# 1 EXECUTIVE SUMMARY

Professional Service Industries, Inc. (PSI) performed a Phase I Environmental Site Assessment (Phase I ESA) of the vacant building located at 1601 Civic Center Drive, Santa Clara, California. PSI performed the assessment to comply with the contract between Charities Housing (the Client) and PSI.

## 1.1 FINDINGS

A summary of findings is provided below. The report should be read in its entirety to obtain a more complete understanding of the information provided and to aid in any decisions made or actions taken based on this information.

### 1.1.1 SITE DESCRIPTION AND CURRENT USE

The subject property is located on the east side of Lincoln Street, north of its intersection with Civic Center Drive. The site address is 1601 Civic Center Drive, Santa Clara, California 95050. The site can also be defined by Santa Clara County Assessor Parcel Number: 224-49-006.

Currently, the subject property is developed with one two-story building that totals approximately 30,000 square feet on a 1.49-acre property. The building is currently unoccupied and appeared to previously function as an office space. The building includes multiple offices, break rooms, restrooms, and conference rooms. The subject property also has parking and limited landscaping.

No RECs were identified during the site reconnaissance.

### 1.1.2 ADJOINING PROPERTY DESCRIPTION AND USE

The subject property is located within a commercial and residential area in Santa Clara, California. Current use(s) of adjoining properties are:

<b>Adjoining Current Use</b>	
<b>Direction</b>	<b>Interpreted Property Use</b>
<b>North</b>	Santa Clara United Methodist Church
<b>South</b>	Civic Center Drive followed by Bank of the West and Best Western University Inn Santa Clara
<b>West</b>	Lincoln Street followed by City Hall
<b>East</b>	Multiple single-family residences

### 1.1.3 HISTORICAL USE OF SITE AND SURROUNDING AREA

Historical information sources researched in this assessment allowed uses of the property to be traced from the present back to 1939 as undeveloped and partially agricultural land with internal roads. The subject property appears to be undeveloped land in 1963 and was developed in its current configuration by 1974. Based on historical sources, it appears that the subject property has always functioned as office space for multiple tenants since 1975.

The general surrounding area has been agriculturally developed and undeveloped land until around 1963, when the adjacent properties appear to be developed with various commercial and residential structures. Around late-1970s to early-1990s, the commercial and residential buildings appear to be developed in their current configuration.

### 1.1.4 GOVERNMENTAL RECORDS REVIEW

PSI subcontracted with ERIS, to provide a review of governmental database records for spill sites, tanks, hazardous waste handlers, and other facilities of potential concern within proximity to the subject property. In our review of the environmental database report for the subject property and site vicinity, none of the listed sites appeared to be a REC.

### 1.1.5 SIGNIFICANT DATA GAPS

The Standard Practice defines a Significant Data Gap as a gap that affects the ability to identify RECs. Findings and conclusions are subject to the limitations imposed by Significant Data Gaps. Based on our experience, the information that we gathered and evaluated did not present significant data gaps that affected our ability to identify RECs in connection with the subject property.

## **1.2 CONCLUSIONS**

PSI performed a Phase I Environmental Site Assessment of the subject property in general accordance with the scope and limitations of ASTM Practice E 1527-13. Any exceptions to or deletions from this practice are described in Section 2.3 of this report. The following conclusions have been made with regard to evidence of RECs, HRECs, CRECs, VECs, off-site RECs, and de minimis conditions on the subject property, as defined in ASTM E 1527-13.

### 1.2.1 RECOGNIZED ENVIRONMENTAL CONDITIONS

This assessment has revealed no evidence of RECs in connection with the subject property.

### 1.2.2 CONTROLLED RECOGNIZED ENVIRONMENTAL CONDITIONS

This assessment has revealed no evidence of CRECs in connection with the subject property.

### 1.2.3 HISTORICAL RECOGNIZED ENVIRONMENTAL CONDITIONS

This assessment has revealed no evidence of HRECs in connection with the subject property.

#### 1.2.4 VAPOR ENCROACHMENT CONDITIONS

This assessment has revealed no evidence of VECs in connection with the subject property.

#### 1.2.5 DE MINIMIS CONDITIONS

PSI did not identify any evidence of *de minimis* conditions on the subject property.

#### 1.2.6 OFF-SITE RECOGNIZED ENVIRONMENTAL CONDITIONS

This assessment has revealed no evidence of off-site RECs in connection with the subject property.

### **1.3 NON-SCOPE CONSIDERATIONS – OTHER BUSINESS ENVIRONMENTAL RISKS**

Assessment of other environmental issues beyond the consideration of ASTM E 1527-13 was not conducted at the request of the Charities Housing.

### **1.4 RECOMMENDATIONS**

PSI recommends no further assessment for RECs in connection with the subject property at this time.

## **2 PHASE I ESA SCOPE AND METHODOLOGY**

### **2.1 PURPOSE OF SERVICES**

PSI performed the Phase I ESA in conformance with ASTM E 1527-13, Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process (the Practice). The purpose of the Practice was to define good commercial practice for conducting an environmental site assessment and as such, the Practice is intended to permit the user to satisfy one of the requirements to qualify for the LLPs. The goal of the processes established by the Practice is to identify RECs in connection with the property.

### **2.2 PHASE I ESA METHODOLOGY**

PSI performed a Phase I ESA of the subject property. The scope of our services and general methodology is presented below.

The information sources that PSI used, including published material, material obtained from commercial, and other sources, is listed below and cited as it is presented in the report. The information or excerpts thereof is appended.

This assessment included four components:

- Records review;
- Reconnaissance;
- Interviews; and,
- Preparation of this report, including our evaluation.

Assessment of other environmental issues beyond the consideration of ASTM E 1527-13 was not conducted at the request of Charities Housing.

### **2.3 LIMITATIONS, EXCEPTIONS, DEVIATIONS, AND DATA GAP**

PSI considers that limitations, exceptions, and deviations from the Practice manifest as a lack of or inability to obtain information required by the Practice. This represents the definition of the 'data gap' contained in the Practice. PSI listed the component objectives of the Practice on the appended Data Gap Worksheet and tracked the information obtained against the objectives. Therefore, the limitations, exceptions, and deviations are identified in the Worksheet.

In general, when required information was incomplete, not provided, otherwise not obtained, or indicated a need for additional information, PSI attempted to use information from other sources to meet the Practices' performance objectives. When the data gaps affected the Environmental Professional's ability to identify RECs, PSI considered the data gap(s) to be significant. PSI identified significant data gaps (if any) on the Data Gap Worksheet and reported them in Section 1.1.5.

## 2.4 SIGNIFICANT ASSUMPTIONS

PSI made the following assumptions in developing our Phase I ESA findings and conclusions:

- Regulatory Agency Information - PSI considers all information provided by our environmental database subcontractor regarding regulatory status of facilities to be complete, accurate, and current.
- Other Regulatory Information - PSI considers all information obtained from regulatory or enforcement agencies to be complete, accurate, and current.
- Title, Lien and AUL Information - PSI considers all information provided by real estate title record review firms regarding property use or ownership, encumbrances or other limitations, if provided, to be complete, accurate, and current.
- Interviews - PSI considers all information provided through interviews to be complete, unbiased, and provided in good faith.
- Groundwater - PSI interpreted and inferred the direction of the shallow groundwater movement based on the information we obtained and our experience. Actual groundwater flow may be locally influenced by many factors beyond the scope of this assessment. Subsurface investigation would be necessary to determine site-specific groundwater flow direction.

### 3 USER-PROVIDED INFORMATION

PSI considers the Client to be the 'User' of our assessment, defined in ASTM Practice E 1527 as "the party seeking to use ASTM E 1527 to complete an environmental site assessment of the property. A User may include, without limitation, a potential purchaser of property, a potential tenant of property, an owner of property, a lender, or a property manager. The User has specific obligations for completing a successful application of this practice...."

#### 3.1 USER QUESTIONNAIRE

The EPA All Appropriate Inquiry Rule (40 CFR Part 312) and ASTM E1527 Section 6 require the User to answer certain questions related to the property, in order to obtain certain LLPs from CERCLA liability.

##### Environmental Liens

The Client did NOT return the UQ and we were not contracted for a lien/AUL search: PSI was not provided with information about environmental cleanup liens. This limitation and our evaluation are recorded on the appended Data Gap Worksheet.

##### Activity and Use Limitations

The Client did NOT return the UQ and we were not contracted for a lien/AUL search: PSI was not provided with information about AULs. This limitation and our evaluation are recorded on the appended Data Gap Worksheet.

#### 3.2 SUGGESTED INFORMATION

The Client provided PSI with the following suggested information described by the Practice.

- The reason for performing the Phase I ESA.
- The type of property and type of property transaction.
- The complete and correct address of the property.
- The scope of services desired for the Phase I ESA, including any evaluation for business environmental risk that is beyond the scope of ASTM E1527.
- Identification of all parties who will rely upon the report.
- Identification of the key site contact and contact information.

#### 3.3 HELPFUL DOCUMENTS

The Practice requires that the environmental professional ask the property owner, the key site manager (if any is identified), and the User for certain helpful documents about the property and certain legal proceedings involving hazardous substances and the subject property. PSI mailed or e-mailed questions or performed interviews requesting this information. The responses documenting the persons we corresponded with, and relevant information obtained, are appended where practical.

PSI mailed, e-mailed questions, or performed interviews requesting this information. The Client did not provide PSI with prior reports of prior assessments of the site.

## 4 PHYSICAL SETTING

PSI reviewed a USGS topographic (topo) map, information from the USDA and/or Natural Resources Conservation Service (NRCS), and/or other information regarding the physical setting of the subject property to assist with the interpretation of subsurface water movement near the subject property. Physical setting information is summarized in the table below.

## 5 SITE RECONNAISSANCE

The location and approximate boundaries of the subject property are illustrated on the appended figures. The legal description of the subject property, if provided to PSI, is appended.

