Executive Summary

This report presents the results of the Transportation Analysis (TA) conducted for the proposed residential development at 505 E. Bayshore Road in Redwood City, California. The 2.54-acre project site is currently developed with industrial warehouse structures and outdoor industrial storage uses. The project proposes to construct 56 rowhouses within 9 buildings. The project would remove two of the three existing driveways along E. Bayshore Road and would reconstruct one existing driveway to provide access to the project site.

The transportation analysis was conducted for the purpose of identifying potential traffic impacts related to the project. The potential impacts of the project were evaluated in accordance with the standards set forth by Redwood City and the City/County Association of Governments of San Mateo County (C/CAG). The C/CAG administers the San Mateo County Congestion Management Plan (CMP). This report includes an evaluation of transportation impacts according to CEQA and a Local Transportation Analysis (LTA) per the City's requirements.

CEQA Transportation Impacts

Because the proposed project would require a General Plan Amendment, the bi-county C/CAG-Santa Clara Valley Transportation Authority (VTA) travel forecasting model was used to estimate the daily project generated VMT and project effect on VMT. The land use inputs for the project TAZ were updated for the “with Project” scenario to reflect the proposed addition of households and decrease in jobs associated with the existing warehouse space. The project generated VMT statistics are expressed per resident and the project effect on VMT is expressed per capita to distinguish the effects of population growth from the effects of changes in personal behavior.

The results of the project generated VMT analysis are presented in Table ES-1. The project's relatively remote location on the east side of US 101 next to the Bay in an area lacking transit connectivity results in a project generated VMT rate that is higher than the average Countywide VMT rate for the proposed residential use. The project generated home-based VMT per capita of 13.4 is greater than the threshold of 10.5 for residential uses. Therefore, the project would have a significant impact based on the project generated VMT. The project generated VMT can be reduced by implementation of a Transportation Demand Management (TDM) Plan that includes physical facilities, programs, and policies. The project applicant is preparing a TDM Plan to fulfill C/CAG and City requirements, which are discussed in the next chapter. While the TDM Plan has not yet been finalized, it is expected to result in a reduction in daily VMT that would satisfactorily mitigate the project's impact on VMT.

Table ES 1
Project Generated VMT Assessment

Land Use	Significance Criteria	Threshold ¹	Project TAZ VMT ²
Residential	Project exceeds existing countywide home-based VMT per capita minus 15%	10.5	13.4
Notes:			
¹ The threshold for project generated VMT per capita is 15% below the San Mateo County average.			
² Average VMT per capita within the TAZ where the project is located.			

Projects requiring a General Plan Amendment are also required to evaluate the project effect on VMT under Year 2040 Cumulative Conditions. The cumulative project effect on VMT was estimated using the City limit boundary and extracting the total link-level VMT for both no project and with project conditions. The cumulative threshold for the project effect on VMT is no change to the City's per capita VMT applying the boundary method. The proposed project would result in a marginal decrease in VMT per service population (see Table ES 2).

Table ES 2
Project Effect on VMT Analysis

Scenario	Population	Jobs	Service Population	Daily VMT	VMT per Service Population
No Project	105,098	74,831	179,929	1,526,860	8.49
Project	105,249	74,803	180,052	1,526,483	8.48
Change	151	-28	123	-377	-0.01

Level of Service (LOS) Transportation Analysis (Non-CEQA Analysis)

Project Trip Generation

The trip generation rates published for “Single-Family Housing” (Land Use 210) located in a general Urban/Suburban area were used to estimate the trips generated by the proposed project. Based on the ITE rates, the proposed project would generate 529 gross daily trips including 41 AM peak-hour trips and 55 PM peak-hour trips. After crediting the existing trips, the proposed project is expected to generate a net total of 480 daily vehicle trips with 36 net trips in the AM peak hour and 50 net trips in the PM peak hour (see Table ES 3). To be conservative, the analysis of the project’s potential effects on nearby intersections does not assume any trip reductions due to Transportation Demand Management (TDM) measures that may be implemented by the project.

Table ES 3
Project Trip Generation Estimates

Land Use	Size	Daily		Rate	AM Peak Hour			Rate	PM Peak Hour		
		In	Out		Total	In	Out		In	Out	Total
Proposed Land Use											
Single-Family Housing	56 Units	9.44	529	0.74	10	31	41	0.99	35	20	55
Existing Land Use											
Warehouse	-28,255 s.f.	1.74	-49	0.17	-4	-1	-5	0.19	-1	-4	-5
Net Project Trips		480			6	30	36		34	16	50

Notes:

Source: ITE *Trip Generation Manual, 10th Edition* 2017

1. Trip generation rates for the proposed office space are based on the ITE's Trip Generation Manual, 10th Edition rates for Land Use Code 210 "Single-Family Detached Housing".

2. Trip generation rates for the existing warehouse are based on the ITE's Trip Generation Manual, 10th Edition rates for Land Use Code 150 "Warehousing".

Project Conditions Intersection Levels of Service

Based on Redwood City level of service standards and thresholds, the proposed project would not result in a substantial adverse effect at any study intersections under existing plus project conditions and background plus project conditions (see Table ES 4).

Cumulative (2040) Plus Project Intersection Levels of Service

Two cumulative scenarios were analyzed to evaluate cumulative volumes with and without the proposed Blomquist Street extension project (see Table ES 4).

With Blomquist Street Extension

The results show that the project would cause a substantial adverse effect at the intersection of Blomquist Street and Maple Street under the short-term all-way stop control. The project would not cause a substantial adverse effect at the remaining study intersections.

Blomquist Street and Maple Street

The intersection would meet signal warrants under cumulative conditions during the AM and the PM peak hours both without and with the proposed project. Because the project would increase the average delay by more than five seconds and the intersection would meet signal warrants under cumulative conditions, the project is considered to have a **substantial adverse effect** at this intersection.

The intersection would operate at an acceptable LOS B or C with a single-lane roundabout under both cumulative no project and cumulative plus project conditions during the AM and PM peak hours. This roundabout is included as part of the Blomquist Street extension project, which will be funded in part through the City's Transportation Impact Fee (TIF). Therefore, payment of the City's TIF would mitigate this deficiency.

Without Blomquist Street Extension

The results of the level of service analysis under cumulative no project and cumulative plus project conditions without the Blomquist Street extension show that the project would not cause a substantial adverse effect at any study intersections.

Other Transportation Issues

Generally, the proposed site plan shows adequate site access and on-site circulation, and the proposed project would not have an adverse effect on the existing transit services, pedestrian facilities, or bicycle facilities in the study area. Hexagon provides the following recommendations and enhancements for the proposed project:

1. The proposed project should provide bicycle facilities along the project frontage on East Bayshore Road in coordination with the City of Redwood City and adjacent property owners.
2. No transit services currently exist in the project vicinity. Due to the lack of transit accessibility, the project is expected to generate minimal transit trips. To improve transit access, the project should work with the City and SamTrans to create a bus route that serves the various residential, office, and retail uses on Bair Island.
3. The project should provide additional guest parking spaces to satisfy the Zoning Code requirements.

Table ES 4
Intersection Level of Service Summary

Notes:¹ Control Type Definitions: Rbt = Roundabout; OWSC = One-Way Stop Control; AWSC = All-Way Stop Control.

Overall weighted average control delay (seconds per vehicle) is reported for signalized and AWSC intersections.

Worst stop-controlled approach delay (seconds per vehicle) is reported for OWSC intersections.

² The intersection of Blomquist St and Maple St will be converted to either an AWSC or Rbt intersection under cumulative conditions. The above results for Rbt reflect a single-lane Rbt.³ Synchro default parameters were adjusted to ensure intersection delay and LOS reflect field observations.**Bold** indicates a substandard level of service.**Bold** indicates that the proposed project would cause an adverse effect at this intersection.

1. Introduction

This report presents the results of the Transportation Analysis (TA) conducted for the proposed residential development at 505 E. Bayshore Road in Redwood City, California. The 2.54-acre project site is currently developed with industrial warehouse structures and outdoor industrial storage uses. The project proposes to construct 56 rowhouses within 9 buildings. The project would remove two of the three existing driveways along E. Bayshore Road and would reconstruct one existing driveway to provide access to the project site. A public trail would be constructed along the northern boundary of the site, providing access between E. Bayshore Road and a planned public trail segment to be located on the adjacent property to the east, expanding and enhancing public access along the shoreline. The project site and the surrounding study area are shown on Figure 1. The project site plan is shown on Figure 2.

Scope of Study

The purpose of the traffic study is to identify any traffic impacts in accordance with the standards set forth by Redwood City and the City/County Association of Governments of San Mateo County (C/CAG). C/CAG administers the County's Congestion Management Program (CMP). The project would generate more than 100 daily vehicle trips. Therefore, the project is subject to the C/CAG TDM Policy. However, none of the study intersections are part of the CMP roadway network, so the project is not required to evaluate compliance with CMP intersection levels of service standards. This report includes an evaluation of transportation impacts according to CEQA and a Local Transportation Analysis (LTA) per the City's requirements specified in the Redwood City Transportation Analysis Manual dated July 21, 2020.

CEQA Analysis

Vehicle Miles Travelled (VMT) Analysis

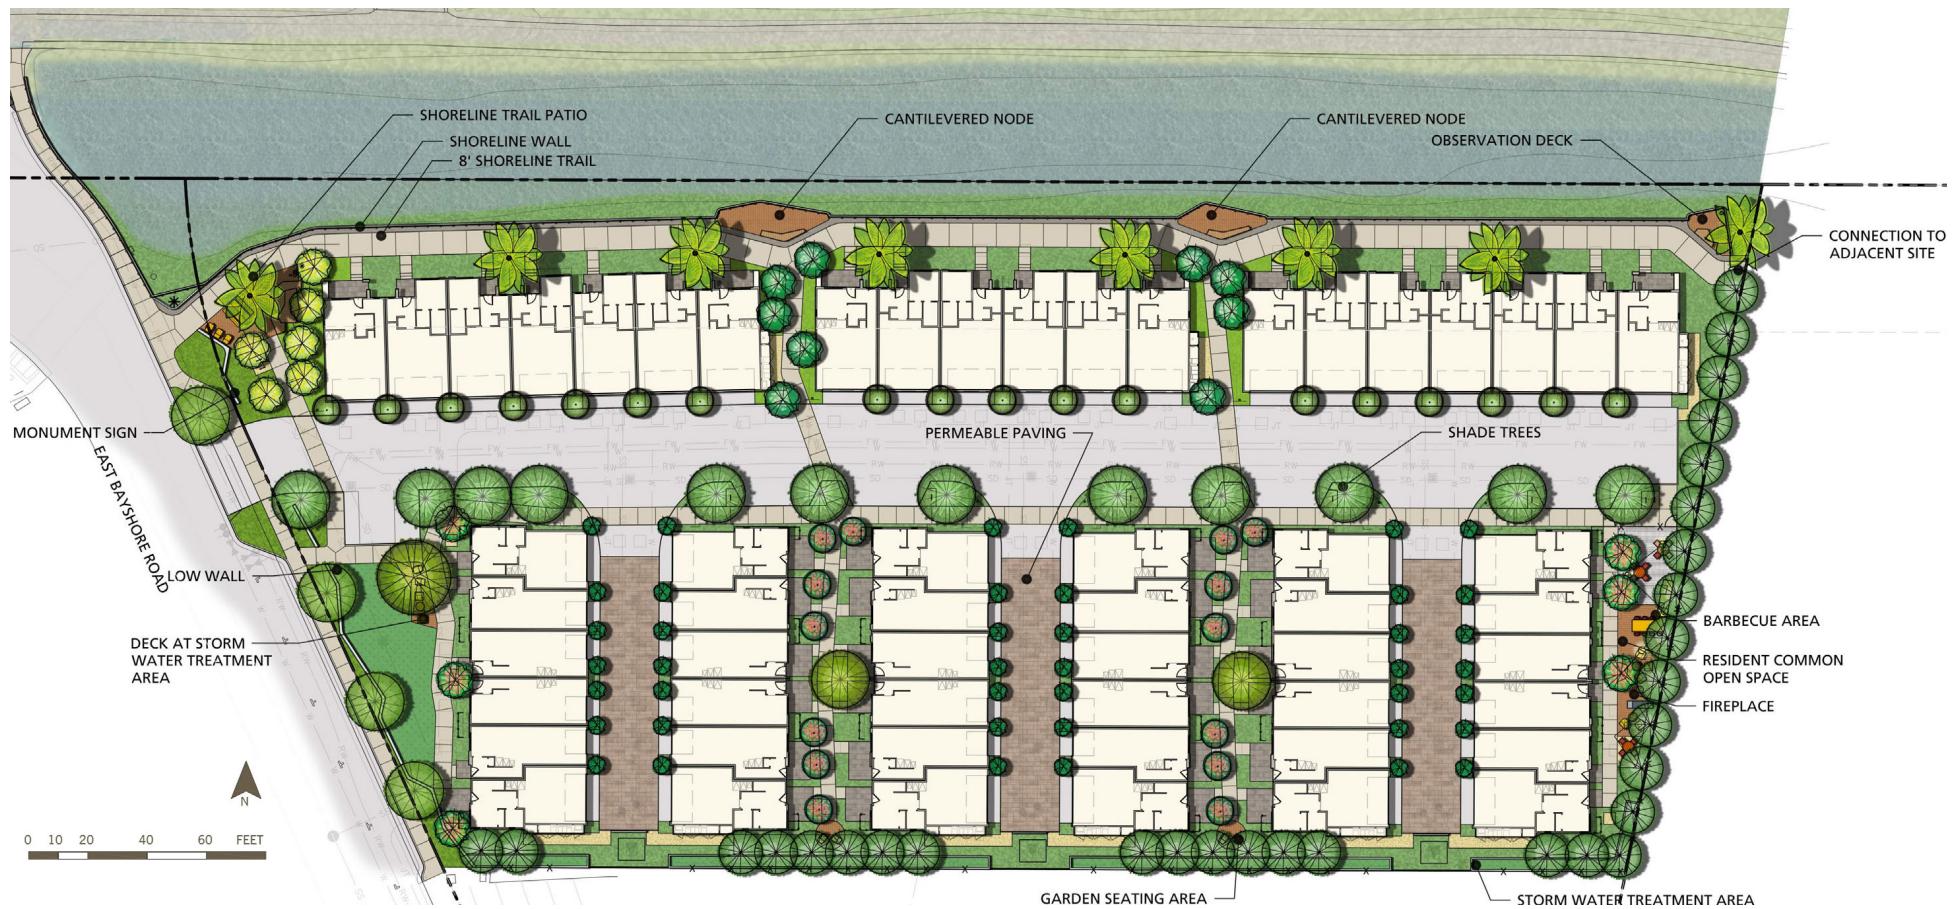

Senate Bill (SB) 743 changed the way transportation impacts are identified under CEQA from vehicle level of service (LOS) to daily vehicle miles travelled (VMT). The City of Redwood City recently adopted a Transportation Analysis Manual that outlines policies and guidelines for VMT impact evaluation generally consistent with SB 743 and the Governor's Office of Planning and Research (OPR) recommendations. A project can be screened from the VMT analysis if it meets the following criteria:

- Transit Priority Areas (TPA): Projects located within $\frac{1}{2}$ -mile walkshed around major transit stops or within $\frac{1}{4}$ mile walkshed around high-quality transit corridors.

