

Appendix F

Traffic Study

March 21, 2022 Traffic Study updates the enclosed June 26, 2015 Traffic Study. The earlier analysis addressed a larger project configuration. The conclusions presented in the attached report and shown in Chapter 3 of this ISMND are not changed with the currently proposed project.

Re: Palmas de Greenfield Multi-Family Residential Development Traffic Study, Greenfield, California

Dear Dave,

Per your request, this is a traffic study for the proposed Palmas de Greenfield Multi-family Residential Development. The Project is proposed to include 18 apartments and 14 condominiums/townhomes on the east side of Fourth Street between Apple and Palm Avenues in Greenfield, California. The project location is included as **Exhibit 1**, which also includes the project site plan.

This report is an update of the traffic study of the previous development proposal submitted in a letter to Eduardo Couttolenc, Salinas, California, dated June 26, 2015 entitled "Greenfield Mixed-Use Project, Greenfield, California," (Previous Project Traffic Study), which is included herein as **Appendix A**. The previous study analyzed the traffic impacts of a mixed use project including four apartments, 20 townhomes and approximately 16,000 square feet of commercial / retail floor area.

The City of Greenfield has requested an update of the previous traffic study to reflect the change in project description and that the previous study was prepared in 2015, which is outdated. The traffic operations analysis is based on information in the Previous Project Traffic Study, more recent traffic studies of land development projects elsewhere in Greenfield as well as the "City of Greenfield Traffic Impact Fee Program," Higgins Associates, May 24, 2005. In addition, this study includes an evaluation of the project's vehicle-miles-traveled (VMT) impacts to comply with the current California Environmental Quality Act (CEQA) requirements.

This study includes the following scope of work.

1. Discussion of Existing traffic operations at the US 101/Oak Avenue interchange, including the following intersections.
 - a. Oak Avenue / US 101 Southbound Ramps
 - b. Oak Avenue / US 101 Northbound Ramps
 - c. Oak Avenue / Fourth Street
2. Estimate of Current Project trip generation estimate, compared with the Previous Project.
3. Description of General Plan build out traffic conditions at the US 101 / Oak Avenue interchange.
4. VMT analysis.

David Elliott
March 12, 2022

1. Existing Traffic Operations

Traffic operations at the following three study intersections were studied in the previous project traffic study.

- a. Oak Avenue / US 101 Southbound Ramps
- b. Oak Avenue / US 101 Northbound Ramps
- c. Oak Avenue / Fourth Street

As indicated on **Appendix A, Exhibits 4A and 4B**, all three intersections operated well within acceptable levels of service and did not need any improvements in 2015. Subsequently, a traffic study was prepared for the Las Viñas subdivision in the southern portion of Greenfield entitled “Las Viñas (formerly The Vines) Residential Development Traffic Impact Report Update,” Keith Higgins Traffic Engineer, February 18, 2019. That study determined that also determined all three intersections operated acceptably as of 2018, as indicated on **Exhibit 2**.

Exhibit 3 provides a summary of the total entering morning and evening peak hour traffic at the three study intersections in 2015 as well as 2018. Current traffic volumes are expected to be higher than the 2018 volumes. However, the COVID pandemic has affected traffic patterns, thus the validity of traffic counts if collected under current conditions. In order to estimate traffic volumes, the 2022 volumes are assumed to have increased at the annual growth rate between the 2018 volumes and traffic volumes expected at General Plan buildout in 2030. **Exhibit 3** also summarizes the General Plan buildout volumes estimated in the Previous Project Traffic Study. The 2022 volumes are estimated to be about 14.3% to 17.7% higher than in 2018. This is a growth rate of about 3.5% to 4% per year, which is consistent with the Greenfield population increase of about 3.6% per year from 2018 to 2020. The increase in traffic from 2018 to 2022 does not result in a decline in traffic operations that would require capacity or traffic control improvements.

2. General Plan Buildout Traffic Operations

As indicated on **Appendix A, Exhibits 4A and 4B**, the Oak Avenue intersections with the Northbound and Southbound US 101 Ramps will operate at an acceptable level of service through General Plan Buildout, which will occur in about 2030. However, the Oak Avenue / Fourth Street intersection is expected to operate deficiently and require the addition of left turn lanes on eastbound Oak Avenue as well as northbound and southbound Fourth Street. A second westbound Oak Avenue through lane is also recommended. Stop signs will be needed on both Oak Avenue approaches in addition to the existing stop signs on northbound and southbound Fourth Street.

The City of Greenfield has adopted a traffic impact fee to fund traffic improvements locations throughout the city. The improvements would include installing traffic signals at the Oak Avenue intersections with the Southbound US 101 Ramps, Northbound US 101 Ramps and Fourth Street intersections as well as widening the existing bridge over US 101 to provide left turn lanes on Oak Avenue. Based on the results of the Previous Project Traffic Study, these are likely beyond what will be needed to accommodate traffic at the buildout of the current General Plan.