Mr. Hai Nguyen of Charities Housing arranged for PSI to access to the subject property. Our accessor was unescorted b during the site reconnaissance.

The site reconnaissance consisted of observing the periphery of the subject property and viewing the subject property from accessible adjoining public access areas. Visual reconnaissance of adjoining properties was limited to areas and facilities that were readily observable from the subject property or from public access areas. PSI also systematically toured the interior portions of the subject property parcels to provide an overlapping field of view.

The peripheries of surface features and/or structures, where present on the subject property, were observed along with accessible interior common areas. PSI photo-documented selected features. The photo log is included in the Appendix.

PSI observed an emergency generator located on the north side on the subject property. This emergency generator appeared to be diesel-fueled with an integral tank and associated piping under the generator equipment, but above the ground. Typically, tanks associated with emergency generators are equipped with integral secondary containment systems. PSI did not observe evidence of leaking or staining around the base of the generator at the time of the site reconnaissance. Based on this information, the presence of the emergency generator is not considered to be evidence of a REC in connection with the subject property.

No evidence of recognized environmental conditions was observed as part of the site reconnaissance of the subject property.

The information developed and reviewed for adjoining properties did not reveal evidence of recognized environmental conditions in connection with the subject property.

## 6 HISTORICAL USES

PSI utilized readily ascertainable historical data resources in order to research the history of the site and surrounding area. The intent of this review was to identify historical tenancies or uses of the subject property and surrounding area, which might be considered evidence of a recognized environmental condition. Generally, PSI reviewed the following readily ascertainable historic data resources, where they were available:

- Readily available historical topographic maps were reviewed to evaluate land development in the area over time. It should be noted that the scale of topographic maps in some cases does not allow for mapping of individual structures and developed areas may be shown by shading only.
- Selected historical aerial photographs were reviewed at 5 to 10-year intervals to obtain information concerning the development and history of the subject property and surroundings.
- PSI reviewed readily ascertainable historical city directories at 5 to 10-year intervals in order to obtain information on tenancies on the subject property and adjoining properties.
- PSI requested available historical fire insurance maps from ERIS, Inc. The Sanborn Map Company and other regional providers historically mapped urban areas for use by insurance underwriters. In some cases, these maps provide useful information in evaluating previous tenancies and uses of the subject property and surrounding area.

Copies of select historical documents are provided in the report appendix; however, it should be noted that some of the resources used by PSI may be copyrighted and PSI has summarized these resources herein, but we have not included copies of these resources in the appendix.

The historical information developed and reviewed for the subject property did not reveal evidence of recognized environmental conditions in connection with the subject property.

It should be noted that part of the subject property appears to have been agriculturally developed at some point. While no structures indicative of pesticide/herbicide/chemical storage/mixing areas were distinguished in the aerial photographs, typically, crops are maintained with chemicals applied as a normal agricultural process. While no surficial evidence of misuse, misapplication of residual materials from pesticides, herbicides, or fertilizers were observed during the site reconnaissance, in certain instances, the chemicals historically applied to the subject site could be persistent and not biodegrade. As with any agriculturally developed land, there exists the possibility that pesticides, herbicides, or fertilizers have been applied, which may have impacted the subject property. Since there is no evidence of mixing and storage of pesticides, herbicides, or fertilizers at adjoining properties, PSI does not consider former agricultural use to represent a REC.

Our interpretation of the past uses of the adjoining properties is tabulated below.

The historical information developed and reviewed for adjoining properties did not reveal evidence of recognized environmental conditions in connection with the subject property. However, it should be noted that some of the adjoining properties appear to have been agriculturally developed at some point. While no structures indicative of pesticide/herbicide/chemical storage/mixing areas were distinguished in the aerial photographs, typically, crops are maintained with chemicals applied as a normal agricultural process. As with any agriculturally developed land, there exists the possibility that pesticides, herbicides, or fertilizers have been applied, which may have impacted the subject property. Since there is no evidence of mixing and storage of pesticides, herbicides, or fertilizers at adjoining properties, PSI does not consider former agricultural use to represent a REC in connection to the subject property.

## 7 ENVIRONMENTAL REGULATORY RECORDS REVIEW

### 7.1 REGULATORY AGENCY INQUIRIES

PSI requested records or information about the subject property and/or surrounding area from the governmental agencies listed in the following sections. Information was requested by telephone, in person, via e-mail or through a written Freedom of Information Act (FOIA) or equivalent request, as appropriate. Please see Section 6.2 for additional information.

### 7.2 DATABASE FINDINGS

PSI retained ERIS to provide environmental database information attributed to the subject property and its surroundings. ERIS obtains environmental databases published by local, state, tribal, and federal agencies and maps the information for electronic searches. ERIS's service includes reporting Standard Environmental Records Sources and, in most cases, some Additional Environmental Records Sources.

The search was performed to AMSDs listed in ASTM E 1527-13. The search radius required by ASTM varies by database.

Unmappable (orphan) sites (if any were listed) having insufficient address information to be mapped were evaluated for potential location within the AMSD. Those that could be determined to be within the AMSD are discussed, as appropriate.

The distribution of listed sites with respect to the subject property is tabulated and mapped in ERIS's Radius Map Report, which is appended. The reader is referred to the table, which can be found near the front of ERIS's report. The full names of the acronyms used below and in ERIS's report can be found in the Government Records Searched/Data Currency Tracking section of ERIS's report.

#### 7.2.1 SUBJECT PROPERTY

The subject property was listed on the searched governmental databases as a spill site or regulated facility and is summarized below.

<b>Facility Name &amp; Address</b>	Owen Properties, Old Mission Center, K&K Outdoor Advertising, 1601 Civic Center Drive, Santa Clara, California	<b>Map ID Number(s)</b>	1 Subject Property
Database(s) Listed: FINDS/FRS, Emissions			
The subject property was identified on the FINDS/FRS and Emissions databases. The database listings are associated with the site being regulated as a small source of air point pollution with the Bay Area Air Quality Management District for the emergency back-up generator. These listings do not have any violations associated with them nor do they identify a release to the subject property. Based on this information, PSI does not consider these listings to be a REC in connection with the subject property.			

**7.2.2 ADJACENT AND SURROUNDING PROPERTIES**

ERIS's report identified sites surrounding the subject property. PSI considered all of the listed sites unlikely to impact the subject site, based upon factors including (but not limited to):

- The nature of the listing;
- The use of the facility;
- When the facility was listed and its current listed status;
- The developmental density of the setting;
- The potential for vapors to encroach from the property to the subject property;
- The distance between the listing and subject sites related to whether releases are likely to migrate based on local surface and subsurface drainage conditions;
- The contaminant of concern; and/or
- The presence of intervening drainage divides; and/or inferred groundwater movement.

The following facilities were either adjacent to the subject property or deserved additional comment.

<b>Facility Name &amp; Address</b>	Santa Clara Police Department 1541 Civic Center Drive Santa Clara, California	<b>Map ID Number(s)</b>	4 Adjacent to the east, across Lincoln Street
Database(s) Listed: LOP Santa Clara, LUST, HHSS, Hist Tank, UST Sweeps			
This facility was identified on the LOP Santa Clara, LUST, HHSS, Hist Tank, and UST Sweeps databases. These listings are associated with the removal of a number of USTs from the site between 1985 and 2001. Only minor amounts of impact were identified in the soil, and the site received closure on April 23, 2004. Based on the closure and lack of evidence of groundwater impact, PSI does not consider the listing to represent a recognized environmental condition.			

## 8 VAPOR ENCROACHMENT SCREENING

### 8.1 METHODOLOGY

Vapor encroachment is an emerging concern associated with the potential for volatile chemicals, such as petroleum fuels and chlorinated solvents to migrate through the subsurface in the gas phase from contaminated soil and/or groundwater plumes. Vapor encroachment may be a concern if subsurface volatile contaminants migrate into occupied buildings through cracks and penetrations in the building slab.

The ASTM E1527-13 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment process requires the Environmental Professional to evaluate the potential for vapor encroachment onto the subject property, and to determine if such vapor encroachment constitutes evidence of a recognized environmental condition on the subject property. The E1527-13 Standard Practice does not specifically state the methods that must be used to screen for potential vapor encroachment issues. However, ASTM has developed a separate Standard Guide for Vapor Encroachment Screening on Property Involved in Real Estate Transactions (ASTM E2600-15). The VES guidance outlines a methodology to conduct vapor encroachment screening, which will satisfy the vapor screening requirements under the Phase I ESA Standard Practice. PSI utilized the ASTM E2600-15 Standard Guide to conduct vapor encroachment screening for the subject property.

The goal of conducting VES is to identify a VEC, which is defined as the presence or likely presence of COC vapors in the subsurface of the subject property caused by the release of vapors from contaminated soil either on or near the subject property. If a VEC is identified, the environmental professional must determine whether the VEC represents evidence of a REC on the subject property under the context of the Phase I ESA Standard Practice. It should be noted that the identification of a VEC on the subject property does not necessarily indicate that a potential for migration of vapors into existing or proposed structures on the subject property is likely. The environmental professional will identify the VEC as a recognized environmental condition where the potential for vapor migration into structures is considered likely, or where the contaminant concentrations in the soil, groundwater, or soil vapors on the subject property are significant and likely to result in enforcement against on-site or off-site responsible parties.

The VES utilizes information regarding the potential presence of releases on or near the subject property that were collected as a normal part of the Phase I ESA process, such as governmental database records, review of governmental files, historical data sources, etc. No additional data was collected specifically for the purpose of the VES. In order to identify potential sites of concern within the approximate minimum search distance, PSI reviewed Sanborn Maps, governmental database records, regulatory agency files, aerial photographs, and other information as available and appropriate.