Figure 1
Project Location and Study Intersections

505 East Bayshore Road TA

Source: Dahlin Group Architecture, June 25, 2021.

Figure 2
Proposed Site Plan

- Affordable Housing: 100% restricted affordable residential projects in infill locations and near transit.
- Small Projects: Projects defined as generating 150 or fewer average daily vehicle trips, absent substantial evidence indicating that a project would generate a potentially significant level of VMT.
- Locally-Serving Public Facility: Locally-serving public facility that encompasses government, civic, cultural, health, and infrastructure uses and activities that contribute to and support community needs.
- Neighborhood-Serving Retail Project: Neighborhood-serving retail projects that are less than 30,000 square feet that serve the immediate neighborhoods and have a similar use within three miles.

The proposed project land use and location do not meet the above screening criteria. Because the proposed project would require a General Plan Amendment, the bi-county C/CAG-Santa Clara Valley Transportation Authority (VTA) travel forecasting model was used to estimate the daily project generated VMT and the project effect on VMT. The project generated VMT statistics are expressed per resident and the project effect on VMT is expressed per capita to distinguish the effects of population growth from the effects of changes in personal behavior.

Local Transportation Analysis

The LTA analyzed the effect of traffic operations by the project on six key intersections in the vicinity of the project site. The study intersections were selected in consultation with Redwood City staff and include those intersections that provide primary access to and from the project site and locations that may be affected by the proposed project. The study intersections are listed below and shown on Figure 1. Traffic conditions at the study locations were analyzed for the weekday AM and PM peak hours of traffic.

Study Intersections

1. Veterans Boulevard and Whipple Avenue
2. US 101 Northbound Off-Ramp and Whipple Avenue
3. East Bayshore Road (Blomquist Street) and Bair Island Road (unsignalized)
4. Blomquist Street and Maple Street (unsignalized)
5. Blomquist Street and Seaport Boulevard
6. Veterans Boulevard and Woodside Road (SR 84)

Traffic conditions at the study intersections were analyzed for the weekday AM and PM peak hours of adjacent street traffic.

The proposed project would generate more than 100 daily vehicle trips. Therefore, the project is subject to the C/CAG TDM Policy. However, none of the study intersections are part of the CMP roadway network. Furthermore, new project trips on freeway segments would comprise less than one percent of the roadway capacity. Therefore, the project is not required to evaluate compliance with CMP level of service standards.

The proposed project would only add minimal trips to the freeway ramps; therefore, a freeway ramp analysis is not necessary. Instead, the study documents the trips added by the proposed project to the freeway ramps for informational purposes only.

A queuing analysis at study intersections was not conducted because the project would add less than 10 peak-hour trips to all turning movements and would have an insignificant effect on intersection operations.

Traffic conditions were evaluated for the following scenarios:

Scenario 1: *Existing Conditions.* Existing traffic volumes are still depressed due to the COVID-19 pandemic. Therefore, to be conservative, pre-pandemic traffic volumes were used in this study. Weekday AM and PM peak-hour traffic volumes from September 2019 were obtained from the transportation analysis conducted for the proposed development at 557 East Bayshore Road.

Scenario 2: *Existing plus Project Conditions.* Project-generated traffic was added to the existing traffic volumes. Existing plus project conditions were evaluated relative to existing conditions in order to identify substantial adverse effects due to the project.

Scenario 3: *Background Conditions.* Background traffic volumes were estimated by adding to existing traffic volumes the projected volumes from approved but not yet constructed projects that would generate trips at the study intersections. A list of approved projects was obtained from Redwood City.

Scenario 4: *Background plus Project Conditions.* Background traffic volumes with the project were estimated by adding to background traffic volumes the additional traffic generated by the project. Substantial adverse effects on study intersections associated with the development of the project were evaluated relative to background conditions.

Scenario 5: *Cumulative Conditions.* This scenario assumes the development of the Blomquist Street extension project. The cumulative no project traffic volumes were estimated by reassigning the existing volumes based on the extension, adding the trips generated by approved projects and proposed (not yet approved) projects in the vicinity of the project site, and applying a growth factor based on direction from Redwood City staff. Project trips were assigned based on this road network change and then added to the cumulative no project traffic volumes to yield cumulative traffic volumes. Intersection levels of service were evaluated for cumulative conditions with and without the project.

Scenario 6: *Cumulative Conditions without the Blomquist Street Extension.* The cumulative no project conditions traffic volumes under this scenario were estimated by adding to existing traffic volumes the trips generated by approved projects and proposed projects in the vicinity of the project site and applying a growth factor based on direction from Redwood City staff. Cumulative volumes without the Blomquist Street extension were estimated by adding to the cumulative no project volumes the trips associated with the project. Intersection levels of service were evaluated for cumulative conditions with and without the project.

Methodology

This section presents the methods used to determine the traffic conditions at study intersections for each scenario described above. It includes descriptions of the data requirements, the analysis methodologies, and the applicable level of service standards and mobility deficiency criteria.

Data Requirements

The data required for the analysis were obtained from previous studies, field observations, and the City of Redwood City. The following data were obtained from these sources:

- existing peak-hour intersection turning-movement volumes,
- existing lane configurations,
- signal timing and phasing,

- existing bicycle and pedestrian volumes, and
- list of approved but not yet constructed projects and pending projects.

Intersection Level of Service Methodologies

Traffic conditions at the study intersections were evaluated using level of service (LOS). Level of Service is a qualitative description of operating conditions ranging from LOS A, or free-flow conditions with little or no delay, to LOS F, or jammed conditions with excessive delays.

This study uses the Highway Capacity Manual (HCM) 6th Edition methodology for signalized and unsignalized intersections utilizing Synchro software to determine intersection level of service. This method evaluates intersection operations on the basis of average control delay time for all vehicles at the intersection. This average delay can then be correlated to a level of service. Table 1 presents the level of service definitions for signalized intersections. The level of service definitions for unsignalized intersections are presented in Table 2. Note that for unsignalized intersections under two-way or side-street stop control, the level of service is reported for the worst approach.

Table 1
Signalized Intersection Level of Service Definitions Based on Control Delay

Level of Service	Description	Average Control Delay Per Vehicle (sec.)
A	Signal progression is extremely favorable. Most vehicles arrive during the green phase and do not stop at all. Short cycle lengths may also contribute to the very low vehicle delay.	10.0 or less
B	Operations characterized by good signal progression and/or short cycle lengths. More vehicles stop than with LOS A, causing higher levels of average vehicle delay.	10.1 to 20.0
C	Higher delays may result from fair signal progression and/or longer cycle lengths. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant, though some vehicles may still pass through the intersection without stopping.	20.1 to 35.0
D	The influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable signal progression, long cycle lengths, or high volume-to-capacity (V/C) ratios. Many vehicles stop and individual cycle failures are noticeable.	35.1 to 55.0
E	This is considered to be the limit of acceptable delay. These high delay values generally indicate poor signal progression, long cycle lengths, and high volume-to-capacity (V/C) ratios. Individual cycle failures occur frequently.	55.1 to 80.0
F	This level of delay is considered unacceptable by most drivers. This condition often occurs with oversaturation, that is, when arrival flow rates exceed the capacity of the intersection. Poor progression and long cycle lengths may also be major contributing causes of such delay levels.	greater than 80.0

Source: Transportation Research Board, *Highway Capacity Manual 6th Edition* (Washington, D.C., 2016), p.16-19.

Table 2
Unsignalized Intersection Level of Service Definitions Based on Delay

Level of Service	Description	Average Delay Per Vehicle (Sec.)
A	Little or no traffic delay	10.0 or less
B	Short traffic delays	10.1 to 15.0
C	Average traffic delays	15.1 to 25.0
D	Long traffic delays	25.1 to 35.0
E	Very long traffic delays	35.1 to 50.0
F	Extreme traffic delays	greater than 50.0

Level of Service Standards and Mobility Deficiency Criteria

City of Redwood City

The City of Redwood City General Plan contains the following transportation policy with respect to level of service:

“Program BE-55 / Level of Service Policy Evaluation: Evaluate Redwood City’s current Level of Service (LOS) policies for motor vehicle circulation. The evaluation shall consider the following to ensure efficient traffic flow and balance multi-modal mobility goals:

Maintaining LOS D or better for motor vehicles in all areas of the city, except the Downtown area as defined by the Downtown Precise Plan. In Downtown, no minimum vehicular LOS standard will be maintained but vehicular LOS will be calculated and alternate LOS standards for other travel modes will be established.”

The study intersections are located outside the Downtown area; thus, the intersections are subject to the City’s LOS D standard.

According to the City of Redwood City Transportation Analysis Manual, a substantial adverse effect at a study intersection will be caused by the project if:

Signalized Intersection

1. Operations at a signalized intersection deteriorate from an acceptable level (LOS D or better) to an unacceptable level (LOS E or F); or
2. Average delay at a signalized intersection operating at an unacceptable level (LOS E or F) increases by 5 seconds or more.

Unsignalized Intersection

1. Operations at an unsignalized intersection deteriorate from an acceptable level (LOS D or better) to an unacceptable level (LOS E or F); or

2. Delay at an unsignalized intersection operating at an unacceptable level (LOS E or F) increases by 5 seconds or more; and traffic volumes at the intersection satisfy the Caltrans peak-hour volume signal warrant for traffic signal installation.

A substantial adverse effect at an intersection by the City of Redwood City standards is said to be satisfactorily mitigated when improvements are implemented that eliminate the project's adverse effect.

Relevant Plans and Policies

Redwood City Transportation Impact Mitigation Fee Program

The Redwood City Transportation Impact Mitigation Fee (TIF) was adopted by the City to establish a source of funding for future transportation system capital improvements. The list of transportation projects associated with the transportation fee is on file with the Redwood City Community Development Department and is subject to amendment periodically. The notable TIF project in the vicinity of the proposed 505 East Bayshore project is the Blomquist Street extension from Maple Street, over Redwood Creek, to the East Bayshore Road/Bair Island Road intersection. The TIF also includes area-wide improvements to alternative modes such as neighborhood traffic management programs, a City-based shuttle system, a transportation demand management coordinator, and miscellaneous transit, pedestrian, and bicycle projects throughout the City.

US 101/SR 84 (Woodside Road) Interchange Improvement Project

Redwood City, in cooperation with Caltrans and the San Mateo County Transportation Authority (SMCTA), is proposing to reconstruct the US 101 and Woodside Road interchange. The proposal includes modifying the on- and off-ramp configuration at the interchange to improve traffic flow, increase safety, and better accommodate pedestrian and bicycle access across US 101. The project design was paused at the 95% design level while the City seeks to secure full capital funding. The project is not expected to be completed by the cumulative horizon year (2024). Key components of the project include redesign of the existing southbound off-ramp termini from a five-legged intersection to a four-legged intersection, a direct Veterans Boulevard ramp connection to US 101 to reduce vehicular traffic on Woodside Road, perpendicular ramp termini to Woodside Road to allow for improved crossing for both pedestrians and bicyclists, and Class I multi-use paths on the south side of the interchange and along the UPRR corridor to provide safer pedestrian/bicycle access across US 101.

Report Organization

The remainder of this report is divided into four chapters. Chapter 2 presents the CEQA impact analysis. Chapter 3 presents the local transportation analysis including the description of the existing roadway network, transit service, bicycle and pedestrian facilities as well as traffic conditions in the study area under existing, background, background plus project, cumulative with and without the Blomquist Street Extension project, cumulative plus project, and recommended mitigation improvements. Chapter 4 provides an evaluation of other transportation-related issues, such as site access, on-site circulation, parking, and potential project impacts on bicycle, pedestrian, and transit facilities.

2. CEQA Transportation Analysis

This chapter describes the CEQA transportation analysis, including the VMT analysis methodology, threshold of significance, and the project-level VMT impact analysis results. Senate Bill (SB) 743 changed the way transportation impacts are identified under CEQA from vehicle level of service (LOS) to daily vehicle miles travelled (VMT). The City of Redwood City recently adopted a Transportation Analysis Manual that outlines policies and guidelines for VMT impact evaluation generally consistent with SB 743 and the Governor's Office of Planning and Research (OPR) recommendations.

Vehicle Miles Traveled Analysis

Because the proposed project would require a General Plan Amendment, the bi-county C/CAG-Santa Clara Valley Transportation Authority (VTA) travel forecasting model was used to estimate the daily project generated VMT and project effect on VMT. The land use inputs for the project TAZ were updated for the “with Project” scenario to reflect the proposed addition of households and decrease in jobs associated with the existing warehouse space. The project generated VMT statistics are expressed per resident and the project effect on VMT is expressed per capita to distinguish the effects of population growth from the effects of changes in personal behavior.

VMT Impact Criteria

Per the Redwood City Transportation Analysis Manual, a proposed residential project would have a significant impact on VMT if the project generated home-based VMT per capita exceeds 10.5 miles, which is the existing countywide average home-based VMT per capita (12.3 miles) minus 15 percent.

VMT Assessment Results

Project Generated VMT

The results of the project generated VMT analysis are presented in Table 3. The project’s relatively remote location on the east side of US 101 next to the Bay in an area lacking transit connectivity results in a project generated VMT rate that is higher than the average Countywide VMT rate for the proposed residential use. The project generated home-based VMT per capita of 13.4 is greater than the threshold of 10.5 for residential uses. Therefore, the project would have a significant impact based on the project generated VMT.

Table 3
Project Generated VMT Assessment

Land Use	Significance Criteria	Threshold ¹	Project TAZ VMT ²
Residential	Project exceeds existing countywide home-based VMT per capita minus 15%	10.5	13.4

Notes:

¹ The threshold for project generated VMT per capita is 15% below the San Mateo County average.

² Average VMT per capita within the TAZ where the project is located.

Mitigation

The project generated VMT can be reduced by implementation of a Transportation Demand Management (TDM) Plan that includes physical facilities, programs, and policies. The project applicant is preparing a TDM Plan to fulfill C/CAG and City requirements, which are discussed in the next chapter. While the TDM Plan has not yet been finalized, it is expected to result in a reduction in daily VMT that would satisfactorily mitigate the project's impact on VMT. Table 4 presents a sample TDM Plan that could mitigate the project's impact on VMT.

Table 4
Sample TDM Plan Designed to Mitigate VMT Impact

TDM Measure	Estimated Reduction in Drive-Alone Trips/Mode Share	
	Min	Max
On-site information*	1.0%	1.5%
New resident orientation*	1.0%	1.5%
Annual promotion of TDM measures*	0.5%	1.0%
Bike racks for visitors	1.0%	4.0%
Indoor bike parking for residents	2.0%	5.0%
Land/facilities for pedestrian/bike connections	0.0%	2.0%
Caltrain/Samtrans subsidies	10.0%	15.0%
Moderate below market rate units (8 du)	0.0%	0.0%
Total	15.5%	30.0%
Average	22.8%	

* Maximum 4% reduction for all information improvements combined.

Source: Minimum/maximum trip reductions obtained from RWCMoves Appendix E: Redwood City Transportation Demand Management (TDM) Program.

