HYDROLOGY STUDY INFORMATION

APPENDIX C: PROJECT HYDRAULIC CALCULATIONS

APPENDIX D: PRIORITY PROJECT CHECKLIST AND APN'S

# I. INTRODUCTION

TTM 20368 is a residential subdivision of approximately 20 gross acres into 65 single family residential lots, located at the southeast corner of Eucalyptus Road and Topaz Road in the City of Victorville. The property is rectangular in shape and is bordered on the North by Eucalyptus road, which is paved. There is existing development north of the project. Minimum lot size is 7,200 sf. The project is considered a "priority project" and thus WQMP calculations will be provided. A fully executed WQMP will be prepared with the final drainage report and project design.

The purpose of this study is to determine the pre-development and post development runoff emanating from on-site for TTM 20368. The study will determine the peak flow rate for the existing condition, the peak flow rate for the proposed condition, and the proposed condition flow rate routed through a combination water quality and detention basin. Additional analysis will confirm hydraulic capacity of proposed street sections compared to rationale expected runoff.

The scope of the study includes the following:

- Determination of points of flow concentration and watershed areas.
- Determination of the 10 and 100-year 24 hours storm runoff based upon the onsite drainage conditions utilizing the San Bernardino County Flood Control District (SBCFCD) SCS Unit Hydrograph Method.
- Determination of the 10-year and 100-year peak flow rates for the

offsite area utilizing the San Bernardino County Flood Control District (SBCFCD) Rational Method.

The project will be subject to and designed in compliance with the MS4 Phase II NPDES Permit, the Mojave River Watershed Group Stormwater Management Plan.

## II. SITE DISCUSSION

The current property is vacant, undeveloped and undisturbed land with uniform slope of approximately 1.7 percent. The topography indicates that the runoff drains in a northeasterly direction in the form of sheet flow, and there is a ridge near the southeast corner of the site that is the edge of the bank of the large blue line stream just southwest of the new Sand Bernardino County Flood Control Amethyst Basin. There are no defined washes on site, but there is a small concentration of flow that follows a dirt access road from the area directly south of the property. Refer to Appendix A for additional offsite detail. The proposed development is for a 65 lot subdivision. No project phasing is proposed or evaluated at this time.

## III. RAINFALL DATA

The San Bernardino County Flood Control District (SBCFCD) hydrology Manual, (Reference 1) was used to develop the hydrological parameters for the 10-year and 100-year storm events. The Rational Method was used to determine the peak flow rates associated with the existing project conditions as well as the time of concentration used in the Unit Hydrograph method. In addition, the Unit Hydrograph Method was utilized to determine the runoff volume. Computations were performed using the CivilCADD drainage software for San Bernardino County Developed by CivilDesign Corporation.

Rainfall data was taken from NOAA Atlas 14 Precipitation Frequency Date.

Return Period - Duration	Isohyetal (in)
10 year - 1 hour	0.72
10 year - 6 hour	1.53
10 year - 24 hour	3.14
2 year - 6 hour	0.93
2 year - 24 hour	1.74
100 year - 1 hour	1.19
100 year - 6 hour	2.65
100 year - 24 hour	5.75

Hydrologic Soil Group "A", "Cajon Sand" is present, and an Antecedent Moisture Conditions (AMC) 2 is used for the study area. The percentage impervious is 60, and the SCS runoff is 32. Refer to Appendix B for additional detail.

The projects runoff is designed to be contained in a single basin that will act as both water quality infiltration, and flood storage for peak runoff mitigation. The 100- year 24 runoff event is the limiting factor for design.

## IV. ONSITE RUNOFF

### Existing Condition/Pre Development

The runoff from the subject site in the existing condition is primarily sheet flow, so for this study a single concentration of flow was analyzed. The site drains northeasterly to Eucalyptus Road where it continues easterly into an existing City Storm drain inlet along the north side of Eucalyptus. It is shown as Area A and Nodes 101 to 103 on the Existing Conditions Drainage Exhibit in Appendix A. In the existing condition a 100 year peak of 19.9 cfs is estimated. Post development conditions will require that be mitigated to 90% or <17.9 cfs.

