SOIL GAS SAMPLING REPORT

Dear Mr. Muzzio:

We are pleased to submit the findings from the soil gas sampling conducted at the subject site in San Jose, California (Site). The purpose of this assessment was to determine if subsurface soil gas conditions pose a future risk to the planned residential development at the Site. The sampling was conducted in accordance with the *Soil Gas Sampling Work Plan* that was prepared by ENGE (Reference 3) and approved by the Santa Clara County Department of Environmental Health (SCCDEH).

SITE BACKGROUND

The Site is located north of the intersection of Montague Expressway and Seely Avenue, in San Jose, California. The approximately 22-acre Site consists of two areas, the northern area is identified by Assessor's Parcel Number (APN) 097-15-033 and the southern area is identified by APNs 097-15-034 and 097-066-008 (681 East Trimble Road), Figure 1.

The southern area is currently occupied by two residential structures, barns and other storage structures, a fruit stand, and agricultural land (orchards, fruits, and vegetables), and miscellaneous debris (multiple tanks, farming equipment, tires, pipes, and other debris) in several locations across the Site. The northern area is currently vacant. Review of historical records indicates that the Site has been in the current configuration since the late 1990s. Previous historical records indicate that the Site had been utilized for orchards since at least the late 1930s. The Site has not been used for any other purposes.

ENGE conducted a phase I environmental site assessment for the Site in 2021 (ENGE 2021). One small (approximately 200-gallon) heating oil underground storage tank (UST) exists on the Site, Figure 2. We understand that the tank has not been used in 20 years and is believed to be empty. In addition, two small above-ground storage tanks (ASTs) were observed during the site reconnaissance conducted by ENGE in 2021. According to the Site owner, the ASTs were previously filled with diesel and gasoline and had been used to fuel farming equipment. Other than these features, ENGE did not identify any features or operations on the Site that would present a potential vapor intrusion risk. Additionally, during previous soil and groundwater sampling conducted by ENGE, no evidence of a potential vapor intrusion risk was identified.

SCOPE OF INVESTIGATION

Field activities were conducted on August 24, 2022. We retained a C-57 licensed drilling contractor to advance 10 borings to collect soil gas samples at the Site. Borings were co-located at five locations (SG-1 through SG-5), Figure 2. Five temporary soil gas borings were installed with vapor points at depths of approximately 5 feet below ground surface (bgs), and five co-located borings were installed with vapor points at depths of approximately 15 bgs. The installation and sampling of the soil vapor monitoring wells will be performed in general accordance with the *Department of Toxic Substances Control (DTSC) Final Advisory Active Soil Gas Investigations (July 2015)*. Groundwater was not encountered in any of the borings. The following procedures were conducted.

- Boreholes for the temporary soil gas wells were installed using a direct-push probe rig, which advanced an approximately 2-inch-diameter boring to depths of 6 and 15 feet bgs, respectively.
- The boreholes were backfilled with 6 inches of #3 sand, and an inert soil gas sampling tip attached to ¼-inch Teflon tubing was set at this depth and covered with an additional 6 inches of #3 sand. Six inches of dry granular bentonite was placed over the sand pack, and the borings were backfilled to 5½ and 15 feet into native soil with hydrated granular bentonite slurry. An additional 1-foot sand pack was installed at this depth with a shallow vapor tip and tubing placed. An additional 6-inch dry granular bentonite pack was installed above the sand pack and hydrated bentonite slurry was placed in the holes to the ground surface.
- The temporary wells were left to equilibrate for a minimum of 2 hours following installation.
- The purging/sampling manifold was assembled, including the sample and purge canisters, and a shut-in test was conducted by evacuating the manifold lines with the well plug valve shut, to a minimum vacuum of 100 inches of water (inwc). Once the lines were evacuated, the purge canisters/pump was shut, and the vacuum gauge was monitored for at least 1 minute. If any drop in vacuum occurred during this time, the manifold was examined, retightened, and repeated until it passed.
- The wells were purged of three dead space volumes, which include the sand pack, dry bentonite, and tubing. One purge volume was estimated at 0.26 liters (L) for shallow wells (total of 0.78 L for three purge volumes), assuming a porosity of 0.3 of the sand pack. Purge rates of 150 milliliters per minute equated to a purge time of approximately 5.2 minutes.
- After purging, the purge canister was shut, and the sample canister was opened. Samples were collected in batch-certified 1-L summa canisters.
- During purging and sampling, the in-line vacuum gauges was monitored to ensure that vacuum in the well does not exceed 100 inwc of water. If vacuum approaches 100 inwc, purging and sampling was stopped to see if vacuum subsides, and purging/sampling continued once vacuum equilibrated.
- Clean rags were sprayed with the leak-check compound 1,1-difluoroethane (DFA) and was wrapped around the sample train and placed over the annular seal of the soil gas well during sampling.
- After summa tank pressure reached approximately 3 to 4 inches of mercury, the sampling was considered complete. The soil gas samples were submitted to a State-certified laboratory for analysis of volatile organic compounds (VOCs) (EPA Test Method TO-15) and for the fixed gas oxygen (ASTM D1946).
- The soil gas borings were abandoned shortly after installation and sampling.