VES Standard Guide prescribes a two-tier approach for screening of sites for potential vapor encroachment. In Tier I, potential sites of concern within the search radii are identified and the environmental professional must determine whether a VEC exists or not based on the information that is available within the context of the Phase I ESA data gathering. If the available information indicates that a VEC exists based on available information, the environmental professional, in consultation with the User, may conduct Tier II screening to further evaluate the potential risk. Under Tier II, the environmental professional would review available reports through the regulatory agency or other reasonably ascertainable sources to determine the status of assessment/remediation, size and migration pathways for any associated plumes, geologic conditions, and other geologic information. This information would be utilized to determine the distance between the plume and the target property boundary. For example, if the

distance from the edge of a plume in a downgradient position to the subject property boundary exceeds 100 feet for VOCs or petroleum free product, or 30 feet for dissolved petroleum hydrocarbons (PHCs), then the site may be screened out and a VEC does not exist. Functionally, where Tier II information is readily available during the normal course of conducting the Phase I ESA, PSI has combined the Tier I and Tier II steps herein. Where agency files are not readily available for nearby contaminated sites within the typical schedule for a Phase I ESA, then Tier II screening might be recommended as a separate step subsequent to the Phase I ESA. Where Tier II screening is recommended, the sites of concern where data is lacking are considered a VEC until further information is available and/or further screening is completed.

The VES Standard Guide requires the environmental professional to search for potential sites of concern within the following databases and search distances, where groundwater flow is not known and/or preferential pathways for groundwater or vapor flow may exist:

<b>Standard Environmental Records Sources</b>	<b>Minimum Search Distance (miles) - VOCs, excluding PHCs</b>	<b>Minimum Search Distance (miles) - PHCs</b>
State and tribal HWS lists	1/3	1/10
State or tribal-equivalent NPL	1/3	1/10
State or tribal-equivalent CERCLIS list	1/3	1/10
State or tribal landfill or solid waste site list	1/3	1/10
State or tribal leaking storage tank lists	1/3	1/10
State and tribal registered tank lists	Subject property only	Subject property only
State and tribal IC/EC registries	Subject property only	Subject property only
State and tribal voluntary cleanup site lists	1/3	1/10
State and tribal brownfield sites list	1/3	1/10
Federal NPL site list	1/3	1/10
Federal CERCLIS list	1/3	1/10
Federal RCRA CORRACTS list	1/3	1/10
Federal RCRA non-CORRACTS TSD List	1/3	1/10
Federal RCRA Generators List	Subject property only	Subject property only
Federal IC/EC registries	Subject property only	Subject property only
Federal ERNS list	Subject property only	Subject property only

The default search distances may be expanded or reduced in the upgradient, downgradient, or cross-gradient directions by the environmental professional based on experience in the local area and applying professional judgment to factors such as where a well-defined regional groundwater flow direction is identified, or whether other geologic features such as low permeability soils or hydrogeologic boundaries

such as rivers or streams exist which would tend to limit the potential for migration of groundwater or vapors in a particular direction.

## **8.2 VES RESULTS**

PSI did not identify a site of concern within the VES search radii; and concludes that a VEC does not exist on the subject property.

## **8.3 VES LIMITATIONS**

The VES process is not intended to be an exhaustive screening and cannot wholly eliminate uncertainty regarding the presence of VECs in connection with the subject property. Screening is intended to reduce, but not eliminate uncertainty regarding whether or not a VEC exists in connection with the subject property.

## 9 CONTRACT INFORMATION

### 9.1 STANDARD OF CARE AND WARRANTIES

Our services were not intended to be technically exhaustive. There is a possibility that with the proper application of methodologies, conditions may exist on the property that could not be identified within the scope of the assessment(s) or that were not reasonably identifiable from the available information.

No ESA can wholly eliminate uncertainty regarding the potential for RECs in connection with the property. The ESA was intended to reduce, but not eliminate uncertainty regarding the potential for RECs in connection with a property.

Our report is based on commonly known and reasonably ascertainable information, including limited, ground-level visual inspection of the property except where otherwise explicitly indicated, in general conformance with ASTM E 1527-13. Findings and conclusions derived from the methodologies described in the Practice contain all of the inherent limitations in the methodologies that are referred to in the Practice.

PSI has assumed that factual information provided to us by the Client, or obtained from governmental and historical research firm, the public domain, interviews, and other sources is accurate and unbiased. PSI assumes no liability for the accuracy of data provided to us by others.

The ESA was not a building code, safety, regulatory or environmental compliance inspection. The ESA is not intended to reduce the risk of the presence of mold and physical deficiencies conducive to mold nor the risk that mold or physical deficiencies conducive to mold may pose to the buildings and building occupants.

The methodologies include reviewing information provided by other sources. PSI treats information obtained from the record reviews and interviews concerning the property as reliable and the ASTM protocol does not require PSI to independently verify the information. Therefore, PSI cannot and does not warrant or guarantee that the information provided by these other sources is accurate or complete.

PSI has performed the services in a manner consistent with that level of care and skill ordinarily exercised by other members of our profession currently practicing in the same locality and under similar conditions, within the limitations of ASTM E 1527-13 standard, and the All Appropriate Inquiries Rule established by the U.S. Environmental Protection Agency (40 C.F.R. Part 312). No other warranties are implied or expressed.

**Site History:**

1985 – In March, 3 underground storage tanks (USTs) were removed from the site. 4 soil samples (#1 through #4) were collected from 15.5 to 16 feet below the ground surface (ft bgs) and analyzed for Total Petroleum Hydrocarbons as Gasoline (TPHg). No samples were required below the 10,000-gallon UST. The maximum concentration of TPHg was 6,600 parts per million (ppm) in sample #2. In April, 3 additional soil samples (#1R through #3R) were collected from 18 to 18.5 ft bgs. The maximum concentration of TPHg was 2,500 ppm in sample #1R. In August, 1 monitoring well (MW1) was installed to a depth of 53.5 ft bgs within the UST excavation. 4 soil samples were collected and analyzed for Benzene, Toluene, Ethylbenzene and Xylenes, Chlorobenzene, 1,2-Dichlorobenzene, 1,3-Dichlorobenzene, and 1,4-Dichlorobenzene. Maximum concentrations were reported at 9.0 ppm Benzene, 40 ppm Toluene, and 100 ppm Xylenes and Ethylbenzene (quantified together). A groundwater sample from the well was reported to contain 61,000 parts per billion (ppb) TPHg. In November, 10-inches of free product was measured in a bailer lowered into well MW1. 1986 – In January, 3 monitoring wells (MW2 through MW4) were installed on-site to approximately 55 ft bgs. Soil samples were not submitted for chemical analysis. Groundwater samples collected from these new wells were not reported to have detectable concentrations of TPHg, Benzene, Toluene, Ethylbenzene and Xylenes (BTEX) above the laboratory reporting limit of 1,000 ppb. Well MW1 was not sampled or gauged at this time. 1991 – In February, MW1 was destroyed due to an obstruction at 12 ft bgs. It does not appear the well MW1 was sampled any other time than in 8/85. 2 monitoring wells (MW5 and MW6) were installed to approximately 51.5 ft bgs. 10 soil samples were collected and were analyzed for TPHg and BTEX. A maximum concentration of 390 ppm TPHg was reported for the sample collected from 25.5 ft bgs in MW5 and very low concentrations of BTEX were reported for the other samples. In July, 6 soil borings (SB1 through SB6) and 1 monitoring well (MW7) were advanced onsite to depths of 37 – 40.5 ft bgs and 50 ft bgs, respectively. 22 soil samples were collected and reported to have maximum concentrations of 3,200 ppm TPHg, 22 ppm Benzene, 210 ppm Toluene, 4,800 ppm Ethylbenzene, and 420 ppm Xylenes. The highest concentrations were reported for samples collected from boring B4, which was advanced within the tank excavation. Grab groundwater samples were collected from borings B1, B2, B3 and B6 and were reported only to have low concentrations of TPHg. BTEX were not reported to be present above the laboratory reporting limits. In October, 1 groundwater extraction well (EX1) was installed to approximately 53 ft bgs. No soil samples were submitted for chemical analysis. 1992 – In October, 3 nested vapor piezometers (VMW1 through VMW3), and 1 vapor extraction well (VEW1) were installed. 24 soil samples were collected from the VMW1 through VMW3 and reported to have a maximum concentration of 780 ppm TPHg, 3 ppm Benzene, 17 ppm Toluene, 17 ppm Ethylbenzene, and 83 ppm Xylenes. In November, a soil vapor extraction pilot test was conducted. Approximately 100 pounds of petroleum hydrocarbons were removed during this test. The radius of influence was estimated to be 40-45 ft. In December, a step-drawdown aquifer test was conducted. Drawdown was relatively small ranging from 0.06 to 0.14 ft. 1994 – In September, wells MW2 and MW3 were destroyed. El Camino Real (Route 82) was widened and the wells were now located within the street. 1995 – In June, 3 borings (B7 through B9) onsite and 2 hydropunch borings (HP1 and HP2) off-site were advanced to depths ranging between 24 and 48 ft bgs. 18 soil samples were collected and only 3 samples were reported to have low concentrations of TPHg and BTEX. Grab groundwater samples were collected from the hydropunch borings and were not reported to have concentrations of TPHg and BTEX above the laboratory reporting limits. In July, 2 monitoring wells (MW8 and MW9) were installed to approximately 35 ft bgs. Soil samples were not submitted for chemical analysis. These wells were incorporated into the groundwater monitoring program. It was noted in the report that groundwater at the site has risen approximately 20 feet since investigation began at the site. 1996 – In July, 1 monitoring well (MW10) was installed to 32 ft bgs offsite and downgradient. No soil samples were reported to have been submitted for chemical analysis. 2001 – In October, 3 temporary wells (GW1 through GW3) were installed to 20 ft bgs in order to collect grab groundwater samples. The grab groundwater sampling was conducted because groundwater has been rising since monitoring began at the site in 1990. Also samples were collected from the vapor wells. Sample GW3 was collected from within the UST excavation and was reported to have the highest concentrations of TPHg (27,000 ppb) for the grab groundwater samples. The maximum concentrations were reported for the sample collected from well VEX1, also located within the UST excavation, of 130,000 ppb TPHg, 5,800 ppb Benzene, 24,000 ppb Toluene, 4,300 ppb Ethylbenzene, and 15,000 ppb Xylenes. MtBE was reported at a maximum concentration of 580 ppb in well VMW2. 2002 – In June, groundwater samples from MW9, MW7, and VEX1 were analyzed for bacterial populations and were shown to have depressed values across the site. In July, 9 borings were advanced in the area of the UST excavation and Oxygen Release Compound (ORC) was injected beginning between 30 and 35 ft bgs to the surface. Also at this time, well MW11 was installed to 28 ft bgs. Groundwater was sampled for 3 quarters following the ORC injection. The monitoring included analysis for bacterial populations, which showed an increase across the site of aerobic hydrocarbon degrading bacteria as well as total heterotrophic bacteria. 2004 – In January, 16 borings were advanced in the area of the UST excavation and ORC was injected beginning between 35 and 40 ft bgs to the surface. 2007 – In June, 24 borings were advanced in the area of the UST excavation and ORC Advanced was injected beginning at 30 ft bgs to the surface. In November, wells MW4, EX1, and VMW3 were destroyed. Well MW4 had 45 feet of well screen and was obstructed at