### Proposed Condition/Post Development

The proposed condition is to the basin for water quality and flood routing for the project. The Rationale method was prepared for determination of time of concentration for use in the development of the Unit Hydrographs. The un-routed post development peak flow is 42.8 cfs.

The post development runoff is then routed through the proposed basin to confirm post development runoff could be mitigated to less than pre-development runoff (90%). The basin is designed to be dual purpose retention and detention basins with the bottom for water quality retention only, with no outfall, relying on infiltration. The storage above that is detention for the flood storage and volume needed for peak flow mitigation. In order to drain the top volume, or flood storage, an outlet pipe has been shown and used for preliminary calculations. The following is the detail for the basin shown on the TTM;

PARK BASIN (3' depth w/ 4:1 side slopes)

STAGE	AREA	VOL	VOL TOTAL	Vol ac-ft	Q INF [CFS]	Q WEIR [CFS]
3337	5682					
3338	7448	6565	6565	0.15	0.17	0
3339	9328	8388	14953	0.34	0.17	0
3340	16340	12834	27787	0.64	0.17	16
3341	19703	18022	45809	1.05	0.17	16

After routing through the proposed basin the post development 100 year 24 hour runoff for the project has a peak of 16.0 cfs, with 0.92 ac-ft stored at a depth of 3.7 feet. Preliminary storm drain capacity was used for calculations. At time of final design the final outlet structures shall be specified and designed per this report, and additional routing calculations should be prepared. Refer to Appendices B and C for detailed output files and the TTM for grading detail.

The primary hydraulic design elements are the roads and the storm drain. Roads within the project will be used to carry runoff. At the minimum design slope of 0.5% the roads can carry 37 cfs within the curbs and 52 cfs within the right-of-way. As design grades are increased, the streets can carry much more than that. Refer to Appendix C for details. The project stormdrain has been preliminarily sized by the CivILD Drainage program, or estimated using the Hydraflow Drainage Design software. The outlet pipe from the basin is preliminarily sized at a 24" pipe. Refer to the Proposed Conditions Drainage Exhibit in Appendix A and Appendix B and C for additional detail.

## V. OFFSITE RUNOFF

Runoff from a roughly 39.3 acre area south of the project will need to be accepted and routed through the property matching existing conditions, and providing for a future outlet of developed flows when the bordering properties develop. As there is no development surrounding the property, this project will establish the concentration of flow and the alignment of the controlled flow path. The southern boundary of the site will be designed with block wall with an open area at the existing low point, or point of run-on near the southwest corner. The 100 year peak runoff from the contributing area is 25.0 cfs. The flow will be accepted via open channel, and routed into a sediment basin at the end of street A. That basin is designed to overtop northerly into the site retention basin, and then follow the same overflow path into the existing storm drain system in Eucalyptus. Once the property to the south is developed this run-on point will be maintained, although at a reduced runoff rate. Further, the sediment basin will no longer require periodic cleaning. Refer to Appendix A, Appendix B, and the TTM for preliminary details.

## VI. STORMWATER TREATMENT

Stormwater treatment through infiltration will be provided at the bottom of the proposed basin, where the required volume will infiltrate through the site soils and into the groundwater. As shown on the TTM, the basin exceeds the required water quality volume. At time of final design

percolation testing will be required to confirm rates are sufficient to de-water the basins. Water quality calculations were prepared based on the San Bernardino County Model Water Quality Management Plan Guidance document. The following calculations were used in preliminary sizing of facilities:

- WQ Contributing area - 19.6 Acres
- 2 yr 1 hour rainfall - 0.42"
- Impervious ratio - 40% (from SBCFCD hydrology Manual)
- $C_{BMP} = 0.28$
- Drainage Area Region - Desert - Regression Coefficient  $P_6 = 1.2371$
- $P_6 = 1.2371 \times 0.42" = 0.52"$
- Regression Constant  $a = 1.963$  for 48 hours
- $P_0 = a * C_{BMP} * P_6 = 1.963 \times 0.28 \times 0.52 = 0.286$
- $V_0 = (P_0 * A)/12 = (0.286 \times 19.6)/12 = 0.47 \text{ acft}$

Post construction BMP's should be implemented, including but not limited to; N1, N2, N3, N11, N12, N14, N15, SD-13, and SD-32. In addition the infiltration basin will require regular maintenance and inspection to ensure the 2 year 24hr storms are contained and infiltrated and the post development 10 year 24hr storm runoff does not exceed the pre-development conditions (as confirmed in the above results). Maintenance will be provided through inclusion of the basins into a City Managed Landscape Maintenance Assessment District (LMAD). Maintenance and inspection details will be included in the WQMP for the final plan check process.

## VII. CONCLUSION

The proposed development of tract 20368, a 20 gross acres, 65 single family detached subdivision can be mitigated as designed and analyzed in this report to be compatible with the City of Victorville Master Plan of Drainage. The development of the subject site will not adversely affect area drainage patterns, impact any of the surrounding properties, or change any of the regional master plan facilities contemplated in the MDP. The Site will construct combination retention and detention basin of sufficient size to handle water quality through infiltration, and flood mitigation through detention. The streets have been analyzed and confirmed to contain the 10 year runoff within the curb, and the 100 year runoff within the right of way. At time of final design, the basins and outlet structures will need be designed and analyzed in conjunction with final grading and paving plans, street grades and curb inlets will need to be designed and sized to confirm capacity with final street design.

