final EIR provides a clear breakdown of anticipated daily Project-related truck trips, constituting substantial evidence that the Project would not be the type of Project that would result in substantial heavy-duty diesel truck trips (i.e., the Project would result in less than 100 diesel trucks per day), thereby confirming the conclusion in the Draft EIR. This information from Gibson Transportation is included in the Confirmatory Air Quality, GHG, and Energy Analysis in Response to Public Comments (see Appendix FEIR-9 of this Final EIR). However, although the Draft EIR correctly concluded that impacts would be less than significant based on the qualitative health risk analysis discussed above in Response to Comment No. 1-2 and this Response to Comment, further evaluation of TAC emissions in response to SCAQMD’s comments is included in this Final EIR to confirm the conclusions of the Draft EIR; refer to the quantitative HRA, included as Appendix FEIR-10 of this Final EIR, which confirms the Draft EIR’s conclusion that health risks from the Project would be below the applicable significance thresholds and impacts would be less than significant.

Comment No. 1-5

Therefore, it is recommended that, at minimum, the Lead Agency provide a qualitative analysis that inventories and evaluates all the stationary sources (including the permitted, proposed, and planned for future units) and mobile sources with the map showing the locations of the stationary sources, the truck routes to and from the site and truck loading/unloading docks, and their proximity to the sensitive receptors under the currently existing and foreseeable probable future conditions and show the justifications if the Proposed Project has potentially substantial health risk impacts or not from the existing condition. If a qualitative analysis is not included in the Final EIR, the Lead Agency should provide reasons for not having it supported by substantial evidence in the record.

If the results from the qualitative analysis show the Proposed Project may have potentially significant health risk impacts, South Coast AQMD staff recommends that quantitative analysis, HRA should be conducted and compare the Proposed Project’s cancer risks to South Coast AQMD CEQA significance threshold of 10 in one million¹⁷ to determine the

level of significance for the Proposed Project's health risk impact in the Final EIR¹⁸. The Lead Agency should also disclose the potential health risks for chronic and acute impacts of the Project's operation on residents living and/or workers working outside the Proposed Project's boundary in the Final EIR. If an HRA is not included in the Final EIR, the Lead Agency should provide reasons for not having it supported by substantial evidence in the record.

¹⁷ South Coast AQMD Air Quality Significance Thresholds can be found at: <http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf?sfvrsn=2>.

¹⁸ South Coast AQMD's guidance for performing a mobile source health risk assessment can be found at: <http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/mobile-source-toxics-analysis>.

Response to Comment No. 1-5

The quantitative HRA includes an assessment of health risk impacts from both Project-related construction and operational activities. On May 5, 2023, SCAQMD concluded that the HRA protocol adequately addresses health risk impacts related to the Project (see Appendix FEIR-10 of this Final EIR). The HRA prepared in response to these comments demonstrates that health risks from the Project would be a maximum of approximately 7.5 in one million for residences immediately east of the Project Site (Broadcast Center Apartments), which is below the applicable significance threshold of 10 in one million. Of note, the construction related impact was approximately 6.3 in one million and the operational incremental risk was approximately 1.2 in one million (difference between the buildout operational impact of 7.4 in one million and existing impact of 6.2 in one million). The increase in operational risk is primarily the result of conservatively locating proposed new emergency generators in close proximity to residents east of the Project Site whereas existing emergency generators are spread out throughout the Project Site (see Response to Comment No. 1-3). This risk analysis is conservative as it assumes an outdoor exposure for the entire length of construction and operations and does not account for any reductions from the time spent indoors, where air quality tends to be better. As shown in the quantitative HRA, the Draft EIR's qualitative health risk analysis correctly determined that Project health risk impacts would be less than significant.

Comment No. 1-6

South Coast AQMD Permits and Responsible Agency

If the implementation of the Proposed Project, including more than 1.8 million square foot modernization and expansion of media production facilities, methane mitigation systems, or any other soil remedial activities that may be needed, would require modifying the existing or use of new stationary equipment, including but not limited to emergency generators, fire water pumps, boilers, spray booths, etc., permits from South Coast AQMD are required. The Final EIR should include a discussion on stationary equipment requiring South Coast

AQMD permits and identify South Coast AQMD as a Responsible Agency for the Proposed Project. Any assumptions used for the stationary sources in the Final EIR will also be used as the basis for the permit conditions and limits for the Proposed Project. Please contact South Coast AQMD's Engineering and Permitting staff at (909) 396-3385 for questions on permits. For more general information on permits, please visit South Coast AQMD's webpage at: <http://www.aqmd.gov/home/permits>.

Response to Comment No. 1-6

The SCAQMD refers to page IV.A-16 in Section IV.A, Air Quality, of the Draft EIR, which provides a list of SCAQMD rules and regulations applicable to land use development projects (including this Project). Rule 1113—Architectural Coatings, Rule 1146.2—Emissions of Oxides of Nitrogen from Large Water Heaters and Small Boilers and Process Heaters and Rule 1470—Requirements for Stationary Diesel-Fueled Internal Combustion Ignition Engines are included in this list. As discussed in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR, in Response to Comment No. 1-3, and in the Confirmatory Air Quality, GHG, and Energy Analysis in Response to Public Comments (see Appendix FEIR-9 of this Final EIR), seven new diesel fuel emergency generators would be included as part of the Project. Since the seven new generators could be located within 50 meters (approximately 170 feet) of residential uses, the Project will be required to comply with the new requirements in Table 1 (PM Emission Standards for New Stationary Emergency Standby Diesel-Fueled CI Engines Located at a Sensitive Receptor or 50 Meters or Less From a Sensitive Receptor—gram per brake horsepower-hour (g/bhp-hr)) of SCAQMD Rule 1470. A new PDF (i.e., Project Design Feature AIR-PDF-2) is included in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, requiring all new generators to meet the new emission standards included in Table 1 of SCAQMD Rule 1470 and USEPA Tier 4 Final standards regardless of whether the generator is within 50 meters of sensitive land uses. Regarding boilers, natural gas consumption was calculated consistent with CalEEMod default factors and emission factors. Please note that the City of Los Angeles subsequently passed an all-electric buildings ordinance, which does not allow installation of new natural gas-powered equipment, with certain exceptions. The Project would comply with the new ordinance.

Comment No. 1-7

Conclusion

Pursuant to California Public Resources Code Section 21092.5(a) and CEQA Guidelines Section 15088(b), South Coast AQMD staff requests that the Lead Agency provide South Coast AQMD staff with written responses to all comments contained herein prior to the certification of the Final EIR. In addition, when the Lead Agency's position is at variance with recommendations raised in the comments, the issues raised in the comments should be addressed in detail, giving reasons why specific comments and suggestions are not

accepted. There should be good faith and reasoned analysis in response. Conclusory statements unsupported by factual information will not suffice (CEQA Guidelines Section 15088(c)). Conclusory statements do not facilitate the purpose and goal of CEQA on public disclosure and are not meaningful, informative, or useful to decision-makers and to the public who are interested in the Proposed Project.

South Coast AQMD staff is available to work with the Lead Agency to address any air quality questions that may arise from this comment letter. Please contact Danica Nguyen, Air Quality Specialist, at dnguyen1@aqmd.gov should you have any questions.

Response to Comment No. 1-7

The City has coordinated with SCAQMD regarding its comments on the Draft EIR. As requested, the City's responses to SCAQMD's comments will be sent to the SCAQMD as part of this Final EIR distribution prior to certification of this Final EIR. The City, in making the findings for the Project, will comply with the requirements of CEQA Guidelines Section 15091. As noted in the responses above, all of the SCAQMD's comments have been fully addressed and the conclusions in the Draft EIR have been confirmed.

Comment Letter No. 2

Charles C. Holloway
Utility Services Manager
Environmental Planning and Assessment
Department of Water and Power
111 N. Hope St., Rm. 1044
Los Angeles, CA 90012-2607

Comment No. 2-1

The Los Angeles Department of Water and Power (LADWP) appreciates the opportunity to provide comments on the TVC 2050 Project (Project) located at 7716–7860 West Beverly Boulevard, Los Angeles, CA 90036. The mission of LADWP is to provide clean, reliable water and power to the City of Los Angeles. Based on our review of the Draft Environmental Impact Report prepared for the Project, we respectfully submit the comments below:

Comments:**Joint:**

1. The City of Los Angeles, herein referred to as City, shall pertain to its employees, agents, consultants, contractors, officers, patrons, or invitees of the City, or by any other of the City's affiliated entities.
2. This response shall not be construed as an approval for any project.

Response to Comment No. 2-1

This introductory comment does not raise an environmental issue specific to CEQA or the Draft EIR and the environmental impacts addressed therein. The comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 2-2**Water System:****IV.M.1 Utilities and Service Systems—Water Supply and Infrastructure**

1. Page IV.M.1-39: The information in the fourth paragraph states that the TVC 2050 Project (Project)'s estimated net operational domestic water demand of

269,123 gpd (301 afy) is a fraction of LADWP's projected water demand shown in LADWP's 2020 Urban Water Management Plan (UWMP) and it "would represent a miniscule proportion of LADWP's projected water demand and supply in 2025". [sic]

LADWP finds that the Project's water demand is included in LADWP's 2020 UWMP, which is a planning document that forecasts adequate water supplies to meet all projected water demands in the City of Los Angeles (City) through the year 2045 based on the following:

- The Los Angeles Department of City Planning has determined that the Project is consistent with the demographic forecasts for the City from the 2020–2045 Regional Transportation Plan/Sustainable Communities Strategy (2020 RTP/SCS) demographic projection by the Southern California Association of Governments (SCAG).
- The City's water demand projection in LADWP's 2020 UWMP was developed based on SCAG's 2020 RTP/SCS demographic projection.

Projects that conform to the demographic projection from SCAG's 2020 RTP/SCS and are currently located in the City's service area are considered to have been included in LADWP's water supply planning efforts; therefore, the projected water supplies would meet the Project's water demand.

The fourth paragraph on page IV.M.1-39 shall be revised to reflect the conclusion stated in the Water Supply Assessment (WSA) for the TVC 2050 Project. Please see the enclosed file for the WSA conclusion.

Response to Comment No. 2-2

The suggested revisions of the commenter have been incorporated into Section III, Revisions, Clarifications, and Corrections to the Draft EIR. Specifically, the language quoted by the commenter, which is found on page IV.M.1-39 of Section IV.M.1, Utilities and Service Systems—Water Supply and Infrastructure, of the Draft EIR and refers to the Project's net operational water demand as "a miniscule proportion of LADWP's projected water demand and supply in 2025," has been clarified. The sentence that includes this text has been replaced with the following text:

As stated in the WSA, this additional water demand for the Project Site has been accounted for in the City's overall total demand projections in LADWP's 2020 UWMP using a service area-wide approach that does not rely on individual development demand. LADWP's 2020 UWMP utilized SCAG's 2020–2045 RTP/SCS data that provide for more reliable water demand forecasts, considering changes in population, housing units, and employment.

The second paragraph from the conclusion of the WSA states the following.

Based on the Planning Department's determination that the Project is consistent with the demographic forecasts for the City from the 2020 SCAG RTP, LADWP finds that the Project water demand is included in the LADWP's 2020 UWMP, which forecasts adequate water supplies to meet all projected water demands in the City through the year 2045. LADWP concludes that the maximum projected 301 AFY increase in the total water demand for this Project is accounted for in the LADWP's 2020 UWMP 25-year water demand projections. LADWP finds it will be able to meet the proposed water demand of the Project as well as existing and planned future water demands of its service area.

Much of the content of this paragraph has already been incorporated into the discussion on pages IV.M.1-39 and IV.M.1-40 of Section IV.M.1, Utilities and Service Systems—Water Supply and Infrastructure, of the Draft EIR. However, in response to this comment, as shown in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, the text in underline below has been incorporated into the first partial paragraph on page IV.M.1-40 of the Draft EIR.

Furthermore, as stated in the WSA, based on the Department of City Planning's determination that the Project is consistent with the demographic forecasts for the City from the SCAG's 2020–2045 RTP/SCS, LADWP concluded that the projected water supplies for average, single-dry, and multiple-dry years reported in LADWP's 2020 UWMP would be sufficient to meet the Project's estimated water demand, in addition to the existing and anticipated future water demands within LADWP's service area through the year 2045.

Comment No. 2-3

If you have any questions regarding the above comments, please contact Ms. Jazmin Martin of my staff, at (213) 367-1768 or Jazmin.Martin@ladwp.com.

Response to Comment No. 2-3

This comment provides a point of contact that will be included on future public mailings for the Project. The comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 2-4**Conclusion**

The Project is estimated to increase the total maximum water demand within the site by 301 AF annually. This additional water demand for the Project site has been accounted for in the City's overall total demand projections in the LADWP's 2020 UWMP using a service area-wide approach that does not rely on individual development demand. The LADWP's 2020 UWMP utilized SCAG's RTP data that provide for more reliable water demand forecasts, considering changes in population, housing units, and employment.

Based on the Planning Department's determination that the Project is consistent with the demographic forecasts for the City from the 2020 SCAG RTP, LADWP finds that the Project water demand is included in the LADWP's 2020 UWMP, which forecasts adequate water supplies to meet all projected water demands in the City through the year 2045. LADWP concludes that the maximum projected 301 AFY increase in the total water demand for this Project is accounted for in the LADWP's 2020 UWMP 25-year water demand projections.

LADWP finds it will be able to meet the proposed water demand of the Project as well as existing and planned future water demands of its service area.

Response to Comment No. 2-4

This comment concludes the letter and acknowledges that the Project's annual increase in water demand together with existing and planned future water demands of its service area will be met by LADWP. The comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment Letter No. 3

Rowena Lau
Division Manager
Wastewater Engineering Services Division
LA Sanitation and Environment
2714 Media Center Dr.
Los Angeles, CA 90065-1733

Comment No. 3-1

This is in response to your July 14, 2022 letter requesting a review of the proposed mixed-use project located at 7716–7860 West Beverly Boulevard, Los Angeles, CA 90036. The project will consist of TV facilities. LA Sanitation has conducted a preliminary evaluation of the potential impacts to the wastewater and stormwater systems for the proposed project.

WASTEWATER REQUIREMENT

LA Sanitation, Wastewater Engineering Services Division (WESD) is charged with the task of evaluating the local sewer conditions and to determine if available wastewater capacity exists for future developments. The evaluation will determine cumulative sewer impacts and guide the planning process for any future sewer improvement projects needed to provide future capacity as the City grows and develops.

Response to Comment No. 3-1

This comment acknowledges that LA Sanitation (LASAN) has conducted a preliminary evaluation of the potential impacts to the wastewater and stormwater systems for the proposed Project, and that LASAN Wastewater Engineering Services Division (WESD) is responsible for evaluation of local sewer divisions and wastewater capacity to guide future development. The comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 3-2**Projected Wastewater Discharges for the Proposed Project:**

Type Description	Average Daily Flow per Type Description (GPD/UNIT)	Proposed No. of Units	Average Daily Flow (GPD)
<i>Existing</i>			
Sound Stages	50 GPD/KGSF	28,900 SF	(4,777)
Production Support	50 GPD/KGSF	325,450 SF	(16,272)
Production Office	170 GPD/KGSF	163,090 SF	(27,725)
General Office	170 GPD/KGSF	159,600	(27,132)
<i>Proposed</i>			
Sound Stages	50 GPD/KGSF	350,000 SF	17,500
Production Support	50 GPD/KGSF	104,000 SF	5,200
Production Office	170 GPD/KGSF	700,000 SF	119,000
General Office	170 GPD/KGSF	700,000 SF	119,000
Retail	25 GPD/1000 SQ.FT	20,000 SF	500
Total			185,294 GPD

Response to Comment No. 3-2

The table shown above as Comment No. 3-2 is LASAN's estimation of the net operational wastewater that would be generated by the Project. This differs from that studied in the Draft EIR and reviewed by LASAN in its December 13, 2021, and July 13, 2021, letters, which are included as part of the Utility Report within Appendix O of the Draft EIR. Specifically, the existing floor area numbers shown in this table do not reflect the existing floor area on-site and thus do not reflect existing wastewater generation, which results in the EIR providing a more conservative estimate compared to the estimate provided by LASAN. In addition, the wastewater demand analysis in Section IV.M.2, Utilities and Service Systems—Wastewater, of the Draft EIR and the supporting Utility Report included as Appendix O of the Draft EIR is based on LADWP's detailed analysis of water demand associated with the Project and accounts for all elements of the Project, including basecamp, a Mobility Hub, covered parking and restaurant uses. Furthermore, the wastewater analysis in the Draft EIR (and in LASAN's December 13, 2021, letter) also accounts for the maximum wastewater demand associated with the Project's limited Land Use Exchange Program. As shown in Table IV.M.2-3 on page IV.M.2-16 of Section IV.M.2, Utilities and Service Systems—Wastewater, of the Draft EIR and in the Utility Report, the Project would result in a net increase of approximately 217,498 gallons of wastewater per day under the maximum demand scenario. Based on LASAN's data, including data from its December 13, 2021, letter, the Utility Report concluded that the existing capacity is available to accommodate this increase in wastewater flow.

Comment No. 3-3**SEWER AVAILABILITY**

The sewer infrastructure in the vicinity of the proposed project includes an existing 10-inch line on Fairfax Av R/W. The sewage from the existing 10-inch line feeds into a 21-inch line on Crescent Heights Blvd. The sewage from the 21-inch line feeds into a 39-inch line on Crescent Heights Blvd before discharging into a 48-inch sewer line on Crescent Heights Blvd. Figure 1 shows the details of the sewer system within the vicinity of the project. The current flow level (d/D) in the 10-inch line cannot be determined at this time without additional gauging.

The current approximate flow level (d/D) and the design capacities at d/D of 50% in the sewer system are as follows:

Pipe Diameter (in)	Pipe Location	Current Gauging d/D (%)	50% Design Capacity
10	Fairfax Av R/W	*	416,000 GPD
21	Crescent Heights Blvd.	39	2.85 MGD
39	Crescent Heights Blvd.	54	16.43 MGD
48	Crescent Heights Blvd.	33	28.91 MGD

* No gauging available

Based on estimated flows it appears the sewer system might be able to accommodate the total flow for your proposed project. Further detailed gauging and evaluation will be needed as part of the permit process to identify a specific sewer connection point. If the public sewer lacks sufficient capacity, then the developer will be required to build sewer lines to a point in the sewer system with sufficient capacity. A final approval for sewer capacity and connection permit will be made at the time. Ultimately, this sewage flow will be conveyed to the Hyperion Water Reclamation Plant, which has sufficient capacity for the project.

All sanitary wastewater ejectors and fire tank overflow ejectors shall be designed, operated, and maintained as separate systems. All sanitary wastewater ejectors with ejection rates greater than 25 GPM shall be reviewed and must be approved by LASAN WESD staff prior to other City plan check approvals. Lateral connection of development shall adhere to Bureau of Engineering Sewer Design Manual Section F 480.

If you have any questions, please call Christopher DeMonbrun at (323) 342-1567 or email at chris.demonbrun@lacity.org.

Response to Comment No. 3-3

The description of existing wastewater infrastructure in Section IV.M.2, Utilities and Service Systems—Wastewater, of the Draft EIR and the supporting Utility Report included as Appendix O of the Draft EIR is based on information provided by LASAN in its December 13, 2021, and July 13, 2021, letters responding to a request for wastewater services information for the Project (refer to Exhibit 4 of the Utility Report included as Appendix O of the Draft EIR), as well as review of maps and data by KPFF Engineers (e.g., existing surveys and data and mapping from NavigateLA). The LASAN letters include different discharge flow paths that provide for a more comprehensive understanding the existing sewer system in the Project vicinity. Nonetheless, the information in the December 13, 2021, and July 13, 2021, letters is consistent with what is included in this comment. Specifically, the routing of the sewer discharge in the City system includes the same starting pipe (i.e., the 10-inch diameter Fairfax Avenue line with a 50-percent design capacity of 416,000 gallons per day [gpd]) and ending pipe (i.e., the 48 inch-diameter Crescent Heights Boulevard line with a 50-percent design capacity of 28.91 million gpd). As with the previous input provided by LASAN in its December 13, 2021, and July 13, 2021, letters regarding the Project, this comment provides LASAN's standard conclusion that the sewer lines appear to be able to accommodate the Project and that the Hyperion Water Reclamation Plant has sufficient capacity for the Project. Consistent with this comment, as part of the Project, all future sewer connections and related infrastructure would be reviewed and approved by LASAN as required by the standard permitting process.

Comment No. 3-4**STORMWATER REQUIREMENTS**

LA Sanitation, Stormwater Program is charged with the task of ensuring the implementation of the Municipal Stormwater Permit requirements within the City of Los Angeles. We anticipate the following requirements would apply for this project.

POST-CONSTRUCTION MITIGATION REQUIREMENTS

In accordance with the Municipal Separate Storm Sewer (MS4) National Pollutant Discharge Elimination System (NPDES) Permit (Order No. R4-2012-0175, NPDES No. CAS004001) and the City of Los Angeles Stormwater and Urban Runoff Pollution Control requirements (Chapter VI, Article 4.4, of the Los Angeles Municipal Code), the Project shall comply with all mandatory provisions to the Stormwater Pollution Control Measures for Development Planning (also known as Low Impact Development [LID] Ordinance). Prior to issuance of grading or building permits, the applicant shall submit a LID Plan to the City of Los Angeles, Public Works, LA Sanitation, Stormwater Program for review and approval.

The LID Plan shall be prepared consistent with the requirements of the Planning and Land Development Handbook for Low Impact Development.

Current regulations prioritize infiltration, capture/use, and then biofiltration as the preferred stormwater control measures. The relevant documents can be found at: www.lacitysan.org. It is advised that input regarding LID requirements be received in the preliminary design phases of the project from plan-checking staff. Additional information regarding LID requirements can be found at: www.lacitysan.org or by visiting the stormwater public counter at 201 N. Figueroa, 2nd Fl, Suite 280.

Response to Comment No. 3-4

As discussed in Section IV.G, Hydrology and Water Quality, of the Draft EIR, the Project would comply with the City's Low Impact Development (LID) Ordinance, which describes infeasibility criteria. Feasibility of treatment is confirmed by the City of Los Angeles during the regulatory plan check process. The LID Ordinance provides for a number of alternatives for stormwater management. As discussed on page IV.G-30 of the Draft EIR, based on the Preliminary Geotechnical Engineering Investigation prepared for the Project by Geotechnologies, Inc. (and included as Appendix E.1 of the Draft EIR), infiltration is not feasible. Since infiltration has been determined to be infeasible by the Preliminary Geotechnical Engineering Investigation, the next tier of treatment is a stormwater capture and use system. As described in Section 5.2.2 of the Hydrology and Water Quality Report included as Appendix H of the Draft EIR, the Project would include the installation of a capture and reuse system to be used for irrigation. If that approach is later determined to be infeasible during the plan check process, high efficiency biofiltration/bioretention systems, consistent with the LID requirements, would be installed. In either case, Best Management Practice (BMP) systems would be designed within the Project Site to capture the typical urban contaminants found in stormwater. As the current stormwater is discharged without any such controls, the BMPs installed as part of the Project would be an improvement over the current conditions.

The comment refers to these measures as "post-construction mitigation requirements." However, please note that the regulatory compliance measures described above are not mitigation measures, as these measures are required by law. A summary of regulatory measures related to hydrology and water quality that are applicable to the Project is provided in Appendix FEIR-11 of this Final EIR.

Comment No. 3-5**GREEN STREETS**

The City is developing a Green Street Initiative that will require projects to implement Green Street elements in the parkway areas between the roadway and sidewalk of the public right-of-way to capture and retain stormwater and urban runoff to mitigate the impact of stormwater runoff and other environmental concerns. The goals of the Green Street elements are to improve the water quality of stormwater runoff, recharge local groundwater basins, improve air quality, reduce the heat island effect of street pavement, enhance pedestrian use of sidewalks, and encourage alternate means of transportation. The Green Street elements may include infiltration systems, biofiltration swales, and permeable pavements where stormwater can be easily directed from the streets into the parkways and can be implemented in conjunction with the LID requirements. Green Street standard plans can be found at: <https://eng2.lacity.org/techdocs/stdplans/index.htm>

Response to Comment No. 3-5

This comment discusses the City's Green Street Initiative, which does not relate to the Draft EIR's analysis of the Project's environmental impacts. According to the City of Los Angeles Bureau of Sanitation website, Green Street is "a storm water management approach" and not a current requirement. This comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 3-6**CONSTRUCTION REQUIREMENTS**

All construction sites are required to implement a minimum set of BMPs for erosion control, sediment control, non-stormwater management, and waste management. In addition, construction sites with active grading permits are required to prepare and implement a Wet Weather Erosion Control Plan during the rainy season between October 1 and April 15. Construction sites that disturb more than one-acre of land are subject to the NPDES Construction General Permit issued by the State of California, and are required to prepare, submit, and implement the Storm Water Pollution Prevention Plan (SWPPP).

If there are questions regarding the stormwater requirements, please call WPP's plan-checking counter at (213) 482-7066. WPD's plan-checking counter can also be visited at 201 N. Figueroa, 2nd Fl, Suite 280.

Response to Comment No. 3-6

As discussed on page IV.G-29 in Section IV.G, Hydrology and Water Quality, of the Draft EIR, Project construction would disturb more than one acre of soil, and, therefore, the Project would be subject to a Construction General Permit with the State Water Resources Control Board (SWRCB), which governs stormwater discharge during construction, including sediment and pollutant reduction/elimination. In accordance with the requirements of the Construction General Permit, the Project would prepare and implement a site-specific Stormwater Pollution Prevention Plan (SWPPP) that specifies BMPs to be used during construction to manage stormwater and non-stormwater discharges. BMPs would include, but would not be limited to, erosion control, sediment control, non-stormwater management, and materials management BMPs. In addition, Project construction activities would occur in accordance with City grading permit regulations (Los Angeles Municipal Code [LAMC] Chapter IX, Division 70), including the preparation and implementation of an erosion control plan, to reduce the effects of sedimentation and erosion. Erosion control BMPs may include slope drains that can be used to intercept and direct surface runoff or groundwater into a stabilized area or compost socks and berms that act as three-dimensional biodegradable filtering structures to intercept runoff where sheet flow occurs. In addition, in accordance with regulatory requirements, a Wet Weather Erosion Control Plan (WWECP) would be implemented should grading activities occur during the rainy season. A WWECP is a subset of the more general erosion control plan discussed on pages IV.G-29 and IV.G-35 of Section IV.G, Hydrology and Water Quality, of the Draft EIR. The WWECP is meant specifically for implementation of the rainy season (starting on September 1), whereas the general erosion control plan accounts for the full calendar year. In some cases the erosion control plan can be used as the WWECP, or, a site/project specific WWECP with additional BMPs during the rainy season may be necessary.

As stated on page IV.G-35 of the Draft EIR, through compliance with all applicable NPDES Construction General Permit requirements, including preparation of a SWPPP and implementation of BMPs, as well as compliance with applicable City grading permit regulations, Project construction activities would not substantially alter the Project Site drainage patterns in a manner that would result in substantial erosion, siltation, or flooding on- or off-site. As such, construction impacts related to erosion and flooding on- or off-site would be less than significant.

Comment No. 3-7**GROUNDWATER DEWATERING REUSE OPTIONS**

The Los Angeles Department of Water and Power (LADWP) is charged with the task of supplying water and power to the residents and businesses in the City of Los Angeles. One of the sources of water includes groundwater. The majority of groundwater in the City

of Los Angeles is adjudicated, and the rights of which are owned and managed by various parties. Extraction of groundwater within the City from any depth by law requires metering and regular reporting to the appropriate Court-appointed Watermaster. LADWP facilitates this reporting process, and may assess and collect associated fees for the usage of the City's water rights. The party performing the dewatering should inform the property owners about the reporting requirement and associated usage fees.

On April 22, 2016 the City of Los Angeles Council passed Ordinance 184248 amending the City of Los Angeles Building Code, requiring developers to consider beneficial reuse of groundwater as a conservation measure and alternative to the common practice of discharging groundwater to the storm drain (SEC. 99.04.305.4). It reads as follows: "Where groundwater is being extracted and discharged, a system for onsite reuse of the groundwater, shall be developed and constructed. Alternatively, the groundwater may be discharged to the sewer."

Groundwater may be beneficially used as landscape irrigation, cooling tower make-up, and construction (dust control, concrete mixing, soil compaction, etc.). Different applications may require various levels of treatment ranging from chemical additives to filtration systems. When onsite reuse is not available the groundwater may be discharged to the sewer system. This allows the water to be potentially reused as recycled water once it has been treated at a water reclamation plant. If groundwater is discharged into the storm drain it offers no potential for reuse. The onsite beneficial reuse of groundwater can reduce or eliminate costs associated with sewer and storm drain permitting and monitoring. Opting for onsite reuse or discharge to the sewer system are the preferred methods for disposing of groundwater.

To help offset costs of water conservation and reuse systems, LADWP offers a Technical Assistance Program (TAP), which provides engineering and technical assistance for qualified projects. Financial incentives are also available. Currently, LADWP provides an incentive of \$1.75 for every 1,000 gallons of water saved during the first two years of a five-year conservation project. Conservation projects that last 10 years are eligible to receive the incentive during the first four years. Other water conservation assistance programs may be available from the Metropolitan Water District of Southern California. To learn more about available water conservation assistance programs, please contact LADWP Rebate Programs 1-888-376-3314 and LADWP TAP 1-800-544-4498, selection "3".

For more information, related to beneficial reuse of groundwater, please contact Greg Reed, Manager of Water Rights and Groundwater Management, at (213)367-2117 or greg.reed@ladwp.com.

Response to Comment No. 3-7

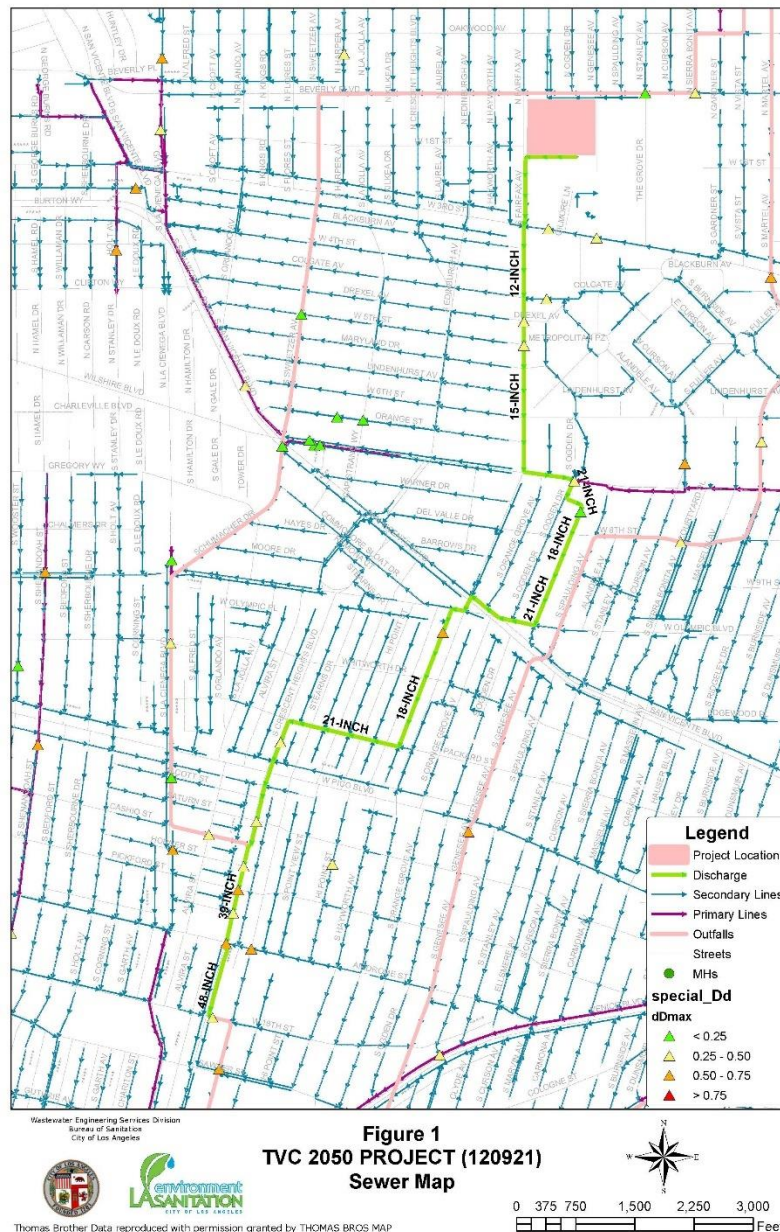

As stated on page IV.M.1-36 in Section IV.M.1, Utilities and Service Systems—Water Supply and Infrastructure, of the Draft EIR, the Project would comply with the applicable provisions of Ordinance No. 184248, including Section 99.04.305.4. Temporary dewatering is planned for below-grade parking structures and building foundation excavation and construction. As discussed on pages IV.G-30 and IV.G-31 of the Draft EIR, if conditions warrant, a temporary dewatering system consisting of pumps and filtration would be installed and operated in accordance with NPDES requirements. Section 99.04.305.4 of Ordinance No. 184248 requires that extracted groundwater be reused on-site if feasible to do so or discharged to the sewer if not. However, it is not anticipated that extracted groundwater would be reused on-site due to the volume and general water quality. Any discharge of groundwater during Project construction would comply with the applicable NPDES permit or industrial user sewer discharge permit and applicable LARWQCB requirements. Additionally, per Project Design Feature GEO-PDF-1, which is included on pages IV.D-18 to IV.D-19 in Section IV.D, Geology and Soils, of the Draft EIR, the below-grade parking structures would be designed to withstand hydrostatic pressure so that post-construction dewatering would not be necessary.

Comment No. 3-8**SOLID RESOURCE REQUIREMENTS**

The City has a standard requirement that applies to all proposed residential developments of four or more units or where the addition of floor areas is 25 percent or more, and all other development projects where the addition of floor area is 30 percent or more. Such developments must set aside a recycling area or room for onsite recycling activities. For more details of this requirement, please contact LA Sanitation Solid Resources Recycling hotline 213-922-8300.

Response to Comment No. 3-8

This comment summarizes the City's recycling requirements. The comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 3-9**Response to Comment No. 3-9**

This comment includes a technical exhibit with regard to wastewater infrastructure. This exhibit has been accounted for in the wastewater analysis within Section IV.M.2, Utilities and Service Systems—Wastewater, of the Draft EIR and the supporting Utility Report included as Appendix O of the Draft EIR.

Comment Letter No. 4

Michael Gralapp
President
A & G Lumber Company
5942 Washington Blvd.
Culver City, CA 90232-7325

Comment No. 4-1

I strongly support TVC 2050: The Los Angeles Studio Plan. TVC 2050 is a significant investment in our City's most identifiable industry, creating thousands of good-paying jobs and ensuring that Los Angeles remains the entertainment capital of the world.

TVC 2050 will enhance and modernize the studio's production operations, allowing the facility to meet constantly changing demands of the entertainment industry and promoting long-term operational sustainability. TVC 2050 includes the development of much-needed sound stages and new production facilities, keeping production and production jobs in Los Angeles.

TVC 2050 is a thoughtfully designed plan that preserves the existing studio use and rehabilitates the studio's Historic Cultural Monument. TVC 2050 encourages multi-modal transportation options through an on-site Mobility Hub, beautifies the public realm, and improves pedestrian safety and connectivity to the surrounding neighborhood. Importantly, the City's Draft Environmental Impact Report identifies no significant impacts from studio operations.

Please move TVC 2050 forward for approval. It will provide long-term benefits to the Beverly Fairfax District, the City, and the region. The plan creates thousands of entertainment and production jobs, prioritizes sustainability, and promotes diversity, equity, and inclusion through its Changing Lenses initiative, ensuring this iconic studio and the important industry and Angelenos it supports will continue to thrive.

Response to Comment No. 4-1

This comment indicating support for the Project is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment Letter No. 5

Beverly Fairfax Community Alliance
info@beverlyfairfaxcommunityalliance.org

Comment No. 5-1

On behalf of the Beverly Fairfax Alliance, we want to provide our comments on the Draft Environmental Impact Report for the TVC 2050 Project. We join the Beverly Wilshire Homes Association, the Save Beverly Fairfax HOA, the Hancock Park Homeowners Association, the Miracle Mile Residents association, and the hundreds of community members that have provided comments to this Draft EIR.

Response to Comment No. 5-1

This introductory comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 5-2

To the extent that what is being proposed at the Project site can be understood from the DEIR's uncertain and convoluted description, TVC 2050 is too large and intense for its proposed location. It will alter the fundamental character of this community. We hope the developer will step back and rethink what he is proposing and come back to the community with a well-defined and more reasonable project.

Response to Comment No. 5-2

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding how the Project Description was completed in full compliance with CEQA. Refer to Response to Comment No. 11-3 regarding the size of the Project. As demonstrated in the analysis provided on pages IV.H-39 through IV.H-57 of Section IV.H, Land Use and Planning, of the Draft EIR, the Project would not conflict with applicable land use plans and policies, including those that specifically address compatibility with surrounding land uses.

Comment No. 5-3

The project cannot be understood based on the Draft EIR's description. The first line of the Project Description states: "The TVC 2050 Project would establish the TVC 2050 Specific Plan...". [sic] There is no Specific Plan in the Draft EIR. Did the City not have the Specific Plan or chose not to make it available to the public? Please explain how the public is

supposed to evaluate the TVC 2050 Project when the key document describing the project does not exist? Why wasn't it provided if it is the central document defining the project?

Response to Comment No. 5-3

As stated consistently throughout the Initial Study, Draft EIR, and Final EIR, the Project is a studio project. The Project would include the establishment of the proposed Specific Plan to continue the existing studio use and modernize and expand production facilities within Television City, which has operated as a studio facility for over 70 years, through a cohesive and comprehensive plan. As stated throughout the Draft EIR, the proposed Specific Plan would permit the development of up to 1,874,000 square feet of sound stage, production support, production office, general office, and retail uses.

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding how the Project Description was completed in full compliance with CEQA. As discussed in Topical Response No. 1, the Draft EIR describes all of the physical aspects of the proposed Project that are necessary to fully evaluate the potential impacts of the Project, including, but not limited to, permitted and proposed floor area; a Land Use Exchange Program; design and architecture; height zones; frontage areas; building setbacks; other design elements, including screening and fencing; historic preservation elements; open space; landscaping; public realm enhancements; access; circulation; parking; lighting; signage; Project Site security; sustainability features; anticipated construction schedule; earthwork activities; and haul routes. As also discussed in Topical Response No. 1, the land use and development parameters within the proposed Specific Plan are fully consistent with those set forth in Section II, Project Description, of the Draft EIR. The Draft EIR discusses all of the physical elements of the proposed Specific Plan in the same amount of detail as the proposed Specific Plan itself. The level of detail included in the Draft EIR complies with CEQA and is consistent with the level of detail in certified EIRs for other specific plans throughout Los Angeles.

As discussed in Topical Response No. 1, CEQA defines the "project" to be analyzed in the EIR as the "physical change in the environment," not the regulatory document describing that change. Also note the OPR Guide to Specific Plans provides that, "[t]o the extent feasible, the process of preparing the specific plan and the environmental analysis should proceed concurrently because both documents require many of the same studies and resulting information. The information in the EIR provides decision-makers with the insight necessary to guide policy development, thereby ensuring the plan's policies will address and provide the means by which to avoid potential impacts to the environment."

An initial draft of the Specific Plan that was provided by the Applicant has been publicly available since 2021 as part of the administrative record. Further, neither CEQA nor City policy requires a draft Specific Plan itself to be included in the Draft or Final EIR.

Nonetheless, in response to comments on the Draft EIR, a Preliminary Draft Specific Plan has been made publicly available on the Department of City Planning's website for informational purposes. Note that this draft has not been approved by the City. Please also refer to Appendix FEIR-2, Comparison Chart of the Draft EIR and the Preliminary Draft Specific Plan, of this Final EIR.

Comment No. 5-4

Similarly, the Sign District has not been made available to the public. It is mentioned in the Draft EIR but not provided.

Response to Comment No. 5-4

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, and Response to Comment Nos. 5-10, and 26-129 regarding the Sign District.

Comment No. 5-5

The "Conceptual Site Plan" provided by the Draft EIR does not define what will be built. The Draft EIR states that the conceptual site plan "illustrates one possible development scenario." The Draft EIR confirms "actual development would be governed by the requirements of the proposed Specific Plan and not the conceptual site plan....". [sic] Please explain how the public supposed to know what the Project is if the Conceptual Site Plan is not the development, and the Specific Plan is not provided? How can the City evaluate the environmental impacts of the Project if the Project is not defined?

The other plans included with the Draft EIR are all also identified as illustrative. Even the Height Zone map says it is illustrative and the Draft EIR states the "height zones do not represent the actual development footprint of Project buildings."

How can the public or the City know what will be built and where? How did the City undertake its environmental analysis if it does not know what will actually be built, where and how?

Response to Comment No. 5-5

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan. As discussed therein, a CEQA project description is required to disclose the nature of the project and its main features. In addition, the degree of specificity required depends on the type of project. There must be sufficient information to understand the environmental impacts of the proposed project. The EIR must achieve a balance between technical accuracy and public understanding. The fact that the plans and other figures in

the Project Description are labeled as “conceptual” and/or “illustrative” does not render the Project Description unstable or not finite. There is no provision under CEQA that requires conceptual plans for a specific plan project to identify the precise location and use of each building as requested by the commenters, and the individual building for future development under the proposed Specific Plan will not be created until after the adoption of the Specific Plan. Any plans included in an EIR or other CEQA document are inherently conceptual, and plans are finalized during the building permit process, which occurs after a project is approved and its EIR certified.

The EIR for the Project provides the detail required by CEQA and is subject to mandated review processes by the City for future implementation. Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, and Response to Comment No. 5-3 regarding how the Draft EIR describes the physical aspects of the proposed Specific Plan that are necessary to fully evaluate the potential impacts of the Project. In particular, the proposed height zones, stepbacks, and frontage areas will dictate the placement, orientation, mass, and height of potential future buildings.

The Draft EIR analyzed the Project described in Section II, Project Description, of the Draft EIR (refer to Table II-2, Proposed Development Program, on page II-13 and Figure II-4, Conceptual Site Plan, on page II-14 of the Draft EIR). As discussed in detail in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Specific Plan would include a regulatory framework for implementation of the Project. Future changes that are substantially different than the Project or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, as well as potential CEQA compliance review.

With regard to the height zones, pages II-17 through II-20 of Section II, Project Description, of the Draft EIR provide a detailed description of the proposed height zones, including Figure II-5, Height Zone Map. Additional figures have also been added as part of this Final EIR for informational purposes in response to public comments. Refer to Figure II-4 through Figure II-6 on pages II-244 through II-246 for axonometric diagrams and to Figure II-4(a) and Figure II-4(b) within Section III, Revisions, Clarifications, and Corrections to the Draft EIR, for aerial renderings depicting the Conceptual Site Plan. These height zones are not proposed as “illustrative” height zones. Rather, as described in the Draft EIR, these height zones set forth the maximum building height limits for all buildings within the Project Site (there is currently no height limit under the existing zone designations). New buildings would occupy only a portion of the building envelope permitted in each height zone. The height zones in the Draft EIR are the same as those in the proposed Specific Plan.

HEIGHT ZONE MAP

Figure II-4
Height Zone C1 Diagram

Figure II-5
Height Zone C2 Diagram

Figure II-6
Height Zone D Diagram

Comment No. 5-6

What are the uses permitted as part of the TVC 2050 Project? Is it not just studios and offices? The DEIR lists a couple dozen possible uses including many typical studio uses and then adds “communication facilities, conference facilities, modular offices and trailers, ...special events, audience and entertainment shows, museum exhibits, theaters, educational facilities, e-sports, fitness facilities, mills/manufacturing, ...recreational facilities, restaurants and special event areas including the sale of alcoholic beverages, warehouses, ...transportation facilities, including a Mobility Hub and helipad, ...medical offices... *and all other uses permitted in the C2 zone unless expressly prohibited in the Specific Plan.*” Please explain how did the City decide what uses it would evaluate in the 100 or more uses permitted by the C2 zone? Since the public does not have the Specific Plan and apparently the City either does not have the Specific Plan or chose not to make it available in the Draft EIR, please explain how the City decided which environmental impacts to study based on the hundred potential uses in the C2 zone?

How did the City define impacts to be studied if there is no clarity as to what uses will be built and where? Obviously different uses can have very different impacts. An auditorium sports arena to seat 3,000 people as permitted in the C2 zone would have very different impacts from a warehouse.

Response to Comment No. 5-6

Television City has been an operating studio within the Project Site since 1952, and will continue to operate as a studio upon completion of the Project. Refer to Topical Response No. 3, Permitted On-Site Uses. Specifically, as set forth on page II-10 of Section II, Project Description, of the Draft EIR, the underlying purpose of the Project is to maintain Television City as a studio use and to modernize and enhance production facilities to meet both the existing and unmet demands of the entertainment industry, keep production activities and jobs in Los Angeles, upgrade utility and technology infrastructure and create a cohesive studio lot. As stated in Topical Response No. 3, Permitted On-Site Uses, Section III, Revisions, Clarifications, and Corrections to the Draft EIR, includes clarifications to Section II, Project Description, of the Draft EIR to provide a clarified list of five permitted studio related uses within the Project Site consistent with the underlying purpose of the Project: sound stage; production support; production office; general office; and retail. As discussed on pages IV.H-22 to IV.H-23 in Section IV.H, Land Use and Planning, of the Draft EIR, the Specific Plan would also allow ancillary sitewide uses, such as parking, communication facilities, childcare, fitness facilities, and facilities equipment and infrastructure, supporting the studio and the five permitted studio land uses. Ancillary facilities, such as childcare and/or fitness facilities, would be for use by on-site users and they would not be accessed separately by the public as an individual commercial tenant space. In addition, the text on page II-16 of Section II, Project Description, of the Draft EIR stating that permitted uses include “all other uses permitted in the C2 zone unless

expressly prohibited in the Specific Plan” has been deleted (even though these uses are currently permitted). A use, such as an auditorium sports arena open to the public, would not be permitted within the Project Site. Impacts associated with all uses permitted under the proposed Specific Plan have been fully evaluated in the EIR. With regard to special events, refer to Topical Response No. 3, Permitted On-Site Uses.

Comment No. 5-7

It is also unclear in the Draft EIR how much is actually going to be built. The Draft EIR makes clear the applicant is changing the definition of how the City measures permitted floor area. The Project’s website shows what appears to be lower-level areas with people working at these levels. By moving production areas below grade (and in parking areas) and redefining floor area, the Draft EIR failed to study the environmental impacts from these uses.

Response to Comment No. 5-7

As stated throughout the Draft EIR, the proposed Specific Plan would permit a maximum total of 1,874,000 square feet of floor area. Floor area is first defined on page II-1 in Section II, Project Description, of the Draft EIR. As also first stated on page II-1 of the Draft EIR, “[t]he proposed approximately 1.874 million square feet of floor area per the Specific Plan definition is equivalent to approximately 1.984 million square feet based on the LAMC definition and approximately 2.103 million gross square feet.” Thus, the Draft EIR disclosed the total floor area under both the proposed Specific Plan and LAMC definitions.

The Project’s proposed definition of floor area does not understate the environmental impacts of the Project. As discussed in Topical Response No. 2, Definition of Floor Area is Appropriate, the Project’s definition of floor area included in Section II, Project Description, of the Draft EIR, and in the proposed Specific Plan is based on the LAMC definition, with a few additional clarifications to account for the unique nature of studio uses and functions, as was done in the Paramount Pictures Specific Plan (Ordinance No. 184,539), which is the most recent and direct precedent for this Project. Areas shown within the Conceptual Site Plan that are dedicated to the Mobility Hub and basecamp areas are appropriately excluded from the Project definition of floor area. LAMC Section 12.03 specifically excludes “parking areas with associated driveways and ramps” from the definition of floor area. The Mobility Hub components are equivalent to “parking areas” where people can access various modes of transportation. Accordingly, the

exclusion of the specific term Mobility Hub from the definition of floor area in the Draft EIR and the proposed Specific Plan provides definitional clarity and is added for transparency of planning and regulatory compliance. The basecamp areas provide for a variety of uses that are ancillary to and necessary for production activities in a studio and include loading, wardrobe, hair, make-up, craft service, parking, and storage of mobile facilities and support vehicles (such supportive services are temporary and mobile). A significant portion of the subterranean basecamp would be used for storage of mobile facilities and support vehicles. These basecamp areas would also provide access, staging, storage, and connectivity between active production and supporting uses, as well as space for production staging, loading, and emergency vehicle access throughout the Project Site. Thus, the basecamp activities are consistent with the elements that are excluded from the floor area definition under LAMC Section 12.03.

Also note that, while outdoor production activities may occur above-grade, no active production activities or uses would be located in the parking and basecamp areas below Project Grade. Refer to Figure II-4(c) in Section III, Revisions, Clarifications, and Corrections to the Draft EIR. This is consistent with the renderings included in the comment, which show below-Project Grade basecamp areas and above-Project Grade production activities.

Comment No. 5-8

The applicant is seeking to change the Wilshire Community Plan land use designations for the TVC 2050 Project. Why doesn't the Draft EIR include any discussion of the potential impacts from the proposed General Plan amendment to change from Community Commercial, Limited Commercial, and Neighborhood Commercial to Regional Center? The current land use designations would permit less development than proposed. This change is a major shift in the character of the community.

Response to Comment No. 5-8

As stated on page 29 of the Initial Study published on July 2, 2021 (Appendix A of the Draft EIR), and on page II-36 of the Draft EIR published on July 14, 2022, the Applicant is requesting, among other Project approvals, a General Plan Amendment to change the General Plan land use designations from Community Commercial, Limited Commercial, and Neighborhood Commercial to a unified Regional Center Commercial land use designation; assign a Regional Center Commercial land use designation to an approximately 0.63-acre portion of the Project Site located in unincorporated Los Angeles County to be annexed to the City of Los Angeles; and allow the TVC zone as a corresponding zone to the Regional Center Commercial designation pursuant to LAMC

Section 11.5.6.^{96,97} As set forth in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, the requested land use designation change is to a “Regional Commercial” land use. The Applicant is requesting the Regional Commercial designation to accurately align the function of the Project Site with the appropriate General Plan land use designation. Pages IV.H-43 and IV.H-44 in Section IV.H, Land Use and Planning, of the Draft EIR address the proposed General Plan Amendment to change the General Plan land use designations to a unified Regional Commercial land use designation, rather than the three different land use designations covering portions of the Project Site today. As demonstrated therein, unifying the General Plan designations for the Project Site to Regional Commercial is consistent with the applicable policies in the General Plan.

More specifically, in the Wilshire Community Plan, the “Regional Commercial” land use designation is one of the categories used to help differentiate types of commercial development. As identified in the Wilshire Community Plan, the “Regional” designation uses criteria identified within the City of Los Angeles General Plan Framework Element. As identified in Chapter 3 of the General Plan Framework Element, “Regional Commercial” land uses “contain a diversity of uses such as offices, retail [and] major entertainment facilities and supporting services,” which “typically provide a significant number of jobs”⁹⁸ and are “intended to serve as the focal points of regional commerce, identity, and activity.”⁹⁹ TVC’s function has been consistent with the Regional Commercial land use designation for over 70 years as the first purpose-built television studio and an icon for the entertainment industry, as well as a major component of the Beverly-Fairfax community’s identity. As such, the proposed Regional Commercial land use designation is appropriate for Television City. As discussed throughout the Draft EIR, the proposed Specific Plan would permit the development of up to 1,874,000 square feet of sound stages, production support, production office, general office, and retail uses, thereby creating thousands of new jobs and generating significant economic revenue during construction and operation.

The proposed Regional Commercial designation would not increase the size of the Project allowed under the requested entitlements; rather, a site’s permitted FAR and height are controlled by its zone and height district designations. Currently, an FAR of 1.5:1 is permitted by existing zoning, and the Project is requesting an increase to 1.75:1 (a

⁹⁶ Commenters refer to the term “Regional Center.” However, the correct term used in the Wilshire Community Plan is “Regional Commercial.”

⁹⁷ The Wilshire Community Plan states that there are four areas designated as Regional Commercial. The proposed General Plan Amendment will require a modification to the Regional Commercial description in the Wilshire Community Plan to identify a fifth Regional Commercial area.

⁹⁸ City of Los Angeles General Plan Framework Element, Chapter 3, Land Use.

⁹⁹ City of Los Angeles General Plan Framework Element, Chapter 3, Land Use.

0.25 increase in permitted FAR represents an approximately 17 percent increase over existing zoning).

Notwithstanding, it should also be noted that the proposed 1.75 FAR for the Project Site would also be consistent with the existing Community Commercial, Limited Commercial, and Neighborhood Commercial designations. As mentioned above, General Plan land use designations do not determine floor area. Rather, these designations determine the types of zoned uses which inhabit a specific geography. Therefore, the designation of the Project Site as either Community Commercial, Limited Commercial, or Neighborhood Commercial does not change or modify the Project Site's studio use.

Per the General Plan Framework Element, "[g]enerally, regional centers will range from FAR 1.5:1 to 6:1." The lower end of this general FAR range is consistent with the proposed FAR of 1.75:1. As demonstrated in the analysis provided on pages IV.H-39 through IV.H-57 of Section IV.H, Land Use and Planning, of the Draft EIR, and in the detailed land use policy tables included as Appendix I to the Draft EIR, the size and scale of the Project would not conflict with any applicable land use plans and policies, including those that specifically address compatibility with surrounding land uses, and the Project would not result in a major shift in the character of the community. The proposed Regional Commercial land use designation is appropriate for Television City, a studio campus that would generate thousands of jobs for the City.

To the south of the Project Site, The Original Farmers Market has operated at its location since 1934. As noted by the Zoning Administrator in City Planning Case No. ZA-1999-0318-CUB-CUZ-ZV-YV, The Original Farmers Market is "a Los Angeles landmark, which draws tourists to the area from not only California and the nation, but also from other international points." The subsequent development and operation of The Grove, in accordance with the Zoning Administrator's 1999 approval of this case, have demonstrated its symbiotic relationship with The Original Farmers Market as well. Thus, properties in the vicinity of the Project Site have already been developed with uses consistent with a Regional Commercial designation regardless that those properties retain a Community Commercial designation.

Comment No. 5-9

To provide a sense of the project in the context of the community, below is a height model showing the heights of the TVC 2050 project. Note: this is not a massing model. Part of the issue with the Draft EIR is that there is no visual representation of this Project or clarity on what the Project is. Below is a 3D model of the projected height zones in reference to the community.

Shouldn't the City provide an analysis of the potential impacts from the proposed General Plan amendment? Shouldn't the City include a representative model that actually represents the heights of what might be built?

Response to Comment No. 5-9

The height zones represented within the illustrations included in this comment are inaccurate and do not portray what would be allowed under the proposed Specific Plan. Refer to pages II-17 through II-20 of Section II, Project Description, of the Draft EIR for a detailed description of the proposed height zones, including Figure II-5, Height Zone Map, which are the same as the height zones included in the Preliminary Draft Specific Plan. As detailed therein, Height Zones C and D are subject to a base height limit of 88 feet. Height Zone C allows a maximum height of 160 feet within up to 40 percent of the Height Zone C area, not the entirety of the area as depicted in this comment. Similarly, the 225-foot maximum height limit within Height Zone D is only allowed within 40 percent of this height zone, not the entirety of the area as depicted in this comment. Refer to Figure II-4 through Figure II-6 on pages II-244 through II-246 under Response to Comment No. 5-5 for diagrams of Height Zones C and D and to Figures II-4(a) and II-4(b) within Section III, Revisions, Clarifications, and Corrections to the Draft EIR, for aerial renderings depicting the Conceptual Site Plan. In addition, the images in this comment do not appear to demonstrate that building heights within Height Zone A would be limited to 58 feet or accurately depict the historic viewshed corridor restriction set forth in Project Design Feature CUL-PDF-1 and in the proposed Specific Plan that codifies an existing regulation set forth in the historic-cultural monument (HCM) designation for the Project Site. Also note that the illustrations within this comment do not appear to depict the required frontage areas, including, among others, the 30-foot frontage areas between the Broadcast Center Apartments and Project buildings. Refer to Response to Comment No. 5-8 regarding the proposed General Plan Amendment to change the General Plan land use designations to a unified Regional Commercial land use designation, which was fully studied in the Draft EIR.

Comment No. 5-10

The TVC 2050 Project is requesting 31,000 square feet of signage at the perimeter of the Property and unlimited interior signage without further explanation. Very little information is provided regarding the size, scale, type and placement of the proposed signage. How can the community and the Draft EIR evaluate the proposed signage without this information?

Response to Comment No. 5-10

Pages II-30 through II-32 of Section II, Project Description, of the Draft EIR, and pages IV.H-30 through IV.H-31 of Section IV.H, Land Use and Planning, of the Draft EIR, provide a description of proposed signage within the Sign District, including types of signs; maximum signage along Fairfax Avenue, Beverly Boulevard, and The Grove Drive; limitation of signage along the Project's Shared Eastern Property Line adjacent to the Broadcast Center Apartments; limitations on interior signage above 88 feet; illumination requirements pursuant to the LAMC; and prohibited signage. As stated in therein, the proposed Sign District would not conflict with the standards and goals of the Historic Sign

Guidelines for the Primary Studio Complex (included as Appendix C.4 of the Draft EIR). Also refer to the revised Proposed Signage Plan included in revised Figure II-10 of Section III, Revisions, Clarifications, and Corrections to the Draft EIR, and to Figure II-7 on page II-256 for an illustration of potential interior digital display locations. The proposed draft signage plans were submitted to the Department of City Planning as a part of the Sign District application. Additional details regarding the proposed signage is included in this Final EIR in response to public comments; refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR.

As set forth in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, operation of outdoor digital displays in the Project Site interior would be prohibited within 200 feet of the Broadcast Center Apartments between the hours of 10 p.m. and 7 a.m.

As discussed on page 20 of the Land Use Plans Consistency Analysis Tables included as Appendix I to the Draft EIR, Project signage would be integrated with and complement the overall aesthetic character of on-site development. It should be noted that CEQA and City policy do not require the proposed Sign District to be included in the Draft or Final EIR. Nevertheless, in response to comments on the Draft EIR and for informational purposes, the Preliminary Draft Specific Plan has been made publicly available on the Department of City Planning's website. The proposed Sign District is fully consistent with the description in the Draft EIR. Please note that, pursuant to Public Resources Code Section 21099 (SB 743), because the Project is an employment center project located on an infill site, the Project's aesthetic impacts shall not be considered significant impacts on the environment and, therefore, do not require evaluation under CEQA. Nevertheless, the Initial Study included as Appendix A of the Draft EIR included an aesthetics analysis for informational purposes only.

LEGEND

- BOUNDARY OF PROJECT INTERIOR SIGNS ¹
- SITE INTERIOR FACADES SUITABLE FOR DIGITAL SIGNAGE
- POTENTIAL DIGITAL SIGNAGE LOCATIONS
- 200' MULTI-FAMILY BUFFER ²

¹ AS SHOWN IN FIGURE II-10, PROPOSED SIGNAGE PLAN, OF THE DRAFT EIR

² OPERATION OF OUTDOOR DIGITAL SIGNAGE WILL BE PROHIBITED WITHIN 200 FEET OF THE EXISTING MULTI-FAMILY USE LOCATED TO THE NORTHEAST OF THE PROJECT SITE BETWEEN THE HOURS OF 10 P.M. AND 7 A.M.

NOTE:

- DIGITAL DISPLAYS WILL NOT BE PERMITTED ON THE PROJECT EXTERIOR
- ALL SIGNAGE ABOVE 88 FEET ABOVE PROJECT GRADE WILL BE LIMITED TO A MAXIMUM SIGN SIZE OF 300 SQUARE FEET AS STATED ON PAGE IV-H-31 OF THE DRAFT EIR

Figure II-7
Potential Interior Digital Signage Locations

Comment No. 5-11

The parking, trip generation and VMT numbers don't add up based on the projected uses and square footage of the TVC 2050 Project. For example, did the City evaluate the parking, trip generation and VMT numbers based on the projected use of the studios as audiences stages. If all or a high percentage of the stages are available for audience shows, that could add thousands of trips to the Project and the need for thousands of parking spaces not currently anticipated to be provided. Did the City consider that use in its analysis? The Draft EIR says the transportation analysis was a "worst case" analysis? But is it a worse case analysis, if it fails to include significant expansion of the primary use of the existing stages today? Please explain why many permitted uses which have different trip generation rates were not analyzed. Also why wasn't real world data provided by the existing Project site?

Response to Comment No. 5-11

Refer to Section A, Parking Supply, of Topical Response No. 13, Parking, regarding the adequacy of the parking supply to accommodate the peak parking demands of the Project, including demand associated with visitors, including audiences.

Contrary to the statement by the commenter, the parking, trip generation and VMT numbers account for the Project's uses and square footage. With regard to parking, as discussed on page II-30 of Section II, Project Description, of the Draft EIR, the Project would provide a sitewide total of approximately 5,300 parking spaces based on the proposed parking ratios set forth for all of the Project's proposed uses. With regard to trip generation, as shown in Table 6 on page 81 of the Transportation Assessment (Appendix M.1 of the Draft EIR), all of the Project's uses and square footage have been accounted for in the trip generation calculations. Similarly, with regard to VMT, Table IV.K-4 on page IV.K-74 in Section IV.K, Transportation, of the Draft EIR showed that all of the Project's uses and square footage have been accounted for in the VMT analysis. Refer to Section B, Visitor Trips, of Topical Response No. 10, Trip Generation, regarding how visitor trips, including audiences, have been fully accounted for in the Transportation Assessment. As discussed therein, the number of sound stages used for audience shows has been assumed to increase over the existing level of audience shows and the trip generation numbers reflect that increase in audience shows. See Table II-6 in Section B, Visitor Trips, of Topical Response No. 10 for a comparison of existing and future audience member trips.

The comment asks why the "many permitted uses which have different trip generation rates were not analyzed." There are not "many permitted uses" that would be allowed on the Project Site. The Specific Plan would limit the permitted land uses to those analyzed in the Draft EIR (i.e., sound stage, production support, production office, general office, and retail), and the transportation analysis accounts for all permitted land uses,

including audience sound stages and the projected growth in audience sound stages. Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding the proposed Land Use Exchange Program. As discussed in Topical Response No. 8, Vehicle Miles Traveled, the Draft EIR analyzed both the Conceptual Site Plan, as well as the land use exchange scenarios that would generate the maximum potential transportation impact, and, thus, the Draft EIR analyzed and disclosed the full range of potential transportation impacts associated with the Project.

With regard to the use of real-world data, refer to page IV.K-24 of the Draft EIR for a discussion of the existing traffic volumes that were obtained in 2019 for the Project vicinity. Also, refer to Section A, Empirical Data, of Topical Response No. 10, Trip Generation, regarding the collection of empirical data from other Los Angeles studios and its comparison to the trip generation rates used in the analysis in consultation with LADOT. The use of the rates in question, based on empirical trip generation data developed at different studio campuses in Los Angeles, was valid and consistent with LADOT and CEQA policy and precedent. In terms of existing traffic data for the Project Site, new traffic counts were conducted at the Project driveways and compared to the trip rates used in the Transportation Assessment analysis. Appendix FEIR-5 of this Final EIR presents the actual traffic counts at the Project driveways.

Comment No. 5-12

We also do not understand how many construction trucks will be required to build this Project. Please provide a comprehensive table showing how many trucks are required including dump trucks, concrete trucks, trucks to deliver steel, rebar, building materials, HVAC and MEP equipment, glass and masonry, etc. The Draft EIR says the Project will be built either in 3 years or 20 years. Why wasn't an analysis impacts provided showing what happens if it takes 20 years to build the Project?

Response to Comment No. 5-12

Refer to Table II-21 of Topical Response No. 14, Construction Vehicle Impacts, which provides a comprehensive summary of the number of construction trucks required during each subphase of construction, including haul trucks, concrete trucks, and delivery trucks under a 32-month construction schedule. In terms of the requested breakdown of the function of trucks (e.g., what specific materials is each truck delivering), this specificity is not necessary. The number of trucks per construction phase and the size of those trucks are the factors important to the evaluation of the effects of trucks on the roadway system. These details are known and were included in the analysis of truck effects.

As stated throughout the Draft EIR, while Project buildout is anticipated in 2026, the Applicant is seeking a Development Agreement with a term of 20 years, which could

extend the full buildout year to approximately 2043. Accordingly, the Draft EIR analyzed the Project's impacts associated with a long-term buildout for each of the 13 environmental impact areas analyzed in Section IV of the Draft EIR. With the exception of impacts to air quality, impacts under a long-term buildout scenario would be the same or less than the impacts under the anticipated 32-month construction timeline. With a long-term buildout and operation of some facilities on-site while construction is occurring, only a single excavation operation could be accommodated onsite, thus reducing the excavation activities and associated haul truck trips by half. A single excavation operation would only result in half the number of pieces of equipment operated and result in approximately 300 daily haul truck trips instead of approximately 600 trips. Other construction activities, such as building construction and finishing, would likely occur at a further reduced level but were still assumed to occur at 50 percent of the maximum daily intensity. Regardless, the maximum construction air quality impacts would occur during the excavation subphase. As shown on pdf page 32 of Appendix B, Air Quality and Greenhouse Gas Emissions, of the Draft EIR, the mat pour foundation subphase could require up to five concrete pour days for mat foundations and up to 1,000 concrete truck trips which would occur under both the 32-month construction schedule and the long-term buildout scenario. As discussed on page IV.A-75 in Section IV.A, Air Quality, of the Draft EIR and in Appendix FEIR-8, Details of Project Buildout and Construction, of this Final EIR, under a long-term buildout scenario, construction activities, including truck trips, were conservatively assumed to occur at approximately 50 percent of the maximum daily intensity as would occur during the 32-month schedule, with the exception of mat pour activities which were assumed to be the same as under the 32-month schedule. These assumptions were used to evaluate the potential environmental impacts associated with long-term buildout of the Project throughout the Draft EIR. Refer to Response to Comment No. 9-24, below, for further discussion.

Comment No. 5-13

The Draft EIR virtually ignores one of the most significant historical resources in the area—the Gilmore Adobe that dates back to the early 1800's. [sic] The failure to analyze the potential impacts to the Gilmore Adobe and Original Farmers Market is perplexing. These two historic assets of the City are critically important and the Draft EIR barely discusses the Project's potential impacts to these resources. The proposed project's 225-foot buildings directly adjacent to these historic properties will overwhelm and overshadow them. Below is a visual of the height of the Project as compared to the Adobe and Farmers Market. Why was this not analyzed?

Response to Comment No. 5-13

Refer to Section E, Impacts to Historical Resources in the Vicinity of the Project Site, of Topical Response No. 5, Historical Resources, regarding the Gilmore Adobe (also referred to as the Rancho La Brea Adobe) and The Original Farmers Market.¹⁰⁰ The Gilmore Adobe, located approximately 167 feet from the nearest Project buildings and approximately 125 feet from the nearest construction activities within the Project Site, and separated from the Project Site by one- and two-story support buildings and an approximately 28-foot-wide service alley, is the closest of the five historical resources identified in the vicinity to the Project Site. The Original Farmers Market buildings, clustered at the northeast corner of 3rd Street and Fairfax Avenue, are further separated from the Project Site by interstitial commercial buildings and a surface parking lot.

This comment incorrectly states that the Draft EIR failed to analyze impacts to the Gilmore Adobe and The Original Farmers Market. The Draft EIR fully and adequately analyzed potential impacts to historical resources in the Project Site Vicinity, including the Gilmore Adobe and The Original Farmers Market, in Section IV.B, Cultural Resources, and Appendix C.1 (Historic Report) of the Draft EIR. The Gilmore Adobe and The Original Farmers Market are discussed on pages IV.B-27 to IV.B-29 of the Draft EIR and pages 39

¹⁰⁰ Both Gilmore Adobe and Rancho La Brea Adobe refer to the same structure. This document uses Gilmore Adobe throughout.

to 40 of the Historic Report, and potential impacts to these historical resources are discussed on page IV.B-55 of the Draft EIR and pages 87 to 88 of the Historic Report. As stated on page 88 of the Historic Report:

The Project does not include the demolition, relocation, rehabilitation, alteration or conversion of either The Original Farmers Market or the Rancho La Brea Adobe. Both the Original Farmers Market and the Rancho La Brea Adobe would remain unchanged after implementation of the Project, and the Project would not result in adverse impacts to either resource.

Integrity of setting for both resources has been substantially altered previously by the construction of The Grove shopping and entertainment center in 2002, and neither The Original Farmers Market nor the Rancho La Brea Adobe retains integrity of setting. The Project would not affect the integrity of location, design, materials, workmanship, or association of The Original Farmers Market or the Rancho La Brea Adobe. Both of these resources would remain intact in their current locations and would not be materially altered by new construction in its immediate surroundings. Therefore, integrity of feeling would also remain unaffected because all of the existing physical elements that characterize The Original Farmers Market and the Rancho La Brea Adobe would continue to convey their historic significance. All of the aspects of integrity for both The Original Farmers Market and the Rancho La Brea Adobe would be unaffected by the Project, and the historic integrity of both resources would be retained (with the exception of setting, which is no longer intact since construction of The Grove). After construction of the Project, The Original Farmers Market and Rancho La Brea Adobe would remain intact and continue to convey their historic significance. For these reasons, the historic significance and integrity of The Original Farmers Market and Rancho La Brea Adobe would not be materially impaired by the Project. [emphasis added]

The massing model included in this comment is inaccurate and does not portray what could be built in the southern portion of the Project Site under the proposed Specific Plan. As discussed on pages II-17 to II-20 and shown in Figure II-5 on page II-18 in Section II, Project Description, of the Draft EIR, the proposed Specific Plan would establish height zones with maximum height limits across the entire Project Site (there is currently no height limit under the existing zoning). As stated therein, Height Zone D, which is located in the central/southern portion of the Project Site, would limit building heights to a maximum of 88 feet, consistent with the height of the existing Primary Studio Complex. In addition, the Specific Plan would permit heights up to a maximum of 225 feet in up to 40 percent of the Height Zone D area, not 100 percent of Height Zone D as depicted in the comment. A diagram that shows the maximum height area is included next to the Height Zone Map in

Figure II-5 of the Draft EIR. Also refer to the three-dimensional diagram of Height Zone D in Response to Comment No. 5-5 and the Conceptual Site Plan rendering in Figure II-4(b) of Section III, Revisions, Clarifications and Corrections to the Draft EIR that shows the location of the Gilmore Adobe relative to the Project. The closest on-site building would be located approximately 167 feet from the Gilmore Adobe. In addition, the massing model included in this comment does not appear to account for the full 30 foot frontage along the southern property line that would be required under the proposed Specific Plan, which would separate new buildings from adjacent properties to the south. The height zone and frontage requirements discussed in the Draft EIR are the same as those included in the Preliminary Draft Specific Plan, which has been made publicly available for informational purposes prior to the release of this Final EIR on the Department of City Planning's website. Please note that this draft is not final and has not been approved by City decision-makers. Also refer to Figure 11, New Construction Adjacent to Primary Studio Complex, on page 73 of the Historic Report for an accurate depiction of the massing of the Conceptual Site Plan (the areas closest to the Gilmore Adobe).

In addition, Section IV.I, Noise, of the Draft EIR also analyzed potential impacts from vibration on the historical resources in the Project Site vicinity, including the Gilmore Adobe and The Original Farmers Market. As demonstrated in the analysis provided on page IV.I-60 of the Draft EIR, potential vibration impacts on these historical resources would be less than significant.

Comment No. 5-14

The impact to the Broadcast Center Apartments would be significant. The TVC project is reserving the right to build a 160-foot building to the east and 130-foot building to the south of the apartments. How can the impacts to these residences not be fully analyzed?

Response to Comment No. 5-14

This comment does not include any evidence to support the assertion that impacts to the Broadcast Center Apartments were not fully evaluated in the Draft EIR. The potential environmental impacts to the Broadcast Center Apartments were thoroughly analyzed throughout the Draft EIR and in the Initial Study included as Appendix A to the Draft EIR. For example, Section IV.I, Noise, of the Draft EIR considers building height in the evaluation of outdoor noise. The Draft EIR analyzed impacts related to land use and planning in Section IV.H, Land Use and Planning, of the Draft EIR in accordance with Appendix G of the CEQA Guidelines, which focused on the potential to divide an established community or conflict with an established plan or policy, and impacts were demonstrated to be less than significant. Also refer to Response to Comment No. 5-9 regarding the noted inaccuracies with the illustration provided in this comment, including the fact that it does not appear to depict any of the required frontage areas, including, among others, the 30-foot frontage areas between the Broadcast Center Apartments and Project buildings. Please note that the Project would be developed to the west, rather than the east, of Broadcast Center Apartments. Furthermore, as discussed in Response to Comment No. 5-10, pursuant to Public Resources Code Section 21099 (SB 743), because the Project is an employment center project located on an infill site, the Project's aesthetic impacts shall not be considered significant impacts on the environment.

Comment No. 5-15

There is nothing in the Draft EIR to let the public know if the applicant is required to build the sound stages. Or at the end of the day, will the community just get office and warehouses? What is the relationship of what will be built when?

Response to Comment No. 5-15

As discussed in Response to Comment No. 5-6, the underlying purpose of the Project is to maintain Television City as a studio use and to modernize and enhance production facilities to meet both the existing and unmet demands of the entertainment industry, keep production activities and jobs in Los Angeles, upgrade utility and technology infrastructure, and create a cohesive studio lot. As discussed in Topical Response No. 1, Clearly Defined Description and Specific Plan, Topical Response No. 3, Permitted On-site Uses, and Response to Comment No. 5-6, the proposed Specific Plan would allow five studio land uses: sound stage, production support, production office, general office, and retail (only a limited amount of neighborhood serving retail uses). Sitewide ancillary uses that support the studio and the five land uses would also continue to be permitted within the Project Site. Table II-2 and page II-16 of Section II, Project Description, of the Draft EIR describe the maximum amount of floor area that would be permitted for each of these studio-related land uses. Contrary to this comment, warehouse uses would not be permitted; refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR.

Also, as discussed in Topical Response No. 1, the proposed Specific Plan would include a regulatory framework for implementation of the Project, and future changes that are substantially different than the Project would require additional discretionary City review and approval, as well as CEQA compliance review. See the Preliminary Draft Specific Plan, which is publicly available on the Department of City Planning's website.

Regarding the construction timeline, refer to Response to Comment No. 9-24.

Comment No. 5-16

There are hundreds of other questions about this Draft EIR and the proposed Project. Unfortunately, the Draft EIR does not meet the requirements of CEQA or serve as an information document for the community. The Draft EIR should be withdrawn, and the process restarted with a clearly defined revised project.

Response to Comment No. 5-16

As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, and Response to Comment Nos. 5-2 through 5-15, the Draft EIR has been prepared in full compliance with CEQA and fulfills CEQA's informational purpose by disclosing all of the elements of the Project required by CEQA and providing a comprehensive analysis of the potential environmental impacts of the Project. The comment is noted for the administrative record and has been incorporated into the Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment Letter No. 6

Comment No. 6-1

On behalf of the Los Angeles County Business Federation (BizFed), a grassroots alliance of more than 215 diverse business groups mobilizing 410,000 employers in Los Angeles County, we wish to express our support of the Environmental Impact Report relating to the proposed TVC 2050 Project (Project).

We are excited that the Project will represent a \$1.25 billion investment in Television City, one of Los Angeles' most iconic studios. This includes more than 4,000 jobs during construction and over 18,000 jobs during operations. Additionally, the project will feature modern sound stages, production offices, an enhanced public-pedestrian experience, supportive retail, and a new, multi-modal Mobility Hub.

For nearly 70 years, Television City has played an integral role in the entertainment industry. The Project will ensure that Television City remains a premier production studio that continues to attract top talent and media creators, thereby keeping production activities and jobs in Los Angeles.

We respectfully request approval of the Project so that it may move forward to promote local and regional economic growth and maximize tax and property revenues to the City.

Thank you for your consideration. If you have any questions, please don't hesitate to contact our BizFed Policy Manager Chris Wilson at (562) 201-6034 or chris.wilson@bizfed.org.

Attachment—BizFed Association Members

Response to Comment No. 6-1

This comment indicating support for the Project is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment Letter No. 7

Susan Ferris
Bohemia Group
7471 Melrose Ave., Ste. 1
Hollywood, CA 90046-7551

Comment No. 7-1

When I learned about the plans for Television City, I was glad to hear that something was going to be done to reinvigorate that historic studio lot. After opening its gates 70 years ago, the industry and its technology has evolved to the point where the studio is very much in need of modernization.

The TVC 2050 project will allow Television City to meet the growing demand for production space in Los Angeles. Construction of modern, purpose-built sound stages will increase production capacity. The project also includes studio office space, designed to serve creative content creators and to support the production process.

If Los Angeles is to remain a viable production center, we need to ensure that projects like this move forward through the approval process. I hope that that will be the case, since the Draft Environmental Impact Report indicated that there were no significant impacts found during the operation of the studio and only a couple of impacts during the construction phase.

This is an exciting project that will have a long-lasting impact on the entertainment industry.

Response to Comment No. 7-1

This comment indicating support for the Project is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment Letter No. 8

Lupe Aldaco, Jr.
President
Bricklayers & Allied Craftworkers Local 4
2679 Sierra Way
La Verne, CA 91750-5642

Comment No. 8-1

On behalf the Bricklayers & Allied Craftworkers [sic] the Local #4 union enthusiastically supports TVC 2050: The Los Angeles Studio Plan.

This plan to modernize the 70-year-old Television City will bring more than 4,200 construction jobs to Los Angeles at a time when the city is continuing to recover from the impacts of COVID-19 and confronts increasing competition from other global production centers.

The modernization of Television City will ensure the future of the studio, create thousands of jobs, generate more than \$2.4 billion in new, annual economic output, and maintain Los Angeles' status as the entertainment capital of the world.

TVC 2050 represents a massive investment in one of the city's biggest industries and it will produce new, well-paying construction jobs. Television [sic] City has agreed to employ union construction [sic] workers for the project which means new job opportunities [sic] for the skilled and trained men and women of the Building Trades.

We're pleased to support this important project that will bring more jobs and revenue to Los Angeles.

Response to Comment No. 8-1

This comment indicating support for the Project is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment Letter No. 9

Amy Minter
Chatten-Brown, Carstens & Minter LLP
2200 Pacific Coast Highway, Ste. 318
Hermosa Beach, CA 90254-2702

Sunjana Supekar

Hermosa Beach, CA 90254-2702

Comment No. 9-1

On behalf of Save Beverly Fairfax, we provide the following comments on the draft environmental impact report (DEIR) for the Television City 2050 Specific Plan project (the “Project” or TVC 2050 Project). We also join in the comments provided by the Beverly Wilshire Homeowners Association.

Response to Comment No. 9-1

This introductory comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 9-2

Save Beverly Fairfax is a volunteer organization of neighborhood owners, residents and preservation advocates in the Beverly Fairfax Historic District (“Historic District”) advocating for the protection of the architectural and cultural history of this historic neighborhood. Save Beverly Fairfax led the successful effort to list this historic neighborhood, on the National Register of Historic Places as a National Register Historic District. The Historic District, roughly bordered by Beverly Boulevard to the south, Melrose Avenue to the north, Fairfax Avenue to the west and Gardner Street to the east, is deeply rooted in Jewish American history and boasts a collection of largely intact Period Revival homes. The Project’s location at 7716–7860 West Beverly Boulevard is adjacent to and directly south of the Historic District. For this reason, Save Beverly Fairfax is deeply concerned with the design and development of this Project which could adversely impact this important historic neighborhood.

Response to Comment No. 9-2

This introductory comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project. However, it should be noted that the Project Site is not “adjacent to” the Beverly Fairfax Historic District as incorrectly claimed in this comment. The northern edge of the Project Site is located over 200 feet from the southern boundary of the Beverly Fairfax Historic District. The Project Site is separated from the Beverly Fairfax Historic District by Beverly Boulevard, as well as the commercial buildings on the north side of Beverly Boulevard.

Comment No. 9-3

The TVC 2050 Project is intended to establish the TVC 2050 Specific Plan to modernize and expand production facilities within the 25-acre Television City site. The Project also proposes to approve a general plan amendment for the Project site to Regional Center Commercial, which would allow for significant increases in the amount of allowable development at the site. The Project also proposes the adoption of a Sign District for the Project site, opening the site to an expanded amount of signage and the ability to expand signage even further in the future.

Response to Comment No. 9-3

As discussed in Response to Comment No. 5-8, the proposed Regional Commercial designation for the Project Site would not result in an increase in the amount of allowable development at the Project Site.

Refer to Response to Comment No. 5-10 regarding the proposed Sign District. All future signage would be implemented in accordance with the regulations of the Sign District and Historic Sign Guidelines (Appendix C.4 of the Draft EIR) and would be consistent with the description provided in the Draft EIR. Expansions of signage beyond that set forth in the Sign District would require a discretionary approval and additional CEQA compliance review.

Comment No. 9-4

The DEIR prepared for the Project is wholly inadequate because the Project it is intended to analyze—the TVC 2050 Specific Plan—has yet to be prepared. Without a defined Specific Plan, the DEIR is attempting to review a project that does not yet exist. This falls short of CEQA’s requirement to commence environmental review late enough in the process to provide meaningful information regarding the Project’s impacts. (Cal. Code Regs., tit. 14 (“CEQA Guidelines”) § 15004, subd. (b).) Though we urge the City to reject this Project altogether as proposed in the DEIR, if the City decides to move forward with

this Project, the DEIR must be recirculated once a fully formed draft Specific Plan is available and can be reviewed by the City, the public, and decisionmakers.

Response to Comment No. 9-4

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, and Response to Comment No. 5-3 regarding the fact that a draft Specific Plan was not required to be included as part of the Draft or Final EIR, the physical aspects of the proposed Specific Plan are fully accounted for in Section II, Project Description, of the Draft EIR and in the associated impact analyses throughout the Draft EIR, and environmental review is not premature. Although not required by CEQA, in response to comments on the Draft EIR and for informational purposes, the Preliminary Draft Specific Plan has been made publicly available on the Department of City Planning's website.

With regard to recirculation, CEQA requires the recirculation of a draft EIR for additional public comment "[w]hen significant new information is added to an environmental impact report after notice has been given..." (Pub. Resources Code, § 21092.1). CEQA Guidelines Section 15088.5 provides further definition to the phrase "significant new information." That statutory term is defined to include the following scenarios:

- (1) A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.
- (2) A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.
- (3) A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the significant environmental impacts of the project, but the project's proponents decline to adopt it.
- (4) The draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

(CEQA Guidelines Section 15088.5, subd. (a)(1)-(4).)

Consistent with CEQA Guidelines Section 15088.5, the courts have held that "[n]ew information added to an EIR is not 'significant' unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect (including a feasible project alternative) that the project's proponents have declined to implement." (*Laurel Heights Improvement Assn. v. Regents of University of California*

(1993) 6 Cal.4th 1112, 1129.) Recirculation is not required when the changes merely clarify, amplify, or make insignificant modifications to an adequate EIR.

Based on the facts and analyses contained in this Final EIR for the Project, including the comments received on the Draft EIR and the responses to those comments, there is no substantial evidence that (1) a new significant environmental impact would result from the Project or from a new mitigation measure that was not analyzed in the Draft EIR, (2) a substantial increase in the severity of an environmental impact would result from the Project that was not analyzed in the Draft EIR, or (3) the Applicant declined to adopt a feasible project alternative or mitigation measure considerably different from others previously analyzed that would lessen the significant environmental impacts of the Project.

Further, CEQA Guidelines Section 15088.5(a)(4) requires recirculation of a draft EIR if “the draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.” (*Mountain Lion Coalition v. Fish & Game Comm.* (1989) 214 Cal.App.3d 1043.) Following the holding in *Mountain Lion Coalition*, courts have required recirculation of a draft EIR when an EIR wholly failed to evaluate an entire impact area. As detailed in this Final EIR, the Draft EIR did not omit the analysis of an entire impact area that has the potential for significant effects to the environment.

This comment is acknowledged for the record and will be forwarded to the decision-makers for their review and consideration prior to any action on the Project.

Comment No. 9-5

In addition to the lack of Specific Plan, the Project fails to meet CEQA’s requirements for an accurate, stable, and finite description of the Project. The Project Description’s failures mirror the violations of CEQA identified by the Court of Appeal in *Stopthemillenniumhollywood.com v. City of Los Angeles* (2019) 39 Cal.App.5th 1.

Response to Comment No. 9-5

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding how the Project Description is accurate, stable, and finite and how the Project Description is distinguishable from the project description at issue in *Millennium* case. Refer also to Response to Comment Nos. 9-13 through 9-16 for a discussion of the differences between the Project and the *Millennium* project.

Comment No. 9-6

The Project also proposes a Sign District, but the EIR lacks information on the necessity and parameters of this Sign District, and fails to provide a draft Ordinance.

Response to Comment No. 9-6

Refer to Response to Comment No. 5-10 regarding the information provided in the Draft EIR regarding the proposed Sign District and the availability of the Preliminary Draft Specific Plan for public review. Refer also to Topical Response No. 1, Clearly Defined Project Description and Specific Plan. As discussed therein, the Draft EIR disclosed all physical elements of the Sign District required by CEQA, and the Sign District is not necessary for the environmental analysis of the Project. Nevertheless, in response to comments and for informational purposes, a Preliminary Draft Specific Plan has been made publicly available on the Department of City Planning's website.

Comment No. 9-7

The Project's traffic analysis is also inadequate. The DEIR fails to provide adequate information on parking and traffic hazards, relies on unsupported assumptions to assess vehicle miles traveled, improperly defers analysis of cut-through traffic, relies on project design features that improperly compress the DEIR's disclosure and analysis functions, and fails to disclose impacts to emergency response times.

Response to Comment No. 9-7

Contrary to the commenter's assertions, the transportation analysis in the Draft EIR was completed in full compliance with CEQA and was approved by LADOT.

Refer to page II-30 of Section II, Project Description, of the Draft EIR for a description of parking within the Project Site. Also refer to Section A, Parking Supply, of Topical Response No. 13, Parking, regarding the adequacy of the proposed parking supply to meet the peak demands of the Project and prevent spillover parking. Please note that, pursuant to SB 743, the adequacy of a new development's parking supply is not a consideration for evaluating a project's transportation impacts under CEQA. Assembly Bill (AB) 2097 is a new State law that prohibits public agencies and cities from imposing a minimum automobile parking requirement on most development projects located within a one-half mile radius of a major transit stop. This bill would apply to the Project Site. Accordingly, the parking provisions discussed in the Draft EIR that would be implemented under the proposed Specific Plan have been clarified to be the proposed parking ratios to meet the studio's peak parking demands.

With regard to traffic hazards, refer to Response to Comment No. 9-29.

Refer to Section C, Assumptions in the VMT Analysis, of Topical Response No. 8, Vehicle Miles Traveled, regarding the specific assumptions used in the Project's VMT analysis in the Draft EIR. These assumptions were reviewed and approved by LADOT.

With regard to cut-through traffic, a detailed analysis of cut-through traffic is provided in Section 5C (commencing on page 167) of the Transportation Assessment included as Appendix M.1 to the Draft EIR. As discussed in Topical Response No. 9, Neighborhood Traffic Management Plan, in particular the introduction and Section A, Deferred Mitigation, a project's effect on automobile delay (including neighborhood traffic) is not an environmental impact area under CEQA pursuant to SB 743 and, thus, the preparation of an NTMP as part of the Project does not represent deferred mitigation.

As discussed in Response to Comment No. 19-9, the Draft EIR does not improperly use PDFs. In addition, the transportation-related PDFs are consistent with the VMT Calculator and with the TDM requirements of the City, and these PDFs were approved by the Department of City Planning and LADOT.

Refer to Section D, Emergency Access, of Topical Response No. 12, Safety and Congestion, and Response to Comment Nos. 9-35, 26-147, and 35-134 regarding emergency response times.

Comment No. 9-8

Finally, the DEIR presents Alternative 2, a less impactful alternative. CEQA prohibits approval of a project with significant adverse environmental impacts when there are feasible alternatives or mitigation measures that would "avoid or substantially lessen" the project's significant effects. Though we urge the City to reject this Project, should the City decide to move forward with this proposal, we support the adoption of Alternative 2 instead of the proposed Project.

Response to Comment No. 9-8

The commenter claims that Alternative 2 would avoid or substantially lessen the Project's significant effects. Refer to pages V-58 and V-59 of Section V, Alternatives, of the Draft EIR. As stated therein, Alternative 2 would not avoid or substantially reduce the Project's significant and unavoidable impacts with respect to Project-level and cumulative regional construction emissions; regional emissions associated with concurrent construction and operations; Project-level and cumulative on and offsite noise during construction; and Project-level onsite vibration and Project-level and cumulative offsite vibration (related to the significance threshold for human annoyance) during construction.

These impacts would continue to be significant and unavoidable under Alternative 2, although the duration of such impacts would be reduced due to the overall reduction in building footprint and associated construction activities.

Refer also to Topical Response No. 16, Project Alternatives Analysis, regarding the analysis of alternatives, including Alternative 2.

Comment No. 9-9

For these reasons, which are detailed below, we find the TVC 2050 Project DEIR to be wholly inadequate.

Response to Comment No. 9-9

As demonstrated in the responses to comments in this letter, the Draft EIR has been completed in full compliance with CEQA. This comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 9-10

I. The DEIR Fails to Provide Adequate Information and Documentation to Support Environmental Review.

A. Environmental Review is Premature Because There is No Draft Specific Plan.

As a preliminary matter, we object to the City's preparation of the EIR at this premature stage. The EIR purports to analyze the proposed TVC 2050 Specific Plan ("Specific Plan"). However, we were informed by the Department of City Planning that the Specific Plan is currently being drafted and not available for public review. Accordingly, the draft Specific Plan does not currently exist and thus was not provided to the public along with the EIR and its appendices.

The California Supreme Court has recognized that the timing of environmental review requires a balance between being early enough so that the information obtained can practically be used to guide decisionmakers, yet "late enough in the development process to contain meaningful information." (*Save Tara v. City of West Hollywood* (2008) 45 Cal.4th 116, 129.) Here, because the Specific Plan has not yet been drafted, the EIR is reviewing an inchoate project that is subject to change once the Specific Plan is finally drafted. The lack of a fully formed draft Specific Plan makes meaningful analysis of the Project impossible, because the EIR is analyzing potential impacts of a project that is not clearly formed.

Response to Comment No. 9-10

Refer to Response to Comment No. 5-3 and Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding the fact that a draft Specific Plan was not required to be included as part of the Draft or Final EIR and how the physical aspects of the proposed Specific Plan are fully consistent with Section II, Project Description, of the Draft EIR. Nevertheless, in response to comments and for informational purposes, the Preliminary Draft Specific Plan has been made publicly available on the Department of City Planning's website. As discussed in Topical Response No. 1, the assertion that the Specific Plan needs to be fully drafted prior to environmental review undermines CEQA's informational purpose coupled with the importance of public participation and feedback.

Comment No. 9-11

B. The Project Description Violates CEQA.

Every EIR must set forth a project description that is sufficient to allow an adequate evaluation and review of the project's environmental impacts. (CEQA Guidelines § 15124.) "An accurate, stable and finite project description is the *sine qua non* of an informative and legally sufficient EIR." (*County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 192 93; accord *San Joaquin Raptor/Wildlife Reserve Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 730.) "[O]nly through an accurate view of the project may the public and interested parties and public agencies balance the proposed project's benefits against its environmental cost, consider appropriate mitigation measures, assess the advantages of terminating the proposal and properly weigh other alternatives." (*City of Santee v. County of San Diego* (1989) 214 Cal.App.3d 1438, 1454.)

Here, the Project Description is unstable, not finite, and highly misleading, because it purports to review a Specific Plan that is not currently drafted and thereby cannot be presented to the public. Further, the Specific Plan provisions the EIR does attempt to review are vague and lead to an inordinate number of development possibilities for the Project. Further, the Project's timeline is also poorly defined and offers the public no information as to whether the Project will be built in three years or 20 years. These deficiencies serve as an "an obstacle to informed public participation" because the public and the decisionmakers cannot evaluate a project that lacks a concrete project proposal. (*Stopthemillenniumhollywood.com v. City of Los Angeles* (2019) 39 Cal.App.5th 1, 20 (*Millennium*).) For these reasons, which we detail below, the DEIR must be recirculated with an adequate Project Description that complies with CEQA.

Response to Comment No. 9-11

Refer Topical Response No. 1, Clearly Defined Project Description and Specific Plan, and Response to Comment Nos. 5-3 and 26-5 regarding how the Project Description is accurate, stable, and finite and the fact that the Specific Plan was not required to be included as part of the EIR. The proposed Specific Plan would include a regulatory framework for implementation of the Project. Future changes that are substantially different than the Project would require additional discretionary City review and approval, as well as CEQA compliance review. Also refer to Topical Response No. 1 regarding the limited Land Use Exchange Program that was fully evaluated in the Draft EIR and is consistent with the Preliminary Draft Specific Plan. As explained in Topical Response No. 1 and Response to Comment No. 9-13, the Project Description within the Draft EIR is distinguishable from the project description at issue in *Millennium*.

With regard to the Project timeframe, the Draft EIR conservatively assumed a 32-month construction duration that includes overlapping activities and construction phases and more intense activities on a daily basis. In addition, to be comprehensive and account for all potential impacts associated with the Project, an analysis of the impacts associated with a 20-year buildout is also included for each of the environmental topics studied in the Draft EIR. Refer to Response to Comment No. 9-24 regarding the buildout timeline.

With regard to the *County of Inyo v. City of Los Angeles* case cited in this comment, it should be noted that the case also states that the project that is ultimately approved and built may deviate from the project description in the EIR, as the CEQA process “is not designed to freeze the ultimate proposal in the precise mold of the initial project,” and “new and unforeseen insights may emerge during [the environmental] investigation, evoking revision of the original proposal.”¹⁰¹

As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Draft EIR fulfilled CEQA’s informational purpose by disclosing all of the elements of the Project required by CEQA and providing a comprehensive analysis of the Project. Thus, recirculation is not required. Refer to Response to Comment No. 9-4 regarding recirculation.

¹⁰¹ *East Sacramento Partnership for a Livable City v. City of Sacramento* (2016) 5 Cal. App. 5th 281 (quoting *County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 193, 199). See also *Carpenters v. City of Los Angeles* (2022) 76 Cal.App.5th 1154, 1179-83 (where the approval of a revised project that was a variant of an alternative first included in the final EIR did not render the project description unstable, require recirculation, impede informed decision making, or prejudice the petitioners challenging the final EIR and project approval).

Comment No. 9-12**1. The Project Description is Unstable, Not Finite, and Misleading.**

The Project Description is unstable, not finite, and highly misleading, because as discussed above in Section I.A, the DEIR purports to review a draft Specific Plan that does not currently exist. The DEIR does not disclose this fact and is very unclear regarding the status of the Specific Plan, instead purporting to analyze standards and guidelines it claims are in or will be in the draft Specific Plan. A project description must contain a “general description of the project’s technical, economic, and environmental characteristics.” (CEQA Guidelines § 15124.) Without a valid project to describe, the DEIR cannot meet these requirements.

Further, an EIR’s project description may not rely on a conceptual impact envelope that merely provides a range of possible development scenarios. (*Millennium, supra*, 39 Cal.App.5th 1, 18.) In the highly relevant *Millennium* case, the Court of Appeal upheld a court order invalidating an EIR prepared by the City of Los Angeles that failed to describe a building development project, and only presented conceptual scenarios. (*Ibid.*) As detailed below, the City has unfortunately repeated that mistake here.

Instead of reviewing a concrete project proposal, the EIR purports to analyze a set of standards and guidelines proposed to be in the Specific Plan, such as a conceptual envelope of land uses, land use exchanges, height zones and other design elements, standards regarding rooftop terraces, signage, and parking, and haul routes. (DEIR, pp. II-12 to II-34.) None of these provide a stable or definite description of the Project. Stated herein are the components of the Project that we believe are vague and require further definition in order to meet the requirements of CEQA.

Response to Comment No. 9-12

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, and Response to Comment Nos. 5-3, 9-13, and 26-5 regarding how the Project Description provided in Section II, Project Description, of the Draft EIR is accurate, stable, and finite and fully complies with CEQA; how the Project is distinguishable from the *Millennium* case in all material respects; and why a draft Specific Plan was not required to be included as part of the Draft or Final EIR. Nonetheless, in response to comments on the Draft EIR and for informational purposes, the Preliminary Draft Specific Plan has been made publicly available on the Department of City Planning’s website. Also refer to Appendix FEIR-2, Comparison Chart of the Draft EIR and the Preliminary Draft Specific Plan, of this Final EIR. That comparison confirms that the relevant Specific Plan elements were discussed and analyzed in the Draft EIR. Also, the proposed Specific Plan would include a regulatory framework for implementation of the Project, including, among other

things, a discretionary process (which requires subsequent CEQA compliance review) for future changes that are substantially different than the Project.

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding how Section II, Project Description, of the Draft EIR fully complies with CEQA, including CEQA's requirement to include a "general description" of the Project's technical, economic and environmental characteristics.

Regarding the comment about a "conceptual impact envelope," as explained in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Project would include height zones, setbacks, and frontage areas that will dictate the placement, orientation, mass, and height of potential future buildings. Specific details about potential future buildings are unknown at this time but would not change the overall development limits set forth in the Draft EIR Project Description and those in the proposed Specific Plan. In addition, the proposed Specific Plan would include a regulatory framework for implementation of the Project, including, among other things, mandatory review processes by the City for implementation of the proposed Project. Future changes that are substantially different than the Project or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, as well as potential CEQA compliance review. Furthermore, the proposed Specific Plan would only allow for development consistent with the parameters described in the EIR and would require future review by the City for conformance with the Certified EIR and the approved Specific Plan. In addition, there is no provision under CEQA that requires a conceptual site plan for a specific plan project to identify the precise location and use of each building as suggested by the commenter, and the individual building plans for future development under the Specific Plan will not be created until after the adoption of the Specific Plan. Refer to Response to Comment Nos. 5-5 and 26-12 regarding the conceptual nature of the plans included in an EIR.

This comment also introduces more specific comments, which are discussed in more detail in Comment Nos. 9-13 through 9-24. As demonstrated in Response to Comment Nos. 9-13 through 9-24, Section II, Project Description, of the Draft EIR provides an accurate, stable, and finite description of the Project, and the Project Description was completed in full compliance with CEQA.

Comment No. 9-13

i. Envelope of Land Use Categories

The EIR includes a list of proposed limits of square footage for different types of uses on the Project site, including sound stage, production support, production office space, general office space, and retail. (DEIR, p. II-13.) The EIR, however, does not specify the mix of

uses, instead stating that the “ultimately constructed” mix “will depend upon market demands.” (DEIR, p. II-13.) As described in further detail below, the EIR also permits exchanges of square footage between land uses. (DEIR, p. II-16.) This means that the Project could allow for a virtually unlimited number of development scenarios. The EIR pairs these proposed, potential limits with a conceptual site plan displaying building footprints; however, the DEIR states that the plan is merely conceptual and “illustrates one possible development scenario that could be developed.” (DEIR pp. II-13 to II-14.) Indeed, the conceptual site plan shown in the EIR lacks detail or description of future development, as the potential buildings are represented by unlabeled white boxes. (DEIR, pp. II-14.)

Thus the Project is highly similar to the project at issue in *Millennium*, where the Court of Appeal found that development regulations incorporated into the project description provided the public and decisionmakers “little by way of actual information” regarding the project’s actual design. (*Millennium*, supra, 39 Cal.App.5th 1, 18.) Here, as in *Millennium*, “these regulations simply limit the range of construction choices for future developers.” (*Ibid.*) This does not meet CEQA’s requirements for a sufficient project description.

Response to Comment No. 9-13

Refer to Response to Comment No. 9-12. The Project Site has been used as a studio for over 70 years and the Project is the continuation of the studio use and the modernization and expansion of the studio. As discussed on pages II-10 to II-11 in Section II, Project Description, of the Draft EIR, the Project objectives include optimizing the currently underutilized studio and maximizing studio production capabilities by providing new technologically advanced sound stages combined with an adequate and complementary mix of state-of-the-art production support facilities, production office, and general office. The digitization of the production industry has created the need for much more office space relative to sound stage and production support space. The proposed development program (Conceptual Site Plan) analyzed in the Draft EIR provides an adequate and complementary mix of uses, including 350,000 square feet of sound stage, 104,000 square feet of production support, 700,000 square feet of production office, 700,000 square feet of general office, and 20,000 square feet of retail uses. The optimal balance of studio uses has changed over time and will continue to change as the entertainment industry continues to evolve, but the existing studio is unable to adapt to such changes. Accordingly, the Project is proposing a Land Use Exchange Program to allow for limited flexibility in the size of the studio uses (increases permitted only to sound stages and production support uses), discussed further in Topical Response No. 1, Clearly Defined Project Description and Specific Plan. Please note that, as discussed in Topical Response No. 1, the proposed Specific Plan would include a regulatory framework for implementation of the Project, including, among other things, mandatory review processes by the City for implementation of the proposed Project. Future changes that are substantially different than the Project, including a proposal that involves a land use

exchange, or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, as well as potential CEQA compliance review.

As explained in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the *Millennium* case is not applicable to the Project because *Millennium* involved an individual building development project rather than a specific plan project. In addition, the description of the Project in the Draft EIR is distinguishable from the project description at issue in *Millennium*.

The draft EIR in *Millennium* described a “mixed-use development” that would include “some combination of residential dwelling units, luxury hotel rooms, office and associated uses, restaurant space, health and fitness center uses, and retail establishments.” The *Millennium* project description did not identify what uses would be built or the square footage or location of such uses. Unlike the project description for the *Millennium* project, Section II, Project Description, of the Draft EIR clearly and consistently states that the Project is a studio specific plan project that will include five studio land uses: sound stage, production support, production office, general office, and retail. In addition, Table II-2 of the Draft EIR provides the proposed floor area for each of these uses and the Conceptual Site Plan provided in Figure II-4 provides an overall layout of the Project.

The full text of the sentence referred to in this comment states: “The specific mix of uses ultimately constructed will depend upon market demands, and the Specific Plan would allow flexibility in locating the various uses within the Project Site.” This sentence immediately follows the detailed description of land uses in Table II-2 of the Draft EIR and is referring to a mix of “sound stage, production support, production office, general office, and retail uses.” Furthermore, the Land Use Exchange Program in the Draft EIR is limited to an exchange of up to 100,000 square feet of additional sound stage and up to 346,000 square feet of additional production support uses for a corresponding decrease in the square footage of the other permitted land uses. The Draft EIR fully disclosed and analyzed these limited land use exchanges. As is typical of a studio specific plan project, the ultimate square footage of each use to be developed within the Project Site will depend on market conditions. However, the total floor area will not exceed that set forth in Table II-2 of the Draft EIR and the maximum floor area for each of the proposed studio-related uses would not exceed that set forth on page II-16 of the Draft EIR. These same requirements are set forth in the Preliminary Draft Specific Plan. The Project is a studio project that provides for the continued operation of a studio with specific regulations regarding total floor area and maximum floor area for each of the studio land uses. With regard to the Conceptual Site Plan, as explained in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Conceptual Site Plan is based on the architectural plans that were submitted as part of the Project’s entitlement application. This Conceptual Site Plan along with the other information within Section II, Project Description,

of the Draft EIR was used to fully evaluate potential impacts associated with the Project. The proposed Specific Plan would include a regulatory framework for implementation of the Project, including, among other things, mandatory review processes by the City for implementation of the proposed Project. Future changes that are substantially different than the Project or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, as well as potential CEQA compliance review. In addition, as discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, precise architectural drawings for individual buildings, building floor plans, landscape plans and building material specifications are details that are not currently available and are not required at this time to be included as part of a draft EIR for a specific plan project. In fact, technical drawings may well supply extensive detail beyond that needed for evaluation and review of the environmental impact in violation of CEQA Guidelines Section 15124. Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, for a more detailed discussion of how Section II, Project Description, of the Draft EIR provides all of the necessary information to provide a thorough analysis of Project impacts in accordance with CEQA.

Comment No. 9-14

ii. Land Use Exchanges

Though the Project's envelope of potential square footage limits for various types of uses on the Project site itself is too vague (DEIR, p. II-13), the Project compounds the issue by allowing floor area from any permitted land use category within the site to be exchanged for additional sound stage and production support uses. (DEIR, p. II-16.) This excessive "development flexibility," as characterized by the DEIR, makes an already too-abstract project even more unstable and allows for an even broader range of future development scenarios. (*Ibid.*) While land use exchanges are still subject to square footage maximums for sound stage, production office, general office, and retail uses, there is no maximum for production support floor area, meaning that the Project could entail as much production support floor area as possible, so long as decreases are made in other uses. (*Ibid.*) Further, the land use exchanges may result in a higher overall footprint than specified in the envelope, so long as the sitewide FAR remains 1.75:1. (*Ibid.*)

The result of these exchanges is essentially to widen the range of square footage parameters applicable to the Project, thereby widening the range of potential future development onsite. This unacceptably broad and ill-defined range of potential development choices does not meet CEQA's requirements for accurate, stable, and finite project descriptions. (*Millennium, supra*, 39 Cal.App.5th 1, 18.)

The DEIR's lack of specificity regarding the Project's permitted uses and footprints is important because future development and its impacts, including future land use exchange

proposals, will be measured against “the envelope of impacts identified in this Draft EIR.” (DEIR, pp. II-16.) The DEIR purports to analyze a “hypothetical development mix” that would generate the “maximum possible” Project impacts (DEIR, pp. II-16 to II-17), but such a “worst case” approach is insufficient under CEQA. (*Millennium*, *supra*, 39 Cal.App.5th 1, 18 [“CEQA’s purposes go beyond an evaluation of theoretical environmental impacts.”].)

Response to Comment No. 9-14

As discussed in Response to Comment No. 9-13 and Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Land Use Exchange Program in the Draft EIR is limited to an exchange of additional sound stage or production support uses for a corresponding decrease in the square footage of other permitted land uses. The Land Use Exchange Program analyzed in the Draft EIR is identical to the program in the Preliminary Draft Specific Plan, except that, in response to comments on the Draft EIR, the program in the Preliminary Draft Specific Plan was clarified to limit production support floor area to a maximum of 450,000 square feet (there was no maximum limit in the Draft EIR). Section III, Revisions, Clarifications, and Corrections to the Draft EIR, includes revisions to Section II, Project Description, of the Draft EIR to limit the exchange for additional production support uses to a maximum of up to 450,000 square feet (an increase of up to 346,000 square feet of production support uses over that in Table II-2 of the Draft EIR) in exchange for a corresponding reduction in square footage in another permitted land use. In addition, the Land Use Exchange Program also includes a limited exchange to increase sound stages by up to 100,000 square feet (for a total of 450,000 square feet) with an equivalent reduction in one of the other permitted land uses. This limited land use exchange does not result in “widening the range of potential future development onsite.” Rather, this land use exchange would allow the studio to adapt and respond to the evolving needs of the entertainment industry. Contrary to the commenter’s assertion, the proposed Land Use Exchange Program does not render the Project Description inaccurate and unstable, as further discussed in Topical Response No. 1. Also, the proposed Specific Plan would include a regulatory framework for implementation of the Project, including, among other things, mandatory review processes by the City for implementation of the proposed Project. Future changes that are substantially different than the Project, including a proposal that involves a land use exchange, or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, as well as potential CEQA compliance review.

As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, unlike the draft EIR for the *Millennium* project, the Draft EIR for the Project does not merely utilize a “worst case” approach for evaluating impacts of the Project. Rather, the Draft EIR’s environmental analysis accounts for the maximum potential environmental impacts associated with buildout of the Project as set forth in Table II-2 of the Draft EIR and in the Conceptual Site Plan included in Figure II-4 of the Draft EIR. In

addition, the Draft EIR also analyzes the maximum impact scenario (i.e., the development scenario under the limited Land Use Exchange Program that would generate the greatest environmental impact). Refer to Appendix FEIR-3 of this Final EIR, which discusses the maximum impact scenarios that were analyzed for each environmental topic in addition to the Project as set forth in Table II-2 of Section II, Project Description, of the Draft EIR. While the Draft EIR has evaluated both the Project and the maximum impact development scenarios under the limited Land Use Exchange Program, the proposed Specific Plan requires that any future development proposal that involves a land use exchange and substantially complies with all applicable Specific Plan regulations would require a discretionary Project Compliance approval pursuant to LAMC Section 11.5.7[13B.4.2] and future CEQA compliance review.

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, and Response to Comment Nos. 5-5 and 26-5 for a more detailed discussion of how Section II, Project Description, of the Draft EIR is accurate, stable, and finite and provides all of the necessary information to provide a thorough analysis of Project impacts in accordance with CEQA. Also refer to Topical Response No. 3, Permitted On-Site Uses. In total, these responses show that the Project as defined in the Draft EIR is more than sufficient under CEQA.

Comment No. 9-15

iii. Project Design and Architecture

The Project's proposed design is completely theoretical and unformed. The DEIR states that the Site's four existing sound stages "would be renovated and modernized to the extent feasible, subject to industry market demand." (DEIR, p. II-17.) This provides no concrete information as to whether renovation would occur, what such potential renovation would entail (such as what elements of the sound stages would be renovated), which sound stages would be renovated, what the timeline of such renovation would be, what relevant market information might govern renovation probability, and what factors determine feasibility of renovation. This cannot be the basis of an accurate, stable, or finite project description under CEQA.

Response to Comment No. 9-15

Contrary to this comment, sufficient detail regarding the design of the Project has been provided within Section II, Project Description, of the Draft EIR. As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, under CEQA, the level of detail required in an EIR is dependent upon the underlying project. Per CEQA Guidelines Section 15146, "[t]he degree of specificity required in an EIR will correspond to the degree of specificity involved in the underlying activity which is described in the EIR." CEQA Guidelines Section 15146(a) states that "[a]n EIR on a construction

project will necessarily be more detailed in the specific effects of the project than will be an EIR on the adoption of a local general plan or comprehensive zoning ordinance because the effects of the construction can be predicted with greater accuracy.” Accordingly, less detail is required for a specific plan project than an individual building development project. Per OPR’s The Planner’s Guide to Specific Plans dated January 2001 (OPR Guide to Specific Plans), “[a]s the name implies, a specific plan EIR should contain analyses specific enough to reflect the level of detail in the plan (CEQA Guidelines § 15146).” The Draft EIR discusses all of the physical elements of the proposed Specific Plan in the same amount of detail as the proposed Specific Plan itself.¹⁰²

Note that the environmental impacts associated with renovation of sound stages, including those related to construction activities, are fully accounted for in the Draft EIR. Specifically, the construction equipment would represent a subset of the construction equipment evaluated in the Draft EIR, and construction activities would occur in accordance with the hours permitted by the LAMC and evaluated with the Draft EIR. Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, for a more detailed discussion of how Section II, Project Description, of the Draft EIR, is accurate, stable, and finite and provides all of the necessary information to allow for a thorough analysis of Project impacts in accordance with CEQA.

Comment No. 9-16

The Project proposes six height zones, within which development would be subject to certain height limits. (DEIR, pp. II-17 to II-20.) The project description found impermissible in *Millennium* also relied on height zones, which obscured the project’s massing and design configuration. (*Millennium*, *supra*, 39 Cal.App.5th 1, 12.)

However, the Project’s height zones are even more unclear, because some of these height zones are variable. In Height Zone C, development is limited to a maximum of 160 feet within up to 40 percent of the area, with the remainder limited to 88 feet. In Height Zone D, development is limited to a maximum of 225 feet within up to 40 percent of the area, with the remainder limited to 88 feet. The 40 percent of Height Zones C and D in which the maximum height is increased is not a specified area; thus, a multitude of configurations, none of which are specifically proposed in the DEIR, could satisfy these requirements. In fact, the DEIR admits that the height zones “do not represent the actual development

¹⁰² Please refer to Appendix FEIR-2 of this Final EIR, which lists all physical elements of the Project that were disclosed and analyzed in the Draft EIR; this appendix also includes a comparison of the Project elements disclosed in the Draft EIR with the proposed Specific Plan, Sign District and General Plan Amendment Resolution that confirms that all necessary Project elements were discussed and analyzed in the Draft EIR.

footprint of Project buildings.” (DEIR, p. II-20.) These height zones further contribute to the Project Description’s instability.

The variability of the height zones also makes the Project’s proposed frontage and setbacks unstable and variable, since the proposed limits include additional setbacks for buildings within Height Zones C and D that exceed the 88-foot base height. (DEIR, p. II-21.) Since the DEIR does not specify building heights, this means that the frontages and setbacks are also unspecified.

Response to Comment No. 9-16

Regarding *Millennium*, refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, for a discussion of how the *Millennium* case is not applicable to the Project, and how the Project Description differs from the project description at issue in *Millennium*.

With regard to the height zones, pages II-17 through II-21 of Section II, Project Description, of the Draft EIR provide a detailed description of the proposed height zones and include Figure II-5, Height Zone Map. As clearly described therein, these height zones set forth maximum building height limits that will regulate building height throughout the Project Site. New buildings would occupy only a portion of the building envelope permitted in each height zone. Contrary to the comment, the frontages shown in Figure II-5 and described on pages II-20 and II-21 of the Draft EIR are not variable and would be implemented as new buildings are constructed. Building setbacks are also required for those portions of buildings in Height Zones C and D that are greater than 88 feet in height above Project Grade and located adjacent to the public right-of-way or the southern property line.

This comment appears to misunderstand the purpose and function of a specific plan as compared to an individual development project. A specific plan is a regulatory land use ordinance that establishes zoning regulations, such as maximum height limits. Notably, the existing zoning for the Project Site permits unlimited height. Nevertheless, the Specific Plan would impose height limits across the entire Project Site. It is important to note that a maximum height limit is different than the proposed height of an individual building. The Project is a specific plan project and not an individual development project, and the proposed height limitations are consistent with the specific plan nature of the Project. Further, as discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, any future development project that is substantially different from the Project would require a discretionary approval and subsequent CEQA compliance review. Most importantly, the proposed height limits in each of the height zones have been consistent throughout the life of the Project; the height limits described in the Draft EIR are the same as those included in the Project’s application submittal in March of 2021, the Initial Study

(Appendix A of the Draft EIR; see pages 17 to 19), and the Preliminary Draft Specific Plan. Thus, the height limits do not contribute to any instability in the Project Description, as incorrectly claimed by the commenter.

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, for a more detailed discussion of how Section II, Project Description, of the Draft EIR is accurate, stable, and finite and provides all of the necessary information to allow for a thorough analysis of Project impacts in accordance with CEQA.

Comment No. 9-17

The Project Description also states that the Specific Plan would include design regulations to address screening of rooftop equipment and outdoor storage areas, fencing, parking structures, and Project access points. (DEIR, p. II-22.) Yet the DEIR fails to specify these regulations. Further, the DEIR improperly defers analysis of these regulations by failing to state them in the DEIR itself.

Response to Comment No. 9-17

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, and Response to Comment No. 5-3. As discussed therein, the Draft EIR disclosed all of the elements of the Project required by CEQA. The design standards included in the Specific Plan and more detailed design information are not necessary for the CEQA environmental analysis of the Project. Nevertheless, in response to comments on the Draft EIR and for informational purposes, the Preliminary Draft Specific Plan has been made publicly available on the Department of City Planning's website. As shown Appendix FEIR-2, Comparison Chart of the Draft EIR and the Preliminary Draft Specific Plan, of this Final EIR, the design regulations in the Preliminary Draft Specific Plan are consistent with the description in the Draft EIR.

The comment does not include all of the relevant text regarding screening that is provided on page II-22 of Section II, Project Description, of the Draft EIR. The full text from page II-22 of the Draft EIR that the comment is referring to is as follows:

The Specific Plan also would include design regulations that address the screening of rooftop equipment and outdoor storage areas, fencing, parking structures, and Project Site access points. In particular, rooftop equipment and outdoor storage areas that are visible from the public right-of-way must be screened with vegetated walls, fences, trellises, graphic treatments, other structures, or other approved measures. Fencing of up to 12 feet in height would be permitted on-site, and chain link fencing without inserts or secondary screening (such as fabric or panels) and barbed wire fencing

would be prohibited. Fencing would be maintained in a clean and well-kept manner, including through the repair of broken walls and removal of graffiti, and improved with either low maintenance landscaping, hardscape, or a combination of both.

Based on the above, the Draft EIR does not defer analysis of these regulations as incorrectly stated in this comment. Also note that CEQA defines the “project” to be analyzed in an EIR as the “physical change in the environment,” not the regulatory document governing that change. Furthermore, as discussed in Response to Comment No. 5-10, pursuant to SB 743, aesthetics impacts associated with the Project are concluded to be less than significant. Also refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, for a more detailed discussion of how Section II, Project Description, of the Draft EIR is accurate, stable, and finite and provides all of the necessary information to allow for a thorough analysis of Project impacts in accordance with CEQA.

Comment No. 9-18

The DEIR similarly fails to specify the Specific Plan’s purported guidelines and parameters for new construction to preserve the Site’s Historic-Cultural Monument. These guidelines are not located in the Project Description.

Response to Comment No. 9-18

The analysis of potential impacts to the Primary Studio Complex and associated PDFs are appropriately included in Section IV.B, Cultural Resources, of the Draft EIR. Section II, Project Description, of the Draft EIR provides an overview of the historic regulations that would be implemented on pages II-22 to II-23. As stated on page IV.B-53 in Section IV.B, Cultural Resources, of the Draft EIR, the Project would comply with LAMC Section 22.171.14 (the Cultural Heritage Ordinance), which requires review of construction documents by the City’s Office of Historic Resources (OHR) prior to approving building permits for any substantial alteration to the HCM and would ensure compliance with the Rehabilitation Standards. As set forth in Section IV.B, Cultural Resources, of the Draft EIR, the Project would also implement Project Design Feature CUL-PDF-1 that includes specific Project Parameters to ensure that the historic significance of the Primary Studio Complex is not adversely impacted by new construction. Additionally, per Project Design Feature CUL-PDF-2, a historic structure report (HSR) would be prepared that will serve as an important guide for the rehabilitation of the Primary Studio Complex in accordance with the Rehabilitation Standards and will provide detailed information and instruction above and beyond what is typically available prior to the rehabilitation of a historical resource. With these regulatory requirements and PDFs, the Draft EIR concludes that potential impacts related to historical resources would be less than significant.

The proposed Specific Plan also would include historic regulations that incorporate the same LAMC regulations and PDFs set forth in Section IV.B, Cultural Resources, of the Draft EIR, and codifies the standards in the HCM designation regarding the Viewshed Restoration Area. Refer to the Preliminary Draft Specific Plan, which is publicly available on the Department of City Planning's website.

Comment No. 9-19

iv. Rooftop Terraces

The DEIR states that rooftop terraces and decks may be incorporated by Project buildings, but does not commit to any design, stating that "such terraces could be located anywhere within the Project Site" in accordance with the yet-to-be-drafted Specific Plan requirements. (DEIR, p. II-23.) Further, the DEIR states that the hours of operation for these outdoor areas would "generally" be 7:00 AM to 12:00 AM, but that is a speculative statement given that the uses of development onsite are still unknown. (DEIR, pp. II-23 to II-24.)

Response to Comment No. 9-19

Pages II-23 and II-25 of Section II, Project Description, of the Draft EIR states the following regarding rooftop terraces and decks:

Within Figure II-6, rooftop landscaping is shown in potential terrace locations, although such terraces could be located anywhere within the Project Site in accordance with Specific Plan requirements. Noise limits would be established for any outdoor amplified sound systems used for gatherings (non-production uses) on roof decks. The hours of operation for use of these outdoor gathering areas generally would be from 7:00 A.M. to 12:00 A.M.

Section IV.I, Noise, of the Draft EIR evaluated the potential noise impacts associated with the use of these outdoor areas illustrated in Figure II-6 and concluded that with the design specifications included in Project Design Feature NOI-PDF-4, operational noise impacts from these outdoor areas would be less than significant. In addition, the analysis shows that under a conservative assumption that 1,200 people would gather at a given roof deck location along each of the four sides of the Project Site perimeter with a total of 5,000 people throughout the Project Site, impacts would be less than significant.

With regard to the hours of use for the rooftop terraces and decks, they will be used between the hours of 7:00 A.M. to 12:00 A.M. as stated in the Draft EIR. The studio will continue to operate on a 24/7 basis, consistent with existing conditions. This clarification is included in Section III, Revisions, Clarifications, and Corrections to the Draft EIR.

Although the Draft EIR conservatively assumed that rooftop decks would be located along the perimeter of the Project Site for analysis purposes, the actual location of such rooftop decks would be on top of the buildings shown in the Conceptual Site Plan. Refer to Response to Comment Nos. 5-3 and 9-13 and Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding the level of detail needed within a draft EIR for a specific plan project.

Comment No. 9-20

v. Parking

The Project's parking facilities are utterly unformed. The DEIR admits that parking may involve a "combination" of above-ground structures, subterranean structures, and surface spaces, but provides no specificity as to which. (DEIR, p. II-30.) The DEIR also admits that parking may be provided onsite "incrementally to meet the needs of individual buildings and uses the spaces would serve, as appropriate and feasible." (*Ibid.*) This provides the public and decisionmakers virtually no specificity with which to analyze the Project's impacts related to parking. The DEIR also claims that the Specific Plan would set forth a process for the approval and implementation of a reduced/shared parking plan, but no details regarding this plan are provided. (DEIR, p. II-30.) Even if they were, analysis of such a plan would amount to impermissible post-hoc environmental review. (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 394.)

Response to Comment No. 9-20

Under SB 743, the adequacy of a new development's parking supply, including the shared/reduced parking process, is not a CEQA consideration. Refer to Topical Response No. 13, Parking, regarding the adequacy of the on-site parking supply to accommodate the peak parking demands of the Project and prevent spillover parking. As discussed therein, the Project no longer proposes off-site parking. This clarification is included in Section III, Revisions, Clarifications, and Corrections to the Draft EIR. Also refer to the Preliminary Draft Specific Plan regarding how parking would be implemented for the Project. The Preliminary Draft Specific Plan has been made publicly available on the Department of City Planning's website. Based on the Conceptual Site Plan provided in Figure II-4 of Section II, Project Description, of the Draft EIR, and the application materials filed with the City, parking would be provided in a parking structure in the southeast corner of the Project Site adjacent to the parking structure serving The Grove shopping center and in underground and surface parking areas. While the Conceptual Site Plan provided in Figure II-4 in Section II, Project Description, of the Draft EIR, illustrates specific parking locations, ultimately, parking may be located at different locations within the Project Site, as disclosed in the Draft EIR. As discussed in Response to Comment No. 26-135, with adherence to the specified frontage areas, operational noise impacts would be less than significant even

if the location were different than set forth in Figure II-4. In addition, modification to the locations of parking areas would also not result in any other environmental impacts. Furthermore, as discussed in detail in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the proposed Specific Plan would include a regulatory framework for implementation of the Project, including, among other things, mandatory review processes by the City for implementation of the proposed Project. Future changes that are substantially different than the Project or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, as well as potential CEQA compliance review.

With regard to the commenter's reference to *Laurel Heights Improvement Assn. v. Regents of University of California* (1988), the EIR in that case failed to discuss the anticipated future uses of the facility at issue and the likely effects of those uses. Here, for the reasons described above, the Draft EIR does not fail to discuss the anticipated future uses of the Project Site or the likely effects of those uses. The exact location of the on-site parking supply is not necessary for a legally sufficient EIR, as explained above. The Court in *Laurel Heights* noted, "we cannot and do not by this opinion prescribe the exact information that the University must include in its EIR. We expect the University will attempt in good faith to fulfill its obligation under CEQA to provide sufficient meaningful information regarding the types of activity and environmental effects that are reasonably foreseeable." This reinforces the concept that, as stated in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, under CEQA, the level of detail required in an EIR is dependent upon the underlying project. Per CEQA Guidelines Section 15146, "[t]he degree of specificity required in an EIR will correspond to the degree of specificity involved in the underlying activity which is described in the EIR." Accordingly, less detail is required for a specific plan project than an individual building development project.

Comment No. 9-21

vi. Signage

The Project's proposed signage is completely unformed. The Project proposal includes an application for a Sign District, but no draft ordinance for the proposed Sign District is included in the DEIR. (DEIR, p. II-31.) The Project Description states that signage "would be integrated with and complement the overall aesthetic character of on-site development," but since there is no proposal for onsite development, this leaves the potential signage onsite, as well as its potential impacts, completely unknown and speculative. The EIR cannot be certified until a concrete proposal for signage, as well as a draft ordinance, are presented to the public and decisionmakers.

Response to Comment No. 9-21

Refer to Response to Comment Nos. 5-10 and 26-129. Refer also to Topical Response No. 1, Clearly Defined Project Description and Specific Plan. As discussed therein, the Draft EIR disclosed all elements of the Preliminary Draft Specific Plan required by CEQA, and the Preliminary Draft Specific Plan is not necessary for the environmental analysis of the Project. Nevertheless, in response to comments and for informational purposes, the Preliminary Draft Specific Plan has been made publicly available on the Department of City Planning's website.

Comment No. 9-22**vii. Haul Routes**

The Project Description fails to provide definite haul routes, instead presenting three options for potential construction haul routes for trucks entering and exiting the Project site. (DEIR, pp. II-34 to II-35.) One route primarily travels through Fairfax Ave from I-10, one route crosses over from La Brea Ave to Fairfax Ave on San Vicente Blvd, and one route primarily travels north/south on La Brea Ave. (*Ibid.*) Each of these routes will have differing impacts. The Project must select one defined haul route so that the public can adequately evaluate its impacts.

Response to Comment No. 9-22

Refer to Topical Response No. 14, Construction Vehicle Impacts, and Response to Comment Nos. 107-2 and 124-6 regarding the haul routes. Each of the three haul routes was adequately disclosed and evaluated in the Draft EIR and was approved by LADOT. For example, refer to pages IV.I-41 through IV.I-43 of Section IV.I, Noise, of the Draft EIR for a detailed analysis of potential off-site noise impacts associated with use of each of the haul routes. Contrary to the comment, the Applicant does not need to select one haul route. Rather, these routes can be used to effectively manage hauling activities. Three routes were selected to comprehensively analyze the potential haul routes and ensure all associated environmental impacts with any of the potential haul routes were evaluated in the Draft EIR.

Comment No. 9-23**viii. Mitigation, Monitoring, and Reporting Plan**

The EIR lacks a Mitigation, Monitoring, and Reporting Plan (MMRP). We request that the City provide an MMRP for this Project to allow for a complete evaluation of the efficacy of mitigation proposed for the Project.

Response to Comment No. 9-23

Pursuant to Section 15097 of the CEQA Guidelines, the Mitigation Monitoring Program is included as Section IV of this Final EIR. The comment is noted for the administrative record and has been incorporated into the Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 9-24**2. The Project Timeline is Unstable.**

In addition to the unstable and inchoate nature of the Project's features, the timeline of the Project is also extremely unclear. The DEIR admits that "[b]uildout under the Specific Plan could take place in one phase over a 32-month period, or could occur in phases over multiple years. Accordingly, the Applicant is seeking a Development Agreement with a term of 20 years, which could extend the full buildout year to approximately 2043." (DEIR, pp. II-12.)

This timeline is simply unacceptable. It provides the public and decisionmakers with very little information about when the Project will be built. The Project—which is still undefined and unknown for the reasons discussed above—may be built in as quickly as just under 3 years, or as slowly as 20 years (or more, as the terms of the Development Agreement are not presented here). The DEIR also suggests the Project may be built in phases, which is required to be studied in an EIR. "When a specific project contemplates future expansion, the lead agency is required to review all phases of the project before it is undertaken." (*Natural Resources Defense Council, Inc. v. City of Los Angeles* (2002) 103 Cal.App.4th 268, 284.)

The lack of clarity regarding the Project's timeline deprives the public and decisionmakers of information regarding what developments may be built onsite at what time. Thus, we urge the City to recirculate an EIR with a defined timeline for the Project.

Response to Comment No. 9-24

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, for a more detailed discussion of how Section II, Project Description, of the Draft EIR is accurate, stable, and finite and provides all of the necessary information to allow for a thorough analysis of Project impacts in accordance with CEQA.

As discussed in Response to Comment No. 5-12, the Draft EIR conservatively assumes a 32-month construction duration that includes overlapping activities and construction phases and more intense activities on a daily basis. The 32-month timeframe

is preferred by the Applicant, who intends to complete construction of the Project within this timeframe, subject to market conditions. However, as stated on page II-36 in Section II, Project Description, of the Draft EIR and throughout the Draft EIR, the Applicant is seeking a Development Agreement with a term of 20 years, which could extend the full buildout year to approximately 2043. As with most development projects, market conditions will ultimately influence the buildout timeframe for the Project. As such, to be comprehensive and account for all potential impacts associated with the Project, an analysis of the impacts associated with a 20-year buildout is also included for each of the environmental topics studied in the Draft EIR. Please note that a 20-year buildout scenario does not mean 20 years of construction, as the scope of the Project is the same regardless of the buildout duration. A long-term buildout scenario involves multiple, non-overlapping construction phases with periods of no construction in between phases. *Natural Resources Defense Council, Inc. v. City of Los Angeles* (2002) (“*NRDC*”) is not applicable to this Project. First, *NRDC* involved a Program EIR, whereas the Draft EIR in this case is a Project EIR. In *NRDC*, the Applicant divided a construction project into three phases under a Program EIR, and the Court determined that the original Program EIR did not cover a new construction project that was not even contemplated at the time the Program EIR was approved. Citing CEQA Guidelines Section 15168, the Court defined a Program EIR as an “EIR which may be prepared on a series of actions that can be characterized as one large project and are related either (1) geographically, [or] (2) as logical parts in the chain of contemplated actions.” (*NRDC*, p. 281). Because the *NRDC* project at issue did not arise until after approval of the Program EIR, it could not have been contemplated as one of the series of actions covered by the Program EIR. The *NRDC* case does not apply to the Project because the Draft EIR in this case disclosed and comprehensively analyzed full buildout of the Project.

Also note that the Development Agreement would only allow for development consistent with the Project described in a Certified EIR. Other provisions of the Development Agreement would be contractual matters between the City of Los Angeles and the Applicant and do not constitute environmental impacts under CEQA. Accordingly, the Development Agreement is not required to be included as part of the Draft EIR.

Comment No. 9-25

C. The DEIR Lacks Sufficient Information about the Necessity of the Sign District.

We question the necessity of the proposed Sign District, and the reasoning for which the Project Applicant has applied for a Sign District for this Project, neither of which are disclosed in the DEIR. The DEIR has also failed to articulate an adequately defined Project Description (Section I.B), which makes the necessity of additional signage even more unclear.

Response to Comment No. 9-25

The necessity of a sign district is not relevant to a project's environmental analysis under CEQA. In accordance with CEQA, all environmental aspects of the Project (i.e., all aspects that may cause a physical impact on the environment), including, among other Project approvals, the proposed Sign District, were fully disclosed and analyzed in the Draft EIR. The Preliminary Draft Specific Plan is not necessary for the environmental analysis of the Project. Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan.

Refer to Response to Comment No. 5-10 regarding the key components of the Preliminary Draft Specific Plan that were disclosed and analyzed in the Draft EIR and the availability of the Preliminary Draft Specific Plan for public review.

Comment No. 9-26

Further, the DEIR fails to include a draft of the ordinance for the proposed Sign District. Pursuant to Los Angeles Municipal Code section 13.11, subdivision (C), development regulations for signage, set forth in a Sign District ordinance, must be determined at the time the Sign District is established. The DEIR appears to include some development regulations but has not provided a draft ordinance. We request a draft ordinance stating the development regulations for the proposed Sign District be provided with a recirculated DEIR.

Response to Comment No. 9-26

Refer to Response to Comment Nos. 5-10 and 26-129 and Topical Response No. 1, Clearly Defined Project Description and Specific Plan. As discussed therein, the Draft EIR disclosed all elements of the Preliminary Draft Specific Plan required by CEQA, and the Preliminary Draft Specific Plan is not necessary for the environmental analysis of the Project. Nevertheless, in response to comments and for informational purposes, the Preliminary Draft Specific Plan has been made publicly available on the Department of City Planning's website. Additionally, the Sign District submittal complies with the requirements of LAMC Section 13.11 B in that, at submittal, the properties were all in C Zones, the size of the Sign District exceeds 3 acres in area (the Project Site is approximately 25 acres), and all the parcels are contiguous. Per this code section, it is this precise boundary condition that is required at the time of application, not the development regulations identified by the commenter. The development regulations for a sign district, as outlined in LAMC Section 13.11 C, shall be determined at the time the sign district ordinance is established (after review and approval by the City Council and Mayor), not at the point the request is submitted.

With regard to recirculation, this comment does not provide substantial evidence to demonstrate that “significant new information” as defined by CEQA Guidelines Section 15088.5 has been presented or added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Also refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 9-27

II. The DEIR’s Analysis of Traffic Impacts is Inadequate.

A. The DEIR’s Traffic Analysis is Informationally Deficient.

The lack of information due to the unavailability of the draft TVC 2025 Specific Plan and unstable project description addressed above infects the adequacy of the DEIR’s transportation analysis. This lack of an adequate project description leaves many questions unanswered and fails to provide adequate information and analysis of the Project’s traffic impacts.

Response to Comment No. 9-27

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding how Section II, Project Description, of the Draft EIR was completed in full compliance with CEQA and includes sufficient information and details to analyze the environmental impacts of the Project, including impacts related to transportation (also refer to Section IV.K, Transportation, of the Draft EIR). As discussed in Topical Response No. 1, the Draft EIR disclosed all elements of the Project required by CEQA and provides a comprehensive analysis of the Project.

Comment No. 9-28

One of the areas with a lack of adequate analysis is parking. The DEIR is unable to identify how many parking spaces would be provided in the Specific Plan area or what type of parking would be included, regular pull-in parking spaces, valet, double tandem or even triple tandem are potential options. (DEIR IV-K.44.) Shared parking is also identified as a possibility. (*Ibid.*) Without this information, the DEIR cannot assess whether there is adequate parking for the Project on site, or if the type of parking would encourage those accessing the Project to try to park off-site.

Response to Comment No. 9-28

Pursuant to SB 743, the adequacy of a new development’s parking supply is not a CEQA consideration or a basis for finding a significant environmental impact. In addition, AB 2097 is a new State law that prohibits public agencies and cities from imposing a minimum automobile parking requirement on most development projects located within a

one-half mile radius of a major transit stop. This bill would apply to the Project Site. Accordingly, the parking provisions discussed in the Draft EIR that would be implemented under the proposed Specific Plan have been clarified to be the proposed parking ratios to meet the studio's peak parking demands.

Nonetheless, as discussed on page II-30 of Section II, Project Description, of the Draft EIR, the Project would provide a sitewide total of approximately 5,300 parking spaces. Vehicles may be parked in tandem or by valet, depending on the specific parking layout. In addition, the Project could include a reduced/shared parking plan as long as an adequate parking supply is maintained. The adequacy of the parking supply would be determined by the shared parking or parking demand analysis, which would in turn be reviewed for adequacy by the Department of City Planning. Contrary to the suggestion in the comment, the operation of the parking supply (valet, tandem attendants, self-park, etc.) is a secondary consideration to having the correct number of spaces included in the supply because the operation can be modified to better serve the parking supply provided. Refer to Section A, Parking Supply, of Topical Response No. 13, Parking, regarding the adequacy of the on-site parking supply to accommodate the peak parking demands of the Project. Off-site parking is not needed to meet the Project's peak parking demands, and the Project no longer proposes any off-site parking; refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR.

Comment No. 9-29

The DEIR also fails to provide adequate information to address whether the Project could have a significant impact due to traffic hazards. The DEIR acknowledges that the intersection of Beverly Boulevard and Fairfax Avenue adjacent to the Project site is included in the City's high injury network. (DEIR App. M, p. 25.) However, the DEIR fails to analyze whether the significant number of new daily trips generated by the Project would increase this existing traffic hazard. The Project would result in the level of service (LOS) at this intersection going from a LOS D (fair) to LOS E (poor). Further, the Project's increase in employees, stages and production space will increase the number of vehicles accessing the site. Since access to the site requires a security verification check-point, the increase in vehicles could lead to increased queueing into the site. Longer queues could stretch into Beverly Boulevard, presenting a traffic hazard. The impacts on increased traffic hazards must be assessed, but were not.

Response to Comment No. 9-29

Consistent with Threshold XVII(c) of Appendix G of the CEQA Guidelines, Threshold T-3 in the TAG relates to significant impacts due to a "substantial increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)." As described on page 2-19 of the TAG, impacts under this

threshold “relate to the design of access points” and “may be created by the driveway configuration or through the placement of project driveway(s) in areas of inadequate visibility, adjacent to bicycle or pedestrian facilities, or too close to busy or congested intersections.” The Transportation Assessment (Appendix M.1 of the Draft EIR) includes a comprehensive analysis of traffic hazards beginning on page 124. As concluded therein, the Project would not increase hazards at the proposed Project driveways and along adjacent streets, due to geometric design features from safety, operational or capacity effects (taking into account a number of compatibility factors, including, among others, the relative amount of pedestrian activity, visibility factors, physical conditions, roadway lanes, roadway utilization/capacity and permitted speeds).

The turn lane queues have been fully disclosed in Table 19 on pages 164 to 165 of the Transportation Assessment (Appendix M.1 of the Draft EIR) and found to not represent any hazards. As with any other development project, the Project would add vehicles to through lanes on area streets, which would add to the queues in the area, as described in Table 18 on pages 162 to 163 of the Transportation Assessment. These non-CEQA transportation effects were determined to not represent problematic operational effects by LADOT. The additional queues along The Grove Drive caused by Project vehicles do not represent a hazard because The Grove Drive Project entrance would be signalized, and if the northbound queue from Beverly Boulevard reaches that point, the traffic signal will regulate vehicles leaving the Project Site until capacity on The Grove Drive is available to accommodate the additional Project vehicles.

As stated on page 125 of the Transportation Assessment, each Project driveway was closely reviewed by LADOT and compared to the driveway design guidelines from Section 321 of the Manual of Policies and Procedures. The final driveway plans would be reviewed by the Los Angeles Department of Building and Safety (LADBS), Bureau of Engineering (BOE), and LADOT during the building permit process to ensure code compliance and safe pedestrian and vehicular design. All parking control systems (e.g., security booths, gate arms) would be placed on-site and would provide adequate reservoir area to avoid potential queue spillover onto adjacent roadways. As concluded in the Transportation Assessment, the Project driveways would not present any geometric design hazards related to traffic movement.

The Initial Study, included in Appendix A of the Draft EIR, provided an analysis of the Project’s potential impacts related to hazards due to a geometric design feature or incompatible uses on pages 73–74 and concluded that impacts would be less than significant; refer also to pages VI-31 to VI-32 in Section VI, Other CEQA Considerations, of the Draft EIR and pages IV.K-78 to IV.K-79 in Section IV.K, Transportation, of the Draft EIR. As discussed therein, all Project access points would be designed to meet all applicable City Building Code and Fire Code requirements and would incorporate pedestrian warning systems as appropriate. The Project would provide passenger loading

areas for carpools and rideshares and dedicated pedestrian access on all street and alley frontages. All crosswalks adjacent to the Project Site are improved with continental crosswalks. The Project proposes to install a pedestrian hybrid beacon (a type of traffic signal control for pedestrian crosswalks) at the crosswalk on Melrose Avenue at Stanley Avenue in support of Vision Zero. The Project would also install left-turn signal phasing at three intersections, including Fairfax Avenue and 3rd Street, Martel Avenue/Hauser Boulevard and 3rd Street, and La Brea Avenue and 3rd Street. Left-turn signal phasing helps to improve pedestrian safety by separating pedestrian crossings from conflicting left-turn movements.

Regarding queuing, please refer to Section A, Queuing at Project Driveways, of Topical Response No. 12, Safety and Congestion, for a discussion of how adequate internal queuing space would be provided at each driveway, meeting or exceeding City minimum standards of 60 feet of off-street queuing for any driveway serving 300 parking spaces or more. Overall, the Project does not propose any uses that are incompatible with the surroundings. The Project Site has consisted of production-related uses for over 70 years, which would continue with the Project. The Project also includes up to 20,000 square feet of retail space, which is also compatible with the surrounding urban character. Retail space is common along the arterial streets in the vicinity of the Project Site, including directly across the street on both Beverly Boulevard and Fairfax Avenue.

Therefore, as concluded in the Initial Study, the Project would have a less-than-significant impact related to increased hazards due to a design feature or incompatible use, and no further analysis of this topic was required in the Draft EIR. Nonetheless, the Transportation Assessment (Appendix M.1 to the Draft EIR) provides a detailed discussion of Threshold T-3 in Section 4C.

The commenter's assertion that the Project would generate a significant number of new daily trips is incorrect. Refer to Topical Response No. 8, Vehicle Miles Traveled, regarding the Draft EIR's analysis of the Project's potential transportation impacts and conclusion that transportation impacts would be less than significant during both construction and operation. Refer also to Topical Response No. 10, Trip Generation, which discusses the number of trips that would be generated by the Project. The assertion that the "significant number of new daily trips generated by the Project would increase this traffic hazard" is an unsubstantiated statement. First, CEQA does not have any threshold for significance related to the number of trips generated by a project. Second, the comment seeks to associate an increase in the number of daily trips to an increase in potential safety hazards. Topical Response No. 12, Safety and Congestion, discusses traffic safety related to congestion and speed along the HIN.

As discussed on page IV.K-1 of Section IV.K, Transportation, of the Draft EIR, with the passage of SB 743, the analysis of transportation impacts shifted from driver delay (i.e.,

LOS) to VMT. Therefore, changes in driver delay are not considered transportation impacts under CEQA, and, under State law, LOS and vehicle delay cannot be considered significant environmental impacts as a matter of law. Nonetheless, in accordance with the TAG, the Transportation Assessment evaluated LOS and vehicle delay as part of the non-CEQA transportation analysis. Refer to Section B, Level of Service, of Topical Response No. 12, Safety and Congestion. With regard to LOS E operations at the intersection of Fairfax Avenue and Beverly Boulevard with Project trips, the Project would only result in a change in the LOS at that location during the morning peak hour under Existing with Project Conditions, which is a theoretical scenario in which the entire Project were completed in year 2021 (refer to Table 17 on page 160 of the Transportation Assessment [included in Appendix M.1 of the Draft EIR]). In the more realistic scenario in which the Project is completed as early as the year 2026, that intersection would operate at LOS E during both the morning and afternoon peak hours as a result of background traffic growth, without the addition of any Project trips (refer to Table 18 on page 162 of the Transportation Assessment). As such, the Project would not cause LOS E conditions, and, therefore, the commenter's statement to the contrary is inaccurate. The Project includes TDM strategies and traffic signal and operational improvements along the HIN corridors that would advance the traffic safety goals of the City's Vision Zero Program and would include LOS benefits.

Comment No. 9-30

B. The DEIR Relies Upon Unsupported Traffic Assumptions to Assess Vehicle Miles Traveled.

The DEIR relies upon a number of unsubstantiated assumptions in support of its claim that the Project would have no signification [sic] traffic impacts and that it does not require any mitigation. The DEIR's assessment of Project-generated vehicle miles traveled (VMTs) relies on a number of assumptions, but the DEIR and its appendices fail to provide evidentiary support to determine the validity of these assumptions. For example, the DEIR uses of an average trip length of between 6.2 and 8.1 miles to assess the Project's VMTs, but fails to provide an evidentiary basis for that assumed trip length. What is the basis to assume that average trip length to the TVC 2050 Project would be that length?

Response to Comment No. 9-30

Refer to Topical Response No. 8, Vehicle Miles Traveled, which provides a detailed explanation of the adequacy of the assumptions and results of the VMT analysis, as well as the appropriateness of using the City's VMT Calculator. The trip length assumptions in the VMT Calculator are based on home-to-work trips in that area of the City as set forth in the City's travel demand forecasting model, and the assumptions in the VMT Calculator follow State guidance on VMT analysis. As stated in Section 15064.3 of the CEQA Guidelines, "a lead agency may use models to estimate a project's vehicle miles traveled." Consistent

with State of California guidance on VMT analysis,¹⁰³ the Project's trip lengths were estimated using the same source data used by the City to develop the significance thresholds (i.e., the City's model), thereby resulting in an "apples-to-apples" comparison between Project VMT and the areawide average VMT upon which the thresholds of significance are based.

Comment No. 9-31

The DEIR also assumes a fairly evenly disbursed trip distribution, with 35% from the northwest, 25% from the northeast, 15% from the southeast, and 25% from the southwest. What evidence does the DEIR rely upon to support this assumed trip distribution?

Response to Comment No. 9-31

This comment refers to the trip distribution associated with the Project-related trips assigned to the local street system, which is directly related to the operational LOS analysis for the Project. It should be noted that as discussed on page IV.K-1 of Section IV.K, Transportation, of the Draft EIR, with the passage of SB 743, the analysis of transportation impacts shifted from driver delay (i.e., LOS) to VMT. Therefore, changes in driver delay are not considered transportation impacts under CEQA, and, under State law, LOS and vehicle delay cannot be considered significant environmental impacts as a matter of law.

The development of the Project trip distribution assumptions used in the non-CEQA analysis included in the LADOT-approved Transportation Assessment (Appendix M.1 of the Draft EIR) considered many factors, including existing employee zip code information, general traffic patterns, locations of residential areas from which potential future employees and visitors of the Project would be drawn, the operating conditions and characteristics of the local street system, access to regional freeways, and proposed driveways to the Project Site. The base assumptions, including the trip distribution for the Project-related trips, were identified as part of the study approach and were outlined in the Memorandum of Understanding dated June 25, 2021, which was reviewed and approved by LADOT and is attached as Appendix A to the Transportation Assessment.