approximately 36 ft bgs. Well EX1 had not been sampled since 9/94 and the nested vapor piezometer VMW3 had not been sampled since 10/01. Well MW4 was replaced with well MW4R, which was advanced to a depth of 28 ft bgs. Groundwater was first encountered at 28 ft bgs. Groundwater at this site has risen approximately 20 feet since investigation began. Soil samples were not collected from this new well.

1985 - In March, 3 underground storage tanks (USTs) were removed from the site. 4 soil samples (#1 through #4) were collected from 15.5 to 16 feet below the ground surface (ft bgs) and analyzed for Total Petroleum Hydrocarbons as Gasoline (TPHg). No samples were required below the 10,000-gallon UST. The maximum concentration of TPHg was 6,600 parts per million (ppm) in sample #2.

In April, 3 additional soil samples (#1R through #3R) were collected from 18 to 18.5 ft bgs. The maximum concentration of TPHg was 2,500 ppm in sample #1R.

In August, 1 monitoring well (MW1) was installed to a depth of 53.5 ft bgs within the UST excavation. 4 soil samples were collected and analyzed for Benzene, Toluene, Ethylbenzene and Xylenes, Chlorobenzene, 1,2-Dichlorobenzene, 1,3-Dichlorobenzene, and 1,4-Dichlorobenzene. Maximum concentrations were reported at 9.0 ppm Benzene, 40 ppm Toluene, and 100 ppm Xylenes and Ethylbenzene (quantified together). A groundwater sample from the well was reported to contain 61,000 parts per billion (ppb) TPHg.

In November, 10-inches of free product was measured in a bailer lowered into well MW1.

1986 - In January, 3 monitoring wells (MW2 through MW4) were installed on-site to approximately 55 ft bgs. Soil samples were not submitted for

chemical analysis. Groundwater samples collected from these new wells were not reported to have detectable concentrations of TPHg, Benzene, Toluene, Ethylbenzene and Xylenes (BTEX) above the laboratory reporting limit of 1,000 ppb. Well MW1 was not sampled or gauged at this time.

1991 - In February, MW1 was destroyed due to an obstruction at 12 ft bgs. It does not appear the well MW1 was sampled any other time than in 8/85. 2 monitoring wells (MW5 and MW6) were installed to approximately 51.5 ft bgs. 10 soil samples were collected and were analyzed for TPHg and BTEX. A maximum concentration of 390 ppm TPHg was reported for the sample collected from 25.5 ft bgs in MW5 and very low concentrations of BTEX were reported for the other samples.

In July, 6 soil borings (SB1 through SB6) and 1 monitoring well (MW7) were advanced onsite to depths of 37 - 40.5 ft bgs and 50 ft bgs, respectively. 22 soil samples were collected and reported to have maximum concentrations of 3,200 ppm TPHg, 22 ppm Benzene, 210 ppm Toluene, 4,800 ppm Ethylbenzene, and 420 ppm Xylenes. The highest concentrations were reported for samples collected from boring B4, which was advanced within the tank excavation.

Grab groundwater samples were collected from borings B1, B2, B3 and B6 and were reported only to have low concentrations of TPHg. BTEX were not reported to be present above the laboratory reporting limits.

In October, 1 groundwater extraction well (EX1) was installed to approximately 53 ft bgs. No soil samples were submitted for chemical analysis.

1992 - In October, 3 nested vapor piezometers (VMW1 through VMW3), and 1 vapor extraction well (VEW1) were installed. 24 soil samples were collected from the VMW1 through VMW3 and reported to have a maximum concentration of 780 ppm TPHg, 3 ppm Benzene, 17 ppm Toluene, 17 ppm Ethylbenzene, and 83 ppm Xylenes.

In November, a soil vapor extraction pilot test was conducted. Approximately 100 pounds of petroleum hydrocarbons were removed during this test. The radius of influence was estimated to be 40-45 ft.

In December, a step-drawdown aquifer test was conducted. Drawdown was relatively small ranging from 0.06 to 0.14 ft.

1994 - In September, wells MW2 and MW3 were destroyed. El Camino Real (Route 82) was widened and the wells were now located within the street.

1995 - In June, 3 borings (B7 through B9) onsite and 2 hydropunch borings (HP1 and HP2) off-site were advanced to depths ranging between 24 and 48 ft bgs. 18 soil samples were collected and only 3 samples were reported to have low concentrations of TPHg and BTEX. Grab groundwater samples were collected from the hydropunch borings and were not reported to have concentrations of TPHg and BTEX above the laboratory reporting limits.

In July, 2 monitoring wells (MW8 and MW9) were installed to approximately 35 ft bgs. Soil samples were not submitted for chemical analysis. These wells were incorporated into the groundwater monitoring program. It was noted in the report that groundwater at the site has risen approximately 20 feet since investigation began at the site.

1996 - In July, 1 monitoring well (MW10) was installed to 32 ft bgs offsite and downgradient. No soil samples were reported to have been submitted for chemical analysis.

2001 - In October, 3 temporary wells (GW1 through GW3) were installed to 20 ft bgs in order to collect grab groundwater samples. The grab groundwater sampling was conducted because groundwater has been rising since monitoring began at the site in 1990. Also samples were collected from the vapor wells. Sample GW3 was collected from within the UST excavation and was reported to have the highest concentrations of TPHg (27,000 ppb) for the grab groundwater samples. The maximum concentrations were reported for the sample collected from well VEX1, also located within the UST excavation, of 130,000 ppb TPHg, 5,800 ppb Benzene, 24,000 ppb Toluene, 4,300 ppb Ethylbenzene, and 15,000 ppb Xylenes. MtBE was reported at a maximum concentration of 580 ppb in well VMW2.

2002 - In June, groundwater samples from MW9, MW7, and VEX1 were analyzed for bacterial populations and were shown to have depressed values across the site.

In July, 9 borings were advanced in the area of the UST excavation and Oxygen Release Compound (ORC) was injected beginning between 30 and 35 ft bgs to the surface. Also at this time, well MW11 was installed to 28 ft bgs.

Groundwater was sampled for 3 quarters following the ORC injection. The monitoring included analysis for bacterial populations, which showed an increase across the site of aerobic hydrocarbon degrading bacteria as well as total heterotrophic bacteria.

2004 - In January, 16 borings were advanced in the area of the UST excavation and ORC was injected beginning between 35 and 40 ft bgs to the surface.

2007 - In June, 24 borings were advanced in the area of the UST excavation and ORC Advanced was injected beginning at 30 ft bgs to the surface.

In November, wells MW4, EX1, and VMW3 were destroyed. Well MW4 had 45 feet of well screen and was obstructed at approximately 36 ft bgs. Well EX1 had not been sampled since 9/94 and the nested vapor piezometer VMW3 had not been sampled since 10/01. Well MW4 was replaced with well MW4R, which was advanced to a depth of 28 ft bgs. Groundwater was first encountered at 28 ft bgs. Groundwater at this site has risen approximately 20 feet since investigation began. Soil samples were not collected from this new well.