Subsurface Conditions

Soil was logged on boring logs using the Unified Soil Classification System (USCS), presented in Appendix A. Soil was screened with a Mini-RAE photoionization detector (PID) for VOC emissions. The subsurface consisted of moist, low plasticity silt to a depth of 6 feet bgs, followed by brown mottled lean and fat clay to 15 feet bgs. Groundwater was not encountered during the investigation to the total depth explored.

ANALYTICAL RESULTS

Soil gas concentrations were compared to the Regional Water Quality Control Board's (RWQCB) environmental screening level (ESLs)¹ for residential land use, as well as the Department of Toxic Substances Control (DTSC) Human and Ecological Risk Office (HERO) Note 3 Screening Levels (SLs)² for residential air (with an attenuation factor of 0.03 and 0.001). The DTSC's August 2022 *Vapor Intrusion Update* document indicates that an attenuation factor of 0.03 can be used for the initial evaluation of the potential for vapors to enter a building, and an alternate attenuation factor may be proposed using multiple lines of evidence. Selection of an attenuation factor should be based on multiple lines of evidence and site-specific conditions. A summary of analytical results is presented in Table A.

Benzene, vinyl chloride, and trichloroethylene (TCE) were detected at samples collected at 15 feet bgs, at concentrations exceeding the very conservative ESLs and DTSC SLs with a 0.03 attenuation factor in the soil gas samples. However, all VOCs detected in shallow and deeper samples were below the DTSC SLs with an attenuation factor of 0.001. Benzene was detected in one shallow soil gas sample (SG-5 at 5 feet) at a concentration exceeding the DTSC SL with a 0.03 attenuation factor, as well as the corresponding ESL. No other shallow detections exceeded the DTSC SLs with a 0.03 attenuation factor or the ESLs.

Oxygen was detected ranging between 16 percent and 18 percent in the samples collected. This represents favorable bioattenuation conditions.

The laboratory report is presented in its entirety in Appendix B.

DISCUSSION

Soil Gas Screening Levels

Screening levels for chemicals in soil, groundwater, and soil gas are not intended to establish regulations or restrictions on land use, nor to establish any mitigation or remediation requirements, and "the presence of a chemical at concentrations in excess of a screening does not necessarily indicate adverse effects on human health or the environment, rather that additional evaluation is warranted."³ Health and Safety Code Section 57008(a)(3) of SB 32 states the following.

¹ RWQCB Subslab/Soil Gas Vapor Intrusion: Human Health Risk Levels (Table SG-1); Residential; January 2019 (Rev. 1).

² DTSC HERO Note 3, Table 3, DTSC Recommended Screening Levels for Ambient Air Analytes – Residential and Commercial Industrial Air.

³ San Francisco Bay Regional Water Quality Control Board, User's Guide: Derivation and Application of Environmental Screening Levels (ESLs), Interim Final 2016 Water Board Environmental Screening Levels.

"A screening number is solely an advisory number, and has no regulatory effect, and is published solely as a reference value that may be used by citizen groups, community organizations, property owners, developers, and local government officials to estimate the degree of effort that may be necessary to remediate a contaminated property. A screening number may not be construed as, and may not serve as, a level that can be used to require an agency to determine that no further action is required or a substitute for the cleanup level that is required to be achieved for a contaminant on a contaminated property."