3. Project Trip Generation

As indicated on **Exhibit 4**, the currently proposed Project is expected to generate about 201 daily trips with 15 during the AM peak hour and 18 during the PM peak hour. This compares with the trip generation

David Elliott
March 12, 2022

estimate for the Previous Project (2015 Mixed Use proposal) that includes 809 daily trips with 30 during the AM peak hour and 52 during the PM peak hour. The current Project will result in about 608 daily trips, 15 AM peak hour trips and 34 PM peak hour trips less than the previous proposal. This is about one-fourth as many daily trips, one-half as many AM peak hour trips and about one-third as many PM peak hour trips as the previous proposal. The current Project impacts will be proportionately less than the previous proposal. The above estimates are based upon the "Trip Generation Manual," Institute of Transportation Engineers, 9th Edition, 2012, which was used in the Previous Project Traffic Study.

Exhibit 5 compares trip generation estimates for the previous and current Projects based upon the latest (11th Edition) of the Trip Generation Manual. The proposed project is estimated to generate about 216 daily trips with 13 during the AM peak hour and 16 during the PM peak hour. This is qualitatively the same as the estimate based on the 9th Edition of the "Trip Generation Manual." However, the 2015 proposed mixed use proposal would be expected to generate about 1,035 daily trips with 50 during the am peak hour and 108 during the PM peak hour. The current Project would have a much lower relative trip generation to the previous Project if the estimate was based upon the latest Trip Generation Manual.

4. Existing Plus Project Traffic Conditions

Exhibit 3 tabulates the anticipated increase in AM and PM peak hour traffic at each of the three study intersections from the previous project as well as the current project. The current project is expected to generate about represent an increase of about 1% in total entering traffic at the study intersections. This is about 1/2 to 1/3 the increase anticipated from the previous proposal. **Appendix A, Exhibit 4A** indicates that the previous proposal would increase delay by only a fraction of a second for any movement at the study intersections. The current proposal will result in increases in delay of about 1/2 to 1/3 of the impact anticipated from the previous proposal. The current Project will have an imperceptible effect on traffic operations at the Northbound and Southbound US 101 Ramp intersections with Oak Avenue intersection as well as at the Oak Avenue / Fourth Street intersection.

5. Vehicle-Miles-Traveled

As required by California SB 743, vehicle-miles-travelled (VMT) has recently replaced level of service in the evaluation of environmental impacts under CEQA. The "Technical Advisory on Evaluating Transportation Impacts in CEQA," State of California Governor's Office of Planning and Research, December 2018 (OPR Guidelines), provides the implementation guidance for SB 743 for evaluating development proposals.

Monterey County and Greenfield are in the process of formally adopting methodologies and procedures for determining if development proposals will require further VMT analysis or if the proposal is below significance thresholds and exempt from additional analysis. Consistent with OPR Guidelines, it is being established that a project with an anticipated VMT that is over 15% below the current development average would have a potentially significant impact on traffic.

A draft VMT policy and corresponding evaluation methodology have been developed using the "VMT Calculator" based on the Association of Monterey Bay Area Governments Regional Travel Demand Model

David Elliott
March 12, 2022

(AMBAG RTDM). The VMT Calculator estimates the VMT for land uses within individual Traffic Analysis Zones (TAZ's) using the AMBAG RTDM, which are geographic subareas throughout the cities and unincorporated areas of Monterey County. The VMT Calculator also compares the result to the significance threshold described above.

The Monterey County VMT Calculator bases the estimate of Project VMT on the location of the Project within the County, which is identified by the Traffic Analysis Zone (TAZ) in which the project is located.

Exhibit 6 provides a map of Greenfield that indicates the Project is in TAZ 1706. As indicated on **Exhibit 7**, the VMT calculator estimates that residential development within this zone has an Average VMT per capita of 12.0. The Threshold of Significance for this TAZ is 12.3. The Project is expected to generate a VMT per capita below this threshold. Therefore, the Project will have a less-than-significant VMT impact. No mitigations such as trip reduction strategies are required.

6. Summary and Recommendations

The following are the findings and recommendations of this analysis.

- a. Existing traffic operations are acceptable in the study area. No improvements are required.
- b. The current Project will not result in any noticeable effects on traffic operations in the study area.
- c. General Plan Buildout traffic operations will be acceptable at the US 101/Oak Avenue interchange but will be deficient at the Oak Avenue/Fourth Street intersection. Improvements will be required including left turn lanes on the northbound Fourth Street and both Oak Avenue approaches. At a minimum, four-way stop control will be required.
- d. The Greenfield Traffic Impact Fee includes funding for traffic signals at the Oak Avenue intersections with the Southbound US 101, Northbound US 101 and Fourth Street intersections as well as widening of the Oak Avenue bridge over US 101. This may be more than necessary at the buildout of the current General Plan, which indicates that adequate funding should be available to implement whatever level of improvements are determined as General Plan Buildout conditions are approached in the future.
- e. The Project will be required to pay a Greenfield traffic impact fee and Transportation Agency for Monterey County Development Impact Fee, which will mitigate the Project's contribution to cumulative local and regional traffic effects.
- f. The Project will have an insignificant VMT impact. No VMT mitigation is required.

If you have any questions regarding this evaluation or need additional information, please do not hesitate to contact me at your convenience.

Thank you for the opportunity to assist you.