**Site History:**

Site improvements consist of an active auto body repair shop, a single-story residential building, and paved parking. The surrounding area is utilized for residential and commercial uses (Figure 1). This report documents our findings and was prepared for the exclusive use and sole reliance of the client On January 31, 1985, two 500-gallon and two 250-gallon gasoline underground storage tanks (USTs) were removed from the Site by JW Construction of San Jose, California. Subsurface soil was reportedly excavated to a depth of 20 feet, aerated, and placed back into the excavation during removal of the former USTs. Groundwater monitoring has been conducted at the Site since 1990. Based on historical analytical results, chemicals of concern (COC's) beneath the Site include total petroleum hydrocarbons as gasoline (TPH-g), benzene, toluene, ethylbenzene, and total xylene (BTEX), and methyl tert-butyl ether (MTBE). According to a review of historical documentation, two 500-gallon and two 250-gallon gasoline underground storage tanks (USTs) were removed from the Site on January 31, 1985, by JW Construction of San Jose, California. During excavation activities soils beneath the USTs were screened with a combustible gas detector. Soil beneath one of the USTs contained concentrations greater than 15,000 parts per million (ppm) of petroleum hydrocarbons. The soil was excavated to a depth of 20 feet below ground surface (bgs) where concentrations greater than 15,000 ppm of petroleum hydrocarbons were encountered. A post excavation soil sample collected from the bottom of the excavation (20 feet) directly below one of the USTs contained 2,400 ppm petroleum hydrocarbons. No sample was collected from under the other three tanks. Based on fuel pump inspection stickers, it did not appear that fuel had been delivered to the site since the mid 1950's. Analytical results from subsequent site and remedial investigations confirmed the soil and groundwater in the vicinity of the USTs were impacted with petroleum hydrocarbons. In September 1990, three groundwater monitoring wells (MW-1, MW-2 and MW-3) were installed by On-Site Technologies, Inc. (OST) to assess the extent of petroleum hydrocarbons at the site. Petroleum hydrocarbons were detected in soil and groundwater at all three well locations. Light Non-Aqueous Phase Liquid (LNAPL) was measured to be 0.34 feet thick in monitoring well MW-2. On January 31 and February 1, 1991, two soil borings (SB-1 and SB-2) and two groundwater monitoring wells (MW-4 and MW-5) were completed to further define the lateral and vertical extent of impact to the soil and groundwater beneath the Site. In an attempt to complete the delineation of impacted soil and groundwater at the Site, OST installed two additional monitoring wells (MW-6 and MW-7) and advanced one additional soil boring (SB-3) between December 1991 and January 1992. According to the March 4, 1992 OST Remedial Investigation Report, soil and groundwater analytical results from this phase of the investigation indicated that impacts to soil and groundwater had been delineated. The soil analytical data indicated that the gasoline-impacted soil appeared to be limited to a radius of approximately 50 feet and 25 feet deep from the center of the source area. An extraction well, EW-1, was installed on October 27, 1992, and pump tests were subsequently performed to evaluate the aquifer characteristics. Results from the pump tests indicated that use of dual phase extraction (DPE) was a viable option for remedial measures. The treatment system selected utilized the three shallow soil vapor extraction wells (VE-1 through VE-3) and three groundwater extraction wells (EW-1, COEX-1, and COEX-2) which were installed in October 1995. The extracted vapor was treated using thermal oxidation before discharge to the atmosphere. The extracted groundwater was treated using granular activated carbon (GAC) filtration prior to discharge to the storm drain. The remediation system was installed and began operating at the Site full time in December 1996 until August 31, 2002. On August 31, 2002, the soil vapor extraction system was shut down (but groundwater extraction continued to operate) by ATC and the Santa Clara Valley Water District (SCVWD) as the hydrocarbon concentrations in the extracted soil vapor had decreased significantly and operation of the system was deemed ineffective. As a preliminary step towards the evaluation of the site for closure, the groundwater extraction and treatment was discontinued on May 22, 2003. Two groundwater sampling events were performed to evaluate rebound of contaminant concentrations. Laboratory analytical results from groundwater samples collected during these events indicated that benzene concentrations in groundwater rebounded significantly in the extraction wells EW-1, COEX-1, and COEX-2. Due to the rebound of benzene in groundwater and a rise in groundwater elevations, the system was converted to a dual phase extraction system utilizing "stingers" and restarted on November 17, 2003. The system operated periodically until September 2005 when it was decommissioned and removed from the Site. Over the course of the active remediation phase, approximately 3 million gallons of groundwater with 440 pounds of petroleum hydrocarbons and over 150 million cubic feet of soil vapor with 4,500 pounds of hydrocarbons have been removed from subsurface. In an attempt to further evaluate the vertical and horizontal extent of petroleum impacted soil and groundwater, ATC installed four shallow groundwater monitoring wells adjacent to the existing deeper monitoring wells (MW-1 through MW-4) in November 2008. However, groundwater was not encountered in these boring, therefore wells were not installed. Analytical results from soil samples collected at these borings (ATC-1 through ATC-4) confirmed that past operation of vapor extraction wells (VE-1 through VE-3) had significantly reduced hydrocarbon concentrations in vadose zone soil. In November 2000, MW-7 was destroyed when the northern adjacent property was redeveloped into a city park. Prior to its destruction, low levels of petroleum constituents had been detected in groundwater samples collected from the well.

<b>Site History:</b>						

Site improvements consist of an active auto body repair shop, a single-story residential building, and paved parking. The surrounding area is utilized for residential and commercial uses (Figure 1). This report documents our findings and was prepared for the exclusive use and sole reliance of the client On January 31, 1985, two 500-gallon and two 250-gallon gasoline underground storage tanks (USTs) were removed from the Site by JW Construction of San Jose, California. Subsurface soil was reportedly excavated to a depth of 20 feet, aerated, and placed back into the excavation during removal of the former USTs. Groundwater monitoring has been conducted at the Site since 1990. Based on historical analytical results, chemicals of concern (COC's) beneath the Site include total petroleum hydrocarbons as gasoline (TPH-g), benzene, toluene, ethylbenzene, and total xylene (BTEX), and methyl tert-butyl ether (MTBE).

According to a review of historical documentation, two 500-gallon and two 250-gallon gasoline underground storage tanks (USTs) were removed from the Site on January 31, 1985, by JW Construction of San Jose, California. During excavation activities soils beneath the USTs were screened with a combustible gas detector. Soil beneath one of the USTs contained concentrations greater than 15,000 parts per million (ppm) of petroleum hydrocarbons. The soil was excavated to a depth of 20 feet below ground surface (bgs) where concentrations greater than 15,000 ppm of petroleum hydrocarbons were encountered. A post excavation soil sample collected from the bottom of the excavation (20 feet) directly below one of the USTs contained 2,400 ppm petroleum hydrocarbons. No sample was collected from under the other three tanks. Based on fuel pump inspection stickers, it did not appear that fuel had been delivered to the site since the mid 1950's. Analytical results from subsequent site and remedial investigations confirmed the soil and groundwater in the vicinity of the USTs were impacted with petroleum hydrocarbons.

In September 1990, three groundwater monitoring wells (MW-1, MW-2 and MW-3) were installed by On-Site Technologies, Inc. (OST) to assess the extent of petroleum hydrocarbons at the site. Petroleum hydrocarbons were detected in soil and groundwater at all three well locations. Light Non-Aqueous Phase Liquid (LNAPL) was measured to be 0.34 feet thick in monitoring well MW-2. On January 31 and February 1, 1991, two soil borings (SB-1 and SB-2) and two groundwater monitoring wells (MW-4 and MW-5) were completed to further define the lateral and vertical extent of impact to the soil and groundwater beneath the Site. In an attempt to complete the delineation of impacted soil and groundwater at the Site, OST installed two additional monitoring wells (MW-6 and MW-7) and advanced one additional soil boring (SB-3) between December 1991 and January 1992. According to the March 4, 1992 OST Remedial Investigation Report, soil and groundwater analytical results from this phase of the investigation indicated that impacts to soil and groundwater had been delineated. The soil analytical data indicated that the gasoline-impacted soil appeared to be limited to a radius of approximately 50 feet and 25 feet deep from the center of the source area.

An extraction well, EW-1, was installed on October 27, 1992, and pump tests were subsequently performed to evaluate the aquifer characteristics. Results from the pump tests indicated that use of dual phase extraction (DPE) was a viable option for remedial measures.

The treatment system selected utilized the three shallow soil vapor extraction wells (VE-1 through VE-3) and three groundwater extraction wells (EW-1, COEX-1, and COEX-2) which were installed in October 1995. The extracted vapor was treated using thermal oxidation before discharge to the atmosphere. The extracted groundwater was treated using granular activated carbon (GAC) filtration prior to discharge to the storm drain. The remediation system was installed and began operating at the Site full time in December 1996 until August 31, 2002.

On August 31, 2002, the soil vapor extraction system was shut down (but groundwater extraction continued to operate) by ATC and the Santa Clara Valley Water District (SCVWD) as the hydrocarbon concentrations in the extracted soil vapor had decreased significantly and operation of the system was deemed ineffective. As a preliminary step towards the evaluation of the site for closure, the groundwater extraction and treatment was discontinued on May 22, 2003. Two groundwater sampling events were performed to evaluate rebound of contaminant concentrations. Laboratory analytical results from groundwater samples collected during these events indicated that benzene concentrations in groundwater rebounded significantly in the extraction wells EW-1, COEX-1, and COEX-2.

Due to the rebound of benzene in groundwater and a rise in groundwater elevations, the system was converted to a dual phase extraction system utilizing "stingers" and restarted on November 17, 2003. The system operated periodically until September 2005 when it was decommissioned and removed from the

Site. Over the course of the active remediation phase, approximately 3 million gallons of groundwater with 440 pounds of petroleum hydrocarbons and over 150 million cubic feet of soil vapor with 4,500 pounds of hydrocarbons have been removed from subsurface.

In an attempt to further evaluate the vertical and horizontal extent of petroleum impacted soil and groundwater, ATC installed four shallow groundwater monitoring wells adjacent to the existing deeper monitoring wells (MW-1 through MW-4) in November 2008. However, groundwater was not encountered in these boring, therefore wells were not installed. Analytical results from soil samples collected at these borings (ATC-1 through ATC-4) confirmed that past operation of vapor extraction wells (VE-1 through VE-3) had significantly reduced hydrocarbon concentrations in vadose zone soil.

In November 2000, MW-7 was destroyed when the northern adjacent property was redeveloped into a city park. Prior to its destruction, low levels of petroleum constituents had been detected in groundwater samples collected from the well.

<b>Site History:</b>			

Former flower shop/nursery is proposed for a residential development. The development project involves the demolition of the existing buildings and surface coverings on the property, and the construction of a three-story, residential apartment complex with landscaping areas and at grade parking. As part of the development, approximately 314 cubic yards of soil contaminated with organochlorine pesticides (OCPs) and the heavy metal lead will be excavated during grading activities, and temporarily stockpiled on-site. The contaminated soil will then be encapsulated beneath the concrete building foundations to substantially reduce the risk of exposure. After the contaminated soil is encapsulated, it will be managed over the long-term through the use of an institutional control (Deed Restriction).