<sup>1</sup> Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

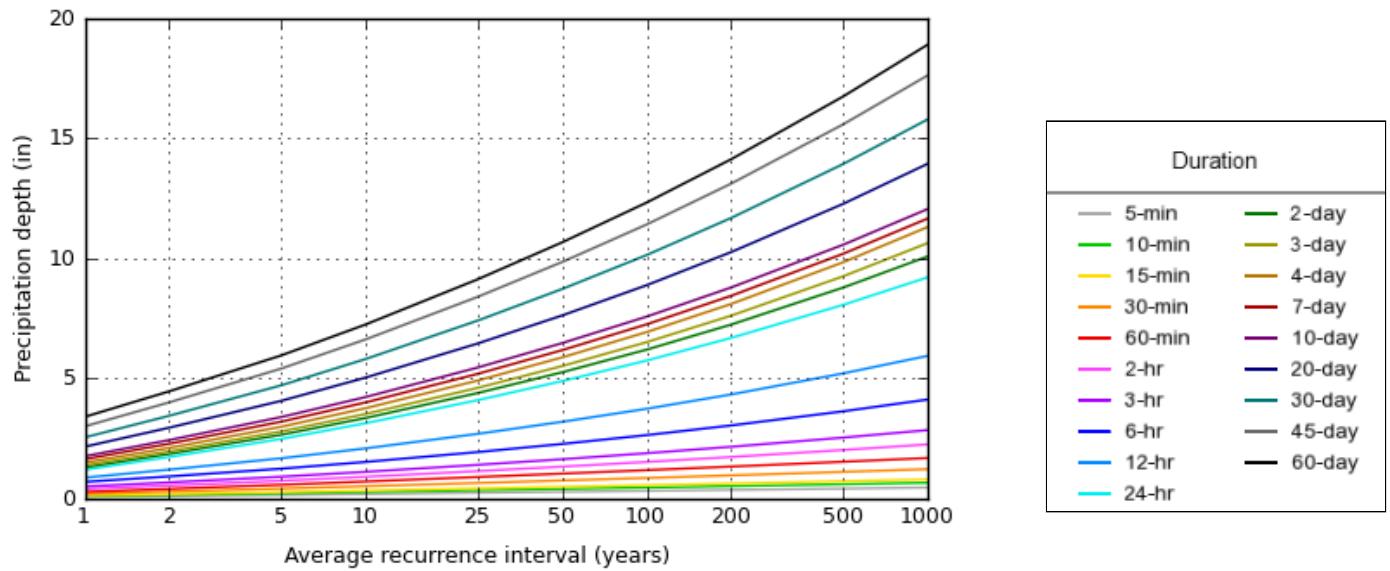

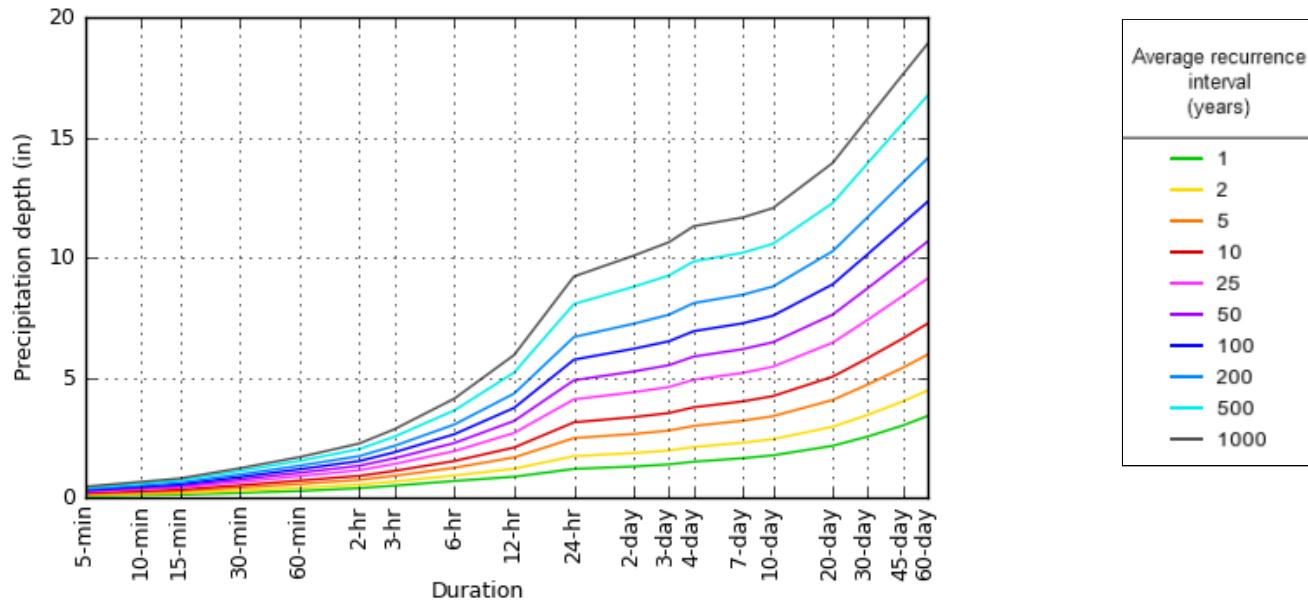

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

## MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service

Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: San Bernardino County, California, Mojave River Area

Survey Area Data: Version 11, Sep 17, 2019

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Feb 1, 2015—Feb 4, 2015

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

## Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
112	CAJON SAND, 0 TO 2 PERCENT SLOPES	21.9	98.7%
114	CAJON SAND, 9 TO 15 PERCENT SLOPES	0.3	1.3%
<b>Totals for Area of Interest</b>		<b>22.2</b>	<b>100.0%</b>