Respectfully submitted,

Keith Higgins

General Notes

- SUMMARY OF THE WORK:** The Work shall consist of all labor, materials, equipment, tools, transportation, services, and operations necessary to furnish and install the work under separate subcontracts, including all auxiliary and incidental work and materials necessary to complete compatible and operable installations as shown on the Drawings and Outline Specifications. The Subcontractor shall cooperate with the Owner's Superintendent and agents, including agency officials.
- COORDINATION:** Before submitting any proposal for the Work, the contractor shall visit the site and become familiar with all the work with other related drawings and specifications, and plan his work to provide the best possible assembly of combined work of all trades. No additional cost will be considered for work, which has to be relocated due to conflicts with other trades.
- DRAWINGS:** The Drawings are schematic, dimensions given on the plans take precedence over scaled dimensions, and all dimensions shall be verified in the field. The exact location of apparatus equipment shall be ascertained from the Owner's superintendent in the field. The Owner reserves to make minor changes in the location of any equipment up to the time of installation without additional cost.
- ERRORS AND OMISSIONS:** The subcontractor shall not take advantage of any unintentional error or omission in the Drawings or Outline Specifications. He will be expected to furnish all necessary items of materials, labor etc., which are necessary to make a complete job to the true intent and meaning of these Specifications. Should there be any discrepancies on the Drawings or these Specifications the Subcontractor shall call the attention of the Superintendent the same, and shall receive the complete instructions before proceeding with that portion of the work. Failure to do so shall make the entire responsibility of correcting the work. Additional cost or added expense if a question is raised after the Bid Award or contract on the Subcontractor.
- LAWS, PERMITS, FEES AND NOTICES:** The Subcontractor shall give notices and comply

RE: Greenfield Mixed-Use Project, Greenfield, California

Dear Eduardo:

Hatch Mott MacDonald (HMM) is pleased to provide traffic engineering services to support the development of your mixed-use project located on Fourth Street, between Apple and Palm Avenues and north of Oak Avenue, in Greenfield, California. Note that this scope of work is based upon input from City of Greenfield staff.

Exhibit 1 depicts the location of the project within Greenfield. **Exhibit 2** contains the proposed project site plan.

A. Existing Conditions

The operations of the following three existing study intersections were reviewed in this study:

1. US 101 Southbound Ramps / Oak Avenue;
2. US 101 Northbound Ramps / Oak Avenue; and
3. Fourth Street / Oak Avenue.

Exhibit 3 shows the existing volumes during the AM and PM peak hours. The existing volumes were collected on Wednesday, May 27, 2015, and included cars, trucks, buses, pedestrians and bicyclists. From these counts, the peak one-hour AM and PM periods were identified at each intersection and are shown on **Exhibit 3**. Note that these counts were balanced to account for minor variations in the traffic counts between adjacent intersections. **Appendix A** contains the raw (i.e. unbalanced) intersection counts.

Exhibit 4A summarizes the levels of service at the study intersections under Existing conditions, and **Exhibit 4B** summarizes the necessary improvements at those intersections. **Appendix B** contains the level of service calculations. This analysis utilizes the Highway Capacity Manual 2010 methodologies.

Under Existing conditions, all of the study intersection operate at an overall level of service (LOS) of "A", with side-street operations of LOS B, LOS C, or LOS D. All of the study intersections operate within the City of Greenfield and Caltrans level of service standards (LOS C and the transition between LOS C and D, respectively).

B. Existing Plus Project Conditions

The project is a mixed-use project, i.e. it has both residential and commercial components. These components are:

- Apartments – 4 units
- Townhomes – 20 units
- Commercial/Retail – approximately 16,000 square feet

Exhibit 5 summarizes the project trip generation estimate. This trip generation estimate uses rates from *Trip Generation Manual*, 9th Edition, published by the Institute of Transportation Engineers (ITE) in 2012.

The “Specialty Retail Center” land use was used to estimate the trip generation for the commercial component of the project. The *Trip Generation Manual* does not provide trip rates for the “Specialty Retail Center” land use during the AM peak hour. Therefore, trip rates during the AM are cited from “San Diego Trip Generators,” published by the San Diego Association of Governments (SANDAG) in April 2002.

It is anticipated that some of the future residents of the residential portion of the site would frequent the commercial portion of the site (also called “Internal Capture,” as they are trips that do not leave the project site). The trip generation estimate therefore assumes a 5% reduction to account for these trips.

As shown in **Exhibit 5**, the project would generate an estimated 809 daily trips, with 30 trips during the AM peak hour (14 in, 16 out) and 52 trips during the PM peak hour (26 in, 26 out).

Project trip distribution represents the percentage of project traffic that would travel to and from the project site at a localized level. **Exhibit 6A** graphically depicts the estimated project trip distribution. This distribution was developed based upon the relative locations of compatible land uses and the relative magnitude of the existing traffic volumes within the study area.

Exhibit 6B contains the project trip assignment for the new project trips on the study network, using both the aforementioned trip generation and trip distribution to quantify the number of new project trips added to each direction of travel at each of the study intersections.

The trip assignment within **Exhibit 6B** was added to the Existing volumes to create the Existing Plus Project volumes shown on **Exhibit 7**.