**Site History:**

In 1995, soil and grab groundwater samples were collected from various locations in the vicinity of the UST system (tanks, piping and fuel dispensers). Up to 3,900 ppm TPHg, were detected in soil beneath a fuel dispenser in the northwest area of the site. Analytical results for a grab groundwater sample indicated up to 8,100 parts per billion (ppb) TPHg, and 19 ppb Benzene. On March 19, 1999, a grab groundwater sample was collected from an excavation during UST removal activities. Analytical results indicated up to 61,000 ppb TPHg and 9,620 ppb TPHd. On October 25, 2001, E2C Inc. (E2C) collected soil and grab groundwater samples from five direct –push sampling locations on the site. Sample and analytical results indicated up to 710 ppm TPHg and 170 ppm TPHd in the soil and 120 ppb TPHg and 110,000 ppb TPHd in groundwater. On October 7 and 8, 2002, E2C installed four groundwater monitoring wells at the site (designated as MW-1, MW-2, MW-3, and MW-7). Analytical results of soil samples collected during the well installations indicated up to 12 ppm TPHg and 645 ppm TPHd. The initial groundwater sample results from the monitoring wells indicated up to 16,230 ppb TPHg, 2,750,000 ppb TPHd, and 83 ppb Benzene. High contaminant concentrations were noted in samples from well MW-3 located in the northeast

corner of the property. On March 26 and 27, 2003, E2C installed four additional groundwater monitoring wells, three offsite to the north across Monroe Street (designated as MW-4, MW-5, and MW-6), and one additional onsite (MW-8). Analytical results from soil samples indicated up to 7.47 ppm TPHg (MW-6, offsite) and less than 1.0 ppm TPHd. On January 15, 2004, E2C performed an offsite direct-push sampling investigation involving soil and grab groundwater samples collected from five borings (DP-2 through DP-6). Analytical results for soil samples indicated up to 150 ppm TPHg and up to 13 ppm TPHd. Analytical results for grab groundwater samples indicated up to 80,000 ppb TPHg and up to 300,000 ppb TPHd. E2C advanced six additional onsite direct-push borings (G-1, G-2, G-3, G-4, G-8, and G-9) on March 16 and 17, 2004. Onsite well MW-9 was installed on April 8, 2004. The results of the investigation delineate the on-site source as the dispenser island. Vacuum-assisted Groundwater Extraction (VAGE) Tests were performed between April 12 through 17, 2004. The VAGE work is described and documented in E2C's VAGE Test Report, May 3, 2004. Based on September, 2008 groundwater testing, the event provided about a 50 percent reduction in the concentration of fuel-related hydrocarbons at off-site wells MW-4 through MW-6. Subsequent groundwater testing has shown a return to historical values for the contaminants in these wells.

 Site History:

In January 1985, Mr. Russell Thornhill with Valley Rockery Inc. contacted the Santa Clara Fire Department regarding removal/decommissioning of the empty and unused 1,000-gallon gasoline UST located partially under the current building. A letter dated January 31, 1985 from the City of Santa Clara Fire Department signed by Richard Peterson, Deputy Fire Marshal and Bill Gianatasio, Fire Marshal, stated that "waiver of U.F.C. Section 79.113(e) (Tank Removal) will be granted, provided compliance with Local Ordinance #1490 is met." The letter also indicated that Valley Rockery had thirty days to submit a letter of intent and 90 days to complete the required work. In a letter dated February 11, 1985, Mr. Thornhill indicated that Valley Rockery would obtain the required soil samples. On April 26, 1985, one exploratory boring was advanced to a depth of 21.5 feet below ground surface (bgs) immediately north of the UST. One soil sample was collected from a depth of 15 feet bgs and submitted for analysis. The sample was analyzed for benzene, toluene, ethylbenzene and total xylenes (BTEX), and the other sample was analyzed for total hydrocarbons and reported concentrations of BTEX at 0.0312 milligrams per kilogram (mg/kg), 0.5992 mg/kg, 2.213 mg/kg, and 1.081 mg/kg, respectively. Groundwater was not encountered during the investigation. AEI performed a subsurface investigation at the subject property on August 25, 2006. Four (4) soil borings (SB-1, SB-2, SB-3, and SB-4) were advanced in the area of the UST, which was located under a landscaped area between the driveway and the building. Soil boring SB-1 encountered the north end of the UST at a depth of five (5) feet bgs. The locations of these soil borings are shown on Figure 2, "Site Plan" and Figure 3, "Detailed Site Plan". The results of TPH-g analyses on soil samples collected from borings SB-2 through SB-4 ranged from 34 mg/kg (SB3-10) to 8,500 mg/kg (SB2-8.5). The results of TPH-d analyses ranged from 2.0 mg/kg (SB3-10) to 1,800 mg/kg (SB2-8.5). The results of TPH-mo analyses ranged from ND<5.0 mg/kg (SB3-10 and SB4-8) to ND<250 mg/kg (SB2-8.5). Analysis by Method 8021B found no detectable concentrations of methyl tertiary butyl ether (MTBE) at reporting limits of 0.50 mg/kg (SB3-10 and SB4-8) and elevated reporting limit of 50 mg/kg in boring SB2-8.5. Grab groundwater samples were collected from the borings and reported to have maximum concentrations of 240,000 ppb TPHg, 140,000 ppb TPHd, 22,000 ppb Benzene, 25,000 ppb Toluene, 5,000 ppb Ethylbenzene, 23,000 ppb xylenes, and 1,000 ppb MtBE (EPA Method No. 8021B). 12/06 additional 9 soil borings (SB5-SB13) were advanced onsite. TPH-g was reported at concentrations ranging from 23 mg/kg (SB-5-10) to 190 mg/kg (SB-7- 9.5). TPH-d was reported at concentrations ranging from 5.5 mg/kg (SB-5-10) to 57 mg/kg (SB-7-9.5). Analysis by Method 8021B found no detectable concentrations of MTBE at or above reporting limits ranging from 0.50 mg/kg (SB3-10 and SB4-8) to 50 mg/kg (SB2-8.5). The maximum concentrations of BTEX reported were 0.42 mg/kg (SB-10-10), 0.69 mg/kg (SB-7-9.5), 0.079 mg/kg (SB-10-10), and 0.12 mg/kg (SB-10-10), respectively. Light non-aqueous phase liquid (LNAPL) was seen in the groundwater grab samples from borings SB-7 and SB-10. LNAPL sheen was seen on the sampler in soil boring SB-5 at a depth of 12 feet bgs. 8/07 - 4 monitoring wells were installed and groundwater monitoring began.

Light non-aqueous phase liquid (LNAPL) was seen in the groundwater grab samples from borings SB-7 and SB-10. LNAPL sheen was seen on the sampler in soil boring SB-5 at a depth of 12 feet bgs. 8/07 - 4 monitoring wells were installed and groundwater monitoring began.

**QUARTERLY UPDATE**

Quarterly Update Period: January to March 2021

**Facility Closure**

DTSC received the final certified closure report and accepted the closure certification. Hazardous waste is no longer being treated or stored at this location and the final facility closure is complete. The facility previously operated under a Standardized Hazardous Waste Facility permit that expired on January 8, 2019. The facility ceased operations on June 29, 2018 during bankruptcy proceedings.

**FACILITY DESCRIPTION/HISTORY**

ECS Refining was located at 705 Reed Street in Santa Clara. ECS was a metal recycler that operated a hazardous waste storage and treatment facility to reclaim precious and base metals from photochemical wastes, metal-bearing wastewaters, tin/lead solder dross and related wastes from electronic manufacturing, and other metal-bearing solid hazardous waste. The site was entirely paved and fenced. The facility was located in a developed industrialized area near the San Jose International Airport. The area is zoned for heavy industry by the City of Santa Clara. The facility transported hazardous wastes to the facility for recycling. Two company trucks picked up hazardous and non-hazardous wastes throughout Northern California daily. In addition, third party trucks made pickups and deliveries of hazardous and non-hazardous wastes several times daily. ECS had been operating at this location since 1979. The City of Santa Clara Historical District, a mixed use residential and commercial area, is located approximately 0.5 mile southwest, the University of Santa Clara is located within 1 mile southeast, and there are a few residences located 0.25 mile from this former facility.

**PERMITTING REGULATORY DESCRIPTION/HISTORY**

ECS received Standardized Permit Interim Status in 1993 and was issued a Standardized Hazardous Waste Facility Permit with an effective date of December 30, 1997. The permit expired on December 30, 2007. ECS submitted a timely renewal application in December 2006. A renewal Standardized Permit was issued on January 9, 2009 with an expiration of January 8, 2019. The Series A Standardized Permit authorized ECS to operate a hazardous waste storage and treatment facility to reclaim precious and base metals from photochemical wastes, metal-bearing wastewaters, tin/lead solder dross and related wastes from electronic manufacturing, and other metal-bearing solid hazardous wastes. Since the permit was issued in 1997, the Facility submitted four Class 1 modifications for minor operational changes and permit application updates, and had closed most of the 27 permitted units, including administrative closure of six units never operated or constructed.

<b>Document Type:</b>					Removal Action Completion Report	
<b>Date Completed:</b>					3/1/2013	
<b>Comments:</b>					The Report documents the removal action, which consisted of excavating soil contaminated with arsenic and total petroleum hydrocarbons in the first two feet of soil, backfilling with clean imported fill, and confirmation soil sampling. Since residual soil contamination above levels that allow for unrestricted land use remains deeper than two feet below the ground surface, the remedy includes a Land Use Covenant restricting sensitive land uses on the site and requiring a soil management plan if soil deeper than two feet is disturbed.

**Comments:** California Environmental Management, the consultant to the owner of Pyramid Circuits, submitted an "Environmental Assessment for Closure" report to DTSC to provide the basis for changing the site status to no further action. The report details the regulatory closure of the Pyramid Circuits facility under the oversight of the Santa Clara Fire Department (the Certified Unified Program Agency with jurisdiction), the cleanup and removal of minor copper contamination in soil, and the cyanide detections in soil and evaluation of the results. No releases at the site have been documented and hazardous materials usage occurred within a designated section of the building with containment. The cyanide detected in soil was at levels well below screening levels that are protective of human health.