Comment No. 9-32

Additionally, the DEIR fails to provide support for its claim that the VMT per employee does not exceed the impact threshold of 7.6. (DEIR App. M, p. 123.) To assess this figure, the DEIR calculates that the Project would have 95,865 total daily VMTs. The DEIR the

¹⁰³ California Governor's Office of Planning and Research, *Technical Advisory on Evaluating Transportation Impacts in CEQA*, December 2018.

subtracts out baseline VMTs and concludes the Project would have 69,055 new daily VMTs. The assessment also relies on a total number of employees for the Project site of 7,832, but does not address how many would be new employees. To calculate the VMT per employee, the DEIR uses a further reduced daily VMTs amount of 52,194, which is reduced further below the new daily VMTs. Instead of dividing this new amount of daily VMTs by the number of new employees to compare apples to apples, the DEIR instead divides the reduced number of daily VMTs by the total number of employees. This does not compare apples to apples and instead results in a diluted number of daily VMTs. This significantly underestimates the VMTs per employee. If the 69,055 new daily VMTs or the 95,865 total daily VMTs were divided by the total number of employees, the Project would exceed the impact threshold for VMT per employee, with 8.8 and 12.2 VMTs per employee respectively.

Response to Comment No. 9-32

The comment misrepresents the VMT analysis and results presented in the Transportation Assessment included in Appendix M.1 of the Draft EIR and summarized in Section IV.K, Transportation, of the Draft EIR. Refer to Topical Response No. 8, Vehicle Miles Traveled, which provides a detailed explanation of the adequacy of the assumptions and results of the VMT analysis, as well as the appropriateness of using the City's VMT Calculator. The Project's transportation analysis and resulting impacts were assessed in the Draft EIR using VMT methodology in accordance with CEQA and LADOT guidance. While Table 13 on page 123 of the Transportation Assessment identifies both gross total and net new daily VMT, the net new daily VMT is provided for informational purposes only. The OPR Technical Advisory makes it clear that for redevelopment projects, where the project replaces or adds to existing operating land uses, the VMT analysis is based on the entire project upon completion. Page 18 of the OPR Technical Advisory, for example, states that the VMT thresholds, which are efficiency metrics (e.g., based on VMT per person), "apply only to the existing project without regard to the VMT generated by the previously existing land use."

Further, the VMT per employee metric is based on *home-based work attraction* trips, which are one specific component of gross total VMT. The gross total daily VMT or other components of total VMT, such as *home-based other attraction* and *non-home-based other attraction*, are not used in the calculation of VMT per employee. Similarly, the City's significant impact thresholds are based only on home-based work attraction VMT and do not incorporate total VMT or the other components of total VMT. Thus, the Project's VMT per employee metric can be compared on an "apples-to-apples" basis with the thresholds of significance, consistent with page 5 of the OPR Technical Advisory guidance on VMT analysis. The VMT analysis is conducted using gross total home-based work attraction VMT (approximately 52,194 total daily work VMT) and the gross total employees (approximately 7,832 employees). In dividing the work VMT by employees, the resulting

VTM per employee is 6.7 miles as stated in the Draft EIR. See Table II-2 in Topical Response No. 8, Vehicle Miles Traveled, for a helpful illustration of how VMT is calculated.

Regarding existing employees, the Transportation Assessment states that there are approximately 2,130 existing employees (see Table 9 in Appendix A of the Transportation Assessment). As explained above, the number of total Project employees, rather than the number of existing employees, is what is relevant for the VMT transportation analysis.

Comment No. 9-33

C. The DEIR's Analysis of Cut-Through Traffic is Improperly Deferred.

The DEIR's analysis and mitigation of neighborhood cut-through traffic impacts is improperly deferred. Degradation of surrounding streets' LOS to LOS E and LOS F, will cause motorists to find less congested routes, likely through the adjacent neighborhood. Based on information provided in the DEIR, it is clear the Project would have residential street cut-through impacts. Buried in DEIR Appendix M, it is identified that mitigation is required to prevent these impacts on Genesee Avenue, but no mitigation is provided in the DEIR. (DEIR App. M, p. 171.) Impacts are also assumed for Stanley Avenue and Spaulding Avenue, also without the provision of any mitigation. (DEIR App. M, p. 171.)

The DEIR improperly defers a full analysis of these cut-through traffic impacts to post-EIR, claiming they cannot be assessed now due to reduced traffic levels following the COVID-19 pandemic. The City cannot approve this Project without a proper assessment of cut-through traffic impacts.

Response to Comment No. 9-33

Refer to Topical Response No. 9, Neighborhood Traffic Management Plan, regarding the non-CEQA analysis of cut-through trips in the Transportation Assessment (Appendix M.1 of the Draft EIR), the Project's NTMP, the timing and preparation of the NTMP, and why the preparation of an NTMP does not represent deferred mitigation. As stated therein, a project's effect on automobile delay, including cut-through trips, is not an impact under CEQA, and, therefore, there are no significant impacts related to automobile delay that require mitigation under CEQA.

Comment No. 9-34

D. The DEIR Improperly Relies Upon Project Design Features Without Disclosing Impacts.

Throughout, the DEIR improperly relies upon so-called project design features (PDFs) and claims that conditions will be placed on the Project in an attempt to reduce many of the

Project's impact without the required analysis of the impacts or the measures relied upon to mitigate them. The majority of these PDFs appear to be mitigation measures that the Project applicant and City have failed to incorporate into the Project's Mitigation Monitoring and Reporting Program (MMRP). When a Project incorporates mitigation measures, CEQA requires that those mitigation measures be "fully enforceable through permit conditions, agreements, or other measures." (Pub. Resources Code § 21081.6(b).)

As mere PDFs that will not necessarily be incorporated into Project approvals, conditions, and the MMRP, the PDFs are not properly enforceable by the City or third parties and cannot be relied upon for any reductions in Project impacts. CEQA's mitigation requirements exist for a reason. "The purpose of these requirements is to ensure that feasible mitigation measures will actually be implemented as a condition of development, and not merely adopted and then neglected or disregarded." (*Federation of Hillside & Canyon v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1261; *Katzeff v. California Dept. of Forestry and Fire Protection* (2010) 181 Cal.App.4th 601, 612; *Lincoln Place Tenants Assn v. City of Los Angeles* (2005) 130 Cal.App.4th 1491.)

The heavy reliance on Project PDFs and the future imposition of conditions also improperly compresses the DEIR's disclosure and analysis functions. (*Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 655–656.) A "mitigation measure cannot be used as a device to avoid disclosing project impacts." (*San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, 663–664.) Here, the DEIR claims that the PDFs are part of the Project itself and fail to assess the impacts of the Project without these PDFs. But, a **mitigation measure is not part of the project**. (*Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, 656 & fn. 8.) An EIR cannot incorporate "the proposed mitigation measures into its description of the project and then conclude [] that any potential impacts from the project will be less than significant." (*Id.* at 655–657.) The DEIR's shortcut is "not merely a harmless procedural failing...[it] subverts the purposes of CEQA by omitting material necessary to informed decisionmaking and informed public participation." (*Id.* at 658.)

Response to Comment No. 9-34

This comment incorrectly states that the Draft EIR disguises mitigation measures as PDFs, and suggests they are unenforceable. The proposed PDFs are not intended to be mitigation and do not "mitigate" any significant impacts but are integral features of the Project (i.e., they are part of the Project that is analyzed in the Draft EIR). By definition, mitigation measures are not part of a project's design. Rather, mitigation measures are actions taken by the lead agency to reduce impacts to the environment resulting from the project design. Mitigation measures are identified by the lead agency after the project has undergone environmental review and are necessary to reduce environmental impacts.

Furthermore, as is the case with every EIR published by the City, the proposed PDFs would be included in the Project's Mitigation Monitoring Program (see Section IV of this Final EIR), along with details about the enforcement and monitoring agencies, timing, and action indicating compliance. Implementation of the Mitigation Monitoring Program would be required as part of the Conditions of Approval for the Project. All of the necessary and required impact analysis is contained in the Draft EIR. Accordingly, the PDFs are fully described, and their effectiveness in reducing or avoiding potential impacts are analyzed in the Draft EIR, consistent with CEQA and *Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645 (per *Lotus*, concluding that an impact is less than significant without describing how avoidance and minimization measures of the project design prevent or minimize the impact, is not legally adequate).

As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Draft EIR fulfilled CEQA's informational purpose by disclosing all of the elements of the Project required by CEQA and providing a comprehensive analysis of the Project potential environmental impacts under CEQA.

Comment No. 9-35

E. The Project Will Worsen Existing Inadequate Emergency Response Times.

The Fire Department has disclosed that emergency response times for the Project site are already inadequate, specifically stating that "fire protection would be considered inadequate" due to excess distance to the nearest fire station. (DEIR App. K, p. 3, emphasis in original.) As set forth above, the Project would result in worsening LOS on streets surrounding the Project site. This will worsen the already inadequate fire protection for the Project site and surrounding residences and business. The DEIR must disclose this significant emergency response impact.

Response to Comment No. 9-35

The phrase from LAFD's August 6, 2021 letter included as Appendix K of the Draft EIR that is cited by the commenter is not directed at emergency response times. Rather, it is directed at LAMC criteria regarding distance from a fire station. As discussed on page IV.J.1-12 of Section IV.J.1, Public Services—Fire Protection, of the Draft EIR, LAMC Section 57.507.3.3 limits the maximum response distances to an LAFD station based on the type of land use. LAMC Section 57.512.2 and Table 57.507.3.3 further provide that where a site's response distance is greater than permitted, all structures must have automatic fire sprinkler systems. As discussed on page IV.J.1-23, based on this LAMC criteria regarding response distance, the Project Site would be located outside of the 1.0-mile response distance from a fire station with an engine company but would be located within the 1.5-mile response distance from a fire station with a truck company. Therefore, per LAMC Sections 57.507.3.3 and 57.512.2, rather than relying upon potential

exemptions, the Project would be required to include automatic fire sprinkler systems in all structures, in addition to the fire protection features listed in LAFD's inter-departmental correspondence regarding the Project (see Appendix K of the Draft EIR). While the LAFD letter states that the Project would exceed the LAFD-required response distance for a fire station with an engine company, LAFD's letter concludes on page 6 that "[t]he inclusion of the above listed recommendations, along with any additional recommendations made during later reviews of the proposed project will reduce the impacts to an acceptable level." Therefore, as concluded in the Draft EIR, operation of the Project would not result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, the construction of which would cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection services. As such, Project impacts related to fire protection were determined to be less than significant in the Draft EIR. Refer to Appendix FEIR-12 of this Final EIR, which confirms the Draft EIR's less than-significant conclusion.

With regard to response times, as discussed on page IV.J-16 through IV.J-18 of Section IV.J.1, Public Services—Fire Protection, of the Draft EIR, LAFD has not established response time standards for emergency response, nor adopted the National Fire Protection Association (NFPA) standard of 5 minutes for emergency medical services response and 5 minutes 20 seconds for fire suppression response. The response times for January 2021 to December 2021 are shown in Table IV.J.1-4 on page IV.J.1-17 of the Draft EIR. According to LAFD, although response times can be considered to assess the adequacy of fire protection and emergency medical services, it is only one factor among several that LAFD utilizes in considering its ability to respond to fires and life and health safety emergencies, including required fire flow, response distance from existing fire stations, and LAFD's judgment for needs in a specific area. If the number of incidents in a given area increases, it is LAFD's responsibility to assign new staff and equipment and potentially build new or expanded facilities, as necessary, to maintain adequate levels of service. As stated on page IV.J.1-5 of the Draft EIR, "[i]n *City of Hayward v. Trustee of California State University* (2015) 242 Cal. App. 4th 833, the court found under Section 35 that cities have 'a constitutional obligation to provide adequate fire protection services.'" In conformance with the California Constitution Article XIII, Section 35(a)(2), the City has and will continue to meet its legal obligations to provide adequate public safety services, including fire protection and emergency medical services. Thus, the need for additional fire protection and emergency medical services is not an environmental impact that CEQA requires a project to mitigate. Also refer to Section D, Emergency Access, of Topical Response No. 12, Safety and Congestion, for further discussion of traffic congestion as it relates to emergency access, including emergency response times. As described therein, as part of the non-CEQA transportation analysis, Section 5B of the Transportation Assessment (Appendix M.1 of the Draft EIR) details the LOS operations at the 31 study intersections selected for operational evaluation. As shown in Table 18 of the

Transportation Assessment, upon anticipated Project completion in 2026, several intersections on arterial streets would operate at LOS E or F before and after the addition of Project trips. The Project would not cause any location to change from LOS D or better to LOS E or F during either peak hour.

As shown in Figure IV.J.1-1 in Section IV.J.1, Public Services—Fire Protection, of the Draft EIR, the two closest fire stations to the Project Site are Fire Station Nos. 61 and 41. Typically, the emergency vehicle response times are most influenced by severe congestion at the key signalized intersections along a response route. Figure II-3 within Section D, Emergency Access, of Topical Response No. 12, Safety and Congestion above illustrates the locations of the LOS E or F intersections along the key corridors for emergency access: Fairfax Avenue and 3rd Street. As shown in Figure II-5, the intersection of Beverly Boulevard and Fairfax Avenue is the only intersection south of Melrose Avenue that would operate at LOS E for Fire Station No. 41 emergency vehicles. Use of the alternate route for Fire Station No. 41 vehicles would avoid this intersection. In addition, emergency vehicles approaching the Project Site from Fire Station No. 61 would experience a LOS E or F at the intersection of 3rd Street and Fairfax Avenue, although this location could be avoided by using the alternate route northbound on The Grove Drive.

Comment No. 9-36

III. Feasible Less Impactful Alternatives Should Be Adopted Instead of the Proposed Project.

CEQA prohibits approval of a project with significant adverse environmental impacts when there are feasible alternatives or mitigation measures that would “avoid or substantially lessen” the project’s significant effects. (Pub. Resources Code § 21002; *City of Marina v. Board of Trustees of California State University* (2006) 39 Cal.4th 341, 350.) An alternative need only avoid or substantially lessen any one of a project’s significant impacts to be considered environmentally superior. (CEQA Guidelines § 15021, subd. (a)(2).) The finding that “[t]here is no feasible way to lessen or avoid the significant effect...” of a project must be supported by substantial evidence. (Guidelines §§ 15043, 15093, subd. (b).) An alternative must be “truly infeasible” for its rejection to be legally valid under CEQA. (*City of Marina, supra*, 39 Cal.4th 341, 369.) CEQA defines feasible as “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social and technological factors.” (Pub. Resources Code § 21061.1.)

We urge the City to comply with CEQA’s requirements by adopting feasible, less impactful alternatives instead of the Proposed Project. Alternative 2 would allow for modernization and renovation of the existing facilities without overhauling the Project site’s land use designations and creating an unnecessary Sign District. It would also provide greater

specificity of the Project itself by providing a concrete project proposal and eliminating ill-defined conceptual development scenarios. Thus, we support adoption of Alternative 2.

Response to Comment No. 9-36

Refer to Response to Comment No. 9-8. Alternative 2 does not avoid or substantially lessen any of the Project's significant and unavoidable impacts. It should also be noted that there were no significant impacts associated with the Project's Sign District. Refer also to Topical Response No. 16, Project Alternatives Analysis, for a discussion of how the Draft EIR presented a reasonable range of alternatives to avoid or substantially lessen the significant impacts of the Project while focusing on attaining the Project objectives, and how each such alternative was deemed infeasible. Note that this comment does not properly interpret caselaw and the CEQA Guidelines. *City of Marina* stated that mitigation measures, rather than alternatives, must be "truly infeasible" to be rejected. Mitigation measures are not at issue here. Furthermore, CEQA Guidelines Section 15021(a)(2) states that "[a] public agency *should* [emphasis added] not approve a project as proposed if there are *feasible* [emphasis added] alternatives or mitigation measures available that would substantially lessen any significant effects that the project would have on the environment." Thus, an alternative still needs to be *feasible*, and the Draft EIR reasonably determined that, of the reasonable range of alternatives presented, none were feasible.

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, and Response to Comment Nos. 5-5 and 9-12 regarding how the Project Description fully complies with CEQA.

Comment No. 9-37

IV. Conclusion

For all of the reasons set forth above, Save Beverly Fairfax finds the DEIR to be wholly inadequate. The DEIR simply cannot provide meaningful information that fulfills CEQA's purpose of informed decisionmaking until a draft Specific Plan is prepared, and the issues described in this letter are resolved. We thus urge the City to reject this DEIR. If this Project does move forward as proposed, which we urge the City not to allow, a revised DEIR must be recirculated to address the many failings described herein.

Response to Comment No. 9-37

This comment summarizes the commenter's concerns addressed above and expresses opposition to the Project. As demonstrated in Response to Comment Nos. 9-1 through 9-36, the Draft EIR has been completed in full compliance with CEQA and recirculation is not required. Refer to Response to Comment No. 9-4 regarding

recirculation. The comment is nevertheless noted for the administrative record and has been incorporated into the Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 9-38

Additionally, we ask that you inform us of any future Project notices pursuant to Public Resources Code section 21092.2 and applicable Municipal Code requirements. We further request that you retain all Project related documents including correspondence and email communications as required by CEQA. (*Golden Door Properties, LLC v. Superior Court of San Diego County* (2020) 52 Cal.App.5th 837 [agency “must retain writings”].)

Response to Comment No. 9-38

The commenter has been added to the mailing list for the Project and will receive all future public notices regarding the Project prepared by the City. In addition, the City will continue to properly maintain the administrative record for the Project.

Comment No. 9-39

Thank you for your time and consideration in this matter.

Response to Comment No. 9-39

This concluding comment is noted for the administrative record.

Comment Letter No. 10

Comment No. 10-1

On behalf of Save Beverly Fairfax, we provide the following additional comments on the draft environmental impact report (DEIR) for the Television City 2050 Specific Plan project (the “Project” or TVC 2050 Project”) regarding cut-through traffic impacts. As set forth in our August 25, 2022 letter, the DEIR improperly defers a full analysis of these cut-through traffic impacts to an ill-defined post-EIR process. These cut-through traffic impacts must be analyzed and mitigated prior to any Project approval.

Additionally, in order to prevent impacts to the neighborhood located north of the Project site, which includes the Beverly Fairfax National Register Historic District, the analysis of cut-through traffic in the North Neighborhood must be thorough. To do so, the cut-through analysis must address all potential impacted streets, including: Orange Grove Avenue, Ogden Drive, Genesee Avenue, Spaulding Avenue, Stanley Avenue, Curson Avenue, Sierra Bonita Avenue, Gardner Street. The DEIR Appendix M identifies the potential for increased cut-through traffic on all of these streets. (DEIR App. M, pp. 170–171.) Once the DEIR is revised to include trip distribution assumptions supported by substantial evidence, as set forth in Save Beverly Fairfax’s previous comments, a more complete analysis of cut-through trips can be assessed and mitigated.

Thank you for your time and consideration in this matter.

Response to Comment No. 10-1

Refer to Topical Response No. 9, Neighborhood Traffic Management Plan, regarding the non-CEQA analysis of cut-through trips in the Transportation Assessment (Appendix M.1 of the Draft EIR), the Project’s NTMP, the timing and preparation of the NTMP, the boundaries of the NTMP areas, and why the preparation of an NTMP does not represent deferred mitigation and no mitigation is required. As stated therein, a project’s effect on automobile delay, including cut-through trips, is not an impact under CEQA, and,

therefore, there are no significant impacts related to automobile delay that require mitigation under CEQA.

The cut-through analysis included the streets that have the potential to experience a level of cut-through traffic that rises to the City's non-CEQA thresholds for requiring an NTMP. This included five of the streets noted in the comment. Additional streets farther to the east, including Curson Avenue, Sierra Bonita Avenue, and Gardner Street, may sporadically carry a small number of additional trips as a result of the Project, but none would approach the City's minimum threshold of 120 cut-through trips per day (which is over 1 percent of the Project's net increase of approximately 9,733 daily trips as shown in Table 13 of the Transportation Assessment [included in Appendix M.1 of the Draft EIR]).

Refer to Section E, Impacts to Historical Resources in the Vicinity of the Project Site, of Topical Response No. 5, Historical Resources, for a discussion of why potential cut-through trips would not result in a significant impact on the historic integrity of the Beverly Fairfax Historic District.

Comment No. 11-1

These comments are submitted on behalf of the Beverly Wilshire Homes Association in connection with the draft environmental impact report (DEIR) prepared for the TVC 2050 Specific Plan ("Project"). The Beverly Wilshire Homes Association is a non-profit, incorporated organization of property owners, residents and businesses within the area bounded by La Brea to La Cienega and Rosewood to the north side of Wilshire Blvd. From 1956 to the present, the Association has been the voice of the community. The Association's mission is to improve the quality of life for its members and the community.

Response to Comment No. 11-1

This introductory comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 11-2

If approved, the TVC 2050 Specific Plan would permit up to 1,626,180 square feet of new development at the existing 25-acre Television Studio site on top of the retention of up to 247,820 square feet of existing uses, for a total of nearly 1.9 million square feet of development. While the proponent claims that the Project is critical to maintaining local television production, the 1.6 million square feet of additional development is not limited to television production. Instead, these allowable uses include retail, parking, and general office uses, as well as the sound stages, production support, and production offices television production requires. Critical to the community, the Project would establish a Sign District to expand allowable signage and amend the General Plan to designate the site as a Regional Center, allowing vast increases in development.

Response to Comment No. 11-2

As stated on page II-10 in Section II, Project Description, of the Draft EIR, the purpose of the Project is to maintain Television City as a studio use and to modernize and enhance production facilities within the Project Site. An operationally feasible balance of studio and studio-related uses is required for a successful modern studio. Refer to Topical Response No. 4, Appropriateness of Economic Objective, for additional information. The proposed development program (Table II-2 of the Draft EIR) includes an operationally feasible balance of studio uses to meet modern production needs. Refer to Topical Response No. 3, Permitted On-Site Uses, regarding the permitted studio uses. As demonstrated therein, the uses that would be permitted under the Preliminary Draft Specific Plan are consistent with the studio-related objectives of the Project.

The commenter mischaracterizes the proposed Regional Commercial designation as allowing increases in development. Refer to Response to Comment No. 5-8 regarding the proposed Regional Commercial land use designation and its relation to the size of the Project.

The comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 11-3

The Project's scale, which would more than double the current development on the site, exceeds the appropriate scale for the site and the neighborhood. Project heights could reach 225 feet. It would be twice the size of the Beverly Center and twice as tall.

Response to Comment No. 11-3

Regarding the scale of the Project, the Project's proposed FAR of 1.75:1 is an approximately 17-percent increase from the 1.5:1 FAR currently permitted by existing zoning. Further, a 1.75:1 FAR is compatible with the surrounding neighborhood and is much smaller than the FAR permitted for surrounding properties. The permitted FAR for The Grove and The Original Farmers Market is 3:1 to 6:1 for individual parcels (1.5:1 FAR sitewide). The Broadcast Center Apartments has an FAR of approximately 2:1. Further, residential areas farther to the north and west of the Project Site are permitted an FAR of 3:1. The Beverly Center, which is mentioned in this comment, has an FAR of 2.99:1 and is approximately 122 feet in height.¹⁰⁴ The commenter's assertion that the Project would be

¹⁰⁴ Information about existing floor area from Case Nos. ZA-2018-3008-PAB and ZA-1994-0656-PAB-PA. Please note that the original approval for the Beverly Center is not available online.

twice the size, when comparing FAR, of the Beverly Center and twice as tall is incorrect. In addition, the Project would impose height, frontage, and stepback requirements that are not currently required under the existing zoning code. Moreover, there are several high- and mid-rise buildings located less than 1 mile from the Project Site, as set forth in Table II-23 on page II-315 of this Final EIR.

Refer to the analysis provided on pages IV.H-39 through IV.H-57 of Section IV.H, Land Use and Planning, of the Draft EIR, and Appendix I, Land Use Plans Consistency Analysis Tables, of the Draft EIR, which show that the Project would not conflict with applicable land use plans and policies, including those that specifically address compatibility with surrounding land uses.

Regarding Project height, refer to Response to Comment No. 9-16. As part of the proposed Specific Plan, height zones with specified height limits would be established to regulate building heights throughout the Project Site. Refer to Figure II-5 and pages II-17 through II-20 in Section II, Project Description, of the Draft EIR. As shown therein, Height Zone A, which extends 430 feet along Beverly Boulevard in the central/northern portion of the Project Site, would be limited to a 58-foot height limit, and much of the Project Site would be subject to a base height limit of 88 feet as measured from Project Grade, consistent with the height of the existing HCM onsite. The base height limit would be augmented with maximum height limits in limited portions of certain height zones. Height Zone B, located within the southeastern portion of the Project Site adjacent to the existing eight-level parking structure at The Grove, would have a maximum height limit of 130 feet. Height Zone C, located in the western, northwestern, and northeastern portions of the Project Site, would have a base limit of 88 feet with a maximum height of up to 160 feet within up to 40 percent of the height zone area. Height Zone D, located within the more central area of the Project Site, would have a base height limit of 88 feet with a maximum height limit of 225 feet within up to 40 percent of the height zone area. In addition, Height Zone E is a rooftop zone along the northern façades of the Primary Studio Complex that limits any rooftop addition to a height limit of 84 feet. Height Zone F prohibits the construction of any new occupiable building to protect the Primary Studio Complex. Internal setback requirements are also included for new development adjacent to the Service Building. Overall, these height zones protect the HCM, open up views of the HCM from Beverly Boulevard, and concentrate building mass and height toward the center of the Project Site. Also note that the Specific Plan would establish frontage area requirements that function as buffers and transitional space around the Project Site perimeter. Among others, a 30-foot-wide frontage area would be provided along the Project Site's edge adjacent to the Broadcast Center Apartments and along a portion of the southern property line as shown in Figure II-5, Height Zone Map, within Section II, Project Description, of the Draft EIR. Additional figures have also been added as part of this Final EIR. Refer to Figures II-4(a) and II-4(b) within Section III, Revisions, Clarifications, and Corrections to the Draft EIR, for aerial renderings depicting the Conceptual Site Plan. In addition,

**Table II-23
Height of Buildings in Vicinity of Project Site**

Site	Building Height	Distance from Project Site (Approx.)
Park La Brea 6200 W. 3rd Street	147 feet, 13 stories	0.36 mile
One Museum Square 640 S. Curson Avenue	245 feet, 21 stories ^a	0.66 mile
SBE Building 5900 Wilshire Boulevard	435 feet, 31 stories ^b	0.75 mile
6100 Wilshire Boulevard	201.5 feet, 16 stories ^c	0.76 mile
^a CPC-2013-193-ZC-CU-ZV-BL-CDO. ^b Building Permit No. 1969LA80993. ^c Building Permit No. 1984LA90564. Source: Eyestone Environmental, 2023.		

building stepbacks would apply to those portions of buildings in Height Zones C and D that are greater than 88 feet in height. Also note that the height zones do not represent the actual development footprint of the Project buildings. Rather, new buildings would occupy only a portion of the development envelope permitted in each height zone. Overall, as shown in the additional conceptual renderings provided in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, the height zones, frontages, stepbacks, and setback requirements related to construction next to the HCM protect the HCM open up views of the HCM from Beverly Boulevard, and concentrate building mass and height toward the center of the Project Site. Furthermore, proposed building heights would be compatible with existing building heights in the Project vicinity that include a range of low- to high-rise buildings. Also note that the proposed height zones establish building height maximums that do not currently exist within the Project Site.

Comment No. 11-4

The Project contains no enforceable standards to prevent increasing neighborhood traffic and parking scarcity.

Response to Comment No. 11-4

As discussed in Topical Response No. 9, Neighborhood Traffic Management Plan, the Project would implement an NTMP that includes measures to minimize potential cut-through trips.

As discussed in Topical Response No. 13, Parking, the proposed parking supply would be sufficient to accommodate the peak parking demands of the Project and would prevent spillover parking. Please note that neither cut-through trips nor adequacy of parking supply are environmental impacts under CEQA. Nevertheless, this comment is acknowledged for the record and will be forwarded to the decision-makers for their review and consideration prior to any action on the Project.

Comment No. 11-5

The Project would excavate 772,000 cubic yards of dirt, resulting in unanalyzed air quality impacts and requiring dewatering that the DEIR assumes, without analysis, will not cause adverse impacts. Unfortunately, however, the Project's size is not its greatest problem.

Response to Comment No. 11-5

The air quality analysis within Section IV.A, Air Quality, of the Draft EIR fully accounts for the 772,000 cubic yards of export anticipated as part of construction of the Project. Refer to page IV.A-60 of Section IV.A, Air Quality, of the Draft EIR and the supporting calculations included in Appendix B of the Draft EIR.

With regard to dewatering, as discussed in Response to Comment No. 3-7, the Project would require temporary construction dewatering and not permanent dewatering.

The Draft EIR evaluated potential impacts associated with temporary construction dewatering. As discussed on page IV.G-9 of Section IV.G, Hydrology and Water Quality, of the Draft EIR, the discharge of groundwater as a result of dewatering would be required per regulatory requirements to consider various wastewater disposal methods and provide a flow diagram of the influent to the discharge point.¹⁰⁵ As described below, the actual composition of the dewatered groundwater (i.e., the dissolved chemical composition and sediment load) produced during the temporary construction dewatering are fundamental data elements of the feasibility study for evaluation of alternative disposal methods that will be determined during future groundwater dewatering pumping tests conducted during the City's regulatory building permit process. As per LADBS (Information Bulletin Number P/BC 2020-131), when temporary dewatering is required as part of construction, industrial wastewater discharge permits are required by the City of Los Angeles Bureau of Sanitation for discharge of the pumped water into the public sewer system. If the water is to be discharged into the public sewer system, the City of Los Angeles Bureau of Sanitation is

¹⁰⁵ Los Angeles Regional Water Quality Control Board, Order No. R4-2013-0095, General NPDES Permit No. CAG994004, Waste Discharge Requirements for Discharges of Groundwater from Construction and Project Dewatering to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties, 2013.

concerned with (1) the quality of the discharge; and (2) the capacity and hydraulics of the public sewer system to accept the discharge. If temporary dewatering pumps are to discharge into the storm drain system (which eventually discharge directly into surface waters such as streams or oceans), National Pollutant Discharge Elimination System (NPDES) permits are required from the Los Angeles Regional Water Quality Control Board (LARWQCB).

The Draft EIR evaluated surface water quality construction impacts on pages IV.G-28 to IV.G-30 in Section IV.G, Hydrology and Water Quality, of the Draft EIR. With regard to dewatering during construction, as stated therein, discharges from dewatering operations can contain high levels of fine sediments, which, if not properly treated, could lead to exceedance of permit requirements. During construction, temporary dewatering pumps and filtration would be utilized in compliance with the discharge permit. These temporary systems would comply with all applicable permit requirements related to construction and discharges from dewatering operations, as well as the LARWQCB Waste Discharge Requirements for Discharges of Groundwater from Construction and Project Dewatering to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties. With the implementation of site-specific BMPs included as part of the SWPPP and implementation of an erosion control plan as required by the LAMC, the Project would reduce or eliminate the discharge of potential pollutants from stormwater runoff. As such, with compliance with discharge permit requirements and City of Los Angeles grading permit regulations, construction of the Project would not result in discharges that would violate any surface water quality standard or waste discharge requirements or otherwise substantially degrade surface water quality. Thus, temporary construction-related impacts on surface water quality would be less than significant.

The Draft EIR also evaluated groundwater quality construction impacts on pages IV.G-30 to IV.G-32 of the Draft EIR. With regard to dewatering, as stated therein, any discharge of groundwater during Project construction would comply with the applicable NPDES permit or industrial user sewer discharge permit and applicable LARWQCB requirements, and, therefore, groundwater quality would not be negatively affected by potential dewatering activities.

Temporary construction dewatering impacts are also analyzed in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR. As stated on page IV.F-44 of the Draft EIR, during construction-phase dewatering, any discharge of groundwater would comply with the applicable NPDES permit or industrial user sewer discharge permit requirements. Pursuant to such regulatory requirements, the extracted groundwater would be chemically analyzed to determine whether the groundwater is contaminated and the appropriate treatment and/or disposal methods. Thus, with compliance with applicable regulations and requirements, Project construction activities would not create or exacerbate a significant

hazard to the public or the environment involving the handling and disposal of extracted groundwater.

In addition, temporary construction dewatering impacts are analyzed in Section IV.D, Geology and Soils, of the Draft EIR. As stated on page IV.D-24 of the Draft EIR, although dewatering operations are expected during construction, such activities would be limited and temporary. Therefore, impacts related to subsidence would be less than significant. In addition, in response to comments regarding the Draft EIR's dewatering analysis, an evaluation of dewatering conditions for the temporary excavation and construction of a below-grade parking structure was conducted by Geosyntec Consultants and is provided in Appendix FEIR-13 of this Final EIR (Dewatering Report) for informational purposes. As discussed in the Dewatering Report, the total amount of groundwater that would be dewatered during the temporary dewatering is approximately 26.4 million gallons (40,600 gallons per day [gpd]). In comparison, the maximum projected operational water demand for the Project is approximately 269,123 gpd (see Table IV.M.1-6 in Section IV.M.1, Utilities and Service Systems—Water Supply and Infrastructure, of the Draft EIR). The Dewatering Report confirms the conclusion in the Draft EIR that impacts associated with temporary dewatering activities during construction would be less than significant. Also refer to the Subsidence Technical Memorandum prepared by Geotechnologies included as Appendix D of the Dewatering Report, which confirms the Draft EIR's conclusion that subsidence impacts associated with temporary dewatering would be less than significant.

Comment No. 11-6

Although termed a “*Specific Plan*” by the proponent and the City, the TVC 2050 Specific Plan is vague. Instead of being clearly defined, Project uses are interchangeable to the point that it is unclear what exactly the proponent plans to build. The result is essentially a 20-year blank check for 1.6 million new square feet of pre-approved development, that can be up to 225 feet tall, in one of the City's densest corridors. From a legal perspective, the Project description is inadequate and results in the DEIR's failure to adequately disclose, analyze, and mitigate the potentially significant and adverse environmental impacts of the Specific Plan. The City cannot describe, discuss, and mitigate what it does not yet know. CEQA provides that an EIR be a document of accountability, full of useful information and providing full disclosure about a Project's consequences. The EIR is woefully uninformative.

If the City wishes to proceed with this Project, the TVC 2050 Specific Plan must be defined in a CEQA-compliant fashion, and an EIR that discloses, analyzes, and mitigates the potential impacts of that well-defined project must be prepared and circulated. However, in the interest of preserving its legal rights if the City chooses to certify this inadequate EIR,

the Association provides the following CEQA comments. The Association also joins in the comments of Save Beverly Fairfax, submitted to the City on August 25, 2022.

Response to Comment No. 11-6

Refer to Response to Comment Nos. 5-3 and 9-13 and Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding how Section II, Project Description, of the Draft EIR was completed in full compliance with CEQA, how all of the physical parameters of the proposed Specific Plan are fully consistent with physical parameters in Section II, Project Description, of the Draft EIR, how the environmental impacts of the Project are fully accounted for, the distinct set of studio-related uses proposed by the Project, and the limited Land Use Exchange Program proposed as part of the Project to respond to future demands of the entertainment industry. Also refer to Response to Comment Nos. 9-16 and 11-3 regarding the proposed height zones that establish a range of maximum building heights across the Project Site that are compatible with surrounding uses.

As discussed in Topical Response No. 1, the Draft EIR analyzed the Project described in Section II, Project Description, of the Draft EIR (refer to pages II-12 through II-35 and specifically Table II-2, Proposed Development Program, on page II-13). Future changes that are substantially different than the Project or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, as well as potential CEQA compliance review.

Contrary to this comment, the Draft EIR is comprehensive and was completed in full compliance with CEQA. Refer to Letter No. 9 for responses to the comments referenced in this comment.

With regard to recirculation, this comment does not provide substantial evidence to demonstrate that “significant new information” as defined by CEQA Guidelines Section 15088.5 has been presented or added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 11-7

I. The DEIR Fails to Adequately Disclose, Analyze, and Mitigate the TVC 2050 Specific Plan’s Adverse Environmental Impacts as Required by CEQA.

The California Environmental Quality Act (CEQA) serves two basic, interrelated functions: ensuring environmental protection and encouraging governmental transparency. (*Citizens of Goleta Valley v. Bd. of Supervisors* (1990) 52 Cal. 3d 553, 564.) CEQA requires full disclosure of a project’s significant environmental effects so that decision-makers and the

public are informed of these consequences before the project is approved to ensure that government officials are held accountable for these consequences. (*Laurel Heights Improvement Ass'n of San Francisco v. Regents of the University of California* (1988) 47 Cal.3d 376, 392.) The environmental impact report (EIR) process is the “heart of CEQA” and is the chief mechanism to effectuate its statutory purposes. (*In Re Bay-Delta Programmatic EIR Coordinated Proceedings* (2008) 43 Cal. 4th 1143, 1162.) In part because the DEIR fails to adequately describe the Project, the DEIR fails to adequately disclose, analyze, and mitigate the Project’s significant adverse environmental impacts.

Although an EIR need not be perfect, the City “must use its best efforts to find out and disclose all that it reasonably can.” (CEQA Guidelines § 15144.) If important information cannot be obtained, the EIR must explain why. (*Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 519–522.) That the EIR has failed to define a Project is not a sufficient reason to omit the required environmental disclosures.

Throughout the administrative process, members of the public, businesses, and citizen groups have documented their concerns about the vagueness of the Project. While the Association appreciates the City’s efforts to incorporate the goals of a broad stakeholder community, the resulting Specific Plan is unclear about what exactly can or will be built. Consequently, the Draft EIR prepared for this Specific Plan fails to adequately define a “project” as needed for CEQA review. The failure to define the Project cascades into the DEIR’s failure to provide sufficient information about the Project’s likely environmental impacts. Without adequate disclosure, the DEIR further fails to adequately analyze and mitigate the Project’s impacts. In short, the Project, as described, is not ripe for environmental review.

Response to Comment No. 11-7

The City is fully committed to carrying out the EIR process as required by CEQA, while making the best effort to disclose all Project information, analysis, and potential environmental impacts therein. As explained in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, Section II, Project Description, of the Draft EIR fully complies with CEQA’s requirements related to preparation of a project description and the Draft EIR fully discloses, analyzes, and mitigates the Project’s significant adverse environmental impacts as required by CEQA.

This comment provides no substantial evidence to demonstrate that the Draft EIR omits “the required environmental disclosures.”

Contrary to this comment, Section II, Project Description, of the Draft EIR is not vague. Rather, as explained in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Project Description is accurate, stable, and finite and

provides sufficient details to fully evaluate the environmental impacts of the Project. Also refer to Response to Comment Nos. 5-3 and 9-13 and Topical Response No. 1 regarding how all the physical parameters of the proposed Specific Plan are fully consistent with physical parameters in Section II, Project Description, of the Draft EIR. The statement in this comment that the Project is not “ripe” for environmental review is incorrect (refer to Topical Response No. 1) but is noted for the administrative record and will be forwarded to the decision-makers for review and consideration.

Comment No. 11-8

A. The City’s Enforcement of a Deadline for Public Comment That Predates the Preparation of the Specific Plan Violates the Spirit of CEQA’s Public Comment Provisions.

The EIR was prepared to analyze the TVC 2050 Specific Plan. The review of a specific plan under CEQA requires availability of that plan to the City and to the public. Using the Specific Plan as a guide, the City and members of the public review the DEIR to confirm that components of the Specific Plan that may have adverse environmental impacts are disclosed, analyzed, and, if necessary, mitigated in the concurrently available DEIR. However, the Department of City Planning has told us that the Specific Plan has not yet been drafted and is, therefore, not available for public review. Thus, in a seemingly unprecedented move, the City is requiring public review and comment regarding whether the environmental review is adequate for a Specific Plan *that is not yet available for public review*.

The City’s process turns on its head one of the basic tenets of CEQA, that of public participation. As the Court explained in *Lincoln Place Tenants Assn. v. City of Los Angeles* (2007) 155 Cal.App.4th 425, 443–444, “The fundamental goals of environmental review under CEQA are information, participation, mitigation, and accountability.” (Citations omitted.) Other courts have confirmed that environmental review derives its vitality from public participation. (See, *Ocean View Estates Homeowners Ass’n, Inc. v. Montecito Water Dist.* (2004) 116 Cal.App.4th 396, 400.) The City’s failure to provide—or to prepare—the Specific Plan prior to circulation of the DEIR for public comment “precludes ‘informed decisionmaking and informed public participation’” because the public cannot provide meaningful comment when the project has not been identified. (*Washoe Meadows Community v. Department of Parks and Recreation* (2017) 17 Cal.App.5th 277, 290 [citations omitted]; *Stopthemillenniumhollywood.com v. City of Los Angeles* (2019) 39 Cal.App.5th 1, 17–19.)

For this reason, and for the reasons detailed below, the City must release the draft Specific Plan and recirculate the DEIR for comment to enable meaningful public comment. The City’s failure to do so thus far violates CEQA.

Response to Comment No. 11-8

Refer to Response to Comment No. 5-3 and Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding the fact that a draft Specific Plan was not required to be included as part of the Draft EIR and how all of the physical aspects of the proposed Specific Plan are consistent with those set forth in Section II, Project Description, of the Draft EIR. As such, potential impacts associated with the physical aspects of the proposed Specific Plan are fully addressed in the Draft EIR and there is no substantial evidence to support the comments that “informed decisionmaking and informed public participation” has been precluded and the case law cited in this comment is not applicable to the Draft EIR. Rather, the Draft EIR is comprehensive and has been completed in full compliance with CEQA. Refer to Topical Response No. 1 for a detailed discussion of how the Project differs from the project description at issue in *Millennium*.

Also refer to Response to Comment No. 32-3 regarding how public noticing was completed in full compliance with CEQA.

This comment does not provide substantial evidence that “significant new information” as defined by CEQA Guidelines Section 15088.5 has been added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 11-9

B. Since There is Not Yet a Specific Plan, the DEIR Does Not Adequately Define the Project.

As discussed above, the DEIR attempts to review a project that does not yet exist. Adequate CEQA review requires a complete and accurate project description. It has long been established that “[a]n accurate, stable and finite project description is the Sine qua non of an informative and legally sufficient EIR.” (*County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 192–193.) To the contrary, a “curtailed or distorted project description may stultify the objectives of the reporting process” and does not allow “outsiders and public decision-makers [to] balance the proposal’s benefit against its environmental cost, consider mitigation measures, assess the advantage of terminating the proposal (i.e., the ‘no project’ alternative) and weigh other alternatives in the balance.” (*Ibid.*)

Since the Specific Plan is not yet fully formed, the City cannot ensure that the DEIR’s project description matches the Project, or that the EIR analyzes all aspects of that Project. The EIR’s “bona fide subject” must be “[t]he defined project and not some different project.” (*Concerned Citizens of Costa Mesa v. 32nd Dist. Agric. Assn.* (1986) 42 Cal.3d 929, 938.)

CEQA also prohibits a project description that fails to describe key elements of a Project. (*San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 730-35.) Providing the Specific Plan to the public at a later time is insufficient, as, “CEQA’s informational purpose ‘is not satisfied by simply stating information will be provided in the future.’” (*Vineyard Area Citizens for Responsible Growth v. City of Rancho Cordova* (2007) 40 Cal.4th at 440-41).

Response to Comment No. 11-9

Refer to Response to Comment No. 5-3 and Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding the fact that a draft Specific Plan was not required to be included as part of the Draft EIR, how Section II, Project Description, of the Draft EIR includes the physical components of the proposed Specific Plan, how Section II, Project Description, of the Draft EIR fully complies with CEQA, including CEQA’s requirement for an accurate, stable, and finite project description, and does not delay the delivery of information relevant to the CEQA analysis.

Comment No. 11-10

The DEIR attempts to rely on a vague and unstable project description that fails to clarify the type and timing of development proposed. The DEIR provides standards and guidelines it claims will be in the draft Specific Plan, but, without a Specific Plan available for review, these claims cannot be confirmed. (DEIR pp. I-9 to I-10, stating the unwritten [“primary development regulations set forth in the Specific Plan would address land use, design, historic preservation, childcare, alcohol sales, and parking, as well as associated implementation procedures.”].) Beyond the limit of total development square footage, there are few limits on the amount of each type of development allowed, or even the types of development allowed beyond “all [] uses permitted in the C2 zone unless expressly prohibited in the Specific Plan.” (DEIR pp. II-15.) Given that the Specific Plan has not yet been drafted, the Project appears to permit any allowable use in the C2 zone. The DEIR contains this exhaustive list of allowable uses:

[M]otion picture, television, and broadcast studios and related incidental uses, including, but not limited to: production activities; indoor and outdoor stages; sets and façades; digital, film, video, audio, video game, eSports, and media production; recording and broadcasting; sound labs; film editing; film video and audio processing; sets and props production; computer design; computer graphics; animation; and ancillary facilities related to those activities. The following types of related uses and facilities would also be permitted, as detailed in the Specific Plan: basecamps, communication facilities, conference facilities, modular offices and trailers, studio support facilities, parking, various ancillary commercial and retail uses to serve the on-site

employees and visitors, catering facilities, special events, audience and entertainment shows, museum exhibits and theaters, childcare and educational facilities, fitness facilities, emergency medical facilities to serve the on-site employees and visitors, fueling stations and vehicle repair related to on-site uses and activities, infrastructure, maintenance and storage facilities, mills/manufacturing, sleeping quarters for certain on-site personnel, recreational facilities, restaurants and special event areas including the sale of alcoholic beverages, security facilities, signs, storage and warehouses, helipad, ***and all other uses permitted in the C2 zone unless expressly prohibited in the Specific Plan.***

(DEIR, II-15, emphasis added.) Notably, the public cannot know which C2 uses are prohibited because there is not yet a Specific Plan. The DEIR lists possible amounts of studio and production-related development but confirms that the “ultimately constructed” mix “will depend upon market demands.” (DEIR, p. II-13.) The DEIR also expressly provides for exchanges of square footage between land uses, further blurring the lines between land use types and amounts. (DEIR, p. II-16.) There are no limits provided for production support floor area. The Project could conceivably build largely retail or all office, if later desired. Thus, despite being sold to the City and to the public as a necessary means of ensuring continued television production in Los Angeles, the Project contains no commitments to building the production space promised.

Response to Comment No. 11-10

These comments are similar to those raised in Comment Nos. 5-3, 5-6, 9-13, and 9-14. As explained in Response to Comment No. 5-3 and Topical Response No. 1, Clearly Defined Project Description and Specific Plan, a draft Specific Plan was not required to be part of the Draft or Final EIR, and the physical aspects of the proposed Specific Plan were fully accounted for in Section II, Project Description, of the Draft EIR, as demonstrated in Appendix FEIR-2, Comparison Chart of the Draft EIR and the Preliminary Draft Specific Plan, of this Final EIR. In addition, as explained in Response to Comment No. 5-6 and Topical Response No. 3, Permitted On-Site Uses, the permitted uses on-site will only include the five studio uses discussed throughout the Draft EIR (i.e., sound stage, production support, production office, general office, and retail) and associated ancillary uses, and these uses have all been addressed in the EIR. The C2 zone uses (which are currently permitted) have been removed from the list of permitted uses within Section II, Project Description, of the Draft EIR; refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR. Please note that retail would be limited to 20,000 square feet (less than 2 percent of the total permitted floor area), and production office and general office would be limited to a maximum of 700,000 square feet each, contrary to this commenter’s assertion. As discussed on pages II-10 to II-11 in Section II, Project Description, of the Draft EIR, the Project objectives include optimizing the currently

underutilized studio and maximizing studio production capabilities by providing new technologically advanced sound stages combined with an adequate and complementary mix of state-of-the-art production support facilities, production office, and general office. The Project, as described in Section II, Project Description, of the Draft EIR, includes an operationally feasible balance of studio uses to meet modern production needs.

Also refer to Response to Comment Nos. 9-13 and 9-14 regarding the clear limitations on floor area for each of the permitted uses, the requirement that production support uses cannot exceed 450,000 square feet, and how the limited land use exchanges have been fully accounted for in the impact analyses throughout the Draft EIR. As discussed therein, the proposed Specific Plan would include a regulatory framework for implementation of the Project, including, among other things, mandatory review processes by the City for implementation of the proposed Project. Future changes that are substantially different than the Project, including a proposal that involves a land use exchange, or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, as well as potential CEQA compliance review. Refer to the Preliminary Draft Specific Plan, which is publicly available on the Department of City Planning's website.

Refer to Response to Comment No. 9-24 regarding the buildout timeline.

Comment No. 11-11

Nor does the Project actually commit to renovating the sound stages allegedly at the center of the Project. The DEIR claims the four existing sound stages “would be renovated and modernized to the extent feasible, subject to industry market demand.” (DEIR, p. II-17.) The qualifications of “to the extent feasible” and “subject to industry market demand” provide no assurance that these promised renovations will ever actually occur.

Response to Comment No. 11-11

Refer to Response to Comment No. 9-15 regarding the proposed renovation of the sound stages.

Comment No. 11-12

A land use plan is provided, but, again, it is conceptual and merely “illustrates one possible development scenario that could be developed.” (DEIR pp. II-13, II-14.) The DEIR also discusses design, parking, and height standards, but it is unknown what these standards will be applied to, or whether they are actually contained in the as-yet completed Specific Plan. The DEIR also undercuts its proposed height limits (already a massive increase at

up to 225 feet), stating, “height zones do not represent the actual development footprint of Project buildings.” (DEIR, II-15, 16, 18.)

Response to Comment No. 11-12

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding how the Project Description was completed in full compliance with CEQA; Response to Comment No. 9-17 regarding design and architecture; Response to Comment No. 9-20 regarding parking; and Response to Comment No. 9-16 regarding building heights.

Comment No. 11-13

It is unclear whether the development will occur over the 32-month construction schedule proposed or the 20 years of the Development Agreement sought. (DEIR p. II-33.)

Response to Comment No. 11-13

Refer to Response to Comment No. 9-24 regarding the Project timeframe.

Comment No. 11-14

The only thing that is clear is that the Project would provide proponents with entitlements to build nearly 1.9 million square feet of development, nearly 2½ times what is currently located onsite, of a type to be determined later, at the proponent’s discretion.

Response to Comment No. 11-14

Refer to Response to Comment No. 9-14 regarding how the Draft EIR evaluated potential impacts associated with the Project and the maximum impact scenarios under the limited Land Use Exchange Program.

Comment No. 11-15

As to actual activities and what will happen when, little information is included. An EIR’s purpose is to eliminate this confusion:

The CEQA process is intended to be a careful examination, fully open to the public, of the environmental consequences of a given project, covering the entire project, from start to finish. This examination is intended to provide the fullest information reasonably available upon which the decision makers and the public they serve can rely in determining whether or not to start the project at all, not merely to decide whether to finish it. The EIR is intended to

furnish both the road map and the environmental price tag for a project, so that the decision maker and the public both know, before the journey begins, just where the journey will lead, and how much they-and the environment-will have to give up in order to take that journey.

(*NRDC v. City of Los Angeles* (2002) 103 Cal.App.4th 268, 271.) The TVC 2050 Specific Plan EIR contains no such road map. Under any definition, the DEIR fails to contain a stable or finite project description. Without a clear Project to serve as the basis of environmental analysis, the DEIR cannot possibly provide the adequate disclosure, analysis, and mitigation of the Project's likely impacts required by CEQA. In effect, the DEIR provides only a "blurred view of the project," a deficiency that required rescission of the EIR and project entitlements in another Los Angeles development in the recent decision, *Stopthemillenniumhollywood.com v. City of Los Angeles* (2019) 39 Cal.App.5th 1, 12–13 ("*Millennium*").

Response to Comment No. 11-15

This comment related to the purpose of CEQA is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 11-16

Like with the Millennium Hollywood Project, for which the Court found the EIR contained little "actual information" and no concrete development project, the TVC 2050 Specific Plan DEIR analyzes a conceptual building envelope and conceptual development possibilities (height zones, parking standards, and various aesthetic standards), but no concrete development project. (*Millennium, supra*, 39 Cal.App.5th 1, 18.) The Millennium Court characterized the design standards—standards that would conceivably be applied to some defined project in the future—as "a range of construction choices," not the required, defined project. (*Ibid.*) The Court concluded, "These concepts and development scenarios—none of which may ultimately be constructed—do not meet the requirement of a stable or finite proposed project." (*Id.* at 17–18.)

The City's approach seems to assume that this is sufficient for environmental review if proposed development is "within the envelope of impacts identified in this Draft EIR." (DEIR, II-16.) However, the Millennium Court roundly rejected the claim that, "so long as the worse-case-scenario environmental effects have been assumed, analyzed, and mitigated, and so long as no development takes place that exceeds those mitigation measures, CEQA's purpose has been fully satisfied." (*Id.* at 18.) Processing of the Project should cease until a stable and finite project description is provided, in the form of a

complete and publicly available Specific Plan, and that project description is incorporated into a recirculated DEIR.

The project description fails to provide adequate information regarding the activities allowed under the Specific Plan to allow for useful environmental review. The Project is essentially unripe. The Association understands the importance of flexibility in land use planning, but the document proposed here is a *Specific Plan*. It is not an imaginary plan. Importantly, the DEIR never discloses that the Specific Plan does not yet exist. The City must draft a Specific Plan that provides clear direction about the types of uses that will be permitted in order to provide at least a modicum of certainty in future planning. The DEIR should be revised as necessary and then recirculated for informed public comment.

Response to Comment No. 11-16

As demonstrated in Response to Comment Nos. 9-12, 9-14, 9-16, 9-20, and 9-24 and Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Project is distinguishable from the project description at issue in *Millennium*. Also refer to Response to Comment No. 5-3 and Topical Response No. 1 regarding the fact that a draft Specific Plan was not required to be included as part of the Draft or Final EIR and how Section II, Project Description, of the Draft EIR describes the physical aspects of the proposed Specific Plan that are necessary to fully evaluate the potential impacts of the Project as required by CEQA, and environmental review is not premature.

With regard to recirculation, this comment letter does not provide substantial evidence to demonstrate that “significant new information” as defined by CEQA Guidelines Section 15088.5 has been presented or added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Also refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 11-17

C. The DEIR Fails to Adequately Disclose, Analyze, and Mitigate Traffic Impacts.

The DEIR’s failure to provide a concrete and definite Project Description results in the DEIR’s inability to accurately or adequately predict, disclose, and mitigate the Project’s impacts with regard to traffic and circulation, emergency access, and general safety. The Project’s uses broadly include all uses allowed in the C2 zone, the locations of these undefined uses are unknown, and uses are interchangeable and may be transferred. While a thorough criticism of the Project’s likely impacts on traffic is premature at this point, the Association comments on what it can below.

Response to Comment No. 11-17

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding how Section II, Project Description, of the Draft EIR was completed in full compliance with CEQA and includes sufficient information and details to analyze the environmental impacts of the Project. Also, refer to Topical Response No. 3, Permitted On-Site Uses, regarding the refined list of permitted uses within the Project Site. As described therein, the Specific Plan would not allow all uses in the C2 zone (even though these uses are currently permitted); rather, the Specific Plan would limit the permitted land uses to sound stages, production support, production office, general office, and retail. This has been clarified in Section III, Revisions, Clarifications, and Corrections to the Draft EIR. In addition, as discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Project includes a limited Land Use Exchange Program that would allow for limited increases in the amount of sound stage or production support floor area in exchange for equivalent decreases in the floor area of other permitted land uses. The Draft EIR's environmental analysis accounts for the maximum potential environmental impacts associated with buildout of the Project. For each environmental topic, in addition to analyzing the impacts of the proposed development program, the Draft EIR also analyzed the maximum impact scenario (i.e., the development scenario under the Land Use Exchange Program that would generate the greatest environmental impact). The Draft EIR evaluated the Project's transportation impacts in accordance with CEQA and the TAG and concluded that impacts would be less than significant. Refer to Section IV.K, Transportation, and Appendix M.1 of the Draft EIR. Also refer to Topical Response Nos. 8, Vehicle Miles Traveled, and 12, Safety and Congestion.

Comment No. 11-18

The Association, its members, and the larger neighborhood are deeply concerned that the Project will exacerbate traffic congestion on Fairfax, Beverly, La Brea Avenue, and 3rd Street. The DEIR claims that studio expansion is expected to generate an additional 787 vehicle trips during morning rush hour and an additional 855 trips during afternoon rush hour, but the variability in future uses makes this prediction speculative, at best. The DEIR also claims that the Project will include up to 5,300 parking spaces, but it fails to commit to any actual number of spaces, arrangement of spaces, or to even commit to providing these spaces onsite. As these areas already experience significant traffic congestion, without concrete and enforceable mitigation, the Project will worsen conditions, hurting residents and local businesses when Angelenos avoid the area due to traffic congestion and endangering anyone who must rely on slower emergency response times for police, fire, and ambulance services.

Response to Comment No. 11-18

Refer to Topical Response No. 12, Safety and Congestion, regarding vehicle congestion.

As discussed in Topical Response No. 9, Neighborhood Traffic Management Plan, a project's effect on automobile delay (including neighborhood traffic) is not an environmental impact under CEQA, and, therefore, there is no significant impact under CEQA and accordingly no mitigation is required. Nonetheless, a non-CEQA analysis of potential effects on neighborhood traffic is included in Section 5C of the Transportation Assessment, included as Appendix M.1 of the Draft EIR. As discussed therein, to minimize the Project's potential effects on cut-through trips, an NTMP would be implemented.

Refer to Topical Response No. 10, Trip Generation, regarding the trips the Project would generate.

With regard to parking, refer to Topical Response No. 13, Parking, and Response to Comment No. 9-28. As discussed on page II-30 of Section II, Project Description, of the Draft EIR, the Project would provide a sitewide total of approximately 5,300 parking spaces based on the proposed parking ratios set forth in the proposed Specific Plan. Refer to Section A, Parking Supply, of Topical Response No. 13, Parking, regarding the adequacy of the parking supply to accommodate the peak parking demands of the Project and prevent spillover parking. Off-site parking is no longer proposed, as it is not needed to accommodate the Project's peak parking demand; refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR.

Refer to Section D, Emergency Access, of Topical Response No. 12, Safety and Congestion, and to Response to Comment Nos. 9-35, 26-147, and 35-134 regarding emergency response times.

Regarding the proposed uses, as discussed in Topical Response No. 3, Permitted On-Site Uses, the Specific Plan would permit five land uses—sound stage, production support, production office, general office, and retail—as well as ancillary and supportive sitewide uses. Thus, the assertion regarding variability in future uses is incorrect.

Comment No. 11-19

Outside of CEQA, the Project's traffic, traffic hazards, safety, and emergency response impacts must be analyzed for compliance with the Community Plan and applicable provisions of the Los Angeles Municipal Code.

Response to Comment No. 11-19

The Draft EIR appropriately focuses on the analysis of environmental impacts of the Project as required by CEQA. As part of the CEQA process, an analysis of the Project's consistency with the Wilshire Community Plan has been conducted, and the Project has been determined to be consistent with the Wilshire Community Plan, including the goals and policies related to traffic, safety, and emergency response. Refer to Table IV.K-2 beginning on page IV.K-58 of Section IV.K, Transportation, of the Draft EIR for an analysis of the Project's consistency with the applicable Wilshire Community Plan goals, policies and objectives regarding traffic, safety and emergency response. As shown therein, the Project does not conflict with the applicable Wilshire Community Plan goals, policies, and objectives regarding traffic, safety and emergency response. Also refer to pages IV.K-67 through IV.K-71 of Section IV.K, Transportation, of the Draft EIR for an analysis of the Project's consistency with the LAMC as it relates to transportation. As shown therein, the Project would meet applicable LAMC requirements.

Refer to Response to Comment No. 9-29 regarding traffic hazards.

Comment No. 11-20**1. Traffic Hazards are Not Analyzed.**

The DEIR fails to analyze traffic hazards. For example, the City has identified the intersection of Beverly Boulevard and Fairfax Avenue as a "high injury" intersection. The Project would worsen the Level of Service to level E, "poor" performance. Yet the DEIR fails to analyze whether the Project's diminution of Level of Service at this intersection significantly affects the level of hazard presented at this high-injury intersection. As discussed in the comments submitted by Save Beverly Fairfax, the DEIR also fails to analyze the potential traffic and safety/hazard impacts of queuing on surrounding streets while increased numbers of visitors to the expanded site wait for safety check point verification.

Response to Comment No. 11-20

Refer to Response to Comment No. 9-29 regarding the analysis of traffic hazards, the High Injury Network, LOS, and the adequacy of the queuing capacity at Project driveways.

Comment No. 11-21**2. Assumptions Made in the DEIR's Vehicle Miles Traveled Analysis Lack Support.**

The DEIR's traffic section and conclusions about the Projects impacts on traffic are based on an analysis of the Project's Vehicle Miles Traveled (VMT). Unfortunately, as discussed further in the comments submitted by Save Beverly Fairfax, the VMT analysis makes unsubstantiated assumptions about trip lengths, trip distribution, and VMT per employee. These assumptions must be substantiated, or the analysis must be repeated with supportable numbers, and the traffic analysis recirculated.

Response to Comment No. 11-21

Refer to Response to Comment No. 9-30 relative to the assumptions in the VMT analysis and trip lengths, Response to Comment No. 9-31 relative to trip distribution, and Response to Comment No. 9-32 relative to VMT per employee.

Also refer to Topical Response No. 8, Vehicle Miles Traveled, for a detailed discussion of the appropriateness of using the VMT Calculator and the trip length assumptions built into that tool (note: trip distribution is captured in the trip length assumptions), which were similarly used to develop thresholds of significance in compliance with the OPR Technical Advisory. The resultant work VMT per employee was calculated accurately and consistent with the methodology recommended in the OPR Technical Advisory and CEQA.

Comment No. 11-22**3. Analysis of Cut-Through Traffic Impacts is Improperly Deferred.**

The Association also joins Save Beverly Fairfax's concern about the DEIR's deferral of analysis of cut-through impacts. Although the DEIR seems to assume that the degradation of Project-area intersections to Levels of Service E and F will prompt motorists to take less-congested routes through the neighborhood, the DEIR never discloses this analysis to the public or to decisionmakers. The Association is particularly concerned about impacts to Hayworth, Edinburgh, and Laurel. That the Project will worsen traffic to the point that neighborhood streets will require mitigation is something that must be disclosed and discussed publicly before the Project may be approved. This goes to the safety of the neighborhood and its residents and to the general livability. It violates CEQA to assume later mitigation without first disclosing and analyzing the potential impact.

Response to Comment No. 11-22

Refer to Topical Response No. 9, Neighborhood Traffic Management Plan, regarding the non-CEQA analysis of cut-through trips in the Transportation Assessment (Appendix M.1 of the Draft EIR), the Project's NTMP, the timing and preparation of the NTMP, the boundaries of the NTMP areas, and why the preparation of an NTMP does not represent deferred mitigation and no mitigation is required. As stated therein, a project's effect on automobile delay, including cut-through trips, is not an impact under CEQA, and, therefore, there are no significant impacts related to automobile delay that require mitigation under CEQA.

This comment incorrectly states that the Draft EIR does not disclose the potential impacts of cut-through traffic on local streets. The potential cut-through effects were evaluated in the Transportation Assessment (included in Appendix M.1 of the Draft EIR) in Section 5C as part of the non-CEQA analysis.

Regarding LOS and vehicle delay, refer to Response to Comment No. 9-29 and Topical Response No. 12, Safety and Congestion.

Hayworth, Laurel, and Edinburgh were included in the analysis of cut-through effects and the results are included in Table 22 on page 178 of the Transportation Assessment. Additionally, the three streets mentioned in the comment are included in the neighborhood area to the west of the Project Site which would be addressed as part of the NTMP. See Figure 26 on page 176 of the Transportation Assessment for the boundaries of the NTMP areas to be studied.

Comment No. 11-23**4. Haul and Construction Traffic Impacts are Not Disclosed, Analyzed, or Mitigated.**

The project requires export of 772,000 cubic yards of material (DEIR p. II-1) but the DEIR fails to disclose the number of truck trips that will be required for and associated with this level of movement. Based on the average size of trucks used for this purpose (10- to 13-ton capacity), the dirt export will require 60,000 to 100,000 trips by heavy construction vehicles. This level of construction traffic would need to proceed up Venice and Fairfax. Based on the location given in the DEIR, construction vehicles would be staged in and around Loyola High School, the Normandie Recreation Center, and St. Thomas the Apostle School on and near Venice Boulevard and near Kaiser Permanente Hospital. (DEIR p. II-35 [“In addition, the Project includes two potential off-site truck staging areas located within the City on the north side of Venice Boulevard, west of Guthrie Avenue and on the north side of Venice Boulevard, east of Normandie Avenue.”].)

The human health impacts, especially to school children, of construction vehicle traffic and staging must be analyzed, but were not. Diesel particulate matter is a known human carcinogen, as “[d]iesel exhaust also contains more than 40 cancer-causing substances.” (See, California Air Resources Board, Summary: Diesel Particulate Matter Health Impacts, <https://ww2.arb.ca.gov/resources/summary-diesel-particulate-matter-health-impacts>.) In *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 518 (“*Friant Ranch*”), the California Supreme Court agreed with the Court of Appeal that an EIR for a development “was inadequate under CEQA because its analysis failed to correlate the increase in emissions that the Project would generate to the adverse impacts on human health.” The Court continued, “a sufficient discussion of significant impacts requires not merely a determination of whether an impact is significant, but some effort to explain the nature and magnitude of the impact.” (*Id.* at 519.) This is absent here. The DEIR utterly fails to perform a *Friant Ranch*-type analysis correlating project activities with potential human health impacts for the area located near the Project site, or for the school-adjacent staging area several miles southeast. In fact, the EIR fails to provide **any** analysis of human health impacts. The City must perform the required analysis, revise the DEIR, and recirculate it for public review and comment.

Response to Comment No. 11-23

Contrary to this comment, the Draft EIR provides the number of truck trips that will be required for and associated with the export of 772,000 cubic yards of export. As shown on pdf page 32 of Appendix B, Air Quality and Greenhouse Gas Emissions, of the Draft EIR, there would be approximately 640 daily truck trips over 185 working days during the excavation/foundation construction phase. Refer to Topical Response No. 14, Construction Vehicle Impacts. All haul truck staging would occur on-site per LADOT’s approval letter dated June 30, 2022 (see the LADOT Haul Route Approval Letter included in Appendix M.5 of the Draft EIR). The two off-site staging locations described and evaluated in the Draft EIR are no longer proposed. As such, an HRA is not warranted for sensitive receptors near the two removed off-site staging areas. The removal of the off-site haul truck staging locations is included in Section III, Revisions, Clarifications, and Corrections to the Draft EIR.

Refer to Response to Comment No. 11-26 regarding *Sierra Club v. County of Fresno* (Friant Ranch).

Comment No. 11-24

D. The DEIR Fails to Provide Sufficient Information to Assess the Project’s Impacts on Parking.

The Project area already experiences heavy traffic, a substantial amount of which is caused by people looking for scarce parking. Heavy traffic reduces emergency response

times and diminishes neighborhood safety, which requires analysis under CEQA. There is not enough parking in the area to accommodate existing uses. The existing parking shortfall will likely increase as new developments take advantage of Metro D-line subway proximity and reduced parking requirements for transit-oriented development near the Wilshire/Fairfax Station. As it is, CBS has been known to rent parking spaces from the Grove.

Despite the fact that parking is a known, hot-button issue in the community, the DEIR fails to provide enough information for the community—and the decisionmakers—to evaluate whether Project parking will be sufficient. This is curious, given that providing adequate parking is an explicit Project Objective. (DEIR p. II-11.) The DEIR states that it would provide approximately 5,300 parking spaces, but it never actually commits to this number. (DEIR p. II-30.) The DEIR does not explain where the spaces would be, noting spaces “**may** be provided in a combination of above-ground structures, subterranean structures, and/or surface spaces and may be designed to accommodate semi-automated or fully automated parking operations.” (*Ibid.*) Nor does the DEIR even commit to providing the spaces at any particular time, as “parking may be provided on-site incrementally to meet the needs of individual buildings and uses the spaces would serve, as appropriate and feasible.” (*Ibid.*) Finally, the DEIR does not even commit to providing the parking spaces **onsite**. Instead, “parking may be located anywhere within the Project Site **or off-site** upon the submittal of an off-site parking agreement or covenant satisfactory to the Director of the Department of City Planning. Furthermore, temporary off-site parking due to displacement resulting from production filming and related activities may be provided, with shuttle service to the Project Site as needed.” (*Ibid.*)

Just as the DEIR fails to describe the uses planned for the site, it fails to explain how it will ensure that parking will be adequate. Members of the public and the City’s decisionmakers are expected to trust that the proponent will provide enough parking, that the parking will be useable and effective, and that the proponent will not decide to rely on offsite parking and shuttle services later. The DEIR also apparently assumes that if the Project provides shuttles to the subway, people will decide not to drive themselves. But 72% of Los Angeles-area commuters drive to work alone, regardless of the availability of transit. (See, <https://centerforjobs.org/ca/special-reports/california-commuters-continue-to-choose-single-occupant-vehicles>.) If the proponent chooses to rely on nearby offsite parking, as the Specific Plan seems to allow, the Project will actually **reduce** parking in the neighborhood and worsen the existing parking deficit and related traffic. The DEIR does not disclose or discuss this possibility, let alone provide mitigation.

That the Specific Plan will allegedly set forth a process for implementing a parking plan is no panacea, as the DEIR contains no details about this plan, what it will achieve, or how it will achieve those undisclosed goals. (DEIR p. II-30.) Even if this parking plan could

substitute for adequate disclosure and analysis, it would amount to impermissible deferred mitigation under CEQA.

Failure to provide sufficient parking will affect not only traffic and emergency response times but also land use if the Project does not comply with City of Los Angeles codes governing parking. The DEIR must be revised and recirculated to confirm that it will comply with all applicable regulations.

Response to Comment No. 11-24

Refer to Topical Response No. 13, Parking, for a discussion of the parking proposed for the Project which would be fully accommodated on-site, the adequacy of the proposed on-site parking supply, and that the Project no longer proposes any off-site parking. This has been clarified in Section III, Revisions, Clarifications, and Corrections to the Draft EIR. Nonetheless, the adequacy of a new development's parking supply is not a CEQA consideration. (Pub. Res. Code § 21099, subd. (b)(3) ["the adequacy of parking for a project shall not support a finding of significance pursuant to this section."].) Thus, the comments that the Draft EIR provides insufficient parking information and defers mitigation, and that the Project would reduce parking supply in the neighborhoods and worsen the existing parking deficit, are incorrect and do not raise valid CEQA concerns. There are no spaces at The Grove parking structure available to existing TVC employees. The Project would include sufficient parking to include the audience parking demand on site.

As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the proposed Specific Plan would include a regulatory framework for implementation of the Project, including, among other things, mandatory review processes by the City for implementation of the proposed Project. Future changes that are substantially different than the Project or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, as well as potential CEQA compliance review.

Refer to Topical Response No. 3, Permitted On-Site Uses, and Response to Comment No. 26-122 regarding the five permitted uses that were disclosed and analyzed in the Draft EIR.

Refer to Section D, Emergency Access, of Topical Response No. 12, Safety and Congestion, and Response to Comment Nos. 9-35, 26-147, and 35-134 regarding emergency response times and how the Project would provide adequate emergency access.

Refer to pages IV.K-67 to IV.K-71 of Section IV.K, Transportation, of the Draft EIR for an analysis of the Project's consistency with the LAMC as it relates to transportation. As discussed therein, the Project would meet the applicable LAMC regulations.

The Project's transportation impacts were comprehensively analyzed in Section IV.K, Transportation, of the Draft EIR in accordance with CEQA and were determined to be less than significant during both construction and operation of the Project. This comment does not provide substantial evidence that "significant new information" as defined by CEQA Guidelines Section 15088.5 has been added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Also refer to Response to Comment No. 9-4 regarding recirculation.

The statement at the end of the first paragraph in the comment may have been true at some time over the previous decades, but the current operation of Television City does not rent or lease parking spaces from The Grove or from The Original Farmers Market.

The third paragraph contains the statement that "72% of Los Angeles-area commuters drive to work alone, regardless of the availability of transit." While that statistic may be true on a regional basis, it is certainly not true for those employment areas in Los Angeles with convenient connections to rail transit. Downtown Los Angeles, for example, has fewer than 50 percent single-occupant vehicles commuting to work according to U.S. Census data from the American Community Survey (summarized at <https://map.mynighborhooddata.org/>). The Draft EIR conservatively assumes that only 15 percent of the employees to the Project Site will use transit, bike and walk modes to get to the Project Site. The provision of direct shuttles to the Metro D (Purple) Line Wilshire/Fairfax Station currently under construction could put the Project in a position to exceed that transit estimate.

Comment No. 11-25

E. The DEIR Fails to Analyze and Mitigate Impacts to Neighboring Properties Caused by Dewatering Required for Construction.

The DEIR further fails to disclose, analyze, and mitigate the impacts of the Project's massive excavations. "Construction would require an estimated 772,000 cubic yards of cut, potentially 50,000 cubic yards of imported fill and up to 772,000 cubic yards of export." (DEIR p. II-1.) The DEIR provides, "Project excavations for below-grade parking would extend to a maximum depth of approximately 45 feet. As discussed in the Geotechnical Investigation, the historic high groundwater level on the Project Site is approximately eight feet bgs [below ground surface], which was conservatively assumed for analytical purposes." Thus, the Project will excavate 37 feet below the historic water level. Although the DEIR claims the opposite, excavation for developable subterranean space will require

large amounts of dewatering, amounts of dewatering sufficient to lower the water table beyond the borders of the Project site. (DEIR pp. I-19, IV.D-19, IV.D-24)

It is well established that the drying of previously wet soils can lead to the destabilization of buildings constructed on those soils. (See, e.g., <https://ctexaminer.com/2022/07/21/dewatering-undermining-the-lofts-apartments-has-a-long-history-in-stamford/>, <https://allamericanenviro.com/process-dewatering-construction-sites/>.) A Miami condominium project was recently halted when dewatering caused soil to sink at the property next door. (<https://www.local10.com/news/local/2021/11/17/city-plans-to-temporarily-pause-construction-of-miamis-deepest-underground-parking-garage/>.) Several experts also believe that the Surfside condominium tower collapse was caused, in part, by dewatering required to construct the neighboring condominium building. (<https://www.bizjournals.com/southflorida/news/2022/03/08/eighty-seven-park-stantec-sued-due-to-surfside.html> [“The complaint also alleged that the process of dewatering, removing groundwater and stormwater, during construction at Eighty Seven Park impacted the water table beneath Champlain Towers South, damaging its foundation.”])

However, since the DEIR assumes that only minimal and temporary dewatering will be required, the DEIR contains neither analysis nor mitigation, or even monitoring, of the potential impacts of years of dewatering. The DEIR fails to disclose, analyze, and mitigate these very real and concerning offsite geotechnical impacts, in violation of CEQA. The DEIR must be revised and recirculated to protect the safety of those working and residing near the Project site.

Response to Comment No. 11-25

As discussed in Response to Comment No. 3-7, the Project would require temporary construction dewatering and not permanent dewatering. Refer to Response to Comment No. 11-5 regarding the Draft EIR’s comprehensive analysis of potential dewatering impacts and the Dewatering Report, which confirms the Draft EIR’s conclusion that impacts associated with dewatering would be less than significant.

Due to the depth of excavation below the water table, and as described in the Draft EIR, the Project would include excavation up to 45 feet below grade, and temporary dewatering during construction will be required. There are many temporary dewatering methodologies available, each of which is suited toward the individual capacities and experiences of the respective specialty contractors. Prior to construction commencement, a suitable specialty contractor is selected to perform a final evaluation of dewatering conditions. This study is far more detailed than the dewatering evaluation conducted for CEQA purposes and allows the selected specialty contractor to prepare a detailed dewatering method specific to the conditions of a particular building site. The specific method of dewatering is chosen after a project is approved during the regulatory building

permit process, considering the following variables, among others, depth of intrusion that is required for each building foundation, the hydraulic properties of the soils in which the excavations occur, the potential to mobilize any existing groundwater contaminants, the potential for ground subsidence and/or liquefaction to occur, proximity to any existing production wells, and the volume of water to be dewatered on a daily basis. After evaluating each of these factors individually and collectively, a dewatering strategy will be developed and implemented in a manner that will minimize any impacts to neighboring properties (i.e., settlement) and regional water resource needs. All dewatering methods will be designed and submitted to the Local jurisdiction, which includes the Los Angeles Department of Building and Safety (LADBS) Grading Division, LARWQCB and/or LASAN for review and approval, and will be performed, inspected, and monitored in compliance with all applicable regulatory requirements. Accordingly, temporary construction dewatering will be performed in a manner that will ensure less-than-significant impacts to neighboring properties and regional water resource needs. Refer to the Dewatering Report included as Appendix FEIR-13 of this Final EIR, which was prepared in response to comments for informational purposes and confirms the conclusion in the Draft EIR that impacts related to construction dewatering would be less than significant. The analysis also confirms that impacts related to subsidence from dewatering would be less than significant and would not damage neighboring properties; refer to Appendix D of the Dewatering Report.

Figures 8A and 8B of the Dewatering Report included in Appendix FEIR-13 of this Final EIR show the estimated dimensions of the cone of depression of lowered groundwater levels during the dewatering program for the Area 2 excavation. At the end of the simulated 21-month dewatering period, the analysis estimated drawdown¹⁰⁶ of approximately 10 feet, extending up to approximately 125 feet away from the Area 2 excavation perimeter and approximately 4 feet of drawdown at a distance of up to approximately 300 feet from the Area 2 excavation perimeter. As discussed in the Dewatering Report and for context, groundwater levels fluctuate naturally, and up to 6.5 feet of groundwater level fluctuation has been historically reported in the area. Also, the Dewatering Report analyzed the drawdown estimates and concludes the drawdown will be less than significant with respect to off-site soil stability.

As the dewatering will be limited to temporary dewatering during construction, and the proposed construction will eliminate the need for permanent dewatering, there will be no long-term impact on the water table in the vicinity of the Project due to dewatering. The

¹⁰⁶ In hydrologic terms, drawdown refers to the lowering of the surface elevation of a body of water, the water surface of a well, the water table, or the piezometric surface adjacent to the well, resulting from the withdrawal of water therefrom. Source: National Oceanic and Atmospheric Administration, National Weather Service Glossary, <https://w1.weather.gov/glossary/index.php?word=drawdown>, accessed November 7, 2023.

Project Site is situated within the Hollywood Subbasin and is designated for the following beneficial uses by the California Department of Water Resources and Los Angeles Regional Water Quality Control Board:¹⁰⁷ municipal, industrial, process, and agricultural. According to the Los Angeles Department of Water and Power's (LADWP) 2020 Urban Water Management Plan (UWMP), the sub-basin is unadjudicated and is a low-priority basin not requiring a groundwater sustainability plan. The subbasin is reported to have a storage capacity of 200,000 acre-feet.¹⁰⁸ For the Area 2 excavation area, approximately 7.5 million gallons (23 acre-feet) of groundwater would be removed over the estimated 21-month temporary dewatering period, which is less than 0.05 percent of the basin capacity. The overall dewatering estimate of approximately 81 acre-feet is also less than 0.05 percent of the basin capacity. Following review of the State of California Groundwater Ambient Monitoring and Assessment Program (GAMA) groundwater well database, there are currently no supply (i.e., pumping) wells within 1 mile of the Project Site and thus the dewatering will not interfere with other active pumping.¹⁰⁹

This comment does not provide substantial evidence that “significant new information” as defined by CEQA Guidelines Section 15088.5 has been added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Refer to Response to Comment No. 9-4 for a detailed discussion regarding recirculation.

Comment No. 11-26

F. The DEIR Failed to Analyze Risks to Human Health, as Required by the Supreme Court in the *Friant Ranch* Decision.

The DEIR must also be revised and recirculated after the City completes a Friant Ranch-type analysis that connects identified Project emissions levels with human health impacts. This type of analysis is required by Supreme Court precedent, has been done in the past, and can be done here.

The most important analysis would study the impact of the Project's NOx emissions on ozone formation in the South Coast Air Basin, and the resulting cumulative impact of these air emissions on human health. In *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, at 519-522 (“*Friant Ranch*”), the Supreme Court held that CEQA requires such an analysis

¹⁰⁷ LARWQCB, Water Quality Control Plan, Los Angeles Region, 1994.

¹⁰⁸ DWR, California's Groundwater Bulletin 118, Coastal Plain of Los Angeles Groundwater Basin, Hollywood Subbasin 4-11.02, 2003, updated 2004.

¹⁰⁹ California Water Boards, GAMA, Groundwater Information System, <https://gamagroundwater.waterboards.ca.gov/gama/gamamap/public/>, accessed October 10, 2023.

correlating increased project air emissions to the probable resulting human health effects. Specifically, the Court determined:

The EIR's discussion of health impacts of the named pollutants provides only a general description of symptoms that are associated with exposure to the ozone, particulate matter (PM), carbon monoxide (CO), and nitrogen dioxide (NO_x), and the discussion of health impacts regarding each type of pollutant is at most a few sentences of general information. The disclosures of the health effects related to PM, CO, and sulfur dioxide fail to indicate the concentrations at which such pollutants would trigger the identified symptoms. As in Bakersfield, "[a]fter reading the EIRs, the public would have no idea of the health consequences that result when more pollutants are added to a nonattainment basin." (Bakersfield, supra, 124 Cal.App.4th at p. 1220, 22 Cal.Rptr.3d 203.) And as mentioned above, a sufficient discussion of significant impacts requires not merely a determination of whether an impact is significant, but some effort to explain the nature and magnitude of the impact. (See Cleveland National Forest, supra, 3 Cal.5th at pp. 514–515, 220 Cal.Rptr.3d 294, 397 P.3d 989.)

(*Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 519.)

No such analysis appears in the DEIR. A number of public agencies have performed a Friant Ranch-type analysis, demonstrating both that it is technically feasible and that it can produce useful information. A prime example of this application is the Sacramento Metropolitan Air Quality Management District (SMAQMD), which, in 2020, produced Guidance to Address The *Friant Ranch* Ruling For CEQA Projects in The Sac Metro Air District (SMAQMD Guidance), available at <http://www.airquality.org/LandUseTransportation/Documents/SMAQMDFriantRanchFinalOct2020.pdf>; last visited 3/23/21. The SMAQMD Guidance states that, inter alia, it:

Provides insight on the health effects that may result from a project emitting at the maximum thresholds of significance (TOS) levels in the Five-Air-District Region for oxides of nitrogen (NO_x), volatile organic compounds (VOCs), and PM, in addition to levels of CO and oxides of sulfur (SO_x) calculated proportional to NO_x (as described in Section 4.1). This information can be used in environmental documents to provide a conservative estimate of the health effects of criteria pollutant emissions at the significance thresholds or below.

(SMAQMD Guidance, p. 2.)

SMAQMD performed photochemical grid modeling, looking at over 40 locations in its jurisdiction where new projects could be sited (based on General Plan classification and zoning, among other factors), estimated generic emissions from such new projects, and then calculated the amount by which ambient air concentrations of pollutants would change when those emissions were added to the mix.

The District then was able to run a health impacts model using those ambient concentrations predictions as inputs (SMAQMD used the Benefits Mapping and Analysis Program [BenMAP] used by U.S. EPA [SMAQMD Guidance, pp. 4–5]), enabling it to predict what health hazards could result, e.g., predicting rates of increases in asthma attacks based on increased ozone concentrations when a new project's NO_x or VOC emissions were added to the District's inventory, or increased incidences of myocardial infarctions when PM_{2.5} emissions rose. (SMAQMD Guidance, pp. 6–7.) Generic modeling was set up for new sources emitting at SMAQMD's significance threshold levels, and at higher levels. SMAQMD has made this modeling system available to the public, enabling a developer to choose a relevant location, input the emissions data for its own proposed project, and run the model, thereby getting reasonable estimates of health impacts for its particular project. (SMAQMD Guidance, Appendix F).

The City and the Project proponent could also arrange to run a comparable air quality and health effects modeling effort as California State University at Dominguez Hills (CSUDH) did for the EIR it performed on its recent Long Range Development Plan. We note that CSUDH is also located in Los Angeles County, like the Project. There is no reason CSUDH could do the appropriate analysis, but the present Project proponent cannot. The CSUDH EIR described its modeling in this way:

An analysis of the potential health effects of the project's criteria pollutant emissions was prepared by Ramboll US Corporation. (See EIR Appendix B.4, which contains detailed information regarding the methodology, input parameters, limitations and uncertainties associated with this analysis.) The analysis focuses on health effects attributable to ozone and particulate matter, as those are the criteria pollutants considered by the USEPA in its Benefits Mapping and Analysis Program (BenMAP), the analytical model it relies on and publicly distributes for use in estimating the health effects of air pollution. A photochemical grid model (CAMx) was used to estimate the incremental increase in ambient air quality concentrations as a result of project-related emissions.

(California State University Dominguez Hills Campus Master Plan EIR, p. 3.2-2, available at <https://www.csudh.edu/Assets/csudh-sites/fpcm/docs/campus-master-plan/2019-09-11-FEIR.pdf>; last visited 3/23/21.)

Comparison to the CSUDH EIR is appropriate because of its geographic proximity in the South Coast Air Basin and recent preparation. In preparing the Final EIR for its campus master plan, CSUDH was prompted by a comment letter that complained of the lack of an analysis responding to the *Friant Ranch* opinion to hire an additional air quality consultant (Ramboll) to perform computerized modeling of the master plan's expected air pollutant emissions over the entire South Coast Air Basin, and to identify health impacts that might be caused by these emissions.

To create a worst-case analysis, the VOC emissions from the year of project construction with the highest VOC use (principally from architectural coatings) were added to the full build-out operational emissions of all other criteria pollutants from both stationary and mobile (vehicle) sources. (CSUDH FEIR, Appendix B4, p. 4.) Annual emissions were distributed in a grid model used by the SCAQMD to represent the South Coast Air Basin, appropriately allocated over time, and the model estimated the change in concentrations of ozone and PM_{2.5} that would result from the addition of the master plan's emissions. (*Id.*) Those results were then evaluated using BenMAP, a health-effects prediction model used by USEPA in its evaluation of the health impacts of potential air pollution control strategies. The Final EIR reported the results of the modeling for ozone and PM_{2.5}, because those are the pollutants for which USEPA generally uses BenMAP, and because those pollutants have the most serious health impacts. (*Id.*, p. 2.)¹

The CSUDH's Final EIR reported the results of the analysis at FEIR, p. RTC-31:

Based on the Ramboll analysis, PM_{2.5}-related health effects attributed to the project include asthma-related emergency room visits (4.38 incidences per year), asthma-related hospital admissions (0.38 incidences per year), cardiovascular-related hospital admissions (excepting myocardial infarctions) (1.05 incidences per year), respiratory-related hospital admissions (2.44 incidences per year), mortality (10.31 incidences per year), and nonacute myocardial infarctions (less than 0.53 incidences per year). Ozone-related health effects attributed to the project include respiratory-related hospital admissions (0.67 incidences per year), mortality (0.28 incidences per year), and asthma-related emergency room visits (lower than 3.38 incidences per year.)

The CSUDH FEIR characterized these results as conservatively estimated, but acknowledged "regulatory agencies, including the USEPA, have judged that, even so, the results supply sufficient information to the public to allow them to understand the health effects of increases or decreases in air pollution." (*Id.*)

As described above, multiple examples demonstrate that a *Friant Ranch* analysis can be done. It is both appropriate and necessary to do such an analysis here.

¹ This process is very similar to the use of CAMx and BenMAP by SMAQMD. See also 2020 Mineta San Jose International Airport Master Plan Amendment Integrated EIR, Supplemental Air Quality Analysis, at Introduction, p. 2, available at <https://www.sanjoseca.gov/Home/ShowDocument?id=61650>; last visited 3/23/21.

Response to Comment No. 11-26

This comment cites two examples of a quantitative assessment of regional pollutant emissions and human health. The first example refers to guidance prepared by SMAQMD for use over a five-air-district region at 40 generic development sites, whereby a project could extrapolate results from this basin-wide modeling exercise using site specific emissions. The usefulness of this approach on a project-specific basis would likely not provide reliable information regarding a measurable increase in concentrations sufficient to accurately quantify potential health impacts. Any modeled increase in concentrations would not be useful for meaningful analysis, as the increase would be so comparatively small that it would be well within the error margins of such models. Regardless, the SMAQMD guidance is specific to the region analyzed (different meteorological data and background pollutant emissions and concentrations), and SCAQMD has not taken on such a program for individual projects. Notably, the SCAQMD in its comment letter did not make any such comment.

The second example cited in this comment is the California State University Dominguez Hills Campus Master Plan EIR in which a study was performed by a private consultant for a specific project and not at the direction or specific guidance from SCAQMD. That consultant used BenMAP, which is a model used for assessing impacts over large areas and populations and is not intended to be used for individual projects, as it would not provide meaningful or reliable results at the smaller scale.¹¹⁰ Again, that consultant then used CAMx which is designed to model emissions on a regional, statewide, and national scale and is, therefore, unsuitable for a project-level analysis. In addition, these models require inputs, such as regional sources of pollutants and global meteorological data, which are generally not accessible for individual project level analyses. In addition to the unsuitability of regional models in providing reliable results for local-level plans or individual projects, other general limitations of the models include limitations on the ability of certain tools to model concentrations or the dispersion of pollutants for all types of sources, addressing a partial and incomplete range of pollutants and secondary pollutants, and limitations on being able to correlate identified concentrations to related health effects.

Pages IV.A-80 to IV.A-82 in Section IV.A, Air Quality, of the Draft EIR provide a discussion of the connection between significant regional pollutant emissions and human

¹¹⁰ City of Los Angeles, Department of City Planning, Air Quality and Health Effects, October 2019, p. 13.

health effects. As discussed therein, the City has provided guidance documenting the public health consequences resulting from exposure to pollutants. The guidance document also explains that direct correlation of an individual project's emissions and health effects is not feasible, as no expert agency has approved a quantitative method to identify health effects for the scale of projects typically analyzed in City EIRs.¹¹¹

In the case of the Project, the regional construction emissions would exceed SCAQMD's recommended daily significance thresholds for NO_x.¹¹² However, this does not mean that a concentration of O₃ would be created at or near the Project Site on a particular day or month of the year or that any specific human health impacts may occur from such an exceedance. As discussed in the City's guidance document, meteorology, the presence of sunlight, and other complex chemical factors all combine to determine the ultimate concentrations and locations of O₃. In addition, it would not be feasible to model with any degree of reliability or certainty the impact on attainment of the ambient air quality standards that these Project emissions which exceed regional thresholds may have. The currently available tools are equipped to model the impact of all emission sources in an air basin in attainment but lack the resolution to reliably model O₃ concentrations from smaller sources of O₃ precursors, such as individual projects. Therefore, O₃ modeling for individual projects would not be feasible or provide meaningful data to assess health impacts.

From a scientific standpoint, it takes a large amount of additional precursor emissions to cause a modeled increase in ambient O₃ levels over an entire region. SCAQMD's 2012 AQMP showed that reducing baseline year 2008 NO_x by 432 tons per day and reducing VOC by 187 tons per day would only reduce O₃ levels at SCAQMD's monitoring site with the highest levels by only 9 parts per billion (ppb). This is a relatively immaterial change in local O₃ concentrations for a large decrease in regional O₃ precursors (NO_x and VOCs).¹¹³ SCAQMD also conducted pollutant modeling for proposed Rule 1315 in which the CEQA analysis accounted for essentially all of the increases in emissions due to new or modified sources in the SCAQMD between 2010 and 2030, or approximately 6,620 pounds per day of NO_x and 89,947 pounds per day of VOC. The results of the analysis showed that this increase of regional pollutant emissions would contribute to a small increase in the Air Basin-wide O₃ concentrations in 2030 by 2.6 ppb and less than one ppb of NO₂. Again, this is a relatively immaterial increase in O₃ concentrations despite the expected very large increase in regional O₃ precursors.

¹¹¹ City of Los Angeles, Department of City Planning, Air Quality and Health Effects, October 2019.

¹¹² Under a long-term buildout scenario, concurrent construction and operational emissions would exceed SCAQMD's recommended daily significance thresholds for NO_x and VOC.

¹¹³ SCAQMD, Final 2012 AQMP, February 2013, Appendix V: Modelling & Attainment Demonstrations, pp. v-4-2, v-7-4, v-7-24.

Based on information provided in the City's guidance document, the Project would fall within the scope of a "typical City project" since the estimated maximum daily construction regional NO_x emissions of 105 pounds per day over SCAQMD's significance threshold represent approximately 1.5 percent of the emissions analyzed by SCAQMD related to Rule 1315.¹¹⁴ Running the regional-scale photochemical grid model used for predicting O₃ attainment with the emissions from the Project (which equates to approximately 0.4 of 1 percent of the VOC and NO_x in the air basin) would not yield reliable information regarding a measurable increase in O₃ concentrations sufficient to accurately quantify the Project's O₃-related health impacts. Any modeled increase in O₃ concentrations would not be useful for meaningful analysis as the increase would be so comparatively small that it would be well within the error margins of such models. Based on this information, a general description of the adverse health impacts resulting from the pollutants at issue is all that can be feasibly provided at this time. Please see Appendix B of the City's guidance document for a discussion of general adverse health impacts resulting from NO_x.

In response to comments on the Draft EIR, a quantitative HRA is included as Appendix FEIR-10 of this Final EIR, which confirms the Draft EIR's conclusion that health risks from the Project would be below the applicable significance thresholds and impacts would be less than significant.

Comment No. 11-27

G. Project Design Features Must Be Incorporated Into the Mitigation Monitoring and Reporting Plan.

The DEIR contains project design features (PDFs) that are used to justify the DEIR's claims that the Project will not have significant and adverse environmental impacts. While the DEIR claims that these PDFs are part of the Project itself, "A mitigation measure is not part of the project." (*Cleveland National Forest Foundation v. San Diego Assn. of Governments* (2017) 17 Cal.App.5th 413, 433.) An EIR cannot incorporate "the proposed mitigation measures into its description of the project and then conclude [] that any potential impacts from the project will be less than significant." (*Lotus*, 223 Cal.App.4th 645, 655-657.)

Instead, these PDFs appear to be no more than mitigation measures by another name. Mitigation measures must be "fully enforceable through permit conditions, agreements, or

¹¹⁴ Under a long-term buildout scenario, concurrent construction (mitigated) and operational regional emissions (approximately 63 pounds of NO_x and approximately 16 pounds of VOC per day) over SCAQMD's significance threshold would represent approximately 0.9 percent of NO_x emissions and approximately 0.02 percent of VOC emissions analyzed by SCAQMD related to Rule 1315.

other measures.” (Pub. Resources Code § 21081.6(b).) “The purpose of these requirements is to ensure that feasible mitigation measures will actually be implemented as a condition of development, and not merely adopted and then neglected or disregarded.” (*Federation of Hillside & Canyon v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1261; *Katzeff v. California Dept. of Forestry and Fire Protection* (2010) 181 Cal.App.4th 601, 612; *Lincoln Place Tenants Assn v. City of Los Angeles* (2005) 130 Cal.App.4th 1491.)

In addition, the DEIR’s reliance on the PDFs as part of the project appears to be an attempt to skirt CEQA’s requirement to disclose a Project’s potential impacts before mitigating them. Agencies cannot use project design features to avoid publicly evaluating alternatives and mitigation measures during the CEQA process. Doing so “precludes both identification of potential environmental consequences arising from the project and also thoughtful analysis of the sufficiency of measures to mitigate those consequences.” (*Lotus, supra*, 223 Cal.App. 4th 645.) This analytical shortcut is “not merely a harmless procedural failing...[it] subverts the purposes of CEQA by omitting material necessary to informed decisionmaking and informed public participation.” (*Id.* at 658.)

The DEIR must incorporate these PDFs, as proper mitigation measures, into the Mitigation Monitoring and Reporting Plan (MMRP). The DEIR must then analyze the impacts of both including, and of not including, these measures in the Project. (*San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645 [EIR must evaluate efficacy of proposed mitigation measures]; CEQA Guidelines § 15126.4 [EIR must evaluate any significant impacts caused by proposed mitigation measures].) Recirculation must occur.

Response to Comment No. 11-27

Refer to Response to Comment No. 9-34. As discussed therein, the proposed PDFs are not mitigation measures, and the proposed PDFs are included in Section IV, Mitigation Monitoring Program, of this Final EIR, along with details about the enforcement and monitoring agencies, timing, and action indicating compliance. Refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 11-28

Finally, as discussed above, the DEIR fails to include a defined project description sufficient to enable useful environmental review or the formulation of mitigation measures. The DEIR must be recirculated after the development of a project ripe for review, along with concrete and useful mitigation measures that address the potentially significant environmental impacts of implementing that ripe project.

Response to Comment No. 11-28

As demonstrated in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, Section II, Project Description, of the Draft EIR has been completed in full compliance with CEQA. Furthermore, feasible mitigation measures have been included throughout the Draft EIR to reduce the potential impacts associated with the Project as required by CEQA.

With regard to recirculation, this comment letter does not provide substantial evidence to demonstrate that “significant new information” as defined by CEQA Guidelines Section 15088.5 has been presented or added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Also refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 11-29

II. The Regional Center General Plan Designation is Inappropriate for the Site, and the City’s Proposed Amendment of the General Plan for this Project is Impermissible Spot-Zoning.

The Project includes a General Plan amendment that would change the site’s General Plan designation from Community Commercial, Limited Commercial, and Neighborhood Commercial to Regional Center Commercial. (DEIR p. II-36.) The Project would also designate unincorporated land as part of the Regional Center for annexation into the City. (*Ibid.*) The Project proponent claims in marketing materials that this designation matches the site’s existing use and function. (DEIR p. IV.H-44.) In reality, once the Project site becomes designated as a Regional Commercial Center, it will be treated not as the community and neighborhood commercial currently present, but as a regional draw along the lines of Century City. Given that proposed height maximums for the Project reach 225 feet, an eventual transition to a more Century City–like high-rise development is hardly far-fetched.

The City’s General Plan Framework Element designates Regional Centers at Figure 3-1. (See, <https://planning.lacity.org/cwd/framwk/chapters/03/F31MtoMp.pdf>.) The Framework Element defines Regional Centers as:

A focal point of regional commerce, identity and activity and containing a diversity of uses such as corporate and professional offices, residential, retail commercial malls, government buildings, major health facilities, major entertainment and cultural facilities and supporting services. Generally, different types of Regional Centers will fall within the range of floor area ratios from 1.5:1 to 6.0:1. Some will only be commercially oriented; others will contain a mix of residential and commercial uses. Generally, Regional

Centers are characterized by 6- to 20-stories (or higher). Regional Centers are usually major transportation hubs.

(General Plan Framework, Long Range Land Use Diagram, Fig. 3-1.) Notably, the City provides that Regional Centers are “generally...6- to 20-stories (or higher)” with floor area ratios of up to 6.0:1. The Framework Element, which provides for future growth in the City based on the adequacy of supporting infrastructure, notably does not provide for a Regional Center along Beverly or Fairfax. (See, <https://planning.lacity.org/cwd/framwk/chapters/03/F31MtoMp.pdf>.)

This General Plan Amendment represents a major change to the identity of the area, and to its future growth potential, that should occur in the context of comprehensive planning, such as an update of the Wilshire Community Plan. The Wilshire Community Plan was last updated in 2001 and is due for a comprehensive update. A change of this magnitude must occur with the expertise of the planning department and proceed through the normal public process. It should not happen through spot-zoning for a single developer. Successful land use planning is comprehensive and cohesive. “Case-by-case reconsideration of regional land-use policies, in the context of a project-specific EIR, is the very antithesis of that goal.” (*Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 572–573.)

Furthermore, once an area is designated as a Regional Center in the General Plan, impacts cascade into the surrounding area. Increased development intensities spread out from the designation, as has been seen at Century City and the Beverly Center. If the City chooses to stay this course and amend the entire General Plan for a single, undefined development, the DEIR must be updated to provide a full and accurate assessment of induced growth that is not currently present.

Response to Comment No. 11-29

Refer to Response to Comment No. 5-8 regarding the proposed Regional Commercial designation. As set forth in Section II, Project Description, of the Draft EIR, and evaluated in Section IV.H, Land Use and Planning, of the Draft EIR, the Project is requesting a General Plan Amendment to change the various existing land use designations for the Project Site to a unified Regional Commercial designation and to assign a Regional Commercial designation to an approximately 0.63-acre portion of the Project Site located in an unincorporated area of the County to be annexed to the City of Los Angeles. As identified in this comment, per the General Plan Framework Element, “Regional Commercial” land uses “contain a diversity of uses such as offices, retail [and] major entertainment facilities and supporting services,” which “typically provide a significant number of jobs” and are “intended to serve as the focal points of regional commerce, identity, and activity.” TVC’s function has been consistent with the Regional Commercial land use designation for over 70 years as the first purpose-built television studio and an

icon for the entertainment industry, as well as a major source of jobs and a major component of the Beverly-Fairfax community's identity. As such, the proposed Regional Commercial land use designation is appropriate for the continued operation of the Project Site as a studio. Furthermore, as discussed in Response to Comment No. 5-8, the Regional Commercial designation does not allow upzoning at the Project Site and would not, in and of itself, result in a major change in the identity of the community. As such, the total amount of floor area requested could be granted regardless of whether the land use designation is modified to "Regional Commercial" or the existing Community Commercial, Limited Commercial, or Neighborhood Commercial designations are retained.

Furthermore, the lack of a Regional Commercial designation by the Framework Element does not mean that the Project Site would not have adequate infrastructure to support the Project. Rather, as demonstrated in the analysis of utilities included in Section IV.M, Utilities and Service Systems, of the Draft EIR, adequate utilities infrastructure would be available to accommodate the Project, and impacts would be less than significant.

Although not related to any specific CEQA analysis performed in the Draft EIR, the comment also raises spot zoning and incorrectly asserts that the Project is impermissible spot zoning. The court, in *Foothill Communities Coalition v. County of Orange* (2014) 222 Cal.App.4th 1302, clarified the two-step analysis for purported "spot zoning." First, the court must determine if a "small parcel of land is subject to more or less restrictive zoning than surrounding properties." (Id. at 1311-12.) Courts recognize that "the essence of spot zoning is irrational discrimination" and that spot zoning usually "involves a small parcel of land." Therefore, "the larger the property the more difficult it is to sustain an allegation of spot zoning." (Id. at 1311.) Second, even if this Project was an example of spot zoning, courts must next determine if the zoning should be nonetheless upheld "where rational reason in the public benefit exists for such a classification." (Id. at 1311.) Spot zoning may be justified if a substantial public need exists "even if the private owner of the tract will also benefit." (Id. at 1314.)

To restate the above, spot zoning involves applying a zoning designation and/or other land use regulations to a single/small parcel of land that are substantially different from those applicable to other parcels in the vicinity. The Project Site is already designated as three separate General Plan land use designations, one of which, the Limited Commercial designation that is applicable to an approximately 5.7-acre portion of the Project Site, is shared with no other properties in the vicinity. Contrary to the commenter's allegations, the General Plan Amendment to the Regional Commercial designation would represent a consolidation of three land use designations and eliminate the current patchwork of designations applicable to the Project Site.

The Project and its associated land use approvals are proceeding through the City's standard review and approval processes and in accordance with public review

requirements required by the City and CEQA. As discussed in Topical Response No. 6, Wilshire Community Plan Update, statutory law contains no requirement that a general plan's land use element—which is the City's Wilshire Community Plan—be updated at any given interval or in connection with any given event (such as the approval of a new development project). Further, unlike certain General Plan elements, such as the Housing Element, State law does not require that local jurisdictions regularly update their land use element within certain time frames. With regard to induced growth, as discussed above, the total amount of floor area requested could be granted regardless of whether the land use designation is modified to "Regional Commercial." As such, the change in the land use designation to Regional Commercial would not, in and of itself, result in induced growth. Refer to pages VI-14 through VI-17 of Section VI, Other CEQA Considerations, of the Draft EIR for a discussion of growth inducement associated with the Project that concludes that direct and indirect growth inducing impacts of the Project would be less than significant.

Finally, the requested General Plan Amendment for the Project is not inconsistent with the court's holding in *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553. The plaintiff in *Goleta* sought to use the alternative analysis in the EIR to reconsider various regional land use plans. The court rejected that argument, stating that in an EIR alternatives analysis, no single project needs to reevaluate the comprehensive land use goals of the region. Instead, an individual development project may seek an amendment to a local land use plan so long as the lead agency evaluates the consistency of the proposed project with the applicable policies, objectives and goals in the existing land use plans. The Draft EIR provided that analysis. Refer to Section IV.H, Land Use and Planning, and Appendix I, Land Use Plans Consistency Analysis Tables, of the Draft EIR.

Comment No. 11-30

III. The Project Fails to Satisfy Sign District Requirements.

As discussed in the comment letter submitted by Save Beverly Fairfax on August 25, 2022, the Project fails to meet City requirements for a Sign District. Los Angeles Municipal Code section 13.11, subdivision (C) provides that the development regulations for signage within a Sign District must be determined at the time the Sign District is established. As a draft ordinance has not yet been proposed or provided to the public, any discussion of a Sign District is premature. Moreover, as the DEIR purports to analyze the impacts of this as-yet-undisclosed Sign District, the DEIR must be revised and recirculated once the Preliminary Draft Specific Plan ordinance becomes publicly available. The DEIR cannot adequately disclose, analyze, and mitigate the impacts of portions of the Project that remain unformed and undisclosed.

Response to Comment No. 11-30

Refer to Response to Comment Nos. 9-25 and 9-26 regarding how the Sign District application was submitted in accordance with LAMC requirements and the timing of the development regulations for a sign district. Also refer to Response to Comment No. 5-10 regarding how the components of the Preliminary Draft Specific Plan were adequately described in the Draft EIR and the availability of the Preliminary Draft Specific Plan for public review, which is not required by CEQA. LAMC Section 13.11 C states that “[t]he development regulations for each “SN” Sign District shall be determined at the time the district is established.” Contrary to the commenter’s incorrect assumption, the Sign District would not be established until after the Final EIR is completed; therefore, environmental review is not premature. Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan.

With regard to recirculation, this comment does not provide substantial evidence to demonstrate that “significant new information” as defined by CEQA Guidelines Section 15088.5 has been presented or added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 11-31**Conclusion**

The TVC 2050 Specific Plan is not a defined “project” for purposes of CEQA. As currently written, the document hinders CEQA’s purposes of providing informed decision making and informed public review. Currently, neither the decision makers nor the public know what exactly the Specific Plan is meant to achieve or the environmental consequences of project approval. If the City’s goal is to ensure continued television production in Los Angeles, and not just the development of 1.6 million square feet of new retail, the Specific Plan’s land use restrictions should reflect that priority. Once the proponent has settled on an actual plan, the City must perform the studies and analysis needed to adequately disclose, analyze, and mitigate the Project’s likely environmental impacts in a revised DEIR. This DEIR must be recirculated for meaningful public comment which has, up to this point, been denied. The City’s failure to take these important steps would result in an EIR vulnerable to legal challenge.

The Association looks forward to revision of the DEIR and the Specific Plan and to continued participation in the City’s process regarding this important Project.

Response to Comment No. 11-31

Refer to Response to Comment No. 5-3 and Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding the fact that a draft Specific Plan

was not required to be included as part of the Draft EIR and how the physical aspects of the proposed Specific Plan are fully accounted for in Section II, Project Description, of the Draft EIR, and in the associated impact analyses throughout the Draft EIR. Refer to Response to Comment No. 11-10 regarding the maximum limit of retail floor area under the proposed Specific Plan.

This comment does not provide substantial evidence to demonstrate that “significant new information” as defined by CEQA Guidelines Section 15088.5 has been presented or added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Refer to Response to Comment No. 9-4 regarding recirculation.

Comment Letter No. 12

Jessica Lall
President & CEO
Central City Association of Los Angeles
626 Wilshire Blvd., Ste. 850
Los Angeles, CA 90017-2938

Comment No. 12-1

Established in 1924, Central City Association (CCA) is committed to advancing policies and projects that enhance Downtown Los Angeles' vibrancy and increase opportunity in the region. **We are pleased to support the Television City 2050 (TVC 2050) specific plan that will help retain and attract good-paying jobs in the creative industries that can bolster our citywide economic recovery.**

Hackman Capital Partners is committed to keeping creative industries in Los Angeles and meeting the high ongoing needs for state-of-the-art production stages. This is especially important as the city works to recover from the pandemic's deep economic impacts. With the necessary proposed updates, the media campus will deliver significant economic and community benefits to the city and region. The project will deliver more than \$2 billion in economic output during construction and \$2.4 billion in total annual economic output once operational.

Further, Hackman has demonstrated its ongoing commitment to the community by bringing on numerous community partners, helping local businesses and providing mentorship and job training opportunities in the media industry. The TVC 2050 plan also includes innovative community-serving features including improved landscaping and first/last mile infrastructure and other public realm improvements.

For all these reasons, we hope you will support this specific plan and thank you for your consideration.

Response to Comment No. 12-1

This comment indicating support for the Project is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment Letter No. 13

Tom Williams
President
Citizens Coalition for a Safe Community
4117 Barrett Rd.
Los Angeles, CA 90032-1712

Comment No. 13-1

The Specific Plan (SP) DEIR is totally inadequate and incomplete with regard to being a Project Specific EIR rather than a Programmatic EIR.

Response to Comment No. 13-1

Refer to Response to Comment No. 20-2 regarding a Project EIR versus a Program EIR. This comment provides no substantial evidence to support the statement that a Programmatic EIR is necessary but is noted for the record and will be forwarded to the decision-makers for review and consideration.

Comment No. 13-2

The Historical, Cultural, Paleontological, and Hydrological Resources are totally excluded, although they are considered on site and potentially significant and without mitigation, they will be significantly environmental impacted.

Response to Comment No. 13-2

Historical and cultural resources are fully addressed in Section IV.B, Cultural Resources, of the Draft EIR. Hydrology is fully addressed in Section IV.G, Hydrology and Water Quality, of the Draft EIR. In addition, paleontological resources are fully addressed in Section IV.D, Geology and Soils, of the Draft EIR.

Comment No. 13-3

Mineral Resources section is excluded, although oil and gases are discussed under Hazards and Hazardous Materials.

Response to Comment No. 13-3

An analysis of potential impacts associated with mineral resources was included in the Initial Study prepared for the Project included as Appendix A to the Draft EIR. As

demonstrated therein, potential impacts associated with mineral resources were determined to be less than significant.

Comment No. 13-4

The Program site subsurface soils must be considered oil and gas contaminated and must be exposed, graded, excavated, and bored through according to a well-documented site investigation and strictly-enforced procedures for construction and long-term occupancy and ventilation/treatment facility/system which have not been provided in the current EIR.

Response to Comment No. 13-4

The nature and extent of both naturally occurring and anthropogenic petroleum hydrocarbons in soil and groundwater at the Project Site have been investigated and reported in the Site Summary Report (Appendix G.1 of the Draft EIR), and various monitoring reports for the former Texaco station located at the northeast corner of the Project Site. As discussed in the Site Summary Report (Appendix G.1 of the Draft EIR) and discussed further in the response below, residual petroleum hydrocarbons detected in soil samples are mostly below regulatory screening levels, and the limited, residual petroleum screening level exceedances in soil appear to be sporadic and confined to shallow soil. Residual petroleum hydrocarbons in soil associated with the former Texaco station remain at a limited area of the northeast corner of the Project Site, consistent with the approval of the remediation by the LARWQCB. Per Mitigation Measure HAZ-MM-1, the testing and proper disposal of all excavated soil for the Project Site, including any soils impacted by releases from the former Texaco station, will follow the procedures described in the Soil Management Plan (Appendix B of the Site Summary Report).

With respect to naturally occurring oil and tar, as discussed in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR, the Project Site is located within the Salt Lake Oil Fields and the La Brea Oil Field, and the Project Site is located approximately 0.6 mile north of the La Brea Tar Pits (Draft EIR pages IV.F-22 and IV.F-30). As discussed on page 4 of the Site Summary Report and page IV.F-22 of the Draft EIR, historical research, such as topographic maps, aerial photographs and records from the State of California Geologic Energy Management Division (CalGEM) well finder database, confirm that no oil or gas production wells or oil derricks were located on the Project Site. Following extensive subsurface investigations and sampling, naturally-occurring tar was noted only in an isolated area near the southwest boundary of the Project Site where a tar collection system is located. (Draft EIR page IV.F-30; see also pages 35 to 36 of the Phase I ESA dated November 20, 2017, included in Appendix G of the Draft EIR). As stated on page IV.F-30 of the Draft EIR, surface fittings associated with a subsurface tar removal system were observed near the southwestern corner of the Project Site; see Figure IV.F-1 on page IV.F-26 of the Draft EIR (and revised Figure IV.F-1 in Section III, Revisions,

Clarifications, and Corrections to the Draft EIR). The tar collection system is serviced on a regular basis by Worldwide Recovery Systems, Inc., and the accumulated tar is collected in 55-gallon drums for proper off-site disposal or recycling. No evidence of related environmental concerns was identified in association with the tar collection system. According to the Phase I ESA, the tar collection system does not appear to represent a significant environmental concern so long as it continues to be maintained and operated in accordance with all applicable industry standards and/or regulatory requirements. Testing and proper disposal of any excavated soil impacted by naturally occurring oil and/or tar will follow the sampling, testing, and disposal procedures described in Section 5 of the Soil Management Plan (Appendix B of the Site Summary Report).

Limited residual petroleum hydrocarbons in soil associated with the former Texaco station located in the northeast portion of the Project Site would remain on-site, as discussed on page 12 of the Site Summary Report. The investigation and remediation of soils impacted by the release from the former Texaco station was approved by the LARWQCB; these efforts were discussed extensively in the documents referenced above. In addition, as discussed in the Site Summary Report, several other instances of petroleum use (second former gasoline station (the Anderson V L, a retail gasoline station) and removed diesel underground storage tanks [USTs]) were investigated and no residual petroleum contamination was identified with the historical uses. The testing and proper disposal of any excavated soil for the Project Site will follow the sampling, testing and disposal procedures described in the Soil Management Plan. As stated on page IV.F-57 of the Draft EIR, based on the analysis in the Site Summary Report, regulatory compliance and appropriate mitigation—specifically, the Soil Management Plan set forth in Mitigation Measure HAZ-MM-1 (see pages IV.F-50 to IV.F-53 of the Draft EIR)—would address any residual constituents associated with the former Texaco station release that might be encountered during construction, and impacts would be reduced to a less-than-significant level. With appropriate protocols and management of impacted soil per Mitigation Measure HAZ-MM-1, as well as related Mitigation Measure HAZ-MM-2 (see pages IV.F-53 to IV.F-54 of the Draft EIR), designed to mitigate the effects of subsurface gases and impacted soil and groundwater on workers and the public, the Project would not create a significant hazard to the public or the environment or exacerbate existing environmental conditions.

Thus, with regard to potential soil contamination, any residual concentrations would be appropriately managed during all soil disturbance activities through implementation of the protocols described in the Soil Management Plan set forth in Mitigation Measure HAZ-MM-1. Specific areas with total petroleum hydrocarbon (TPH) impacts and one location with elevated arsenic also would require appropriate management during excavation and grading operations (refer to Figure 2 of the Site Summary Report). Required protocols would address soil sampling and analysis, stockpiling of affected soils, soil re-use, decontamination, and dust control.

While this comment focused on potential petroleum impacts to soil, it should be noted that any contaminated groundwater (due to petroleum impacts to soil) that is discharged during the temporary construction dewatering will follow the testing, on-site treatment (if necessary), and off-site discharge requirements contained in the approved discharge permit (either an NPDES permit or an industrial sewer discharge permit). Refer to Response to Comment No. 11-5 for additional information regarding compliance with discharge permits.

Comment No. 13-5

A total review/revision/recirculation of the current “Specific Plan” Draft Environmental Impact Report must be conducted, and recirculation must involve a “Programmatic Draft Environmental Impact Report” with suitable, enforceable Program scope/schedule/participation Program for periodic and project specific reviews consistent with the Specific Plan Program Mitigation, Monitoring, and REPORTING plan.

Response to Comment No. 13-5

Refer to Response to Comment No. 20-2. This comment provides no substantial evidence to support the statement that a Programmatic EIR is necessary but is noted for the record and will be forwarded to the decision-makers for review and consideration. It is unclear as to what the comment regarding “enforceable Program scope/schedule/participation Program for periodic and project specific reviews” is referring to. However, Section IV of this Final EIR includes a Mitigation Monitoring Program in compliance with City and CEQA requirements. Thus, recirculation of the Draft EIR is not required. Refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 13-6

Methane gases have been reported along the old Metro rail tunnel alignments on Wilshire and north along Fairfax. They were responsible for the Ross-Store, 3rd & Ogden explosion in 1985 and the later gas without explosion incursions north of 3rd Street, 1300ft [sic] south of Project. The Program site must be considered as gassy and a project-by-project schedule of surveys, monitoring, and remediation must be provided along with an overall Program remediation plan, which is currently absent. Review of historic documents, an overall drilling/sampling/monitoring/degassing program, and a project-by-project ventilation/protection program must be incorporated in a revised Program-DEIR.

As part of the Mineral Resources and Hazardous Materials review and revision, the preparers must identify all subsurface property/oil/mineral rights owners and any abandoned/idled near-surface wells which may endanger the surface owners and residents. As well documented for underground fuel tanks, owners of properties which

have had operators or lessees which contaminated soils/environment remain liable for damages and restoration of surface properties from operations of lessees.

Specific Plan CEQA requires a formal procedure and set of environmental sectors for environmental considerations in a mini-EIR for each project proposed during the duration of the Specific Plan and Programmatic EIR. As commonly required by the Department of City Planning, a formal hazardous materials review must be implemented for the SP Site and then made specific for each project (DCP commonly includes such reports prepared by EDRNet and using LightBox resources, including historic 1920–1940 aerial photos of the Fairfax areas, showing oil well derricks.

Historic resources have been found throughout the surface oil field and additional resources must be expected beneath the SP site, and appropriate survey and monitoring plans must be incorporated and implemented/enforced throughout the life of the SP Project.

Response to Comment No. 13-6

Phase I and Phase II investigations, which are included in Appendix G of the Draft EIR and documented in the Site Summary Report (Appendix G.1 of the Draft EIR), among others, have been performed to evaluate Project Site environmental conditions pertaining to the nature and extent of impacts to soil, soil vapor, and groundwater, including the potential presence of naturally-occurring methane.

As discussed in Response to Comment No. 13-4, despite the Project Site's location within the Salt Lake Oil Fields and La Brea Oil Field and the historic operation of oil wells in the surrounding area, no former oil or gas production wells or oil derricks have been identified within the Project Site. Former oil wells identified as "plugged" or "idle" were located in the developed area, ranging approximately 100 to 200 feet from the Project Site (California Department of Conservation CalGEM Well Finder [Well Star] website). Accordingly, the Draft EIR concluded that the Project would not exacerbate the risk of upset and accident conditions associated with oil wells, and impacts associated with oil wells would be less than significant (see page IV.F-46 of the Draft EIR).

As discussed on pages IV.F-33 to IV.F-34 in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR, the Project Site is located within a designated methane zone mapped by the City of Los Angeles, and a subsurface investigation conducted in 2018 identified elevated methane concentrations in soil vapor at the Project Site (i.e., methane was detected in 5 out of 26 sampling locations with concentrations ranging from

0.2 percent volume to 90.7 percent volume). Sites nearby are also known to be impacted by naturally occurring methane, and a Limited Phase II Investigation revealed concentrations of naturally occurring methane in soils at the Project Site.¹¹⁵ Naturally occurring hydrogen sulfide was not detected in any of the 26 soil vapor samples. Existing operations on-site include a methane alarm, mitigation, and venting system. In addition, Global Realty Services (GRS) Group, who prepared the Phase I Environmental Site Assessment (Phase I ESA; included in Appendix G of the Draft EIR), observed several methane gas vent pipes associated with a methane gas mitigation system protruding from the ground at various exterior locations throughout the Project Site. According to the Phase I ESA, the methane gas mitigation system does not appear to represent a significant environmental concern so long as it continues to be maintained and operated in accordance with all applicable industry standards and/or regulatory requirements.

As stated above, soil vapor sampling across the Project Site identified the presence of methane and naturally-occurring hydrogen sulfide, which is associated with oil deposits in the vicinity. As described on page IV.F-43 of the Draft EIR, with the Project, methane mitigation systems would be designed in accordance with the latest regulatory control measures, including Division 71 of Article 1, Chapter IX of the Los Angeles Municipal Code (Methane Code), LAMC 91.7107 and the City of Los Angeles Methane Hazard Mitigation Standards, as required by LADBS. Based on the results of the investigations performed, and as described in the Site Summary Report and page IV.F-43 of the Draft EIR, and in compliance with the Methane Code, a Site Design Level V methane system will be proposed for any new construction at the Project Site. Furthermore, for existing buildings located within a methane zone, additions, alterations, repairs, changes of use, or changes of occupancy must comply with the methane mitigation requirements of LAMC Sections 91.7104.1 and 91.7104.2, when required by LAMC Chapter IX, Article 1, Divisions 81 or 82. Methane systems would be designed in accordance with the latest regulatory control measures, including the City of Los Angeles Methane Hazard Mitigation Standard Plans, as required by LADBS. Accordingly, the Project's methane controls would include an impervious membrane, ventilation systems capable of providing a complete change of air, an indoor methane detection and alarm system, and development and implementation throughout the life of the Project of an operations, monitoring and maintenance plan, as well as an emergency/contingency plan for the methane mitigation system. Installation of a methane mitigation system will have the added benefit of addressing potential vapor intrusion from residual fuel hydrocarbons from the former Texaco station, and naturally occurring hydrogen sulfide.

¹¹⁵ Geosyntec Consultants, Limited Phase II Site Investigation Report, 7800 West Beverly Boulevard, Los Angeles, CA, November 7, 2018; refer to the Site Summary Report (Appendix G.1 of the Draft EIR) for discussion.

Regarding methane explosions, as stated on page IV.F-33 of the Draft EIR, in high concentrations of between 50,000 and 150,000 parts per million (ppm) by volume in the presence of oxygen, methane can be an explosion hazard. During the Limited Phase II investigations of the Project Site, methane was detected at concentrations up to 90.7 percent of the lower explosion limit. As discussed on page IV.F-55 of the Draft EIR, Mitigation Measure HAZ-MM-2 (included on pages IV.F-53 to IV.F-54 of the Draft EIR) requires the installation of controls during Project construction to mitigate the effects of subsurface gases on workers and the public, including potential explosion hazards. These measures would include monitoring devices for methane and benzene to alert workers of elevated gas concentrations, contingency procedures if elevated gas concentrations are detected, and worker training to identify exposure symptoms and implement alarm response actions. Furthermore, fencing would be erected to limit public access and allow for gas dilution. Lastly, a Health and Safety Plan (HASP) would be prepared to describe the proposed construction activities and hazards associated with each activity. As such, implementation of Mitigation Measure HAZ-MM-2 would ensure potential impacts related to methane would be less than significant.

As discussed in the Site Summary Report, residual petroleum hydrocarbons in soil associated with the former Texaco station remain at a limited area of the northeast corner of the Project Site, consistent with the approval of the remediation by the LARWQCB. Per Mitigation Measure HAZ-MM-1, the testing and proper disposal of all excavated soil for the Project Site, including any soils impacted by releases from the former Texaco station, will follow the procedures described in the Soil Management Plan (Appendix B of the Site Summary Report).

As discussed on page IV.F-44 of the Draft EIR, any discharge of groundwater from the temporary construction dewatering will be treated (if necessary) and discharged in accordance with the applicable regulatory requirements under an NPDES permit issued by LARWQCB or an industrial sewer discharge permit issued by the LASAN.

The investigations of the Project Site, as described in the Site Summary Report and pages IV.F-31 to IV.F-32 of Section IV.F, Hazards and Hazardous Materials, of the Draft EIR, identified several former USTs on-site, all of which were removed and remediated with approval from the appropriate regulatory agency. Specifically, as discussed on page IV.F-44 of the Draft EIR, the Project Site is listed on several UST and LUST (leaking UST) databases related to the former USTs associated with past studio operations, including one 1,000-gallon diesel UST, a 500-gallon diesel UST, and two 8,000-gallon diesel USTs. These four tanks were removed, remediation conducted, and an UST case closure letter was issued by the Los Angeles Fire Department (LAFD) as a Certified Unified Program Agency (CUPA) in 1998, with no further monitoring required. Former USTs on adjacent properties have also been identified; these tanks were also

removed and remediated, as necessary, with approval from the appropriate regulatory agency.

In addition, as discussed on pages IV.F-44 to IV.F-45 of the Draft EIR, the Project Site is listed on several databases associated with the two gas stations formerly located on-site, specifically the Anderson V L station at 7870 Beverly Boulevard and the Texaco station at 7718 Beverly Boulevard. The status of any former USTs at the former Anderson V L gas station is unknown; however, geophysical surveys have confirmed no tanks remain in the location of this former gas station. The former Texaco station contained one 10,000-gallon and three 12,000-gallon USTs, which, along with dispensers, associated piping and pump islands, were removed during station demolition in 1991. LARWQCB issued a No Further Action letter for the former Texaco station on November 29, 2012. Geosyntec performed environmental investigations to confirm the extent of the constituents known to remain on-site, and elevated concentrations of fuel-related constituents were detected in soil and groundwater downgradient of the former Texaco station. No other records were found that indicate the presence of USTs within the Project Site. Notwithstanding, in the unlikely event that USTs are found, suspect materials would be removed in accordance with all applicable federal, state, and local regulations. For example, if USTs are encountered, prior to removal, applicable permits would be obtained from LAFD. As such, with compliance with applicable regulations and requirements, Project construction activities would not exacerbate the risk of upset and accident conditions associated with USTs. Therefore, impacts related to the potential discovery or removal of USTs during construction would be less than significant.

This comment mentions mineral resources. However, as discussed on pages 64 to 65 of the Initial Study for the Project (included as Appendix A.1 of the Draft EIR), the Project would have no impacts on mineral resources.

The comment regarding liability for damages does not concern the environmental analysis in the Draft EIR; therefore, no further response is required.

This comment incorrectly states that a revised program EIR is required. The Draft EIR is a "Project EIR," as defined by Section 15161 of the CEQA Guidelines. This comment does not provide any evidence that a program EIR is required under CEQA. Also refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan.

Comment No. 13-7

Cultural resources have been encountered in the Rancho LaBrea [sic] tar pit and surrounding and must be expected beneath the SP site, and they must be protected by standard consistently implemented/enforced throughout the life of the SP Program. In fact, consistent with the general proposed projects, exhibitions of historic, cultural, and

paleontological resources could be preserved and displayed for community education as to the site and area.

Paleontological resources—a new potential Rancho LaBrea [sic] tar pits have been encountered in the Rancho LaBrea [sic] tar pit and surroundings and must be expected beneath the SP site, and they must be protected by standard [sic] consistently implemented/enforced throughout the life of the SP Program. In fact, consistent with the general proposed projects, exhibitions of historic, cultural, and paleontological resources could be preserved and displayed for community education as to the site and area.

Response to Comment No. 13-7

Regarding cultural resources, Section IV.B, Cultural Resources, of the Draft EIR and the Tribal Cultural Resources Report in Appendix C.2 of the Draft EIR both address the type of archaeological materials that have been found in proximity and could occur within the Project Site. As described on page IV.B-57 of Section IV.B, Cultural Resources, of the Draft EIR, and page 28 of the Tribal Cultural Resources Report, the archaeological discoveries recorded during development of The Grove at Farmers Market Project were composed entirely of historic-period (nineteenth and twentieth century) archaeological resources, designated as Site CALAN-3045H.¹¹⁶ Most of the significant archaeological components recorded in CA-LAN-3045H are associated with historical land uses that are specific to their respective locations and are not strictly equivalent to the setting of the Project Site or the La Brea Tar Pits. The past use by the Native Americans of the La Brea Tar Pits, an important source of asphaltum (tar) and an archaeological site designated as CA-LAN-159, is described on pages 18 and 33 of the Tribal Cultural Resources Report. As discussed on page IV.B-57 of Section IV.B, Cultural Resources, of the Draft EIR, despite the proximity of CA-LAN-159 to the Project Site, no prehistoric archaeological resources were identified within the Project Site or within 0.5 mile of the Project Site. However, the proximity of CA-LAN-3045H to the Project Site is noted on page IV.B-58 of Section IV.B, Cultural Resources, of the Draft EIR, which recognizes that there is some potential for unknown historic-period materials in the Project Site. Thus, the Draft EIR adequately considers the type of archaeological resource most likely to be encountered, and provides a reasonable means of mitigating potentially significant impacts if such a resource is identified. The Archaeological and Tribal Cultural Resources Supplemental Memorandum (Supplemental Cultural Memo) in response to public comment included in Appendix FEIR-14 of this Final EIR adds further detail to these archaeological resources that further reinforces the findings presented in the Draft EIR.

¹¹⁶ The Draft EIR refers to this site as P-19-003045/CA-LAN-003045H, which combines both the primary and trinomial resources identifiers from the California Historical Resources Information System (CHRIS) database. For ease of reading and consistency, this site is referred throughout the public comments section as CA-LAN-3045H.

Mitigation Measure CUL-MM-1, which is included on pages IV.B-58 and IV.B-59 of the Draft EIR, includes provisions to ensure that any significant archaeological resource that may be identified during the Project are given adequate protection. Mitigation Measure CUL-MM-1 also incorporates professional best practices for archaeology by requiring that the principal archaeologist meet the Secretary of the Interior (SOI) Professional Qualification Standards (PQS)¹¹⁷ and that the Cultural Resource Monitoring and Treatment Plan (CRMTP) be prepared in accordance with the SOI's *Standards for Archeological Documentation Guidelines (SOI Documentation Standards)*.¹¹⁸ The *SOI Documentation Standards* provides generalized guidance on how field recording, analysis, reporting, and curation are fulfilled. Therefore, this mitigation measure complies with applicable regulations and meets industry standards. Refer to pages 5 and 6 of the Supplemental Cultural Memo, included in Appendix FEIR-14 of this Final EIR, for an expanded discussion of the standard professional practices and regulatory compliance as they relate to the formulation and implementation of Mitigation Measure CUL-MM-1. Mitigation Measure CUL-MM-1 has also been refined to further define performance criteria and enhance the ability of the Qualified Archaeologist and archaeological monitor(s) to identify, evaluate, and appropriately treat any archaeological resources identified during ground disturbing activities.

Regarding paleontological resources, as stated on pages IV.D-15 and IV.D-16 in Section IV.D, Geology and Soils, of the Draft EIR, although no previously encountered vertebrate fossil localities were identified within the Project Site, it was conservatively assumed that paleontological resources could be discovered at the Project Site because such resources have been found at seven properties within approximately 4,000 feet of the Project Site in older Quaternary age sedimentary deposits known as Pleistocene age deposits. The Pleistocene age alluvial deposits have been documented at the Project Site underneath the artificial fill on page 5 of the Preliminary Geotechnical Engineering Investigation (see Appendix E.1 of the Draft EIR), the report states that "older alluvium" was found below the artificial fill. The boring logs in the report describe in detail the nature of the soil below the artificial fill, which is also described as Quaternary clay, silt, sand, and gravel in the Preliminary Geotechnical Engineering Investigation included as Appendix E.1 of the Draft EIR at page 3. Published geological mapping defines the older surficial sediments mapped below the Project Site as "late Pleistocene age."¹¹⁹

¹¹⁷ National Park Service, Professional Qualifications Standards, www.nps.gov/articles/sec-standards-prof-quals.htm, accessed November 7, 2023.

¹¹⁸ National Park Service, Archeological Documentation Guidelines, www.nps.gov/articles/sec-standards-archeo-doc-guidelines.htm, accessed November 7, 2023.

¹¹⁹ Dibblee, T.W. and H.E. Ehrenspeck, Geologic map of the Hollywood and Burbank (south 1/2) quadrangles, Los Angeles, California, Dibblee Geological Foundation, Dibblee Foundation Map DF-30, 1:24,000, 1991.

Therefore, as stated on pages IV.D-16 and IV.D-26 to IV.D-28 of Section IV.D, Geology and Soils, of the Draft EIR, there is a potential to disturb paleontological resources at depths within previously undisturbed sedimentary deposits of Pleistocene age, and impacts would be potentially significant. To address potential impacts to paleontological resources, a Paleontological Resources Mitigation and Treatment Plan shall be developed and paleontological monitoring would be required during excavation within Pleistocene age deposits. The monitoring program would follow the guidelines outlined by the Society of Vertebrate Paleontology (SVP 2010) and include sediment sampling protocols for microfossil recovery. No monitoring would be required during excavation within artificial fill, as these deposits do not contain paleontological resources in their original stratigraphic context and thus have a low sensitivity. With the implementation of Mitigation Measure GEO-MM-1, Project-level impacts to unique paleontological resources would be reduced to a less-than-significant level. Refer to Response to Comment No. 35-91 regarding revisions to Mitigation Measure GEO-MM-1 and Section III, Revisions, Clarifications and Corrections for the specific text revisions. With implementation of the revised mitigation measure and through consistency with the 2010 SVP Guidelines, any paleontological resources could be preserved and displayed for community education, which is a decision to be made by the museum which may take the donated paleontological resources collection.

Comment No. 13-8

Hydrologic resources are also not considered (= [sic] totally inadequate/incomplete) although the groundwater is generally quite shallow, expected at less than 30ft [sic] below surface and is easily recognized at the ponds over the tar pits, 3900ft [sic] to south. The Specific Plan must incorporate and enforce the Low Impact Development (LID) requirements of the City and eliminate the significant impacts of even a 3/4in [sic] rain in 24-hours from such a large area without adequate collection, storage and reuse systems in place (e.g., 3/4in [sic] on 1000sf [sic] roof = 400+gal [sic] in 24hr, [sic] one acre = $43.56 \times 400 = >17,500$ gal/acre). As no irrigation space will be available for recycling, and collected rain runoff must be convey to other areas, Pan Pacific Park across Grove, or discharge for replenishment of the underlying groundwater table, after a thorough study of the groundwater table so as to not impacted by such replenishment.

Response to Comment No. 13-8

Contrary to the assertion in this comment, the Draft EIR included a comprehensive analysis of hydrologic resources in Section IV.G, Hydrology and Water Quality, of the Draft EIR. As discussed in Response to Comment No. 3-4, the Project has considered the hydrogeology of the Project Site, and stormwater management during operation was specifically addressed on page IV.G-30 of Section IV.G, Hydrology and Water Quality, of the Draft EIR.

As discussed in the Draft EIR and Response to Comment No. 3-4, the Project would comply with the City's LID Ordinance. As discussed on page IV.G-30 of Section IV.G, Hydrology and Water Quality, of the Draft EIR, the LID Ordinance requires the capture and management of the greater of an 85th percentile rain event or the first 0.75-inch of runoff flow during storm events defined in the City's LID BMPs through one or more of the City's preferred LID improvements in priority order: onsite infiltration, capture and reuse, or biofiltration/biotreatment BMPs, to the maximum extent feasible. The City's LID Ordinance provides a number of alternatives for stormwater management. As discussed on page IV.G-30 of the Draft EIR, based on the Preliminary Geotechnical Engineering Investigation prepared for the Project (included as Appendix E.1 of the Draft EIR), infiltration is not feasible. As discussed in Section 6.2.1 of the Hydrology and Water Quality Report included as Appendix H of the Draft EIR, the Project Site is currently approximately 90 percent impervious, and is expected to remain approximately 90 percent impervious post-construction. Since infiltration has been determined to be infeasible by the Preliminary Geotechnical Engineering Investigation, the next tier of treatment is a stormwater capture and use system. As described in Section 5.2.2 of the Hydrology and Water Quality Report included as Appendix H of the Draft EIR, the Project would include the installation of a capture and reuse system to be used for irrigation. If that approach is later determined to be infeasible, high efficiency biofiltration/bioretenion systems, consistent with the LID requirements, would be installed. In either case, BMP systems will be designed within the Project Site to capture the typical urban contaminants found in stormwater. The stormwater that bypasses the BMP systems would discharge to an approved discharge point in the public right-of-way. As the majority of potential contaminants are anticipated to be contained within the "first flush" 85th percentile storm event, major storms are not anticipated to cause an exceedance of regulatory standards. As is typical of most urban developments, stormwater runoff from the Project Site has the potential to introduce pollutants into the stormwater system. Anticipated and potential pollutants generated by the Project include sediment, nutrients, pesticides, metals, pathogens, and oil and grease, similar to existing conditions. The implementation of BMPs required by the City's LID Ordinance would target these pollutants that could potentially be carried in stormwater runoff. Further, the current stormwater is discharged without any such controls, and the BMPs installed as part of the Project would be an improvement over the current conditions. Therefore, as stated on page IV.G-30 of the Draft EIR, with the incorporation of LID BMPs, operation of the Project would not result in discharges that would violate any surface water quality standards or waste discharge requirements and impacts to surface water quality during operation of the Project would be less than significant.

As discussed in Response to Comment Nos. 3-7 and 11-25, dewatering would be limited to temporary dewatering during construction, and there will be no long-term impact on the water table in the vicinity of the Project. Refer to the Dewatering Report included as Appendix FEIR-13 of this Final EIR.

Comment No. 13-9

Land Use resources have not adequately or completely assessed the specific requirements for FAR, floor area ratios, and building heights (feet/stories). All covered floored areas must be considered as part of the floor area and storage/holding/processing conducted on covered/floored surfaces must be included in calculating the floor area ratios.

Response to Comment No. 13-9

Section II, Project Description, of the Draft EIR includes a description of the Project's floor area, FAR, and building height limits. Refer to Topical Response No. 2, Definition of Floor Area is Appropriate, regarding the Project's definition of floor area and how all of the Project uses, areas and activities have been fully accounted for in the impact analyses throughout the EIR. Refer to Section IV.H, Land Use and Planning, of the Draft EIR for a comprehensive analysis of the Project's land use impacts in accordance with CEQA. As concluded therein, impacts would be less than significant. Refer to Response to Comment Nos. 9-16 and 11-3 regarding the height and size of the Project.

Comment No. 13-10

Similarly, considerations must be provided regarding growth inducement forces which influence the opposing sides of major arterials. If high rise is allowed along one side of Fairfax and Beverly, the assessment and mitigation must consider the opposing street frontage will eventually be developed similarly. The Specific Plan must be considered to induce similar developments along the northside of Beverly and west side of Fairfax and beyond. Mitigation beyond the Program site limits must be assessed and funded by the Program.

VI-14/3 Other CEQA Considerations—Growth The [sic] DEIR considers growth inducing aspects but does not provide any current growth projects (LADCP or SCAG—Southern Calif. Assoc. Govts.) for the “Transportation Analysis Zones” including the Program site. Based on general review, the proposed general Program would far exceed current population, households, and jobs projections by DCP using the current Community Plan or by SCAG projections for TAZs including the Project. Therefore, land use and demographic impacts must be considered as significant for the Program overall and must be revised consistently with SCAG/DCP projects of TAZs involving the Program site.

Response to Comment No. 13-10

The comment includes the commenter's claim that the Project's height zones would affect adjacent properties. The height zones identified in Section II, Project Description, of the Draft EIR and in the proposed Specific Plan are only applicable to the Project Site. Thus, the Project would not induce or increase building heights outside of the Project Site.

Also refer to pages VI-15 through VI-16 of Section VI, Other CEQA Considerations, of the Draft EIR for details regarding the Project's consistency with SCAG's growth projections, which are the projections that the City uses in its analysis for determining consistency of a project with future growth. The City of Los Angeles VMT Calculator assumes growth in all traffic analysis zones (TAZs) in the City based on the City's General Plan which, in turn, is based on the growth assumed in each TAZ in the SCAG regional land use and transportation model. So, it is incorrect to say that the Draft EIR technical analyses do not reflect long-range land use growth projections by the regional agency.

Comment Letter No. 14

Oscar Arslanian
Publisher
Discover Hollywood Magazine
5419 Hollywood Blvd., Ste. C717
Hollywood, CA 90027-3480

Comment No. 14-1

I'm writing to express my support for the new investment in Television City located at Beverly Blvd. and Fairfax Avenue.

I am the publisher of Discover Hollywood Magazine, a publication with a 35 year mission that extols the unique culture and lore of Hollywood, board member of the Hollywood Arts Council and past Chairman of the Board of the Hollywood Chamber of Commerce, [sic] I value our entertainment industry and the economic and cultural benefits it brings to the City. We need to support local production growth and responsible development that will bring new studio space to Los Angeles.

This plan will ensure the future of Television City, one of Los Angeles' most iconic studios, by modernizing the complex and adding new sound stages and production facilities. The project will deliver new, technology-rich studio" space that content creators demand and provide the ability to adapt to an ever-changing entertainment industry, while keeping production and jobs in Los Angeles.

Also, I'm delighted to learn through the Draft EIR that the project will not result in any significant impacts during studio operations. This is good news for the community. I appreciate the studio's commitment to invest in the City and look forward to the many benefits this project will provide.

Response to Comment No. 14-1

This comment indicating support for the Project is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment Letter No. 15

Jacqueline Canter
Fairfax Business Association
419 N. Fairfax Ave.
Los Angeles, CA 90036-1716

Comment No. 15-1

My name is Jacqueline Canter. My family owns Canter's. I am the founder and President of the Fairfax Business Association.

I am in full support of TVC 2050. It will bring jobs to the community. If you have any questions, feel free to call me.

Response to Comment No. 15-1

This comment indicating support for the Project is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment Letter No. 16

Laura Lake
Fix the City
laura.lake@gmail.com

Comment No. 16-1**FIX THE CITY REQUESTS A SUPPLEMENTAL EIR FOR TVC: SHOW US THE SPECIFIC PLAN AND DEVELOPMENT AGREEMENT, THEN DO YOUR ANALYSIS**

CEQA is a disclosure law that mandates mitigation where feasible. ***This EIR fails to provide disclosure.*** It claims to analyze the impacts of an invisible Specific Plan and an invisible Development Agreement and ignores the impacts of the project on the Housing Element. *As a result, the entire analysis is speculative and prohibited by CEQA.*

A specific plan lays out exactly what use is permitted in each part of the property. This does not. A “conceptual plan” is not the legal or functional equivalent of a draft specific plan.

The project description is not stable. It is intentionally vague: it could take 32 months or 20 years... it is bigger-than-a-bread-box-and-smaller-than-a-house. The public is entitled to a transparent review process. ***CEQA requires that the curtain be pulled back*** and a good-faith, objective analysis of the proposal be presented. While DCP always insists its analysis is objective, it has an institutional conflict of interest: its budget relies on developer fees.

Response to Comment No. 16-1

Refer to Response to Comment No. 5-3 and Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding the fact that a draft Specific Plan was not required to be included as part of the Draft or Final EIR and how the physical aspects of the proposed Specific Plan are fully accounted for in Section II, Project Description, of the Draft EIR and in the associated impact analyses throughout the Draft EIR. Also refer to Response to Comment Nos. 5-5 and 9-12 regarding the conceptual plans, and Response to Comment No. 9-15 regarding the degree of specificity in a specific plan EIR and how Section II, Project Description, of the Draft EIR is accurate, stable, and finite and fully complies with CEQA. These topics are also comprehensively addressed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan. Thus, contrary to this comment, a supplemental EIR is not required.

With regard to the Project’s timeframe, refer to Response to Comment No. 9-24.

Regarding the proposed Development Agreement, the component of the Development Agreement that is relevant to the environmental analysis is the 20-year term, which could extend buildout of the Project to approximately 2043. Also note that the Development Agreement would only allow for development consistent with the Project described in the certified EIR. Other provisions of the Development Agreement would be contractual matters between the City of Los Angeles and the Applicant and do not constitute environmental impacts under CEQA. Accordingly, CEQA does not require a Development Agreement to be included as part of the Draft EIR. A draft Development Agreement will be made publicly available on the Department of City Planning's website prior to public hearings on the Project.

Comment No. 16-2

The project is inconsistent with the Housing Element. It proposes eliminating thousands of residential units [sic] from this property that are included in the Housing Element. Impacts on housing are on the CEQA checklist, and yet they were not addressed. This omission must be addressed in a supplemental EIR as well. The same holds true for the removal of the designation of Mixed-Use Boulevards for both Fairfax and Beverly Blvds. This project flagrantly ignores the city's goal of a jobs-housing balance.

SB 375 justifies streamlining as an incentive to encourage residential or mixed -use [sic] residential projects which help achieve AB 32 goals to reduce GHG emissions. (D.IV-H Land Use and Planning, p. 2). This site is designated for thousands of housing units in the Housing Element of the General Plan. But the project does not provide housing or the mixed-use development presently designated for both Fairfax and Beverly Blvds. Therefore, it is ***not entitled to streamlined processing*** under CEQA. What is the substantial evidence to support streamlining for this project?

The General Plan Framework designated this property to serve the adjacent community and provide neighborhood commercial in Mixed Use projects (Attachment A). ***Instead, this project turns its back on the community.***

- This project does not need a Regional Center designation to rebuild.
- There is nothing preventing the owner from rebuilding the studio.
- There is nothing preventing the owner from building only commercial office buildings.
- But there is a prohibition against increasing density if emergency services are inadequate or if infrastructure is inadequate. This will be addressed in detail below.

- The FAR calculation for TVC does not comply with LAMC per EIR Footnote 1:

“The proposed approximately 1.874 million square feet of floor area per the Specific Plan definition is equivalent to approximately 1.984 million square feet based on the LAMC definition and approximately 2.103 million gross square feet.”

- The DEIR also mentions **converting garages** (which do not count toward FAR) to other uses. This would add even more FAR. How much more FAR would be added? How is a garage converted to other uses?