Exhibit 4A summarizes the levels of service of the study intersections under Existing Plus Project conditions, and **Exhibit 4B** summarizes the necessary improvements at those intersections. Levels of service at all study intersections continue to operate within the City of Greenfield and Caltrans standards. The project would not represent an impact upon the area street network. **Appendix B** contains the level of service calculations under Existing Plus Project conditions.

C. Background Conditions

Approved development projects within Greenfield were obtained from the City of Greenfield. **Exhibit 8** identifies these projects and estimates their trip generation (again using trip rates within the *Trip Generation Manual*). These trips were assigned throughout the study intersections and added to the Existing Condition volumes to create Background Condition volumes depicted within **Exhibit 9**.

Exhibit 4A summarizes the levels of service of the study intersections under Backgrond conditions, and **Exhibit 4B** summarizes the necessary improvements at those intersections. Levels of service at all study intersections continue to operate within the City of Greenfield and Caltrans standards. The project would not represent an impact upon the area street network. **Appendix B** contains the level of service calculations under Background conditions.

D. Background Plus Project Conditions

The project trip assignment depicted in **Exhibit 6B** was added to the Background volumes depicted in **Exhibit 9** to create the Background Plus Project volumes shown on **Exhibit 10**.

Exhibit 4A summarizes the levels of service of the study intersections under Background Plus Project conditions, and **Exhibit 4B** summarizes the necessary improvements at those intersections. Levels of service at all study intersections continue to operate within the City of Greenfield and Caltrans standards. The project would not represent an impact upon the area street network. **Appendix B** contains the level of service calculations under Background Plus Project conditions.

E. General Plan Buildout Conditions

General Plan Buildout conditions represent operations at the study intersections in the Year 2035. The traffic forecasts at the study intersections were taken from the *Walnut Avenue Commercial Area Specific Plan Traffic Impact Study*, prepared by Wood Rodgers in March 2013. **Exhibit 11** depicts these volumes at the study intersections.

Exhibit 4A summarizes the levels of service of the study intersections under General Plan Buildout conditions, and **Exhibit 4B** summarizes the necessary improvements at those intersections. **Appendix B** contains the level of service calculations under General Plan Buildout conditions. Levels of service at two of the three study intersections continue to operate within the City of Greenfield and Caltrans standards. However, operations at one intersection – Fourth Street / Oak Avenue – would operate at a deficient LOS F (both overall and side-street operations) during the AM and PM peak hours. The project would represent a significant cumulative impact upon the operations of this intersection.

The City of Greenfield has instituted a traffic impact fee to implement roadway improvements at various intersections and segments through the city. The proposed improvements at the intersection of Fourth Street / Oak Avenue are the following:

- Add an eastbound Oak Avenue left turn lane;
- Add northbound and southbound Fourth Street left turn lanes;
- Add a second westbound Oak Avenue through lane; and
- Convert the intersection to all-way stop control.

Implementation of these improvements would result in operations of LOS B (AM) and LOS C (PM) at the Fourth Street / Oak Avenue intersection, which are operations at or better than the City of Greenfield level of service standard. The project's payment of the city's traffic impact fee would constitute its proportional contribution towards these improvements. Therefore, the project applicant's payment of the city's traffic impact fee would reduce the project's impact to a less-than-significant level.

F. Project Access

The project would have a total of four separate driveways – two on Fourth Street and one each on Apple and Palm Avenue. They provide access to a parking lot directly in front of the building. The operations of these driveways are anticipated to operate within city level of service standards. The driveways located on Apple and Palm Avenues are only approximately 25 feet east of the Apple and Palm Avenue intersections with Fourth Street, and their operations may be influenced by operations at those intersections; however, this is expected to be a very minor issue that will only rarely cause significant delays for traffic exiting these driveways.

The project site is currently vacant, and there are no sidewalks along the project street frontages. The project applicant proposes to construct sidewalks along the site's frontages on Apple Avenue, Fourth Street, and Palm Avenue. This improvement, combined with the existing sidewalks along Fourth Street and Oak Avenue, will allow residents of the project to walk continuously on sidewalks to the downtown business district and to nearby Cesar Chavez Elementary School. It will also encourage more site residents and commercial patrons to walk to and from the site.

Bike racks are located at the northeastern and southeastern corners of the project site. This will facilitate bicyclists traveling to and from the commercial area.

G. Traffic Impact Fees

The project would be responsible for payment of both the City of Greenfield traffic impact fee and the Transportation Agency for Monterey County (TAMC) Regional Impact Fee. Payment of these two fees would constitute the project's proportional share towards traffic impacts within the City of Greenfield and Monterey County, respectively.

H. Conclusion

In summary, the project would have no traffic impacts under Existing Plus Project or Background Plus Project conditions. The project would have a significant cumulative impact under General Plan Buildout conditions at the Fourth / Oak intersection; however, the project's payment of the City of Greenfield traffic impact fee will constitute its proportional share towards the planned improvements at that intersection, and thus will result in the project having a less-than-significant impact upon that intersection.

The project driveways are anticipated to operate within acceptable limits. The project will construct sidewalk along its frontages of Apple Avenue, Fourth Street, and Palm Avenue. The project site will also have bike racks at its northeastern and southeastern corners.