Assuming a typical reduction in drive-alone trips and mode share (the average between minimum and maximum values), the sample TDM Plan would yield a 22.8% reduction in drive-alone trips. This would reduce the home-based VMT per capita from 13.4 to 10.4, which is below the impact threshold of 10.5.

TDM Plan monitoring and enforcement requirements are described in the City's TDM Program. The project will be required to implement an annual survey of residents to measure residents travel characteristics and usage of TDM measures. Annual driveway counts and an annual report will also be required to quantify the site's vehicle trip generation. The City of Redwood City will set forth TDM monitoring and enforcement requirements in the project's conditions of approval to ensure that the project's TDM plan satisfactorily mitigates the project impact on VMT

Project Effects on VMT

Projects requiring a General Plan Amendment are also required to evaluate the project effect on VMT under Year 2040 Cumulative Conditions. This scenario reflects buildout of the region's land use and transportation system and provides the long-range view of future travel patterns. The project's effect on VMT under Year 2040 Cumulative Conditions considers the project's influence on the VMT generation of surrounding land uses. The cumulative project effect on VMT was estimated using the City limit boundary and extracting the total link-level VMT for both no project and with project conditions. The cumulative threshold for the project effect on VMT is no change to the City's per capita VMT applying the boundary method. The proposed project would result in a marginal decrease in VMT per service population (see Table 5), and thus the project would not have a significant cumulative impact on VMT and would therefore not require mitigation.

Table 5
Project Effect on VMT Analysis

Scenario	Population	Jobs	Service		VMT per Service Population
			Population	Daily VMT	
No Project	105,098	74,831	179,929	1,526,860	8.49
Project	105,249	74,803	180,052	1,526,483	8.48
Change	151	-28	123	-377	-0.01

3. Local Transportation Analysis

This chapter describes the local transportation analysis including existing transportation facilities near the project site and the intersection operations under existing conditions. The chapter also describes the intersection operations analysis under background conditions and cumulative conditions with and without the Blomquist Extension project, the method by which project traffic is estimated, and intersection operations analysis for with project conditions under existing, background, and cumulative scenarios. Mitigation improvements for any adverse intersection traffic effects caused by the project are recommended.

Existing Conditions

This section describes the existing conditions for all of the major transportation facilities near the site, including the roadway network, transit service, and bicycle and pedestrian facilities.

Roadway Network

Regional access to the project site is provided via US 101.

US 101 is a north/south freeway that extends from north of San Francisco to south of San Jose. In the project vicinity, US 101 has eight lanes (including two high-occupancy vehicle (HOV) lanes south of Whipple Avenue). US 101 provides site access via the full interchanges at Whipple Avenue.

Local access to the site is provided by Whipple Avenue, Woodside Road (SR 84), Veterans Boulevard, Maple Street, and East Bayshore Road/Blomquist Street. These roadways are described below.

Whipple Avenue is a two- to four-lane connector street that extends from US 101, west through Redwood City until its terminus at Upland Road west of Alameda de las Pulgas. Whipple Avenue is a four-lane road between Veterans Boulevard and El Camino Real, and provides access to US 101 via a full interchange. A sidewalk is present along only the south side of Whipple Avenue between Veterans Boulevard and East Bayshore Road, while bike lanes are provided in both directions. The speed limit on Whipple Avenue is 25 mph.

Woodside Road (SR 84) is a four-lane east-west boulevard that extends from US 101 in the east to Portola Road in the west through Woodside. West of Portola Road, Woodside Road becomes La Honda Road and extends all the way to Cabrillo Highway (SR 1). The speed limit on Woodside Road is 35 mph.

East Bayshore Road is a two-lane, local road that extends south from Whipple along the east side of US 101 and currently terminates at its roundabout intersection with Bair Island Road. The speed limit on this segment of East Bayshore Road is 25 mph. A sidewalk is available only on the east side of

street. South of the Woodside Road, East Bayshore Road continues to the south as a frontage road on the east side of US 101 until its intersection with Sleepy Hollow Lane near the Menlo Park border. East Bayshore Road currently does not have a connection between these two segments. East Bayshore Road serves as the west boundary of the project site and provides direct access to the project site.

Veterans Boulevard is a north-south divided boulevard that provides access between US 101 and Redwood City. Veterans Boulevard begins at its connection with the southbound US 101 off ramp north of Whipple Avenue and extends south to Woodside Road where it aligns with the US 101 southbound on ramp. Between Whipple Avenue and Main Street, Veterans Boulevard has three lanes in both directions with a posted speed limit of 35 mph. Between Main Street and Chestnut Street, Veterans Boulevard has two lanes in each direction. Between Chestnut Street and Woodside Road, Veterans Boulevard has one-lane in each direction. Bike lanes are present in both directions along Veterans Boulevard between Whipple Avenue and Chestnut Street.

Maple Street is an east-west, two-lane street that extends from its intersection with El Camino Real, through downtown Redwood City to Bair Island. Maple Street serves as the only roadway between Whipple Avenue and Woodside Road that crosses US 101 without an interchange. Bike lanes or bike “sharrows” are present along Maple Street. The City’s General Plan classifies Maple Street as a pedestrian street west of Veterans Boulevard and a bicycle boulevard east of Veterans Boulevard.

Blomquist Street is a two-lane, local road that extends south from Maple Street to its intersection with Woodside Road. South of Woodside Road, Blomquist Street becomes the southern segment of East Bayshore Road. Bike lanes are present in both directions along Blomquist Street. The speed limit on Blomquist Street is 25 mph.

Bicycle Facilities

Existing Facilities

Bicycle facilities include bike paths, bike lanes, and bike routes. Bike paths (Class I facilities) are pathways separate from roadways that are designated for use by bicycles. Often, these pathways also allow pedestrian access. Bike lanes (Class II facilities) are lanes on roadways designated for use by bicycles with special lane markings, pavement legends, and signage. Bike routes (Class III facilities) are existing rights-of-way that accommodate bicycles but are not separate from existing travel lanes. Class III routes are typically designated with only signs or sharrows (painted, on-road bike markings). The existing bicycle facilities in the project vicinity are shown on Figure 3.

The project site is served relatively well by existing bicycle facilities, which provide access between the project site and downtown Redwood City and nearby office centers. Existing bicycle facilities include Class III routes on East Bayshore Road south of Seaport Boulevard and Whipple Avenue west of Veterans Boulevard. Class II bicycle lanes in the project vicinity include:

- Whipple Avenue at the US 101 overcrossing between Veterans Boulevard and US 101 Northbound Off-ramp
- Whipple Avenue between El Camino Real and Arguello Street
- Maple Street between Marshall Street and Veterans Boulevard
- Veterans Boulevard between Whipple Avenue and Chestnut Street
- Winslow Street between Whipple Avenue and Broadway
- Industrial Way between Harbor Boulevard and Whipple Avenue
- Blomquist Street between Maple Street and Seaport Boulevard
- Marshall Street between Arguello Street and Walnut Street
- Middlefield Road between Veterans Boulevard and Bradford Street
- Main Street between Convention Way and Veterans Boulevard
- Brewster Avenue between Main Street and Fulton Street

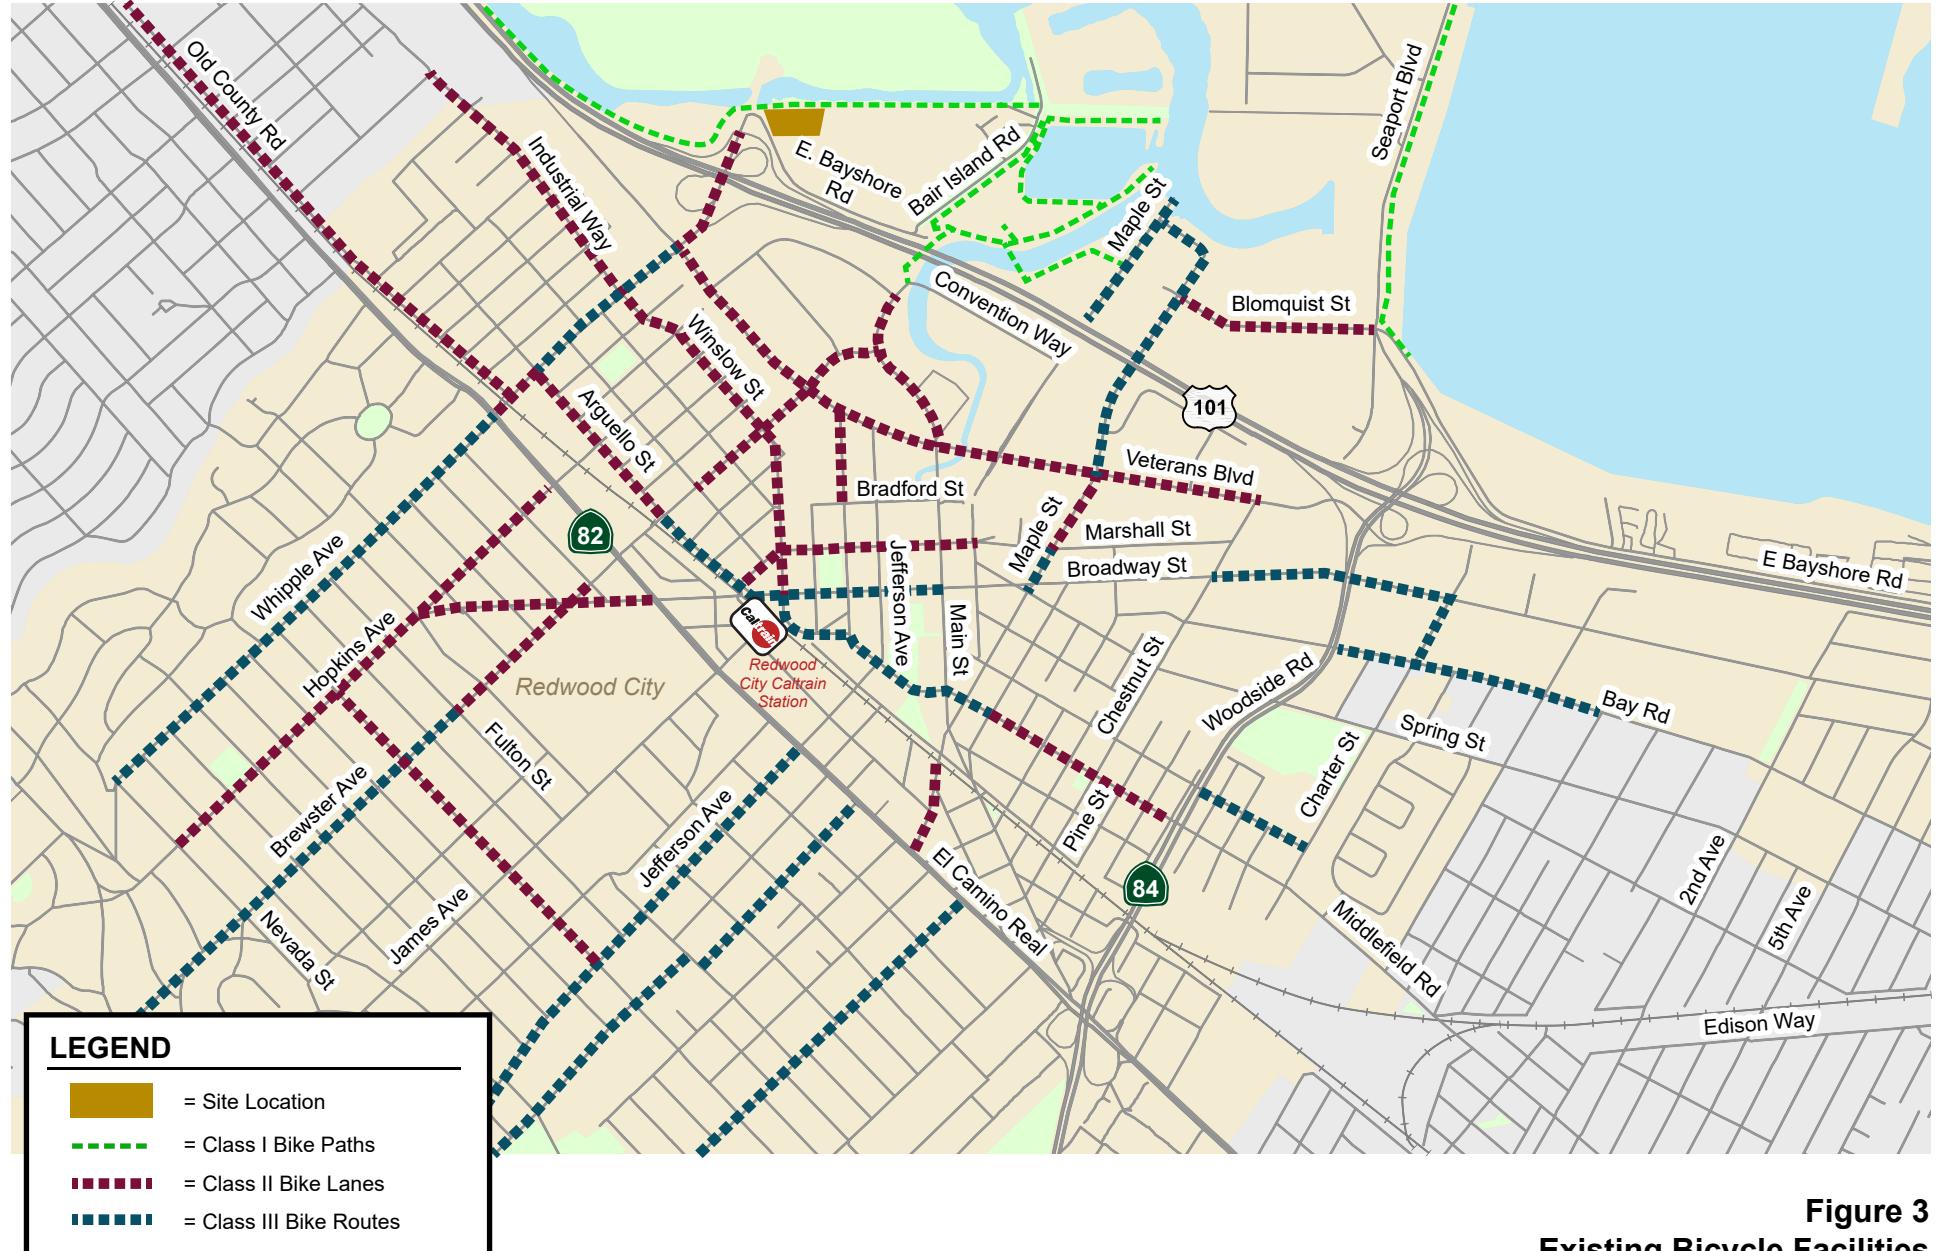

Figure 3
Existing Bicycle Facilities

- Arguello Street between Whipple Avenue and Brewster Avenue
- Stafford Street between Whipple Avenue and Old County Road
- Old County Road between Stafford Street and Bransten Road
- Edgewood Road west of Alameda De Las Pulgas
- Hopkins Avenue between El Camino Real and Nevada Street

Within the vicinity of the project site, a Class I bicycle path, the Bay Trail, exists along the eastern frontage of the site. The Bay Trail can be accessed via Whipple Avenue at East Bayshore Road and via Bair Island Road. The Bay Trail is a planned, 500-mile bicycle and pedestrian trail that extends around the entire San Francisco Bay. Currently, about 350 miles of the trail have been completed. The Bay Trail does not currently provide access to areas south of the project site as it terminates at Bair Island Road. A separated Class I bicycle facility along the south side of Bair Island Road connects the Bay trail to an existing pedestrian and bicycle bridge, commonly referred to as the Bridge to Nowhere. An unpaved pathway on the south side of the bridge provides access between East Bayshore Road and Maple Street. The Class I bicycle facility along the south side of Bair Island Road also connects to the bicycle facilities west of US 101 at Main Street/Convention Way.