The concern with VOCs in soil gas, is the potential that soil gas migrates upwards and enters indoor air through vapor intrusion. The screening levels for soil gas are therefore calculated based on a ratio of the acceptable indoor air concentration to the soil gas concentration. This ratio is referred to as an attenuation factor. The indoor air screening levels for select VOCs are shown in Table 1 below and are the same for both the SF RWQCB and DTSC.

DTSC's most recent guidance related to site assessments for vapor intrusion concern (2011 Vapor Intrusion Guidance) recommends using default attenuation factors based on six different building scenarios, which can be applied for site-specific conditions. DTSC developed their default attenuation factors using the national empirical vapor intrusion database (U.S. EPA, 2008⁴). Soil vapor and paired indoor air measurements, consisting of 311 samples at 13 sites, were reviewed. An attenuation factor of 0.05 (or 20), representing approximately the 90th percentile of the data, was selected as an appropriate attenuation factor for existing residential structures. For new residential construction, the DTSC attenuation factor is 0.001 (or 1,000). Prior to January 2019, the SFRWQCB used an attenuation factor of 0.002 (or 500). However, in January 2019, the SFRWQCB updated its environmental screening levels to use the United States Environmental Protection Agency's (EPA) generic attenuation factor of 0.03 (or 33)⁵. This dramatically reduced the screening levels for numerous VOCs.

In April 2019 and August 2022, DTSC's HERO released an update to the Human Health Risk Assessment Note (referred to as HERO Note 3) that recommended using both the tailored attenuation factors included in the 2011 Vapor Intrusion Guidance and the U.S. EPA generic attenuation factor of 0.03. Therefore, this assessment compares the measured soil gas concentrations to two screening levels – one calculated based on the recommended attenuation factor for new residential construction (0.001), and one calculated based on the U.S. EPA's generic attenuation factor of 0.03.

TABLE 1: Indoor Air and Soil Gas Screening Levels

CHEMICAL	INDOOR AIR (residential) in $\mu\text{g}/\text{m}^3$		SOIL GAS (residential) in $\mu\text{g}/\text{m}^3$	
	SF REGIONAL BOARD	DTSC	DTSC VAPOR INTRUSION GUIDANCE	US EPA GENERIC ATTENUATION FACTOR
Benzene	0.097	0.097	97	3.2
Trichloroethylene	0.48	0.48	480	16
Vinyl Chloride	0.0095	0.0095	9.5	0.32

⁴ U.S. EPA's Vapor Intrusion Database: Preliminary Evaluation of Attenuation Factors, March 4, 2008

⁵ San Francisco Bay Regional Water Quality Control Board Update to Environmental Screening Levels dated January 24, 2019.

Bioattenuation

Petroleum hydrocarbons, including benzene, are known to significantly degrade in aerobic conditions (greater than 4% oxygen) in the vadose zone. However, the RSLs and DTSC SLs presented above do not account for bioattenuation. The DTSC 2011 VIG provides the following statement regarding bioattenuation (bioattenuation and biodegradation are interchangeable).

"Aerobic biodegradation of petroleum hydrocarbon vapors will occur if proper conditions exist in the vadose zone. If sufficient oxygen is present along with appropriate soil moisture, nutrients, and pH conditions, volatile petroleum hydrocarbons can readily biodegrade in the vadose zone. To evaluate the vapor intrusion of petroleum hydrocarbons, the California State Water Resources Control Board's updated Leaking Underground Fuel Tank [LUFT] Guidance Manual should be followed in conjunction with the procedures with this Guidance."

The LUFT Guidance Manual - September 2012, Updated December 2015, includes extensive discussion of bioattenuation for petroleum hydrocarbons including benzene and ethylbenzene. The guidance indicates that a conservative 1,000-fold "bioattenuation factor" of petroleum vapors is assumed for a direct measurement of soil gas concentrations when the source is located more than 5 feet from a building foundation. Additionally, the volatile analytes expected to naturally attenuate over time through volatilization and bioattenuation. The toxicity/screening values assume a long-term exposure of 30 years (for residential exposure), which does not take this degradation into account. Therefore, the results presented in this report likely over-estimate the risk values.

