1.3 User Entered Comments & Non-Default Data

Project Characteristics - Compton Blvd over Compton Creek. SCAQMD.

Land Use - 1.21 acre site area (bridge and approach work).

Construction Phase - Project construction would occur January 2024 through May 2025.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Default equipment assumed.

Trips and VMT - Updated worker, vendor, and haul trips, based on information from applicant. Distance disposal facility assumed to be 30 miles from project site (Whitter or Puente Landfills).

Grading - 1,000 CY material exported during clearing and grubbing/AC pavement removal and 500 CY export during grading/excavation.

Construction Off-road Equipment Mitigation - Comply with fugitive dust control measures per SCAQMD Rule 403 - Water twice daily.

Project Characteristics - Compton Blvd over Compton Creek. SCAQMD.

Land Use - 1.21 acre site area (bridge and approach work).

Construction Phase - Project construction would occur January 2024 through May 2025.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Default equipment assumed.

Trips and VMT - Updated worker, vendor, and haul trips, based on information from applicant. Distance disposal facility assumed to be 30 miles from project site (Whitter or Puente Landfills).

Grading - 1,000 CY material exported during clearing and grubbing/AC pavement removal and 500 CY export during grading/excavation.

Construction Off-road Equipment Mitigation - Comply with fugitive dust control measures per SCAQMD Rule 403 - Water twice daily.

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Compton Blvd over Compton Creek. SCAQMD.

Land Use - 1.21 acre site area (bridge and approach work).

Construction Phase - Project construction would occur January 2024 through May 2025.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Equipment adjusted based off information from applicant.

Off-road Equipment - Default equipment assumed.

Trips and VMT - Updated worker, vendor, and haul trips, based on information from applicant. Distance disposal facility assumed to be 30 miles from project site (Whitter or Puente Landfills).

Grading - 1,000 CY material exported during clearing and grubbing/AC pavement removal and 500 CY export during grading/excavation.

Construction Off-road Equipment Mitigation - Comply with fugitive dust control measures per SCAQMD Rule 403 - Water twice daily.

Summary

This Natural Environment Study-Minimal Impacts report was prepared for Los Angeles County Department of Public Works for the proposed Compton Boulevard Bridge over Compton Creek Project (proposed project), located within the City of Compton in southern Los Angeles County. Specifically, the proposed project would be located along the Compton Boulevard right-of-way (ROW) where it crosses over Compton Creek, 400 feet east of the Compton Boulevard/Wilmington Avenue intersection. Los Angeles County Department of Public Works is proposing to replace an existing two-span steel girder bridge with a new two-span precast, pre-stressed concrete box beam structure bridge to remedy structural deficiencies associated with the existing bridge and to improve vehicular safety and transportation efficiency over Compton Creek. A Biological Study Area (BSA), encompassing 46.36 acres, was established around the impact area for the proposed project to document existing conditions and determine the potential for project-related impacts to occur.

The BSA is largely developed or disturbed in nature with existing residential and commercial developments, ROWs, as well as a concrete-lined flood control channel (i.e., Compton Creek). The BSA does not contain suitable habitat for any federal or state listed plant or wildlife species. However, the BSA is centered on Compton Creek, a major tributary to the Los Angeles River, which likely contains jurisdictional waters of the U.S. and State. Temporary and permanent impacts to waters of the U.S. and State are anticipated to occur as a result of the proposed project.

No special-status plant or wildlife species were detected within the BSA during the biological resource survey conducted on August 1, 2019. Based on the review of current state and federal databases, including the California Natural Diversity Database and U.S. Fish and Wildlife Service (USFWS) Information Planning and Conservation System, no special-status plant or wildlife species have a moderate or higher potential to occur in the BSA. In addition, the BSA is not located within any USFWS-designated critical habitat or a designated wildlife movement corridor. The BSA also does not reside within any approved or proposed Habitat Conservation Plans or Natural Community Conservation Plans.

The BSA does contain ornamental vegetation that could provide suitable nesting habitat for resident and migratory bird species protected under the Migratory Bird Treaty Act and California Fish and Game Code, including a non-native, ornamental tree proposed for removal as part of the project. As such, avoidance and minimization measures would be required to minimize impacts to migratory birds if construction activities take place during the general avian nesting season from February 1st through September 1st.

1. Introduction

This Natural Environment Study-Minimal Impacts (NES-MI) report has been prepared for the Compton Boulevard Bridge over Compton Creek Project (proposed project). The Los Angeles County Department of Public Works (LADPW) is proposing to replace an existing two-span steel girder bridge with a new two-span precast, pre-stressed concrete box beam structure bridge to remedy structural deficiencies associated with the existing bridge and to improve vehicular safety and transportation efficiency over Compton Creek.

1.1 History

The existing two-span steel girder bridge was built in 1938 and is currently supported by abutments and a middle pier. The existing bridge includes two 12-foot-wide travel lanes and one left-turn lane in each direction.

1.2 Project Purpose and Need

The proposed project would correct existing bridge deficiencies, enhance vehicular safety on the bridge and improve transportation efficiency by enabling larger trucks to utilize the bridge. The project is being proposed because the existing steel girder bridge and middle pier have been determined to be structurally deficient due to extensive cracking and delamination of the bridge deck. The proposed project would include replacing the existing, steel girder bridge and pier with a new pre-cast, pre-stressed, concrete box beam structure supported by pile foundations, a new pier and new abutments.

1.3 Project Description

The proposed project would be located at Compton Boulevard where it crosses over Compton Creek within the City of Compton (City) in southern Los Angeles County (County) (Figure 1). The bridge replacement would be located within the South Gate U.S. Geological Survey (USGS) 7.5-minute quadrangle in Section 22, Township 3 South, Range 13 West. The area surrounding the existing bridge is largely developed with existing land uses comprised of residential and commercial development, existing right-of-ways (ROWs), as well as a concrete-lined flood control channel.

The proposed project would include demolition and construction activities. Generally, construction activities would include demolition, grading, pile drilling, installation of metal beam guardrail system, construction of bridge abutments, bridge pier reconstruction, reconstruction of sidewalks, drainage improvements (catch basins at driveway entrances) bicycle path reconstruction, roadway reconstruction to accommodate the raise in bridge elevation, and full road closures within project limits.

Under the proposed project, the existing two-span Compton Boulevard Bridge over Compton Creek would be demolished. Specifically, the existing pier timber piles would be removed three feet below the finished grade, followed by the removal of the existing steel girders, cross brace

FIGURE 1

Project Location

The Compton Boulevard Bridge Over Compton Creek Project

members, reinforced concrete, asphalt pavement (bridge deck), and any excavated soil within the project limits of work. Specifically, the concrete bridge deck would be demolished by saw cutting and the steel girders would be removed by torch cutting before the transporting the fragmented pieces to the dump trucks using a crane.

The new concrete bridge pier would be constructed in the Compton Creek channel, at the same location as the existing pier. Bridge pier construction would involve the installation of cast-in-drilled-hole (CIDH) concrete piles (reinforced concrete piles cast in holes that are drilled to predetermined elevations), construction of concrete pier footings and the stem wall. Specifically, a hydraulic crane and drill rig would be utilized to drill the holes and install the rebar cages, while a concrete truck, concrete pump, forklifts and loaders would be needed to fill the drilled holes and construct the footings and stem wall. A new, sloping concrete pier nose would be constructed upstream from the bridge as part of the proposed project.

The new abutments would be constructed approximately 15 feet behind the existing abutments, which would be protected in place to accommodate clearance for the new bridge structure. Similar to the construction of the bridge pier, the construction of the bridge abutments would involve the installation of CIDH concrete piles, pile caps, and backwalls, which would utilize a drill rig and hydraulic crane, while an excavator and crane would be utilized to install the formwork and the reinforcement for the pile caps. Additional equipment needed to install the pile caps and backwall includes forklifts, loaders, concrete pumps, and a concrete truck.

The construction of the bridge superstructure would involve the installation of precast/pre-stressed adjacent concrete box beams, a cast-in-place reinforced concrete deck, sidewalks, and bridge barriers. Installation of these superstructure components would utilize a hydraulic crane, concrete slipform machine, concrete truck, and concrete pump. After the superstructure has been constructed, the bike paths, and access ramp would be reconstructed and the roadway would be paved and restriped.

Project construction would also include the reconstruction of the sidewalks adjacent to the project limits. The project would include the removal of a private tree, relocation of catch basins, driveways, and a street lighting median located 80 feet west of the bridge, within the Compton Boulevard ROW.

Project construction would also include the reconstruction of the bike paths along the Compton Creek channel. Specifically, reconstruction of the bike paths would include 380 feet (190 feet on either side) of bike path along the north side of the channel along Compton Boulevard, where the bike path would be supported on a concrete slab structure with CIDH piles. An access road, approximately 190 feet long, would be reconstructed along the channel at the southwest corner to accommodate the one-foot change in bridge elevation.

Construction Schedule

Project construction is anticipated to occur between January 2023 and May 2024, and would last for approximately 280 working days. Construction would occur Monday through Friday from 7:00am to 3:30pm.

2. Study Methods

2.1 Regulatory Requirements

The following federal, state, and local regulations provide legal coverage for biological resources that could potentially occur in the BSA.

2.1.1 Federal

Federal Endangered Species Act

The federal Endangered Species Act (FESA) of 1973 (16 U.S.C. 1531 et seq.), as amended, is administered by the U.S. Fish and Wildlife Service (USFWS) for most plant and animal species and by the National Oceanic and Atmospheric Administration (NOAA) National Marine Fisheries Service (NMFS) for certain marine species. FESA is intended to provide a means to conserve the ecosystems upon which endangered and threatened species depend, and to provide programs for the conservation of those species, preventing extinction of plants and wildlife. FESA defines an endangered species as “any species that is in danger of extinction throughout all or a significant portion of its range” (16 U.S.C. 1531 et seq.). A threatened species is defined as “any species that is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range” (16 U.S.C. 1531 et seq.). Under FESA, it is unlawful to take any listed species; “take” is defined as “harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct” (16 U.S.C. 1531 et seq.). FESA allows for the issuance of incidental take permits for listed species under Section 7, which is generally available for projects that also require other federal agency permits or other approvals, and under Section 10, which provides for the approval of habitat conservation plans on private property without any other federal agency involvement. Upon development of a habitat conservation plan, USFWS can issue incidental take permits for listed species.

Clean Water Act

Pursuant to Section 404 of the Clean Water Act, Army Corps of Engineers (ACOE) regulates the discharge of dredged and/or fill material into waters of the United States. The term “wetlands” (a subset of waters) is defined in Title 33, Section 328.3(b), of the Code of Federal Regulations as “those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas.” In the absence of wetlands, the limits of ACOE jurisdiction in non-tidal waters, such as intermittent streams, extend to the ordinary high water mark, as defined in Title 33, Section 328.3(e), of the Code of Federal Regulations. Pursuant to Section 10 of the Rivers and Harbors Act of 1899, ACOE regulates any potential obstruction or alteration of any navigable water of the United States.

Migratory Bird Treaty Act

The MBTA was originally passed in 1918 as four bilateral treaties, or conventions, for the protection of a shared migratory bird resource. The primary motivation for the international negotiations was to stop the “indiscriminate slaughter” of migratory birds by market hunters and others (16 U.S.C. 703–712). Each of the treaties protects selected species of birds and provides for closed and open seasons for hunting game birds. The MBTA protects more than 800 species. Two species of eagles that are native to the United States—bald eagle (*Haliaeetus leucocephalus*) and golden eagle (*Aquila chrysaetos*)—were granted additional protection within the United States under the Bald and Golden Eagle Protection Act (16 U.S.C. 668–668d) to prevent these species from becoming extinct.