The project would be responsible for payment of the aforementioned City of Greenfield traffic impact fee and also the TAMC Regional Impact Fee. Payment of both fees constitute the project's proportional share towards traffic impacts within the City of Greenfield and Monterey County, respectively.

If you have any questions regarding the contents of this letter or need additional information, please do not hesitate to contact Jeff Waller at your convenience. Thank you for the opportunity to assist you with this project.

Respectfully submitted,

A handwritten signature in blue ink that reads "Keith B. Higgins".

March 2022 Study

June 2015 Study

June 26, 2015

Mr. Eduardo Couttolenc
1054 University Avenue
Salinas, CA 93901

RE: Greenfield Mixed-Use Project, Greenfield, California

Dear Eduardo:

Hatch Mott MacDonald (HMM) is pleased to provide traffic engineering services to support the development of your mixed-use project located on Fourth Street, between Apple and Palm Avenues and north of Oak Avenue, in Greenfield, California. Note that this scope of work is based upon input from City of Greenfield staff.

Exhibit 1 depicts the location of the project within Greenfield. **Exhibit 2** contains the proposed project site plan.

A. Existing Conditions

The operations of the following three existing study intersections were reviewed in this study:

1. US 101 Southbound Ramps / Oak Avenue;
2. US 101 Northbound Ramps / Oak Avenue; and
3. Fourth Street / Oak Avenue.

Exhibit 3 shows the existing volumes during the AM and PM peak hours. The existing volumes were collected on Wednesday, May 27, 2015, and included cars, trucks, buses, pedestrians and bicyclists. From these counts, the peak one-hour AM and PM periods were identified at each intersection and are shown on **Exhibit 3**. Note that these counts were balanced to account for minor variations in the traffic counts between adjacent intersections. **Appendix A** contains the raw (i.e. unbalanced) intersection counts.

Exhibit 4A summarizes the levels of service at the study intersections under Existing conditions, and **Exhibit 4B** summarizes the necessary improvements at those intersections. **Appendix B** contains the level of service calculations. This analysis utilizes the Highway Capacity Manual 2010 methodologies.

Under Existing conditions, all of the study intersection operate at an overall level of service (LOS) of "A", with side-street operations of LOS B, LOS C, or LOS D. All of the study intersections operate within the City of Greenfield and Caltrans level of service standards (LOS C and the transition between LOS C and D, respectively).

B. Existing Plus Project Conditions

The project is a mixed-use project, i.e. it has both residential and commercial components. These components are:

- Apartments – 4 units
- Townhomes – 20 units
- Commercial/Retail – approximately 16,000 square feet

Exhibit 5 summarizes the project trip generation estimate. This trip generation estimate uses rates from *Trip Generation Manual*, 9th Edition, published by the Institute of Transportation Engineers (ITE) in 2012.

The “Specialty Retail Center” land use was used to estimate the trip generation for the commercial component of the project. The *Trip Generation Manual* does not provide trip rates for the “Specialty Retail Center” land use during the AM peak hour. Therefore, trip rates during the AM are cited from “San Diego Trip Generators,” published by the San Diego Association of Governments (SANDAG) in April 2002.

It is anticipated that some of the future residents of the residential portion of the site would frequent the commercial portion of the site (also called “Internal Capture,” as they are trips that do not leave the project site). The trip generation estimate therefore assumes a 5% reduction to account for these trips.

As shown in **Exhibit 5**, the project would generate an estimated 809 daily trips, with 30 trips during the AM peak hour (14 in, 16 out) and 52 trips during the PM peak hour (26 in, 26 out).

Project trip distribution represents the percentage of project traffic that would travel to and from the project site at a localized level. **Exhibit 6A** graphically depicts the estimated project trip distribution. This distribution was developed based upon the relative locations of compatible land uses and the relative magnitude of the existing traffic volumes within the study area.

Exhibit 6B contains the project trip assignment for the new project trips on the study network, using both the aforementioned trip generation and trip distribution to quantify the number of new project trips added to each direction of travel at each of the study intersections.

The trip assignment within **Exhibit 6B** was added to the Existing volumes to create the Existing Plus Project volumes shown on **Exhibit 7**.

Exhibit 4A summarizes the levels of service of the study intersections under Existing Plus Project conditions, and **Exhibit 4B** summarizes the necessary improvements at those intersections. Levels of service at all study intersections continue to operate within the City of Greenfield and Caltrans standards. The project would not represent an impact upon the area street network. **Appendix B** contains the level of service calculations under Existing Plus Project conditions.

C. Background Conditions

Approved development projects within Greenfield were obtained from the City of Greenfield. **Exhibit 8** identifies these projects and estimates their trip generation (again using trip rates within the *Trip Generation Manual*). These trips were assigned throughout the study intersections and added to the Existing Condition volumes to create Background Condition volumes depicted within **Exhibit 9**.

Exhibit 4A summarizes the levels of service of the study intersections under Backgrond conditions, and **Exhibit 4B** summarizes the necessary improvements at those intersections. Levels of service at all study intersections continue to operate within the City of Greenfield and Caltrans standards. The project would not represent an impact upon the area street network. **Appendix B** contains the level of service calculations under Background conditions.