The measured oxygen range within the Site (16% to 18% with an average detected concentration of 17%) is within the range of oxygen to support bioattenuation of benzene. Therefore, the conditions at the Site support the use of a minimum bioattenuation factor of 1,000 (or 0.001).

CONCLUSIONS

Previous Site Use

As noted above, the Site has been used for agricultural purposes for decades. Other than two small ASTs and a small historic UST, ENGEO did not identify any features or operations at the Site that would pose a vapor intrusion risk. Based on records searched, there is no evidence of the use of VOCs on the Site.

Regional Groundwater Conditions

Additionally, no VOCs were identified in the previous soil and groundwater sampling conducted at the Site in 2003 and 2021. In addition, based on a review of sites on the State Water Resources Control Board's GeoTracker database, VOCs have not been identified in the monitoring wells in the vicinity of the Site.

Soil Gas Attenuation

Based on the data collected at the Site, there appears to be relatively low levels of VOCs in soil gas present in the subsurface soil, particularly in deep soil. The results indicate that concentrations are higher in deeper samples collected from 15 feet bgs and are non-detect or substantially lower in the samples collected at 5 feet bgs. Therefore, vapor impacts at the surface are not anticipated.

Proposed Development

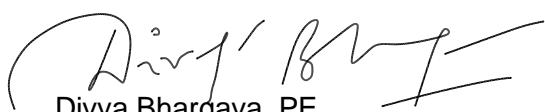

We anticipate that the proposed development of the Site will incorporate new residential construction over compacted soil with a 10-inch-thick to 12-inch-thick post-tension mat foundation for the apartment portion and a 5- to 6-inch slab for the townhomes portion, along with moisture barriers. DTSC's attenuation factor of 0.001 is more representative of the future conditions at the Site than the US EPA's generic attenuation factor of 0.03.

The multiple lines of evidence indicate that the subsurface soil gas conditions do not pose a future risk to the planned detached development; therefore, no further investigations appear necessary. In addition, based on the results of this assessment, vapor mitigation is not required for the future residential structures.

If you have any questions or comments regarding this letter, please call and we will be glad to discuss them with you.

Sincerely,

ENGEO Incorporated

RE: Trimble Rd Parcels

Work Order No.: 2208205

Dear Divya Bhargava:

Torrent Laboratory, Inc. received 10 sample(s) on August 25, 2022 for the analyses presented in the following Report.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.

Torrent Laboratory, Inc. is certified by the State of California, ELAP #1991. If you have any questions regarding these test results, please feel free to contact the Project Management Team at (408)263-5258; ext 204.

A handwritten signature in blue ink that reads "Kathie Evans". The signature is fluid and cursive, with "Kathie" on the left and "Evans" on the right.

Kathie Evans
Project Manager

September 02, 2022

Date

Date: 9/2/2022

Client: Engeo Inc (SJ)

Project: Trimble Rd Parcels

Work Order: 2208205

CASE NARRATIVE

Unless otherwise indicated in the following narrative, no issues encountered with the receiving, preparation, analysis or reporting of the results associated with this work order.

Unless otherwise indicated in the following narrative, no results have been method and/or field blank corrected.

Reported results relate only to the items/samples tested by the laboratory.

This report shall not be reproduced, except in full, without the written approval of Torrent Laboratory, Inc.

Laboratory Qualifiers and Definitions

DEFINITIONS:

Accuracy/Bias (% Recovery) - The closeness of agreement between an observed value and an accepted reference value.
Blank (Method/Preparation Blank) -MB/PB - An analyte-free matrix to which all reagents are added in the same volumes/proportions as used in sample processing. The method blank is used to document contamination resulting from the analytical process.
Duplicate - a field sample and/or laboratory QC sample prepared in duplicate following all of the same processes and procedures used on the original sample (sample duplicate, LCSD, MSD)
Laboratory Control Sample (LCS ad LCSD) - A known matrix spiked with compounds representative of the target analyte(s). This is used to document laboratory performance.
Matrix - the component or substrate that contains the analyte of interest (e.g., - groundwater, sediment, soil, waste water, etc)
Matrix Spike (MS/MSD) - Client sample spiked with identical concentrations of target analyte (s). The spiking occurs prior to the sample preparation and analysis. They are used to document the precision and bias of a method in a given sample matrix.
Method Detection Limit (MDL) - the minimum concentration of a substance that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero
Practical Quantitation Limit/Reporting Limit/Limit of Quantitation (PQL/RL/LOQ) - a laboratory determined value at 2 to 5 times above the MDL that can be reproduced in a manner that results in a 99% confidence level that the result is both accurate and precise. PQLs/RRLs/LODs reflect all preparation factors and/or dilution factors that have been applied to the sample during the preparation and/or analytical processes.
Precision (%RPD) - The agreement among a set of replicate/duplicate measurements without regard to known value of the replicates
Surrogate (S) or (Surr) - An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. Surrogates are used in most organic analysis to demonstrate matrix compatibility with the chosen method of analysis
Tentatively Identified Compound (TIC) - A compound not contained within the analytical calibration standards but present in the GCMS library of defined compounds. When the library is searched for an unknown compound, it can frequently give a tentative identification to the compound based on retention time and primary and secondary ion match. TICs are reported as estimates and are candidates for further investigation.
Units: the unit of measure used to express the reported result - mg/L and mg/Kg (equivalent to PPM - parts per million in liquid and solid), ug/L and ug/Kg (equivalent to PPB - parts per billion in liquid and solid), ug/m3 , mg/m3 , ppbv and ppmv (all units of measure for reporting concentrations in air), % (equivalent to 10000 ppm or 1,000,000 ppb), ug/Wipe (concentration found on the surface of a single Wipe usually taken over a 100cm ² surface)

LABORATORY QUALIFIERS

B - Indicates when the analyte is found in the associated method or preparation blank
D - Surrogate is not recoverable due to the necessary dilution of the sample
E - Indicates the reportable value is outside of the calibration range of the instrument but within the linear range of the instrument (unless otherwise noted) Values reported with an E qualifier should be considered as estimated.
H - Indicates that the recommended holding time for the analyte or compound has been exceeded
J - Indicates a value between the method MDL and PQL and that the reported concentration should be considered as estimated rather than quantitative
NA - Not Analyzed
N/A - Not Applicable
ND - Not Detected at a concentration greater than the PQL/RL or, if reported to the MDL, at greater than the MDL.
NR - Not recoverable - a matrix spike concentration is not recoverable due to a concentration within the original sample that is greater than four times the spike concentration added
R - The % RPD between a duplicate set of samples is outside of the absolute values established by laboratory control charts
S - Spike recovery is outside of established method and/or laboratory control limits. Further explanation of the use of this qualifier should be included within a case narrative
X -Used to indicate that a value based on pattern identification is within the pattern range but not typical of the pattern found in standards. Further explanation may or may not be provided within the sample footnote and/or the case narrative.

Sample Receipt Checklist

Client Name: Engeo Inc (SJ)

Date and Time Received: 8/25/2022 12:00:00PM

Project Name: Trimble Rd Parcels

Received By: Lorna Imbat

Work Order No.: 2208205

Physically Logged By: Lorna Imbat

Checklist Completed By: Lorna Imbat

Carrier Name: Client Drop Off

Chain of Custody (COC) Information

Chain of custody present? Yes

Chain of custody signed when relinquished and received? Yes

Chain of custody agrees with sample labels? Yes

Custody seals intact on sample bottles? Not Present

Sample Receipt Information

Custody seals intact on shipping container/cooler? Not Present

Shipping Container/Cooler In Good Condition? Yes

Samples in proper container/bottle? Yes

Samples containers intact? Yes

Sufficient sample volume for indicated test? Yes

Sample Preservation and Hold Time (HT) Information

All samples received within holding time? Yes

Container/Temp Blank temperature in compliance? Temperature: °C

Water-VOA vials have zero headspace? No VOA vials submitted

Water-pH acceptable upon receipt? N/A

pH Checked by: n/a pH Adjusted by: n/a