Response to Comment No. 16-2

The commenter alleges that the Project is inconsistent with the Housing Element of the General Plan, which is incorrect. The Project does not involve a change in the number of residential dwelling units permissible under the Project Site’s zone classification. The Project involves a Vesting Zone Change request from the C1.5 and C2 Zones to a proposed TVC Zone and assigns the TVC Zone to an approximately 0.63-acre portion of the Project Site located in an unincorporated area of the County to be annexed to the City of Los Angeles. Fundamentally, the TVC Zone is a mixed-use zone consistent with the existing C1.5 and C2 zoning designations. The purpose of the creation and application of the TVC Zone is to implement and effectuate the proposed Specific Plan, which is a studio specific plan. The proposed Specific Plan would not expressly prohibit the development of residential dwelling units on-site, as such development would be regulated by the zoning existing at the time of Project application filing. Any future residential development would require a subsequent discretionary approval and CEQA compliance review.¹²⁰ The Project also involves a General Plan Amendment to change the various land use designations of the Project Site to a consistent Regional Commercial designation and assign the Regional Commercial designation to the portion of the Project Site to be annexed to the City. Typically, this change of land use designation would alter the allowable residential density pursuant to Section 12.22 A.18 of the LAMC. However, in the case of the Project, no changes to the permissible residential density will be provided by the General Plan Amendment per the regulations of the Preliminary Draft Specific Plan. Refer to Response to Comment Nos. 5-8 and 11-29 for further elaboration on the General Plan Amendment to the Regional Commercial designation.

¹²⁰ In accordance with California Government Code Section 66300(b)(1), the Preliminary Draft Specific Plan provides that the Project Site may also be developed with residential uses allowed in accordance with density and all other development standards of the C2-1-O, C1.5-2D-O, and the C-MJ Zones, as in effect on May 13, 2021 and subject to all applicable municipal and State laws. Any future residential project would be required to comply with the development review procedures identified in the Specific Plan.

It should also be noted that nowhere in the scope of the Project's General Plan Amendment is there a request to alter or delete the Mixed Use Boulevard designation applicable to Fairfax Avenue or Beverly Boulevard, as identified by the General Plan Framework Element in Figure 3-1 and included as Attachment A to this Comment Letter. As discussed above, the Project includes a request for a General Plan Amendment from various land use designations of the Project Site to a consistent Regional Commercial designation and assigns the Regional Commercial designation to the portion of the Project Site to be annexed to the City. As stated in Figure 3-1 of the Framework Element, adoption of the Framework Element neither overrides nor mandates changes to the Community Plans but provides general recommendations to assist in determining the individual needs and opportunities of each Community Plan Area. Therefore, the commenter's allegation that a Mixed Use Boulevard designation will be removed is inaccurate, and the Project's proposed General Plan Amendment and adjacency to a Mixed Use Boulevard is not incongruous.

The Project is not requesting "streamlined processing" under SB 375. As discussed in Section II, Project Description, of the Draft EIR, the Project is the continuation of an existing studio use and the modernization and expansion of media production facilities within the Project Site and is, therefore, not a residential or a mixed-use residential project. Regardless, the Project complies with the Sustainable Communities Strategy established by SCAG pursuant to SB 375. The commenter has provided no new significant information to question or refute the conclusions of the analysis within the Draft EIR related to the Project's compliance with SB 375 air quality and emissions targets.

Further, the Project has complied with all standard processes and procedures related to the preparation, circulation, and publication of an EIR and has not proposed or received "streamlined processing" to expedite or eliminate required milestones. Consistent with Section 15082 of the CEQA Guidelines, the City of Los Angeles prepared a Notice of Preparation to provide the public, nearby residents, property owners, responsible agencies, and other interested parties with information regarding the Project and its potential environmental effects. The associated public comment period began on July 2, 2021 and ended on August 2, 2021, during which a Scoping Meeting was held by the City of Los Angeles on July 20, 2021. Consistent with the requirements of Sections 15087 and 15105 of the CEQA Guidelines, the Draft EIR was submitted to the State Clearinghouse, Office of Planning and Research, and the Los Angeles County Clerk and was circulated for public review and comment for a 60-day period, exceeding the CEQA-required 45-day review period. This original 45-day comment period began on July 14, 2022, and was to end on August 29, 2022. In response to a request from Councilmember Paul Koretz's office, on August 19, 2022, the City of Los Angeles extended the comment period by an additional 15 days to September 13, 2022. In sum, the Project is consistent with applicable requirements of SB 375 and has not requested or been granted streamlined processing.

As identified in Table II-2 of Section II, Project Description, of the Draft EIR, a maximum of 700,000 square feet of general office would be permitted by the proposed Specific Plan. Buildout of the general office uses has been analyzed in full in the Draft EIR. Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, and Topical Response No. 3, Permitted On-Site Uses, regarding the five proposed studio uses. The Project does not include only office uses because such a proposal would not meet the Project objectives set forth in Section II, Project Description, of the Draft EIR.

Further, the Project does not involve “rebuilding” the studio as the Project proposes to rehabilitate and preserve the integrity of HCM No. 1167 (CHC-2018-476-HCM) located on-site, a scope of work which has been analyzed in Section IV.B, Cultural Resources, of the Draft EIR.

The commenter also conflates various definitions of floor area, including floor area as defined by Section 12.03 of the LAMC, floor area as defined by the proposed Specific Plan, and building area as defined by the California Building Code. The associated FAR calculation for the Project is consistent in the discussion and analysis presented throughout the Draft EIR, and the commenter has provided no evidence to question or refute the conclusions of the Draft EIR with regard to floor area and building area. See Topical Response No. 2, Definition of Floor Area is Appropriate, for further elaboration on the definition of floor area.

The commenter questions potential future conversions or changes of use to areas not initially tabulated in the Project’s FAR to areas that would meet the definition of floor area for the purposes of calculating the Project’s FAR. As detailed in Table II-2 of Section II, Project Description, of the Draft EIR, the proposed Specific Plan allows maximum amounts of floor area for each type of allowable use on-site, with a Land Use Exchange Program (described on pages II-16 to II-17 of the Draft EIR) allowing limited exchanges in the amount of floor area between certain permitted studio land uses. Conversion of area not currently tabulated as floor area would count towards the maximum amounts of floor area for each type of allowable use, and has therefore been considered in the analysis of the Draft EIR. As mentioned throughout the Draft EIR, the proposed Specific Plan would limit the total floor area to a maximum of 1,874,000 square feet, which was analyzed in the Draft EIR. Refer to Response to Comment Nos. 5-7 and 9-14 and Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding the Land Use Exchange Program.

With regard to jobs/housing balance, as discussed on page IV.K-68 of the Draft EIR, the Project supports initiatives to create transit-oriented developments by expanding employment opportunities near housing and promoting the jobs/housing balance in a dense urban area served by multiple forms of transit.

With regard to density increases and emergency services, refer to Response to Comment No. 16-5.

With regard to the preparation of a supplemental EIR, this comment does not provide substantial evidence to demonstrate that a supplemental EIR is required per Public Resources Code Section 21166 or CEQA Guidelines Section 15163. Accordingly, a supplemental EIR is not required.

Comment No. 16-3

The detailed comments that follow focus on the lack of adequate emergency services (police, fire) that are required by the General Plan Framework to be adequate before any discretionary increase in density is approved, or a new Regional Commercial Center approved.

Response to Comment No. 16-3

This comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project. Specific issues raised by the commenter are addressed in Response to Comment Nos. 16-4 through 16-78.

Comment No. 16-4

Regional Commercial Centers typically have a Height District 2 designation that allows 6:1 FAR, and are immediately adjacent to rail transit. This application appears to be a trojan horse for the 6:1 FAR on 25 acres of prime real estate that is about a mile from mass transit.

This project is inconsistent with the General Plan Framework (GPF). The General Plan Framework targets areas for high density in Commercial Regional Centers. GPF Figure 3-1, The Long-Range Land Use Diagram (Attachment A) does not show this site as a Regional Commercial Center. Approving a Regional Commercial Center is therefore inconsistent with the Long-Range Land Use plan for this area. It is ***spot-zoning on a massive scale.***

The applicant says it will increase entertainment jobs—but it could all be commercial offices. ***This project is a blank check for commercial office development.*** The Paramount update used only 1.2:1 FAR on a 60-acre lot. This is far more intense.

Response to Comment No. 16-4

The commenter incorrectly alleges that the Project's proposed General Plan Amendment to change the land use designation of the Project Site from various designations to a unified Regional Commercial is a method for achieving a greater permissible FAR. Refer to Response to Comment Nos. 5-8 and 11-29 regarding the proposed Regional Commercial designation, which does not allow for increased density or constitute spot zoning, contrary to this comment. In addition to the proposed General Plan Amendment, the Project is requesting a Vesting Zone Change from the C1.5 and C2 Zones to the TVC Zone and to assign the TVC Zone to an approximately 0.63-acre portion of the Project Site in an unincorporated area of the County to be annexed to the City. The purpose of the TVC Zone is to implement and effectuate the proposed Specific Plan. The Project Site's FAR will be governed by the regulations of the Specific Plan. As such, the commenter's elaboration on Height District designations and FAR limitations is not applicable to the Project since allowable FAR for the Project Site will be governed by the Specific Plan.

Contrary to the commenter's assertion, multiple parcels in the City of Los Angeles that are designated Regional Commercial are subject to FAR limitations of approximately 1.5 to 2. For example, the recently adopted, but not yet in effect, Hollywood Community Plan classifies central Hollywood as Regional Commercial with large swaths of parcels located in Height District 2 but carrying "D" Development Limitations enacted by City Council land use ordinance containing a range of FAR restrictions from 1.5 to 4. In the valley geography of the City of Los Angeles, the Canoga Park–Winnetka–Woodland Hills–West Hills Community Plan classifies the approximately 1.7 square-mile Warner Center neighborhood as Regional Commercial with corresponding FAR limitations between 1 and 2, and the Chatsworth–Porter Ranch Community Plan classifies an approximately 109-acre area surrounding the intersection of Tampa Avenue and Nordhoff Street as Regional Commercial with a corresponding FAR of 1.5 per the underlying zone. In South Los Angeles, the West Adams–Baldwin Hills–Leimert Community Plan classifies an approximately 62-acre area surrounding the intersection of Crenshaw Boulevard and Martin Luther King Jr. Boulevard as Regional Commercial with a corresponding FAR of 1.5 per the underlying "D" Limitations. Furthermore, there are numerous larger sites like Television City, including Universal Studios and the ICON at Panorama development located at 14665 Roscoe Boulevard, that have a Regional Commercial designation with zoning that permits a 1.5:1 FAR.¹²¹

Additionally, Chapter 3 of the Framework Element of the General Plan identifies that land designated as Regional Commercial is characterized by development that is built to a

¹²¹ See Case No. CPC-2016-2118-VZC-MCUP-CU-SPR-CDO-DD dated May 17, 2018.

FAR between 1.5 to 6.0. As the Specific Plan will allow a FAR of 1.75, the Project is consistent with the development that the Framework Element of the General Plan envisions for the Regional Commercial designation. Refer to Response to Comment No. 5-8 for further information regarding the proposed Regional Commercial land use designation. The commenter also provides contradictory statements regarding the existing General Plan Framework Element's Long Range Land Use Diagram and spot zoning. The Project is requesting a General Plan Amendment to change the Project Site's various land use designations to a unified Regional Commercial designation and to assign a Regional Commercial designation to an approximately 0.63-acre portion of the Project Site located within an unincorporated area of the County to be annexed to the City.

Spot zoning involves applying a zoning designation and/or other land use regulations to a single/small parcel of land that are substantially different from those applicable to other parcels in the vicinity. Refer to Response to Comment No. 11-29 regarding spot zoning.

The Project's potential land use impacts are analyzed on pages IV.H-39 to IV.H-57 in Section IV.H, Land Use and Planning, and Appendix I of the Draft EIR, which include an analysis of the General Plan Framework Element (including the Land Use Chapter, Open Space and Conservation Chapter, Economic Development Chapter, Transportation Chapter, and Infrastructure and Public Services Chapter), General Plan Conservation Element, the Mobility Plan, Wilshire Community Plan, LAMC, Citywide Design Guidelines, 2020–2045 Regional Transportation Plan/Sustainable Communities Strategy, and the South Coast Air Quality Management District Air Quality Management Plan. As analyzed therein, the Project would not conflict with the goals, policies, and objectives in any of these local and regional plans that were adopted for the purpose of avoiding or mitigating an environmental effect. Accordingly, the Draft EIR concluded that impacts related to land use and planning would be less than significant.

This comment incorrectly states that the Project is a commercial office project. As stated throughout the Draft EIR, the Project is a studio project and will include sound stage, production support, production office, general office, and retail uses. Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, and Topical Response No. 3, Permitted On-Site Uses.

Refer to Response to Comment No. 11-3 regarding the size of the Project.

Comment No. 16-5

Under the GPF, if an area not targeted for high density development is upzoned, this would have a significant adverse impact on police and fire service (Chapters 2.10 Fire, and 2.11 Police, FEIR ([Attachment B](#).) Also attached are the GPF ([Attachment C](#)),

the General Plan Framework FEIR ([Attachment D](#)); the GPF Statement of Overriding Considerations ([Attachment E](#)), and the Certification of the GPF by Council, including the NOD which indicates that mitigations are **mandatory** ([Attachment F](#)). In addition, please analyze the LAFD Dispatch Center Map showing a majority of stations without capacity to respond to alarms ([Attachment G](#)).

Response to Comment No. 16-5

This comment does not provide information that is specific to the Project. The analysis of the Project's potential impacts associated with both fire protection and police protection has been completed in consultation with LAFD and LAPD, respectively, using the criteria determined appropriate by each department. With regard to fire protection services, as discussed on page IV.J.1-20 of Section IV.J.1, Public Services—Fire Protection, of the Draft EIR, the analysis of fire protection and the need for new or expanded facilities is based on:

[The] project's land use, fire-related needs, and whether the project site meets the recommended response distance and fire safety requirements, as well as project design features that would reduce or increase the demand for fire protection and emergency medical services, are taken into consideration. Beyond the standards set forth in the Los Angeles Fire Code, consideration is given to the project size and components, required fire flow, response distance for engine and truck companies, fire hydrant sizing and placement standards, access, and potential to use or storage of hazardous materials. Further evaluation of impacts considers whether or not development of the project would create the need for a new fire station or expansion, relocation, or consolidation of an existing facility to accommodate increased demand. Consultation with LAFD is conducted to determine the project's effect on fire protection and emergency medical services.

In its August 6, 2021 letter (refer to Appendix K of the Draft EIR), LAFD considers each of these criteria and concludes that "inclusion of the above listed recommendations, along with any additional recommendations made during later reviews of the proposed project will reduce the impacts to an acceptable level." Accordingly, as concluded in the Draft EIR, operation of the Project would not result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, the construction of which would cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection services. As such, Project impacts were determined to be less than significant in the Draft EIR, and no mitigation measures are required. Refer to the Confirmatory Fire Analysis included in Appendix FEIR-12 of this Final EIR which confirms that the Project's impacts on fire protection services would be less than significant.

With regard to police protection services, as discussed on page IV.J.2-11 of Section IV.J.2, Public Services—Police Protection, of the Draft EIR, LAPD focuses on the residential population within a given service area to evaluate service capacity as well as existing police services provided by the police station serving the Project Site and the availability of police personnel to serve the estimated Project population. As discussed on pages IV.J.2-11 and IV.J.2-12 of the Draft EIR, the Project would not introduce a new residential population to the Project Site that could generate a direct demand for police protection services. Therefore, as no residential uses are proposed, the Project would not increase the LAPD residential service population in the Wilshire Division. Therefore, as concluded in the Draft EIR, the Project's impact on police services would be less than significant. Additionally, as provided in Project Design Features POL-PDF-2 through POL-PDF-7 (see pages IV.J.2-12 to IV.J.2-13 of the Draft EIR), the Project would include numerous operational design features to enhance safety within and immediately surrounding the Project Site, which would reduce the demand for police services. These include a comprehensive security plan that includes security fencing, secured points of entry, 24-hour security cameras, private on-site security staff, and staff security training protocols. Overall, as stated by LAPD (see Appendix L of the Draft EIR), "the Project, individually or combined with other past, present or future projects, will not result in the need for new or altered police facilities." The Project also would not result in a substantial increase in emergency response times as a result of increased traffic congestion attributable to the Project. Therefore, Project operation would not necessitate the provision of new or physically altered government facilities, the construction of which would cause significant environmental impacts, in order to maintain acceptable police protection services. Thus, Project impacts to police protection services would be less than significant.

The attachments referenced by the commenter, including the dispatch map, are associated with the General Plan Framework EIR that was prepared for the City's Citywide General Plan Framework in June 1996. The LAFD and LAPD data in these attachments from this Final EIR have been updated since 1996. Sections IV.J.1, Public Services—Fire Protection, and IV.J.2, Public Services—Police Protection, of the Draft EIR contain the updated data relevant to LAFD and LAPD services that are pertinent to the analysis of potential impacts associated with fire and police protection services.

The mitigation referenced by the commenter in the General Plan Framework Final EIR with regard to police and fire protection is in the form of Citywide goals, objectives, and policies located in the General Plan Framework itself. The Project's consistency with relevant goals, objectives, and policies from the General Plan Framework, including those related to fire protection and police protection, are discussed in detail on pages 5 and 6 of Appendix I, Land Use Plans Consistency Analysis Tables, of the Draft EIR. Furthermore, in accordance with the fire and police protection-related goals, objectives, and policies set forth in the Framework Element, the City, including LAFD and LAPD, would continue to

monitor the overall demand for existing and projected fire and police facilities and coordinate the development of new fire and police facilities to be phased with growth.

Under CEQA, mitigation measures are only imposed to reduce significant environmental impacts. CEQA Guidelines Section 15126.4 states that “[a]n EIR shall describe feasible measures which could minimize significant adverse impacts,” and “[m]itigation measures are not required for effects which are not found to be significant.”¹²² As discussed above, the Project’s impacts related to fire and police services would be less than significant, and no mitigation measures are required.

Comment No. 16-6

DCP treats the review of land use consistency in EIRs as an exercise in finding policies which support a project, and ignoring those that would prohibit it. This **“cherry picking”** has been called out against the City regarding the Hollywood Community Plan Update by Judge Allan Goodman ([Attachment H](#)). It applies to this General Plan Amendment as well.

- Please identify and analyze the GPF mandatory mitigations that are inconsistent with this project.

For example, this project clearly violates GPF Policy 3.3.2. But there is no mention of Policy 3.3.2. When forced to address it in court, the City claims it is a discretionary policy. It clearly is not. It is “Mitigation Through Policy” with thresholds of significance for both police and fire. The NOD certifying the EIR for the GPF states that mitigations are a condition of approval (Attachment F). Therefore, compliance with Policy 3.3.2 must be addressed in the EIR. ***Otherwise, the city is guilty of failing to enforce CEQA mitigations.***

Response to Comment No. 16-6

This comment does not provide any information that is specific to the Project. With regard to mitigation measures of the General Plan Framework Final EIR, refer to Response to Comment No. 16-5. With regard to thresholds of significance related to the analysis of public services, as set forth on page IV.J.1-20 of Section IV.J.1, Public Services—Fire Protection, and on page IV.J.2-10 of Section IV.J.2, Public Services—Police Protection, of the Draft EIR, the thresholds of significance were based on Appendix G of the CEQA Guidelines and supported by factors and considerations identified in the City’s 2006 L.A. CEQA Thresholds Guide, as appropriate.

¹²² CEQA Guidelines Section 15126.4(a)(1), (3).

With regard to General Plan Framework Policy 3.3.2, this policy is a Citywide policy regarding monitoring of services capacities Citywide with annual reports submitted to the City Council. This policy is not applicable to the Project. However, note that the related Objective 3.3 within the General Plan Framework regarding accommodating growth through adequate infrastructure and public services is addressed on pages 5 and 6 of Appendix I, Land Use Plans Consistency Analysis Tables, of the Draft EIR. As demonstrated in the analyses therein, the Project would not conflict with this objective. Furthermore, LAFD and LAPD continue to monitor their respective service capacities with regular reports to the City Council.

A comprehensive analysis of the Project's consistency with all applicable plans, including the General Plan Framework Element, is included on pages IV.H-39 to IV.H-56 of the Draft EIR. To support that discussion, a detailed list of the goals, objectives, and policies of the General Plan Framework Element applicable to the Project is provided in Table 1 of Appendix I of the Draft EIR, along with an analysis of the Project's consistency with each particular goal, objective, or policy. The Draft EIR concluded that the Project would not conflict with the goals, policies, and objectives in local and regional plans that were adopted for the purpose of avoiding or mitigating an environmental effect. Therefore, the Project would not conflict with or impede implementation of the General Plan or the environmental policies in other applicable plans adopted for the purpose of avoiding or mitigating an environmental effect. As such, impacts related to conflicts with applicable plans, policies, and regulations would be less than significant.

The comment is noted for the administrative record and has been incorporated into the Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 16-7

This project also violates the **Wilshire Community Plan** ([Attachment I](#)) in several respects. Yet, once again, these inconsistencies are not addressed in the EIR. Judge Goodman made it clear that cherry picking policies that comply while omitting policies, particularly mandatory policies, is not lawful.

- Please identify the Wilshire CP mandatory mitigations and policies, goals, and programs and if the project complies with those mandatory mitigations and findings.

To amend the General Plan by adopting a Specific Plan Regional Commercial Center that increases demand for city infrastructure and public services requires that infrastructure and city services are adequate for current demand and can accommodate additional demand (GPF Mandatory Mitigation Policy 3.3.2). These policies are embedded in the GPF FEIR

as mitigations and certified by the City Council as mandatory mitigations. Note that a **box is clearly checked** on the NOD stating that the **mitigations are a condition of approval**. They are not to be ignored or considered discretionary. The DCP does not have the authority to ignore CEQA mitigations that have been certified by the City Council. This is not a question of discretion to interpret a law or policy. This is a mandatory mitigation with specific thresholds of significance.

GPF FEIR Chapters 2.11 and 2.10 specify that the *thresholds of significance* are not the standard CEQA threshold of significance, i.e., whether new facilities will be constructed (DEIR, IV.J.1-18), but rather, *if service will be adequate*. The answer, according to LAFD is no, it may require new facilities, personnel and equipment, and new water delivery systems for hydrants (DEIR, Appendix K).

GPF FEIR Fire Chapter 2.10 (Attachment B) states the threshold of significance for fire service is NOT whether a new station must be built; it is whether services would be adversely impacted by added demand:

“2.10.2 Thresholds of Significance

Implementation of the City of Los Angeles General Plan Framework would result in a significant impact relative to fire/emergency medical services if it results in one or more of the following:

- If the Plan results in a substantial change in land use (equivalent to the introduction or designation of a Targeted Growth Area) in areas inadequately served currently by LAFD services based upon current General Plan planning standards;” [sic] (GPF, FEIR, p. 2.10-1).
- Please analyze the project’s compliance/noncompliance with this mandatory mitigation measure.

Consistency findings must be supported by substantial evidence, not “aspirational plans.” They must address the thresholds established by the GPF, not the CEQA boilerplate of limiting impacts for police or fire service to only if a new station must be constructed. For twenty years, DCP has abdicated its duty to insure adequate police and fire service. It does not have the authority to ignore the GPF’s mitigation policies.

- Constant updating and monitoring of city plans, the stock response to the adequacy question, is nonresponsive to the required finding of current and future adequacy. *It is the equivalent of the orchestra continuing to play while the Titanic sinks.*

- While CEQA permits statements of overriding considerations for impacts that cannot be mitigated, it does require that those impacts be identified and not ignored.
- CEQA does not permit elements of the General Plan to be inconsistent, and that is what will happen if the inconsistencies between this project and Elements of the General Plan (GPF, Housing Element) are left unaddressed.

Response to Comment No. 16-7

As discussed in Response to Comment No. 16-6, the analysis of potential impacts associated with public services is based on the threshold set forth in Appendix G of the CEQA Guidelines. This threshold specifically addresses whether the Project would:

Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which would cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for public services.

As discussed above in Response to Comment No. 16-5, in using this threshold, the City has determined that the Project's potential impacts on fire protection and police protection would be less than significant. The threshold in the 1996 General Plan Framework EIR is not applicable to the Project. Please note that the commenter's statement that the proposed General Plan Amendment to change the Project Site's land use designation to Regional Commercial would increase demand for City infrastructure and public services is inaccurate.

In addition, a detailed analysis of the Project's consistency with relevant policies of the Wilshire Community Plan is included on pages 17 through 25 of Table 2 in Appendix I, Land Use Plans Consistency Analysis Tables, of the Draft EIR. As discussed therein, the Project would not conflict with any of the applicable objectives or policies within the Wilshire Community Plan, including Objective 8-1, Policy 8.1-1, Policy 8.2-2, and Policy 8-2.3 related to police protection and Policy 9-1.1 related to fire protection.

The Project does not propose residential uses, and, therefore, the goals, objectives and policies in the General Plan Housing Element are not applicable to the Project.

Comment No. 16-8

- There is no analysis or assessment of impacts of homelessness on the consumption of emergency services. The traditional way of estimating demand for services is per capita of residents, day-time population (commercial). It is not

known how the city includes the demands of homeless individuals for emergency medical service or for police response. Please explain how both departments evaluate the demand for service and its capacity to meet that demand.

Response to Comment No. 16-8

The potential impact of homelessness on the consumption of emergency services is not an environmental topic under CEQA, and this comment does not discuss information specific to the Project. Notwithstanding, as discussed on page VI-29 of Section VI, Other CEQA Considerations, of the Draft EIR, as no housing currently exists on the Project Site, the Project would not cause the displacement of any persons or housing. Therefore, the Project would not contribute to the consumption of emergency services by people experiencing homelessness. In addition, as discussed in Response to Comment No. 16-5, LAFD and LAPD have been consulted on the Project and the City has determined that the Project's potential impacts on fire protection and police protection would be less than significant. As discussed in Response to Comment No. 16-5, these reviews were based upon a number of factors, including the current ability of the respective departments to respond to requests for service, which would include the consumption of emergency services by people experiencing homelessness.

Comment No. 16-9

Citywide, the deployment of LAFD personnel and equipment involves about 50 stations being dark on any given day. This means that just because there is a fire station near a project site, ***it is not reasonable to assume that it will be available to respond to an alarm***, and that help will come from further away stations and their response time will be hampered by traffic congestion.

- Please provide data on how often Wilshire Plan Area fire stations are dark on a monthly basis for the past two years.
- Please see the LAFD Dispatch Center Map (Attachment G). It shows very few stations are fully available in the City of Los Angeles. Please provide similar maps on an hourly basis for a week for the service area for the proposed project. How often are the six stations dark or not fully staffed?
- Please provide a map that shows all intersections between the first-in station and the project that are LOS E or F as required by City CEQA Threshold Guide (K.2-4). Note that the gridlock experienced around the project site precludes cars pulling to the right to allow emergency vehicles to move. With traffic signal overrides, there is no place to move if the lanes across the intersection are also at a standstill. For evidence of slower response times, each LAFD Annual Strategic Plan shows deteriorating response times.

- How will this project impact response times given the level of congestion at surrounding intersections, and the presence of 18-wheeler trucks attempting to turn corners?
- LAFD fails to report response times as recommended by the National Fire Protection Association 1710, as a percentile of responses within the benchmark time of 5 minutes for a medical emergency (the benchmark is 90% within 5 minutes), and for a fire the benchmark is 90% responses within 5 minutes 20 seconds. Instead, it averages response times. Compounding this situation is the reporting of response times for each fire station on FireStatLA.org only reports the closest station, known as the first-in station. But many times, the first-in station is out, or closed, and more distant stations respond. The response times for non-first-in stations do not show up in public reporting. Please provide these response times.

The data provided in the DEIR is insufficient/misleading for the public and decisionmakers to determine if service is adequate and can accommodate additional demand. Appendix K says it may not be able to meet added demand. More information is required to determine whether fire service is adequate:

- Please provide the response time for the six stations in the Wilshire Plan Area using the benchmark of NFPA 1710 rather than average response times.
- Please provide how many days a month the six stations are dark.
- Please provide what the current staffing is and whether this is considered adequate.
- Please provide a table of response times for the past 10 LAFD Annual Strategic Plans.
- Please address the failure of LAFD to adopt Standards of Cover. When will they be adopted? Is there a draft plan available to share with the public and decision-makers?

Response to Comment No. 16-9

As discussed in Response to Comment No. 16-5, LAFD and LAPD have been consulted on the Project and the City has determined that the Project's potential impacts on fire protection and police protection would be less than significant. These determinations were based on recent data and specific criteria used by LAFD and LAPD. The information requested in this comment varies from the criteria used by City Planning to evaluate impacts associated with fire protection services. Also refer to Response to Comment No. 16-5 regarding LAFD's Letter included in Appendix K of the Draft EIR that was used to analyze impacts associated with fire protection. With regard to LAFD emergency response

times, refer to Response to Comment No. 9-35. Also refer to Section D, Emergency Access, of Topical Response No. 12, Safety and Congestion, regarding emergency response during construction.

Comment No. 16-10

The EIR relies on conclusory speculative statements. Therefore, Fix The City therefore submits to the Planning Department 26,000 pages (Attachment J) of substantial evidence of inadequate infrastructure and city services, including emergency services. This evidence is from the City's own websites. ***The evidence makes it abundantly clear that infrastructure and public services are not adequate.*** Several links to city documents are provided here: (http://bss.lacity.org/NeighborhoodCouncils/street_assessment_map/map.html)

- Parks assessment (http://lacountyparkneeds.org/FinalReportAppendixA/StudyArea_085.pdf)
- Sidewalk status (<http://graphics.latimes.com/la-sidewalks-map/>)
- Water pipe status (<http://graphics.latimes.com/la-aging-water-infrastructure/>)

Response to Comment No. 16-10

The documents referenced by the commenter are not specific to the Project. Rather, they address the overall infrastructure status of parks, sidewalks, and water pipes citywide. As discussed in Response to Comment No. 16-5, LAFD and LAPD have been consulted on the Project and the City has determined that potential impacts to fire protection and police protection services would be less than significant. With regard to parks, refer to Response to Comment No. 35-135. With regard to sidewalks, refer to Section II, Project Description, of the Draft EIR regarding the enhanced streetscape improvements that would be implemented as part of the Project.

With regard to “water pipe status” and infrastructure related to fire protection, LADWP determined that the local infrastructure serving the Project Site related to fire flow would be adequate. As discussed on pages 19 and 20 of the Utility Report included as Appendix O of the Draft EIR, domestic and fire water service to the Project Site would continue to be supplied by LADWP. Fire flow to the Project Site would be required to meet City fire flow requirements as set forth in LAMC Section 57.507.3.1, which establishes fire flow standards by development type. As identified by LAFD, the required fire water flow for the Project Site has been determined to be 6,000 to 9,000 gpm from four to six hydrants flowing simultaneously with a minimum residual water pressure of 20 pounds per square inch (psi), which corresponds to the Industrial and Commercial land use category. As discussed in the Utility Report, an Information of Fire Flow Availability Report (IFFAR) was

submitted to LADWP to determine if the existing public water system will have adequate water pressure to serve the Project's anticipated fire and domestic water needs. Based on the completed IFFAR (see Exhibit 2 of Appendix O of the Draft EIR), all six of the existing public fire hydrants (two on Beverly Boulevard, two on Fairfax Avenue, and two on The Grove Drive) flowing simultaneously can deliver combined flows of 9,000 gpm, which falls within the specified fire flow range for the Project. Therefore, based on the IFFAR, there is adequate fire flow available to serve the Project, and the Project would thus comply with its fire flow requirements. As such, as determined by LADWP, local water infrastructure serving the Project Site with regard to fire protection would be adequate.

Comment No. 16-11

Pedestrian Hazards and Queuing Capacity

- ***The multiple driveways create pedestrian hazards*** and need to be consolidated. Please provide mitigation of pedestrian hazards by consolidating driveways.
- ***Queuing distance for driveways appears to be inadequate.*** Please calculate the queuing demand for these driveways and the traffic impacts of inadequate queuing capacity.
- ***There is no internal circulation roadway*** which might mitigate congestion: please address
- There is no analysis of ***how large trucks will access*** the site and the required turning radius for such trucks (i.e., 18-wheelers). How would these large trucks impact the local circulation system, which is already at LOS F in most places?
- How will 18-wheelers seeking to access the site impact congestion and air quality?

Response to Comment No. 16-11

The Project's transportation impacts were comprehensively analyzed in Section IV.K, Transportation, of the Draft EIR in accordance with CEQA and were determined to be less than significant during both construction and operation of the Project. Thus, mitigation is not required, as incorrectly stated in this comment. Specifically, to address the five comments above:

1. Refer to Section E, Pedestrian Safety at Project Driveways, of Topical Response No. 12, Safety and Congestion, regarding the proposed driveways and pedestrian safety. As discussed in detail therein, the number of driveways is proportional to the increase in the size of development and fewer driveways

would result in a greater mix of trucks and automobiles at each driveway, as well as longer queues, and consolidating driveways would create a number of safety and operational issues. Furthermore, the number of driveways is consistent with LADOT's Manual of Policies and Procedures Section 321. Lastly, the design of each driveway would be reviewed and approved by LADOT as part of the design, regulatory permitting and construction process, and safety issues like safe sight distance and pedestrian control across the signalized locations would be confirmed in the detailed driveway design approval process.

Refer to Response to Comment No. 9-29 regarding traffic hazards. The comment incorrectly states that the driveways create pedestrian hazards. Refer to Response to Comment Nos. 16-72 and 26-E.4-3 regarding pedestrian safety and the Project's pedestrian-oriented design.

2. Project driveway queueing distance is discussed in Section A, Queueing at Project Driveways, of Topical Response No. 12, Safety and Congestion. Queue lengths at the Project driveways were evaluated and summarized in Section 5B of the Transportation Assessment (included in Appendix M.1 of the Draft EIR) as part of the non-CEQA transportation analysis. As discussed therein, adequate queueing storage would be provided at each Project driveway to minimize the potential for vehicles to back out into the adjacent arterial streets. Thus, the commenter's assertion about inadequate queueing capacity is incorrect.
3. As discussed on pages II-25 to II-26 in Section II, Project Description, of the Draft EIR, the Project would include a multi-level internal circulation system that provides efficient and safe access and circulation for both automobiles and trucks throughout the Project Site. See Figure II-4 on page II-14 of the Draft EIR, which shows the Conceptual Site Plan, including the internal circulation system within the Project Site.
4. Truck turning radius tests have been completed for both existing and proposed driveways to ensure adequate access is provided and the design of each Project driveway would be reviewed and approved by LADOT prior to final construction as part of the regulatory building permit process. The truck trips are included in the Project trip generation, and, thus, the transportation analysis for the Project includes the effects of trucks at the Project driveways and at each of the 31 study intersections. The Project trip generation is shown in Table 6 on page 81 of the Transportation Assessment (Appendix M.1 of the Draft EIR), while Figure 21 (page 77) and Figure 22 (page 80) of the same document show the assignment of Project trips through the study intersections and the Project driveways, respectively. Table 18 of the Transportation Assessment (page 162) summarizes the Project's effects, including the movement of Project trucks, on the performance of the 31 study intersections.

The statement that the local circulation system “is already at LOS F in most places” is incorrect. Table 17 on page 160 of the Transportation Assessment shows that only one of the 60 peak hours tested at the study intersections currently operates at LOS F. With respect to congestion during construction, as discussed on page IV.K-1 of Section IV.K, Transportation, of the Draft EIR, with the passage of SB 743, the analysis of transportation impacts shifted from driver delay (i.e., LOS) to VMT. Therefore, congestion is not a CEQA impact, and as discussed above, mitigation is not required. Refer to Section B, Level of Service, of Topical Response No. 12, Safety and Congestion, regarding the non-CEQA LOS analysis in the Transportation Assessment.

5. The truck movements in and out of the Project Site, including 18-wheelers, are also included in the air quality analysis in Section IV.A, Air Quality, of the Draft EIR (refer to pages IV.A-59 through IV.A-62 and IV.A-65 through IV.A-67). As discussed therein, with the implementation of Mitigation Measures AIR-MM-1 through AIR-MM-4, peak daily regional NO_x emissions would be reduced but would still exceed the SCAQMD regional threshold of 100 pounds per day. As such, Project construction would result in a significant Project-level and cumulative impact related to regional NO_x emissions, even with the incorporation of feasible mitigation measures. Although temporary, this impact would be significant and unavoidable.

Comment No. 16-12

The ***Air Quality analysis*** is so speculative that it is inadequate and must be redone based on a draft specific plan. Los Angeles is a non-attainment area under the Federal Clean Air Act. The GPF was adopted to comply with the Clean Air Act (see Certification, Attachment F).

- What is the status of air quality now and projected in the future?
- How many sensitive receptors will be impacted by increased air pollution due to the operation of the project and of the increased congestion produced by the project?

Response to Comment No. 16-12

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding how the Draft EIR disclosed all elements of the proposed Specific Plan required by CEQA and provided a comprehensive analysis of the Project’s impacts in accordance with CEQA.

Please refer to Section 2.b. in Section IV.A, Air Quality, of the Draft EIR, which provides a discussion of federal attainment status and target years for achieving attainment and discusses the Air Quality Management Plan (AQMP) in effect at the time of the analysis.

Section 3.d in Section IV.A, Air Quality, of the Draft EIR analyzed localized operational air quality impacts resulting from Project emissions consistent with SCAQMD Localized Significance Threshold (LST) guidelines. As shown in Table IV.A-10 of the Draft EIR, Project localized operational emissions would not exceed SCAQMD significance thresholds, resulting in a less-than-significant impact. Thus, no sensitive receptors would be impacted by increased air emissions due to the operation of the Project.

Section 3.d in Section IV.A, Air Quality, of the Draft EIR also analyzed air quality impacts associated with Project vehicle trips. Consistent with the carbon monoxide (CO) methodology discussed on page IV.A-45 in Section IV.A, Air Quality, of the Draft EIR, if a project intersection does not exceed 400,000 vehicles per day, then the project does not need to prepare a detailed CO hot spot analysis. At Project buildout, the highest average number of daily trips at an intersection would be approximately 65,260 trips at La Brea Avenue and Beverly Boulevard, which is substantially below the daily traffic volumes expected to generate CO exceedances as evaluated in the 2003 AQMP. Therefore, the Draft EIR correctly concluded that the Project does not trigger the need for a detailed CO hotspots model and would not cause any new or exacerbate any existing CO hotspots, and impacts related to localized mobile source CO emissions would be less than significant. Thus, no sensitive receptors would be impacted by Project-related vehicular air emissions due to the operation of the Project.

Comment No. 16-13

There is no identification of off-site parking locations, the number of spaces, the hours of off-site parking, or analysis of neighborhood traffic intrusion, an adverse environmental impact.

- Will off-site parking be within the code-required distance from the project site? How can a traffic analysis be conducted if the parking and circulation patterns of off-site spaces are not identified.
- Leased facilities can be canceled easily. By contrast, covenanted spaces within proximity to the project site, are a more reliable basis for parking demand.

Response to Comment No. 16-13

The Project no longer proposes off-site parking. Refer to Section B, Off-Site Parking, of Topical Response No. 13, Parking, and Section III, Revisions, Clarifications,

and Corrections to the Draft EIR. Refer to Section A, Parking Supply, of Topical Response No. 13, Parking, regarding a discussion of the adequacy of the proposed on-site parking supply. Refer to Topical Response No. 9, Neighborhood Traffic Management Plan, regarding the non-CEQA analysis of cut-through trips. As discussed therein, the adequacy of a project's parking supply and cut-through effects are not environmental impacts under CEQA.

Comment No. 16-14

When repeatedly challenged by Fix The City to make of adequacy for infrastructure and public services, the DCP has relied on “aspirational” plans rather than substantial evidence of adequacy, and claimed it is monitoring and updating plans. That is nonresponsive to the question at hand: adequacy of infrastructure and public services, particularly Police and Fire, using the thresholds in the GPF FEIR. This EIR ignores the answer from the Fire Department that fire service may be inadequate. That is substantial evidence. ***But nowhere in the EIR is there an answer to whether police and fire service are adequate now, or if they could accommodate added demand.*** Please provide analysis that answers these questions.

Does the project area have enough sworn officers? The answer is no. Based on the General Plan Framework, as of 2001, ***an adequate number citywide was 17,673 sworn officers*** (Statement of Overriding Considerations, FEIR, p. 20, Attachment E). Today LA has around 9,300 sworn officers and a larger population. Please analyze the demand for service from the homeless population in addition to the residential and commercial populations.

The DEIR fails to address mandatory CEQA mitigations in both the General Plan Framework Element (GPF) and the WLA Community Plan (CP). *The required finding is not whether new police or fire facilities are required, but if police, fire, and infrastructure are ADEQUATE as defined in the GPF and the CP, and if the project is consistent with mandatory policies and mitigations.*

Response to Comment No. 16-14

With regard to the adequacy of LAFD fire protection and LAPD police protection services and infrastructure, refer to Response to Comment Nos. 9-35, 16-5, 16-10, 26-147, and 35-133.

With regard to the number of sworn officers, the analysis within Section IV.J.2, Public Services—Police Protection, of the Draft EIR accounts for sworn officers citywide and within the service area of the Project Site. As stated on page IV.J.2-7 of the Draft EIR,

according to LAPD's correspondence (see Appendix L of the Draft EIR), the departmental staffing resources include 9,506 sworn officers.

With regard to the homeless population, see Response to Comment No. 16-8.

With regard to public services objectives and policies within the General Plan Framework and Wilshire Community Plan, refer to Response to Comment Nos. 16-5 and 16-7, respectively.

Comment No. 16-15

Furthermore, in making required general plan and community plan findings, DCP cherry-picks General Plan Framework or Community Plan policies which support an approval and excludes policies that are blatantly violated by an approval, and fails to support its findings with substantial evidence.

Cherry-picking policies that a project supports while ignoring the policies and mitigations that are violated, without substantial evidence is unlawful, as stated clearly by LA Superior Court Judge Alan Goodman regarding Fix The City's lawsuit challenging the Hollywood Community Plan Update ([Attachment H](#)).

Response to Comment No. 16-15

The Project's lack of conflict with the General Plan is discussed on pages IV.H-39 through IV.H-44 of Section IV.H, Land Use and Planning, and on pages 1 through 25 of Appendix I, Land Use Plans Consistency Analysis Tables, of the Draft EIR. The policies evaluated therein were not chosen at will but are the policies applicable to the Project that were adopted for the purpose of avoiding or mitigating an environmental effect, which is the threshold under Appendix G of the CEQA Guidelines.

As identified in Chapter 1 of the Framework Element, "State law recognizes that the diversity of the State's communities and their residents and, thus, requires them to implement the general plan law in ways to accommodate local conditions while meeting its minimum requirements" (Gov't Code § 65300.7). Further, State law recognizes that cities' and counties' capacity to respond to State planning law will vary due to the differences between them in size, characteristics, population, density, fiscal and administrative capabilities, land use and development issues and human needs (Gov't Code § 65300.9). As a result, State law has given a city with the diversity and size of Los Angeles latitude in formatting, adopting and implementing its general plan, as long as it adheres to the minimum requirements of State law. Further, Chapter 10 of the Framework Element acknowledges the latitude provided by State law for the purposes of implementing General Plan goals, objectives, and policies, by stating "not all plan policies can be achieved in any

given action, and in relation to any decision, some goals may be more compelling than others. On a decision-by-decision basis, taking into consideration factual circumstances, it is up to the decision makers to decide how to best implement the adopted policies of the general plan in any way which best serves the public health, safety and general welfare.” In conformance with these provisions of the Framework Element of the General Plan, consistency analyses related to the Project’s conformance with each element of the General Plan are provided in applicable sections of the Draft EIR. In particular, refer to Section IV.H, Land Use and Planning, and Appendix I, Land Use Plans Consistency Analysis Tables, of the Draft EIR.

Additionally, contrary to the commenter’s suggestion, the Department of City Planning has neither made any decision on the Project nor issued any determinations on any component of the Project. The findings for the proposed General Plan Amendment would be prepared subsequent to the publication of the Project’s Final EIR and would be provided to the decision-makers within the Staff Recommendation Report, prior to any decision being made on the Project.

Comment No. 16-16

The city has repeatedly claimed in litigation that Policy 3.3.2 is discretionary. Fix The City submits substantial evidence, the NOD certifying the adoption of the FEIR for the General Plan Framework (Attachment D) as evidence of the mandatory obligation to implement the mitigations of the GPF. *The NOD clearly states that the mitigation measures are mandatory.* **The city is failing to implement mandatory CEQA mitigation measures adopted by the City Council when it certified the General Plan Framework.** GPF Policy 3.3.2 is a policy included as “Mitigation Through Policy.”

The FEIR for the GPF states:

“2.11.2 Threshold of Significance

Significant impacts relative to police services would occur if the future population generated under the proposed plan necessitates an increase in the number of sworn officers (based on planning ratios) which cannot be provided for” (*FEIR, p. 2.11-1, emphasis added*).

In other words, with the increase in population since 2001, and the reduction in sworn officers, a significant adverse impact exists. While a statement of overriding consideration might (mistakenly) be considered a solution, it does not resolve the inconsistency with the General Plan. Furthermore, Figure 3-1 (Attachment D) of the GPF makes it clear that this site is not designated for a Regional Commercial Center.

Failure to provide **adequate** (as defined by the GPF) police service is a **significant adverse impact**. The City does not currently provide adequate police service and is therefore prohibited by Policy 3.3.2, a mandatory mitigation, from approving discretionary increases in density or intensity. The City certified the GPF FEIR, but has not complied with its very clear mandate to safeguard public safety.

The GPF FEIR Statement of Overriding Considerations (Attachment E) shows this policy is a mitigation for police service:

“J. POLICE

1. Impacts

The amount of population. Employment. And housing growth that the Framework Element permits by policy could result in a significant increase in the demand for police protective services as compared to existing baseline levels (1990).” (WCP, p. III-) [sic]

Based on the planning ratio standard used. To determine the adequacy of the supply of sworn officers, **a total of 17.673 officers would be needed to adequately accommodate the City’s 2010 average day/night population. This is in comparison to the 8,817 sworn officers that were on the force as of 1990.**

“These impacts are potentially significant.” (GPF, SOC, p. 19).

2. Mitigation Measures

*The Framework Element’s economic development policy targets an employment base that exceeds SCAG’s jobs forecast to maintain the City’s 1990 jobs/housing ratio through the year 2010. This increased economic base will provide additional revenue necessary to **pay for added police protective services. Additionally. The Framework Element includes a policy that requires the City to correlate the type, amount, and location of development with the provision of adequate supporting infrastructure and public services**” (SOC, p. 20, emphasis added).*

In Fix The City’s litigation over the GPF, the City argued that if it lacked the resources to maintain adequate police and fire, it would not approve discretionary increases in density or intensity.

The GPF FEIR Statement of Overriding Considerations makes this clear: “the Framework Element includes a policy that requires the City to correlate the type, amount, and location

of development with the provision of adequate supporting infrastructure and public services” (p. 19).

Response to Comment No. 16-16

With regard to mitigation measures of the General Plan Framework Final EIR, refer to Response to Comment No. 16-5. With regard to the adequacy of LAFD fire protection and LAPD police protection services and infrastructure, refer to Response to Comment Nos. 9-35, 16-5, 16-10, 26-147, and 35-133.

Comment No. 16-17

All mitigations, including policy mitigation measures, are mandatory, as explained in the Community Plan:

“The quality of life and stability of neighborhoods throughout the West Los Angeles Community critically depends on providing infrastructure resources (i.e., police, fire, water, sewerage, parks, traffic circulation, etc.) commensurate with the needs of its population. If population growth occurs faster than projected and without needed infrastructure improvements to keep pace with that growth, the consequences for livability within the Community could be problematic.

Accordingly, the proposed Plan has three fundamental premises. First, is limiting residential densities in various neighborhoods to the prevailing density of development in these neighborhoods. Second, is the monitoring of population growth and infrastructure improvements through the City’s Annual Report on Growth and Infrastructure with a report to the City Planning Commission every five years on the West Los Angeles Community following Plan adoption. Third, if this monitoring finds that population in the Plan area is occurring faster than projected; and, that infrastructure resource capacities are threatened, particularly critical ones such as water and sewerage; and, that there is not a clear commitment to at least begin the necessary improvements within twelve months; then building controls should be put into effect, for all or portions of the West Los Angeles Community, until land use designations for the Community Plan and corresponding zoning are revised to limit development. The Community Plan includes appropriate policies and implementation measures generated from the mitigation measures listed in the environmental clearance. In many instances these measures encompass the policies contained in the General Plan Framework Element.” (WLA Community Plan p. III-1, emphasis added).

The Wilshire Community Plan imposes restrictions on discretionary approvals **when critical resources are threatened, such as water supply**, as is the current situation in California and Los Angeles. It is common knowledge that California is in an historic drought. Our water supplies are indeed threatened. We have mandatory watering restrictions, the MWD and Colorado River Authority have recognized the drought and severe reductions in supply. The City is relying upon an outdated DWP water supply plan that fails to acknowledge and act accordingly with the drought, as mandated by the Community Plan.

For example, although the GPF calculated that 17,673 sworn officers were required to provide adequate police service in 2001 (SOC, p. 20), the city has only about 9300 sworn officers. **Therefore, the city is not providing the level of police service considered adequate in the GPF.**

Under GPF Policy 3.3.2 and the WCP, the City is obligated to deny discretionary increases in the intensity or density of projects if police or fire services are inadequate. Findings must be supported by substantial evidence, and not by referencing aspirational plans and monitoring of those plans. Public safety is the first responsibility of local government under the California Constitution. In the approval process for massive projects, it is ignored. One explanation for this willful violation of the GPF and the WCP is that the budget of the Planning Department is funded by planning fees from developers. Another is that new development raises the tax base. The City does not act as an objective evaluator. It has an institutionalized conflict of interest in which public safety is jeopardized in order to keep a bureaucracy funded.

This is a general plan issue, and not the city's CEQA workaround that ignores adequacy and instead focuses only on the CEQA threshold of significance if a new police or fire station is required to be constructed, and ignores the CEQA Checklist for conflicting with adopted plans, policies and regulations adopted to mitigate environmental impacts. That is also a CEQA checklist threshold, but it is ignored by this DEIR, and must be addressed in a Supplemental EIR that provides:

1. The Draft Specific Plan
2. The Draft Development Agreement
3. Analysis of Housing Element impacts removing thousands of units from residential development
4. Substantial evidence on the response times for police and fire in the project area, as well as the number of days the 6 stations in the Wilshire Community Plan are dark. Please utilize the LAFD Dispatch Center maps to identify the staffing and

operation of all six stations, their response times (not average response times) following NFP1710, and address the substantial evidence from LAFD that fire service will be inadequate. Under these circumstances, approval of an increase in density or intensity for the subject property would be in direct violation of the GPF SOC and the Wilshire Community Plan.

Response to Comment No. 16-17

The commenter is referring to text contained within the Land Use Plan Policies and Programs Section of the Wilshire Community Plan (Page III-1) that is specifically applicable to projects situated on parcels designated for residential uses by the Community Plan and/or projects containing residential dwelling units in their scope of work. Therefore, this narrative contained in the Community Plan is not applicable to the Project, as—consistent with the Project Description included in Section II of the Draft EIR—the Project does not contain any residential dwelling units or is located on land designated for residential uses by the Community Plan. In accordance with the CEQA Guidelines, City of Los Angeles CEQA Thresholds Guide, and Policy 8-1.1 of the Wilshire Community Plan, consultation with the LAPD regarding the review of development project and land use changes is required to determine law enforcement needs and requirements. This consultation has been completed, as shown in Appendix L of the Draft EIR. As identified on page 20 in the General Plan Framework Revised Findings and Statement of Overriding Considerations dated July 17, 2001, the City should seek to secure additional resources for funding the enhancement of the number of sworn officers needed. As shown in Section II-4 of the Draft EIR, one objective of the Project is to provide substantial economic opportunities for the City and its residents in the form of tax and property revenue. Approval and buildout of the Project would provide the City enhanced resources to allocate to public safety and other necessary City services.

With regard to the appropriate threshold to use for analyzing potential impacts to fire and police protection, refer to Response to Comment No. 16-6. With regard to the Project's consistency with the relevant objectives and policies of the Wilshire Community Plan, refer to Response to Comment No. 16-7. With regard to mitigation measures of the General Plan Framework Final EIR, refer to Response to Comment No. 16-5. With regard to the adequacy of LAFD fire protection and LAPD police protection services and infrastructure, refer to Response to Comment Nos. 9-35, 16-5, 16-10, 26-147, and 35-133. Also refer to Response to Comment No. 16-66 regarding the adequacy of water supplies to serve the Project and the consideration of drought conditions, and Response to Comment No. 26-175 regarding the Project's water demand and impact analysis.

Note that the comments regarding the Planning Department do not raise CEQA issues and are not specific to the Project, and no response is required. However, those comments are noted for the administrative record and have been incorporated into this

Final EIR for review and consideration by the decision-makers prior to any action on the Project.

This comment incorrectly asserts that the CEQA checklist item for conflicts with adopted plans, policies and regulations adopted to mitigate environmental impacts was ignored. The Project's impacts related to land use were analyzed in Section IV.H, Land Use and Planning, of the Draft EIR. In accordance with CEQA, the Draft EIR analyzed the Project's consistency with applicable plans, policies, and regulations that regulate land use on the Project Site, including the LAMC and the Wilshire Community Plan, among others, as well as the compatibility of the proposed uses with surrounding land uses. CEQA Guidelines Section 15125(d) requires that an EIR include a discussion of any inconsistencies between the proposed project and applicable general plans, specific plans, and regional plans. Separately, CEQA Guidelines Appendix G recommends that a lead agency consider whether the project would cause a significant environmental impact due to a conflict with a land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. Per Appendix G of the CEQA Guidelines, a project would have a significant impact related to land use if it would (a) physically divide an established community; or (b) cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. As discussed on pages IV.H-38 to IV.H-39 of the Draft EIR, the Project would not physically divide an established community. As discussed on pages IV.H-39 to IV.H-57 and Appendix I of the Draft EIR, which included an analysis of the General Plan Framework Element (including the Land Use Chapter, Open Space and Conservation Chapter, Economic Development Chapter, Transportation Chapter/Mobility Plan 2035, and Infrastructure and Public Services Chapter), General Plan Conservation Element, Wilshire Community Plan, LAMC, Citywide Design Guidelines, 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy and South Coast Air Quality Management District Air Quality Management Plan, the Project would not conflict with the goals, policies, and objectives in local and regional plans that were adopted for the purpose of avoiding or mitigating an environmental effect. Accordingly, the Draft EIR correctly concluded that impacts related to land use would be less than significant.

The comment incorrectly states that a supplemental EIR is required. Under CEQA, a supplemental EIR is only required if one or more of the following events occurs:

- (a) Substantial changes are proposed in the project which will require major revisions of the environmental impact report.
- (b) Substantial changes occur with respect to the circumstances under which the project is being undertaken which will require major revisions in the environmental impact report.

- (c) New information, which was not known and could not have been known at the time the environmental impact report was certified as complete, becomes available.¹²³

However, none of these criteria apply to the Project.

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan. As discussed therein, the Draft EIR disclosed all of the elements of the Project required by CEQA and provides a comprehensive analysis of the Project. A draft Specific Plan and Development Agreement are not required to be published for evaluation of the Project. In addition, the Preliminary Draft Specific Plan incorporates the same physical elements that could result in a physical impact on the environment that were fully disclosed and analyzed in the Draft EIR.

The comment regarding housing does not concern the Draft EIR's analysis of environmental impacts. Please note that, as discussed in Response to Comment No. 28-9, the Project would not result in a net downzoning or otherwise reduce housing capacity and population. The proposed Specific Plan would not lessen housing intensity or change other development standards in a way that would individually or cumulatively reduce the Project Site's housing capacity. Further, as the Project does not include a change in use, the Project Site's housing capacity would be the same as existing conditions.

Comment No. 16-18

Inconsistency with plans, policies and regulations adopted to mitigate environmental impacts is a CEQA impact. This project is inconsistent with both the GPF, its SOC, and its NOD indicating that the mitigations (e.g., "Mitigation Through Policy") are mandatory. See GPF FEIR, p. [sic]

For example, regarding transportation, the plan repeats the language of the GPF SOC:

***“Objective 16-2** Ensure that the location, intensity, and timing of development is consistent with the provision of adequate transportation infrastructure.*

¹²³ Public Resources Code Section 21166.

Policies

16-2.1 No increase in density shall be effected by zone change, plan amendment, subdivision, or any other discretionary action, unless the Decision-makers make the following findings or a statement of overriding considerations:

The transportation infrastructure serving the project site and surrounding area, presently serving the affected area within the Wilshire Community Plan, have adequate capacity to accommodate the existing traffic flow volumes, and any additional traffic volume which would be generated from projects enabled by such discretionary actions.

Program: *Decision-makers shall adopt findings with regard to infrastructure adequacy as part of their action on discretionary approvals of projects which could result in increased density or intensity” (WCP, p. III-36–37).*

There is no available capacity at the nearby intersections. The finding cannot be made regarding adequate transportation capacity.

There is no analysis, evidence, or reference to the mandatory requirements for discretionary approvals included in the LOD, for the Community Plan or the General Plan Framework. The city’s workaround for a crumbling infrastructure and inadequate public service is to only reference (if at all) the policies which the LOD supports, and never addresses the mandatory findings of adequacy, or direct violation of the Community Plan.

This *cherry-picking* has been called-out by Judge Goodman (Attachment B). Indeed, the City CEQA Thresholds Guide asks “would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project... for the purpose of avoiding or mitigating an environmental effect?” (Thresholds Guide, p. H.1-1). By ignoring the answer(s) to this CEQA question, and cherry-picking, the city is ignoring mitigations is obligated to enforce.

Response to Comment No. 16-18

The Draft EIR addressed transportation in Section IV.K, Transportation, with supporting data in the form of a comprehensive Transportation Assessment approved by LADOT, provided in Appendix M.1 of the Draft EIR. As detailed in Section 2 of the TAG and summarized in Section 4A of the Transportation Assessment, the purpose of the City’s CEQA Threshold T-1—Conflicting with Plans, Programs, Ordinances, or Policies is to assess whether a project would conflict with an adopted transportation-related program, policy, plan, or ordinance that protects the environment. In general, transportation policies

or standards adopted to protect the environment are those that support multimodal transportation options and a reduction in VMT. Conversely, a project would not result in an impact merely based on whether it would implement a particular program, plan, policy, or ordinance. Many of these programs must be implemented by the City over time, and over a broad area, and it is the intention of Threshold T-1 to ensure that proposed development projects and plans do not preclude the City from implementing adopted programs, plans and policies.

As stated in Section 2.1.4 of the TAG, a project that generally conforms with, and does not obstruct, the City's development policies and standards will generally be considered consistent. The detailed analysis provided under CEQA Threshold T-1 was completed in accordance with the methodology outlined in Section 2.1.4 and included a review of the documents and ordinances listed in Table 2.1-1 for City plans, policies, programs, ordinances and standards relevant to determining project consistency. Additionally, in accordance with the CEQA Threshold T-1 methodology, Attachment D: Plan Consistency Worksheet was completed for the Project and is provided in Appendix D of the Transportation Assessment.

As stated in Section 2.1.4 of the TAG, a 'yes' or 'no' answer to these questions outlined in the Attachment D: Plan Consistency Worksheet does not automatically determine a conflict. "Rather, as indicated in Attachment D, the Project Applicant must provide substantiating information to help determine whether the proposed project precludes the City's implementation of any adopted policy and/or program that was adopted to protect the environment. A mere conflict with adopted transportation related policies, or standards that requires administrative relief or legislative change does not in itself constitute an impact." Furthermore, as discussed on pages IV-K-65 and IV.K-66 of Section IV.K, Transportation, of the Draft EIR, the Project would not conflict with Objective 16-2 and related Policy 16-2.1 of the Wilshire Community Plan.

The Project would not preclude the City's implementation of any future improvements to the street system or infrastructure, and the Draft EIR provided substantiating information that adequately addresses the CEQA Threshold T-1 in accordance with the methodology outlined in the TAG.

Furthermore, the Transportation Assessment provided a detailed non-CEQA operational LOS analysis of the surrounding street system in accordance with the methodology and guidelines outlined in the TAG. As stated in LADOT's Assessment Letter provided in Appendix M.2 of the Draft EIR, LADOT has reviewed the non-CEQA operational evaluation and determined it adequately discloses operational effects.

As discussed in Response to Comment No. 26-22, the Draft EIR analyzed the Project's consistency with applicable plans, policies, and regulations in accordance with

Appendix G of the CEQA Guidelines in Section IV.H, Land Use and Planning, of the Draft EIR. As discussed on pages IV.H-39 to IV.H-57 and Appendix I of the Draft EIR, the Project would not conflict with the goals, policies, and objectives in local and regional plans that were adopted for the purpose of avoiding or mitigating an environmental effect. Accordingly, the Draft EIR correctly concluded that impacts related to land use would be less than significant.

Comment No. 16-19

For example, Objective 8 of the Community Plan clearly states: “To provide adequate police facilities, personnel and protection to correspond with existing and future population and service demands” (p. III-16).

Adequacy is not just for facilities, but for personnel. GPF FEIR provides standards for adequacy:

“The City’s law enforcement personnel need is based on standards established by the International Association of Chiefs of Police which are used by the LAPD to determine staffing needs. The standards are based on the amount of population needed to support these personnel. As indicated in Table P-2, the national standard is four sworn police officers per 1000 residents (4:1000) and the local standard for non-sworn support personnel is one per 1000 residents (1:1000)” (GPF FEIR, p. 2.11-1).

We have a population of about 4 million residents. According to the 2001 GPF, we should have a police force of about 17,673 sworn officers. We have fewer than 9,300 according to newspaper articles. Therefore, the amount of police personnel is inadequate. The city is failing to enforce the community plan’s requirement that if funding is not available within twelve months, ICOs and downzoning will be required. At a minimum, no discretionary increases would be permitted.

The GPF Statement of Overriding Considerations and Mitigations for Police state clearly on pp. 19-20 (Attachment E):

“J. POLICE

1. Impacts

The amount of population. employment. and housing growth that the Framework Element permits by policy could result in a significant increase in the demand for police protective services as compared to existing baseline levels (1990). Based on the planning ratio standard used. to determine the

adequacy of the supply of sworn officers, a total of 17,673 officers would be needed to adequately accommodate the City's 2010 average day/night population. This is in comparison to the 8,817 sworn officers that were on the force as of 1990.

These impacts are potentially significant.

2. Mitigation Measures

The Framework Element's economic development policy targets an employment base that exceeds SCAG's jobs forecast to maintain the City's 1990 jobs/housing ratio through the year 2010. This increased economic base will [sic] provide additional revenue necessary to pay for added police protective services. Additionally, the Framework Element includes a policy that requires the City to correlate the type, amount, and location of development with the provision of adequate supporting infrastructure and public services. In addition to the Framework Plan, other mitigation measures include:

- *Planning Standards indicating the most appropriate number of sworn police officers for [sic] implementing police services shall be established.*
- *The existing number of sworn police officer shall be enhanced by meet the established planning standards."*

LAPD and LAFD are below the level of staffing required to adequately serve the project area, according to the Statement of Overriding Considerations for the GPF.

The DWP supply plan is contradicted by MWD and the Colorado River Authority's drought regulations. California has ordered water cutbacks. Under these circumstances, the WLA Community Plan states (as of 1999). The DCP has never provided the data to determine whether infrastructure and public services are adequate. Instead, it cites plans and says that they are constantly monitoring and updating those plans. But plans do not answer the question of whether infrastructure and public services, particularly police and fire, are adequate.

To determine adequacy requires a definition, a benchmark, a standard, whether adopted or not. Otherwise, statements by city departments that infrastructure and city services are adequate to serve current and added demand are speculative and not based on substantial evidence. In fact, the Fire Department has stated on the record, before the City Council

and the Fire Commission, that NFPA 1710 is used as the benchmark to determine adequacy.

And this is repeated in various third-party studies commissioned by the City, by the LA County Grand Jury, and by the LA City Controller (Attachment I). In the absence of this performance metric, any determination of adequacy would be arbitrary and capricious and not supported by substantial evidence.

a. City CEQA Thresholds Guide Cumulative Impacts (Police, K.1), p. K.1-3:

“Cumulative Impacts

Identify the related projects, which would be served by the same LAPD facilities as the proposed project. Consider the characteristics of the related projects in terms of size, location, and types of land uses. Determine the net population increase resulting from the related projects. Based on consultation with LAPD, evaluate the cumulative demand for police services anticipated at the time of project buildout compared to the expected level of service available.”

b. City CEQA Thresholds Guide (Fire), p.K.2):

“Are there any street intersections with a level of service (LOS) of E or F near the project site that would adversely impact response time?”

“A ‘yes’ response to any of the preceding questions indicates further study in an expanded initial study, negative declaration mitigated negative declaration, or EIR may be required. Refer to the Significance Threshold for Fire Protection and Emergency Medical Services, and review the associated Methodology to Determine Significance, as appropriate.”

“In a description of the environmental setting, include the following information:

- *Description including response distances) and map of LAFD facilities that serve the project (for assistance, see Exhibit K.2-1). Identify intersections at LOS E or F that provide access to the project.” (p. K.2-4).*
- *No map was provided with LOS between Station 92 and the project site.*

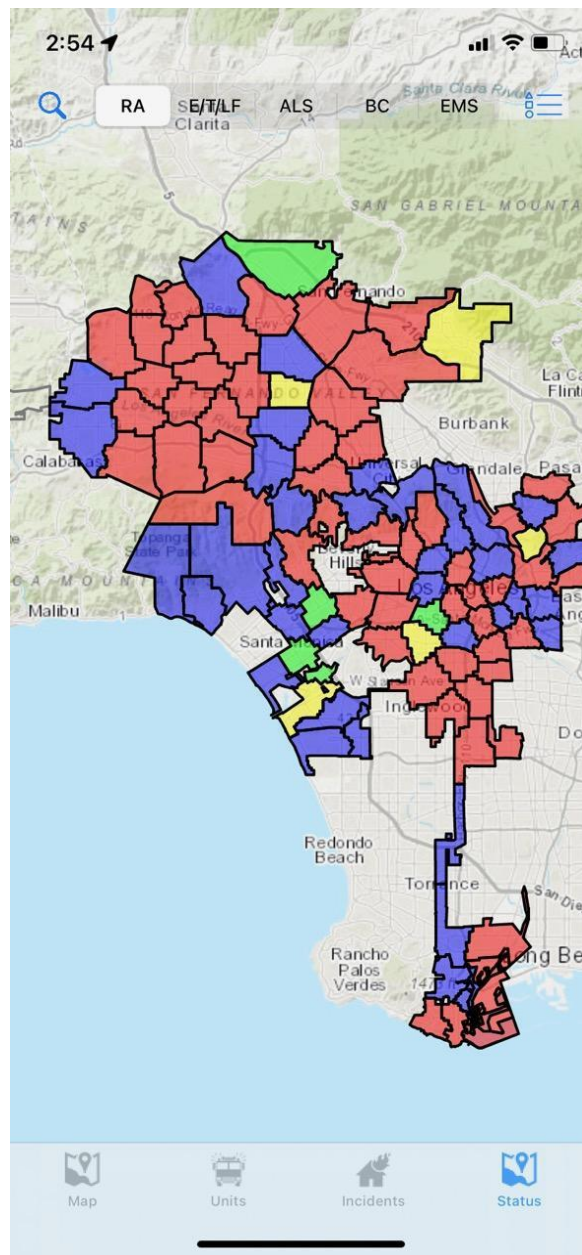

c. “Cumulative Impacts

“Based on consultation with LAFD’s Construction Services Unit, determine the cumulative effect on fire protection and emergency medical services.” (K.2-4)

It is imperative that any analysis factors in the routine closure of stations due to personnel shortages. At any time, about 50 stations are dark. On the next page is a dispatch map from LAFD. Most is red. The city, including the

project area, are not adequately served due to personnel shortages and sometimes, equipment shortages or failures. As shown on the map (next page), **Emergency Medical Services are not available in many parts of the city and are shown as red. This includes the project site.**

- Red: 0 Rescue Ambulance available
- Yellow: RAE Rescue EMT available only
- Blue: RAP Paramedic (higher level of care) available only
- Green: RAP + RAE or RAP < More than one available

Since about 85% of LAFD calls are for medical emergencies, ***this is not just inadequate, it is failure***, despite the heroic efforts of our first responders. *Over time, the response times have deteriorated* (e.g., the average response times reported in the annual LAFD Strategic Plan).

Response to Comment No. 16-19

This comment is substantially similar to the preceding comments made by the commenter. Regarding Objective 8 of the Wilshire Community Plan, refer to Response to Comment No. 16-7. With regard to the adequacy of LAFD fire protection and LAPD police protection services and infrastructure, refer to Response to Comment Nos. 9-35, 16-5, 16-10, 26-172, and 35-133. With regard to LAFD emergency response times and LOS, refer to Response to Comment No. 9-35 and Section D, Emergency Access, of Topical Response No. 12, Safety and Congestion. The materials submitted by the commenter are noted for the administrative record and have been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project. As discussed above, many of these materials were prepared in the 1990s and do not reflect the latest criteria and data used by LAPD to determine impacts of a development project. Also note that the Department of City Planning uses Appendix G of the CEQA Guidelines as its thresholds of significance. The *2006 L.A. CEQA Thresholds Guide* is used, as appropriate, to assist in answering the Appendix G threshold questions. The analysis of fire and police protection includes a detailed discussion of Project and cumulative impacts in consultation with LAFD and LAPD.

Comment No. 16-20

The systemic failure is compounded by traffic congestion, which further slows responders. The Community Plan states as of 1999, "Severe traffic congestion along major transportation corridors and intersections with most streets functioning at full capacity." (p. I-4). Ignoring congestion, incremental increases in density, a failure to consider cumulative impacts of density bonus and TOC projects, have all combined to create gridlock. While the City's response has been that state law requires drivers to move to the right-hand lane, during gridlock, this is not an option. Changing signal lights to proceed through an intersection does not work if the traffic beyond the intersection is also at a standstill. It is for this reason that the City's CEQA Threshold Guide instructs environmental assessments to show LOS E or F on the access route to a project site (p. K.2-4).

This means that rescue EMTs and rescue Paramedics must come from further away and take more time. For cardiac cases, each minute of delay increases mortality rates. Each floor above the third floor also delays response time.

Fix The City incorporates by reference all testimony and documents submitted to the City for this case file.

Response to Comment No. 16-20

This comment discusses topics that are not specific to the Project. With regard to LAFD emergency response times and LOS, refer to Response to Comment No. 9-35 and Section B, Level of Service, and Section D, Emergency Access, of Topical Response No. 12, Safety and Congestion.

With regard to cumulative traffic impacts and level of service, pursuant to SB 743, the City no longer evaluates transportation impacts using vehicle delay or LOS. Rather, the focus of traffic analysis is related to VMT. Refer to Section III, Environmental Setting, of the Draft EIR for the comprehensive list of related projects that was used to evaluate cumulative impacts of the Project.

Comment No. 16-21

CBS DEIR NOTES

This EIR claims to analyze the environmental impacts of an undisclosed, invisible specific plan. For the city to accept such an EIR is a grave violation of CEQA in the absence of the actual specific plan and development agreement. **The entire EIR is speculative and not based on substantial evidence.** For example, there is no evidence that any new studio space will be built or remodeled.

Requires a variance to measure height differently from LAMC 12.21.1. (see IV.H-19, IV.H-25)

Requires a variance to redefine Floor Area (IV.HY-21, Footnote 14).

Response to Comment No. 16-21

Refer to Response to Comment No. 5-3 and Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding how the physical aspects of the proposed Specific Plan were fully described and evaluated in the Draft EIR and how the Draft EIR was completed in full compliance with CEQA. Neither CEQA nor City policy requires the Specific Plan or the Development Agreement to be included in the EIR. Nevertheless, in response to comments on the Draft EIR and for informational purposes, the Preliminary Draft Specific Plan has been made publicly available on the Department of City Planning's website and a draft Development Agreement will be publicly available prior to the public hearings for the Project.

With regard to the underlying purpose of the Project to maintain the Project Site as a studio, refer to Response to Comment No. 5-15. Refer to Topical Response No. 3, Permitted On-Site Uses, regarding the proposed studio uses.

Section 12.27 of the LAMC allows projects subject to the regulations of the LAMC to seek relief from those LAMC regulations through the submission of an application for a Zone Variance. The Project would include the creation of a specific plan, which is a land use ordinance enacted by the City Council superseding standard LAMC regulations. Citywide, specific plans and other overlays are commonly used to prescribe height and floor area limitations differing from standard LAMC provisions. The proposed Specific Plan would regulate height and floor area. Thus, variances are not required.

Comment No. 16-22

Can the Development Agreement be extended beyond 20 years? (IV.H-22).

Response to Comment No. 16-22

Any extension of the Development Agreement beyond 20 years would require additional environmental review pursuant to CEQA. This comment does not concern the environmental impact analysis in the Draft EIR. Nevertheless, this comment is acknowledged for the record and will be forwarded to the decision-making bodies for their review and consideration prior to any action on the Project.

Comment No. 16-23

Show where off-site parking would be provided in order to analyze traffic impacts (see IV.H-29). Will they be within 700 feet of the project site? Requires the distance from site to be disclosed. Will it create neighborhood intrusion impacts? At what hours would the off-site lots be used? Would code-required parking be located off-site?

Response to Comment No. 16-23

Refer to Section B, Off-Site Parking, of Topical Response No. 13, Parking, and Response to Comment No. 16-13. As discussed therein, the Project no longer proposes off-site parking, and as discussed in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, the off-site parking agreement language was deleted from the Draft EIR.

Comment No. 16-24

Special Events are left undefined, no limitation on how many and how often and hours of events. The impacts of special events are too vague to measure and evaluate. (IV.H-23)

Response to Comment No. 16-24

Refer to Topical Response No. 3, Permitted On-Site Uses, regarding how special events would continue to be governed by the LAMC, consistent with existing conditions.

Comment No. 16-25

CUP for restaurants and sale of alcohol not defined. Is there an application (Ibid.) What is the reason to sell alcohol off-site?

Response to Comment No. 16-25

Alcohol sales are discussed on page IV.H-30 in Section IV.H, Land Use and Planning, of the Draft EIR. The alcohol regulations are included in the Preliminary Draft Specific Plan and are consistent with the City's existing regulatory requirements.

Comment No. 16-26

What is the total occupancy for the site and during what hours?

Response to Comment No. 16-26

The studio would continue to be operated on a 24-hour basis, seven days a week, consistent with existing operations. Occupancy for each of the on-site buildings will be determined by the LAMC in coordination with LAFD. As stated throughout the Draft EIR, it is expected that the Project would generate a net increase of approximately 5,702 employees on-site.

Comment No. 16-27

What is the basis for the sign district externally visible? Will it be for on-site tenants, digital, current productions, etc.?

Response to Comment No. 16-27

The Sign District will allow on-site signage, and off-site signage will be prohibited. The signage within the Sign District will be utilized by on-site tenants and by current productions. No digital signage will be allowed along the perimeter of the Project Site.

Comment No. 16-28

Stormwater: p. IV.H-42: what about discharge of ongoing groundwater pumping due to high water table? What is the quality of the groundwater? Is it potable? Does it have hydrocarbons?

Subsidence from operational groundwater pumping? Has this been analyzed (p. IV-H.42) No discussion of operational groundwater pumping. Is it suitable for irrigation? Need analysis of groundwater quality.

Response to Comment No. 16-28

As discussed in the Response to Comment No. 3-7, no operational groundwater pumping is proposed. The Project would require temporary construction dewatering and not permanent dewatering. Refer to Response to Comment Nos. 11-5 and 26-53 through 26-71 regarding dewatering. Refer to Response to Comment Nos. 11-25, 16-74, and 16-85 regarding subsidence.

The groundwater quality found at the Project Site has been sampled, tested, and reported in the Site Summary Report (Appendix G.1 of the Draft EIR) and various monitoring reports for the former Texaco station that was located within the Project Site boundary (see Geotracker database). In general, the groundwater quality at the Project Site is variable. For example, low concentrations of residual hydrocarbons from the former Texaco station were detected in the groundwater in the northeast corner of the Project Site. As discussed on page IV.F-24 in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR, the former Texaco station contained one 10,000-gallon and three 12,000-gallon USTs which, along with dispensers, associated piping, and pump islands, were removed during station demolition in 1991. According to the LUST database, a gasoline release was discovered by Texaco in December 1990. Remedial activities were performed at the former station from 1996 to 2012 and included soil vapor extraction, dual phase extraction, air sparging, and groundwater monitoring. During the final sampling event at the former Texaco station in January 2012, maximum groundwater concentrations were 8,800 micrograms per liter (µg/L) for total petroleum hydrocarbons in the gasoline range (TPH GRO), 1,600 µg/L for benzene, 38 µg/L for methyl tert-butyl ether (MTBE), and 13 µg/L for tertiary butyl alcohol (TBA). A soil vapor investigation and health risk assessment were conducted to assess vapor intrusion from petroleum products in groundwater. Since the area of the former Texaco station was used for parking at the time of the investigation, Texaco's environmental consultant, Arcadis, concluded that adverse health effects were not expected. Based on this data, the LARWQCB issued a No Further Action letter on November 29, 2012. The LARWQCB Closure Package for the former Texaco station includes detailed information on soil, soil vapor, and groundwater investigations associated with remediation of TPH, benzene, MTBE, and other constituents that were known to

remain in the subsurface in the northeast portion of the Project Site. Because that area of the Project Site was used for commercial parking at the time, the Phase I concluded that the former Texaco station is a Controlled Recognized Environmental Condition (CREC).

Environmental investigations were recently performed by Geosyntec to confirm the extent of these remaining constituents, as detailed in the Site Summary Report and mapped in Figure 2 therein. Elevated concentrations of fuel-related constituents were detected in soil and groundwater downgradient of the former Texaco station. As stated on page 12 of the Site Summary Report, TPH detected in soil samples are mostly below regulatory screening levels. TPH diesel range organics (DRO) and TPH motor oil range organics (ORO) screening level (SL) exceedances in soil appear to be sporadic and confined to shallow soil. Specific areas with elevated TPH that will require appropriate management during excavation and grading operations are shown on Figure 3 and discussed in the Soil Management Plan (Appendix B of the Site Summary Report).

Thus, any residual concentrations would be appropriately managed during all soil disturbance activities through implementation of the protocols described in the Soil Management Plan set forth in Mitigation Measure HAZ-MM-1. Specific areas with elevated TPH and one location with elevated arsenic also would require appropriate management during excavation and grading operations. Required protocols would address soil sampling and analysis, stockpiling of affected soils, soil re-use, decontamination, and dust control. Per Mitigation Measure HAZ-MM-1, the Project's Soil Management Plan would require that special precautions be taken to manage soils that will be disturbed during Project earthwork activities in areas containing Chemicals of Concern (COCs) above SLs. These areas include the former Texaco station and other select areas of the Project Site with elevated TPH and arsenic in shallow soil, as shown in the Site Summary Report. Soil in these areas of the Project Site with residual COCs above SLs shall either be excavated prior to commencing excavation and grading operations in these areas or segregated and stockpiled prior to off-site disposal.

As discussed in Response to Comment No. 13-6, the Project's installation of a methane mitigation system will address potential vapor intrusion from residual fuel hydrocarbons from the former Texaco station, and naturally occurring hydrogen sulfide.

Off-site discharge of groundwater from the temporary construction dewatering will be conducted in accordance with the discharge permit obtained and all applicable regulatory requirements. There are no plans to use the pumped groundwater for Project Site potable water uses, irrigation uses, or any other uses. Depending on the most appropriate discharge point, the permit will be an NPDES permit issued by the LARWQCB or an industrial sewer discharge permit issued by the City of Los Angeles.

Comment No. 16-29

Tract Map: check if findings can be made and if findings under Wilshire Plan can be made. **The term of the tract map is less than 20 years.** This makes no sense. See IV.H38.

Response to Comment No. 16-29

The Project includes a proposed Vesting Tentative Tract Map (VTTM), which was submitted concurrent with the other entitlements. Findings for approval will be required by the Advisory Agency, but such findings are not a CEQA issue to be analyzed in the EIR. The Project also includes a proposed Development Agreement for a term of 20 years, which, if approved by the City Council, would vest the tentative map approval for that duration.

Comment No. 16-30

Sidewalks are required to be 15-feet along the boulevards per MP 2035. Therefore Footnote 21's (IV.H-32) statement that because the roadway widens, the sidewalks will narrow disregards the required 15-feet can be met by dedicating 3 feet of the project side to provide required 15-foot sidewalks. Otherwise, the sidewalks do not comply with the MP 2035 required public sidewalk dimensions. This is particularly important to safeguard pedestrian safety due to crowding to enter the project site for special events or perhaps to purchase alcohol.

Response to Comment No. 16-30

Correspondence provided by BOE dated July 14, 2021 (refer to Appendix FEIR-23) identifies that the only element of the Beverly Boulevard right-of-way (other than standard repair and reconstruction language) that needs dedication is a 20-foot radius return at the property line at the intersection of Beverly Boulevard and Fairfax Avenue. Additionally, irrespective of this correspondence, Appendix F of the Mobility Plan identifies Beverly Boulevard (between La Cienega Boulevard and Western Avenue) to have a modified street designation. The language includes the following: "No widening in excess of the existing roadway (Wilshire Plan)." Additionally, the Wilshire Community Plan is consistent with this statement as Beverly Boulevard is listed under streets that were reclassified with alternate standards. The Wilshire Community Plan states, "No widening of roadway west of Western Avenue" (see page III-23). Beverly Boulevard varies in width between La Cienega Boulevard and Western Avenue, and the Modified Avenue I designation applies to that entire stretch of the street.

To clarify for the commenter, the Fairfax Avenue right-of-way will be modified because the right-of-way exceeds the standard required by the Mobility Plan. The sidewalk along Fairfax Avenue will be provided within the public right-of-way and via an easement

within the Project Site. The combined width of those areas will provide for a 15-foot sidewalk.

Refer to Response to Comment Nos. 16-72 and 16-76 regarding sidewalk widths and consistency with the Mobility Plan.

Refer to Topical Response No. 12, Safety and Congestion, and Response to Comment No. 26-E.4-3 regarding pedestrian safety and access.

Comment No. 16-31

Wilshire Plan: EIR claims **adequate police facilities, personnel, and protection** (p. IV.H-44). Where is the substantial evidence? GPF states that 17,673 sworn police officers are required to provide adequate service—and that was in 2000. Present personnel are around 9300. How is this adequate? Please define adequate.

Response to Comment No. 16-31

Refer to Response to Comment No. 16-5 regarding the adequacy of police protection services as determined by LAPD. Substantial evidence for LAPD's determination is provided in Section IV.J.2, Public Services—Police Protection, and Appendix L of the Draft EIR, which includes the LAPD response letter. On page 10, the letter concludes that the Project will not result in the need for new or altered police facilities.

Also refer to Response to Comment No. 16-7 regarding consistency of the Project with the objectives and policies set forth by the Wilshire Community Plan, including those related to police protection services.

In response to how the current citywide number of sworn police officers is adequate, as discussed on page IV.J.2-11 of the Draft EIR, the need for or deficiency in adequate police protection in and of itself is not a CEQA impact, but rather a social and/or economic impact. Where a project causes a need for additional police protection services resulting in the need to construct new facilities or additions to existing facilities, and the construction results in a potential impact to the environment resulting from that separate project, then the impact would need to be assessed in an EIR and mitigated, if found to be significant. For the reasons given in the sources above and Response to Comment No. 16-5, the Project would not create a significant impact on police protection services. The comment is noted for the administrative record and has been incorporated into the Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 16-32

Multiple driveways will create congestion, inadequate queuing capacity and pedestrian hazards. (p. IV.H-44).

Response to Comment No. 16-32

Refer to Response to Comment No. 16-11 and Sections A, Queuing at Project Driveways; B, Level of Service; and E, Pedestrian Safety at Project Driveways, of Topical Response No. 12, Safety and Congestion, regarding queuing capacity, the number and location of the proposed driveways at the Project Site, pedestrian safety at those driveways and traffic hazards. As discussed therein, adequate queueing capacity is provided, and driveways would be designed in accordance with LADOT design standards to ensure pedestrian safety.

Comment No. 16-33

Also, no other Regional Center has an FAR 1.5:1 or 1.75:1. Designation as a Regional Center is not supported by the GPF Figure 3-1, nor the Community Plan. The regional center designation appears to be a trojan horse to upzone subsequently, since Regional Center FARs are often a minimum of 6:1 FAR. There is no disclosure of why a Regional Center is required for this project.

Response to Comment No. 16-33

Chapter 3 of the Framework Element of the General Plan identifies that land designated as Regional Commercial is characterized by development that is built to an intensity of an FAR between 1.5 to 6.0. As the Specific Plan would allow a FAR of 1.75, the Project is consistent with the development that the Framework Element of the General Plan envisions for Regional Commercial. Refer to Response to Comment No. 5-8 for further information regarding the proposed Regional Commercial land use designation.

Comment No. 16-34

The project proposes to remove all potential residential development from this site and is [sic] therefore **is inconsistent with the Housing Element and violates LAMC 11.5.8.**

Response to Comment No. 16-34

Refer to Response to Comment No. 16-2 regarding how the Project would not conflict with the Housing Element. Because the Project does not involve a change in the number of residential dwelling units permissible under the Project Site's zone classification, it does not violate Section 11.5.8 of the LAMC.

Comment No. 16-35

“The City of Los Angeles has the responsibility to maintain and implement the City’s General Plan” (Wilshire Plan, p. II-5). Instead of implementing the plan, it amends it to exceed the carrying capacity of the city for traffic, air quality, public safety services, water supply, etc. CEQA allows the city to approve projects that have unmitigable impacts through statements of overriding considerations. But it is not permitted to violated [sic] the General Plan, Community Plan, and Specific Plans. This EIR once again ignores the guardrails adopted by prior city councils to maintain public safety and public health. Air quality deteriorates as evidenced by more inhalers seen at AYSO soccer games.

Response to Comment No. 16-35

Refer to Response to Comment Nos. 5-8 and 11-29 regarding how the proposed General Plan Amendment does not, in and of itself, increase density and, thereby, does not result in significant impacts. Also refer to pages IV.H-39 through IV.H-44 of Section IV.H, Land Use and Planning, of the Draft EIR, and pages 1 through 25 of Appendix I, Land Use Plans Consistency Analysis Tables, to the Draft EIR, for a discussion of the Project’s overall consistency with the goals and policies of the General Plan Framework Element, Wilshire Community Plan, and other applicable plans.

Regarding air quality, as stated on pages IV.A-59, IV.A-66, IV.A-73, and IV.A-75 through IV.A-77 of the Draft EIR, air quality impacts would be less than significant for all criteria pollutants after the application of mitigation, except for regional construction NOx emissions, and regional overlapping construction plus operational VOC and NOx emissions during the long-term buildout scenario. However, construction and operational localized air quality impacts would be less than SCAQMD’s significance criteria for all pollutants (see Tables IV.A-10 and IV.A-11 of the Draft EIR). Additionally, a quantitative HRA, which includes an analysis of carcinogenic and non-cancer risks (such as respiratory issues), was developed in response to SCAQMD comment on the Draft EIR and is included in Appendix FEIR-10 of this Final EIR. As discussed on pages IV.A-72 and IV.A-73 of the Draft EIR, and further confirmed by the results of the HRA, the Project would not generate substantial toxic air contaminant (TAC) emissions or result in significant contributions to human health hazards in the Project area.

Refer to Topical Response No. 10, Trip Generation, regarding the trips generated by the Project and Topical Response No. 9, Neighborhood Traffic Management Plan, regarding the Project’s NTMP. Also refer to Response to Comment No. 16-66 regarding the Project’s less-than-significant impacts associated with water supply and Response to Comment No. 16-5 regarding the Project’s less-than-significant impacts associated with public safety.

Comment No. 16-36

While the State has adopted **VM**T to measure traffic impacts, the **Wilshire Community Plan requires measurement of congestion**, which creates additional pollution, and it defines adequate traffic capacity (. [sic] The Plan has specific thresholds to measure adequate traffic flow. For those of us who live here and attempt to drive, LOS tells you how slow traffic will be, and defines adequate capacity as better than LOS E or F. The intersections surrounding the project site are already failing. Unless or until they can be improved, the Wilshire Plan prohibits making it worse. Violation of the Wilshire Community plan cannot be lawfully ignored through a statement of overriding consideration.

GPF 3.3.2 and Wilshire Plan both state that if resources are not available to remedy infrastructure and emergency services to become adequate, then density and intensity cannot be increased, and in fact, may require downzoning. This city has reached the point where it cannot afford to fix its deteriorating services and resources and must therefore only allow by-right development.

Response to Comment No. 16-36

The Draft EIR analyzed the Project's potential transportation impacts in Section IV.K, Transportation, which was based on a comprehensive Transportation Assessment (Appendix M.1 of the Draft EIR) that was approved by LADOT. As discussed in Section B, Level of Service, of Topical Response No. 12, Safety and Congestion, Section 5B of the Transportation Assessment provided a detailed non-CEQA operational LOS analysis of the surrounding street system in accordance with the methodology and guidelines outlined in the TAG, as well as vehicular queuing within the Study Area during the commuter peak hours under both the existing and future intersection conditions. As shown in Table 18 of the Transportation Assessment, in year 2026 upon anticipated Project completion, several intersections on arterial streets would operate at LOS E or F, before and after the addition of Project trips. The Project would not cause any location to change from LOS D or better to LOS E or F during either peak hour. Nonetheless, the Project would implement a comprehensive TDM Program that would encourage visitors and employees to reduce vehicular trips on the adjacent streets during the peak hours by promoting carpooling and non-auto travel. Although Project trips would be further reduced with implementation of the TDM Program, no additional trip reductions were assumed in the operational LOS evaluation. As stated in LADOT's Assessment Letter provided in Appendix M.2 of the Draft EIR, LADOT has reviewed the non-CEQA operational evaluation and determined it adequately discloses operational effects. Thus, the Draft EIR and Transportation Assessment fully evaluated and disclosed the operating conditions of the street system in accordance with the City's guidelines.

With regard to the adequacy of LAFD fire protection and LAPD police protection services and infrastructure, refer to Response to Comment Nos. 9-35, 16-5, 16-10, 26-147, and 35-133.

Comment No. 16-37

p. IV-4 claims that the GPF densities include reductions in VMT. This is not accurate. VMT is a recent measurement that reflects the city's failure to achieve congestion reduction and therefore to *ignore congestion entirely*. But the *GPF was based on reducing congestion and improving air quality*. The **claim that VMT leads to greater service levels within infrastructure has no basis**.

Response to Comment No. 16-37

The comment incorrectly correlates reductions in VMT with reductions in congestion. The Draft EIR does not claim that VMT leads to greater service levels or reduced congestion. As discussed on page IV.K-1 of Section IV.K, Transportation, of the Draft EIR, with the passage of SB 743, the analysis of transportation impacts shifted from driver delay (i.e., LOS) to VMT. Page IV.H-4 of the Draft EIR summarizes the General Plan Framework Element in stating, "the establishment of the designated arrangement of land uses and development densities addresses an array of environmental issues, including, but not limited to, reductions in VMT." The reduction in VMT is part of General Plan Framework Element Objective 3.2: "Provide for the spatial distribution of development that promotes an improved quality of life by facilitating a reduction of vehicular trips, vehicle miles traveled, and air pollution." Additionally, while it is true that the General Plan Framework Element expresses concern about increasing congestion and deteriorating air quality in Chapter 3, the focus of the concern is on low-density development and the long-distance regional travel that it causes, rather than localized congestion in high-density areas.

Comment No. 16-38

The evidence provided by Fix The City, using City data, 26,000 pages (Attachment J) shows that infrastructure is inadequate and deteriorating, and that the costs of delayed repairs make adequacy even more expensive... perhaps beyond reach. Water, power, sidewalks, roads are in disrepair.

The Planning Department, knowing this, ignores the evidence in its own files, and says yes to any applicant who walks in the door, partially to increase the tax base of the city, but perhaps most significantly, to fund the budget of the Planning Department through planning approval fees. Although an EIR is required to be objective, the Planning Department's own survival makes it biased, in violation of CEQA. The Planning Department is like the orchestra on the Titanic to slow down the rush to lifeboats. It has failed to safeguard public

safety, which the California Constitution declares is the first responsibility of local government.

Response to Comment No. 16-38

With regard to the adequacy of fire protection and police protection services and infrastructure as determined by LAFD and LAPD, refer to Response to Comment Nos. 9-35, 16-5, 16-10, 26-147, and 35-133. The attachments submitted by the commenter are not specific to the Project. Specifically, as discussed in Response to Comment No. 16-10, above, Attachment J to this comment letter includes letters addressing other projects in the City, and documents that address the infrastructure status of parks, sidewalks, and water pipes Citywide, many of which are outdated. These attachments are noted for the administrative record and have been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project. The comments regarding the Planning Department do not raise any issues regarding CEQA, and no response is required.

Comment No. 16-39

Federal Clean Air Act violations. The GPF committed to improving, not degrading air quality. Certification of that FEIR in 2001 by the City Council specifically agreed to comply with the Implementation Plan. Worsening air quality indicates that the City has incrementally violated the implementation plan. **All it does is optimize the profit for a speculative development, further imperiling public health and safety.**

Response to Comment No. 16-39

As discussed above in Response to Comment No. 16-12, the Project is not expected to worsen air quality in the region as construction and operational localized air quality impacts would be less than SCAQMD's significance criteria for all pollutants. SCAQMD's localized significance thresholds represent the maximum emissions from a project that will not cause or contribute to an exceedance of the most stringent applicable federal or State ambient air quality standard.

This comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 16-40

CEQA requires that the curtain be pulled so both the public and the city can evaluate the impacts of the project. Lacking the Specific Plan is a fatal flaw of this EIR. Please prepare a **supplemental EIR** of the Specific Plan, sign district and Regional Center and the helipad

location, elevation, hazards to pedestrians posed by multiple additional driveways, flight path and impact on the Cedars emergency helicopter operations.

Response to Comment No. 16-40

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, and Response to Comment Nos. 5-3 and 5-10 regarding how the physical components of the proposed Specific Plan and Sign District were fully evaluated in the Draft EIR and their availability for public review. Refer to Response to Comment Nos. 5-8 and 11-29 regarding the proposed Regional Commercial land use designation. Refer to Response to Comment No. 26-15 regarding the on-site helipad that would continue to operate as part of the Project consistent with existing conditions in accordance with established permits (ZA Case No. 11412) and regulatory requirements. The only change to the helipad would be its location at a higher level. As such, as discussed in Response to Comment No. 16-87, noise levels associated with continued operation of the helipad would decrease, and no other impacts would occur. Refer to Response to Comment No. 16-87 regarding how continued use of the helipad would not affect the Cedars-Sinai helicopter operations. With regard to pedestrian safety, refer to Section E, Pedestrian Safety at Project Driveways, of Topical Response No. 12, Safety and Congestion, and Response to Comment No. 26-E.4-3. Refer to Response to Comment No. 9-29 regarding traffic hazards.

This comment does not provide substantial evidence to demonstrate that a supplemental EIR is required per Public Resources Code Section 21166 or CEQA Guidelines Section 15163. Accordingly, a supplemental EIR is not required.

Comment No. 16-41

While CEQA permits the city to adopt a statement of overriding considerations for impacts that cannot be feasibly mitigated, **state law does not permit the city to approve an amendment to the general plan that is inconsistent with the General Plan elements**, including the General Plan Framework and Mandatory Policy 3.3.2.

Response to Comment No. 16-41

A detailed analysis of the Project's consistency with the City's General Plan, including the General Plan Framework Element, is presented on pages IV.H-39 through IV.H-44 of Section IV.H, Land Use and Planning, of the Draft EIR, and on pages 1 to 25 of Appendix I, Land Use Plans Consistency Analysis Tables, of the Draft EIR. As demonstrated therein, the Project would not conflict with the applicable goals, objectives, or policies of the General Plan. With regard to General Plan Framework Policy 3.3.2, refer to

Response to Comment No. 16-6. Also refer to Response to Comment No. 16-5 regarding the Project's less-than-significant impacts associated with public services.

Comment No. 16-42

IV.H: purpose is to analyze compliance with mandatory mitigation measures (IV-H.2). However, this project fails to analyze **Mandatory Mitigation Policy 3.3.2** of the General Plan Framework, adopted in the certification of the GPF FEIR, as discussed above.

Response to Comment No. 16-42

With regard to mitigation measures of the General Plan Framework Final EIR, refer to Response to Comment Nos. 16-5 and 16-6.

Comment No. 16-43

The GPF does not direct high density/regional centers to Beverly Boulevard or Fairfax. It directs regional centers to Wilshire Boulevard. Figure 3-1 "Long Range Land Use Diagram, Metro." This diagram shows clearly that the GPF designates Beverly Boulevard for neighborhood-serving commercial use, and not a regional center. The proposed project conflicts with the GPF designations for the project site. Changing the designation to Regional Center would constitute spot zoning for a spec [sic] developer who does not even present the specific plan.

Response to Comment No. 16-43

As discussed in Section II, Project Description, of the Draft EIR, the Project is requesting a General Plan Amendment to unify the various existing land use designations to "Regional Commercial." The request requires the City Planning Commission and City Council to find that the General Plan Amendment is in accordance with the public necessity, convenience, general welfare, and good zoning practice. Refer to Response to Comment Nos. 5-8, 11-29, and 16-4 regarding the appropriateness of the Regional Commercial land use designation and how the proposed General Plan Amendment does not constitute "spot zoning." Refer to Response to Comment No. 16-41 regarding how the Project would not conflict with the applicable goals, objectives, or policies of the General Plan.

As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, neither CEQA nor City policy requires a Specific Plan to be included in the EIR.

Comment No. 16-44

Since there is no draft Specific Plan, and this EIR claims to analyze the impacts of the **invisible specific plan**, all analysis is speculative and not supported by substantial evidence, in violation of CEQA.

Response to Comment No. 16-44

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding how the physical aspects of the proposed Specific Plan were fully disclosed and analyzed in the Draft EIR and how a Specific Plan was not required to be included as part of the Draft or Final EIR.

Comment No. 16-45

Regional Center Designation provides a minimum of HD2 (6:1 FAR) and not 1.75:1 FAR proposed for the invisible specific plan. If the applicant sought only an increase from 1.5:1 FAR to 1.75:1 FAR, a HD amendment would suffice. Instead, the Regional Center appears to be a trojan horse for a much larger project that would also have a sign district. Sign districts like the one for the Motion Picture Museum address the public right of way, not internal signs. Without a specific plan, it is impossible to determine where signs will be, whether they will be digital, etc.

Response to Comment No. 16-45

The comment regarding the Regional Commercial land use designation is similar to Comment No. 16-4. Refer to Response to Comment No. 16-4 for further discussion of the Regional Commercial land use designation. Table 3-6 included in Chapter 3 of the Framework Element of the General Plan identifies the CR, C1.5, C4, and [Q]C2 Zones as corresponding to the Regional Commercial designation but does not identify corresponding height districts. Similarly, the Wilshire Community Plan's General Plan Land Use Map identifies the CR, C1.5, C2, C4, P, PB, RAS3, RAS4, R3, R4, and R5 Zones as corresponding to the Regional Commercial designation, and only identifies a corresponding Height District of 2 to a single parcel located in Koreatown but is otherwise silent on corresponding height districts.

Refer to Response to Comment Nos. 5-8 and 11-29 for further information regarding the proposed Regional Commercial land use designation. Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, for a discussion of how CEQA and City policy do not require a Preliminary Draft Specific Plan or draft Specific Plan to be included in the EIR. Refer also to Response to Comment Nos. 5-10 and 9-26 regarding how the components of the proposed Sign District were adequately described in the Draft EIR and how digital signage would not be allowed along the perimeter of the Project Site.

Comment No. 16-46

Project conflicts with GPF Policy 5.5 because it does not improve the quality of the public realm. It degrades it by increasing congestion, pedestrian hazards, and creating additional demand for city services which are now threatened, e.g., water supply. **[Evidence of the threat to adequate water supply is mandatory watering regulations and a declaration by the Governor, statements by MWD and by the Colorado River Authority.]**

Response to Comment No. 16-46

As discussed in detail on page 8 of Appendix I, Land Use Plans Consistency Analysis Tables, of the Draft EIR, the Project would not conflict with Objective 5.5 of the General Plan Framework Element regarding upgrading and improving the quality of the public realm. As discussed therein, the Project would improve the quality of the public realm through streetscape improvements to the pedestrian experience, while continuing to provide for the unique security needs of a working production studio, by providing new open space and landscaping along the Project Site boundaries. Refer to Response to Comment No. 16-72 regarding the Project's pedestrian-oriented design and public realm improvements.

Regarding congestion, under SB 743, the transportation impact analysis shifted from vehicular delay (i.e., LOS) to VMT. Thus, congestion and driver delay are not CEQA impacts. Refer to Section B, Level of Service, of Topical Response No. 12, Safety and Congestion, and Response to Comment Nos. 9-29 and 16-36 regarding the non-CEQA LOS analysis in the Transportation Assessment.

Regarding pedestrian hazards, refer to Sections C, Traffic Safety vs. Congestion, and E, Pedestrian Safety at Project Driveways, of Topical Response No. 12, Safety and Congestion, and Response to Comment Nos. 9-29 and 26-E.4-3 regarding pedestrian safety.

With respect to water supply, as discussed on page IV.M.1-34 of Section IV.M.1, Utilities and Service Systems—Water Supply and Infrastructure, of the Draft EIR, LADWP has concluded that adequate water supplies would be able to accommodate the Project, and impacts would be less than significant.

Comment No. 16-47

GPF 6.3.3 conflict and misrepresentation. No public open space is created. There may be open space, but it is private property. Therefore, the statement lacks substantial evidence to support the conclusion. Appendix A, p. 9.

GPF 6.4.8: there is no public open space. False statement. It is a closed, private campus. Appendix A, p. 10.

GPF Objective 7.2: project does not meet the needs of local residents because it does not address homelessness and crime. App. A, p. 11

Response to Comment No. 16-47

The General Plan Framework policies and objective referred to in this comment read as follows:

- **Policy 6.3.3.** Utilize development standards to promote development of public open space that is visible, thereby helping to keep such spaces and facilities as safe as possible.
- **Policy 6.4.8:** Maximize the use of existing public open space resources at the neighborhood scale and seek new opportunities for private development to enhance the open space resources of the neighborhoods.
 - a. Encourage the development of public plazas, forested streets, farmers markets, residential commons, rooftop spaces, and other places that function like open space in urbanized areas of the City with deficiencies of natural open space, especially in targeted growth areas.
 - b. Encourage the improvement of open space, both on public and private property, as opportunities arise. Such places may include the dedication of “unbuildable” areas or sites that may serve as green space, or pathways and connections that may be improved to serve as neighborhood landscape and recreation amenities.
- **Objective 7.2:** Establish a balance of land uses that provides for commercial and industrial development which meets the needs of local residents, sustains economic growth, and assures maximum feasible environmental quality.

As demonstrated on pages 9 to 11 of Appendix I, Land Use Plans Consistency Analysis Tables, of the Draft EIR, the Project would not conflict with General Plan Framework Policy 6.3.3, Policy 6.4.8, or Objective 7. The Project would include development standards for certain open space components, including the proposed frontage areas around the Project Site perimeter. In particular, a minimum of approximately 28,900 square feet of open space would be provided along the Project Site boundaries, as shown in Figure II-6 in Section II, Project Description, of the Draft EIR. These perimeter areas would include landscaping, such as street trees and shrubs, lighting, wayfinding signage, and pedestrian amenities, such as benches and shade

structures. Along all street frontages, pedestrian access and safety would be improved, and bus stops and street lighting would be maintained. The proposed landscape and sidewalk improvements around the Project Site perimeter would improve pedestrian safety and comfort; incorporate visual screening and fencing within a softened, landscaped edge condition; incorporate berms to conceal partially subterranean parking areas; contribute to improved street identities; and highlight the main pedestrian studio entrance on Beverly Boulevard.

While not all of the open space along the Project Site frontages would be publicly accessible, open space would be visible along the street frontages, and specific pedestrian improvements would be located within and along the public right-of-way. As such, the Project would result in enhanced street frontages that promote safety and enhance the public realm. Refer also to Response to Comment No. 16-72 regarding the Project's pedestrian-oriented design. Note that as a non-residential use, the Project is not required to provide public open space. With regard to General Plan Framework Objective 7.2, as set forth above, this objective does not address homelessness or crime. With regard to crime, refer to Response to Comment No. 16-5 regarding the Project's less-than-significant impacts associated with police protection. With regard to homelessness, refer to Response to Comment No. 16-8.

Comment No. 16-48

Policy 7.2.3 How will shuttle work with the Motion Picture Academy Museum special events along Fairfax? App I p. 12.

Response to Comment No. 16-48

This comment does not concern CEQA issues or the Draft EIR's analysis of the Project's potential impacts. Nevertheless, a response is provided below for informational purposes.

As discussed on page IV.K-38 in Section IV.K, Transportation, of the Draft EIR, the Project's TDM Program would include a shuttle service between the proposed Metro D (Purple) Line Wilshire/Fairfax Station and the Project Site, and the shuttle will operate during typical commuter peak periods. Most major events at the Academy Museum of Motion Pictures occur on weekends or during the evening hours of a weekday. Thus, the shuttle hours of operation are not anticipated to overlap with special events at the Academy Museum of Motion Pictures. In the event that normal shuttle operations would be disrupted, suitable detours or alternative services would be utilized.

Comment No. 16-49

LAND USE

- Findings are incomplete
- Not a geographic area with significant social, economic, or physical identity.
- Check on batching—how many times has the GP been amended this year?

Response to Comment No. 16-49

The comment regarding the findings provides no evidence to support the statement that the land use findings are incomplete. The commenter alleges that the Project is not located in an area with significant social, economic, or physical identity. The commenter appears to be referring to the General Plan Framework's definition of "Regional Commercial." Refer to Response to Comment Nos. 5-8 and 11-29 regarding the proposed Regional Commercial designation for the Project Site.

In accordance with all applicable processes and procedures, the Project sought issuance of City Planning Form No. CP-7750.1 (General Plan Amendment Initiation Request Form) prior to filing the application with the Department of City Planning. Initiation of General Plan Amendments is at the discretion of the Director or their designee. Note that the Department of City Planning does not utilize "batching" or "batching windows" when reviewing General Plan Amendments. Regardless of the City's procedures for reviewing General Plan Amendments, this comment regarding batching does not raise a CEQA issue or identify any deficiency in the analysis provided in the Draft EIR. Nevertheless, this comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 16-50**Ch. IV.H. Land Use and Planning**

- LAMC: ***violates how height is measured.*** LAMC 12.21.1 natural grade. **Requires Variance.**

Response to Comment No. 16-50

Refer to Response to Comment No. 16-. As discussed therein, height would be regulated by the proposed Specific Plan, and a variance would not be required.

Comment No. 16-51

- **ZI-1195** review by **dept of conservation, division of oil, gas, and geothermal resources??** Did they consult? Is there a letter?

Response to Comment No. 16-51

Effective January 1, 2020, the California Department of Conservation's Division of Oil Gas and Geothermal Resources (DOGGR) was renamed the Geological Energy Management Division (CalGEM). CalGEM oversees the drilling, operation, and closure of oil and gas wells within the State of California. City Zoning Information No. 1195 (last revised on 08/13/2020) requires that projects on a lot(s) with a ZI-1195 notation obtain clearance from the LAFD prior to permit issuance. During plan check, the Plan Check Engineer shall instruct the Applicant to obtain a Construction Site Well Review (CSWR) report from CalGEM prior to contacting the LAFD. None of the lots identified within the Project Site are noted by ZIMAS as being subject to Zoning Information No. 1195. Also refer to Response to Comment No. 26-105 regarding how the Project would comply with all applicable regulatory requirements, including LAMC Section 91.7109.2, which requires LAFD notification when an abandoned oil well is encountered during construction activities and requires that any abandoned oil well not in compliance with existing regulations be reabandoned in accordance with applicable rules and regulations of CalGEM (see page IV.F-18 of the Draft EIR).

Comment No. 16-52

- Fox Studio Expansion to build office tower for "synergistic creativity" was immediately sold to a non-studio owner. Fool me once, shame on you.... The use the phrase on p. "synergistic mix" Appendix A, p. 3. is a warning.

Response to Comment No. 16-52

Refer to Response to Comment No. 5-15 and Topical Response No. 3, Permitted On-Site Uses, regarding the studio purpose of the Project. This comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 16-53

- **The DEIR fails to analyze consistency with Measure JJJ. LAMC 11.5.8.**

Response to Comment No. 16-53

The Project Site is not improved with any residential uses. In addition, the Project does not propose or has submitted any General Plan Amendment, Zone Change, or Height District change that would introduce any residential uses to the Project Site. Measure JJJ, codified in part in Section 11.5.8 of the LAMC, instituted requirements related to housing development projects requiring General Plan Amendments and Zone and Height District changes, including, but not limited to, the on-site provision of affordable housing units or in-lieu fees for restricted affordable residential dwelling units. Therefore, no analysis of consistency with Measure JJJ is required or applicable as the Project does not propose any housing units.

Refer to Response to Comment No. 16-2 regarding the Specific Plan's provisions to maintain the housing density allowed on-site at the time of application submittal.

Comment No. 16-54

- **No Draft Development Agreement.** Again, the devil is in the details. This is a contract with the City that requires transparency.

Response to Comment No. 16-54

Refer to Response to Comment No. 16-1. As discussed therein, the Development Agreement would only allow for development consistent with the Project described in the certified EIR. Other provisions of the Development Agreement would be contractual matters between the City of Los Angeles and the Applicant and do not constitute environmental impacts under CEQA. Accordingly, the Development Agreement is not required to be included as part of the EIR.

Comment No. 16-55

- **This project is inconsistent with the Housing Element.** p. II-9.

Response to Comment No. 16-55

Refer to Response to Comment No. 16-2 regarding how the Project would not conflict with the Housing Element.

Comment No. 16-56

- **Will new sidewalk dimensions comply with MP 2035?** What is a frontage area that includes sidewalk? Where is the property line, the building line, etc.?

Project Des. Says what the current sidewalks are but not what the new ones will be. p. II-9

Response to Comment No. 16-56

Refer to Response to Comment Nos. 16-30, 16-72, and 16-76 regarding sidewalk and frontage widths and Mobility Plan consistency. Regarding the frontage areas, the frontage areas dictate the placement, orientation, mass, and height of potential future buildings. The frontage areas may include areas for pedestrian access. However, a frontage area is not equivalent to a setback or building line, which are established by zone or ordinance, respectively. The Project Site is currently located in multiple zones with minimal to zero setback requirements and is not subject to any building line ordinance.

Comment No. 16-57

- **Identify off-site uses and their neighborhood intrusion impacts (App I, p. II-11)**

Response to Comment No. 16-57

It is unclear what this comment is specifically referring to. Nonetheless, the Project does not include any off-site uses, and off-site parking and truck staging are no longer proposed; refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR. Figure 1 depicting the on-site staging areas has also been included in Appendix FEIR-8 of this Final EIR. In addition, existing off-site uses that are not a part of the Project are identified in Section II, Project Description, of the Draft EIR (see pages II-2 through II-5) and throughout the impact analyses within the Draft EIR.

Comment No. 16-58

- **What is a rooftop zone (Zone F)?** p. II-20.

Response to Comment No. 16-58

As described on pages II-19 and II-20 and illustrated in Figure II-5 of Section II, Project Description of the Draft EIR, Height Zones E and F are “rooftop zones” with specific limitations to preserve the integrity of the Primary Studio Complex. As stated therein:

- **Height Zone E—84-Foot Height Limit:** Height Zone E is a rooftop zone that extends a length of approximately 350 feet along the northern façades of the Primary Studio Complex at a beginning point 55 feet south of the northern façade of the Studio Building. Height Zone E is not subject to the base height limit of 88 feet but rather limits any rooftop addition to a height limit of 84 feet.

Accordingly, new construction in Height Zone E would be limited to a height of 36 feet above the existing parapet of the Studio Building within the entirety of the Height Zone E area.

- **Height Zone F—HCM Protection Zone:** Height Zone F is a rooftop zone that extends a length of approximately 350 feet along the northern façades of the Primary Studio Complex and approximately 167 feet south from the northern façade of the Service Building and approximately 55 feet south from the northern façade of the Studio Building. Height Zone F is not subject to the base height limit of 88 feet but prohibits the construction of any new occupiable building. Non-occupiable structures and elements, such as circulation elements, sidewalks, landscaping, security kiosks, fences, walls, projections, stairs, balconies, and appurtenances, would be permitted with no height limit. Existing rooftop appurtenances in Height Zone F may be maintained and modernized as long as screening is provided in compliance with the Specific Plan.

Comment No. 16-59

- **Project is inconsistent with the General Plan Framework designation for neighborhood commerce**, as opposed to a regional center designation. p. II-36).
- See also Land Use Tables, p. 2. Policy 3.1.4—conflicts with framework location for regional centers. Figure 3-1 GPF.

Response to Comment No. 16-59

As discussed in Section IV.H of the Draft EIR, the Project is consistent with the General Plan Framework Element. As stated within the General Plan Framework's Long Range Land Use Diagram (Figure 3-1), which is included as Attachment A to this Comment Letter, because the Framework Element extends citywide, the Framework Element cannot anticipate every detail. Therefore, the community plans dictate the final determinations related to boundaries, land use categories, intensities, and heights that fall within the ranges described in the Framework Element. The Wilshire Community Plan currently designates the Project Site as Neighborhood Office Commercial, Limited Commercial, and Community Commercial. The Project involves a General Plan Amendment to change the various land use designations to a consistent Regional Commercial designation and assigns the Regional Commercial designation to an approximately 0.63 acre portion of the Project Site located in an unincorporated area of the County to be annexed to the City. Refer to Response to Comment No. 16-4 regarding the General Plan Framework Element land use diagram and to Response to Comment Nos. 5-8 and 11-29 regarding the proposed Regional Commercial land use designation. Also refer to page 2 of Appendix I, Land Use Plans Consistency Analysis Tables, of the Draft EIR regarding how the Project would not conflict with Framework Element Policy 3.1.4.

Comment No. 16-60

- **Violates Policy 3.2.4: it does not enhance the character of commercial district:** it is an inward-facing development and does not contribute to a neighborhood commercial, pedestrian friendly district. Appendix A, p.5. [sic]

Response to Comment No. 16-60

Contrary to the assertion of the commenter, the Project would include outward facing components, including numerous public realm improvements, as discussed in detail on pages 4 and 5 of Appendix I, Land Use Plans Consistency Analysis Tables, of the Draft EIR, where the Project's lack of conflict with Policy 3.2.4 is discussed. Refer also to Response to Comment No. 16-47.

Comment No. 16-61

- **Conflicts with Objective 3.16 because it does not enhance pedestrian activity.** Also, Policy 3.1, 2.3: walking across multiple driveways is dangerous and stressful. App p. 12. **Multiple driveways create pedestrian hazard and interrupt pedestrian flow.** For pedestrians, this is like running the gauntlet, dodging cars anxious to get to work, etc. App. A, p. 8

Response to Comment No. 16-61

Refer to Response to Comment No. 16-11 and Section E, Pedestrian Safety at Project Driveways, of Topical Response No. 12, Safety and Congestion, regarding pedestrian safety at the proposed driveways and traffic hazards. As discussed therein, all driveways would be designed in accordance with LADOT design standards to ensure pedestrian safety.

The Project itself includes wider sidewalks and wider landscaped parkways around the west, north, and east sides of the Project Site, thus enhancing the pedestrian realm as called for in Objective 3.16. Street facing retail on the Fairfax Avenue and/or Beverly Boulevard sides of the Project Site and an open park-like setting available to the public along Beverly Boulevard will also enhance pedestrian activity.

Comment No. 16-62

- **Policy 3.3: the project does not promote equitable land use** decision because it will increase congestion and remove the neighborhood serving retail proposed for Mixed Use Boulevards. There will not be a destination along these boulevards for residents. App I p. 13-14.

Response to Comment No. 16-62

Policy 3.3 of the Framework Element reads as follows: “Promote equitable land use decisions that result in fewer vehicle trips by providing greater proximity and access to jobs, destinations, and other neighborhood services.” As set forth on page 13 of Appendix I, Land Use Plans Consistency Analysis Tables, of the Draft EIR, the Project would not conflict with this policy. As described in more detail therein, the Project would include amenities, such as a Mobility Hub and a potential childcare use, among many others, and the Project would also expand employment opportunities in close proximity to residential areas, destinations, and local serving retail and restaurants which would result in reduced vehicle trips. Furthermore, contrary to this comment, the Project would provide a limited amount of neighborhood serving retail uses that do not currently exist within the Project Site, which would activate the street frontage along Beverly Boulevard and/or Fairfax Avenue.

Comment No. 16-63

- **Policy 3.3: VMT does not measure the impacts of congestion on emergency service response time, as noted by the City’s CEQA Threshold Guide.** This Guide also requires a map showing all of the intersections at LOS D or F between the project site and the nearest fire station (K)., p. 13.p. [sic] 14, the shuttle is only for employees, not neighbors or visitors. P.14. [sic]

Response to Comment No. 16-63

Policy 3.3 of the General Plan Framework Element does not relate to the impact of congestion on emergency response times. It encourages “equitable land use decisions that result in fewer vehicle trips by providing greater proximity and access to jobs, destinations, and other neighborhood services.” As discussed on page 13 of Appendix I, Land Use Plans Consistency Analysis Tables, to the Draft EIR, the Project “would expand employment opportunities in close proximity to residential areas, destinations, and local-serving retail and restaurants.” This would reduce trips by offering “convenient, non-commute commercial opportunities for Project employees and visitors.” The Applicant has committed to providing a shuttle for Project employees, visitors, and audience members between the Metro D (Purple) Line Wilshire/Fairfax Station currently under construction and the Project Site, which would further reduce vehicle trips by improving transit access to the Project Site. Under its currently planned operation, the shuttle would not be open to the public, but service to the general public along this route would likely be covered by the DASH service in the area.

Although not required by CEQA, a map of LOS E or F intersections between the Project Site and the nearest fire station is provided as Figure II-3 in Topical Response No. 12, Safety and Congestion.

Comment No. 16-64

- **Policy 9.3.1 conflicts** because the excavation may release **hydrocarbons from the oilfield** that will need to be discharged to the storm drain and require treatment and an **NPDES permit from the Feds**. App I, p. 16.
- There may be a need to be **toxic cleanup** around the refueling facilities and testing to see if this had entered the groundwater table. Need state clean-up and removal to a **Class I landfill**.

Response to Comment No. 16-64

The Project fully complies with Policy 9.3.1 of the Framework Element regarding reducing potential hazardous substances and flow entering the wastewater system as discussed on page 16 of the Land Use Plans Consistency Analysis Tables included in Appendix I of the Draft EIR. Refer also to Response to Comment No. 13-4 regarding hydrocarbons and the oilfield and the former gas stations and Response to Comment No. 16-28 regarding potential groundwater contamination. The nature and extent of petroleum hydrocarbon impacts in soil and groundwater at the Project Site are described in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR, the Site Summary Report (Appendix G.1 of the Draft EIR), and various groundwater monitoring reports for the former Texaco station (see State of California Geotracker database; <https://geotracker.waterboards.ca.gov/>). These investigations identified naturally-occurring tar in an isolated area near the southwest boundary of the Project Site where a tar collection system is located. These reports also document residual petroleum hydrocarbons in soil associated with the former Texaco station that had been located on the Project Site, which received cleanup approval from the LARWQCB under the State's Low Threat Closure Policy (see Geotracker; <https://geotracker.waterboards.ca.gov/>). No further soil remediation is required, but any soil excavated from the Project Site will be tested, analyzed, and disposed of following the procedures described in the Soil Management Plan per Mitigation Measure HAZ-MM-1. Similarly, the presence of residual petroleum hydrocarbons in the Project Site groundwater does not require remediation, but the groundwater that is pumped during the temporary construction dewatering efforts onsite may require treatment, pursuant to the applicable discharge permit. As stated on page IV.F-44 of the Draft EIR, a discharge permit will be obtained from either the LARWQCB (NPDES permit) or LASAN (sanitary sewer industrial discharge permit), depending on the appropriate discharge point, and any discharge of groundwater would need to comply with all applicable regulatory requirements. Pursuant to such requirements, the extracted groundwater would be chemically analyzed to determine contamination and the appropriate treatment and/or disposal methods and will result in a less-than-significant impact as stated in the Draft EIR.

This comment discusses the need for "toxic cleanup" around the refueling facilities. Refer to Response to Comment Nos. 13-6 and 16-28 for a discussion of the former

Anderson V L and Texaco stations and to Response to Comment No. 26-83 regarding the disposal of contaminated soil. There are no existing refueling facilities on the Project Site and, as clarified in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, no future fueling or refueling facilities are proposed by the Project.

Comment No. 16-65

- **Also, this is in a flood plain, which is not disclosed.**

Response to Comment No. 16-65

As discussed on page IV.G-38 in Section IV.G, Hydrology and Water Quality, of the Draft EIR, the Project Site is not located within a 100-year flood plain as mapped by FEMA. The northwestern portion of the Project Site is located in an area of minimal flood hazard, while the remainder of the Project Site is located in Zone X, which is defined as a flood hazard zone with a 0.2 percent annual chance of flooding. While minor changes in the direction of surface water flow could result from new finished grades onsite, overall drainage patterns would be maintained as shown in Figure IV.G-1 on page IV.G-21 of the Draft EIR (and as revised in Section III, Revisions, Clarifications, and Corrections to the Draft EIR), and the Project Site would continue to sheet flow towards the southern boundary. As such, the Project would not alter the existing drainage pattern of the Project Site in a manner that would impede or redirect flood flows, and no impacts related to flood flows would occur.

Comment No. 16-66

- **Goal AC: Adequate water supply. CONFLICT:** We are in an historic drought, rationing, and sources drying up. The WSA is inaccurate and does not account for the historic drought. App I, p. 17. Under these circumstances, the Wilshire CP requires that if funds are not available to fix the problem (public services, utilities, water, etc.) within a year, then an ICO is required, while entitlements are downzoned. Under drought, there can be no discretionary increases in density or intensity.

Response to Comment No. 16-66

The analysis of water supplies is based on the Water Supply Assessment (WSA) process completed with LADWP as required by SB 610 and not the Wilshire Community Plan. As discussed in Section IV.M.1, Utilities and Service Systems—Water Supply and Infrastructure, of the Draft EIR, a WSA was prepared for the Project and adopted by LADWP. The WSA, which is included as Appendix N of the Draft EIR, was completed in full compliance with all applicable regulatory requirements, and the commenter's statement that the WSA is inaccurate is false. As stated on page 21 of the WSA, LADWP concluded

that the projected water supplies for average, single-dry, and multiple-dry years reported in LADWP's 2020 Urban Water Management Plan (UWMP) would be sufficient to meet the Project's estimated water demand, in addition to the existing and anticipated future water demands within LADWP's service area through the year 2045, which exceeds the Project's Development Agreement term of 2043.

The WSA specifically addresses drought conditions and near-term drought risk management (refer to page 10 of the WSA), and the detailed discussion of drought conditions and plans to address such drought conditions throughout Appendix F of the WSA. In addition, as discussed on page IV.M.1-40 in Section IV.M.1, Utilities and Service Systems—Water Supply and Infrastructure, of the Draft EIR, the 2020 LADWP UWMP takes into account the realities of climate change and the concerns of drought and dry weather and notes that the City of Los Angeles will meet all new demand for water due to projected population growth by expanding local water supply programs and reducing demands on purchased imported water. Note that the commenter references Appendix I of the WSA. However, the WSA does not include an Appendix I.

Comment No. 16-67

- **Policy 1-1.2: conflict:** The project would remove residential uses by changing the property from neighborhood serving commercial with mixed-use residential, and thousands of proposed dwelling units per the Housing Element, to only commercial uses. App I, p. 18. As such, this plan amendment is **spot zoning**. It is not near the Wilshire regional center. p. 19

Response to Comment No. 16-67

Refer to Response to Comment No. 16-2 with regard to housing. Refer to Response to Comment Nos. 5-8 and 11-29 regarding the concern about spot zoning and the Regional Commercial designation.

Comment No. 16-68

- Any investigation of **venturi effect** around the tall buildings, or of **heat-island effects** from so much hardscape and buildings? See p. 19.

Response to Comment No. 16-68

As discussed on page IV.G-34 of Section IV.G, Hydrology and Water Quality, of the Draft EIR, the Project would not result in an increase in impervious surfaces within the Project Site. In addition, as discussed on page II-23 in Section II, Project Description, of the Draft EIR, the Project would include planting zones and associated planting palettes that would be established to define streetscape areas, gateways and major Project Site

entrances, production areas, bungalows, and rooftop terraces. Plantings would include resilient, drought-tolerant non-invasive and adaptive tree, shrub, and groundcover species, including shade trees. A minimum of approximately 28,900 square feet of landscaped open space would be also located along the Project Site boundaries. The provision of open space under the Project would be an improvement in comparison to the limited amount of landscaped area under existing conditions and as such proposed landscaped open space would serve to potentially reduce the “heat-island” effect. Furthermore, as discussed on page II-17 of the Draft EIR, much of the Project Site would be subject to a base height limit of 88 feet as measured from Project Grade. This base height limit would be augmented with maximum height limits in limited portions of certain height zones. Please refer to Response to Comment No. 26-E.1-2 for a discussion of why the Project would not result in “venturi” effects also known as “air canyon” effects.

Comment No. 16-69

- Policy 2-2.2: **encourage large mixed-use projects.** Mixed-use is combining commercial with residential. This project excludes residential. App. A, p. 19.

Response to Comment No. 16-69

Framework Element Policy 2-2.2 does not specify that a large mixed-use project must include residential uses. Rather, the policy states: “Encourage large mixed use projects to incorporate facilities beneficial to the community such as libraries, child care facilities, community meeting rooms, senior centers, police sub-stations, and/or other appropriate human service facilities as part of the project.” As described in more detail on page 19 of Appendix I, Land Use Plans Consistency Analysis Tables, of the Draft EIR, the Project would not conflict with this policy as the Project would include on-site retail uses and support uses, such as a childcare use.

Comment No. 16-70

POLICE

- Objective 8-1 “provide adequate police facilities, personnel and protection to correspond with existing and future population and service demands.” FEIR SOS for GPF states 17000 officers needed in 2001. We are way below that number. Response times show inadequate staffing. ARE RESPONSE TIMES PROVIDED [sic] IN EIR?
- Policy 3.3.2 mitigation through policy requires (as a mandatory mitigation measure) that response time, etc. be adequate for current and added demand. No evidence since fail to provide “adequate” measure. Arbitrary and capricious.

- City has failed to adopt Standards of Cover for LAPD and LAFD. Started, but has not completed.
- Claim project tax revenues could provide new police facilities. Is this analyzed as an environmental impact? (App. A., p. 22)

Response to Comment No. 16-70

These comments are similar to the commenter's previous comments. With regard to the adequacy of LAPD police protection services and infrastructure, refer to Response to Comment Nos. 16-5 and 35-133. With regard to mitigation measures and the General Plan Framework policies, refer to Response to Comment Nos. 16-5 and 16-6. With regard to the Wilshire Community Plan policies, refer to Response to Comment No. 16-7.

Refer to Response to Comment Nos. 9-35 and 26-147, and Section D, Emergency Access, of Topical Response No. 12, Safety and Congestion, regarding emergency response times.

The comment regarding Standards for Cover is not specific to the Project and does not relate to the Draft EIR's analysis of environmental impacts. Nevertheless, this comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

With regard to tax revenues, as discussed on page IV.J.2-15 of Section IV.J.2, Public Services—Police Protection, of the Draft EIR, the Project would generate revenues to the City's General Fund (in the form of property taxes, sales tax revenue, etc.) that could be applied toward the provision of new police facilities and related staffing in the community, as deemed appropriate. Tax revenue is not an environmental impact under CEQA. Nevertheless, this comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 16-71

FIRE:

- **Water pressure inadequate.** During drought, this puts a strain on pressure for the entire area. In the event of an earthquake, the residential neighborhood would lose pressure. There is only so much to go around. (App I p. 22)

Response to Comment No. 16-71

With regard to the adequacy of LAFD fire protection services and infrastructure, including water pressure, refer to Response to Comment Nos. 16-5, 16-10 and 26-147. Also refer to Response to Comment No. 16-66 regarding the adequacy of water supplies to serve the Project, including during drought conditions.

Comment No. 16-72

- Objective 2-2, Policy 2-2.1: does not encourage pedestrian-oriented design for the public. App I, p. 19. It does not enhance the public realm, but is a project that is a closed, secure site that turns its back on the community, shuts it out, and denies it the neighborhood-serving mixed-use boulevards promised by the General Plan and by the GPF. In fact, rather than improving the pedestrian experience, it creates pedestrian hazards with multiple driveways along both boulevards.

Response to Comment No. 16-72

An analysis of the Project's consistency with Objective 2-2 and Policy 2-2.1 of the Wilshire Community Plan is included on page 19 of Appendix I, Land Use Plans Consistency Analysis Tables, of the Draft EIR. This analysis states the following:

<p>Objective 2-2: Promote distinctive commercial districts and pedestrian-oriented areas.</p> <p>Policy 2-2.1: Encourage pedestrian-oriented design in designated areas and in new development.</p>	<p>No Conflict. As previously discussed, the Project would enhance the public realm through streetscape improvements to the pedestrian experience, while continuing to provide for the unique security needs of a working production studio. In particular, the Project has been designed to restore views of the HCM from Beverly Boulevard (which are currently obstructed). A minimum of approximately 28,900 square feet of open space would be provided along the Project Site boundaries. These perimeter areas would include landscaping such as trees and shrubs, lighting, wayfinding signage, and pedestrian amenities such as benches and shade structures. Thus, the proposed Project would represent a positive contribution to the commercial and pedestrian environment in the Wilshire Community Plan area. As such, the Project would not conflict with this objective and associated policy.</p>
---	---

Also note that the Project Site is and will continue to be a secured studio campus that, by its nature, requires a secured perimeter. Nevertheless, the Project's design is pedestrian-oriented and enhances the public realm. Accordingly, the Draft EIR concluded that the Project would not conflict with Objective 2-2 and Policy 2-2.1. Further, as discussed on pages IV.H-51 to IV.H-52 of the Draft EIR, the Project would create a pedestrian-oriented public realm along Fairfax Avenue, Beverly Boulevard, and The Grove

Drive to accommodate pedestrian travel and provide a more comfortable pedestrian environment. The Project would include new landscaping along all public Project Site frontages, upgraded bus stops around the Project Site perimeter as needed, and signalization of the currently uncontrolled crosswalk across Fairfax Avenue at 1st Street. Furthermore, the Applicant would make a financial contribution toward pedestrian facility improvements as part of Vision Zero.

With regard to pedestrian access at the Project driveways, the busiest driveways would be controlled by a traffic signal, which would help reduce the pedestrian/vehicular conflicts along the sidewalks. Refer to Section E, Pedestrian Safety at Project Driveways, of Topical Response No. 12, Safety and Congestion, regarding pedestrian safety at the proposed driveways. As discussed therein, all driveways would be designed in accordance with LADOT design standards to ensure pedestrian safety.

As stated on page IV.H-17 of the Draft EIR, under State Planning and Zoning Law (Government Code Section 65000, et seq.), strict conformity with all aspects of a plan is not required. Generally, plans reflect a range of competing interests, and agencies are given great deference to determine consistency with their own plans. As discussed in Section IV.H, Land Use and Planning, and Appendix I of the Draft EIR, the Project would be consistent with the objectives and policies that support the goals of the Wilshire Community Plan.

Also refer to Response to Comment No. 9-29 regarding transportation-related hazards.

Comment No. 16-73

- UNLESS the project changes, which it can, and then with the Regional Center designation, the residential density would be R5, the highest density permitted in the city. But the project that was studied most definitely removes the option of both neighborhood-serving commercial and residential uses.
- Policy 2-1.2: not adhering to the community plan land use designations App p. 19. Disregarding neighborhood serving commercial and Mixed-Use Boulevards. To complement the existing residential community.

Response to Comment No. 16-73

The proposed Regional Commercial designation would not affect the residential dwelling-unit density regulations for the Project Site. Refer to Response to Comment No. 16-2 with regard to the Project Site's residential potential. The commenter appears to be referring to Section 12.22 A.18(a) of the LAMC, which states, "Any use permitted in the R5 Zone [is permitted] on any lot in the CR, C1, C1.5, C2, C4, or C5 Zones provided that

such lot is located within the Central City Community Plan Area or within an area designated on an adopted community plan as Regional Center or Regional Commercial. Any combination of R5 uses and the uses permitted in the underlying commercial zone shall also be permitted on such lot.” No changes to the existing allowable residential density will occur as a result of the Project. Refer to Response to Comment Nos. 5-8, 11-29, and 16-4 regarding the proposed General Plan Amendment. Refer to pages 17 and 18 of Appendix I, Land Use Plans Consistency Analysis Tables, of the Draft EIR regarding how the Project does not conflict with General Plan Framework Policy 2-1.2. Also refer to Response to Comment No. 16-2 regarding the General Plan Framework Element’s designation of Fairfax Avenue as a Mixed-Use Boulevard.

Comment No. 16-74

- **Goal 9B: project site drainage patterns** likely to change because of **high water table** on site and **excavation. App I p. 16. In addition, subsidence may occur damaging historic resources.**
- **Permanent dewatering post-construction was not analyzed.**

Response to Comment No. 16-74

In accordance with Appendix G of the CEQA Guidelines, the Draft EIR analyzed the Project’s potential to alter the existing drainage pattern of the Project Site or area on pages IV.G-34 to IV.G-38 in Section IV.G, Hydrology and Water Quality, and concluded that impacts would be less than significant, as discussed below.

As stated on page IV.G-35 of the Draft EIR, construction activities for the Project have the potential to temporarily alter existing drainage patterns on-site by exposing the underlying soils, modifying flow direction, and making the Project Site temporarily more permeable. Exposed and stockpiled soils could also be subject to erosion and conveyance into nearby storm drains during storm events. In addition, on-site watering activities to reduce airborne dust could contribute to pollutant loading in runoff. However, as the construction site would be greater than one acre, the Project would be subject to the NPDES Construction General Permit. In accordance with the requirements of this permit, the Project would implement a SWPPP that specifies BMPs and erosion control measures to be used during construction to manage runoff flows. These BMPs are designed to contain stormwater or construction watering on the Project Site such that runoff does not impact off-site drainage facilities or receiving waters. In addition, Project construction activities would occur in accordance with City grading permit regulations (LAMC Chapter IX, Division 70), such as the preparation of an erosion control plan, to reduce the effects of sedimentation and erosion. Thus, through compliance with all applicable NPDES Construction General Permit requirements, including preparation of a SWPPP and implementation of BMPs, as well as compliance with applicable City grading permit

regulations, Project construction activities would not substantially alter the Project Site drainage patterns in a manner that would result in substantial erosion, siltation, or flooding on- or off-site, and impacts would be less than significant.

As discussed on pages IV.G-35 to IV.G-36 of the Draft EIR, as illustrated in Figure IV.G-1 on page IV.G-21 of the Draft EIR (and as revised in Section III, Revisions, Clarifications, and Corrections to the Draft EIR), the existing drainage areas and overall drainage patterns would remain unchanged as a result of Project implementation. As discussed above, similar to existing conditions, the Project Site would continue to be comprised of up to approximately 90 percent impervious surfaces following Project buildout. As such, there would be a limited potential for erosion or siltation to occur from exposed soils or large expanses of pervious areas. In addition, as determined in the Hydrology and Water Quality Report included as Appendix H of the Draft EIR and as summarized in Table IV.G-1 on page IV.G-36, the overall surface water flow rate would not change with implementation of the Project. Specifically, existing runoff flows during a 50-year storm event are 53.53 cubic feet per second (cfs) of stormwater.¹²⁴ As shown in Table IV.G-1, runoff flows during Project operation would remain the same at 53.53 cfs during a 50-year storm event. Accordingly, there would be no increase in runoff volumes into the existing storm drain system. Furthermore, the Project's stormwater infrastructure would be designed to convey the 50-year storm to the designated discharge location. Inlets within the Project Site would be sized to eliminate the potential for ponding. Accordingly, drainage within the Project Site during operations would be similar to current conditions. Therefore, the Project would not substantially alter the existing drainage pattern of the Project Site or surrounding area such that substantial erosion, siltation, or on-site or off-site flooding would occur, and impacts would be less than significant.

As discussed on page IV.G-37 of the Draft EIR, under existing conditions, stormwater sheet flows from the Project Site without infiltration or capturing. In accordance with LID requirements, the Project BMPs would control stormwater runoff, with no increase in runoff resulting from the Project Site, as shown in Table IV.G-1 on page IV.G-36. Specifically, the existing flow rate of 53.53 cfs would remain with implementation of the Project. Therefore, stormwater flows from the Project Site would not increase due to the Project. In terms of polluted runoff, the Project's uses would be typical of studio operations, similar to existing conditions, and would not introduce new or substantial sources of polluted water. Anticipated and potential pollutants generated by the Project would include sediment, nutrients, pesticides, metals, pathogens, oil, and grease. The implementation of BMPs required by the City's LID Ordinance would target these pollutants and prevent

¹²⁴ Table IV.G-1 in Section IV.G, Hydrology, included a clerical error that has been corrected in Section III, Revisions, Clarifications, and Corrections to the Draft EIR. The existing and proposed flow rate is 53.53 cfs.

pollution of stormwater runoff. As such, the Project would not create or contribute additional runoff water that would exceed the capacity of the existing stormwater system or provide substantial sources of polluted runoff, and impacts would be less than significant.

As discussed on page IV.G-38 of the Draft EIR and in Response to Comment No. 16-65, the Project Site is not located within a 100-year flood plain as mapped by FEMA. As discussed in Response to Comment No. 16-65, the northwestern portion of the Project Site is within an area of minimal flood hazard while the remainder is located within Zone X, which is a flood hazard zone with a 0.2 percent annual chance of flooding. While minor changes in the direction of surface water flow could result from new finished grades onsite, overall drainage patterns would be maintained as shown in Figure IV.G-1 on page IV.G-21 of the Draft EIR (and as revised in Section III, Revisions, Clarifications, and Corrections to the Draft EIR), and the Project Site would continue to sheet flow towards the southern boundary. As such, the Project would not alter the existing drainage pattern of the Project Site in a manner that would impede or redirect flood flows, and no impacts would occur.

The Draft EIR did not analyze permanent dewatering because the Project would not include permanent dewatering post-construction. As recommended in the Preliminary Geotechnical Engineering Investigation for the Project (Appendix E.1 of the Draft EIR), the proposed structures will be designed for hydrostatic pressure such that the temporary construction dewatering system will be terminated at the completion of construction, allowing the groundwater to return to its pre-construction levels and natural drainage pattern.

Refer to Response to Comment Nos. 3-7 and 11-5. As discussed in Response to Comment No. 11-25 and in the Dewatering Report included as Appendix FEIR-13 of this Final EIR, temporary construction dewatering will be designed to minimize impacts to neighboring properties, including the potential for settlement or subsidence in the vicinity of historic structures. As stated on page IV.D-14 in Section IV.D, Geology and Soils, of the Draft EIR, no permanent large-scale extraction of groundwater, gas, oil, or geothermal energy currently occurs or is planned at the Project Site. As discussed in the Geotechnical Addendum II, prepared by Geotechnologies Inc., and included as Appendix E.5 of the Draft EIR, based on the age of the older surficial sediments that underlie the Project Site, subsidence is not anticipated on-site. Therefore, the potential for ground subsidence due to the withdrawal of fluid or gas at the Project Site, including to the historical resources, is low, and subsidence is not anticipated to result in damage to historical resources, as confirmed in the analysis conducted by Geotechnologies, Inc. in Appendix D of the Dewatering Report. As concluded therein, the subsidence effects on neighboring properties, including historic buildings, would be negligible and less than significant with the implementation of regulatory groundwater infiltration control measures and shoring

techniques discussed in the Dewatering Report; refer also to the regulatory summary included in Appendix FEIR-11 of this Final EIR.

Comment No. 16-75

- **Conflicts with Objective 3.3** because it does not provide adequate transportation, utility infrastructure and public services (emergency services, etc.) Appendix A, p. 5.
- Conflicts with Goal 3L promote pedestrian activity and provide a quality experience for the city's residents. It does the opposite—inward, no street life/commercial. Multiple queues seeking to enter the site will impede the flow of traffic.
- **What is the queuing space?** p. Appendix A, p. 7
- What is the **required turning radius for an 18-wheeler** to access or exit the project site?

Response to Comment No. 16-75

Refer to Sections IV.K, Transportation; IV.M, Utilities and Service Systems; and IV.J, Public Services, of the Draft EIR, which comprehensively analyzed the Project's potential transportation, utilities, and public services impacts, respectively, and determined the impacts to be less than significant.

Refer to Response to Comment No. 16-72, above, for a discussion of the Project's pedestrian-oriented design and amenities. As discussed therein, while the Project requires a secured perimeter, pedestrian amenities have been included to the extent possible. In addition, the Project would include up to 20,000 square feet of retail space accessible to the public, which is intended to activate the frontages along Beverly Boulevard and/or Fairfax Avenue.

Refer to Section A, Queuing at Project Driveways, of Topical Response No. 12, Safety and Congestion, regarding queue lengths. Overall, adequate queuing storage would be provided at each Project driveway to minimize the potential for vehicles to back out into the adjacent arterial streets.

As discussed in Response to Comment No. 16-11, the turning radius requirements of trucks entering and leaving the Project Site at each driveway have been checked and found to be adequate. The truck radii would be verified again by LADOT when the driveway permits are sought.

Comment No. 16-76

- Analyze the impacts on queuing, vehicular congestion, and pedestrian safety of eliminating many of the driveways and providing an internal circulation road?
- Objective 11-2: promote pedestrian mobility. Conflicts because of multiple driveways. Pedestrian-oriented streets are designed to be as free from driveways as possible. This project appears to violate the concept of pedestrian-oriented streets.
- Will sidewalk dimensions comply with MP 2035 15-foot sidewalks (not including the property that is fenced-in?)
- Policy 11-2.3: protect and improve existing pedestrian-oriented street segments. ***Conflicts because it creates new pedestrian hazards*** (driveways) that are not mitigated. App I, p. 24.

Response to Comment No. 16-76

Refer to Response to Comment Nos. 16-11 and 9-29 and Sections A, Queuing at Project Driveways; B, Level of Service; and E, Pedestrian Safety at Project Driveways, of Topical Response No. 12, Safety and Congestion, regarding queuing, the number and location of the proposed driveways at the Project Site, pedestrian safety at those driveways and traffic hazards. The comment regarding mitigating pedestrian hazards is incorrect because the transportation analysis found that the Project would not cause any significant pedestrian impacts, and therefore no pedestrian mitigations are necessary.

As described on pages IV.K-55 to IV.K-57 in Section IV.K, Transportation, of the Draft EIR, currently, the public sidewalks and landscape parkways around the Project Site perimeter range from nine to 15 feet wide, and the areas accessible to pedestrians are as narrow as 3 to 4 feet along portions of The Grove Drive and Fairfax Avenue. Further, the existing sidewalk widths along The Grove Drive and Fairfax Avenue do not meet current Mobility Plan standards. The Project would maintain the existing variable 12- to 15-foot sidewalk area along Beverly Boulevard, in accordance with the Mobility Plan.¹²⁵ In addition, the Project would provide a varying 5- to 8-foot-wide frontage area (including a portion of the sidewalk) for a total 20-foot-wide sidewalk and frontage area along the entire Project Site edge along Beverly Boulevard. The Project proposes to provide a 15-foot sidewalk on Fairfax Avenue, plus a 17-foot-wide frontage area (including a portion of the

¹²⁵ Specifically, the sidewalk width meets the standard of 15 feet adjacent to the Project Site; however, on Beverly Boulevard toward Fairfax Avenue where the roadway widens up to three feet to accommodate the westbound left-turn lane to Fairfax Avenue, the sidewalk is reduced to approximately 12 feet. In consultation with the Los Angeles Bureau of Engineering, the existing configuration is considered generally compliant with the Mobility Plan, and no dedication or widening is required.

sidewalk), for a total 20-foot-wide sidewalk and frontage area along the entire Project Site edge along Fairfax Avenue. The Project would provide a 10-foot sidewalk on The Grove Drive, plus a 7-foot-wide frontage area (which includes a portion of the sidewalk), for a total 14-foot-wide sidewalk and frontage area along the entire Project Site edge along The Grove Drive. Although this would remain narrower than the 13-foot standard in the Mobility Plan, it would exceed the existing sidewalk width. Thus, the Project would be consistent with the intent of the Mobility Plan. Refer to Figures IV.H-3 through IV.H-6 in the Draft EIR, which shows the proposed sidewalk and frontage improvements.

Comment No. 16-77

- Will greenhouse gases be released by dewatering the site during construction?

Response to Comment No. 16-77

Refer to pages IV.E-74 through IV.E-77 of Section IV.E, Greenhouse Gas Emissions, of the Draft EIR, and Appendix B, Air Quality and Greenhouse Gas Emissions, of the Draft EIR regarding the analysis of greenhouse gas (GHG) emissions during construction. Dewatering equipment was included in the construction assumptions as pumps were included in the CalEEMod modeling on pdf page 31 of Appendix B of the Draft EIR, and the GHG emissions reported in Table IV.E-10 on page IV.E-77 of the Draft EIR include emissions from this equipment. In addition, shoring would be required during site preparation (concurrent with demolition activities) occurring prior to dewatering activities. The additional equipment required for shoring and its associated electricity usage associated with pumping equipment is also included within the Confirmatory Air Quality, GHG, and Energy Analysis in Response to Comments (see Appendix FEIR-9 of this Final EIR). Please note that the inclusion of GHG emissions from shoring equipment and electricity usage associated with pumping equipment does not change the less than significant GHG impact conclusions in the Draft EIR.