**Site History:**

The Site was used for agricultural orchards beginning in 1939 until 1963. The Site has used for a construction staging area from 2009 to 2011 and a parking lot from 2013 to 2016. Agricultural use of pesticides may have impacted Site soils. Soil sampling found that lead, arsenic and pesticide (DDE) at elevated levels. The recommended cleanup is to leave the contaminated soil in place underneath a protective "cap" and land use controls. Contaminated soil that is left onsite would be buried beneath future foundations and structures including, buildings, parking lots, and two feet of clean soil in landscaped areas. 8/5/2020 JSR

**Site History:**

Used for agriculture until 1939 when the western portion was developed as a tile manufacturer. The eastern portion remained agricultural until the 1960s. A trucking company occupied the entire site from 1975 to 1995 when a wood recovery company took over the site until 1998. Since then the property has not been used.

A site visit was conducted on December 14, 2015 to assess the City's compliance with the Land Use Covenant and the Operation and Maintenance Agreement requirements for the consolidation cells. The asphalt consolidation area cap appeared to be well- maintained and in good condition, and there appeared to be no significant drainage problem affecting the consolidation cells. Based on a technical assessment as part of the 5-year review, it was concluded that the site remedial actions remain protective of human health and the environment.</p>

<b>Comments:</b>			Sample results from a soil quality evaluation conducted in 1997 under DTSC oversight indicated lead, nickel, and polynuclear aromatic hydrocarbons (PAHs) including but not limited to anthracene, benzo(a)pyrene, and pyrene were found in soil. Lead contaminated soil was found to be the major issue, with concentrations up to 4,100 mg/kg. The RAW required consolidation and capping of impacted soil as well as underground tank removal and capping.

<b>Comments:</b>			The City of Santa Clara conducted an annual inspection and submitted the annual summary report as required by section 1.02 of the Land Use Covenant and section 2.4 of the Operation and Maintenance Agreement. About 20 feet of small cracks were observed in the asphalt of the parking lot over the cells where contaminated soil is contained. The cracks are small and will not let significant water penetrate the asphalt. The City Street Department plans to seal the cracks when the weather is drier and warmer.

<b>Comments:</b>	The Lombardo site is approximately 2 acres in size and used for parking and storage of vehicles, heavy equipment and supplies by the company in its concrete cutting business. Lombardo has owned this property since April 1985. Historical information indicates that from the 1960's to the 1970's, metal coating company, a galvanizing facility operated onsite. Available information likewise indicates that metal coating may have discharged waste pickling and washing solution on-site, resulting to soil and ground- water contamination prior to Lombardo's purchase of the property in 1985. Sampling results in 1991 showed zinc in soil as high as 34,000 ppm; and 364 ppm in groundwater. The San Francisco Regional Water Quality Control Board (SF RWQCB) is currently providing direct oversight in remedial activities at the site. Site cleanup requirements (order 92-052) was issued on May 20, 1992 to Lombardo and outlines specific tasks needed to be complied with.

ARCO TRUCK WAS UNLOADING AT STATION #0606 WHEN A MOTORIST IN A 4X4 BLAZER ENTERED THE STATION AND DROVE AROUND THE UNLOADING FITTINGS AND HOSE TO GET TO THE AIR PUMP. AT THIS TIME, THE ARCO DRIVER STOPPED THE FLOW OF PRODUCT AND WATCHED FROM THE FRONT OF THE TRUCK. AS THE DRIVER OF THE 4X4 BLAZER BACKED UP, HE HIT A FITTING THAT WAS CONNECTED TO THE CLEAR FILL CAUSING IT TO BREAK APART. APPROXIMATELY 5 GALLONS OF GASOLINE SPILLED ON THE CONCRETE AND WAS CLEANED UP BY OUR DRIVER USING SPILL PADS.

## Appendix: Database Descriptions

*Environmental Risk Information Services (ERIS) can search the following databases. The extent of historical information varies with each database and current information is determined by what is publicly available to ERIS at the time of update. ERIS updates databases as set out in ASTM Standard E1527-13, Section 8.1.8 Sources of Standard Source Information:*

*"Government information from nongovernmental sources may be considered current if the source updates the information at least every 90 days, or, for information that is updated less frequently than quarterly by the government agency, within 90 days of the date the government agency makes the information available to the public."*

##### **Formerly Utilized Sites Remedial Action Program:**

[DOE FUSRAP](#)

The U.S. Department of Energy (DOE) established the Formerly Utilized Sites Remedial Action Program (FUSRAP) in 1974 to remediate sites where radioactive contamination remained from the Manhattan Project and early U.S. Atomic Energy Commission (AEC) operations. The DOE Office of Legacy Management (LM) established long-term surveillance and maintenance (LTS&M) requirements for remediated FUSRAP sites. DOE evaluates the final site conditions of a remediated site on the basis of risk for different future uses. DOE then confirms that LTS&M requirements will maintain protectiveness.

**Government Publication Date: Mar 4, 2017**

##### **National Priority List:**

[NPL](#)

National Priorities List (Superfund)-NPL: EPA's (United States Environmental Protection Agency) list of the most serious uncontrolled or abandoned hazardous waste sites identified for possible long-term remedial action under the Superfund program. The NPL, which EPA is required to update at least once a year, is based primarily on the score a site receives from EPA's Hazard Ranking System. A site must be on the NPL to receive money from the Superfund Trust Fund for remedial action.

**Government Publication Date: Jun 25, 2021**

##### **National Priority List - Proposed:**

[PROPOSED NPL](#)

Includes sites proposed (by the EPA, the state, or concerned citizens) for addition to the NPL due to contamination by hazardous waste and identified by the Environmental Protection Agency (EPA) as a candidate for cleanup because it poses a risk to human health and/or the environment.

**Government Publication Date: Jun 25, 2021**

##### **Deleted NPL:**

[DELETED NPL](#)

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

**Government Publication Date: Jun 25, 2021**

##### **SEMS List 8R Active Site Inventory:**

[SEMS](#)

The Superfund Program has deployed the Superfund Enterprise Management System (SEMS), which integrates multiple legacy systems into a comprehensive tracking and reporting tool. This inventory contains active sites evaluated by the Superfund program that are either proposed to be or are on the National Priorities List (NPL) as well as sites that are in the screening and assessment phase for possible inclusion on the NPL. The Active Site Inventory Report displays site and location information at active SEMS sites. An active site is one at which site assessment, removal, remedial, enforcement, cost recovery, or oversight activities are being planned or conducted.

**Government Publication Date: Mar 23, 2021**

##### **SEMS List 8R Archive Sites:**

[SEMS ARCHIVE](#)

The Superfund Enterprise Management System (SEMS) Archived Site Inventory displays site and location information at sites archived from SEMS. An archived site is one at which EPA has determined that assessment has been completed and no further remedial action is planned under the Superfund program at this time.

**Government Publication Date: May 25, 2021**

**Inventory of Open Dumps, June 1985:**

ODI

The Resource Conservation and Recovery Act (RCRA) provides for publication of an inventory of open dumps. The Act defines "open dumps" as facilities which do not comply with EPA's "Criteria for Classification of Solid Waste Disposal Facilities and Practices" (40 CFR 257).

**Government Publication Date: Jun 1985**

**Comprehensive Environmental Response, Compensation and Liability Information System -**

CERCLIS

**CERCLIS:**

Superfund is a program administered by the United States Environmental Protection Agency (EPA) to locate, investigate, and clean up the worst hazardous waste sites throughout the United States. CERCLIS is a database of potential and confirmed hazardous waste sites at which the EPA Superfund program has some involvement. It contains sites that are either proposed to be or are on the National Priorities List (NPL) as well as sites that are in the screening and assessment phase for possible inclusion on the NPL. The EPA administers the Superfund program in cooperation with individual states and tribal governments; this database is made available by the EPA.

**Government Publication Date: Oct 25, 2013**

**EPA Report on the Status of Open Dumps on Indian Lands:**

IODI

Public Law 103-399, The Indian Lands Open Dump Cleanup Act of 1994, enacted October 22, 1994, identified congressional concerns that solid waste open dump sites located on American Indian or Alaska Native (AI/AN) lands threaten the health and safety of residents of those lands and contiguous areas. The purpose of the Act is to identify the location of open dumps on Indian lands, assess the relative health and environment hazards posed by those sites, and provide financial and technical assistance to Indian tribal governments to close such dumps in compliance with Federal standards and regulations or standards promulgated by Indian Tribal governments or Alaska Native entities.

**Government Publication Date: Dec 31, 1998**

**CERCLIS - No Further Remedial Action Planned:**

CERCLIS NFRAP

An archived site is one at which EPA has determined that assessment has been completed and no further remedial action is planned under the Superfund program at this time. The Archive designation means that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL). This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

**Government Publication Date: Oct 25, 2013**

**CERCLIS Liens:**

CERCLIS LIENS

A Federal Superfund lien exists at any property where EPA has incurred Superfund costs to address contamination ("Superfund site") and has provided notice of liability to the property owner. A Federal CERCLA ("Superfund") lien can exist by operation of law at any site or property at which EPA has spent Superfund monies. This database is made available by the United States Environmental Protection Agency (EPA).

EPA and state regulators work with facilities and communities to design remedies based on the contamination, geology, and anticipated use unique to each site.

**Government Publication Date: Jun 14, 2021**

**RCRA non-CORRACTS TSD Facilities:**

**Federal Engineering Controls-ECs:**

[FED ENG](#)

Engineering controls (ECs) encompass a variety of engineered and constructed physical barriers (e.g., soil capping, sub-surface venting systems, mitigation barriers, fences) to contain and/or prevent exposure to contamination on a property. This database is made available by the United States Environmental Protection Agency (EPA).

**Government Publication Date: Feb 23, 2021**

**Federal Institutional Controls- ICs:**

[FED INST](#)

Institutional controls are non-engineered instruments, such as administrative and legal controls, that help minimize the potential for human exposure to contamination and/or protect the integrity of the remedy. Although it is EPA's (United States Environmental Protection Agency) expectation that treatment or engineering controls will be used to address principal threat wastes and that groundwater will be returned to its beneficial use whenever practicable, ICs play an important role in site remedies because they reduce exposure to contamination by limiting land or resource use and guide human behavior at a site.