2.1.2 State

California Endangered Species Act

The California Department of Fish and Wildlife (CDFW) administers the California Endangered Species Act (CESA), which prohibits the take of plant and animal species designated by the California Fish and Game Commission as endangered or threatened in California. Under CESA Section 86, “take” is defined as “hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill” (California Fish and Game [CFG] Code, Section 86). CESA Section 2053 stipulates that state agencies may not approve projects that will “jeopardize the continued existence of any endangered species or threatened species, or result in the destruction or adverse modification of habitat essential to the continued existence of those species, if there are reasonable and prudent alternatives available consistent with conserving the species or its habitat which would prevent jeopardy” (CFG Code, Section 2053).

CESA defines an endangered species as “a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant which is in serious danger of becoming extinct throughout all, or a significant portion, of its range due to one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, or disease” (CFG Code, Section 2050 et seq.). CESA defines a threatened species as “a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant that, although not presently threatened with extinction, is likely to become an endangered species in the foreseeable future in the absence of the special protection and management efforts required by this chapter. Any animal determined by the [California Fish and Game] Commission as rare on or before January 1, 1985, is a threatened species” (California Fish and Game Code, Section 2050 et seq.). A candidate species is defined as “a native species or subspecies of a bird, mammal, fish, amphibian, reptile, or plant that the Commission has formally noticed as being under review by the department for addition to either the list of endangered species or the list of threatened species, or a species for which the Commission has published a notice of proposed regulation to add the species to either list” (CFG Code, Section 2050 et seq.). CESA does not list invertebrate species.

California Fish and Game Code, Sections 3503, 3511, 3513, 3801, 4700, 5050, and 5515

Section 2081(b) and (c) of the CFG Code authorizes take of endangered, threatened, or candidate species if take is incidental to otherwise lawful activity and if specific criteria are met. These provisions also require CDFW to coordinate consultations with USFWS for actions involving federally listed species that are also state-listed species. In certain circumstances, Section 2080.1 of CESA allows CDFW to adopt a federal incidental take statement or a 10(a) permit as its own, based on its findings that the federal permit adequately protects the species and is consistent with state law. A Section 2081(b) permit may not authorize the take of “fully protected” species or “specified birds” (CFG Code, Sections 3505, 3511, 4700, 5050, 5515, and 5517). If a project is planned in an area where a fully protected species or a specified bird occurs, an applicant must design the project to avoid take.

California Fish and Game Code, Sections 1600–1602

Pursuant to Section 1602 of the CFG Code, CDFW regulates all diversions, obstructions, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake that supports fish or wildlife. A streambed alteration agreement is required for impacts to jurisdictional wetlands in accordance with Section 1602 of the CFG Code.

California Environmental Quality Act

The California Environmental Quality Act (CEQA) requires identification of a project’s potentially significant impacts on biological resources and ways that such impacts can be avoided, minimized, or mitigated. CEQA also provides guidelines and thresholds for use by lead agencies for evaluating the significance of proposed impacts.

Special-Status Plants and Wildlife

The CEQA Guidelines define endangered animals or plants as species or subspecies whose “survival and reproduction in the wild are in immediate jeopardy from one or more causes, including loss of habitat, change in habitat, overexploitation, predation, competition, disease, or other factors” (14 CCR 15380(b)(1)). A rare animal or plant is defined in CEQA Guidelines, Section 15380(b)(2), as a species that, although not currently threatened with extinction, exists “in such small numbers throughout all or a significant portion of its range that it may become endangered if its environment worsens; or . . . [t]he species is likely to become endangered within the foreseeable future throughout all or a significant portion of its range and may be considered ‘threatened’ as that term is used in the federal Endangered Species Act” (14 CCR 15380(b)(2)). Additionally, an animal or plant may be presumed to be endangered, rare, or threatened if it meets the criteria for listing as defined further in CEQA Guidelines, Section 15380(c).

Endangered, rare, or threatened plant species as defined in Section 15380(b) of the CEQA Guidelines (14 CCR 15000 et seq.) are referred to as “special-status plant species” in this report and include endangered or threatened plant species recognized in the context of CESA and FESA (CDFW 2019ba) and plant species with a CRPR 1 through 4 (CNPS 2019). Species with CRPR 3 or 4 may,

but generally do not, qualify for protection under this provision. Species with CRPR 3 and 4 are those that require more information to determine status and plants of limited distribution. Thus, CRPR 3 and 4 plant species are not analyzed further.

Endangered, rare, or threatened wildlife species as defined in CEQA Guidelines, Section 15380(b) (14 CCR 15000 et seq.), are referred to as “special-status wildlife species” and, as used in this report, include (1) endangered or threatened wildlife species recognized in the context of CESA and FESA (CDFW 2019b); (2) California Species of Special Concern (SSC) and Watch List species as designated by CDFW (2019c); (3) mammals and birds that are fully protected species as described in the CFG Code, Sections 4700 and 3511; and (4) Birds of Conservation Concern as designated by USFWS (2008).

Natural Communities of Special Concern

Sensitive natural communities, as defined in Section IV, Appendix G (Environmental Checklist Form), of the CEQA Guidelines (14 CCR 15000 et seq.), are referred to as “natural communities of special concern” and, as used in this report, include communities identified as high priority for inventory in the California Natural Community List (CDFW 2018b) by a state rarity ranking of S1, S2, or S3.

