SUBJECT: Airport Road Distribution Center Project—Tree Survey Report

Per your request, ENPLAN has completed a tree survey for the ±40-acre Airport Road Distribution Center Project and an associated ±1.4-acre sewer line corridor extending south to Shasta View Drive. The project site is located on the east side of Airport Road approximately 1.5 miles north of the Redding Municipal Airport, in the City of Redding, Shasta County. The study area is situated in Section 22, Township 31 North, Range 4 West (U.S. Geological Survey Enterprise 7.5-minute quadrangle). The Distribution Center site is identified as Shasta County Assessor's Parcels 054-200-002 and 054-210-006; the sewer corridor would be in existing undeveloped road right-of-way. This report provides the results of the tree survey.

The site is undeveloped and is located between 500 and 520 feet above sea level. The habitat is primarily oak and pine woodland composed of valley oak (*Quercus lobata*), interior live oak (*Quercus wislizeni*), gray pine (*Pinus sabiniana*), poison oak (*Toxicodendron diversilobum*), common manzanita (*Arctostaphylos manzanita*) and white-leaf manzanita (*Arctostaphylos viscida*). An aerial image of the site is shown in **Figure 1**.

City of Redding Tree Protection Ordinances and Permitting

The Redding Municipal Code provides tree protection through the Streets and Sidewalks Ordinance, Chapter 13.40.010 (Trees and Shrubs) and through Zoning Ordinance, Chapter 18.45.030 (Tree Management). As described in Chapter 13.40.010, trees that are considered unique, outstanding specimens of desirable species, have historic interest, or are of distinct form will be identified and preserved in a Landmark and Heritage Tree Plan developed by the community services advisory commission.

The City of Redding Zoning Ordinance, Chapter 18.45.030, states that “no tree, regardless of species, that exceeds 6 inches dbh on any developed or undeveloped/vacant property in the city shall be destroyed, killed, or removed unless a tree removal permit is first obtained.” An application for a “Discretionary Permit”, as described in Chapter 18.45.070, will also serve as “an application for tree removal in those instances where trees will be affected by the development.”

To secure a Discretionary Permit, “candidate trees and “candidate tree groupings”, as defined under Chapter 18.61, must be identified on the site. These trees are classified as a single healthy tree or group of healthy trees (i.e., common, unbroken canopy) warranting consideration for preservation by virtue of its value to the community, the immediate neighborhood, or the natural environment in recognition of the existence of one or more of the following attributes:

- It is an outstanding specimen of its species in terms of aesthetic quality as determined by shape and branch structure.
- It is one of the largest or oldest trees in Redding that also has historical or neighborhood interest.
- It adds significantly to the environment of the City because of its location, distinct form, unique species, or other identifying characteristics.
- It is in a location which is connected to a larger natural woodland system, such as a permanent open-space area, and which is likely to be self-supporting over time.
- It serves a desirable function, such as buffering dissimilar land uses, or is a component of an overall landscape plan.

Section 18.45.060 states that prior to any work done on the site, “every tree designated for removal on the approved site plan that is outside the proposed right-of-way or easement areas shall be clearly marked in the field.” Section 18.45.080 states that “a pre-construction meeting” be “held with the contractor and City staff to review any tree protection measures required.”

Tree Survey Methodology

The following methodology was used for the tree survey:

- The site was inspected to identify all trees ≥ 6 -inch diameter at breast height (dbh). Using a diameter tape, tree diameters were measured approximately 4½ feet above the ground surface. Where the trunk split below this level, each stem was separately measured and recorded.
- The species of each tree ≥ 6 -inch dbh was determined and recorded.
- The arborist rated the health of each tree ≥ 6 -inch dbh on a scale of 1-5 (Poor-Best). Health factors include tree form and structure; crown diameter; density; amount of foliage on lateral branches; trunk defects; presence of damage, disease, or decay; condition of old and new wood; etc. See Tables 1 and 2 for a more detailed description of health ratings.
- The arborist identified candidate trees and candidate tree groupings in accordance with the factors described in the City of Redding Zoning Ordinance Chapter 18.61 (see above).
- Trees ≥ 6 -inch dbh were labeled with a numbered metal tree tag where accessible.
- The locations of trees ≥ 6 -inch dbh were recorded with a GPS unit capable of sub-meter accuracy.