**Government Publication Date: Feb 23, 2021**

# Definitions

**Database Descriptions:** This section provides a detailed explanation for each database including: source, information available, time coverage, and acronyms used. They are listed in alphabetic order.

**Detail Report:** This is the section of the report which provides the most detail for each individual record. Records are summarized by location, starting with the project property followed by records in closest proximity.

**Distance:** The distance value is the distance between plotted points, not necessarily the distance between the sites' boundaries. All values are an approximation.

**Direction:** The direction value is the compass direction of the site in respect to the project property and/or center point of the report.

**Elevation:** The elevation value is taken from the location at which the records for the site address have been plotted. All values are an approximation. Source: Google Elevation API.

**Executive Summary:** This portion of the report is divided into 3 sections:

'Report Summary'- Displays a chart indicating how many records fall on the project property and, within the report search radii.

'Site Report Summary'-Project Property'- This section lists all the records which fall on the project property. For more details, see the 'Detail Report' section.

'Site Report Summary-Surrounding Properties'- This section summarizes all records on adjacent properties, listing them in order of proximity from the project property. For more details, see the 'Detail Report' section.

**Map Key:** The map key number is assigned according to closest proximity from the project property. Map Key numbers always start at #1. The project property will always have a map key of '1' if records are available. If there is a number in brackets beside the main number, this will indicate the number of records on that specific property. If there is no number in brackets, there is only one record for that property.

The symbol and colour used indicates 'elevation': the red inverted triangle will dictate 'ERIS Sites with Lower Elevation', the yellow triangle will dictate 'ERIS Sites with Higher Elevation' and the orange square will dictate 'ERIS Sites with Same Elevation.'

**Unplottables:** These are records that could not be mapped due to various reasons, including limited geographic information. These records may or may not be in your study area, and are included as reference.

The ERIS **Physical Setting Report - PSR** provides comprehensive information about the physical setting around a site and includes a complete overview of topography and surface topology, in addition to hydrologic, geologic and soil characteristics. The location and detailed attributes of oil and gas wells, water wells, public water systems and radon are also included for review.

The compilation of both physical characteristics of a site and additional attribute data is useful in assessing the impact of migration of contaminants and subsequent impact on soils and groundwater.

RE: CITY DIRECTORY RESEARCH  
Office Building  
1601 Civic Center Drive Santa Clara, CA

Thank you for contacting ERIS for an City Directory Search for the site described above. Our staff has conducted a reverse listing City Directory search to determine prior occupants of the subject site and adjacent properties. We have provided the nearest addresses(s) when adjacent addresses are not listed. If we have searched a range of addresses, all addresses in that range found in the Directory are included.

Note: Reverse Listing Directories generally are focused on more highly developed areas. Newly developed areas may be covered in the more recent years, but the older directories will tend to cover only the "central" parts of the city. To complete the search, we have either utilized the ACPL, Library of Congress, State Archives, and/or a regional library or history center as well as multiple digitized directories. These do not claim to be a complete collection of all reverse listing city directories produced.

ERIS has made every effort to provide accurate and complete information but shall not be held liable for missing, incomplete or inaccurate information. To complete this search we used the general range(s) below to search for relevant findings. If you believe there are additional addresses or streets that require searching please contact us at 866-517-5204.

**Search Criteria:**

1546-1680 of Civic Center Drive  
1655-1745 of El Camino Real

Dear Mr. Parissenti:

Attached please find the uniform underground storage tank closure letter and the site closure summary for the subject site. Please contact Barbara Sieminski of my staff at (510) 622-2423 or e-mail [bgs@rb2.swrcb.ca.gov](mailto:bgs@rb2.swrcb.ca.gov) if you any questions regarding this matter.

Residual contamination both in soil and groundwater remains at the site that could pose an unacceptable risk under certain site development activities such as site grading, excavation, or the installation of water wells. The District and the appropriate planning and building department shall be notified prior to any changes in land use, grading activities, excavation, and installation of water wells. This notification shall include a statement that residual contamination exists on the property and list all mitigation actions, if any, necessary to ensure compliance with this site management requirement. The levels of residual contamination and any associated site risk are expected to reduce with time.

Does corrective action protect public health for current land use? Santa Clara Valley Water District staff does not make specific determinations concerning public health risk. However, it does not appear that the release would present a risk to human health.		
Site Management Requirements: Residual contamination both in soil and groundwater remains at the site that could pose an unacceptable risk under certain site development activities such as site grading, excavation, or the installation of water wells. Therefore, the impact or the disturbance of any residual contamination or the installation of a water well in the vicinity of the residual contamination shall be assessed and appropriate action taken so that there is no significant impact to human health, safety, or the environment. This could necessitate additional sampling, health risk assessment, and mitigation measures. The District and the appropriate planning and building department shall be notified prior to any changes in land use, grading activities, excavation, and installation of water wells. This notification shall include a statement that residual contamination exists on the property and list all mitigation actions, if any, necessary to ensure compliance with this site management requirement. The levels of residual contamination and any associated site risk are expected to reduce with time.		
Should corrective action be reviewed if land use changes? Yes, please see site management requirements

#### V. ADDITIONAL COMMENTS, DATA, ETC.

<p><b>Site Summary:</b></p> <p><b>1985:</b> In November, two underground storage tanks (USTs) (one 2,000 gallon diesel and one 4,000 gallon gasoline) were removed. Santa Clara Valley Water District and the San Jose Fire Department did not have records of soil or groundwater analytical results. According to historical records, both tanks were replaced.</p> <p><b>1989:</b> In May, a 10,000 gallon gasoline UST was removed. Approximately 200 cubic yards were excavated during the tank removal activity. A total of 120 cubic yards of soil was disposed and the remaining 80 cubic yards of soil was left on-site to aerate. Two soil samples were collected beneath the tank and up to 11 parts per million (ppm) Total Petroleum Hydrocarbon as Gasoline (TPHG) were detected. A 12,000 gallon gasoline tank was installed to replace the 10,000 gallon gasoline tank.</p> <p><b>1997:</b> In March, a 4,000 gallon gasoline UST was removed. Up to 2,100 parts per billion (ppb) TPHG and 10 ppb Benzene were detected in a pit groundwater sample.</p> <p><b>2001:</b> In September, two USTs (one 2,000 gallon diesel and one 12,000 gallon gasoline) were removed. Up to 0.88 ppm Methyl tert Butyl Ether (MTBE) was detected in soil and 410 ppb MTBE was detected in a pit groundwater sample. Groundwater in the tank pit was subsequently pumped, allowed to recharge and</p>

pumped again. The pit water sample was sampled for the second time and detected up to 21 ppb of MTBE. On September 29, over-excavation was performed on the east side of the 12,000 gallon tank pit. Approximately 3 feet was removed and up to 0.058 ppm MTBE was detected in collected confirmation soil samples.

**Conclusions:**

Residual petroleum hydrocarbon contamination exists beneath the site, however, the extent of impacted soil and groundwater appears to be limited in extent and all sources have been removed from the subject site. Furthermore, we expect the remaining contamination to continue naturally attenuate. Therefore, Santa Clara Valley Water District have concluded that a continuing threat to groundwater, human health and the environment from residual petroleum hydrocarbons does not exist at this site and that Regional Water Control Board objectives have not been compromised. Therefore, no further corrective action is necessary at this time.

**Frank Poss, REA**

*Professional Service Industries, Inc.  
Department Manager*

Mr. Poss joined Professional Service Industries, Inc. (PSI) in 1993 as a Department Manager. He has brought with him 33 years of experience in the management of environmental site assessments; groundwater and soil remediation projects; hazardous waste management; and subsurface investigation programs. His experience includes supervision of project and staff level personnel, as well as subcontractors, implementation of QA/QC programs and Health and Safety Programs, contractual negotiations, and budgetary management of projects ranging from \$20,000 to over \$1,000,000. Mr. Poss has completed over 1,000 ESAs in his career and as a Senior Reviewer, he has reviewed over 1,000 ESAs from sites across the United States. He was the project manager for over \$2,000,000 of work for Caltrans, including projects that involved wetlands studies, preliminary endangerment studies, remedial investigation, transportation corridor studies, and landfill assessments. The projects included work throughout the State of California. Mr. Poss has also been the project manager on numerous geotechnical investigations throughout Northern California with projects ranging from small tilt up buildings to multi-story residential buildings to large distribution facilities.

**Representative Project Experience**

**Environmental Site Assessments - Citigroup, Northern California, California**

Project manager for over 400 Phase I/II ESA projects associated with Citigroup branches throughout the State of California. Mr. Poss was the manager for two separate portfolios of over 100 Citigroup branches each, which had a quick four-week turnaround with all reports delivered on time. The environmental assessments were completed according to standard protocol and included regulatory record review, site reconnaissance, aerial photograph interpretation, and report preparation.

**Soil and Groundwater Studies - State of California Department of Transportation, Bay Bridge, California**

Project manager for a site investigation for CalTrans at the "Maze" (the busiest freeway intersection in Northern California) and the West Approach to the Bay Bridge. The project was conducted as part of the seismic retrofit program. The project objective was to evaluate whether soil and groundwater generated during seismic retrofitting would be handled as a hazardous waste. The project included the drilling of over 500 borings and the analyses of these samples for metals, volatile organics, semi-volatile organics, and PCBs.

**Preliminary Endangerment Study - Westlake Realty, Foster City, California**

Project manager for a Preliminary Endangerment Study for the DTSC for a new school in Foster City, California. Multiple possible sources of impact at the property required the drilling of over 100 borings, 25 soil-vapor samples, and 15 indoor air samples. The preparation of a Human Health Risk Evaluation allowed PSI to obtain a partial site closure, which allowed construction to be completed while remedial activities on a release from a former dry cleaner were conducted.