2.2 Studies Required

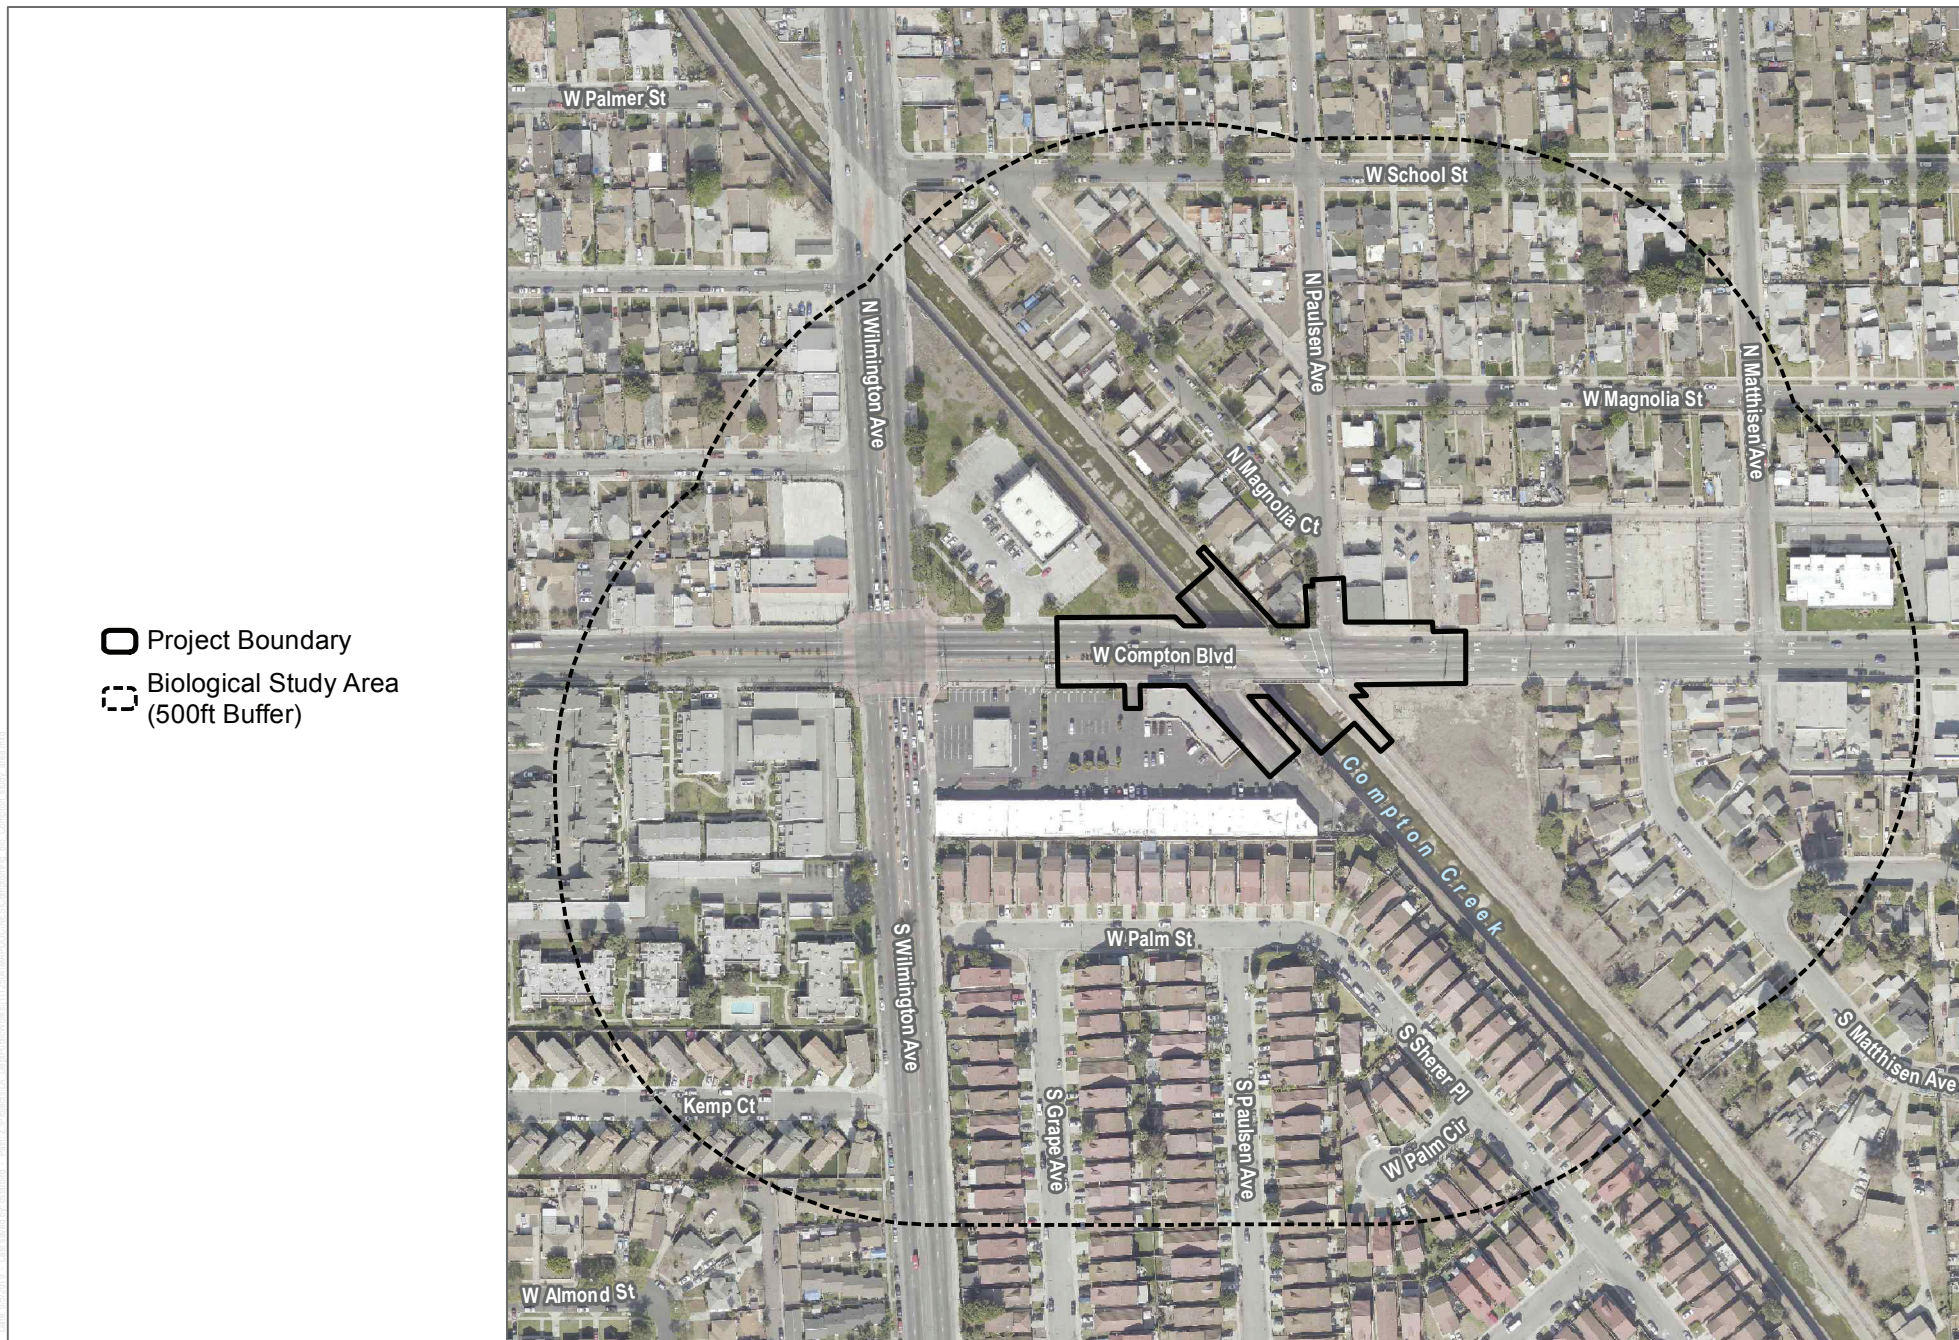

A Biological Study Area (BSA) consisting of the proposed project impact area and a 500-foot buffer (Figure 2) was created to determine the biological resources within and near the proposed project that could potentially be affected by project implementation. Data regarding biological and jurisdictional resources present within the BSA was obtained through a review of pertinent literature and field reconnaissance, and impacts to these resources were analyzed pursuant to relevant regulatory requirements, described in detail below.

A literature search was conducted to determine what biological resources have previously been mapped in the project vicinity and provided a focus for the field effort. The biological resources observed during the field survey were mapped and noted to establish the baseline conditions of the BSA.

2.2.1 Literature Search

The following data sources were reviewed to assist with biological assessment efforts:

- USFWS Critical Habitat Mapper (USFWS 2019a);
- USFWS Information Planning and Conservation (IPaC) System (USFWS 2019b);
- National Marine Fisheries Service (NMFS) Species List (NMFS 2016);

SOURCE: Esri, Digital Globe 2017; Open Street Map 2019

FIGURE 2

- California Native Plant Society (CNPS) Inventory of Rare and Endangered Plants (CNPS 2019).

2.2.2 Field Review

Dudek biologist Tracy Park conducted a field survey of the project site and surrounding BSA under the supervision of senior biologist Michael Cady. The biological reconnaissance-level survey included the mapping of the vegetation communities and land covers present within the BSA, mapping of potential jurisdictional wetlands or waters, and an evaluation of the potential for special-status species to occur in the BSA.

Survey Methods

All plant and wildlife species observed during the field survey by sight, calls, tracks, scat, or other signs were recorded. Binoculars (10x42 magnification) were used to aid in the identification of wildlife. Typically, vegetation communities are mapped following *A Manual of California Vegetation, 2nd Edition* (Sawyer et al. 2009). However due to the substantial urban development occurring throughout the BSA, no natural vegetation communities were observed that would conform with *A Manual of California Vegetation, 2nd Edition*. Communities that did not conform to *A Manual of California Vegetation, 2nd Edition*, were mapped according to their dominant characteristics.

The potential for special-status plant and wildlife species to occur with the BSA was evaluated based on the vegetation communities and soils available, if present. Where applicable, Dudek used the CDFW's *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities* (CDFW 2018a), *California Natural Communities List* (CDFW 2018b), also referred to as the Natural Communities List, and *A Manual of California Vegetation, Second Edition* (MCV2; Sawyer et al. 2009) to map vegetation communities present within the BSA. Modifications were incorporated to accommodate the lack of conformity of the observed communities to those included in these references.

Personnel Survey Dates

Dudek biologist Tracy Park conducted a biological reconnaissance-level field survey of the BSA for the proposed project on August 1, 2019 (Table 1).

Table 1: Biological Reconnaissance-Level Survey

Date	Hours	Personnel	Focus	Conditions
8/1/2019	1115-1200	TP	General biological reconnaissance level survey, vegetation mapping, resources mapping, habitat assessment	80-84°F, 0% cc, 1-4 mph wind

TP = Tracy Park; °F = degrees Fahrenheit; cc = cloud cover; mph = miles per hour

Ms. Park has over three years' experience as a field technician and biologist conducting biological surveys throughout Southern California. Her experience includes conducting various wildlife and botanical surveys, habitat assessments, vegetation mapping, and wetland delineations, as well as reporting for projects requiring CEQA compliance. She has conducted focused protocol surveys for a variety sensitive plant and wildlife species.

Michael Cady is the supervising biologist for this project. He has over 15 years' professional experience as a biologist specializing in technical surveys and reporting in support of projects requiring CEQA/NEPA compliance. His field experience includes conducting rare plant surveys, general flora and fauna surveys, oak and general tree surveys, vegetation mapping, and nesting bird surveys. Additionally, he has conducted protocol surveys and habitat assessments for a variety of special-status wildlife species. He holds a current California Department of Fish and Wildlife (CDFW) Scientific Collecting Permit, as well as a CDFW State-Listed Plant Voucher Collection Permit.

Agency Coordination and Professional Contacts

No agency coordination has occurred to date.

Limitations That May Influence Results

Limitations of the survey include seasonal constraints, a diurnal bias, and the absence of focused protocol surveys. The survey was completed to assess habitat and the potential for special-status species to occur within the BSA.

Focused rare plant surveys were not conducted for the proposed project. In addition, the list of plant species observed within the BSA includes those species observed during general biological reconnaissance survey conducted in August, when many botanical resources would have been limited. Therefore, this list is not comprehensive and does not include plant species that may have been present but were not blooming at the time of the survey. No wildlife trapping was conducted for small mammals, reptiles, and amphibians. The survey was conducted during the daytime to maximize detection of biological resources. Based on the diurnal nature of the survey, most wildlife species observed were birds.

3. Results: Environmental Setting

3.1 Description of the Existing Biological and Physical Conditions

The proposed project involves the replacement of the existing Compton Boulevard Bridge over Compton Creek in the City of Compton, Los Angeles County (Figure 1). The impact area for the replacement project would include the existing bridge deck, abutment walls, and concrete channel bottom, as well as the roadway approach to the east and west (Figure 1). Appendix A contains representative photographs of the BSA.

3.1.1 Physical Conditions

According to the U.S. Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS), the BSA supports two soil type/mapping units, which are described below: Urban land-Biscailuz-Hueneme, drained complex, 0 to 2 percent slopes; and Urban land-Windfetch-Centinela complex, 0 to 5 percent slopes (USDA NRCS 2019).

The project site and surrounding BSA occurs within the Urban land-Biscailuz-Hueneme, drained complex, 0 to 2 percent slopes, soil-mapping unit. This mapping unit is primarily composed of urban land covered by roads, parking lots, and buildings, under which extensive cutting and filling has occurred during urban development. This mapping unit also supports the Biscailuz and Hueneme soil series, both of which are somewhat poorly drained fine to coarse loams or loam sands formed from discontinuous human-transported materials over mixed alluvium (USDA NRCS 2017). The bridge site and much of the surrounding BSA occurs within this soil-mapping unit.

The Urban land-Windfetch-Centinela complex, 0 to 5 percent slopes, soil-mapping unit is primarily composed of urban land covered by roads, parking lots, and buildings, under which extensive cutting and filling has occurred during urban development. This mapping unit also supports the Windfetch and Centinela soil series, both of which are well drained loams formed in human-transported material overlying alluvium from marine or mixed rock sources (USDA NRCS 2017). This soil-mapping unit occurs along the southwestern extent of the BSA.

Topography within the BSA is generally flat with elevations on site ranging from 50 to 70 feet above mean sea level, gently sloping in the southerly direction (Google 2019), and vegetation is limited to ornamental or ruderal vegetation associated with surrounding urban development and disturbed land.

The area surrounding the existing bridge is largely developed or disturbed in nature with existing land uses comprised of residential and commercial, the existing ROWs, as well as a concrete-lined flood control channel.

The project site occurs within the Los Angeles River Watershed (USGS HUC 8: 18070105) and crosses over Compton Creek (USGS HUC 12: 180701050402) (USGS 2019).