Comment No. 16-78

- Project is inconsistent with General Plan Framework Policy 3.3.2.

Response to Comment No. 16-78

Refer to Response to Comment No. 16-6 with regard to General Plan Framework Policy 3.3.2. Refer to Response to Comment No. 5-8 regarding the proposed Regional Commercial designation.

Comment No. 16-79

- **The heights** proposed are inconsistent with the neighborhood-serving designation for the commercial development. Project description p. II-18
- Changing how height is measured requires a variance of a code amendment. (p. II-31)

Response to Comment No. 16-79

The commenter appears to reference a height limit related to the “Neighborhood Office Commercial” land use designation of the land use map of the Wilshire Community Plan. However, no such specific height limit exists. For informational purposes, in the City of Los Angeles, height limitations are imposed on parcels by Height Districts, primarily codified in Section 12.21.1 of the LAMC, or by specific plan or other specialized overlay or district. A Height District may only be assigned to a land use designation of the General Plan or Community Plan by creation of a General Plan footnote. However, no such footnote applies to the Project Site.

As discussed in Response to Comment No. 16-21, height would be regulated by the proposed Specific Plan. Accordingly, a variance would not be required.

Comment No. 16-80**Project is inconsistent with Wilshire Community Plan:**

- **No analysis of off-site uses, shuttles, etc. Employees, audiences (p. II-29)**

Response to Comment No. 16-80

The Project does not include any off-site land uses that need to be analyzed. As discussed in Section IV.K, Transportation, of the Draft EIR, the Project’s TDM Program would include a shuttle service between the Metro D (Purple) Line Wilshire/Fairfax Station currently under construction and the Project Site for employees and visitors, and the shuttle will operate during typical commuter peak periods. The Mobility Hub would support shuttle service between the Metro D (Purple) Line Wilshire/Fairfax Station currently under construction and the Project Site, as well as future shuttle services connecting to other existing and/or future transit stations (e.g., the Metro B (Red) Line or Metro K (Crenshaw) North Extension). The comment references page II-29 of the Draft EIR, which includes Figure II-9, Conceptual Mobility Hub. As discussed in Topical Response No. 2, Definition of Floor Area is Appropriate, the impacts associated with the Mobility Hub were fully analyzed in the EIR.

To provide a conservative transportation analysis, the Project's automobile trip generation was reduced by only 15 percent to account for transit, bicycle and pedestrian modes of travel to/from the Project Site. In the more robust TDM Program proposed by the Project, the proposed shuttle bus system is expected to provide buses with a capacity of approximately 40 passengers. The goal is to provide 10- to 15-minute headways for each of the shuttle buses for the four hours of the morning and the four hours of the afternoon peak commute hours, which along with limited mid-day service would provide the Project Site with the ability to move over 1,600 employees and visitors between the Project Site and the subway station per day as shown in the Mobility Hub memorandum included as Appendix FEIR-20 of this Final EIR. Table 6 on page 81 of the Transportation Assessment (Appendix M.1 of the Draft EIR) shows that the traffic impact study only accounted for 170 to 180 trips in the morning and afternoon peak one-hour periods, respectively. Thus, the shuttles included as part of the enhanced TDM Program could potentially reduce the traffic impacts of the Project as measured in the Draft EIR by approximately 1,365 net automobile trips per day to/from the Project Site (including the reduction of 1,469 vehicle trips and the creation of 104 shuttle trips as shown in Table 3 of the Mobility Hub memorandum).

Employee and audience trips were accounted for and analyzed in the transportation analysis in Section IV.K, Transportation, of the Draft EIR, as discussed in Topical Response No. 8, Vehicle Miles Traveled, and Sections A, Empirical Data, and B, Visitor Trips, of Topical Response No. 10, Trip Generation.

Comment No. 16-81

- **Do driveways provide adequate queuing space? (p. II-driveway diagram)**
- **TDM has not been effective in LA. This project relies on it (p. II-30)**
- **Off-site parking must be covenanted within 700 feet (per LAMC). No leases...**

Response to Comment No. 16-81

Refer to Section A, Queuing at Project Driveways, of Topical Response No. 12, Safety and Congestion. As discussed therein, adequate queuing storage would be provided at each Project driveway to minimize the potential for vehicles to spill over into the adjacent arterial streets.

Refer to Sections A, TDM Effects on Trip Generation, and B, Transit and TDM Effectiveness, of Topical Response No. 11, Transportation Demand Management. As discussed in Section A, the VMT analysis in Section IV.K, Transportation, of the Draft EIR and the Transportation Assessment (Appendix M.1 of the Draft EIR) conservatively excluded the effects of the Project's TDM measures. Section B discusses the history of the

effectiveness of TDM in California. As described in Response to Comment No. 16-80 above, the Transportation Assessment underestimates the potential effectiveness of TDM and transit to the Project Site to be conservative; as such, the comment's assertion that the Project "relies" on TDM is not correct. The Project has committed to the TDM Program as Project Design Feature TR-PDF-2 (see pages IV.K-37 to IV.K-40 of the Draft EIR), and it would meet (and be expected to exceed) the goals established by the TDM Ordinance.

Off-site parking is no longer proposed for the Project, as discussed in Topical Response No. 13, Parking.

Comment No. 16-82

- **Water shortage: state declared emergency, city watering regs. Please provide all city regulations regarding water conservation and drought declarations.**
- **Inadequate infrastructure**

Response to Comment No. 16-82

Refer to pages IV.M.1-9 through IV.M.1-14 of Section IV.M.1, Utilities and Service Systems—Water Supply and Infrastructure, of the Draft EIR for a discussion of City plans and regulations regarding water conservation and drought conditions, including LADWP's 2020 UWMP, L.A.'s Green New Deal, One Water LA 2040 Plan, and applicable provisions in the City of Los Angeles General Plan and LAMC. The Draft EIR fully and adequately analyzed water infrastructure on pages IV.M.1-31 to IV.M.1-34 and the Utility Report included as Appendix O of the Draft EIR. As stated therein, the Project would not require or result in the relocation or construction of new off-site water facilities or expansion of existing facilities that could cause a significant environmental effect. As such, impacts on water infrastructure would be less than significant.

Comment No. 16-83

- **NPDES permit required** because the excavation will hit groundwater.

Response to Comment No. 16-83

Refer to Response to Comment Nos. 3-7 and 11-5 for additional information regarding compliance with discharge permit requirements.

Comment No. 16-84

- **Clean Air Act lawsuit in federal court** over noncompliance with State and Regional Air Quality Plans, particularly with the additional traffic and hydrocarbon release from excavation. Air quality has been declining, and we are not in compliance with the Clean Air Act. We are a nonattainment area. Need to comply, not make it worse.
- What about diesel fumes wafting over shoppers at the Grove and Farmer's Market.

Response to Comment No. 16-84

This comment does not specify a specific lawsuit regarding the Clean Air Act related to the State and regional air quality plans that pertains to the Project. However, as discussed above in Response to Comment No. 16-12, the Project is not expected to worsen air quality in the region and construction (including emissions related to excavation) as operational localized air quality impacts would be less than SCAQMD's significance criteria for all pollutants. SCAQMD's localized significance thresholds represent the maximum emissions from a project that will not cause or contribute to an exceedance of the most stringent applicable federal or state ambient air quality standard.

In response to comments on the Draft EIR, a quantitative HRA is included as Appendix FEIR-10 of this Final EIR. The HRA includes health risk impacts from both Project-related construction and operational activities. Sources analyzed in the HRA include diesel exhaust (referred to as diesel fumes in this comment) from trucks and equipment with receptors located immediately south of the Project Site. As discussed in Response to Comment No. 26-E.1-2, the quantitative HRA confirms the Draft EIR's conclusion that health risks from the Project would remain below applicable significance thresholds.

Comment No. 16-85

- No analysis of subsidence, alteration of subsurface flow, pollution with hydrocarbons from oil field and within the La Brea water table.

Response to Comment No. 16-85

The Draft EIR addressed each of the topics mentioned in this comment. As stated in the Geotechnical Addendum II, included in Appendix E.5 of the Draft EIR, the Project Site is not located within an area of known subsidence due to withdrawal of oil or any other fluid. According to the Geologic Map of the Hollywood and Burbank (South ½) Quadrangles, Los Angeles, California (Dibblee, Map DF-30), the Project Site is underlain by Older Surficial Sediments. Due to the age of the sediments, subsidence is not

anticipated for the Project Site soils. As stated on page IV.D-14 in Section IV.D, Geology and Soils, of the Draft EIR and discussed in Response to Comment Nos. 11-5 and 16-74, no permanent large-scale extraction of groundwater, gas, oil, or geothermal energy currently occurs or is planned at the Project Site. Therefore, the potential for ground subsidence due to the withdrawal of fluid or gas at the Project Site is low. As discussed in Response to Comment No. 3-7, no permanent dewatering would be required, and only temporary construction dewatering would occur. Temporary construction dewatering methods will be designed to address the potential for subsidence from the dewatering efforts; refer to the Dewatering Report in Appendix FEIR-13 of this Final EIR. As discussed in Appendix D of the Dewatering Report, the dewatering system methods and shoring design are subject to regulatory control for safety and subsidence and will be submitted to LADBS for review and approval as part of the regulatory building permit process. Refer to Response to Comment No. 11-25 regarding the quantity of groundwater to be extracted during temporary dewatering.

Refer to Response to Comment Nos. 13-4, 13-6, and 16-28 regarding hydrocarbons and the Project Site's location within an oil field.

There are no identified impacts to the Project Site groundwater from the oil field. Nevertheless, any petroleum impacts to groundwater that is discharged during the temporary construction dewatering will follow the testing, on-site treatment (if necessary) and off-site discharge requirements contained in the approved discharge permit (either an NPDES permit or an industrial sewer discharge permit). Refer to Response to Comment No. 11-5.

The Project's impact on groundwater flows is discussed on pages IV.G-33 to IV.G-34 of the Draft EIR. As stated therein, excavation for below-grade parking would extend to a maximum depth of 45 feet below grade, and the historic high groundwater level on the Project Site is approximately eight feet below the existing Project Site grade. Therefore, dewatering activities are anticipated during construction as disclosed in the Draft EIR. However, due to the limited and temporary nature of dewatering operations, and with compliance with all applicable regulatory requirements, impacts to regional groundwater levels would be less than significant. Furthermore, no water supply wells, spreading grounds, or injection wells are located at the Project Site or within a one-mile radius of the Project Site that could be impacted by Project construction. Regarding Project operation, the Project Site is currently comprised of approximately 90 percent impervious surfaces, and, as such, limited groundwater recharge occurs. Project buildout would result in up to approximately 90 percent impervious surfaces throughout the Project Site. Furthermore, consistent with LID requirements to reduce the quantity and improve the quality of runoff that leaves the Project Site, the Project would include the installation of stormwater capture and use or biofiltration/bioretenion BMPs as established by the LID Manual. In addition, the stormwater which bypasses the BMP systems would discharge to an approved

discharge point in the public right-of-way and would not result in infiltration of a large amount of rainfall that would affect groundwater hydrology, including the rate or direction of groundwater flow. Therefore, the Project would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the Project may impede sustainable groundwater management, and impacts on groundwater supplies during operation of the Project would be less than significant.

Comment No. 16-86

SP flexibility in locating various uses within the site. But this does not permit analyzing impacts on adjacent properties. NOP p. 14

Response to Comment No. 16-86

The comment is unclear. Nonetheless, the Draft EIR fully evaluates potential impacts of the Project on adjacent properties and other properties in the vicinity of the Project Site as required by CEQA. Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, for a discussion of the Conceptual Site Plan that was analyzed in the Draft EIR and the regulatory framework under the proposed Specific Plan.

Comment No. 16-87

Helipad

- What are the noise impacts of putting the helipad at a higher elevation? (II-15)
- What are the impacts of this helipad on the Cedars emergency helipad?
- What flight paths will be used?
- Will the helicopters fly over Farmers Market and the Grove?
- Is this a helipad for emergency use or is it a heliport, rather than a helipad?
- Flight path of new helipad? (II-15)
- Frequency of flights? (II-15)
- Conditions of CUP ZA 11412 for helipad. Make sure it's not a heliport.... (II-15).

Response to Comment No. 16-87

As discussed in Response to Comment No. 26-15, the Project would include the continued operation of a helipad in the same general location and in accordance with

applicable regulatory requirements. The only change to the helipad would be its higher elevation.

Raising the helipad to a higher elevation at the same location would increase the vertical distance between helicopter activities (e.g., take-off, taxiing, hovering, final approach, landing) and ground-based sensitive receptors when compared to existing conditions. As a result, all phases of helicopter operations would be at a higher elevation than under current conditions, thereby increasing the attenuation of noise. This would incrementally reduce noise exposure at ground-based sensitive receptors. As such, as discussed on page IV.I-43 in Section IV.I, Noise, of the Draft EIR, noise impacts associated with the use of the helipad would be less than significant.

Continued use of the helipad would not impact the Cedars Sinai emergency helipad located approximately 1.25 miles to the west for two reasons. First, as the location of the on-site helipad would not change, existing flight paths would not be altered. Second, use of the helipad would not increase with development of the Project. As such, the Cedars Sinai helipad would not be affected in any way when compared to existing conditions.

With regard to flights over The Original Farmers Market and The Grove, as the location of the helipad and number of flight operations would not change, existing flight paths would not be altered. As such, any flights to and from the south over The Original Farmers Market and The Grove would not change under the Project.

The helipad would continue to operate in accordance with its existing Conditional Use Permit (CUP) (ZA 11412). It would not include services associated with a heliport (e.g., maintenance, fuel bunkering, fire suppression).

Comment No. 16-88

PROJECT DESCRIPTION:

- ***Executive summary fails to disclose all discretionary approvals required for the project and omits need for variances to measure height and FAR.***

Response to Comment No. 16-88

Section II, Project Description, of the Draft EIR provides a full list of the discretionary approvals required for the Project. As described therein, height and FAR would be regulated by the proposed Specific Plan. Thus, variances are not required.

Comment No. 16-89

- Huge difference in time-frame: **30 months or 20 years** (p. 13). Not a stable project description (p. II-12)

Response to Comment No. 16-89

Refer to Response to Comment No. 9-24 regarding the Project's timeframe. Also refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, for a more detailed discussion of how Section II, Project Description, of the Draft EIR is accurate, stable, and finite and provides all the necessary information to provide a thorough analysis of Project impacts in accordance with CEQA.

Comment No. 16-90

- p. II-11: integrate off-site uses. What are the off-site uses? What are the impacts of off-site uses? Are they analyzed?

Response to Comment No. 16-90

As discussed in Response to Comment No. 16-57, there are no off-site uses proposed as part of the Project and off-site parking and haul truck staging are no longer proposed; refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR. Figure 1 depicting the on-site haul truck staging areas has also been included in Appendix FEIR-8 of this Final EIR.

Specifically, the commenter is referring to a Project objective contained in Section II, Project Description, of the Draft EIR. The referenced Project objective describes the design focus of the Specific Plan and its goal of facilitating development of a Project that can lead to better integration with its surroundings. The Project has proposed (among others) an enhanced and more inviting public realm and the relocation of surface parking to subterranean levels to allow for the ability to construct up to 20,000 square feet of publicly-accessible retail uses. The Project objective, as stated, identifies the overarching goal of the Project to enhance the Project Site's frontages and, through that, encourage and provide opportunity for on-site staff, employees, and guests to walk or bike to locally adjacent uses, such as restaurants, retail, and sundry stores.

Comment No. 16-91

- Show route of employee shuttles (p. II-11)

Response to Comment No. 16-91

As described on page IV.K-38 of the Draft EIR, the Applicant will either operate or fund an employee van or shuttle service between the Metro D (Purple) Line Wilshire/Fairfax Station currently under construction and the Project Site.

Comment No. 16-92

- Signs visible from public right-of-way?? (p. II-11)

Response to Comment No. 16-92

Refer to Response to Comment No. 5-10 regarding the externally visible signs associated with the proposed Sign District.

Comment No. 16-93

- *Any tax relief in the development agreement?* (p. II-12)

Response to Comment No. 16-93

This comment does not concern the Draft EIR's analysis of the physical environmental impacts of the Project. Nevertheless, this comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 16-94

- No there-there: guidelines, concepts used to evaluate proposals. Really? Where are these? (II-12)

Response to Comment No. 16-94

It is not clear what this comment is referring to. This comment does not raise an environmental issue specific to CEQA or the Draft EIR and the environmental impacts addressed therein. Thus, no further response is required.

Comment No. 16-95

- Where is the regulatory framework? (II-12)

Response to Comment No. 16-95

It is unclear what regulatory framework the commenter is referring to, but the regulatory framework underpinning both the Specific Plan and environmental analysis is included.

As stated on page II-12 in Section II, Project Description, of the Draft EIR, the proposed Specific Plan would create a regulatory framework that accounts for the special needs of the Project Site and provides the Applicant with flexibility to address potential future changes in technology and space requirements inherent to the rapid pace of entertainment technology's advancement. As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Draft EIR disclosed all of the elements of the Project required by CEQA and provides a comprehensive analysis of the Project. Although not necessary for evaluation of the Project, in response to comments the Preliminary Draft Specific Plan has been made publicly available for informational purposes and can be found on City Planning's website page for this Project.

The regulatory framework relevant to each of the environmental topics studied in the Draft EIR is provided in Section 2, Environmental Setting, of each of the Draft EIR sections.

Comment No. 16-96

- Create a new land use zone: TVC (p. II-12). Why is this required to obtain an increase in FAR?

Response to Comment No. 16-96

The Project Site currently derives its FAR limit from the underlying C2-1-O and C1.52D-O Zones. Height District 1 and 2D both limit the Project Site's FAR to 1.5. The purpose of the TVC Zone is to implement the proposed Specific Plan as the regulatory control document applicable to the Project Site. Instead, the FAR and allowable floor area will be codified within the rules and regulations of the adopted Specific Plan. As stated previously, though not approved by the City, the Preliminary Draft Specific Plan has been made publicly available on the Department of City Planning's website.

Comment No. 16-97

- How do you convert production office space to basecamp/parking? II-13 Footnotes c, d)
- How do you convert garages into "other uses?"

- Flexibility of uses on the site is not what a specific plan does: it locates the uses in the most beneficial and compatible way. (II-13)
- There is no prohibition now to develop office and studio uses. The only limitation is the FAR. Why is the specific plan even needed if these uses are already permitted?

Response to Comment No. 16-97

Footnote c. of Table II-2 on page II-13 of Section II, Project Description, of the Draft EIR states that an estimated 6,608 square feet of existing production office space would not be demolished but may be converted to basecamp or parking uses. Footnote d. of Table II-2 states that an estimated 36,068 square feet of existing general office space would not be demolished but may be converted to basecamp or parking uses. These conversions would occur at grade level using typical construction techniques that would open up these areas for this use. Such conversions would be permitted through the City of Los Angeles Department of Building and Safety. As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Project is proposing a Land Use Exchange Program to allow for limited flexibility in the size of the studio uses (increases permitted only to sound stages and production support uses), but the total floor area throughout the Project Site would not exceed 1,874,000 square feet.

The comment regarding conversion of garages is unclear and does not appear to be raising a question specific to CEQA or the Draft EIR and the environmental impacts addressed therein. Thus, no further response is required.

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding the purpose of the proposed Specific Plan and the limited flexibility it provides.

Comment No. 16-98

- Analysis required for impact on MP 2035 changing the designation from Mixed-Use to TVC zone.

Response to Comment No. 16-98

The Mobility Plan does not designate the property as a Mixed Use Boulevard. The Mixed-Use Boulevard designation is identified within both the Framework Element of the City of Los Angeles General Plan and the Wilshire Community Plan as a tool to stimulate vibrancy and activity. Further, a Mixed-Use District has not been adopted. It has only been identified as an item that the Department of City Planning supports for areas within the

Wilshire Community Plan. Please refer to Response to Comment No. 16-2 for further elaboration on Mixed Use Boulevards in the General Plan Framework Element.

Additionally, the zoning designation is proposed to change from the C1.5 and C2 Zones to the TVC Zone and assign the TVC Zone to an area of unincorporated County of Los Angeles to be annexed by the City of Los Angeles. Refer to pages IV.K-46 through IV.K-57 of Section IV.K, Transportation, and pages 11 through 14 of Appendix I, Land Use Plans Consistency Analysis Tables, of the Draft EIR for a discussion of the Project's consistency with the Mobility Plan.

Comment No. 16-99

- Residential density for Regional Center is R5 if they change their minds and ask for a change in use from the Director of Planning. This is like the high-rise Wilshire Corridor in Westwood.

Response to Comment No. 16-99

Refer to Response to Comment No. 16-73 regarding how no changes to the allowable residential density would occur as a result of the Project.

Comment No. 16-100

- Area not designated in GPF as a regional center. Requires meeting the mandatory mitigations of Policy 3.3.2 discussed above.

Response to Comment No. 16-100

Refer to Response to Comment No. 5-8 regarding the proposed Regional Commercial designation.

Comment No. 16-101

- p. II-16 references change in use to be determined by the Director of Planning and no mention of public hearings and required findings. Changing a specific plan requires a new specific plan amendment, not an administrative review. It is a legislative approval, not administrative fiat.

Response to Comment No. 16-101

Page II-16 in Section II, Project Description, of the Draft EIR does not discuss changes of use; rather, page II-16 discusses the proposed Land Use Exchange Program under the proposed Specific Plan and not a specific plan amendment. As stated on pages

II-16 to II-17 of the Draft EIR, “[s]pecific proposals for development that involve a land use exchange would require a review by the Director of the Department of City Planning. This process would entail a determination of whether the development proposal complies with the TVC Specific Plan regulations and mitigation measures set forth in the Mitigation Monitoring Program for the Project and whether the environmental impacts resulting from the proposed development would be within the envelope of impacts identified in this Draft EIR.” The process discussed in the Draft EIR language above is set forth in the Preliminary Draft Specific Plan, which is publicly available on the Department of City Planning’s website. As stated therein, any future development proposal that involves a land use exchange and substantially complies with all applicable Specific Plan regulations would require a discretionary Project Compliance approval pursuant to LAMC Section 11.5.7[13B.4.2] and future CEQA compliance review. Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, for a discussion of the Land Use Exchange Program and the procedures under the proposed Specific Plan.

Comment No. 16-102

CONCLUSION

A Supplemental EIR is required to provide the requested information, based on a Draft Specific Plan and a Draft Development Agreement.

Fix The City had requested 30 days additional comment period. With only the 15-day extension, there has not been time to edit this letter to eliminate redundancies.

Response to Comment No. 16-102

The comment incorrectly states that a supplemental EIR is required. Under CEQA, a subsequent or supplemental EIR is only required if one or more of the following events occur:

- (a) Substantial changes are proposed in the project which will require major revisions of the environmental impact report.
- (b) Substantial changes occur with respect to the circumstances under which the project is being undertaken which will require major revisions in the environmental impact report.

- (c) New information, which was not known and could not have been known at the time the environmental impact report was certified as complete, becomes available.¹²⁶

None of these criteria apply to the Project. The Draft EIR was completed in full compliance with CEQA. As demonstrated in the response to comments to this and other comment letters received regarding the Draft EIR, there are no new significant environmental impacts or any substantial increases in the severity of any significant environmental impacts that result from these comments. As such, a supplemental EIR is not required under CEQA. Further, as discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, and Response to Comment No. 5-3, the Draft EIR disclosed all of the elements of the Project required by CEQA and provides a comprehensive analysis of the Project. While neither CEQA nor City policy requires a draft Specific Plan to be included in the Draft or Final EIR, in response to comments, the Preliminary Draft Specific Plan has been made publicly available and can be found on the Department of City Planning's website page for this Project. A draft Development Agreement will be publicly available prior to the public hearings for the Project. In addition, as set forth by CEQA Guidelines Section 15105, the public review period for a Draft EIR should not be less than 30 days nor should it be longer than 60 days except under unusual circumstances. The Department of City Planning extended the original Draft EIR comment period (45 days from July 14, 2022, to August 29, 2022) by 15 days, until September 13, 2022, for a total comment period of 60 days. Following the publication of this Final EIR, the EIR and the Project's requested approvals will be considered during public hearings and meetings before City decision-makers, including the City Hearing Officer and Deputy Advisory Agency, the City Planning Commission, the Planning and Land Use Management Committee, and the City Council.

Comment Letter No. 17

Brian Larrabee
Executive Director
Good City Mentors

Comment No. 17-1

Located in the heart of Los Angeles, Television City is one of LA's most iconic studios. Maintaining its 70-year historic presence is important to me, which is why I was pleased to learn that the project team worked with the Los Angeles Conservancy on its preservation plan.

Not only is the TVC 2050 project committed to preserving the historic cultural monument onsite, but they've also restored and preserved the public viewshed along Beverly Boulevard. One of the project's key planning principles, was to honor the original architects' intent for the studio—to have the ability to grow and adapt to changing industry needs.

TVC 2050 will allow the flexibility to accommodate ever-changing production and technological needs. The specific mix of uses ultimately constructed will depend on market demands. Having that flexibility is critical to the studio's longevity.

This modernization effort will allow Television City to keep up with industry demands, maintain a wonderful landmark and preserve our entertainment industry legacy.

Response to Comment No. 17-1

This comment indicating support for the Project is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment Letter No. 18

Michael Patterson
Business Manager
Heat & Frost Insulators Local 5
P.O. Box 3160
Ontario, CA 91761-0916

Comment No. 18-1

On behalf of Local 5 of the International Assn. of Heat & Frost Insulators & Allied Workers, we want to express our strong support for the TVC 2050: The Los Angeles Studio Plan proposed project.

This plan to modernize the 70-year-old Television City will bring more than 4,200 construction jobs to Los Angeles at a time when the city is continuing to recover from the impacts of COVID-19 and confronts increasing competition from other global production centers.

The modernization of Television City will ensure the future of the studio, create thousands of jobs, generate more than \$2.4 billion in new, annual economic output, and maintain Los Angeles' status as the entertainment capital of the world.

TVC 2050 represents a massive investment in one of the city 's biggest industries and it will produce new, well-paying construction jobs. Television City has agreed to employ union construction workers for the project which means new job opportunities for the skilled and trained men and women of the Building Trades.

We're pleased to support this important project that will bring more jobs and revenue to Los Angeles.

Response to Comment No. 18-1

This comment indicating support for the Project is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment Letter No. 19

Brian Curran
Hollywood Heritage, Inc.
P.O. Box 2586
Hollywood, CA 90078-2586

Comment No. 19-1

The Board of Directors of Hollywood Heritage, its Preservation Issues Committee, and its members, thank you for the opportunity to review and comment on The Television City 2050 Draft Environmental Impact Report (DEIR).. [sic] This includes the Appendix C.1 Historic Resources Technical Report TVC 2050 Project by Historic Resources Group.

Our review of the DEIR addresses a central issue: that the DEIR is stated as analyzing a Specific Plan as the “Project”, yet that Specific Plan was not included for DEIR review. Our interest is in preservation, rehabilitation, and additions to the existing historic buildings and the compatibility of new construction with them. We see that considerable effort has gone into this issue, but the “Project” and the DEIR does not connect the dots. Implementation in the Specific Plan and future environmental review is not guaranteed or clear. We hope to hear how and when the Specific Plan will be available to the public and circulated for our comment, prior to your preparation of the FEIR.

Response to Comment No. 19-1

Refer to Response to Comment No. 5-3 regarding the Project Description and Specific Plan. Also refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, for a discussion of how all physical aspects of the Project, including the proposed Specific Plan, were fully disclosed and analyzed in the Draft EIR. As discussed in Topical Response No. 1, the Specific Plan is not necessary for evaluation of the Project. Nevertheless, in response to comments, the Preliminary Draft Specific Plan has been made publicly available and can be found on City Planning’s website for this Project. Please note that the Preliminary Draft Specific Plan incorporates the same Project elements that could result in a physical impact on the environment that were fully disclosed and analyzed in the Draft EIR. Refer to Appendix FEIR-2, Comparison Chart of the Draft EIR and the Preliminary Draft Specific Plan, of this Final EIR.

Comment No. 19-2

Project Presentation and Illustrations: Hollywood Heritage was fortunate to have a presentation August 10th from the developer, the design team, and the historic architectural consultants. It is evident that much effort is going into retaining the historic

Primary Studio Complex and in making new building designs compatible. The illustrations we saw showed new buildings sited to the sides of the CBS “Service” and “Studio” [sic] Buildings, respecting the Beverly Boulevard “viewshed” to these historic buildings. The designers had tried many successive concepts over time, with an increasing sensitivity to historic structures and a solid grasp of studio function.

Response to Comment No. 19-2

This comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 19-3

Our overall impression is quite positive. But designers and intentions can change over the 20 year horizon this EIR is expected to cover.. [sic] (We do not agree on allowing additions *a priori* to the top of the Primary Studio Complex without having actual detailed plans to review and concurrence by the Office of Historic Resources..) [sic] Hollywood Heritage looks forward to continuing involvement in the buildings’ restoration and the compatible new construction as the actual Specific Plan gets written, the EIR gets recirculated, and more detailed plans are presented.

Response to Comment No. 19-3

The historic analysis in the Draft EIR was based on the Conceptual Site Plan (Figure II-4 on page II-14 of the Draft EIR). Future changes in and around the HCM and Viewshed Restoration Area that are substantially different than the Conceptual Site Plan or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, including review by OHR and the Department of City Planning, as well as potential CEQA compliance review. In response to comments on the Draft EIR, the proposed Specific Plan has been made publicly available prior to the publication of this Final EIR, which can be accessed on the Department of City Planning’s website. Please note that this draft is not final and has not been approved by City decision-makers. As discussed in Section B, Historic Structure Report and the Future Preservation of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, any substantial alteration to a designated HCM would require OHR review and compliance with the Rehabilitation Standards pursuant to Section 22.171.14 of the Cultural Heritage Ordinance.

As discussed in Section D, Analysis of Impacts to the Primary Studio Complex, of Topical Response No. 5, Historical Resources, the potential impacts from any rooftop addition were thoroughly analyzed in the Draft EIR (see page IV.B-50 in Section IV.B,

Cultural Resources, of the Draft EIR) and Historic Report (see Appendix C.1 of the Draft EIR, pages 65 to 68), and the Draft EIR correctly concluded that impacts from any rooftop addition would be less than significant.

Regarding the comment about the 20-year horizon, as stated on page II-36 in Section II, Project Description, of the Draft EIR and throughout the Draft EIR, the Applicant is seeking a Development Agreement with a term of 20 years, which could extend the full buildout year to approximately 2043. The Development Agreement would confer a vested right to develop the Project in accordance with the Specific Plan and Mitigation Monitoring Program throughout the term of the Development Agreement. The Specific Plan and Mitigation Monitoring Program would continue to regulate development of the Project Site and provide for the implementation of all applicable PDFs and mitigation measures associated with any development activities during and beyond the term of the Development Agreement. In addition, as discussed above and in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the proposed Specific Plan would include a regulatory framework for implementation of the Project.

As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Draft EIR discloses all of the elements of the Project required by CEQA and provides a comprehensive analysis of the Project. Please note that the Preliminary Draft Specific Plan incorporates the same elements that could result in a physical impact on the environment that were fully disclosed and analyzed in the Draft EIR. Refer to Appendix FEIR-2, Comparison Chart of the Draft EIR and the Preliminary Draft Specific Plan, of this Final EIR.

This comment does not provide substantial evidence that “significant new information” as defined by CEQA Guidelines Section 15088.5 has been added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Also refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 19-4

“PROJECT” IS A SPECIFIC PLAN, NOT YET WRITTEN

Unfortunately the DEIR Project Description includes none of the building designs, site plans, drawings or good design we saw and would have been able to evaluate as part of our DEIR review. The “Project” is the Specific Plan, not buildings. This DEIR concludes “no significant adverse effect” on Cultural Resources, based on an analysis of 4 highly schematic drawings on pages 120-125 in Appendix C1.(Cultural Resources). While providing a detailed professional analysis of this plan in the DEIR 3 important issues arise:

1. these buildings may or may not be what the actual Specific Plan ultimately entitles;
2. OHR is always relied on to perform design review of the rehabilitation, demolitions, additions, and maybe the compatibility of neighboring on-site structures. But in this case it appears the Specific Plan will reduce OHR oversight entitling additions and new building “envelopes” as a part of zoning, without OHR input.
3. the Historic Structure Report has not yet been prepared

In other words, the Project Description is inadequate under CEQA, because the “project” is a Specific Plan which is not yet written, publicly circulated, and accepted.

Response to Comment No. 19-4

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, and Response to Comment Nos. 19-3 and 5-3 regarding the proposed Specific Plan and how CEQA and City policy do not require a draft Specific Plan to be included as part of a Draft or Final EIR. Also refer to Response to Comment No. 19-3 regarding the discretionary review process that would be followed under the proposed Specific Plan in the event there are any substantial changes from the Project evaluated in the EIR.

With regard to OHR input and the HSR, as discussed in Section B, Historic Structure Report and the Future Preservation of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, any alteration to the HCM would require OHR review and compliance with the Rehabilitation Standards pursuant to LAMC Section 22.171.14. Section B of the topical response also presents a discussion of why CEQA and City regulations for the treatment of designated HCMs, as well as the standard purpose and use of an HSR, do not require the completion of the HSR before the Project EIR is approved.

Comment No. 19-5

An FEIR cannot be completed for this entitlement process until the Specific Plan itself has been circulated and reviewed by the public. Or until Mitigation Measures are added which make all the referenced inclusions in the EIR mandatory which are used to arrive at the conclusion of “no significant adverse effect”. [sic]

- The “SP” is the actual entitlement action this DEIR supports.
- As presented, we find the pronouncements of what “would” be included in the Specific Plan as conjectural, and not sufficient enough to ensure compatible design of additions and future buildings.

- We see the proposed Specific Plan building heights and setbacks as reducing the ability of the Office of Historic Resources to review additions and alterations of even the Primary Studio Complex as they are presented.
- If historic review is going to be pre-approved as suggested within this EIR, then the Cultural Heritage Commission should have the opportunity now to review the Specific Plan in detail before losing their ability to see actual building plans and approve or disapprove.

When the Specific Plan is available for the public to review, or when Mitigation Measures are added, then there will be a verifiable basis for the Project Description and the environmental findings.

Response to Comment No. 19-5

Refer to Response to Comment Nos. 19-3 and 5-3 regarding the proposed Specific Plan and how CEQA and City policy do not require a draft Specific Plan to be included as part of a Draft or Final EIR. In addition, refer to Response to Comment No. 19-3 regarding the discretionary review process that would be followed under the proposed Specific Plan in the event there are any substantial changes from the Project evaluated in the EIR. Refer to Section B, Historic Structure Report and the Future Preservation of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, regarding OHR input and how any alteration to the HCM would require OHR review and compliance with the Rehabilitation Standards pursuant to LAMC Section 22.171.14.

As discussed in Response to Comment No. 9-18, the proposed Specific Plan includes historic preservation regulations that incorporate the same LAMC regulations and PDFs set forth in Section IV.B, Cultural Resources, of the Draft EIR and specific standards regarding the Viewshed Restoration Area. Refer to the Preliminary Draft Specific Plan, which is publicly available on the Department of City Planning's website.

The Draft EIR comprehensively evaluated historic impacts in Section IV.B, Cultural Resources, of the Draft EIR, and concluded that impacts would be less than significant. Thus, mitigation is not required as incorrectly asserted in this comment.

Comment No. 19-6

HOW EIR AND SPECIFIC PLAN ARE PROCEDURALLY DISCONNECTED

The Specific Plan is the "Project". A [sic] conclusion of "No Significant Adverse Effect" on Cultural Resources isn't supportable unless the dots are connected. The intents here are laudable, and the design and consultant work to date is laudable, but the missing Specific

Plan and missing “‘follow through’ for project design features undermines the intent. The EIR conclusions are thus unsupportable.

Specific Plan contents as described are very basic zoning concepts: In the DEIR Project Description Page II-12 to 23 we are seeing very standard abstract zoning concepts to regulate future buildings—allowable square footage (with a new definition); heights, uses, setbacks applied across the 25 acre land area as a whole—to be tracked over time.. [sic] These are large scale abstract allowable “building envelopes”—far from specific and precise for evaluating a rehabilitation plan or the compatibility of new construction.

This Specific Plan “zoning’ is written to allow this developer flexibility going forward, and there is nothing wrong with that—IF each step of the way rehabilitation and additions to the historic buildings, and compatibility of new construction with historic buildings, is ensured. In the section of the DEIR called “Design and Architecture.” Design and Architecture .are [sic] missing. Compatibility and adequate rehabilitation goes beyond basic zoning “envelopes”. [sic]

Response to Comment No. 19-6

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, for a discussion of how CEQA and City policy do not require a draft Specific Plan to be included as part of a Draft or Final EIR, and how the Project Description in Section II, Project Description, of the Draft EIR is accurate, stable, and finite and provides all of the necessary information to provide a thorough analysis of Project impacts in accordance with CEQA.

As discussed in Response to Comment No. 9-18, the proposed Specific Plan includes historic regulations that incorporate the same LAMC regulations and PDFs set forth in Section IV.B, Cultural Resources, of the Draft EIR.

As discussed in Response to Comment No. 19-8, all PDFs have been included in the Mitigation Monitoring Program for the Project included as Section IV of this Final EIR to ensure their implementation.

In addition, refer to Response to Comment No. 19-3 regarding the discretionary review process that would be followed under the proposed Specific Plan in the event there are any substantial changes from the Project evaluated in the EIR. With implementation of the PDFs, LAMC requirements, and procedures within the Preliminary Draft Specific Plan, compatibility of new construction with the HCM would be ensured.

With regard to the comment regarding design and architecture, the discussion on pages II-17 through II-22 of Section II, Project Description, of the Draft EIR does provide an overview of the design and architecture of the Project and includes a discussion of how the design is intended to be compatible with the architectural elements of the HCM, as well as a description of height zones, frontage areas, building stepbacks, and other design elements, such as screening and fencing. As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, more detailed design information is not necessary for the CEQA environmental analysis of the Project.

With regard to the comment regarding “envelopes,” refer to Response to Comment No. 9-12.

Comment No. 19-7

First procedural disconnect: The promise is that the Specific Plan “would” require the following. “Would” is not “shall”. [sic] Also, producing these items is not adequate: they must be requirements of the Specific Plan or Mitigation Measures that are monitored. But also the process of how the actual reduction of potential adverse impact will be done must be delineated—HOW the Specific Plan will require these activities; HOW they will be evaluated by professionals and the public; and HOW the review will be accepted or not.

- an Historic Structure Report
- preservation of the Primary Studio Complex
- demolition of everything else
- submissions of building plans to OHR .
- review by the Director of Planning of work in the “viewshed”

Response to Comment No. 19-7

Potential impacts on historical resources were comprehensively analyzed in Section IV.B, Cultural Resources, of the Draft EIR, and the Draft EIR concluded that impacts from demolition, alteration, and new construction associated with the Project would be less than significant. Note that the City uses the term “would” when discussing a project in its environmental documents to reflect the fact that the project has not been approved by the decision-maker(s). If approved, all of the regulations within the proposed Specific Plan must be implemented. Refer to Response to Comment No. 19-3 regarding the discretionary review process that would be followed under the proposed Specific Plan in the event there are any substantial changes from the Project evaluated in the EIR (including new structures proposed in and around the HCM and Viewshed Restoration

Area that materially differ from the Conceptual Site Plan). Also refer to Section B, Historic Structure Report and the Future Preservation of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, regarding how any alteration to the HCM would require OHR review and compliance with the Rehabilitation Standards pursuant to LAMC Section 22.171.14. Note that all PDFs and mitigation measures within the Draft and Final EIR have been included in Section IV, Mitigation Monitoring Program, of this Final EIR. Refer to Section C, Potential New Construction North of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, regarding the regulations and procedures for new construction in the Viewshed Restoration Area and restoration of the historic viewshed along Beverly Boulevard.

Comment No. 19-8

Second procedural disconnect:, [sic] Specific Plans usually have development regulations and standards, with clear Design Review procedures mandated, including publicly noticed Board reviews of design.

IThis [sic] DEIR offers “Project Design Features” on Page I-16. These PDFs are usually attached to entitlements actions for proposed building projects—not for a Specific Plan with maximized flexibility for 2 million square feet of construction., [sic]

These Project Design Features and Project Parameters are the advice of a qualified preservation consultant in Appendix C-1. They are intended to delimit the wider flexibility of the future Specific Plan. It is not clear how and whether they are a part of the Specific Plan, or how they will be adjusted if the developer changes from the schematic design analyzed in the Appendix.. [sic]

- **“Project [sic] Design Feature CUL-PDF-1** Project Parameters includes the following, and references illustrations in the Historic Resources Technical Report: (Appendix C1). There is also a full list and discussion in Appendix C1.
- **Rehabilitation of the Primary Studio Complex** (This is stated in the EIR to involve review by OHR According to Appendix C, the historic resource would be retained and rehabilitated based upon the Secretary of the Interior’s Standards for Rehabilitation, the Rehabilitation Standards.
 - **Rooftop Addition above the Primary Studio Complex** (This should involve review by OHR, but OHR will be hobbled-in-advance by “permissions’ [sic] granted in the zoning heights and the verbiage of the roject [sic] Design Features.)
 - Adjacent New Buildings (Role of OHR unclear.)
- **“Project [sic] Design Feature CUL-PDF-2** Historic Structure Report required.

For example, the consultant's Project Parameters seem to be addressing a particular design, while the Specific plan has flexibility.

- Directives like “ Remove [sic] up to two bays of the Studio Building's west wall to allow an interior east-west passage through the Primary Studio Complex”. [sic] delimit the ability of OHR to evaluate a project as a whole.
- The “viewshed” is referred to in the Appendix C1—but its implementation is unclear.
- Without mandatory professional review and monitoring, and without public review of the specifics, the words are open to wide interpretation and unclear enforcement.. [sic] but are insufficient for clearing all possible cultural resources environmental impacts.

Response to Comment No. 19-8

Refer to Topical Response No. 5, Historical Resources, specifically Section B, Historic Structure Report and the Future Preservation of the Primary Studio Complex, regarding preservation of the Primary Studio Complex and regulatory procedures; Section C, Potential New Construction North of the Primary Studio Complex, regarding potential new construction in the Viewshed Restoration Area; and Section D, Analysis of Impacts to the Primary Studio Complex.

As discussed in Response to Comment No. 19-3, the historic analysis in the Draft EIR analyzed the Conceptual Site Plan (Figure II-4 on page II-14 of the Draft EIR). Future changes in and around the HCM and Viewshed Restoration Area that are substantially different than the Conceptual Site Plan or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, including review by OHR and the Department of City Planning, as well as potential CEQA compliance review.

As discussed in Section D, Analysis of Impacts to the Primary Studio Complex, of Topical Response No. 5, Historical Resources, the Project Parameters are required to be implemented by Project Design Feature CUL-PDF-1 and are not the “advice” of a consultant. All PDFs have been included in the Mitigation Monitoring Program for the Project included as Section IV of this Final EIR to ensure their implementation. The Mitigation Monitoring Program has also been appended to the Preliminary Draft Specific Plan. Any substantial alteration to a designated HCM would require OHR review for compliance with the Rehabilitation Standards pursuant to Section 22.171.14 of the Cultural Heritage Ordinance. It should be noted that OHR staff is responsible for reviewing alterations to properties designated as HCMs to ensure they meet the Secretary of the Interior's Professional Qualification Standards. Thus, the involvement of a Historic Preservation Professional is not mandatory but voluntary. The proposed Specific Plan

would not supersede the Cultural Heritage Ordinance and would not hinder the ability to OHR review alterations to the Primary Studio Complex. Refer to Section C, Potential New Construction North of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, regarding the regulations and review process for new construction in the Viewshed Restoration Area.

The comment that the Specific Plan maximizes flexibility for 2 million square feet of new construction is incorrect. As stated throughout the Draft EIR, the proposed Specific Plan would permit a maximum of 1,874,000 square feet of floor area within the Project Site. The proposed development program analyzed in the Draft EIR includes 350,000 square feet of sound stage, 104,000 square feet of production support, 700,000 square feet of production office, 700,000 square feet of general office, and 20,000 square feet of retail uses. The proposed Specific Plan would also include a Land Use Exchange Program to allow for limited increases in sound stage and production support uses with a corresponding reduction in square footage from another permitted land use as discussed further in Topical Response No. 1, Clearly Defined Project Description and Specific Plan.

Comment No. 19-9

Third procedural disconnect: The Parameters and Project Design Features must be formally reviewed and accepted by the Cultural Heritage Commission and OHR before they relinquish their “normal” authority. The zoning “envelopes” of allowable additions and new buildings must be vetted.. [sic] OHR will still need to address compatibility of height, materials, style, etc.

Project Design Features—if somehow attached to a Specific Plan in the future—still carry less legal weight than Mitigation Measures. The EIR somewhere mentions how to amend Character-Defining Features without the requisite public involvement at the Cultural Heritage Commission or through an EIR process.

An EIR like this is rarely adequate for future implementation of such a large project with so many variables. An EIR can put into motion a set of further professional and public reviews at such a time as actual project plans are available—often at 25%, 50%, and 75% construction documents. Unmonitored and unreviewed, these are hollow promises.

Response to Comment No. 19-9

This comment discusses the Cultural Heritage Commission and OHR’s review of the PDFs and certain elements of the Project. However, this is not a comment on the Draft EIR’s analysis of the Project’s physical impacts on the environment. Nevertheless, this comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

This comment states that PDFs carry less legal weight than mitigation measures. However, enforcement of the EIR's PDFs and mitigation measures would be ensured through the City Council's adoption of the Mitigation Monitoring Program for the Project as part of its certification of the EIR and approval of the Project. Section 21081.6 of the Public Resources Code requires a Lead Agency to adopt a "reporting or monitoring program for changes to the project or conditions of project approval, adopted in order to mitigate or avoid significant effects on the environment." Therefore, if the Project is approved, there will be a detailed plan in place to ensure monitoring and enforcement of all of the EIR's PDFs and mitigation measures. Note that all PDFs and mitigation measures within the Draft and Final EIR have been included in Section IV, Mitigation Monitoring Program, of this Final EIR.

This comment also discusses amending the character-defining features without the requisite public involvement. However, the Project would not amend the character-defining features of the Primary Studio Complex. The character-defining features are set forth in the findings that were adopted as part of the HCM designation, included as Appendix C of the Historic Report, which is included as Appendix C.1 of the Draft EIR. Per Project Design Feature CUL-PDF-1, the Project will preserve the existing character-defining features of the Primary Studio Complex and restore those character-defining features, which, in some cases, have been compromised in the past (prior to the Project), as stated on page IV.B-38 in Section IV.B, Cultural Resources, of the Draft EIR. As discussed in Section B, Historic Structure Report and the Future Preservation of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, any alteration to the HCM would require OHR review and compliance with the Rehabilitation Standards pursuant to LAMC Section 22.171.14. As discussed in Section C, Potential New Construction North of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, per the proposed Specific Plan, any proposed modification to character-defining features would require submittal to the Director, in consultation with OHR, of written verification from a Historic Preservation Professional that the modification complies with the Secretary of the Interior's Standards for the Treatment of Historic Properties.

Lastly, this comment states that an EIR like this is rarely adequate. As described in Section 15121 of the CEQA Guidelines, an EIR is an informational document that will inform public agency decision-makers and the public of the significant environmental effects of a project, identify possible ways to minimize any significant effects, and describe reasonable project alternatives. Therefore, as discussed on page I-1 in Section I, Executive Summary, of the Draft EIR, the purpose of the Draft EIR is to focus the discussion on the Project's potential environmental effects that the City, as the Lead Agency, has determined to be, or potentially may be significant. Feasible mitigation measures are recommended, when applicable, that could reduce or avoid the Project's significant environmental impacts. In accordance with CEQA, the Draft EIR serves as the environmental document for all actions associated with the Project. Also, the proposed

Specific Plan would include a regulatory framework for implementation of the Project, including, among other things, mandatory review processes by the City for implementation of the proposed Project. Future changes that are substantially different than the Project or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, as well as potential CEQA compliance review. See the Preliminary Draft Specific Plan, which is publicly available on the Department of City Planning's website. The Draft EIR is a "Project EIR," as defined by Section 15161 of the CEQA Guidelines. Furthermore, the Draft EIR complies with Section 15064 of the CEQA Guidelines, which discusses determining the significance of the environmental effects caused by a project.

Comment No. 19-10

ALLOWABLE ROOFTOP AND OTHER ADDITIONS TO THE PRIMARY STUDIO COMPLEX

The historic consultant analyzes some proposals for adding to the current Cultural Heritage Monument Primary Studio Complex buildings and the proposed Specific Plan allows tall building above and in the vicinity of the Primary Studio Complex. The list is called "Rooftop Addition above the Primary Studio Complex". [sic] It interfaces with the list "Rehabilitation of the Primary Studio Complex."

While the consultant has found the proposals to be acceptable and has outlined specific limitations in the Project Parameters, Hollywood Heritage felt that these "additions" to the building are not in keeping with Preservation Brief #14, are not reversible, are not architecturally and structurally developed enough to evaluate, and may be larger and more problematic if and when the project is re-designed. A specific Mitigation measure should be added to require OHR or Cultural heritage Commission and public review of these additions at both a Schematic and a Construction Documents phase.

Response to Comment No. 19-10

Contrary to the claims of the commenter, the proposed Specific Plan does not allow for tall buildings "above" the Primary Studio Complex. Any rooftop addition to the Primary Studio Complex must be designed in conformance with Project Design Feature CUL-PDF-1, which limits the size and scale of any potential rooftop addition so that the integrity of the Primary Studio Complex is retained. Refer to Section D, Analysis of Impacts to the Primary Studio Complex, of Topical Response No. 5, Historical Resources, for further information regarding the preservation of the Primary Studio Complex.

The commenter states that the potential rooftop addition and new construction on the Project Site are not in keeping with Preservation Brief #14 but does not provide any

analysis as to why this might be the case. Preservation briefs were developed by NPS to assist with the interpretation of the Rehabilitation Standards. Neither the preservation briefs nor the Rehabilitation Standards are prescriptive but rather guidelines for managing the alterations and additions to historic buildings to protect their character. As noted in the Historic Report (Appendix C.1 of the Draft EIR), Preservation Brief #14 states, in part, that “a new addition should always be subordinate to the historic building; it should not compete in size, scale or design with the historic building.” As detailed in the Draft EIR (Draft EIR page IV.B-50) and Historic Report (pages 65–68), any rooftop addition would be consistent with Preservation Brief #14 guidance and could be engineered to be technically “reversible.” Any actual design, however, would require additional design and engineering development for permitting purposes as well as review by OHR. For more information on the Project’s compliance with the Rehabilitation Standards, refer to Section B, Historic Structure Report and the Future Preservation of the Primary Studio Complex, of Topical Response No. 5, Historical Resources.

Regarding the comment that additions to the Primary Studio Complex may be larger and more problematic, refer to Section C, Potential New Construction North of the Primary Studio Complex, of Topical Response No. 5, Historical Resources. As discussed in Response to Comment No. 19-3, the historic analysis in the Draft EIR was based on the Conceptual Site Plan (Figure II-4 on page II-14 of the Draft EIR). Future changes in and around the HCM and Viewshed Restoration Area that are substantially different than the Conceptual Site Plan or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, including review by OHR and the Department of City Planning, as well as potential CEQA compliance review.

Regarding the comment that a specific mitigation measure should be added to require OHR or Cultural Heritage Commission and public review of these additions at both a schematic and a construction documents phase, CEQA does not require mitigation measures when impacts would be less than significant. As discussed in Section B, Historic Structure Report and the Future Preservation of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, any alteration to the HCM would require OHR review and compliance with the Rehabilitation Standards pursuant to Section 22.171.14 of the Cultural Heritage Ordinance. Further, the Draft EIR correctly concluded that impacts to the Primary Studio Complex would be less than significant. Therefore, a mitigation measure is not necessary or required under CEQA.

Comment No. 19-11

BACKGROUND

Significance:

- Current listing: Historic-Cultural Monument.# 1167 (2018, CHC-2018-476-HCM)

- Eligibility: Survey LA found the site to be eligible as a 3S;3CS;5S3. SurveyLA did not distinguish the primary Studio Complex—the entire site is a single lot.

Eligibility: [sic] EIR found the site eligible for the National Register

Response to Comment No. 19-11

The information in this comment is provided in Section 7.1, Previous Evaluations and Designations, of the Historic Report (page 33 of Appendix C.1 of the Draft EIR). Refer to Response to Comment No. 19-12, below, regarding the comment that the entire site is eligible.

Comment No. 19-12

Amendment and Treatment of Primary Studio Complex:

- The Cultural Heritage designation applies to the site as a whole, based on customary procedures of the City of Los Angeles. However, an amendment to the nomination created a “Primary Studio Complex”, [sic] and the only Character-Defining Features listed and acknowledged were within those original Studio and Service buildings.
- The Amendment created a “Viewshed” so that these buildings could be seen from Beverly Boulevard.
- The designation points out:. “the purpose of the designation is to prevent significant impacts to an Historic-Cultural Monument through the application of the standards set for th [sic] in the LAAC (e.g. [sic] Sec 22.171.14). Without the regulation imposed by way of the pending designation, the historic significance and integrity of the property could be lost through incompatible alterations and new construction and the demolition of an irreplaceable historic site/open space.”
- Period of Significance: not found in the HCM, but stated in the EIR as [sic] 1952–1963

Response to Comment No. 19-12

The commenter’s claim that designation as an HCM “applies to the site as a whole, based on customary procedures of the City of Los Angeles” is incorrect. While this may sometimes be the case, specific aspects of a property considered to be historically significant, as is the case for Television City, are often delineated for designation. For a more detailed discussion, refer to Section A, Existing Evaluation and Designation of the Primary Studio Complex, of Topical Response No. 5, Historical Resources. As discussed therein, the HCM nomination identified the 1952 Primary Studio Complex (including alterations through 1963) as eligible for designation. As stated in the HCM Findings that

were adopted as part of the HCM designation, “[t]he CBS Television City proposed Historic-Cultural Monument is limited to the exterior of the original 1952 buildings (the ‘Studio Building’ on the west, and the ‘Service Building’ on the east) and the CBS logo tiles in the main entry lobby and adjacent corridor.” The HCM Findings are included in Appendix C of the Historic Report (Appendix C.1 of the Draft EIR). With regard to the comment regarding the Viewshed Restoration Area, refer to Section C, Potential New Construction North of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, regarding the Viewshed Restoration Area that would be provided as part of the Project.

The commenter’s statement that the period of significance for Television City is not found in the HCM is also incorrect. The 2018 Historic Assessment for Television City, which identified the 1952-1963 period of significance, was appended to the HCM nomination for review by the Cultural Heritage Commission as part of the nomination process.

Comment No. 19-13

Alterations include (from the CHM) : [sic] The nomination stated the following, but did not resolve what this meant: “CBS Television City remains largely intact as originally designed on the exterior.

- As intended, the studio wing was expanded by approximately 50% on the west side, toward Fairfax Ave., in the 1970s for a digital studio, but the original exterior materials and appearance were retained as Pereira and Luckman planned.
- The original rehearsal 9 halls on the third level were also converted to studios.
- Overall, it retains a high degree of original physical integrity.
- Among the alterations to the original design, the audience seating pits in studio #31 was filled in to create a flat stage.
- Two lower wing blocks were added on the east side of the building in the 1970s” [sic]

Response to Comment No. 19-13

This comment quotes the HCM nomination for the Primary Studio Complex. The comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 19-14

Character-defining features include—from the CHM:bullets added [sic] “The subject property is intact and retains a high level of integrity of location, design, materials, workmanship, feeling, and association. [sic]

- Character-defining features of the property include, but are not limited to: its location at the corner of Beverly Boulevard and Fairfax Avenue, with the main building set back and facing Beverly Boulevard; the pilotis at the ground floor; the exterior concourses with railings and angled fin stanchions at the first floor; the central concrete entry bridge CHC-2018-476-HCM 7800-7860 West Beverly Boulevard Page 5 of 5 [sic] with walls, planters, railing, canopy, and metal “X” supports; the glass curtain wall; the projecting planters and shed roof canopy at exterior of the entry lobby; the concrete cladding and corrugated steel decking material; and the tiled wall in the main lobby with the CBS “eye logo.”

Response to Comment No. 19-14

This comment quotes the HCM Findings for the Primary Studio Complex. The comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 19-15

Entitlements Covered by this EIR: CPC-2021-4089-AD-GPA-ZC-SN-SP

- General Plan Amendment
- Zone Change
- Signs
- Specific Plan
- Unclear what the environmental review is for the Vesting Tentative Tract

Project Description: The [sic] Project is a Specific Plan for property currently developed as CBS Television City, plus additional land area beyond the 25 acre Television City land to the east (and south?) which will be annexed to Los Angeles.

The “original” 25 acre lot is the site of the HCM.

- The DEIR states “The Specific Plan would establish standards to regulate land use, massing, design, and development. [sic] However, the Ordinance and the

-

Figure 7: Primary Studio Complex Roof Retention, Removal and Rehabilitation

61

Response to Comment No. 19-15

This comment includes a listing of several of the requested approvals for the Project. The full list of approvals is provided on pages II-35 and II-36 of Section II, Project Description, of the Draft EIR. Note that the Draft EIR also covers the CEQA review for the Vesting Tentative Tract Map.

The description of the Project Site in this comment is incorrect. As discussed on pages II-1 and II-2 of Section II, Project Description, of the Draft EIR, the Project Site consists of approximately 25 acres in total, including an approximately 0.63-acre portion of the Project Site located in an unincorporated area of the County to be annexed to the City. The entire Project Site is currently occupied by Television City. Refer to Response to Comment No. 19-12 regarding the area of the Project Site that is part of the HCM designation. Also refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, and Response to Comment Nos. 19-3 and 5-3 regarding the proposed Specific Plan and how CEQA and City policy do not require a draft Specific Plan to be included as part of the Draft or Final EIR.

The comment also provides an overview of the floor area associated with the Project, including the existing floor area to remain and the floor area to be removed, as well as illustrations of the Vesting Tentative Tract Map, Conceptual Site Plan and the Primary Studio Complex. All of these aspects of the Project were fully accounted for in the environmental analysis throughout the Draft EIR, including the analysis of potential impacts to historical resources. Refer to Section A, Existing Evaluation and Designation of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, regarding the non-historic Support Building.

Comment No. 19-16

For four decades Hollywood Heritage has been an advocate of the preservation and protection of Hollywood's historic resources. We support the goal of preserving what is most significant in Hollywood, while encouraging responsible new and infill development. Our organization has nominated many of the current Historic Cultural Monuments, listed the Hollywood Boulevard Commercial and Entertainment District in the National Register of Historic Places at the national level of significance, provided technical assistance to developers and owners of significant properties, and participated in numerous public policy discussions involving historic resources. These efforts have resulted in the rehabilitation of significant landmarks, landscapes, institutions, and districts in Hollywood.

Response to Comment No. 19-16

The comment provides a general overview of the Hollywood Heritage organization and its involvement in the nomination of historic districts and policy discussions regarding historic resources. The comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 19-17

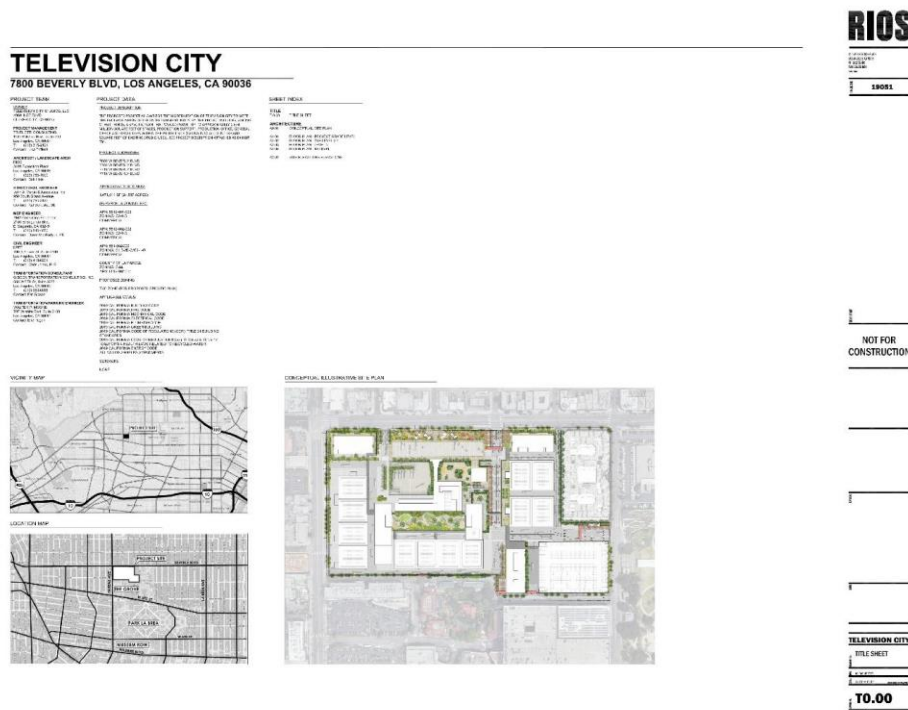

It is great to comment on a project that will extend the useful life of a major historic landmark. And a studio so vital to Hollywood. We look forward to working together to develop a project that benefits the resource, brings jobs and production capabilities to the area, and enhances the public realm.

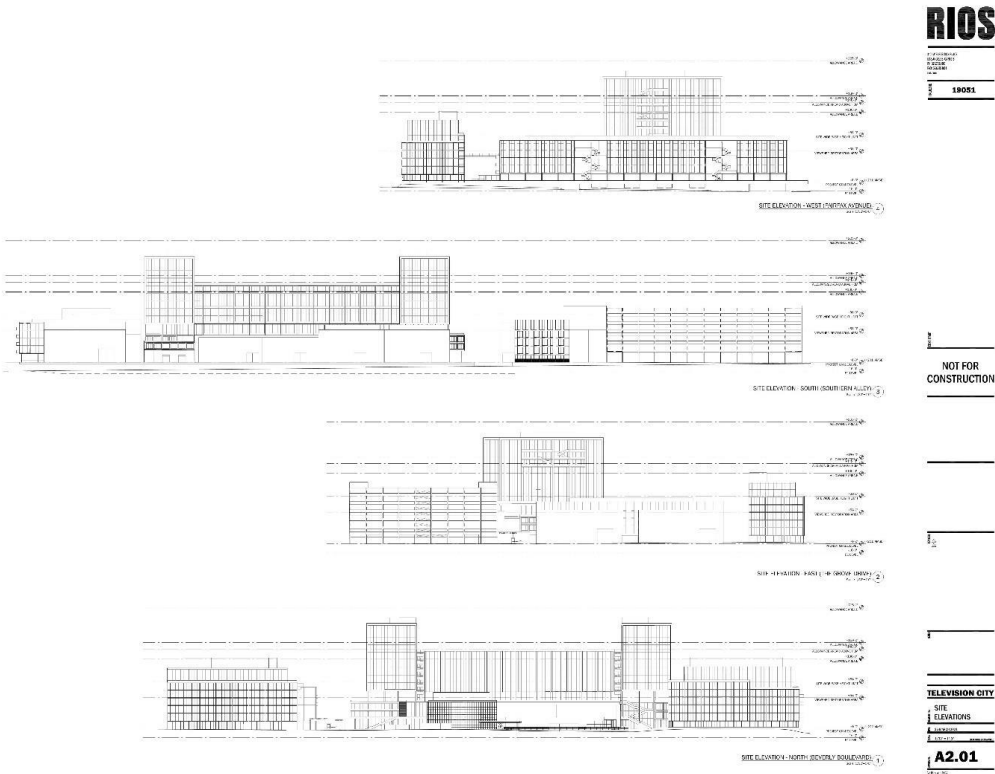

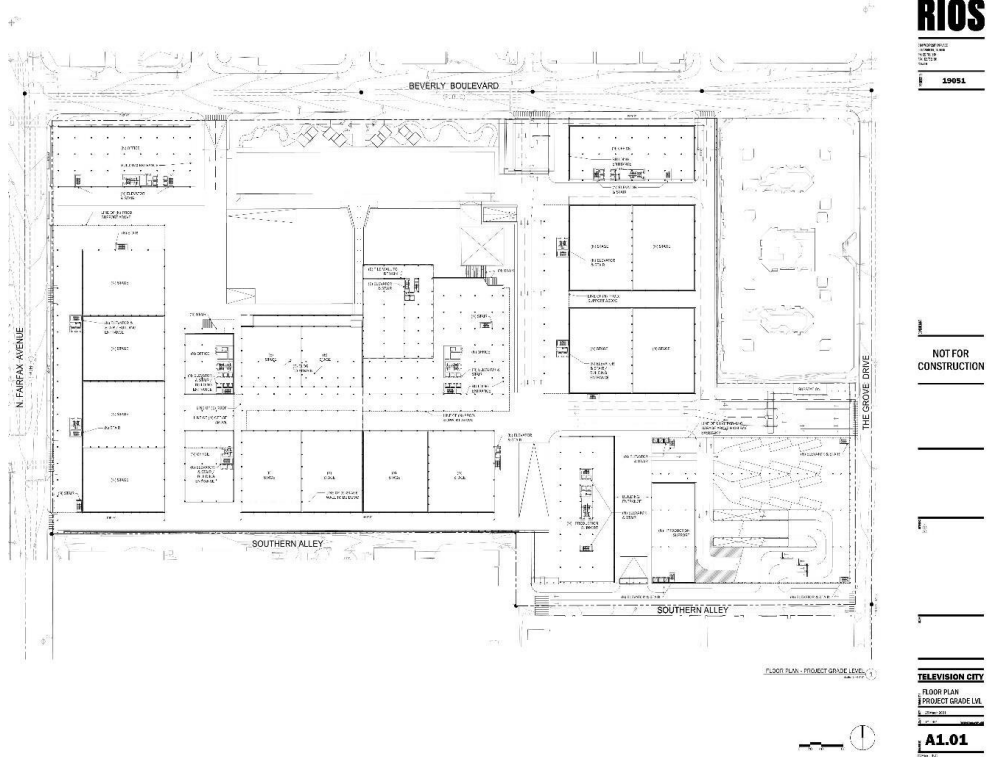

Response to Comment No. 19-17

This comment, which concludes the letter, is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 19-18

Attachment #1: Plans in Appendix C1

Response to Comment No. 19-18

This comment consists of selected pages from the Project plan set attached to the Historical Resources Technical Report included as Appendix C.1 of the Draft EIR. Responses related to this attachment have been included in the responses to comments above.

Comment Letter No. 20

Cindy Chvatal
President
Hancock Park Homeowners Assn.
137 N. Larchmont Blvd., #718
Los Angeles, CA 90004-3704

Mark Alpers
Land Use Chair
Hancock Park Homeowners Assn.
137 N. Larchmont Blvd., #718
Los Angeles, CA 90004-3704

Comment No. 20-1

The Hancock Park Homeowners Association (HPHOA) has reviewed the Television City (TVC) Project Specific Plan Draft Environmental Impact Report (Draft EIR) and offers the following comments which were approved by the HPHOA Board of Directors on August 23, 2022.

Response to Comment No. 20-1

This introductory comment is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 20-2**PROJECT VS PROGRAM EIR**

Page I-1 of the Executive Summary describes the document as a “Project EIR” as defined in Section 15161 of the *State CEQA Guidelines*. In our view, this Specific Plan provides a similar level of detail about future development of the site as many Community Plans, approved for many areas within the City of Los Angeles. Therefore, for this reason and those stated below, the analysis of impacts is more like what is found in Program EIRs as defined in Section 15168 of the *State CEQA Guidelines*. Like other Program EIRs, the TVC Specific Plan is a set of rules and regulations that evaluates a program with multiple components that are interrelated geographically. Like other Program EIRs, the document is a higher-level environmental assessment prior to the consideration of individual projects.

As stated in the Draft EIR and on the City's website describing the project, "The Specific Plan would provide development flexibility by allowing for limited exchanges between certain categories of permitted land uses and associated floor areas in order to respond to the future needs and demands of the entertainment industry. Specifically, additional sound stage uses and/or production support uses may be developed in exchange for a reduction in floor area of another permitted land use category, so long as the limitations of the Specific Plan are met..." The Draft EIR further states that development could occur in one phase as early as 2026 or in multiple phases extending to 2043. Under these circumstances where there is no precise location of specific land uses and the timing is very uncertain, this Draft EIR seems to admit that it is programmatic, rather than project-specific, in nature.

Response to Comment No. 20-2

As discussed on page I-1 in Section I, Executive Summary, of the Draft EIR, the Draft EIR is a "Project EIR," as defined by Section 15161 of the CEQA Guidelines. Furthermore, the Draft EIR complies with CEQA Guidelines Section 15064, which discusses determining the significance of the environmental effects caused by a project.

In practice, the phrase "program EIR" is used to refer to an EIR that presents a higher level of analysis with less detail, generally looking at a broad policy of a planning document, whereas the phrase "project EIR" is used to refer to an EIR that presents a more detailed level of analysis generally focusing on environmental changes caused by a development project including planning, construction and operations. However, the name of the analysis—program or project level—does not ultimately dictate the specificity required in an EIR under CEQA. Instead, as discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, CEQA Guidelines Section 15146 sets forth the degree of specificity necessary in an EIR, stating that "[t]he degree of specificity required in an EIR will correspond to the degree of specificity involved in the underlying activity which is described in the EIR." The level of detail included in the Draft EIR complies with CEQA and is consistent with the level of detail in certified EIRs for other projects in the City of Los Angeles.

Moreover, as stated throughout the Draft EIR, construction is anticipated to take place over 32 months. However, the Applicant is seeking a Development Agreement with a term of 20 years, in which case the Project could be built out in multiple phases. The Draft EIR comprehensively analyzed the 32-month buildout scenario as well as the long-term buildout scenario for each environmental topic area in the Draft EIR to provide the most conservative analysis of potential Project impacts.

Comment No. 20-3**VMT CALCULATIONS**

To estimate impacts related to vehicle miles travelled (VMT), the Draft EIR uses the Los Angeles Department of Transportation (LADOT) VMT Calculator, which is based on resident and job density, the availability of transit, and accessibility of biking and walking paths (DEIR, Page IV.A-44). While this methodology is purportedly valid to estimate trip generation from “mixed use sites,” it is in no way, shape or form based on any industry-specific origin/destination studies for the existing project site or other entertainment facilities in Los Angeles. To substantiate (or to revise as necessary) the quantification of these impacts, the Draft EIR should quantify VMT based on the travel patterns of current CBS employees at the project site. If available, other industry-specific data should also be used to substantiate the estimates of VMT-related impacts.

Response to Comment No. 20-3

Refer to Section A, Appropriateness of Using VMT Calculator, of Topical Response No. 8, Vehicle Miles Traveled, for a detailed discussion regarding the appropriateness of using the VMT Calculator for the Project. The comment incorrectly suggests that the City’s VMT Calculator tool is inadequate for the analysis of the Project because it is not based on “industry-specific origin/destination studies.” The VMT Calculator is coded with travel characteristics based on validated data from the City Travel Demand Forecasting Model. It does not compare industries—rather, it compares the relative characteristics of one location with another in terms of relative numbers of residents and jobs, land use density, transportation connectivity, transit availability, surrounding retail and other jobs, vehicle ownership, and household size.¹²⁷

The VMT Calculator is designed to analyze VMT for any land use project that is not customer- or visitor-focused (e.g., retail or entertainment/event center). While production-related facilities are not specifically built into the VMT Calculator’s internal model, it has a Custom Land Use feature that allows analysis of other employment-focused land uses. The Custom Land Use feature requires three inputs: daily trip generation, total employee population (for an employment-based use, such as the Project), and trip purpose assumptions. These three inputs represent the key factors used to calculate work VMT per employee for each employment-based land use built into the VMT Calculator. The Project’s VMT analysis, described beginning on page IV.K-73 of Section IV.K, Transportation, of the Draft EIR, calculated daily Project trip generation rates for the sound stage, production support, and production office uses based on industry-specific data, as

¹²⁷ Los Angeles Department of Transportation, *Vehicle Miles Traveled Documentation Report*, February 2019, pages 2 and 3.

further described in Topical Response No. 10, Trip Generation. Refer to Section A, Empirical Data, of the topical response for a comparison of the rate. Similarly, data from the Draft EIR technical team's experience with production studios in Southern California were used to inform employment estimates that went into the Custom Land Use function. These studios include NBCUniversal, Paramount Picture Studios, and studio complexes in Hollywood, Downtown Los Angeles, and Culver City. Trip purposes were based on office uses as studio employees have similar daily travel characteristics between home and work (which is the type of trip that forms the basis of the work VMT per employee metric). Refer to Section C, Assumptions in the VMT Analysis, of Topical Response No. 8, Vehicle Miles Traveled.

Comment No. 20-4

HISTORIC PRESERVATION

In addition to the Main Studio Complex on the project site, there are five designated Los Angeles Historical Cultural Monuments (HCMs) in the immediate proximity to the project site including the Original Farmers Market, the Rancho La Brea Adobe, the Fairfax Theater, the Chase Bank building and an old air raid siren on Beverly Boulevard. The Draft EIR includes an extensive discussion of the effort to protect the Main Studio Complex on the project site as supported by the LA Conservancy. The attention given to the other HCM sites in the Draft EIR is exceedingly general, with the impacts upon them considered less than significant. Will the existing and/or future use of these HCMs be enhanced or reduced by the scale of development proposed in the Specific Plan? Will increased project and cumulative traffic act to deter or increase the use of these resources? Although vibration impacts on HCMs are not concluded to be not significant, additional mitigation requiring monitoring the structural condition of these buildings throughout construction and indemnifying the owners for any structural damage due to vibration from project-related construction equipment would provide more reassurance that these historical resources will be preserved.

Response to Comment No. 20-4

Refer to Section E, Impacts to Historical Resources in the Vicinity of the Project Site, of Topical Response No. 5, Historical Resources, regarding the Draft EIR's analysis of potential impacts to The Original Farmers Market, Gilmore Adobe (also referred to as the Rancho La Brea Adobe), Fairfax Theater, Chase Bank, and Air Raid Siren No. 25. The analysis of the potential impacts to these resources is included on pages IV.B-27 to IV.B-31 of the Draft EIR and pages 87 to 90 of the Historic Report (Appendix C.1 of the Draft EIR).

The analysis is not "general" and is based upon the thresholds in Appendix G of the CEQA Guidelines. A significant impact is defined as a substantial adverse change such as demolition, destruction, relocation, or alteration of a resource or its immediate

surroundings. Thus, the thresholds are focused on the physical characteristics that convey the significance of a historical resource. The commenter does not explain why the trips generated by the Project would result in a change of use of any of the historical resources in the vicinity of the Project Site. Furthermore, a change of use would not automatically result in a significant impact, as demonstrated by adaptive reuse projects involving historical resources throughout Los Angeles. The commenter does not provide any evidence of how the scale of proposed development would result in the substantial adverse change in the significance of any of the historical resources in the vicinity of the Project Site.

In addition, Section IV.I, Noise, of the Draft EIR analyzed potential impacts from vibration on the historical resources in the Project Site vicinity, including the Gilmore Adobe and The Original Farmers Market. As demonstrated in the analysis provided on page IV.I-60 of the Draft EIR, potential vibration impacts on these historical resources would be less than significant. Specifically, as summarized in Table IV.I-20 of the Draft EIR, impacts at these locations would be no more than 0.011 peak particle velocity (PPV), well below the 0.12 PPV threshold of significance from Federal Transit Administration (FTA) for buildings “extremely susceptible to vibration damage,” the applicable standard for historical resources. Therefore, mitigation measures are unnecessary and not required by CEQA. Also refer to Response to Comment No. 363-2.

Comment No. 20-5

Thank [sic] for the opportunity to comment. We look forward to reviewing your responses prior to certification the EIR.

Response to Comment No. 20-5

This comment, which concludes the letter, is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment Letter No. 21

Stephan Davis
Business Manager/Financial Secretary
IBEW Local Union 40
5643 Vineland Ave.
North Hollywood, CA 91601

Comment No. 21-1

On behalf of the International Brotherhood of Electrical Workers, Local 40, I'm writing to express our enthusiastic support for TVC 2050: The Los Angeles Studio Plan.

This plan to modernize the 70-year-old Television City will bring more than 4,200 construction jobs to Los Angeles at a time when the city is continuing to recover from the impacts of COVID-19 and confronts increasing competition from other global production centers.

The modernization of Television City will ensure the future of the studio, create thousands of jobs, generate more than \$2.4 billion in new, annual economic output, and maintain Los Angeles' status as the entertainment capital of the world.

TVC 2050 represents a massive investment in one of the city's biggest industries and it will produce new, well-paying construction jobs. Television City has agreed to employ union construction workers for the project which means new job opportunities for the skilled and trained men and women of the Building Trades.

We're pleased to support this important project that will bring more jobs and revenue to Los Angeles.

Response to Comment No. 21-1

This comment indicating support for the Project is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment Letter No. 22

Keith Harkey
Business Manager
Ironworkers Local 433
17495 Hurley St. East
City of Industry, CA 91744-5106

Comment No. 22-1

On behalf of the union members of Ironworkers local 433, we want to express our support for the TVC 2050 project.

The Los Angeles Studio Plan to modernize the 70-year-old Television City will bring more than 4,200 construction jobs to Los Angeles at a time when the city is continuing to recover from the impacts of COVID-19 and confronts increasing competition from other global production centers.

The modernization of Television City will ensure the future of the studio, create thousands of jobs, generate more than \$2.4 billion in new, annual economic output, and maintain Los Angeles' status as the entertainment capital of the world.

TVC 2050 represents a massive investment in one of the city's biggest industries and it will produce new, well-paying construction jobs. Television City has agreed to employ union construction workers for the project which means new job opportunities for the skilled and trained men and women of the Building Trades.

We're pleased to support this important project that will bring more jobs and revenue to Los Angeles.

Comment Letter No. 23

Rachel Grose
Executive Director
Jewish Free Loan Association
6505 Wilshire Blvd., Ste. 715
Los Angeles, CA 90048-4958

Comment No. 23-1

TVC 2050 represents an extraordinary vision for the future of the entertainment industry in Los Angeles by supporting the industry's evolving demands. The TVC 2050 project would establish the TVC Specific Plan to allow for the continuation of existing studio use and the modernization and expansion of media production facilities within the project site.

The proposed Specific Plan would permit up to 1,874,000 square feet of sound stage, production support, production, and general office space as well as retail uses within the 25-acre project site.

Market demand will dictate the specific mix of uses that ultimately will be constructed. The Specific Plan would allow flexibility in locating the various uses throughout the studio lot. Flexibility is something that we should be thinking about in all future projects, because one thing we have learned from this pandemic, is the need to be adaptive and responsive to changing demands.

Thank you for this opportunity to submit a letter to express our support for the proposed Television City plan.

Response to Comment No. 23-1

This comment indicating support for the Project is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment Letter No. 24

Adrian Scott Fine
Senior Director of Advocacy
Los Angeles Conservancy
523 W. Sixth St., Ste. 826
Los Angeles, CA 90014-1248

Comment No. 24-1

On behalf of the Los Angeles Conservancy, I am writing to comment on the Draft Environmental Impact Report (EIR) for the TVC 2050 Project. The project would establish the TVC 2050 Specific Plan to allow for the modernization and expansion of media production facilities within the Television City Studio campus.

The Conservancy has long recognized the historic significance of this iconic studio and the need to preserve it as an important historic cultural monument. In 2018, the Conservancy initiated and worked closely with CBS to designate Television Studio as Historic-Cultural Monument (HCM) #1167.

I. Preservation and continued use of Television City

Television City opened in 1952 at the corner of Beverly Boulevard and Fairfax Avenue as the first large-scale, purpose-built television broadcast studio in the world. CBS hired local architecture firm Pereira & Luckman, with Gin Wong as the lead designer, to design the company's new headquarters, which contained soundstages, studios, editing rooms, offices, rehearsal halls, shops, and storage. Since its construction, Television City has been home to some of America's most iconic television series like *The Carol Burnett Show* and *All in the Family*. It was designated and listed as a HCM for both its architectural and cultural associations.

The Conservancy's consistent focus and goal has been to ensure Television City is preserved, as it fully transitions from CBS's long stewardship and tenancy to Hackman Capital Partners. We believe change and expansion is readily achievable at this large site while still allowing for the preservation of Television City, and for it to be appropriately modernized and updated for the future.

II. TVC 2050 Specific Plan

The proposed project is ambitious and will greatly expand the current and longtime use of this historic television production facility. Initially, through our Notice of Preparation (NOP)

comments, the Conservancy raised strong concerns about the design and overall scope of this project.

For nearly a year, the Conservancy worked with Hackman Capital Partners and their project team to create a refined and collaborative plan that preserves historic Television City and allow for significant new development at this legendary studio property. Through a reduction of the proximity, bulk and mass of the intended new construction, a comprehensive framework for a state-of-the-art modernization will now preserve the historic complex and maintain the 430-foot Beverly Boulevard viewshed. The revised plan is compatible with this historic place, and ensures the studio's much-needed modernization while protecting this historic building and maintaining its eligibility as a Historic-Cultural Monument (HCM).

The Conservancy greatly appreciates Hackman Capital Partners and the team's willingness to meet with the Conservancy and revise their proposal to meet many of our concerns regarding the integrity of Television City as a designated historic resource. Their openness to discuss issues and collaboration to date has created a project that the Conservancy supports. While there are still details to be worked out regarding the design and materiality of the proposed new construction, the Conservancy looks forward to being an integral part of this process in the future.

The Conservancy fully supports the TVC 2050 Project as we believe it provides for a win-win solution that balances both preservation and new development at the site. This will preserve the studio's history while adapting it to meet the unmet demands of production, and ensure Television City remains viable for future generations in the entertainment industry.

About the Los Angeles Conservancy:

The Los Angeles Conservancy is the largest local historic preservation organization in the United States, with nearly 5,000 members throughout the Los Angeles area. Established in 1978, the Conservancy works to preserve and revitalize the significant architectural and cultural heritage of Los Angeles County through advocacy and education.

Please do not hesitate to contact me at (213) 430-4203 or afine@laconservancy.org should you have any questions.

Response to Comment No. 24-1

This comment indicating support for the Project is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment Letter No. 25

Chris Hannan
Executive Secretary
LA/Orange Counties Building and Construction Trades Council
1626 Beverly Blvd.
Los Angeles, CA 90026-5784

Comment No. 25-1

On behalf of the Los Angeles/Orange Counties Building and Construction Trades Council, representing 140,000 skilled construction workers in 14 Trades and 48 local unions and district councils, I am writing in support of the TVC 2050 plan and the accompanying Draft Environmental Impact Report (EIR).

As the Draft EIR analysis states, this plan is an economic engine for Los Angeles, with a strong tie-in to the historic and thriving entertainment industry that is such a part of our city's fabric. It will create thousands of jobs during construction for the state-of-the-art modernization of production facilities within the Television City studio property. Los Angeles needs this growth and new investment.

Television City will make a significant commitment to this iconic studio, preserving it as a working production center and bringing more than \$2 billion a year of economic activity to our region. In addition, Television City has a Project Labor Agreement with our Building Trades Council that guarantees this plan will be built with the best-trained union construction workers in the country. Many will come from Los Angeles and the cities of LA County, and will represent the diversity of all our communities.

Los Angeles needs more soundstages to keep our economy strong, and the Building Trades unions have the skilled members to construct these stages to the quality the entertainment industry demands. TVC 2050 will help keep filming in the City of Los Angeles and grow our economy.

On behalf of our skilled tradesmen and women, I enthusiastically support TVC 2050 and its investment in Los Angeles.

Response to Comment No. 25-1

This comment indicating support for the Project is noted for the administrative record and has been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 26-1

On behalf of our client, The Grove, LLC, we appreciate the opportunity to provide written comments on the Draft Environmental Impact Report (“DEIR”) for the TVC 2050 Project. The Grove understands the importance of the entertainment industry to Los Angeles and strongly supports expanding and maintaining a thriving film and television studio at the

Television City property. The Television City property, however, should be developed in a manner that minimizes the adverse impacts to the surrounding residences and businesses.

Unfortunately, to the extent any information can be gleaned from the DEIR, which does not include the Specific Plan or anything more than “conceptual” development plans, it is clear the Project would have significant impacts on the surrounding community and its history. We respectfully request that the City work with the applicant to define the Project as CEQA requires and to address the negative impacts to and the concerns of the surrounding community.

Under CEQA, an environmental impact report must inform the public of what the Project actually is, the Project’s significant impacts, and the feasible mitigation measures or alternatives that would avoid or reduce these impacts. The DEIR falls short of those mandates, failing even to meet the most basic requirement of describing the Project. Further, the DEIR is missing crucial data, analyses, and mitigation measures that should have been included in the document across all technical sections. Given its many failings, the DEIR must be revised and recirculated.

Response to Comment No. 26-1

This comment introduces the comment letter and raises concerns regarding the Draft EIR, which are discussed further below. Refer to Response to Comment Nos. 26-2 through 26-183. As demonstrated therein, the Draft EIR has been completed in full compliance with CEQA and recirculation is not required.

Comment No. 26-2

What is the Project? There is absolutely no clarity as to what the actual Project is. The DEIR makes clear that the Project is essentially the establishment of a Specific Plan, but the Specific Plan is not included in the DEIR. The DEIR includes a conceptual site plan and description of height zones but then states the conceptual site plan only “illustrates one possible development scenario” and that the “height zones do not represent the actual development footprint of Project buildings.”

It is not even clear that studio uses are required. As described in the DEIR, the Project could develop just office and warehouse uses with no stages. The DEIR states the “combination of use may vary” and includes in its long list of possible uses on the site “conference facilities... special events, audience and entertainment shows, museum exhibits, theaters, ...restaurants and special event areas... warehouse... ***and all other uses permitted in the C2 zone unless expressly prohibited in the Specific Plan.***” Despite numerous references to the Specific Plan, no such plan is presented so the public and DEIR must assume all C2 uses are allowed. Uses permitted in the C2 zone include

hotels, hospitals, educational facilities, auditoriums seating up to 3,000 people, and many dozens of other uses.

By not providing an accurate, stable, and finite project description the City repeats the same mistakes it made in the Millennium Hollywood case. “Analyzing a ‘set of environmental impact limits,’ instead of analyzing the environmental impacts for a defined project, [is] not consistent with CEQA.” (*Stopthemillenniumhollywood.com* [sic] v. *City of Los Angeles* (2019) 39 Cal.App.5th 13.)

Response to Comment No. 26-2

These comments are similar to those raised in Comment Nos. 5-3, 5-5, 5-6, 5-15, 9-12, 9-13, 9-14, and 9-16. Refer to Response to Comment Nos. 5-3, 5-5, 5-6, 5-15, 9-12, 9-13, 9-14, and 9-16, as well as Topical Response No. 1, Clearly Defined Project Description and Specific Plan. As explained in Response to Comment No. 5-3 and Topical Response No. 1, a draft Specific Plan was not required to be part of the EIR and all of the physical aspects of the proposed Specific Plan were fully disclosed and analyzed in the Draft EIR as demonstrated in Appendix FEIR-2, Comparison Chart of the Draft EIR and the Preliminary Draft Specific Plan, of this Final EIR. In addition, as explained in Response to Comment Nos. 5-6 and 9-13 and Topical Response No. 3, Permitted On-Site Uses, consistent with the Project’s studio objectives, the permitted uses on-site will only include studio-related uses and associated ancillary uses, and these uses have all been addressed in the EIR. As such, the sound stage is the base unit from which all other land uses are organized—together, provided in the appropriate ratio, these studio-related uses provide the creative ecosystem that modern productions require. Without such mix of uses, a studio would not meet the minimum needs of productions and tenants. For example, the original development of Television City in 1952 included a mix of sound stage, production support, production office, and general office to support, sustain, and evolve with production needs. The language regarding C2 zone uses (which are currently permitted) referenced in this comment has been removed from the list of permitted uses within Section II, Project Description, of the Draft EIR. See Section III, Revisions, Clarifications, and Corrections to the Draft EIR.

Refer to Response to Comment Nos. 5-5 and 9-12 and Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding the Conceptual Site Plan and the procedures under the proposed Specific Plan. Refer to Response to Comment No. 9-13 and Topical Response No. 1 regarding how the Draft EIR comprehensively analyzes the environmental impacts of a defined project. Also refer to Response to Comment No. 9-16 regarding the height zones. As demonstrated in these responses, Section II, Project Description, of the Draft EIR is accurate, stable, and finite and fully complies with CEQA, and the Project is distinguishable from the *Millennium* case.

Comment No. 26-3

The DEIR Is Full of Errors and Inconsistencies. The DEIR is fatally flawed as an informational document because it fails to identify significant impacts, fails to explain its assumptions and analyses, and fails to analyze and adopt all feasible mitigation measures across the entirety of the document. For example, the DEIR concludes no new fire facilities would be required to serve the Project despite the Los Angeles Fire Department concluding the existing facilities are “inadequate.” Additionally, the DEIR fails to identify sensitive receptors near the Project site, thus overlooking potential significant impacts. The analysis regarding trip generation and traffic are not supported and the analysis of VMT is contrary to the City’s own guidance and inconsistent with other data. Finally, the omission of a Health Risk Assessment in the DEIR despite significant air quality impacts is inexplicable.

Response to Comment No. 26-3

As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Draft EIR fulfilled CEQA’s informational purpose by disclosing all of the elements of the Project required by CEQA and providing a comprehensive analysis of the Project potential environmental impacts under CEQA.

Refer to Response to Comment No. 9-35 regarding LAFD facilities and the City’s conclusion that potential impacts to these facilities would be less than significant.

The comment also claims the Draft EIR fails to identify sensitive receptors, which is incorrect. The identification of sensitive receptors is relevant to the analysis of air quality and noise and vibration. Refer to revised Figure IV.A-4, Air Quality Sensitive Receptors Locations, in Section III, Revisions, Clarifications, and Corrections to the Draft EIR for the location of air quality sensitive receptors, and Figure IV.I-3, Noise Measurement Locations—Project Site Area (R1 through R8), on page IV.I-20 of the Draft EIR for the location of noise sensitive receptors.

The comments regarding trip generation and traffic are incorrect and not supported by evidence. Refer to Topical Response No. 10, Trip Generation, in particular Section A, Empirical Data, regarding the collection of empirical data from other Los Angeles studios and its comparison to the trip generation rates used in the analysis in consultation with LADOT. This methodology, and the subsequent analysis, were reviewed and approved by LADOT. A full discussion of the trip length and other assumptions that went into the VMT analysis is found in Section C, Assumptions in the VMT Analysis, of Topical Response No. 8, Vehicle Miles Traveled, and Response to Comment No. 26-156.

Refer to Response to Comment No. 26-E.1-2 for a discussion of the Project’s Health Risk Assessment.

Comment No. 26-4

The DEIR is Fundamentally Inadequate. The DEIR also fails to present data in a manner calculated to adequately inform the public and decision makers, who may not have prior knowledge of the Project. “Information ‘scattered here and there in EIR appendices’ or a report ‘buried in an appendix,’ is not a substitute for ‘a good faith reasoned analysis.’” (*Vineyard Area Citizens v. Rancho Cordova* (2007) 40 Cal.4th 412 [quoting *California Oak Foundation v. City of Santa Clarita* (2005) 133 Cal.App.4th 1219, 1239].) The DEIR’s lack of clarity, length, inconsistencies, and reliance on appendices (and documents that are not appended) with no further guidance to the reader make it incomprehensible.

As a result of these failures and those detailed in the attached memorandum and the reports from Ramboll US Consulting, Inc., Linscott, Law & Greenspan, Shannon & Wilson and Statistical Research, Inc., the DEIR falls very far below the standards that the City and other public agencies would normally apply to documents for a project of this magnitude.

When faced with a long list of obvious mistakes and missing information, a concerned citizen could simply throw up their hands, note the general nature of the fatal flaw mistakes, and rely upon the fact that any future certification of the document would be overturned by the courts due to these mistakes. However, we have chosen to provide comments and information to the City as detailed as the limited time would permit in the hopes that the City will not repeat the same errors as in the Millennium Hollywood project and that it will endeavor to publish and recirculate a DEIR that corrects these errors. The community deserves nothing less.

Response to Comment No. 26-4

The comment asserts that the Draft EIR is inadequate but does not provide any specific examples. Refer to Response to Comment Nos. 26-5 through 26-183. As demonstrated therein, the Draft EIR has been completed in full compliance with CEQA and recirculation is not required.

With respect to the length of the document, the length of the Draft EIR reflects the amount of information and the comprehensive analyses that are included within it. Further, a full reading of the Draft EIR is not required in order to understand a general overview of the Project and its potential environmental impacts. The first section of the Draft EIR—Section I, Executive Summary—includes, among other things, a summary of the existing conditions, the Project, impacts not found to be significant, environmental impacts, PDFs, mitigation measures, alternatives, and public review process. A detailed description of the Project is included in Section II, Project Description, of the Draft EIR. Section IV, Environmental Impact Analysis, of the Draft EIR provides a comprehensive analysis of all

potential environmental impact. The environmental impact conclusions in Section IV are summarized in Table I-1 in Section I of the Draft EIR.

Regarding the *Millennium* project, see Topical Response No. 1, Clearly Defined Project Description and Specific Plan, and Response to Comment No. 9-13.

Comment No. 26-5

THE GROVE, LLC

COMMENTS ON DRAFT ENVIRONMENTAL IMPACT REPORT

Below are more detailed comments on some of the DEIR's flaws.¹ Given the lack of information as to the nature and scope of the Project, the below includes questions critical to understanding the Project and its impacts that must be addressed. The integrity of the CEQA process is dependent on the adequacy of the EIR. (*In re Bay-Delta etc.* (2008) 43 Cal.4th 1143, 1162 ("The EIR is the heart of CEQA.")) Without the information and analyses noted below, the DEIR fails as a vehicle for intelligent public participation. (*Ballona Wetlands Land Trust v. City of Los Angeles* (2011) 201 Cal.App.4th 455,467 ("[The EIR's] purpose is to inform the public and its responsible officials of the environmental consequences of their decisions *before* they are made. Thus, the EIR 'protects not only the environment but also informed self-government.' To this end, public participation is an 'essential part of the CEQA process.'")) The DEIR must be revised and recirculated for another round of public review and comment before the issuance of a final EIR. (*Schellinger Brothers v. City of Sebastopol* (2009) 179 Cal.App.4th 1245, 1258 ("If the feedback is 'new' and 'significant,' the draft EIR may be modified, at which the period of notice and comment begins again. This process of resubmission is commonly called recirculation..."))

¹ In addition to the comments provided herein, attached are the following exhibits with additional comments for City's review and response: **Exhibit 1, Ramboll Report; Exhibit 2, SRI Report; Exhibit 3, Shannon & Wilson Report; and Exhibit 4, LLG Report.**

I. PROJECT DESCRIPTION

A. Project Description

The Project Description Is Not Stable and Finite

"An accurate, stable and finite project description is the *sine qua non* of an informative and legally sufficient EIR." (*County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 193.) "Only through an accurate view of the project may affected outsiders and public decision-makers balance the proposal's benefit against its environmental cost, consider

mitigation measures, assess the advantage of terminating the proposal... and-weigh other alternatives in the balance.” (*Id.*, pp. 192–93.)

The DEIR’s project description does not satisfy these requirements and the DEIR accordingly fundamentally fails as an informational document.

Given the lack of a clear and well-defined project description, many of the analyses are deficient and inconsistent, rely on incorrect, unstated or varying assumptions, and fall short of analyzing the potential environmental impacts of the Project.

Missing Specific Plan. As specifically stated in the opening line of the TVC 2050 Draft EIR Project Description: “The TVC 2050 Project would establish the TVC 2050 Specific Plan...” (DEIR, p. II-1.) The Project Description goes on to reference provisions supposedly set forth in the Specific Plan 53 times. Overall the Draft EIR references supposed provisions of the Specific Plan 273 times. As listed on the City website, the Project Description for the TVC Project is as follows:

Project Description: The Project would establish the TVC 2050 Specific Plan (Specific Plan) to allow for the continuation of an existing studio use and the modernization and expansion of media production facilities within the approximately 25-acre Television City studio (Project Site)....

Although the Specific Plan essentially is the Project, the Specific Plan has not been included in the DEIR.

Why was the Specific Plan not included? Does the City planning staff have the Specific Plan? If so, has the City Planning staff reviewed in detail the Specific Plan? Why was it not provided to the public? As the Project is the adoption of the Specific Plan, how can the public evaluate the Project if the essential element defining the Project is not provided?

Per the DEIR, the Specific Plan “**would** establish a clear and cohesive development framework for the entire Project Site, serving to integrate the proposed mix of permitted land uses and set standards for Project Site planning, massing, and building design.” (emphasis added) (DEIR, p. II-12.) How is the public to understand the development framework and the rules governing the development and use of the site absent a copy of the Specific Plan? There is virtually no information in the DEIR regarding the development regulations of the proposed Specific Plan or the relationship of the Specific Plan to the Los Angeles Municipal Code (LAMC). The DEIR is supposed to be an informational document for the public and decision-makers. To add the Specific Plan after the DEIR has been circulated, particularly given the lack of any actual development plans in the DEIR, is meaningless for the public unless the DEIR is recirculated for public review and comment.

Without the context of the Specific Plan, the DEIR as drafted for this Project is essentially meaningless.

The repeated use of the word “would” in the DEIR begs the question as to whether the Specific Plan referenced hundreds of times in the DEIR has actually been drafted. If it has been drafted, but not included for review in the DEIR, then the public is being left in the dark as to what the Project actually is. If the Specific Plan has in fact *not* been drafted or provided to the City planning staff, then the public is not only being left in the dark as to what the Project actually is, but it is impossible for even the City to know what the Project is or how to analyze the Project impacts. Did the City’s environmental consultant have the Specific Plan? If not, how can the City’s environmental consultant prepare the DEIR? What was it analyzing? This is relevant information for the public to assess the informational value of the DEIR. If the Specific Plan was provided to the City’s environmental consultant and formed the basis of the environmental consultant’s analysis, then why was it not provided in the DEIR?

Similarly, was the Specific Plan made available to the various technical consultants that evaluated the Project’s impacts, such as air quality, noise, transportation, etc., when they were preparing those analyses? How can the technical consultants evaluate the Project (which principally is the Specific Plan) and prepare the technical reports if the essential document comprising the Project is not available to the consultants? Upon what Project information did the technical consultants base their analyses? As discussed below, the DEIR technical reports have varying descriptions of the Project (or no stated descriptions of the Project). How does the DEIR reconcile these differences in the analyses? A “...project description that gives conflicting signals to decision makers and the public about the nature and scope of the project is fundamentally inadequate and misleading.” (*Citizens for a Sustainable Treasure Island v. City and County of San Francisco* (2014) 227 Cal.App.4th 1036, 1052.) In order for the public to understand the Project and how it was analyzed, please provide a matrix showing the Project as defined for each of the technical analyses and the bases for those descriptions.

The DEIR states that “The Specific Plan would establish development guidelines and standards to regulate basic planning, design, and development concepts for future development within Television City.” (*Id.*, emphasis added.) What are these “development guidelines and standards”? How can the City or the public analyze the potential impacts of the Project without knowing what these development guidelines and standards will allow or require? How did the City evaluate the impacts if the “development guidelines and standards” are not drafted? How did the City’s environmental consultant do so? How did the technical consultants do so? What is the “future development” referenced in the DEIR statement? As the “development guidelines and standards to regulate basic planning, design, and development concepts for future development” have not been provided, what is the information in the DEIR upon which the public can evaluate the “basic planning,

design, and development concepts”? Since the Specific Plan is not provided and the “development guidelines and standards” are not provided, will there be a future discretionary review process, subject to CEQA, for all “future development”? There must be informed decision-making with public review and comment at some point in the approval of the “future development.”

The DEIR states that the “development regulations... **would** address land use, design, historic preservation, childcare, alcohol sales, and parking, as well as associated implementation procedures,” (DEIR, p. II-12, emphasis added.) How can the public evaluate the impacts of the Project if the development regulations, which are undisclosed, will determine almost everything about the Project in the future? Everything about those types of issues is relevant to the environmental impacts of the Project and is missing from the DEIR. For example, hypothetical development regulations could permit a development of a studio facilities construction mill next to the adjacent residential properties, a truck staging lot or a basecamp next to the apartment building and across from a school, unlimited special events with amplified sound adjacent to residences, schools and the park, or unlimited audience participation shows with greater vehicle trips and demand for parking. The DEIR does not address these potential impacts. How can these impacts be assessed if the development regulations are not provided?

Further extending the DEIR’s error, the DEIR states that these “development guidelines and standards **would** provide a measure against which specific future development proposals could be evaluated.” (*Id.*, emphasis added.) Please explain how the undefined “Project” will somehow in the future be evaluated against an unknown set of development guidelines and standards in a Specific Plan that has not been provided to the public and possibly the City. How can the public comment on the potential environmental impacts of those future development activities and how can the City measure these future projects against unknown standards?

The DEIR must be revised and recirculated to include an accurate, stable and finite project description and sufficient analysis of such project that will enable the decision-makers to make a decision that intelligently takes account of the environmental consequences of the actual project.

Response to Comment No. 26-5

As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Draft EIR describes all of the physical aspects of the proposed Project that are necessary to fully evaluate the potential impacts of the Project, including, but not limited, to permitted and proposed floor area; a Land Use Exchange Program; design and architecture; height zones; frontage areas; building stepbacks; other design elements including screening and fencing; historic preservation elements; open space; landscaping;

public realm enhancements; access; circulation; parking; lighting; signage; site security; sustainability features; anticipated construction schedule; earthwork activities; and haul routes. As such, the Draft EIR does not “fail as a vehicle for intelligent public participation” or lack a clear and well-defined project description that results in deficient analyses that “fall short of analyzing the potential environmental impacts of the Project” as asserted incorrectly by the commenter.

As explained in Response to Comment No. 5-3 and Topical Response No. 1, CEQA and City policy do not require a draft Specific Plan to be included in a Draft or Final EIR. As discussed in Topical Response No. 1, CEQA defines the “project” to be analyzed in the EIR as the “physical change in the environment,” not the regulatory document describing that change. Also note the OPR Guide to Specific Plans provides that, “[t]o the extent feasible, the process of preparing the specific plan and the environmental analysis should proceed concurrently because both documents require many of the same studies and resulting information. The information in the EIR provides decision makers with the insight necessary to guide policy development, thereby ensuring the plan’s policies will address and provide the means by which to avoid potential impacts to the environment.” Although CEQA requires that a project description include a list of the entitlements sought, CEQA does not require the entitlements themselves to be included in the EIR. The Draft EIR comprehensively analyzes the potential environmental impacts associated with all proposed entitlements. Nonetheless, in response to comments on the Draft EIR, the Preliminary Draft Specific Plan has been made publicly available on the Department of City Planning’s website. Also refer to Appendix FEIR-2, Comparison Chart of the Draft EIR and the Preliminary Draft Specific Plan, of this Final EIR, which confirms that the physical Specific Plan elements were discussed and analyzed in the Draft EIR, and that the Preliminary Draft Specific Plan includes the same elements. This same information was used by the environmental consultant and the other technical consultants in preparing the impact analyses. The technical reports include the specific aspects of the Project necessary to evaluate the Project and those aspects vary by environmental topic.

The Project is similar to the project in the *Treasure Island* case referenced in this comment, which involved a comprehensive, long-range development plan to redevelop a former naval station located in San Francisco Bay. The Court in *Treasure Island* held that the project description was adequate where the basic characteristics of the project remained accurate, stable, and finite throughout the EIR process, and the project description included all of the information required by CEQA Guidelines Section 15124.¹²⁸

¹²⁸ *Treasure Island*, 227 Cal.App.4th at 1055.

Like the TVC 2050 Draft EIR, the EIR in *Treasure Island* included a “conceptual” land use plan. Also like the TVC 2050 Draft EIR, the *Treasure Island* EIR included height zones with maximum height envelopes and square footage limits for proposed uses. The Court in *Treasure Island* rejected appellant’s argument that the project description was not accurate, stable or finite because the project was nothing more than a “conceptual land use map” and lacked project-level details necessary to fully analyze potentially significant impacts.¹²⁹ To the contrary, the Court found that the “EIR made an extensive effort to provide meaningful information about the project, while providing for flexibility needed to respond to changing conditions and unforeseen events that could possibly impact the Project’s final design.” The EIR described permitted uses of the project area and provided detailed standards that would govern development, including (through incorporation by reference) plans showing street layouts and concepts for the shapes of new buildings and landscapes. The Court in *Treasure Island* explained that a project description that included both fixed elements (such as street layouts) and conceptual elements (such as the shape of buildings or specific landscape designs) was all that could be meaningfully provided at this stage.

In *Treasure Island*, the standards for development were comprehensive, although details regarding the final configuration and design of certain buildings had been left for further review. The Court concluded that even if some of the details had not been decided upon when the EIR was approved, “the basic characteristics of the Project under consideration remained accurate, stable, and finite throughout the EIR process.”¹³⁰

As discussed in Response to Comment No. 9-12 and Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Project Description is accurate, stable and finite, and the Specific Plan sets forth a discretionary process (which includes subsequent CEQA compliance review) for future changes that are substantially different than the Project or are beyond the scope of impacts analyzed in the EIR. Furthermore, the Specific Plan would only allow for development consistent with the parameters described in the EIR and would require future review by the City for conformance with the Certified EIR and the adopted Specific Plan.

Note that the City typically uses the term “would” when discussing a project in its environmental documents to reflect the fact that the project has not been approved by the decision-maker. As such, the term “would” is used throughout the Draft EIR, including within the discussion of development standards, as these standards “would” only be implemented if the Project is approved. Furthermore, the Preliminary Draft Specific Plan

¹²⁹ Id.

¹³⁰ Id.

development standards are consistent with those included in Section II, Project Description, of the Draft EIR (e.g., maximum floor area, building heights, frontages, stepbacks, etc.).

As identified in Section 11.5.7 of the LAMC, procedures for the establishment, amendment, or repeal of a specific plan are set forth in Section 12.32 of the LAMC. All procedures relevant to the initiation and processing of an application for a land use plan have been followed, and the commenter has provided no new significant information to the contrary. Refer to Response to Comment No. 26-22 regarding the comment about the relationship of the Specific Plan to the LAMC.

Refer to Response to Comment No. 9-17 regarding the design standards, which are a part of the Specific Plan.

Refer to Topical Response No. 3, Permitted On-Site Uses, regarding special events.

Refer to Section B, Visitor Trips, of Topical Response No. 10, Trip Generation, regarding audience shows and audience trips.

Thus, the Draft EIR fulfilled its informational purpose under CEQA by disclosing all of the elements of the Project required by CEQA, as evidenced by this comment's statement regarding the number of times the Specific Plan and its physical elements are discussed throughout the Draft EIR. Accordingly, environmental review is not premature.

All of the exhibits referenced in this comment have been fully responded to in the responses following this letter. With regard to recirculation, this comment does not provide substantial evidence to demonstrate that "significant new information" as defined by CEQA Guidelines Section 15088.5 has been presented or added to the Draft EIR. Thus, recirculation is not required. Refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 26-6

No Project. The DEIR also lacks any description of what is actually to be built at the Project Site. There are no development plans or other documentation in the DEIR clearly demonstrating the actual development proposed to be built. Without either the Specific Plan or actual development plans, how can the DEIR provide meaningful analysis of the Project's potential impacts? Without either the Specific Plan or actual development plans, how can the public assess the potential impacts? How did the City assess the environmental impacts?

The DEIR does provide a “conceptual site plan” to “illustrate one possible buildout scenario in accordance with the proposed development program” and lists a “maximum permitted floor area... for each of the individual land use categories.” (DEIR, p. II-15, emphasis added.) The DEIR makes clear that the conceptual site plan does not actually govern what might be developed. The DEIR is clear that the few plans included in the Project Description are all illustrative. Without the Specific Plan regulations, the conceptual site plan provides no guidance as to (a) what actually may be built, (b) where it may be built, (c) what limitations or regulations may restrict what may be built, and (d) what uses may be on the Project Site. What is the definition of each of the land use categories? Under which land use category are each of the permitted uses allowed? How did the DEIR, for example, evaluate air quality and noise impacts to residents in the apartment on the east side of the Project Site without clarity as to what will be built on the Project Site near the Broadcast Center Apartments? Did the analysis assume development next to the Broadcast Center Apartments would be a sound stage with its elephant doors open facing the residential buildings during set construction? Did it assume there would be a truck access road or parking area or a basecamp next to the Broadcast Center Apartments? Did it assume a fueling station would be located next to the Broadcast Center Apartments? Did it assume a “mill” for construction of stages would be located next to the Broadcast Center Apartments? Did it assume outdoor decks within 30 feet of the Broadcast Center Apartments with events occurring 7am [sic] to 12am? [sic] Without the Specific Plan regulations, it appears that all of these uses are permitted adjacent to the Broadcast Center Apartments. What are the air quality impacts and noise impacts on the residents from each of these potential uses?

Response to Comment No. 26-6

This comment appears to misunderstand the purpose and function of a specific plan as compared to an individual development project. A specific plan is a regulatory land use ordinance that establishes zoning regulations, such as maximum height limits and FAR. Precise architectural drawings for individual buildings, building floor plans, landscape plans and building material specifications are details that are not currently available and are not required at this time to be included as part of a draft EIR for a specific plan project. In fact, technical drawings may well supply extensive detail beyond that needed for evaluation and review of the environmental impact in violation of CEQA Guidelines Section 15124. Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, for a more detailed discussion of how Section II, Project Description, of the Draft EIR provides all of the necessary information to provide a thorough analysis of Project impacts in accordance with CEQA.

As discussed in Response to Comment Nos. 9-12 and 9-13 and Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Project would include height zones, setbacks, and frontage areas that will dictate the placement, orientation,

mass, and height of potential future buildings. In addition, the proposed Specific Plan would include a regulatory framework for implementation of the Project, including, among other things, mandatory review processes by the City for implementation of the proposed Project. Future changes that are substantially different than the Project or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, as well as potential CEQA compliance. Furthermore, the Specific Plan would only allow for development consistent with the parameters described in the EIR and would require future review by the City for conformance with the Certified EIR and the adopted Specific Plan. Refer to Topical Response No. 1 and Response to Comment Nos. 5-5, 9-12, 9-13, and 26-12 regarding the conceptual nature of the plans included in an EIR. As discussed therein, the massing and locations of the proposed buildings are depicted on the Conceptual Site Plan included as Figure II-4 on page II-14 of the Draft EIR and are consistent with the architectural plans on file with the City. Project plans are part of the administrative record and are available on the Department of City Planning's website, <https://planning.lacity.org/pdiscaseinfo/>, by searching the Project's entitlement case number, *CPC-2021-4089-AD-GPA-ZC-SN-SP*. The Conceptual Site Plan along with the other information about the Project within Section II, Project Description, of the Draft EIR was used to fully evaluate potential impacts associated with the Project.

As discussed in Response to Comment No. 26-5, the development standards included in Section II, Project Description, of the Draft EIR are consistent with those within the Preliminary Draft Specific Plan. Note that Section II, Project Description, of the Draft EIR has been revised to limit the permitted uses and this clarified list of permitted uses is consistent with the Preliminary Draft Specific Plan. Specifically, as discussed in detail in Topical Response No. 3, Permitted On-Site Uses, Section III, Revisions, Clarifications, and Corrections to the Draft EIR, includes clarifications to Section II, Project Description, of the Draft EIR to provide a clarified list of five permitted studio uses within the Project Site consistent with the underlying purpose of the Project: sound stage; production support; production office; general office; and retail. The Project would also continue to allow for ancillary sitewide uses, such as parking, communication facilities, childcare, and facilities equipment and infrastructure supporting the studio and the five permitted land uses. Refer to Response to Comment No. 26-122 regarding the definitions of the permitted uses.

Consistent with existing practices, sound stages that are adjacent to residential uses, where set construction would occur within said sound stage, would occur with the elephant doors (large acoustical sliding doors) closed. As is consistent with the existing condition, regarding a truck access road or parking area or a basecamp that are adjacent to residential uses, these uses would continue to be allowed and have been fully analyzed in the Draft EIR and consistent with the Conceptual Site Plan. Regarding a fueling station adjacent to the Broadcast Center Apartments, or anywhere else on-site, no such use is allowed by the proposed Specific Plan. Additionally, no mill or outdoor decks would be

permitted within a minimum of 30 feet of the Broadcast Center Apartments based on the Project's proposed frontage area.

Regarding potential operational air quality impacts at the Broadcast Center Apartments, refer to Response to Comment No. 26-E.1-2. With regard to potential operational noise impacts at the Broadcast Center Apartments, refer to Response to Comment No. 26-146.

Comment No. 26-7

The DEIR also says the “height zones do not represent the actual development footprint of Project buildings.” The height zone figure states it is illustrative. Can a 160-foot building be built directly next to the apartment complex on the east? Can a 225-foot building be built almost directly adjacent to the Gilmore Adobe? Can a 58-foot building be built in front of the CBS Historic building as shown on the height zone figure? The maximum heights are permitted over a large portion (40%) of each of the taller height zones. Where exactly within each zone are the maximum heights permitted? Is there any further regulation of these maximum height zones? For example, what is the extent of the floor plate that could be developed to such maximum height? Absent that information, the DEIR should assume that a 160-foot tall building could be built along the entire western side of the existing Broadcast Center Apartments and a 130-foot tall building could be built along its entire southern side, significantly overwhelming this residential building as shown in the graphic below. The graphic represents the height zones. It is not a massing model. As noted below, it is virtually impossible to determine the Project's massing given the lack of information in the DEIR.

The DEIR should similarly assume that a 225+ foot tall building could be built along the entire southern frontage directly across from the Gilmore Adobe, overwhelming that historic structure as shown on the graphic below.

Further, the DEIR should assume that a 58-foot tall building could be built in front of the HCM and that 160-foot tall buildings could be built along Beverly Boulevard, overwhelming the HCM and the Historic District to the north as shown below.

We also note that the measurement of height as described in the DEIR is different from the LAMC and it appears that buildings across from the Gilmore Adobe could actually be up to 235 feet or 240 feet above adjacent grade. The DEIR states that “Project Grade” is based on the elevations at the northwest corner of the site and acknowledges that the existing site elevation slopes down as much as 15 feet at the southwest corner of the site. So, how tall can the building actually be as compared to existing grade? Are the maximum heights in Height Zones C and D actually an additional 15 feet taller in some areas? Which areas? Does this mean that a building along the southern frontage can actually be 240 feet tall? The public is not adequately informed as to the actual height of buildings. This is yet another example of how the DEIR fails to provide accurate information to the public. This information must be clarified in the DEIR.

Response to Comment No. 26-7

As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Draft EIR analyzed the Project described in Section II, Project Description, of the Draft EIR, and any substantial changes from the Project would be subject to a discretionary process with subsequent CEQA compliance review and subject to the maximum height limits set forth in the Specific Plan. There is no height limit for the Project Site under the current zoning regulations. Refer to Response to Comment No. 5-9 regarding the inaccuracies in the graphics included in this comment and how they do not portray what could be built under the proposed Specific Plan. In particular, these graphics do not depict the maximum height limitations in Height Zones C and D or appear to reflect the required frontage areas. As discussed on pages II-17 to II-20 of the Draft EIR, the proposed Specific Plan would permit heights up to a maximum of 160 feet in up to 40 percent of the Height Zone C area and up to a maximum of 225 feet in up to 40 percent of the Height Zone D area, with a base height limit of 88 feet within the remaining 60 percent of these height zones, whereas the graphics in this comment inaccurately depict the maximum height limits of 160 feet and 225 feet in 100 percent of Height Zones C and D, respectively.

This comment appears to misunderstand the purpose and function of a specific plan as compared to an individual development project. A specific plan is a regulatory land use ordinance that establishes zoning regulations, such as maximum height limits. Importantly, the maximum height limits established by the height zones are not the proposed heights for individual buildings. As discussed in Response to Comment No. 5-5, the height zones are not proposed as “illustrative” height zones. Rather, as described in the Draft EIR, these height zones set forth a maximum building height limit across the entire Project Site. New buildings would occupy only a portion of the building envelope permitted in each height zone. The height zones in the Draft EIR are the same as those in the Preliminary Draft Specific Plan.

Regarding Project Grade, given that the Project Site is comprised of approximately 25 acres, a set definition of Project Grade was established to reflect the predominant existing grade level consistent with the current studio operations, from which new building heights would be measured. As discussed on page II-9 of the Draft EIR, the Project Site slopes down gently from northeast to southwest. The existing Project Site slopes approximately 16 feet, with site elevation ranging from approximately 185 to 201 feet above mean sea level (AMSL). The existing Primary Studio Complex, in operation for over 70 years, where the four original production facilities are located, is set at an elevation of 201 feet AMSL. The Primary Studio Complex elevation will remain unchanged in the proposed Project, given its status as an HCM, coupled with its subsequent requirements. Primary production activities occur along a shared support spine and concourse, which encompasses the four 1952 sound stages and require a level and connected floor to

maintain a proper operational environment. As such, and given the importance and future integration of the Primary Studio Complex into the overall Project, maintaining the 201-foot elevation as Project Grade is an appropriate and critical consideration. A substantial portion of the existing topographic elevation of the Project Site is also at an elevation of 201 feet AMSL. As such, an elevation of 201 feet AMSL was used as the basis for measuring building heights across the Project Site. As shown in Figure II-3(c) within Section III, Revisions, Clarifications, and Corrections to the Draft EIR, the existing topographic conditions at the primary corners of the Project Site are approximately 192.95 feet AMSL at the northwest corner, approximately 202.47 feet AMSL at the northeast corner, approximately 198.14 feet AMSL at the southeast corner, and approximately 185.07 feet AMSL at the southwest corner.

Furthermore, building heights are typically related to aesthetics. As described in Section 4.I on pages 30 to 31 in the Initial Study, provided in Appendix A of the Draft EIR, the Project is an employment center project located on an infill site within 0.5 mile of an existing major transit stop pursuant to SB 743 (Public Resources Code Section 21099). As such, as discussed in ZI File No. 2542, “[v]isual resources, aesthetic character, shade and shadow, light and glare, and scenic vistas or any other aesthetic impact as defined in the City’s CEQA Threshold Guide shall not be considered an impact.” An evaluation of aesthetic impacts related to building heights is not required under CEQA.

With regard to building heights and on-site historical resources, refer to Section D, Analysis of Impacts to the Primary Studio Complex, of Topical Response No. 5, Historical Resources, and Response to Comment No. 26-E.2-6 regarding the analysis of impacts to the Primary Studio Complex that accounts for building heights and demonstrates that potential impacts would be less than significant.

New buildings would be located a minimum of approximately 167 feet from the Gilmore Adobe. Refer to Section E, Impacts to Historical Resources in the Vicinity of the Project Site, of Topical Response No. 5, Historical Resources, and Response to Comment Nos. 28-29 and 26-E.2-8 regarding how the Project would not impact the setting of the Gilmore Adobe or diminish its integrity such that its eligibility for historic listing is threatened.

With regard to building heights adjacent to the Broadcast Center Apartments, buildings to the west of the Broadcast Center Apartments could be up to a maximum of 160 feet in height within 40 percent of Height Zone C (the base height limit within Height Zone C would be 88 feet) and buildings to the south of the Broadcast Center Apartments could be up to 130 feet in height within Height Zone B. However, as shown in Figure II-5 of Section II, Project Description, of the Draft EIR, a 30-foot frontage area would be required along the Shared Eastern Property Line that would serve as a buffer between new buildings and the Broadcast Center Apartments. Between the required 30-foot frontage

area plus the Broadcast Center Apartment building's existing setback of over five feet, there would be over 35 feet separating Broadcast Center Apartments from any new building. Potential CEQA impacts to the Broadcast Center Apartments were thoroughly analyzed in Section IV of the Draft EIR and in the Initial Study (Appendix A of the Draft EIR).

Any new construction in Height Zone A (Viewshed Restoration Area) would be limited by the HCM Findings and LAMC Section 22.171.14, notwithstanding the 58-foot height limit in Height Zone A, which is taken directly from the HCM Findings. Refer to Section C, Potential New Construction North of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, and Response to Comment No. 26-45.

Refer to Section E, Impacts to Historical Resources in the Vicinity of the Project Site, of Topical Response No. 5, Historical Resources, regarding impacts to the Beverly Fairfax Historic District, if hypothetically assumed to be located within the Project Site vicinity.

The commenter's assertions about buildings "overwhelming" the Primary Studio Complex, Gilmore Adobe, Broadcast Center Apartments, and Beverly Fairfax Historic District are not supported by any evidence demonstrating an environmental impact under CEQA.

Also refer to Response to Comment No. 11-3 regarding how the height and scale of the Project are compatible with existing uses.

As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Draft EIR fulfilled CEQA's informational purpose by disclosing all of the elements of the Project required by CEQA and providing a comprehensive analysis of the Project's potential environmental impacts. Also refer to Response to Comment No. 26-6 regarding the purpose and function of a specific plan.

Comment No. 26-8

The discussion of setbacks is also unclear. For example, what are the limitations in the "Frontage Areas" shown on the Height Zone Map (Figure II-5? The DEIR says these are to be buffers and transitional space (DEIR, p. II-20). However, from the conceptual site plan, those appear to be truck access routes. Is a road with heavy truck usage consistent with a "buffer"? What regulations govern the "Frontage Areas"? Are there any setbacks provided that would not permit structures, trucks or other active uses in the Frontage Areas?

Response to Comment No. 26-8

There are no setbacks required for the Project Site under the current zoning regulations. The Project frontage areas are voluntarily proposed and they function with the same purpose as setbacks. Page II-20 of the Draft EIR states that “[f]rontage areas would function as buffers and transitional space around the Project Site perimeter. Within these areas, features such as sidewalks, landscaping, security kiosks, fences, walls, projections, stairs, balconies, and parking would be permitted.” As a transitional space, frontage areas would include space for vehicle and pedestrian access and circulation within the Project Site. As shown in Figure II-3 in Section II, Project Description, of the Draft EIR and in Figure II-8 on page II-517, the existing use of the areas proposed as frontage areas includes, but is not limited to, parking, vehicular access, and basecamp activities. The frontage area requirements described in the Draft EIR, which are the same as those included in the Preliminary Draft Specific Plan, would provide greater amenity space and viewsheds than what would otherwise be required by the current zoning regulations. Zoning and land use regulatory nomenclature is not a CEQA issue; however, the physical, built environment, and changes thereto are, and the physical aspects of the frontage areas, including vehicular activity on the internal circulation lanes shown in the Conceptual Site Plan, were fully evaluated in the Draft EIR. The commenter has not provided any information identifying a deficiency in the Draft EIR’s analysis with regard to the operational and physical characteristics of the frontage areas.

Regarding truck access, please note that at full buildout of the maximum square footage permitted under the Specific Plan, there would be a total of approximately 83 daily trucks during Project operation, and only a portion of these trucks would access the Project Site from the northeast driveways (only four trucks per day would use the northeast driveway adjacent to Broadcast Center Apartments). Refer to Section E, Truck Trips, of Topical Response No. 10, Trip Generation.

LEGEND

FRONTAGE AREA

NOTE:

- Existing uses in the proposed frontage areas include, but are not limited to, surface parking, driveways and entry gates, circulation roads and areas for vehicles and pedestrians, security guard booths, security fencing and walls, trees and landscaping, signage, lighting and utility poles, and buildings and structures.

Figure II-8
Existing Uses in Proposed
Frontage Areas

Comment No. 26-9

The DEIR also states the combination of uses may vary and includes a litany of possible uses and activities permitted on the Project Site and then goes on to state: “***...and all other uses permitted in the C2 zone unless expressly prohibited in the Specific Plan.***” It is impossible to know what that means without the Specific Plan. One must assume that every use in the C2 zone is eligible to be developed on the Project Site since no Specific Plan is provided. Did the DEIR analyze all of those potential uses? Could there be a hotel in the Project? A hospital? A 3,000 seat arena for athletic, entertainment or e-sport events? What amount of the Project square footage could be allocated to each of the permitted categories of uses? How were all of these permitted uses analyzed? In the absence of this analysis, the DEIR lacks the information necessary to allow the public and decision-makers to understand the impacts of the Project. Please explain how the City, the environmental consultant and the technical consultants evaluated the impacts without understanding the range of permitted uses.

Response to Comment No. 26-9

This comment is similar to Comment Nos. 5-6, 26-2, and 26-5. Refer to Response to Comment Nos. 5-6, 26-2, and 26-5 and Topical Response No. 3, Permitted On-Site Uses, regarding the clarified list of proposed uses and how impacts associated with all permitted uses have been fully evaluated within the EIR.

Comment No. 26-10

In addition, while many of the Project objectives are to maintain and grow the entertainment studio business in Los Angeles, there does not appear to be any requirement to maintain the Project site as an operating studio or any requirement to allow the addition of supporting uses (such as production office, warehouse, basecamp, etc.) only in connection with construction of on-site stages for which such uses would serve. Is that a requirement of the Project? If not, with the range of permitted uses identified in the DEIR, how can the City be certain this will remain an operating studio use for at least the next 20 years? Were any other site plans submitted to the City or the environmental consultant during the preparation of the DEIR? What is the requirement as to how many stages must be built? And in what sequence (phasing) are the stages to be built? Is there a requirement that the other permitted uses be solely supportive of the on-site production uses? For example, will the office and warehouse uses only be allowed to support stage uses that are developed before or concurrent with the office and warehouse uses?

There is no indication in the DEIR that the Project restricts the development other than the overall maximum permitted square footage (for which permitted “floor area” is redefined by the Specific Plan), the unclear maximum heights and minimum setbacks, and some limited

separations around the HCM. Are there any other limitations as to what the applicant can build across the Project Site?

Response to Comment No. 26-10

Television City has been a studio for over 70 years, and the proposed Specific Plan will ensure that the Project Site will continue to operate as a studio in the future. In addition, the Applicant has committed to preserving and maintaining the original historic studio buildings for studio use and all of the character-defining features as reflected in the HCM designation for the Project Site that will be further memorialized in the adopted zoning regulations and entitlement approvals. Refer to Response to Comment No. 5-6 regarding the underlying purpose of the Project, which is to maintain Television City as a studio, and the limited range of permitted uses, which does not include warehouse uses (refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR). As discussed in Topical Response No. 3, Permitted On-Site Uses, the proposed Specific Plan only permits five studio uses (i.e., sound stage, production support, production office, general office, and retail) as well as related ancillary uses in support of the studio and the five permitted uses, all of which were fully disclosed and analyzed in the Draft EIR. Plans for alternate uses were not submitted to the City.

The comment regarding a requirement to build stages is similar to Comment No. 5-15. Refer to Response to Comment No. 5-15 for further discussion of the underlying purpose of the Project. In addition, as explained in Response to Comment Nos. 5-6 and 9-13 and Topical Response No. 3, Permitted On-Site Uses, consistent with the Project's studio objectives, the permitted uses on-site will only include studio-related uses and associated ancillary uses, and these uses have all been addressed in the EIR. Refer to Response to Comment No. 26-2 regarding the needs of modern production studios.

Regarding the construction timeframe, refer to Response to Comment No. 9-24. The Applicant anticipates that the Project will be built in a single phase.

The commenter's assertion regarding the "unclear" regulations is not supported by any evidence or explanation. With regard to the maximum floor area for each of the five permitted uses, refer to Table II-2 and page II-16 of Section II, Project Description, of the Draft EIR. Also refer to Response to Comment Nos. 9-16 and 26-8 regarding the specificity of the height zones, frontage areas, and setbacks. As set forth in Section II, Project Description, of the Draft EIR, there are clear limitations on what the Project can build across the Project Site. These regulations are consistent with the regulations in the proposed Specific Plan, as demonstrated in Appendix FEIR-2, Comparison Chart of the Draft EIR and the Preliminary Draft Specific Plan, of this Final EIR.

As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the proposed Specific Plan would include a regulatory framework for implementation of the Project, including, among other things, mandatory review processes by the City for implementation of the proposed Project. Future changes that are substantially different than the Project or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, as well as potential CEQA compliance review.

Comment No. 26-11

Lack of Stable Project Description is Clear Error. In *Stopthemillenniumhollywood.com v. City of Los Angeles* (2019) 39 Cal.App.5th 1, the Court of Appeal affirmed the trial court's decision that the City's CEQA review of the Millennium Hollywood Project was wholly inadequate because the EIR lacked an accurate, stable, and finite project description.

In *Stopthemillenniumhollywood.com*, [sic] petitioners challenged the adequacy of an EIR for a four-and-a-half-acre mixed-use development in Hollywood. The EIR described several potential development scenarios, but did not include the final project arrangement or density of specific land uses, siting, or massing characteristics, in an admitted effort to provide the applicant with "flexibility." Instead, the EIR contemplated only an "illustrative scenario" to demonstrate a "potential development program."

The Court of Appeal found that the project description was not only inconsistent, but also that it failed "to describe the siting, size, mass, or appearance of any building proposed to be built at the project site." (*Id.* at 17.) "The requirement of an accurate, stable, and finite project description [is] the sine qua non of an informative and legally sufficient EIR[.]" (*Id.* at 18.) The Court explained that concept scenarios and potential designs, none of which may ultimately be constructed, do not meet CEQA's requirement of a stable and finite project description. The Court rejected the City's argument that so long as the worst case scenario environmental effects had been analyzed and mitigated, CEQA's purpose was satisfied. By failing to provide a project description that evaluated what may actually be built, the Court determined that the EIR prevented the public from effectively participating in the approval process. Thus, the Court held that the lack of an accurate, stable, and finite project description prejudicially precluded informed decision-making and public participation.

Like the project description in the Millennium Hollywood case, the TVC Project's project description does not meet the requirement of a stable or finite proposed project. The TVC 2050 DEIR's mention of the Project's "development guidelines and standards" provides the public and decision makers little by way of actual information regarding the 'design features' or the 'final development scenario.' Rather, like Millennium Hollywood's "limits," the DEIR's supposed "limits imposed are vague and ambiguous." (*Id.*)

In describing what an acceptable project description would include, the *Millennium Hollywood* Court listed things like: “site plans, cross-sections, building elevations, or illustrative massing to show what buildings would be built, where they would be sited, what they would look like, and how many there would be.” (39 Cal.App.5th 19.) Like the *Millennium Hollywood* EIR, the DEIR for the Project lacks sufficient information.

Finally, like *Millennium Hollywood*, “there [are] no practical impediments as to why [TVC] could not have provided an accurate, stable, and finite description of what it intended to build.” (*Id.*) The City could have waited to complete a draft Specific Plan and included it in the DEIR. The applicant provided the City with some plans as part of its application as far back as March 2021. (See Exhibit 5, Vesting Tentative Tract Map.) Why didn’t the City use these plans that shows the location of proposed buildings as the basis of the DEIR analysis? Why are those plans not part of the Project description if that is what the applicant applied for? Why is the development not restricted to the plans filed with the application?

Lacking fundamental information to make reasonable conclusions about the Project and its impacts, the DEIR must be revised and recirculated to include an actual project description, including the Specific Plan, and other related documents such as the Sign District regulations, and re-analyze all impact areas to understand the impacts of what will actually be built, and not simply an undefined envelope of impacts for a project that apparently could be almost anything.

Response to Comment No. 26-11

This comment is similar to the comments raised in Comment Letter No. 9. As explained in Response to Comment No. 9-14 and Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Draft EIR does not merely utilize a “worst case” approach for evaluating impacts of the Project. As explained in Response to Comment Nos. 9-5, 9-11, 9-12, 9-13, 9-14, 9-15, and 9-16 and Topical Response No. 1, Section II, Project Description, of the Draft EIR contains sufficient details regarding the Project design, including a Conceptual Site Plan (that is consistent with the architectural plans on file with the City) and other graphic images that portray the physical aspects of the Project. With regard to the proposed Specific Plan, refer to Response to Comment Nos. 5-3 and 26-5. Also refer to Response to Comment No. 5-10 regarding the proposed Sign District. As demonstrated in these responses and Topical Response No. 1, Section II, Project Description, of the Draft EIR is accurate, stable, and finite, and fully complies with CEQA, and the Project is distinguishable from the *Millennium* case. Further, as discussed in Topical Response No. 1, the proposed Specific Plan would include a regulatory framework for implementation of the Project, including, among other things, mandatory review processes by the City for implementation of the proposed Project. Future changes that are substantially different than the Project or are beyond the scope of impacts evaluated in the

EIR would require additional discretionary City review and approval, as well as potential CEQA compliance review.

As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, neither CEQA nor City policy requires drafts of a Specific Plan or Sign District to be included in an EIR, and environmental review is not premature. A fundamental principle of CEQA is that EIRs should be prepared as early as feasible in the planning process.¹³¹ Per the OPR Guide to Specific Plans, a specific plan is typically drafted concurrently with the environmental review process and need not be included in the EIR. This allows the comments on the draft EIR to be reflected in the specific plan, thereby fulfilling CEQA's goal of public participation and feedback. Further, the massing and locations of the proposed buildings are depicted on the Conceptual Site Plan included as Figure II-4 on page II-14 of the Draft EIR and are consistent with the architectural plans on file with the City. Project plans are part of the administrative record and are available on the Department of City Planning's website, <https://planning.lacity.org/pdiscaseinfo/>, by searching the Project's entitlement case number, *CPC-2021-4089-AD-GPA-ZC-SN-SP*. These plans are part of the administrative record and have been publicly available on the Department of City Planning's website, as evidenced by this comment, which attaches the Project's proposed Vesting Tentative Tract Map that was submitted as part of the Project's application. Regarding recirculation, this comment does not provide substantial evidence to demonstrate that "significant new information" as defined by CEQA Guidelines Section 15088.5 has been presented or added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Also refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 26-12

No Basis for Determining Environmental Impacts. Please explain how the DEIR can present an analysis of environmental impacts when the Project—essentially the adoption of an unspecific Specific Plan—remains undefined. How did the DEIR define an analytic framework for analysis of air quality, noise, transportation, and the other impact categories without that information? The applicant officially submitted to the City some project development plans in the applications for the Project available at <https://planning.lacity.org/pdiscaseinfo/caseid/MjQ3Mjg20>. Most of this information was submitted before the DEIR was completed. The information includes locations of buildings and uses, typical floor plans, elevations, parking and subterranean land use, and landscaping. How do these plans differ from the conceptual plan and height zones shown in the DEIR? Did the DEIR analyze the Project as reflected in these detailed plans? In what way? Why was this detailed information not included within the Project Description of the DEIR? Will these

¹³¹ CEQA Guidelines § 15004(b).

plans be part of the missing Specific Plan? If the development will differ from these plans, how will it differ?

The applicant has also provided information and plans regarding the development of the Project to the Neighborhood Council and Cultural Heritage Commission. (See **Exhibit 6**, TVC 2050 Presentation to Neighborhood Council and **Exhibit 7**, TVC 2050 Presentation to Cultural Heritage Commission.) These plans show proposed elevations, complete renderings of a fully built out Project, proposed viewsheds, site plans of various levels, circulation and access maps, and visual depictions of the Mobility Hub. How do these plans differ from the conceptual plan and height zones shown in the DEIR? Did the DEIR analyze the Project as reflected in these detailed plans? In what way? ‘Why were they not provided in the DEIR? Is the applicant constrained to these plans presented to the Neighborhood Council and Cultural Heritage Commission? The integrity of the CEQA process is called into question when the applicant shows the public and decision-makers “plans” outside of the DEIR but the DEIR says the applicant is not bound by any plans and provides virtually no development regulations.

The lack of Project plans in the DEIR itself and other information being provided to the City outside of the DEIR is confusing and misleading and further highlights the problems with the lack of an accurate-and stable Project description.

The DEIR states, “throughout this Draft EIR, where appropriate, the analyses address the potential impacts resulting from a hypothetical development mix under the proposed land use exchange program that would generate the maximum impact for that environmental issue (e.g., a maximum water demand scenario or maximum air emissions scenario). Accordingly, the maximum possible impacts of the Project are evaluated herein and represent the measure against which future land use exchange proposals may be considered.” (DEIR, pp. II-16 to II-17, emphasis added.) What is the hypothetical development mix? How many hypothetical development mixes are there? How can the public assess if a particular mix of uses would generate a greater impact for any one environmental impact area? What was the basis for determining that a particular hypothetical development mix generates the maximum impact for any particular area of analysis? What is the “real development mix”? Without the Specific Plan, an actual development program, or other information regarding the development regulations, it is impossible for the public and decision-makers to assess whether the maximum environmental impacts have been adequately disclosed and evaluated.

Response to Comment No. 26-12

Refer to Response to Comment No. 5-3 regarding how Section II, Project Description, of the Draft EIR includes sufficient information to fully evaluate the environmental impacts of the Project and how this information is consistent with the

physical aspects of the proposed Specific Plan. This information was specifically used as the inputs for the analyses of air quality, noise and transportation. As also explained therein and in more detail in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Conceptual Site Plan is based on the architectural plans on file with the City. Further, the proposed Specific Plan would include a regulatory framework for implementation of the Project, including, among other things, mandatory review processes by the City for implementation of the proposed Project. Future changes that are substantially different than the Project or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, as well as potential CEQA compliance review. The Neighborhood Council and Cultural Heritage Commission presentations were educational presentations to explain the Project, by and on behalf of the Applicant, with figures shown therein that are consistent with the proposed Project, proposed Specific Plan, and Figure II-4, Conceptual Site Plan, of the Draft EIR.

Also refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding how the Project Description includes all of the information required by CEQA Guidelines Section 15124 and how precise architectural drawings for individual buildings, building floor plans, landscape plans and building material specifications are details that are not required at this time to be included as part of an EIR for a specific plan project. Further, neither CEQA nor City policy requires a draft Specific Plan to be included in the Project's EIR.

Refer to Response to Comment No. 9-13 and Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding how the Project's proposed land use program set forth in Table II-2 of the Draft EIR and the Conceptual Site Plan set forth in Figure II-4 of the Draft EIR were evaluated throughout the Draft EIR and how the analyses also accounted for the limited Land Use Exchange Program. Refer to Appendix FEIR-3 of this Final EIR for a discussion of each of the maximum impact scenarios that were analyzed in the Draft EIR.

Comment No. 26-13

What evidence is there that the DEIR actually evaluated the "maximum impact" of the Project for each impact area? If the DEIR actually undertook this level of analysis, one would expect a discussion at the start of each environmental topic section discussing which "development mix" was evaluated and why that "development mix" "would generate the maximum impact." For almost all of the impact areas, there is no discussion or analysis as to why the assumed development mix used in that impact area (if it was actually even stated) would result in the maximum impact for that impact area. Please clarify for each impact section what was the "hypothetical development mix" that was evaluated and why that mix of uses evaluated would have the greatest environmental impacts in that impact area.

Without this analysis, how is it possible for the City and the public to understand the Project's true potential impacts?

Response to Comment No. 26-13

This comment raises the same topic as Comment No. 9-14. As discussed in Response to Comment Nos. 9-14 and 26-12 and in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Draft EIR's environmental analysis accounts for the maximum potential environmental impacts associated with buildout of the Project as set forth in Table II-2 of the Draft EIR and in the Conceptual Site Plan included in Figure II-4 of the Draft EIR. In addition, the Draft EIR also analyzes the maximum impact scenarios (i.e., the development scenarios under the limited Land Use Exchange Program that would generate the greatest environmental impact). Refer to Appendix FEIR-3 of this Final EIR, which discusses the maximum impact scenarios that were analyzed for each environmental topic, as applicable, in addition to the proposed development program as set forth in Table II-2 of Section II, Project Description, of the Draft EIR.

Comment No. 26-14

No Clarity on Allowed or Proposed Uses. The DEIR provides no clarity as to what actual uses will be on the property, other than to reserve the right to develop virtually any use permitted in the C2 zone.

With the limited information provided, it is impossible to know what the Project will end up being (or what it will look like) and, therefore, what the impacts of the Project will be. The DEIR lists the following types of uses that would be permitted on site: "production activities; indoor and outdoor stages; sets and façades; digital, film, video, audio, video game, eSports, and media production; recording and broadcasting; sound labs; film editing; film video and audio processing; sets and props production; computer design; computer graphics; animation; and ancillary facilities related to those activities. The following types of related uses and facilities would also be permitted, as detailed in the Specific Plan: basecamps, communication facilities, conference facilities, modular offices and trailers, studio support facilities, parking, various ancillary commercial and retail uses to serve the onsite employees and visitors, catering facilities, special events, audience and entertainment shows, museum exhibits and theaters, childcare and educational facilities, fitness facilities, emergency medical facilities to serve the onsite employees and visitors, fueling stations and vehicle repair related to onsite uses ,and [sic] activities, infrastructure, maintenance and storage facilities, mills/manufacturing, sleeping quarters for certain onsite personnel, recreational facilities, restaurants and special event areas including the sale of alcoholic beverages, security facilities, signs, storage and warehouses, helipad, ***and all other uses permitted in the C2 zone unless expressly prohibited in the Specific Plan.***" (DEIR, pp. II-15 to II-16, emphasis added.)

First of all, the DEIR does not state which category of land use each of these proposed permitted uses falls under, so the public has no idea of even a theoretical maximum amount of space used for any one of these permitted uses and activities. What land use categories do each of these activities fall under?

The applicable land use category is really just a guess given that there is no definition of the land use categories discussed in the DEIR. What are the definitions of each of the land use categories? For example, what is production office space and how is its definition, use, and function different from general office space? Are impacts for the two classes of office treated differently? If so, how and why? What is the basis for distinguishing between the two? How will their usage be regulated and enforced? Given the absence of regulatory information, the DEIR must assume the more impactful use for all analyses.

Similarly, what is the definition of production support? There is a litany of permitted uses that do not appear to be stage, office, or retail, but without the definition of the land use categories, it's impossible to tell. Is "conference facilities" part of production support, "production office," or "office"? How about "theaters", [sic] is that "production support," "stage," or "retail"? And warehouse, is that "production support" or something else? Without the definitions that might be in the Specific Plan (which was not provided), how could the preparers of the DEIR and technical reports know how much of these uses are permitted and accurately assess the related impacts?

Second, in addition to the other stated uses, the DEIR allows for, "all other uses permitted in the C2 zone unless expressly prohibited in the Specific Plan." As noted, there is no Specific Plan. The DEIR does not say which uses would be "expressly prohibited" so the DEIR must assume all uses are permitted. The C2 zone would provide more than one hundred additional allowable uses, as shown below.

<ul style="list-style-type: none"> • Music conservatory or music instruction. 		
<ul style="list-style-type: none"> • Newsstand. 	<ul style="list-style-type: none"> • Second-hand store, except pawnshops, if all activities other than incidental storage are conducting wholly within a completely enclosed building. 	<ul style="list-style-type: none"> • Shelters for the homeless
<ul style="list-style-type: none"> • Nursery, flower or plant, provided that all incidental equipment and supplies, including fertilizer and empty cans, are kept within a building. 		<ul style="list-style-type: none"> • Motion picture, television, video and other media production, no outdoor sets
<ul style="list-style-type: none"> • Parcel delivery service, branch, if all activities including storage and loading and unloading, are conducted within a completely enclosed building. 	<ul style="list-style-type: none"> • Studios (except motion picture). 	
	<ul style="list-style-type: none"> • School (elementary or high), educational institution, or private school. 	
	<ul style="list-style-type: none"> • Indoor swap meets 	
<ul style="list-style-type: none"> • Parking buildings and all buildings containing 	<ul style="list-style-type: none"> • Trade school, if not objectional due to noise, odor, 	

Because the DEIR does not identify which (if any) of these are “expressly prohibited,” did the DEIR analysis assume that all of these uses could be present at the Project Site? If not, which uses were assumed to be prohibited? How did the City come to the decision to exclude specific uses, if they were actually excluded from the analysis?

According to the DEIR, the applicant is allowed to include a hospital or clinic, a special event venue for 3,000 people, a FedEx or UPS facility, schools, and more. The DEIR must analyze specific, particular impacts related to each of these permitted uses. The lack of a real project description in the DEIR and the “flexibility” that is apparently being built into a completely undefined Specific Plan moving forward makes it impossible to know what will happen on the Project Site. For example, can the stages be used for e-sports activities? Are these spectator events? How many spectators? How often? How many times a day? What type of manufacturing and mill facilities are permitted and at what size and quantity?

Response to Comment No. 26-14

This comment raises the same topic as Comment Nos. 5-6 and 26-2. Refer to Response to Comment Nos. 5-6 and 26-2 and Topical Response No. 3, Permitted On-Site Uses, regarding the clarified list of proposed uses and how impacts associated with all permitted uses have been fully evaluated within the EIR. Based on the comments received on the Draft EIR, the permitted uses were clarified to reflect the Project’s studio objectives, including, among other things, removing the C2 zone text on page II-16 of the Draft EIR referenced in this comment. The list of C2 zone uses included in this comment are currently permitted uses for the Project Site, and the Project would substantially narrow the uses that would be permitted on-site. Hospitals, clinics, event venues, shipping facilities, and schools would not be permitted. The proposed Specific Plan would only allow five land uses—sound stage, production support, production office, general office, and retail—as well as related ancillary and supportive uses that support the studio and the five permitted land uses, all of which were fully disclosed and analyzed in the Draft EIR.