Bicycle counts were conducted as part of the 2019 peak-hour turning movement counts at the study intersections during the AM and PM peak periods. The traffic count data are included in Appendix A.

Planned Facilities

Based on the Citywide Transportation Plan, known as RWC moves, a Class I bike path is proposed along East Bayshore Road and the planned Blomquist Street extension between Whipple Avenue and Seaport Boulevard. This proposed bicycle path would improve connectivity between the project site and areas to the west of US 101, including to downtown Redwood City.

Pedestrian Facilities

Pedestrian facilities near the project site consist of sidewalks, crosswalks, and pedestrian signals at signalized intersections. Sidewalks are not present along the project frontage nor along the nearby buildings on East Bayshore Road. Approximately 625 feet south of the project site, there is a sidewalk along the east side of East Bayshore Road. Pedestrian facilities in the project vicinity also include a sidewalk on the south side of Bair Island Road, the Bay Trail, and a mixed-use trail that extends from Bair Island Road under US 101 to Convention Way and Main Street. A sidewalk is present along the south side of the Whipple Avenue overcrossing. Pedestrians crossing US 101 at Whipple Avenue can access the project site via the crosswalk on the US 101 Northbound Off Ramp, a cut-through sidewalk through the triangle area circled by the US 101 Northbound Off-ramp and East Bayshore Road, and a crosswalk with pedestrian crossing warning sign and flashing beacon at the sharp curve where East Bayshore Road turns to the south. A crosswalk also exists in the project vicinity on Bair Island Road just east of the roundabout at East Bayshore Road. This crosswalk provides access from the project site to the existing Bridge to Nowhere, the residential and hotel uses on the south side of Bair Island Road, and the mixed-use trail that connects to Convention Way and Main Street.

Pedestrian counts were conducted as part of the 2019 peak-hour turning movement counts at the study intersections adjacent to the project site. The count data are included in Appendix A.

Transit Services

Primary transit service in Redwood City is provided by the San Mateo County Transit District (SamTrans). However, the project site is not served by any existing transit routes. The nearest bus stops are located more than $\frac{1}{2}$ mile from the site at either the Arguello Street and A Street intersection, or the Maple Street and Blomquist Street intersection (see Figure 4). The bus stops are beyond walking distance for most residents.

Figure 4
Existing Transit Services

Intersection Lane Configurations and Traffic Volumes

The existing lane configurations at the study intersections were obtained from field observations and are shown on Figure 5.

Existing traffic volumes are still depressed due to the COVID-19 pandemic. Therefore, to be conservative, pre-pandemic traffic volumes were used in this study. Weekday AM (7:00-9:00 AM) and PM (4:00-6:00 PM) peak hour traffic volumes from September 2019 were obtained from the transportation analysis conducted for the proposed development at 557 East Bayshore Road. The existing peak hour traffic volumes used for the study are shown graphically on Figure 6. All traffic count data are included in Appendix A Peak-hour intersection volumes for the study intersections are tabulated in Appendix B.

Existing Condition Intersection Levels of Service

The results of the level of service analysis under existing conditions are summarized in Table 6. The results show that five of the six study intersections currently operate at an acceptable level of service during the AM and PM peak hours. The intersection of Veterans Boulevard and Woodside Road operates at LOS F in the PM peak hour. The level of service calculation sheets are included in Appendix C.

While this report uses the same traffic count data as the 557 East Bayshore Transportation Analysis (TA) report, the intersection level of service analysis presented in this report is based on an updated methodology from the Highway Capacity Manual (HCM), 6th Edition per the City's new Transportation Analysis Manual, while the other TA report used an earlier version of the HCM methodology. The different HCM methodologies produce slight differences in the delay calculated at each intersection but would not affect the study conclusions regarding adverse effects of the proposed project.

Table 6
Existing Intersection Levels of Service

ID	Intersection	Control ¹	LOS Standard	Peak Hour	Count Date	Existing	
						Avg. Delay	LOS
1	Veterans Boulevard and Whipple Avenue	Signal	D	AM	09/10/19	38.6	D
				PM	09/10/19	36.1	D
2	US 101 Northbound Off-Ramp and Whipple Avenue	Signal	D	AM	09/10/19	12.3	B
				PM	09/10/19	12.8	B
3	East Bayshore Road (Blomquist Street) and Bair Island Road	Rbt	D	AM	09/10/19	4.5	A
				PM	09/10/19	4.4	A
4	Blomquist Street and Maple Street	OWSC	D	AM	09/10/19	11.2	B
				PM	09/10/19	12.7	B
5	Blomquist Street and Seaport Boulevard	Signal	D	AM	11/06/18	32.8	C
				PM	11/06/18	29.7	C
6	Veterans Boulevard and Woodside Road (SR 84) ²	Signal	D	AM	09/10/19	50.7	D
				PM	09/10/19	102.6	F

Notes:

¹ Control Type Definitions: Rbt = Roundabout; OWSC = One-Way Stop Control.

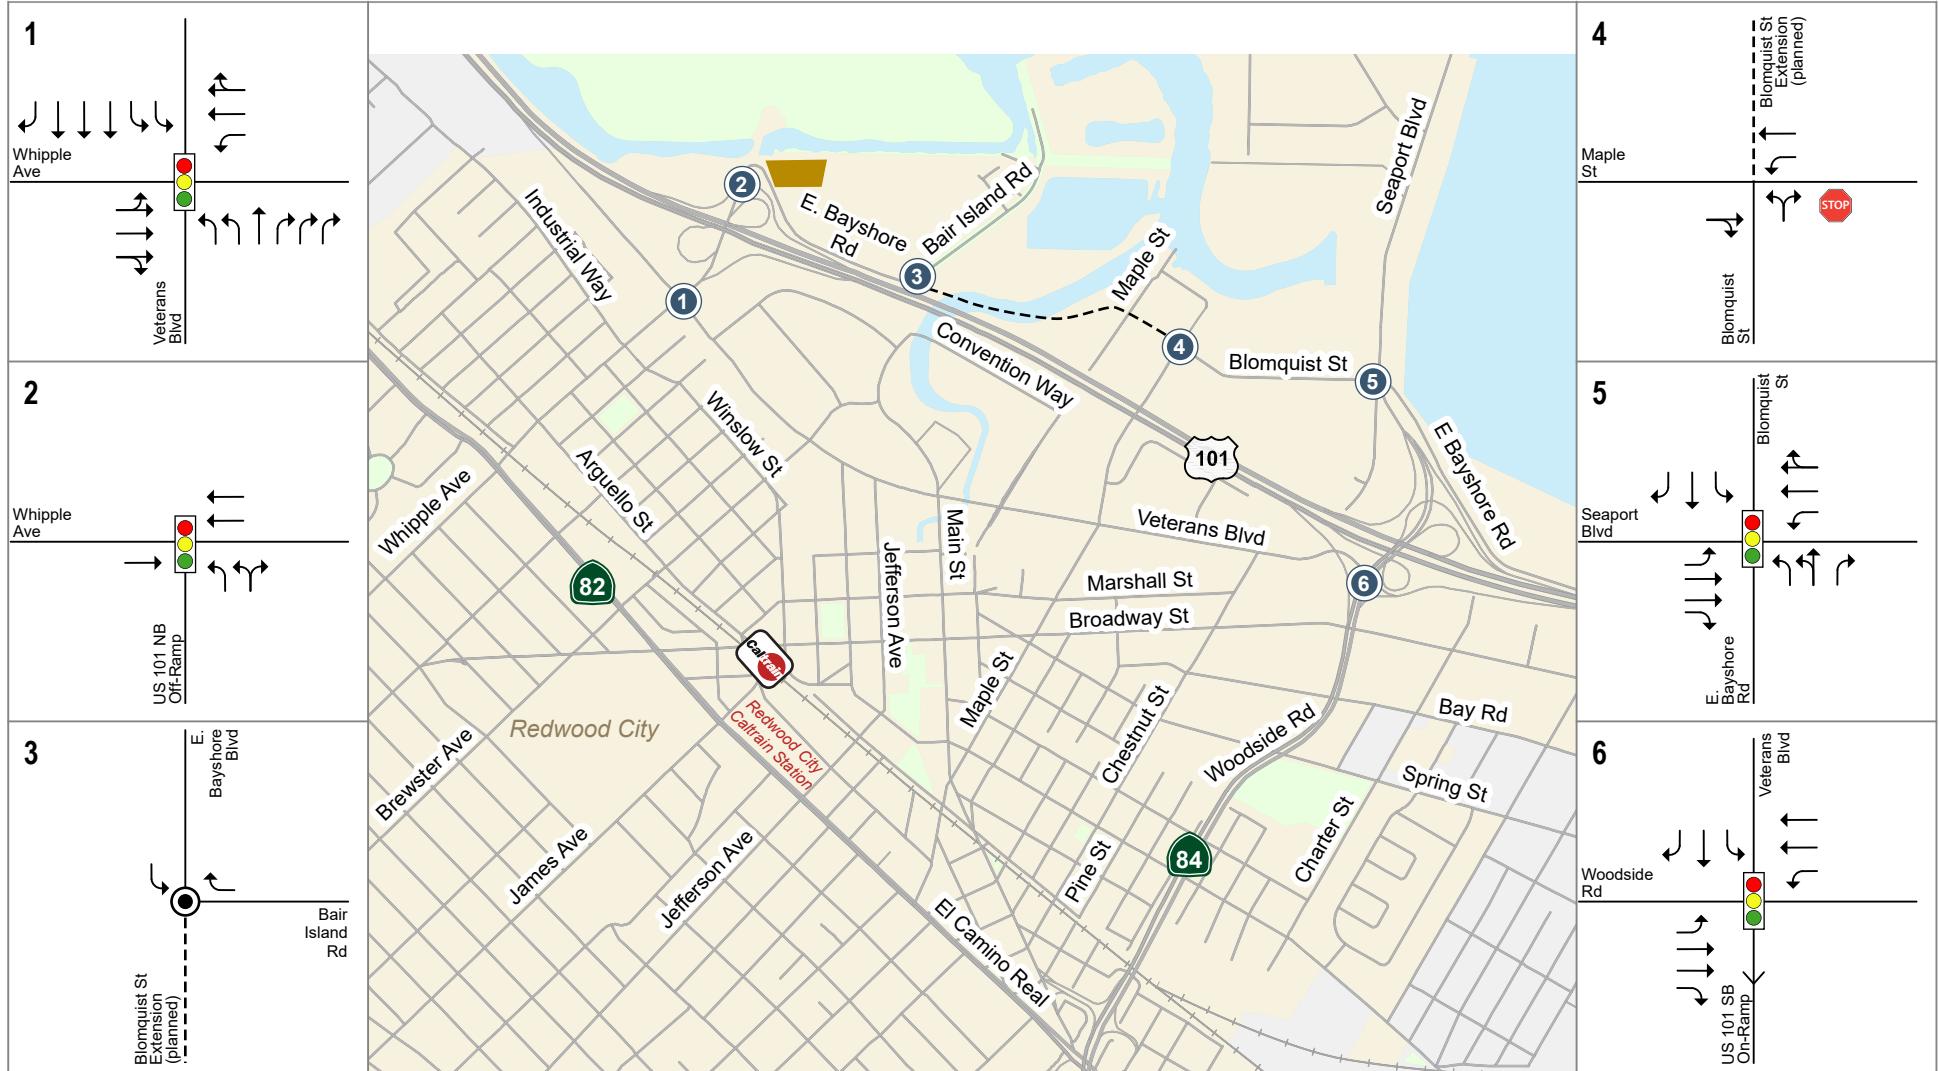

Overall weighted average control delay (seconds per vehicle) is reported for signalized intersections.

Worst stop-controlled approach delay (seconds per vehicle) is reported for OWSC intersections.

² Synchro default parameters were adjusted to ensure intersection delay and LOS reflect field observations.

Bold indicates a substandard level of service.

Background Conditions

Roadway Network

There are no near-term planned and funded transportation improvements at the study intersections that would alter the existing intersection lane configurations.

Approved Developments

Background traffic volumes were forecast based on the project trip assignments provided for the relevant approved but not yet completed projects. The list of approved and under construction projects was developed based on information provided by Redwood City's website¹ (accessed on October 11, 2021). The following approved but not constructed projects were considered under background conditions because they would contribute background trips to the study intersections.