3.1.2 Biological Conditions in the Study Area

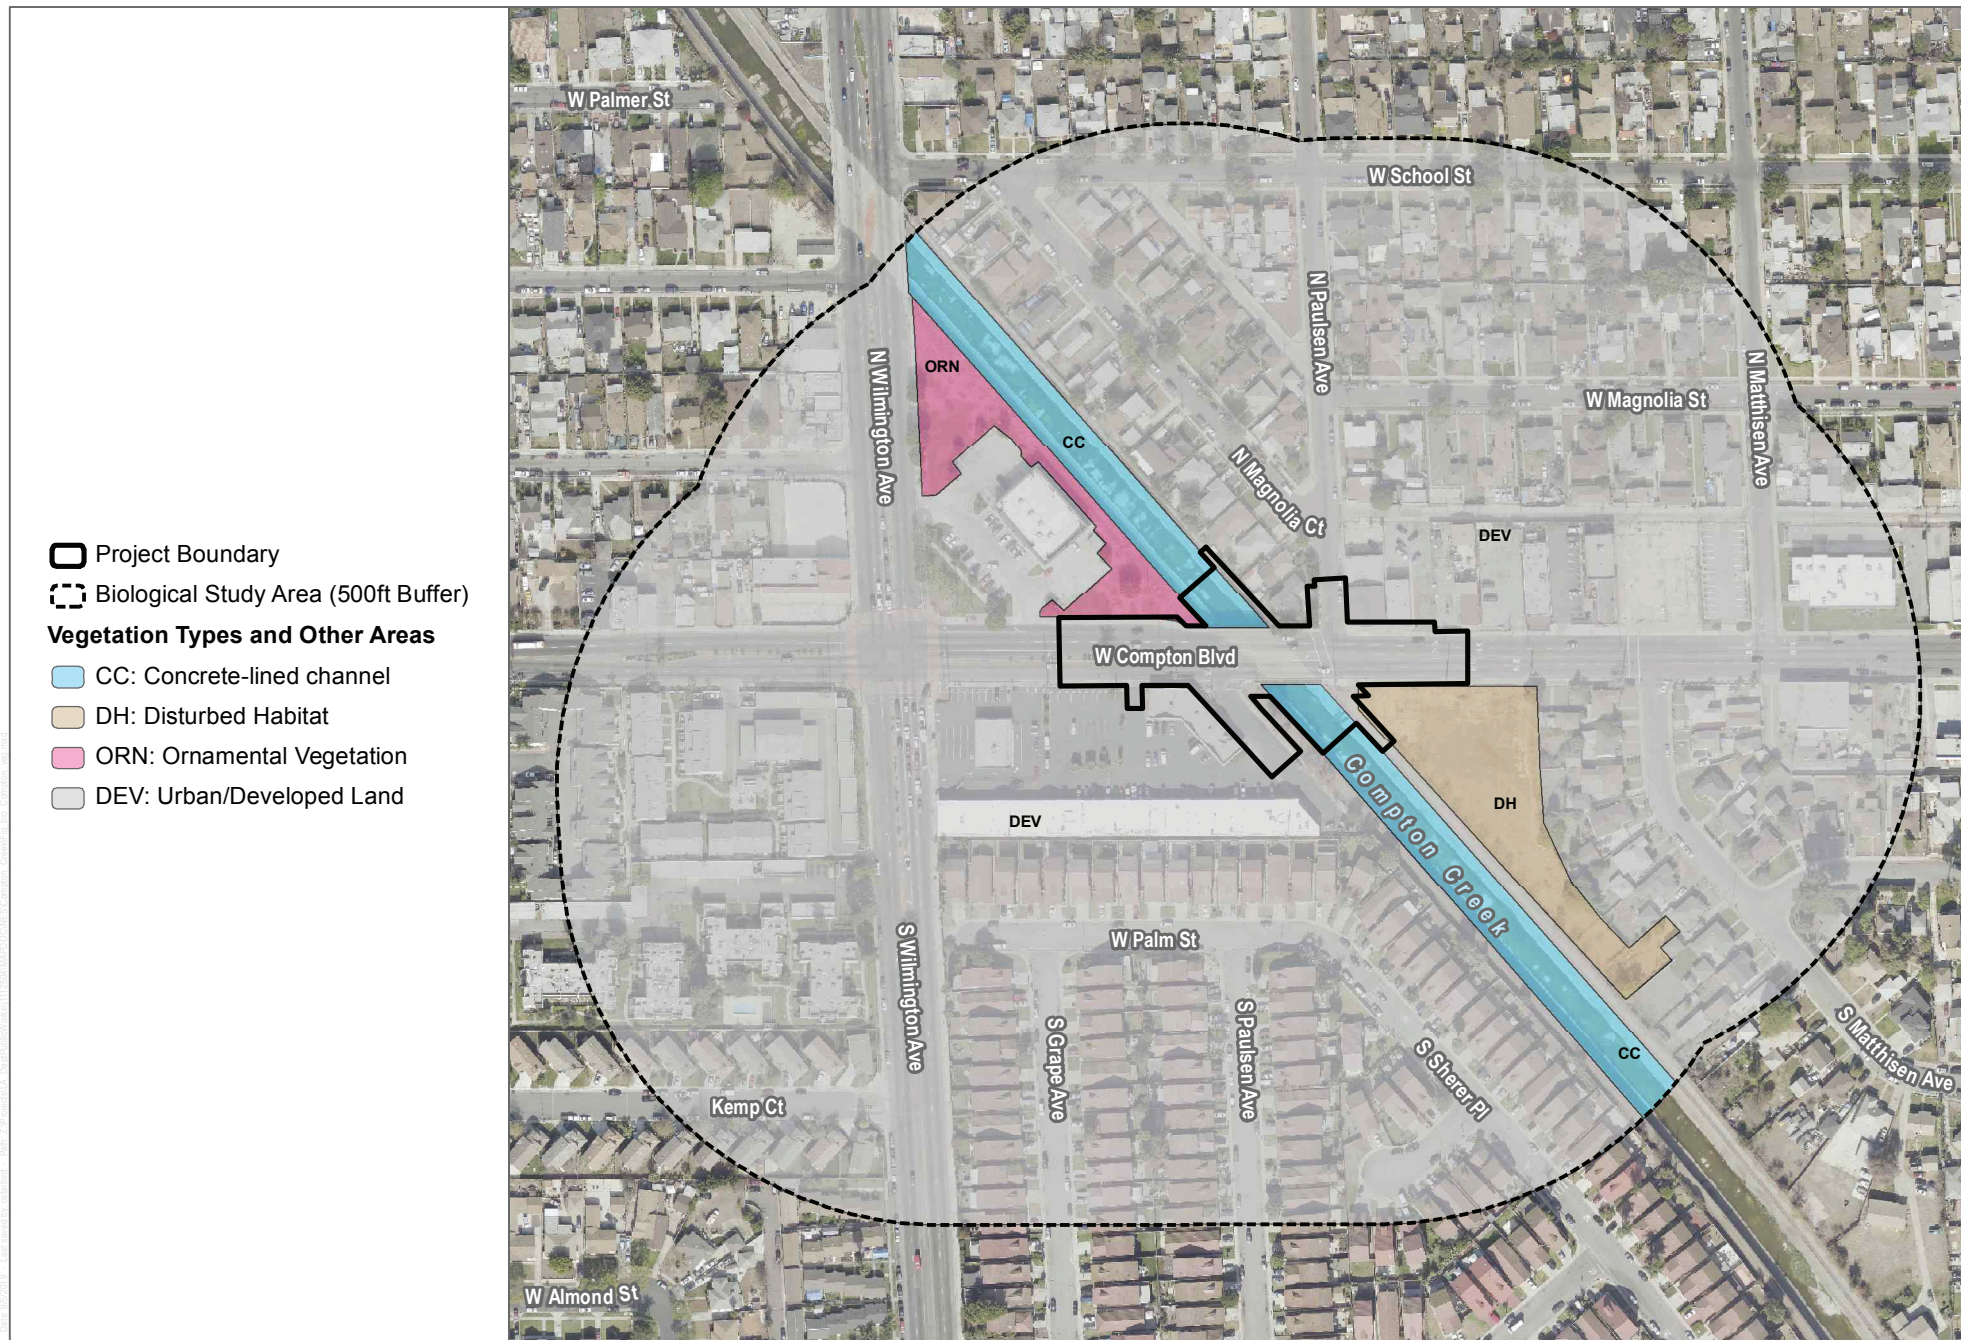

Vegetation communities and land covers found within the BSA are entirely non-native and non-natural land covers comprised of urban/developed land, disturbed habitat, ornamental vegetation, as well as concrete-lined channels associated with Compton Creek (Figure 3). The vegetation communities and land covers identified within the BSA are discussed in further detail below. The BSA is generally situated in a heavily urbanized setting with vegetation limited to ornamental plantings or disturbed vegetation occurring within vacant lots. Prominent features within the BSA include major thoroughfares such as Compton Boulevard and Wilmington Avenue; Compton Creek, a north-south trending channelized watercourse; and the Compton Creek bike path, which runs adjacent to the Compton Creek channel. The Los Angeles River is located approximately 2.75 miles east of the BSA and approximately 4.25 miles downstream.

3.1.3 Habitat Connectivity

Wildlife corridors are linear features that connect large patches of natural open space and provide avenues for dispersal or migration of animals and dispersal of plants (e.g., through wildlife vectors). Wildlife corridors contribute to population viability by assuring continual exchange of genes between populations, which helps maintain genetic diversity; providing access to adjacent habitat areas representing additional territory for foraging and mating; allowing for a greater carrying capacity; and providing routes for colonization of habitat lands following local population extinctions or habitat recovery from ecological catastrophes (i.e., the rescue effect).

Habitat linkages are small patches that join larger blocks of habitat and help reduce the adverse effects of habitat fragmentation. They serve as connections between habitat patches and help reduce the adverse effects of habitat fragmentation. Although individual animals may not move through a habitat linkage, the linkage is a potential route for gene flow and long-term dispersal. Habitat linkages may serve as both habitat and avenues of gene flow for small animals such as reptiles, amphibians, and rodents. Habitat linkages may be represented by continuous patches of habitat or by nearby habitat “islands” that function as stepping stones for dispersal and movement (especially for birds and flying insects). Wildlife corridors and habitat linkages provide avenues for dispersal or migration of animals that also contribute to population viability in several ways, including (1) ensuring continual exchange of genes between populations to aid in maintaining genetic diversity, (2) providing habitat for some species, (3) providing access to adjacent habitat areas representing additional territory for foraging and mating, (4) allowing for a greater carrying capacity, and (5) providing routes for colonization of habitat lands following local population extinctions or habitat recovery from ecological catastrophes.

The BSA is surrounded by urban, developed land uses, and does not contain any greenbelts for wildlife movement, or native vegetation and undeveloped land capable of facilitating the movement of species between large tracts of native habitat. The Compton Creek watershed is entirely urban, so the channel does not connect any large natural areas upstream with the Los Angeles River and Pacific Ocean downstream.

3.1.4 Regional Species and Habitats and Natural Communities of Concern

Special-Status Plants

Endangered, rare, or threatened plant species as defined in Section 15380(b) of the CEQA Guidelines (14 CCR 15000 et seq.) are referred to as “special-status plant species” in this report and include endangered or threatened plant species recognized in the context of CESA and FESA (CDFW 2019a) and plant species with a CRPR 1 through 4 (CNPS 2019). Species with CRPR 3 or 4 may, but generally do not, qualify for protection under this provision. Species with CRPR 3 and 4 are those that require more information to determine status and plants of limited distribution. Thus, CRPR 3 and 4 plant species are not analyzed further.

Thirty-eight special-status plant species are reported to occur within the USGS 7.5-minute South Gate quadrangle and surrounding eight 7.5-minute quadrangles (i.e., Hollywood, Los Angeles, El Monte, Inglewood, Whittier, Torrance, Long Beach, Los Alamitos) (CDFW 2019d; CNPS 2019) or included within the USFWS IPaC Trust Resource List for the proposed project (USFWS 2019b) (Appendix B). Eleven of these species are federal- and/or State-listed as endangered or threatened species; however, none of these species are listed in the USFWS IPaC Trust Resource List for the proposed project (USFWS 2019b). Potential habitat was determined to be absent for all of the thirty-eight species due to the heavily urbanized nature of the BSA. Additionally, these species are not expected to occur within the BSA due to extirpation of nearby occurrences, lack of known populations within five miles of the BSA, or absence during the field survey. All thirty-eight special-status plant species, their habitat requirements, regulatory status, presence of habitat within the BSA, and their potential to occur are discussed in Table 2, below.

Table 2: Listed, Proposed, and Other Special-status Plant Species Known to Occur surrounding the BSA.

Common Name	Scientific Name	Status (Federal/State/CRPR)	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Habitat Present/ Absent	Rationale
aphanisma	<i>Aphanisma blitoides</i>	None/None/1B.2	Coastal bluff scrub, Coastal dunes, Coastal scrub; sandy or gravelly/annual herb/Feb–June/0–1000	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
marsh sandwort	<i>Arenaria paludicola</i>	FE/SE/1B.1	Marshes and swamps (freshwater or brackish); sandy, openings/perennial stoloniferous herb/May–Aug/5–560	A	Not expected to occur. Suitable associated habitat is not present in the BSA.