Refer to Response to Comment No. 26-122 regarding the definitions of the permitted uses in the Specific Plan, including the definition of production office and general office uses. Production office is defined as a studio land use that includes office uses associated with or in furtherance of production activity, including but not limited to merchandising, marketing, promotion, licensing, sales, leasing, accounting, distribution, legal, and administration. General office includes general office uses, which may or may not include those office uses associated with or in furtherance of production activity, including but not limited to merchandising, marketing, promotion, licensing, sales, leasing, accounting, distribution, legal, general commercial, professional, executive, business, and administration. With regard to the definition of production support uses, these are uses that primarily support production activities and employee services, “such as storage and mills” (page II-5 of the Draft EIR). Studio support facilities, such as mail rooms, would also be

permitted. Production office and general office uses may include conference rooms; however, a “conference facility” would not be permitted. E-sports and theater facilities that are used for production activities would be permitted under the sound stage definition and would not be allowed in any other permitted use, such as production office or production support. Audience capacity would be regulated by applicable LAMC and State regulations, as is the case with current existing conditions. In addition, the defined warehouse uses are not proposed as part of the Project and would not be permitted under the proposed Specific Plan. Refer to Topical Response No. 3, Permitted On-Site Uses, regarding special events.

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, for a discussion of how the Project Description complies with CEQA, the limited Land Use Exchange Program and the regulatory process under the proposed Specific Plan.

Regarding the specific question of the utilization of sound stages for sports activities, competitive activities with contestants for production purposes, e-sports, or similar creative endeavors would be allowed, as the existing condition allows today.

Comment No. 26-15

The DEIR also summarily mentions the relocation of an existing helipad use but provides no operational information with which to assess its impacts. How often is the helipad used now? What existing restrictions or regulations are there on the use of the helipad? Does the Project propose to increase the use of the helipad from the baseline condition? If so, how? Does the Project propose to change any existing restrictions or regulations on the use of the helipad? If so, which and how? Can the helipad be located next to the Broadcast Center Apartments? What restrictions will be imposed on the use of the helipad in the future? How are any changes in the helipad use from baseline conditions assessed in the DEIR? Impacts on noise, air quality, hazards, land use, and other impact areas need to assess the changes in location and use to the helipad. What are the safety considerations of the helipad use? Could, for example, helipad use conflict with any helicopter use by Cedars-Sinai Medical Center for medical transport? For what use will the helipad be permitted. Will the helipad be permitted to bring in celebrities to the stages? Studio executives? Can anyone rent the use of the helipad?

Response to Comment No. 26-15

As discussed on page II-15 and shown in Figure II-3 on page II-6 in Section II, Project Description, of the Draft EIR, “[e]xisting uses include, among other things, a helipad that has been in operation since 1951. The original Conditional Use Permit (CUP) (ZA No. 11412), approved on October 17, 1950, authorized the existing helipad and recognized it as a necessary accessory use to a successful studio. The existing helipad use will be retained in approximately the same location on the Project Site, but at a higher elevation,

as a part of the Project.” The helipad is currently located in the central portion of the Project Site on the roof of the Service Building, and the helipad will remain in that location with the Project (refer to Figure II-3, Key Existing Site Features, on page II-6 and Figure II-4, Conceptual Site Plan, on page II-14 of the Draft EIR). In addition, the Project does not propose to change this existing use. Therefore, the Draft EIR correctly analyzed the helipad at this location, and an analysis of other locations or other considerations, as requested by the commenter, is not required.

The comment states that the Draft EIR provides no operational information with which to assess the helipad’s impacts. However, the physical environmental impacts of the helipad were discussed and analyzed in the Draft EIR. As discussed on page IV.I-43 of the Draft EIR, the helipad would continue to operate in the same general location in accordance with the existing applicable regulatory requirements, and there would be no increase in helicopter use compared to existing conditions. The only change to the helipad would be its location at a higher level. As such, the noise levels associated with the continued operation of the helipad would decrease, and no other impacts would occur. The helipad is also discussed in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR. As discussed on pages IV.F-29 to IV.F-30 of the Draft EIR, a clarifier associated with the helipad was observed during Project Site reconnaissance for the Phase I ESA. The helipad clarifier is plumbed to an external double-walled steel reservoir. Minimal stormwater is collected from the reservoir by maintenance staff and disposed of under manifest as a hazardous waste. The helipad clarifier and reservoir are inspected regularly during the City’s regulatory inspections. No visual or olfactory evidence of any spills, leaks, or releases has been observed. In addition, no past leaks or releases were reported by personnel, and the clarifier is not reported to contain standing fluids. Further, as discussed on page IV.J.1-24 in Section IV.J.1, Public Services—Fire Protection, of the Draft EIR, per LAMC Section 57.4705.4, the Project would be required to provide an emergency helicopter land facility (EHLF). The continuation of the existing helipad meets this requirement.

Nevertheless, in response to comments on the Draft EIR, the Helipad Operations Memorandum, which was prepared by Michael Klausman, President of Television City, and Jeff Mapes, Vice President of Facilities Operations at Television City, included in Appendix FEIR-15 of this Final EIR, discusses how the future operation of the helipad would continue to be similar to existing conditions, including the arrival and departure flight paths and the number of flight operations. Since the future helipad would be at a higher elevation, the noise levels due to helicopter operations would be slightly lower compared to existing conditions.

Comment No. 26-16

Redefining Permitted Floor Area (Size of the Project). The DEIR relegates a critical provision about the size of the Project to a footnote. After claiming that the Project will be limited to a maximum of 1,874,000 square feet, the very first footnote in the DEIR Project Description provides so many exceptions to what is included in that 1,874,000 square feet it is clear that significant aspects of the size of the Project are being excluded from the definition of the project and the analysis in the DEIR. The footnote admits that the square footage could be well over 2 million square feet, but that still appears to significantly undercount Project square footage and, in turn, the impacts of the Project.

The DEIR footnote redefines permitted “floor area” to exclude the following areas from the Project development square footage and, therefore, from the required analysis throughout the DEIR: “exterior walls; stairways; shafts; light courts; bicycle parking (covered); rooms housing building-operating equipment or machinery; basement and ground floor (covered) storage areas; recycling or waste management equipment or machinery; parking areas with associated driveways and ramps; areas related to the Mobility Hub; outdoor eating areas (covered or uncovered); trellis and shade structures; covered canopies; existing marquees and walkways (covered); outdoor production areas; buildings wholly constructed to house mechanical, plumbing, electrical, or other co-generation and storm water equipment; production trailers; basecamp areas; temporary uses; and sets/façades.” (DEIR, p. II-1.)

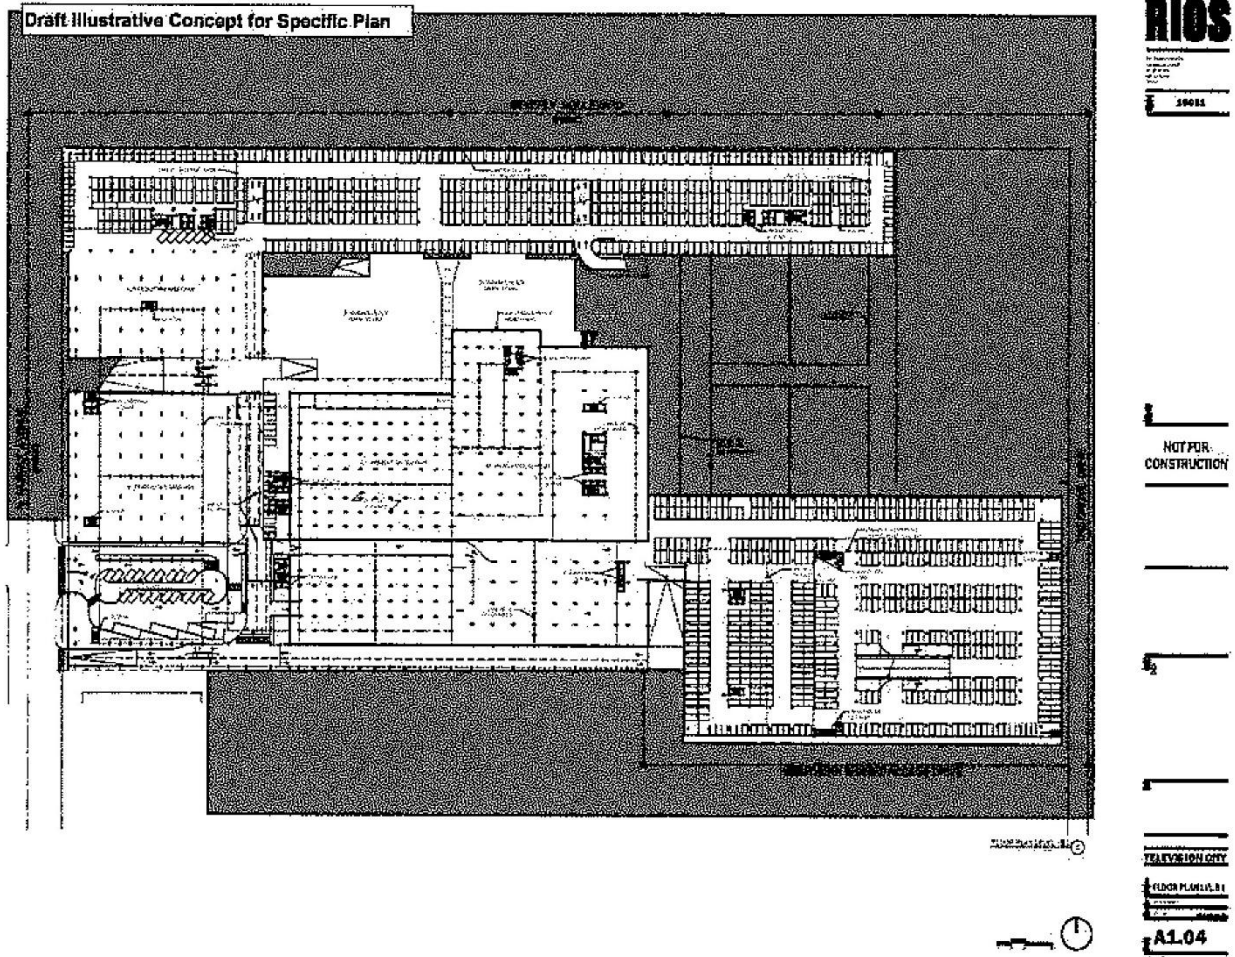

The Project’s proposed floor area definition excludes more areas than the LAMC definition of floor area. In significantly expanding the areas to be excluded from the floor area calculation, the DEIR grossly understates the size of the Project and the potential environmental impacts of the Project. Without a clear understanding of how much of these areas, including active production areas and basecamps, are incorporated into the Project, how is the public expected to understand the full scope of the Project? Excluding portions of the actual development from the definition of “floor area” would permit the Project to be much bigger than presented to the public in the DEIR. Thus the Project would have much larger impacts than is studied in the DEIR. The DEIR states, without explanation, that the change in definition would result in an approximately 110,000 square foot reduction in what is included in floor area as compared to the LAMC. How was that calculation made? What is the difference in the LAMC and DEIR definition of floor area?

The Project proposes to exclude, via a definitional change floor area that would generally be subject to environmental review, grossly understating the potential environmental impacts of the Project. Will the Project be limited to both the maximum DEIR definition derived 1.874 million square feet of floor area *and* the supposedly LAMC-derived 1.984 square feet stated in the DEIR?

The Project's website (images reproduced below) shows what appear to be below grade "parking areas" and "basecamp areas" with people working at these levels. By moving production activities below grade and redefining floor area, the DEIR appears to fail to study the impacts from these additional production areas. As indicated in the DEIR, there is an existing 95,540 square feet of sound stages and 325,450 square feet of production support. The DEIR states that the undisclosed Specific Plan would permit 350,000 square feet of sound stages yet reduce overall production support to a total 104,000 square feet. Given the significant increase in sound stages, the reduction of production support seems inconsistent with an operating studio based on industry needs to support production.

However, the Project description is misleading and may not actually reduce production support area—just redefine it so as to exclude it from the definition of "floor area." Excluded from floor area would be major areas of production support facilities through the use of production trucks and trailers and below grade areas. The current site has a ratio of 3.1:1 of production support to stage areas. Even assuming a reduced need for production support, at a 2:1 ratio, production support would be approximately 700,000 square feet, not 104,000 square feet. It appears that the below grade areas are really intended to serve as unaccounted for production space.

A review of the floor plans available in the City's files as part of the Project applications indicate that there will be at least 360,000 square feet of production area included as part of the Project that does not appear to have been counted as floor area and was not included in the DEIR analysis. This uncounted production area could actually be 500,000 or more square feet. Even if not defined as "floor area" these actively used production areas generate environmental impacts that should be studied in the DEIR. The DEIR should disclose and analyze these uncounted production areas. Please provide a detailed analysis of the actual floor area as defined by the LAMC reflected in the various plans provided to the City and in the public presentations by the applicant. Please include all subgrade areas available for use as production areas.

Below are visual renderings provided by the applicant of its below grade areas. The below grade areas are shown as being used for a wide range of production activities including dressing rooms, makeup rooms, props and sets, food services, bathrooms, meetings, trailers, and filming. The DEIR does not appear to include these actively used production areas in most of the analyses. The DEIR states, for example, that “Basecamps are defined areas at, near, or within a filming location where critical production activities can be coordinated. These areas provide for active use (including, but not limited to, loading, wardrobe, hair, make-up, craft services, etc.) and passive uses (including, but not limited to parking, storage of mobile facilities, power generators, support vehicles, etc.) all related to production activities.” (DEIR, p. II-7). What is the impact of using below grade areas to increase production support? If not included in the floor area analyzed in the DEIR, what is the increase in the impacts disclosed in the DEIR?

As a result of these activities and square footages, the DEIR understates impacts from the production activities that will occur in below grade areas on-site. Please provide an analysis of facilities designed to provide production support. It is important for the public and decision makers to understand the full scope of production support activity permitted at the site. Please also disclose the number, type and size of related production trucks and trailers that can access the site in total and on a daily basis. Also, will the Project Site be used as a staging area for offsite productions? For example, will production vehicles be staged at the Project Site for use in off-site location filming? Have all the impact area analyses provided for in the DEIR included the impacts from these “uncounted” floor area and activities? If so, please explain where and how as it is not evident from the DEIR.

By excluding square feet that will be actively used for production the Project's true floor area ratio [sic] (FAR) could exceed the requested FAR of 1.75:1. Even at the requested FAR of 1.75:1, the Project would be much more dense than other urban film and television studios with specific plans. At an FAR of 1.75, the density far outstrips that of both the Paramount Specific Plan and Century City South (Fox Studios) Specific Plan. The Project objectives do not justify such a dense project, which density will result in much greater impacts on surrounding properties. Why is such a high density project proposed? The Project applicant refers to these other studios as a reason for establishing a Specific Plan for the Project Site. Why does the Project need a density in excess of the Project Site's existing 1.5:1 FAR, which is already greater than these other studios' specific plans? Why isn't 1.0 or 1.2 FAR used as a basis for a reduced project alternative? Project impacts would be avoided or reduced if the Project's FAR was closer to that of other studio specific plan projects.

Studio	Studio Area	Maximum Total Development Allowed	Calc. FAR
Paramount SP	2,700,720 sf (62 acres)	3,284,400 sf	1.2
Fox (Century City South SP – Area B)	2,307,372 sf (52.97 acres)	1,895,000 sf	0.82

Response to Comment No. 26-16

Refer to Topical Response No. 2, Definition of Floor Area is Appropriate, and to Response to Comment Nos. 5-7, 26-121, and 26-122 regarding the basis for the definition of floor area, how the Draft EIR does not underestimate the size of the Project, how all of the proposed areas, uses and activities have been accounted for in the impact analyses in the EIR regardless of whether they meet the definition of floor area, and how no active production activities would be located in the parking and basecamp areas below Project Grade. This is consistent with the renderings included in this comment, which show

basecamp uses below Project Grade and outdoor production activity and basecamp uses above Project Grade. It should be noted that basecamp uses operate as a subset of outdoor production activities at the Project Site, which is consistent with existing studio conditions. With the Project, the Applicant will continue this existing use with one limitation that no active filming would occur in parking or basecamp areas below Project Grade, which has been clarified in the Final EIR; refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR. The first rendering included in this comment depicts outdoor production activity at Project Grade, which would include active filming, as well as basecamp activities, and basecamp uses below Project Grade. As shown in the second rendering in this comment, some of the outdoor production activity and basecamp uses occurring at Project Grade may have overhangs and would not be fully enclosed. It appears that the commenter incorrectly assumes that the second rendering illustrates a location below Project Grade; this rendering shows a location at Project Grade adjacent to the existing sound stages contained in the Primary Studio Complex. Regardless of whether these areas would be open to the sky or covered partially, such areas were appropriately excluded from the definition of floor area because they do not independently generate production activity and all activity in these areas are accounted for in and derivative of the sound stage use.

As discussed in Response to Comment No. 26-121, outdoor production activities, which are related to and dependent on the sound stage use, currently occur throughout the Project Site and would continue to occur in a similar manner within the Project. As with the existing studio, productions that occupy the sound stages film outdoors within the Project Site, and this activity is captured by the sound stage use for environmental analysis purposes as an existing use that will be continued in the future with the Project. The comment incorrectly suggests that areas for outdoor production activities that occur today and are not considered floor area in the LAMC should be changed in the future for floor area purposes with this Project.

Refer to Figures II-3(a), II-3(b), II-4(c), II-4(d), and II-4(e) of Section III, Revisions, Clarifications, and Corrections to the Draft EIR, which show the existing and proposed basecamp and outdoor production activity areas. As shown therein, the Project would substantially reduce the amount of outdoor production areas, which would reduce impacts, such as noise associated with these areas. The general locations of the proposed uses are depicted on the Conceptual Site Plan included as Figure II-4 on page II-14 of the Draft EIR and are consistent with the architectural plans on file with the City. Project plans are part of the administrative record and are available on the Department of City Planning's website, <https://planning.lacity.org/pdiscaseinfo/>, by searching the Project's entitlement case number, *CPC-2021-4089-AD-GPA-ZC-SN-SP*.

In addition, note that the total maximum floor area number of 1,874,000 square feet that would be permitted on-site would be based on the definition of floor area set forth on

page II-13 of Section II, Project Description, of the Draft EIR, which is also consistent with the definition provided in the Preliminary Draft Specific Plan. Regarding daily truck trips, refer to Section E, Truck Trips, of Topical Response No. 10, Trip Generation. The Project Site will not be used as a staging area for off-site productions.

Regarding the ratio of studio land uses, the existing studio currently includes substantially more production support floor area than is needed to support the studio, with very little sound stage area; nearly half of the existing studio is production support floor area, whereas sound stages make up less than 15 percent of the existing floor area, which is not consistent with most modern studio campuses. This imbalance of studio uses has resulted in an inefficient and underutilized studio campus. As discussed on pages II-10 and II-11 in Section II, Project Description, of the Draft EIR, the Project objectives include optimizing the currently underutilized studio and maximizing studio production capabilities by providing new technologically advanced sound stages combined with an adequate and complementary mix of state-of-the-art production support facilities, production office, and general office. The proposed development program analyzed in the Draft EIR provides an adequate and complementary mix of uses. The digitization of the production industry has created the need for much more office space to support studio uses relative to sound stage and production support space. As stated on page II-10 of the Draft EIR, one of the goals of the Project is to “provide an expandable, flexible, and operationally seamless production ecosystem that can respond to evolving market demands, support content creation, and maximize studio production capabilities.” An operationally feasible balance of studio and studio-related uses is required for a successful modern studio, but the optimal balance of uses has changed over time and will continue to change as the needs of the entertainment industry continue to evolve. Accordingly, the Project is proposing a Land Use Exchange Program to allow for limited flexibility in the size of the studio uses (increases permitted only to sound stages and production support uses), discussed further in Topical Response No. 1. Notably, the needs of a modern studio were discussed in detail in the Applicant’s Neighborhood Council presentation that is attached to this comment letter.

As discussed in Response to Comment No. 26-12, the public presentations were educational presentations to explain the Project, and the figures shown therein are consistent with the Conceptual Site Plan.

Contrary to this comment, a reduction in the size of the Project would not substantially reduce or eliminate the potentially significant impacts associated with the Project, as these impacts are associated with construction noise and vibration and regional air quality emissions associated with the overlap of construction activities with operational activities. These impacts are related to the construction equipment mix and the proximity to sensitive receptors. A reduction in the size of the Project, as suggested, would not eliminate the noted impacts; rather, it would significantly hamper modern production operations and impact the studio’s financial viability. (Refer to Appendix FEIR-4, Economic

Considerations). Refer to Section V, Alternatives, of the Draft EIR and the analysis of Alternative 3, Reduced Density Alternative, on pages V-62 to V-90 of the Draft EIR. As discussed therein, although Alternative 3 would reduce the size of the Project by 20 percent, it would require the same excavation footprint and earthwork quantities as the Project. Moreover, although Alternative 3 would result in a reduction in overall construction activity, associated equipment, and the duration of construction, the peak level of daily activity—which are the factors used to determine air quality and noise impacts—would be similar to the Project.

Note that the comments regarding the density and the size of other studios do not raise an environmental issue specific to CEQA or the Draft EIR and the environmental impacts addressed therein. Thus, no further response is required. However, the comments are noted for the administrative record and have been incorporated into this Final EIR for review and consideration by the decision-makers prior to any action on the Project.

Comment No. 26-17

Land Use Exchange. The proposed “land use exchange” permits “production support floor area [to] be increased from 104,000 square feet in exchange for decreases in other uses.” Is there a maximum on this use? What percentage of the Project Site could be production support floor area? How intense is this use? How many trucks, trailers, etc., could be added to the site? What amount of production support would trigger new significant impacts? Would the Specific Plan prohibit that level of production support? How? Can production support be provided to other off-site activities? Can production support be provided to other studios? Will production support services be provided to production not using proposed on-site stages? If so, have the related transportation impacts been assessed? Would there be any requirement that the production support be limited to on-site uses? Given the stated project objectives, will the Specific Plan require a base amount of stage to be constructed with/before office and production support uses?

Response to Comment No. 26-17

Land use exchange programs are common features that have been included in numerous specific plans throughout Los Angeles, including, but not limited to, the Paramount Pictures Specific Plan, NBCUniversal Specific Plan, USC Specific Plan, Los Angeles Sports and Entertainment District Specific Plan, Los Angeles International Airport Specific Plan, and Playa Vista Specific Plan.³⁸ The Land Use Exchange Program in the

³⁸ City of Los Angeles Ordinance No. 184,539, accessed at <https://planning.lacity.org/odocument/9eae5e02-0544-4bba-9d2d-96367165d695>; County of Los Angeles Ordinance No. 2013-0010, accessed at https://planning.lacounty.gov/assets/upl/case/tr_068565_specific-plan-approved-final.pdf; City of Los (Footnote continued on next page)

proposed Specific Plan would allow for limited flexibility with respect to the size of the five permitted land uses, subject to maximum floor area limits for each land use, as well as a total sitewide limit of 1,874,000 square feet. The proposed Land Use Exchange Program is more limited than many of the programs found in other specific plans, as it would only permit limited increases in sound stage and production support floor area. Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding the proposed Land Use Exchange Program. As discussed therein, the Land Use Exchange Program analyzed in the Draft EIR is identical to the program in the Preliminary Draft Specific Plan, except that, in response to comments on the Draft EIR, the Land Use Exchange Program in the Preliminary Draft Specific Plan was clarified to limit production support floor area to a maximum of 450,000 square feet. Refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR. This change does not affect any of the environmental analyses or impact conclusions in the Draft EIR, as production support is generally the least impactful of the five permitted uses from a CEQA perspective. In addition, sound stage and production support uses are symbiotic (i.e., sound stages require some amount of production support), so increases in sound stages are typically accompanied by increases in production support area. Further, an operationally feasible balance of studio and studio-related uses is required for a successful modern studio. Thus, the 450,000-square-foot maximum limit for sound stages would have already indirectly limited the amount of production support floor area that would be developed.

The production support activities would be associated with on-site production activities and would not support off-site activities or other studios. The maximum amount of floor area that would be permitted for each of the five studio land uses is provided in Table II-2 and page II-16 of Section II, Project Description, of the Draft EIR, and the intensity of each of these uses has been accounted for in the impact analysis in the Draft EIR. There is no requirement that a base amount of sound stage be constructed with/before production office or general office and production support uses. Refer to Response to Comment Nos. 5-6 and 26-2 regarding the Project's studio objectives and mix of studio-related uses.

As discussed in Topical Response No. 1, the proposed Land Use Exchange Program would enable different ratios of the specified studio uses (i.e., different land use

Angeles Ordinance No. 182,343, accessed at <https://planning.lacity.org/odocument/63eaebbc-8804-486d-bfce-786657d47734>; City of Los Angeles Ordinance No. 174,224, accessed at <https://planning.lacity.org/odocument/ae3fa4-2d46-420a-b6b3-56bee727fb95>; City of Los Angeles Ordinance No. 185,164, accessed at https://planning.lacity.org/odocument/8c371dd7-15a2-4d05-a8ee-25a78a6362d4/13-0285_ord_182542.pdf; and City of Los Angeles Ordinance Nos. 160,521, accessed at <https://planning.lacity.org/odocument/656d910b-91fd-42c9-a795-33b259fb86bc/Playa%20Vista%20Area%20B%20Specific%20Plan.pdf>, 160,522, accessed at <https://planning.lacity.org/odocument/58f371f3-51d2-4436-bcc4-cf5411e576ba/Playa%20Vista%20Area%20C%20Specific%20Plan.pdf>, and 160,523, accessed at https://planning.lacity.org/odocument/c90c4ac0-f690-4e15-abc1-e153a5cd6b07/Playa_Vista_Area_D_Specific_Plan.pdf.

“mixes”), and the Draft EIR analyzed this “maximum impact scenario” such that the full range of impacts that could result from development under the proposed Specific Plan are disclosed.³⁹ Further, the proposed Specific Plan would include a regulatory framework for implementation of the Project, including, among other things, mandatory review processes by the City for implementation of the proposed Project. Future changes that are substantially different than the Project, including proposals that involve a land use exchange, or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, as well as potential CEQA compliance review.

Refer to Section E, Truck Trips, of Topical Response No. 10, Trip Generation, regarding truck trips associated with operation of the Project. Note that a trailer would be attached to a truck and, therefore, is accounted for in the vehicle trips associated with the Project. In addition, it is not necessary to specify the number of trailers as such specific data are not necessary for any CEQA-related analysis.

Comment No. 26-18

Project Objectives Are So Vague As To Be Meaningless. The Project Objectives are unclear statements against which the Project could possibly be evaluated, are not met by the Project itself, and require more information to evaluate. Therefore, they do not meet the requirements of objectives under CEQA.

First, the Project Objectives are unclear statements against which the Project could not possibly be evaluated. For example, the first project objective provides that the Project should be an “expandable, flexible and operationally seamless production ecosystem.” How is the City evaluating the Project and the Alternatives against such a standard? What is the basis for that evaluation? What are the factors the City considered in evaluating an “expandable, flexible and operationally seamless production ecosystem”? What is a “production ecosystem”? Did the City retain a technical expert to assist it with the evaluation of this objective? This information is necessary for the public and decision-makers to understand what is meant by this objective and how it was used to evaluate the Project and Alternatives.

What does it mean to provide “adequate, safe, and efficient ingress/egress, circulation, staging, and parking that satisfies the unique demands of a large-scale production studio...”? How is that adequacy determined? What are the unique demands? How is safety determined in this context? Is that on-site safety? Offsite safety? How is the

³⁹ Please refer to Appendix FEIR-3 of this Final EIR, which discusses the maximum impact scenarios that were analyzed for each environmental topic, as applicable.

adequacy of circulation and parking assessed without development plans? The Project Site is already a production studio with ingress/egress. Is the existing ingress/egress not adequate? If not, how so? Have there been safety issues with the existing truck access to the site? As this is a Project objective, did the DEIR consider alternative ingress/egress, circulation, and parking scenarios? The DEIR should include such alternative information and an explanation of why the proposed access and circulation was chosen. This information is necessary for the public and decision-makers to understand what is meant by this objective and how it was used to evaluate the Project and Alternatives.

Second, the Project itself does not meet its own stated objectives. The Project does not “concentrate building mass and height towards the center of the Project Site.” In fact, as noted below, this objective appears to be largely inconsistent with the announced settlement between the applicant and the Los Angeles Conservancy. The buildings are not massed to the center of the Project Site. Exactly the opposite. They are massed to the perimeter of the Project Site as shown in the image below. The Project should be redesigned consistent with its own objective. Why would the City concentrate the impacts to the adjacent community? Isn’t that inconsistent with fundamental planning principles?

In addition, it is unclear how the Project provides an “adequate and complementary mix of state-of-the-art production support facilities...” when the Project is supposedly dramatically reducing the ratio of production support space to stage.

**Table II-2
Proposed Development Program^a**

Use	Existing (sf)	Demolition (sf)	Existing to Remain (sf)	Proposed New Construction (sf) ^b	Total Permitted (sf)	Net Change (sf)
Sound Stages	95,540	41,360	54,180	295,820	350,000	+254,460
Production Support	325,450	302,340	23,110	80,890	104,000	-221,450
Production Office	163,090	98,490	64,600 ^c	635,400	700,000	+536,910
General Office	159,600	53,670	105,930 ^d	594,070	700,000	+540,400
Retail ^e	0	0	0	20,000	20,000	+20,000
Total	743,680	495,860	247,820	1,626,180	1,874,000	1,130,320
<i>sf = square feet</i>						

Based on the Proposed Development Program there would be a 68% reduction in production support space while stages are increasing more than 260% (unless, as noted earlier, the Project is just failing to count all of its production support space.) What is considered an adequate amount of production support space per stage in the industry? How is that determined?

Third, some objectives require additional information for the public and the decision-maker to be able to adequately assess whether the Project meets the identified objective. For example, the last objective is to “Permit a reasonable, risk-adjusted return on investment commensurate with the Project Applicant’s fiduciary responsibilities and allow for sustained economic viability and growth in an evolving entertainment market, while generating tax and property revenues to the City.” (DEIR, p. II-12.) This Project objective was expressly used to evaluate the Project and the various alternatives. What information did the City obtain in order to understand whether the Project or the alternatives meet this objective? Did the City obtain the following information from the applicant or another source?

- Financial modeling for the Project including analysis of what the applicant’s expected “risk-adjusted return on investment” for the Project.
- Information to support what the “Project Applicant’s fiduciary responsibilities” are.
- Projections on the anticipated tax revenues for the City and analysis of the Project’s costs to the City.
- Detailed Project proforma including construction costs and soft costs (i.e., design fees, etc.).

Is there any other information that the City intends to use to evaluate such objective? The DEIR should provide all the financial information evaluated to support this objective with a the public the analysis by the City or its financial expert of this financial information description of how the City is using such information for this purpose. For example, did the City undertake an analysis of financial information provided by the applicant? Did the City retain a financial expert to review the applicant's financial information? Please provide to the public the analysis by the City or its financial expert of this financial information.

If the foregoing information was provided to the City, why was it not included in the DEIR?

What was the applicant's "risk-adjusted rate of return"? How was this evaluated? How does the applicant risk-adjusted rate of return compare to other developers of office, studio, and entertainment projects?

How much was paid for the property? How is the price paid for the property evaluated in the context of determining the appropriate risk-adjusted rate of return? Did the applicant pay a purchase price dependent on the City changing the Wilshire Community Plan land use designations to "Regional Center"? Did the applicant pay a purchase price dependent on the City approving a discretionary project that has impacts on the community? Are those appropriate bases for the City to evaluate the Project?

What are the applicant's "fiduciary responsibilities"? To whom are these "fiduciary responsibilities" owed? If not the City, why is this a relevant consideration? How were these fiduciary responsibilities evaluated?

Because the DEIR identified this as an objective of the Project and a basis upon which to evaluate the Project and the Alternatives, this information is critical to the public's understanding of the Project and DEIR analyses.

Response to Comment No. 26-18

The requirement to identify project objectives is set forth in CEQA Guidelines Section 15124(b), which provides that an EIR shall contain "[a] statement of the objectives sought by the proposed project," including "the underlying purpose of the project," but does not impose any substantive limitations on those objectives. The Project objectives on pages II-10 through II-12 accomplish just that. They include both the underlying purpose of the Project and a statement of the objectives for the Project. Those Project objectives were stated broadly enough to leave room for consideration of alternatives that reduce environmental impacts. The Lead Agency satisfied its obligations under CEQA and the CEQA Guidelines by preparing an EIR that allows for informed decision-making by giving meaningful consideration to potentially feasible Project alternatives with reduced environmental impacts.

Refer to Topical Response No. 16, Project Alternatives Analysis, for a discussion of how the Project objectives are not vague or unclear. An “expandable, flexible and operationally seamless production ecosystem” is referring to the mix of uses and activities that are needed to support the continued operation of a modern studio in a manner that responds to the changing demands of the entertainment industry. Refer also to Response to Comment No. 26-16.

In addition, the Project objective to “[p]rovide adequate, safe, and efficient ingress/egress, circulation, staging, and parking that satisfies the unique demands of a large-scale production studio with direct, enhanced access to the uses on-site and sufficient truck and trailer circulation areas, in compliance with modern fire and life safety requirements” is not unclear. This objective reflects the intent to develop a project that has adequate, safe, and efficient access that complies with modern life safety requirements, which is an important component of the Project. The information requested by the commenter is not required or necessary for the CEQA analysis. The Conceptual Site Plan meets this Project objective. Refer to the traffic and safety study included as part of the Transportation Assessment (Appendix M.1 of the Draft EIR), and Topical Response No. 12, Safety and Congestion. Refer to pages II-25 to II-30 and IV.H-52 of the Draft EIR for a discussion of the Project’s access, circulation and parking plan, which facilitates efficient, safe and effective production circulation. As discussed therein, the Project would incorporate a multi-level circulation plan to facilitate adequate, safe, and efficient ingress/egress, circulation, staging, and parking that meets the demands and unique security needs of a large-scale production studio. Refer to Response to Comment No. 16-11 regarding the multi-level circulation plan. Notably, the Project’s multi-level circulation plan was discussed in the Applicant’s Neighborhood Council presentation that is attached to this comment letter.

The existing Project Site has not experienced significant safety incidents, including safety issues associated with truck access under current operations. Note that security personnel are present at all gates to ensure safe and adequate access to the Project Site by all vehicle types. Also refer to Section A, Queuing at Project Driveways, of Topical Response No. 12, Safety and Congestion, regarding queuing.

The statements that the Project does not meet its own objectives regarding height or mix of uses are also incorrect. Refer to Response to Comment No. 26-19 for a detailed explanation of how the Project meets the objective to concentrate building height and mass towards the center of the Project Site, while also preserving the integrity of the HCM onsite, which is another Project objective. Relative to building height, refer to Response to Comment No. 11-3. Refer to Response to Comment No. 5-9 regarding how the graphic included in this comment is inaccurate and does not portray what could be built under the proposed Specific Plan. Furthermore, note that the Los Angeles Conservancy has reviewed the Draft EIR and supports the Project; refer to Comment Letter No. 24.

Regarding the Project objective to provide an “adequate and complementary mix of state-of-the-art production support facilities[,]” the Project Site currently functions as a studio and would continue to do so with the Project. The Project seeks to modernize and enhance the studio and meet the existing unmet and anticipated future demands of the entertainment industry, which are continuously changing. The proposed development program shown in Table II-2 of the Draft EIR meets the underlying purpose of the Project. Refer to Response to Comment No. 26-16 regarding the mix of uses. In addition, the limited Land Use Exchange Program would permit limited increases in sound stage and production support uses (not to exceed 450,000 square feet each) in exchange for equivalent decreases in other permitted uses, which would allow the studio to adjust the ratio of studio uses in response to the demands of the entertainment industry. Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, and Response to Comment Nos. 9-13, 9-14, and 26-17 regarding the proposed Land Use Exchange Program.

Contrary to the commenter’s claim, no active production activities or uses would be located in the parking or basecamp areas below Project Grade. Refer to Figure II-6(a) in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, and to Response to Comment No. 26-121.

Refer to Topical Response No. 4, Appropriateness of Economic Objective, regarding this comment’s CEQA-related questions about the economic objective. The financial information requested by the commenter is not required or necessary.

Comment No. 26-19

The Project Description Conflicts with Conservancy Settlement Agreement. The Project applicant and the LA Conservancy have announced a “Settlement Agreement” regarding the protection of the CBS Historic Cultural Monument on the Project Site. This announcement was made before the DEIR was released to the public.

As noted above, a stated Project objective is to “concentrate building mass and height towards the center of the Project Site.” As reported by the applicant and Conservancy, the HCM buildings in the center of the Project Site, are to be protected and the views to the HCM preserved. As a result, the Project design now has the buildings pushed to the perimeter of the Project Site away from the “center of the Project Site.” This change increases offsite impacts to adjacent properties and historical resources. The Project objective is inconsistent with the illustrative site plan and the announced settlement.

If the Project applicant is bound by the Conservancy Settlement Agreement, shouldn’t the elements of the Conservancy Settlement Agreement be reflected in the analyses in the

DEIR? Is the City, in essence, bound by the Settlement Agreement? If not, how does the “settlement” relate to the development of the property?

Has the City reviewed the Settlement Agreement and the restrictions agreed to by the applicant? Does the City have a copy of the Settlement Agreement? Since this Settlement Agreement is a key issue in the Project Site development and runs directly contrary to the Project objective shouldn't the public and decision-makers have an opportunity to review the Agreement? If the Settlement Agreement results in greater impacts to other historic resources, how can the City agree to implement it through the project approval process?

The Height Zone Map and description of height zones also does not appear to reflect the Settlement Agreement-with the LA Conservancy. It has been stated on the LA Conservancy website that the Settlement Agreement, which has not been provided to the public and may not have been provided to the City, provides for the following:

- The new proposal for TVC results in the following modifications—all intended to reduce the proximity, bulk, and mass of the intended new construction and impact on the historic TVC complex:
 1. Reduction of proposed new construction directly on top of the, historic TVC, eliminating 84 percent of overall volume and 102 feet of height
 2. Limitation to single volume rooftop addition with a maximum height of 36 feet, and set back 55 feet from existing TVC Stage Building north façade
 3. Setbacks for proposed eastern (60 feet from TVS Service Building) and western (150 feet from TVC Service Building) production office buildings
 4. Removal of proposed Flex Pavilion in front of existing TVC Service Building, and establishment of 60 feet no-build zone

However, it is unclear if these limitations are in the DEIR and in fact, the height zone map included in the DEIR conflicts with the stated settlement. With no massing permitted in these areas as provided for in the Conservancy Settlement Agreement, then the massing will likely be displaced to other areas on the Project site. If that is to occur, the DEIR needs to analyze it. Will the Specific Plan text allow for such displacement? Why doesn't the DEIR have to be revised to reflect the private agreement with the Conservancy and be recirculated for public review? If the City is going to implement the “Settlement Agreement” through the Specific Plan or other conditions of approval, shouldn't the Settlement Agreement be provided to the public and decision-makers for review?

The DEIR also fails to explain how the areas along the Beverly Boulevard frontage can have buildings up to 58 feet in height and at the same time protect the views of the HCM

for the pedestrian level on Beverly Boulevard. How is the view of the HCM protected from the corner of Beverly and Fairfax when the height district permits a building up to 160 feet at that corner? How is the Project Objective to provide the massing in the center of the property met by the Project after taking into account the Conservancy Settlement Agreement?

This issue needs to be reflected in the analysis and Project Description needs to describe accurately what the Project is. By not including this information in the Project Description, the public is left without an accurate understanding of how the Project may be built out and where the height will be located. When the Project Description is provided accurately, then the impact analyses have to be updated consistent with the accurate, finite, and stable Project description.

Response to Comment No. 26-19

As stated in CEQA Guidelines Section 15002(c), a “[p]rivate action is not subject to CEQA unless the action involves governmental participation, financing, or approval.” The confidential agreement between the Applicant and the Los Angeles Conservancy is an agreement between private parties and is, therefore, not required by CEQA to be discussed or analyzed in the EIR. The City has not reviewed the confidential agreement between the Applicant and the Los Angeles Conservancy. The Applicant confirmed that nothing in the agreement would conflict with the analysis in the EIR. In addition, any private agreement would not affect the restrictions and process set forth in the Preliminary Draft Specific Plan and is, therefore, not relevant to the impacts analyzed in the Draft EIR, and any potential conflict between the proposed Specific Plan and the terms of the agreement would be a private contractual matter between the Applicant and the Los Angeles Conservancy.

The Draft EIR analyzed the Project described in Section II, Project Description, of the Draft EIR (refer to Table II-2, Proposed Development Program, on page II-13 and Figure II-4, Conceptual Site Plan, on page II-14 of the Draft EIR), and any substantial changes from the Project (including new structures proposed in and around the HCM and Viewshed Restoration Area that materially differ from the Conceptual Site Plan) would be subject to further discretionary review and CEQA compliance per the proposed Specific Plan, including review by OHR, as applicable, and the Department of City Planning. Refer to Section C, Potential New Construction North of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, regarding the review process for new construction adjacent to the HCM and in the Viewshed Restoration Area. Refer also to Response to Comment No. 26-131.

This comment also discusses the Project objective to concentrate mass and height towards the center of the Project Site. The Project meets this objective through the

proposed height zone, frontage, and setback requirements in addition to the historic Project Parameters set forth as Project Design Feature CUL-PDF-1 to preserve the integrity of the Primary Studio Complex, discussed below. Collectively, these building restrictions and design elements would allow Project development to remain sensitive to both the HCM on-site and surrounding uses.

As discussed on pages II-17 to II-20 in Section II, Project Description, of the Draft EIR, the Specific Plan would include height zones with specified maximum height limits to regulate building heights throughout the Project Site, with taller maximum heights concentrated in the center of the Project Site, away from Project Site edges and adjacent uses; refer to the Preliminary Draft Specific Plan, which is publicly available on the Department of City Planning's website. Height Zone A (the Viewshed Restoration Area) would extend 430 feet along Beverly Boulevard in the central/northern portion of the Project Site and limit building heights to up to 58 feet or two-thirds the height of the existing HCM (88 feet in height), consistent with and subject to the HCM designation (CHC 2018-476-HCM). Height Zone B in the southeastern portion of the Project Site and Height Zone C in the western, northwestern, and northeastern portions of the Project Site would limit building height to 130 feet and 160 feet, respectively. The tallest buildings on-site would be located in Height Zone D, in the central/rear portion of the Project Site, with a maximum height of 225 feet. Building heights above the Primary Studio Complex would be further limited, with heights limited to 36 feet above the existing parapet of the Studio Building in Height Zone E (approximately 84 feet above Project Grade) and no new occupiable buildings in Height Zone F. Additionally, new development within the Project Site would be subject to frontage area and building setback requirements, as described on pages II-20 to II-21 in Section II, Project Description, of the Draft EIR, and set forth in the proposed Specific Plan. Frontage areas would function as buffers and transitional space around the Project Site perimeter. Building setbacks are an architectural tool used to reduce building massing and vary building forms by pulling the façade of upper stories back from the building edge at a predetermined elevation above Project Grade. Building setbacks would apply to those portions of buildings in Height Zones C and D greater than 88 feet in height above Project Grade. The Project would include a 17-foot frontage and a 10-foot setback along Fairfax Avenue, a 5- to 8-foot frontage and a 10-foot setback along Beverly Boulevard, a 30-foot frontage along the Shared Eastern Property Line, a 7-foot frontage along The Grove Drive, and a 10- to 30-foot frontage and a 20-foot setback along the southern property line/Southern Shared Access Drive. Compliance with these requirements would ensure that mass and height are set back from the Project Site perimeter and concentrated towards the center of the Project Site.

As shown in Figure V-1 of the Draft EIR and discussed in detail in the Applicant's Neighborhood Council presentation that is attached to this comment letter, development within the Project Site is constrained by the HCM on-site, which is located in the center of the Project Site. Instead of concentrating density towards the perimeter of the Project Site

where there is more available area for new development, as shown in the graphics included in the Neighborhood Council presentation, the Project concentrates height and mass towards the center of the Project Site adjacent to the HCM to the extent feasible while still preserving the integrity of the HCM.

In addition, the Project would comply with the Project Parameters in Project Design Feature CUL-PDF-1, included on pages IV.B-38 to IV.B-40 in Section IV.B, Cultural Resources, of the Draft EIR to ensure that the rehabilitation of the Primary Studio Complex preserves its historic significance and integrity and maximizes the retention of its historic fabric and character-defining features. Refer to Section C, Potential New Construction North of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, for a discussion of how the Project would restore and preserve the currently obstructed viewshed along Beverly Boulevard.

Refer to Section C, Potential New Construction North of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, regarding the regulations and procedures for new construction in the Viewshed Restoration Area. As discussed therein, the 58-foot height limit, which is approximately two-thirds of the 88-foot height of the existing Primary Studio Complex, is taken directly from the HCM Findings. The restoration of the viewshed along Beverly Boulevard would be ensured by the historic regulations and procedures set forth in the Draft EIR and the proposed Specific Plan, and the 58-foot height limit is only one of the regulations that future development in the Viewshed Restoration Area would be required to comply with. The HCM Findings set forth the character-defining viewshed features of the Primary Studio Complex as seen from adjacent public areas along Beverly Boulevard. Per the Project Parameters (Project Design Feature CUL-PDF-1) set forth on pages IV.B-39 to IV.B-40 of the Draft EIR, which are incorporated into the Preliminary Draft Specific Plan, any future development in the Viewshed Restoration Area would be required to restore and maintain meaningful views of the Primary Studio Complex and the character-defining viewshed features set forth in the HCM Findings. Further, the Preliminary Draft Specific Plan includes objective development standards based on the HCM Findings. Accordingly, in addition to complying with the 58-foot maximum height limit and restoring the character-defining viewshed features, development in the Viewshed Restoration Area greater than one story in height would require a Project Compliance approval pursuant to LAMC Section 11.5.7[13B.4.2], which is a discretionary approval that would require subsequent CEQA compliance review. Consistent with the HCM Findings, the Draft EIR states that all new construction located within the Viewshed Restoration Area would require review by the Director of City Planning, which is reflected in the Preliminary Draft Specific Plan. Further, as discussed in Section B, Historic Structure Report and the Future Preservation of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, any alteration to a designated HCM would require OHR review and compliance with the Rehabilitation Standards pursuant to LAMC Section 22.171.14. As such, any proposal for new construction within the Viewshed Restoration Area will be required to

meet the objectives of the HCM Findings, conform with the Rehabilitation Standards, and would not result in significant impacts to the Primary Studio Complex as defined by CEQA. Thus, the Draft EIR correctly concluded that the impact from new construction as described in the Conceptual Site Plan within the Viewshed Restoration Area (Height Zone A) would be less than significant. In addition, the commenter is incorrect that the Viewshed Restoration Area includes the corner of Beverly Boulevard and Fairfax Avenue; the Viewshed Restoration Area is located to the east of that corner by approximately 441 feet.

As shown in Figure II-5 in Section II, Project Description, of the Draft EIR, a maximum height of up to 160 feet would be permitted in up to 40 percent of the Height Zone C area. Height Zone C is located on the western and eastern portions of the Project Site outside of the Viewshed Restoration Area. Refer to the three-dimensional diagram of Height Zone C provided in Response to Comment No. 5-9.

The construction of buildings up to 160 feet in Height Zone C as depicted in the Conceptual Site Plan would not significantly impact the Primary Studio Complex as analyzed in the Draft EIR.

Regarding the comment about the accurate, stable, and finite Project Description, refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, for a discussion of the clearly-defined Project and Specific Plan.

With regard to recirculation, this comment does not provide substantial evidence to demonstrate that “significant new information” as defined by CEQA Guidelines Section 15088.5 has been presented or added to the Draft EIR. Thus, recirculation is not required. Also refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 26-20

The Project Description Is Incomplete. In addition to not providing the Specific Plan or any real project description at all, the DEIR includes brief mentions of certain proposed uses that are not described or otherwise omitted from further discussion.

Mobility Hub. The DEIR discusses the potential benefits of the “Mobility Hub” throughout the DEIR, but never accurately or definitively describes what it will be, where it will be located, or what impacts the Mobility Hub itself might have. For example, will the Mobility Hub be open to public or just employees and visitors to the site? Will it serve other uses in the Beverly Fairfax area? How are shuttles, buses, and rideshare included in the trips generation and transportation analyses? Will Metro or other public transit providers use the Mobility Hub? Will other private shuttle providers use the Mobility Hub? Where can the Mobility Hub be located? Can it be located anywhere on the Project Site? Is the siting limited or can it be placed next to the apartment building or across from the school? Is

there a limitation on sizing? How many buses and shuttles can it accommodate? The Mobility Hub is a transportation project in and of itself that should be analyzed as such. For example, what are the air emissions from idling buses? Will all shuttles be electric? If not, the DEIR needs to treat it like a bus yard for purposes of impacts analysis. Where and how were the noise and air quality impacts from the Mobility Hub disclosed and analyzed in the DEIR? These sorts of questions go unanswered throughout the DEIR. Further, while some impact area analyses consider the Mobility Hub uses (e.g., water use), others completely ignore it (e.g., energy), leading to inaccurate and under-disclosed impacts.

Response to Comment No. 26-20

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding the adequacy of Section II, Project Description, of the Draft EIR, and the proposed Specific Plan. Regarding the Mobility Hub, the Mobility Hub has been adequately described and fully addressed throughout the EIR. Refer to Topical Response No. 7, Mobility Hub, and Response to Comment Nos. 35-24 and 35-51. Refer to Topical Response No. 2, Definition of Floor Area is Appropriate. As discussed in Response to Comment Nos. 26-E.1-23 and 35-138, the Mobility Hub would not generate trips; rather, it would reduce single-occupant vehicle trips to and from the Project Site and, thus, reduce VMT. Regarding noise and air quality impacts associated with the Mobility Hub, refer to Response to Comment Nos. 35-129 and 26-E.1-28, respectively. Refer to Topical Response No. 7, Mobility Hub, regarding the location, implementation schedule, and operation of the proposed Mobility Hub. The Mobility Hub would not be open to the public, and public transit providers would not use the Mobility Hub. Refer to Response to Comment No. 35-138 regarding rideshare trips. As discussed in Response to Comment No. 26-160, the Mobility Hub is not a transportation project as defined by the TAG; in fact, it serves the opposite purpose by reducing trips.

Comment No. 26-21

Sign District. The DEIR refers to a sign district and provides virtually no information regarding the nature and extent of Project signage.

The Project proposes 31,375 total square feet of signs on the north, east, and west perimeter. Virtually no information is provided regarding the nature and extent of this signage. For example, is there a maximum number of individual signs that will be permitted? An average highway billboard is 675 feet. At this size, approximately 45 billboards could be on the perimeter of the Project Site. Is there a maximum size per individual sign? Are there maximums by each sign type? How will sign area be measured? What types of signs are permitted—digital, wall, roof, projecting image, billboards, supergraphics? What are the limitations for each type of sign? What are the limitations on light and sound from the signs? For example, will the Project be permitted to

include supergraphics? If so, of what size? Can the supergraphics be illuminated? Is there a limit on the number or location of the supergraphics? Will signage be visible from the immediately adjacent apartments, schools, and park? If so, will there be any limitation on what is visible on such signs? From exactly which existing City sign regulations does the Project propose to deviate? How are off-site and on-site signs defined? There is reference made to “Vertical Sub-Districts” in the Figure II-10, but no explanation provided. Also, the signage plan is for “illustrative purposes only,” so what is the actual plan? Why was the “Sign District” not presented for review by the public? How can the public assess the impacts from signage if the plan is merely illustrative?

The Project would also allow an additional unlimited amount of “interior” signage. What constitutes “interior”? If it is visible from the Broadcast Center Apartments, is it interior? If it is visible from the Farmers Market or Gilmore Adobe, is it interior? Why is visibility defined as whether it is visible from offsite, public right of way, or publicly accessible plaza adjacent to right of way?

Further, it is not correct that only 31,375 square feet of signage is proposed on the site’s perimeter. The southern boundary, which is included in the Project Site “interior” for the description of the signage areas, has no square footage limitation for total proposed signage. Is there unlimited signage allowed on the southern property line? The public cannot know without the Sign District (which is not provided in the DEIR), but it appears that there is no limitation on the amount, size, and type of signage along the southern boundary.

The DEIR’s analysis appears to be limited to a discussion of the consistency of the proposed signage with the standards and goals of the Television Historic Sign Guidelines for the Primary Studio Complex (ARG’s report—Appendix C). However, Appendix C (DEIR page 490) has no “standards” or “goals” for signs on the new structures. Appendix C includes only guidelines for maintaining historic signs, replacement of existing signs, and for placement of signs on historic buildings. When it comes to new construction, Appendix C merely states that new signs outside of the historic viewshed area are to be consistent and compatible with the overall sign program. That appears to be a reference to the Sign District regulations that are completely absent from the DEIR. The disclosure and analysis of the proposed signage is completely lacking in the DEIR. The DEIR needs to be revised and recirculated with this information.

Response to Comment No. 26-21

Refer to Response to Comment No. 5-10 and Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding the Sign District, how the Draft EIR disclosed the physical elements of the proposed Sign District required by CEQA, and CEQA and City policy do not require the Preliminary Draft Specific Plan to be included in

the Draft EIR or the Final EIR. The Preliminary Draft Specific Plan will be made publicly available on the Department of City Planning's website prior to hearings for the Project.

Please note that, pursuant to Public Resources Code Section 21099 (SB 743), because the Project is an employment center project located on an infill site, the Project's aesthetic impacts are not considered significant impacts on the environment and, therefore, do not require evaluation under CEQA. Nevertheless, the below responses are included for informational purposes only.

Refer to Response to Comment No. 5-10 regarding the maximum signage square footages allowed along the Project perimeter as well as the allowances granted for signage located within the Site Interior and Vertical Sub-District F.1. Signs located in the Site Interior and Vertical Sub-District F.1 are not intended to be publicly facing (as further described in Response to Comment No. 26-129) and as such are not limited in area, in keeping with signage precedent set by other approved sign districts and specific plans.

As signage is limited depending on a sign's location/placement within the Project Site, there is no limitation imposed on the individual number of signs, nor a limitation on any individual sign type. Signage, rather, is allowed in various sign typologies (e.g., architectural ledge signs, awning signs, wall signs, hanging signs, identification signs, information signs, wall signs, supergraphics, etc.). While many of these signs would be allowed site-wide, individual sign types would be governed based on their Sign Sub-District, Vertical Sub-District (a tool to limit signage above the Project's baseline height), or proximity to the Shared Eastern Property Line. Signs located within Vertical Sub-District F.1 of the Site Interior would not be visible from the public realm, as discussed in detail in Response to Comment No. 26-129. Signage located along the Project frontages would be visible from the right-of-way, but digital signage would be prohibited in this area. (Refer to the revised Proposed Signage Plan included in Figure II-10 of Section III, Revisions, Clarifications, and Corrections to the Draft EIR.)

All signs would be measured consistent with the definition of "Sign Area" codified within LAMC Section 14.4.2 and restated within the proposed Sign District. While individual signs generally would not have size limitations, signs located within Vertical Sign Sub-District F.2. would have a limitation of 300 square feet per building face. All signs that would be permitted within the proposed Sign District are on-site signs. No off-site signage (e.g., billboards) would be permitted. On- and off-site signage would be defined consistent with LAMC Section 14.4.2.

Signage referenced in the EIR and within those documents submitted to the case file is referenced as "illustrative" or "proposed" as no signage or design has yet to be approved by the decision-makers. Until such time as the Project entitlements are acted on by the

appropriate governmental body, the elements described are not approved and are correctly described as “illustrative” or “proposed.”

Refer to Response to Comment No. 26-129 regarding signage lighting and noise; visibility of signage from Broadcast Center Apartments, The Original Farmers Market and Gilmore Adobe; visibility of signage from the immediately adjacent apartments, schools, and park; and the Historic Sign Guidelines.

Regarding recirculation, this comment does not provide substantial evidence to demonstrate that “significant new information” as defined by CEQA Guidelines Section 15088.5 has been presented or added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 26-22

Other Purported Changes to LAMC Regulations. The DEIR states that the Specific Plan would also address historic preservation, childcare, alcohol sales, and parking. Presumably, the Project would somehow be changing the regulations of the LAMC related to those issues. What changes are proposed? How can the public comment on the proposed changes if they are not disclosed and assessed in the DEIR? For example, what alcohol sales will be permitted? What will be the related regulations, hours of operations, security, etc.? Will alcohol service be permitted in stages? In theaters? How will the alcohol approvals be issued? Will these be discretionary approvals and will the public have an opportunity to comment on those decisions? What will be the minimum and maximum parking for each permitted use? Will, for example, stages with audience participation have a different parking requirement than stages that are not rated for audiences? If a stage is rated for up to 500 audience guests, what will be the parking requirement? What will the environmental impacts from changes to the City’s general standards for all of these uses?

Response to Comment No. 26-22

As discussed in Subsection 5 of Section II, Project Description, of the Draft EIR, the primary development regulations set forth in the proposed Specific Plan would address development of the Project related to land use, design, historic preservation, childcare, alcohol sales, and parking, as well as associated implementation procedures; refer to the Preliminary Draft Specific Plan. Although not required by CEQA or City policy, in response to comments on the Draft EIR, the Preliminary Draft Specific Plan has been made publicly available on the Department of City Planning’s website. Refer to Topical Response No. 3, Permitted On-Site Uses, regarding permitted uses, Topical Response No. 5, Historical Resources, regarding historic regulations, and Topical Response No. 13, Parking, regarding parking supply and operations.

As discussed in Response to Comment No. 9-18, the proposed Specific Plan would incorporate the same LAMC regulations and PDFs set forth in Section IV.B, Cultural Resources, of the Draft EIR and would codify the standards in the HCM designation.

Childcare is identified within the Specific Plan as a permitted ancillary use to general office. Any potential childcare use would be sited and constructed in accordance with all applicable regulatory requirements. Site-specific operational conditions for a childcare use are outlined in the proposed Specific Plan, including requirements that said facility shall comply with all applicable licensing requirements, State of California Code of Regulations requirements and site-specific regulations related to the location of activity space (if required by the State of California Code of Regulations, outdoor activity space shall be no closer than 200 feet from existing residential). In addition, Project Design Feature AIR-PDF-2 was added that requires any future childcare use to be located a minimum of 330 feet from the existing Big Blue emergency generator to the extent it remains in use; refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR.

Alcohol sales are discussed on page IV.H-30 in Section IV.H, Land Use and Planning, of the Draft EIR. The alcohol regulations are included in the Preliminary Draft Specific Plan and are consistent with both the City's existing regulatory requirements and the overarching operational hours and guidance of the California Department of Alcoholic Beverage Control. The proposed Specific Plan authorizes future on-site and off-site alcohol uses for the entirety of the Project Site and outlines parameters under which they may operate. However, it also requires the Department of City Planning to review and administratively approve each alcohol request to ensure that each use complies with all applicable regulations. Alcohol is currently permitted in sound stages during special events and studio-related events and would continue to be under the Project. The Specific Plan would permit theater facilities for on-site users that support production activities. Refer to Topical Response No. 3, Permitted On-Site Uses.

As discussed in Topical Response No. 13, Parking, the adequacy of a Project's parking supply is not a CEQA issue. Further, AB 2097 prohibits a public agency from imposing minimum parking requirements on development projects located within 0.5 mile of a major transit stop as defined by the PRC.

The proposed Specific Plan regulations are disclosed and analyzed in the Draft EIR as necessary under CEQA. The Project's impacts related to land use were analyzed in Section IV.H, Land Use and Planning, of the Draft EIR. In accordance with CEQA, the Draft EIR analyzed the Project's consistency with applicable plans, policies, and regulations that regulate land use on the Project Site, including the LAMC and the Wilshire Community Plan, among others, as well as the compatibility of the proposed uses with surrounding land uses. CEQA Guidelines Section 15125(d) requires that an EIR include a discussion of any inconsistencies between the proposed project and applicable general

plans, specific plans, and regional plans. Separately, CEQA Guidelines Appendix G recommends that a lead agency consider whether the project would cause a significant environmental impact due to a conflict with a land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. Per Appendix G of the CEQA Guidelines, a project would have a significant impact related to land use if it would (a) physically divide an established community; or (b) cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. As discussed on pages IV.H-38 to IV.H-39 in Section IV.H, Land Use and Planning, of the Draft EIR, the Project would not physically divide an established community. As discussed on pages IV.H-39 to IV.H-57 and Appendix I of the Draft EIR, which included an analysis of the General Plan Framework Element (including the Land Use Chapter, Open Space and Conservation Chapter, Economic Development Chapter, Transportation Chapter, and Infrastructure and Public Services Chapter), General Plan Conservation Element, the Mobility Plan, Wilshire Community Plan, LAMC, Citywide Design Guidelines, SCAG 2020–2045 RTP/SCS and SCAQMD AQMP, the Project would not conflict with the goals, policies, and objectives in local and regional plans that were adopted for the purpose of avoiding or mitigating an environmental effect. Accordingly, the Draft EIR correctly concluded that impacts related to land use would be less than significant.

Comment No. 26-23

Offsite Project Components are Not Disclosed. The DEIR states that the Project will require the excavation of over 700,000 cubic yards of dirt. How was that quantity calculated? Is it based on the conceptual site plan? If so, how does the City know that is the maximum? Will there be a limitation on the overall cut and fill at the Project Site?

A typical dump truck can hold approximately 10 to 14 cubic yards. Assuming approximately 700,000 cubic yards of excavation, the Project will generate the need to bring roughly 60,000 diesel dump trucks to the Project Site. Would that be 120,000 truck trips? Is there a limit on the daily number of dump trucks accessing the Project Site? Is there a size limit on the dump trucks?

It is unclear as to the total numbers of trucks needed to construct the Project. Did the City or environmental consultant know the total number of trucks needed to build the project? Is it 150,000 or 200,000 trucks? More?

Please provide a full description of the total number of trucks for Project construction, including excavation, rebar, concrete, steel, construction material and equipment, etc. Assuming the Project is constructed in its entirety in a 3 year period, how many daily trucks would need to come to the Project Site? How will these access the site if the construction time period is 3 years? What would be the number of trucks a day? What is the ability of

Fairfax Avenue to sustain such a number? How many construction workers required to access the Project Site? Does the DEIR analyses reflect that amount of trucks and construction worker traffic?

Response to Comment No. 26-23

The Draft EIR analyzed the proposed development program described in Section II, Project Description, of the Draft EIR (refer to pages II-12 through II-35 of the Draft EIR), and, as discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, future changes that are substantially different than the Project or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, as well as CEQA compliance review. As stated on page II-1 in Section II, Project Description, and throughout the Draft EIR, Project construction would require an estimated 772,000 cubic yards of cut, potentially 50,000 cubic yards of imported fill and up to 772,000 cubic yards of export. Thus, a total of approximately 822,000 cubic yards of import and export were evaluated. The earthwork quantities are based on the maximum potential grading for the proposed development program. The City of Los Angeles is the authority having jurisdiction and has approval authority, which if granted will provide the limitation on the cut and fill. Any substantial deviation from the Project would require further CEQA review.

The Draft EIR includes detailed information regarding construction activities, including the number of truck trips and construction workers. The analyses in the Draft EIR take into account that information. Refer to Appendix FEIR-8, Details of Buildout and Construction, of this Final EIR. Refer to Topical Response No. 14, Construction Vehicle Impacts, and Response to Comment Nos. 32-6, 107-2, and 124-6 regarding construction trips and construction workers. As discussed therein, as well as on page 181 of the Transportation Assessment (Appendix M.1 of the Draft EIR), the excavation/foundation subphase is anticipated to include up to approximately 640 total truck trips per day (320 truck trips in and 320 truck trips out of the Project Site), including approximately 300 haul trucks and approximately 20 delivery trucks over an approximately 8.5-month period. Haul trucks were assumed to carry approximately 14 cubic yards of soil. It would result in up to approximately 107 truck trips per hour on average, as shown in Table IV.I-11 of the Draft EIR. These truck trips are fully accounted for in the analyses within the Draft EIR. Also note that the delivery trips associated with rebar, steel, decking, sheet rock, glass, exterior walls, HVAC, plumbing, and other construction materials are included in the truck trips included in Topical Response No. 14, Construction Vehicle Impacts, and are fully accounted for in the analyses within the Draft EIR. The construction trucks would range in size, with the largest trucks consisting of a full-size semi-truck (WB-40 classification).

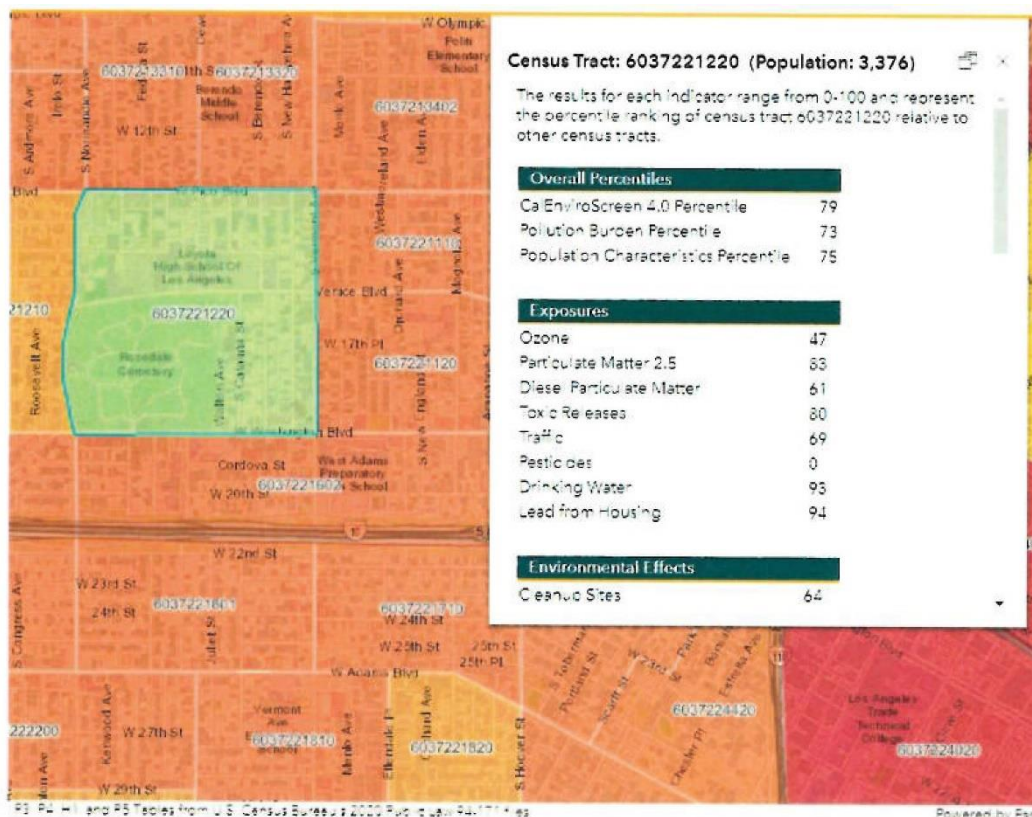

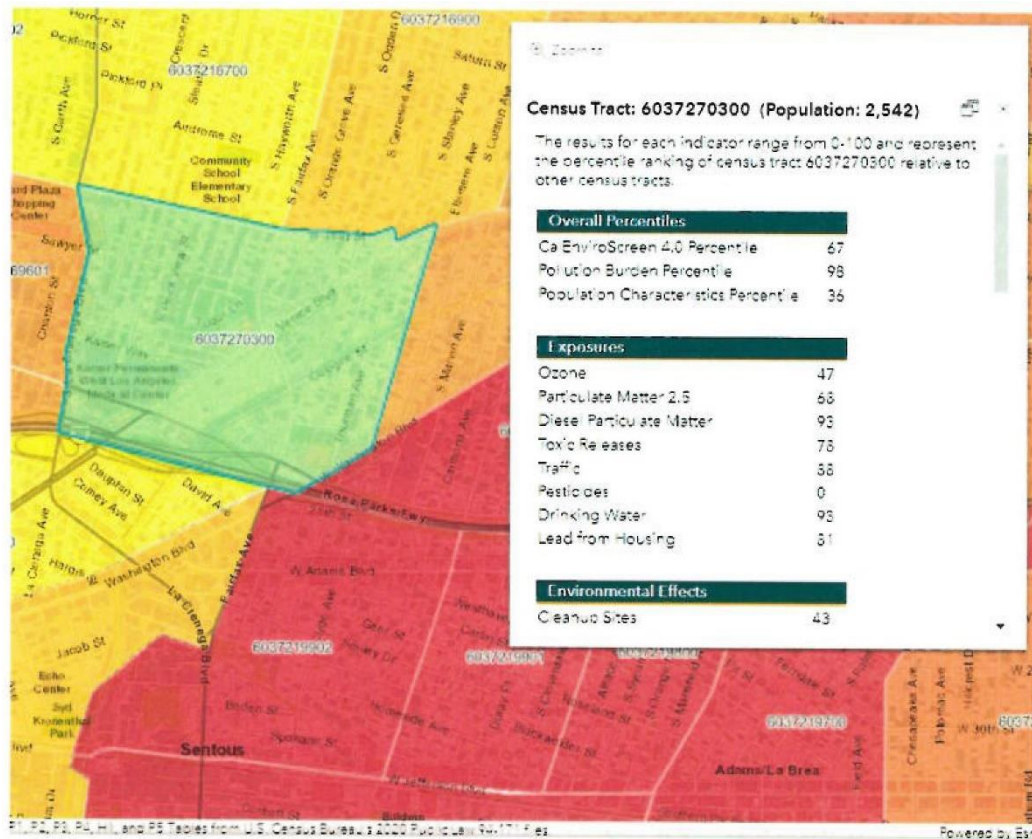

The last paragraph of this comment is substantively similar to Comment No. 5-12. Refer to Response to Comment No. 5-12, above. As discussed in Topical Response No.

14, Construction Vehicle Impacts, Project trip generation during construction would be less than the Project when fully operational and, thus, would have a lesser effect on traffic than the Project as analyzed in the Transportation Assessment (Appendix M.1 of the Draft EIR) and Section IV.K, Transportation, of the Draft EIR. Also refer to the Applicant's Neighborhood Council presentation that is attached to this comment letter (i.e., Comment Letter No. 26), and includes a graphic showing the trip capacity on Fairfax Avenue.

Comment No. 26-24

The project description does not adequately disclose the location of the offsite truck staging areas or the impacts of truck routes to the Project Site. This section simply states that "off-site truck staging areas located within the City on the north side of Venice Boulevard, west of Guthrie Avenue and on the north side of Venice Boulevard, east of Normandie Avenue." (DEIR, p. II-35.) The DEIR does not provide a map of these locations. However, both of these truck staging areas are directly adjacent to sensitive receptors including a school, community center, and a hospital. The DEIR fails to disclose these impacts by not properly disclosing the locations. The DEIR should include a map showing the location of the staging areas and adjacent sensitive receptors. (See Figures 02 and 03 in the Ramboll Report.)

Further, not only are these proposed staging areas located directly adjacent to a hospital, community center, churches, school, and cemetery, but they are also located in areas of the City that are already heavily burdened by pollution. The State's California Communities Environmental Health Screening Tool, CalEnviroScreen 4.0, is a screening methodology that is used to identify California communities that are disproportionately burdened by multiple sources of pollution. The two areas proposed as staging areas are in the 98th and 73rd percentile for "pollution burden." Adding the staging uses to these areas would further increase the already high pollution burden in these communities. The impacts of increased pollution, noise, pedestrian safety, and other risks to these communities should be assessed and disclosed in the DEIR. The DEIR needs to be recirculated with this new information.

Why were these areas chosen as the staging areas? Were other staging areas evaluated? If yes, where were the other staging areas evaluated and what were the impacts to the alternative staging areas as compared to the designated sites? Have these areas been selected as staging areas for other projects? If so, what is the cumulative impact to these communities of air quality, noise, congestions, safety, etc.?

Response to Comment No. 26-24

The Draft EIR evaluated two potential off-site construction staging areas and demonstrated that impacts associated with the use of these staging areas would be less than significant. In addition, graphics depicting the location of the two staging areas were provided in Figures IV.I-4 and IV.I-5 of the Draft EIR. However, the two off-site staging areas are no longer proposed to be used as part of the Project's construction activities. Instead, all haul truck staging would occur on-site. Refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR. As shown in Figure 1 of Appendix FEIR-8, two on-site haul truck staging areas would be used. These staging areas would be located along the northern and southern property lines to provide access throughout the Project Site for construction activities, and efficient truck access to these staging areas would be provided from Fairfax Avenue and Beverly Boulevard. Each staging area would have the capacity to accommodate up to 30 trucks. Although the staging area would accommodate up to 30 trucks at the same time, not all of the trucks would be idling at the same time, as each truck is limited to a maximum of 5 minutes of idling per CARB.⁴⁰ Therefore, it is estimated that up to 25 percent of the 30 trucks (eight trucks) would be idling at the same time. As shown in Table II-24 on page II-563, the estimated noise levels associated with the on-site construction staging would be consistent with the existing ambient levels and would not exceed the significance thresholds. In addition, noise levels associated with the on-site construction staging would be a minimum of approximately 10.6 dBA to 29.2 dBA lower than the noise levels from other on-site construction equipment during the grading phase (Table IV.I-10 of the Draft EIR). As such, the on-site construction staging when combined with the other Project construction noise sources analyzed in the Draft EIR would not result in additional measurable noise increase as compared to the Project analysis and would not change any of the significance conclusions in the Draft EIR.

In addition to noise, construction trucks would generate limited groundborne vibration. As provided in Table IV.I-20 and Table IV.I-21 of the Draft EIR, a loaded truck would generate a vibration level of 0.076 inch/second PPV or 86 VdB at a distance of 25 feet. The nearest offsite building to the staging areas (i.e., the commercial building to the south) would be a minimum of approximately 30 feet from the southern staging area.

⁴⁰ Each truck would be limited to a maximum of 5 minutes of idling per CARB regulatory requirements.

**Table II-24
On-Site Construction Staging Noise Levels**

Off-Site Receptor Location	Estimated Noise Levels due to Construction Staging (L _{eq} (dBA))	Existing Daytime Ambient Noise Levels (L _{eq} (dBA))	Significance Criteria (L _{eq} (dBA))	Maximum Noise Exceedance Above the Criteria (L _{eq} (dBA))	Significant Impact Without Mitigation?
R1	59.8	61.1	66.1	0.0	No
R2	51.4	62.8	67.8	0.0	No
R3	58.6	68.5	73.5	0.0	No
R4	53.2	67.7	72.7	0.0	No
R5	58.5	58.9	63.9	0.0	No
R6	45.5	60.4	65.4	0.0	No
R7	53.9	56.6	61.6	0.0	No
R8	64.5	66.9	71.9	0.0	No
R9 (Gilmore Adobe) ^a	52.4	56.0	61.0	0.0	No
<p>^a The Gilmore Adobe (also referred to as the Rancho La Brea Adobe) is a commercial use, and the Draft EIR correctly analyzed the Gilmore Adobe as a commercial use. This is verified by the 2018 book, <i>A Family Vision – Spanning Three Centuries—The History of the A.F. Gilmore Company</i>, written by the A.F. Gilmore Company and the certified Addendum to the Final Environmental Impact Report for The Grove at Farmers Market Project. A commercial use is not a sensitive receptor for purposes of the noise analysis under CEQA. Nonetheless, even if the Gilmore Adobe were treated hypothetically as a residential use, potential noise impacts associated with on-site construction staging at the Gilmore Adobe would be less than significant.</p> <p>Source: AES, 2023</p>					

The groundborne vibration at 30 feet distance would be 0.058 inch/second PPV, which would be well below the building damage significance criteria of 0.3 inch/second PPV (applicable to the commercial building to the south). The nearest offsite sensitive receptor to the staging areas is receptor location R8, which is a hotel use along Fairfax Avenue located approximately 95 feet from the southern staging area. The groundborne vibration at a distance of 95 feet would be 68.6 VdB, which would be below the human annoyance significance criteria of 72 VdB. Vibration levels due to trucks at the onsite staging areas would be lower at other offsite sensitive receptors further away, as vibration levels dissipate with distance. As such, vibration impacts associated with the onsite construction staging areas when combined with the other Project construction vibration sources analyzed in the Draft EIR would be less than significant.

As the two off-site haul truck staging locations described and evaluated in the Draft EIR are no longer proposed, an HRA is not warranted for sensitive receptors near the two removed off-site staging areas. Please refer to Response to Comment No. 26-E.1-17 regarding on-site vehicle travel and idle exhaust emissions. Contrary to the commenter's assertion, the Draft EIR disclosed and analyzed the air quality impacts of truck routes to the

Project Site. Project haul routes for both loaded and empty construction trucks are also disclosed in the LADOT approval letter dated June 30, 2022. As accurately pointed out by the commenter, census tracts experiencing high levels of pollution burden are present in the vicinity of the Project area. Pollution burden is estimated based on pollution levels and population densities; thus, pollution burden tends to be higher in areas with higher populations which are nearer to sources of pollution, such as near highways. Therefore, where haul routes connect to and travel along highways, routing through high-burden areas is unavoidable.

The cumulative impacts of Project implementation, including construction haul truck routing, with respect to air quality, noise, congestion, and pedestrian safety are discussed in Section IV.A, Air Quality, Section IV.I, Noise, Section IV.K, Transportation, and Sections IV.J.1 and J.2, Public Services, of the Draft EIR, respectively.

The Draft EIR disclosed all elements of the Project required by CEQA and comprehensively analyzed the Project's potential impacts in accordance with CEQA. Thus, contrary to the commenter's assertion, recirculation is not required. This comment does not provide substantial evidence that "significant new information" as defined by CEQA Guidelines Section 15088.5 has been added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Also refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 26-25

II. IMPACTS AND MITIGATION MEASURES

A. Air Quality

As detailed below and in the attached **Exhibit 1**, *Review of the Draft Environmental Impact Report for the TVC 2050 Project* prepared by Ramboll US consulting, Inc. (the "Ramboll Report"), the air quality analysis is deficient, contains numerous inconsistencies and errors, and is misleading. Moreover, as noted in the previous discussion regarding Project Description, once a stable and finite Project description is established, the air quality analysis will need to be revised and recirculated.

Failure to Prepare Health Risk Assessment

Despite the Project Site, haul routes, and staging areas being very close (next door) to sensitive receptors, the DEIR failed to prepare a Health Risk Assessment (HRA). As shown in Figure IV.A-4, the Project Site is surrounded by sensitive receptors, such as residences and schools.

The Project's construction and operations include sources of diesel particulate matter (DPM) and other toxic air contaminants (TACs) that could potentially have a significant health risk impact on the surrounding receptors due to: (1) the large areal scope of construction activity (25 acres); (2) the close proximity to sensitive receptors; (3) the length of construction, which could occur intensively over a 3 year period or over 20 years; (4) the additive emissions from concurrent operational emissions (such as diesel and other trucks providing production support activities and servicing on-site warehouses and facilities); (5) over 500 trucks per day visiting the Project Site for operations (which, as indicated herein, likely is underestimated); (6) the 772,000 cubic yards of excavated soil and 50,000 cubic yards of imported soil to be moved to and from the Project Site necessitating 60,000 or more dump trucks (totalling [sic] approximately 120,000 trips); (7) at least 100,000 or more heavy diesel trucks required to bring concrete, rebar, steel, glass, exterior walls, construction material, construction equipment, facility equipment, and other required materials to the Project Site; and (8) the potential release of VOCs, methane, and other oil-related products during dewatering activities and/or soil moving activities.

Given all of these factors, why did the DEIR not include an HRA? A detailed HRA should have been prepared to calculate and disclose to the public the increased risk of cancer and other health impacts (e.g., acute, chronic, and cancer risk) caused by the Project's construction and operational emissions, particularly on the community's most vulnerable residents.

Response to Comment No. 26-25

Please refer to Topical Response 1, Clearly Defined Project Description and Specific Plan, for a detailed explanation of how Section II, Project Description, of the Draft EIR is accurate, stable, and finite, and how the Draft EIR disclosed all elements of the Project required by CEQA and fully evaluated the environmental impacts of the Project.

Please see Response to Comment Nos. 26-24, 107-2, and 124-6 regarding staging and haul routes.

See Response to Comment Nos. 9-24 and 26-E.1-24 for a discussion of the buildout timeline and the long-term buildout impact assessment.

See Response to Comment No. 26-E.1-21 for a discussion of sensitive receptor proximity to the Project Site.

See Section E, Truck Trips, of Topical Response No. 10, Trip Generation, and Response to Comment No. 26-E.1-16 for a discussion of Project truck trip generation during operation, rebutting the comment's incorrect claim that the Project will generate 500 truck trips per day.

See Topical Response No. 14, Construction Vehicle Impacts, regarding truck trips during Project construction.

Refer to Response to Comment No. 13-6 regarding potential releases during dewatering or soil-moving activities.

Additionally, in response to comments on the Draft EIR, a quantitative HRA is included as Appendix FEIR-10 of this Final EIR. The HRA includes health risk impacts from both Project-related construction and operational activities. Sources analyzed in the HRA include diesel exhaust from trucks and equipment with receptors located adjacent to the Project Site. As discussed in Response to Comment No. 26-E.1-2, the quantitative HRA confirms the Draft EIR's conclusion that health risks from the Project would remain below the applicable significance thresholds. Please refer to Response to Comment No. 26-E.1-2 for additional details on health impacts to nearby sensitive receptors.

This comment does not provide substantial evidence that "significant new information" as defined by CEQA Guidelines Section 15088.5 has been added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Refer also to Response to Comment No. 9-4 regarding recirculation.

Comment No. 26-26

Failure to Identify All Sensitive Receptors

Moreover, Figure IV.A-4 and the DEIR generally fails to identify all sensitive receptors in the vicinity of the Project. For example, the DEIR fails to label the Gilmore Adobe and the Morasha Hebrew Academy as sensitive receptors. An EIR must comprehensively canvass the entire area to identify residences, transient lodgings (hotels), schools, day care facilities, libraries, churches, hospitals, nursing homes, playgrounds, and parks to adequately assess health impacts. Does the existing site have any child-care facilities on-site?

The Project Site itself would contain sensitive receptors. Depending on the phasing of the Project, sensitive receptors may be on-site and active when additional phases are constructed. On pages 15–17 of Chapter D.II Project Description, the Project's Specific Plan is described as having flexible land uses. In addition to the permitted land uses of production-related and ancillary uses, it is unknown if the Specific Plan sensitive receptor uses and facilities such as childcare and educational facilities, sleeping quarters for certain on-site personnel, and recreational facilities will be constructed and when. In addition, the proposal to permit any C2 use has an extensive number of potential sensitive receptors. A comprehensive HRA must be prepared in order to accurately gauge impacts on all offsite and on-site sensitive receptors.

Response to Comment No. 26-26

The air quality analysis in Section IV.A, Air Quality, of the Draft EIR correctly identified and analyzed impacts to sensitive receptors consistent with the SCAQMD LST methodology. The SCAQMD in their LST methodology identifies sensitive receptors to be a receptor, such as residence, hospital, or convalescent facility, where it is possible that an individual could remain for 24 hours.⁴¹ The Project would not include uses where individuals could stay for extended periods (years) but would, instead, as listed on page II-16 in Section II, Project Description, of the Draft EIR, include sleeping quarters for certain on-site personnel, such as security guards with long overnight shifts. These uses would not be considered sensitive receptors. Please note that the Project Site does not have existing childcare uses. Refer to Response to Comment Nos. 5-6 and 224-1 regarding the uses permitted under the proposed Specific Plan.

Commercial and industrial facilities are not included in the definition of sensitive receptor because employees do not typically remain on-site for a full 24 hours but are present for shorter periods of time, such as 8 hours. LSTs based on shorter averaging periods, such as the NO₂ and CO LSTs, were applied to receptors, such as industrial or commercial facilities in the vicinity of the Project, since it is reasonable to assume that a worker at these sites could be present for periods of 1 to 8 hours, or recreational facilities included in the CEQA analysis.

The SCAQMD LST screening methodology instructs users to identify the maximum daily Project emissions and the distance to the nearest off-site receptor. Data tables are provided to identify the maximum allowable Project emissions based on distance to the nearest off-site receptor. If Project emissions are below the lookup table allowable emissions, then significant local impacts are not expected. As shown in Table IV.A-10 and Table IV.A-11 of the Draft EIR, Project localized construction and operational emissions would remain below the significance thresholds for receptors located within 25 meters of the Project Site. A 25-meter receptor distance is the closest receptor distance on the SCAQMD LST lookup tables and may be used to analyze receptors located closer than 25 meters, including any on-site receptors. Use of the SCAQMD LST 25-meter receptor distance is, therefore, representative of impacts for on-site uses (e.g., any proposed childcare use), and the proper application of the LST methodology demonstrates that there would be no significant impacts to on-site uses, including any proposed childcare use. Therefore, the Project's air quality analysis properly analyzed localized impacts and identified sensitive receptors consistent with SCAQMD LST methodology.

⁴¹ SCAQMD, Final Localized Significance Threshold Methodology, June 2003, revised July 2008, p. 3-2.

The receptors identified in the comment, the Gilmore Adobe and the Morasha Hebrew Academy, are specifically identified in the Draft EIR, as discussed on page IV.A-29 of the Draft EIR. Figure IV.A-4 (Air Quality Sensitive Receptors Locations) on page IV.A-30 of the Draft EIR (and as revised in Section III, Revisions, Clarifications, and Corrections to the Draft EIR) identifies Morasha Hebrew Academy as an educational use. While the Gilmore Adobe was not specifically identified in Figure IV.A-4 as it is a commercial use, the closest sensitive receptor land use to the Project Site would remain to be the residential use located immediately adjacent to the east of the Project Site (Broadcast Center Apartments). As shown in Table IV.A-10 and Table IV.A-11 of the Draft EIR, Project localized construction and operational emissions would remain below the significance thresholds for receptors located within 25 meters of the Project Site.

Moreover, in response to comments on the Draft EIR, a quantitative HRA is included as Appendix FEIR-10 of this Final EIR. The HRA includes health risk impacts from both Project-related construction and operational activities. Sources analyzed in the HRA include diesel exhaust, architectural coatings, char broilers and other fugitive emissions. Receptors analyzed in the HRA include sensitive uses and commercial uses to the south of the Project Site.⁴² Although not required for CEQA purposes, Project on-site receptors, including any proposed childcare use, were also analyzed for informational purposes and impacts were determined to be less than significant, confirming the conclusions in the Draft EIR. Please refer to Response to Comment No. 26-E.1-2 below for additional details on health impacts to nearby sensitive receptors.

Refer to Topical Response No. 3, Permitted On-Site Uses, regarding the permitted uses under the proposed Specific Plan. A childcare use is the only sensitive use that would be permitted, and, as explained above, would not be subject to significant localized air quality impacts based on the SCAQMD LST methodology. The childcare use would also be sited and constructed in accordance with all applicable regulatory requirements. In addition, a PDF is included in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, to address emergency generators to ensure all applicable regulatory requirements, as well as the additional 100-meter buffer distance, are taken into account in the siting of any childcare use on the Project Site. Project Design Feature AIR-PDF-2 requires all new emergency generators to meet the emission standards included in Table 1

⁴² Based on the 2018 book, *A Family Vision—Spanning Three Centuries—The History of the A.F. Gilmore Company*, which was written by the A.F. Gilmore Company, the Gilmore Adobe has been home to the corporate offices of the A.F. Gilmore Company since 1976 (see page 59). This is consistent with the certified Addendum to the Final Environmental Impact Report for The Grove at Farmers Market Project, which identified the Gilmore Adobe as a commercial office use (The Grove at Farmers Market Addendum to Final Environmental Impact Report dated July 15, 1999 [EIR No. 87-515-SUB(ZV)(YV)(ZC); State Clearinghouse No. 87102102]). Accordingly, the Draft EIR correctly identified and analyzed the Gilmore Adobe as a commercial use. Nevertheless, for informational purposes, the HRA provides an analysis of the Gilmore Adobe as a hypothetical sensitive receptor.

of SCAQMD Rule 1470 and USEPA Tier 4 Final standards. The existing “Big Blue” emergency generator (SCAQMD Permit No. 618456), which is shown in Figure IV.F-1 of the Draft EIR (and Figure IV.F-1 as revised in Section III, Revisions, Clarifications, and Corrections to the Draft EIR), results in 0.08 grams per brake horsepower-hour (g/bhp-hr) of DPM and meets the SCAQMD Rule 1470 standard (0.15 g/bhp-hr of DPM) for emergency generators located greater than 50 meters (approximately 164 feet) from sensitive receptors and 100 meters (approximately 330 feet) from schools. To be conservative, the childcare use, if any is proposed in the future, would be located a minimum of 330 feet from the existing Big Blue generator if such generator remains in use.

Comment No. 26-27

Flawed Assumptions about Distances to Sensitive Receptors

The DEIR relies on the use of SCAQMD’s Localized Significant Thresholds (LSTs) to evaluate the localized impacts of criteria air pollutants (NO_x, CO, PM₁₀, and PM_{2.5}) during construction and operation. The DEIR says the closest sensitive receptors to the Project Site are the residential uses located east of and directly adjacent to the Project Site (the Broadcast Center Apartments). This assumption may be wrong given the presence of the Gilmore Adobe. But even if correct, the DEIR incorrectly assumes that these residential uses are 25 meters (82 feet) away. However, these apartments are much closer than 82 feet away, which is readily apparent when looking at the maps in the DEIR. In fact, there is only a limited setback between the Broadcast Center Apartments and the Project Site. What’s more, the apartments have open air balconies and windows that open to the Project Site. Given the lack of detailed Project information, it appears that Project uses with air emissions, such as diesel trucks, generators, mills, etc., could be immediately adjacent to the residential receptors.

The DEIR also fails to perform site-specific emission dispersion modeling after the LST was exceeded. At a minimum, the DEIR should have run a project-specific analysis using the AERMOD dispersion model, which would show how the concentration of pollutants is dispersed from the area and volume resources to nearby sensitive receptors.

Moreover, construction emissions are compared against an assumed 5-acre site. However, if the Project pursues a phased approach to construction, such as constructing a parking structure first, the area of land under construction at any given time may be less than 5 acres. The LST thresholds for smaller land sizes are more stringent, and thus the DEIR analysis is not appropriately conservative and the Project’s LST impacts would be greater than disclosed. Given that the Project may have construction areas much smaller than 5 acres, the DEIR must evaluate the potential impact for construction areas less than 5 acres.

Response to Comment No. 26-27

Please refer to Response to Comment No. 26-E.1-21 regarding the analysis of localized air quality impacts and the use of SCAQMD's LST methodology (i.e., applicability of a 5-acre site and 25-meter receptor distance). While the Gilmore Adobe was not considered a sensitive receptor in the Draft EIR, the receptor is located farther than the analyzed distance of 25 meters. As shown in Table IV.A-11 and discussed on pages IV.A-66 and IV.A-73 in Section IV.A, Air Quality, of the Draft EIR, with the application of mitigation measures, localized Project construction emissions would result in less-than-significant impacts based on the SCAQMD LST screening methodology. Therefore, detailed dispersion modeling is not required.

As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Draft EIR disclosed all of the elements of the Project required by CEQA and provided a comprehensive analysis of the Project's potential impacts.

Comment No. 26-28**DEIR Makes Unsupported Statements about Atmospheric Dispersion of TACs**

At page IV.A-31, the DEIR states that sensitive receptors "would experience lower air quality impacts from potential sources of emissions at the Project site due to atmospheric dispersion effects." However, the DEIR does not conduct any modeling of atmospheric dispersion, which can and should be conducted as part of an HRA. The DEIR likely avoids this HRA air dispersion modeling because, among other reasons, the Project would create a canyon filled with exhaust from trucks and other emissions sources on the eastern boundary of the Project Site. The Project proposes a new internal street at the eastern property boundary that would be used as a roadway for diesel trucks. The Project building directly across the truck roadway from the Broadcast Center Apartments could be up to 160 feet tall and the Broadcast Center Apartments are 5 stories, leaving nowhere for the DPM from the hundreds of trucks accessing through the new Project roadway and other TACs to disperse. Another internal street with vehicular and truck access is proposed to the south of the apartments with an up to 130-foot Project building next to the internal roadway. As detailed in Ramboll's Report, traffic emissions in the wake of a development with a proposed height of 130–160 feet can result in an increase in annual concentrations of approximately 5% while peak concentration may increase by up to 15–20%. The impact will be greater for particulate matter (PM) concentrations as compared to NOx concentrations. In short, the balconies of the Broadcast Center Apartments would be subject to diesel exhaust, soot, and other air quality impacts and expose residents to these emissions.

The DEIR also fails to analyze the air quality impacts caused by the trucks, generators, food trucks, equipment, and other production-related vehicles that will be staged in the

basecamp and production support areas. Some of these areas are below grade and will not experience the same type of atmospheric dispersion that would occur in an open setting. However, portions of the below grade areas may be open to the sky if developed similar to the site plans submitted to the City with the applications and available at the City's Project website.² It is also unclear where the venting for the below grade areas and subsurface systems will be located and whether the emissions were factored into the air quality and GHG analyses. The DEIR must include modeling of intake and exhaust of all below grade areas. Is there any restriction as to where this venting can be located? Can it be located next to the residential uses?

² <https://planning.lacity.org/pdiscaseinfo/caseid/MjO3Mjg20>.

Response to Comment No. 26-28

The commenter inaccurately claims that the Draft EIR must include dispersion modeling. Please refer to Response to Comment No. 26-26 regarding the analysis of localized construction and operational air quality impacts. As stated on page IV.A-31 in Section IV.A, Air Quality, of the Draft EIR, the air quality analysis was performed consistent with SCAQMD LST methodology. This methodology employs intentionally conservative dispersion parameters, derived from dispersion modeling conducted by SCAQMD which incorporated local meteorology and background pollutant levels, to evaluate whether estimated emissions from a project site would have the potential to result in local air quality impacts. Following the LST methodology, the nearest receptor to the Project Site would be the most likely to have the potential for local air quality impacts. The Draft EIR's statement that sensitive receptors "would experience lower air quality impacts from potential sources of emissions at the Project Site due to atmospheric dispersion effects" is in specific reference to those receptors which would be farther from the Project Site than the nearest receptor and is, therefore, accurate. Tables IV.A-10 and IV.A-11 on pages IV.A-70 and IV.A-74, respectively, in Section IV.A, Air Quality, of the Draft EIR show that localized construction and operational emissions would remain below the significance thresholds for receptors located within 25 meters of the Project Site after the application of mitigation. It should be noted that a 25-meter receptor distance is the closest receptor distance on the SCAQMD LST lookup tables and may be used to analyze receptors located closer than 25 meters (SCAQMD, Final Localized Significance Threshold Methodology, page 3-3, 2008). Therefore, the Project's air quality analysis properly analyzed localized impacts and identified sensitive receptors consistent with SCAQMD LST methodology.

As discussed on page II-7 of Section II, Project Description, of the Draft EIR, basecamp areas would include parking, storage of mobile facilities, support vehicles, etc. While existing production activities occasionally require the use of small portable generators when electrical hookups are not available, the Project will provide a sufficient number of electrical hookups in basecamp areas such that use of portable generators will

not be needed. Project Design Feature GHG-PDF-3 is included in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, to require the installation of additional electrical hookups at all basecamp areas. Diesel trucks, including food trucks accessing basecamps, would travel on-site for short distances and would plug into electric power when parked in below or above Project Grade areas. Diesel trucks would also comply with a CARB-mandated airborne toxic control measure (ATCM) which limits idling to no more than five minutes at a time. As discussed in Topical Response No. 10, Trip Generation, trip generation estimates in the Draft EIR included trips associated with basecamp operations. Also note that, as discussed in Response to Comment No. 26-121, while outdoor production activities may occur above-Project Grade, no active production activities or uses would be located in the parking and basecamp areas below Project Grade. As discussed in Topical Response No. 2, Definition of Floor Area is Appropriate, all of the proposed uses, areas and activities were fully accounted for in the impact analyses in the EIR. Basecamp uses are specifically accounted for in the Confirmatory Air Quality, GHG, and Energy Analysis in Response to Public Comments (see Appendix FEIR-9 of this Final EIR).

Underground parking exhaust fans are typically placed inside the parking structure to allow for energy efficiency and minimize potential noise from the mechanical equipment. While there are no restrictions where the venting for the below grade areas will be located, venting is typically run vertically through the parking structure and out through the top level of the parking structure. Ventilation for underground parking and basecamp areas will comply with Section 120.6(c) of the California Building Code (CBC), Mandatory Requirements for Enclosed Parking Garages, which mandates a minimum flow rate of 0.15 cubic feet per minute per square feet when the structure is scheduled to be occupied. As discussed on page IV.A-45 of Section IV.A, Air Quality, of the Draft EIR, a CO exceedance of ambient air quality standards (AAQS) is caused by vehicular emissions, primarily when idling. Therefore, the CBC requires installation of at least one CO sensor per 5,000 square feet and also requires automatic controls and/or devices that would increase the air flow to maintain acceptable CO concentrations well below the AAQS (health protective of the underground parking users). This, in turn, would protect nearby sensitive receptors as the vented air from the underground parking would be further diluted with ambient air further reducing the CO concentrations below the AAQS.

As discussed in Response to Comment No. 26-E.1-2, in response to comments on the Draft EIR, a quantitative HRA is included as Appendix FEIR-10 of this Final EIR. The HRA includes health risk impacts from both Project-related construction and operational activities. Sources analyzed in the HRA include, among others, diesel exhaust, architectural coatings, char broilers, production and basecamp operations, Mobility Hub operations, venting, parking operations (e.g., venting from parking structures), and other fugitive emissions. Receptors analyzed in the HRA include sensitive uses and commercial uses to the south of the Project Site. Project on-site receptors were also analyzed for informational purposes. As discussed in Response to Comment No. 26-E.1-2, the

quantitative HRA confirms the Draft EIR's conclusion that health risks from the Project would remain below the applicable significance thresholds. Please refer to Response to Comment No. 26-E.1-14 for additional details on health impacts to nearby sensitive receptors.

Please note that the Project would not include a new internal "street" as incorrectly stated in the comment. Rather, the Project would include internal circulation pathways and lanes as is typical in any development project.

Comment No. 26-29

Truck Trips Are Artificially Lowered

Page IV.A-72 of the DEIR claims, per SCAQMD guidance, that since the Project site would not exceed 100 trucks visits per day, an HRA is not required. What is the basis for the DEIR's conclusion that truck trips will be less than 100 trucks per day? What range of permitted uses were assumed in drawing that conclusion? Warehouse is a permitted use—how much warehouse was assumed for that calculation? What amount of production support was assumed and how many daily trucks associated with that production support? How many stages were assumed and how many truck trips were assumed per stage? How much office was assumed and how many truck deliveries for the offices was assumed? The amount of trucks calculated, the type of trucks, and basis for the calculation of daily truck trips should be disclosed.

Moreover, the DEIR's own analysis is not consistent with the statement that the Project will not exceed 100 trucks per day. On page 98 of Appendix B, the Total Permitted Land Uses CalEEMod winter run presents the fleet mixes for each of the land uses (page 103) and the average daily trip rate (page 102). Combining these, it is estimated the number of truck trips per day to be 559 one-way trips/day, or 279 round trips/day for the Project (assuming the truck types include light-heavy duty trucks, medium-heavy duty, and heavy-heavy duty trucks). How can the DEIR make conclusions based on assumptions that contradict the technical information appended to the DEIR?

The DEIR needs to correct this inconsistency as there is no way to understand what is the correct assumption. Further, without clarity as to which permitted uses will be built and to what square footage, it is not supportable to assume that the 100 truck per day threshold will not be exceeded.

More importantly, given that the DEIR's own analysis estimates that the number of truck visits is greater than 100, then the DEIR fails its own criteria to determine if an HRA is required. An HRA must be prepared and a recirculated DEIR made available to the public.

Response to Comment No. 26-29

Please refer to Response to Comment No. 1-4 for a discussion of the 100 truck per day screening criteria. Please refer to Topical Response No. 10, Trip Generation, and Response to Comment No. 26-E.1-16 for a detailed explanation of the trip generation assumptions which went into the Draft EIR's truck trip estimates. As discussed therein, trip generation estimates were based on Project-specific vehicle trip data from existing facility operations, rather than CalEEMod default trip generation parameters of representative land uses for the facility's subtypes. Thus, no specific breakdown of facility land use subtypes was necessary for trip generation estimates. A more detailed overview of facility vehicle trips is provided in the Confirmatory Air Quality, GHG, and Energy Analysis in Response to Public Comments (see Appendix FEIR-9 of this Final EIR).

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, and Topical Response No. 3, Permitted On-Site Uses, regarding the Conceptual Site Plan and the size of the five permitted uses.

As discussed in Response to Comment No. 26-E.1-2, the quantitative HRA confirms the Draft EIR's conclusion that health risk from the Project would remain below the applicable significance thresholds (see Appendix FEIR-10 of this Final EIR).

This comment does not provide substantial evidence that "significant new information" as defined by CEQA Guidelines Section 15088.5 has been added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Also refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 26-30**Hauling Trips are Underestimated, Failing to Disclose Construction Air Impacts**

The DEIR underestimates the number of hauling trips evaluated in the CalEEMod runs, thereby underestimating the air quality impacts of construction. The CalEEMod analysis must be corrected and the DEIR recirculated.

On page 3 of Appendix B, it is noted that it is expected that haul trucks will dispose of exported soil materials at United Rock Products Landfill in Irwindale. Following the haul route given on page 8, this path results in ~30 miles the haul truck would need to travel. On top of that, the DEIR has assumed that up to 60,000 cubic yards of hazardous soil materials, which is reportedly a subset of the maximum 772,000 cubic yards of export, 'Will be exported to Button-willow Landfill in Kern County which is 145 miles away. When reviewing the CalEEMod runs (on pages 26 and 311 of Appendix B), it shows that the default hauling trip number given in the CalEEMod run of 102,750 trips was reduced to

8,572 trips. This updated trip number was noted to be associated with the 60,000 cubic yards of contaminated soil exported. The hauling trip length was also changed from the default of 20 miles to 145 miles.

Based on this and the comment below, it appears that the CalEEMod run only accounts for hazardous waste haul trips and the other 94,178 haul trips with a trip length of ~30 miles have not been accounted for in the emissions inventory analysis.

On pages 28, 53, 131, 156, 180, 205, and 312 of Appendix B, there is another line item in the CalEEMod defaults table for a trip number for hauling trucks of 2,255 that was changed to 0. It is not clear in the analysis why this was done. Furthermore, the CalEEMod run does not appear to be accounting for the hauling trips associated with the more than 700,000 cubic yards of non-hazardous material after this on-site import is accounted for. It is also important to note that the estimate of 60,000 cubic yards of contaminated soil export may in fact be underestimated given the known conditions at the Project Site that necessitated preparation of a soil management plan. The DEIR should be revised to correct the discrepancy and update the analysis accordingly.

The true number of haul trips for soil conservatively could be up to 91,923 after accounting for the soil import/export transfer on-site and the hazardous waste trips. This number is over ten times higher than what was presented in CalEEMod currently and could result in an additional ~2,750,000 VMT by the hauling trucks that has not been accounted for in the Project emissions inventory. Use of this corrected number would more than double the VMT associated with hauling trips based on the current CalEEMod runs. This does not account for other construction truck trips for delivery of concrete, steel, and other construction material.

The DEIR should be revised to include a complete list of the estimated trucks needs to construct the Project over a 3-year period and a 20-year period and the associated trip lengths. Please provide a full description of the total number of trucks for Project construction, including excavation, rebar, concrete, steel, construction material and equipment, etc.

Response to Comment No. 26-30

This comment misrepresents information provided in Appendix B, Air Quality and Greenhouse Gas Emissions, of the Draft EIR and instead identifies some limitations of CalEEMod 2020. The comment cites that CalEEMod provides a total of 102,750 haul truck trips for import/export. CalEEMod 2020 provides two truck purposes vendor and haul, for each construction phase. Vendor trips are input as peak daily and haul trips are input as the total number of haul trucks trips over the grading/export duration. To account for peak daily export activity, haul truck trips were input into CalEEMod as 640 vendor trips of which

600 trips would be for hauling of import/export and 40 trips could be used for deliveries or import/export. All trips were assumed to be of the hauling vehicle class and trip length was adjusted to account for hauling to import/export site of approximately 30 miles. As identified in the CalEEMod input file, grading/excavation would occur over 185 days, which is equivalent to hauling of up to 777,777 cubic yards (300 hauls x 14 cy truck x 185 days) or 111,000 haul trips. Please note that the grading phase also includes up to 50,000 cubic yards of import, and it was assumed that export haul trucks would provide the imported materials on return trips. Furthermore, it was conservatively assumed that the 40 vendor trips could be used for hauling exported soil with the same 30-mile trip distance, which would account for an additional 7,400 truck trips. This comment also misconstrues the hauling trip information related to contaminated soil. The comment cites that the CalEEMod runs default hauling trip number was reduced from 102,750 to 8,572 and the trip length was changed from 20 to 145 miles. This comment acknowledges that the Draft EIR provided a note that the 8,572 trips were associated with 60,000 cubic yards of contaminated soil export and that the trip distance was increased from 20 to 145 miles. Therefore, it should be clear why the default number of trips and trip distance was modified as the construction activity was not related to general import/export. As shown in Appendix B, Air Quality and Greenhouse Gas Emissions, of the Draft EIR, the modeling included 8,572 haul trips for the additional VMT (145 miles per trip) related to any hazardous soil materials (60,000 cy / 14 cy truck capacity x 2 trips). Based on the provided information above, the Draft EIR analysis accounted for a total of 126,972 (111,000 + 7,400 + 8,572) truck trips during the grading phase, which is conservative and more than the CalEEMod default (102,750 truck trips). Refer to Response to Comment No. 26-83 regarding the conservative estimate of 60,000 cy of contaminated soil.

Please note that this comment also misstates the number for hauling truck trips associated with demolition activities. Once again, the truck trips were input as vendor trips to account for peak daily activity. As shown on the same pages in the Draft EIR cited in this comment (i.e., pages 28, 53, 131, 156, 180, 205, and 312 of Appendix B), the Project would include 80 daily truck trips over the 65-day construction period (5,200 total truck trips) and is more than double the CalEEMod number of demolition truck trips (2,255). To summarize, the CalEEMod analysis included in the Draft EIR correctly reflects peak daily truck trips and distances during grading/export and demolition, and all construction-related VMT has been accounted for in the Project emissions inventory. No changes to the air quality analysis are necessary based on this comment.

Please refer to Details of Project Buildout and Construction Activities and Confirmatory Air Quality, GHG, and Energy Analysis in Response to Public Comments (see Appendices FEIR-8 and FEIR-9 of this Final EIR, respectively) for a detailed discussion of the long-term buildout scenario. As discussed therein, with a long-term buildout and operation of some facilities on-site while construction is occurring, only a single excavation operation could be accommodated on-site, thus reducing the excavation activities and

associated haul truck trips by half. A single excavation operation would only result in half the number of pieces of equipment operated and result in 300 daily haul truck trips instead of 600 trips. Other construction activities, such as building construction and finishing, would likely occur at a further-reduced level but were still assumed to occur at 50 percent of the maximum daily intensity for a conservative analysis.

Refer to Topical Response No. 14, Construction Vehicle Impacts, for additional discussion regarding construction truck trips.

Comment No. 26-31

DEIR Contains Flawed Trip Counts and VMT Reduction Claims

The significant flaws in trip counts and VMT reduction claims detailed elsewhere in this letter ripple throughout the DEIR, rendering the Air Quality Section, associated appendices, and CalEEMod runs inadequate. Some of those flaws are further highlighted below.

Visitor Trips

The DEIR does not properly account for visitor trips. As outlined in the Project Description on page II-26, the Project includes a Mobility Hub, which it intends to provide services to visitors. However, as referenced in the Appendix M Sub-appendix E Attachment B, the persons taken into account in the overall VMT calculation only include “employees,” and trips taken into account only include those within the land use “Studio, Production, and Office.” Why was this distinction made? What support is there for only including those trips? Furthermore, as referenced in Appendix B section 4.2 Trip Summary Information, calculations of annual VMT and trip rate values are only performed for trips within the land use “User Defined Commercial,” while trips within other land use types are excluded. Visitor trips must be added and the overall trips recalculated.

Also, it is unclear how and to what extent visitor trips from audience shows were included in the analyses. The Television City studio is unique in that all of its existing stages are rated for audience shows. The Project provides for 350,000 or 450,000 sf of stage, which could be up to 19 or more stages that could accommodate 300 or more audience guests. The DEIR does not include any limitations as to the amount or operation of audience shows. Absent any limitations, based on the past use of this studio, there could be 5,000 or more visitors a day to audience shows at the Project Site. How were the trips associated with these visitors included in the overall Project trips? Were they included in the VMT? Are these trips factored into the air quality analyses? How? If not included, the DEIR must be revised to include the analyses which account for these and other visitor trips to this proposed “Regional Center”. [sic]

Response to Comment No. 26-31

The trip counts and VMT reductions in the Draft EIR are not flawed. Rather, the trip counts and VMT analysis in the Draft EIR were completed in accordance with LADOT procedures and CEQA. Refer to Topical Response No. 8, Vehicle Miles Traveled, and Topical Response No. 10, Trip Generation. As discussed in Section A, Appropriateness of Using VMT Calculator, of Topical Response No. 8, Vehicle Miles Traveled, the Project trip totals calculated by the VMT Calculator includes all trips generated by the Project (employees, visitors, audience members, production vehicles, deliveries, etc.). These trip totals were used in the air quality analysis in Section IV.A, Air Quality, of the Draft EIR. As such, the air quality analysis accounts for all Project trips, including visitor and audience trips. Also refer to Section A of the Topical Response regarding the evaluation of VMT impacts based on the daily work VMT per employee, consistent with the OPR Technical Advisory.

Figure 1 on page 11 of the Transportation Assessment (Appendix M.1 of the Draft EIR) shows that the Project would contain 12 sound stages which is consistent with the 350,000 square feet of total sound stages shown in Table 7 on page 82 of the Transportation Assessment.

The Mobility Hub proposed for the Project would serve employees, visitors, or audience members by providing multi-modal transportation services to or from the Project Site. As discussed in detail in Topical Response No. 10, Trip Generation, the studio audience trips are inherent in the empirical trip generation rates that were used in the Transportation Assessment (Appendix M.1 of the Draft EIR) to estimate Project trips. There is no evidence provided by the commenter to support the statement that the Project could have 5,000 visitors per day. Refer to Section B, Visitor Trips, of Topical Response No. 10, Trip Generation, for a detailed discussion of the number of audience stages and audience visitors under existing conditions and with the Project.

Because most of the trips to and from the Project Site are generated by employees, the VMT analysis was conducted based on the Project serving as an employment destination. As discussed in detail in Topical Response No. 8, Vehicle Miles Traveled, the VMT analysis followed guidelines from *Technical Advisory on Evaluating Transportation Impacts in CEQA* (California Governor's Office of Planning and Research, December 2018) and appropriately focused on home-based-work attraction trips for estimating work VMT per employee. When other trip types are a small component of overall VMT, page 5 of the OPR Technical Advisory recommends that the focus of VMT reduction efforts should be on trips between home and work. As described in Topical Response No. 10, Trip Generation, the visitor trips to the Project Site represent a small percentage of the total trips and therefore the focus on work VMT per employee is the appropriate measure of the potential transportation environmental impacts of the Project.

Comment No. 26-32**VTM Reductions are Overestimated**

On Page IV.A-531 the DEIR assumes VMT reduction features result in an approximately 37% reduction in overall VMT, citing SCAG RTP/SCS strategies as the basis of the reductions in the length and number of automobile trips. However, as described in more detail in the GHG Section of the Ramboll Report, CARB's Draft SB 150 2022 Progress Report (https://ww2.arb.ca.gov/sites/default/files/2022-06/2022_SB_150_Main_Report_Draft_1.pdf) indicates that most trends (e.g., land use and housing trends, travel behavior, per capita VMT, etc.) “demonstrate limited progress in meeting the targets through 2019” and “many trends moved in the wrong direction, away from advancing climate goals and showing worsening inequality.” The report concludes that “Californians are driving more... despite State planning statutes that encourage better transportation and planning decisions.” In other words, the DEIR's reliance on a plan that has been found inadequate renders the assumed VMT reductions flawed.

The DEIR must identify realistic VMT reductions (if any) that can be attributed to the Project. What evidence supports a 37% reduction in overall VMT that is based in empirical data? Why is the City using 37% when the existing data demonstrates the actual percentage is much lower? The analysis should be re-run without the assumed reduction.

The number of parking spaces being built also suggests the Project applicant also assumes the use of public transit is overstated. The Project proposes 3 spaces for every 1,000 square feet of office. This is above the LAMC's standard requirement of 2 spaces for every 1,000 square feet of office. How does the Project justify a 15% trip reduction (and concomitant) reduction in VMT when a higher rate of parking is proposed? What evidence, is there to support the 15% reduction in the face of the Project's proposed parking?

Response to Comment No. 26-32

Please refer to Response to Comment No. 26-E.1-22 for a discussion of the 37 percent reduction in overall VMT with incorporation of TDM measures and in comparison to the MXD VMT provided in the LADOT VMT Calculator.

The proposed rate of three parking spaces per 1,000 square feet of office does not conflict with the 15-percent transit usage assumption. Consistent with Table 1 of the City's *VMT Calculator Documentation Version 1.3* (May 2020), the Project assumes four employees per 1,000 square feet of office space. With 15 percent riding public transit, there are 3.4 employees per 1,000 square feet using other modes, including many drivers. Refer to Section A, TDM Effects on Trip Generation, of Topical Response No. 11, Transportation Demand Management, for a detailed discussion of the 15-percent trip

generation adjustment. Refer to Topical Response No. 13, Parking, for additional information on the validity of the Project's proposed parking supply.

Comment No. 26-33

Overlapping Construction and Operational Emissions Not Properly Calculated and Analysed [sic]

Has the applicant provided a construction phasing schedule for the 20-year construction scenario? Without that information how could the DEIR analyze the emissions associated with a 20-year construction plan?

The DEIR does not properly evaluate the emission scenarios throughout the potentially very long duration of Project construction (20 years). While Table IV.A-13 on page IV.A-78 in DEIR Chapter IV purports to show emission estimates for overlapping construction and operation, the underlying model runs for construction emissions were not performed properly.

Construction of the Project could-extend to 2043. As such, it is likely that construction emissions would occur in parallel with operational emissions. The construction emissions presented in the DEIR represent 50% of the maximum daily intensity that was found in CalEEMod runs for each of the five-year increments presented in these tables. But the 50% value was arbitrarily selected, with no substantial evidence supporting its use. The DEIR should provide detailed information as to an estimate of what level of construction activity may occur for the entire duration of a 20-year construction period and then align them with the anticipated operational emissions. The Project applicant should provide information as to a phasing plan for the Project indicating how that Project would be constructed over a 20-year period.

Response to Comment No. 26-33

Please refer to Response to Comment No. 26-E.1-24 for a discussion of the 20-year build out analysis and assumptions.

Comment No. 26-34

DEIR uses old emissions models and, even then, misapplies them

The DEIR fails to utilize or even address the federal 2010 1-hour NO₂ standard. The DEIR must evaluate the Project's potential impact relative to this federal standard. In other words, the DEIR must run the appropriate models and disclose their results.

Also, as explained in the Ramboll Report, the DEIR and appendices lack basic information and the emissions modeling is akin to a black box for which even technical experts have difficulty understanding or replicating the results. It is virtually impossible to “connect the dots” in the analyses.

- The DEIR does not utilize the most recent version of CalEEMod and the Emission FACtor (EMFAC) model. The DEIR uses CalEEMod2020.4.0, which in turn uses EMFAC2017. EMFAC2021 has been available on the EMFAC web tool for over a year and is used in CalEEMod2022. Please re-run the analysis using the EMFAC2021 model.
- The DEIR does not provide complete technical documentation in the appendices for the air quality and GHG analyses, and so it is not clear if the peak daily emissions are represented in the DEIR. The missing output files prevent the reviewer from verifying the technical analyses and results of the analysis. The information must be provided in a recirculated DEIR.
- There are numerous assumptions in the CalEEMod analysis that do not appear to be consistent or accurate, such as unsupported changes in energy intensity factors.
- The DEIR does not adequately evaluate the various types of permitted uses that would be allowed on the Project Site. Among the various permitted uses are: fueling stations; vehicle repair; maintenance and storage facilities; warehouses; and helipads. No information is provided regarding the operation of these permitted uses. There is an extensive list of permitted uses that would be allowed, most of which do not appear to be analyzed in the Project’s CalEEMod runs, which only include the following land uses: production offices, sound stages, retail centers, and a restaurant. As a result, the Project’s estimated air quality and greenhouse gas emissions may not be accurate if other permitted uses were constructed.
- Emissions caused by wind-blown dirt are not adequately analyzed in the DEIR. Any excavated soil becomes a potential source of fugitive dust that may be carried throughout the community by wind erosion. The DEIR omits analysis of the impact of fugitive dust from wind and the radius that may be impacted. In particular, the DEIR fails to provide specific analysis of Santa Ana winds that occur periodically on-site and alter the typical wind pattern, resulting in a different impact radius for air emissions. The DEIR omits analysis of impacts from air emissions generated by the extensive cutting, filling, and hauling of soils during construction during Santa Ana wind events, which poses a high risk to health and safety. This omitted analysis of wind erosion and of Santa Ana winds understates the Project’s air quality impacts. The DEIR should evaluate the potential impacts to community from emissions caused by wind.

Response to Comment No. 26-34

Please refer to Response to Comment No. 26-E.1-21 for a discussion of localized construction and operational emissions regarding the federal 1-hr NO₂ standard. The significance conclusions provided in Tables IV.A-9, IV.A-10, IV.A-11, and IV.A-13 of Section IV.A, Air Quality, of the Draft EIR remain unchanged when considering the calculated LST for the federal 1-hour NO₂ standard. Localized impacts remain less than significant.

Please refer to Response to Comment No. 26-E.1-25 for an explanation as to the applicability of the CalEEMod 2020.4.0 version used in the Draft EIR and a discussion of CalEEMod 2022.1.1 results included in Appendix FEIR-9 of this Final EIR for informational purposes.

Please refer to Response to Comment No. 26-E.1-25 regarding technical documentation for the air quality and GHG analyses. The commenter's report incorrectly asserts that the CalEEMod output file provided in Draft EIR Appendix B is missing pages. As discussed in Response to Comment No. 26-E.1-25, documentation and CalEEMod output files provided in Draft EIR Appendix B properly identify Project construction and operational impacts.

Please refer to Response to Comment No. 26-E.1-27 for a discussion of changes to CalEEMod default industrial park land use energy factors to account for Project-specific utility requirements.

Please also refer to Response to Comment No. 26-E.1-27 for a discussion of allowable land uses and the applicability of Project emissions, estimated using CalEEMod, for representative land uses. The Project would not include a fueling station, vehicle repair, or warehouse, and these uses would not be permitted under the proposed Specific Plan. Refer to Topical Response No. 3, Permitted On-Site Uses, and Section III, Revisions, Clarifications, and Corrections to the Draft EIR. Refer to Response to Comment No. 26-15 regarding the helipad.

As discussed in Response to Comment No. 26-26, localized air quality impacts were analyzed using SCAQMD's LST methodology. The emission limits from the LST methodology for a given source receptor area (SRA) were developed by SCAQMD based on dispersion modeling incorporating localized meteorological data and background pollutant concentrations. Therefore, since the LST methodology already accounts for the effects of local meteorological conditions, such as Santa Ana winds, the mitigated localized construction impacts, summarized in Table IV.A-11 of the Draft EIR, are appropriate and considerate of localized meteorological conditions.

Comment No. 26-35**DEIR Undercounts Emissions by Failing to Include Basecamps and Mobility Hub in Analysis**

The DEIR does not appear to evaluate emission sources from uses within the basecamps, production areas, and Mobility Hub in its analysis. The DEIR states that the Project is redefining floor area to exclude base camp activities and other production areas; this does not mean that there are not emissions associated with these activities. Whatever the square footage is called, the impacts from how the space is to be used must be analyzed.

The CalEEMod inputs on page 264 of Appendix B lists the land uses that were used to evaluate emissions. It does not appear to include emissions associated with basecamps, certain production areas, or the Mobility Hub. These uses will clearly have emissions associated with them. For instance, as discussed below, basecamps will include diesel trucks, portable generators and other equipment, as may the below production areas. The Mobility Hub will include vehicles coming and going throughout the day, and idling while awaiting pickups. The DEIR's analysis of water usage includes both the basecamps' and Mobility Hub's usage; why wasn't the same analysis done for air quality? The DEIR must be revised to account for emissions from basecamps, all production areas (including all production zones whether included in floor area or not) and the Mobility Hub.

Response to Comment No. 26-35

The trips associated with basecamp areas and the Mobility Hub are accounted for in the transportation analysis. Refer to Topical Response No. 10, Trip Generation, for a more detailed explanation of the derivation of the trip generation estimates for the Project, including Section D, Basecamp, for a discussion of basecamp trips.

As discussed in Response to Comment No. 26-160, the Mobility Hub would not be a source of net new trips because it would generate fewer new trips than it displaces. The Mobility Hub would reduce single-occupant vehicle trips to and from the Project Site and thus reduce both vehicle trips and VMT. Therefore, the air quality, GHG, and noise analyses in the Draft EIR are conservative because they are based on the higher number of trips and VMT that do not measure the overall positive effects of the Mobility Hub.

As discussed in Topical Response No. 2, Definition of Floor Area is Appropriate, the EIR accounts for the potential physical environmental impacts of all proposed uses and activities, regardless of whether they are within the definition of floor area.

As discussed in Response to Comment No. 26-E.1-28, within the Draft EIR, electricity and GHG emissions associated with lighting of basecamp areas and the Mobility

Hub were accounted for in the GHG emissions and energy calculations associated with covered parking areas. However, as part of this Final EIR, these components were separately evaluated within the confirmatory air quality, GHG, and energy analyses included as Appendix FEIR-9. As shown in these confirmatory analyses, impacts would remain less than significant.

Also note that no portable generators would be used for basecamp and Mobility Hub operations, and electrical hookups would be provided for trailers to minimize use of combustion powered equipment.

Comment No. 26-36

DEIR Ignores Portable Generators Spread Across the Project Site

According to the Project Description, power generators would be used to supply power to the basecamps. But the DEIR fails to indicate whether these portable generators would run on diesel fuel or some other fuel, such as compressed natural gas (CNG).

If they combust diesel fuel, then they will emit DPM and other TACs, apparently without any restrictions on location, hours of use, or duration of use.

Furthermore, it appears that large areas of basecamps and other production areas are to be located below grade and in parking structures and it's unclear how diesel trucks and generator emissions will be controlled. The DEIR must calculate the emissions associated with these generators (and diesel trucks) and model their health impacts on the sensitive receptors.

Similarly, fuel stations can be a source of TACs both on-site and offsite, including for sensitive receptors. The DEIR includes inadequate information on the locations and specifications (e.g., how many pumps) of these fuel stations.

Response to Comment No. 26-36

Power generators would not be used to supply power to the basecamps. While existing production activities occasionally require the use of small portable generators when electrical hookups are not available, the Project will provide a sufficient number of electrical hookups in basecamp areas such that use of portable generators will be prohibited. Project Design Feature GHG-PDF-3 is included in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, to require the installation of additional electrical hookups at all basecamp areas. Diesel trucks accessing basecamps would travel on-site for short distances and would plug into electric power when parked. Diesel trucks would also comply with a CARB-mandated ATCM which limits idling to no more than five

minutes at a time. As discussed in Topical Response No. 10, Trip Generation, trip generation estimates in the Draft EIR included trips associated with basecamp operations.

Also note that, while outdoor production activities may occur above Project Grade, no active production activities or uses would be located in the basecamp or parking areas below Project Grade. Refer to Figure II-6(a) in Section III, Revisions, Clarifications, and Corrections to the Draft EIR.

A fueling station would not be permitted under the proposed Specific Plan. Accordingly, the fueling station use has been removed from Section II, Project Description, of the Draft EIR. The removal of fueling operations is included in Section III, Revisions, Clarifications, and Corrections to the Draft EIR.

Comment No. 26-37

Failure to Assess Applicability of SCAQMD Warehouse Indirect Source Rule

On May 7, 2021, the SCAQMD Governing Board adopted Rule 2305, known as the Warehouse Indirect Source Rule (ISR). The rule requires warehouses greater than 100,000 square feet to directly reduce nitrogen oxide (NOx) and DPM emissions, or to otherwise reduce emissions and exposure of these pollutants in nearby communities.

Warehouses are a key destination for heavy-duty trucks and have other sources of emissions like cargo handling equipment, all of which contribute to local pollution, including toxic emissions, to the communities that live near them. Among the Project permitted uses is warehouses. No further information is provided regarding the warehouses. How much warehousing would be permitted? What size of warehouse? How many? As indicated by the very existence of the ISR, warehouses on the Project Site could attract large numbers of trucks on an ongoing basis that would further burden local air quality with DPM and other TACs, as well as regional air quality with NOx emissions.

While the DEIR mentions the ISR (Rule 2305), it fails to analyze the applicability of the ISR to the on-site warehouses. The DEIR must disclose the square footage of warehouses on the Project Site, assess applicability of Rule 2305, and notify the public of the Project's compliance plan.

Response to Comment No. 26-37

The commenter discusses Rule 2305, which applies to warehouse facilities with warehouse buildings greater than or equal to 100,000 square feet and defines a warehouse as a building which stores cargo, goods, or products on a short- or long-term basis for later distribution to businesses and/or retail customers. The Project does not include the defined

warehouse uses, and such warehouse uses would not be permitted under the proposed Specific Plan. Accordingly, the warehouse use has been removed from Section II, Project Description, of the Draft EIR; refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR. Thus, Rule 2305 does not apply to the Project. As stated on page II-16 in Section II, Project Description, of the Draft EIR, the Project includes five uses—sound stage, production support, production office, general office, and retail uses. See Topical Response No. 3, Permitted On-Site Uses, for additional detail on the permitted on-site land uses.

Comment No. 26-38

Inconsistency with South Coast Air Quality Management District Rules

Additionally, Rule 1166 lays out certain requirements for disturbed and excavated soils that may contain petroleum hydrocarbons. Petroleum hydrocarbons (e.g., tar or oil) are present at the Project Site. Rule 1166 requires submission of an excavation plan application. Additionally, excavation operations need to be monitored for VOC concentrations and the excavation plan must include a discussion of how the Project will handle VOC-contaminated soil. How will the Project comply with SCAQMD Rule 1166? Given the sensitive uses immediately adjacent to the Project Site (residences, schools, park) additional information is required to assess the potential emission of hazardous substances, such as petroleum, hydrogen sulfide and VOCs during soil disturbance and other construction activities.

The Project Site has naturally-occurring methane that will create a safety problem for the underground facilities that would be allowed by the DEIR. This methane can build up and risk explosions. The DEIR refers to methane venting systems but does not refer to SCAQMD Rule 219. How will the Project comply with SCAQMD Rule 219? That rule includes an exemption for certain residential methane venting systems, but if a system vents H₂S or other TAC emissions to atmosphere, a District permit may be required and District Rule 1401's health risk limits might be triggered. The DEIR must perform the necessary analysis to determine whether compliance with SCAQMD Rule 2019 or Rule 1401 is required, how compliance will be achieved, and the potential impacts associated with compliance.

Response to Comment No. 26-38

As discussed on page IV.F-43 in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR, in the event that VOC-impacted soils are encountered during construction or construction occurs in areas of known or potential contamination, appropriate handling, off-site disposal, and/or treatment would be implemented in accordance with the Soil Management Plan (included as Appendix B of the Site Summary Report [Appendix G.1 of the Draft EIR]) and applicable regulatory requirements, including SCAQMD Rule 1166

(Volatile Organic Compound Emissions from Decontamination of Soil). Pursuant to Mitigation Measure HAZ-MM-1 (see pages IV.F-50 to IV.F-53 of the Draft EIR) and the Soil Management Plan, in the event VOC-contaminated soil is encountered during excavation, a SCAQMD Rule 1166 permit must be obtained before resuming excavation. Rule 1166 defines VOC-contaminated soil as a soil which registers a concentration of 50 ppm or greater of VOCs as measured before suppression materials have been applied and at a distance of no more than 3 inches from the surface of the excavated soil with an organic vapor analyzer (OVA) calibrated with an appropriate calibration solution, such as hexane or isobutylene. Based on available subsurface soil, soil vapor and groundwater testing data, conditions that might exceed the 50 ppm VOC level would not be commonly encountered at the Project Site, but excavation at the residual gasoline plume in soil and groundwater (northeast corner of the Project Site) may create limited conditions above the 50-ppm level due to gasoline range organics (GRO) and benzene, toluene, ethylbenzene, and total xylenes (BTEX).

Rule 1166, Volatile Organic Compound Emissions from Decontamination of Soil, is applicable to excavation and grading of soil containing VOC materials. As discussed on pages 16–17 of the Soil Management Plan and set forth in Mitigation Measure HAZ-MM-1, either a Various Locations permit and plan, or a site-specific permit and plan will be required for excavation, depending upon the volume of soil to be excavated per Rule 1166. Undisturbed soil is not included in the scope and jurisdiction of Rule 1166. Notifications, monitoring, and reporting related to the SCAQMD Rule 1166 permit will be the responsibility of the General Contractor. Requirements under Rule 1166 are briefly summarized below. The list below is a general, not comprehensive, list of Rule 1166 requirements for VOC-contaminated soil handling, stockpiling, and off-site disposal. In addition, Rule 1166 requirements vary depending upon concentrations of VOC encountered.

- If a Rule 1166 permit is required, an air monitoring plan may be required by the SCAQMD. Air monitoring plans are intended to protect the surrounding community from harmful exposure to VOCs from the Project Site and typically entail stationary monitoring stations for sample collection for laboratory analysis. Protection of on-site construction workers shall be accomplished by development and implementation of a Health and Safety Plan.
- VOC-contaminated soil is determined at the time of excavation by measurement of VOCs emitted from the soil cut face with a photoionization detector (PID), equipped with a 10.6 electron volt (eV) lamp, calibrated with hexane or isobutylene. The ambient air in all areas of soil impact (e.g., excavation) will be measured and recorded every 15 minutes.
- Stockpiles are required to be managed in accordance with specific criteria stipulated in Rule 1166 and the Rule 1166 permit. At a minimum, stockpiles of VOC contaminated soil must be segregated from non-VOC-contaminated soil.

Water suppressant and/or plastic sheet covering with sand-bag anchors may be required for VOC-contaminated soil stockpiles.

- No on-site or off-site spreading, grading, or screening of excavated VOC contaminated soil is permitted.
- VOC-contaminated soil must either be shipped off-site for appropriate disposal or on-site treatment must be initiated within 30 days of excavation. If total VOCs are 1,000 ppm or greater (by PID), then the soil must be placed into sealed containers or directly loaded into haul trucks moistened with water, covered, and immediately transported off-site the same day to an appropriate disposal facility.

As discussed in Response to Comment Nos. 13-4 and 16-28, with regard to potential soil contamination, any residual concentrations would be appropriately managed during all soil disturbance activities through implementation of the protocols described in the Soil Management Plan set forth in Mitigation Measure HAZ-MM-1. Required protocols would address soil sampling and analysis, stockpiling of affected soils, soil re-use, decontamination, and dust control. For example, as stated in Mitigation Measure HAZ-MM-1, if the General Contractor or subcontractor(s) encounter any soil that is stained or odorous (Suspect Soil), the General Contractor and subcontractor(s) shall immediately stop work and take measures to not further disturb the soils (e.g., cover suspect soil with plastic sheeting) and inform the property owner's representative and the environmental monitor. The environmental monitor, an experienced professional trained in the practice of the evaluation and screening of soil for potential impacts working under the direction of a licensed Geologist or Engineer, shall be identified by the property owner prior to the beginning of work. The Suspect Soil must be managed and handled in accordance with Sections 5.3.1 to 5.3.3 of the Soil Management Plan.

Odors potentially produced by excavation activities, such as from hydrogen sulfide, will be monitored and controlled pursuant to SCAQMD Rule 402, Nuisance [SCAQMD, 1976] and an odor monitoring plan. With respect to methane gas control, refer to Response to Comment No. 13-6. As stated therein, the installation of a methane mitigation system will address potential vapor intrusion from residual fuel hydrocarbons from the former Texaco station, and naturally occurring hydrogen sulfide.

With respect to SCAQMD Rule 219, Equipment not Requiring a Written Permit Pursuant to Regulation II, this rule applies to passive and intermittently operated active venting systems used at and around residential structures to prevent the accumulation of naturally occurring methane and associated gases in enclosed spaces, which is not applicable to the Project because the Project does not include residential structures. Therefore, a permit exception in accordance with SCAQMD Rule 219 is not required. As discussed in Response to Comment No. 13-6, the Project's methane mitigation system will be reviewed and approved by LADBS and will ensure a less-than-significant impact.

SCAQMD Rule 1401, New Source Review of Toxic Air Contaminants, this rule specifies limits for maximum individual cancer risk (MICR), cancer burden, and noncancer acute and chronic hazard index (HI) from new permit units, relocations, or modifications to existing permit units which emit toxic air contaminants listed in Table I of Rule 1401, which does not include methane.

Note that the SCAQMD provides guidance for compliance with Rule 1401, and the quantitative HRA prepared for the Project in response to comments on the Draft EIR (refer to Appendix FEIR-10 of this Final EIR) is consistent with this guidance. In addition, any permitted sources on-site would also be required to obtain a SCAQMD Permit, consistent with Rule 1401.

Comment No. 26-39

The DEIR's Mitigation Proposals Are Inadequate

CEQA requires the City to implement all feasible mitigation measures that would reduce the Project's significant impacts. The DEIR's proposed mitigation measures are insufficient to mitigate the identified and unidentified significant impacts. Therefore, the City must adopt further, feasible measures as described more fully below.

The Project's construction air quality impacts would remain significant and unavoidable after mitigation. In addition, the Project's concurrent construction and operational emissions under the long-term buildout scenario would remain significant and unavoidable after mitigation. To minimize these impacts as required by CEQA, the DEIR should consider the feasibility of the following mitigation measures for the Project and apply all feasible measures:

- Use of exclusively electric-powered construction equipment where such models are available.
- Use of zero emission or near-zero emission (ZE and NZE, respectively) heavy-duty trucks and other equipment during construction. Use of these trucks would further reduce NOx emissions.
- Use of ZE and NZE vendors and delivery trucks during operation, particularly for the warehouse operations given the JSR discussed herein.
- Installation of not only light-duty EV charging stations, but also charging stations for medium- and heavy-duty EVs.
- A prohibition on use of diesel and CNG portable generators, at basecamps or elsewhere on-site. Installation of a backbone electrical grid so that plugs are available at all potential basecamp sites.

Response to Comment No. 26-39

The commenter summarizes a series of proposed mitigation measures intended to address the Project's significant and unavoidable air quality impacts. Please note that the commenter's consultant (Comment Letter No. 26-E.1) recommended these measures as mitigation for GHG impacts, not air quality (see Comment No. 26-E.1-38), and there is no technical basis for applying these measures to air quality.

The similar mitigation measures are discussed in greater detail in responses to the following comments:

- Use of electric-powered (ZE and NZE) construction equipment: Response to Comment Nos. 1-2 and 26-40;
- ZE and NZE operational trucks: Response to Comment No. 26-E.1-38; and
- Medium- and heavy-duty EV charging stations: Response to Comment No. 26-E.1-38

With respect to construction ZE and NZE construction trucks, ZE and NZE truck use will occur in the future and it is not within the Project's operational influence to ensure that only ZE or NZE vehicles operate at the Project Site during construction. During construction, numerous independent contractors will operate haul trucks and delivery trucks, who may themselves subcontract other entities, including small businesses, to provide hauling and deliveries to meet those needs. There is simply no feasible mechanism to fairly apply and enforce such a requirement given the scale of Project construction. Development of commercial ZE and NZE technologies is ongoing and further development is necessary to meet the requirements of CARB's adopted Advanced Clean Trucks program, in-development Advanced Clean Fleets program, and any other future ZE and NZE vehicle programs or policies. Moreover, the needs of commercial ZE and NZE vehicles have changed dramatically over the past decade, and, as the adoption of ZE and NZE trucks increases and new ZE and NZE vehicles technologies emerge, the needs will continue to evolve. As discussed on page IV.A-44 in Section IV.A, Air Quality, and on page IV.E-48 in Section IV.E, Greenhouse Gas Emissions, of the Draft EIR, mobile source emissions were estimated using emission rates from the current version of CalEEMod, which do not account for the use of ZE and NZE trucks and do not account for improvements to fuel economy or emissions standards beyond 2026. Therefore, Project mobile source emissions conservatively overestimate emissions for this source. The truck trips estimated for the Project in the Draft EIR represent the reasonably foreseeable trips which could be associated with Project construction. Due to the conservative vehicle emissions estimates in the Draft EIR, actual future construction mobile source emissions are expected to be lower than those presented in the Draft EIR.

With respect to the commenter's suggestion to prohibit the use of portable generators at basecamps, Project Design Feature GHG-PDF-3 is included in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, to require the installation of additional electrical hookups at all basecamp areas to eliminate the need for portable generators.

Comment No. 26-40

The following mitigation measures which appear to be feasible for the Project also should be imposed:

Construction Mitigation Measures
In construction contracts, include language that requires all off-road equipment with a power rating below 19 kilowatts (e.g., plate compactors, pressure washers) used during Project construction be battery-powered. The use of battery operated equipment will reduce emissions associated with diesel/gasoline powered equipment.
In construction contracts, include language that requires all heavy-duty trucks entering the construction site, during the grading and building construction phases be model year 2014 or later. All heavy-duty haul trucks should also meet CARB's lowest optional low-NOx standard. This goes beyond the proposed measure of requiring 2010 model year or newer and would provide additional reductions beyond those identified in the DEIR.
Require all construction vehicles to be rinsed prior to exiting the construction site. This will reduce fugitive dust emissions associated with the Project.
Use cement blended with the maximum feasible amount of flash or other materials that reduce emissions from cement production.
Use lighter-colored pavement where feasible. This Will prevent heat islands which can increase air pollution.
All exposed surfaces shall be watered with non-potable water at a frequency adequate to maintain minimum soil moisture of 12%. Moisture content can be verified by lab samples or moisture probe.
All excavation, grading, and/or demolition activities shall be suspended when average wind speeds exceed 20 mph. This will prevent fugitive dust from spreading into the nearby sensitive receptor areas.

Wind breaks (e.g., trees, fences) shall be installed on the windward side(s) of actively disturbed areas of construction. Wind breaks should have at maximum 50% air porosity. This will prevent fugitive dust from spreading into the nearby sensitive receptor areas,

The simultaneous occurrence of excavation, grading, and ground-disturbing construction activities on the same area at any one time shall be prohibited. Activities shall be phased to reduce the extent of disturbed surfaces at any one time.

Use low-VOC coatings beyond the local requirements.

Require that all construction equipment, diesel trucks, and generators be equipped with Best Available Control Technology for emission reductions of NO_x and PM.

Operation Mitigation Measures

Provide off-site safety or other improvements for bicycles, pedestrians, and transit connections beyond the referenced cross-walk improvements.

Given the Specific Plan nature of the Project and its long-term buildout, require the Project to report energy use, and set specific targets for reductions in energy use over time.

Provide a micromobility charging hub, such as a Perch portal (<https://www.perchmobility.com/>) to be used by employees and visitors.

Response to Comment No. 26-40

The commenter recommends a variety of emissions mitigation measures for consideration. Please note that the commenter's consultant (Comment Letter No. 26-E.1) recommended these measures as mitigation for GHG, not air quality (see Comment No. 26-E.1-39), and there is no technical basis for applying these measures to air quality.

As discussed on pages IV.A-62, IV.A-65, and IV.A-76 in Section IV.A, Air Quality, of the Draft EIR, the Project would result in significant regional construction emissions of NO_x, significant localized construction emissions of PM₁₀ and PM_{2.5}, significant regional combined construction and operational emissions of VOC under the long-term buildout scenario, and less than significant regional and localized operational emissions. As discussed on page IV.E-83 in Section IV.E, Greenhouse Gas Emissions, of the Draft EIR, the Project would be consistent with applicable plans, policies, and regulations pursuant to GHG emissions and, thus, no mitigation is required. The Draft EIR details various PDFs and mitigation measures included in the Project for the minimization of air quality and GHG emissions. All recommended measures have been considered, compared to existing PDFs

and mitigation measures and, if not already present in the document, analyzed for applicability and feasibility as follows to reduce air quality impacts.

The commenter suggests that small (less than 19 kilowatt) off-road construction equipment be electrically powered. Per the commenter's suggestion, Mitigation Measure AIR-MM-1 has been revised as presented in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, and now additionally requires, to the extent commercially available, the use of electric small (less than 19 kilowatt) off-road construction equipment.

The commenter suggests a mitigation measure requiring the use of model year 2014 or newer heavy-duty trucks meeting CARB's low-NO_x standard during construction. Per the commenter's suggestion, Mitigation Measure AIR-MM-2 has been revised as presented in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, and now additionally requires, to the extent commercially available, the use of model year 2014 or newer heavy-duty trucks meeting CARB's 2013 optional low-NO_x standard.

The commenter suggests that construction vehicles be rinsed prior to exiting the construction site. As discussed on page IV.A-17 in Section IV.A, Air Quality, of the Draft EIR, SCAQMD Rule 403—Fugitive Dust would require the use of best available control technologies (BACT) for dust control, including measures for the prevention of dust track-out onto public roads. As such, a specific measure to rinse vehicles prior to exiting the construction site is not necessary as compliance with SCAQMD Rule 403 requires BACT measures to be included. The commenter suggests that cement be blended with the maximum feasible amount of flash or other emission-reducing products. Incorporation of high levels of flash (i.e., fly ash or coal ash) can reduce GHG emissions associated with concrete production (which occurs off-site) by reducing CO₂ emissions through mineral carbonation. However, as discussed above, the Project would result in a less-than-significant GHG impact. Thus, no mitigation is required. This comment has not provided substantial evidence of how the use of flash in concrete would reduce significant Project-related air quality impacts. Furthermore, flash contains hazardous contaminants, including mercury, cadmium, and arsenic, which could negatively impact communities in the vicinity of the Project Site if carried off-site by local winds. Based on the above information, this measure does not need to be considered further in this Final EIR. The commenter suggests that lighter-colored pavement be used to reduce heat island effects; however, this measure is already addressed through Project Design Feature GHG-PDF-1, which mandates that the Project be designed to meet the equivalent of LEED Gold or higher sustainability standards. These standards require design elements, such as those suggested by the commenter, to reduce the heat island effects of the Project. However, as discussed above, the Project would result in less-than-significant GHG impacts. Thus, no mitigation is required. Furthermore, this comment has not provided substantial evidence of how this measure would reduce significant Project-related air quality impacts.

The commenter suggests a variety of mitigation recommendations related to the control of fugitive dust, including watering of disturbed areas, suspension of construction activities during periods of high wind, use of wind breaks at the boundaries of construction activities, and phasing of construction activities. As discussed on page IV.A-17 in Section IV.A, Air Quality, of the Draft EIR, SCAQMD Rule 403—Fugitive Dust would require the use of BACTs for dust control, which includes mandatory control actions and dust control contingency measures incorporating each of the commenter's suggested measures as appropriate and applicable to control fugitive dust.

The commenter suggests that low-VOC emission coatings be used beyond local requirements. As discussed on page IV.A-17 in Section IV.A, Air Quality, of the Draft EIR, SCAQMD Rule 1113—Architectural Coatings limits the allowable VOC content of architectural coatings in the SCAQMD's jurisdiction and is regularly amended to reduce allowable VOC content of architectural coatings based on the commercial availability of low-VOC products. This rule was most recently amended in 2015, limiting building envelope coatings to low-VOC content levels (50 grams per liter) beginning in 2019. Construction and subsequent operation of the Project will be consistent with Rule 1113 requirements as even lower-VOC products are made more commercially available and the rule continues to be updated.

The commenter suggests that BACT be employed for construction equipment PM and NO_x emissions. The suggested measure is already addressed through Mitigation Measure AIR-MM-1, which requires the use of Tier 4 Final emission standard equipment. As discussed in Response to Comment No. 1-2, Mitigation Measure AIR-MM-1 has been revised as presented in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, and now additionally requires equipment to meet future CARB Tier 5 emission standards if commercially available.

The commenter suggests a mitigation measure pertaining to off-site safety or other improvements for bicycles, pedestrians, and transit connections. As described on pages II-21, II-23, and II-25 in Section II, Project Description, of the Draft EIR, the Project would include an array of frontage and public realm improvements to enhance pedestrian, bicycle, and bus access. Refer also to Response to Comment Nos. 16-72 and 26-E.4-3. Additionally, consistent with Project Design Feature TR-PDF-2, the Project will implement a series of TDM measures that exceed the requirements established in the current TDM Ordinance and support pedestrian safety and additional bike lanes.

Regarding the recommendation to report energy use and set specific targets for reductions in energy use over time, please refer to pages IV.C-41 and IV.C-43 in Section IV.C, Energy, of the Draft EIR, as neither construction nor subsequent operation of the Project would result in significant impacts with respect to energy; thus, the suggested

measure, which would not directly reduce energy consumption, is not necessary or required under CEQA.

Regarding the recommendation to include a micromobility charging hub, please refer to page IV.E-51 in Section IV.E, Greenhouse Gas Emissions, of the Draft EIR, in which the Project would comply with the City's EV charging requirements, which specify that 10 percent of new parking spaces must include EV charging equipment, and a total of 30 percent of all new parking spaces would be required to be EV "ready," which must be capable of supporting future EV charging equipment. This requirement would effectively implement the recommended measure.