Tree Survey Results

The site was surveyed on July 14, 16, 19, 20, August 2, and October 18, 2021, and all on-site trees ≥ 6 -inch dbh were evaluated, as defined above. The survey was conducted by Rico Montenegro, Certified Arborist #WE-6734A, with assistance from ENPLAN biologist

Allison Loveless. A total of 890 trees were recorded on the site, within six species: blue oak, interior live oak, gray pine, ponderosa pine, valley oak, and the non-native tree-of-heaven. Twenty-two of the recorded trees were identified as candidate trees, as shown in **Table 1** below. No candidate tree groupings were identified. The surveyed trees, including their identification number, species, size, health rating, and classification, are characterized in the attached **Table 2**. The locations of all surveyed trees are depicted on **Figures 2 and 3**; the locations of candidate trees are shown on **Figure 4**.

Table 1. Candidate Trees

Tag Number	Scientific Name	Common Name	Health Rating*	Diameter at Breast Height (Inches)
46	<i>Pinus sabiniana</i>	Gray pine	5	40
51	<i>Quercus lobata</i>	Valley oak	4	32
231	<i>Pinus sabiniana</i>	Gray pine	5	38
237	<i>Pinus sabiniana</i>	Gray pine	5	40
298	<i>Quercus wislizeni</i>	Interior live oak	5	26
489	<i>Pinus sabiniana</i>	Gray pine	5	40
559	<i>Pinus sabiniana</i>	Gray pine	4	46
564	<i>Pinus sabiniana</i>	Gray pine	5	46
592	<i>Pinus sabiniana</i>	Gray pine	3	40
634	<i>Pinus sabiniana</i>	Gray pine	3	54
807	<i>Quercus wislizeni</i>	Interior live oak	4	18
812	<i>Pinus sabiniana</i>	Gray pine	4	44.5
832	<i>Quercus lobata</i>	Valley oak	4	33
835	<i>Quercus lobata</i>	Valley oak	5	21
841	<i>Pinus sabiniana</i>	Gray pine	5	38
850	<i>Quercus lobata</i>	Valley oak	5	21.5
884	<i>Pinus sabiniana</i>	Gray pine	4	42
905	<i>Pinus sabiniana</i>	Gray pine	3	46
960	<i>Pinus ponderosa</i>	Ponderosa pine	5	36
984	<i>Quercus lobata</i>	Valley oak	5	31.5
1027	<i>Quercus lobata</i>	Valley oak	5	23.5
1029	<i>Quercus lobata</i>	Valley oak	5	26

* Health rating (Defined by Rico Montenegro Certified Arborist #WE-6734A)

3. Moderate amounts of visible disease, insect damage, decay, or limb loss. Between 50 and 80% of the branches are foliated. Trees are generally single trunked, with compromised form and structure, and moderate growth.

4. Minor evidence of disease, insect damage, decay, or limb loss. More than 80 to 90% of the branches are foliated. Trees are generally single trunked, with good form and structure, and good growth.

5. None or very little evidence of disease, insect damage, decay, or limb loss. More than 90% of the branches are foliated. Trees are generally single trunked, with very good form and structure, and vigorous growth.

City of Redding Application Process

An application for a Discretionary Permit is considered an application for tree removal in those instances where trees will be affected by planned development of the subject site. Any identified candidate trees should be preserved. Further, if all identified candidate trees cannot be preserved, the design of the development should address preservation of the most desirable and significant of the healthy candidate trees. However, at the City's discretion, the tree preservation requirements can be waived based on site characteristics and/or proposed plans for grading and infrastructure improvements.