Common Name	Scientific Name	Status (Federal/State/CRPR)	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Habitat Present/ Absent	Rationale
Braunton's milk-vetch	<i>Astragalus brauntonii</i>	FE/None/1B.1	Chaparral, Coastal scrub, Valley and foothill grassland; recent burns or disturbed areas, usually sandstone with carbonate layers/perennial herb/Jan–Aug/10–2100	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
Ventura marsh milk-vetch	<i>Astragalus pycnostachyus</i> var. <i>lanosissimus</i>	FE/SE/1B.1	Coastal dunes, Coastal scrub, Marshes and swamps (edges, coastal salt or brackish)/perennial herb/(June)Aug–Oct/0–115	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
coastal dunes milk-vetch	<i>Astragalus tener</i> var. <i>titi</i>	FE/SE/1B.1	Coastal bluff scrub (sandy), Coastal dunes, Coastal prairie (mesic); often vernal mesic areas/annual herb/Mar–May/0–165	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
Coulter's saltbush	<i>Atriplex coulteri</i>	None/None/1B.2	Coastal bluff scrub, Coastal dunes, Coastal scrub, Valley and foothill grassland; alkaline or clay/perennial herb/Mar–Oct/5–1510	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
South Coast saltscale	<i>Atriplex pacifica</i>	None/None/1B.2	Coastal bluff scrub, Coastal dunes, Coastal scrub, Playas/annual herb/Mar–Oct/0–460	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
Parish's brittlescale	<i>Atriplex parishii</i>	None/None/1B.1	Chenopod scrub, Playas, Vernal pools; alkaline/annual herb/June–Oct/80–6235	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
Davidson's saltscale	<i>Atriplex serenana</i> var. <i>davidsonii</i>	None/None/1B.2	Coastal bluff scrub, Coastal scrub; alkaline/annual herb/Apr–Oct/30–655	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
Nevin's barberry	<i>Berberis nevinii</i>	FE/SE/1B.1	Chaparral, Cismontane woodland, Coastal scrub, Riparian scrub; sandy or gravelly/perennial evergreen shrub/(Feb)Mar–June/225–2705	A	Not expected to occur. Suitable associated habitat is not present in the BSA.

Common Name	Scientific Name	Status (Federal/State/CRPR)	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Habitat Present/ Absent	Rationale
intermediate mariposa lily	<i>Calochortus weedii</i> var. <i>intermedius</i>	None/None/1B.2	Chaparral, Coastal scrub, Valley and foothill grassland; rocky, calcareous/perennial bulbiferous herb/May–July/340–2805	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
lucky morning-glory	<i>Calystegia felix</i>	None/None/1B.1	Meadows and seeps (sometimes alkaline), Riparian scrub (alluvial); Historically associated with wetland and marshy places, but possibly in drier situations as well. Possibly silty loam and alkaline/annual rhizomatous herb/Mar–Sep/95–705	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
southern tarplant	<i>Centromadia parryi</i> ssp. <i>australis</i>	None/None/1B.1	Marshes and swamps (margins), Valley and foothill grassland (vernally mesic), Vernal pools/annual herb/May–Nov/0–1575	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
smooth tarplant	<i>Centromadia pungens</i> ssp. <i>laevis</i>	None/None/1B.1	Chenopod scrub, Meadows and seeps, Playas, Riparian woodland, Valley and foothill grassland; alkaline/annual herb/Apr–Sep/0–2100	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
salt marsh bird's-beak	<i>Chloropyron maritimum</i> ssp. <i>maritimum</i>	FE/SE/1B.2	Coastal dunes, Marshes and swamps (coastal salt)/annual herb (hemiparasitic)/May–Oct(Nov)/0–100	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
Peruvian dodder	<i>Cuscuta obtusiflora</i> var. <i>glandulosa</i>	None/None/2B.2	Marshes and swamps (freshwater)/annual vine (parasitic)/July–Oct/45–920	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
many-stemmed dudleya	<i>Dudleya multicaulis</i>	None/None/1B.2	Chaparral, Coastal scrub, Valley and foothill grassland; often clay/perennial herb/Apr–July/45–2590	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
San Diego button-celery	<i>Eryngium aristulatum</i> var. <i>parishii</i>	FE/SE/1B.1	Coastal scrub, Valley and foothill grassland, Vernal pools; mesic/annual / perennial herb/Apr–June/65–2035	A	Not expected to occur. Suitable associated habitat is not present in the BSA.

Common Name	Scientific Name	Status (Federal/State/CRPR)	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Habitat Present/ Absent	Rationale
Los Angeles sunflower	<i>Helianthus nuttallii</i> ssp. <i>parishii</i>	None/None/1A	Marshes and swamps (coastal salt and freshwater)/perennial rhizomatous herb/Aug–Oct/30–5005	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
mesa horkelia	<i>Horkelia cuneata</i> var. <i>puberula</i>	None/None/1B.1	Chaparral (maritime), Cismontane woodland, Coastal scrub; sandy or gravelly/perennial herb/Feb–July(Sep)/225–2655	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
decumbent goldenbush	<i>Isocoma menziesii</i> var. <i>decumbens</i>	None/None/1B.2	Chaparral, Coastal scrub (sandy, often in disturbed areas)/perennial shrub/Apr–Nov/30–445	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
Coulter's goldfields	<i>Lasthenia glabrata</i> ssp. <i>coulteri</i>	None/None/1B.1	Marshes and swamps (coastal salt), Playas, Vernal pools/annual herb/Feb–June/0–4005	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
mud nama	<i>Nama stenocarpa</i>	None/None/2B.2	Marshes and swamps (lake margins, riverbanks)/annual / perennial herb/Jan–July/15–1640	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
Gambel's water cress	<i>Nasturtium gambelii</i>	FE/ST/1B.1	Marshes and swamps (freshwater or brackish)/perennial rhizomatous herb/Apr–Oct/15–1085	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
spreading navarretia	<i>Navarretia fossalis</i>	FT/None/1B.1	Chenopod scrub, Marshes and swamps (assorted shallow freshwater), Playas, Vernal pools/annual herb/Apr–June/95–2150	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
prostrate vernal pool navarretia	<i>Navarretia prostrata</i>	None/None/1B.1	Coastal scrub, Meadows and seeps, Valley and foothill grassland (alkaline), Vernal pools; Mesic/annual herb/Apr–July/5–3970	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
coast woolly-heads	<i>Nemacaulis denudata</i> var. <i>denudata</i>	None/None/1B.2	Coastal dunes/annual herb/Apr–Sep/0–330	A	Not expected to occur. Suitable associated habitat is not present in the BSA.

Common Name	Scientific Name	Status (Federal/State/CRPR)	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Habitat Present/ Absent	Rationale
California Orcutt grass	<i>Orcuttia californica</i>	FE/SE/1B.1	Vernal pools/annual herb/Apr–Aug/45–2165	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
Lyon's pentachaeta	<i>Pentachaeta lyonii</i>	FE/SE/1B.1	Chaparral (openings), Coastal scrub, Valley and foothill grassland; rocky, clay/annual herb/(Feb)Mar–Aug/95–2265	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
Brand's star phacelia	<i>Phacelia stellaris</i>	None/None/1B.1	Coastal dunes, Coastal scrub/annual herb/Mar–June/0–1310	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
white rabbit-tobacco	<i>Pseudognaphalium leucocephalum</i>	None/None/2B.2	Chaparral, Cismontane woodland, Coastal scrub, Riparian woodland; sandy, gravelly/perennial herb/(July)Aug–Nov(Dec)/0–6890	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
Nuttall's scrub oak	<i>Quercus dumosa</i>	None/None/1B.1	Closed-cone coniferous forest, Chaparral, Coastal scrub; sandy, clay loam/perennial evergreen shrub/Feb–Apr(May–Aug)/45–1310	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
Parish's gooseberry	<i>Ribes divaricatum</i> var. <i>parishii</i>	None/None/1A	Riparian woodland/perennial deciduous shrub/Feb–Apr/210–985	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
southern mountains skullcap	<i>Scutellaria bolanderi</i> ssp. <i>austromontana</i>	None/None/1B.2	Chaparral, Cismontane woodland, Lower montane coniferous forest; mesic/perennial rhizomatous herb/June–Aug/1390–6560	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
salt spring checkerbloom	<i>Sidalcea neomexicana</i>	None/None/2B.2	Chaparral, Coastal scrub, Lower montane coniferous forest, Mojavean desert scrub, Playas; alkaline, mesic/perennial herb/Mar–June/45–5020	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
estuary seablite	<i>Suaeda esteroa</i>	None/None/1B.2	Marshes and swamps (coastal salt)/perennial herb/(May)July–Oct(Jan)/0–15	A	Not expected to occur. Suitable associated habitat is not present in the BSA.

Common Name	Scientific Name	Status (Federal/State/CRPR)	Primary Habitat Associations/ Life Form/ Blooming Period/ Elevation Range (feet)	Habitat Present/ Absent	Rationale
San Bernardino aster	<i>Symphyotrichum defoliatum</i>	None/None/1B.2	Cismontane woodland, Coastal scrub, Lower montane coniferous forest, Meadows and seeps, Marshes and swamps, Valley and foothill grassland (vernally mesic); near ditches, streams, springs/perennial rhizomatous herb/July–Nov(Dec)/5–6695	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
Greata's aster	<i>Symphyotrichum greatae</i>	None/None/1B.3	Broadleaved upland forest, Chaparral, Cismontane woodland, Lower montane coniferous forest, Riparian woodland; mesic/perennial rhizomatous herb/June–Oct/980–6595	A	Not expected to occur. Suitable associated habitat is not present in the BSA.

Table 2 Key:

Status: Federal Endangered (FE); Federal Threatened (FT); State Endangered (SE); State Threatened (ST)

California Rare Plant Rank (CRPR):

1A: Plants presumed extirpated in California and either rare or extinct elsewhere

1B: Plants rare, threatened, or endangered in California and elsewhere

2B: Plants rare, threatened, or endangered in California, but more common elsewhere

Threat Ranks:

.1 Seriously threatened in California (over 80% of occurrences threatened/high degree and immediacy of threat)

.2 Moderately threatened in California (20% to 80% of occurrences threatened/moderate degree and immediacy of threat)

.3 Not very threatened in California (less than 20% of occurrences threatened/low degree and immediacy of threat or no current threats known)

Habitat Present / Absent: Absent [A] - no habitat present and no further work needed.

Special-Status Wildlife

Endangered, rare, or threatened wildlife species as defined in CEQA Guidelines, Section 15380(b) (14 CCR 15000 et seq.), are referred to as “special-status wildlife species” and, as used in this report, include (1) endangered or threatened wildlife species recognized in the context of CESA and FESA (CDFW 2019b); (2) California Species of Special Concern and Watch List species as designated by CDFW (2019c); (3) mammals and birds that are fully protected species as described in the CFG Code, Sections 4700 and 3511; and (4) Birds of Conservation Concern as designated by USFWS (2008).

Forty-seven special-status wildlife species are reported to occur within the USGS 7.5-minute South Gate quadrangle and surrounding eight 7.5-minute quadrangles (i.e., Hollywood, Los Angeles, El Monte, Inglewood, Whittier, Torrance, Long Beach, Los Alamitos) (CDFW 2019d; USFWS 2019b, NMFS 2016). Thirteen of these species are federally- and/or State-listed (or proposed for listing) as endangered or threatened species. Potential habitat was determined to

be absent for forty-four species. Of the three species determined to have potential habitat present, none were determined to have a moderate or higher potential to occur. All forty-seven special-status wildlife species, their habitat requirements, regulatory status, presence of habitat within the BSA, and their potential to occur are discussed below in Table 3.