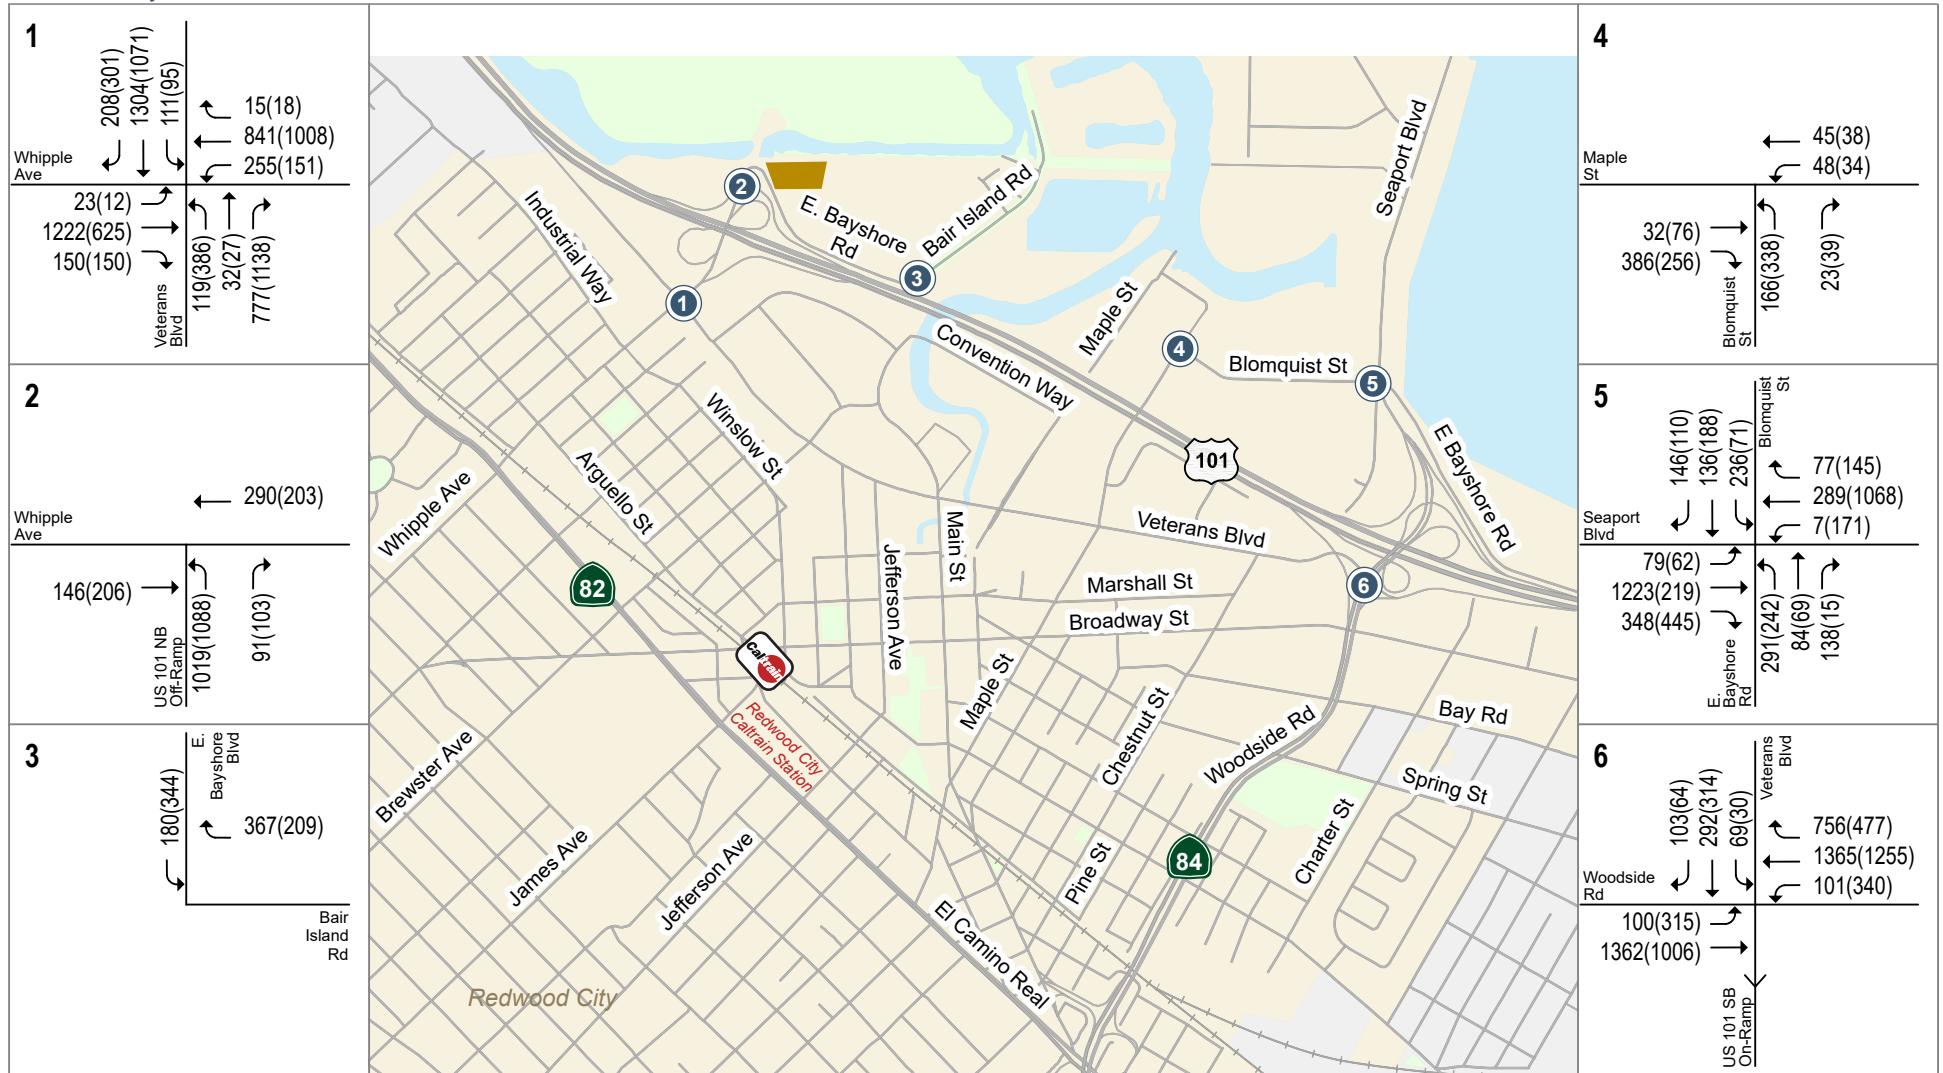

- 610 Walnut Street – 65,080 s.f. office
- 1180 Main Street – 109,375 s.f. office
- 353 Main Street – 125 units of affordable housing
- Holiday Inn Express & Suites (1690 Broadway) – 112-room hotel
- Strada (1548 Maple Street) – 131 residential dwelling units
- Broadway Plaza (1401 Broadway and 2201 Bay Road) – Mixed-use development including 520 residential dwelling units, 420,000 s.f. of office, 26,000 sf of retail, and 10,000 s.f. of child-care space
- San Mateo County Government Center – 186,000 s.f. office
- Kaiser Medical Office Building 2 (1175 Marshall Street) – 197,800 s.f. of medical office
- 707 Bradford Street – 117-units of affordable housing and 8,000 s.f. of daycare
- Habitat for Humanity (612 Jefferson Avenue) – 20-units of affordable housing
- Greystar IV (1409 El Camino Real) – 350 residential dwelling units and 2,900 s.f. retail
- 851 Main Street – 78,832 s.f. office and 6,900 s.f. retail
- Greystar II (103 Wilson Street) – 175 residential dwelling units
- Broadway Station RWC (2075 Broadway) – 66,786 s.f. office and 26,729 s.f. retail
- Stanford in Redwood City (405, 425, 475, 500-585 Broadway and 1228 Douglas Avenue) – 570,000 s.f. office, 31,159 s.f. of recreation, and 14,000 s.f. of childcare space
- 849 Veterans Boulevard – 90 residential dwelling units
- 690 Veterans Boulevard – 92-room hotel
- South Main Mixed-use (1601 El Camino Real) – 540 residential dwelling units, 530,000 s.f. office, 28,841 s.f. retail, 8,367 s.f. childcare space

Intersection Traffic Volumes

Background peak-hour traffic volumes were calculated by adding to existing volumes the estimated traffic from approved developments. Trip generation and assignment for each project was obtained from each project's transportation analysis (TA) or environmental impact report (EIR). Project trips for developments within the Downtown Precise Plan area were assigned to the study network based on the trip distribution included within the Downtown Precise Plan DEIR. Background traffic volumes are shown on Figure 7. Peak-hour intersection volumes for the study intersections are tabulated in Appendix B.

Background Traffic Volumes

Intersection Levels of Service

The results of the level of service analysis under background conditions are summarized in Table 7. The results show that five of the six study intersections would continue to operate at an acceptable level of service during the AM and PM peak hours. The intersection of Veterans Boulevard and Woodside Road would operate at LOS F in both the AM and PM peak hours. The level of service calculation sheets are included in Appendix C.

Table 7
Background Intersection Levels of Service

ID	Intersection	Control ¹	Peak Hour	Existing		Background	
				Avg. Delay	LOS	Avg. Delay	LOS
1	Veterans Boulevard and Whipple Avenue	Signal	AM	38.6	D	42.6	D
			PM	36.1	D	37.6	D
2	US 101 Northbound Off-Ramp and Whipple Avenue	Signal	AM	12.3	B	12.3	B
			PM	12.8	B	12.8	B
3	East Bayshore Road (Blomquist Street) and Bair Island Road	Rbt	AM	4.5	A	4.5	A
			PM	4.4	A	4.4	A
4	Blomquist Street and Maple Street	OWSC	AM	11.2	B	13.4	B

			PM	102.6	F	>120	F

Notes:

¹ Control Type Definitions: Rbt = Roundabout; OWSC = One-Way Stop Control.
Overall weighted average control delay (seconds per vehicle) is reported for signalized intersections.
Worst stop-controlled approach delay (seconds per vehicle) is reported for OWSC intersections.

² Synchro default parameters were adjusted to ensure intersection delay and LOS reflect field observations.
Bold indicates a substandard level of service.

Project Conditions

This section describes the roadway traffic operations under existing plus project and background plus project conditions, the method by which project traffic is estimated, and any substantial adverse effects due to the project. Existing plus project conditions could potentially occur if the project were to be occupied prior to the other approved projects in the area. Background plus project conditions represent the likely conditions in which the proposed project is developed after approved projects in the area have been developed.

Roadway Network

There are no project-sponsored improvements and no near-term planned and funded transportation improvements at the study intersections. Thus, the intersection lane configuration under existing plus project conditions and under background plus project conditions would be the same as under existing conditions.

Project Trip Estimates

The magnitude of traffic produced by a new development and the locations where that traffic would appear are estimated using a three-step process: 1) trip generation, 2) trip distribution, and 3) trip assignment. In determining project trip generation, the magnitude of traffic entering and exiting the project site is estimated for the AM and PM peak hours. As part of the project trip distribution, an estimate is made of the directions to and from which the project trips would travel. In the project trip assignment, the project trips are assigned to specific streets and intersections. These procedures are described below.

Trip Generation

To be conservative, daily and peak hour trip generation estimates for the proposed project were based on trip rates published in the Institute of Transportation Engineers (ITE) *Trip Generation Manual, 10th Edition* (2017) for “Single-Family Housing” (Land Use 210) located in a general Urban/Suburban area. Based on the ITE rates, the proposed project would generate 529 gross daily trips including 41 AM peak-hour trips and 55 PM peak-hour trips.

The project is eligible to receive credit for trips generated by the existing buildings on the site. The traffic generated by the existing warehouse buildings was estimated by applying trip rates for “Warehousing” (Land Use 150). The total number of trips generated by the existing warehouse use was deducted from the estimated number of trips generated by the proposed project, which results in a net increase of 480 daily trips including 36 net trips in the AM peak hour and 50 net trips in the PM peak hour. The project trip generation estimates are presented in Table 8.

The C/CAG TDM Policy Update (September 2021) includes a new requirement that local jurisdictions notify C/CAG of any new development project under their purview that is estimated to generate at least 100 Average Daily Trips (ADT). C/CAG categorizes new developments as small projects and large projects. Multi-family residential projects larger than 50 dwelling units (generating more than 500 average daily trips) are considered large projects. The project would not qualify as a transit proximate development, which is described as a project between 0.5 and 3 miles of high-quality transit. A high-quality transit area provides fixed-route bus service with headways of 15 minutes or less during peak hours. The recommended vehicle trip reduction target for large multi-family residential projects that are not transit oriented developments (TOD) is 35 percent.

Likewise, the City of Redwood City requires new multi-family residential developments with 25 or more dwelling units to prepare a Transportation Demand Management (TDM) Plan. Per the City’s TDM program, the project will have a 44 percent drive-alone mode share target. The project’s TDM Plan has not yet been finalized. To be conservative, the analysis of the project’s potential effects on nearby intersections does not assume any trip reductions due to TDM measures that may be implemented by the project.

Table 8
Project Trip Generation Estimates

Land Use	Size	Daily		AM Peak Hour			PM Peak Hour				
		Rate	Trips	Rate	In	Out	Total	Rate	In	Out	
Proposed Land Use											
Single-Family Housing	56 Units	9.44	529	0.74	10	31	41	0.99	35	20	55
Existing Land Use											
Warehouse	-28,255 s.f.	1.74	-49	0.17	-4	-1	-5	0.19	-1	-4	-5
Net Project Trips		480			6	30	36		34	16	50

Notes:

Source: ITE *Trip Generation Manual, 10th Edition* 2017

1. Trip generation rates for the proposed office space are based on the ITE's Trip Generation Manual, 10th Edition rates for Land Use Code 210 "Single-Family Detached Housing".

2. Trip generation rates for the existing warehouse are based on the ITE's Trip Generation Manual, 10th Edition rates for Land Use Code 150 "Warehousing".

Trip Distribution and Assignment

The trip distribution patterns were estimated based on existing travel patterns on the surrounding roadway system, locations of complimentary land uses, and the trip distribution patterns provided as part of the Peninsula Park Project EIR produced by Fehr & Peers (2007). The project trip distribution patterns are shown on Figure 8.

The estimate project generated traffic was added to the surrounding road network based on the distribution percentages described above. The project trip assignment is shown on Figure 9.

Intersection Traffic Volumes

For the existing plus project scenario, the new trips generated by the project were added to the existing traffic volumes to derive the existing plus project traffic volumes. Figure 10 shows the intersection turning-movement volumes under existing plus project conditions. Effects of the project under existing plus project conditions were evaluated relative to existing conditions.

For the background plus project scenario, the new trips generated by the project were added to the background traffic volumes to derive the background plus project traffic volumes. Figure 11 shows the intersection turning-movement volumes under background plus project conditions. Effects of the project under background plus project conditions were evaluated relative to background conditions.

Peak-hour intersection volumes for the study intersections are tabulated in Appendix B.

Background Plus Project Traffic Volumes

Intersection Levels of Service

The results of the intersection level of service analysis for existing plus project and background plus project conditions are summarized in Tables 9 and 10, respectively.

Existing Plus Project Conditions

The results show that under existing plus project conditions five of the six study intersections would operate at an acceptable level of service during the AM and PM peak hours. The intersection of Veterans Boulevard and Woodside Road would continue operate at LOS F in the PM peak hour. Since the proposed project would not increase the average delay at Veterans Boulevard and Woodside Road by five seconds or more, the project would not cause a substantial adverse effect at the intersection.

Table 9
Existing Plus Project Intersection Levels of Service

ID	Intersection	Control ¹	Existing			Existing Plus Project	
			Peak Hour	Avg. Delay	LOS	Avg. Delay	LOS
1	Veterans Boulevard and Whipple Avenue	Signal	AM	38.6	D	38.8	D
			PM	36.1	D	36.2	D
2	US 101 Northbound Off-Ramp and Whipple Avenue	Signal	AM	12.3	B	12.2	B
			PM	12.8	B	12.7	B

5	Blomquist Street and Seaport Boulevard	Signal	AM	32.8	C	32.9	C
			PM	29.7	C	29.7	C
6	Veterans Boulevard and Woodside Road (SR 84) ²	Signal	AM	50.7	D	50.7	D
			PM	102.6	F	102.7	F

Notes:

¹ Control Type Definitions: Rbt = Roundabout; OWSC = One-Way Stop Control.

Overall weighted average control delay (seconds per vehicle) is reported for signalized intersections.

Worst stop-controlled approach delay (seconds per vehicle) is reported for OWSC intersections.

² Synchro default parameters were adjusted to ensure intersection delay and LOS reflect field observations.

Bold indicates a substandard level of service.

Background Plus Project Conditions

The results show that under background plus project conditions, five of the six study intersections would operate at an acceptable level of service during the AM and PM peak hours. The intersection of Veterans Boulevard and Woodside Road would operate at LOS F in the AM and PM peak hour. Since the proposed project would not increase the average delay by five seconds or more during any peak hour at Veterans Boulevard and Woodside Road, the project would not cause a substantial adverse effect at the intersection.