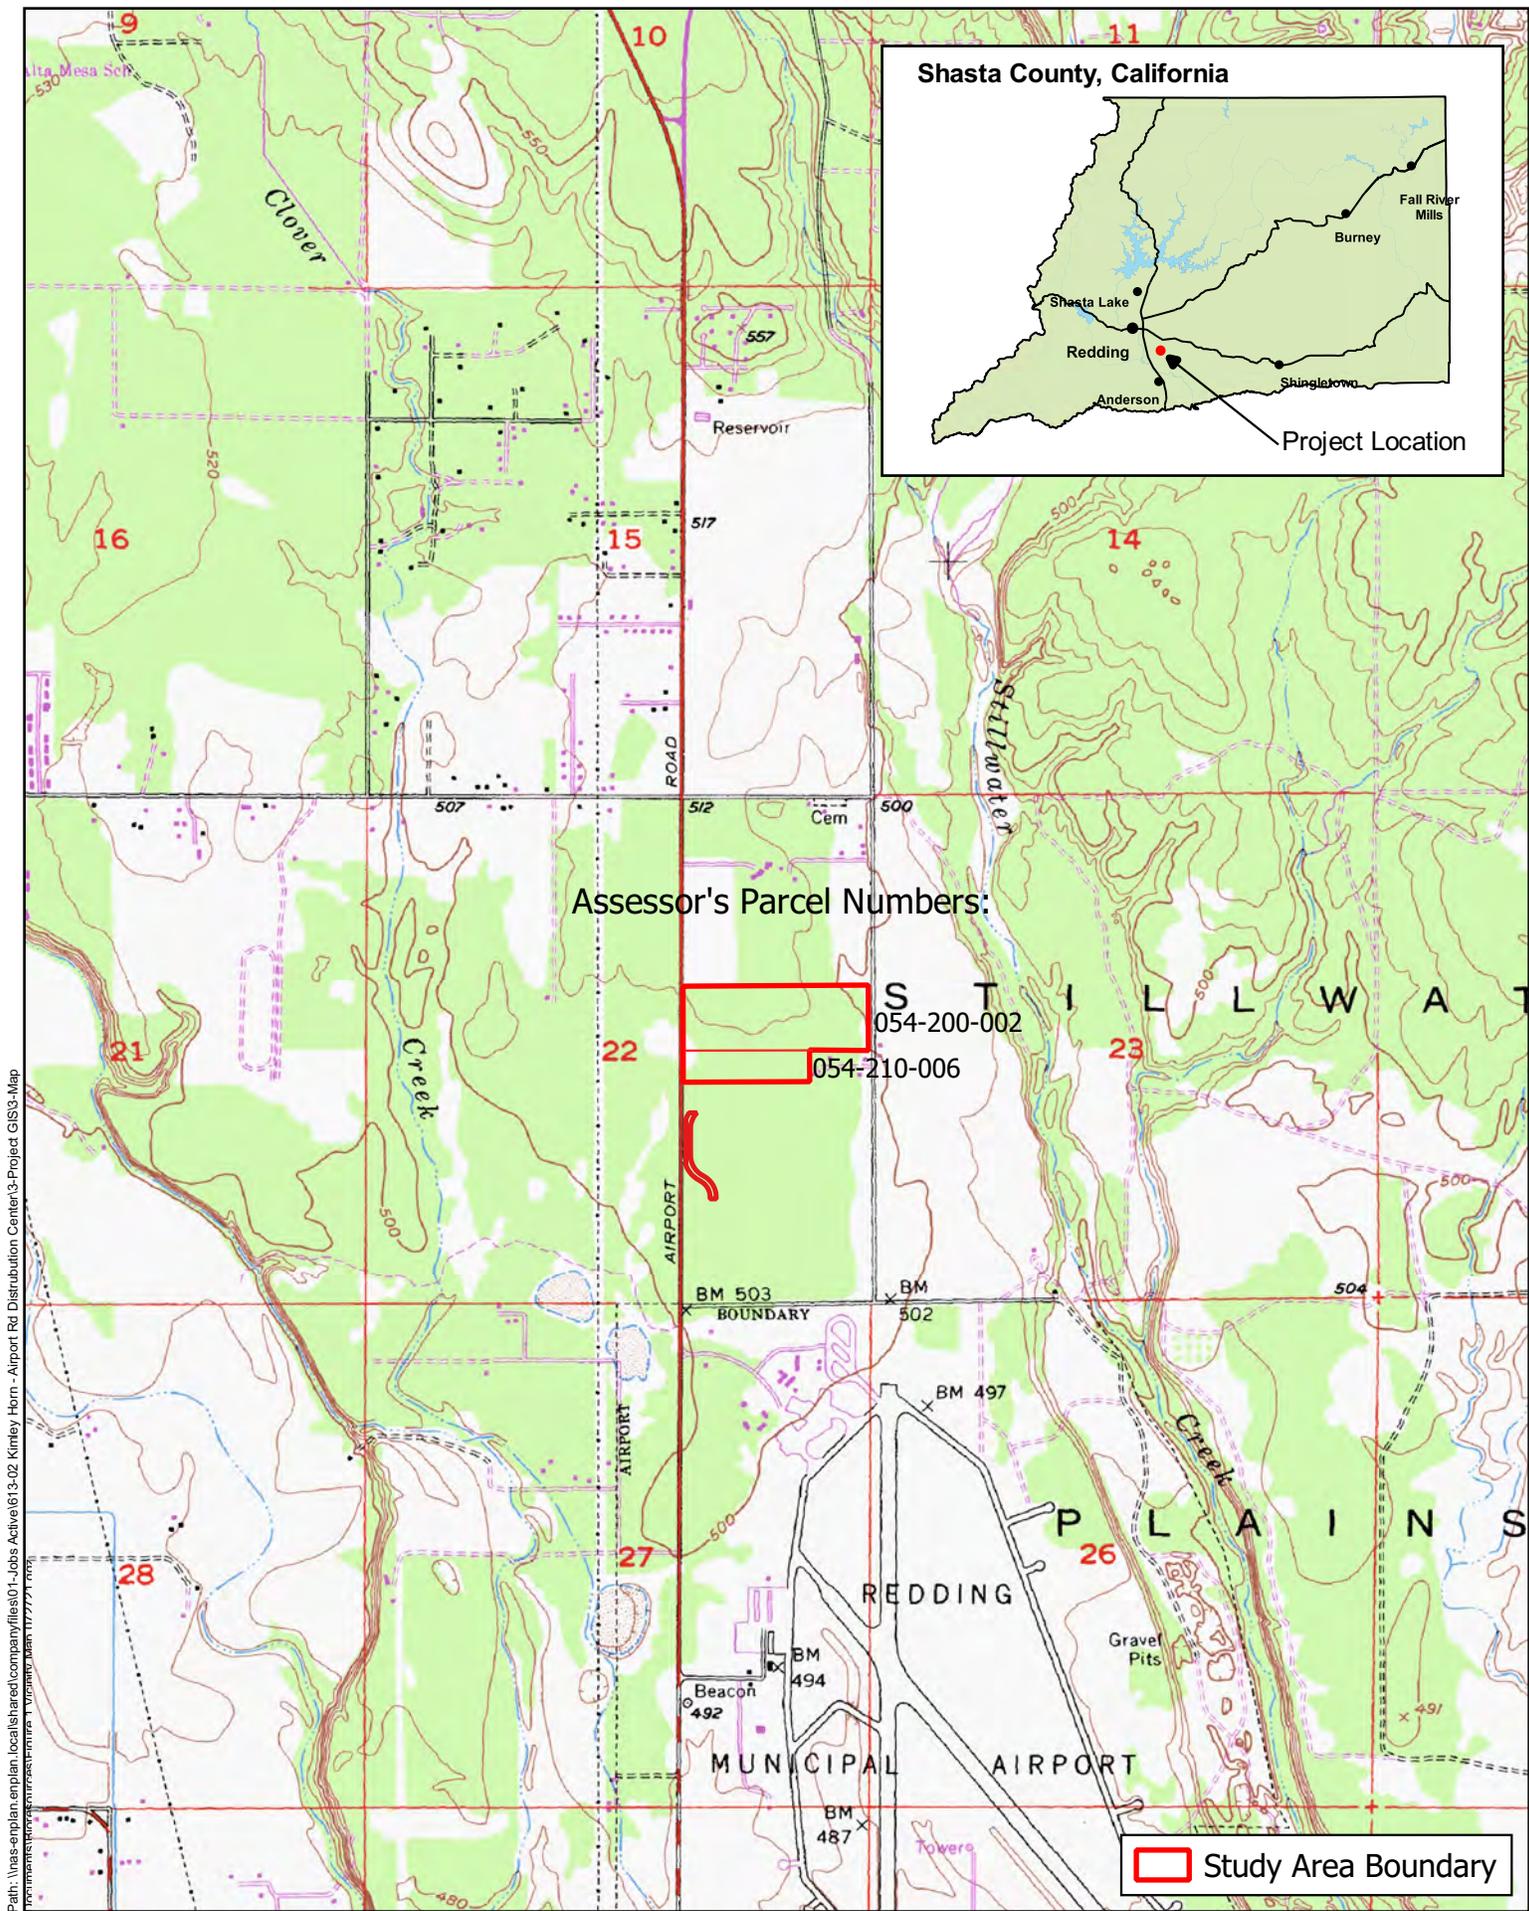

Please contact us if you have any questions regarding the results of our tree survey.

Sincerely,

Allison Loveless
Environmental Scientist/Wildlife Biologist

† Multi-trunked tree that splits below breast height; multiple diameters may be listed

* Health rating (Defined by Rico Montenegro Certified Arborist #WE-6734A)

1. Extreme and profound visible evidence of disease, insect damage, decay, or limb loss. Less than 25% of branches are foliated. Trees may contain single or multiple trunks with deteriorated form and structure. Trees are in later stages of senescence.
2. Major and large amounts of visible disease, insect damage, decay, or limb loss. Between 25 and 50% of the branches are foliated. Trees can contain single or multiple trunks, with poor form and structure. Trees are in the early stages of senescence.
3. Moderate amounts of visible disease, insect damage, decay, or limb loss. Between 50 and 80% of the branches are foliated. Trees are generally single trunked, with compromised form and structure, and moderate growth.
4. Minor evidence of disease, insect damage, decay, or limb loss. More than 80 to 90% of the branches are foliated. Trees are generally single trunked, with good form and structure, and good growth.
5. None or very little evidence of disease, insect damage, decay, or limb loss. More than 90% of the branches are foliated. Trees are generally single trunked, with very good form and structure, and vigorous growth.