Comment No. 26-41

B. Cultural Resources and Tribal Cultural Resources

The DEIR's sections on Cultural Resources and Tribal Cultural Resources are fundamentally incomplete and inadequate. See attached **Exhibit 2, Letter Report on the Review of the Draft Environmental Impact Report and Supporting Technical Appendices for the TVC 2050 Project** from Statistical Research, Inc. (SRI Report). The DEIR's Cultural Resources and Tribal Cultural Resources sections must be revised and recirculated for further public review and comment.

The DEIR Defines the Period of Significance Too Narrowly

The DEIR claims that the Project's period of significance only extends from 1952 to 1963. As discussed in the SRI Report, the period of significance for the CBS television studio on the Project Site is the span of time when the property actively contributed to the growth and popularity of commercial television, which ended no earlier than 1979.

By improperly limiting the period of significance, the DEIR conveniently excludes the 1969 Mill Addition and the 1976 Support Building from the period of significance and avoids addressing the impacts of the proposed demolition of these likely historic resources. The 1969 Mill Addition and 1976 Support Building were part of the original Television City master plan. Gin Wong, a master architect who coordinated the architectural design and construction of the Primary Studio Complex for Pereira and Luckman, also designed these additions. The Project's Cultural Resource analysis must be redone with an appropriate period of significance, the 1969 Mill Addition and 1976 Support Building must be reevaluated under the more appropriate period of significance of 1952–1979, and the DEIR must be recirculated.

Response to Comment No. 26-41

Refer to Section A, Existing Evaluation and Designation of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, and Response to Comment No. 19-12 regarding the period of significance determined for Television City. As discussed therein, the period of significance was not established by the Draft EIR, but by the adopted HCM designation, which identified the 1952 Primary Studio Complex (including alterations through 1963) as eligible for designation.

The commenter provides no explanation as to how the period of significance was determined improperly. Furthermore, in preparing the Historic Report (Appendix C.1 of the Draft EIR), HRG reviewed all of the relevant materials for consistency with best practices and concluded the period of significance was appropriate. The period of significance ends in 1963 because that is the year CBS ended its vision of a single unified production facility and moved its filmed programming operations to the CBS Studio Center lot in Studio City.

The commenter provides no justification for extending the period of significance to 1979. The commenter incorrectly states that the 1969 Mill Addition and 1976 Support Building “must” be considered historical resources because they were designed by Gin Wong. For the record, the 1969 Mill Addition was designed by Pereira and Luckman, while Wong was the project coordinator. The 1976 Support Building and 1992 East Studio Building were designed by Gin Wong Associates. Although designed by a notable architect, neither the Support Building nor the East Studio Building are of particular merit individually.

A celebrated architect in his own right, Wong’s indispensable contributions to the design and construction of Television City is thoroughly acknowledged in the HCM nomination. NPS guidance, however, states that not every property designed by a master architect is necessarily significant. To be eligible, the property “must express a particular phase in the development of the master’s career, an aspect of his or her work, or a particular idea or theme in his or her work.”⁴³ The improvements at Television City directly credited to Wong do not represent an architectural achievement and did not play an important role in Wong’s career. Therefore, the 1976 Support Building addition and 1992 East Studio Building are not eligible as historical resources in and of themselves or character-defining features of Television City because they were designed by Wong.

Overall, the analysis of historical resources was completed in full compliance with CEQA. This comment does not provide substantial evidence that “significant new

⁴³ Patrick Andrus and Rebecca Shrimpton, National Register Bulletin #15: How to Apply the National Register Criteria for Evaluation (Washington D.C.: U.S. Department of the Interior, 1997), 20.

information” as defined by CEQA Guidelines Section 15088.5 has been added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Also refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 26-42

The Cultural Resources Surveys Are Incomplete

The DEIR fails to include an archaeologic resources report. The DEIR merely relies on information from the Tribal Cultural Resources report, which does not include consideration of archaeological resources from the protohistoric and historical periods and fails to adequately investigate specific types of buried cultural resources with a high likelihood of being present at the Project Site. Why did the City not require a detailed review of cultural resources given the clear evidence that such resources are likely present at the Project Site?

Given the known archaeological resources in the Project area, the Project should follow standard methodology for the evaluation of archaeological resources, including a geoarchaeological study. As detailed in the SRI Report, the level of archaeological resource analysis conducted for the Project, especially in light of the known resources in the area, failed to meet the minimum standards for CEQA review.

Instead, the DEIR surprisingly focuses on prehistoric period information from San Diego and the Mojave Desert instead of the Los Angeles Basin. Why focus on San Diego and the Mojave Desert? The limited Los Angeles Basin information relies on cultural resource surveys that were performed over a decade ago, with the last investigation performed in 2012, and ignores recent research in downtown Los Angeles and the coastal communities. Why was more recent research information excluded?

The DEIR omits historical archaeology, which includes known buried historical period resources on the Project Site and immediate vicinity, such as those relating to the Mexican Rancho Period and the Rancho La Brea, the Gilmore Adobe, the local oil industry, and development of early sports and entertainment businesses, including Gilmore Field and Gilmore Stadium. Why was this rich history ignored? This information is important to anticipating the potential buried resources that can exist in the Project area.

The Tribal Cultural Resources Report is also inadequate because: (1) there was no pedestrian survey completed; (2) the records search area of a ½-mile radius should be increased to 10 miles to capture relevant sites; and (3) the Tribal Cultural Resources Report incorrectly focuses on the wrong regions (e.g., San Diego and Mojave Desert). Further, the DEIR states that copies of four studies within the Project Site were not obtained due to COVID-19 operation protocols. How did the protocols affect the City’s

ability to get copies of the reports? What efforts has the City recently taken to get copies of the reports? Does the City know the results of the reports?

Response to Comment No. 26-42

Regarding the standards for a CEQA review, the need for additional technical analysis considers whether information on the existing conditions is already available and whether substantial evidence has already been identified, such that the agency can make a decision regarding the potential for impacts and evaluate the adequacy of proposed measures to mitigate potentially significant impacts. As explained below, the analysis of the Project's potential impact to archaeological resources in the Draft EIR, including the various technical reports included as appendices to the Draft EIR, satisfies that standard under CEQA. Multiple sources presented in the Draft EIR provide substantial information on the historical setting and existing conditions for the Project Site as they relate to the assessment of archaeological resources. The available information includes the following: results from searches of the California Historical Resources Information System (CHRIS) and Sacred Lands File (SLF); discussion of historical land uses supported by archival photographs, maps, permits, and other published sources; photographs from recent site visits depicting the Project site and surroundings; and geotechnical data. This information was included in the following sources: pages IV.B-16 through IV.B-16, IV.B-57 and IV.B-58 in Section IV.B, Cultural Resources, of the Draft EIR; pages IV.D-11, IV.D-15, and IV.D-16 in Section IV.D, Geology and Soils, of the Draft EIR; pages IV.L-5 through IV.L-13 in the Section IV.L, Tribal Cultural Resources, of the Draft EIR; the Historic Report in Appendix C.1 of the Draft EIR; a historical resources report prepared by Architectural Resources Group (ARG) for the assessment of CBS Television City, which is included as Appendix C to the Historic Report; the Tribal Cultural Resources Report in Appendix C.2 of the Draft EIR; the Preliminary Geotechnical Engineering Investigation in Appendix E.1 of the Draft EIR; and the Phase I Environmental Site Assessment in Appendix G of the Draft EIR.

There is a detailed discussion of the historical background and context for the Project Site in pages 24–28 and 39–44 in the historic resources report by ARG, pages 13–54 in the Historic Report, and pages 20–22 in the Tribal Cultural Resources Report. Relevant portions of are excerpted or summarized in Section IV.B, Cultural Resources, of the Draft EIR. A review of Gabrielino ethnographic literature is included in pages 15–20 and 32–41 in the Tribal Cultural Resources Report. Additional historical sources were included in the review of maps and aerial photographs that are discussed on pages 28–29 of the Tribal Cultural Resources Report. These sections include a discussion of the Spanish and Mexican historical periods; the developments made by the Gilmore family, including the operation of the dairy and their ventures in the oil, sports, and entertainment industry; and the development of the CBS Studios.

The discussion of the CHRIS records search results and on-site soils is especially relevant to analysis of archaeological resources. The CHRIS results are initially referenced on pages IV.B-33 and IV.B-34 of Section IV.B, Cultural Resources, of the Draft EIR, and then repeated on page IV.B-57, and discussed on page 28 of the Tribal Cultural Resources Report. The discussion of on-site soils is included in Section IV.D, Geology and Soils, of the Draft EIR, and the Preliminary Geotechnical Engineering Investigation included in Appendix E.1 of the Draft EIR. The results of the geotechnical investigation were also reviewed and addressed on pages 29–30 in the Tribal Cultural Resources Report. The CHRIS search results identified two historical archaeological sites: CA-LAN-3045H and CA-LAN-2964H. CA-LAN-3045H was identified during construction of The Grove at Farmers Market commercial development. Additional information on these two resources were obtained from studies obtained in the CHRIS search, particularly two reports discussing the archaeological monitoring work conducted in the early 2000s by Cogstone Resource Management Inc. (Cogstone) for The Grove at Farmers Market project: *Archaeological and Paleontological Monitoring Report for Phase I of The Grove at Farmers Market (CA-LAN-3045H), Los Angeles, Los Angeles County, California*; *Final Archaeological and Paleontological Monitoring Report for The Grove at Farmers Market, The Farmers Market Expansion Project, and the Gilmore Adobe Landscaping Project, Los Angeles, Los Angeles County, California*. These reports were both submitted in 2003 and provided additional information on the archaeological components of CA-LAN-3045H and summarized the results of a records search conducted at the time.

The components of CA-LAN-3045H, which include the Gilmore Adobe itself, were composed entirely of historic-period materials (from the nineteenth and twentieth century). While some of the specific components recorded in CA-LAN-3045H are not necessarily also likely to occur within the Project Site (e.g., features from The Original Farmers Market and early 1900s oil extraction), the historical themes and material components referenced in the summary of CA-LAN-3045H constitute a substantial element of the historical context and existing conditions for the Project Site, and thereby provide a reasonable basis on which to analyze the potential for impacts. CA-LAN-2964H was composed of assorted historical refuse found as a diffuse scatter and one brick-lined structure, which mostly date between 1930 and 1950, although a few items date as early as 1901 to 1911. The components were identified during construction monitoring for a mixed-use development and were recorded in two discontinuous parcels situated between the Park La Brea apartments and 3rd Street, west of Cochran Avenue and east of Ogden Drive, between 280 and 990 meters (919 to 3,248 feet) south-southwest of the Project Site. The type and age of materials from CA-LAN-2964H are already represented by the archaeological components in CA-LAN-3045H, which otherwise provides more representative example of the type of archaeological resources likely to be encountered in the Project Site; therefore, detailed analysis or discussion of CA-LAN-2964H is unnecessary and does not contribute any substantially new information on the existing conditions or potential for impacts. The relevance of CA-LAN-2964H in the assessment of the CHRIS records search results is

further summarized in the Supplemental Cultural Memo, included in Appendix FEIR-14 of this Final EIR.

The proximity of CA-LAN-3045H to the Project Site is noted on page IV.B-58 of Section IV.B, Cultural Resources, of the Draft EIR, which recognizes that there is some potential for unknown historic-period materials in the Project Site, adequately considers the type of archaeological resource most likely to be encountered, and provides a reasonable means of mitigating potentially significant impacts if such a resource is identified. Thus, the information already obtained and presented in the above-references sources provided sufficient evidence to reasonably conclude that the Project Site has the potential to contain previously unidentified archaeological resources, particularly materials associated with the historical land uses during the late nineteenth and twentieth centuries.

Regarding the need for a pedestrian survey, the lack of exposed ground surfaces and the availability of information on the existing conditions for the Project Site eliminates the need for a pedestrian survey to adequately assess archaeological resources. Ground photographs taken of the Project Site and surrounding area were provided in Appendix A of the Historic Report, which was included in Appendix C.1 of the Draft EIR. Another set of ground photographs taken of the Project Site and surroundings were provided in Attachment B of the Phase I Environmental Site Assessment, which was included as part of Appendix G in the Draft EIR. Analysis of the recent ground photographs combined with recent aerial imagery made it clear that existing unpaved surfaces on the Project Site were confined to landscaping whose inspection through further pedestrian survey has no obvious utility in an archaeological assessment. While on some occasions it may be helpful to include a pedestrian survey for a mostly paved setting, it is common for an archaeological assessment to exclude this for urban settings. The Supplemental Cultural Memo, included in Appendix FEIR-14 of this Final EIR, provides additional discussion and expert opinion regarding standard archaeological practices and methodological considerations given in assessing the need for pedestrian survey.

Regarding the need for a geoarchaeological analysis, this portion of comment is referring to an analysis that considers archaeological evidence in relationship to geological and environmental data such as sediment type (also referred to as soil), stratigraphy, geomorphology, and topographic setting. Archaeological evidence includes information from previously recorded artifacts and sites, consideration of Native American foraging behaviors and patterns, and historical land uses. A geoarchaeological study may be conducted to answer several different types of research topics, but the most pertinent application in an environmental review under CEQA is assessing the potential for a buried resource within a given project site. Analyzing the potential for a buried resource is also referred to as preservation potential, sensitivity analysis, sensitivity assessment, or buried site assessment. From a regulatory perspective, there are no standard terms and defined methods specific to conducting a geoarchaeological study or analysis of buried site

potential. Rather, this is assessed under CEQA as part of the existing environmental conditions. As discussed above, the presence of CA-LAN-3045H provided sufficient evidence to suggest that archaeological materials similar in nature could occur within the Project Site, as was disclosed on pages IV.B-57 and IV.B-58 in Section IV.B, Cultural Resources, of the Draft EIR. The presence of CA-LAN-3045H and multiple sources discussing the historical background and on-site soils provided the relevant information to support this finding. The Supplemental Cultural Memo, included in Appendix FEIR-14 of this Final EIR, further reinforces the findings of the impact analysis presented in the Draft EIR, Tribal Cultural Resources Report, historical resources report, geotechnical investigation, and Phase I Environmental Site Assessment.

The additional detail presented in the Supplemental Cultural Memo includes information on the internal components of CA-LAN-3045H, and expands the discussion of the geotechnical results, historical land uses, and sensitivity for historical archaeological resources. The Supplemental Cultural Memo also further integrates the archaeological data with the discussion of the geotechnical data otherwise presented in Section IV.D, Geology and Soils, of the Draft EIR, Preliminary Geotechnical Engineering Investigation in Appendix E.1 of the Draft EIR, and the Tribal Cultural Resources Report in Appendix C.2 of the Draft EIR. The need for additional archaeological testing—including but not limited to methods using mechanical excavation and remote sensing—as part of an expanded geoarchaeological assessment was further assessed and confirmed as being unnecessary to support the findings already presented in the Draft EIR, which considers the substantial evidence already provided concerning the likelihood of discovering an archaeological resource and the proposed means of mitigating the potential for impacts. Given the availability of the existing information from multiple data sources, additional sampling is unlikely to contribute any significant information that would materially change the analysis of impacts and recommended mitigation measure provided in the Draft EIR. As stated in the Supplemental Cultural Memo, additional review did not identify any new or substantially more significant impacts than were disclosed in the Draft EIR or considered in the Tribal Cultural Resources Report.

Regarding the adequacy of the CHRIS records search area, a radius of 0.5 mile around the Project Site was used to identify previously recorded cultural and tribal cultural resources, and reports prepared for study areas that have been mapped within the specified radius around the Project area. This radius is among the three most commonly used by technical experts for assessing archaeological and tribal cultural resources. Neither the CHRIS search nor the radius used for the search are specifically cited in existing regulations, but the search itself is nonetheless conducted as a matter of due diligence and is cited as such in most guidance documents and recommendations. In all cases, the project scale and nature of the existing knowledge are considered when assessing the radius and whether the results returned are adequate for characterizing the existing conditions. CHRIS records search radii of 0.25, 0.5, and 1.0 mile are the standard

increments used for technical studies conducted in the City of Los Angeles. The smaller radius is often conducted in areas that have more resources recorded nearby, whereas a 1.0-mile radius might be used when there are fewer. A search radius of 10 miles is disproportionate to the Project's potential impact(s) to archaeological or tribal cultural resources, in addition to being unnecessary, given available information.

The CHRIS records search presented in the Draft EIR was conducted using a 0.5-mile radius and identified the two historical archaeological sites mentioned above: CA-LAN-2964H and CA-LAN-3045H. The information contained in the archaeological site records and associated reports obtained at the time, as summarized in the Draft EIR and technical studies, were detailed enough to provide a reasonable characterization of the existing conditions for the Project Site, and further reinforces that the CHRIS records search was more than adequate for purposes of assessing archaeological resources for the Project Site.

The Supplemental Cultural memo, included in Appendix FEIR-14 of this Final EIR, provides further details regarding the selection of a radius distance when conducting a CHRIS records search and gives expert opinion confirming that the use of a 0.5-mile radius for the Project provided adequate information to characterize the existing conditions within the Project Site.

Regarding the copies of reports that were not available at the time of the CHRIS records search, of the 37 reports identified in the CHRIS records search, copies of four studies (LA-01939, LA-04558, LA-06442, and LA-11473) were not provided. The staff at the South Central Coastal Information Center (SCCIC) stated that the reports were not already digitized and their staff could not access the paper records because of COVID-19 restrictions in place at the time, as stated in the Draft EIR and Tribal Cultural Resources Report. These access constraints applied to any party who requested the CHRIS records search, including public agencies. Even without the copies of the report being available at the time, the information obtained from the CHRIS records search—bibliographic information of all studies, site records, and full-length copies of other studies—provided a reasonable indication that the reports were unlikely to provide substantially new information beyond what was already available.

Of the four studies for which only bibliographic references were available, LA-04558 and LA-11473 did not explicitly address archaeological or tribal cultural resources because they were conducted for projects that did not involve ground disturbances, and instead were focused on assessing above-grade historic resources. For the other two reports that were not available (LA-01939 and LA-06442), both had been previously reviewed or

otherwise referenced in the aforementioned studies by Cogstone. LA-06442 is a report prepared by Greenwood and Associates in 2002 titled *The Grove at Farmers Market, Phase I, Archaeological Monitoring*.⁴⁴ The report presents the results from an earlier phase of work for the same project (The Grove at Farmers Market) reported by Cogstone. Report LA-01939 contains an excerpt from a draft EIR prepared in the late-1980s for the Grove at Farmers Market Project (State Clearinghouse No. 1987102102). To clearly demonstrate that the analysis did not exclude any substantial information presented in these reports, copies of the four studies were obtained while preparing the Supplemental Cultural Memo. The Greenwood and Associates report (LA-06442) included some more detailed information on the archaeological components of CA-LAN-3045H, but their work preceded that of Cogstone who had largely accounted for the prior work at the site and offered a more recent update to the site. The other three reports were confirmed as having no information relevant to a review of archaeological or tribal cultural resources. Assessment of these reports confirmed the prior assessment that none of the information presented in these four reports altered the conclusions of the original findings or omitted meaningful information not otherwise presented in the Draft EIR or technical studies. The Supplemental Cultural Memo, included in Appendix FEIR-14 of this Final EIR, provides further detail on the contents of these specific reports and gives expert opinion confirming the conclusions of the findings presented in the Section IV.B, Cultural Resources, of the Draft EIR.

Regarding the regional prehistoric context referenced in the Tribal Cultural Resources Report, page 13 of the report states that, “[v]arious attempts to parse out variability in prehistoric archaeological assemblages over this broad period have led to the development of several cultural chronologies; some of these chronologies are based on geologic time, most are based on temporal trends in archaeological assemblages, and others are interpretive reconstructions.” There is no single “correct” chronology and California archaeologists have developed multiple chronologies based on new information and in service of different research objectives. For example, in their synthesis of the Native American archaeological record in Southern California, Brian Byrd and Mark Raab⁴⁵ use a chronology based on a region defined as the Southern Bight of California—the coast and near-coastal setting covering the area between Point Conception, California, and northern Baja. The Tribal Cultural Resources Report draws on broader regional patterns that are documented through review of early prehistory to supplement information gaps local to the Project Site. The summary of the prehistoric context presented in the Draft EIR was put

⁴⁴ Messick, Pete, Alice Hale, Roberta S. Greenwood, *The Grove at Farmers Market, Phase I, Archaeological Monitoring*, 2002 (Greenwood and Associates, Pacific Palisades). On file, South Central Coastal Information Center, California State University, Fullerton, California.

⁴⁵ Byrd, Brian F. and Mark Raab, “Prehistory of the Southern Bight: Models for a New Millennium” (*California Prehistory: Colonization, Culture, and Complexity*, Terry L. Jones and Kathryn A. Klar, eds., 2007, pp. 215–228. AltaMira Press, Lanham, Maryland).

forward as a good faith effort to publicly disclose that the Native American archaeological record within southern California begins thousands of years ago, and has been subdivided various ways by scholars to characterize various changes that are represented across this timespan. In this regard, by giving a basic summary of Native American history for the region, both the Archaeological Resources and Tribal Cultural Resources sections of the Draft EIR provide an adequate means of characterizing the existing conditions, which was used to inform the impact analysis. The Supplemental Cultural Memo, included in Appendix FEIR-14 of this Final EIR, provides further details on some of the alternative chronological sequences used in academic literature and provides confirmation on the adequacy of the typology used in the Tribal Cultural Resources Report.

Comment No. 26-43

The Project Design Features (“PDF”) Are Disguised Mitigation Measures

CUL-PDF-1 and CUL-PDF-2 are mitigation measures disguised as a “Project Design Feature.” By assuming implementation of the PDFs, the DEIR fails to disclose the Project’s actual environmental impacts. The DEIR must analyze potential impacts first and then propose all feasible mitigation measures. The Courts have been clear that projects cannot disguise their actual impacts in this manner. (See *Lotus v. Department of Transportation*, 223 Cal.App.4th 645.) Therefore, the Cultural Resource analysis must be redone without assuming the PDFs would be in place. This is especially true because there is no Project even proposed—just a Specific Plan that allegedly sets forth guidelines for development which are not available for public review.

The PDFs Improperly Defer Mitigation

CUL-PDF-2 constitutes deferred analysis. This work is critical to understanding what the impacts will be, and it should have been performed prior to the DEIR’s release. As explained in the SRI Report, without a Historic Structure Report (HSR) prepared now, the public and decision-makers cannot understand how the proposed rehabilitation of the Primary Studio Complex would impact the historical resource. A detailed HSR should be required as part of the DEIR, particularly because there is no defined development plan for the Project. Without an HSR, the DEIR’s analysis and conclusions regarding the Project’s potential impacts on historical resources is unsupported. Why did the DEIR not include this necessary analysis? The public and decision-makers are denied the opportunity to evaluate the feasibility of implementing this massive Project without significantly impacting on-site cultural resources until it is too late. The DEIR should be recirculated with this new information.

Response to Comment No. 26-43

The comment that Project Design Features CUL-PDF-1 and CUL-PDF-2 are disguised as mitigation measures is incorrect. These PDFs are included as an integral part of the design of the Project (i.e., they are part of the Project that is analyzed by the Draft EIR). By definition, mitigation measures are not part of the original project design. Rather, mitigation measures are actions taken by the lead agency to reduce impacts to the environment resulting from the original project design. Mitigation measures are identified by the lead agency after the project has undergone environmental review and are above and beyond existing laws, regulations, and requirements that would reduce environmental impacts.

As discussed throughout Section IV.B, Cultural Resources, of the Draft EIR, Project Design Feature CUL-PDF-1 establishes Project Parameters to ensure that the rehabilitation of the Primary Studio Complex preserves its historic significance and integrity and maximizes the retention of its historic fabric and character-defining features. In part, these Project Parameters set forth the removal of non-historic additions and the retention of character-defining features to ensure that the Primary Studio Complex is not adversely impacted. These Project Parameters form the basis for the Conceptual Site Plan analyzed in the Historic Report. In addition, as discussed in Section B, Historic Structure Report and the Future Preservation of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, the Project would also include an HSR to guide the rehabilitation of the Primary Studio Complex in accordance with the Rehabilitation Standards. OHR would use the HSR in reviewing Project plans and approving permits pursuant to the requirements of the Cultural Heritage Ordinance. Accordingly, the PDFs are described, and their effectiveness in reducing or avoiding potential impacts are analyzed in the Draft EIR, consistent with CEQA and *Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645 (per *Lotus*, concluding that an impact is less than significant without describing how avoidance and minimization measures of the project design prevent or minimize the impact, is not legally adequate). Further, the PDFs are included in the Mitigation Monitoring Program; refer to Section IV, Mitigation Monitoring Program, of this Final EIR. Therefore, the commenter's statement that the cultural resource analysis must be redone without assuming the PDFs would be in place is incorrect and contrary to CEQA and the case cited in their comment.

Regarding the comment that there is no project, refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, for a more detailed discussion of how Section II, Project Description, of the Draft EIR provides all of the necessary information to provide a thorough analysis of the Project's potential impacts in accordance with CEQA. As discussed in Response to Comment No. 19-3, the historic analysis in the Draft EIR was based on the Conceptual Site Plan (Figure II-4 on page II-14 of the Draft EIR). Future changes in and around the HCM and Viewshed Restoration Area that are

substantially different than the Conceptual Site Plan or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, including review by OHR and the Department of City Planning, as well as potential CEQA compliance review. As discussed in Section B, Historic Structure Report and the Future Preservation of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, any substantial alteration to a designated HCM would require OHR review and compliance with the Rehabilitation Standards pursuant to Section 22.171.14 of the Cultural Heritage Ordinance. Refer also to Section B of Topical Response No. 5 regarding Project Design Feature CUL-PDF-2 and the implementation timing of the HSR.

Refer to Response to Comment Nos. 5-14, 11-3, and 26-7 for further discussion on the scale of the Project. In addition, with regard to recirculation, this comment does not provide substantial evidence to demonstrate that “significant new information” as defined by CEQA Guidelines Section 15088.5 has been added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Also refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 26-44

The Mitigation Measures Are Inadequate

Based on the DEIR’s failure to assess potential impacts to buried archaeological resources, CUL-MM-1 regarding archaeological monitoring during Project grading is inadequate. On-site monitoring may be appropriate to identify and treat unanticipated resources, but it is inadequate where there is a very high likelihood for buried resources to be present. Given the information regarding the Project Site, it is anticipated such resources will be encountered. As such, an archaeological testing plan should be developed for any major ground disturbance activities in order to fully avoid or mitigate the Project’s potential impacts.

Response to Comment No. 26-44

Regarding the assessment of the likelihood for buried resources, see Response to Comment No. 26-42 for the discussion of the process for characterizing the existing conditions and identifying the potential for buried archaeological resources, especially those similar in nature to those recorded for CA-LAN-3045H. Mitigation Measure CUL-MM-1, as stated in the Section IV.B, Cultural Resources, of the Draft EIR, includes specific provisions to ensure that any archaeological discoveries are evaluated and treated in accordance with applicable regulations and following professional standards. The measure specifically refers to “unanticipated” archaeological resources, also referenced as “unknown resources,” but neither of these phrasings negate the statements in the impact analysis recognizing that there is a potential for historical archaeological resources to occur, as suggested by the presence of an archaeological site CA-LAN-3045H. For the

Project Site as a whole, it is reasonable to conclude that there may be archaeological materials identified in specific locations that cannot be anticipated, even if there is an overall understanding of the most likely resources likely to occur and a general sense of where they may or may not be located. Conversely, areas designated as having a higher likelihood of containing archaeological resources are anticipated to have areas without any archaeological materials, even though one area may have a higher likelihood compared to another.

The phrasing of “unanticipated” or “unknown” resources is intended to acknowledge that archaeological materials could be present but have as-yet not been confirmed archaeologically. Response to Comment No. 26-42 addresses why archaeological testing to confirm the presence or absence across the Project Site is impractical and unnecessary, which is firstly because the evidence needed to provide a reasonable characterization of the existing conditions within the Project site had already been identified, and secondly because the same result could be achieved through implementation of the steps proposed in Mitigation Measure CUL-MM-1. The Supplemental Cultural Memo, included in Appendix FEIR-14 of this Final EIR, provides further clarification regarding the potential for buried resource within the Project Site.

By identifying the qualification standards for retaining a qualified archaeologist, specifying the criteria by which the CRMTP shall be prepared, requiring a worker training program, and identifying the timing necessary for each of these steps, implementation of Mitigation Measure CUL-MM-1 provides a reasonable means by which trained specialists would identify any archaeological resources that may be present, evaluate them as a historical resource and unique archaeological resource, and proceed in implementing mitigative treatment measures that would avoid or allow for the recovery of scientifically consequential information, or take other potential actions that could be appropriate based on the specific type of resource identified. When carried out, these steps can reasonably be expected to allow for any archaeological resources that may be present to be confirmed, evaluated, and if necessary, treated when avoidance is not feasible. In so doing, the provisions put forward in Mitigation Measure CUL-MM-1 provide an adequate means of reducing potentially significant impacts to less than significant levels.

Also, as shown in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, of this Final EIR, Mitigation Measure CUL-MM-1 has been clarified to further define performance criteria and enhance the ability of the principal archaeologist (now referred to as the Qualified Archaeologist) and archaeological monitor(s) to identify, evaluate, and appropriately treat any archaeological resources identified during ground disturbing activities.

The activities of the Qualified Archaeologist and archaeological monitors working under their direction are now supplemented by a Tribal Consultant and Native American

monitor. These roles have been identified to ensure that in the event of an archaeological resource that is Native American in origin is discovered, then tribal values would be appropriately considered in addition to scientific values during evaluation and treatment. By providing a second individual to observe ground-disturbing activities, the Native American monitor further enhances the ability of the archaeological monitor to ensure that any potential archaeological resources that may be present are identified.

Revisions to Mitigation Measure CUL-MM-1 have been made to provide greater clarity and consistency in the terminology used to describe the roles of various qualified personnel. For example, the “qualified principal archaeologist meeting the Secretary of the Interior’s Professional Qualification Standards for Archaeology” is now defined as the Qualified Archaeologist.

Revisions to Mitigation Measure CUL-MM-1 have been made to clarify and enhance the CRMTP. The provision in Mitigation Measure CUL-MM-1 requiring the CRMTP include “applicable regulations” has been revised to include specific regulations, including but not limited to the requirement that preservation in place be the preferred alternative for treatment. The revised measure has removed the provision requiring that the archaeological monitor be approved by the City’s Office of Historic Resources (OHR) because Mitigation Measure CUL-MM-1 already requires the CRMTP to include qualifications standards for a monitor and that the CRMTP be approved by City Planning, which includes the OHR.

The revised mitigation measure also includes a minimal radius of 25 feet as an area in which Ground Disturbing work must cease in the event an archaeological resource is discovered. Details related to the curation of archaeological materials have also been added in the revision to Mitigation Measure CUL-MM-1 that further clarify the treatment procedures defined in the CRMTP.

Mitigation Measure CUL-MM-1, as revised, has removed the reference to “native soils” as a condition for monitoring ground-disturbing activities. Mitigation Measure CUL-MM-1 has also been revised to clarify that the monitoring will occur during demolition and construction activities and continue until the “...Qualified Archaeologist and Tribal Consultant, in consultation with the archaeological monitor and Native American Monitor, determines monitoring is no longer necessary.”⁴⁶ Reporting requirements have been

⁴⁶ “Tribal Consultant” refers to a representative of a California Native American Tribe. “Native American monitor” refers to any person authorized by the Tribal Consultant to act as a monitor, regardless may of their status as a member of a California Native American Tribe. The difference in the terms “Tribal” and “Native American” in these respective roles conveys that the monitor may have a different tribal affiliation from person(s) acting as the Tribal Consultant.

added to further clarify the means by which the SOI *Standards for Archeological Documentation* will be implemented. Refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR, of this Final EIR for this revised mitigation measure.

Archaeological documentation and treatment provisions may include but are not limited to the collection and curation of artifacts as part of a larger data recovery program, which is typically the most appropriate means of mitigating archaeological losses resulting from construction. Identification of an appropriate repository for the curation of any collected materials is a standard component of a treatment plan and would be identified during preparation of the CRMTP as specified in Mitigation Measure CUL-MM-1. At a minimum, public benefit is conferred through archaeological data recovery by recovering the scientifically relevant information through recording, collection and analysis of artifacts, making the results available in a report, and retaining a curated sample of artifacts at repository for future research, which are all standard components of treatment for archaeological resources, especially those that are historic-in-age. The need for a public education component or artifact exhibition would require considering the basis on which the significance of the resource has been established and several other factors that could only be determined once a resource was identified. The Supplemental Cultural Memo, included in Appendix FEIR-14 of this Final EIR, provides further clarification and expert opinion regarding how the preparation and implementation of the CRMTP in accordance with the SOI Documentation Standards provides adequate protection for significant archaeological resources and defines a process for determining when it is appropriate to collect, analyze, curate, and exhibit any archaeological materials that could be identified during the Project.

Thus, curating and exhibiting collected items from an archaeological resource as a means of treatment is not imposed as a condition in the Mitigation Measure CUL-MM-1 but is also not specifically ruled out from consideration as a means of implementing the measure. Minor revisions have been made to Mitigation Measure CUL-MM-1 that otherwise maintains the same overall framework described in the Draft EIR to further ensure that implementation would avoid or reduce potentially significant impacts to archaeological resources encountered during the Project.

Comment No. 26-45

Project Parameters Are Purely Conceptual

The Historic Report underlying the DEIR's analysis analyzed a purely conceptual design that the applicant is not required to implement and limited and inappropriate "Project Parameters" (CULPDF1). Because the Project design is merely conceptual and no Specific Plan is provided, it is impossible to know the Specific Plan's actual impacts. The public needs to be able to review the Specific Plan and other Project documents, such as the Sign District and HSR to understand what they allow in order to assess the Project's

Cultural Resources impacts. The Project Parameters do not aid in this evaluation as they are vague or themselves result in significant impacts as discussed in more detail in the SRI Report. In the absence of definitive development plans, based on the Project's proposed Height Zones, new construction would envelop the Primary Studio Complex and result in a significant loss of integrity with respect to setting, feeling, and association. Height Zone A (Figure II-5), which is supposedly a "viewshed restoration" area, would permit buildings up to 58 feet in height. How can historic views from Beverly Boulevard be preserved with one or more six-story buildings allowed directly north of the Primary Studio Complex? The Primary Studio complex could then be surrounded on the remaining sides by Height Zone D that permits buildings up to 225-feet in height. And development would be permitted on top of the Primary Studio Complex as well. Height Zone E would permit a rooftop addition up to 36 feet above the existing parapet of the Studio Building for a length of approximately 350 feet. In addition, Height Zone F is a rooftop zone that would apparently permit a variety of non-occupiable structures on top of the Primary Studio Complex north of Height Zone E. So the Primary Studio Complex would be surrounded and overshadowed by new development, diminishing its integrity.

Response to Comment No. 26-45

Refer to Topical Response No. 5, Historical Resources, specifically Section B, Historic Structure Report and the Future Preservation of the Primary Studio Complex, regarding the HSR and preservation of the Primary Studio Complex and regulatory procedures; Section C, Potential New Construction North of the Primary Studio Complex, regarding potential new construction north of the Primary Studio Complex (i.e., Height Zone A, the Viewshed Restoration Area); and Section D, Analysis of Impacts to the Primary Studio Complex, regarding impacts to the Primary Studio Complex, including an analysis of the rooftop addition. Also refer to Response to Comment No. 26-E.2-6 regarding the proposed buildings to the east and west of the Primary Studio Complex within Height Zone D and how the distinctive form and design of the Primary Studio Complex would remain intact, and its architectural features would remain visible with implementation of the Project.

As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Draft EIR discloses all of the elements of the Project required by CEQA and provides a comprehensive analysis of the proposed development program. A draft Specific Plan and Preliminary Draft Specific Plan are not required by CEQA for environmental analysis of the Project. Please note that the Preliminary Draft Specific Plan incorporates the same elements that could result in a physical impact on the environment that were fully disclosed and analyzed in the Draft EIR. Refer Appendix FEIR-2, Comparison Chart of the Draft EIR and the Preliminary Draft Specific Plan, of this Final EIR.

As discussed in Response to Comment No. 19-3, the historic analysis in the Draft EIR was based on the Conceptual Site Plan (Figure II-4 on page II-14 of the Draft EIR). Future changes in and around the HCM and Viewshed Restoration Area that are substantially different than the Conceptual Site Plan or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, including review by OHR and the Department of City Planning, as well as potential CEQA compliance review.

As discussed throughout Section IV.B, Cultural Resources, of the Draft EIR, Project Design Feature CUL-PDF-1 establishes Project Parameters to ensure that the rehabilitation of the Primary Studio Complex preserves its historic integrity and maximizes the retention of its character-defining features. The assertion that the Project Parameters would themselves result in significant impacts seems to be based upon the false belief that the 1969 Mill Addition and 1976 Support Building are character-defining features of the Primary Studio Complex. As discussed in Section A, Existing Evaluation and Designation of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, and Response to Comment No. 26-41, the 1969 Mill Addition and 1976 Support Building were not included in the HCM Findings or designation. The report referred to by the commenter does not provide any “details” about the 1969 Mill Addition and 1976 Support Building. It just states that these buildings are “likely” significant without providing any evidence. As discussed on pages 51 to 54 of the Historic Report, removing these non-historic additions would not adversely impact the Primary Studio Complex, but rather reveal extant historic fabric to be rehabilitated. Additionally, as discussed in Section B, Historic Structure Report and the Future Preservation of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, any substantial alteration to a designated HCM would require OHR review and compliance with the Rehabilitation Standards pursuant to Section 22.171.14 of the Cultural Heritage Ordinance.

As discussed in Section B, Historic Structure Report and the Future Preservation of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, the preparation of an HSR will complement the City’s regulations aimed at protecting and managing the historical resource. The claim that an HSR is required to properly analyze potential impacts to the Primary Studio Complex is incorrect as neither the State of California nor the City of Los Angeles requires an HSR as baseline information for the CEQA review of historical resources.

Refer to Section C, Potential New Construction North of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, regarding the regulations and procedures for new construction in the Viewshed Restoration Area and restoration of the historic viewshed along Beverly Boulevard; see also Response to Comment No. 26-19. The statement that six-story buildings would be allowed in the Viewshed Restoration Area is incorrect. As discussed in Section C of the topical response, the 58-foot height limit in

the Viewshed Restoration Area, which is approximately two-thirds of the 88-foot height of the existing Primary Studio Complex, is taken directly from the HCM Findings. In addition to the 58-foot height limit, any development in the Viewshed Restoration Area would be required by the HCM Findings, which would be codified in the proposed Specific Plan, to restore the currently obstructed character-defining viewshed features of the Primary Studio Complex as seen from adjacent public areas along Beverly Boulevard. Further, as proposed in the Preliminary Draft Specific Plan, development in the Viewshed Restoration Area greater than one story in height would require a Project Compliance approval pursuant to LAMC Section 11.5.7[13B.4.2], which is a discretionary approval that would require CEQA compliance review.

As discussed in Section D, Analysis of Impacts to the Primary Studio Complex, of Topical Response No. 5, Historical Resources, the Draft EIR and Historic Report included a full analysis of integrity after implementation of the Project. This analysis concluded that integrity of *association* would be retained but the integrity of *feeling* for the Primary Studio Complex would be adversely affected. In addition, the integrity of *setting* has already been lost prior to this Project. As explained in the Historic Report, NPS guidance states, “to retain historic integrity a property would always possess several, and usually most of the (seven) aspects” of integrity.⁴⁷ The integrity analysis included in the Draft EIR and Historic Report found that after the Project is constructed, the Primary Studio Complex would retain most of the aspects of integrity, including *location*, *design*, *materials*, *workmanship*, and *association*. Retaining five out of seven of the aspects of integrity—one of which was already compromised prior to the Project—would qualify as retaining “most.”

With regard to the “non-occupiable structures” allowed in Height Zone F, such structures refer to housing for mechanical services or communication equipment which are common on building rooftops. These types of structures have always occupied portions of the Primary Studio Complex roof and are necessary for maintaining building operations. Non-occupiable rooftop structures do not add to the height and mass of the building overall in any substantial way.

Comment No. 26-46

Destruction of the South Façade

The Project proposes to demolish the South Façade of the Service Building. This level of alteration would destroy the entire building’s integrity. There is no evidence in the DEIR supporting a contrary conclusion. The DEIR claims that the demolition of the 1976 Support

⁴⁷ Refer to the Historical Resources Technical Report included as Appendix C.1 of the Draft EIR, Section 9.7.

building would restore the Studio Building to its original form and volume. However, as discussed in the SRI Report, the 1976 Support Building is likely a historical resource. Therefore, the Cultural Resource analysis must be redone to identify these impacts.

Response to Comment No. 26-46

The commenter is correct that the south façade of the Service Building would be removed; however, the commenter offers no evidence or analysis as to why this might “destroy the entire building’s integrity.” Contrary to the assertions of the commenter, the comprehensive analysis provided in Section IV.B, Cultural Resources, of the Draft EIR does support the conclusion that the Primary Studio Complex would retain sufficient integrity to maintain its historic significance (see Draft EIR, Section IV.B, Cultural Resources, pages IV.B-41 to IV.B-55 and Appendix C.1, Historic Report, pages 50 to 64). The Draft EIR correctly concluded that the Project would not result in a substantial adverse change in the significance of the Primary Studio Complex, and impacts would be less than significant. This is due to the fact that removal would be limited to the rear portion of the original Service Building which retains few character-defining features and is not generally visible to the public. More importantly, the analysis accounts for the retention and rehabilitation of the entire Primary Studio Complex, which includes both the Service Building and the attached Studio Building. Although the two original component parts of the Primary Studio Complex are referred to as the “Studio Building” and “Service Building” to reflect programmatic distinctions, they were, in fact, designed together as an integrated and functionally dependent complex. Since its original construction, portions of the Primary Studio Complex have been altered through removal and additions. As discussed on page IV.B-42 of the Draft EIR, demolition of the south portion of the Service Building would remove some original material and alter the building’s overall form and volume. This loss of material, however, would be counterbalanced by the removal of the 1976 Support Building, which would restore the original form and volume of the Studio Building and restore and reveal its original west wall. Because the majority of the original volume of the Studio Building would be restored, the overall form and volume of the original Primary Studio Complex would be improved as compared to existing conditions. Moreover, compliance with the Rehabilitation Standards is based upon the totality of a project and whether a project preserves the historic character of the subject building as a whole. This Project is not limited to removing the rear portion of the original Service Building. Despite some loss of integrity by removing the southern portion of the Service Building, on balance, the integrity of the Primary Studio Complex would be improved overall. For more information regarding the preservation of the Primary Studio Complex, refer to Section D, Analysis of Impacts to the Primary Studio Complex, of Topical Response No. 5, Historical Resources. Refer to Response to Comment No. 26-E.2-5 regarding impacts to the Service Building.

The claims that the 1976 Support Building is likely a historical resource and the cultural resource analysis must be redone are incorrect. Refer to Section A, Existing Evaluation and Designation of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, and Response to Comment No. 19-12 regarding the period of significance determined for Television City. As discussed therein, the HCM Findings identified the 1952 Primary Studio Complex (including alterations through 1963) as eligible for designation. The 1969 Mill Addition, the 1976 Support Building and any other buildings and structures constructed after 1963 were not included in the designation.

Comment No. 26-47

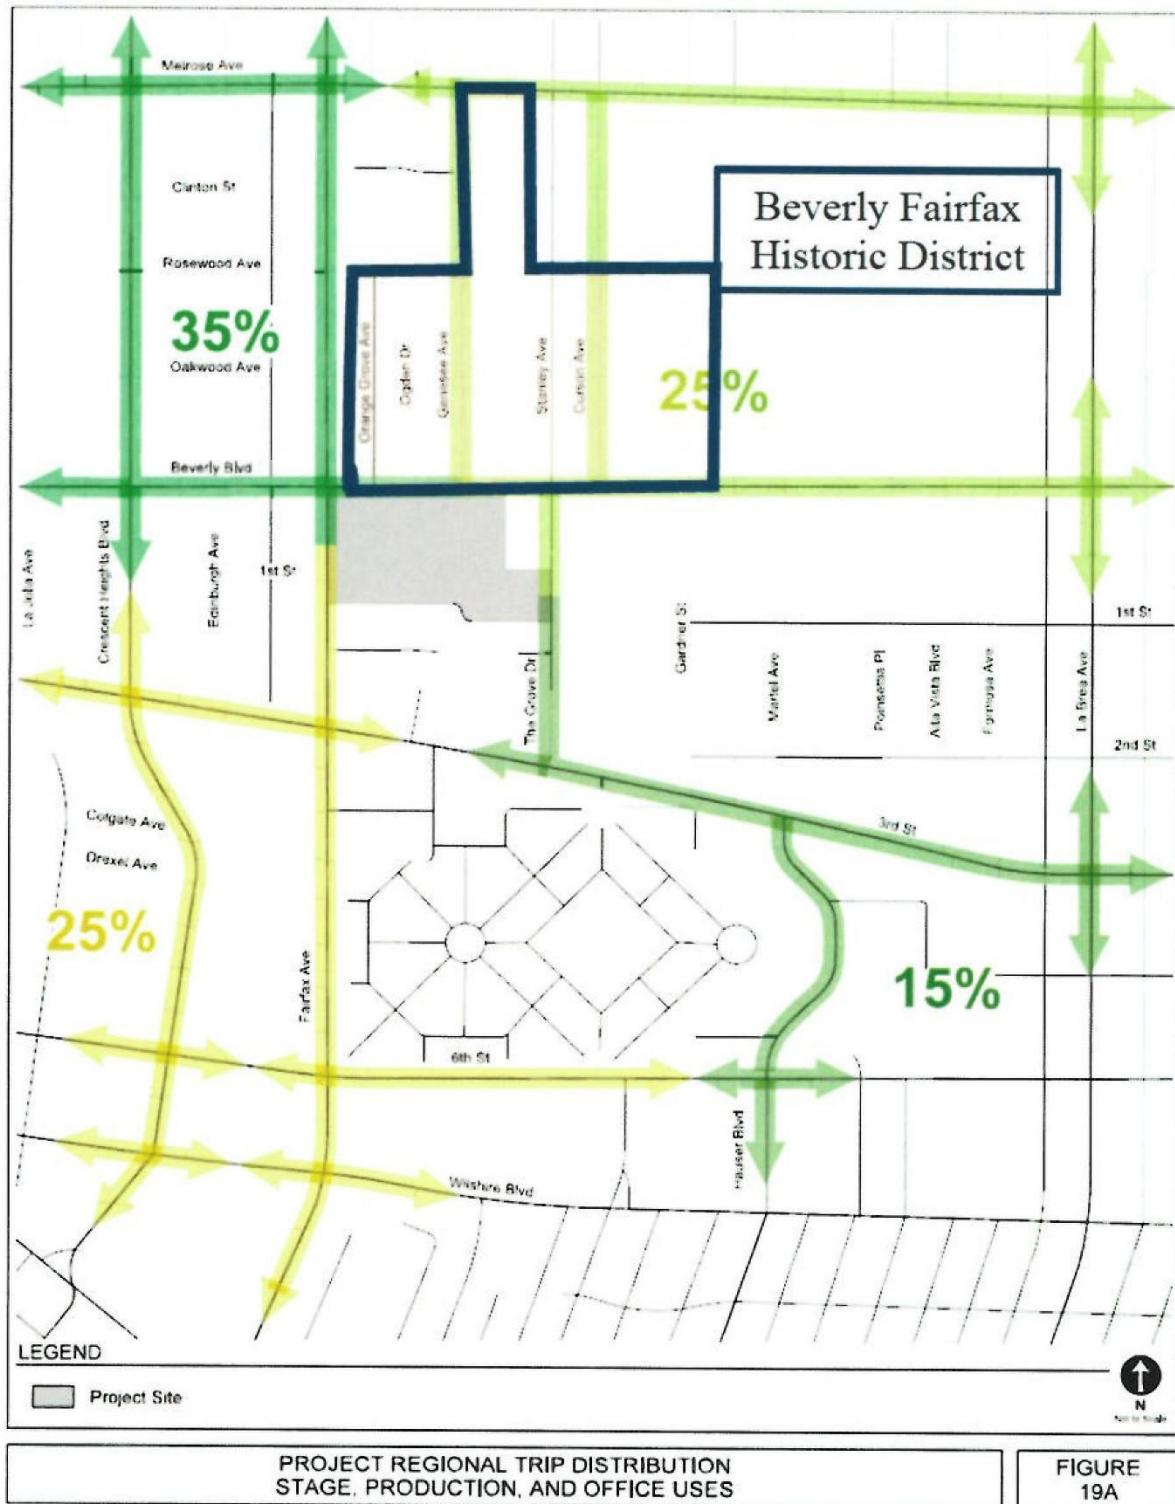

Identified Historical Resources

In addition, the DEIR describes “numerous historical-period resources [that] were identified during the records search,” but it only focuses on one (P-19-003045/CA-LAN-003045H). Why does the DEIR only focus on the one? What about the other “numerous” historical-period resources that were identified? The DEIR needs to describe and analyze those resources too.

The DEIR Gives Short Shrift to the Gilmore Adobe, Farmer’s Market and Beverly Fairfax Historic District

The DEIR inappropriately dismisses potential impacts to the Gilmore Adobe and the Farmer’s Market. The overall setting will markedly change following Project implementation, with the proposed height and massing of buildings immediately adjacent to the Gilmore Adobe and the Farmer’s Market. Currently, the entire area is characterized by low-rise structures whereas the Project proposes development of structures that could reach 225 feet (up to 20 stories), significantly diminishing the environmental setting and affecting the view sheds of the Gilmore Adobe and Farmer’s Market. A more detailed assessment of potential impacts to both of these historic resources is required.

The DEIR and Historic Report also fail to adequately assess the potential impacts to other surrounding resources, including the Beverly Fairfax Historic District (listed in the NRHP in 2018). Anticipated cut-through traffic in the neighborhood from the Project which is documented in the Transportation Assessment for the Project, is an unstudied impact on the historic district. As noted in the SRI Report, increased traffic through the historic district would diminish the integrity of the Beverly Fairfax Historic District. A comparison of the map of the district and the map of the traffic intrusion for the Project transportation study shows the direct impact on this district. The DEIR must be revised to include this information and recirculated.

Response to Comment No. 26-47

Regarding the focus on CA-LAN-3045H⁴⁸ of the likelihood for buried resources, see Response to Comment No. 26-42 for a discussion on the relevance of the site to the characterization of existing conditions and how this informed the analysis of the potential for impacts. In brief, the material contents of CA-LAN-3045H, its location and associated historical land uses, and the circumstances of its discovery during construction monitoring provided important information regarding the existing conditions within the current Project Site. Combining the documentary evidence from CA-LAN-3045H with the other sources of data, including but not limited to the other results from the CHRIS records search, the available information provided sufficient evidence to analyze the potential for impacts to archaeological and tribal cultural resources, and formulate reasonable and feasible means of mitigation. The Supplemental Cultural Memo, included in Appendix FEIR-14 of this Final EIR, provides further analysis of how the information from CA-LAN-3045H was used in this regard.

The reference to “numerous historical-period resources” is cited on page IV.B-34 of Section IV.B, Cultural Resources, of the Draft EIR, which provides a review of the CHRIS records search results based on the contents in the Tribal Cultural Resource Report in Appendix C.2 of the Draft EIR. The section discussing previously recorded resources that were identified in the CHRIS records search is given on page 27 of the Tribal Cultural Resource Report. There is a summary table that lists two previously recorded archaeological sites, both composed of materials from the eighteenth and nineteenth centuries, i.e., the historic period.⁴⁹ The two sites are CA-LAN-2964H and CA-LAN-3045H. A description of CA-LAN-2964H is provided in the table and the site is noted as being approximately 915 feet away from the Project Site. The location of CA-LAN-2964H plotted on a scaled map that is part of the confidential appendix, which also includes the site forms that contain further confidential information on the detailed contents and location of the site. Compared with CA-LAN-3045H, the contents of CA-LAN-2964H were redundant and did not contribute any substantially new information otherwise obtained from the analysis of CA-LAN-3045H. Given that CA-LAN-3045H provided adequate and more precise information on the existing conditions with the Project Site, partly by virtue of being located in closer proximity, further description of CA-LAN-2964H was excluded from the summary of CHRIS results in Section IV.B, Cultural Resources, of the Draft EIR.

⁴⁸ The commenter uses a combination of CHRIS database identifiers P-19-003045/CA-LAN-003045H that is simplified to the trinomial site number used here.

⁴⁹ As discussed on pages IV.B-33 and IV.B-34 of the Draft EIR, “...the CHRIS records search indicate that there are eight cultural resources mapped by the SCCIC within the 0.5-mile records-search radius. Of these, six are historic built environment resources and two are historic-period archaeological sites.

Refer to Section E, Impacts to Historical Resources in the Vicinity of the Project Site, of Topical Response No. 5, Historical Resources, and Response to Comment No. 5-13 regarding impacts to historical resources in the vicinity of the Project Site. As discussed therein, the Draft EIR fully and adequately analyzed potential impacts to historical resources in the vicinity of the Project Site, including the Gilmore Adobe and The Original Farmers Market, in Section IV.B, Cultural Resources, and Appendix C.1 (Historic Report) of the Draft EIR. The Gilmore Adobe and The Original Farmers Market are discussed on pages IV.B-27 to IV.B-29 of the Draft EIR and pages 39 to 40 of the Historic Report, and potential impacts to these historical resources are discussed on page IV.B-55 of the Draft EIR and pages 87–88 of the Historic Report.

The immediate setting of these two historical resources would be unaffected by the Project because it would not involve the demolition, destruction, relocation, or alteration of either of these historical resources. The broad setting of the Gilmore Adobe and The Original Farmers Market has been continually altered by adjacent construction, demolition, and new construction since they were originally built, including construction of The Grove shopping and entertainment center in 2002, which shares a property line with the aforementioned resource. Therefore, neither The Original Farmers Market nor the Gilmore Adobe currently retains their integrity of broad setting. The commenter does not explain how or why the broad setting, which has already been substantially changed, is essential to conveying the significance of these historical resources. Visibility of a new building constructed as a result of the Project from a historical resource in the vicinity alone would not result in a significant impact. For a significant impact to occur under CEQA, the integrity of the historical resource would have to be diminished to the degree that it would no longer be able to convey its significance. The Draft EIR and Historic Report correctly considered the impact the Project could have on the integrity of the historical resources in the vicinity, including their integrity of setting, and concluded that any potential impacts would be less than significant.

As discussed in Section E, Impacts to Historical Resources in the Vicinity of the Project Site, of Topical Response No. 5, Historical Resources, historical impacts and transportation impacts are analyzed separately and have different thresholds. No explanation is provided as to how increased trips through the Beverly Fairfax Historic District might translate to physical demolition, destruction, relocation, or alteration such that the significance of the Beverly Fairfax Historic District would be materially impaired, which is the threshold for significant impacts on historical resources in Appendix G of the CEQA Guidelines.

With regard to recirculation, this comment does not provide substantial evidence to demonstrate that “significant new information” as defined by CEQA Guidelines Section 15088.5 has been added to the Draft EIR. Thus, recirculation is not required. Also refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 26-48**Cumulative Impacts**

In addition, the DEIR identifies only 3 related projects in the Project vicinity, assuming a buildout year of 2026. The DEIR must consider a longer build-out year—up to 2043—given the proposed build out until 2043. The DEIR must analyze reasonably foreseeable projects based on that longer build out.

Nature of Use

The Project proposes 1.4 million square feet of office space and only 350,000 square feet of sound stages and 104,000 of production support. Thus, in terms of use, this is an office project. The change in use from studio to office was not considered as part of the historic assessment. Shouldn't that change of use be evaluated in the historic assessment? The DEIR must be revised to include this analysis and recirculated.

Response to Comment No. 26-48

The cumulative impact analyses in the Draft EIR include development of all known related projects in the Project Site vicinity based on information provided by LADOT and the Department of City Planning. As shown in Section III, Environmental Setting, of the Draft EIR, this list includes 68 related projects, not three related projects as stated by the commenter. In addition, this list of related projects is not limited to projects with a buildout year of 2026. For the purpose of assessing cumulative impacts on historical resources, the analysis focused on the three related projects located in the Project Site vicinity. Only these three have the potential to contribute to alterations to identified historical resources on the Project Site and in the Project Site vicinity. Thus, the Draft EIR fully evaluates cumulative impacts based on a list of reasonably foreseeable projects. The Draft EIR also includes a specific discussion of a long-term buildout scenario for each of the impact analyses.

The comment incorrectly claims that the Project is an office project and is a change in use. As stated repeatedly throughout the Draft EIR, the Project is a studio project that would continue the existing studio use. The proposed Specific Plan would allow five land uses—sound stage, production support, production office, general office, and retail (these are the same uses as the existing studio, except the Project would include a small amount of neighborhood-serving retail). Further, the proposed Specific Plan would limit general office and production office floor area to a maximum of 700,000 square feet each. Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan. The rise of digital media has created the need for larger and taller sound stage volumes as well as enhanced technological infrastructure and production office, and the studio ecosystem requires offices to be located close to sound stages and production support. The industry

has changed and become more digitized which requires much more office space co-located on a campus setting than traditional studios. The proposed development program analyzed in the Draft EIR provides an adequate and complementary mix of uses, including 350,000 square feet of sound stage, 104,000 square feet of production support, 700,000 square feet of production office, 700,000 square feet of general office, and 20,000 square feet of retail uses. Regardless of how the property would be used in the future, a change of use does not, in and of itself, constitute a significant impact to a historical resource under CEQA. A project has the potential to result in a significant impact only if a new use will cause a substantial physical change such that the historical resource can no longer convey its historic significance. The Draft EIR and Historic Report included a full analysis of the integrity of the Primary Studio Complex after implementation of the Project (refer to Draft EIR pages IV.B-54 to IV.B-55 and Historic Report pages 76 to 81), and found that the Primary Studio Complex would retain sufficient integrity after implementation of the Project to convey its historic significance. Refer to Section D, Analysis of Impacts to the Primary Studio Complex, of Topical Response No. 5, Historical Resources, for more information regarding the preservation of the Primary Studio Complex.

As discussed in Topical Response No. 1, the Draft EIR disclosed all of the elements of the Project required by CEQA and provides a comprehensive analysis of the Project. Further, the proposed Specific Plan would include a regulatory framework for implementation of the Project, including, among other things, mandatory review processes by the City for implementation of the proposed Project. Future changes that are substantially different than the Project or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, as well as CEQA compliance review.

With regard to recirculation, this comment does not provide substantial evidence to demonstrate that “significant new information” as defined by CEQA Guidelines Section 15088.5 has been added to the Draft EIR. Thus, recirculation is not required. Also refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 26-49

Tribal Consultation

The City’s tribal consultation does not appear to comply with SB 18. It also appears that the City did not meet the good faith effort standards for AB 52. The City sent one letter to the tribal representative on the City’s contact list near the height of the COVID-19 pandemic. It appears that the City’s tribal consultation letters did not require a signature for delivery, so it is possible that letters were not actually delivered or were delivered to unoccupied offices given the ongoing pandemic. There is nothing in the record that indicates the recipients actually received the letters. There is also nothing that indicates

that the City followed up with any phone calls or other letters, even when the City did not receive any responses. As a result, particularly in light of the pandemic and potential that letters were not received, the City's efforts fall short of the good faith effort required by law.

Response to Comment No. 26-49

Refer to Response to Comment No. 26-E.2-17 with regard to SB 18 and the adequacy of the City's tribal consultation efforts in accordance with AB 52.

Comment No. 26-50

C. Energy

The State is facing a future where impacts to the energy system will become even more critical as we transition away from fossil fuels and rely on renewables. This necessary transition can be undermined by the Project's failure to adequately analyze impacts related to energy use. The DEIR's analysis related to energy is wholly inadequate and must be revised and recirculated.

DEIR Undercounts Energy Use by Failing to Include Basecamps, Production Areas, and Mobility Hub in Analysis

The DEIR does not appear to evaluate energy use from uses within the basecamps, production zones and Mobility Hub in its analysis. The DEIR admits that hundreds of thousands of square feet will be used for basecamp and production purposes but does not include these areas as floor area for the Project. Significant below grade areas and parking areas clearly are to be used for basecamps and production areas. Basecamps and production areas, which support production efforts, will use electricity. Therefore, such electricity use must be included in the DEIR's analysis of energy consumption. Similarly, the Mobility Hub will require electricity for support functions and yet the DEIR did not disclose how much electricity will be used by it. This information needs to be added into the analysis and the DEIR recirculated for public review.

The DEIR's analysis of water usage includes both basecamps' and Mobility Hub's usage, although it is not clear if the water usage factors accounted for the additional areas in the BI level and parking garage that will be used for production areas and basecamps. Please explain why the Draft EIR excludes these uses from its energy consumption analysis. Please provide a clear chart showing the energy assumptions for these uses. The DEIR must be revised to account for energy use from basecamps, production areas, and the Mobility Hub and recirculated for additional public comment.

There is a well-established correlation between fuel and electricity use and air quality emissions. The Project has numerous significant and unavoidable air quality impacts that require imposition of all feasible mitigation measures. There are a number of feasible, market-ready measures that the DEIR did not analyze or disclose to reduce electricity, natural gas, diesel fuel, and gasoline use. At a minimum, the City needs to analyze and disclose the energy use reductions that would be achieved by these measures. Please include this analysis in a recirculated DEIR for public comment.

Response to Comment No. 26-50

Refer to Response to Comment Nos. 26-E.1-27, 26-E.1-28, and 35-53 and Appendix FEIR-9 of this Final EIR for a detailed discussion regarding electricity usage associated with the basecamp areas, production areas, and the Mobility Hub, the CalEEMod land use modeling, and how the EIR analyzed the potential physical environmental impacts of all proposed uses, areas, and activities. Contrary to what is stated in this comment, electricity usage associated with basecamp, which are a subset of outdoor production areas, and the Mobility Hub was accounted for in the Draft EIR.

Per the comment's request, the electricity analysis is further detailed in the Confirmatory Air Quality, GHG, and Energy Analysis in Response to Public Comments (see Appendix FEIR-9 of this Final EIR) to account more specifically for these uses, which confirms the conclusions in the Draft EIR for energy usage and GHG emissions. Regarding the correlation between fuel and electricity use and air quality emissions, Section IV.A, Air Quality, of the Draft EIR states that CalEEMod does not calculate criteria pollutant emissions from regional power plants associated with building electricity use (refer to pages IV.A-43 and IV.A-44). When electricity is used in buildings, the electricity generation typically takes place off-site at power plants, the majority of which burn fossil fuels. Because power plants are existing stationary sources permitted by air districts and/or the USEPA, criteria pollutant emissions are generally associated with the power plants themselves, and not individual buildings or electricity users. Additionally, criteria pollutant emissions from power plants are subject to local, State, and federal control measures, which can be considered the maximum feasible level of mitigation for stack emissions. This comment also refers to "a number of feasible, market-ready measures"; however, no specific measures were provided for consideration. The Draft EIR comprehensively analyzed the Project's energy impacts in Section IV.C, Energy, and concluded that impacts would be less than significant. Thus, no mitigation is required.

Refer to Topical Response No. 2, Definition of Floor Area is Appropriate, and to Response to Comment Nos. 5-7 and 26-121 regarding the definition of floor area, how the Draft EIR does not underestimate the size of the Project, how all of the uses and activities have been accounted for in the impact analyses in the EIR regardless of whether they meet

the definition of floor area, and how no active production activities would be located in the parking and basecamp areas below Project Grade.

This comment acknowledges that the Draft EIR's analysis of water usage includes both basecamp and Mobility Hub usage. Please note that Table IV.M.1-5 in Section IV.M.1, Utilities—Water Supply and Infrastructure, of the Draft EIR also provides water usage associated with covered parking (e.g., BI level and parking garage).

This comment does not provide substantial evidence that “significant new information” as defined by CEQA Guidelines Section 15088.5 has been added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Also refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 26-51

The DEIR Fails to Properly Analyze Natural Gas Usage Given the Long-term Buildout of Project

The DEIR's analysis of Threshold (b) in Energy Section (“Would the Project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?”) fails to analyze whether the Project conflicts with the State's goal of electrification of buildings in California. Why doesn't the DEIR address how the Project would be consistent with building electrification plans where the Project would include buildings that utilize natural gas for heating (e.g., space and water heating)?

Does the Project's use of natural gas conflict-with the State's SIP strategy and the 2022 AQMP for the SCAQMD? These strategies include control measures that require the use of zero-emission space and water heaters in new residential and commercial buildings-starting in 2030 (well before long-term build out date of 2043). Additionally, per the State's SIP strategy, the use of these fuels in buildings (primarily natural gas) for space and water heating can “contribute significantly to building related criteria pollutant and GHG emissions and provide an opportunity for substantial emissions reductions where zero-emission technology is available.”

For example, the State's SIP strategy includes a zero-emission standard for space and water heaters. Under this measure, CARB intends to develop a zero-emission standard using its regulatory authority for GHGs (which includes consideration of related criteria pollutant reduction benefits) for space and water heaters sold in California. This measure would go into effect in 2030 and require 100% of new space and water heaters (for either new construction or replacement of burned-out equipment in existing buildings) sold in California to meet the zero-emission standard. Does the Project) with a 2043 buildout, conflict with these standards?

Similarly, the SCAQMD's 2022 AQMP includes several building control measures intended to reduce emissions from water heating, space heating, cooking, and other combustion sources in both residential and commercial applications. In general, these control measures include the proposed development of rules to require installation of zero-emission equipment and appliances in both new and existing buildings. Does the Project, with a 2043 buildout, conflict with these measures?

The DEIR does not identify City policies on natural gas usage in new construction. Are there no such policies? Given the 2043 buildout the DEIR should-consider the relevant City energy policies.

As required by state law, both the CPUC (<https://www.cpuc.ca.gov/about-cpuc/divisions/energy-division/building-decarbonization>) and the CEC (<https://www.energy.ca.gov/data-reports/reports/building-decarbonization-assessment>) have proceedings focused on transitioning buildings, including existing building stock, to be fully electric.

In light of these State and regional priorities and requirements, why doesn't the DEIR assess how a 2043 buildout of the Project including natural gas hookups would be consistent with the state's and region's various plans to electrify buildings?

Response to Comment No. 26-51

The Draft EIR analyzed the Project's energy impacts in Section IV.C, Energy, of the Draft EIR in accordance with CEQA and concluded that impacts would be less than significant. The Project's impacts related to conflicts with applicable plans for renewable energy or energy efficiency, including the California Title 24 energy standards, the 2019 CALGreen Code, the City of Los Angeles Green Building Code, the Green New Deal, and SCAG's 2020–2045 RTP/SCS, is analyzed on pages IV.C-41 to IV.C-43 of the Draft EIR. The Project's energy impacts under a long-term buildout scenario are analyzed on pages IV.C-43 to IV.C-44 of the Draft EIR.

The comments regarding the SIP strategy and the 2022 AQMP are similar to Comment No. 26-E.1-26. Refer to Response to Comment No. 26-E.1-26 for further discussion of this topic.

The Draft EIR analyzed all relevant and applicable City policies related to natural gas usage in new construction, as mentioned above. Based on the analysis presented in the Draft EIR, it was determined that the Project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency. After the Draft EIR for the Project was publicly circulated, the City of Los Angeles passed Ordinance No. 187714 (effective January 2023), which requires all new buildings to be all-electric with a few exceptions. The City's all-electric buildings ordinance applies to any development where an application

for a building permit is submitted after April 1, 2023. As this all-electric buildings ordinance was not in effect at the time the Draft EIR was published, it was assumed that the Project would consume natural gas during operations. Although the all-electric buildings ordinance was not assumed in the GHG and energy demand modeling conducted for the Draft EIR, it would be expected that under the long-term buildout, at the milestone years indicated in the AQMP and SIP, construction approval would have required designs consistent with future applicable rules developed to implement AQMP and SIP control strategies for natural gas. As an example, Title 24 requirements apply to projects based on the date when a building permit is issued. Thus, buildings constructed at a later date would be required to comply with subsequent versions of Title 24, which typically include increasingly stringent energy conservation requirements and associated reductions in energy use. As the requirements under subsequent versions of Title 24 are not yet known, it would be speculative to include reductions in natural gas usage under a long-term buildout scenario and as such were not included in the calculation of natural gas usage.

Nonetheless, the Project would potentially be the first studio in the City built in accordance with the City's new all-electric buildings ordinance. Therefore, the GHG and energy analyses have been updated to take into account compliance with the City's new all-electric buildings ordinance. The updated Project modeling is included in Appendix FEIR-9 of this Final EIR, which confirms the less than significant conclusions of the Draft EIR. As detailed in the updated modeling, the building-related energy demand and GHG emissions included in the Draft EIR represented a conservative assessment of Project demands and emissions (i.e., the estimate of natural gas usage did not account for the City's new all-electric buildings ordinance that prohibits new natural gas usage with certain exceptions).

Please note that Project Design Feature GHG-PDF-3 is included in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, to require the installation of electrical hookups at all basecamp areas.

Comment No. 26-52

Failure to Assess Whether Electricity Distribution Infrastructure is Adequate to Handle the Project Site's Peak Load

Please explain why the DEIR failed to analyze whether the existing electricity distribution infrastructure can handle the Project's peak load. The DEIR only compares the Project's peak load to LADWP's total peak load across its service territory, which is not an informative or useful comparison as to impacts on utility infrastructure in the area. DWP often has localized infrastructure limitations and requires significant local projects to increase capacity. Has the City requested an assessment from DWP as to infrastructure needed to support the Project? Will the Project upgrades to local infrastructure require

additional offsite construction activities? Will the Project put area residents and businesses at risk for localized failures due to local infrastructure limitations? Why was this level of analysis not required?

With more uses being electrified (such as cars and trucks), the electricity grid is being strained at the local level. For examples, the Advanced Clean Trucks (ACT) regulation, adopted by CARB in 2020, covers everything from heavy-duty pickups or work trucks to the semi-trucks used in drayage and long-haul applications, and requires truck manufacturers, beginning with the 2024 model year (MY), to produce and sell ZEVs into California's market in growing numbers. The proposed ACF regulation would require certain fleets to deploy ZEVs starting in 2024 and would establish a clear end date of new medium- and heavy-duty internal combustion engine (ICE) vehicle sales in 2040. In its own CEQA-equivalent document prepared in support of the ACF regulation, CARB discloses the impact of electrified trucking on the grid:

- The electrification of the various sectors affected by the Proposed Program could increase local and regional energy use and impact supplies and requirements for additional capacity. The Proposed Program may also impact peak and base load period demands for electricity and other forms of energy. The level of energy demand generated from these actions, and the potential for a change in energy demand, would be site-specific and dependent on the location and scale that the electrification of these sectors would occur.
- CEC's preliminary modeling, which considered 5.0-kilowatt (kW) and 350-kW charging power levels, suggests that to charge these 180,000 medium- and heavy-duty BEVs, 157,000 DC fast chargers will be needed, of which 141,000 are 50 kW and 16,000 are 350 kW by 2030.
- This charging need will initially be focused "behind the fence" through depot charging, but publicly accessible options will be needed to enable a widespread charging network for long-range and interstate travels.
- CEC modeling indicates that the necessary make-ready infrastructure to support EVSEs requires special attention and investment.³

Given the level of truck usage anticipated for this Project, how did the DEIR consider these impacts of electrified trucking?

As described elsewhere herein, the Project may be required to fully electrify (i.e., no natural gas hookups), include plugs instead of portable diesel generators, and numerous charging stations to service, light-, medium-, and heavy-duty vehicles, plus micromobility options like e-bikes and e-scooters. This is especially true now that California has prohibited the sale of gas-powered vehicles starting in 2035, with significant reductions prior to 2035. A single heavy-duty charger can require 1 megawatt of capacity, over 16% of the Project's projected

peak load of 6,103 kw (which likely is an underestimate of the Project's actual peak load at buildout).

As has been well established by LADWP, SCE, PG&E, and SDG&E activity, the electrical distribution grid was not designed to handle these higher peak loads. Please provide a detailed analysis of the overall infrastructure needs to support the Project long-term, including consideration of the evolving electrification requirements.

Please assess whether the feeder lines (i.e., distribution lines) and substation currently serving the Project Site are adequate to address the peak load of a stable and finite Project design. This information should be included in a recirculated DEIR.

³ See <https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2022/acf22/appd.pdf> (internal citations omitted).

Response to Comment No. 26-52

Exhibit 5 (LADWP Will Serve Letter) provided in Appendix O, Utility Infrastructure Technical Report, of the Draft EIR details that electric service is available and will be provided in accordance with the DWP Rules and Regulations. The estimated power requirement for the Project is part of the total load growth forecast for the City and has been taken into account in the planned growth of the power system. As discussed in Response to Comment No. 26-E.1-33, the energy demand analysis for existing conditions was conservatively based on CalEEMod historical default emission factors and resulted in reduced energy demand relative to the actual energy demands of the 50+ year old existing buildings at the Project Site. The updated energy usage estimated using CalEEMod 2022.1.1, which accounts for the City's Ordinance No. 187714 (effective January 2023), is presented in the Confirmatory Air Quality, GHG, and Energy Analysis in Response to Public Comments (see Appendix FEIR-9 of this Final EIR) and shows, based on application of Ordinance No. 187714, that energy usage would be higher than the energy usage estimated for the Project in the Draft EIR. Thus, the City requested LADWP to provide an updated will-serve letter demonstrating that the Project's estimated electricity demand (including EV chargers and electrical hook-ups) could be met by the existing electrical infrastructure in the Project area. The updated LADWP will-serve letter is provided as part of the Confirmatory Air Quality, GHG, and Energy Analysis in Response to Public Comments (see Appendix FEIR-9 of this Final EIR) and confirms (a) that LADWP's infrastructure, including distribution grid, is sufficient to address the Project's electricity demands, and (b) the Project's less-than-significant electricity impact conclusion in the Draft EIR. Regarding the electrification of various sectors at the State level, it is not the responsibility of an individual project to evaluate or individually affirm the regional power grid's ability to meet the presumed power demands of CARB's current and future ZE and NZE program requirements. Given the Project's less-than-significant electricity impact, no

further analysis is required under CEQA. Refer to Response to Comment No. 26-E.1-38 for further discussion with respect to ZE and NZE infrastructure support.

As stated on page IV.E-51 of the Draft EIR, the Project would comply with the City's Green Building Ordinance regarding EV charging requirements. Additionally, a PDF is included in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, to require the installation of electrical hookups at basecamp areas during operations and this additional electricity usage is included in the Confirmatory Air Quality, GHG, and Energy Impacts Analysis in Response to Comments (see Appendix FEIR-9 of this Final EIR). Trucks accessing basecamps would travel on-site for short distances and would plug into electric power when parked in lieu of use of small portable generators (e.g., food trucks). The Draft EIR concluded that energy impacts associated with trucks would be less than significant and the Confirmatory Air Quality, GHG, and Energy Impacts Analysis in Response to Comments (see Appendix FEIR-9 of this Final EIR) confirmed that energy impacts associated with the additional electrical hookups for trucks/trailers at basecamp areas during operations would be less than significant; therefore, the Project does not require electrified trucking to reduce energy impacts.

This comment does not provide substantial evidence that "significant new information" as defined by CEQA Guidelines Section 15088.5 has been added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Also refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 26-53

D. Geology, Soils, and Seismicity

The Geology and Soils section of the DEIR fails to provide important information to the public and decision-makers and includes conclusory statements of impact determinations, and proposes inadequate mitigation measures. Therefore, it must be revised and recirculated so the public and decision-makers can understand the Project's true impacts.

DEIR Fails to Analyze Dewatering Impacts

The DEIR fails to specify the extent of construction dewatering required.

Response to Comment No. 26-53

The dewatering analysis included in the Draft EIR is consistent with CEQA and City policy. Refer to Response to Comment No. 11-5 regarding the Draft EIR's analysis of impacts related to dewatering, which were determined to be less than significant. Refer to Response to Comment Nos. 11-25, 13-6, 16-64, 26-56 through 26-62, 26-64, 26-65, and

26-67 through 26-70 for further information regarding the temporary construction dewatering. A detailed technical dewatering analysis is typically performed during the individual building design and permitting phases after a project is approved, and not as part of an EIR. Nevertheless, in response to comments regarding the Draft EIR's dewatering analysis, an evaluation of dewatering conditions for the temporary excavation and construction of a below-grade parking structure (i.e., the Dewatering Report) is provided in Appendix FEIR-13 of this Final EIR for informational purposes. The Dewatering Report confirms the conclusion in the Draft EIR that impacts associated with dewatering activities during construction would be less than significant.

In addition, as discussed in Response to Comment No. 3-7, per Project Design Feature GEO-PDF-1, the proposed below-grade parking structures will be designed to resist the hydrostatic pressure such that a permanent dewatering system (post-construction dewatering) will not be required.

This comment does not provide substantial evidence that "significant new information" as defined by CEQA Guidelines Section 15088.5 has been added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Refer to Response to Comment No. 9-4 for a detailed discussion regarding recirculation.

Comment No. 26-54

The DEIR states that excavations will go to a depth of 45 feet. How was that depth determined?

Response to Comment No. 26-54

The maximum excavation depth of approximately 45 feet was determined based on the proposed development program described on pages II-12 to II-35 of Section II, Project Description, of the Draft EIR. As stated on page 36 of Geotechnologies' Preliminary Geotechnical Engineering Investigation included as Appendix E.1 of the Draft EIR, it is anticipated that excavations up to a maximum of approximately 45 feet in vertical height will be required to accommodate three levels of subterranean parking and related substructure. The excavation process will remove any unsuitable materials and compact per the recommendations discussed in the Preliminary Geotechnical Engineering Investigation included as Appendix E.1 of the Draft EIR. Refer to Response to Comment No. 26-55 for additional information regarding the depth of excavation.

Comment No. 26-55

Is the Project restricted from excavating beyond 45 feet below ground surface?

Response to Comment No. 26-55

The Draft EIR analyzed the Project described in Section II, Project Description, of the Draft EIR (refer to pages II-12 to II-35 therein), and any substantial changes from the Project would be subject to further discretionary City review and subsequent CEQA compliance review per the proposed Specific Plan. As stated on page II-1 in Section II, Project Description, of the Draft EIR and throughout the Draft EIR, the Project would include excavations up to a maximum of approximately 45 feet below grade, which is based on the proposed development program described on pages II-12 to II-35 of Section II, Project Description, of the Draft EIR.

Comment No. 26-56

Given that depth of excavation, what is the nature and extent of dewatering required?

Response to Comment No. 26-56

Refer to Response to Comment Nos. 11-5 and 26-61 regarding estimated quantities of groundwater that may be extracted. The Dewatering Report in Appendix FEIR-13 of this Final EIR provides estimates of pumping rates, water-level drawdown, and cone of depression radius of influence for the estimated 21-month temporary dewatering period. See Figures 8A and 8B in the Dewatering Report for estimated temporary cones of depression and Table 1 in the Dewatering Report for estimated groundwater dewatering quantities.

Comment No. 26-57

What will be the rate, drawdown, and radius of influence of dewatering needed for construction?

Response to Comment No. 26-57

Refer to Response to Comment Nos. 11-25 for a summary of the drawdown and radius of influence estimated to result from temporary dewatering during construction of the Project. The Dewatering Report in Appendix FEIR-13 of this Final EIR provides estimates of pumping rates, water-level drawdown, and cone of depression radius of influence for the estimated 21-month temporary dewatering period. See Figures 8A and 8B in the Dewatering Report for estimated temporary cones of depression and Table 1 in the Dewatering Report for estimated groundwater dewatering quantities.

Comment No. 26-58

What will be the design of the dewatering system?

Response to Comment No. 26-58

As discussed in Addendum I, Response to Soils Report Review Letter prepared by Geotechnologies dated June 3, 2021 (included in Appendix E.3 of the Draft EIR), the Project is currently in the pre-approval process.

Once the final construction plans are prepared for individual buildings during the regulatory building permit process, the feasibility of a traditional temporary dewatering system with well points to draw down the water level will be evaluated. Additional dewatering and settlement analyses will be provided and submitted to the City of Los Angeles Grading Division for review and approval. For example, the number and type of groundwater extraction points for each excavation will be based on additional subsurface and hydrogeologic testing that takes into account the volume and rate of flow of water intercepted by the below grade levels.

While the dewatering system will be determined during the City's building permit process, specifically LABC Sections 1803.5.4 (which states that a subsurface soil investigation shall be performed to determine whether the existing groundwater table is above or within 5 feet below the elevation of the lowest floor level where such floor is located below the finished ground level adjacent to the foundation) and/or 1805.1.3 (which states that the design of a system to lower the groundwater table shall be based on accepted principles of engineering), in response to comments and for informational purposes, a dewatering evaluation is included in the Dewatering Report included in Appendix FEIR-13 of this Final EIR, which confirms the Draft EIR's conclusion that impacts associated with temporary construction dewatering would be less than significant. The dewatering system would include regulatory infiltration control measures, as necessary. The Dewatering Report analysis assumes cut-off walls will be installed to provide lateral groundwater infiltration control. However, this is only one example of a potential regulatory infiltration control measure, and other control methods will be considered when final construction plans are prepared during the regulatory building permit process. A final dewatering analysis will be performed upon the selection of the specialty contractor performing the dewatering scope. The final dewatering analysis will incorporate the experience of the specialty contractor and confirm the quantity and rate of flow once construction plans for individual buildings are prepared to develop a suitable temporary dewatering program.

Comment No. 26-59

Depending on the design of the system—number of wells, size of wells, spacing of wells—the extent of the impacts may vary.

Response to Comment No. 26-59

Refer to Response to Comment No. 26-58 for additional information regarding the design of the dewatering system. While the dewatering system design can affect the lateral and vertical extent of groundwater drawdown, as described in the Dewatering Report, regulatory lateral groundwater infiltration control measures are planned to be implemented as needed to reduce temporary groundwater drawdown off-site.

Comment No. 26-60

Please provide information as to the rate, drawdown, and radius of influence of dewatering needed for buildout by 2026 or 2043.

Response to Comment No. 26-60

As further described in Response to Comment No. 11-25, the Dewatering Report provided in Appendix FEIR-13 of this Final EIR provides estimates of temporary construction dewatering rates and drawdown cone of depression dimensions (also referred to as radius of influence) for the Area 2 excavation dewatering program that is estimated to occur over a 21-month period. Based on the Area 2 analysis, the dewatering quantities and cones of depression for the other excavations are estimated based on the similar assumption of a 21-month dewatering period for the 2026 buildout plan.

As discussed in Response to Comment No. 11-5, and as discussed in the Dewatering Report, the total amount of groundwater that would be dewatered during the temporary dewatering is approximately 26.4 million gallons (40,600 gpd).

With regard to the 2043 buildout scenario, recognizing groundwater conditions may have fluctuated slightly due to natural conditions (i.e., drought, precipitation events, etc.), the dewatering rates, quantities, and cone of depression estimates would be expected to be comparable to or less than the estimates for the 32-month buildout scenario given that the dimensions of the excavations are not expected to change between the two buildout scenarios.

Comment No. 26-61

How much water will be extracted and how will the water be disposed?

Response to Comment No. 26-61

Refer to Response to Comment No. 11-5 regarding the estimated quantities of groundwater that may be extracted and Response to Comment No. 3-7 the reuse or discharge of extracted groundwater.

Please see the temporary construction dewatering estimate quantities in the Dewatering Report that was prepared in response to comments, which is included in Appendix FEIR-13 of this Final EIR. As discussed therein, a total of approximately 26.4 million gallons, or 81 acre-feet, of groundwater would be extracted during the temporary construction dewatering. Please note that there are no active pumping wells within 1 mile of the Project Site, and the groundwater storage capacity of the Hollywood Subbasin in which the Project Site is located is reported to be approximately 200,000 acre-feet. The overall dewatering estimate of 81 acre-feet is therefore less the 0.05 percent of the basin capacity. Thus, the temporary construction dewatering program is anticipated to have a minor effect on the local groundwater resource.

As further discussed in Response to Comment Nos. 3-7 and 11-5, any discharge of groundwater during Project construction would comply with the applicable NPDES permit or industrial user sewer discharge permit and applicable LARWQCB requirements, and, therefore, groundwater quality would not be negatively affected by potential dewatering activities.

Comment No. 26-62

What happens if the water is contaminated?

Response to Comment No. 26-62

Refer to Response to Comment No. 16-64 for a summary of how the extracted groundwater would be chemically analyzed to determine contamination and the appropriate treatment and/or disposal method.

Comment No. 26-63

Given that the area is an oil field zone, hydrocarbons may well be issues that will need to be addressed and should be evaluated in the DEIR.

Response to Comment No. 26-63

Refer to Response to Comment No. 13-4 regarding hydrocarbons, the oilfield and the former gas stations and Response to Comment No. 16-64 regarding potential groundwater contamination and for a summary of how the extracted groundwater would be chemically analyzed to determine contamination and the appropriate treatment and/or disposal methods. The nature and extent of petroleum hydrocarbon impacts in soil and groundwater at the Project Site are described in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR, the Site Summary Report (Appendix G.1 of the Draft EIR), and various groundwater monitoring reports for the former Texaco station (see State of California Geotracker database; <https://geotracker.waterboards.ca.gov/>). Overall, while

hydrocarbons have been detected sporadically in each of the media, average concentrations for the Project Site are low.

Comment No. 26-64

There is some reference in the DEIR to a cut-off wall system. What exactly are the details of that system? Will it rely on sheet piles, well points, or some other design? How will it limit the construction dewatering and related impacts? What is the potential for leakage to occur through or below the cut-off wall? How does the design of the cut-off wall proposed for the Project address the potential for leakage? If construction of the Project is phased, how is the cut-off wall system implemented for a phased project? Have any pilot tests been completed for the system? Will some amount of dewatering still be required with such a system? How much? What impact will the cutoff wall have on adjacent properties? Will it cause a mounding effect on the neighboring properties? Could it impact structures, especially historic structures, on the neighboring properties? Do the neighboring properties have dewatering systems? If so, how will they be affected by the cutoff wall or Project dewatering?

Response to Comment No. 26-64

Refer to Response to Comment No. 26-58 regarding a summary of the dewatering system. As described therein, although a preliminary grading and excavation plan has been developed, additional and more detailed Project Site characterization will be performed as part of determining the means and methods of construction for individual buildings during the regulatory building permit process. Specifically, the specific means and methods for potential site retention and dewatering systems for individual buildings will be developed for the various excavations based on the elevations of water bearing strata, flow rates and varying sizes, locations and depths of the excavations. Depending on the results of the detailed Project Site characterization, the final dewatering system may or may not include a cut-off wall. The final dewatering system methods, phasing, potential pilot tests, and shoring design (per Section 1812 and 3307 of the Los Angeles Building Code), which are subject to regulatory control for safety and subsidence, will be submitted to LADBS for review and approval as part of the building permit processes prior to construction.

A Dewatering Report is provided in Appendix FEIR-13 of this Final EIR. The report presents estimates of groundwater dewatering quantities and drawdown cone of depression dimensions. The analysis uses modeling to conclude an approximation of a vertical cut-off wall system can reduce dewatering quantities and the estimated surrounding groundwater drawdown cone of depression by impeding lateral groundwater flow into the excavations. While a cut-off wall is estimated to significantly impede lateral groundwater inflow into the proposed excavations, in practice some leakage can occur. The cut-off wall

may also be able to be founded into a low permeability clay or silt layers to impede groundwater leakage into the excavation bottoms. During the temporary construction dewatering program and including the potential use of a cut-off wall, temporary water level declines are expected due to the active groundwater pumping and groundwater mounding is not expected.

None of the neighboring properties are known to have dewatering systems, thus the temporary construction dewatering is not expected to create interference with neighboring structures, including historic structures. Appendix D of the Dewatering Report presents a geotechnical analysis that concludes that subsidence associated with dewatering would be negligible and have a less-than-significant impact on surrounding properties, including historical buildings.

Comment No. 26-65

While information regarding construction dewatering is insufficient, information regarding operational dewatering is completely missing from the analysis of the Project. The only reference to operational dewatering for the Project is the description of methane systems. The DEIR otherwise assumes no ongoing extraction of groundwater after Project construction. What analysis in the DEIR supports the assumption that there will be no dewatering required after the Project buildings are constructed?

Response to Comment No. 26-65

As discussed in Response to Comment No. 11-5, the Project would require temporary construction dewatering and not permanent dewatering. Per Project Design Feature GEO-PDF-1, the proposed below-grade parking structures will be designed to resist the hydrostatic pressure such that a permanent dewatering system (post-construction dewatering) will not be required.

Refer to Response to Comment Nos. 11-5 and 11-25 regarding the Draft EIR's comprehensive analysis of potential dewatering impacts. As discussed therein, the temporary dewatering system would be installed and operated in accordance with the NPDES discharge permit or industrial sewer permit requirements, and the specific dewatering system will be determined during the City's building permit process. Nevertheless, in response to comments regarding the Draft EIR's dewatering analysis, an evaluation of dewatering conditions for the temporary excavation and construction of a below-grade parking structure is provided in Appendix FEIR-13 of this Final EIR for informational purposes, the Dewatering Report. The Dewatering Report confirms the conclusion in the Draft EIR that impacts associated with dewatering activities during construction would be less than significant.

Comment No. 26-66

The discussion of the methane systems suggests that it will be required (the Project is in a methane zone). If there is no operational dewatering, then how will the integrity of the building systems and methane systems be insured?

Response to Comment No. 26-66

Refer to Response to Comment No. 13-6 regarding methane gas control.

Comment No. 26-67

On the other hand, if an operational dewatering system is implemented, then what will be the nature and extent of the dewatering? Where is the analysis of the impacts of such system? How will the dewatering systems be designed? What will be the design of the wells and piping? What will be the rate, drawdown, and radius of influence of dewatering needed after the Project buildings are completed?

Response to Comment No. 26-67

As discussed above in Response to Comment No. 65, the Project would not include permanent dewatering during operations. Refer to Response to Comment No. 26-69 below for a discussion of construction dewatering.

Comment No. 26-68

Is there dewatering at the Project Site today? What is the nature and extent of that dewatering? Was that information taken into consideration in developing the Project plans?

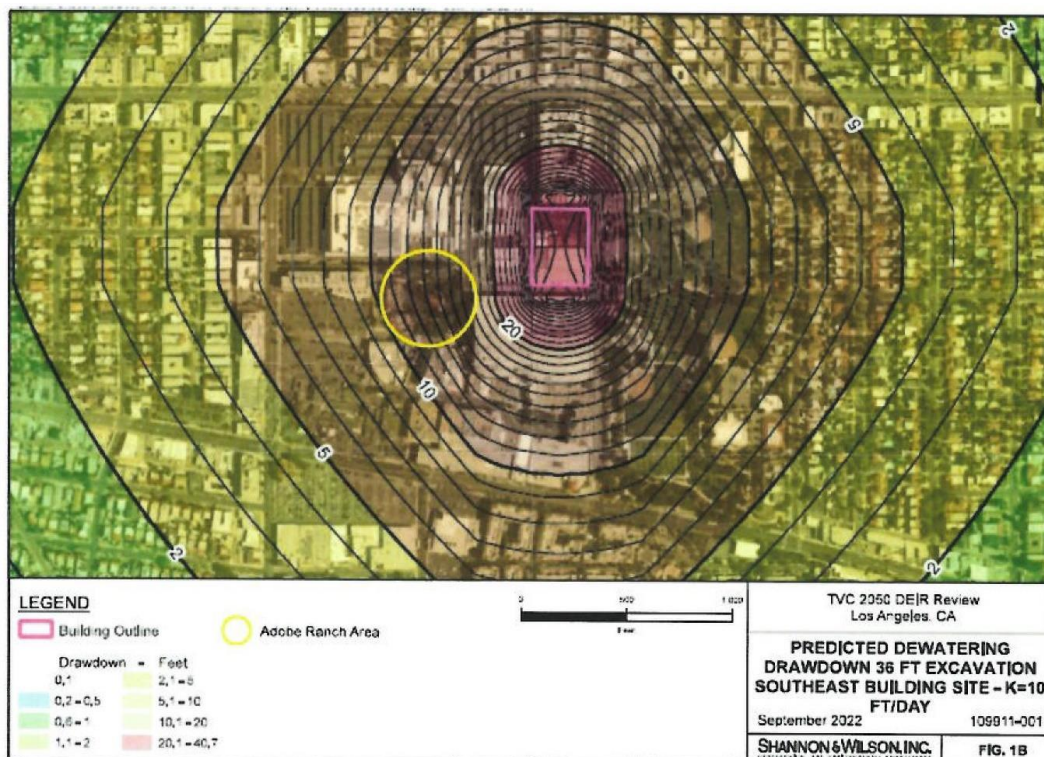

Response to Comment No. 26-68

There is no dewatering system at the Project Site under existing conditions.

Comment No. 26-69

By failing to fully assess the potential extent of construction and operational dewatering, the DEIR fails to disclose the related geotechnical impacts, such as settlement or subsidence impacts from dewatering. Specifically, there may be potential impacts to existing historic structures, utilities, rights of way, and adjacent structures. These impacts may be significant. As depicted in the following graphics from the Shannon & Wilson Report, attached as Exhibit 3, dewatering during construction or operations could impact

groundwater levels several thousand feet from the Project site. The DEIR must disclose the extent of dewatering and related impacts.

Response to Comment No. 26-69

Operational dewatering is not proposed for the Project. See the Dewatering Report in Appendix FEIR-13 of this Final EIR for a description of the temporary groundwater dewatering analysis during construction, as well as a confirmatory settlement analysis from Geotechnologies included as Appendix D of the Dewatering Report which confirms the Draft EIR's conclusion that potential impacts related to settlement during the temporary construction dewatering would be less than significant. The Dewatering Report was prepared in response to comments and confirms the Draft EIR's conclusions that impacts related to dewatering would be less than significant. The analysis concludes the groundwater dewatering quantities and drawdown dimensions displayed in Figures 1A and 1B of this comment are based on incorrect assumptions and methodologies that overestimate the nature of the anticipated impacts to groundwater as discussed further below:

- The dewatering analysis attached to this comment letter assumed “unrestrained (no cut-off walls)” or no infiltration control measures for the dewatering program. Excavation infiltration control measures are described in the Draft EIR and will be implemented during construction dewatering if necessary, the application of which would significantly reduce dewatering volumes and drawdown dimensions as compared with the analysis in this comment letter. Further, the dewatering analysis attached to this comment letter and cones of depression calculations assume achieving 36 feet of drawdown for a proposed excavation (Area 6) that only extends 17 feet into groundwater. Both of these incorrect assumptions result in substantially overstating the anticipated nature of the dewatering quantities and cone of depression dimensions.
- The dewatering analysis attached to this comment letter uses an analytical solution (i.e., approximation of *Theis equation*, an analytic solution for the drawdown in a confined aquifer) without providing the parameter assumption details, such as “an appropriately large storage coefficient is used.” Dewatering would be performed over a 21-month period during Project construction. The amount of dewatering is related to pumping over time and thus is a time-dependent variable that is best analyzed with a time-dependent approach like the combined steady state and transient model used in the Dewatering Report. Although the documentation is limited, it is our understanding the dewatering analysis attached to this comment letter using this equation does not consider time, but rather estimates a theoretical maximum drawdown that overstates the drawdown for temporary dewatering. A time-dependent steady state and transient model analysis has been prepared to more accurately simulate the 21-month dewatering period.
- An inaccurate, simplifying assumption of the *Theis equation* analysis is that the water-bearing materials are assumed to be isotropic (i.e., the material properties are equivalent in all directions), which do not consider vertical anisotropy in the

common silt- and clay-bearing layers of Project Site soils. As described in Section IV.D, Geology and Soils, and Appendix E of the Draft EIR, as well as the Dewatering Report, the majority of the Project soils are fine-grained silt and clay-bearing materials that have a strong anisotropy that substantially reduce groundwater flow. It is expected that due to the predominance of fine-grained clay and silt layers, vertical migration rates will be substantially lower than horizontal flow rates, potentially limiting upward flow rates into the excavation bottoms. The Dewatering Report uses a three-dimensional model that accurately accounts for the properties of the soil within the Project Site.

- The dewatering analysis attached to this comment letter used hydraulic conductivity (K) values of 1 and 10 feet/day. No reference is provided other than to base the values on an “overall silty sand” composition, which is not reasonable or representative of the Project Site soils. The analysis in the Dewatering Report is based on site-specific data, including four CPT/HPT borings, and published references that supports the use of a lower K value of 0.1 foot/day, which is more representative for the bulk of the water-bearing materials based on the actual geology of the Project Site, which consists mostly of silt and clay layers. The K value of 10 feet/day used in the commenter’s analysis is more representative of a sand, and their assumption of 1 to 10 feet/day is 10 to 100 times greater than the results of the Project Site-specific analysis in the Dewatering Report.
- The commenter describes the use of an unstated “appropriately large storage coefficient” in their analysis. In an unconfined aquifer analysis, the storage coefficient is virtually identical to specific yield (the S_y of a soil or rock is the ratio of the volume of water that, after saturation, can be drained by gravity to its own volume). The Dewatering Report evaluated published data that supports an S_y of 10% for the bulk aquifer due to the significant proportion and quantity of fine-grained silt- and clay-bearing water bearing soils.
- The analysis attached to this comment letter assumes incorrect excavation depths. For example, the analysis assumes a 36-foot excavation depth near the southeast corner of the Project Site. The excavation depths for the Project are shown in Figure 3 of the Soil Management Plan (included in Appendix G.1 of the Draft EIR), and this figure is also included as Figure 3 of the Dewatering Report. As shown therein, the estimated excavation depth for the southeast portion of the Project Site (Area 6) is 27 feet. Thus, the commenter’s analysis assumes a greater depth than is planned and thus overestimates anticipated drawdown dimensions in this area.

Thus, the methodology, assumptions and inputs used in the dewatering analysis attached to this comment letter are not representative of the Project’s temporary dewatering program or Project Site conditions and substantially overestimates the dewatering quantities and cone of depression dimensions.

Refer to the technical memorandum prepared by Geotechnologies included as Appendix D of the Dewatering Report. As discussed therein, given the long-term water level fluctuations recorded in the vicinity of the Project Site (due to seasonal changes and regulatory-approved activities), the anticipated groundwater drawdown will only be up to 3.5 to 7 feet below previously recorded water levels for the Project vicinity. As stated in Appendix D of the Dewatering Report, this small amount of drawdown will have less than significant subsidence effects on the surrounding properties adjacent to the excavation, and it is anticipated that the drawdown effects will result in less than 0.5 inch of settlement for areas located in the immediate surrounding vicinity of the Project. The magnitude of any potential settlement will decrease with increased distance away from the excavation. For properties located further away from the excavation, where the depth of temporary dewatering drawdown will be approximately equal to the recorded long-term groundwater level fluctuation, the anticipated subsidence effects as a result of dewatering will be negligible.

LADBS requires a maximum deflection of 0.5 inch for all shoring systems where a structure is located within a 1:1 surcharge plane (45-degree angle) projected up from the base of the excavation. Where there are no structures located within a 1:1 surcharge plane extending up from the base of the excavation, the maximum lateral deflection of 1 inch at the top of the shoring system is accepted by LADBS. Refer to Appendix D of the Dewatering Report for further discussion of the applicable regulatory requirements. One half inch of horizontal or vertical movement is required by the City during the regulatory building permit process for individual structures and is widely accepted and adopted by design professionals and construction industry standard of acceptance and is considered to be well within the structural tolerance of a well-designed structure. The Project would be required to comply with this requirement and all other applicable regulatory requirements related to the temporary dewatering and shoring.

Comment No. 26-70

The DEIR inappropriately defers the analysis related to dewatering. The Project's June 3, 2021 response to the City's Department of Building and Safety May 21, 2021 Soils Report Review Letter states "once the design of the proposed structures and depth of the proposed subterranean levels achieve more definition.... Additional dewatering and settlement analysis will be provided and submitted to the City ... for review and approval if the shoring and dewatering system changes from a cut-off wall system." This deferred analysis relates back to the fundamental failure described above regarding the lack of an accurate, stable, and finite Project description. First, the EIR must assess and disclose the impacts now. If the Project allows for changes in the methodology regarding dewatering changes, the public, especially the neighboring property owners that could be most affected by dewatering impacts, should have an opportunity to review and comment.

Response to Comment No. 26-70

Refer to Response to Comment Nos. 3-7, 11-5, and 11-25 regarding the Draft EIR's comprehensive analysis of potential dewatering impacts under CEQA. Refer to the Dewatering Report in Appendix FEIR-13 of this Final EIR for an analysis of the potential groundwater drawdown pertaining to temporary construction dewatering. As is City practice, the dewatering system will be determined during the City's building permit process. Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding the accurate, stable, and finite Project Description.

With regard to notification, all dewatering methods will be designed and submitted to the local jurisdictions for review and approval including LADBS' Grading Division, LARWQCB and/or LASAN in accordance with building code and all other applicable regulatory requirements.

Comment No. 26-71

Aside from the dewatering issues associated with excavation, how will the excavations be supported? Have the potential impacts to adjacent properties to the east and south been assessed? Does the Project propose to have tieback anchors extend into adjacent properties? How can the Project presume to rely on a neighboring property for such structural support? Has any assessment of the impacts of such tiebacks been completed? Such information should be made available to the neighboring property owners for review as part of the DEIR. The details of the support for the excavations, potential impacts to the neighboring property owners, and application of appropriate mitigation must be included in a recirculated DEIR.

Response to Comment No. 26-71

Temporary shoring will be required for the excavation of the proposed below-grade levels. As with all other projects in the City, the specific means and methods of shoring will be developed during the City's building permit process. Several methods of shoring systems exist and may be comprised of cantilever and/or restrained elements depending on the depth of the excavation. Restrained shoring may consist of tiebacks and/or internal restrained system (raker footings). Any tiebacks extending below adjoining neighboring properties will require written consent of the adjacent property owner or the owner's authorized representative. The written consent shall be notarized and a copy of said consent shall be filed with the City of Los Angeles Department of Building and Safety before a permit for such work may be issued, as is required by Section 7006.6 of the Los Angeles Building Code. In lieu of tiebacks, the shoring system may also be designed utilizing internal bracing or raker footings installed internal to the Project Site for bracing of the shoring system, if necessary.

The design of the shoring systems will be consistent with all applicable regulatory requirements, including, but not limited to Sections 1812 and 3307 of the Los Angeles Building Code (LABC) and best trade practices to preserve the integrity of all surrounding land and ensure the protection of construction workers. Inspections of shoring installations, surveying, and monitoring requirements will be incorporated and detailed in the final shoring plans, as required by the local jurisdiction as part of the plan review and approval process. All plans for shoring will be submitted for review and approval by the local jurisdiction prior to construction.

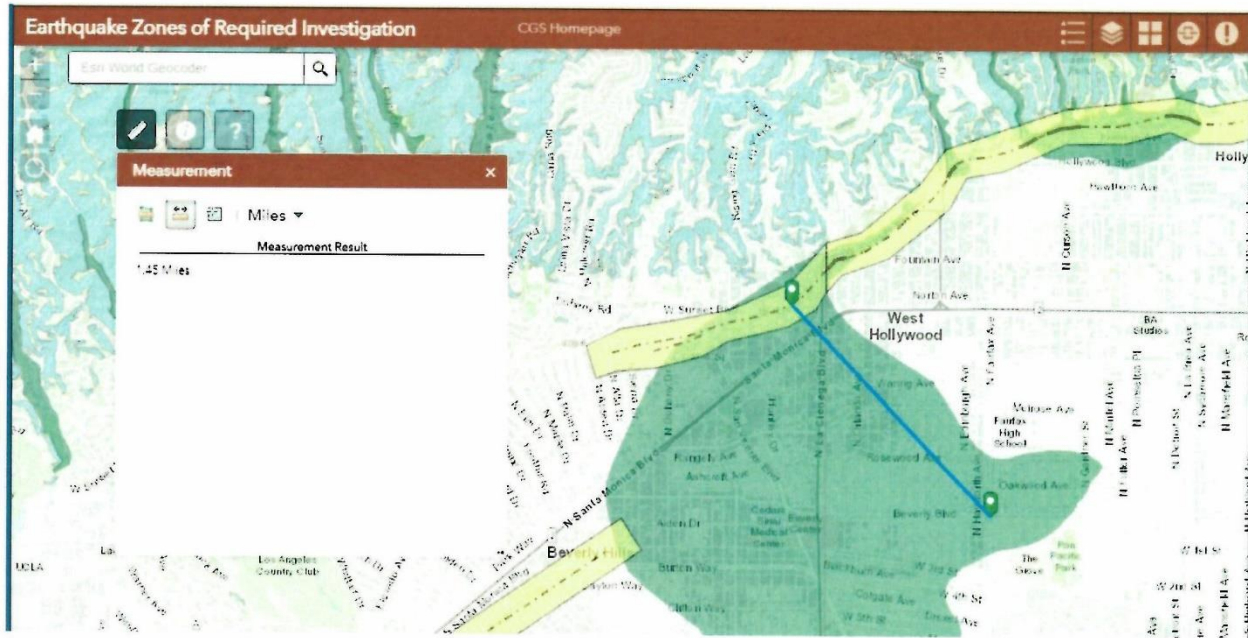

This comment does not provide substantial evidence that “significant new information” as defined by CEQA Guidelines Section 15088.5 has been added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Refer to Response to Comment No. 9-4 for a detailed discussion regarding recirculation.

As discussed in Response to Comment No. 3-7, per Project Design Feature GEO-PDF-1, the proposed below-grade parking structures will be designed to resist the hydrostatic pressure such that a permanent dewatering system (post-construction dewatering) will not be required.

Comment No. 26-72

DEIR Includes Incorrect Fault Information

The DEIR states that the Project is approximately 1.7 miles to the south of the Hollywood Fault. (DEIR, p. IV.D-19.) That is incorrect. Per the California Department of Conservation and California Geological Survey, the Hollywood Fault passes 1.45 miles from the Project’s location, which is also located in a liquefaction zone. Therefore, the DEIR’s conclusions regarding the Project’s exposure of the building’s occupants to risk of loss, injury, or death due to strong seismic ground shaking is based on an incorrect assumption regarding the distance to the Hollywood Fault. The DEIR’s conclusions must be reassessed to reflect the Project’s closer proximity to the Hollywood Fault.

Response to Comment No. 26-72

As discussed on page IV.D-19 in Section IV.D, Geology and Soils, of the Draft EIR, the Hollywood Fault is located to the north of the Project Site. As stated therein, the Project Site is located approximately 1.7 miles from the Hollywood Fault, as measured from the center of the Project Site. The distance from the northwest corner of the Project Site to the closest mapped trace of the Hollywood Fault is approximately 1.45 miles. The specific point of measurement does not affect the conclusions regarding the Project's exposure of the building's occupants to risk of loss, injury, or death due to strong seismic ground shaking as the analysis is based on the Preliminary Geotechnical Engineering Investigation approved by the City (refer to Appendix E.1 of the Draft EIR) that is based on detailed mapping of the Project Site (refer to Figure II therein). This mapping is consistent with the mapping provided in this comment.

The Project Site is not located within an Alquist-Priolo Earthquake Fault Zone, and, therefore, the performance of a fault rupture study is not required. However, it is located within a mapped liquefaction zone requiring site investigation to address the potential of seismic related hazards. Liquefaction analyses were performed in accordance with CGS Special Publication 117A⁵⁰ and the Earthquake Engineering Research Institute (EERI)

⁵⁰ California Geological Survey (CGS), Special Publication 117A Guidelines for Evaluating and Mitigating Seismic Hazards in California, 2008.

Monograph⁵¹ (refer to pages 9 and 16 of the Preliminary Geotechnical Engineering Investigation report in Appendix E.1 of the Draft EIR). The results of the liquefaction analyses indicated that the liquefaction potential of the Project Site is low under the Peak Ground Motion.

Comment No. 26-73

E. Greenhouse Gas

Deficiencies in Trip, VMT, and Emissions Calculations Carry Over to GHG Section

All of the omissions and mistakes associated with calculations and disclosure of the Project's trips (cars and trucks, transit use, etc.), VMT, and emissions calculations for DPM, TACs, and criteria pollutants, as detailed in this comment letter, carry over to the GHG Section. Those issues must be corrected before the DEIR can accurately calculate the Project's GHG emissions. As such, the DEIR needs to be revised and recirculated so that the public is informed of the Project's actual GHG emissions.

Inaccurate GHG Emissions Calculations

In addition to errors noted in other comments, the calculations involving the existing solar array are inaccurate, resulting in an underestimate of the existing Project Site GHG inventory as detailed in the Ramboll Report. (DEIR at p. IV.E-39.) In Table IV.E-5, the annual emissions reduction from the existing solar array is estimated as 544 MT CO₂e. This calculation uses the 2019 LADWP grid intensity factor, and thus assumes an operational year of 2019 for the solar array. However, all other emissions in Table IV.E-5 are estimated from the CalEEMod run for existing conditions, which has an operational year of 2021. To align with the CalEEMod run, the solar emissions should be estimated using the 2021 LADWP grid intensity.

The DEIR has not incorporated any natural gas and electricity data for the existing uses. The DEIR included such information for water, but it is not clear why this data was collected only for water consumption and not natural gas and electricity. The existing Project Site must have utility bills and/or metering data available that would provide a more accurate and site specific baseline. The DEIR should provide greater transparency on this issue and for consistency also use existing data on natural gas and electricity usage for the existing conditions. On page 310 of Appendix B, the RPS emission factor calculation table is presented; however, this table inaccurately calculates the CO₂ emission factor based on RPS benchmarks and does not clearly outline the methodology used in order to find the

⁵¹ Idriss, I.M and R.W. Boulanger, Soil Liquefaction During Earthquakes, 2008.

final emission factor used in the analysis. A carbon intensity of 520 lbs/MWh is provided in the first part of the table for 2026; however, in the second part of the table, this is presented as 585 lbs/MWh. There is no clear reasoning for why these two values differ, or how this value was ultimately calculated. As indicated in the Ramboll Report, using the most up-to-date power label from Los Angeles Department of Water and Power for 2020 provides a GHG intensity of 579 lbs CO₂e/MWh for 36.7% eligible renewables. Using the percent renewables and GHG intensity to calculate the carbon intensity for the years given in the table on page 310 gives values that differ from the provided value. The Project must provide further documentation on their RPS calculation and update the emission factor using the most up-to-date information available.

On page 309 of Appendix B, the DEIR provides an unsubstantiated GHG emission reduction for electric vehicle parking. This calculation notes in footnote 4 that 20% of the miles charged would be driven by the electric vehicle. However, in the actual calculation, a value of 10% is instead used, with no basis given for either of these values. The DEIR also reduces the energy consumption of the charging stations by 90% thereby underestimating the total electricity usage for the charging stations by 90%. As a result, the Project's electricity demand on-site and the emissions generated from electricity use have been underestimated. Please clarify which is the correct factor and correct the analysis.

Response to Comment No. 26-73

This comment misconstrues information provided in Appendix B, Air Quality and Greenhouse Gas Emissions, of the Draft EIR. Please refer to Response to Comment Nos. 26-30, 26-35, and 26-E.1-16, which further detail the construction and operation vehicle trips and VMT assumed in the air quality and GHG emissions calculations.

The electricity generation from the existing solar array correctly identified Year 2019 (the latest year of data available during the preparation of the Draft EIR). However, this comment correctly identifies that the GHG reduction from existing solar panels identified in Table IV.E-5 (Existing Project Site Annual GHG Emissions Summary) on page IV.E-39 of Section IV.E, Greenhouse Gas Emissions, of the Draft EIR was incorrectly based on a Year 2019 carbon intensity factor. GHG emissions associated with existing solar panels have been updated in Appendix FEIR-9 to use a Year 2021 carbon intensity factor. As shown on pdf page 309 of Appendix B, Air Quality and Greenhouse Gas Emissions, of the Draft EIR, electricity generation from the existing solar array under the future no project condition correctly used a Year 2026 carbon intensity factor. As such, Project incremental GHG emissions reported in Table IV.E-11 (Annual Project GHG Emissions Summary) on page IV.E-78 of the Draft EIR would remain unchanged.

Please refer to Response to Comment No. 26-E.1-33 and the Energy Consumption Memorandum included as Appendix C of Appendix FEIR-9 of this Final EIR for a

discussion of natural gas and electrical demand for existing uses, and how the Draft EIR conservatively used CalEEMod rather than utility data for the existing uses.

Please refer to Response to Comment No. 26-E.1-34 for a discussion of the carbon intensity factors used in the Draft EIR analysis.

Please refer to Response to Comment No. 26-E.1-36 for a discussion relating to energy-related emissions associated with electric vehicle parking.

This comment does not provide substantial evidence that “significant new information” as defined by CEQA Guidelines Section 15088.5 has been added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Also refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 26-74

DEIR Undercounts Emissions by Failing to Include Basecamps, Production Areas and Mobility Hub in Analysis

As described above, the DEIR does not appear to evaluate emission sources from uses within the basecamps, production zones, and Mobility Hub in its analysis. Just because the DEIR states that the Project is redefining floor area to exclude basecamp activities and other production zones that are happening in below grade areas or in parking structures, this does not mean that there are not emissions associated with these activities. Notwithstanding that the Project’s definition of floor area is inconsistent with the LAMC, the impacts from how the space is to be used must be analyzed. The proposed uses in the basecamps, production zones and Mobility Hubs will emit GHGs. Further, any electricity used in these spaces will have indirect GHG emissions. These were not accounted for in the GHG analysis.

The DEIR’s analysis of water usage includes both basecamps’ and the Mobility Hub’s usage, why wasn’t the same analysis done for GHG impacts? The DEIR must be revised to account for GHG emissions from basecamps, production zones and the Mobility Hub and recirculated for public comment.

Response to Comment No. 26-74

Please refer to Response to Comment No. 26-E.1-28 regarding the analysis of emissions associated with basecamp and the Mobility Hub. As provided in Topical Response No. 10, Trip Generation, the trip volume data included all Project-related trips, including basecamp trips.

As discussed in Topical Response No. 2, Definition of Floor Area is Appropriate, and Response to Comment Nos. 26-36 and 26-E.1-28, Project emission modeling accounted for the entirety of the Project, not just the uses meeting the definition of “floor area.” Please see Response to Comment No. 26-E.1-23 for a discussion of the vehicle trip effects of the Mobility Hub, which would be expected to reduce vehicle trips, and thus GHG and energy demands, associated with Project operations.

Please note that no active production activities or uses would be located in the parking or basecamp areas below Project Grade. Refer to Figure II-6(a) in Section III, Revisions, Clarifications, and Corrections to the Draft EIR.

This comment does not provide substantial evidence that “significant new information” as defined by CEQA Guidelines Section 15088.5 has been added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Also refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 26-75

DEIR Ignores CARB’s 2022 Scoping Plan Update

The DEIR completely ignores the most important plan for addressing climate change impacts and decarbonizing California: CARB’s 2022 Scoping Plan Update (the “Update”) even though it was published in May 2022-before the DEIR was released (available at <https://ww2.arb.ca.gov/our-work/programs/ab-32-climate-change-scoping-plan/2022-scoping-plan-documents>).

The Project as designed is not consistent with the Update, particularly given the Project’s 2043 buildout date. The Update, in Appendix D (Local Actions), underscores that “local governments have tremendous opportunity to reduce GHGs in these three strategy areas: 1. Transportation electrification 2. VMT reduction 3. Building decarbonization.” (Update, Appendix D at 4.) The DEIR fails to address the Project’s consistency with these strategies.

The DEIR must evaluate the Project in the context of the Update’s findings:

- “CEQA can be a powerful and useful tool to engage the public, identify additional opportunities to support climate efforts, and localize change. It is important that lead agencies look for ways to use CEQA to support these core purposes, ensuring that these processes do not become sources of delay but instead unlock more opportunities. Mitigation measures applied in the communities impacted by projects subject to CEQA have the added benefit of improving

health, social, and economic resiliency as climate impacts worsen.” (Update at 220.)

- “Lead agencies should prioritize on-site design features and GHG mitigation measures that reduce GHG emissions, such as methods to reduce VMT and support building decarbonization, access to shared mobility services or transit, and EV charging. After exhausting all the on-site GHG mitigation measures, CARB recommends prioritizing local, off-site GHG mitigation measures, including both direct investment and voluntary GHG reduction or sequestration projects, in the neighborhoods impacted by the project. This could include, for example, development of a neighborhood green space, investment in street trees, or expansion of transit services. Implementing GHG mitigation measures in the project’s vicinity would allow the project proponent and the lead agency to work directly with the affected community to identify and prioritize the mitigation measures that meet their needs while minimizing multiple environmental and societal impacts.” (*Id.*)
- “Once all potential on-site and local off-site GHG mitigation measures have been incorporated to the extent feasible, other voluntary offsets issued by a reputable voluntary carbon registry (as listed on CARB’s website) may be appropriate.” *Id.* at 220–221.

The DEIR fails to implement the measurements identified by CARB to reduce emissions, improve public health, and address climate impacts.

Response to Comment No. 26-75

CARB’s 2022 Scoping Plan Update, referenced by the commenter, was published in draft form on May 10, 2022, and was not finalized until November 16, 2022. The Draft EIR was published on July 14, 2022, months before the finalization of the 2022 Scoping Plan Update. Contrary to the commenter’s assertions, the Draft EIR analyzed the Project’s consistency with key aspects of CARB’s Climate Change Scoping Plan and cumulative updates, as analyzed in Tables IV.E-6 and IV.E-7 in Section IV.E, Greenhouse Gas Emissions, of the Draft EIR. This analysis was properly based on the 2008 Scoping Plan and subsequent updates (through 2017) that had been adopted at the time the Draft EIR was prepared and published, consistent with CEQA. CEQA requires that an EIR “discuss any inconsistencies between the proposed project and applicable general plans, specific plans, and regional plans.”⁵² An “applicable” plan is a plan that has already been adopted and thus legally applies to a project; draft plans need not be evaluated.⁵³ The date of the

⁵² CEQA Guidelines § 15125(d).

⁵³ *Chaparral Greens v. City of Chula Vista* (1996) 50 Cal.App.4th 1134, 1145.

publication of the EIR, rather than a project's buildout date, is what determines which plans are applicable under CEQA.

As indicated in the comment, the 2022 Scoping Plan Update includes Appendix D, which is focused on actionable strategies for local governments to contribute to achieving State climate goals. The strategies in Appendix D reflect CARB's recommendations and are not binding on local lead agencies. Further, the project-level strategies in Appendix D only apply to residential and mixed-use projects, which the Project is not. Of these strategies, only the improved public mobility options, TDM, all-electric new construction, and renewable energy deployment are potentially applicable at a project level, and each of these strategies are already included in the currently proposed Project through the implementation of Project Design Feature TR-PDF-2 (mobility and TDM), Project Design Feature GHG-PDF-2 (renewables), and additional PDFs presented in Section III, Revisions, Clarifications, and Corrections to the Draft EIR. Those measures require the use of all electric off-road operational equipment, and provision of electrical tie-ins at basecamps. In addition, the Project would comply with City Ordinance 187714, which was adopted after the publication of the Draft EIR and requires all newly constructed buildings to be all-electric, with certain exceptions. Additionally, as stated on page IV.E-51 of the Draft EIR, the Project would comply with the City's Green Building Ordinance EV charging requirements.

The Draft EIR not only contains numerous PDFs and mitigation measures that reduce Project GHG emissions, as discussed in pages IV.E-50 through IV.E-51 therein, but also includes off-site investments consistent with the mitigation strategies of the CARB Scoping Plan, such as Project Design Feature TR-PDF-4, which would include direct monetary contributions to transportation management systems in the Project area. Neither CEQA nor the 2022 CARB Scoping Plan Update requires the purchase of offsets in the case of the Project, which would have a less-than-significant impact with respect to GHG emissions.

For informational purposes, refer to Appendix B-2 of Appendix FEIR-9 of this Final EIR for a detailed discussion of the Project's consistency with the 2022 Scoping Plan Update. As concluded therein, the Project would not conflict with the applicable policies in the 2022 Scoping Plan Update.

Comment No. 26-76

Consistency with SCAG SCS/RTP

The DEIR relies very heavily on the Project's alleged consistency with SCAG's SCS/RTP to find that the Project is consistent with the State's decarbonization efforts. The SCS/RTP itself is supposed to reduce VMT. However, the DEIR does not address a recent Progress

Report from CARB that found that the SCS/RTP is failing to reduce VMT. See CARB, Draft 2022 Progress Report California's Sustainable Communities And Climate Protection Act (June 2022). As such, even if the Project were consistent with the SCS/RTP, the DEIR does not explain how the Project would meet the State's VMT and GHG reduction goals.

Below are some of the key findings in the Progress Report. Given the Specific Plan and proposed Regional Center nature of the Project and likely extent of VMT as discussed in other sections of this comment letter, the DEIR should address these issues specifically.

- “Californians are driving more—leading to more pollution, higher costs, and worse day-to-day experiences—despite State planning statutes that encourage better transportation and planning decisions. The core problem is that even well-made plans too often remain as plans, rather than becoming realities. The gap between intention and action impairs our daily quality of life, and harms are worst in communities that have already borne the brunt of car-dependent planning in the past.” (Progress Report at 4.)
- “Implementation of SCS plans is essential to meeting the State's climate goals. Under SB 375, MPOs estimate the combined impact of transportation, land use, and housing development patterns included in the RTP/SCSs on per capita GHG emissions. The impacts to GHG emissions are based primarily on changes to vehicle travel, as measured by per capita vehicle miles traveled (VMT).” (*Id.*)
- “For this 2022 Progress Report, CARB collected and analyzed data for over two dozen indicators to tell a more complete story regarding land use and housing trends; travel behavior; and whether transit, carpooling, and active transportation have become more convenient and frequent choices relative to driving. For the first time, CARB is including metrics for VMT by region, accessibility to key destinations, housing activity by income level, units with a density bonus or inclusionary deed restrictions, and Greenhouse Gas Reduction Fund spending.” (*Id.* at 5.)
- “Unfortunately, since the first report, most trends demonstrate limited progress in meeting the targets through 2019. While some limited progress on VMT reduction has been observed within the largest MPO regions where most Californians live, it has not been enough. There is an urgent need to build on the good work that has produced some positive change in these regions in light of the overall trajectory. Many trends moved in the wrong direction, away from advancing climate goals and showing worsening inequality. Although the 2020 data were not available for this report, the COVID-19 pandemic further impacted the ability of regions to implement SCSs as commute patterns, construction and building supply chains, transit use, and the general economic downturn disrupted land use and transportation activity.” (*Id.*)

- “California is still not reducing GHG emissions from personal vehicle travel as needed under SB 375. Per capita GHG emissions and per capita VMT continued to increase....” (Progress Report at 6.)
- “Increases in per capita GHG emissions and per capita VMT are observed in nearly all MPO regions.” (*Id.*)
- “Californians are still choosing to drive.” (*Id.*)
- “In general, from 2005 to 2019, Californians continued to drive more, and carpool less, when traveling to work.” (*Id.*)
- “Furthermore, while transit service hours either remained steady or grew in most regions between 2005 and 2019, data show transit boardings in most MPO regions decreased during the same period, especially starting in 2014. Although the transit ridership decline was occurring before the COVID-19 pandemic, a sharp decline in all regions due to the pandemic compounds the challenge to attain ridership at the levels identified in SCSs.” (*Id.*)

The DEIR’s discussion of consistency with the SCS/RTP should be revised to address the Progress Report.

Response to Comment No. 26-76

The Project’s consistency with the current 2020–2045 SCAG RTP/SCS is adequately detailed in pages IV.E-54 through IV.E-65 in Section IV.E, Greenhouse Gas Emissions, of the Draft EIR. While the progress report referenced by the commenter may question the efficacy of the statewide implementation of the RTPs/SCSs, CEQA does not obligate an individual project, at the project level, to overcome regional or statewide deficiencies, actual or purported, in implementing the applicable plans and policies with which a project is required to comply. If SCAG or CARB were to have published revisions or updates to the RTP/SCS before the Draft EIR was published, an updated analysis of consistency would have been included in this Final EIR. At the time of publication, the 2020–2045 SCAG RTP/SCS reflects the currently adopted RTP/SCS applicable to the Project, and the Draft EIR’s consistency analysis is appropriate and complete.

Please see Response to Comment No. 26-E.1-22 for an explanation of how the findings of the CARB Progress Report are not applicable at the project level and do not reasonably suggest any inadequacy with respect to Project Design Feature TR-PDF-2.

Comment No. 26-77**The DEIR Must Address Electrification Policies Given the 2043 Buildout of the Project**

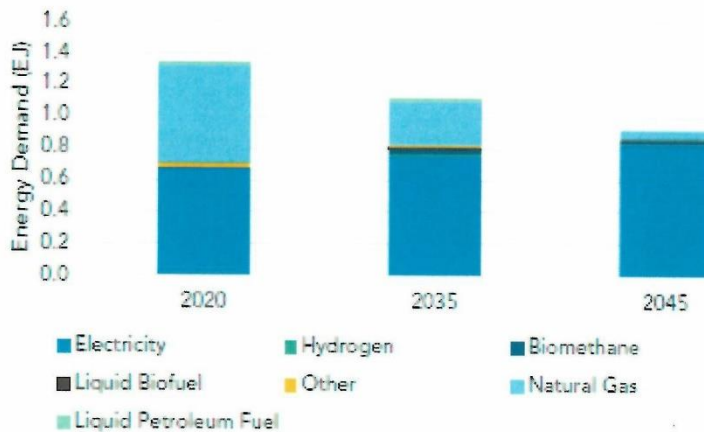

The Update includes a 44-page Appendix F on electrification. As explained therein, the Update “establishes three main goals for buildings to reduce emissions for both GHGs and air pollution: 1) energy efficiency aligned with the mid-high (electric) and mid-mid (gas) scenarios from the 2019 Integrated Energy Policy Report; 2) new construction would be zero-emission starting in 2026 for residential buildings and 2029 for commercial buildings through alignment of state and local authorities; and 3) all new appliances sold in California would be zero-emission by 2035 for installation in homes and by 2045 for installation in commercial buildings.” (CARB, Update, Appendix Fat 1.) In Appendix F, Table 1 (Technical readiness of zero-emission space conditioners) and Table 2 (Technical readiness of zero-emission building water heaters) establish that electric space and water heating for both large and small commercial buildings are not only technically feasible but also commercially available today.

The DEIR should discuss how natural gas hookups and a 2043 buildout are consistent with the below:

- “All-electric new construction is one of the most cost-effective near-term applications for building decarbonization efforts.” (*Id* at 14.)
- “New construction of all-electric buildings also helps to avoid investments in what would become stranded assets of gas pipelines that may no longer be in use the next thirty years.”
- “Each year, about 120,000 new homes and more than 100 million square feet of commercial buildings are newly constructed across California. These new buildings will represent between a third to half of the total building stock by midcentury. Achieving carbon neutrality must include transitioning away from fossil gas in residential and commercial buildings, and will rely primarily on advancing energy efficiency while replacing gas appliances with electric alternatives.” (Update at 170.)
- Strategies for success include: “End fossil gas infrastructure expansion for newly constructed buildings.” (*Id* at 172.)

The Update figure below shows the degree of electrification that is needed in 2045, a mere 2 years after the Project buildout.

Figure 4-8: Final energy demand in buildings in 2020, 2035, and 2045 in the Proposed Scenario

Response to Comment No. 26-77

Since the publication of the Draft EIR, the City has adopted Ordinance 187714, requiring all newly constructed buildings to be all electric (i.e., no natural gas emissions), with limited exceptions. New PDFs reflecting this new ordinance have been added for the Project that require the use of all electric off-road operational equipment (including landscaping equipment) and providing electrical tie-ins at basecamps. Refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR, for the details regarding these PDFs. As such, the inclusion of natural gas space and water heaters in the Draft EIR analysis constitutes a conservative assessment of local pollutant GHG emissions. The modeling output files, included as part of Appendix FEIR-9 of this Final EIR, present an updated estimate of operational GHG emissions incorporating building electrification and the additional PDFs using CalEEMod Version 2022.1.1. This confirmatory analysis does not change any of the less than significant conclusions in the Draft EIR's GHG analysis.

Comment No. 26-78

F. Hazards

The DEIR's analysis of Hazards and Hazardous Materials is flawed. It must be revised to address the comments below and in the Ramboll Report and be recirculated for public review and comment.

As a preliminary matter, the baseline condition for hazards is unclear. The DEIR should more clearly explain what hazardous materials are present at the Project Site, how the materials are handled, stored and disposed, in what quantities and what environmental regulatory permits the Project Site operations currently have or require. What hazardous materials are used on the Project Site today? In what quantities? Which regulatory

permits does the Project hold or require? The DEIR should list the regulatory permits and compliance status.

The DEIR should then explain how hazardous materials usage will change with the Project (e.g., types, quantities, etc.) and how the materials will be managed during construction and operation. Will the Project increase the use of hazardous materials? How? By how much? Which materials? The DEIR summarily states that the Project would continue to “involve the routine use of small quantities of potentially hazardous materials typical of studio campuses.” (DEIR IV.F-47) What does that mean? What are small quantities? Which hazardous materials? Will hazardous materials be stored and/or used next to the Broadcast Center Apartments? Next to the on-site daycare? Will the fueling stations have USTs? How will the fuels be stored? Will the fueling and vehicle maintenance areas have hazardous wastes? Will there be on-site painting of sets? Pyrotechnics stored on-site? Where will they be located? This information is relevant to the assessment of the extent of hazards posed by the Project and is only summarily mentioned in the DEIR. Without additional information, the conclusion that the Project would not exacerbate the risk of upset or accident conditions is unsubstantiated. (DEIR, IV.F-48.)

Response to Comment No. 26-78

Regarding the baseline conditions for the hazards analysis, a detailed discussion of the existing conditions is included on pages IV.F-20 to IV.F-35 in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR. This section discusses current and historical uses of the Project Site, including the two former gas stations; the findings of the hazardous materials database search; hazardous materials use and storage; hazardous waste generation, handling, and disposal; former USTs; aboveground storage tanks (ASTs); polychlorinated biphenyls (PCBs); asbestos-containing materials; lead-based paint (LBP); methane gas; and subsurface investigations. Refer to revised Figure IV.F-1, Hazards and Hazardous Materials Site Map, in Section III, Revisions, Clarifications and Corrections to the Draft EIR.

Recognizing that hazardous materials generators produce waste in different quantities, USEPA has established three categories of generators in the regulations: very small quantity generators (100 kilograms or less per month), small quantity generators (between 100 to 1,000 kilograms per month), and large quantity generators (1,000 kilograms or more per month). As discussed on page IV.F-48 of Section IV.F, Hazards and Hazardous Materials, of the Draft EIR, the Applicant is currently designated as a small quantity generator under Resource Conservation and Recovery Act (RCRA), and the Applicant implements the life cycle provisions of both RCRA and the Hazardous Waste Control Law (HWCL) by maintaining the required inspection logs, manifests, and records, which are subject to review by the Los Angeles County Department of Health Services. In addition, the Applicant currently employs staff members trained in the

appropriate standards for the management of hazardous waste and the clean-up of releases and uses licensed firms for the transport of hazardous waste. The Project would allow for continued operation of the Project Site under these provisions and the required records, training, and licensed transport would continue to be maintained, thus minimizing risks, and adhere to regulatory compliance.

Information on hazardous materials currently stored at the Project Site is provided in the Phase I ESA included in Appendix G of the Draft EIR. These include diesel in ASTs for emergency generators, routine cleaning products, paints, inks, and HVAC chemicals. The routine use of small quantities of potentially hazardous materials typical of studio campuses such as paints, stains, adhesives, solvents and other materials used in set design and fabrication, fuels, pesticides for landscaping, cleaning and maintenance supplies, materials for pyrotechnic special effects, and other general products related to studio operations, as discussed on page IV.F-40 of Section IV.F, Hazards and Hazardous Materials, of the Draft EIR will continue to be managed in similar quantities in accordance with applicable permits and regulations, such as LAFD California Environmental Reporting System (CERS)/CUPA permitting requirements (i.e., Unified Program Ordinance, Los Angeles County Code Chapter 12.50), under which the Project Site current operates. Similar to existing practices, hazardous materials would not be stored and/or used next to the Broadcast Center Apartments or a potential on-site childcare use. With regard to pyrotechnics, pyrotechnics would only be used inside the sound stages and not outdoors; refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR. Such materials are stored indoors in a locked safe and will continue to be stored in this manner with the Project. Regarding hazardous material related to potentially contaminated soil and groundwater and the location of a potential childcare use, refer to Response to Comment No. 26-E.1-69.

As discussed on pages IV.F-39 to IV.F-40 of the Draft EIR, during Project construction, hazardous materials such as fuel and oils associated with construction equipment, as well as coatings, paints, adhesives, and caustic or acidic cleaners could be used on-site. While some hazardous materials used during construction could require off-site disposal, such activity would follow all appropriate regulatory protocols and would cease upon completion of Project construction. As such, construction of the Project would involve the short-term use of hazardous materials, and no hazardous waste disposal would occur on-site. All potentially hazardous materials used during construction would be handled and disposed of in accordance with manufacturers' specifications and instructions, thereby reducing associated risks. In addition, as described in Subsection 2.a, Regulatory Framework, in Section IV.F, Hazardous and Hazardous Materials, of the Draft EIR, various regulations (i.e., the Occupational Safety and Health Act [OSHA] Hazardous Waste Operations and Emergency Response [HAZWOPER] standards and Hazardous Materials Transportation Act) establish specific guidelines regarding risk planning and accident prevention, protection from exposure to specific chemicals, and the proper storage of hazardous materials. The Project would be in full compliance with all applicable federal,

state, and local requirements concerning the transport, use, storage, management, and disposal of hazardous materials.

Regarding Project operation, as discussed on pages IV.F-40 to IV.F-42 of the Draft EIR, similar to the existing conditions within the Project Site, operation of the Project would involve the routine use of small quantities of potentially hazardous materials typical of those used on studio campuses, including paints, stains, adhesives, solvents and other materials used in set design and fabrication, fuels, pesticides for landscaping, cleaning and maintenance supplies, materials for pyrotechnic special effects, and other general products related to studio operations. Such materials would continue to be stored in appropriate containers, including drums and ASTs, with secondary containment as required. As is currently the Applicant's practice, all hazardous materials would be acquired, handled, used, stored, and disposed of in accordance with all applicable federal, state, and local requirements (i.e., California Health & Safety Code, Division 20, Chapter 6.5; California Code of Regulations, Division 4.5, Title 22; Unified Program Ordinance, Los Angeles County Code Chapter 12.50; LAMC, Article 7 of Chapter V, Divisions 8, 14). Monitoring of the Applicant's hazardous materials management would be conducted by LAFD and other applicable regulatory authorities, as appropriate. In addition, the Project would be subject to applicable OSHA training and informational requirements, including hazardous materials training for onsite employees who handle or may encounter as a small quantity generator under these provisions and the required records, training, and licensed transport would continue to be maintained, thus minimizing risks.

As is currently the Applicant's practice, compliance with all applicable federal, state, and local requirements concerning the handling, storage, and disposal of hazardous waste would effectively reduce the potential for Project operations to expose people to a substantial risk resulting from the release or explosion of a hazardous material, or from exposure to a health hazard, in excess of regulatory standards. As such, with compliance with existing applicable regulations and requirements, operational activities would not exacerbate the risk of upset and accident conditions associated with the release of hazardous materials into the environment. Therefore, impacts associated with hazardous waste generation, handling, and disposal during operation of the Project would be less than significant.

Please note that the Project would not include a fueling station; refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR.

This comment does not provide substantial evidence that "significant new information" as defined by CEQA Guidelines Section 15088.5 has been added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Refer to Response to Comment No. 9-4 for a detailed discussion regarding recirculation.

Comment No. 26-79

The DEIR also should explain the baseline condition of contamination on the Project Site and surrounding area. The DEIR includes excerpts of information from other reports that mention contamination at various locations on the Project Site over time, but the current condition of site soil, soil gas, and groundwater is not clear. For example, what level of contamination remained after the remediation of the former gas station on the site? Remediation was completed in 2012 and a health risk assessment conducted. Are the conclusions of that assessment consistent with current day standards? Has the health risk assessment been updated? The referenced reports should be appended to the DEIR to allow the public to review the referenced information. The current condition of each media (soil, soil gas, groundwater), the contaminants that could be released during construction and operation and a comparison of the levels of such contaminants compared to current regulatory standards should be described. Where is there existing soil, soil gas and groundwater contamination at the Project Site? At what levels? How do those levels compare with regulatory requirements?

Will the Project construction or use release such contaminant, e.g., soil gas escaping from excavations? At what levels? How will those releases be managed so that they do not impact the adjacent residents and schools? If remediation is required during construction, how will the remediation be completed? What will be the impacts to the immediately adjacent residences and schools?

Response to Comment No. 26-79

The current conditions of the Project Site, including, among other things, residual impacts to soil, soil vapor, and groundwater from the former Texaco station, the cleanup of which was approved by LARWQCB, are presented and discussed in the Site Summary Report, which was included in Appendix G.1 of the Draft EIR. Several soil, groundwater, and soil vapor investigations and remedial activities have been completed at the Project Site to assess potential contamination associated with the former uses and activities on-site, including in anticipation of future development. These have included a Limited Phase II Investigation in October 2018 and Supplemental Phase II Investigations in November 2018, August 2019, and May 2020 (included in Appendix G of the Draft EIR), all of which were performed by Geosyntec, as discussed on pages IV.F-34 to IV.F-35 in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR and on pages 5 to 11 in the Site Summary Report. Concentrations of contaminants and comparison to regulatory screening levels are also included in the Site Summary Report; refer to pages 12 to 13 of the Site Summary Report for a summary of the residual concentrations in soil, groundwater, and soil vapor at the Project Site.

As supporting data and documentation for the former Texaco Station Cleanup Case Closure Request to the LARWQCB, the environmental consultant for the station prepared a human health risk assessment in the Soil Vapor Sampling Results and Case Closure Request Report, dated December 5, 2011 (Arcadis, 2011). The site case closure was approved on November 2, 2012 by the LARWQCB under the State of California Low-Threat Underground Storage Tank Case Closure Policy.⁵⁴ The closure review and approval is based on general, groundwater, and vapor intrusion criteria as set forth in the Closure Policy (State Water Board Resolution No. 2012-0062), which continues to be the State's regulatory standard for cleanup of retail fueling stations. Thus, the cleanup criteria and regulatory conclusions in 2012 are expected to be unchanged at this time. Based on a review of the Closure Policy (State Water Board Resolution No. 2012-0062), there is no provision or requirement to perform an updated station-specific HRA following closure approval. The Low-Threat Closure Policy does allow for residual levels of petroleum hydrocarbons in soil, soil vapor and groundwater to remain in place that are deemed a low-threat to human health and the environment. A key rationale for the policy is residual levels of petroleum hydrocarbons that remain in place at the time of closure are known to biodegrade over time under most conditions.

Remediation is not expected to be required during construction. The testing and proper disposal of any soil excavated from the Project Site during construction will follow the sampling, testing and disposal procedures described in the Soil Management Plan (Appendix B of the Site Summary Report included as Appendix G.1 of the Draft EIR).

With respect to the question regarding soil gas escaping from excavations, please see the discussion of SCAQMD Rule 1166 monitoring in Response to Comment No. 26-38.

Comment No. 26-80

It is also unclear if the information in the hazards section is consistent with other analyses in the DEIR. For example, did the potential stormwater quality assessment consider the types of substances present at the Project Site as described in the hazardous sections? The hazards section suggests there is an existing tar collection system on-site. (DEIR, p. IV.F-30.) This does not appear to be discussed in other analyses. How was the presence of tar and ongoing tar removal assessed in geology and soils, cultural resources and water quality? How does the presence of tar affect the operation of the methane mitigation systems? Do the existing historic structures have methane mitigation systems? How will Project development affect the methane mitigation of those structures? Will the existing historic buildings need to be retrofitted with methane mitigation systems? If they

⁵⁴ California Environmental Protection Agency, Underground Storage Tank Low Risk Case Review Form, LUSTIS File No. I-16219, November 2, 2012.

do not have methane systems today and they will not be retrofitted, how will the methane risks be addressed? If they will be retrofitted, how will those retrofits affect the integrity of the buildings? How many emergency generators are on-site today? How many will be on-site in the future? How often are the generators tested? Were the emissions from the testing included in the analysis of air quality and GHGs? Similarly, the DEIR Hazards and Hazardous Materials section should properly evaluate the impacts from helipad use. The DEIR should explain how the existing helipad is used today and how such use will change in the future. How many helicopter take-offs and landings occur at the Project Site under baseline conditions? What are the regulations limiting operations currently? Are there limits on the number of flights? Hours of take-offs and landings? How will the operations change with the Project? Will the change in location change the offsite impacts, such as noise and lighting? Will the frequency of use change? Will the hours of operations change? How were the related impacts analyzed? What regulations will be imposed to ensure operations are consistent with the assumptions analyzed? Will helipad use impact emergency and medical services in proximity to the regional medical center?

Without the foregoing basic information, the conclusions in the DEIR, including for example the conclusions under Threshold (a), Threshold (e), and Threshold (f), are unsubstantiated.

Response to Comment No. 26-80

The information in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR is consistent with the other environmental analysis in Section IV of the Draft EIR. Naturally occurring tar was only encountered in one of the geotechnical borings (Boring B7), below a depth of 60 feet. Boring B7 is located near the southwest corner of the Project Site, away from the historical building onsite, where an existing tar collection system is located. Refer to Response to Comment No. 13-4 regarding the existing tar collection system and disposal requirements for any impacted soil and to Response to Comment No. 26-103 regarding tar as it relates to archaeological resources. Excavation proposed along the southwestern portion of the Project Site is only approximately 7.5 feet in depth, as shown in Figure 3 of the Soil Management Plan (Appendix B of the Site Summary Report included as Appendix G.1 of the Draft EIR). Testing and proper disposal of any excavated soil impacted by naturally occurring oil and/or tar, if encountered, will follow the sampling, testing, and disposal procedures described in Section 5 of the Soil Management Plan. As discussed in Section 6.1.2 of the Hydrology and Water Quality Report included as Appendix H of the Draft EIR, the Project would prepare a SWPPP in compliance with the Construction General Permit and would implement Project Site-specific BMPs, including the management of potentially hazardous materials typical of studio campuses.

As discussed in Section 6.2.2 of the Hydrology and Water Quality Report, post-construction stormwater will be managed via BMPs in accordance with the LID Ordinance. Refer also to Response to Comment Nos. 3-4 and 3-7. The treatment from

these LID BMPs, in addition to proper management of potentially hazardous materials typical of studio campuses in accordance with applicable regulations and the proper management of naturally occurring oil and/or tar, would not result in discharges that would cause (1) pollution which would alter the quality of the waters of the State (i.e., the Los Angeles River) to a degree which unreasonably affects beneficial uses of the waters; (2) contamination of the quality of the waters of the State by waste to a degree which creates a hazard to the public health through poisoning or through the spread of diseases; or (3) a nuisance that would be injurious to health; affect an entire community or neighborhood, or any considerable number of persons; and occurs during or as a result of the treatment or disposal of wastes.

Refer to Response to Comment No. 13-6 regarding existing and proposed methane systems. As discussed therein, existing operations onsite include methane detection, alarm, mitigation, and venting systems. The East Studio Building at the Project Site has an existing methane mitigation system comprised of a geomembrane methane barrier and an indoor methane detection system, and other areas are fitted with a system of methane venting risers. The methane gas detected at the Project Site is a result of the naturally occurring upward migration of methane from the petroleum hydrocarbon deposits found in the subsurface. As such, the Project development is not expected to affect the methane migration to existing structures.

It is anticipated compliance with the Methane Code (Division 71 of Article 1, Chapter IX of the Los Angeles Municipal Code) will require the installation of a Site Design Level V methane mitigation system (the most protective) for new construction at the Project Site and, if necessary, alternative designs will be provided to the LADBS for review and approval pursuant to the existing Methane Code. Furthermore, for existing buildings located within a methane zone, additions, alterations, repairs, changes of use, or changes of occupancy must comply with the methane mitigation requirements of LAMC Sections 91.7104.1 and 91.7104.2, when required by LAMC Chapter IX, Article 1, Divisions 81 or 82. Methane systems would be designed in accordance with the latest regulatory control measures, including the City of Los Angeles Methane Hazard Mitigation Standard Plans, as required by LADBS. Accordingly, the Project's methane controls would include an impervious membrane, ventilation systems capable of providing a complete change of air, and development and implementation of an operations and maintenance plan, as well as an emergency plan. Installation of a methane mitigation system will have the added benefit of addressing potential vapor intrusion from residual fuel hydrocarbons from the former Texaco station, and naturally occurring hydrogen sulfide. Typically, a Level V methane mitigation system is comprised of active sub-slab gas extraction, impervious membrane, and mechanical ventilation, methane detection and alarm system in the lowest occupied spaces, and paved area venting. A portion of the proposed below-grade parking structures can be assumed to extend below the groundwater table, which would require the approval of an alternate design with the impervious membrane installed with a minimum one percent

slope toward the perimeter of the parking structure in lieu of active subslab gas extraction. While naturally-occurring tar is not expected to be encountered during excavation, if tar is encountered, it will be addressed in accordance with the Soil Management Plan (included in Appendix G.1 of the Draft EIR). Limited tar in soil is not expected to negatively impact the performance of the Level V methane mitigation system. The methane mitigation system will be designed to account for the presence of tar by providing adequate clearance from tar in soils and the lowest component of the methane mitigation system or by incorporating a methane mitigation system design which would not be impacted by the presence of tar (e.g., sloped concrete slab and methane barrier geomembrane in lieu of subslab gas ventilation system).