Table 10
Background Plus Project Intersections Levels of Service

ID	Intersection	Control ¹	Peak Hour	Background		Background Plus Project		Incr. in Avg. Del.
				Avg. Delay	LOS	Avg. Delay	LOS	
1	Veterans Boulevard and Whipple Avenue	Signal	AM	42.6	D	43.0	D	0.4
			PM	37.6	D	37.8	D	0.2
2	US 101 Northbound Off-Ramp and Whipple Avenue	Signal	AM	12.3	B	12.7	B	0.4
			PM	12.8	B	12.7	B	-0.1

			PM	17.1	C	17.2	C	0.1
5	Blomquist Street and Seaport Boulevard	Signal	AM	34.8	C	34.8	D	0.0
			PM	30.5	C	30.5	C	0.0
6	Veterans Boulevard and Woodside Road (SR 84) ²	Signal	AM	>120	F	>120	F	0.0
			PM	>120	F	>120	F	0.0

Notes:

¹ Control Type Definitions: Rbt = Roundabout; OWSC = One-Way Stop Control.
Overall weighted average control delay (seconds per vehicle) is reported for signalized intersections.
Worst stop-controlled approach delay (seconds per vehicle) is reported for OWSC intersections.

² Synchro default parameters were adjusted to ensure intersection delay and LOS reflect field observations.
Bold indicates a substandard level of service.

At some intersections, the project would result in a slight decrease in the average delay . This occurs because the intersection delay is a weighted average of all intersection movements. When traffic is added to movements with delays lower than the average intersection delay, the average delay for the entire intersection can decrease.

Cumulative Conditions

This section describes traffic operations under cumulative no project conditions and cumulative conditions. For this study, cumulative no project conditions reflect a horizon year of 2024. Cumulative no project traffic volumes reflect regional growth in the study area and traffic generated by nearby approved and proposed development projects. Two cumulative scenarios were analyzed to evaluate cumulative volumes with and without the proposed Blomquist Street extension project (described in detail in Chapter 1).

Roadway Network

Cumulative Conditions with Blomquist Street Extension

The roadway network under cumulative no project conditions assumes the completion of the planned Blomquist Street extension to connect with East Bayshore Road at Bair Island Road. The Blomquist Street extension would include geometry changes to the following two study intersections:

- **East Bayshore Road/Bair Island Road:** Addition of a northbound leg to the existing roundabout intersection. The northbound leg would have one receiving lane and one right-turn lane.

- **Blomquist Street/Maple Street:** Addition of a southbound leg to the existing “T” intersection. The addition of this leg would be accompanied by the installation of all-way stop traffic control at the intersection. This all-way stop control would serve as a short-term control device. The City has stated that the preferred long-term control device for this intersection would be a one-lane roundabout. An analysis of both intersection controls is included as part of this cumulative analysis.

The proposed Blomquist Street extension project and lane configurations at the two intersections described above are shown on Figure 12. No other changes to the roadway network were assumed that would alter existing intersection lane configurations or the existing network.

Cumulative Conditions without Blomquist Street Extension

For the purposes of this analysis and at the direction of City staff, an analysis of cumulative conditions without the development of the Blomquist Street extension project was conducted. For this alternative analysis, no changes to the roadway network were assumed that would alter the existing lane configurations at any study intersections.

Intersection Traffic Volumes

The cumulative scenarios assume a horizon year of 2024. A growth factor of 1.0 percent per year for both the AM and PM peak periods was assumed based on direction from Redwood City staff.

Cumulative No Project

Cumulative no project volumes were forecast based on the growth factor, the addition of background volumes from approved projects, and the addition of trips from other proposed but not yet approved projects in the study area. Trip generation and trip distribution for proposed projects were obtained from each project’s traffic analysis (TA) or environmental impact report (EIR). If there was no traffic study or EIR available for the project, trip generation was developed using rates provided in the ITE *Trip Generation Manual*. Trip distributions were developed based on existing travel patterns on the surrounding roadway system, locations of complimentary land uses, and the trip distribution patterns provided as part of nearby traffic studies. Peak-hour intersection volumes for the study intersections are tabulated in Appendix B.

The list of proposed projects was based on information provided on Redwood City’s website¹ (accessed in October 2021). The following proposed but not yet approved projects were considered under cumulative conditions because they would contribute cumulative trips to the study intersections.

- Sequoia Station Transit Sub-Area Plan (1057 El Camino Real) – 440 residential dwelling units and 1,635,000 s.f. office
- 557 East Bayshore Road - 480 multifamily residential dwelling units and a 97,101 s.f. sport fitness center
- 1125 Arguello Street – 68 townhomes
- Toyota 101 (525 East Bayshore Road) – 201,670 s.f. automotive dealership
- Harbor View (320-350 Blomquist Street) – 745,150 s.f. office (including 35,000 s.f. amenities space) and 20,000 s.f. community space
- 1330 El Camino Real – 130 residential dwelling units
- 800 Main Street – 83 hotel rooms, ground floor retail and restaurant space, rooftop bar, and basement amenities

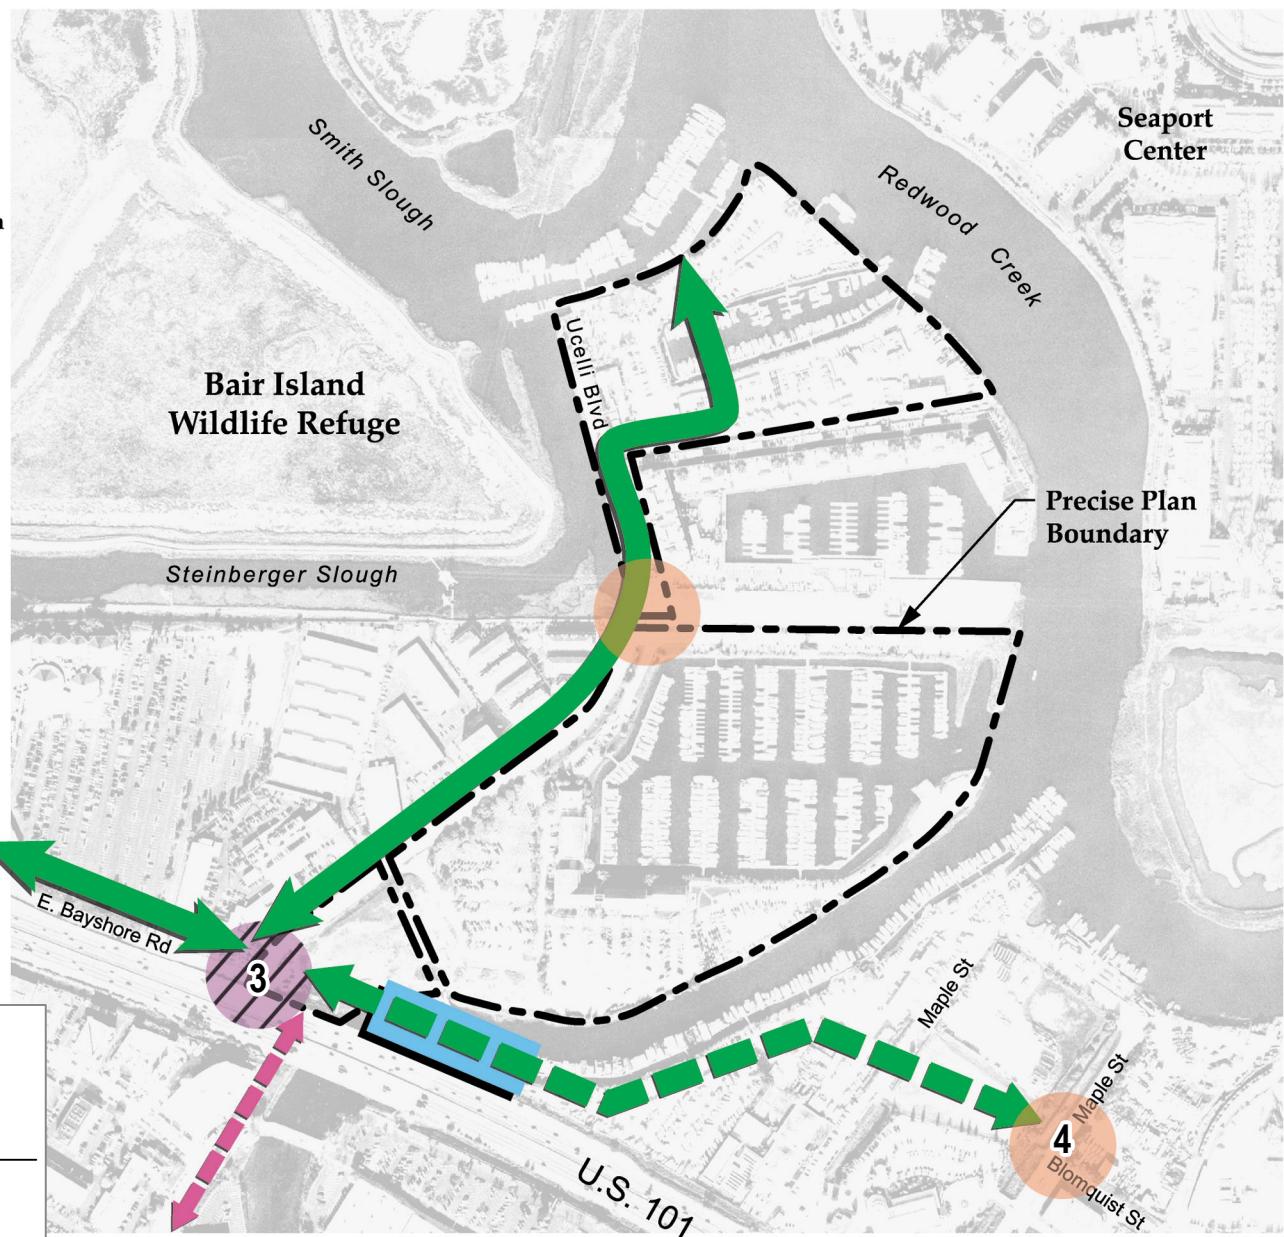

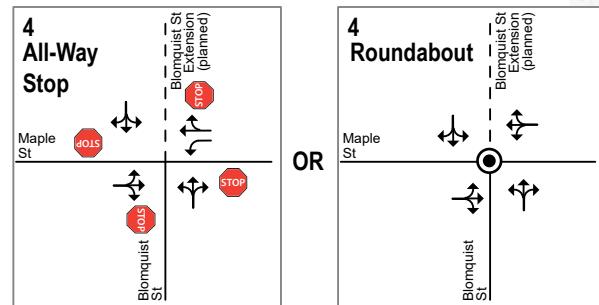

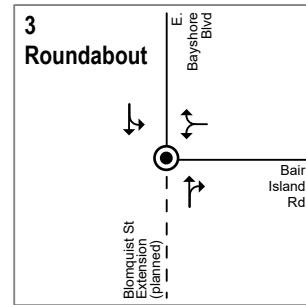

Figure 12
Blomquist Street Extension

- 2300 Broadway – 200,000 s.f. office, 15,000 s.f. retail space, and 5,000 s.f. of open space
- 901 El Camino Real - 169,686 s.f. office, a two-story 4,462 s.f. teen center, and 4,000 s.f. public open space
- 651 El Camino Real - 300 residential dwelling units with a 12,000 s.f. space for American Legion
- 750 Bradford Street - 70,000 s.f. office building and 87 workforce housing units
- 601 Allerton Street – 80,579 s.f. of office space, 635 s.f. of ground floor retail space, two community futsal courts, and a rooftop clubhouse.

Since the Blomquist Street extension has yet to be built, the existing counts were reassigned to represent travel patterns that would occur if the Blomquist Street extension were in place (See Figure 13). The planned new roadway connection is expected to result in a diversion of trips from US 101 to Blomquist Street/E. Bayshore Road. In addition, existing developments on Bair Island Road and Uccelli Boulevard that are currently only accessible from the north via Whipple Avenue would also be accessible from the south via Maple Street and Seaport Boulevard. Furthermore, trips from the approved Strada development at 1548 Maple Street also were reassigned to reflect the Blomquist Street extension.

As described previously, the City has requested that the analysis include a cumulative scenario without the Blomquist Street extension. The traffic studies for proposed development projects east of the US 101, including 557 East Bayshore Road, Toyota 101, and Harbor View, were completed assuming the Blomquist extension was in place. Therefore, the project traffic needed to be reassigned to reflect no Blomquist Street extension.

Cumulative no project volumes with and without the Blomquist Street extension are presented in Figures 14 and 15, respectively.

Cumulative with Project

Project trips were reassigned to the future roadway network assuming the completion of the Blomquist Street extension based on the same trip generation and distribution estimates provided previously (see Figure 16). These reassigned project trips were added to the cumulative no project volumes to generate cumulative volumes (see Figure 17).

Under cumulative conditions without the Blomquist Street extension, the project trip assignment would be the same as shown on Figure 9. These project trips were added to the cumulative no project (no Blomquist Extension) volumes to generate cumulative (no Blomquist Extension) volumes (see Figure 18).