Table 3: Listed, Proposed, and Other Specials-status Wildlife Species Known to Occur surrounding the BSA

Common Name	Scientific Name	Status (Federal/State)	Habitat	Habitat Present/Absent	Rationale
Invertebrates					
Busck's gallmoth	<i>Carolella busckana</i>	None/None	Coastal scrub dunes	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
western tidal-flat tiger beetle	<i>Cicindela gabbii</i>	None/None	Inhabits estuaries and mudflats along the coast of Southern California	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
sandy beach tiger beetle	<i>Cicindela hirticollis gravida</i>	None/None	Inhabits areas adjacent to non-brackish water along the coast of California from San Francisco Bay to northern Mexico	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
western beach tiger beetle	<i>Cicindela latesignata latesignata</i>	None/None	Mudflats and beaches in coastal Southern California	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
senile tiger beetle	<i>Cicindela senilis frosti</i>	None/None	Inhabits marine shoreline, from Central California coast south to saltmarshes of San Diego; also found at Lake Elsinore	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
Oblivious tiger beetle	<i>Cicindela latesignata obliviosa</i>	None/None	Inhabited the Southern California coastline, from La Jolla north to the Orange County line. Occupied saline mudflats and moist sandy spots in estuaries of small streams in the lower zone. Has not been observed in 20 years. The oblivious tiger beetle (<i>C. l. obliviosa</i>) is no longer the accepted name for this species (ITIS 2016).	A	Not expected to occur. Suitable associated habitat is not present in the BSA.

Common Name	Scientific Name	Status (Federal/State)	Habitat	Habitat Present/Absent	Rationale
Palos Verdes blue butterfly	<i>Glaucopsyche lygdamus palosverdesensis</i>	FE/None	Cool, fog-shrouded, seaward side of Palos Verdes Hills, Los Angeles County	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
Riverside fairy shrimp	<i>Streptocephalus woottoni</i>	FE/None	Vernal pools, non-vegetated ephemeral pools	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
mimic tryonia (=California brackishwater snail)	<i>Tryonia imitator</i>	None/None	Inhabits coastal lagoons, estuaries, and saltmarshes, from Sonoma County south to San Diego County	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
Fish					
Mohave tui chub	<i>Siphateles bicolor mohavensis</i>	FE/FP, SE	Lacustrine ponds or pools; 4 feet min water depth; freshwater flow; mineralized and alkaline environment; habitat for aquatic invertebrate prey and egg attachment substrate; <i>Ruppia maritima</i> preferred for egg attachment and thermal refuge in summer months	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
Amphibians					
western spadefoot	<i>Spea hammondi</i>	None/SSC	Primarily grassland and vernal pools, but also in ephemeral wetlands that persist at least 3 weeks in chaparral, coastal scrub, valley-foothill woodlands, pastures, and other agriculture	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
Reptiles					
western pond turtle	<i>Actinemys marmorata</i>	None/SSC	Slow-moving permanent or intermittent streams, ponds, small lakes, and reservoirs with emergent basking sites; adjacent uplands used for nesting and during winter	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
southern California legless lizard	<i>Anniella stebbinsi</i>	None/SSC	Coastal dunes, stabilized dunes, beaches, dry washes, valley-foothill, chaparral, and scrubs; pine, oak, and riparian woodlands; associated with sparse vegetation and moist sandy or loose, loamy soils	A	Not expected to occur. Suitable associated habitat is not present in the BSA.

Common Name	Scientific Name	Status (Federal/State)	Habitat	Habitat Present/Absent	Rationale
California glossy snake	<i>Arizona elegans occidentalis</i>	None/SSC	Commonly occurs in desert regions throughout southern California. Prefers open sandy areas with scattered brush. Also found in rocky areas.	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
San Diegan tiger whiptail	<i>Aspidoscelis tigris stejnegeri</i>	None/SSC	Hot and dry areas with sparse foliage, including chaparral, woodland, and riparian areas.	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
green sea turtle	<i>Chelonia mydas</i>	FT/None	Shallow waters of lagoons, bays, estuaries, mangroves, eelgrass, and seaweed beds	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
Blainville's horned lizard	<i>Phrynosoma blainvillii</i>	None/SSC	Open areas of sandy soil in valleys, foothills, and semi-arid mountains including coastal scrub, chaparral, valley-foothill hardwood, conifer, riparian, pine-cypress, juniper, and annual grassland habitats	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
Birds					
tricolored blackbird	<i>Agelaius tricolor</i> (nesting colony)	BCC/SSC, SCE	Nests near freshwater, emergent wetland with cattails or tules, but also in Himalayan blackberry; forages in grasslands, woodland, and agriculture	A	Not expected to occur. Suitable associated nesting, roosting, and foraging habitat is not present in the BSA.
Southern California rufous-crowned sparrow	<i>Aimophila ruficeps canescens</i>	None/WL	Nests and forages in open coastal scrub and chaparral with low cover of scattered scrub interspersed with rocky and grassy patches	A	Not expected to occur. Suitable associated nesting, roosting, and foraging habitat is not present in the BSA.
burrowing owl	<i>Athene cunicularia</i> (burrow sites & some wintering sites)	BCC/SSC	Nests and forages in grassland, open scrub, and agriculture, particularly with ground squirrel burrows	A	Not expected to occur. Suitable associated nesting, roosting, and foraging habitat is not present in the BSA.
ferruginous hawk	<i>Buteo regalis</i> (wintering)	BCC/WL	Winters and forages in open, dry country, grasslands, open fields, agriculture	A	Not expected to occur. Suitable associated nesting, roosting, and foraging habitat is not present in the BSA.

Common Name	Scientific Name	Status (Federal/State)	Habitat	Habitat Present/Absent	Rationale
Swainson's hawk	<i>Buteo swainsoni</i> (nesting)	BCC/ST	Nests in open woodland and savanna, riparian, and in isolated large trees; forages in nearby grasslands and agricultural areas such as wheat and alfalfa fields and pasture	A	Not expected to occur. Suitable associated nesting, roosting, and foraging habitat is not present in the BSA.
wrentit	<i>Chamaea fasciata</i>	BCC/None	A common, characteristic resident of California chaparral habitat. Also frequents shrub understory of coniferous habitats from the coast to lower regions of mountains throughout cismontane California	A	Not expected to occur. Suitable associated nesting, roosting, and foraging habitat is not present in the BSA.
western yellow-billed cuckoo	<i>Coccyzus americanus occidentalis</i> (nesting)	FT, BCC/SE	Nests in dense, wide riparian woodlands and forest with well-developed understories	A	Not expected to occur. Suitable associated nesting, roosting, and foraging habitat is not present in the BSA.
yellow rail	<i>Coturnicops noveboracensis</i>	BCC/SSC	Nesting requires wet marsh/sedge meadows or coastal marshes with wet soil and shallow, standing water	A	Not expected to occur. Suitable associated nesting, roosting, and foraging habitat is not present in the BSA.
southwestern willow flycatcher	<i>Empidonax traillii extimus</i> (nesting)	FE/SE	Nests in dense riparian habitats along streams, reservoirs, or wetlands; uses variety of riparian and shrubland habitats during migration	A	Not expected to occur. Suitable associated nesting, roosting, and foraging habitat is not present in the BSA.
saltmarsh common yellowthroat	<i>Geothlypis trichas sinuosa</i>	BCC/SSC	Nests in woody swamp, brackish marsh, and freshwater marsh.	A	Not expected to occur. Suitable associated nesting, roosting, and foraging habitat is not present in the BSA
song sparrow	<i>Melospiza melodia</i>	BCC/None	Breeds in riparian thickets of willows, other shrubs, vines, tall herbs, and in fresh or saline emergent vegetation	A	Not expected to occur. Suitable associated nesting, roosting, and foraging habitat is not present in the BSA
Belding's savannah sparrow	<i>Passerculus sandwichensis beldingi</i>	None/SE	Nests and forages in coastal saltmarsh dominated by pickleweed (<i>Salicornia</i> spp.)	A	Not expected to occur. Suitable associated nesting, roosting, and foraging habitat is not present in the BSA.

Common Name	Scientific Name	Status (Federal/State)	Habitat	Habitat Present/Absent	Rationale
California brown pelican	<i>Pelecanus occidentalis californicus</i> (nesting colonies & communal roosts)	FDL/FP, SDL	Forages in warm coastal marine and estuarine environments; in California, nests on dry, rocky offshore islands	A	Not expected to occur. Suitable associated nesting, roosting, and foraging habitat is not present in the BSA.
Nuttall's woodpecker	<i>Picoides nuttallii</i>	BCC/None	Nest located mostly in riparian habitat in dead (occasionally live) trunk or limb of willow, sycamore, cottonwood, or alder; rarely in oak. Forages mostly in oak and riparian deciduous habitats.	A	Not expected to occur. Suitable associated nesting, roosting, and foraging habitat is not present in the BSA.
coastal California gnatcatcher	<i>Poliophtila californica</i>	FT/SSC	Nests and forages in various sage scrub communities, often dominated by California sagebrush and buckwheat; generally avoids nesting in areas with a slope of greater than 40%; majority of nesting at less than 1,000 feet above mean sea level	A	Not expected to occur. Suitable associated nesting, roosting, and foraging habitat is not present in the BSA.
bank swallow	<i>Riparia riparia</i> (nesting)	None/ST	Nests in riparian, lacustrine, and coastal areas with vertical banks, bluffs, and cliffs with sandy soils; open country and water during migration	A	Not expected to occur. Suitable associated nesting, roosting, and foraging habitat is not present in the BSA.
rufous hummingbird	<i>Selasphorus rufus</i>	BCC/None	A common migrant and uncommon summer resident of California. Breeding areas north of California in coniferous forests.	A	Not expected to occur. Suitable associated nesting, habitat is not present in the BSA. The species may forage in the area as a transient.
Allen's hummingbird	<i>Selasphorus sasin</i>	BCC/None	Often attaches nest to more than one lateral support on eucalyptus, juniper, willow, other trees, vines, shrubs, or ferns.	HP	Low potential to occur. Marginal nesting habitat is present in the BSA.
California least tern	<i>Sternula antillarum browni</i> (nesting colony)	FE/FP, SE	Forages in shallow estuaries and lagoons; nests on sandy beaches or exposed tidal flats	A	Not expected to occur. Suitable associated nesting, roosting, and foraging habitat is not present in the BSA.

Common Name	Scientific Name	Status (Federal/State)	Habitat	Habitat Present/Absent	Rationale
least Bell's vireo	<i>Vireo bellii pusillus</i> (nesting)	FE/SE	Nests and forages in low, dense riparian thickets along water or along dry parts of intermittent streams; forages in riparian and adjacent shrubland late in nesting season	A	Not expected to occur. Suitable associated nesting, roosting, and foraging habitat is not present in the BSA.
Mammals					
pallid bat	<i>Antrozous pallidus</i>	None/SSC	Grasslands, shrublands, woodlands, forests; most common in open, dry habitats with rocky outcrops for roosting, but also roosts in man-made structures and trees	HP	Low potential to occur. The species is commonly found on bridges (Erickson et al. 2002); however, the BSA lacks the habitat that the species is associated with and there are few modern records from the Los Angeles Basin. Additionally, the project is within a highly urbanized area, which is a deterrent to roosting (Erickson et al. 2002).
western mastiff bat	<i>Eumops perotis californicus</i>	None/SSC	Chaparral, coastal and desert scrub, coniferous and deciduous forest and woodland; roosts in crevices in rocky canyons and cliffs where the canyon or cliff is vertical or nearly vertical, trees, and tunnels. Roosts are generally high above the ground, usually allowing a clear vertical drop of at least 3 meters below the entrance for flight	A	Not expected to occur. Suitable associated roosting habitat is not present in the BSA. The species may forage over the area during the night.
silver-haired bat	<i>Lasionycteris noctivagans</i>	None/None	Old-growth forest, maternity roosts in trees, large snags 50 feet aboveground; hibernates in hollow trees, rock crevices, buildings, mines, caves, and under sloughing bark; forages in or near coniferous or mixed deciduous forest, stream or river drainages	A	Not expected to occur. Suitable associated roosting habitat is not present in the BSA. The species may forage over the area during the night.