D. Background Plus Project Conditions

The project trip assignment depicted in **Exhibit 6B** was added to the Background volumes depicted in **Exhibit 9** to create the Background Plus Project volumes shown on **Exhibit 10**.

Exhibit 4A summarizes the levels of service of the study intersections under Background Plus Project conditions, and **Exhibit 4B** summarizes the necessary improvements at those intersections. Levels of service at all study intersections continue to operate within the City of Greenfield and Caltrans standards. The project would not represent an impact upon the area street network. **Appendix B** contains the level of service calculations under Background Plus Project conditions.

E. General Plan Buildout Conditions

General Plan Buildout conditions represent operations at the study intersections in the Year 2035. The traffic forecasts at the study intersections were taken from the *Walnut Avenue Commercial Area Specific Plan Traffic Impact Study*, prepared by Wood Rodgers in March 2013. **Exhibit 11** depicts these volumes at the study intersections.

Exhibit 4A summarizes the levels of service of the study intersections under General Plan Buildout conditions, and **Exhibit 4B** summarizes the necessary improvements at those intersections. **Appendix B** contains the level of service calculations under General Plan Buildout conditions. Levels of service at two of the three study intersections continue to operate within the City of Greenfield and Caltrans standards. However, operations at one intersection – Fourth Street / Oak Avenue – would operate at a deficient LOS F (both overall and side-street operations) during the AM and PM peak hours. The project would represent a significant cumulative impact upon the operations of this intersection.

The City of Greenfield has instituted a traffic impact fee to implement roadway improvements at various intersections and segments through the city. The proposed improvements at the intersection of Fourth Street / Oak Avenue are the following:

- Add an eastbound Oak Avenue left turn lane;
- Add northbound and southbound Fourth Street left turn lanes;
- Add a second westbound Oak Avenue through lane; and
- Convert the intersection to all-way stop control.

Implementation of these improvements would results in operations of LOS B (AM) and LOS C (PM) at the Fourth Street / Oak Avenue intersection, which are operations at or better than the City of Greenfield level of service standard. The project's payment of the city's traffic impact fee would constitute its proportional contribution towards these improvements. Therefore, the project applicant's payment of the city's traffic impact fee would reduce the project's impact to a less-than-significant level.

F. Project Access

The project would have a total of four separate driveways – two on Fourth Street and one each on Apple and Palm Avenue. They provide access to a parking lot directly in front of the building. The operations of these driveways are anticipated to operate within city level of service standards. The driveways located on Apple and Palm Avenues are only approximately 25 feet east of the Apple and Palm Avenue intersections with Fourth Street, and their operations may be influenced by operations at those intersections; however, this is expected to be a very minor issue that will only rarely cause significant delays for traffic exiting these driveways.

The project site is currently vacant, and there are no sidewalks along the project street frontages. The project applicant proposes to construct sidewalks along the site's frontages on Apple Avenue, Fourth Street, and Palm Avenue. This improvement, combined with the existing sidewalks along Fourth Street and Oak Avenue, will allow residents of the project to walk continuously on sidewalks to the downtown business district and to nearby Cesar Chavez Elementary School. It will also encourage more site residents and commercial patrons to walk to and from the site.

Bike racks are located at the northeastern and southeastern corners of the project site. This will facilitate bicyclists traveling to and from the commercial area.

G. Traffic Impact Fees

The project would be responsible for payment of both the City of Greenfield traffic impact fee and the Transportation Agency for Monterey County (TAMC) Regional Impact Fee. Payment of these two fees would constitute the project's proportional share towards traffic impacts within the City of Greenfield and Monterey County, respectively.

H. Conclusion

In summary, the project would have no traffic impacts under Existing Plus Project or Background Plus Project conditions. The project would have a significant cumulative impact under General Plan Buildout conditions at the Fourth / Oak intersection; however, the project's payment of the City of Greenfield traffic impact fee will constitute its proportional share towards the planned improvements at that intersection, and thus will result in the project having a less-than-significant impact upon that intersection.

The project driveways are anticipated to operate within acceptable limits. The project will construct sidewalk along its frontages of Apple Avenue, Fourth Street, and Palm Avenue. The project site will also have bike racks at its northeastern and southeastern corners.

The project would be responsible for payment of the aforementioned City of Greenfield traffic impact fee and also the TAMC Regional Impact Fee. Payment of both fees constitute the project's proportional share towards traffic impacts within the City of Greenfield and Monterey County, respectively.