There are currently six diesel-fueled emergency generators on-site. The diesel fuel is stored in permitted ASTs. Any additional generators will comply with all applicable regulatory requirements. As stated in the Draft EIR, the Project would replace five of the six existing emergency generators (see page IV.E-81 in Section IV.E, Greenhouse Gas Emissions, of the Draft EIR). Air quality, energy, and GHG impacts associated with emergency generators, including emissions from the testing of emergency generators, were fully evaluated in the Draft EIR. Section IV.A, Air Quality, of the Draft EIR analyzed air quality impacts related to stationary source emissions during routine maintenance and testing of emergency generators. Refer to Table IV.A-7 and Table IV.A-10 on pages IV.A-64 and IV.A-70, respectively, of the Draft EIR for the estimated maximum emissions from emergency generators during operation of the Project. As stated on page IV.C-17 in Section IV.C, Energy, of the Draft EIR, the six existing diesel generators on the Project Site use approximately 8,759 gallons of diesel per year for routine testing and maintenance, which occurs twice a month for maintenance. As stated on page IV.C-29 of the Draft EIR, the Project would also include several emergency generators, which would be used on a temporary basis during construction and are not expected to provide long-term power generation. However, the generators require periodic testing, which would consume diesel fuel. As shown in Table IV.C-2 on page IV.C-27 of the Draft EIR, diesel fuel usage would be approximately 4,594 gallons per year related to testing and maintenance of the on-site emergency generators. Regarding greenhouse gas emissions, as shown in Table IV.E-11 on page IV.E-78 of the Draft EIR, the Project is expected to result in one MTCO_{2e} per year from stationary sources (i.e., emergency generators).

Refer to Response to Comment No. 26-15 regarding the on-site helipad, which was properly analyzed as part of the Draft EIR and would continue to operate as part of the Project consistent with existing conditions in accordance with established permits (ZA Case No. 11412) and regulatory requirements.

Comment No. 26-81**The Construction Assumptions Have Major Gaps**

The DEIR's construction assumptions have numerous gaps that result in unaccounted impacts. First, construction impact determinations on pages IV.F-42 and 47 has virtually no information of what, where, and how much hazardous materials and wastes are used, disposed, and transported. The Project Site is an operating studio that appears to have substantial usage of hazardous materials. The management of such materials during construction is not adequately disclosed. The DEIR says that all appropriate regulatory protocols would be followed—which protocols? This information should be included for public review.

The DEIR states that the construction of the Project would involve “short-term use” of hazardous materials. (DEIR, p. IV.F-39.) But the Project construction could occur for 20 years. The DEIR fails to analyze whether long-term buildout to 2043 would have the potential for greater impacts. For example, would impacts be greater because of an increase in the on-site population? Longer construction would mean that part of the Project would be operational before construction is completed. How will potential impacts to employees and visitors from the potential release of hazardous substances during construction be managed?

Response to Comment No. 26-81

As noted in this comment, the Project is currently an operating studio. See Response to Comment No. 26-78 for a discussion of current and anticipated use of hazardous materials in connection with studio operations.

The Project's potential impacts related to the risk of upset and accident conditions and the release of hazardous materials are evaluated on pages IV.F-42 to IV.F-55 in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR. As discussed therein, with regulatory compliance and implementation of Mitigation Measures HAZ-MM-1 and HAZ-MM-2, construction and operation of the Project would not exacerbate the risk of upset and accident conditions associated with the release of hazardous materials into the environment. Therefore, impacts associated with handling or use of hazardous materials or with hazardous waste generation, handling, and off-site disposal during construction and operation would be less than significant with mitigation.

As discussed in Section 6.1.2 of the Hydrology and Water Quality Report (Appendix H of the Draft EIR), the Project would prepare a SWPPP in compliance with the Construction General Permit and would implement Project Site-specific BMPs, including the management of hazardous materials during construction.

With regard to the 20-year buildout as it relates to construction, refer to Response to Comment No. 9-24. As stated on pages IV.F-58 to IV.F-59 of the Draft EIR, while Project buildout is anticipated in 2026, the Applicant is seeking a Development Agreement with a term of 20 years, which could extend the full buildout year to approximately 2043. The Development Agreement would confer a vested right to develop the Project in accordance with the proposed Specific Plan and the Mitigation Monitoring Program throughout the term of the Development Agreement. The proposed Specific Plan and the Mitigation Monitoring Program would continue to regulate development of the Project Site and provide for the implementation of all applicable PDFs and mitigation measures associated with any development activities during and beyond the term of the Development Agreement. The Draft EIR discussion of the use, handling, disposal of hazardous materials and/or hazardous waste applies to the full buildout, without regard to the construction timeline. Therefore, a later buildout date would not affect the impacts or significance conclusions presented above.

Comment No. 26-82

Also, on page IV.F-58 for Threshold (f), there is insufficient information provided regarding lane closures and other disruptions during construction. What are the existing emergency access and disaster routes in the Project area? How will access to those routes be maintained? What is the emergency evacuation plans for the Project Site? Has consideration been given to how the adjacent residents would be evacuated if emergency conditions at the Project Site could impact the immediately adjacent multi-story apartment building? The public, area hospitals, and first responders can be impacted by disruptions to emergency and disaster routes and general circulation. What are the elements of the Construction Management Plan and related emergency evacuation plans? The DEIR assumes that there would be limited off-site construction activities within adjacent streets that would require temporary lane closures. (DEIR, p. IV.F-58.) How was the nature and extent of off-site construction determined? What is the off-site construction? Where and when would it occur? The DEIR also states that **operation** of the Project would generate traffic that would result in limited **temporary** modifications to Project Site Access (DEIR, p. IV.F-58.) How can operational traffic impacts be considered temporary? These impacts need to be assessed as long-term impacts and adequately disclosed in the DEIR. What are they? And how does the long-term nature of the impacts change the conclusion of Threshold (f)? How is adequate circulation and emergency access determined?

Given the immediately adjacent uses, such as the Broadcast Center Apartments, Etz Jacob Congregation synagogue, the post office, Pan Pacific Park, The Grove, and Farmers Market, the Construction Management Plan should reflect the input from these neighbors; including providing advance schedule of construction activities to these neighbors; identifying one managerial level point of contact for immediate response to construction concerns; prohibiting construction vehicles or lane closures on The Grove Drive/Stamley

Avenue; prohibiting sidewalk closures on frontage of the Broadcast Center Apartments, the Etz Jacob Congregation synagogue and Torah Center, the post office, Pan Pacific Park, the Grove and the Farmers Market; prohibiting street and sidewalk closures and roadwork on the immediately surrounding streets during the Jewish holy days or from November–January 15th; restricting continuous concrete pours to days and times and months of the year that do not adversely impact the surrounding uses, and requiring construction workers to park on-site.

Response to Comment No. 26-82

The Construction Traffic Management Plan, which is Project Design Feature TR-PDF-1 on page IV.K-36 of the Draft EIR, will include street closure information, a detour plan, haul routes, and a staging plan that will be reviewed and approved by City staff. The Construction Traffic Management Plan would include temporary traffic controls during all construction activities adjacent to public rights-of-way on public roadways to provide for the safe passage for all modes of travel during construction. The Construction Traffic Management Plan would be based on the nature and timing of the specific construction activities and other projects in the vicinity of the Project Site. In addition, a work site traffic control plan identifying the location of all temporary roadway lane and/or sidewalk closures will include designated detour routes, including for pedestrians, to the extent necessary to ensure safe circulation. Specific road closure information would be identified and planned for once construction plans for individual buildings are prepared and approved by the City. Potential temporary lane closures on streets around the Project Site would typically be related to utility work, traffic signal work, or road work (such as the proposed widening of The Grove Drive adjacent to the Project Site). Except in extreme circumstances, two-way access is maintained on streets at all times during this type of work. These types of closures are routine throughout the City and do not constitute unusual hazards or significant impacts to the environment. The nature and extent of off-site work is based on the proposed development program described in Section II, Project Description, of the Draft EIR and technical input from various City departments with oversight of development projects, including, among others, LADOT, LADWP, Fire, Police, Public Works, and Planning, as noted in the Draft EIR.

Los Angeles County maintains a map of disaster routes which are pre-identified freeways or arterial streets for use during times of crisis to bring in emergency personnel, equipment, and supplies to impacted areas. They receive priority for clearing, repairing, and restoration over other roads. Beverly Boulevard is on the map of Disaster Routes. However, as noted above, the temporary and limited off-site work that would be needed for the Project would generally only require temporary lane closures and two-way access would be maintained at all times. Any such work would require approval and permitting in accordance with City requirements as well as the requirements of the Construction Traffic

Management Plan, and adequate detour routes—if warranted—would be prepared as part of those requirements.

The statement on page IV.F-58 in the Draft EIR that “[o]peration of the Project would generate traffic in the Project vicinity and would result in limited temporary modifications to Project Site access, primarily in expanding the number of access points” is true of any development project that adds vehicle trips and site access points. By adding access points to the Project Site, the current and future Project vehicles will be redistributed to utilize all available access driveways which will cause a short-term shift in the current traffic patterns. The transportation analysis in the Draft EIR takes the location of the new driveways into account by distributing Project vehicles to the proposed locations of the new driveways. Thus, the Draft EIR already takes into account the long-term effects of the new access locations. The question of the adequacy of the access and circulation systems is answered in Table 18 on pages 162 and 163 in the Transportation Assessment (Appendix M.1 of the Draft EIR) which shows that the four main driveways to the Project Site will all operate at LOS B or C during both the morning and afternoon peak hours of the day upon full buildout of the Project. See Section D, Emergency Access, of Topical Response No. 12, Safety and Congestion, for a discussion of emergency access for the Project Site.

Phased construction, which could be spread over a longer period of time than single phase construction, would not result in a greater potential impact to implementation of an adopted emergency response plan. The type of work that may require temporary lane closures would not have an extended duration as a result of Project phasing. Refer to Section D, Emergency Access, of Topical Response No. 12, Safety and Congestion, and Response to Comment Nos. 9-35, 26-147, 35-134, and 35-150 regarding emergency response times and how the Project would provide adequate emergency access.

The comment requests that the Construction Traffic Management Plan incorporate a variety of features that are already identified as part of Project Design Feature TR-PDF-2. These include designation of a construction manager as a liaison with the surrounding community, advance notification of adjacent property owners and occupants of upcoming construction activities and hours, and prohibition of construction worker or equipment parking on adjacent streets or in residential areas. The Draft EIR concluded that impacts related to transportation and emergency access would be less than significant during construction; thus, the additional measures requested in this comment are not required under CEQA.

Comment No. 26-83

The DEIR refers to an export of 60,000 cy of hazardous soil during construction. How was that figure calculated? Was it based on the conceptual plan? Could that amount be greater? If the volume of hazardous soil could be greater, how would the impacts differ? If

the volume of hazardous soil could not be greater, why not—on what facts is that based? Given the residences and schools in the area surrounding the Project Site, the DEIR should also disclose the appropriate regulatory protocols referenced for off-site disposal.

Response to Comment No. 26-83

The Soil Management Plan (Appendix B of the Site Summary Report [Appendix G.1 of the Draft EIR]), on page 40 of the PDF file, presents an analysis that compares subsurface soil testing data with the grading and excavation plan (Figure 3), which is based on the proposed development program described on pages II-12 to II-35 of Section II, Project Description, of the Draft EIR. The areas and depths of planned grading and excavation and the estimated lateral and vertical extent of residual soil impacts above acceptable regulatory standards are presented in the Soil Management Plan (Appendix B of the Site Summary Report [Appendix G.1 of the Draft EIR]). Based on soil testing data, the estimated lateral extent and depth of individual impacted areas (area times depth to calculate volume) were summed and used to estimate the total volume of contaminated soil above permissible regulatory standards that are anticipated to be encountered and exported during redevelopment activities. That analysis estimates approximately 60,000 cubic yards of excavated soil could be classified as “hazardous” based on regulatory standards and the estimated distribution of soil concentration levels. “Hazardous” in this context simply means that the soil is not “clean fill” and must be disposed of at a properly licensed disposal facility. The soil quantity estimate is based on the maximum extent and concentration of chemicals detected in soil at the Project Site; therefore, it is unlikely that the volume of impacted soil encountered would be greater than estimated. The Draft EIR identified the preferred disposal facility—Buttonwillow Landfill in Kern County. Future additional soil characterization will be conducted during the City’s regulatory building permit process to confirm the estimate in the Soil Management Plan. The impacts will not change; excavated soil that is determined to be “hazardous” will be disposed of properly and in accordance with all applicable regulatory requirements. Any excavated soil determined to be “hazardous” will be disposed of offsite and will not be disposed of or relocated onsite. As discussed in the Soil Management Plan, sampling and analytical results shall be used for proper characterization of the soil for offsite disposal. Based on the results of the analysis, the General Contractor or designated subcontractor shall select and utilize an appropriate facility licensed to accept such soil. Concentrations exceeding the applicable regulatory screening levels shall be the basis for development of appropriate worker protection, handling, and disposition of the suspect soil.

Comment No. 26-84

Finally, the Project would likely lead to removal of existing solar panels during Project construction. Are the existing panels going to be reused on-site or disposed? The DEIR does not disclose what would happen to existing solar panels, and the potential impacts of

potential solar panel waste disposal. The DEIR should address how the Project will dispose of photovoltaic cells.⁴

⁴ See a recent Los Angeles Times article revealing that the cells cannot be recycled and contain harmful chemicals. <https://www.latimes.com/business/story/2022-07-14/california-rooftop-solar-pv-panels-recycling-danger>.

Response to Comment No. 26-84

As stated on page IV.F-39 of Section IV.F, Hazards and Hazardous Materials, of the Draft EIR, the Project would be in full compliance with all applicable federal, state, and local regulatory requirements concerning the transport, use, storage, management, and disposal of hazardous materials. The existing solar panels will be removed as part of the Project. Any construction waste, including the solar panels and photovoltaic cells, will be disposed of in accordance with applicable regulatory requirements (California Code of Regulations, Title 22, Section 66273.32). With respect to privately-owned solar panels, certain components may be recyclable, such as metal frames, glass, and copper. Any components that cannot be recycled will be handled in accordance with applicable regulatory requirements; if the panels meet the definition of “universal waste,” as defined in California Code of Regulations, Title 22, Division 4.5, Chapter 23, as amended, they will be recycled. Otherwise, the panels will be properly disposed of as hazardous waste. Leased solar equipment will be returned to the lessor.

Comment No. 26-85

Impacts to Sensitive Receptors Were Not Adequately Analyzed

The DEIR does not adequately account for all impacts to sensitive receptors, resulting in incorrect impact analysis. For instance, the impact analysis in Threshold 9(c) [sic] says that the Project is not expected to involve hazardous emissions or handle acutely hazardous materials, substances, or waste. On what basis does the DEIR make that conclusion? Earlier the hazards section describes a range of hazardous materials usage and contamination. Will that usage and contamination not involve hazardous emissions? What does the DEIR mean by “acutely hazardous”? Is there no usage or presence of “acutely hazardous substances” on the Project Site?

It also is unclear how compliance with regulations reduce risk to nearby schools to less than significant for Threshold (c), when the schools are subject to the risks to the general public acknowledged in Threshold (d). If the “Project may create a significant hazard to the public or the environment caused in whole or in part from the Project’s exacerbation of existing environmental conditions” (DEIR IV.F-56), then why would it not impact existing or proposed schools within one-quarter mile? It is also unclear whether the DEIR considered all known and proposed schools. The DEIR discussion distinguishes between the distance

to religious and LAUSD schools. Why make that distinction? Did the impact analysis consider both the same? Was the existing religious school directly across from the Project Site considered in the impact analyses? The Project uses also include education uses. Were those considered in the evaluation of Threshold (c)?

The DEIR also should clarify whether, from a hazards exposure and health risk standpoint, the below grade production zone was evaluated as occupied space or parking. These uses would have different emissions profiles and, therefore, depending on how the spaces will be used, would have different impacts.

Response to Comment No. 26-85

As discussed on pages IV.F-55 and IV.F-56 of Section IV.F, Hazards and Hazardous Materials, of the Draft EIR, Ohel Chana High School (which is located directly across from the Project Site) and Morasha Hebrew Academy are located on Beverly Boulevard approximately 0.1 mile and 0.2 mile east of the Project Site, respectively. The nearest Los Angeles Unified School District (LAUSD) schools, Hancock Park Elementary and Fairfax Senior High School, are located just over 0.25 mile to the south and north, respectively.

The Draft EIR considered both public and private schools equally; these were listed separately for organizational purposes—not because they were analyzed differently. Regarding consideration given to future schools, among the 68 related projects in the vicinity of the Project Site, the only related project that involves a school is a private school located at 9120 Olympic Boulevard, approximately 2.9 miles southwest of the Project Site, as shown on page III-13 of Section III, Environmental Setting, of the Draft EIR. This distance is beyond the 0.25-mile radius considered under Threshold (c).

As discussed in the Initial Study prepared for the Project, provided in Appendix A of the Draft EIR, the Project is not expected to involve hazardous emissions or handle acutely hazardous materials, substances, or waste. “Acutely hazardous” means severely hazardous. Although the Project would involve the use of hazardous materials common to urban construction projects and studio operations, as discussed above, all activities involving the handling, use, storage, transport, and disposal of hazardous materials and wastes would occur in compliance with applicable federal, state, and local regulatory requirements. This already occurs under existing conditions and would not change with the Project. As such, with compliance with applicable regulations and requirements, the Project would not create a significant hazard to nearby schools or other sensitive receptors. Therefore, impacts regarding potential emissions or the handling of hazardous materials and wastes within 0.25 miles of an existing school would be less than significant.

Additionally, as discussed on page IV.F-57 of Section IV.F, Hazards and Hazardous Materials, of the Draft EIR, the discussion provided under Thresholds (a) and (b) in Subsection 3.d of Section IV.F details the various conditions present on-site that could pose a hazard to the public or the environment. Based on the analysis in the Site Summary Report (Appendix G.1 of the Draft EIR), regulatory compliance and appropriate mitigation—specifically the Soil Management Plan set forth in Mitigation Measure HAZ-MM-1—would address residual constituents associated with the former Texaco station release and other residual soil conditions, and impacts would be reduced to a less-than-significant level. With appropriate regulatory protocols and management of impacted soil per Mitigation Measure HAZ-MM-1, as well as related Mitigation Measure HAZ-MM-2, designed to mitigate the effects of subsurface gases and impacted soil and groundwater on workers and the public, the Project would not create a significant hazard to the public or the environment or exacerbate existing environmental conditions. Therefore, impacts with respect to this threshold would be less than significant with mitigation, as concluded in the Draft EIR. Schools within 0.25 mile are part of “the public” and were, therefore, included in the Draft EIR’s analysis with regard to this threshold.

Lastly, the Project would not include educational uses. As stated in Topical Response No. 3, Permitted On-Site Uses, Section III, Revisions, Clarifications, and Corrections to the Draft EIR, includes clarifications to Section II, Project Description, of the Draft EIR to provide a clarified list of five permitted studio related uses within the Project Site consistent with the underlying purpose of the Project: sound stage; production support; production office; general office; and retail. The Project would also continue to allow for ancillary sitewide uses, such as parking, communication facilities, childcare, and facilities equipment and infrastructure, supporting the studio and the five permitted land uses.

With regard to the below-grade uses, such uses would include parking areas, basecamp uses, and the Mobility Hub (which would be partially open to the sky). No active production activities would occur in the parking or basecamp areas below Project Grade. Refer to Response to Comment No. 26-28 for the analysis of emissions associated with these uses.

Comment No. 26-86

The DEIR Does Not Include all Feasible Mitigation Measures

The Project also did not consider all feasible mitigation measures despite potentially significant impacts, especially to the adjacent residences and schools and nearby public park. For instance, given the proximity of sensitive users and known historic contamination near such uses, perimeter air monitoring should be conducted throughout Project grading activities. The Project should also commit to placing stockpiles away from offsite areas and

limiting them in size. These are feasible mitigation measures that would lessen the risk to the public, especially immediately adjacent sensitive receptors.

Please also note a potential oversight in Mitigation Measure Haz-MM-2. [sic] It is unclear how “soil and groundwater exposure during excavation shall be minimized to reduce the surface area which could off-gas”. [sic] How will this be achieved when large areas of the site are being graded? What is the extent of excavation that can be exposed while off-gassing is minimized? What does it mean for the off-gas to be minimized? What amount of off-gassing is acceptable? How is that determined? How will this measure be implemented differently for a 3-year construction versus a 20-year construction schedule? Has the composition of the off-gassing been adequately assessed?

Also, the DEIR does not clarify whether the Health and Safety Plan mentioned in Mitigation Measure HAZ-MM-1 factors in exposure to immediately adjacent residences and on-site operational personnel or just on-site construction personnel. If just on-site construction personnel, how will the health and safety of these other populations be addressed? Should the SMP consider and address potential impacts to all on-site and offsite populations that could be exposed to site conditions through the emission of contaminated gases and soils?

Response to Comment No. 26-86

As discussed in Subsection 3 of Section IV.F, Hazards and Hazardous Materials, of the Draft EIR, the Project would result in temporary potentially significant impacts during construction with respect to Threshold (b) (whether the project would create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment) and Threshold (d) (whether the project would be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would create a significant hazard to the public or environment) under Appendix G of the CEQA Guidelines.

With respect to Threshold (b), as discussed on pages IV.F-42 to IV.F-44 of the Draft EIR, construction of the Project may exacerbate the risk of upset and accident conditions associated with the release of hazardous materials into the environment. Therefore, impacts associated with hazardous waste generation, handling, and disposal during construction would be potentially significant. As such, Mitigation Measures HAZ-MM-1 and HAZ-MM-2 (included on pages IV.F-50 to IV.F-54 of the Draft EIR) are proposed, as discussed below. As discussed on pages IV.F-46 to IV.F-47 of the Draft EIR, the Project may exacerbate the risk of upset and accident conditions associated with methane gas, and impacts associated with methane gas and hydrogen sulfide during construction would be potentially significant. Accordingly, Mitigation Measure HAZ-MM-2 is proposed, as discussed below.

As discussed on pages IV.F-54 to IV.F-53 of the Draft EIR, with regard to potential soil contamination, any residual concentrations of contaminants, including specific areas with TPH impacts and one location with elevated arsenic or of naturally occurring tar (which, as discussed in Response to Comment No. 26-80 is unlikely) would be appropriately managed during all soil disturbance activities through implementation of the protocols described in the Soil Management Plan (included in Appendix G.1 of the Draft EIR) set forth in Mitigation Measure HAZ-MM-1 also would require appropriate management during excavation and grading operations. Required protocols would address soil sampling and analysis, stockpiling of affected soils, soil re-use, decontamination, and dust control. Thus, the size of excavation areas and stockpiles will be determined based on the protocols described in the Soil Management Plan (e.g., soil sampling and analysis) to minimize the release of volatile organic compounds (VOCs) (referred to as "off-gas" in this comment). In addition, during excavation of soils containing VOCs, the contractor would be required to comply with SCAQMD Rule 1166 requirements and control measures. Such control measures include segregating VOC-contaminated stockpiles from non-VOC contaminated stockpiles; spraying contaminated stockpiles with water or vapor suppressants; and covering stockpiles with plastic sheeting for periods of inactivity.

In the event that VOC-contaminated soils are encountered during construction or construction occurs in areas of known or potential contamination, appropriate handling, off-site disposal, and/or treatment would be implemented in accordance with applicable regulatory requirements, including SCAQMD Rule 1166 (Volatile Organic Compound Emissions from Decontamination of Soil), if necessary. SCAQMD Rule 1166 requires that a permit be obtained from and a mitigation plan be approved by SCAQMD prior to commencing any of the following activities: the excavation of an underground storage tank or piping which has stored VOCs; the excavation or grading of soil containing VOC material including gasoline, diesel, crude oil, lubricant, waste oil, adhesive, paint, stain, solvent, resin, monomer, and/or any other material containing VOCs; the handling or storage of VOC-contaminated soil (i.e., soil which registers 50 ppm or greater using an organic vapor analyzer calibrated with hexane) at or from an excavation or grading site; or the treatment of VOC-contaminated soil at a facility. SCAQMD Rule 1166 further requires that a copy of the approved mitigation plan be maintained on-site during the entire excavation period and that the SCAQMD executive officer be notified at least 24 hours prior to excavation. In accordance with SCAQMD Rule 1166, monitoring for VOC contamination would occur at least once every 15 minutes, and VOC concentration readings would be recorded. Compliance with existing regulations and implementation of Mitigation Measure HAZ-MM-1 would be the same for a 32-month construction schedule or a 20-year construction schedule and would ensure the Project would not create or exacerbate a significant hazard to the public, including nearby residences, schools and public park, or the environment through reasonably foreseeable upset and accident conditions involving the handling and disposal of VOC-contaminated soil that may be encountered on-site. Additionally, refer to Response to Comment No. 26-87 regarding stockpiling of soils.

VOC emissions from excavation of potentially contaminated soils and groundwater were specifically taken into account (see Appendix C.2, Geosyntec, TAC Emissions Related to Excavation of Potentially Contaminated Soils and Groundwater Dewatering Activities) in the quantitative HRA (Appendix FEIR-10 of this Final EIR) that was prepared in response to comments on the Draft EIR. As discussed in Response to Comment No. 26-E.1-2, the HRA confirms the Draft EIR's conclusion that health risks from the Project would be below the applicable significance thresholds, and impacts would be less than significant.

With regard to methane, Mitigation Measure HAZ-MM-2 requires the installation of controls during Project construction to mitigate the effects of subsurface gases on workers and the public. These measures would include monitoring devices for methane and benzene to alert workers of elevated gas concentrations, contingency procedures if elevated gas concentrations are detected, worker training to identify exposure symptoms and implement alarm response actions, and the minimization of soil and groundwater during excavations. Additionally, soil and groundwater removed as part of construction would be sampled and tested for off-site disposal in a timely manner and if soil is stockpiled prior to disposal, it would be managed in accordance with the Project's SWPPP. Furthermore, fencing would be erected to limit public access and allow for gas dilution. Lastly, a HASP would be prepared to describe the proposed construction activities and hazards associated with each activity. As such, implementation of Mitigation Measure HAZ-MM-2 would ensure potential impacts related to subsurface gases and associated potential impacts to soil and groundwater would be less than significant. Therefore, with regulatory compliance and the implementation of Mitigation Measures HAZ-MM-1 and HAZ-MM-2, impacts associated with hazardous waste generation, handling, and disposal during construction and operation would be less than significant with mitigation. Lastly, Mitigation Measure HAZ-MM-2 applies to the entire duration of construction regardless of length.

With respect to Threshold (d), as discussed on pages IV.F-56 to IV.F-57 of the Draft EIR, Government Code Section 65962.5 requires the CalEPA to develop and update annually the Hazardous Waste and Substances Sites (Cortese) List, which is a list of hazardous waste sites and other contaminated sites. While the Cortese List is no longer maintained as a single list, several databases provide information that meet the Cortese List requirements, including the LUST database. As discussed above, as a result of the release at the former Texaco station, the remediation of which was approved by LARWQRB, the Project Site is listed on the HIST CORTESE database. The discussion provided under Thresholds (a) and (b) above in Subsection 3.d of Section IV.F, Hazards and Hazardous Materials, of the Draft EIR details the various conditions present on-site that may pose a hazard to the public or the environment. Although no current violations and no active regulatory cases were identified for the Project Site, based on the analysis in Subsection 3.d, the Project may create a significant hazard to the public or the environment

caused in whole or in part from the Project's exacerbation of existing environmental conditions. The discussion provided in Subsection 3.d details the various conditions present on-site that may pose a hazard to the public or the environment. Therefore, impacts with respect to this threshold would be potentially significant. Based on the analysis in the Site Summary Report, regulatory compliance and appropriate mitigation—specifically the Soil Management Plan set forth in Mitigation Measure HAZ-MM-1—would address residual constituents associated with the former Texaco station release, and impacts would be reduced to a less-than-significant level. With appropriate protocols and management of impacted soil per Mitigation Measure HAZ-MM-1, as well as related Mitigation Measure HAZ-MM-2, designed to mitigate any potential effects of subsurface gases and impacted soil and groundwater on workers and the public, the Project would not create a significant hazard to the public or the environment or exacerbate existing environmental conditions. Therefore, impacts with respect to this threshold would be less than significant with mitigation. Thus, Project-level impacts related to the Project Site's inclusion on a list of hazardous materials sites were determined to be less than significant with implementation of regulatory requirements and Mitigation Measures HAZ-MM-1 and HAZ-MM-2.

Under CEQA, mitigation measures are only imposed to reduce significant environmental impacts. CEQA Guidelines Section 15126.4 states that “[a]n EIR shall describe feasible measures which could minimize significant adverse impacts,” and “[m]itigation measures are not required for effects which are not found to be significant” (CEQA Guidelines Section 15126.4(a)(1), (3)). As discussed above, Mitigation Measures HAZ-MM-1 and HAZ-MM-2 are feasible and would reduce the potentially significant hazards impacts during construction to a less than significant level.

Comment No. 26-87

Soil Management Plan was Not Described in Adequate Detail

Mitigation Measure HAZ-MM-1 requires the Project to implement a Soil Management Plan (“SMP”) which will be submitted to the City of Los Angeles Department of Building and Safety (“LADBS”) for review and approval prior to the commencement of excavation and grading activities. However, many critical details concerning the SMP are missing.

First, the qualifications of individuals involved in the SMP process should be disclosed. The SMP and mitigation measure does not mention what qualifications or certifications will be required of the general contractor and subcontractors implementing the SMP. It appears that the SMP proposes that the contractor and subcontractor have primary responsibility for visual and olfactory screening for potentially impacted soil. What qualifications will the contractor and subcontractor be required to have to make such critical assessments? Is visual and olfactory observation sufficient for the types of contamination

anticipated? Will they also screen with a photoionization detector or similar instrument? Who will be responsible for that screening and what are their qualifications? The SMP indicates that a Rule 1166 permit may be obtained if VOCs are encountered. There is known VOC contamination at the Project Site. Shouldn't the Rule 1166 permit be obtained before commencing soil disturbance? At a minimum, the DEIR should require an appropriately certified environmental consultant on-site to observe all earthwork and daily reports be prepared and available for review.

Second, it is unknown how the SMP will address the likelihood of encountering soil that is stained or having odors considering the Project's location in an area characterized by oil field conditions (e.g., tar, petroleum hydrocarbons, hydrogen sulfide). It is likely that the contractors will continuously encounter stained and odorous soils. Will construction be halted continuously? What will this do to the construction schedule? Where will suspect material be stockpiled? It should not be stockpiled at the perimeters of the site where residents, school children, and pedestrians could be exposed to the materials. HAZ MM-1 [sic] suggest that known areas of contamination could be excavated prior to commencing Project excavation and grading. Will this be a required condition of approval? How will those areas be determined? Will additional sampling be conducted prior to excavation and grading? Will the remaining soils after excavation (bottom and sidewalls of excavations) be sampled to ensure there is not remaining contamination above regulatory levels? Also, what will be the criteria for reuse of excavated on-site soils? The DEIR should be revised and the SMP should include a clear and thorough discussion of how to handle soil that is stained or has odors given the known conditions at the Project Site.

Third, the DEIR states that LADBS will review and approve the SMP at some future date. Is LADBS the appropriate agency to review the SMP? What expertise does LADBS have to review an SMP? Has LADBS agreed to provide the oversight of the SMP?

Fourth, the DEIR assumes that VOCs in groundwater are from offsite sources. How and on what basis did the DEIR determine that the sources were offsite? Given historic industrial operations at the Project Site, there is a possibility that VOCs can be from on-site sources. For example, couldn't the soil and groundwater proximate to drains located in paint shops or vehicle servicing areas be impacted by on-site operations? Potential on-site sources should be adequately investigated and the management of any impacted media addressed in the SMP. Finally, the Mitigation Measure states that the SMP should be updated to reflect changes in site conditions or regulatory/legal criteria. If the SMP is modified in the future, will such modification be subject to approval? By whom?

Response to Comment No. 26-87

The Project Site has been thoroughly investigated, as described in the Site Summary Report (Appendix G.1 of the Draft EIR), and this investigation informed the Soil

Management Plan (Appendix B of the Site Summary Report). Additional investigation of the Project Site is not planned or required by applicable legal requirements and it is unlikely that the contractors will continuously encounter stained and odorous soils. Per Mitigation Measure HAZ-MM-1, the Applicant must implement the Soil Management Plan attached as Appendix B of the Site Summary Report (Appendix G.1 of the Draft EIR), which must be submitted to LADBS for review and approval prior to the commencement of excavation and grading activities. The Soil Management Plan provides a detailed description of the procedures required for soil testing, handling and proper disposal during the earthwork, grading, excavation, or other soil disturbance activities during Project construction. The Soil Management Plan was prepared by a hazardous substances expert in addition to Professional Geologists licensed in the State of California and will be implemented by a General Contractor and subcontractor(s) licensed to work in the State of California under the direct supervision of a State-licensed professional such as a Professional Engineer or Professional Geologist. The licensed professional is required to ensure the Soil Management Plan is implemented by field personnel qualified and trained on the field procedures and monitoring instruments. A photoionization detector (PID) is a standard field screening instrument that will be used during the excavation process in compliance with Rule 1166. Daily field reports of observations and monitoring will be prepared and will be available for review by the City. Pursuant to the Soil Management Plan, any soil that is disturbed, excavated, or trenched due to on-site construction activities must be handled in accordance with local, state, and/or federal regulations; therefore, the qualifications of the General Contractor and its subcontractor(s) will meet the requirements of the local, state, and/or federal regulations. No soil disturbance or excavation activities would occur without a Project Site-specific HASP in accordance with California Code of Regulations, Title 8, Section 5192. The HASP will identify equipment to be used for protecting worker safety. The Soil Management Plan is intended to provide proper control and management of soils at the Project Site that are known or found to be impacted by chemicals of concern and to provide risk management measures that are designed to be protective of potentially exposed populations. Special precautions will be taken to manage soil in areas containing chemicals of concern above screening levels. These areas include the former Texaco station and other select areas of the Project Site with elevated TPH and arsenic in shallow soil. Soil in these areas of Project development with residual contaminant above screening levels will either be excavated and properly disposed of off-site prior to commencing Project Site-wide excavation and grading operations or segregated during construction. To the extent that it is not practical or possible to live-load these soils for off-site disposal due to interruptions in the availability of trucking from weather or traffic, they will be stockpiled on-site in a location away from sensitive receptors prior to off-site disposal.

Refer to Response to Comment Nos. 26-38 and 26-86 regarding the Project's compliance with Rule 1166. Rule 1166 requires that an approved mitigation plan be obtained from SCAQMD prior to commencing any of the following activities: the excavation of an underground storage tank or piping which has stored VOCs; the excavation or

grading of soil containing VOC material including gasoline, diesel, crude oil, lubricant, waste oil, adhesive, paint, stain, solvent, resin, monomer, and/or any other material containing VOCs; the handling or storage of VOC-contaminated soil (i.e., soil which registers 50 ppm or greater using an organic vapor analyzer calibrated with hexane) at or from an excavation or grading site; or the treatment of VOC-contaminated soil at a facility. SCAQMD Rule 1166 further requires that a copy of the approved mitigation plan be maintained onsite during the entire excavation period and that the SCAQMD executive officer be notified at least 24 hours prior to excavation. In accordance with SCAQMD Rule 1166, monitoring for VOC contamination would occur at least once every 15 minutes, and VOC concentration readings would be recorded. Undisturbed soil is not included in the scope and jurisdiction of Rule 1166. Notifications, monitoring, and reporting related to the SCAQMD Rule 1166 permit will be the responsibility of the General Contractor.

Odors potentially produced by excavation activities, such as for hydrogen sulfide, will be monitored and controlled pursuant to SCAQMD Rule 402, Nuisance, and an odor monitoring plan.⁵⁵

Regarding the commenters' VOC-related comments, the Site Summary Report (Appendix G.1 of the Draft EIR) describes in detail the subsurface investigations of soil, soil vapor and groundwater performed at the Project Site. As discussed in the Site Summary Report, these investigations have detected generally non-detect levels of chlorinated VOCs, such as PCE, TCE, and cis-1,2-DCE, with low-concentration and sporadic detections which are likely due to remnants of offsite, upgradient releases from historical dry cleaners to the north along Beverly Boulevard (refer to the Phase I ESA included in Appendix G of the Draft EIR and Figure 2 of the Site Summary Report). As discussed in Response to Comment Nos. 13-4, 13-6, and 16-28, residual low levels of petroleum hydrocarbons (including some aromatic VOCs) have been detected in the northeast portion of the Project Site in the location of the former Texaco station. Further, naturally occurring tar has been detected in an isolated location in the southwest corner of the Project Site. With the exception of the previously described residual petroleum hydrocarbon release from the former Texaco station, subsurface investigations have identified no other onsite sources of VOCs. The Project Site conditions have been adequately characterized in the Draft EIR, and this characterization informs the likelihood of encountering impacted materials during the Project, which would then be handled pursuant to the Soil Management Plan.

Refer to Response to Comment Nos. 13-4, 13-6, and 16-28 with regard to potential encounters with soil contamination. As discussed therein, any residual concentrations

⁵⁵ SCAQMD, Rule 402, Nuisance, adopted May 7, 1976.

would be appropriately managed during all soil disturbance activities through implementation of the protocols described in the Soil Management Plan set forth in Mitigation Measure HAZ-MM-1. Required protocols would address soil sampling and analysis, stockpiling of affected soils, soil re-use, decontamination, and dust control. For example, as stated on page IV.F-51 of Section IV.F, Hazards and Hazardous Materials, in Mitigation Measure HAZ-MM-1, if the General Contractor or subcontractor(s) encounter any soil that is stained or odorous (Suspect Soil), the General Contractor and subcontractor(s) shall immediately stop work and take measures to not further disturb the soils (e.g., cover suspect soil with plastic sheeting) and inform the property owner's representative and the environmental monitor. The environmental monitor, an experienced professional trained in the practice of the evaluation and screening of soil for potential impacts working under the direction of a licensed Geologist or Engineer, shall be identified by the property owner prior to the beginning of work. The Suspect Soil must be managed and handled in accordance with Sections 5.3.1 to 5.3.3 of the Soil Management Plan.

It is anticipated that all soil will be immediately loaded onto trucks for disposal and, thus, stockpiling on-site would not be necessary. In certain situations, however, soil may need to be temporarily stored on-site. In these situations, the stockpiled soil would be stored on the Project Site interior away from public interfaces on the perimeter. Mitigation Measure HAZ-MM-1 has been revised to reflect this commitment. See Section III, Revisions, Clarifications, and Corrections to the Draft EIR. The impacts to the construction schedule are reflective of the amount of unsuitable soil that may be discovered. Preliminary studies indicate potential schedule impacts to be minimal. The Soil Management Plan will be submitted to the Grading Division of LABDS for review and approval as part of the Grading Permit plan check's review and approval of the Soil Management Plan. LABDS is the designated permitting organization for the Project and thus is the appropriate agency to review and approve the Soil Management Plan. LAFD is designated as the enforcement agency for the City that regulates hazardous materials and thus LABDS may designate LAFD or other regulatory agencies to review the Soil Management Plan. As described in the Site Summary Report, onsite sources of contamination have been adequately investigated and addressed. Should an update to the Soil Management Plan be deemed necessary, it would be submitted to LABDS or its designee.

Regarding the comments related to Mitigation Measure HAZ-MM-1 and excavation, the Site Summary Report (Appendix G.1 of the Draft EIR) presents the results of extensive subsurface investigations and sampling performed to date. The Soil Management Plan (Appendix B to Appendix G.1 of the Draft EIR) estimates the location and quantity of soils that may be encountered during excavation that may exceed regulatory standards and require offsite disposal at designated disposal facilities. No additional subsurface soil sampling is required by the City or CEQA. The excavation bottoms and sidewalls are not required to be sampled and tested (this would be required for an underground storage tank

soil remediation project, which the Project is not), and no such sampling or testing is planned. Existing contamination, to the extent it exists, may remain in place outside the limits of the excavations.

On-site soils with no evidence of chemical impacts, either through visual observations or field screening, may be considered for reuse on-site. Soil re-use is discussed in Section 5.3.3 of the Soil Management Plan. As stated therein, excavated soil that is suspect, either due to visual inspection or field screening measurements, may not be re-used at the Project Site until it is sampled and chemically analyzed. A California Department of Health Services certified testing laboratory shall be contracted to perform testing of suspect soil intended for on-site re-use. Excavated soil should be re-used on-site to the extent it is safe, practicable, and in accordance with applicable regulatory regulations.

Comment No. 26-88

Dewatering and Groundwater Extraction Impacts to Hazards Were Not Adequately Addressed

The extent of existing groundwater contamination and the source of such contamination is not well documented in the DEIR. The DEIR appears to assume that contaminated groundwater emanates from an offsite source without explanation or support. What is the evidence supporting the DEIR's conclusion given the prior releases of hazardous substances which occurred onsite?

Response to Comment No. 26-88

Refer to Response to Comment Nos. 13-4, 13-6, 16-28, 16-64, 16-85, and 26-78 regarding the Draft EIR's discussion of soil and groundwater contamination, including among other things, the extent and source of contamination, under existing conditions and the proposed Project. As explained therein, some of the contamination comes from on-site sources (e.g., low levels of PAHs and aromatic VOCs from the former Texaco station), whereas other contamination likely comes from off-site sources (e.g., chlorinated VOCs from off-site properties), as fully and adequately explained in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR. For a detailed description of the impacts to groundwater and their source, see the Site Summary Report (Appendix G.1 of the Draft EIR).

Comment No. 26-89

It also is unclear from the DEIR how dewatering will change the rate and direction of groundwater contamination.

Response to Comment No. 26-89

Please see Response to Comment Nos. 11-25 and 26-69 as well as the Dewatering Report in Appendix FEIR-13 of this Final EIR, for a discussion of historical groundwater levels and flow directions at the Project Site. Also, see Figures 8A and 8B in the Dewatering Report that depict the estimated temporary groundwater level cone of depression during dewatering for excavation Area 2. In general, the flow directions are directed toward the excavation center by the concentric temporary cone of depression. The temporary groundwater pumping will induce localized steeper gradients and increased groundwater flow rates toward the excavations being dewatered. Based on a review of the State databases for environmental cleanup sites (i.e., Geotracker and Envirostor), at this time there are no active environmental remediation cases at the Project Site, within 1,000 feet of the Project Site boundary, or within the estimated temporary construction dewatering cones of depression. A number of former cleanup cases located on Beverly Boulevard and Fairfax Avenue have been completed and closed by regulatory authorities. Thus, while isolated and/or residual low-level detections of contaminants may be detected in groundwater, there is no evidence of a defined offsite contaminant plume that would be affected by temporary dewatering during Project construction.

Comment No. 26-90

Will dewatering draw contamination toward the site or offsite sensitive receptors such as the school across Beverly or the Broadcast Center Apartments? How was that determined?

Response to Comment No. 26-90

The temporary dewatering during Project construction is not anticipated to draw contamination toward the Project Site or off-site sensitive receptors; refer to Response to Comment No. 26-89.

Comment No. 26-91

Was the potential for off-gassing from such groundwater contamination during construction and operation evaluated? Were the potential impacts of such off-gassing on on-site and offsite populations assessed?

Response to Comment No. 26-91

Refer to Response to Comment Nos. 13-4, 13-6, 16-28, and 16-85 regarding the potential to encounter groundwater contaminants and to Response to Comment No. 26-86 for an analysis of risk from contaminants in groundwater and off gassing potential.

Comment No. 26-92

According to DEIR IV.F-34, there are multiple sites with historical and active groundwater monitoring and remediation programs focused on cleanups of VOCs and petroleum hydrocarbons. How will dewatering affect those plumes?

Response to Comment No. 26-92

Refer to Response to Comment Nos. 11-25 and 26-69 regarding the estimated temporary construction dewatering cones of depression and to Response to Comment No. 16-85 regarding the potential to encounter groundwater contaminants.

Comment No. 26-93

The analysis by Shannon & Wilson suggests that the dewatering could draw contamination from a broad area to the Project Site and neighboring sensitive receptors. The DEIR should further analyze these potential impacts.

Response to Comment No. 26-93

Refer to Response to Comment Nos. 26-E.3-3 through 26-E.3-10 regarding temporary dewatering. The commenter's analysis overestimates the vertical and lateral extent of the anticipated dewatering cones of depression for a number of reasons, including, but not limited to: (1) the analysis does not consider regulatory lateral migration infiltration control measures that will be incorporated if necessary; (b) a time-variable dewatering program of 21 months was not used; and (3) Project Site-specific material properties that each combine to reduce the anticipated dewatering quantities and cone of depression dimensions. The projected cone of depression lateral dimensions are not estimated to extend to active environmental cleanup sites. The commenters' analysis relies upon unrealistic assumptions (unrestrained dewatering), lacks supporting calculation details and references (silty sand and undefined high storage coefficient), and uses a simplified, non-representative analytical solution (i.e., assumes isotropic water bearing materials), that combine to overestimate the anticipated dewatering conditions. Refer also to Response to Comment Nos. 11-25 and 26-69 regarding the estimated temporary construction dewatering cones of depression.

Because the Project includes excavation below the water table, temporary construction dewatering will be required. As discussed in Response to Comment No. 11-5, temporary construction dewatering impacts were analyzed in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR. As stated on page IV.F-44 of the Draft EIR, during construction-phase dewatering, any discharge of groundwater would comply with the applicable NPDES permit or industrial user sewer discharge permit requirements. Pursuant to such regulatory requirements, the extracted groundwater would be chemically

analyzed to determine whether the groundwater is contaminated and the appropriate treatment and/or disposal methods, if any. Thus, with compliance with applicable regulations and requirements, Project construction activities would not create or exacerbate a significant hazard to the public or the environment involving the handling and disposal of extracted groundwater, and impacts would be less than significant.

Appendix FEIR-13 of this Final EIR presents the methods and findings of a Dewatering Report for temporary construction dewatering, which was prepared in response to comments and confirms the Draft EIR's conclusions that impacts related to dewatering would be less than significant.

As discussed therein, the completion of the underground parking structure construction (i.e., at the end of the 21-month dewatering period), the model estimated drawdown of approximately 10 feet extending up to approximately 125 feet from the Area 2 excavation perimeter and approximately 4 feet of drawdown at a distance of up to approximately 300 feet from the Area 2 excavation perimeter. Notably, as described in Section 2.4.4 of the Dewatering Report included in Appendix FEIR-13 of this Final EIR, naturally occurring annual groundwater fluctuations often range between 0.5 and 2 feet, and long-term groundwater fluctuations in the Project Site vicinity have been found to be in the range of 3 to 6.5 feet in the Project Site vicinity. Furthermore, it is common to have groundwater elevation fluctuations in the range estimated in the Dewatering Report from a variety of regulatory-approved activities, including other construction excavation dewatering projects, groundwater remediation systems, industrial supply wells, and stormwater infiltration systems. The Dewatering Report concludes that the temporary dewatering would have a less-than-significant impact on neighboring properties and regional water resource needs

As the dewatering will be limited to temporary dewatering during construction, and the proposed construction will eliminate the need for permanent dewatering (see Response to Comment No. 3-7), the post-construction groundwater conditions at the Project Site are expected to return to general pre-construction conditions.

Refer to Response to Comment No. 16-85 regarding the Draft EIR's groundwater analysis.

Comment No. 26-94

Please also note that page IV.F-20 of the DEIR states that the groundwater report detected water at 7 feet bgs. However, the balance of the DEIR assumes 8 feet based on a "historic high." This should be updated to 7 feet based on the report. Any impacts associated with the difference should be disclosed.

Response to Comment No. 26-94

In response to comments on the Draft EIR, a dewatering simulation and analysis was prepared for informational purposes; refer to the Dewatering Report (Appendix FEIR-13 of this Final EIR). As stated in the Draft EIR, the historic high groundwater level for the Project Site is approximately eight feet below grade (please note that, as discussed in the Draft EIR, although individual well water level gauging measurements of less than 8 feet below ground surface (bgs) have been recorded historically in isolated locations, they are not representative of the current overall water table levels for the Project Site). Groundwater levels vary over time, and the groundwater level measurements in monitoring wells and investigation borings vary due to a variety of factors. In preparing the Dewatering Report, Geosyntec conducted a confirmatory evaluation of groundwater levels for the Project Site using historical data as well as the most current data in order to interpolate individual well and boring water level measurement data into average estimated water table surfaces per time period. Based on more recent data from 2002 to 2023, the approximate 10 feet bgs mean water level measurement was determined to be the appropriate existing condition for the dewatering simulations presented in the Dewatering Report, as this is the most representative estimate of the Project Site's groundwater level. It is Geosyntec's professional opinion that the 2-foot difference between 8 feet bgs (historic high water table depth) and 10 feet bgs (average water table depth based on extensive historic and current data) within an average 60-foot-thick aquifer saturated interval simulation would result in only incremental differences in dewatering quantities and cone of depression dimensions and would not change any of the less than significant conclusions in the Dewatering Report or the subsidence appendix provided by Geotechnologies (Appendix D of the Dewatering Report).

Comment No. 26-95**The DEIR Does Not Adequately Analyze Methane and Hydrocarbon Impacts**

The DEIR mentions that the Project Site is within a designated methane zone mapped by the City, which also has naturally occurring hydrogen sulfide. However, it is not clear if the methane-related and hydrogen sulfide Project impacts have been adequately analyzed.

For example, will additional development have impacts on the migration of methane and hydrogen sulfide to the existing buildings on and offsite? As noted above, the DEIR does not disclose whether existing buildings that will remain have methane systems, and if not, whether they will be retrofitted. It is also possible methane may act as a carrier and increase the potential for VOC migration.

Response to Comment No. 26-95

Refer to Response to Comment No. 13-6 regarding existing and proposed methane systems. The existing buildings to remain currently have methane systems. Naturally occurring hydrogen sulfide was not detected in any of the 26 soil vapor samples collected during the Phase II Site Investigation included as Appendix G.2 of the Draft EIR. Installation of methane mitigation systems have the added benefit of addressing potential vapor intrusion from residual fuel hydrocarbons from the former Texaco station, and naturally occurring hydrogen sulfide. No technical studies have been identified that conclude methane gas can serve as a carrier gas for VOC gases.

Comment No. 26-96

What is the potential for the methane mitigation systems to vent other gases? Which gases and to what extent? Where will these vents be located?

Response to Comment No. 26-96

It is possible that vents associated with a methane mitigation system might vent other gases. However, system monitoring and sensors, as required by the Methane Code (Division 71 of Article 1, Chapter IX of the Los Angeles Municipal Code) and LADBS permit review, will establish safe levels of operation and appropriate locations. Refer to Response to Comment No. 13-6 regarding existing and proposed methane systems.

Comment No. 26-97

Will they be near the Broadcast Center Apartments? The DEIR should elaborate on these potential impacts.

Response to Comment No. 26-97

At this time, the methane system designs have not been developed. Methane mitigation system design will be developed and finalized during the future design review process for individual Project buildings with LADBS and LAFD as part of the regulatory building permit process, at which time the final approved PDFs will be available for integration of the methane mitigation system. However, during the future design review process with LADBS and LAFD, potential vent locations will be evaluated for proper locations to meet health and safety standards. The Methane Code (Division 71 of Article 1, Chapter IX of the Los Angeles Municipal Code) includes requirements for setback distances for vent riser terminations from window and door openings, roof openings, air intakes, and property lines. Refer to Response to Comment No. 13-6 regarding existing and proposed methane systems.

Comment No. 26-98

The DEIR does not mention whether the methane system will be permitted by the South Coast Air Quality Management District (SCAQMD).

Response to Comment No. 26-98

Methane emissions from naturally occurring sources or methane mitigation systems are not regulated by the SCAQMD. As the Project proceeds, the SCAQMD will be consulted regarding potential methane system permitting, along with all applicable local jurisdictions, as described in Response to Comment No. 13-6.

Comment No. 26-99

The DEIR notes that the methane system will be venting other constituents such as fuel hydrocarbons and hydrogen sulfide. What are the risks associated with the vented methane, hydrogen sulfide, and other substances for the sensitive receptors? How will the emissions be controlled?

Response to Comment No. 26-99

Methane is a naturally occurring gas found in the subsurface within the City of Los Angeles Methane Zone. As such, outside the buildings and structures, the naturally occurring methane will continue to escape and dissipate at the surface at the regular, natural rate. The methane control systems are designed to monitor and control methane levels in buildings and structures. The future methane control system designs will be subject to review and approval by LADBS. It is presumed that a design Level V methane mitigation system will be appropriate for any new construction at the Project Site as required by the LADBS and the City of Los Angeles Methane Code (Division 71 of Article 1, Chapter IX of the LAMC). Systems will be designed in accordance with the latest regulatory control measures, including the City of Los Angeles Methane Hazard Mitigation Standard Plans as required by LADBS. Other potential gases detected at the Project Site may also be controlled by these systems depending upon the final approved design. Refer also to Response to Comment No. 13-6.

Comment No. 26-100

The DEIR does not mention whether control devices will be included and whether applicable regulatory (SCAQMD) requirements will be followed.

Response to Comment No. 26-100

Refer to Response to Comment Nos. 13-6 and 26-98. The future methane control system designs for individual buildings will be subject to review and approval by LADBS during the regulatory building permit process. It is presumed that a design Level V methane mitigation system will be appropriate for any new construction at the Project Site as required by the LADBS and the City of Los Angeles Methane Code (Division 71 of Article 1, Chapter IX of the LAMC). Systems will be designed in accordance with the latest regulatory control measures, including the City of Los Angeles Methane Hazard Mitigation Standard Plans as required by LADBS.

Comment No. 26-101

What regulations apply and how will the Project comply? It is also unclear whether this impact has been factored into Project emissions and underscores the need for a proper HRA. Were the emissions from the methane systems included in the air quality and GHG analyses? Please explain how.

Response to Comment No. 26-101

As discussed in Response to Comment No. 26-99, methane is a naturally occurring gas found in the subsurface within the City of Los Angeles Methane Zone. As such, outside the buildings and structures, the naturally occurring methane will continue to escape and dissipate at the surface at the regular, natural rate. Therefore, the methane systems would not result in new sources of emissions. Please refer to Response to Comment No. 13-6 for information regarding methane mitigation system requirements for the Project. The proposed systems would not result in air pollutant emissions. However, slab foundation buildings (e.g., sound stages) may require ventilation systems (i.e., small electric mechanical fans) as part of the methane mitigation systems. This additional electricity usage and related GHG emissions are included in the Confirmatory Air Quality, GHG, and Energy Impacts Analysis in Response to Public Comments included in Appendix FEIR-9 of this Final EIR.

Comment No. 26-102

How exactly will the Project comply with the City's methane mitigation requirements? What effect does the existing hydrostatic pressure documented at the Project Site per the DEIR have on the methane mitigation systems? How will that be addressed in the methane system design?

Response to Comment No. 26-102

The future methane control system design will be subject to review and approval by LADBS. Based on the Project being located within the Los Angeles Methane Zone, it is anticipated that a Site Design Level V methane mitigation system will be implemented for any new construction at the Project Site as required by the LADBS and the City of Los Angeles Methane Code (Division 71 of Article 1, Chapter IX of the LAMC). Systems will be designed in accordance with the latest regulatory control measures, including the City of Los Angeles Methane Hazard Mitigation Standard Plans as required by LADBS.

The methane control system design for on-grade structures will not be influenced by hydrostatic pressures, and the methane control system design for the below-grade parking structures will account for the effects of hydrostatic pressure. Per Project Design Feature GEO-PDF-1, which is included on pages IV.D-18 to IV.D-19 in Section IV.D, Geology and Soils, of the Draft EIR, the below-grade parking structures will be designed to withstand hydrostatic pressures, which will minimize the potential impact of hydrostatic pressures on the below grade components of the methane control system for below-grade structures.

Comment No. 26-103

Also, the DEIR does not analyze how the presence of tar impacts a methane mitigation system. How does the tar removal work? Is there a potential that the tar could clog the methane mitigation systems increasing the risk of unmitigated methane hazards at the site? How does the dewatering system work with the tar collection? Are other potential impacts of tar removal considered; for example, what are the effects on archaeological and paleontological resources? Will tar removal increase with the Project? Where will the tar removal systems be located? Are there any differences in the potential impacts from the tar removal based on location? Have any such differences been considered?

Response to Comment No. 26-103

Refer to Response to Comment Nos. 13-6 and 26-80 regarding the presence of methane and the proposed Project's methane mitigation system. The methane mitigation system will be designed to seal off any potential tar containing zones to prevent system clogging.

Refer to Response to Comment Nos. 13-4, 16-64, and 26-80 regarding naturally occurring tar. Following extensive subsurface investigations, including soil logging and sampling in 21 geotechnical borings and 39 environmental borings located throughout the Project Site, tar was noted in only a single interval (60-70 feet bgs) in one boring (B7). Boring B7 is located adjacent to the tar sump in the southwest corner of the Project Site and the interval in which tar was detected is well below the base of proposed excavations.

Thus, tar was noted only in an isolated area near the southwest boundary of the Project Site where a tar collection pit is located and currently collected and disposed of according to applicable regulations on a regular basis when passively filled. Given the extensive distribution of soil borings in which tar was not encountered, it is not expected that any tar will be encountered during construction nor is construction expected to encounter tar seeps or increase tar removal rates. Nevertheless, as discussed in Response to Comment No. 13-4, testing and proper disposal of any excavated soil impacted by naturally occurring oil and/or tar will follow the sampling, testing, and disposal procedures described in Section 5 of the Soil Management Plan (Appendix B of the Site Summary Report [Appendix G.1 of the Draft EIR]) pursuant to Mitigation Measure HAZ-MM-1.

As discussed in Response to Comment No. 11-5, any discharge of groundwater during Project construction would comply with the applicable NPDES permit or industrial user sewer discharge permit and applicable LARWQCB requirements, including any required treatment prior to discharge, and, therefore, groundwater quality would not be negatively affected by potential dewatering activities.

With regard to archaeological resources, Mitigation Measure CUL-MM-1 would be implemented during soil excavation, ensuring that any impacts to archaeological resources at that time would be mitigated to a less than significant level. Mitigation Measure CUL-MM-1 has been refined to further define performance criteria and enhance the ability of the Qualified Archaeologist and archaeological monitor(s) to identify, evaluate, and appropriately treat any archaeological resources identified during ground disturbing activities. Furthermore, the ongoing passive collection of tar on-site, which is not anticipated to increase due to the Project, does not impact archaeological resources, as it does not involve ground disturbance.

Regarding impacts to paleontological resources, Mitigation Measure GEO-MM-1 would be implemented during soil excavation, ensuring that any impacts to paleontological resources at that time would be mitigated to a less than significant level. Refer to Response to Comment No. 35-91 regarding revisions to Mitigation Measure GEO-MM-1. Furthermore, the ongoing passive collection of tar on-site, which is not anticipated to increase due to the Project, would not impact paleontological resources, as it does not involve ground disturbance.

Comment No. 26-104

Do the cumulative air quality and GHG analyses factor in the methane mitigation systems? HAZ-MM-2 is described as protocols for construction. How would HAZ-MM-2 reduce the recognized potentially significant impacts of the “risk of upset and accident conditions associated with methane gas during operation, and impacts associated with methane gas and hydrogen sulfide” as stated at DEIR IV.F-50?

Response to Comment No. 26-104

Emissions from the methane mitigation system will be required to comply with applicable SCAQMD regulatory requirements. Refer to Response to Comment Nos. 13-6, 26-80 and 26-86 regarding the presence of hydrogen sulfide. With regard to Mitigation Measure HAZ-MM-2, which requires the installation of controls during Project construction to mitigate the effects of subsurface gases on workers and the public, this measure is not applicable to the analysis on page IV.F-50 of the Draft EIR regarding risks due to methane during operation. Please refer to Response to Comment No. 26-101 regarding air quality and GHG emissions associated with the methane mitigation systems.

Comment No. 26-105**The DEIR Does Not Adequately Analyze Historical Oil and Gas Operations**

The Project Site is identified on several Underground Storage Tank (“UST”) databases related to the former USTs associated with past CBS operations. The UST closures occurred 31 years ago. Do the UST closures meet current regulatory standards? Was residual contamination left in place at the time of the closure? Do remaining contamination levels meet current regulatory screening or remedial action levels?

On Page IV.F-25, prior Notice of Violations for poor storage and handling practices regarding waste streams are mentioned. However, these were not considered Recognized Environmental Conditions. Why not? How will the future operations prevent such poor handling practices?

In addition, page IV.F-46 of the DEIR states that no oil or gas production wells or derricks have been identified on-site. What sources were reviewed to make this determination? Because the Project Site was within the Salt Lake Oil Fields and the La Brea Oil Fields, oil and gas operations were significant in the area. If undocumented wells are encountered during excavation and grading, what steps will the Project take to properly assess and close the wells?

Also, given the oil production in the area, does the DEIR consider the potential for subsidence from cumulative water, oil, and gas withdrawal in the area?

Finally, the DEIR should clarify why the Limited Phase II Environmental Site Assessment (“ESA”) described in page IV.F-34 assumes Total Petroleum Hydrocarbon (“TPH”) detections are from naturally occurring petroleum when there were USTs previously on-site.

Response to Comment No. 26-105

Refer to Response to Comment No. 13-6 regarding the former USTs identified on-site.

Page IV.F-25 of Section IV.F, Hazards and Hazardous Materials, of the Draft EIR states that the studio generated waste streams onsite in the past and the facility received several violation notices from applicable state agencies over the years, due mainly to storage, handling, and administrative violations related to these wastes. These violation notices described in the Draft EIR and the Phase I ESA (included in Appendix G of the Draft EIR) were related to operational issues that were not reported to have resulted in any releases of hazardous materials. With regard to future use of hazardous materials onsite, as discussed on page IV.F-40 of Section IV.F, Hazards and Hazardous Materials, of the Draft EIR, as is currently the Applicant's practice, all hazardous materials would be acquired, handled, used, stored, and disposed of in accordance with all applicable federal, state, and local requirements, and are not considered Recognized Environmental Conditions. Monitoring of the Applicant's hazardous materials management would be conducted by LAFD and other applicable regulatory authorities, as appropriate. In addition, the Project would be subject to applicable federal and state OSHA training and informational requirements, including hazardous materials training for onsite employees who handle such materials.

As discussed in Response to Comment Nos. 13-4 and 13-6, despite the Project Site's location within the Salt Lake Oil Fields and La Brea Oil Field and the historic operation of oil wells in the surrounding area, no former oil or gas production wells or oil derricks have been identified within the Project Site. This was confirmed by historical research, such as topographic maps, aerial photographs, and records from the CalGEM well finder database, as discussed on page 4 of the Site Summary Report (Appendix G.1 of the Draft EIR) and page IV.F-22 of the Draft EIR. Former oil wells identified as "plugged" or "idle" were located in the developed area outside of the Project Site. Further, the Project does not include the installation of new oil wells. Accordingly, the Draft EIR concluded that the Project would not exacerbate the risk of upset and accident conditions associated with oil wells, and impacts associated with oil wells would be less than significant (see page IV.F-46 of the Draft EIR). While it is considered very unlikely, the discovery of an unknown oil well during construction would be addressed through an oil well abandonment following existing State of California Well Plug and Abandonment procedures under CalGEM. As discussed in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR, the Project would comply with all applicable regulatory requirements, including LAMC Section 91.7109.2, which requires LAFD notification when an abandoned oil well is encountered during construction activities and requires that any abandoned oil well not in compliance with existing regulations be re-abandoned in accordance with applicable rules and regulations of CalGEM (see page IV.F-18 of the Draft EIR).

As stated on page IV.D-14 in Section IV.D, Geology and Soils, of the Draft EIR and discussed in Response to Comment Nos. 11-5, 11-25, and 16-74, no permanent large-scale extraction of groundwater, gas, oil, or geothermal energy currently occurs or is planned at the Project Site. Therefore, the potential for ground subsidence due to the withdrawal of fluid or gas at the Project Site is low. This was confirmed by the Dewatering Report and subsidence appendix (Appendix D of the Dewatering Report) that was prepared in response to comments on the Draft EIR; refer to Appendix FEIR-13 of this Final EIR. The comment misconstrues the Draft EIR, which states that certain detections of petroleum hydrocarbons, specifically GROs, are likely from either naturally-occurring oil and gas; the Draft EIR and Site Summary Report clearly document petroleum impacts from anthropogenic sources in addition to naturally occurring sources. In either case, the cleanup levels and approaches are governed by State of California regulations as described in the Soil Management Plan (Appendix B of the Site Summary Report). Refer also to Response to Comment Nos. 13-4, 13-6, and 16-28.

Comment No. 26-106

Missing Documents

Some documents referenced in the DEIR were not included in the appendices. Were these documents available to the City? How did the DEIR base its analysis on documents not publicly available? The DEIR should include the following documents mentioned throughout the DEIR for public review and comment:

- Consolidated Contingency Plan
- Television Studios Emergency Action Plan
- Television Studios Injury and Illness Prevention Plan
- Various referenced reports that “were prepared for the property independently of the Project and are on file at the Department of City Planning”
- Referenced “existing” health and safety plans

Response to Comment No. 26-106

The Consolidated Contingency Plan, Television Studios Emergency Action Plan, and Television Studios Injury and Illness Prevention Plan will be updated as set forth in Project Design Features HAZ-PDF-1, HAZ-PDF-2, and HAZ-PDF-4. While the existing plans were not included in the Draft EIR, the updated plans were described on pages IV.F-38 and IV.F-39 of the Draft EIR. As stated therein, under Project Design Feature HAZ-PDF-1, the Applicant will update, and the Project will comply with, the Consolidated Contingency Plan for the Project Site. This will include spill prevention measures such the

use of secondary containment storage and storing materials away from drains in leak-proof containers with tight-fitting lids. Spill response measures will include the evacuation of unnecessary employees from a spill area, the use of absorbent materials in the case of small spills or evacuating all employees, calling 911, and reporting to LAFD in the case of large spills. Absorbent materials used to clean small spills will be placed in a leak-proof container that is compatible with the waste, labeled as hazardous waste, and lawfully disposed of as such. Notifications will be made to the Health Hazardous Waste Materials Division of the LAFD and the California Office of Emergency Services (Cal OES) as necessary. Under Project Design Feature HAZ-PDF-2, the Applicant will update, and the Project will comply with, the Television Studios Emergency Action Plan and associated emergency exit and assembly maps. The Emergency Action Plan will include procedures for earthquakes, emergency evacuation, fires, medical emergencies, and active shooters. Under Project Design Feature HAZ-PDF-4, the Applicant will update, and the Project will comply with, the Television Studios Injury and Illness Prevention Program (IIPP). The IIPP will include protocols regarding responsibility, compliance, employee communication, hazard assessment, accident/exposure investigation, hazard correction, training and construction, and recordkeeping. These PDFs will be included in the Mitigation Monitoring Program for the Project, which will ensure their completion. With regard to the “[v]arious referenced reports that ‘were prepared for the property independently of the Project and are on file at the Department of City Planning’” as stated by the commenter, this phrase is from a footnote in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR in reference to the Phase II Investigations prepared for the Project Site, which are on file with the City. With regard to the “[r]eferenced ‘existing’ health and safety plans” as stated by the commenter, the Safety Manual for the Project Site is on file with the City.

Comment No. 26-107

Wind Impacts Were Not Analyzed

The DEIR does not address the potential wind impacts from the Project. Tall buildings, especially those over 100 feet, and exposed structures can strongly affect the wind environment for pedestrians and surrounding uses. Structure designs that present projecting tall flat surfaces square to strong winds can create ground-level winds that can be hazardous to pedestrians. Despite proposing buildings as tall as 225 feet, there is no analysis of whether the Project will create hazardous wind conditions at the ground level. The DEIR also does not evaluate the possible wind effect on the balconies of the adjacent Broadcast Center apartments due to Project buildings which could be 160 feet tall. The DEIR should be revised to analyze the Project’s potential wind impacts to on- and off-site public spaces and off-site private spaces.

Response to Comment No. 26-107

CEQA does not require a discussion of wind impacts in Appendix G of the CEQA Guidelines, and the *L.A. CEQA Thresholds Guide* does not contain any standards that would apply to the evaluation of wind impacts. Reported case law (e.g., *Mission Bay Alliance v. Office of Community Inv. & Infrastructure* (2016) 6 Cal.App.5th 160, 197) further confirms that CEQA does not require analysis of wind impacts. Therefore, a wind analysis was not required or conducted for the Project. The commenter does not provide any authority that a wind impact analysis is required by CEQA or any technical support for the claim that the Project could cause wind impacts or that there is a hazardous wind condition at ground level.

Comment No. 26-108**Air Hazards Were Not Properly Analyzed**

The DEIR does not address multiple potential significant impacts to air navigation from the construction and operation of the Project and also fails to analyze corresponding mitigation measures.

As the DEIR fails to address multiple potential negative impacts to safe air navigation resulting from the construction and operation of the proposed Project, the mitigation measures presented in the DEIR cannot be properly analyzed.

The publicly available “Notice Criteria Tool” on the Federal Aviation Administration’s website indicates that the Project “is in proximity to a navigation facility and may impact the assurance of navigation signal reception.” (See image below) Further, the Notice Criteria Tool indicates that any Project Site structure exceeding 200 feet would require filing the Project with the FAA and would require the FAA to undertake an air hazards analysis prior to construction. The DEIR makes no reference to these requirements despite the Project including uses above 200 feet. The Project Applicant must undertake a study to understand the impacts to the “assurance of navigation signal reception” for the entire Project Site and also understand the potential physical hazard impacts to air travel for the Project’s tallest buildings and cranes. These air hazards are compounded by the fact that the Project will have a helipad and helicopters may be flying in and out of the Project Site at all times of day and night (no limitations on the helipad use are provided in the DEIR).

Results

You exceed the following Notice Criteria:

Your proposed structure is in proximity to a navigation facility and may impact the assurance of navigation signal reception. The FAA, in accordance with 77.9, requests that you file:

77.9(a) by 25 ft.

The FAA requests that you file:

**Response to Comment No. 26-108**

The Draft EIR fully addresses impacts associated with safe air navigation as required by CEQA. As discussed on page 58 of the Initial Study included as Appendix A of the Draft EIR:

The Project Site is not located within two miles of an airport or within an airport planning area. The nearest airport is the Santa Monica Airport located approximately 8.4 miles southwest of the Project Site. Given the distance between the Project Site and this airport, the Project would not have the potential to exacerbate current environmental conditions that would result in a

safety hazard or excessive noise. Therefore, no impact would occur, and no mitigation measures are required.

With regard to FAA requirements for buildings over 200 feet, as stated by the Commenter, FAA review of Project buildings taller than 200 feet would be necessary prior to construction. More specifically, this review would occur during the pre-construction permitting process and not as part of the Project's environmental review process. This review would include submittal of Form 7460-1 (14 CFR Part 77, Notice of Proposed Construction or Alteration) to the FAA. The Project would comply with performance standards, which could include but is not limited to appropriate markings and lighting, that may be required by FAA as part of the 7460-review process.

Also refer to Response to Comment No. 26-15 regarding the on-site helipad that would continue to operate consistent with existing conditions in accordance with established permits (ZA Case No. 11412) and regulatory requirements.

Comment No. 26-109

The DEIR Does Not Discuss the Risk of Cranes Collapsing

The DEIR does not discuss the potential for a crane collapse on the site or any measures that will mitigate a crane collapse on the site or the hazards associated with the presence of a crane adjacent to public areas. Recently, a 300-foot tall crane collapsed at the SoFi Stadium construction site. (CBS Los Angeles, Crane Collapses At Under-Construction SoFi Stadium In Inglewood, available at: <https://www.cbsnews.com/losangeles/news/2-cranes-collapse-sofi-stadium-inglewood/>.) The DEIR should be updated to analyze the risk of a crane failure and the mitigation measures needed to address this risk. The mitigation measures should also include limitations on crane placement, swing (i.e., the arc the boom travels), and when cranes can be erected or dismantled.

Response to Comment No. 26-109

As would be required by any construction project of this scale and complexity, a crane safety plan, meeting all applicable local and State safety guidelines, including but not limited to Cal-OSHA Article 15 and Article 29 Section 1710, will be put in place prior to the start of construction. Such plans are the obligation of the general contractor.

Comment No. 26-110

The DEIR Does Not Discuss Pyrotechnics

The DEIR states that pyrotechnics will be permitted through regulatory requirements. However, the DEIR does not discuss the potential for pyrotechnics being stored and used

at the Project Site. What is the plan for the proper storage and handling of these dangerous materials? The DEIR should be revised to discuss the plan for the safe handling of pyrotechnics so the public can be assured that the City and the Project Applicant are properly prepared. Where will the pyrotechnics be used? In open to the sky production areas? How will the use of pyrotechnics affect the adjacent residents?

Response to Comment No. 26-110

The use of pyrotechnics for special effects would only occur within interior areas of sound stage buildings at the Project Site and would occur in accordance with all applicable regulatory requirements consistent with existing conditions. This includes having at least one licensed pyrotechnician on stage, with approval from the City Fire Marshal, and utilization of fire detection and suppression methods, including set design features such as the use of specific fabrics like “Smoke Out” that is designed to disintegrate when water from the sprinklers make contact. Pyrotechnics would not be used in areas of the Project Site open to the sky. Additionally, pyrotechnic materials are and would continue to be stored in a locked safe. Therefore, the use of pyrotechnics would not affect adjacent residents.

Comment No. 26-111

G. Hydrology and Water Quality

The DEIR concludes that the Project’s impacts on hydrology and water quality will be less than significant based on an incomplete evaluation of the Project and hypothetical data.

The DEIR notes that under the City’s LID Ordinance, the first tier for addressing stormwater is infiltration. However, the DEIR goes on to state that the Geotechnical Investigation concludes that infiltration is not possible, in part due to the depth of the potential subterranean parking level. How was this determination made when there are no set Project development plans? If there is no requirement for subterranean development, then the DEIR should not assume below grade construction and should explain whether an infiltration system would be otherwise feasible.

Is subterranean parking required? What is that requirement? Where will it be built? When? What will be the required parking? How is that determined? What will be the phasing of the parking?

The DEIR anticipates that on-site runoff may contain nutrients, pesticides, metals, oil, and grease. (DEIR, p. IV.G-19.) How was that determined? Were the range of hazardous substances discussed in the Hazards and Hazardous Materials section (DEIR IV.F) considered when evaluating which hazards are currently or in the future could be picked up

in stormwater? Without an accurate description of existing and potential pollutants, the conclusions regarding impacts to the stormwater system are unsubstantiated.

The DEIR states that “the Project Site contributes minimally to groundwater recharge. Therefore, the existing Project Site does not substantially contribute to groundwater pollution or otherwise adversely impact groundwater quality.” (DEIR IV.G-22). However, recharge is not the only way that the Project Site could impact groundwater. The Project Site has a range of existing and proposed uses of hazardous materials. Groundwater levels at the site are shallow (reportedly ~eight feet below ground surface). Thus, hazardous substances in surface and subsurface features have the potential to impact groundwater. The DEIR acknowledges that USTs have greater potential to impact groundwater, but does not recognize other surface and subsurface features. What other existing and proposed uses at the Project Site could release hazardous substances to groundwater? The on-site potential to impact groundwater should be fully evaluated and disclosed in the DEIR.

Response to Comment No. 26-111

As discussed in Response to Comment No. 26-55, the Draft EIR analyzed the Project described in Section II, Project Description, of the Draft EIR (refer to pages II-12 to II-35 therein), and any substantial changes from the Project would be subject to further discretionary City review and potential subsequent CEQA compliance review, per the proposed Specific Plan. As stated on page II-1 in Section II, Project Description, of the Draft EIR and throughout the Draft EIR, the Project would include excavations up to a maximum of approximately 45 feet below grade, which is based on the proposed development program described on pages II-12 to II-35 of Section II, Project Description, of the Draft EIR. Contrary to the commenter’s assertion, the Draft EIR fully analyzed the Project’s potential impacts related to hydrology and water quality in Subsection 3.d in Section IV.G, Hydrology and Water Quality, of the Draft EIR, and concluded that impacts would be less than significant. This comment does not provide any evidence that the Draft EIR’s analysis is based on an incomplete evaluation of the Project and hypothetical data.

Refer to Response to Comment Nos. 3-4 and 3-7 regarding hydrology and water quality. The Project has considered the hydrogeology of the Project Site, and stormwater management was specifically addressed in Section IV.G, Hydrology and Water Quality, of the Draft EIR. The City’s LID Ordinance No. 181,899 (updated September 2015 with Ordinance No. 183,833) provides for a number of alternatives for stormwater management. As discussed on page IV.G-30 of the Draft EIR, based on the Preliminary Geotechnical Engineering Investigation prepared for the Project (and included as Appendix E.1 of the Draft EIR), infiltration is not feasible due to multiple factors, including the expansive and relatively impermeable nature of the underlying soils and the historic groundwater level of 8 feet bgs encountered at the Project Site. LADBS requires the bottom of the infiltration

system to be a minimum of 10 feet above the groundwater level. As discussed in Section 6.2.1 of the Hydrology and Water Quality Report (Appendix H of the Draft EIR), the Project Site is currently approximately 90 percent impervious and is expected to remain approximately 90 percent impervious post-construction. The next tier in the LID Manual after infiltration is a stormwater capture and use system. Therefore, consistent with LID requirements to reduce the quantity and improve the quality of rainfall runoff from the Project Site, the Project would include the installation of a capture and reuse system to be used for irrigation. If that approach is later determined to be infeasible, high efficiency biofiltration/bioretenion systems, consistent with the LID requirements, would be installed. In either case, BMP systems will be designed within the property to capture the typical urban contaminants found in stormwater. As the current stormwater is discharged without any such controls, the BMPs installed as part of the Project will be an improvement over the current conditions.

As discussed in Section II, Project Description, of the Draft EIR, excavation for below-grade parking would extend to a maximum depth of 45 feet below grade. Accordingly, temporary construction dewatering would be required; regarding dewatering, refer to Response to Comment No. 3-7. The excavation areas are shown in Figure 3 of the Soil Management Plan, which is included in Appendix G.1 of the Draft EIR.

Regarding parking, refer to Topical Response No. 13, Parking.

As stated on pages IV.G-40 to IV.G-41 in Section IV.G, Hydrology and Water Quality, of the Draft EIR, potential pollutants in stormwater resulting from the Project would be those typical of studio land uses and may include sediment, nutrients, pesticides, metals, pathogens, and oil and grease, similar to existing conditions. The discussion of runoff and the potential presence of nutrients and pesticides, among other things, was a discussion of the general condition of urban stormwater runoff, and not specific to this Project or Project Site. Additionally, as stated on page IV.G-41 of the Draft EIR and discussed in Response to Comment Nos. 3-4 and 3-7, the Project will comply with the LID requirements with respect to stormwater management. The implementation of BMPs required by the City's LID Ordinance would target these pollutants to minimize pollutant loads in stormwater runoff. Implementation of LID BMPs as part of the Project would result in improved surface water runoff quality as compared to existing conditions. As such, the Project would not introduce new pollutants or an increase in pollutants that would conflict with or obstruct any water quality control plans for the Ballona Creek Watershed. Accordingly, as determined in the Initial Study, with compliance with existing applicable regulatory requirements and implementation of LID BMPs, the Project would not conflict with or obstruct implementation of a water quality control plan or a sustainable groundwater management plan, and impacts would be less than significant.

As discussed in Section 6.1.2 of the Hydrology and Water Quality Report (Appendix H of the Draft EIR), the Project would prepare a SWPPP in compliance with the Construction General Permit and would implement Project Site-specific BMPs, including the management of potentially hazardous materials typical of studio campuses.

As discussed in Section 6.2.2 of the Hydrology and Water Quality Report, post-construction stormwater would be managed via BMPs in accordance with the LID Ordinance. The treatment from these LID BMPs, in addition to proper management of potentially hazardous materials typical of studio campuses in accordance with applicable regulations and the proper management of naturally occurring oil and/or tar, would not result in discharges that would cause: (1) pollution which would alter the quality of the waters of the State (i.e., the Los Angeles River) to a degree which unreasonably affects beneficial uses of the waters; (2) contamination of the quality of the waters of the State by waste to a degree which creates a hazard to the public health through poisoning or through the spread of diseases; or (3) a nuisance that would be injurious to health; affect an entire community or neighborhood, or any considerable number of persons; and occurs during or as a result of the treatment or disposal of wastes.

The Draft EIR's hydrology and water quality analysis in Section IV.G, Hydrology and Water Quality, of the Draft EIR accounted for all of the existing and proposed hazardous materials discussed in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR. As discussed on pages IV.G-32 to IV.G-33 of the Draft EIR, operational activities that could affect groundwater quality include spills of hazardous materials. In accordance with City requirements, source control measures, including adequate housekeeping, removal of trash and maintenance of driveways and parking areas, and proper use and storage of pesticides, would reduce water quality impacts and prevent pollutants from entering the groundwater by percolation within landscaped areas or other permeable surfaces. As discussed in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR, any potentially hazardous materials associated with Project operations, such as the use of small quantities of cleaning solvents, painting supplies and adhesives during set construction, pesticides for landscaping, as well as fuel storage associated with production vehicles, maintenance, and emergency equipment, would be acquired, handled, used, contained, stored, and disposed of off-site in accordance with manufacturers' instructions and all applicable regulatory requirements such that no hazardous materials would contaminate or otherwise affect groundwater. Such protocols may include, but would not be limited to, "spot cleaning" leaks and drips routinely, and labeling drains within the Project Site boundary. While leaking USTs could affect groundwater quality, as discussed in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR, there are currently no USTs within the Project Site, and no new USTs are proposed as part of the Project. In addition, the Project would comply with all applicable regulations and would not affect or expand any areas of contamination, increase the level of contamination, or cause regulatory water quality standards at an existing production well to be violated, as defined

in the California Code of Regulations, Title 22, Division 4, Chapter 15 and the Safe Drinking Water Act. Therefore, operation of the Project would not result in discharges that would violate any groundwater quality standard or waste discharge requirements or otherwise substantially degrade groundwater quality, and the Project's potential impact on groundwater quality during operation would be less than significant.

Regarding the analysis of hazardous substances and groundwater, refer to Response to Comment Nos. 13-4, 13-6, 16-28, and 26-78. As stated in Response to Comment No. 26-78, a detailed discussion of the existing conditions is included on pages IV.F-20 to IV.F-35 in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR. This section discusses current and historical uses of the Project Site, including the two former gas stations; the findings of the hazardous materials database search; hazardous materials use and storage; hazardous waste generation, handling, and disposal; former USTs; ASTs; PCBs; asbestos-containing materials; LBP; methane gas; and subsurface investigations. Refer to revised Figure IV.F-1, Hazards and Hazardous Materials Site Map, in Section III, Revisions, Clarifications and Corrections to the Draft EIR. With the implementation of Mitigation Measures HAZ-MM-1 and HAZ-MM-2, impacts related to hazardous materials would be less than significant.

Comment No. 26-112

The DEIR mentions that the City of Beverly Hills draws water from the Hollywood Subbasin. What is the proximity of the closest water supply wells to the Project Site? How is pumping in the subbasin regulated? Are there any limitations on extraction from the subbasin? How will dewatering during construction and/or operations affect the subbasin?

The DEIR states that the analysis utilizes factors in the City's 2006 LA CEQA Thresholds Guide, as appropriate, to assist in answering the Appendix G Threshold questions (DEIR IV.G-25). How did the DEIR utilize the listed groundwater factors?

The DEIR surface water impacts discussion refers to 772,000 cubic yards of cut and 50,000 cubic yards of fill. How were those amounts determined? Will Project construction be limited to those amounts of cut and fill? How was the depth of excavation determined? Will other building improvements such as elevator pits or shafts, structural piles or footings, methane mitigation system components such as trenches, etc., cause excavation to go deeper than 45 feet?

Response to Comment No. 26-112

As discussed in Section IV.G, Hydrology and Water Quality, of the Draft EIR, the Project Site is located within the Los Angeles Coastal Plain Groundwater Basin and specifically overlies the Hollywood Subbasin. Per LADWP's 2020 UWMP, the Hollywood

Subbasin is an unadjudicated basin, meaning no annual pumping quantities have been established for groundwater users. Refer to Response to Comment No. 26-94 regarding the groundwater depth at the Project Site. As stated on pages IV.G-33 and IV.G-43 of the Draft EIR, there are currently no water supply (i.e., pumping) wells within a one-mile radius of the Project Site.

As discussed on page IV.G-23 of the Draft EIR, based on a review of the California Department of Water Resources (DWR) California's Groundwater Bulletin 118, the subbasin surface area is approximately 16.4 square miles and the total basin groundwater storage capacity is reported to be 200,000 acre-feet.⁵⁶ By comparison, the dewatering analysis evaluated an estimated use of approximately 81 acre-feet, roughly 0.05 percent during the construction duration. As noted in the Dewatering Report included as Appendix FEIR-13 of this Final EIR and Response to Comment No. 11-25, this amount of dewatering would not materially impact the Hollywood Subbasin and is considered less than significant. As discussed in Response to Comment No. 3-7, there would be temporary dewatering during Project construction. No permanent dewatering is proposed. Following completion of the temporary construction dewatering, the groundwater conditions are expected to generally recover to pre-construction conditions.

Regarding the City's 2006 L.A. CEQA Thresholds Guide, as mentioned on page IV.G-25 of the Draft EIR, the Draft EIR relied on the Appendix G CEQA Guidelines thresholds to determine whether the Project would have significant impacts related to hydrology and water quality. Further, the analysis utilized factors and considerations identified in the City's 2006 L.A. CEQA Thresholds Guide, as appropriate, to assist in answering the Appendix G threshold questions. The L.A. CEQA Thresholds Guide criteria are listed on pages IV.G-25 to IV.G-26 of the Draft EIR, which were utilized in the impact analysis on pages IV.G-28 to IV.G-44 of the Draft EIR. Specifically, the L.A. CEQA Thresholds Guide identifies the following criteria to evaluate groundwater impacts:

- Change potable water levels sufficiently to:
- Reduce the ability of a water utility to use the groundwater basin for public water supplies, conjunctive use purposes, storage of imported water, summer/ winter peaking, or to respond to emergencies and drought;
 - Reduce yields of adjacent wells or well fields (public or private); or
 - Adversely change the rate or direction of flow of groundwater;

⁵⁶ California Department of Water Resources, California's Groundwater Bulletin 118, Coastal Plain of Los Angeles Groundwater Basin, Hollywood Subbasin, February 27, 2004.

- Result in demonstrable and sustained reduction of groundwater recharge capacity;
- Affect the rate or change direction of movement of existing contaminants;
- Expand the area affected by contaminants;
- Result in an increased level of groundwater contamination (including that from direct percolation, injection or salt water intrusion); or
- Cause regulatory water quality standards at an existing production well to be violated, as defined in the CCR, Title 22, Division 4, Chapter 15 and in the Safe Drinking Water Act.

The analysis with regard to groundwater in the Draft EIR included consideration of each of the criteria above. Refer to Response to Comment Nos. 3-6, 11-5, 13-6, and 16-74 for a detailed discussion of the Draft EIR's analysis related to hydrology and water quality.

As discussed in Response to Comment No. 26-55, the Draft EIR analyzed the Project described in Section II, Project Description, of the Draft EIR (refer to pages II-12 through II-35 of Section II, Project Description, of the Draft EIR), and any substantial changes from the Project would be subject to further discretionary review and CEQA compliance. As stated on page II-1 in Section II, Project Description, and throughout the Draft EIR, Project construction would require an estimated 772,000 cubic yards of cut, potentially 50,000 cubic yards of imported fill and up to 772,000 cubic yards of export, with a maximum excavation depth of approximately 45 feet.

The earthwork volumes represent a conservative estimate based on the proposed development program as set forth in Section II, Project Description, of the Draft EIR. The elevator shafts, structural piles, footings, methane mitigation systems, and other subterranean components will not exceed 45 feet in depth; accordingly, Project construction will be limited to these earthwork volumes.

Comment No. 26-113

The DEIR information regarding the assessment of construction dewatering is incomplete. There is no information on the nature and extent of the dewatering. How will the dewatering be done? How many wells, what's their placement, size, capacity, etc.? How will spoils from the dewatering well points be handled? How will drilling effluent be handled? What is the rate of the extraction from the wells and their radius of influence? What is the condition of the water to be extracted? This information is completely lacking. The DEIR references pumps and filtration without detail. What filtration? Without this information, how were the impacts conclusions made? Will the dewatering affect the rate

or change direction of movement of existing contaminants? Will dewatering expand the area affected by contaminants? Based on information from Shannon & Wilson, it appears that the dewatering could have an extensive radius of influence. Will dewatering result in an increased level of groundwater contamination? Will it cause regulatory water quality standard at existing production wells to be violated? The DEIR merely refers to the NPDES or sanitary sewer permit requirements, but those requirements focus on the quality of the groundwater at the point of discharge. The NPDES permit would not address the impacts to the groundwater or users overlying the groundwater from the movement of the contaminants. Also, how does HAZ-MM-2 reduce construction groundwater impacts to less than significant? None of this is assessed in the DEIR and the conclusions on DEIR IV.IG-32 [sic] are unsupported.

Response to Comment No. 26-113

Refer to Response to Comment Nos. 11-5 and 11-25 regarding the Draft EIR's comprehensive analysis of potential impacts from temporary construction dewatering. Refer to Response to Comment Nos. 11-25, 13-6, 16-64, and 26-54 through 26-64 and 26-69 through 26-71 for further information regarding the temporary construction dewatering. Refer to the Dewatering Report in Appendix FEIR-13 of this Final EIR, which was prepared in response to comments for informational purposes and confirms the conclusion in the Draft EIR that impacts related to construction dewatering would be less than significant. This level of dewatering analysis would typically be performed during the design and permitting phases for individual buildings as part of the regulatory building permit process, and not during the entitlement phase. Nevertheless, a Dewatering Report has been completed to provide additional information and analyses at this time.

As discussed therein, the temporary dewatering system would be installed and operated in accordance with NPDES discharge permit or industrial user sewer permit requirements, and the specific dewatering system will be determined during the City's building permit process. During construction, temporary dewatering pumps and filtration would be utilized in compliance with the applicable permit. These temporary systems would comply with all applicable regulatory requirements, including but not limited to SWRCB ORDER NO. 2009-0009-DWQ related to construction and discharges from dewatering operations, as well as LARWQCB's Waste Discharge Requirements for Discharges of Groundwater from Construction and Project Dewatering to Surface Waters in Coastal Watersheds of Los Angeles and Ventura Counties.

Appendix D of the Dewatering Report also confirms that impacts related to subsidence from dewatering would be less than significant and would not damage neighboring properties; refer to Appendix FEIR-13 of this Final EIR.

Refer to Response to Comment No. 26-112 regarding the extent of Project excavation.

Refer to Response to Comment Nos. 13-4, 13-6, 16-28, 16-64, and 26-78 regarding the Draft EIR's analysis of groundwater contamination.

Refer to Response to Comment No. 16-85 regarding the Draft EIR's analysis of groundwater flows.

As discussed in Response to Comment No. 26-112, there are currently no water supply (i.e., pumping) wells within a 1-mile radius of the Project Site.

The Draft EIR analyzed groundwater quality impacts during construction on pages IV.G-30 to IV.G-32 of the Draft EIR. As discussed therein, a temporary dewatering system consisting of pumps and filtration would be installed and operated in accordance with applicable requirements. Any discharge of groundwater during Project construction would comply with the applicable NPDES permit or industrial user sewer discharge permit and applicable LARWQCB requirements. As such, groundwater quality would not be negatively affected by potential dewatering activities.

The presence of any UST or the removal of a UST also could affect groundwater quality. As discussed in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR, all former USTs have been removed from the Project Site, and there is no evidence of existing USTs on-site.

Oil wells may also affect groundwater quality. As discussed in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR, the Project Site is located within the Salt Lake Oil Fields and the La Brea Oil Field. However, no oil or gas production wells or oil derricks were identified on-site in any topographic maps, aerial photographs, or CalGEM's Well Finder database.

As also discussed in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR, based on recent subsurface investigations, elevated concentrations of fuel-related constituents have been detected in soil and groundwater on-site. Residual concentrations would be appropriately managed during all soil disturbance activities through implementation of the protocols described in the Soil Management Plan set forth in Mitigation Measure HAZ-MM-1. Additionally, the Project Site is located within a City-designated Methane Zone as defined by LADBS. A subsurface investigation conducted in 2018 identified elevated methane concentrations in soils at the Project Site, as well as naturally occurring hydrogen sulfide. As such, the Project would implement Mitigation Measure HAZ-MM-2 to ensure that potential impacts to the public related to

subsurface gases and associated impacts to soil and groundwater are less than significant. Moreover, chlorinated VOCs such as tetrachloroethene (PCE) and trichloroethene (TCE) were detected in groundwater below their respective maximum contaminant levels (MCLs) at isolated locations, with the exception of PCE at one boring, which was detected slightly above the MCL. As previously discussed, during construction-phase dewatering, any discharge of groundwater would comply with the applicable NPDES permit or industrial user sewer discharge permit requirements. Pursuant to such regulatory requirements, the extracted groundwater would be chemically analyzed to determine whether the groundwater is contaminated and the appropriate treatment and/or disposal methods, if any. As concluded in Section IV.F, Hazards and Hazardous Materials, of the Draft EIR, with compliance with applicable regulations and requirements, Project construction activities would not create or exacerbate a significant hazard to the public or the environment involving the handling and disposal of extracted groundwater.

Furthermore, hazardous materials, such as fuels, oils, paints, solvents, and concrete additives, as well as resulting hazardous wastes, could be used/handled during on-site grading and building construction and would require proper management and, in some cases, disposal. The management of such hazardous materials and wastes could increase the potential to release contaminants into the groundwater. The property owner is responsible for compliance with all applicable federal, state, and local requirements concerning the handling, storage, and disposal of hazardous materials and waste would reduce the potential for Project construction activities to release contaminants into groundwater. In addition, as there are no existing groundwater production wells or public water supply wells within one mile of the Project Site, construction activities would not be anticipated to affect existing wells.

As stated on page IV.G-32 of the Draft EIR, based on the above, with regulatory compliance and implementation of mitigation to reduce impacts related to hazardous materials (see Section IV.F, Hazards and Hazardous Materials, of the Draft EIR), construction of the Project would not result in discharges that would violate any groundwater quality standard or waste discharge requirements or otherwise substantially degrade groundwater quality. Therefore, construction-related impacts on groundwater quality would be less than significant.

Regarding the dewatering rate of extraction and radius of influence, refer to the Dewatering Report provided in Appendix FEIR-13 of this Final EIR. Based on the modeling analysis for the Area 2 excavation and assuming lateral infiltration control measures, the collective rate of excavation dewatering for the excavation could be approximately 50 gallons per minute (gpm) to begin with. Once the groundwater table is lowered to the base of the excavation, dewatering rates are estimated to be reduced to 5 to 10 gpm. A total groundwater dewatering quantity of 7.5 million gallons (23 acre-feet) is estimated for Area 2. Dewatering pumping rates would be higher if more than one excavation were

undergoing dewatering simultaneously. The radius of influence, or cone of depression created by the dewatering of the Area 2 excavation for 21 months, is presented in Figure 8B in the Dewatering Report. As described in the Dewatering Report, after the end of the 21-month simulated dewatering period, the model estimated a cone of depression drawdown of approximately 10 feet extending up to approximately 125 feet from the Area 2 excavation perimeter and approximately 4 feet of drawdown at a distance of up to approximately 300 feet from the Area 2 excavation perimeter (Figure 8B). Refer to Response to Comment No. 26-69 regarding the inaccuracies within the commenter's dewatering analysis.

Regarding groundwater movement, the Dewatering Report (Appendix FEIR-13 of this Final EIR) provides a discussion of historical groundwater flow directions and gradient. Overall, the groundwater in the area is expected to flow from northeast to southwest. Review of the State databases Geotracker and Envirostor found no active environmental remediation cases within 1,000 feet from the Project Site boundary. The closest active cleanup site was approximately 1,300 feet distant in the southeast, downgradient direction. The closest active cleanup site in the upgradient direction is approximately 1 mile to the northeast. Thus, these active cleanup sites are well beyond the cone of depression dimensions presented in the Dewatering Report. It is acknowledged there have been a number of completed cleanup sites along Beverly Boulevard and Fairfax Avenue. While there may be low-level residual contaminants in soil and groundwater, there is no evidence of a definable contaminant plume that will get mobilized by temporary dewatering during Project construction.

Comment No. 26-114

The DEIR also does not discuss the types of BMPs that will be used to address impacts related to stormwater runoff. The DEIR states that "with implementation of site-specific BMPs included as part of the [Storm Water Pollution Prevention Plan (SWPPP)] and implementation of an erosion control plan as required by the LAMC, the Project would reduce or eliminate the discharge of potential pollutants from stormwater runoff." (DEIR, p. IV.G-29.) The DEIR lacks sufficient information to support such conclusion. What assumptions were made as to the potential pollutants for purposes of these conclusions? What was assumed to be included in the SWPPP to address these pollutants?

The DEIR similarly does not provide adequate information regarding potential pollutants during Project operations as noted earlier. The lack of an accurate, stable and finite project description makes it particularly unclear. How was the scope of potential pollutants determined for the range of permitted uses identified in the DEIR? Which pollutants were assumed for each permitted use? Why does the DEIR assume that the runoff would be typical of urban development given the range of undetailed potential permitted uses? Which BMPs were identified for each of the permitted uses and their associated pollutants?

Without this information, how is the conclusion that, with the LID BMPs, operation of the Project would result in less than significant surface water impacts substantiated?

Response to Comment No. 26-114

Refer to Response to Comment Nos. 3-4, 3-6, 3-7, 13-6, 26-86, and 16-74 regarding the preparation of a SWPPP, implementation of BMPs, and the Draft EIR's analysis of potential surface water impacts.

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding the accurate, stable and finite Project Description. Refer to Topical Response No. 3, Permitted On-Site Uses, regarding the permitted uses within the Project Site.

Refer to Response to Comment No. 26-111 for a discussion of potential pollutants in stormwater runoff.

Comment No. 26-115

The analysis of operational groundwater impacts is even more lacking. There is absolutely no assessment of the impacts of dewatering during Project operations. Will there be no operational dewatering? The description of the methane mitigation systems refers to dewatering. How will the subsurface structures and methane systems be protected against water intrusion if there is no dewatering? It is more likely that there will be operational dewatering.

What will be the nature and extent of such operational dewatering? How is that determined given the lack of development plans? What is the radius of influence of such dewatering? What is the condition of the groundwater? Will the operational dewatering spread contamination? How will that affect the surrounding property? How will that affect the ability of Beverly Hills to continue to use the water for potable uses? What is the status of the Hollywood Subbasin under the Sustainable Groundwater Management Act?

Response to Comment No. 26-115

As discussed in Response to Comment No. 3-7, the Project would include temporary construction dewatering and not permanent dewatering.

Refer to Response to Comment No. 13-6 regarding the Project's methane mitigation system and any potential dewatering associated with such system.

The questions regarding the nature and extent of dewatering, radius of influence, condition of groundwater, and contamination spread are similar to the questions in Comment No. 26-113. Refer to Response to Comment No. 26-113.

The assertion regarding the lack of development plans is incorrect. Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan.

Refer to Response to Comment No. 26-112 regarding the Project Site's location within the Hollywood Subbasin. Per LADWP's 2020 Urban Water Management Plan, the Hollywood Subbasin is unadjudicated, located outside the adjudicated portion of the Central Basin. Also, the same report states the Hollywood Subbasin was classified as very low priority by the California Department of Water Resources and thus is not subject to management by a Groundwater Sustainability Act (GSA) or a Groundwater Sustainability Plan (GSP) (refer to page IV.G-40 of the Draft EIR).

At this time, there are no plans for the Project to use on-site pumped groundwater for Project Site potable water uses, irrigation uses, or any other uses. If the groundwater is not used there would be no impact on use of the groundwater by others, including the City of Beverly Hills, which has wells that are located more than one mile to the northwest.

Comment No. 26-116

As with the Hazards and Hazardous Materials section, the Hydrology and Water Quality section makes unsubstantiated assertions regarding the use of hazardous substances. On what basis does the DEIR determine that the usage would be small quantities? How can the DEIR assume that no USTs will be included with the Project when the Project also proposes fuel storage? How will that fuel be stored? Will they be stored in above grade tanks? Where on the Project site will the fuel be stored? At what quantities? Will there be multiple fueling locations? Who will be able to dispense the fuel? Which regulatory agencies will evaluate the proposed fueling operations? How did the DEIR evaluate the potential hazards and other impacts of such storage and usage?

Response to Comment No. 26-116

In regard to the Project's use of hazardous substances, refer to Response to Comment No. 26-78.

The Project does not include a fueling station; this has been clarified in Section III, Revisions, Clarifications, and Corrections to the Draft EIR. There are currently no USTs at the Project Site. The only petroleum storage tanks at the Project Site are ASTs used in connection with the emergency generators. There are currently six diesel-fueled emergency generators on-site. The diesel fuel is stored in permitted ASTs. As discussed

on page IV.F-48 of Section IV.F, Hazards and Hazardous Materials, of the Draft EIR, any additional generators will comply with applicable regulatory requirements, including those related to fuel storage (California Aboveground Petroleum Storage Act, HSC Sections 25270–25270.13; 40 CFR Part 112 and HSC Section 25270.5[c]). As stated in the Draft EIR, the Project would replace five of the six existing emergency generators (see page IV.E-81 of the Draft EIR).

Comment No. 26-117

In addition to the noted deficiencies in the Project analyses, the analysis of cumulative hydrology and water quality impacts is deficient. The cumulative impacts analysis appears to be limited to the 68 identified related projects. Aside from the fact that the related project list is clearly missing known related projects (such as the Holocaust Museum), the list does not account for related projects through Project buildout at 2043. How are the cumulative impacts through Project buildout at 2043 assessed? What assumptions were made regarding groundwater conditions and dewatering in the area?

Response to Comment No. 26-117

Project impacts associated with long-term buildout through 2043 related to hydrology and water quality are specifically addressed in Section IV.G, Hydrology and Water Quality, of the Draft EIR. As discussed therein, while Project buildout is anticipated in 2026, the Applicant is seeking a Development Agreement with a term of 20 years, which could extend the full buildout year to approximately 2043. The Development Agreement would confer a vested right to develop the Project in accordance with the proposed Specific Plan and Mitigation Monitoring Program throughout the term of the Development Agreement. The Specific Plan and the Mitigation Monitoring Program would continue to regulate development of the Project Site and provide for the implementation of all applicable PDFs and mitigation measures associated with any development activities during and beyond the term of the Development Agreement. Additionally, given that impacts related to hydrology and water quality are site-specific and do not typically vary over the course of relatively short timeframes, a later buildout date would not affect the impacts or significance conclusions presented in the Draft EIR, including the cumulative impact analyses.

Additionally, the number of related projects considered as part of the cumulative impact analyses in the Draft EIR would not alter the analysis therein. As discussed in Subsection 3.f of Section IV.G, Hydrology and Water Quality, of the Draft EIR, with regard to surface water quality, as with the Project, related projects would be subject to NPDES requirements relating to water quality for both construction and operation. Related projects would be required, pursuant to the City's LID Ordinance (or equivalent requirements in other jurisdictions, including the cities of West Hollywood and Beverly Hills), to implement

BMPs that target potential pollutants that could be carried in stormwater runoff. Additionally, regarding groundwater quality, like the Project, the related projects would be required to comply with applicable regulations during construction and would implement site-specific measures where needed. With regard to surface water hydrology, in accordance with City requirements, related projects and other future development projects would be required to implement BMPs to manage stormwater in accordance with LID guidelines. With regard to groundwater hydrology, as with the Project, any related project would be required to evaluate its individual impacts to groundwater hydrology due to temporary or permanent dewatering operations. If any related project requires permanent dewatering systems, such systems would be regulated by the LARWQCB. Should excavation for other related projects extend beneath the groundwater level, temporary groundwater dewatering systems would be designed and implemented in accordance with NPDES permit requirements. Additionally, as with the Project, related projects would be required to implement BMPs to capture stormwater runoff on-site, thereby minimizing effects on groundwater recharge. Therefore, cumulative impacts related to hydrology and water quality would be less than significant.

Refer to Response to Comment No. 26-159 with regard to the Holocaust Museum and the related projects list as it relates to long-term buildout.

Comment No. 26-118

H. Land Use and Planning

A portion of the Project Site is located in the unincorporated County of Los Angeles and subject to County regulation. The DEIR does not include any discussion of applicable County Code regulations regarding land use. Why was this not included in the DEIR?

How will the Specific Plan regulations deviate from the County Code? Will the change in regulation alter the extent of impacts to the surrounding properties? For example, the County regulates noise quite differently than the City. Will the Specific Plan allow the Project to generate greater sound levels than under County regulations? If so, how? And why is that not disclosed?

If the County portion of the Project Site is not annexed to the City, how will that change the Project and development pursuant to the Project? With which specific County land use policies that have been adopted to address environmental impacts will the Project be consistent and inconsistent? To the extent there are inconsistencies, how will these impacts be addressed?

Response to Comment No. 26-118

As discussed in Section II, Project Description, of the Draft EIR, the Project Site has three existing zone designations—C2-1-O, C1.5-2D-O, and C-MJ. The C2-1-O Zone is codified in Section 12.14 of the LAMC, with height and oil drilling criteria listed in Sections 12.21.1 and 13.01 of the LAMC, respectively. This portion of the Project Site presently has no height limit. The C1.5-2D-O Zone is codified in Section 12.13.5 of the LAMC with the height and oil drilling criteria listed in Ordinance No. 171,432 and Section 13.01 of the LAMC, respectively. This portion of the Project Site presently has no height limit. The remaining portion of the Project Site (approximately 0.63 acres in size and proposed to be annexed into the City of Los Angeles) is zoned C-MJ and codified in Title 22, Division 3 (22.20.030) of the Los Angeles County Code. Under the Los Angeles County Code requirements, this portion of the Project Site is the only parcel currently subject to a height limit. The current maximum height for this parcel is 65 feet, with the ability to increase to 75 feet through the utilization of a CUP. This small remnant unincorporated County parcel is completely surrounded on all sides by properties in the City's jurisdiction. These zones are identified in Table II-1 on page II-10 and discussed on page II-9 of the Draft EIR.

As discussed on pages II-35 and II-36 in Section II, Project Description, of the Draft EIR, the Project's requested approvals include annexation of the approximately 0.63-acre portion of the Project Site located within unincorporated Los Angeles County into the City of Los Angeles, including a General Plan Amendment and Zone Change to pre-zone the County land, as required under the laws governing annexation (this action would be included in the General Plan Amendment and Zone Change described below), and related applications to the Local Agency Formation Commission. Thus, the proposed Project would include the annexation of the County parcel into the City. The annexation is a necessary Project entitlement and the Project would not proceed without the annexation. Deviations from County Code are therefore not the appropriate standards for CEQA analysis purposes. Accordingly, Section IV.H, Land Use and Planning, of the Draft EIR properly included an analysis of the Project's consistency with applicable City, rather than County, plans and policies. In addition, Section IV.I, Noise, of the Draft EIR analyzed the Project's potential noise impacts in accordance with City standards and CEQA.

As the Lead Agency under CEQA, the City of Los Angeles has prepared and processed the Draft EIR in accordance with all applicable requirements and guidelines. As described above, all relevant information regarding the existing County of Los Angeles zoning and land use policies have been disclosed in the Draft EIR. The commenter has provided no new significant information that disputes that the City has incorrectly analyzed the future annexation of the approximately 0.63-acre portion of the Project Site located in an unincorporated area of the County of Los Angeles.

Comment No. 26-119

Without the actual Specific Plan, which is not included as part of the DEIR, it is impossible to assess potential land use impacts. The Specific Plan is the essential controlling land use document being proposed and the public needs to be able to see it in order to assess its impacts. Why was the Specific Plan not included with the DEIR? Does the City have a copy? If so, why wasn't it provided? If not, how did the DEIR evaluate the proposed Project? The Specific Plan must be provided to the public and decision-makers in a recirculated DEIR.

How will the Specific Plan change the LAMC regulations for the Project Site? The proposed deviations from the LAMC need to be disclosed and the impacts of those changes assessed.

CUL-PDF-1 presents "Project Parameters," but the "Project Parameters" state that they "will not limit the land uses or floor areas permitted under the proposed Specific Plan." So, what are they for? They merely outline what portions of the existing property will be demolished and purport to establish some height limits. This is not a discussion of the Project's Specific Plan or the actual land use regulations that will apply to the Project Site. The public cannot understand the Project's actual land use impacts based on the Project Parameters. The Specific Plan must be provided to the public and decision-makers in a recirculated DEIR.

Response to Comment No. 26-119

As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Draft EIR disclosed all of the elements of the Project required by CEQA and provided a comprehensive analysis of the Project. A draft Specific Plan is not necessary for evaluation of the Project. Nevertheless, an initial draft of the Specific Plan that was provided by the Applicant has been publicly available as part of the administrative record since 2021. In response to comments on the Draft EIR, the Preliminary Draft Specific Plan has been made publicly available on the Department of City Planning's website for informational purposes. Please note that the Preliminary Draft Specific Plan includes the same elements that could result in a physical impact on the environment that were fully disclosed and analyzed in the Draft EIR. Refer Appendix FEIR-2, Comparison Chart of the Draft EIR and the Preliminary Draft Specific Plan, of this Final EIR. Further, the proposed Specific Plan would include a regulatory framework for implementation of the Project, including, among other things, mandatory review processes by the City for implementation of the proposed Project. Future changes that are substantially different than the Project or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, as well as potential CEQA compliance review.

Refer to Response to Comment No. 26-22 regarding the Project's consistency with the LAMC.

Lastly, this comment discusses the Project Parameters (Project Design Feature CUL-PDF-1) included on pages IV.B-38 to IV.B-40 in Section IV.B, Cultural Resources, of the Draft EIR, and seems to confuse the Project Parameters and the Specific Plan. As stated on page IV.B-38 of the Draft EIR, "[the] Project Parameters set forth the maximum permitted development footprint and building heights for new adjacent construction and additions to the Primary Studio Complex to ensure that the historic significance of the Primary Studio Complex is not adversely impacted by new construction. These Project Parameters will not limit the land uses or floor areas permitted under the proposed Specific Plan." As stated in Section II, Project Description, of the Draft EIR and throughout the Draft EIR, the Specific Plan would regulate land use and floor area, among other regulations, in addition to the restrictions contained in the referenced historic Project Parameters. Compliance with the Project Parameters would be ensured by the Mitigation Monitoring Program and the Specific Plan.

With regard to recirculation, this comment does not provide substantial evidence to demonstrate that "significant new information" as defined by CEQA Guidelines Section 15088.5 has been presented or added to the Draft EIR. Also refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 26-120

The DEIR includes a long list of permitted land uses, ranging from office, studio uses, basecamps, conference facilities, parking, commercial and retail uses, special events, theaters, warehouses, and dozens of other uses that do not seem to be consistent with a television or film studio. The DEIR states that any use in the C2 zone not prohibited by the Specific Plan (which is not provided) is permitted. The potential impacts associated with each of these uses vary significantly.

How those uses are permitted is unclear. How much floor area is allowed for each of these uses? Is there any limitation on the quantity or location of the various permitted uses? To what extent do the various permitted uses have to support the studio use? Some of the uses listed on pages IV.H-22–23 specify that they are related to on-site uses and activities, but most do not. What amount of studio use is required before supporting uses are developed? Do the studio uses have to be on-site? Can the Project consist of just office and warehouse uses without sound stages? Can the Project consist of production vehicle storage and support for regional movie productions occurring elsewhere? Absent the Specific Plan, all of this is unclear and the various DEIR impact analyses must assume the full range of possibilities. Is there any limitation on the nature and extent of visitor-generating uses on the Project Site? Can all the sound stages have audience shows at the

same time? Is there any limit on the type, size, quantity and frequency of special events? How did the DEIR account for the varied impacts of each permitted use? While the DEIR seems to have assumed that each of the five uses is monolithic, the DEIR makes clear it is not. Dozens of uses are actually permitted. There is no analysis of impacts of these uses from a land use perspective or otherwise. Why not?

For example, what are the “conference facilities” described in the DEIR? How did the DEIR analyze potential impacts from such a use? What is the maximum square footage permitted for conference facilities? What land use of the five described in the DEIR (sound stages, production support, production office, general office, and retail) does the conference facility fall under? Without the definition of the various use categories, this is unclear. Do they fall under office use? Does that mean there can be 1.4 million square feet of conference facilities at the Project Site? Or can there be only a limited ratio of conference facilities to stage or office uses? Conferences generate substantial parking demand, trips, and VMT. How did the DEIR’s analysis account for these impacts?

Similarly, what is meant by the “e-sports” referenced in the list of uses? What does this use entail? Is there a maximum area that can be devoted to this use? What land use category (e.g., sound stages, production support, etc.) does e-sports fall under? Can the sound stages be used for e-sports competitions? E-sport events can attract tens of thousands of spectators and have a significant electrical demand. (See, e.g., 2015 League of Legends Championship Tournament selling out Madison Square Garden, <https://www.businessinsider.com/league-of-legends-championship-series-at-madison-square-garden-2015-8#the-2015-north-american-league-of-legends-championship-tournament-is-held-at-world-famous-stadium-madison-square-garden-msg-msg-has-a-capacity-of-18200-and-tickets-for-both-days-of-the-weekend-are-sold-out-1>.) How will these spectators be accommodated? Where will they park? What electrical infrastructure will be needed to support this activity? Without the Specific Plan, there are a number of unanswered and relevant questions, such as what would be the hours of operation for e-sports uses? What would be the seating capacity? Depending on the nature of the e-sport use, it could generate substantial parking demand, trips, and VMT. Does the Specific Plan include any constraints on this use? How did the DEIR account for this use and its potential impacts?

Response to Comment No. 26-120

Refer to Response to Comment No. 26-119 regarding the Specific Plan. Refer to Response to Comment Nos. 5-6 and 26-14 and Topical Response No. 3, Permitted On-Site Uses, regarding the clarified list of permitted uses. Also refer to Topical Response No. 3 regarding special events. With regard to audiences, refer to Section B, Visitor Trips, of Topical Response No. 10, Trip Generation.

Regarding the maximum floor area, refer to pages II-12 to II-16 in Section II, Project Description, of the Draft EIR and Response to Comment No. 26-16.

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding the regulatory framework under the proposed Specific Plan, which requires a discretionary approval and subsequent CEQA compliance review for any substantial changes to the Project that was analyzed in the EIR.

As discussed in Response to Comment No. 26-16, the Project Site will not be used for off-site productions.

The comments regarding permitted uses are similar to Comment No. 26-14. Refer to Response to Comment No. 26-14 for further discussion of the permitted uses.

Refer to Topical Response No. 13, Parking, regarding how the proposed on-site parking supply would meet the peak parking demands of the Project. Please note that the adequacy of a development's parking supply is not a CEQA impact.

Refer to Response to Comment No. 35-84 regarding how the Project's impacts associated with energy were comprehensively analyzed in the Draft EIR. The analysis includes a detailed analysis of energy usage associated with sound stages and accounts for audience-based shows.

Comment No. 26-121

What is the definition of production support? Which permitted uses fall under the production support land use category? Is there a cap on the amount of production support floor area? The DEIR states that it can be increased from 104,000 square feet, but no maximum is provided. As noted elsewhere, there appears to be an extensive amount of active production area that is not being included as floor area. Why? If these areas are enclosed and actively used for production why would they not be included as floor area? From the application documents, it appears that much of the below grade levels can be utilized for production support and basecamps. That is hundreds of thousands of square feet. Has the impact of these active production zones that are not included in the Project's definition of floor area been analyzed throughout the DEIR? What restrictions are applicable to limit the amount of unaccounted floor area? If not restricted, how can the community know, for example, the amount of production trucks and trailers that can access the site over time?

Response to Comment No. 26-121

The definition of production support has been clarified in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, of this Final EIR, as “[a] studio land use primarily used for the support of production activities and employee services.” This definition, which is based on the definition in the Paramount Pictures Specific Plan,⁵⁷ is consistent with the Draft EIR’s analysis. The same definition is included in the Preliminary Draft Specific Plan, which is publicly available on the Department of City Planning’s website.

Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, and Response to Comment No. 26-17 regarding the proposed Land Use Exchange Program.

As discussed in Topical Response No. 2, Definition of Floor Area is Appropriate, CEQA requires an analysis of all physical environmental impacts, regardless of how something is defined or classified in a land use regulation (e.g., noise impacts from an above-ground parking structure must be analyzed under CEQA even though a parking structure is not considered floor area under the LAMC). As such, even though basecamp and outdoor production activities are not counted as floor area, these activities were fully accounted for in the EIR’s environmental analysis.

Basecamp and outdoor production activities currently occur throughout the Project Site and would continue to occur in a similar manner within the Project, as the Project will continue the studio use. Refer to Figures II-3(a), II-3(b), II-4(c), II-4(d), and II-4(e) in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, which show the existing and proposed basecamp and outdoor production activity areas. Basecamp and outdoor production activity areas are related to and dependent upon sound stages; those areas do not separately generate production activity. Basecamp activities are described on page II-7 of the Draft EIR as defined areas at, near, or within a filming location where critical production activities can be coordinated. These areas include, but are not limited to, loading, wardrobe, hair, make-up, craft service, parking, storage of mobile facilities, support vehicles, etc., which are all related to production activities. Within the Project Site, basecamp and outdoor production activities typically occur within existing surface parking areas and other open areas. As shown in Figure II-3(b) in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, there is approximately 177,000 square feet of existing basecamp areas to support the approximately 95,540 square feet of existing sound stages. The Project would include approximately 194,600 net new square feet of basecamp (371,600 square feet total), which was accounted for in the Draft EIR’s analysis

⁵⁷ Ordinance No. 184,539.

(see the utilities and service systems analyses in the Draft EIR; specifically, Tables IV.M.1-5, IV.M.1-6, IV.M.2-2, and IV.M.2-3 in Sections IV.M.1, Utilities and Service Systems—Water Supply and Infrastructure, and IV.M.2, Utilities and Service Systems—Wastewater, of the Draft EIR). Outdoor production activities were analyzed in Section IV.I, Noise, of the Draft EIR. As discussed on page IV.I-44 of the Draft EIR, outdoor production activities currently occur throughout the Project Site, and noise sources associated with outdoor production activities include, but are not limited to, setup and take down of set, and outdoor filming activities. The square footage of basecamp and outdoor production activity areas are already reflected in the LADOT-approved trip rates for the studio land uses used in the Project's transportation analysis.

Further, as discussed in Response to Comment No. 26-16, while outdoor production activities may occur at Project Grade, no active production activities or uses would occur in the parking and basecamp areas below Project Grade. Refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR. As discussed on page IV.H-46 in Section IV.H, Land Use and Planning, of the Draft EIR, the Project would include two primary production levels to provide access, staging, storage, and connectivity between active production and supporting uses. The lower level, or the production operations level, would provide large areas of flexible space to house production vehicles and store equipment. Both the at-grade production activity level and the below-grade production operations level would provide space for basecamp, production staging, loading, and emergency vehicle access throughout the Project Site.

With regard to truck trips during operation of the Project, refer to Section D, Basecamp Trips, of Topical Response No. 10, Trip Generation, which discusses the ancillary nature of the trips to/from the basecamp areas of the Project Site. Basecamp areas do not generate trips in and of themselves; rather, they support the sound stage uses within the Project Site, and, thus, it is the sound stages that generate the trips to/from the Project Site. The Project's ability to switch between land uses within the Project is controlled by an evaluation of the trip generation of the land use categories being modified. Section E, Truck Trips, of Topical Response No. 10, Trip Generation, provides information of the number of truck trips generated by each of the land uses within the Project. As discussed in Response to Comment No. 26-17, it is not necessary to specify the precise number of trailers as such specific data is not necessary for any CEQA-related analysis.

Comment No. 26-122

The DEIR provides: "Specific proposals for development that involve a land use exchange would require review by the Director of the Department of City Planning. This process would entail a determination of whether the development proposal complies with the Specific Plan regulations and mitigation measures set forth in the Mitigation Monitoring Program for the Project and whether the environmental impacts resulting from the

proposed development would be within the envelope of impacts identified in this EIR.” Without the definition of the various land uses, it is not possible to assess what uses could be exchanged for other uses. Would e-sport uses come under stage or production support? If production support, that doesn’t seem to be limited in land use exchange. Would theater come under stage, production office, or production support? Without the Specific Plan attached to the DEIR, how does the public know what process would be followed for a land use exchange and how potential impacts would be assessed? The DEIR must be recirculated with the Specific Plan.

Response to Comment No. 26-122

As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Draft EIR disclosed all of the elements of the Project required by CEQA and provides a comprehensive analysis of the Project, and CEQA and City policy do not require inclusion of a Specific Plan in either the Draft EIR or the Final EIR. Further, the Draft EIR’s environmental analysis accounts for the maximum potential environmental impacts associated with buildout of the Project. For each environmental topic, as applicable, in addition to analyzing the impacts of the proposed development program, the Draft EIR also analyzed the maximum impact scenario (i.e., the development scenario under the Land Use Exchange Program that would generate the greatest environmental impact). Please refer to Appendix FEIR-3 of this Final EIR, which discusses the maximum impact scenarios that were analyzed for each environmental topic. Refer to Topical Response No. 1 and Response to Comment No. 26-17 regarding the proposed Land Use Exchange Program. Please note that the Preliminary Draft Specific Plan incorporates all of the same Project elements that could result in a physical impact on the environment that were fully disclosed and analyzed in the Draft EIR. Refer to Appendix FEIR-2, Comparison Chart of the Draft EIR and the Preliminary Draft Specific Plan, of this Final EIR. Further, the proposed Specific Plan would include a regulatory framework for implementation of the Project, including, among other things, mandatory review processes by the City for implementation of the proposed Project. Future changes that are substantially different than the Project or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, as well as potential CEQA compliance review.

All of the proposed studio and studio-related uses were disclosed in the Draft EIR. The definitions of the five permitted land uses have been clarified in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, as discussed below, and are included in the Preliminary Draft Specific Plan, which is publicly available and can be accessed on the Department of City Planning’s website. The definitions of the five permitted land uses, as well as the other definitions in the Preliminary Draft Specific Plan, are consistent with what was analyzed in the Draft EIR. The definitions of the five permitted studio uses from the Preliminary Draft Specific Plan are included below for reference.

- **Sound Stage(s).** A studio land use that includes permanent buildings for production activities and which may contain Sets/Façades.
- **Production Support.** A studio land use primarily used for the support of production activities and employee services.
- **Production Office.** A studio land use that includes those office uses associated with or in furtherance of production activity, including but not limited to merchandising, marketing, promotion, licensing, sales, leasing, accounting, distribution, legal, and administration.
- **General Office.** A studio land use that includes general office uses, which may or may not include those office uses associated with or in furtherance of production activity, including but not limited to merchandising, marketing, promotion, licensing, sales, leasing, accounting, distribution, legal, general commercial, professional, executive, business, and administration.
- **Retail.** A studio land use that includes all Neighborhood Retail uses identified in LAMC Section 13.07 C.

Refer to Topical Response No. 3, Permitted On-Site Uses, and Response to Comment No. 26-14 regarding the five permitted studio uses, as well as e-sport and theater uses.

With regard to recirculation, this comment does not provide substantial evidence to demonstrate that “significant new information” as defined by CEQA Guidelines Section 15088.5 has been presented or added to the Draft EIR. Also refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 26-123

Are the height zones fixed or can they be changed under the Specific Plan? In addition, some height zones have base limits, but are allowed a maximum height for 40% of the area. What was the basis for selecting 40%? The 40% limitation above base height does not appear to be restricted in terms of placement or individual building size. For example, Height Zone C permits building up to 160 feet next to the residential building to the east. Given the land area of Height Zone C, can a 160-foot tall building be built all along the boundary of the Broadcast Center Apartments? That would overwhelm the Broadcast Center Apartments as shown in the 3-D imaging of the Project Height Zones below.

Similarly, can a 225-foot building be built along the southern boundary adjoining the Farmers Market and Gilmore Adobe?

Are there additional limitations in the Specific Plan that would reduce the impacts on the Broadcast Center Apartments? Is there any limitation as to the size of the individual building floor plate that can be built in these maximum Height Zones? Since the Specific Plan is not provided, please clarify the regulations related to the Height Zones and to what extent the Height Zones can be modified.

Further, Height Zone A allows structures up to 58 feet in height (shown as the slightly transparent area in the front of the height zone model, below).

This conflicts with the stated goal of restoring views of the Historical Cultural Monument. If there is a 58-foot building, how will anyone at the pedestrian level be able to see the HCM? Isn't that a significant impact to the HCM? The DEIR must address this issue. Will the subsequent review by OHR referenced in the DEIR be a discretionary review? Will further environmental analysis be conducted? If not, what are the standards that will be objectively applied?

According to the DEIR, the Specific Plan will include historic preservation regulations? What are these regulations? How will they alter the placement of buildings under the conceptual plan and height zones? How will regulations address placement of new structures, including their locations, design, materials, and paint? How do the regulations comply with the Secretary of Interior Standards? Did an architectural historian prepare the preservation regulations? Will the regulations also address impacts to the adjacent historic resources such as the Adobe? The regulations should be provided to the public for review and comment as part of a recirculated DEIR.

Response to Comment No. 26-123

As discussed in Response to Comment No. 5-9, the illustrations provided in this comment are inaccurate and do not portray what could be built under the proposed Specific Plan. Regarding building heights and height zones, stepbacks, and frontages, refer to Response to Comment Nos. 9-16, 11-3, 26-6, and 26-7. The height zone regulations discussed in the Draft EIR are the same as those included in the Preliminary Draft Specific Plan. Any changes to the height zone regulations in the adopted Specific Plan would require a Specific Plan Amendment, which is a discretionary approval that requires CEQA review, per the proposed Specific Plan. Additionally, as discussed in Response to Comment No. 26-7, the Project is exempt from the study of aesthetics impacts in the CEQA analysis.

Refer to Response to Comment Nos. 26-7 and 26-45 and Section C, Potential New Construction North of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, regarding the restoration of the historic viewshed along Beverly Boulevard and any potential development considered within that zone.

With regard to historic preservation regulations in the proposed Specific Plan, refer to Response to Comment No. 9-18. With regard to adjacent historical resources, refer to Section E, Impacts to Historical Resources in the Vicinity of the Project Site, of Topical Response No. 5, Historical Resources. In addition, refer to Topical Response No. 5, Historical Resources, for further comment and summary of analyses regarding historic resources, related professional analysis, and adherence to LAMC Section 22.171.14.

With regard to recirculation, this comment does not provide substantial evidence to demonstrate that “significant new information” as defined by CEQA Guidelines Section 15088.5 has been presented or added to the Draft EIR. Also refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 26-124

The Project does not appear to provide for any meaningful separation from offsite sensitive uses. Based on the conceptual plan the “frontage areas” that are supposed to provide a buffer are actual internal roads. How does a road for production trucks, with their related emissions and noise, provide a buffer to the offsite sensitive uses? In some cases, the “frontage area” is actually the sidewalk. The “stepbacks” only apply over 88 feet and then are still limited. What are the actual requirements that will be applied in the Specific Plan given that the conceptual plan is but one example of what might be built? Why aren’t significant setbacks required along the eastern and southern boundaries? Why can’t such setback be required? What would be the impact on overall Project Site development if meaningful setbacks were required?

Response to Comment No. 26-124

Refer to Response to Comment Nos. 9-16, 16-76, 26-7, and 26-8 regarding the required frontage areas and setbacks, and impacts to adjacent uses. As discussed therein, the distances between future Project buildings and off-site buildings such as the Broadcast Center Apartments and Gilmore Adobe would be substantial. Further, the uses contemplated in the frontage areas exist today and would not change in the future; refer to Figure II-8 on page II-517 within Response to Comment No. 26-8, above. Refer to Topical Response No. 1, Clearly Defined Project Description and Specific Plan, regarding how the frontage and setback regulations discussed in the Draft EIR are the same as those in the Preliminary Draft Specific Plan, and a discussion of the regulatory framework detailed in the Preliminary Draft Specific Plan.

Comment No. 26-125

What are the parking ratios for each use? Are there minimum and maximum parking requirements? How do the Project's parking requirements compare to existing code? How do the parking requirements apply to operational needs? To the extent the requirements are less than code, how did the DEIR assess the impacts to the surrounding community? Recently, the website of one of the TVC audience shows encouraged show attendees to park in The Grove parking structure. To the extent the requirements are greater than existing code, how does that support the assumed VMT reductions from transit? It is not possible to assess these questions with the information in the DEIR. Without the Specific Plan, the public and decision-makers have no idea how much parking would be required or is appropriate under various development scenarios.

The amount of parking directly impacts environmental impacts through construction impacts and air emissions. The DEIR assumes 5,300 parking spaces. Is that based on the conceptual plan? Is that based on the conceptual square footage table? Which permitted uses were assumed under each land use category to determine the parking requirements? Is the Project limited to a maximum 5,300 spaces? If not, how many can be provided? Is there a minimum amount of spaces required? What minimum and maximum parking is required for "audience and entertainment shows", "museum exhibits," "theaters," "e-sports," "fitness facilities," etc.? The parking requirements for each permitted use should be disclosed. Will there be a fee for parking on the Project Site? Will parking be charged to employees and visitors? Audience show guests? [sic] If there is a parking fee, how will these fees encourage parking in surrounding areas?

Response to Comment No. 26-125

The Project Site is adjacent to a Major Transit Stop at the intersection of Beverly Boulevard and Fairfax Avenue, as defined by PRC Section 21064.3. As such, recently enacted State legislation (AB 2097) prohibits a public agency from imposing or enforcing

any minimum automobile parking requirements on any residential, commercial, or other development project that is within 0.5 mile of a Major Transit Stop, with minor exceptions.

However, as discussed in Topical Response No. 13, Parking, sufficient parking for the proposed uses would be provided on-site to accommodate the Project's peak parking demands, including audience parking, such that spillover parking would not occur. Off-site parking is no longer proposed; refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR. Please note that the adequacy of a project's parking supply and congestion are not CEQA impacts pursuant to SB 743. Refer to Topical Response No. 13, Parking, regarding the Draft EIR's analysis of impacts associated with parking.

As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, neither CEQA nor City policy requires a draft Specific Plan to be included in the EIR. Please note that the parking ratios discussed in Section IV.K, Transportation, of the Draft EIR are identical to those in the Preliminary Draft Specific Plan. Also refer to Topical Response No. 3, Permitted On-Site Uses, regarding the clarified list of uses proposed by the Project.

Unlike The Grove, employees and visitors to the Project Site will not pay for parking as part of their entry to the Project Site, and, therefore, there will be no reason to park off-site.

Comment No. 26-126

Will the Specific Plan include design regulations for the entry ways to the Project Site, including establishing queuing requirements? Will the Specific Plan require separate entrances for (i) production trucks, (ii) employees and contract workers and (iii) visitors (including audience shows) to facilitate access and circulation? How will the design queue compare with expected peak arrivals for various users (audience shows, employees)? Will there be a security check in at the entry gates? How will delay at the security check-in be incorporated into the entry design requirements to restrict back up on to the street system?

Response to Comment No. 26-126

Refer to Section A, Queuing at Project Driveways, of Topical Response No. 12, Safety and Congestion, for a discussion of queuing at the Project driveways and the analysis methodology that went into the calculation of the queuing at each driveway. Refer to Table II-12 therein, which shows the queue processing times for different vehicles (employees, audience/visitor, and trucks). A security check at the entry gates would continue to be implemented, and the time required for that security check has been factored into the processing time for each group of vehicle types entering the Project Site.

The proposed Specific Plan would not include the regulations or the separation by vehicle type at different driveways as listed in this comment. The driveways are intended to offer access to all types of vehicles entering/leaving the Project Site. In each case, the types of vehicles projected to enter a specific driveway have been factored into the location of the security check point, the number of entry and exit lanes at each driveway, and the assignment of vehicle types to specific inbound lanes at each driveway. The comparison of peak demand and available queuing is shown in Table-II-13(a) in Section A, Queuing at Project Driveways, of Topical Response No. 12, Safety and Congestion. The design of the driveways and queuing calculations would be reviewed and confirmed by LADOT as a part of the regulatory building permit process.

Comment No. 26-127

What is the maximum amount of parking that may be required under the highest parking intensity uses? For example, if there are 7,800 employees and another 5,000 audience show members and special event guests, where will the 12,800 people park? Please detail parking required for each use. How does this figure differ from 5,300 spaces quoted in the DEIR? How did the DEIR analyze the impacts from the development of the maximum required parking? How much will be developed? Where will it be located? How will it be constructed?

The DEIR states that the Specific Plan “would set forth a process for the approval and implementation of a reduced/shared parking plan, so long as an adequate parking supply is maintained.” How will the adequacy of the parking supply be determined? What are the parameters for allowing reduced or shared parking? What types of uses will be permitted to have reduced or shared parking and on what basis? Where will the parking be provided? How will tandem and valet parking be managed? How will the arrival of guests for multiple audience participations shows and special events be managed on-site so as to not queue on the adjacent streets or not result in parking in the community? What evidence is there in the DEIR to support such determinations?

The DEIR further states that “parking may be located anywhere within the Project Site or off-site upon the submittal of an off-site parking agreement or covenant satisfactory to the Director of the Department of City Planning. Furthermore, temporary off-site parking due to displacement resulting from production filming and related activities may be provided, with shuttle service to the Project Site as needed.” The DEIR does not analyze the potential impacts of such offsite parking. Where would the offsite parking be located? How many spaces might be located off-site? How often could this occur? How much parking could be displaced by production? How were the impacts of this offsite parking (shuttles, traffic in community, etc.) analyzed in the DEIR?

What number of production vehicles may access the site on a daily basis? What is the maximum? What is the mix of sizes and types of production vehicles to access the site on a daily basis? What amount (spaces and square feet) is needed for production support and basecamp parking to accommodate these vehicles? How were the impacts from these production support and basecamp parking areas assessed in the DEIR? Wide areas are needed for these vehicles which can include various sized trucks, including 18 wheeler trucks, trailers, and modular buildings. What regulations will apply to the production support and basecamp parking areas? If the below grade areas are used for production and basecamp areas, how will cars access the proposed parking garage on the east side of the Project site at Grove Drive from the Fairfax entrance? Will access be limited by varying levels of production activity?

The DEIR authorizes different types of parking: “above-ground structures, subterranean structures, and/or surface spaces and may be designed to accommodate semi-automated or fully-automated parking operations.” Do the different types of parking have a different effect on the transportation analyses? How were the impacts of development of the different types of parking analyzed in the DEIR? If automated parking is employed, how will the arrival of employees and guests be managed on-site so as not to queue on the adjacent streets? What evidence is there in the DEIR that supports such determinations?

Response to Comment No. 26-127

Although the adequacy of a development’s parking supply is not a CEQA impact per SB 743, a response to this comment is included for informational purposes. Refer to Topical Response No. 13, Parking, for a discussion of the Project’s proposed on-site parking supply, the parking provisions in the Preliminary Draft Specific Plan, the adequacy of the proposed on-site parking supply to meet the peak parking demand of the Project and prevent spillover parking, and the results of the shared parking analysis. Section B, Off-Site Parking, of Topical Response No. 13, Parking, discusses the fact that off-site parking would not be needed to support the Project. Accordingly, off-site parking is no longer proposed; refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR.

The implication that 12,800 people or vehicles will need to park simultaneously on the Project Site is incorrect. Table 13 on page 123 of the Transportation Assessment (Appendix M.1 of the Draft EIR) shows that the total number of vehicle trips to/from the site every day would be approximately 13,454. This estimate includes employee vehicle trips, visitors and audience member trips and truck trips. Given that this number represents two-way trips, the maximum number of individual vehicles on the Project Site each day would be approximately 6,727, and not all of these vehicles would be on the Project Site simultaneously. The estimate of parking demand by user group throughout the day is shown in Table II-15 of Topical Response No. 13, Parking. The results of the shared parking analysis presented in Table II-15 indicates that the peak parking demand would

occur in the late morning time period when a maximum of approximately 5,081 cars would be parked on the Project Site.

The comment regarding the number of audience members is incorrect. Refer to Section B, Visitor Trips, of Topical Response No. 10, Trip Generation, regarding the number of audience members and audience trips under existing conditions and with the Project.

Refer to Section E, Truck Trips, of Topical Response No. 10, Trip Generation, for a discussion of truck activity at the Project Site. The Project Site will serve an estimated peak activity level of 18 heavy trucks (semi-trucks), 43 10-ton trucks, and 22 5-ton (single unit) trucks per day. The level of specificity regarding truck size and function is not necessary information to conduct the transportation analysis. The number and size of trucks are all that is needed, and these details are explained in Section E, Truck Trips, of Topical Response No. 10, Trip Generation. The activity generated within the production support and the basecamp areas are all included in the Project trip generation estimates and, therefore, are included in the transportation analysis.

Comment No. 26-128

What are the referenced “streamlined” alcohol use approval procedures? What are the “certain conditions” that must be met? What are the conditions for the off-site consumption and “tasting”? How many people can attend the tastings? What security measures will be required? What are the hours of operation? Where will the 10 new on-site and 2 new off-site alcohol uses be located? Given that there are only 20,000 sf of retail and restaurant use, why does the Project require 12 on-site alcohol uses? Is there additional square footage for which alcohol use will be permitted? How will alcohol service be handled for special events? Where will special events be located? The DEIR says that with compliance with the Specific Plan, the alcohol uses would not require any additional approval from City Planning. (DEIR, p. IV.H-30.) What are the requirements of the Specific Plan and how do they differ from the LAMC requirements? Were the potential impacts of those differences in regulations and the alcohol uses assessed in the DEIR? How?

Response to Comment No. 26-128

The proposed Specific Plan would allow for a maximum number of overall alcohol approvals on-site with requisite conditions of approval required for effectuation of each individual approval. The proposed Specific Plan would establish a streamlined alcohol use approval procedure subject to review by the Department of City Planning for up to 10 new establishments offering the sale of a full line of alcoholic beverages for on-site consumption, provided that certain conditions are met. In addition, the proposed Specific

Plan would allow up to two new establishments for the sale of a full line of alcoholic beverages for off-site consumption (e.g., for sale at a retail store), as well as tastings, provided certain conditions are met.” The two off-site alcohol requests are identified to maintain flexibility to provide complementary uses for the proposed public-facing retail square footage identified within the Draft EIR and the proposed Specific Plan. The alcohol regulations are included in the Preliminary Draft Specific Plan and are consistent with the City’s existing regulatory requirements.

Refer to Section IV.H, Land Use and Planning, and Appendix I of the Draft EIR regarding the Project’s consistency with the LAMC.

Comment No. 26-129

As with the Specific Plan, the Sign District document was not provided with the DEIR. The DEIR summarily discusses a broad range of the proposed signage. The detailed regulations of the Sign District must be included in a recirculated DEIR for public review. Were the potential impacts of the signage analyzed in the DEIR? How? What are the impacts from signage on the integrity of the HCM? What are the impacts of lighting and noise from the proposed signage to neighbors? What is the analysis of the Sign District’s consistency with plans, especially the Wilshire Community Plan? The DEIR is so lacking information that it cannot be relied upon for CEQA compliance for the Sign District.

A total of “approximately 31,375 square feet of externally visible, on-site signage” is proposed. (DEIR Page IV.H-31). Why is that an approximation? What is the actually regulated maximum? And why does it specify “on-site signage”; can there be additional off-site signage? Where can the permitted signage be located? At what heights? What types of signs are allowed where? What are the size limitations on each sign type? Is there an overall numeric limit for each sign type? How was the maximum amount of signage determined? How was the maximum 6,100 square feet of signage along Beverly Boulevard determined? Given the supposed limitation on impacting the viewshed to the HCM, will that lead to a greater concentration of signs at the remaining perimeter along Beverly Boulevard? How about the 11,325 square feet on Fairfax Avenue? Or the 10,350 square feet along The Grove Drive? Is there a detailed sign program? The specificity of these numbers suggests there is a detailed sign program that wasn’t included with the DEIR. If so, why not?

Why is “internal” signage based on being below 88 feet in height and 100 feet (or 30 feet) from the property boundary? What does it mean to not be “generally externally visible”? Why is unlimited signage, including digital signage, permitted within 30 feet of the Broadcast Center Apartments as long as it is less than 88’ in height? The Broadcast Center Apartments are approximately 55 feet tall. What is the benefit to the limit of 88 feet? Is there any regulation on the orientation or screening of the interior signs? Any

limitations on the brightness and glare for illuminated interior signs? Were the impacts of unlimited signage analyzed in the DEIR? For example, does the electricity, energy, and GHG sections account for the electricity usage of unlimited signage? Does the Cultural Resources assessment evaluate the impacts to the integrity of the HCM from unlimited signage? How about the impacts to the surrounding historic resources, such as the Beverly Fairfax District, the Gilmore Adobe and the Farmers Market from the proposed signage?

Why is signage on the southern property boundary not limited in the same manner as the other perimeters? Why isn't signage next to the Gilmore Adobe limited? What types and sizes of signs can face the Gilmore Adobe and Farmers Market? Can signs be placed on the proposed parking structure facing the Holocaust Museum and Pan Pacific Park? If so, what is the impact on the Pan Pacific Park and the Holocaust Museum?

What are the definitions of "off-site" and "on-site" signs? Are they the same as defined under the LAMC? If they are different, then the DEIR must be revised to include this information.

Response to Comment No. 26-129

As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the EIR disclosed all of the elements of the proposed Sign District required by CEQA, and the Preliminary Draft Specific Plan is not necessary for the environmental analysis of the Project. A Preliminary Draft Specific Plan will be made publicly available on the Department of City Planning's website prior to hearings for the Project.

Refer to Response to Comment Nos. 5-10 and 26-21 regarding the primary physical elements of the proposed Sign District (e.g., sizes, types, locations, maximum square footage, illumination, etc.) that were fully described in the Draft EIR and evaluated as part of the land use policy analysis included in Appendix I, Land Use Plans Consistency Analysis Tables, of the Draft EIR. The parameters governing maximum signage along the Project perimeter utilize the baseline calculation identified for signage square footages (wall, monument, projecting, etc.) under LAMC Section 14.4.4 in addition to metrics identified for buildings that exceed one story in height (stated within the same section). The overall signage calculation along the Project perimeter was informed by using this code section as a baseline. As part of this calculation, these sign areas were identified as "approximate" to identify that the total area studied ("approximately 31,375 square feet of externally visible, onsite signage," for example) is a cumulative number and may have included fractional quantities that were rounded up to provide a conservative total, for clarity and technical analysis. However, specific dimensional restrictions along the Shared Eastern Property Line near the Broadcast Center Apartments and opposite The Grove Drive from Pan Pacific Park and the Holocaust Museum would be limited to smaller

identification, informational, and directional signs of no more than 25 square feet each and located no more than 15 feet above Project Grade. The Preliminary Draft Specific Plan prohibits digital displays from placement along the perimeter and incorporates the standard illumination limitations identified in LAMC Section 14.4.4. (Refer to the revised Proposed Signage Plan included in revised Figure II-10 in Section III, Revisions, Clarifications, and Corrections to the Draft EIR.) Signage on the southern property boundary, across from the Gilmore Adobe and facing The Original Farmers Market, would be identified within Vertical Sub-District F.1 of the Site Interior. It is defined as signage that is internal to the Project Site and is not located directly along and facing a public right-of-way or within 100 feet from the perimeter along Beverly Boulevard, Fairfax Avenue or The Grove Drive, 30 feet from the Shared Eastern Property Line or the southern property line, or 10 feet from the Southern Shared Access Drive. These interior signs, identified by the commenter, are not intended to be viewed from the public realm (e.g., public right-of-way) at existing grade. In addition, where a portion of said sign's structure could be visible at a specific spot or location along the public realm, the text or graphics included within the signage would not be visible because they are on-site, interior facing signs in keeping with the intent of existing signage currently on-site.

To define and limit these signs, a Vertical Sign Zone (referenced above) has been identified to quantify specific sign types and distinguish sign type based on its location on the façade of a building. Signage located below 88 feet would be governed consistent with those requirements identified for the Project perimeter. Signage located above 88 feet would be limited to wall signs and high rise identification signs. This interior signage would not be limited by total square footage but by location and the ability to view a sign's graphic from outside the Project Site. Digital displays would only be allowed within the Project Site interior as shown in Figure II-8 on page II-517 within Response to Comment No. 5-10, above. The Sign District would impose specific criteria on interior digital displays within 200 feet of the Broadcast Center Apartments. These limitations include a prohibition on digital displays facing any off-site location, including the Broadcast Center Apartments, and a prohibition on the operation of interior digital displays within 200 feet of the Broadcast Center Apartments between the hours of 10 P.M. to 7 A.M. These elements are shown in said Figure II-8. As discussed on page IV.H-31 in Section IV.H, Land Use and Planning, of the Draft EIR, LAMC illumination regulations would apply. No deviation has been requested for the typical signage illumination criteria identified in LAMC Section 14.4.4 within the Project Site interior.

As defined by Section 14.4.2 of the LAMC, an off-site sign is "a sign that displays any message directing attention to a business, product, service, profession, commodity, activity, event, person, institution or any other commercial message, which is generally conducted, sold, manufactured, produced, offered or occurs elsewhere than on the premises where the sign is located." As stated on page IV.H-31 of the Draft EIR, off-site signs would be prohibited throughout the Project Site. The Preliminary Draft Specific Plan

does not permit any off-site signage or propose to alter, change, or modify the definition of an “off-site” sign.

With regard to potential noise impacts related to signage, signage is not a substantial source of noise, and such noise would be associated with the use electricity to light signage or operate digital displays. Furthermore, as discussed above and in Response to Comment No. 5-10, digital displays would be prohibited along the perimeter of the Project Site, and signage facing the Broadcast Center Apartments would be limited to smaller identification, informational, and directional signs. As such, significant noise impacts associated with signage would not occur. Refer to Response to Comment No. 102-6 regarding how electricity use associated with Project signage was accounted for in the energy analysis associated with the Project. Energy use associated with proposed signage was also incorporated into the analysis of GHG emissions associated with the Project. Refer to Appendix FEIR-9 of this Final EIR for these calculations. As concluded in the Draft EIR, Project-related impacts associated with energy and GHG emissions would be less than significant. In response to comments on the Draft EIR, a specific analysis of Project signage was added to the Historic Report (Appendix C.1 of the Draft EIR); refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR. As discussed therein and summarized below, impacts would be less than significant.