Common Name	Scientific Name	Status (Federal/State)	Habitat	Habitat Present/Absent	Rationale
hoary bat	<i>Lasiurus cinereus</i>	None/None	Forest, woodland riparian, and wetland habitats; also juniper scrub, riparian forest, and desert scrub in arid areas; roosts in tree foliage and sometimes cavities, such as woodpecker holes	A	Not expected to occur. Suitable associated roosting habitat is not present in the BSA and the species is not known to use bridges (Erickson et al. 2002). The species may forage over the area during the night.
western yellow bat	<i>Lasiurus xanthinus</i>	None/SSC	Valley–foothill riparian, desert riparian, desert wash, and palm oasis habitats; below 2,000 feet above mean sea level; roosts in riparian and palms	A	Not expected to occur. Suitable associated roosting habitat is not present in the BSA and the species is not known to use bridges (Erickson et al. 2002). The species may forage over the area during the night.
south coast marsh vole	<i>Microtus californicus stephensi</i>	None/SSC	Tidal marshes	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
pocketed free-tailed bat	<i>Nyctinomops femorosaccus</i>	None/SSC	Pinyon–juniper woodlands, desert scrub, desert succulent shrub, desert riparian, desert wash, alkali desert scrub, Joshua tree, and palm oases; roosts in high cliffs or rock outcrops with drop-offs, caverns, and buildings	HP	Not expected to occur. The species has not been recorded using bridges for roosting in California and the project is within a highly urbanized area, which is a deterrent to roosting (Erickson et al. 2002).
big free-tailed bat	<i>Nyctinomops macrotis</i>	None/SSC	Rocky areas; roosts in caves, holes in trees, buildings, and crevices on cliffs and rocky outcrops; forages over water	A	Not expected to occur. Suitable associated roosting habitat is not present in the BSA. The species may forage over the area during the night.

Common Name	Scientific Name	Status (Federal/State)	Habitat	Habitat Present/Absent	Rationale
Pacific pocket mouse	<i>Perognathus longimembris pacificus</i>	FE/SSC	fine-grained sandy substrates in open coastal strand, coastal dunes, and river alluvium	A	Not expected to occur. Suitable associated habitat is not present in the BSA.
American badger	<i>Taxidea taxus</i>	None/SSC	Dry, open, treeless areas; grasslands, coastal scrub, agriculture, and pastures, especially with friable soils	A	Not expected to occur. Suitable associated habitat is not present in the BSA.

Table 3 Key:

Status:

Federal Endangered (FE), Federal Threatened (FT), Federal Delisted (FDL), Birds of Conservation Concern (BCC) / State Endangered (SE), State Threatened (ST), State Candidate Endangered (SCE), State Delisted (SDL), State Fully Protected (FP), CDFW Species of Special Concern (SSC), CDFW Watch List

Habitat Present / Absent:

Absent [A] - no habitat present and no further work needed.

Habitat Present [HP] -habitat is, or may be present.

Natural Communities of Special Concern

Sensitive natural communities, as defined in Section IV, Appendix G (Environmental Checklist Form), of the CEQA Guidelines (14 CCR 15000 et seq.), are referred to as “natural communities of special concern” and, as used in this report, include communities identified as high priority for inventory in the *California Natural Community List* (CDFW 2019e) by a state rarity ranking of S1, S2, or S3.

Four natural communities of special concern are reported to occur within the USGS 7.5-minute South Gate quadrangle and surrounding eight 7.5-minute quadrangles (i.e., Hollywood, Los Angeles, El Monte, Inglewood, Whittier, Torrance, Long Beach, Los Alamitos): California walnut woodland, southern coastal salt marsh, southern sycamore alder riparian woodland, and walnut forest (CDFW 2019a; Table 4). None of these natural communities of special concern overlap with the BSA for the project.

Table 4: Natural Communities of Special Concern Known to Occur surrounding the BSA.

Natural Community Name	Status Global/State Rank	Habitat Present/Absent
California Walnut Woodland	G2/S2.1	Absent
Southern Coastal Salt Marsh	G2/S2.1	Absent
Southern Sycamore Alder Riparian Woodland	G4/S4	Absent
Walnut Forest	G1/S1.1	Absent

Table 4 Key:

Status:

Global/State Rank –

G1 or S1: Critically Imperiled, at very high risk of extinction or elimination due to very restricted range, very few populations or occurrences, very steep declines, very severe threats, or other factors.

G2 or S2: Imperiled, at high risk of extinction or elimination due to restricted range, few populations or occurrences, steep declines, severe threats, or other factors.
G4 or S4: Apparently Secure, at fairly low risk of extinction or elimination due to an extensive range and/or many populations or occurrences, but with possible cause for some concern as a result of local recent declines, threats or other factors.

0.1: Very threatened

Habitat Present / Absent: Absent [A] - no habitat present and no further work needed.

Critical Habitat

Based on a review of the USFWS Critical Habitat viewer, there is no USFWS-designated critical habitat for listed wildlife species within the BSA (USFWS 2019a). The closest mapped critical habitat, coastal California gnatcatcher final critical habitat Unit 8 Palos Verde Peninsula Sub-region, is located approximately 9.3 miles southwest of the BSA (USFWS 2019a). The next closest mapped critical habitat, western snowy plover (*Charadrius alexandrinus nivosus*) final critical habitat Unit 21 Subunit D, is approximately 9.6 miles west-southwest of the BSA (USFWS 2019a). Suitable habitat and primary constituent elements for these species do not occur within the BSA.

Regulatory Waters

The proposed project is centered on Compton Creek (USGS HUC12: 180701050402), a north-south trending, USGS intermittent watercourse, and tributary to the Los Angeles River (USGS HUC8: 18070105) (USGS 2019). Compton Creek within the project conveys flow from upstream headwaters, through a heavily urbanized portion of the southern Los Angeles Basin, and eventually converges with the Los Angeles River approximately four miles southeast of the BSA. Within the BSA, Compton Creek is a rectangular concrete-lined flood control channel devoid of vegetation in the channel bottom with a clear demarcation of the potential limits of regulatory agency jurisdiction. The limits of jurisdiction for channelized rectangular channels are typically defined as the channel bottom and up to the ordinary high water mark on the channel walls for ACOE and Regional Water Quality Control Board (RWQCB), and the top of the channel bank or vertical wall for CDFW. Channels with vertical concrete walls have the same limit of jurisdiction for all three regulatory agencies. Therefore, the BSA contains a clearly defined regulated non-wetland Waters of the U.S. and State.

4. Results: Biological Resources, Discussion of Impacts & Mitigation

4.1 Habitats and Natural Communities of Special Concern

4.1.1 Mapped Vegetation Communities and Land Covers

Four vegetation communities and land covers were identified and mapped within the BSA for the project: ornamental vegetation, disturbed habitat, concrete-lined channel, and urban/developed. The vegetation communities and land covers within the BSA are listed below in Table 5 along with their acreages, and their spatial coverage depicted on Figure 3. Each individual vegetation community and land cover is described further detail below.

Table 5: Vegetation Communities and Land Cover Types in the BSA.

Vegetation Community/Land Cover	Status Global/State Rank	Acreage within the BSA
Urban/Developed (DEV)	GNR/SNR	42.58
Concrete Channel (CC)	GNR/SNR	2.02
Disturbed Habitat (DH)	GNR/SNR	1.15
Ornamental (ORN)	GNR/SNR	0.74
TOTAL		46.49
Table 5 Key: <u>Status:</u> GNR or SNR: Unranked, global or state rank not yet assessed.		

Urban/Developed Land

The urban/developed land mapping unit is not recognized by the Natural Communities List (CDFW 2018b), but is described by Holland (1986). Urban/developed land refers to areas that have been constructed upon or disturbed so severely that native vegetation is no longer supported (Holland 1986). Developed land includes areas with permanent or semi-permanent structures, pavement or hardscape, landscaped areas, and areas with a large amount of debris or other materials (Holland 1986). Developed areas are generally graded and compacted, sometimes covered with gravel road base or built structures, and have little to no vegetation present. Developed land dominates the majority of the BSA and refers to those areas supporting manmade structures or features including paved/compacted roadways, driveways, parking lots, residences, and commercial or industrial buildings. These areas support limited natural ecological processes, native vegetation, or habitat for wildlife species and thus are not considered sensitive by local, State, and/or federal agencies.

Disturbed Habitat

The disturbed habitat mapping unit is not recognized by the Natural Communities List (CDFW 2018b), but is described by Jones & Stokes (1993). Disturbed habitat refers to areas that experience or have experienced high levels of human disturbance and as a result are generally lacking vegetation. Areas mapped as disturbed land may include unpaved roads and graded lots. Vegetation in these areas is

usually sparse and dominated by non-native weedy herbaceous species such as Maltese star-thistle (*Centaurea melitensis*), wild oat (*Avena fatua*), black mustard (*Brassica nigra*), spiny sowthistle (*Sonchus asper*), and prickly lettuce (*Lactuca serriola*) (Jones & Stokes 1993). Within the BSA, disturbed habitat is limited to a vacant lot located southeast of the proposed project. These areas support limited natural ecological processes, native vegetation, or habitat for wildlife species and thus are not considered sensitive by local, state, and/or federal agencies.

Concrete Channel

The concrete channel mapping unit is not recognized by the Natural Communities List (CDFW 2018b), but is described by Oberbauer et al. (2008). Concrete channels are characterized by barren or sparsely vegetated concrete-lined channels. Within the BSA, Compton Creek is mapped as a concrete-lined rectangular channel devoid of vegetation, which extends northwest-southeast across the BSA.

Ornamental Vegetation

The ornamental vegetation mapping unit is not recognized by the Natural Communities List (CDFW 2018b), but is described by Jones & Stokes (1993). Ornamental vegetation consists of introduced plantings of exotic species as landscaping elements within features such as greenbelts, parks, and horticultural nurseries (Jones and Stokes 1993). Ornamental vegetation within the BSA includes landscaping within commercial development located to the northwest of the proposed project. Ornamental vegetation is scattered throughout urban development within the BSA; however, these units did not meet the minimum mapping threshold and are therefore included within the urban/developed land mapping unit. Ornamental vegetation is not considered sensitive by local, state, and/or federal agencies.

4.1.2 Survey Results

The BSA for the project does not contain any natural communities of special concern.

4.1.3 Project Impacts

Impacts to mapped vegetation communities and land covers associated with the proposed project were quantified by overlaying the proposed impact area with mapped biological resources (Figure 4). Vegetation community/land cover types impacted by the proposed project are urban/developed, concrete channel, and ornamental (Table 6). Urban/developed and ornamental are not habitats and natural communities of special concern. The concrete channel contains the waters of Compton Creek that are likely to be determined Waters of the U.S., Waters of the State, and a CDFW regulated-stream. A formal jurisdictional waters delineation was not conducted; however, the limits of jurisdiction are expected to be delineated along the channel bottom for ACOE and RWQCB, and along the top of the vertical wall of the channel for CDFW, with the horizontal demarcation for each of these jurisdictions being concurrent. The channel is devoid of vegetation within the BSA.