## San Bernardino County, California, Mojave River Area

### 112—CAJON SAND, 0 TO 2 PERCENT SLOPES

#### Map Unit Setting

*National map unit symbol:* hkrj

*Elevation:* 1,800 to 3,200 feet

*Mean annual precipitation:* 3 to 6 inches

*Mean annual air temperature:* 59 to 66 degrees F

*Frost-free period:* 180 to 290 days

*Farmland classification:* Farmland of statewide importance

#### Map Unit Composition

*Cajon and similar soils:* 85 percent

*Minor components:* 15 percent

*Estimates are based on observations, descriptions, and transects of  
the mapunit.*

#### Description of Cajon

##### Setting

*Landform:* Alluvial fans

*Landform position (two-dimensional):* Backslope

*Landform position (three-dimensional):* Tread

*Down-slope shape:* Linear

*Across-slope shape:* Linear

*Parent material:* Alluvium derived from granite sources

##### Typical profile

*H1 - 0 to 7 inches:* sand

*H2 - 7 to 25 inches:* sand

*H3 - 25 to 45 inches:* gravelly sand

*H4 - 45 to 60 inches:* stratified sand to loamy fine sand

##### Properties and qualities

*Slope:* 0 to 2 percent

*Depth to restrictive feature:* More than 80 inches

*Natural drainage class:* Somewhat excessively drained

*Capacity of the most limiting layer to transmit water (Ksat):* High to  
very high (5.95 to 19.98 in/hr)

*Depth to water table:* More than 80 inches

*Frequency of flooding:* None

*Frequency of ponding:* None

*Calcium carbonate, maximum in profile:* 1 percent

*Available water storage in profile:* Low (about 4.1 inches)

##### Interpretive groups

*Land capability classification (irrigated):* 3e

*Land capability classification (nonirrigated):* 7e

*Hydrologic Soil Group:* A

*Ecological site:* Sandy (R030XF012CA)

*Hydric soil rating:* No

### Minor Components

#### **Manet**

*Percent of map unit:* 5 percent  
*Landform:* Playas  
*Hydric soil rating:* Yes

#### **Kimberlina**

*Percent of map unit:* 5 percent

#### **Helendale**

*Percent of map unit:* 5 percent

## Data Source Information

	1.000 *	1.000 *	14.490) + =	42.807	

Total of 3 main streams to confluence:

Flow rates before confluence point:

16.856	13.729	15.490
--------	--------	--------

Maximum flow rates at confluence using above data:

42.655	38.956	42.807
--------	--------	--------

Area of streams before confluence:

6.800	7.200	5.600
-------	-------	-------

Effective area values after confluence:

18.470	19.600	18.197
--------	--------	--------

Results of confluence:

Total flow rate = 42.807(CFS)

Time of concentration = 16.223 min.

Effective stream area after confluence = 18.197(Ac.)

Study area average Pervious fraction( $A_p$ ) = 0.475

Study area average soil loss rate( $F_m$ ) = 0.464(In/Hr)

Study area total = 19.60(Ac.)

End of computations, Total Study Area = 19.60 (Ac.)

The following figures may

be used for a unit hydrograph study of the same area.

Note: These figures do not consider reduced effective area effects caused by confluences in the rational equation.

Area averaged pervious area fraction( $A_p$ ) = 0.475

Area averaged SCS curve number = 32.0

# STORMWATER PLANNING PROGRAM PRIORITY PROJECT CHECKLIST

FORM  
**PC**

Project Name	Eucalyptus & Topaz	Owner Name	Tanner Family Trust	Developer Name	SAME AS OWNER
Project Address	SEC Eucalyptus Rd and	Owner Address	2501 Markwood Street	Developer Address	
Topaz, Victorville, CA		Duarte, CA 91010			
Plan Check #	TTM 20368	Owner Phone		Developer Phone	

## TYPE OF PROJECT

Does the proposed project fall into one of the following categories? Please check Yes/No	YES	NO
--	-----	----