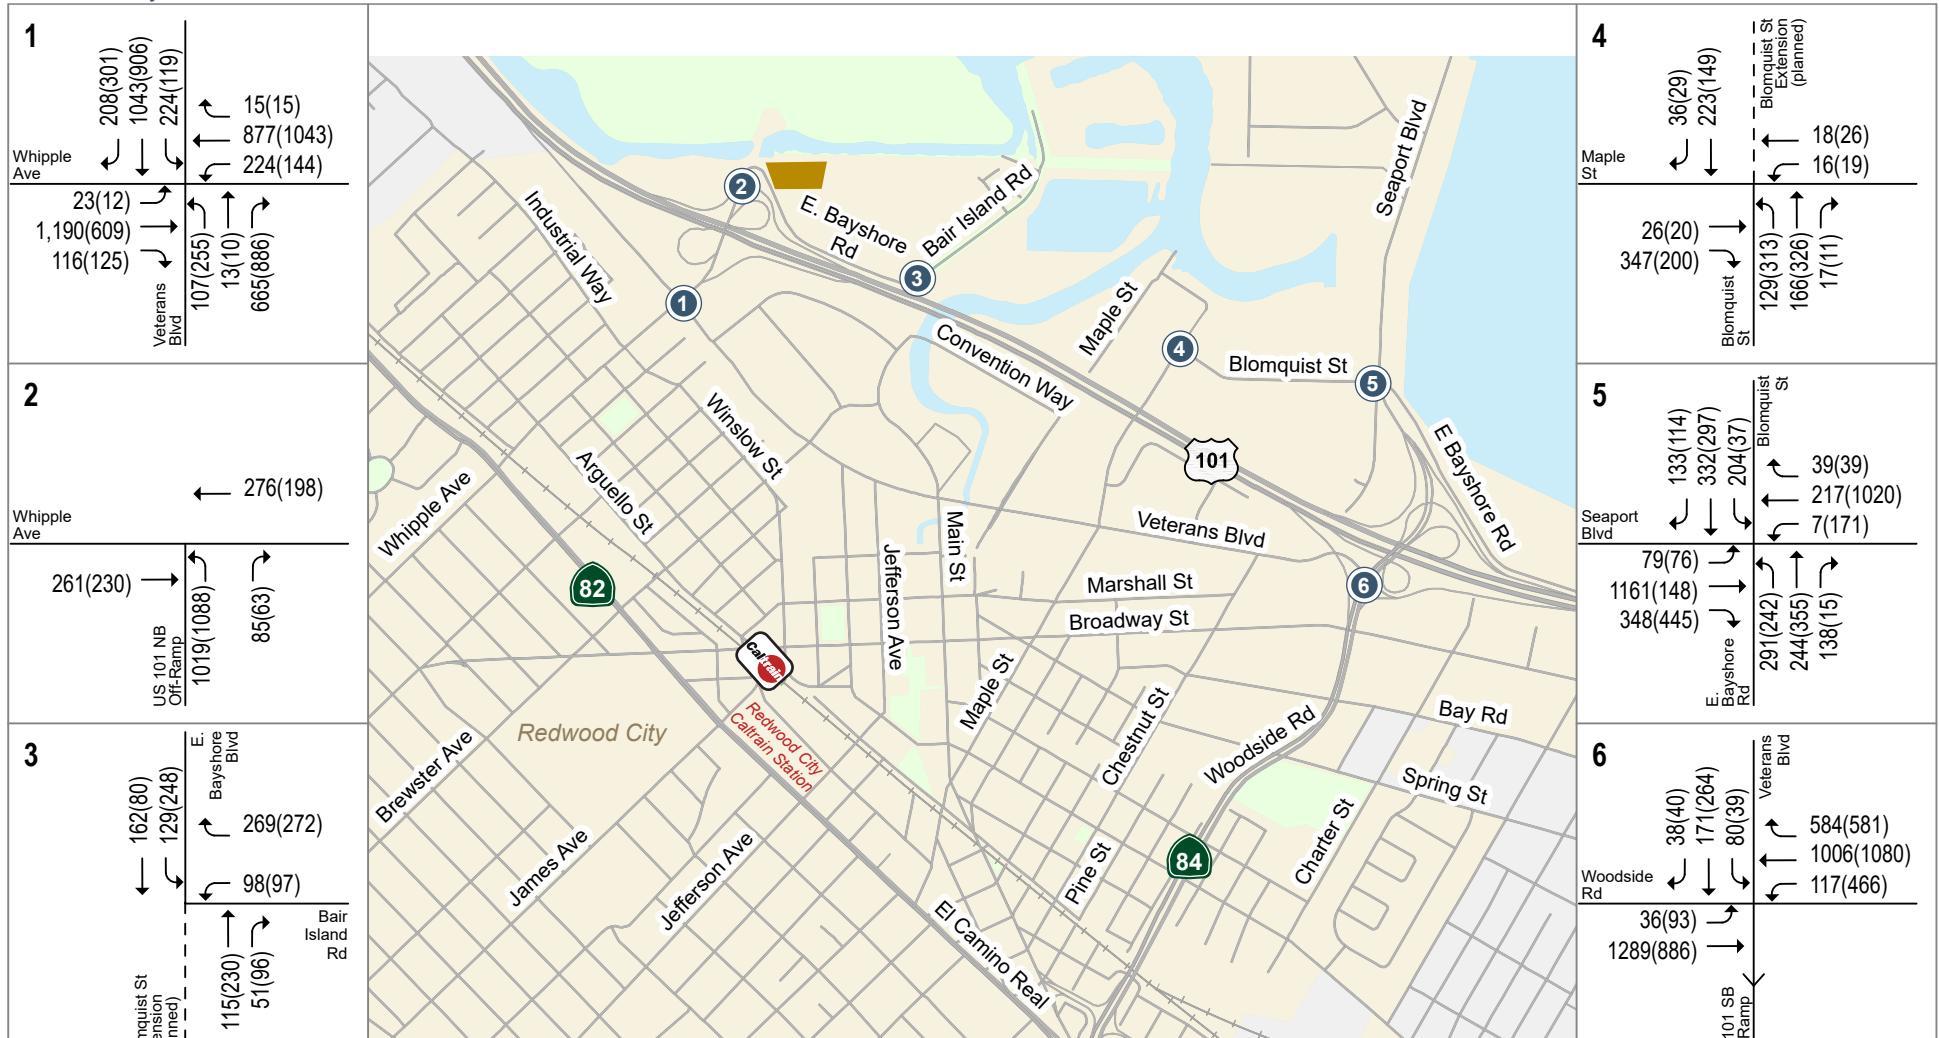

Intersection Levels of Service

Intersection levels of service were analyzed with and without the Blomquist Street extension.

With Blomquist Street Extension

The results of the level of service analysis under cumulative no project and cumulative plus project conditions with the Blomquist Street extension are summarized in Table 11. The results show that the project would cause a substantial adverse effect at the intersection of Blomquist Street and Maple Street under the short-term all-way stop control. The project would not cause a substantial adverse effect at the remaining study intersections.

Figure 18

Cumulative Plus Project Traffic Volumes without Blomquist Street Extension

Blomquist Street and Maple Street

With the installation of the all-way stop control, the Blomquist Street and Maple Street intersection would operate at an unacceptable LOS F during the AM and PM peak hours under both cumulative no project and cumulative plus project conditions. The addition of project trips would increase the average delay at this unsignalized intersection by 5.9 seconds in the PM peak hour. As described later in this chapter, this intersection would meet signal warrants under both cumulative conditions during the AM and the PM peak hours both without and with the proposed project. Because the project would increase the average delay by more than five seconds and the intersection would meet signal warrants under cumulative conditions, the project is considered to have a **substantial adverse effect** at this intersection.

As shown in Table 11, this intersection would operate at an acceptable LOS B or C with a single-lane roundabout under both cumulative no project and cumulative plus project conditions during the AM and PM peak hours. This roundabout is included as part of the Blomquist Street extension project, which will be funded in part through the City's Transportation Impact Fee (TIF). Therefore, payment of the City's TIF would mitigate this deficiency.

Table 11
Cumulative With Blomquist Street Extension Intersection Levels of Service

ID	Intersection	Control ¹	Peak Hour	With Blomquist St Extension				
				Cumulative No Project		Cumulative Plus Project		
				Avg. Delay	LOS	Avg. Delay	LOS	
1	Veterans Boulevard and Whipple Avenue	Signal	AM	83.9	F	84.2	F	0.3
			PM	48.4	D	48.9	D	0.5
2	US 101 Northbound Off-Ramp and Whipple Avenue	Signal	AM	13.5	B	13.5	B	0.0
			PM	13.7	B	13.9	B	0.2
3	East Bayshore Road (Blomquist Street) and Bair Island Road	Rbt	AM	6.9	A	7.0	A	0.1
			PM	11.8	B	12.1	B	0.3

			PM	>120	F	>120	F	1.5

Notes:

¹ Control Type Definitions: Rbt = Roundabout; AWSC = All-Way Stop Control.

Overall weighted average control delay (seconds per vehicle) is reported for signalized and AWSC intersections.

² The intersection of Blomquist St and Maple St will be converted to either an AWSC or Rbt intersection under cumulative conditions. The above results for Rbt reflect a single-lane Rbt.

³ Synchro default parameters were adjusted to ensure intersection delay and LOS reflect field observations.

Bold indicates a substandard level of service.

Bold indicates that the proposed project would cause an adverse effect at this intersection.

Without Blomquist Street Extension

The results of the level of service analysis under cumulative no project and cumulative plus project conditions without the Blomquist Street extension are summarized in Table 12. The project would not cause a substantial adverse effect at any study intersections.

Table 12
Cumulative Without Blomquist Street Extension Intersection Levels of Service

ID	Intersection	Control ¹	Peak Hour	Without Blomquist St Extension			
				Cumulative No Project		Cumulative Plus Project	
				Avg. Delay	LOS	Avg. Delay	LOS

			PM	>120	F	>120	F

Notes:

¹ Control Type Definitions: Rbt = Roundabout; OWSC = One-Way Stop Control.
Overall weighted average control delay (seconds per vehicle) is reported for signalized intersections.
Worst stop-controlled approach delay (seconds per vehicle) is reported for OWSC intersections.

² Synchro default parameters were adjusted to ensure intersection delay and LOS reflect field observations.
Bold indicates a substandard level of service.

Signal Warrants

An assessment was made of the need for signalization at the stop-controlled study intersection at Blomquist Street and Maple Street. This assessment was made on the basis of the Peak-Hour Volume Signal Warrant, Warrant #3, described in the *California Manual on Uniform Traffic Control Devices* (CA MUTCD). This method makes no evaluation of intersection level of service, but simply provides an indication whether peak-hour traffic volumes are or would be sufficient to justify installation of a traffic signal. Intersections that meet the peak hour warrant are subject to further analysis before determining that a traffic signal is necessary. Additional analysis may include unsignalized level of service analysis and/or operational analyses such as evaluation of vehicle queuing and delay. Other options such as traffic control devices, signage, or geometric changes may be preferable based on existing field conditions.

The peak-hour signal warrant check was completed for the Blomquist Street and Maple Street intersection for the AM and PM peak hours under all scenarios. The analysis showed that the signal warrant *would be satisfied* during the AM and PM peak hour under cumulative no project and cumulative plus project conditions without and with the Blomquist Street extension. The signal warrant worksheet can be found in Appendix D.

As described previously, the project would cause the average delay at this intersection to increase by more than five seconds under cumulative conditions with the Blomquist Street extension with all-way stop control during the PM peak hour. Based on the City's mobility deficiency criteria, a project is said to have a substantial adverse effect at an unsignalized intersection operating at an unacceptable level of service if the addition of project traffic increases the worst movement delay by greater than 5.0 seconds and the peak-hour signal warrants is met at the intersection. Therefore, the project would cause a substantial adverse effect at the intersection during the PM peak hour.

This intersection is planned to have a roundabout with the Blomquist Street extension. The analysis of a one-lane roundabout showed that the intersection would operate at an acceptable LOS B or C under both cumulative no project and cumulative plus project conditions during the AM and PM peak hours, respectively. Based on the projected traffic volumes, a roundabout would be a preferred control method rather than a traffic signal at this intersection.

Without the Blomquist Street extension, the intersection is expected to operate at an acceptable level under the current one-way stop control during the AM peak hour. During the PM peak hour, the intersection would operate at unacceptable level of service E with the current one-way stop control under both cumulative no project conditions and cumulative plus project conditions. The peak-hour signal warrant check showed that the signal warrant *would be satisfied* during the AM and PM peak hour under cumulative no project and cumulative plus project conditions. Because the project would cause the average delay to increase by less than five seconds without the Blomquist Street extension, the project would not result in an adverse effect under this scenario.

4. Other Transportation Issues

This chapter presents other transportation issues associated with the proposed project. These include an analysis of:

- Site access and on-site circulation
- Potential impacts to transit, bicycle, and pedestrian facilities
- Parking

Unlike the level of service and VMT impact methodology, which is adopted by the City Council, the analyses in this chapter are based on professional judgment in accordance with the standards and methods employed by the traffic engineering community.

Site Access and On-Site Circulation

Site access and on-site circulation were evaluated using commonly accepted transportation principles. This review is based on the site plan prepared by the DAHLIN Group, dated June 24, 2021 (see Figure 2).

Vehicle Site Access

Vehicular access to the site would be provided via one driveway on E. Bayshore Road. A 26-foot wide internal roadway would provide access to three residential buildings along the north side of the project site and connect to three 20-foot wide short dead-end roads serving the remaining six buildings on the southern portion of the project site. The project is estimated to generate 41 gross trips during the AM peak hour and 55 gross trips during the PM peak hour. That is less than one car every minute entering or exiting the driveway. Given the small number of project trips and the low traffic volume on East Bayshore Road, turning movements to and from the project driveway would not cause any operational issues.

Sight Distance

Sight distance generally should be provided in accordance with Caltrans design standards. Sight distance requirements vary depending on the roadway speeds. The speed limit on East Bayshore Road is 25 mph. The Caltrans recommended stopping sight distance at this speed is 150 feet. This means that a driver must be able to see 150 feet down East Bayshore Road to locate a sufficient gap to turn out of the driveways.

The driveway is located about 90 feet south of the sharp curve where Whipple Avenue connects to East Bayshore Road. Therefore, eastbound right-turn traffic from Whipple Avenue is expected to travel at lower speeds while making turns. Based on the curb radius, vehicles slow to a maximum of

approximately 15 mph when making this turn. The recommended stopping sight distance would be 100 feet for a design speed of 15 mph. There are no landscaping features next to the site driveway that would obstruct the vision of exiting drivers. However, there is a fence along the west side of East Bayshore Road that extends south from the pedestrian crosswalk that limits visibility of vehicles approaching around the curve. Measured on the current site plan, outbound drivers at the project driveway would be able to see vehicles approaching on eastbound Whipple Avenue 150 feet away, which would be more than adequate for the expected vehicle speeds.

Currently, on-street parking is not allowed on East Bayshore Road near the project driveway. Under project conditions, the site plan shows that five parallel street parking spaces will be provided to the San Francisco Bay Conservation & Development Commission (BCDC) for public use by Bay Trail visitors south of the project driveway on East Bayshore Road. However, a bulb out would be constructed on East Bayshore Road on both sides of the project driveway that would enable exiting drivers to pull forward after confirming the sidewalk is clear of approaching pedestrians and see past any cars parked near the driveway. There are no roadway curves or tall structures that would obstruct a driver's ability to see 150 feet to the south on East Bayshore Road. Thus, the sight distance looking south on East Bayshore Road would be adequate.

Emergency Vehicles, Truck Access and Circulation

Emergency response vehicles would be able to access the project site from the driveway on E. Bayshore Road. The width of the main internal road would be 26 feet wide, which is adequate for emergency vehicle access and circulation. The site plan shows three 20-foot-wide short dead-end roads serving the six buildings on the southern portion of the project site. Dead-end streets generally are undesirable because upon reaching the end of an aisle, drivers must either back out or perform a three-point maneuver. Because the dead-end streets would only provide access to resident garages and no visitor parking spaces, they would not cause any operational issues. The 20-foot wide dead-end roads would not be wide enough for garbage trucks, large delivery trucks, and emergency vehicles to turn around. However, a hammerhead turnaround area would allow large vehicles to back out to the main internal road in order to turn around on site.

Pedestrian, Bicycle and Transit Analysis

Pedestrian facilities near the project site consist of sidewalks, crosswalks, and pedestrian signals at signalized intersections. Whipple Avenue has pedestrian walkways on only the south side of the roadway at the US 101 interchange. Bicycle and pedestrian access to and from the site is also provided via the mixed-use trail along Redwood Creek connecting East Bayshore Road to Convention Way/Main Street. As shown on the site plan, the proposed project will provide new sidewalks along its frontage on East Bayshore Road. A public trail would be constructed along the northern boundary of the site, providing access between E. Bayshore Road and a planned public trail segment to be located on the adjacent property to the east, expanding and enhancing public access along the shoreline. Pedestrian pathways would be located throughout the site, connecting the proposed buildings to the public trail and E. Bayshore Road. The public trail would also provide bicycle access to the site.