As discussed in Section IV.B, Cultural Resources, of the Draft EIR, Historic Sign Guidelines for on-site signage have been prepared by Architectural Resources Group to ensure that all exterior signs located on the Primary Studio Complex and within the Viewshed Restoration Area comply with the Secretary of the Interior’s Standards for Rehabilitation. As such, these guidelines will ensure that any future sign design or modification associated with the Primary Studio Complex will not result in significant impacts to the significance and integrity of the Primary Studio Complex.

The Project also anticipates additional signage associated with new construction outside the Primary Studio Complex and Viewshed Restoration Area, including signage along the Project perimeter facing public rights-of-way. Digital displays would be prohibited along the Project Site perimeter. The anticipated signage will be affixed to new construction only and will not physically alter the Primary Studio Complex or any identified historical resource located in the Project Site vicinity. The addition of new signage does not include the demolition, relocation, rehabilitation, alteration or conversion of the Primary Studio Complex which would remain intact in its current location and would not be materially altered by new signage located on the proposed new construction. The Primary Studio Complex would remain intact and continue to convey its historic significance. For these reasons, the historic significance and integrity of the Primary Studio Complex would not be materially impaired by the Project and the proposed new signage would not result in significant impacts to the Primary Studio Complex.

Similarly, the addition of new signage does not include the demolition, relocation, rehabilitation, alteration or conversion of any identified historical resource located in the Project Site vicinity. All of these resources would remain intact in their current locations and would not be materially altered by new signage located in their larger surroundings. After construction of the Project, all the identified historical resources located within the Project Site vicinity would remain intact and continue to convey their historic significance. For these reasons, the historic significance and integrity of the identified historical resources located within the Project Site vicinity would not be materially impaired by the Project and the proposed new signage would not result in significant impacts to off-site historical resources.

Comment No. 26-130

The DEIR concludes that land use impacts do not vary substantially over the course of a “relatively short time frame. Therefore, a later buildout date would not affect the impacts or significance conclusions.” What was the basis for that conclusion, particularly for a 20-year buildout time frame? That statement is inconsistent with the Project build out for 20 years. The Development Agreement could extend full buildout until 2043. Please clarify how the construction time frame until 2043 is characterized as a “relatively short time frame”? The Land Use analysis must be revised to account for a later buildout date.

Response to Comment No. 26-130

A discussion of potential land use impacts under a long-term buildout scenario is included on page IV.H-57 of Section IV.H, Land Use and Planning, of the Draft EIR. This discussion states as follows:

The Development Agreement would confer a vested right to develop the Project in accordance with the Specific Plan and a Mitigation Monitoring and Reporting Program (MMRP) throughout the term of the Development Agreement. The Specific Plan and MMRP would continue to regulate development of the Project Site and provide for the implementation of all applicable Project design features and mitigation measures associated with any development activities during and beyond the term of the Development Agreement. Additionally, land use impacts do not vary substantially over the course of relatively short time frames. Therefore, a later buildout date would not affect the impacts or significance conclusions presented above.

Land use plans and policies remain in place over a long timeframe. For example, the Wilshire Community Plan was adopted on September 19, 2001, and has been the applicable plan for the Wilshire Community Plan area for 22 years. The phrase “relatively short time frames” is referring to the 20-year timeframe of the Development Agreement in relation to the longer-term nature of adopted land use plans, policies, and regulations. This

clarification has been made to the Draft EIR. Refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR.

Refer to Response to Comment No. 9-24 regarding the buildout timeline.

Comment No. 26-131

The DEIR claims that “[t]he Project has been designed to restore views of the [Historic-Cultural Monument] (which are currently obstructed)” on the Project Site (referring to the Primary Studio Complex). (See DEIR, p. IV.H-51.) How can that be the case when Height Zone A permits a 58-foot building in front of the HCM along Beverly Boulevard? How can this be the case when the buildings along Fairfax Avenue can be up to 160 feet? How can this be the case when the conceptual plan shows a building at the corner of Beverly and Fairfax? Please explain how the Project has been designed to restore views of the HCM.

This also is at odds with having a twelve-foot-high security fencing surround the Project Site. (See DEIR, pp. II-22 [“Fencing up to 12 feet in height would be permitted on-site”], IV.H-27 to IV.H-28 [same]; see also *id.*, pp. II-33 [“Fencing, walls, landscaping, and other elements would be used to create a physical barrier at the perimeter of the Project Site to maintain the necessary privacy for certain production activities and ensure pedestrian safety”], IV.H-32 [“Visual screening and fencing would be provided around the entire Project Site perimeter”].) Further, the Specific Plan contains the precise design regulations for fencing (*id.*, p. IV.H-27), but without the Specific Plan itself, the public and decision-makers cannot be informed as to the full impact of the proposed fencing or understand how the fencing would somehow “restore views” of the Primary Studio Complex.

Response to Comment No. 26-131

Refer to Section C, Potential New Construction North of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, and Response to Comment Nos. 26-19 and 26-45 regarding the regulations and procedures for new construction in the Viewshed Restoration Area and restoration of the historic viewshed along Beverly Boulevard. As discussed on page IV.B-53 of Section IV.B, Cultural Resources, of the Draft EIR, the Project would open the currently obstructed views of the Primary Studio Complex from Beverly Boulevard, thereby restoring an important character-defining viewshed feature that has been compromised in the past. Views from the public right-of-way along Beverly Boulevard are currently obstructed by security fencing planted with dense shrubs and climbing vines, as well as existing solar canopies and miscellaneous structures. The distinctive entry bridge generally cannot be seen from Beverly Boulevard, and only the very top portion of the Primary Studio Complex is visible. The Project would include more visually transparent fencing along the northern perimeter and height restrictions between Beverly Boulevard and the Primary Studio Complex so that the currently obstructed views

of the Primary Studio Complex, including the main entry bridge, would be restored. As such, the Draft EIR fully describes how the historic viewshed would be restored. Also note that the proposed Specific Plan Design Standards would include a requirement that all fencing be appropriately scaled, designed, and sited to maintain visibility in accordance with the HCM regulations.

Comment No. 26-132

There is no discussion of the potential impacts from the proposed General Plan Amendment to change the General Plan Land Use designation to Regional Center Commercial. The current land use designations are Community Commercial, Limited Commercial, and Neighborhood Commercial. Each designation allows less intensive development than proposed. Changing the Project Site land use designation to Regional Commercial may result in more intensive development on and around the Project Site. What are the consequences from a land use perspective on adjacent sites from changing the land use designation to Regional Commercial?

The DEIR does not explain the difference between the existing and proposed land use designations. Why does the designation need to be changed to Regional Center Commercial? What is permitted by Regional Center Commercial that is not permitted under the existing community plan designations?

Response to Comment No. 26-132

Pages IV.H-43 and IV.H-44 of Section IV.H, Land Use and Planning, of the Draft EIR address the proposed General Plan Amendment to change the three existing General Plan land use designations to a unified Regional Commercial land use designation. Also refer to Response to Comment Nos. 5-8 and 11-29 regarding the proposed Regional Commercial designation.

Comment No. 26-133

The proposed sidewalk widths are not consistent with the Mobility Plan 2035. Why is the Project, with a 25-acre site, not required to provide the additional sidewalk dedication to be consistent with the adopted Mobility Plan? If the additional dedication is not provided, then how is the Project consistent with existing applicable land use plans? Why are dedications provided as easements and not actual dedication? The public sidewalk areas should be dedicated to meet current Mobility Plan standards. Are the public realm improvements conceptual or required? What is actually required?

The proposed vehicular and pedestrian improvements along the shared access drive are inconsistent with the existing use of that private alleyway. Did the DEIR assess the

hazards from pedestrians accessing this private alleyway that has limited visibility and no pedestrian activity today? How did the DEIR assess the increased hazards and other transportation impacts of introduction passenger loading, vehicular access, and truck access to this private alleyway? Given the dimensions and existing use of the alleyway, the Project should not introduce new vehicular, truck, and pedestrian activity to the private alleyway. In addition, the applicant has no ownership or access rights over the western portion of the private alleyway. How will the Project restrict traffic from using the western portions of the alleyway?

Response to Comment No. 26-133

Pages IV.K-55 to IV.K-57 of Section IV.K, Transportation, of the Draft EIR provides a detailed description of the Mobility Plan's ROW requirements and the Project's proposed roadway dedications, mergers, improvements, and waivers of dedication adjacent to the Project Site. As described therein, Fairfax Avenue and Beverly Boulevard currently meet Mobility Plan ROW requirements, but, in some locations, the roadway width exceeds the standard, leaving substandard sidewalks. Therefore, the Project would provide private easements to widen sidewalks and/or parkway areas, as needed, to meet Mobility Plan standards on Fairfax Avenue and Beverly Boulevard. A waiver of dedication would be requested on The Grove Drive to provide a modified ROW resulting in a much wider sidewalk and parkway area than anywhere else along The Grove Drive. Refer to Response to Comment Nos. 16-30, 16-72, 16-76 regarding the Project's pedestrian-oriented design, sidewalk widths, and public realm enhancements and correspondence provided by BOE dated July 14, 2021. Based on the absence of any policies in the Mobility Plan that conflict with the Project, the Project is not inconsistent with the Mobility Plan regardless of any future determination (approval or dismissal) on the proposed waiver of dedication.

As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, any site plan, including the public realm improvement plans shown in the conceptual plans (Figures IV.H-3 through IV.H-6 in the Draft EIR), in an EIR or other CEQA document is inherently conceptual, and plans are finalized during the building permit process, which occurs after a Project is approved and its EIR certified. Notwithstanding, as discussed in the topical response, the proposed Specific Plan would include a regulatory framework for implementation of the Project, including, among other things, mandatory review processes by the City for implementation of the proposed Project. Future changes that are substantially different than the Project or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, as well as CEQA compliance review.

As discussed in Response to Comment No. 9-29, the Project's impacts related to traffic hazards would be less than significant. Vehicles and pedestrians currently have

access along the Southern Shared Access Drive. The Project has joint access rights to the Southern Shared Access Drive, and the two vehicular driveways proposed onto the roadway are in the southeast quadrant of the Project Site. The Project would provide a 10-foot frontage along the Southern Shared Access Drive for sidewalks, screening, and/or planting which would improve pedestrian connections to any new pedestrian gate to the Project Site. Pedestrians would not walk in the existing drive area of the Southern Shared Access Drive, and any pedestrian areas would be plainly marked or on a raised curb and sidewalk, and thereby would be protected from vehicular traffic. Such pedestrian activity would not result in any unusual safety hazard, as the facilities would be comparable to a typical sidewalk along a low-volume street with commercial driveways. The limited amount of Project vehicular activity that would use the Southern Shared Access Drive would be a minor addition to the existing vehicular activity from neighbors to the south and does not pose a new hazard. As shown in Figure 22 on page 80 of Appendix M.1, Transportation Assessment, of the Draft EIR, the Southern Shared Access Drive is only anticipated to serve approximately 55 Project trips in the morning peak hour and approximately 59 Project trips in the afternoon peak hour. This low level of Project activity (less than one vehicular trip per minute) will not burden the operation of the Southern Shared Access Drive. The existing Project driveway on the southwestern corner of the Project Site at Fairfax Avenue has only approximately 28 Project trips assigned to it during the morning peak hour and approximately 30 Project trips in the afternoon peak hour. No Project trips would use the western portion of the private alleyway belonging to The Original Farmers Market especially given the close proximity of the Project driveway immediately to the north.

Comment No. 26-134

The cumulative impacts analysis appears to be limited to related projects through 2026. How were cumulative impacts through full buildout (2043) assessed? Further, the cumulative impacts analysis claims that the related projects and Project would "...provide needed housing and amenities..." What is the support for that conclusion?

Response to Comment No. 26-134

Refer to Response to Comment No. 26-159 regarding the related projects. The Draft EIR's cumulative impact analyses include all known related projects in the vicinity based on information provided by LADOT and the Department of City Planning. This list of related projects is not limited to projects with a buildout year of 2026. Thus, the Draft EIR fully evaluates cumulative impacts based on a list of reasonably foreseeable projects and also includes a specific discussion of a long-term buildout scenario for each of the impact analyses. Additionally, regarding housing and amenities, the commenter is incorrect in stating that the Draft EIR states that the Project would provide needed housing. The full sentence to which the commenter is referring to is included on page IV.H-58 in Section IV.H, Land Use and Planning, of the Draft EIR, which states: "Furthermore, the related

projects and the Project would increase employment opportunities in the Project vicinity, concentrate development near public transit, provide needed housing and amenities, and activate the surrounding area, consistent with local and regional goals and objectives.” As such, the sentence is intended to convey that the Project and related projects would collectively provide these aspects of development. As set forth in Section II, Project Description, of the Draft EIR, the Project does not propose to provide housing.

Comment No. 26-135

I. Noise and Vibration

Noise Sources Must be Modeled at the Pro [sic] Line

The DEIR Noise section seems to assume throughout that certain noise sources are located in specific parts of the property. However, the only Project plan provided was the “conceptual site plan.” Nothing keeps the Project from deviating from the conceptual plan and causing noise impacts inconsistent with the analysis in the DEIR. An assessment of impacts from all noise levels needs to be assumed to occur at the property line, unless there are enforceable limitations in the Specific Plan to otherwise restrict the noise sources. As no such limitations are included in the DEIR, it must be assumed that the noise sources could be adjacent to the property line and in proximity to the offsite noise sensitive receptors. Did the noise model of the Project sources assume the noise sources at the property line?

For instance, the DEIR does not disclose the assumed distance between the sensitive uses and outdoor gatherings. Since outdoor gatherings could occur at any location, the noise analysis should have assumed that the noise from such activities would occur at the property line. The DEIR instead appears to have assumed outdoor gatherings at specific locations throughout the Project Site. Will the Specific Plan restrict outdoor gatherings to these locations? Also, the DEIR Noise section states that parking may be located in an above-ground parking structure at the southeastern portion of Project Site. The DEIR again appears to refer to the location in the conceptual site plan. There does not appear to be any limitation on the location of the parking structure. Therefore, the analysis of noise impacts from the above-ground parking structure needs to be modeled as close to the offsite sensitive uses as it is permitted to be developed. The same should be done with other noise producing activities, such as loading activities, mechanical activities, production areas and basecamp, generators, mills, etc. Please provide this data so that the public and decision-makers may be fully informed of the Project’s potential noise levels at nearby sensitive uses.

Response to Comment No. 26-135

As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, and Response to Comment No. 5-5, the Draft EIR analyzed the Project described in Section II, Project Description, of the Draft EIR.

The noise analysis in the Draft EIR was performed based on the proposed development program shown in Figure II-4, Conceptual Site Plan, of the Draft EIR as well as conservative assumptions. As discussed in Topical Response No. 1, the proposed Specific Plan would include a regulatory framework for implementation of the Project, including, among other things, a discretionary review process (which includes potential subsequent CEQA compliance review) for future changes that are substantially different than the Conceptual Site Plan. The noise analysis assumed implementation of the frontage areas and building stepbacks shown in Figure II-5, Height Zone Map, of the Draft EIR. Between the required 30-foot frontage area along the Shared Eastern Property Line plus the Broadcast Center Apartment building's existing setback of approximately eight feet, there would be approximately 38 feet separating Broadcast Center Apartments from any new building. Outdoor roof deck gathering spaces are evaluated on pages IV.I-45 through IV.I-47 of the Draft EIR. As discussed therein, the maximum number of persons that could occupy outdoor roof deck gathering areas would range from approximately 270 to 1,200 persons (based on an occupancy load of 15 square feet per person).

The Draft EIR conservatively analyzed this occupancy level based on a total of 5,000 persons gathering throughout the outdoor roof deck gathering areas at any given time and concluded that impacts from use of these outdoor areas would be less than significant (refer to Table IV.I-13 of the Draft EIR). Additional noise analysis was also conducted in response to this comment conservatively assuming that 1,200 persons could gather at each of the deck locations shown in Figure II-9 on page II-737, and this analysis demonstrates that impacts would continue to be less than significant. Refer to the worksheets included as Appendix FEIR-16 of this Final EIR (beginning on page 61) for the informational analysis in response to this comment.

In addition, note that Project Design Feature NOI-PDF-4 establishes the noise limits for any amplified sound system for outdoor gatherings on roof decks so as to not exceed the City's noise limit (i.e., an increase of 5 dBA above the ambient noise level) at any off-site noise-sensitive receptor location. With regard to noise from mechanical equipment, as discussed on page IV.I-43 of the Draft EIR, new mechanical equipment (e.g., air ventilation equipment) would be located at the roof level and/or within each of the building structures (e.g., garage exhaust fans). As further discussed therein, the Project would comply with LAMC Section 112.02, which prohibits noise from air conditioning, refrigeration, heating, pumping, and filtering equipment from exceeding the ambient noise levels on the premises of other occupied properties by more than 5 dBA. In addition, with

Potential on-site outdoor roof decks locations.
Assumed up to 1,200 people at each area.¹

Potential on-site above-grade parking structure. Assumed up to 2,322 parking spaces at the above grade parking structure.²

Potential on-site surface parking lots. Assumed up to 40 parking spaces at each of the surface parking lots.²

Notes:

1. Project Draft EIR, Page IV.I-45.

2. Appendix J of the Draft EIR, pdf page 164.

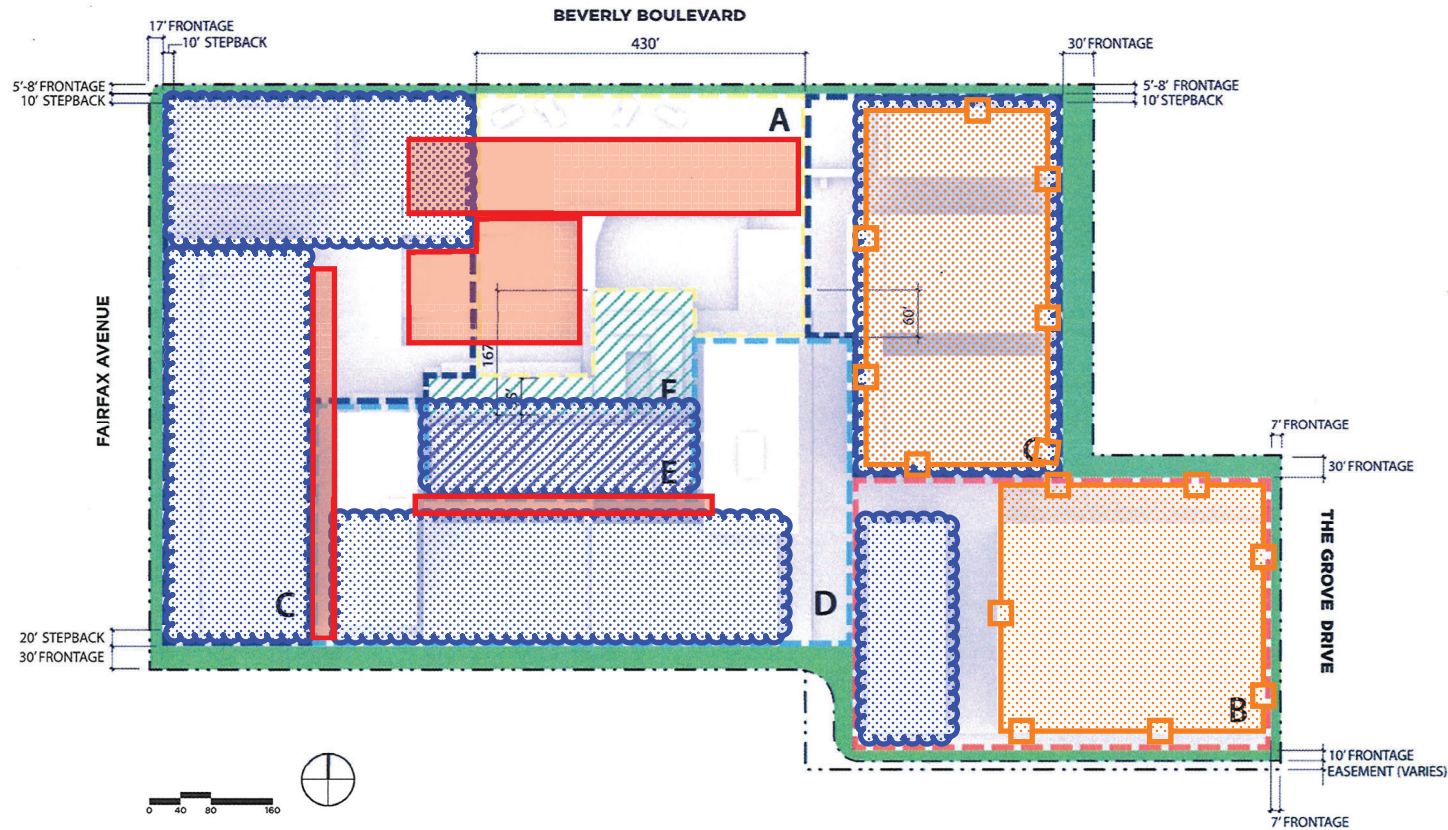

Figure II-9

On-site Noise Sources – Roof Decks and Parking Areas

Project Design Feature NOI-PDF-3, all outdoor mounted mechanical equipment will be enclosed or screened from off-site noise-sensitive receptors. As such, as shown in Table IV.I-12 of the Draft EIR, noise impacts associated with the outdoor mechanical equipment would be less than significant.

Noise related to parking facilities is addressed on pages IV.I-46 and IV.I-1-48 of the Draft EIR. As discussed therein, the analysis assumed that parking spaces would be located within an underground parking level, an above-ground parking structure (located at the southeastern portion of the Project Site), and/or surface parking throughout the Project Site. As shown in Table IV.I-14 of the Draft EIR, impacts were concluded to be less than significant. Also note that noise impacts would remain less than significant if the parking structure were to be located along the eastern perimeter of the Project Site, where the 30-foot frontage area would separate the structure from the Shared Eastern Property Line. Refer to the worksheets included as Appendix FEIR-16 of this Final EIR (beginning on page 78) for the informational analysis in response to this comment and to Figure II-9 on page II-737 for the potential parking locations that were evaluated.

The evaluation of noise impacts from loading activities is provided on pages IV.I-46 through IV.I-49 in Section IV.I, Noise, of the Draft EIR. Loading activities were assumed to be located along the perimeter of the Project Site and adjacent to a sound stage, to provide a conservative noise analysis. The estimated noise levels were calculated with the assumption that up to 60 truck loadings and two trash compactors would operate concurrently to represent a conservative noise analysis. As presented in Table IV.I-15 in Section IV.I, Noise, of the Draft EIR, the estimated noise levels from loading and trash compactors would be below the significance threshold at all off-site sensitive receptors. In addition, noise levels associated with loading activities would be consistent with the existing loading operations as the loading activities would be located at similar distances from the off-site receptor locations.

With regard to noise associated with outdoor production activities, as discussed on pages IV.I-44 and IV.I-45 of the Draft EIR, the overall amount of outdoor area used for studio production activities during Project operation would be reduced as compared to existing conditions due to the development of new buildings and parking facilities throughout much of the Project Site. Specifically, the total outdoor area used for studio production activities would be reduced by approximately 10 percent from 651,849 square feet (existing condition) to 585,902 square feet (future Project condition). In addition, the existing outdoor area (i.e., basecamp) adjacent to the Broadcast Center Apartments would be reduced from approximately 77,000 square feet (existing condition) to approximately 56,500 square feet (future Project condition), an approximately 27-percent reduction. Therefore, noise levels associated with outdoor studio production activities would be expected to be somewhat lower than under existing conditions. Furthermore, in accordance with Project Design Feature NOI-PDF-5, outdoor production activities will

continue to be prohibited within 200 feet of the Shared Eastern Property Line and receptor location R1 between the hours of 10 P.M. and 7 A.M. Also refer to Response to Comment No. 26-146 for a quantitative analysis confirming this conclusion.

In summary, the analysis of onsite noise sources included in Section IV.I, Noise, of the Draft EIR is based on the proposed development program and Conceptual Site Plan. The noise analysis accounts for onsite uses that would occur at the perimeter of the Project Site. Furthermore, as noted above, a discretionary review process (including potential subsequent CEQA compliance review) would be required for future changes that are substantially different than the Conceptual Site Plan or are beyond the scope of impacts evaluated in the EIR.

Comment No. 26-136

The DEIR Does Not Consider All Feasible Mitigation Measures

The DEIR did not explore all feasible mitigation measures to minimize impacts to various sensitive receptors. For mitigation measures implemented, the DEIR failed to adequately analyze the extent of mitigation measure feasible.

For example, Mitigation Measure NOI-MM-1 states that a temporary and impermeable sound barrier will be erected at various locations to mitigate on-site construction noise. However, noise impact to sensitive receptor R1 was not decreased to below thresholds because reducing construction-related noise levels at the upper levels of the residential building up to five-stories would require temporary noise barriers to be as high as the building, which would apparently not be feasible. Here, a blanket statement is made that it would not be feasible to do so, but no evidence or explanation is provided. The Alternatives section purports to evaluate additional noise mitigation and concludes that a 30-foot sound wall 100 feet from the eastern property boundary would not be feasible because, in part, it would block views and sunlight for residential units. However, the Project would permit 160-foot buildings in closer proximity to the residential units. Either the Project should not be permitted to build an 160-foot building there or the 30-foot sound wall is feasible. The DEIR should include sound mitigation above what is provided in NOI-MM-1. Also, the DEIR should explore alternate mitigation measures such as silent construction equipment and more effective noise muffling devices. See below for additional feasible mitigation measures.

The DEIR also wrongly concludes that there are no feasible mitigation measures for areas impacted by hauling. Are there not other staging areas away from sensitive uses that could be used? These alternative locations should have been identified and analyzed.

The DEIR also wrongly concludes that there is no mitigation measure for human annoyance from vibration. Creating a construction buffer zone—an area along the property line in which no vibration generating activities could occur—would mitigate vibration impacts from on-site construction activities. The Alternatives section states that moving construction activities using heavy equipment at least 80 feet westerly from the Shared Eastern Property would reduce vibration impact to less-than-significant level, but states that this would be infeasible because it would render a substantial portion of the Project Site undevelopable. The DEIR fails to explain why a significant vibration impact for the long construction period is preferable over an 80 feet buffer on a site of more than a million square feet. Also, the DEIR fails to discuss the feasibility of having a construction buffer of less than 80 feet. At least some construction buffer is feasible; however, this mitigation was completely dismissed. As a feasible mitigation measure, it must be implemented to reduce the vibration impacts to less than significant.

Response to Comment No. 26-136

As discussed in the Draft EIR, the Project would have the potential to result in temporary significant construction noise and vibration impacts. As provided in Mitigation Measure NOI-MM-1, the Draft EIR specified that the Project would provide, among other noise barriers, an approximately 16-foot-high temporary noise barrier along the Shared Eastern Property Line to reduce the construction noise levels to the extent feasible. As shown in Table IV.I-19 on page IV.I-58 of the Draft EIR, with Mitigation Measure NOI-MM-1, the construction noise impacts would be reduced to a less-than-significant level at all offsite noise-sensitive receptors, with the exception of receptor location R1. There are 48 apartment units that face the Project Site along the Shared Eastern Property Line. Due to the height of receptor location R1 (a five-story building), it would not be feasible to construct a temporary wall high enough to eliminate the construction noise at the upper levels of the affected receptor. Table II-25 on page II-741 presents the estimated noise reduction at the receptor location R1 with various sound barrier heights. As shown in Table II-25, a 16-foot-high sound barrier would provide a reduction of 16 dBA at Level 1; however, this barrier would not provide any noise reduction at upper levels. Thus, as part of this Final EIR, in response to this and other public comments, Mitigation Measure NOI-MM-1 has been revised to provide for a 30-foot high noise barrier along the Shared Eastern Property Line. While a 30-foot-high barrier would not substantially reduce noise at Levels 4 and 5, this barrier would provide a substantial reduction of 16 dBA at Levels 1 and 2, and 5 dBA at Level 3. A 50-foot-high barrier would provide a reduction of 16 dBA at Levels 1, 2, 3 and 4 and 8 dBA at the top Level 5. However, as stated by AECOM Hunt in the Noise Memo included as Appendix FEIR-17 of this Final EIR, installing a 50-foot-high temporary wall is not a financially or logistically practical solution and would be extremely difficult to implement. At 50 feet in height, there is a significant increase in wind loading, which typically requires lateral bracing. Lateral bracing at this location is not possible to install due to the footprint of the new construction and the location of the existing Broadcast

Table II-25
Sound Barrier Noise Reduction at Receptor R1 (the Broadcast Center Apartments)

Building Level	Estimated Sound Barrier Noise Reduction with Various Heights, dBA		
	16 Feet High	30 Feet High	50 Feet High (not feasible) ^a
Level 1	16	16	16
Level 2	0	16	16
Level 3	0	5	16
Level 4	0	0	16
Level 5	0	0	8
^a Per AECOM, it is not feasible to provide a temporary 50-foot-high temporary construction noise barrier. Refer to Appendix FEIR-17 of this Final EIR. Source: AES, 2023			

Center Apartment building. In addition, the lateral bracing, even if possible, would interfere with the construction sequencing requiring a complicated phased installation and removal. The added complexity would inhibit construction progress in this vicinity causing the overall construction duration to lengthen considerably.⁵⁸

Refer to Appendix FEIR-8 for a detailed list of the construction assumptions, including specific types of equipment provided by AECOM for use in the Draft EIR. Noise and vibration impacts associated with the installation and removal of the temporary 30-foot-high temporary wall would include a subset of the pieces of equipment evaluated as part of the grading/excavation phase for the Project. In addition, a 30-foot-high noise barrier is estimated to require several days for installation. As such, noise and vibration impacts associated with the installation and removal of the temporary 30-foot-high noise barrier would be within the envelope of construction impacts disclosed in the Draft EIR.

As noted by the commenter, an alternative was evaluated to determine whether the construction noise could be reduced to a less-than-significant level at receptor location R1. In order to reduce construction-related noise at R1 to a less-than-significant level, development would need to be moved a minimum of 100 feet west of the Shared Eastern Property Line together with a 30-foot-high noise barrier. However, as discussed in the Section V, Alternatives, of the Draft EIR, it would be cost prohibitive to implement a 100-foot construction setback that would render a substantial portion (approximately 83,513 square feet or 1.9 acres) of the Project Site undevelopable.

⁵⁸ AECOM Hunt, TVC 2050 Project, Noise Public Comments, Memo dated August 16, 2023 (Appendix FEIR-17 of this Final EIR).

The commenter suggests use of “silent” construction equipment; however, such construction equipment is not commercially available. Refer to Response to Comment No. 26-137 regarding use of electric equipment to reduce construction noise. In addition, the commenter’s suggested construction equipment with muffling devices has already been incorporated into Project Design Feature NOI-PDF-1, which requires power construction equipment to be equipped with state-of-the-art noise shielding and muffling devices.

As analyzed in the Draft EIR, the estimated offsite noise levels due to construction haul trucks during site grading would exceed the significance threshold by approximately 0.5 dBA along Fairfax Avenue. This is the only segment of the approved haul routes where a significant impact would temporarily occur during grading activities. As provided in the Draft EIR, conventional engineering mitigation measures, such as temporary noise barriers, would reduce the offsite construction truck traffic noise. However, it would not be feasible to construct barriers along Fairfax Avenue as the barriers would obstruct access and visibility to the properties along this haul route. Please refer to Response to Comment No. 26-24 regarding the construction staging areas. As discussed therein, the two offsite staging areas have been eliminated and all construction haul truck staging would occur within the Project Site.

With regard to vibration associated with human annoyance at off-site receptors, as analyzed in the Draft EIR, the estimated vibration levels due to on-site construction equipment would exceed the significance threshold at receptor location R1. The impacts would occur when heavy construction equipment (e.g., large bulldozers, caisson drilling, and loaded trucks) operate within 80 feet of the affected building. As discussed in Section V, Alternatives, of the Draft EIR, providing an 80-foot buffer zone to reduce the temporary construction vibration impacts would render a substantial portion of the Project Site (approximately 1.5 acres) undevelopable, and, therefore, it was considered infeasible. A reduced buffer zone that leaves a portion of the Project Site undevelopable would also not be practical or reasonable. Furthermore, construction activities within 80 feet of receptor location R1 would be temporary and would cease once heavy construction (with the use of heavy construction equipment; e.g., drill rig and large bulldozer) during the site grading/excavation within that area of the Project Site is complete.

Comment No. 26-137

Additional Mitigation Should be Required

The DEIR’s proposed mitigation measure is inadequate to substantively reduce the impacts associated with the proposed Project’s construction. The DEIR should evaluate the following additional mitigation measures:

- Construction contractors shall schedule construction activities to avoid the simultaneous operation of construction equipment so as to minimize noise levels resulting from operating several pieces of high-noise-level emitting equipment.
- Construction equipment staging areas shall be located as far as feasible from residential areas. The Alternative section discusses that construction activities would need to be moved approximately 700 feet westerly from the Shared Eastern property line for a less than significant impact, and that such a measure would be infeasible because development could not occur on over half of the Project Site. However, the DEIR fails to analyze the effect of distances less than 700 feet in conjunction with other mitigation measures listed here.
- Contractors shall place stationary noise sources, such as generators and air compressors, on the Project Site away from affected noise-sensitive receivers. Contractors shall place non-noise producing mobile equipment such as trailers in the direct sound pathways between suspected major noise-producing sources and sensitive receivers.
- The City shall establish a telephone hot-line for use by the public to report any adverse noise conditions associated with the construction of the Project. If the telephone is not staffed 24 hours per day, the contractor shall be required to include an automatic answering feature, with date and time stamp recording, to answer calls when the phone is unattended. This hot-line telephone number shall be posted at the Project Site during construction in a manner visible to passersby. This telephone number shall be maintained until the Project has been considered commissioned and ready for operation.
- Throughout the construction of the Project, the City shall be required to document, investigate, evaluate, and attempt to resolve all Project-related noise complaints. The City shall be required to:
 1. Use a Noise Complaint Resolution Form to document and respond to each noise complaint;
 2. Conduct an investigation to attempt to determine the source of noise related to the complaint; and
 3. Take all reasonable measures to reduce the noise at its source.

The City shall publish a monthly summary of the status and response to Project-related noise complaints and shall present the report orally to the City Council on a monthly basis. The public shall be given an opportunity to review and submit written and oral comment on the monthly report to the City Council.

- Contractors shall use concrete crushers or pavement saws rather than impact devices such as jackhammers, pavement breakers, and hoe rams for tasks such as concrete or asphalt demolition and removal.
- Contractors shall line or cover hoppers, storage bins, and chutes with sound-deadening material (e.g., apply wood or rubber liners to metal bin impact surfaces).
- Contractors shall use construction equipment manufactured or modified to reduce noise and vibration emissions, such as:
 1. Electric instead of diesel-powered equipment.
 2. Hydraulic tools instead of pneumatic tools.
 3. Electric saws instead of air- or gasoline-driven saws.
- All impact tools should be shrouded or shielded.
- Construction equipment shall not be idled for extended periods of time in the vicinity of noise-sensitive receptors.
- Music (i.e., workers' radios) from the construction site shall not be audible at off-site noise-sensitive receptors.

These mitigation measures are feasible and implementable and are not exhaustive of possible mitigation measures. The DEIR should provide additional mitigation for these impacts and describe post-mitigation conditions.

Response to Comment No. 26-137

As provided in the Draft EIR (Table IV.I-19), Mitigation Measure NOI-MM-1 would eliminate the construction noise impacts at all off-site sensitive receptors, with the exception of receptor location R1 (the Broadcast Center Apartments). As discussed on page IV.I-56 of the Draft EIR, per Mitigation Measure NOI-MM-1, the sound barrier would provide a minimum 16 dBA noise reduction at the ground level of receptor location R1, which is a substantial noise reduction (an approximately 97-percent reduction in the sound energy). In addition, as discussed in Response to Comment No. 26-136, Mitigation Measure NOI-MM-1 has been revised to require a 30-foot-high sound barrier along the Shared Eastern Property Line, which would further reduce noise levels (up to 16 dBA at Levels 1 and 2 and 5 dBA at Level 3). However, as discussed above in Response to Comment No. 26-136 and in Section V, Alternatives, of the Draft EIR, there are no other feasible mitigation measures that would reduce the noise impact at the upper levels of receptor location R1 to a less-than-significant level. Nevertheless, while not readily

quantifiable, the following suggestions from the commenter have been incorporated into Project Design Feature NOI-PDF-1 to reduce construction noise and vibration:

- Construction contractors will schedule construction activities to avoid the simultaneous operation of construction equipment within 100 feet of receptor location R1 to minimize noise levels resulting from operating several pieces of high-noise-level emitting equipment such as drilling rigs, excavators, and concrete pumps.
- Construction equipment staging areas will be located at least 100 feet from receptor location R1. Contractors will place stationary noise sources on the Project Site at least 100 feet from receptor location R1.
- A telephone hot-line for use by the public will be established to report any adverse noise conditions associated with the construction of the Project. The hot-line telephone number shall be posted at the Project Site during construction in a manner visible to passersby with a minimum spacing of one sign for each 200 feet of the perimeter. In the event that the noise complaint is Project construction-related, the Applicant shall:
 - Document and respond to each noise complaint;
 - Conduct an investigation to attempt to determine the source of noise related to the complaint;
 - Take all reasonable measures to reduce the noise at its source; and
 - Submit a monthly summary report of the Project-related noise complaints to the City Planning Department or Building and Safety.
- Hydraulic tools will be used instead of pneumatic tools within 100 feet from receptor location R1, when commercially available.
- All impact tools will be shrouded or shielded within 100 feet from receptor location R1.
- Construction equipment will not be idled for extended periods of time (more than 5 minutes) within 100 feet of receptor location R1, as specified by CARB.
- Music (i.e., workers' radios) from the construction site will not be audible at off-site noise-sensitive receptors.
- Large 40-yard dumpsters will not be located within 200 feet from receptor location R1 (the Broadcast Center Apartments); or, if located within 200 feet of receptor location R1, a sound barrier blocking the line-of-sight to the dumpster from receptor location R1 shall be required.

- Within 100 feet from any sensitive receptor location, the Project would utilize electric or battery powered construction equipment for the following pieces of equipment: tower cranes; mounted placing booms; scissor lifts; welding machines once permanent power is in place; swing stages; light towers for limited durations; concrete saw; and some light material forklifts (except for heavy material lifting) once concrete is in place.

Refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR, for these revisions. Construction noise levels with the use of electric construction equipment under revised Project Design Feature NOI-PDF-1 would be reduced approximately 2 to 4 dBA.

The request to place non-noise-producing mobile equipment such as trailers in the direct sound pathways between suspected major noise-producing sources and sensitive receptors is not needed, as a construction noise barrier that would be taller than the construction trailers would be located between the Project Site and receptor location R1 as required by Mitigation Measure NOI-MM-1.

The requested use of concrete crushers or pavement saws rather than impact devices such as jackhammers, pavement breakers, and hoe rams for tasks such as concrete or asphalt demolition and removal would not be feasible. Concrete crushers and pavement saws are meant to be utilized in high precision situations and are considered low production tools for smaller jobs. Use of this equipment would substantially extend the duration of demolition activities (i.e., several months) and would substantially increase construction costs.

The requested use of line or cover hoppers, storage bins, and chutes with sound-deadening material (e.g., application of wood or rubber liners to metal bin impact surfaces) would not be feasible for the 40-yard dumpster that is expected to be used onsite. Heavily used hoppers and chutes would quickly erode the sound-deadening materials and require frequent removal and replacement of those materials. The remove/replace process would be constant and time consuming, which would require cessation of the use of such hoppers and chutes that would substantially delay construction progress and dramatically lengthen the overall duration of construction. However, as set forth above, Project Design Feature NOI-PDF-1 has been revised to either prohibit the 40-yard dumpster from being located within 200 feet (a distance greater than 200 feet would have a less-than-significant impact) from receptor location R1 (the Broadcast Center Apartments), or if located within 200 feet of receptor location R1, a sound barrier blocking the line-of-sight to the dumpster from receptor location R1 would be required. Refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR.

The comment also requests the use of specific construction equipment that is manufactured or modified to reduce noise and vibration emissions (i.e., the use of electrical equipment instead of diesel-powered or gas-powered equipment). The Project's use of diesel equipment would primarily be associated with excavation and shoring activities. Although technology continues to evolve, there is currently no electric/battery powered or hybrid equipment available in the United States for use in the heavy-duty requirements for mass excavation and shoring operations in terms of horsepower, torque, running timing, etc. It is anticipated that as technology improves and regulations change, that equipment manufacturers will generate electric-powered options for fleets in the United States, and California markets will slowly begin to transition large equipment to diesel alternatives. Nonetheless, in response to this comment, the Project would commit to use various types of electric or battery powered equipment as set forth above.

Comment No. 26-138

DEIR Must Analyze Long Term Impacts of Alternative Construction Schedules

Contrary to what is assumed in the DEIR, it is not true that noise impacts would be the same over 20 years as opposed to 32 months. An environment with ongoing construction activities for 20 years is substantially different from one whose noise levels are limited to 2.5 years. An assessment of the effects from long-term noise levels, including health impacts, must be completed for a construction project that could last 20 years.

Response to Comment No. 26-138

As discussed on page IV.I-29 in Section IV.I, Noise, of the Draft EIR, the noise analysis relies upon the threshold questions from Appendix G of the CEQA Guidelines. The analysis utilizes factors and considerations identified in the City's 2006 L.A. CEQA Thresholds Guide, as appropriate, to assist in answering the Appendix G threshold questions. As discussed on page IV.I-35 in Section IV.I, Noise, of the Draft EIR, the Project may occur in one phase, with a total construction period of approximately 32 months. This 32-month construction duration would include overlapping construction stages and thus, the analysis is conservatively based on the peak equipment mix associated with this 32-month construction duration. As discussed on page IV.I-29 in Section IV.I, Noise, of the Draft EIR, per the 2006 L.A. CEQA Thresholds Guide, for construction activities lasting more than 10 days, the corresponding significance criterion to be used in the construction noise analysis is when the Project-related construction noise exceeds the ambient exterior noise levels by 5 dBA (hourly L_{eq}) or more at a noise sensitive use. As shown in Table IV.I-10 in Section IV.I, Noise, of the Draft EIR, this significance threshold was used for the construction noise analysis for the Project. As discussed on pages IV.I-38 to IV.I-40 in Section IV.I, Noise, of the Draft EIR, to present a conservative impact analysis, the estimated noise levels were calculated for a scenario in which all pieces of construction equipment were assumed to operate simultaneously at the

construction area nearest to the sensitive receptors. These assumptions represent a conservative noise scenario because construction activities would typically be spread out throughout the Project Site, and, thus, some equipment would be farther away from the sensitive receptors, which increases buffer zones and/or reduces sound levels of construction equipment due to distance attenuation and intervening buildings. In addition, the noise modeling assumes that the construction noise would be constant, when, in fact, construction activities and associated noise levels are periodic and fluctuate based on the construction activities as equipment is often idle, or powering up or down.

In addition to the 32-month buildout scenario, the Draft EIR also addressed noise impacts for a 20-year buildout scenario. Refer to Response to Comment No. 9-24 regarding the construction timeline. As explained throughout the Draft EIR, while Project buildout is anticipated in 2026, the Applicant is seeking a Development Agreement with a term of 20 years, which could extend the full buildout year to approximately 2043. Under the long-term buildout schedule, construction activities within the Project Site would not be continuous for the entire 20-year duration. Rather, once completed, construction would move to a more distant location, which would further reduce the construction noise due to distance attenuation. In addition, once intervening buildings are constructed between the off-site sensitive receptors and construction areas, construction noise would be further attenuated. As such, the noise impacts at a noise sensitive receptor under long-term buildout of the Project would be similar to that of the anticipated 32-month build out schedule when construction activities occur adjacent to the sensitive receptor and less than that of the 32-month build out schedule once intervening buildings are constructed.

As stated on page IV.I-68 in Section IV.I, Noise, of the Draft EIR, a later buildout date would not increase the construction noise impacts or change the significance conclusions for the 32-month build out scenario, as such impacts are not dependent upon buildout year. Furthermore, as stated previously, based on the 2006 L.A. CEQA Thresholds Guide, construction noise impacts are analyzed and measured based on a peak hour for each construction stage rather than duration. With respect to potential noise impacts on human health, the City of Los Angeles currently has not set specific noise limits beyond the City's Noise Regulations (LAMC Chapter XI). However, there are varying effects of noise and associated standards and metrics set forth by agencies to address such effects. For example, the United States Occupational Safety and Health Administration (OSHA) and the State's Division of Occupational Safety and Health (also known as Cal/OSHA) have adopted regulations designed to protect workers against the effects of occupational noise exposure. Per Cal/OSHA, the permissible noise exposure for 8 hours would be 90 dBA (L_{eq}).⁵⁹ In addition, as provided in Table IV.I-19 in Section IV.I,

⁵⁹ California Code of Regulations, Section 5096, Exposure Limits for Noise, Table N-1 Permissible Noise Exposure.

Noise, of the Draft EIR, the estimated noise levels from the Project construction would be well below the Cal/OSHA permissible noise exposure level. In addition, the USEPA has identified a 24-hour exposure level of 70 dBA (environmental noise) to protect potential hearing loss. This USEPA recommended noise level includes a margin of safety and is based on steady noise exposure of 24 hours per day over a period of 40 years.⁶⁰ However, the Project would not expose people to noise levels above 70 dBA for an extended duration of 40 years. Thus, the Project would not exceed the USEPA identified level for protection of potential hearing loss.

Comment No. 26-139

The DEIR Fails to Adequately Analyze Impacts to the Gilmore Adobe

The DEIR did not analyze noise impacts to the Gilmore Adobe, which is the closest sensitive use south of the Project. Ambient noise levels were also not taken in the area.

NOI-PDF-5 prohibits outdoor production activities within 200 feet of the Shared Eastern Property Line adjacent to R1. Why is this PDF not applied to the southern property line adjacent to the residences at the Gilmore Adobe? There is no analysis of how studio-related production will impact the Gilmore Adobe. In addition, a construction sound barrier is not proposed between the Project and Gilmore Adobe. The DEIR needs to be revised with an assessment of construction and operational noise impacts on the Adobe and appropriate mitigation measures identified.

The DEIR's calculations regarding vibration impacts of the large bulldozer to the Gilmore Adobe is questionable. The DEIR should disclose how close the bulldozer will be to the Gilmore Adobe. On Table IV.I-20, a large bulldozer generates 0.114 PPV at R1, but only 0.011 PPV at the Gilmore Adobe, which is a much more sensitive structure. The DEIR should clarify the reason for such a calculated reduction in offsite vibration levels at the Adobe.

The DEIR presents no information on the long-term effects that construction and production-related vibrations may have on the structural integrity of the historic Adobe. The DEIR should demonstrate the Gilmore Adobe will not be susceptible to future damage as a result of construction and/or production activities. The Project should include a mitigation measure requiring ground motion monitoring during construction and operations, and require that construction immediately cease upon the detection at the southerly property line of any ground motion exceeding 0.01 mm/s.

⁶⁰ USEPA, Noise Effects Handbook: A Desk Reference to Health and Welfare Effects of Noise, October 1979, revised July 1981, p. 2-21.

Additionally, the DEIR does not evaluate human annoyance that might be experienced at the Gilmore Adobe. This oversight is a significant omission as the Gilmore Adobe is the closest residence to the south. The DEIR should be recirculated for public comment with this information since the DEIR already predicts that vibration levels at the R1 site will exceed the threshold for human annoyance.

Response to Comment No. 26-139

As discussed in Section IV.B, Cultural Resources, of the Draft EIR, the Gilmore Adobe (also referred to as the Rancho La Brea Adobe) is a historical resource and potential impacts to the Gilmore Adobe as a historical resource have been fully evaluated in the Draft EIR, including potential impacts associated with vibration during construction activities. The Gilmore Adobe would be located approximately 167 feet from the nearest buildings within the Project Site and approximately 125 feet from the nearest construction activities southerly to the north. The Gilmore Adobe is also separated from the Project Site by one and two-story support buildings and an approximately 28-foot-wide service alley. To evaluate potential vibration impacts to the Gilmore Adobe, Section IV.I, Noise, of the Draft EIR used the most stringent criterion of 0.12 PPV for “buildings extremely susceptible to vibration damage” from the FTA. This criterion is even more stringent than FTA’s 0.20 PPV criterion for “nonengineered timber and masonry buildings.” As shown in Table IV.I-20 of the Draft EIR, the maximum vibration level associated with construction equipment would be 0.011 PPV, which is well below the 0.12 threshold for building damage for the most stringent FTA threshold of 0.12 PPV. Furthermore, the estimated maximum vibration level at the Gilmore Adobe (0.011 PPV) would be well below Caltrans’ most stringent vibration criterion of 0.08 PPV, applicable to “extremely fragile historic buildings, ruins, ancient monuments.” Accordingly, the Draft EIR concluded that potential vibration impacts during Project construction pursuant to the significance criteria for building damage would be less than significant. Therefore, the requested vibration monitoring for the Gilmore Adobe during construction is not required under CEQA. Generally, vibration monitoring would be provided when the estimated vibration levels would be near or would exceed the vibration threshold (i.e., 0.12 PPV for buildings extremely susceptible to vibration damage). Also note that the estimated vibration levels at receptor location R1 are higher than at the Gilmore Adobe because receptor location R1 would be located approximately 20 feet from construction equipment as shown in Table IV.I-20 in Section IV.I, Noise, of the Draft EIR, which is much closer when compared with the distance of construction equipment to the Gilmore Adobe. In addition, the vibration significance threshold for building damage at the Gilmore Adobe of 0.12 PPV is more stringent than the 0.50 PPV (FTA criterion for reinforced concrete, steel, or timber buildings) threshold used for receptor location R1.

The comment that the Gilmore Adobe is a residential use is incorrect. Per the 2018 book, *A Family Vision—Spanning Three Centuries—The History of the A.F. Gilmore Company*, which was written by the A.F. Gilmore Company, the Gilmore Adobe has been

home to the corporate offices of the A.F. Gilmore Company since 1976 (see page 59 therein). This is consistent with the certified Addendum to the Final Environmental Impact Report for The Grove at Farmers Market Project, which identified the Gilmore Adobe as a commercial office use.⁶¹ Accordingly, the Draft EIR identified and analyzed the Gilmore Adobe as a commercial use. A commercial use is not a sensitive receptor for purposes of the noise analysis under CEQA.⁶² Nonetheless, in response to this comment, Mitigation Measure NOI-MM-1 in Section IV.I, Noise, of the Draft EIR has been revised to include a sound barrier along the southern property line that would provide a minimum 15 dBA noise reduction at the ground level of the Gilmore Adobe. Refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR. Thus, even if the Gilmore Adobe were treated hypothetically as a residential use, potential noise impacts associated with Project construction at the Gilmore Adobe would be less than significant. Specifically, the Gilmore Adobe would be shielded from noise from Project construction activities due to the presence of the existing commercial buildings located to the north of the Gilmore Adobe and the concrete walls located along Gilmore Adobe northern/eastern property line. The estimated maximum noise levels due to construction activities at the Gilmore Adobe would be approximately 74.4 dBA (L_{eq}), which would be approximately 13.5 dBA above the significance threshold (ambient plus 5 dBA). This is a conservative analysis as it assumes all construction equipment would operate at the southeast portion of the Project Site, approximately 125 feet from the Gilmore Adobe. As such, the proposed sound barrier with a 15 dBA noise reduction would reduce noise levels to less than 5 dBA above ambient, which would be a less-than-significant impact if the Gilmore Adobe were treated hypothetically as a residential use.

With regard to Project operational noise at the Gilmore Adobe, as discussed above, the Draft EIR identified and analyzed the Gilmore Adobe as a commercial use, and a commercial use is not a sensitive receptor for purposes of the operational noise analysis under CEQA. Nonetheless, as discussed on pages IV.I-44 and IV.I-45 of the Draft EIR, the overall amount of outdoor area used for studio production activities during Project operation would be reduced as compared to existing conditions due to the development of new buildings and parking facilities throughout much of the Project Site. Therefore, noise levels

⁶¹ The Grove at Farmers Market Addendum to Final Environmental Impact Report dated July 15, 1999 (EIR No. 87-515-SUB(ZV)(YV)(ZC); State Clearinghouse No. 87102102).

⁶² The L.A. CEQA Thresholds Guide states that noise-sensitive uses include residences, transient lodgings (hotels), schools, libraries, churches, hospitals, nursing homes, auditoriums, concert halls, amphitheaters, playgrounds, and parks (City of Los Angeles, L.A. CEQA Thresholds Guide, p. I.1-3). Similarly, the City of Los Angeles General Plan Noise Element defines noise-sensitive land uses as single-family and multi-unit dwellings, long-term care facilities (including convalescent and retirement facilities), dormitories, motels, hotels, transient lodging, and other residential uses; houses of worship; hospitals; libraries; schools; auditoriums; concert halls; outdoor theaters; nature and wildlife preserves; and parks (Noise Element, City of Los Angeles General Plan, Chapter IV, p. 4-1). These uses are considered more sensitive to noise than commercial and industrial land uses.

associated with outdoor studio production activities would be expected to be somewhat lower than under existing conditions at all off-site areas. Also refer to Response to Comment No. 26-146 for a quantitative analysis of outdoor production activities that confirms this conclusion. Note that if the Gilmore Adobe were treated hypothetically as a residential use, Project operational noise sources (including building mechanical, outdoor spaces, loading docks, trash compactors, and parking facilities) would not generate noise levels at the Gilmore Adobe that would exceed the significance threshold (ambient plus 5 dBA) as set forth in the worksheets included as Appendix FEIR-16 of this Final EIR (page 85).

With regard to vibration related to human annoyance at the Gilmore Adobe, as discussed above, the Draft EIR identified and analyzed the Gilmore Adobe as a commercial use, and a commercial use is not a sensitive receptor for purposes of the vibration analysis associated with human annoyance under CEQA. Even if the Gilmore Adobe were treated hypothetically as a residential use, vibration levels associated with human annoyance from the Project would not exceed the significance threshold at the Gilmore Adobe. Specifically, vibration levels at the Gilmore Adobe due to Project construction activities would range from approximately 37 VdB (small bulldozer) to 66 VdB (large bulldozer), which would be well below the 72 VdB significance threshold (for a residential use). Furthermore, operation of the Project would not generate any new sources of vibration that would not already be present today and as such off-site vibration levels at the Gilmore Adobe due to Project operations would not increase beyond existing conditions.

This comment does not provide substantial evidence that “significant new information” as defined by CEQA Guidelines Section 15088.5 has been added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Also refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 26-140

The DEIR Failed to Adequately Analyze Impacts to R1

The DEIR failed to adequately analyze impacts to the multi-family residential property at the shared eastern property line (R1).

First, on Table IV.I-10, R1 is assumed to be 20 feet away from construction activity. What is the basis for assuming this distance? If the construction will occur immediately at the Project’s property line, R1 should be the distance between the property line and the closest exterior wall, including balconies, of the adjacent apartment. The DEIR should substantiate the accuracy of this assumption or redo the noise analysis consistent with the accurate distance.

Second, how were outdoor studio production activities analyzed? NOI-PDF-5 says “outdoor studio production activities will be prohibited within 200 feet” of the property line with R1 between the hours of 10pm [sic] and 7am. [sic] What does that mean? Exactly which activities will be prohibited? Will production truck travel be prohibited? How will the activities be prohibited? Why is 200 feet the appropriate distance? Why just along the eastern property line? How about the southern boundary with R1? How about relative to the other offsite noise sensitive receptors? Will the activities be allowed between 7am [sic] and 10pm? [sic] What are the impacts from such activities during those hours? The DEIR should disclose the type and frequency of the “outdoor studio production activities” and noise impacts to the sensitive receptors from the activities and then provide for appropriate mitigation as to all the offsite noise sensitive receptors, such as increased setbacks, soundwalls, and limits on operational hours, among other mitigation measures, should be imposed.

Finally, the DEIR does not show how outdoor gatherings would cause a less than significant impact to R1. The DEIR does not commit to specific locations for outdoor gatherings. It is clear that outdoor gatherings at the property line would cause significant noise impacts to R1. Also, the DEIR does not disclose the locations of mechanical equipment with respect to R1.

Response to Comment No. 26-140

The distance between the receptor locations and construction activities used in the noise analysis was based on the anticipated location of the construction equipment operating relative to the receptor location. Based on field observations, receptor location R1 (the Broadcast Center Apartments) is set back approximately eight feet from the Shared Eastern Property Line. While construction equipment would operate near the property line, the main noise source (i.e., internal combustion engine and exhaust) would be set back further. Specifically, engines are often located at the rear of such equipment behind the cab and oriented away from offsite sensitive receptors. For example, while excavators use buckets to perform work near a property line, these involve use of relatively quiet hydraulic cylinders while the engine and exhaust are often 20-30 feet behind the working bucket. In addition, equipment also would not straddle property lines, as a buffer from the property line must be maintained for maneuverability. Furthermore, construction equipment would typically move around on the construction site. Therefore, the 20-foot distance is representative of a conservative estimate of where construction equipment (e.g., an excavator, bulldozer, water truck, drill rig, or crane) would be located closest to receptor location R1 for an extended period of time.

In addition, as discussed on page IV.I-38 in Section IV.I, Noise, of the Draft EIR, to represent a conservative noise impact analysis, the analysis assumed that all pieces of construction equipment would be operating simultaneously and would be located at the

construction area nearest to the sensitive receptors. Furthermore, the noise analysis assumed that the loudest construction equipment would be placed near the perimeter of the Project Site, to further provide a conservative analysis. As provided in Appendix J, Noise Calculations Worksheets, of the Draft EIR, the noise analysis assumed up to 27 pieces of construction equipment operating between 20 feet and 220 feet of receptor location R1, which would likely not occur during actual construction activities.

As discussed on pages IV.I-44 to IV.I-45 in Section IV.I, Noise, of the Draft EIR, outdoor studio production activities currently occur throughout the Project Site. This is depicted in Figure II-3(a) in Section III, Revisions, Clarifications, and Corrections to the Draft EIR. Noise sources associated with outdoor studio production activities include, but are not limited to, basecamp activities, setup and take down of production equipment, construction of sets, loading and unloading of production vehicles, vehicular circulation, filming activities, etc. Basecamp is a subset of outdoor production activities. Outdoor studio production activities may occur at any time and any day of the week, including weekends. The studio currently operates 24/7, which would continue with the Project. However, noise generation associated with outdoor studio production activities is currently prohibited within 200 feet of the adjacent multi-family residences to the east of the Project Site (receptor location R1) between 10 P.M. and 7 A.M.

Outdoor studio production activities would continue to occur throughout the remaining portions of the Project Site as shown in Figure II-4(c) in Section III, Revisions, Clarifications, and Corrections to the Draft EIR. Figure II-4(c) shows that the outdoor production area would be reduced with the Project. As such, as discussed on pages IV.I-44 and IV.I-45 in Section IV.I, Noise, of the Draft EIR, noise levels associated with outdoor production activities would be reduced due to the introduction of new buildings and reduction of outdoor areas used for studio production activities, and impacts would be less than significant. Also note that Project Design Feature NOI-PDF-5 would continue to prohibit outdoor studio production activities within 200 feet of the Shared Eastern Property Line between 10 P.M. to 7 A.M. This PDF is included in Section IV, Mitigation Monitoring Program, along with details about enforcement and monitoring.

The Draft EIR concluded that potential noise impacts during Project operation would be less than significant. Thus, no mitigation measures are required, contrary to the commenter's assertion. Please also refer to Response to Comment No. 26-146 for an additional quantitative noise analysis of the outdoor studio production activities, which confirms that noise impacts associated with outdoor studio production activities would be less than significant at all off-site noise receptor locations.

Please refer to Response to Comment No. 26-135 for further discussion regarding the noise analysis of on-site noise sources, including outdoor gatherings, parking, vehicle

loading, and mechanical equipment. Refer to Response to Comment No. 26-141, regarding noise from on-site vehicles.

Comment No. 26-141

DEIR Also Suffers from Other Inadequacies

In addition to the issues identified above, the DEIR suffers from a number of other inadequacies that must be addressed.

The Project proposes to introduce a new entry point at the Grove Drive. Currently there is not an access point for the property at Grove Drive. What assumptions were made in the roadway noise analysis as to the amount of vehicles and trucks that would utilize the Grove Drive? Do the projected roadway noise levels reflect the maximum amount of Project traffic, including visitors and trucks that can go in and out of the Grove Drive entrance? What were those assumptions? The projected roadway noise levels do not appear to reflect the full extent of Project roadway noise. The DEIR should disclose the percentage of trucks that were assumed to use this entrance, the basis for that assumption, and an accurate assessment of the related noise impacts. The analysis should start with a detailed assessment as to the number of trucks accessing the Project Site. The same analysis should be done for the proposed new entrances off of Beverly Boulevard and the private alleyway.

On Table IV.I-7, a noise model was used for calculating existing vibration levels and not actual measurements. The DEIR should provide evidence that the model provides a valid approximation of existing vibration levels. Actual vibration measurements should have been taken and the analysis should not have relied on a model. Why weren't actual measurements taken?

The additional sound stages will increase the amount of audience visitors to the Project Site. Has the off-site operational noise impacts analysis considered the increased traffic from audience participation on pages IV.I-49–IV.I-56? It is unclear from the section or the appendix whether such numbers are included.

Response to Comment No. 26-141

The transportation noise analysis provided in the Draft EIR was based on the trip volumes from the Project's Transportation Assessment that was approved by LADOT, which is provided in Appendix M.1 of the Draft EIR. The trip data included volumes at each of the Project's entry points, including The Grove Drive. As provided in Topical Response No. 10, Trip Generation, the trip volume data included all Project-related trips, including audience visitor trips, special events trips, and basecamp trips. Therefore, the

transportation noise analysis included the maximum amount of vehicle volumes. The noise analysis evaluated roadway segments surrounding the Project Site, including: The Grove Drive, Beverly Boulevard, and Fairfax Avenue, which represent the roadways with the highest Project-related trip volumes (pages 216–219 of Appendix J of the Draft EIR). The trip volumes along these roadway segments include trips in and out of the Project Site access driveways along The Grove Drive, Beverly Boulevard and Fairfax Avenue.

The percentage of trucks used in the off-site traffic noise analysis is provided in Table IV.I-7 in Section IV.I, Noise, of the Draft EIR. As shown therein, truck trips would represent approximately 3 percent of total vehicle trips accessing the Project Site, which is a conservative assumption as the actual trucks would be less than 3 percent. Refer to Section E, Truck Trips, of Topical Response No. 10, Trip Generation. Specifically, based on the Project's transportation analysis, under existing conditions there are approximately 78 truck trips (13 heavy truck trips and 65 light truck trips) per day and under future Project conditions there would be approximately 166 truck trips (36 heavy truck trips and 130 light truck trips) per day, which represent approximately 1.2 percent of the total daily trips.⁶³ In addition, the Project-related trucks would normally access the Project Site via the Fairfax Avenue and Beverly Boulevard gates (50 percent per gate). Trucks could access the Project Site via The Grove Drive gate, but only approximately 20 percent of the trucks would use this gate. As provided on page IV.I-49 in Section IV.I, Noise, of the Draft EIR, the Project would result in a maximum noise increase of 1.0 dBA (CNEL) in traffic-related noise along The Grove Drive under Existing Plus Project conditions. The estimated maximum noise levels increase along Beverly Boulevard and Fairfax Avenue would be 0.3 dBA (CNEL) and 0.2 dBA (CNEL), respectively. As concluded on page IV.I-54 in Section IV.I, Noise, of the Draft EIR, noise impacts associated with off-site traffic under Existing Plus Project conditions would be less than significant.

In response to this comment, additional analysis was conducted to specifically account for the noise associated with on-site vehicle movement and to confirm the conclusions in the Draft EIR. Refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR. The noise analysis assumed 50 percent of trucks would be traveling along the perimeter of the Project Site to represent a conservative analysis. This is much higher than the actual number of trucks, as only approximately 4 trucks—less than 5 percent of the Project trucks—would use the Beverly Boulevard driveway west of the Broadcast Center Apartments per day, and, as discussed, above approximately 20 percent of the trucks would use The Grove Drive driveway. In addition, to represent a conservative analysis, the noise analysis assumed 50 percent of the 166 truck trips per day would be traveling on the driveway adjacent to the Broadcast Center Apartments, which is significantly higher than the anticipated four trucks (eight truck trips) per day, per the

⁶³ Refer to Section E, Truck Trips, of Topical Response No. 10, Trip Generation a summary of this data.

transportation analysis (refer to Section E, Truck Trips, of Topical Response No. 10, Trip Generation). Furthermore, the noise analysis assumed the trucks would be traveling along the driveways adjacent to the closest noise sensitive receptors, as a conservative analysis. Table II-26 and Table II-27 on pages II-758 and II-759 provide the estimated noise levels under the existing and future conditions, respectively. As shown in Table II-26 and Table II-27, the Project would result in a maximum noise increase of approximately 0.1 dBA and 1.7 dBA at receptor location R1 during the daytime and nighttime hours, respectively. As provided on page IV.I-6 in Section IV.I, Noise, of the Draft EIR, a change of 3 dBA in ambient noise levels is considered to be a barely perceivable difference. In addition, the estimated noise levels would be below the 5 dBA significance threshold. Thus, the Draft EIR correctly concluded that noise impacts associated with on-site vehicles would be less than significant.

The comment incorrectly references Table IV.I-7 of the Draft EIR for the existing vibration levels. Table IV.I-7, Vehicle Mix for Traffic Noise Model, in Section IV.I, Noise, of the Draft EIR provides the vehicle mix used to calculate transportation noise, which is based on the typical vehicle mix (automobile, medium truck and heavy truck) for a studio, as confirmed by the City and LADOT and discussed above. As described on page IV.I-25 in Section IV.I, Noise, of the Draft EIR, the existing primary source of ground-borne vibration in the vicinity of the Project Site is vehicular traffic. Ground-borne vibration impacts are evaluated based on the anticipated peak levels generated by the vibration sources, e.g., vehicles, and not based on the change in the existing condition (like noise). Therefore, existing ground-borne vibration levels were not measured as suggested by the comment. As discussed on page IV.I-25 of the Draft EIR, the existing ground-borne vibration levels in the vicinity of the Project Site are based on typical levels provided by the FTA for trucks. Vibration levels generated by on-site vehicles, including trucks and passenger vehicles, would be similar to existing conditions, and would include the use of driveways along the Project's perimeter. In addition, as discussed on page IV.I-9 in Section IV.I, Noise, of the Draft EIR, even in locations close to major roads, it is unusual for vibration from vehicular sources, such as rubber-tired buses and trucks, to be perceptible, and ground-borne vibration is not a common environmental effect. Furthermore, the Project will include signage that would limit vehicles driving on-site to 15 mph, which would not generate perceptible vibration levels. As such, vibration levels associated with on-site vehicles would be less than significant at off-site sensitive uses.

Comment No. 26-142

According to p. II-15 of the Project Description, the existing helipad use will be retained in approximately the same location on the Project Site, but at a higher elevation. The noise section provides no detail on existing operation of the helipad or the change in frequency of flights, times of departure or arrivals, or type of equipment employed. What is the existing frequency of flights, times of departure or arrivals, and type of equipment employed for the helipad? What will be the frequency of flights, times of departure or arrivals, and type of equipment employed for the Project helipad use? What are the actual measurements from the current use? How will the increased elevation of the helipad impact noise? In the absence of other substantial evidence, it is reasonable to assume that increased square footage means increased employees and visitors, which equate to more frequent helipad use. The noise impacts of increased helicopter use and the change in helipad location and elevation should be quantified and added to the noise analysis.

Response to Comment No. 26-142

Refer to Response to Comment Nos. 16-87 and 26-15 regarding continued operation of helipad on-site and the reduction in helipad noise levels with placement of the helipad at a higher elevation.

Comment No. 26-143

Table IV.I-19 has errors with units—"Minimum Noise Reduction Provided by Mitigation Measures (feet)." Feet is not a unit of measurement for noise.

On page IV.I-65, the DEIR fails to disclose vibration impacts to the offsite staging areas. It is unclear whether human annoyance was assessed with respect to the school, recreational center, cemetery and church adjacent to the staging area. In addition, for the off-site truck staging location, the existing ambient noise measurements was based on only one measurement taken at 1:00 p.m. However, the truck staging will start much earlier in the day when ambient noise is likely less. Additional ambient measurements should be taken throughout the day, including in the early morning at those staging locations. Impacts from increases in ambient noise during the early morning hours should be assessed and disclosed.

How is it that existing noise level at R1 is considered conditionally acceptable but the noise level at the receptor directly across Beverly Boulevard from R1 is considered conditionally unacceptable? If the existing condition for some residences at the Broadcast Center Apartments represented by R1 are within the range of conditionally unacceptable, wouldn't the impact from mobile noise sources be significant?

Why are the existing ambient noise levels for R1 stated as averages rather than the lowest measured daytime and lowest measured nighttime ambient noise? How would the impacts conclusions be different if compared to the lowest measured ambient noise during daytime and nighttime?

What is the combined composite noise levels from all on-site noise sources compared to ambient noise levels in Leq? Does it exceed 5 dBA over ambient Leq?

Response to Comment No. 26-143

Table IV.I-19 in Section IV.I, Noise, of the Draft EIR has been revised to change "(feet)" to "(dBA)" in the second column. Refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR. This typo does not affect the analysis or conclusions in the Draft EIR.

The analysis in Section IV.I, Noise, of the Draft EIR fully evaluated noise and vibration from the two off-site staging areas and concluded that impacts associated with staging areas would be less than significant (refer to page IV.I-40 and page IV.I-65 of the Draft EIR for the noise and vibration analysis, respectively). Nonetheless, the two off-site staging areas are no longer proposed to be used as part of the Project's construction activities. Instead, all haul truck staging will occur on-site. Refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR, for an analysis of the on-site construction staging areas.

The reason that the existing ambient noise environment at receptor location R1 (conditionally acceptable) is lower than existing ambient noise at other receptor locations along Beverly Boulevard (conditionally unacceptable) is due to the fact that receptor R1 is located further and partially shielded from the vehicle noise along Beverly Boulevard. As shown in Figure IV.I-3 in Section IV.I, Noise, of the Draft EIR, the residential units at receptor location R1 primarily front The Grove Drive.

In the Draft EIR, the ambient noise levels are presented as averaged over the measurement period, per LAMC Section 111.01(a). As such, the noise analysis is consistent with the applicable City noise regulations.

The combined composite noise levels from all onsite noise sources during construction compared to ambient noise levels in L_{eq} are summarized in Table IV.I-10 on page IV.I-39 in Section IV.I, Noise, of the Draft EIR (before mitigation) and Table IV.I-19 on page IV.I-58 in Section IV.I, Noise, of the Draft EIR (after mitigation). With regard to operation, as provided on page IV.I-54 in Section IV.I, Noise, of the Draft EIR, a composite noise analysis was conducted to evaluate operational noise impacts associated with all on-site and off-site noise sources. The composite noise analysis was evaluated using the CNEL noise metric, as specified by the L.A. CEQA Thresholds Guide. The CNEL analysis evaluated noise levels throughout the entire 24-hour day. On-site noise sources would vary throughout the day, and it would not be accurate or consistent with City and CEQA practice to combine noise sources into the hourly L_{eq} metric. Refer to Appendix FEIR-16 for a composite analysis that confirms the Draft EIR's conclusion that noise impacts during Project operation would be less than significant.

Comment No. 26-144

The DEIR acknowledges that ground-borne vibration associated with heavy trucks traveling on road surfaces with irregularities, such as speed bumps and potholes, could reach the perceptible threshold. (DEIR, p. IV.I.-26.) However, the analysis of operational vibration impacts qualitatively states that the primary source of vibration related to operation would include vehicle circulation within the parking facilities and off-site vehicular trips and summarily concludes that vehicular induced vibration is unlikely to be perceptible by

people. (DEIR, p. IV.I-33.) Was the entry/exit and on-site circulation of the production trucks considered in that assessment? How? What assumptions were made as to the amount of trucks and the conditions of the roadway, or the presence of speed bumps or roadway surface traffic/security features considered? Did the DEIR consider how that could create uneven surfaces for truck travel and the related impact on vibration? Did the analysis consider the location of internal truck routes relative to the offsite sensitive receptors? All of these factors need to be disclosed and assessed in the DEIR.

The analysis also summarily says the Project doesn't include land uses that would generate high levels of vibration. Which land uses were evaluated in drawing that conclusion? Were each of the permitted uses identified in the list of uses in the Land Use section evaluated? How? The evaluation of each of the permitted uses should be disclosed.

Response to Comment No. 26-144

As discussed in Section IV.I, Noise, of the Draft EIR, sources of vibration related to operation of the Project would include vehicular circulation, delivery trucks, and building mechanical equipment associated with each of the five permitted studio uses. Based on the land uses described in Section II, Project Description of the Draft EIR and as clarified in Section III, Revisions, Clarifications, and Corrections to the Draft EIR, the Project does not include land uses that would generate high levels of vibration. Rather, the proposed land uses represent a continuation of existing studio-related land uses within the Project Site. Land uses that generate high levels of vibration include uses, such as mining, oil drilling, and heavy industrial land uses, and none of the land uses are proposed as part of the Project. Refer to Topical Response No. 3, Permitted On-Site Uses. Vibration levels generated by on-site vehicles, including trucks and passenger vehicles, would be similar to existing conditions, and would include the use of driveways along the Project's perimeter. Even in locations close to major roads, it is unusual for vibration from vehicular sources, such as rubber-tired buses and trucks, to be perceptible, and ground-borne vibration is not a common environmental effect.⁶⁴ In addition, as discussed in Response to Comment No. 26-141, vehicles driving on-site would travel at a controlled slow speed (i.e., 15 mph), which would not generate perceptible vibration levels. As such, vibration levels associated with on-site vehicles would not be perceptible at off-site sensitive uses. Further, building mechanical equipment installed as part of the Project would include typical commercial-grade stationary mechanical equipment, such as air-condenser units (mounted at the roof level) that would include vibration-attenuation mounts to reduce vibration transmission to

⁶⁴ Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual, September 2018, page 112. "...[i]t is unusual for vibration from sources such as buses and trucks to be perceptible...."

ensure that vibration would not be perceptible at the off-site sensitive receptors. Therefore, the Draft EIR correctly concluded that vibration impacts associated with operation of the Project, including on-site vehicles, would be less than significant.

Comment No. 26-145

What is the basis for the construction equipment mix assumptions? How was it determined what distance certain equipment would be from the offsite sensitive receptors? The location of future Project buildings is unknown, so how were these assumptions made? For example, the DEIR says that on demolition, it is assumed that concrete saws will be 45' or 70' from the receptors and excavators will be 20'–120'. On what basis? Won't there be any construction activity adjacent to the property lines? Also, please explain how a reference noise level at 50 feet is used if the distance of the equipment is assumed to be less than 50 feet?

The analysis of noise from parking facilities (DEIR IV.I-46) says that the underground parking would be fully enclosed on all sides; however, the site plans included with the Project application appear to show that the B-1 level parking could be open to the sky. Also, isn't the B1 level at actual grade in the southwest portion of the Project Site? Will all of the underground parking be fully enclosed on all sides? If not, the noise impacts from the open areas of the underground parking should be assessed.

How were the noise impacts from stage loading evaluated? Was it included as a noise source in the assessment of studio-related production noise? Was it included in the assessment of loading dock and trash collection noise? Or was it just not considered?

On what basis does the analysis assume that additional stages do not increase noise because stages are sound insulated. What if sound stage elephant doors are open, particularly when the sets are being constructed? How was the sound from open sound stages, including the sound of set construction equipment and workers yelling over equipment or playing music assessed? Aren't pyrotechnics proposed as an allowed stage activity? Where is the analysis to show that sound insulation is sufficient to fully mitigate pyrotechnic-related noise? As there is no known limitation on the placement of stages and their elephant doors, the analysis must assume that such uses can occur adjacent to the offsite sensitive receptors.

Response to Comment No. 26-145

The construction equipment mix (i.e., construction equipment type and number of pieces of construction equipment) that would be used for each of the anticipated construction phases (i.e., demolition, grading/excavation, mat foundation, structure enclosure, finishing, and landscaping) was provided by AECOM, based on information from

Television City and MBS. Refer to Appendix FEIR-8 of this Final EIR for a detailed list of the construction assumptions provided by AECOM for use in the Draft EIR. The construction noise analysis assumed that the loudest construction equipment would be placed near the perimeter of the Project Site. As noted in Response to Comment No. 26-140, the distance from mobile construction equipment and activities to off-site sensitive receptors would vary based on the phase and activity involved. In general, construction equipment noise would be set back from any property lines, as the main noise source (i.e., internal combustion engines and exhaust) are typically located at the rear of such equipment behind the cab and oriented away from off-site sensitive receptors. In addition, equipment would not straddle property lines, as a buffer from the property line must be maintained for maneuverability. Therefore, the estimated distances evaluated are conservative estimates of where construction equipment (e.g., excavator, bulldozer, water truck, drill rig, or crane) would be located closest to receptor location R1 for an extended period of time.

As described on page IV.I-38 in Section IV.I, Noise, of the Draft EIR, to represent a conservative noise impact analysis, the analysis also assumed that all pieces of construction equipment would be operating simultaneously. As provided on Table IV.I-9 in Section IV.I, Noise, of the Draft EIR, the reference construction equipment noise levels for each equipment type are provided at a distance of 50 feet. The estimated noise level from the construction equipment at a particular receptor location is calculated relative to the reference noise source level at 50 feet distance and the standard sound attenuation rate of 6 dB per doubling of distance (applicable to both conditions where the receptor is located farther or closer than the reference noise source); see page IV.I-32 in Section IV.I, Noise, of the Draft EIR. For example, with the reference noise level of 81 dBA at a distance of 50 feet for an excavator, the noise level for a receptor at 25 feet from the excavator would be 87 dBA [$87 = 81 - 20 \cdot \log(25/50)$].

As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Draft EIR analyzed the Project described in Section II, Project Description, of the Draft EIR, and the Conceptual Site Plan is based on the architectural plans on file with the City. The underground parking would be enclosed on all sides, with the exception of a portion near the center of the Project Site, which would be partially open to the sky. The noise analysis for the parking areas addresses surface parking areas-grade parking levels, and a below grade (Level B-1) parking area that is partially open to the sky. Table IV.I-14 on page IV.I-48 of the Draft EIR presents the estimated noise levels from the at-grade and above-grade parking levels at the off-site receptor locations. As shown in Table IV.I-14, the estimated noise levels from the parking facilities would range from approximately 24.1 dBA (L_{eq}) at the uses represented by receptor location R6 to approximately 54.5 dBA (L_{eq}) at the uses represented by receptor location R1. The estimated ambient noise levels with the addition of the noise levels generated by the Project parking facilities would be below the significance criterion of 5 dBA (L_{eq}) above the

ambient noise levels (based on the lowest measured ambient noise levels), and, thus, the Draft EIR correctly concluded that noise impacts from parking facilities during Project operation would be less than significant.

As described on pages IV.I-46 to IV.I-48 in Section IV.I, Noise, of the Draft EIR, the noise analysis accounted for noise from on-site loading docks. As discussed in the Draft EIR, loading docks would be located throughout the Project Site in support of production activities. The loading areas would typically be located at the basecamp areas or adjacent to the sound stages. In addition, the noise analysis assumed that up to 60 truck loadings would operate concurrently to represent a conservative noise analysis, as it is unlikely that 60 trucks would load or unload simultaneously. Furthermore, as discussed further below in Response to Comment No. 26-146, in response to comments, additional quantitative noise analysis was conducted for the basecamp and outdoor production activity areas, which included loading/unloading activities. As discussed therein, the analysis confirmed that noise impacts associated with the loading/unloading activities would be less than significant.

Sound stage activities would be contained within enclosed buildings with high sound insulation around the Project Site with operational restrictions on opening doors during production. Therefore, noise levels associated with production inside the sound stages would be contained and would not be transmitted to the exterior. Noise levels associated with production setup inside the sound stage were measured outside of a stage at an existing studio with the elephant door open. These outdoor sound levels from the production setup inside of the sound stages were included as part of the quantitative basecamp and outdoor production analysis described in Response to Comment No. 26-146. Refer to the worksheets included as Appendix FEIR-16 of this Final EIR (page 12) for the measured noise levels at an existing studio and additional confirmatory basecamp and outdoor production noise analysis in response to comments.

With regard to pyrotechnics, note that the Project would not involve the use of pyrotechnics as part of the outdoor production activities.

Comment No. 26-146

The tables show different ambient Leq levels for R1. Which is correct? Does it alter the impacts conclusion?

Did the noise analysis model outdoor production activities? How was it modeled? What was assumed? If not, why not?

The special events traffic noise analysis is purely qualitative and unsupported. Additional information should be provided regarding the permitted special events and the noise

impacts to the surrounding uses disclosed. Such analysis should consider the permitted amount of events, the permitted hours, the maximum amount of attendees, whether amplified sound will be permitted, whether outdoor music will be permitted, etc.

Also, does the cumulative noise analysis include the cumulative noise impacts of special events/gathering space? Do the cumulative noise impacts consider the Holocaust Museum across the street as a related project? Could the projects have simultaneous special events? How was that potential assessed in the cumulative impacts of noise and traffic?

On what basis were the roadway segments selected for the offsite roadway noise analyses?

Response to Comment No. 26-146

The comment does not specify which tables show the different ambient noise levels for receptor location R1. Ambient noise level measurements were conducted for eight receptor locations, and the measured ambient noise levels are provided in Table IV.I-6 on page IV.I-24 in Section IV.I, Noise, of the Draft EIR. Depending on the analysis, the ambient noise levels presented in the other tables throughout Section IV.I, Noise, of the Draft EIR are either the measured daytime or nighttime ambient noise levels, as stated in each of the tables.

As discussed on pages IV.I-44 to IV.I-45 in Section IV.I, Noise, of the Draft EIR, outdoor studio production activities currently occur throughout the Project Site and will continue to occur with the continued operation of the Project Site as a studio. However, the noise levels associated with outdoor studio production would be expected to be lower than the existing conditions, due to the reduction in the outdoor areas used for studio production activities as discussed in Response to Comment No. 26-140.

Nonetheless, in response to public comments, a quantitative analysis of noise levels associated with the outdoor studio production activities, including basecamp operations (which is a subset of outdoor production activities), were analyzed for existing and future conditions. Noise sources associated with outdoor production activities include, but are not limited to, basecamp activities, setup and takedown of production equipment, construction of sets, loading and unloading of production vehicles, vehicular circulation, filming activities, etc. Reference noise levels for these activities were measured at an existing studio. Noise associated with production setup inside a sound stage as measured at the exterior of the sound stage outside of the open elephant door was also accounted for. Hours of operation for outdoor production activities are assumed to be during both daytime hours (7:00 A.M. to 10:00 P.M.) and nighttime hours (10:00 P.M. to 7:00 A.M.). Table II-28 and Table II-29 on pages II-767 and II-768 present the estimated noise levels associated with outdoor

Table II-28
Outdoor Production Activities Noise Levels—Daytime Hours

Off-Site Receptor Location	Estimated Noise Levels due to Outdoor Activities (Basecamp and Outdoor Production), dBA (L _{eq})		Existing Daytime Ambient Noise Levels, dBA (L _{eq})	Ambient + Project Noise Levels, dBA (L _{eq})		Noise Increase from Existing to Future, dBA (L _{eq})
	Existing	Future		Existing	Future	
R1	64.7	58.8	61.1	66.3	63.1	0.0
R2	52.5	54.0	62.8	63.2	63.3	0.1
R3	55.8	48.1	68.5	68.7	68.5	0.0
R4	47.8	41.1	67.7	67.7	67.7	0.0
R5	49.5	49.2	58.9	59.4	59.3	0.0
R6	39.3	36.0	60.4	60.4	60.4	0.0
R7	50.4	50.3	56.6	57.5	57.5	0.0
R8	55.0	53.3	66.9	67.2	67.1	0.0
R9 (Gilmore Adobe) ^a	49.5	42.4	56.0	56.9	56.2	0.0

^a The Gilmore Adobe (also referred to as the Rancho La Brea Adobe) is a commercial use, and the Draft EIR correctly analyzed the Gilmore Adobe as a commercial use. This is verified by the 2018 book, *A Family Vision—Spanning Three Centuries—The History of the A.F. Gilmore Company*, written by the A.F. Gilmore Company and the certified Addendum to the Final Environmental Impact Report for The Grove at Farmers Market Project. A commercial use is not a sensitive receptor for purposes of the noise analysis under CEQA. Nonetheless, even if the Gilmore Adobe were treated hypothetically as a residential use, potential noise impacts associated with on-site construction staging at the Gilmore Adobe would be less than significant.

Source: AES, 2023.

production and basecamp operations under the existing and future conditions during the daytime and nighttime hours, respectively. This analysis assumes full operation of the outdoor production areas. As shown in Table II-28, the estimated noise levels associated with future outdoor production and basecamp operations during the daytime and nighttime hours would not result in increased noise levels at off-site receptors locations with the exception of receptor location R2, which would result in a maximum noise increase of 0.1 dBA. The estimated noise increases are well below the perceptible level and the 5-dBA significance threshold. Therefore, this analysis confirms the Draft EIR's conclusion that noise impacts associated with the outdoor production activities and basecamp operations would be less than significant.

As described on page IV.I-72 in Section IV.I, Noise, of the Draft EIR, the cumulative noise analysis includes trip volumes under existing conditions and future conditions that account for anticipated future growth, related projects in the vicinity of the Project Site, and Project-generated trips. With regard to the Holocaust Museum, the existing Holocaust Museum was open and operating when the trip counts for the Project were conducted and, therefore, the existing Holocaust Museum trips were included in the analysis. The

proposed Holocaust Museum project involves minor construction at the existing museum, which the City determined would include a negligible or no expansion of use.⁶⁵ As such, the proposed Holocaust Museum was deemed too small in terms of the generation of additional peak hour trips on the street system by LADOT to include on the list of related projects. Further, the trips for the Holocaust Museum project and for other similarly situated related projects within or even outside the Study Area would be covered by the one percent annual growth rate in ambient traffic assumed in the Draft EIR's transportation analysis.

With regard to special events on-site, refer to Topical Response No. 3, Permitted On-Site Uses regarding how special events would continue to be governed by the LAMC consistent with existing conditions. In addition, cumulative noise impacts associated with

⁶⁵ City of Los Angeles Board of Recreation and Park Commissioners, Board Report No. 22-011, January 20, 2022.

both on-site and off-site noise sources have been evaluated in the Draft EIR (page IV.I-72 and Table IV.I-20) and have been demonstrated to be less than significant.

The roadway segments for the off-site roadway noise impacts analysis were selected based on the proximity to noise-sensitive uses along the roadway segments and potential increases in trips from the Project.

Comment No. 26-147

J. Public Services

The DEIR's conclusions that the Project's impacts to public services will be less than significant are not supported by substantial evidence or analysis.

The Project May Require New or Relocated Fire Protection Facilities

The DEIR does not provide support for the contention that new or altered fire facilities will not be required for the provision of fire and emergency medical services. The DEIR concludes that "Project Impacts with regard to LAFD facilities and equipment would be less than significant." (DEIR, IV.J.1-25.) However, this is in direct contradiction to the LAFD's comment letter on the NOP. The LAFD identified a multitude of problems with the Project's potential impacts on LAFD facilities and services.

First, the LAFD states, "the first-due Engine Company should be within 1.0 mile(s), the first-due Truck Company within 1.5 mile(s)." (DEIR Appendix K (no page number provided).) The LAFD then notes that the closest fire station to the Project is located 1.2 miles away. Based on this observation, the LAFD states unequivocally: "Based on these criteria (response distance from existing fire stations), fire protection would be considered **Inadequate**." (DEIR Appendix K (no page number provided) (emphasis in original).) LAFD then explicitly states that, "At present, there are no immediate plans to increase Fire Department staffing or resources in those areas, which would serve the proposed project." (*Id.*) Thus, the LAFD concluded that it does not presently have, nor in the planned future in a world without the Project plan to have, adequate fire stations to serve the Project. Therefore, the DEIR's conclusion that Project impacts would be less than significant is unsupported and incorrect.

Notwithstanding the Fire Department's clear response, the DEIR rejects the Fire Department's analysis and provides a conclusion contrary to the Fire Department. The DEIR states that, "Although the Project would exceed the LAFD-required response distance for a fire station with an engine company, LAFD concludes in its correspondence that inclusion of the above listed recommendations, along with any additional recommendations made during later reviews of the proposed project will reduce the

impacts to an acceptable level.” (DEIR, p. IV.J.1-23.) However, the DEIR is citing a completely separate portion of the LAFD comment letter. The LAFD comment letter is broken up into four substantive sections: Fire Flow, Response Distance, Fire Stations, and Firefighting Personnel & Apparatus Access. Its conclusion following the section on Fire Stations is what was described above: “fire protection would be considered **Inadequate**.” In the next section, “Firefighting Personnel & Apparatus Access,” LAFD lists 27 recommendations that the Project incorporate into its design and procedures to ensure adequate access for Fire Department personnel and apparatus. At the end of the section addressing “Firefighting Personnel & Apparatus Access,” LAFD concludes, “The inclusion of the above listed recommendations, along with any additional recommendations made during later reviews of the proposed project will reduce the impacts to an acceptable level.” (DEIR Appendix K (no page number provided).) LAFD is clearly only referring to impacts related to Firefighting Personnel & Apparatus Access. This conclusion is not related to and does not change the LAFD’s earlier conclusion that fire protection based on the location of the nearest fire station would be **Inadequate**.

LAFD explicitly ends the entire letter, summarizing the potential impacts as follows: “The development of this proposed project, along with other approved and planned projects in the immediate area, may result in the need for the following:

- Increased staffing for existing facilities.
- Additional fire protection facilities.
- Relocation of present fire protection facilities.”

Please explain why the DEIR contradicts the clear conclusion of the Fire Department that “fire protection would be considered inadequate” and the further statements in the Fire Department letter regarding deficiencies in fire facilities. This is the precise type of impact that CEQA seeks to disclose, analyze, and mitigate. Please explain why the DEIR not only completely ignores this conclusion by the Fire Department but provides a contrary unsupported conclusion.

This is a new significant impact and therefore the DEIR must be revised to assess the potential environmental impacts of the additional fire protection facilities or relocation of fire protection facilities that LAFD identified as potential impacts of the Project.

After LAFD Concludes Fire Facilities are Inadequate, The DEIR Defers Public Service Impacts Analysis

The DEIR states that “the City and LAFD would continue to monitor the overall demand for existing and projected fire facilities and coordinate the development of new fire facilities to

be phased with growth.” (DEIR, p. IV.J.1-25.) This statement is not an appropriate analytical framework when determining whether the Project will have an impact on the environment for the purposes of CEQA and what should be the required mitigation particularly given the LAFD’s statements regarding existing inadequacy of facilities. CEQA requires the lead agency to determine impacts of a project and then, if there is an impact, provide mitigation to lessen the impact. The analyses and the needed mitigation cannot be deferred. It is clear from the LAFD letter there is an impact. The DEIR must properly disclose the impact and provide for appropriate mitigation to reduce the impact.

CEQA requires an analysis of what impact the Project will have on fire and police resources and not rely on a post-approval assessment of what is required. It is feasible to analyze the potential need for new fire facilities due to the Project. Why has this analysis not been provided? The DEIR should have analyzed the relevant data, determined whether the data indicates that additional resources would be needed, and then determine significance. What is the data and why was it not fully provided in the DEIR? Instead, the DEIR ignores the conclusion of the LAFD and improperly defers the analysis to the future. The DEIR must fix this error, recognize the significant impact, and determine what is the appropriate mitigation. Once done, the DEIR must be recirculated for the public’s comment.

Response to Comment No. 26-147

The commenter incorrectly asserts that the analysis of fire protection services and the need for new facilities is inadequate. The methodology for analyzing a project’s impacts on fire services is discussed on pages IV.J.1-20 to IV.J.1-21 of Section IV.J.1, Public Services—Fire Protection, of the Draft EIR. As discussed therein, the need for or deficiency in adequate fire protection in and of itself is not a CEQA impact, but rather a social and/or economic impact. Where a project causes a need for additional fire protection services resulting in the need to construct new facilities or additions to existing facilities, and the construction results in a potential impact to the environment, then the impact would need to be assessed in an EIR and mitigated, if found to be significant. The ultimate determination of whether a project would result in a significant impact to the environment related to fire protection is determined by whether construction of new or expanded fire protection facilities is reasonably foreseeable as a direct or indirect effect of the project. There are no current capital improvement plans for the construction or expansion of fire facilities in the impact area.

The Project’s impacts on fire protection services during construction were analyzed on pages IV.J.1-21 to IV.J.1-23 of the Draft EIR. As discussed therein, Project construction activities would not require a new fire station or the expansion of an existing facility in order to maintain service levels, the construction of which would cause significant environmental

impacts. Therefore, impacts on fire protection services during Project construction would be less than significant.

As stated on page 2 of the LAFD letter (Appendix K of the Draft EIR), “[t]he adequacy of fire protection for a given area is based on required fire-flow, response distance from existing fire stations, and this Department’s judgment for needs in the area.” Regarding required fire flow, as discussed in Response to Comment No. 16-10, the local infrastructure serving the Project Site with regard to fire flow would be adequate. As discussed on page IV.J.1-23 of the Draft EIR, the Project Site would be located outside of the 1.0-mile response distance from a fire station with an engine company but would be located within the 1.5-mile response distance from a fire station with a truck company. In these situations, per LAMC Sections 57.507.3.3 and 57.512.2, the Project would be required to include automatic fire sprinkler systems in all structures, in addition to the fire protection features listed in LAFD’s inter-departmental correspondence regarding the Project (see Appendix K of the Draft EIR). The automatic fire sprinkler requirement addresses the distance issue. In addition, LAFD concludes in its correspondence that “inclusion of the above listed recommendations, along with any additional recommendations made during later reviews of the proposed project will reduce the impacts to an acceptable level.” Refer also to Response to Comment No. 9-35 as well as the Confirmatory Fire Public Services Technical Memorandum included in Appendix FEIR-12 of this Final EIR which confirms impacts related to fire protection would be less than significant.

In addition, the analysis in Section IV.J.1, Public Services—Fire Protection, of the Draft EIR appropriately incorporates statements from LAFD’s letter regarding the continued monitoring of the need for services and facilities by the LAFD as such monitoring is required by all City departments to ensure services continue to be adequately provided for. Refer to Response to Comment No. 35-132 for a discussion of how the Project would implement all applicable Los Angeles Building Code and Fire Code requirements regarding structural design, building materials, site access, fire flow, storage, and management of hazardous materials, alarm and communications systems, etc., including as set forth in the written correspondence from LAFD included in Appendix K of the Draft EIR.

As such, there is no deferred analysis, and no significant impacts requiring mitigation would occur as a result of implementation of the Project. Rather, the analysis of fire protection services has been prepared in accordance with CEQA and based on the input provided by LAFD. Thus, recirculation of the Draft EIR is not required. Refer to Response to Comment No. 9-4 for additional discussion regarding recirculation.

Comment No. 26-148**The DEIR Relies on Piecemealing to Show Less Than Significant Impacts**

A basic tenet of CEQA is that a project cannot be piecemealed into a bunch of smaller projects to avoid analyzing impacts. Yet, the DEIR does just this when it states “if new [fire] facilities were needed in the future, associated construction would be required to undergo separate environmental review per CEQA.” (DEIR, p. IV.J.1-25.) Not only is this classic deferred analysis in violation of CEQA, but it is also piecemealing the environmental analysis particularly in light of the LAFD statement that existing facilities are “Inadequate.”

Please explain why it is permissible to defer required analysis of a critical impact such as fire services, after the LAFD has said exiting [sic] facilities are inadequate, and why piecemealing is appreciate [sic] for the critical issue. This is error and the DEIR should be revised to analyze the likely required additional fire stations within the Project EIR and the impacts associated with development of those facilities.

Will the additional fire facilities be a requirement of the Project? If not, how will the fire facilities be developed? What will be the impact of the delay in providing the additional fire facilities?

Response to Comment No. 26-148

Refer to Response to Comment No. 26-147 regarding the less-than-significant impacts associated with fire protection services as analyzed in detail in Section IV.J.1, Public Services—Fire Protection, of the Draft EIR and confirmed again in the Confirmatory Fire Public Services Technical Memorandum included in Appendix FEIR-12 of this Final EIR.

As discussed in Response to Comment No. 26-147, there is no deferred analysis of impacts as asserted by the comment. Nonetheless, at a future time, should the LAFD determine that a new or expanded fire station is required within the City, the Draft EIR analysis is correct in that if new fire facilities were needed in the future, associated construction would be required to undergo separate environmental review in accordance with CEQA. Contrary to the assertion in this comment, this is not piecemealing because any future fire facilities are not included in the Project, and as discussed previously, are not being triggered by the Project. The Draft EIR analyzed the whole of the action, including all discretionary actions necessary to carry out the Project, in accordance with CEQA.

Comment No. 26-149**The DEIR Fails to Analyze Response Times**

The DEIR states, “LAFD has not established response time standards for emergency response, nor adopted the National Fire Protection Association (NFPA) standard of 5 minutes for emergency medical service response and 5 minutes 20 seconds for fire suppression response.” (DEIR, IV.J.1-16.) However, the DEIR is silent as to the impact the Project will have on response times. Despite discussing response times in the Existing Conditions portion of the section, the DEIR includes no analysis of response times in the Project Impact portion of the section. This is despite the DEIR’s own recognition that “response times can be considered to assess the adequacy of fire protection and emergency medical services.” (DEIR, p. IV.J.1-17.)

As is further described in Section K, Traffic and Transportation, *infra*, the Project is going to cause significant traffic impacts in the Project vicinity. There is no discussion of whether these significant traffic impacts will cause emergency response times longer than 5 minutes, an outcome that seems very likely. What would be the impact on fire response times from the Project? What would be the impacts from the maximum amount of construction truck traffic? From the maximum amount of operational employee, visitor (including audience) and production truck traffic? The DEIR must be revised and recirculated to include this necessary missing information and with the proper analysis conducted to inform the public and decision makers of the Project’s impacts on emergency response times.

Response to Comment No. 26-149

Refer to Response to Comment Nos. 9-35 with regard to LAFD emergency response times and Section D, Emergency Access, of Topical Response No. 12, Safety and Congestion, regarding emergency access and emergency response times during both construction and operation of the Project. Impacts to emergency services are not determined based on the LOS grades of intersections, and LOS is no longer used to determine significant transportation impacts under CEQA per SB 743. Refer to Topical Response No. 8, Vehicle Miles Traveled; Section B, Level of Service, and Section D, Emergency Access, of Topical Response No. 12, Safety and Congestion; and Response to Comment No. 9-35. As discussed therein and in Section IV.K, Transportation, Section IV.J.1, Public Services—Fire Protection, and Section VI, Other CEQA Considerations, of the Draft EIR, and evaluated in the Initial Study prepared for the Project, included as Appendix A of the Draft EIR, the Project would provide adequate emergency access. Therefore, the Draft EIR correctly concluded that the Project’s impact on emergency access and fire-related services would be less than significant.

This comment does not provide substantial evidence that “significant new information” as defined by CEQA Guidelines Section 15088.5 has been added to the Draft EIR. Thus, recirculation of the Draft EIR is not required. Refer to Response to Comment No. 9-4 regarding recirculation.

Comment No. 26-150

The DEIR Fails to Analyze the Project’s True Impacts

The DEIR discusses potential impacts to fire and police based on the square footage of the Project. Square footage alone does not cause public service needs; the people and the uses on top of that square footage also causes public service needs. The DEIR states that “the Project would result in a total net increase of approximately 1,130,320 square feet of floor area upon full buildout. As such, the Project would increase the demand for LAFD fire protection and emergency medical services” (DEIR, IV.J.1-24.) In addition to the issues regarding the DEIR’s failure to properly include all square footage discussed throughout this letter, this avoids the required analysis.

For example, how many people will be on the site on an average day? What will those people be doing? The DEIR states that the proposed uses would be “expected to generate a range of fire service calls similar to other studio uses” (*id.*) but does not disclose what those uses are or the number of service calls that such uses generate. Does that account for all the uses proposed for the Project? Audience and entertainment shows, special events, and theaters? In the Police Protection section of the DEIR, it is stated that there would be a net increase of 5,702 employees on-site per day. However, that does not disclose anything about the number of visitors. Does that include the potential for over 5,000 audience members attending shows at the Project Site? Does that account for possible auditorium use? What are the differing impacts if a significant percentage of these visitors park in the community? The DEIR should be revised with this updated information.

Response to Comment No. 26-150

As discussed in Topical Response No. 2, Definition of Floor Area is Appropriate, and Response to Comment No. 5-7, the Draft EIR has properly accounted for all square footage proposed by the Project.

In addition, refer to Topical Response No. 3, Permitted On-Site Uses, regarding the five uses that would be permitted on-site (i.e., sound stage, production support, production office, general office, and retail) and the continued special events that would occur through the existing Temporary Special Event permit process through the Department of Building and Safety. All of the permitted uses already occur on-site with the exception of retail and childcare, which have been accounted for in the impact analyses within the Draft EIR. The

statement that the proposed uses would be “expected to generate a range of fire service calls similar to other studio uses” accounts for all permitted uses. The Project does not include any auditorium uses (apart from sound stages with audience seating) or theaters open to the public.

With regard to audience visitors to the Project Site, refer to Section B, Visitor Trips, of Topical Response No. 10, Trip Generation, which shows that the number of visitors to the Project Site on an average weekday would be approximately 427 visitors (in approximately 194 vehicles), well below the 5,000 audience visitors suggested by the commenter.

Also refer to Topical Response No. 13, Parking, regarding how the Project would provide convenient and sufficient on-site parking to its employees and visitors to meet its full demand and prevent spillover parking in the nearby community (please note that parking does not relate to the analysis of fire and police protection services under CEQA). Refer to Table II-15 therein, which estimates the maximum number of vehicles that may be parked on-site at a given time.

Furthermore, as discussed above and in Section B, Visitor Trips, of Topical Response No. 10, Trip Generation, visitors would represent a small fraction of the Project’s on-site population. In addition, as discussed in detail in Sections IV.J.1, Public Services—Fire Protection, and IV.J.2, Public Services—Police Protection, of the Draft EIR, the Project includes numerous features that would reduce the need for fire and police protection services. As discussed in Response to Comment Nos. 16-5, 16-10, 26-147, and 35-133, the City has concluded that impacts on fire and police protection services would be less than significant.

Comment No. 26-151

In addition, the Police Protection section of the DEIR includes PDFs that are disguised mitigation and the DEIR all but comes out and says that. The DEIR states, “[t]he proposed Project design features... would help offset the Project-related increase in demand for police services.” (DEIR, p. IV.J.2-16.) Offsetting impacts are mitigation measures, not PDFs. A properly formulated PDF is part of the project that avoids an impact, not part of a project that “offsets” or lessens an impact. The DEIR seems to imply that the PDFs will be used to bring the Project’s impacts below a significance level. The DEIR should be revised to change the PDFs to mitigation measures to reflect this reality.

The DEIR also fails to analyze potential impacts of the PDFs themselves. For example, POL-PDF-2 requires “fencing, walls, landscaping, and other elements to create a physical barrier at the Project Site perimeter.” (DEIR, IV.J.2-12.) The DEIR must be revised to consider what environmental impacts these features will have. For example, will such

“fencing, walls, landscaping, and other elements to create a physical barrier at the Project Site perimeter” impact the visibility of the HCM?

In addition, POL-PDF-6 is deferred mitigation. The Project team should be consulting with LAPD now and not “prior to the issuance of a building permit” to incorporate feasible crime prevention features into the Project. Will the security measures be part of the Specific Plan?

Response to Comment No. 26-151

The PDFs included in Section IV.J.2, Public Services—Police Protection, of the Draft EIR are not disguised mitigation measures as asserted by the commenter. Rather, these PDFs are included as an integral part of the design of the Project given the security needs of a large-scale studio and are part of the Project that is analyzed by the EIR. As discussed in Response to Comment No. 26-43, by definition, mitigation measures are not part of the original project design. Rather, mitigation measures are actions taken by the lead agency to reduce impacts to the environment resulting from the original project design. Mitigation measures are identified by the lead agency after the project has undergone environmental review and are above-and-beyond existing laws, regulations, and requirements that would reduce environmental impacts.

As described in detail on pages IV.J.2-12 and IV.J.2-13 of the Draft EIR, these PDFs include security fencing, secured points of entry, 24-hour security cameras, private on-site security staff, staff security training protocols, security lighting, design for visibility, and further coordination with LAPD at the building permit and certificate of occupancy stage. These PDFs would not result in any environmental impacts. Rather, they would enhance safety and security. With regard to Project Design Feature POL-PDF-2, which requires fencing, walls, landscaping, and/or other elements to create a physical barrier at the Project Site perimeter, the Project Site already includes similar elements along the perimeter.

Furthermore, regarding impacts to visibility of the HCM, as discussed in Section IV.B, Cultural Resources, of the Draft EIR and in Section C, Potential New Construction North of the Primary Studio Complex, of Topical Response No. 5, Historical Resources, the Project would open up the currently obstructed views of the Primary Studio Complex from Beverly Boulevard, thereby restoring an important character-defining viewshed feature that has been compromised in the past. As such, contrary to this comment, the Project, including Project Design Feature POL-PDF-2, would not impact the visibility of the HCM.

Furthermore, Project Design Feature POL-PDF-6 is not deferred mitigation. LAPD was consulted with regard to the Project (see the LAPD Response Letter attached as Appendix L of the Draft EIR), and LAPD concluded that the Project would not require any special police protection requirements and would not result in the need for new or altered

police facilities. As discussed in LAPD's inter-departmental correspondence regarding the Project and in Project Design Feature POL-PDF-6, the Applicant will also consult with LAPD's Crime Prevention Unit prior to the issuance of a building permit regarding the incorporation of feasible crime prevention features appropriate for the design of the Project as it at this time that detailed plans are reviewed by LAPD and other City departments. These would be on-site features that would improve safety and security and would not result in impacts on the environment.

All of the PDFs related to security and safety that are included on pages IV.J.2-12 and IV.J.2-13 of the Draft EIR will be included as part of the Project's Mitigation Monitoring Program, which is included as Section IV, Mitigation Monitoring Program, of this Final EIR, which will also be appended to the Specific Plan.

Comment No. 26-152

The DEIR Improperly Relies on the City's Obligation in the California Constitution

Rather than disclosing, analyzing, and mitigating the Project's impacts on public services, the DEIR simply states that the City will have the obligation to fix whatever problems the Project creates and therefore the DEIR doesn't need to analyze them. In light of the Fire Department's statement regarding the inadequacy of facilities and the policies of the Wilshire Community Plan, this is in clear opposition to CEQA's requirement that a Project disclose, analyze, and mitigate its impacts. If the Project causes impacts that jeopardize public safety as described above, the DEIR should be revised to remove the reliance on the City's constitutional obligation and add in analysis of the Project's obligation to mitigate its impacts.

Response to Comment No. 26-152

Refer to Response to Comment Nos. 16-5 and 26-147 regarding the adequacy of LAFD fire protection services and infrastructure to serve the Project. Also refer to the Confirmatory Fire Public Services Technical Memorandum included in Appendix FEIR-12 of this Final EIR which reaffirms that the Project would not result in significant impacts associated with fire protection and the need for new fire protection facilities. Note that as demonstrated in the detailed analyses provided in Section IV.J.1, Public Services—Fire Protection, and Section IV.J.2, Public Services—Police Protection, of the Draft EIR, the analyses do not rely on the City's constitutional obligation to provide fire and police protection services. These obligations are presented in the regulatory framework of these sections and are not the sole basis for the impact conclusions. Rather, the impact conclusions are based on specific criteria and information provided by LAFD and LAPD.

Comment No. 26-153**The Cumulative Impact Analysis is Inadequate**

As described throughout this letter, the DEIR's cumulative impact analysis, which is limited to only the *potential* buildout of 2026 but not the allowed or more likely buildout over 20 years, is inadequate. Fire and Police services are heavily dependent on the types of uses and the number of people in a certain area. By limiting the analysis of cumulative impacts to only the next four years, the DEIR improperly limits the scope of potential impacts from other foreseeable development in the area through 2043.

Response to Comment No. 26-153

The cumulative impact analyses in the Draft EIR account for the development of all known related projects in the vicinity of the Project based on information provided by LADOT and the Department of City Planning. This list of related projects is not limited to projects with a buildout year of 2026. Thus, the Draft EIR fully evaluates cumulative impacts based on a list of reasonably foreseeable projects and also includes a specific discussion of a long-term buildout scenario for each of the impact analyses. As discussed on page IV.J.1-28 of Section IV.J.1, Public Services—Fire Protection, and on pages IV.J.2-17 and IV.J.2-18 of Section IV.J.2, Public Services—Police Protection, of the Draft EIR, the Project's fire and police protection requirements would not change with a later buildout date, as such requirements are based on full occupancy and operation of the Project regardless of when they occur.

Cumulative impacts on fire protection services are analyzed on pages IV.J.1-28 to IV.J.1-30 of the Draft EIR, and the analysis conservatively assumes that all of the related projects would be built out at the time the Project is built out. As stated therein, as with the Project, the related projects and other future development projects in the surrounding area would be required to comply with applicable regulatory requirements related to fire protection. In addition, each related project and other future development projects would be reviewed by LAFD (or the respective fire department) to ensure that sufficient fire safety measures are implemented to reduce potential impacts to fire protection and emergency medical services. Furthermore, the Project, related projects, and other future growth would be subject to the standard construction permitting process, which includes review by LAFD (or the respective fire department) for compliance with building and site design standards related to fire/life safety, as well as coordinating with LADWP (or the respective water supplier) to ensure that local fire flow infrastructure meets current code standards for the type and intensity of land uses involved. In addition, the related projects and other future development projects in the City would also generate revenues to the City's General Fund (in the form of property taxes, sales revenue, etc.) that could be applied toward the provision of new fire station facilities and related staffing, as deemed appropriate. Cumulative increases in demand for fire protection and emergency medical services due to

the related projects and other future development projects would be identified and addressed through the City's annual programming and budgeting processes. LAFD resource needs would be identified and monies allocated according to the priorities at the time. Any requirement for a new fire station or the expansion, consolidation, or relocation of an existing fire station would also be identified through this process, the impacts of which would be addressed accordingly. Furthermore, over time, LAFD will continue to monitor population growth and land development throughout the City and identify additional resource needs, including staffing, equipment, trucks and engines, ambulances, other special apparatuses, and possibly station expansions or new station construction, which may become necessary to achieve the required level of service. Consistent with the California Constitution Article XIII, Section 35(a)(2), the obligation to provide adequate fire protection services is the responsibility of the City. Through the City's regular budgeting efforts, LAFD's resource needs, including staffing, equipment, trucks and engines, ambulances, other special apparatuses and possibly station expansions or new station construction, will be identified and allocated according to the priorities at the time. At this time, LAFD has not identified the need for any new stations or station improvements in the Project area either because of this Project or other projects in the service area. However, if a new fire station, or the expansion, consolidation, or relocation of an existing station was determined to be warranted by LAFD, such facilities: (1) would occur where allowed under the designated land use; (2) would be located on parcels that are infill opportunities on lots that are between 0.5 and 1.0 acre in size; and (3) could qualify for a categorical exemption under CEQA Guidelines Section 15301 or 15332 or a Mitigated Negative Declaration and would not be expected to result in significant impacts. Therefore, development of a station at this scale is unlikely to result in significant impacts, and projects involving the construction or expansion of a fire station would be addressed independently pursuant to CEQA.

Based on the above, as stated on page IV.J.1-30 of the Draft EIR, the Project and related projects would not result in significant cumulative impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which would cause significant environmental impacts, in order to maintain acceptable service ratios, response times, or other performance objectives for fire protection services. As such, the Project's contribution would not be cumulatively considerable, and cumulative impacts on fire protection services would be less than significant.

In addition, refer to the Confirmatory Fire Public Services Technical Memorandum included in Appendix FEIR-12 of this Final EIR, which confirms that the Project's contribution to cumulative impacts would be less than significant.

With regard to cumulative impacts related to police protection, as discussed on pages IV.J.2-18 through IV.J.2-22 of Section IV.J.2, Public Services—Police Protection, of

the Draft EIR, the cumulative analysis assumes that all of the related projects would be built out at the time the Project is built out. Based on a household size factor of 3.14 persons for affordable multi-family units and 2.25 persons for other multi-family housing, the residential component of related projects that fall within the service area of the Wilshire Community Police Station would generate approximately 4,592 residents. The Project does not include residential uses and would not add to this residential population and thus would not affect the crime per capita rate. Furthermore, while the daytime population in the Wilshire Area is anticipated to increase as a result of the Project, the Project would implement Project Design Features POL-PDF-2 through POL-PDF-7 to reduce its demand for police protection services. As stated by LAPD, “[t]he TVC 2050 Project, individually or combined with other past, present or future projects, will not result in the need for new or altered police facilities.”⁶⁶ As such, the Project’s incremental impact would not be cumulatively considerable, and cumulative impacts would be less than significant. Additionally, similar to the Project, each related project located in the City would be subject to the City’s routine permitting process, which includes a review by LAPD to ensure that sufficient security measures are implemented to reduce potential impacts to police protection services. In accordance with the police protection-related goals, objectives, and policies set forth in the Framework Element, LAPD would also continue to monitor population growth and land development throughout the City and identify additional resource needs, including staffing, equipment, vehicles, and possibly station expansions or new station construction that may become necessary to achieve the desired level of service. Through the City’s regular budgeting efforts, LAPD’s resource needs would be identified and monies allocated according to the priorities at the time.⁶⁷ In addition, it is anticipated that the related projects would implement project design features similar to the Project, which would reduce cumulative impacts to police protection services. Furthermore, the Project, as well as the related projects located in the City, would generate revenues to the City’s General Fund (in the form of property taxes, sales tax revenue, etc.) that could be applied toward the provision of new facilities and related staffing, as deemed appropriate.

Thus, as concluded in the Draft EIR, the Project and related projects would not result in significant cumulative impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which would cause significant environmental impacts, in order to maintain service. As such, the Project’s contribution would not be cumulatively considerable, and cumulative impacts on police protection services would be less than

⁶⁶ Written correspondence from Alfonso Velasco, Public Engagement Section and Crime Prevention Through Environmental Design Section, Los Angeles Police Department, March 3, 2022. See Appendix L of the Draft EIR.

⁶⁷ City of Los Angeles, Proposed Budget for the Fiscal Year 2021–22.

significant. Based on the above and the detailed analyses included in Section IV.J.1, Public Services—Fire Protection, and Section IV.J.2, Public Services—Police Protection, of the Draft EIR, the cumulative analyses regarding public services have been completed in full compliance with CEQA.

Comment No. 26-154

K. Traffic and Transportation

Under Senate Bill 743, agencies must analyze a project's traffic impacts using vehicle miles travelled or "VMT." The DEIR's approach to VMT analysis is fatally flawed and must be redone.

The traffic analysis uses the City of Los Angeles VMT Calculator Version 1.3 (July 2020). (DEIR, p. IV.K-6.) As discussed in the Linscott Law & Greenspan Comments on Transportation Section and Transportation Assessment in Draft Environmental Impact Report for TVC 2050 Project (LLG Report), the official User Guide for the City's VMT calculator states that it is "specifically designed and intended to be used to develop project specific daily household VMT per capita and daily work VMT per employee metrics for residential and office land use development projects in the City of Los Angeles." (Los Angeles Department of Transportation, City of Los Angeles VMT Calculator User Guide Version 1.3 (May 2022) at I ("User Guide"); available at https://ladot.lacity.org/sites/default/files/documents/vmt_calculator_user_guide-2020.05.18.pdf.)

The User Guide goes on to expressly state the VMT calculator "is not designed to do the following:... [e]valuate VMT impacts of... entertainment projects [or] [e]valuate VMT impacts of land use plans (e.g., general plans, community plans, and specific plans)." (*Id* at 2, 3 (emphasis in original).)

The Project includes the adoption of a Specific Plan. Indeed, the Specific Plan essentially is the Project. (E.g., DEIR, p. II-1 ("The TVC 2050 Project (Project) would establish the TVC 2050 Specific Plan (Specific Plan)...").) The Project is requesting a land use change to "Regional Center" and adoption of a Specific Plan.

The Project objective describes the project as a "major studio and entertainment center" and an "iconic entertainment and media center." The DEIR also repeatedly describes the Project as an "entertainment" project. The allowed entertainment uses described in the DEIR are broad. (*Id.* at II-15, 16.) The Project will be a major entertainment venue used for unlimited audience and entertainment shows, special events, e-sport events, theaters and other entertainment uses allowed in the C2 zone, attracting thousands of visitors.

Given this, why was the calculator used for this specific plan project that characterizes itself in its project objectives as an “iconic entertainment and media center”? What evidence is there that the calculator is an accurate predictor of VMT for this Project? The User Guide expressly rejects use of the VMT calculator for this Project.

It makes sense because the calculator is based on a static model and the inclusion of a specific plan with thousands of employees and visitors changes the calculator’s equilibrium. As such, the calculator is not an accurate predictor of VMT for specific plan projects, such as this Project, because once the equilibrium is changed the calculator doesn’t respond to this change. Why was the VMT calculator used for the Project when the express instructions of the City’s Official User Guide is that the calculator not be used for a specific plan? How can the VMT calculator be used when the Project itself changes the calculator’s and underlying model’s equilibrium? Since the calculator cannot be used for specific plans please provide a new VMT analysis that accurately predicts the Project’s VMT.

The VMT traffic analysis must “be prepared with a sufficient degree of analysis to provide decision-makers with information which enables them to make a decision which intelligently takes account of environmental consequences” and it must reflect “completeness, and a good faith effort at full disclosure.” (*Id.*; 14 Cal. Code Regs. § 15151.) There is no disclosure in the DEIR to justify the use of the VMT Calculator. Using the City’s VMT calculator is contrary to the express instructions in the City’s User Guide and there is no analytic framework provided in the DEIR to support its use.

The DEIR states that it “uses a conservative (i.e., worst-case from a trip generation perspective) mix” of uses to estimate traffic from the Project. (DEIR, p. IV.K-35.) This claim is not supported by any data or modeling that the mix of uses are in fact the worst-case. The analysis is opaque and difficult for a layperson or a decision-maker to sift through, and it is clear that the DEIR minimizes and understates the Project’s true traffic impacts. How is the mix of uses analyzed the “worst-case”? What evidence is there that the use mixes analyzed are a “worst-case”?

Response to Comment No. 26-154

The VMT analysis was completed in full compliance with CEQA and LADOT requirements. Refer to Topical Response No. 8, Vehicle Miles Traveled, for a detailed discussion of the appropriateness of using the City’s VMT Calculator for the Project. Topical Response No. 8 includes an explanation of why a development project implemented under a specific plan can and should be analyzed using the VMT Calculator. It also explains why the City’s definition of an “entertainment project” is not applicable to the Project. Finally, it describes why the Project is not large enough to change demographics in a meaningful way such that the data underlying the VMT Calculator would become invalid. Please note that this comment includes an inaccurate quotation of the Draft EIR;

page II-11 of the Draft EIR states “major studio and entertainment institution” and not “major studio and entertainment center” as incorrectly stated in the comment.

Also, refer to Topical Response No. 3, Permitted On-Site Uses, regarding the five permitted land uses under the Specific Plan and the regulation of special events (e.g., premieres, charitable events, community events, commercial events, and non-commercial events, etc.). All of the permitted uses have been accounted for in the transportation analysis.

The comment also questions how the Project’s mix of land uses can be considered to be the worst-case from a trip generation perspective as the Specific Plan would permit a narrow range of flexibility in what studio land uses may be developed through the Land Use Exchange Program described on pages II-16 to II-17 of the Draft EIR. The proposed development program includes 350,000 square feet of sound stages, 104,000 square feet of production support, 700,000 square feet of production office, 700,000 square feet of general office, and 20,000 square feet of retail, for a total of 1,874,000 square feet. Under the Land Use Exchange Program, the amount of sound stage may be increased up to a maximum of 450,000 square feet, and production support may be increased up to a maximum of 450,000 square feet, in exchange for an equivalent decrease in the floor area of any of the other permitted land uses (individually or in combination). Importantly, the two office uses and the retail space generate the most trips, and the Project assumed the maximum allowable buildout of each of those uses under the Land Use Exchange Program. Further, the specific mix of retail land uses was chosen to maximize trip generation.⁶⁸ Sound stages and production support generate fewer trips per square foot, and, therefore, the Project assumed the least amount of those uses as is possible within the total permitted floor area under the Land Use Exchange Program. Hence, the assumed Project land use program resulted in the maximum (i.e., worst-case) trip generation. Also, since the CEQA analysis is based on VMT rather than trips, two supplemental land use programs under the Land Use Exchange Program were analyzed that generate slightly higher VMT or VMT per employee than the Project. The results of these “maximum transportation impact” scenarios were described on page IV.K-77 of Section IV.K, Transportation, of the Draft EIR. Neither would exceed the City’s significance threshold or result in significant VMT impacts. Refer to Section A, Appropriateness of Using VMT Calculator, of Topical Response No. 8, Vehicle Miles Traveled, and Appendix FEIR-3,

⁶⁸ The retail land use assumption was chosen to present a realistic potential development scenario that would maximize trip generation. It consisted of 15,000 square feet of supermarket, a 3,500 square foot high-turnover restaurant, and a 1,500 square foot coffee shop. These uses generate substantially more trips during both the morning and afternoon peak hours than standard retail uses and other specialty uses that could be developed within the 20,000 square feet of retail space. The retail trip generation estimates are provided in Appendix E to the Transportation Assessment, provided in Appendix M.1 to the Draft EIR.

Maximum Impact Scenarios, of this Final EIR for additional details about the maximum transportation impact scenarios.

Refer to Section B, Visitor Trips, of Topical Response No. 10, Trip Generation, regarding the number of audience shows and trips under existing conditions and the Project.

Refer to Section C, Special Events, of Topical Response No. 10, Trip Generation, regarding special events.

Comment No. 26-155

The traffic analysis appears to omit trips and VMT from some of the specified uses for this Project. Are the assumptions regarding trip and VMT consistent with the Specific Plan? How are the trips and VMT from the following uses accounted for in the analysis: special events; audience shows; entertainment shows; e-sports; and any number of other uses permitted in the C2 zone? What assumptions were made regarding these permitted uses? These uses alone could generate thousands of VMT. They do not appear to be accounted for in the VMT calculator or transportation analysis. If these uses are permitted (as the DEIR indicates they are) and are not accounted for in the traffic analysis, then please explain how the DEIR could conclude this is a “worst-case” from a trip generation perspective. Is it even an accurate or reasonable assessment, if the DEIR states these uses are permitted and they are not included in the trip generation? To meet CEQA’s standard of “completeness, and a good faith effort at full disclosure,” it is essential that the DEIR first disclose the VMT for all of the proposed uses the Project allows and clearly delineate how the VMT for each use was accounted.

As discussed above, how and to what extent the extensive list of permitted uses are allowed in the Specific Plan is unclear. As the DEIR is drafted, the public and the decision-maker have no idea how VMT and traffic will change if the Project is constructed and used for the different allowable uses. For example, e-sports are a burgeoning entertainment area and an allowed use. But how are the trips for e-sports events (including spectators) accounted for in the analyses? How many e-sport facilities are allowed? Are they part of the sound stage permitted square footage or other land use? What about the other laundry list of C2 uses?

Similarly, how many “audience and entertainment uses” were assumed, and how were those traffic impacts, including VMT, calculated? Are the audience and entertainment uses under the sound stages permitted square footage? As detailed in the LLG Report, currently, each sound stage at Television City is rated for audience shows with many allowing for 300+ audience members. If all permitted sound stages in the future are used for audience shows this can be over 5,000 audience members per day (assuming only one

show a day). How did the DEIR consider audience trips and the impact on VMT? The permitted uses also allow for arenas, stadiums, and auditoriums each with an occupancy of up to 3,000 people. Were these uses accounted for in the VMT analysis? What size theater was included in the VMT analysis? What size special event? Please describe how each permitted use was accounted for in the transportation analyses. Without the Specific Plan it is not possible to assess.

Again, the traffic generated for each of these uses could substantially differ. Using a generic trip-generation factor without accounting for the extensive list of permitted uses or providing more information regarding the regulation of these uses in the Specific Plan is inadequate. Adequate disclosure and analysis requires that the public have enough information in the DEIR to understand the existing traffic and VMT, how the Project will change the traffic and VMT, whether additional generation sources cause significant impacts, and what, if any, mitigation is required. The DEIR falls far short of that standard. For example, in a week with ten audience-participation shows and 2 feature film filming, an e-sports tournament, a new museum exhibit, a theater event, and warehousing what would the trip generation be and what would the VMT be? This information cannot be ascertained from the DEIR. And every one of those uses is a permitted use.

To meet CEQA's information mandate, the DEIR must include analysis of all uses allowed by the Specific Plan (which is not available) and the trips generated and the VMT generated by each use. Though the public does not have the Specific Plan, by what is presented in the DEIR it apparently would be up to the Project proponent whether to build a project that emphasizes, for example, e-sports over motion picture production, or warehousing and office rather than studio uses. There is no information in the DEIR that indicates otherwise. There is nothing stated requiring the Project applicant to build any particular element of studio or office or to link the other litany of uses to on-site studio uses. According to the DEIR, the applicant could build all office and no stages. How did the DEIR assess the range of non-studio uses for the Project? Please provide a transportation analyses that reflects the range of possible uses and configurations of the site.

The public deserves to know how those decisions affect traffic and VMT. Specifically, please provide the trip and VMT generation factors assumed for each of the following uses allowed in the DEIR:

motion picture, television, and broadcast studios and related incidental uses, including, but not limited to: production activities; indoor and outdoor stages; sets and façades; digital, film, video, audio, video game, eSports, and media production; recording and broadcasting; sound labs; film editing; film video and audio processing; sets and props production; computer design; computer graphics; animation; and ancillary facilities related to those activities. The following types of related uses and facilities would also be permitted, as

detailed in the Specific Plan: basecamps, communication facilities, conference facilities, modular offices and trailers, studio support facilities, parking, various ancillary commercial and retail uses to serve the on-site employees and visitors, catering facilities, special events, audience and entertainment shows, museum exhibits and theaters, childcare and educational facilities, fitness facilities, emergency medical facilities to serve the on-site employees and visitors, fueling stations and vehicle repair related to on-site uses and activities, infrastructure, maintenance and storage facilities, mills/manufacturing, sleeping quarters for certain on-site personnel, recreational facilities, restaurants and special event areas including the sale of alcoholic beverages, security facilities, signs, storage and warehouses, helipad, and all other uses permitted in the C2 zone unless expressly prohibited in the Specific Plan. (DEIR, p. II-15, 16.)

These uses are so diverse, it is simply not the case that a single trip or VMT-generation factor covers all of them, and the DEIR should disaggregate the trip and VMT generation by permitted use. Please provide a matrix showing the trip and VMT generation rates for each of the uses that the DEIR states is permitted to occur at the Project Site.

Response to Comment No. 26-155

Refer to Topical Response No. 8, Vehicle Miles Traveled, and Section B, Visitor Trips, of Topical Response No. 10, Trip Generation, for information about how sound stage audience shows (which could include entertainment shows or e-sports productions with an audience) were accounted for in the trip generation estimates and VMT calculations. As described therein, studio audience activity is anticipated to approximately double from current levels with the Project, resulting in approximately 388 total average daily trips.

Regarding special events, the Specific Plan would not regulate special events. As discussed in Section C, Special Events, of Topical Response No. 10, Trip Generation, approximately three such events occur at the Project Site today with special event permits from the City. They are evaluated on a case-by-case basis by various City departments in the granting of event permits, and this process would not be affected in any way by the Specific Plan.

Refer to Topical Response No. 3, Permitted On-Site Uses, regarding the refined list of permitted uses within the Project Site that corresponds with the proposed set of uses outlined in the proposed Specific Plan. As shown therein, five studio land uses (i.e., sound stage, production support, production office, general office, and retail) are permitted in addition to a refined list of permitted sitewide uses that are ancillary to those five uses. The sitewide uses are standard features of a studio campus and are inherent in the trip generation rates used to estimate Project trip generation (which were also used in the

calculation of VMT per employee). More specifically, these additional sitewide uses are ancillary to the core studio uses, and do not generate external trips or VMT. The list of C2 uses referenced in the comment is not proposed and this reference has been removed from Section II, Project Description, of the Draft EIR; refer to Section III, Revisions, Clarifications, and Corrections to the Draft EIR. As discussed in Topical Response No. 3, Permitted On-Site Uses, in response to comments on the Draft EIR, the list of permitted uses in the Draft EIR was refined to correspond with the proposed uses outlined in the Preliminary Draft Specific Plan. Specifically, the Draft EIR was clarified to substantially narrow the permitted uses consistent with the studio-related objective of the Project. E-sports and theater facilities that are used for production activities would be permitted under the sound stage definition and would not be permitted in any other permitted use such as production office or production support. In addition, arenas, stadiums, and auditoriums with up to 3,000 people, as identified in the comment, would not be permitted. Warehouses would not be permitted, but storage would be permitted for production support uses and basecamp areas.

As discussed throughout all sections in the Draft EIR, the Project is a studio project that would include sound stage, production support, production office, general office and retail uses. As discussed in Topical Response No. 1, Clearly Defined Project Description and Specific Plan, the Draft EIR disclosed all of the elements of the Project required by CEQA and provides a comprehensive analysis of the Project. Additionally, the Specific Plan would incorporate all of the same Project elements that could result in a physical impact on the environment that were fully disclosed and analyzed in the Draft EIR. Refer to Appendix FEIR-2, Comparison Chart of the Draft EIR and the Preliminary Draft Specific Plan, of this Final EIR. Further, the proposed Specific Plan would include a regulatory framework for implementation of the Project, including, among other things, mandatory review processes by the City for implementation of the proposed Project. Future changes that are substantially different than the Project or are beyond the scope of impacts evaluated in the EIR would require additional discretionary City review and approval, as well as CEQA compliance review.

Overall, the trip generation estimates and VMT analysis provided in Section IV.K, Transportation, of the Draft EIR and the Transportation Assessment (Appendix M.1 of the Draft EIR) fully address all of the uses set forth in the proposed Specific Plan.

Comment No. 26-156

As the Project Site is an operating studio, why doesn't the DEIR include information for the existing trip generation, VMT, and transit use at the Project Site under baseline conditions? The Project Site is a working studio with offices and production facilities. This information would be uniquely helpful to assess the actual trip generation and VMT generation related to the Project Site. Why was 2009 data from another studio used rather than data from the

existing Project Site? Television City is different from the other studios in that it is all audience participation stages. In light of the differences, what was the basis for determining that the trip generation rates from the other studios were applicable to Television City absent corroborating data? Please provide existing baseline data on vehicle trips, distance and direction of travel, and transit use for the Project Site.

The DEIR VMT analysis assumes that 15% of the workers at the Project Site use transit. (DEIR, p. IV.K-35.) Again as there is an existing studio at the Project Site with workers who commute, there is no reason to use a generic 15% factor to account for transit use. The DEIR should use actual data based on the existing workers to determine what percentage of trips and VMT are displaced by transit use. What is the baseline transit use by the existing users at the Project Site today?

As it stands, there is no substantial evidence that 15% of trips and VMT are displaced by transit trips. Data from the California Air Resources Board shows that in Southern California, before the pandemic, only 3.8 percent of drivers in the area including Los Angeles took transit. (Data available at <https://ww2.arb.ca.gov/our-work/programs/sustainable-communities-program/dashboard-tracking-progress-sustainable>.) Almost all people drive alone to their jobs. (See CARB, Appendix A Regional and Statewide Transportation, Housing, and Land Use Performance Metrics Under SB 150 (June 2022) at 32, available at https://ww2.arb.ca.gov/sites/default/files/2022-07/2022_SB_150_Appendix_A_Draft_ADA.pdf.) And again, even before the COVID pandemic, the trend for transit use was down-with fewer people taking transit and more people driving alone in their cars. (*Id.*) Since COVID, transit ridership has plummeted further. For example, the California Air Resources Board reports that “[a]lthough the transit ridership decline was occurring before the COVID-19 pandemic, a sharp decline in all regions due to the pandemic compounds the challenge to attain ridership at the levels identified in the [Sustainable Communities Strategy].” (California Air Resources Board, Draft 2020 Progress Report (June 2022) at 6.) Please provide support for assuming that Project employees will use transit. Does the transportation analysis assume that 15% of studio production trips and VMT are displaced by transit? Please provide support for the assumption of the level of transit usage by studio production workers. What assumption is made about the level of transit usage by production office workers? General office workers? Audience guests? Production and basecamp workers?

Further, the fact that the Project intends to provide an increased proportion of parking per square foot indicates that it does not expect to achieve the 15% transit use. As an example, the Project is providing office usage with 3 spaces per 1,000 square feet of floor area. This is higher than the LAMC requirement of 2 spaces per 1,000 square feet. Did the City consider limiting the amount of office parking to encourage transit? Why does the Project include more parking for office use for trips that will supposedly be reduced by employees using transit? If employees actually used transit, why would the Project need

more office parking than provided by the LAMC? Given the lack of support for the assumed transit use, the analyses that rely on the trip reductions from transit use (e.g., air quality, GHG, and noise) are inaccurate and need to be redone.

The modeled VMT per employee in the DEIR is 6.7 or 6.4 miles (or roughly a 3.2-mile commute distance), depending on the assumptions. (DEIR, pp. IV.K-76, 77.) However, the VMT Calculator User Guide states that the calculator should not be used for this Specific Plan project. Therefore, the VMT per employee generated for this Project is not reliable. The 3.2 miles is not supported by any other data in the DEIR. Actually, other published trip length data suggests that the Project VMT, if properly calculated, would be much greater. For example, the nearby City of West Hollywood traffic data documented an average commute distance of 15.8 miles, more than two times the value used in the DEIR. (See City of West Hollywood, Citywide Traffic & Mobility Study, available at <https://www.weho.org/city-government/city-departments/planning-and-development-services/long-range-planning/mobility-planning/citywide-traffic-mobility-study>.)

As explained in the LLG Report, the census data for the area indicates that more than half of the workers in the Project area commute greater than 10 miles each way, with more than 25% commuting more than 25 miles each way. And when plotted on a map, the DEIR's assumed commute length of 3.2 miles each way excludes areas of high residential concentration like West LA/Santa Monica, South LA and the Southbay, [sic] Downtown LA and the San Gabriel Valley, and the San Fernando Valley.

LLG also used Big Data analytics provided by StreetLightData (SLD) which showed that the daily average one-way trip length measured to and from the Project Site for all vehicles (employees, visitors, deliveries, etc.) is 17.1 miles. In addition, as discussed in the LLG Report, cell phone tracking data from the analytics company Placer compiled for 2018 and 2019 indicated that more than 65% of employees traveled greater than seven miles one-way to the Project Site.

Taken together, the inapplicable use of the VMT calculator and all of this data shows that the DEIR's assumed VMT per employee is grossly understated.

While modeled VMT analysis may be appropriate for a new use and when the model is intended for that use, there is no justification for using modeled VMT based on non-Project Site data here. The Project is an expansion of an existing studio use, and the Project is a Specific Plan. Why didn't the applicant obtain data regarding VMT from the existing uses, workers, and visitors and use the empirical site data to model the Project VMT? The output of the VMT calculator is further evidence that the use of the VMT calculator is inappropriate for this Project as stated in the User Guide. The output is inconsistent with other data and does not reflect where a significant percentage of studio workers live.

Page IV.K-15 of the DEIR describes the existing conditions and the transportation study area. However, because the DEIR understates the VMT and trips from the Project, the study area should be broader to account for the increased trip generation from the Project. In addition, there is no discussion of how the study area was selected. Please explain why, using the proper trip length and trip generation from permitted uses from this Project Site, a broader study area is not required. Why limit the study area to 31 intersections, when commuters can travel over 15 miles or more to and from the Project Site?

What is the distribution of commute lengths for workers at the existing studio? That data should be available from existing workers, and it is relevant baseline data for trip generation and VMT by the Project. How did the DEIR determine the appropriate distribution without the distribution of the existing employees and visitors? Was this information provided to the City? The information should be included in the DEIR.

Response to Comment No. 26-156

Refer to Topical Response No. 10, Trip Generation, for a discussion on the validity of the empirical data used to estimate trip generation for sound stage, production support, and production office uses, including a comparison of actual driveway counts of existing trips at the Project Site to estimates using those trip rates. Topical Response No. 10, Trip Generation, provides data on the trip generation of the existing studio operations, as requested in the comment. In the Transportation Assessment that was approved by LADOT (Appendix M.1 of the Draft EIR), the existing trip counts were not used as the sole criterion for the derivation of future trip generation rates because the proposed Project modifies the proportion of the land uses within the Project Site such that the trip rates from other studios with a land use mix closer to the proposed Project was determined to be a more appropriate and conservative basis for estimating future trips. The comparison of the existing driveway counts at the Project Site to the trip rates based on the NBC Universal Studios EIR showed that the use of the 2009 trip rate data is still accurate and reliable.

The ZIP Code information from the existing employees on the Project Site was used to inform the trip distribution estimates shown in Figures 19A and 19B on pages 69–72 of the Transportation Assessment. Detailed mode split data for the existing employees was not available.

It is inaccurate to describe the existing studio as comprised of “all audience participation stages.” At any given time, there are more stages operating without audiences than with audiences. Refer to Section B, Visitor Trips, of Topical Response No. 10, Trip Generation, for more information on studio audiences.

Refer to Topical Response No. 11, Transportation Demand Management, for a discussion of the appropriateness of applying a 15-percent transit/walk-in adjustment to the

Project trip generation estimates. As discussed in Response to Comment No. 26-32, the proposed rate of three parking spaces per 1,000 square feet of office does not conflict with the 15-percent transit usage assumption. The Trip Generation Handbook, 3rd Edition (Institute of Transportation Engineers, September 2017) provides a summary of research of TDM programs at many different employers. As discussed in the Transportation Assessment, at places that had the most comprehensive programs, including both economic incentives (e.g., transit passes, etc.) and support services, the programs resulted in an average reduction of approximately 24 percent in commuter vehicles. The Project's TDM Program is robust. However, to be conservative, the Project's operational transportation analysis was conducted without consideration of any trip reductions as a result of the TDM Program.

There are several examples of major studio and entertainment campuses that have successfully implemented TDM programs for employees and visitors that have far exceeded the 15-percent automobile reductions estimated in the Draft EIR and even exceeded the estimated 20- to 30-percent reductions from the TDM Program.

- UCLA has one of the most successful TDM programs in Southern California, with participation from both students and faculty. As a result of the TDM program, a total of 17 percent of the faculty at UCLA travel to/from the campus via transit, and 25 percent of such faculty members have an annual salary over \$100,000. An annual comprehensive traffic count on the streets surrounding the UCLA campus shows that trips to/from the campus have decreased despite the growth in enrollment, faculty/staff, and programs. In 2006, the traffic count showed 120,000 vehicular trips in/out of the campus. That same cordon showed 102,000 in 2009. This reduction in vehicle trips is attributed to the TDM program used at the campus.⁶⁹
- Cedars-Sinai Hospital, which is located near the Project Site, has a TDM program that includes carpools, vanpools, transit passes, TAP cards and e-Trips, and these measures have helped the hospital reduce individual vehicle trips and parking demand. The hospital manages 32 vanpools that each carry between 5–14 people, removing an average of 200 automobiles from the street system every day.⁷⁰
- NBCUniversal has been working with Metro to institute the business transit access pass (BTAP pass) as part of the E-Pass system that offers employees discounted or free transit rides with seven different transit agencies. Tax-free

financial transportation incentives and programs like a shuttle bus connection to the subway station have decreased the single-occupant vehicle trips from 59 percent of peak-hour employee arrivals to 14 percent for the employees in the initial pilot of this program.⁷¹

These examples demonstrate that a TDM program can reduce the number of automobile trips generated by a particular development. The programs described above reduced the amount of automobile trips in far greater numbers than the levels assumed in the Project's Transportation Assessment. Refer to Topical Response No. 8, Vehicle Miles Traveled, for a detailed discussion of the appropriateness of using the City's VMT Calculator for the Project. It includes discussions of the following:

- Why a development project implemented under a specific plan can and should be analyzed using the VMT Calculator;
- Why the VMT Calculator's estimate of 6.7 work VMT per employee does not mean that the average commute distance is half of that distance;
- That the alternative data sources cited in the comment (census data, Streetlight Data, Placer) are based on small, non-representative samples, cannot be isolated to employee trips, do not provide precise data, and are not approved for use in VMT analysis in the City;
- That there is no recommendation in City or State guidance on VMT analysis to use empirical trip lengths when a model-based solution that combines trip thresholds and Project analysis is available; and
- That it is important in conducting VMT analysis that both the thresholds of significance and the Project-level VMT estimates be developed using the same data source in order to ensure an apples-to-apples comparison.

The comment suggesting that the Study Area should have been larger and included analysis of more intersections is incorrect for many reasons. First, intersection analysis is not a CEQA requirement; therefore, the City can set boundaries at its discretion. Second, the Study Area was identified in accordance with guidelines provided in the TAG. Third, Project vehicles disperse and have a diminishing effect on any single location the further they are from the Project Site, and the Study Area was chosen to include locations with a specified concentration of Project vehicles (the TAG recommends including locations carrying at least 100 peak hour Project trips).

⁷¹ | October 6, 2022 telephone interview with Devon Demming, Los Angeles Metro.

As discussed in Topical Response No. 8, Vehicle Miles Traveled, the trip distribution and resulting commute lengths for existing on-site employees and for future Project employees are both taken from the LADOT VMT Calculator. Travel patterns in the VMT Calculator are based on the City's long-range travel demand model and the VMT Calculator is used for both existing and future employees in order to provide a fair comparison of new VMT generated by the Project. The distribution of employee work trips is based on arrangement of land use and population assumed in the long-range model and, therefore, does not depend on the current trip patterns of existing on-site employees as suggested in the comment.

Comment No. 26-157

Additionally, the DEIR's environmental setting acknowledges that the Project may have traffic impacts in Beverly Hills and West Hollywood: "The Project's Transportation Assessment approved by LADOT also accounts for more distant projects up to three miles away that could pose cumulative impacts on the transportation system, including projects within the adjacent cities of Beverly Hills and West Hollywood." (DEIR, p. III-8.) If the Project and other cumulative projects will have traffic impacts in other jurisdictions, the City needs to coordinate with those other jurisdictions-including West Hollywood and Beverly Hills-and conduct a traffic analysis using the thresholds adopted by those local governments. (See City of West Hollywood, Citywide Traffic & Mobility Study, available at <https://www.weho.org/city-government/city-departments/planning-and-development-services/long-range-planning/mobility-planning/citywide-traffic-mobility-study>.) The City of West Hollywood's traffic data further supports a low transit split for commuters (3% before COVID) and a much longer average commute than the DEIR reports for the Project-15.8 miles. (See also City of Beverly Hills, CEQA Thresholds of Significance for Transportation Impacts, available at <https://www.beverlyhills.org/cbhfiles/storage/files/4460592531431926648/RFP-20-270-2-ATTACHMENTCCITY'SCEQATHRESHOLDS.pdf>.)

Response to Comment No. 26-157

The CEQA-required VMT analysis uses the City of Los Angeles' VMT Calculator, which takes into account employee work travel through the streets of the City of Los Angeles and through the streets of adjacent jurisdictions.

CEQA gives cities the option to ask for an operational study of project impacts on key intersections, but this analysis is not required by CEQA. LADOT identified 31 intersections that should be studied for non-CEQA operational effects, all within City of Los Angeles city limits.

Figure III-1 and Table III-2 in Section III, Environmental Setting, of the Draft EIR detail the location and trip generation of the 68 related projects in the general vicinity of the

Project. Of that total, 25 are located in Los Angeles, 25 in West Hollywood, 17 in Beverly Hills and one that touches multiple city boundaries (the Metro D (Purple) Line extension, a transportation infrastructure project). Morning and afternoon peak hour trips from these related projects were added to the future trip levels to estimate a Future Without Project scenario. Figure 15 in the Transportation Assessment (Appendix M.1 of the Draft EIR) shows the level of trips generated by these related projects and assigned through the Project study intersections. This figure shows that the related projects are responsible for the addition of approximately 200 morning peak hour trips per hour and approximately 356 afternoon peak hour trips per hour on Fairfax Avenue adjacent to the Project Site. Along Beverly Boulevard, the related projects add approximately 90 morning peak hour trips and approximately 162 afternoon peak hour trips adjacent to the Project Site.

In comparison, Figure 21 on page 21 of the Transportation Assessment (included in Appendix M.1 of the Draft EIR) shows that the Project would generate fewer than approximately one trip per minute westerly towards Beverly Hills or northerly towards West Hollywood along any street. In fact, trips from the related projects have a greater impact on the study intersections near the Project Site than Project trips would have on the distant intersections in West Hollywood or Beverly Hills. Project trips would utilize less than two percent of the capacity at the nearest major intersections in either Beverly Hills or West Hollywood and even that low level of traffic would dissipate the further away from the Project.

Comment No. 26-158

Existing parking for the Project Site is 1,510 for about 750,000 square feet. (DEIR, p. IV.K-22.) Proposed parking is 5,300 parking spaces for 1,874,000 square feet (setting aside the redefinition of the total amount of development). This increases the parking ratio from about 1 per 500 square feet to 1 per 350 square feet. Please clarify how increased parking is consistent with the City and regional goals of transit usage.

Response to Comment No. 26-158