## PRIORITY PROJECTS

1. A new project equal to 1 acre or greater of disturbed area and adding more than 10,000 square feet of impervious* surface area	X	
2. A new industrial park with 10,000 square feet or more of surface area		X
3. A new commercial mall with 10,000 square feet or more surface area		X
4. A new retail gasoline outlet with 5,000 square feet or more of surface area		X
5. A new restaurant (SIC 5812) with 5,000 square feet or more of surface area		X
6. A new parking lot with either 5,000 ft <sup>2</sup> or more of impervious* surface or with 25 or more parking spaces		X
7. A new automotive service facility (SIC 5013, 5014, 5511, 5541, 7532-7534 and 7536-7539) with 5,000 square feet or more of surface area		X
8. Projects located in or directly adjacent to, or discharging directly to a Significant Ecological Area (SEA)*, where the development will:		X
a. Discharge stormwater runoff that is likely to impact a sensitive biological species or habitat; and		
b. Create 2,500 square feet or more of impervious surface area		
9. Redevelopment*		X

## SPECIAL PROVISION PROJECTS

10. Green street* project		X
11. Single family hillside* home		X

If checked YES, numerical criteria will apply to items 1,2,6-9 and items 3-5 (for project areas of 5,000 ft<sup>2</sup> or more of surface area.) If any of the boxes are checked YES, this project will require the preparation of a Low Impact Development (LID) Plan and a Maintenance Agreement Transfer\*

## **DEFINITIONS:**

**Impervious** are those surfaces that do not allow stormwater runoff to percolate into the ground. Typical impervious surfaces include: concrete, asphalt, roofing materials, etc. However, some specially designed concrete/asphalt do allow water to percolate (pervious).

**Hillside** means property where the slope is 25% or greater and where grading contemplates cut or fill slopes. Single family hillside homes will require a less extensive plan. During the construction of a single-family hillside home, the following measures are implemented:

- a. Conserve natural areas
- b. Protect slopes and channels
- c. Provide storm drain system stenciling and signage
- d. Divert roof runoff to vegetated areas before discharge unless the diversion would result in slope instability
- e. Direct surface flow to vegetated areas before discharge unless the diversion would result in slope instability.

**Green Streets** means any street and road construction of 10,000 square feet or more of impervious surface area

- a. These projects will follow an approved green streets manual to the maximum extent practicable. Street and road construction applies to standalone streets, roads, highways, and freeway projects, and also applies to streets within larger projects. Stormwater mitigation measures must be in compliance with the approved green streets manual requirements.

**Redevelopment** means land-disturbing activities that result in the creation, addition, or replacement of 5,000 ft<sup>2</sup> or more of impervious surface area on an already developed site.

Redevelopment does not include routine maintenance activities that are conducted to maintain the original line and grade, hydraulic capacity, or original purpose of facility, nor does it include modifications to existing single family structures, or emergency construction activities required to immediately protect public health and safety.

**Significant Ecological Area** means an area in which plant or animal life or their habitats are either rare or especially valuable because of their special nature or role in an ecosystem and would be disturbed or degraded by human activities and developments. Also, an area designated by the City as approved by the Regional Water Quality Control Board.

**Maintenance Agreement and Transfer:** All developments subject to LID and site specific plan requirements provide verification of maintenance provisions for Structural and Treatment Control BMPs, including but not limited to legal agreements, covenants, CEQA mitigation requirements, and/or conditional use permits. Verification at a minimum shall include:

- The developer's and/or owner's signed statement accepting responsibility for maintenance until the responsibility is legally transferred; and
- A signed statement from the public entity assuming responsibility for Structural or Treatment Control BMP maintenance and conduct a maintenance inspection at least once a year; or
- Written conditions in the sales or lease agreement, which requires the recipient to assume responsibility for maintenance and conduct a maintenance inspection at least once a year; or
- Written text in project conditions, covenants and restrictions (CCRs) for residential properties assigning maintenance responsibilities to the Home Owners Association for maintenance of the Structural and Treatment Control BMPs; or
- Any other legally enforceable agreement that assigns responsibility for the maintenance of post-construction Structural or Treatment Control BMPs.