Several new bicycle connections across US 101 have been constructed in recent years including enhanced Class II bike lanes on Whipple Avenue from Veterans Boulevard to East Bayshore Road and a new Class I bicycle path under US 101 connecting Convention Way/Main Street and East Bayshore Road. The Citywide Transportation Plan also calls for a new Class I bicycle path connecting Chestnut Street and Seaport Boulevard. Furthermore, a Class I bicycle path is proposed adjacent to the entire length of East Bayshore Road and Blomquist Street. The proposed development on the adjacent property at 557 East Bayshore Road would add Class II bicycle lanes along its project frontage on East Bayshore Road. However, the new bicycle lanes would not connect to other bicycle facilities.

Recommendation: The proposed project should provide bicycle facilities along the project frontage on East Bayshore Road in coordination with the City of Redwood City and adjacent property owners.

No transit services currently exist in the project vicinity. Due to the lack of transit accessibility, the project is expected to generate minimal transit trips. To improve transit access, the project should work with the City and SamTrans to create a bus route that serves the various residential, office, and retail uses on Bair Island.

Parking Analysis

Vehicle Parking

The project is proposing a General Plan Amendment and associated rezoning from General Commercial to Mixed-Use Waterfront District. The required parking supply is determined using the parking rates specified in the City Municipal Code Section 30.4.B. The project is located within a mixed-use zone. Based on the Redwood City Zoning Ordinance (Section 30.4), the project would be required to provide parking at the following rates for each use:

- Residential Use: 2 spaces per each unit with two or more bedrooms, 1.5 spaces for each one-bedroom or studio unit.
- Guests or Visitors: 1 space for every 4 residential units

Based on the project site plan and description, all 56 residential units will have two or more bedrooms. Based on the requirements listed above, the project would be required to provide a total of 112 parking spaces for residents and 14 spaces for guests or visitors. Based on the site plan, the project would provide a two car garage for each unit for a total of 112 reserved resident spaces and seven surface parking spaces on the site available to residents and guests. The proposed on-site parking satisfies the City's parking requirement for residents but falls short of the required guest parking. The Zoning Code states that the required number of guest or visitor spaces for a multiple dwelling development may be reduced or eliminated if one of the following conditions applies:

- a. Adequate street parking is available, and/or
- b. Only one parking space is reserved per unit for residents, and/or
- c. The site is in close proximity to retail shopping facilities and services.

The project would also provide five onstreet parking spaces to the San Francisco Bay Conservation & Development Commission (BCDC) for public use by Bay Trail visitors. There are no other on-street parking spaces available in the project vicinity. Because the project would provide more than one reserved per unit for residents and the site is not in close proximity to retail shopping facilities and services, it would not qualify for a reduction in guest parking.

Recommendation: The project should provide additional guest parking spaces to satisfy the Zoning Code requirements.

Bicycle Parking

The bicycle parking requirements per Redwood City Zoning Ordinance (Section 57.6) for residential uses in the Mixed-Use Waterfront District are: one bicycle parking space shall be provided per every three dwelling units.

Per the above zoning code, the project is required to provide 19 bicycle parking spaces for the proposed residential development. The project proposes to provide 19 bicycle parking spaces. The site plan does not show the location of the bicycle parking spaces. Acceptable secure bicycle parking

includes covered, lockable enclosures with permanently anchored racks for bicycles; lockable bicycle rooms with permanently anchored racks; or lockable, permanently anchored bicycle lockers.

TRAFFIC SIGNAL WARRANTS WORKSHEET

Major Street: Maple St
 Minor Street: Blomquist St

Analyst: LJ date: 11/5/21
 Critical Approach Speed* (mph) 25
 Critical Approach Speed* (mph) 25

*Posted Speed.

Critical speed of major street traffic > 50 mph (64 km/h).....

or

Rural (R)

In built up area of isolated community of < 10,000 population.....

Urban (U)

AM PEAK PERIOD

Warrant 3 - Peak Hour

The need for a traffic control signal should be considered if an engineering study finds that the criteria in either of the following two categories (Parts A and B) are met:

PART A

(All parts 1, 2, and 3 below must be satisfied)

	AM PEAK PERIOD							
	Existing	Existing + Proj	Background	Background + Proj	Cumulative No Proj	Cumulative	Cumulative No Proj (No BE)	Cumulative (No BE)
Minor Street Approach Direction w/ Highest Delay	NB	NB	NB	NB	NB	NB	NB	NB
Highest Minor Street Average Delay (sec/veh)	11.2	11.2	13.4	13.4	106.8	109.1	23.9	23.9
Corresponding Minor Street Approach Volume (veh/hr)	146	146	189	189	544	545	317	317
Minor Street Total Delay (veh-hrs)	0.5	0.5	0.7	0.7	16.1	16.5	2.1	2.1
Total Entering Volume (veh/hr)	553	554	700	701	1792	1804	1110	1111
1. The total delay experienced for traffic on one minor street approach controlled by a STOP sign equals or exceeds 4 vehicle-hours for a 1-lane approach and 5 vehicle-hours for a 2-lane approach; AND	No	No	No	No	Yes	Yes	No	No
2. The volume on the same minor street approach equals or exceeds 100 vph for 1 moving lane of traffic or 150 vph for 2 moving lanes; AND	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
3. The total entering volume serviced during the hour equals or exceeds 800 vph for intersections with 4 or more approaches or 650 vph for intersections with 3 approaches.	No	No	Yes	Yes	Yes	Yes	Yes	Yes
Signal Warranted based on Part A?	No	No	No	No	Yes	Yes	No	No

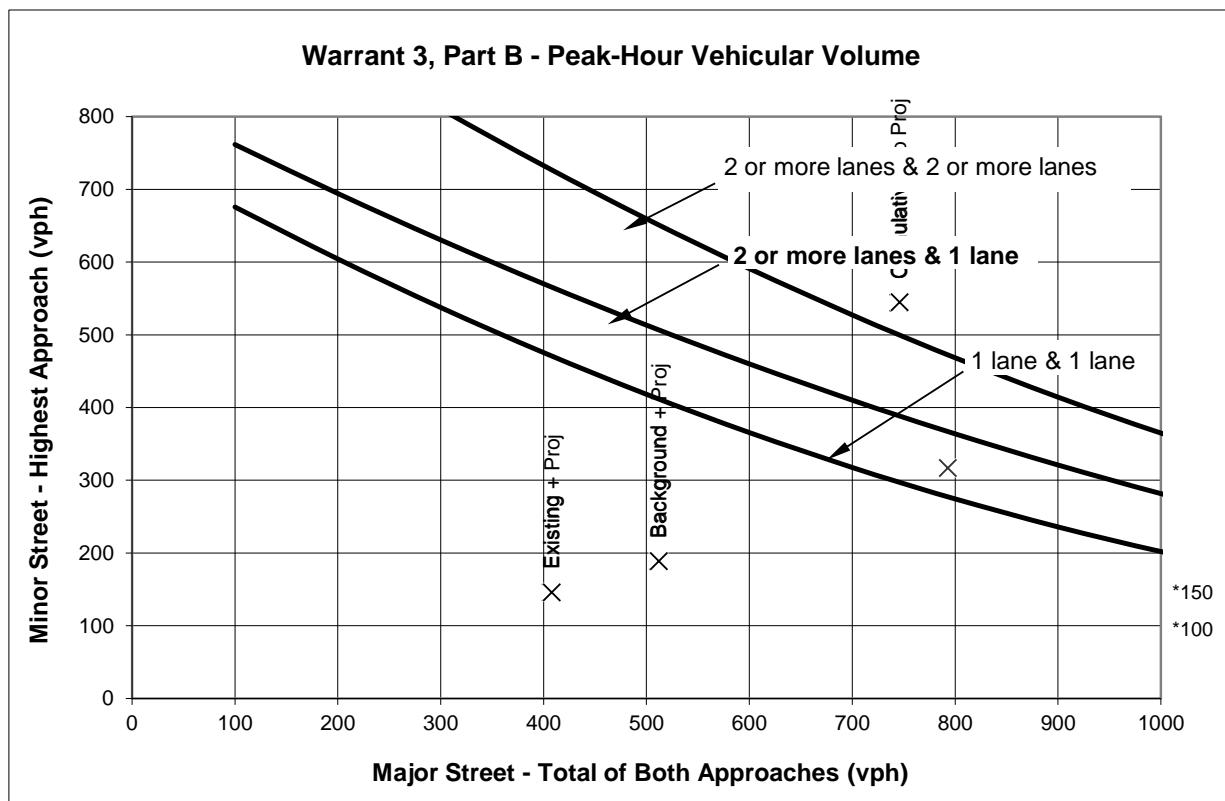

* Note: 150 vph applies as the lower threshold volume for a minor-street approach with two or more lanes and 100 vph applies as the
PART B

	Approach Lanes	AM PEAK PERIOD							
		Existing	Existing + Proj	Background	Background + Proj	Cumulative No Proj	Cumulative	Cumulative No Proj (No BE)	Cumulative (No BE)
Major Street - Both Approaches	Maple St	X		407	408	511	512	745	746
Minor Street - Highest Approach	Blomquist St	X		146	146	189	189	544	545
Signal Warranted based on Part B?		No	No	No	No	Yes	Yes	Yes	Yes

The Warrant is satisfied if the plotted point for vehicles per hour on the major street (both approaches) and the corresponding per hour higher vehicle volume minor street approach (one direction only) for one hour (any four consecutive 15-minute periods) fall above the applicable curves in California MUTCD Figure 4C-3 or 4C-4.

PM PEAK HOUR

Warrant 3 - Peak Hour

The need for a traffic control signal should be considered if an engineering study finds that the criteria in either of the following two categories (Parts A and B) are met:

PART A

(All parts 1, 2, and 3 below must be satisfied)

	PM PEAK HOUR							
	Existing	Existing + Proj	Background	Background + Proj	Cumulative No Proj	Cumulative	Cumulative No Proj (No BE)	Cumulative (No BE)
Minor Street Approach Direction w/ Highest Delay	NB	NB	NB	NB	NB	NB	NB	NB
Highest Minor Street Average Delay (sec/veh)	12.7	12.8	17.1	17.2	517.6	528.5	36.7	37.1
Corresponding Minor Street Approach Volume (veh/hr)	324	325	377	378	1091	1094	514	515
Minor Street Total Delay (veh-hrs)	1.1	1.2	1.8	1.8	156.9	160.6	5.2	5.3
Total Entering Volume (veh/hr)	589	591	781	783	2039	2055	1065	1067

1. The total delay experienced for traffic on one minor street approach controlled by a STOP sign equals or exceeds 4 vehicle-hours for a 1-lane approach and 5 vehicle-hours for a 2-lane approach; <u>AND</u>	No	No	No	No	Yes	Yes	Yes	Yes
2. The volume on the same minor street approach equals or exceeds 100 vph for 1 moving lane of traffic or 150 vph for 2 moving lanes; <u>AND</u>	Yes							
3. The total entering volume serviced during the hour equals or exceeds 800 vph for intersections with 4 or more approaches or 650 vph for intersections with 3 approaches.	No	No	Yes	Yes	Yes	Yes	Yes	Yes

Signal Warranted based on Part A?

No	No	No	No	Yes	Yes	Yes	Yes
----	----	----	----	-----	-----	-----	-----

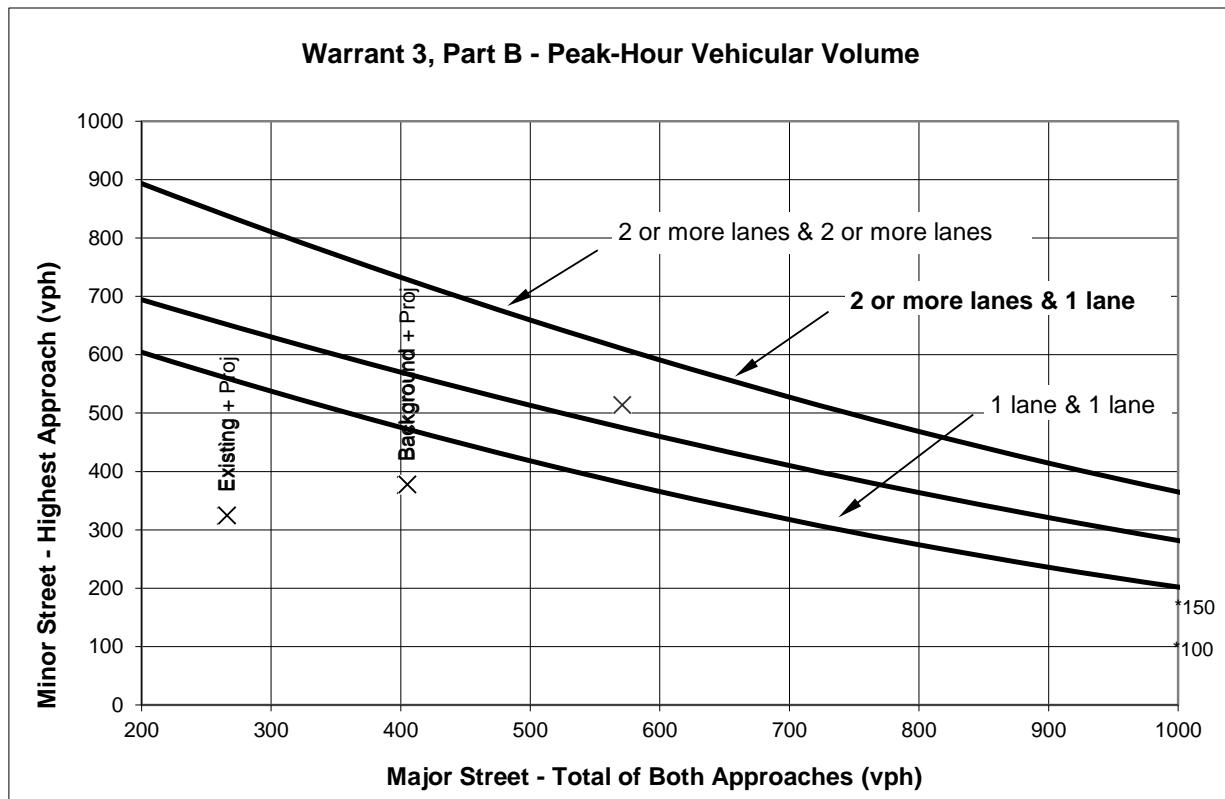

* Note: 150 vph applies as the lower threshold volume for a minor-street approach with two or more lanes and 100 vph applies as the **PART B**

	PM PEAK HOUR							
	Approach Lanes	Existing	Existing + Proj	Background	Background + Proj	Cumulative No Proj	Cumulative	Cumulative No Proj (No BE)
Major Street - Both Approaches	Maple St	X		265	266	404	405	564
Minor Street - Highest Approach	Blomquist St	X		324	325	377	378	1091
	Signal Warranted based on Part B?	No	No	No	No	Yes	Yes	Yes

The Warrant is satisfied if the plotted point for vehicles per hour on the major street (both approaches) and the corresponding per hour higher vehicle volume minor street approach (one direction only) for one hour (any four consecutive 15-minute periods) fall above the applicable curves in California MUTCD Figure 4C-3 or 4C-4.