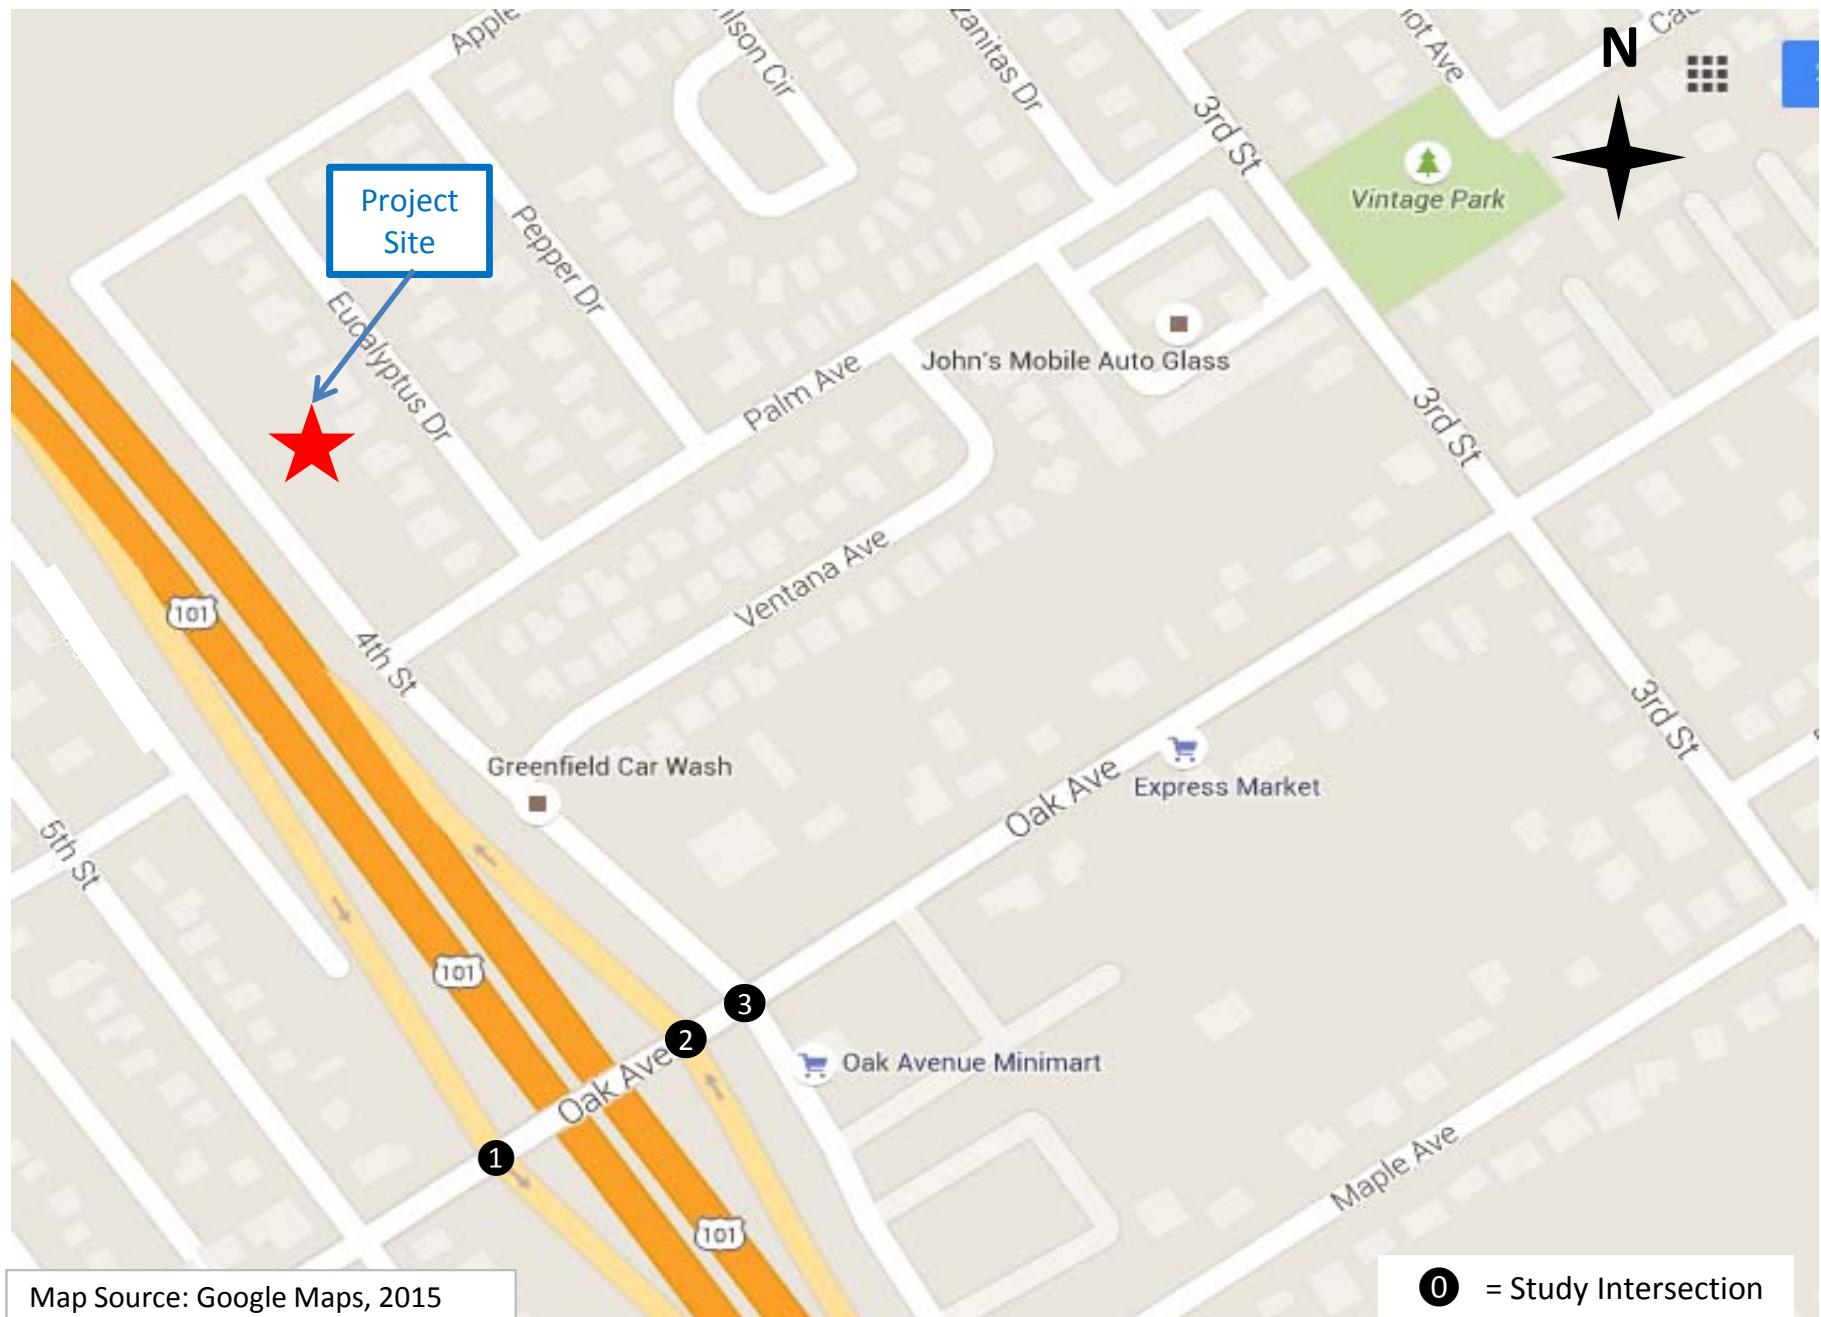

If you have any questions regarding the contents of this letter or need additional information, please do not hesitate to contact Jeff Waller at your convenience. Thank you for the opportunity to assist you with this project.

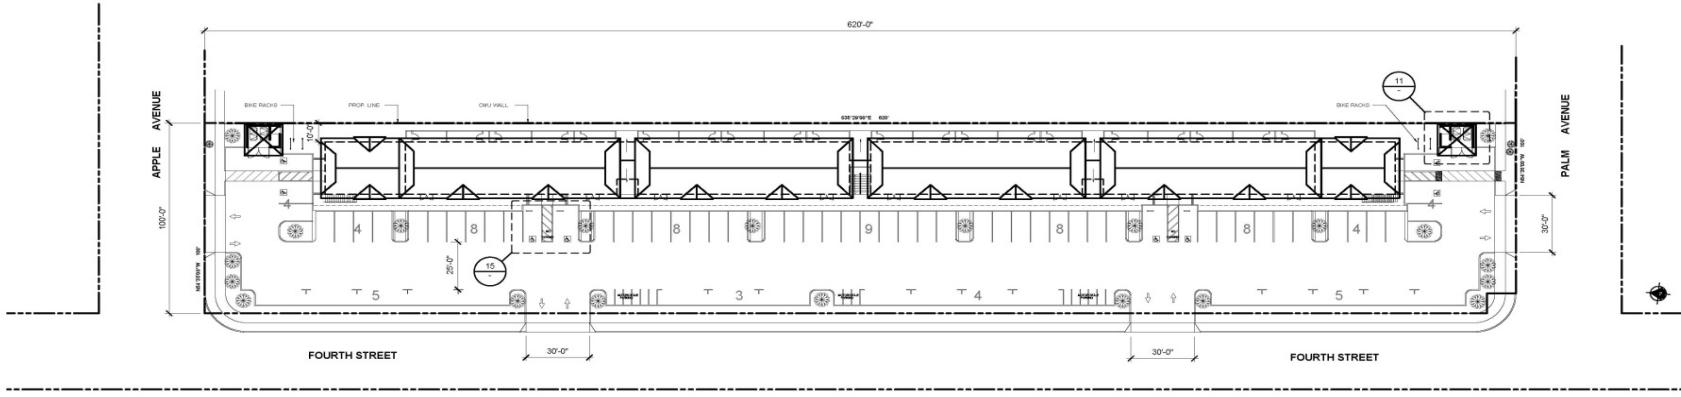

Respectfully submitted,

A handwritten signature in blue ink that reads "Keith B. Higgins".

Notes:

1. Trip generation rates from Institute of Transportation Engineers, "Trip Generation Manual," 9th Edition, 2012, unless otherwise noted.
2. "Trip Generation Manual" does not provide trip rates for Specialty Retail Center during AM. Cited trip rates are from San Diego Association of Governments, "San Diego Traffic Generators," April 2002.
3. Internal Capture rate of 5% represents trip reduction due to interactions between the on-site uses (e.g. a resident of a townhouse that also frequents the retail space).