Table 6: Impacts to Vegetation Communities and Land Cover by the Proposed Project

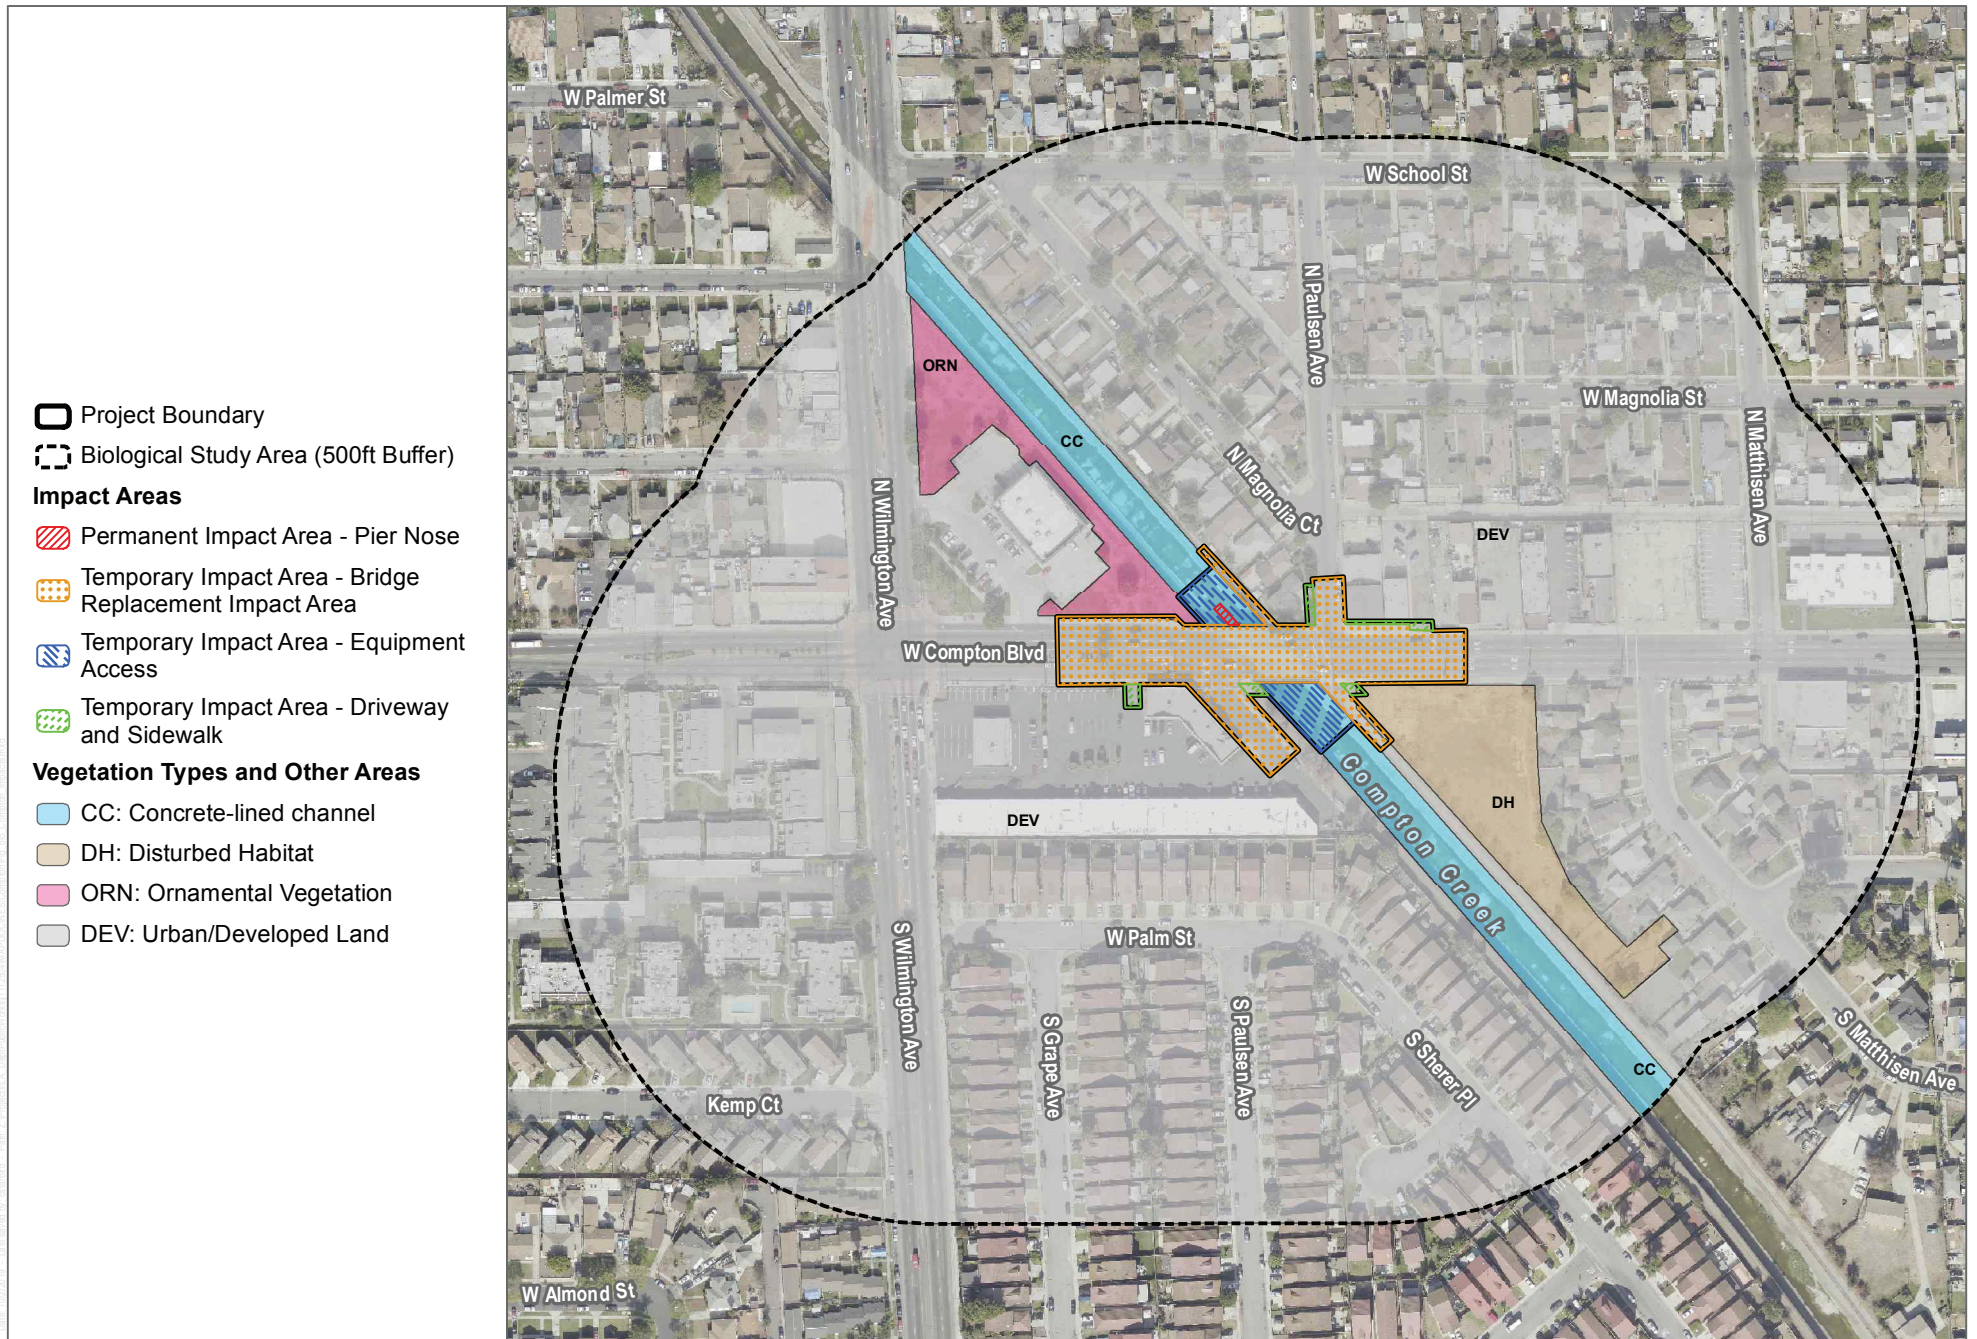

Vegetation Community/Land Cover	Permanent Impacts (acres)	Temporary Impacts (acres)
Urban/Developed (DEV)	0	1.32
Concrete Channel (CC)	0.01	0.40
Disturbed Habitat (DH)	0	0
Ornamental (ORN)	0	0
TOTAL	0.01	1.72

The new abutments for the proposed bridge would be constructed approximately 15 feet behind the existing abutments, which are outside of the potential jurisdictional limits of Compton Creek. The existing concrete channel wall would be protected in place. The proposed new pier in the middle of the channel would be constructed where the existing bridge pier is located and the proposed footing (including the sloping pier nose) would result in very small increase over the existing footing (0.01 acres). The proposed bridge deck would be constructed where the existing deck is located and would not increase shading of the waters within Compton Creek.

Potential temporary impacts to jurisdictional waters within the concrete channel would result from proposed construction activities. Temporary impacts would include vehicles and equipment within the channel, the generation of concrete debris and sediment due to the demolition of the existing bridge, and the potential introduction of chemical pollutants (fuel, oil, lubricants, paints, release agents, and other construction materials). The release of chemical pollutants can reduce the water quality downstream, especially if water is actively flowing through a project site. Work would be conducted during the dry season (April 15 to October 15); however, based on historical imagery (Google 2019), urban runoff is present in the Compton Creek channel throughout the year.

4.1.4 Avoidance and Minimization Efforts

Work areas would be reduced to the maximum extent feasible, and staging areas would be along the roadways and outside of Compton Creek. During construction, erosion-control measures would be implemented by the contractor as part of their County-certified Storm Water Pollution Prevention Plan (SWPPP) for the proposed project. The SWPPP will identify the sources of pollutants that may affect the quality of storm water and include best management practices (BMPs) to control the pollutants. All work shall conform to the site specific surface water diversion plan prepared for the project that will comply with the conditions included in the Water Quality Certification from the RWQCB and also include pertinent BMPs from the *Construction Site Best Management Practices (BMPs) Manual* (LADPW 2010). These include, but are not limited to, temporary sediment control, temporary soil stabilization, waste management and materials pollution control, wind erosion control, and other non-storm water BMPs.

SOURCE: LAR-IAC 2014; Open Street Map 2019

4.1.5 Compensatory Mitigation

With implementation of avoidance and minimization measures, adverse impacts are not anticipated; therefore, no compensatory mitigation is required.

4.2 Special Status Plant Species

Special-status plant species include those listed as endangered, rare, or threatened species, as defined in CEQA Guideline Section 15380(b) (14 CCR 15000 et seq.). This designation includes endangered or threatened species recognized in the context of the CESA and ESA (CDFW 2019a), as well as plant species with a California Rare Plant Rank (CRPR) of 1 or 2 (CNPS 2019).

4.2.1 Survey Results

A total of fifteen plant species were recorded during the field survey. A full list of plant species observed within the proposed project area is provided in Appendix C.

No special-status plant species were detected during the biological reconnaissance survey. Due to the extent of developed lands and disturbed vegetation within the BSA, there is limited potential for special-status plant species to occur. Table 2 includes special-status plants that are known to occur in the USGS 7.5-minute South Gate quadrangle and surrounding eight topographic quadrangles (CDFW 2019d; CNPS 2019), as well as species included in the USFWS IPaC Trust Resource List (2019b) (Appendix B). Table 2 also analyzes each of these special-status species' potential to occur based on known range, habitat associations, preferred soil substrate, life form, elevation, and blooming period. There are no special-status plant species with a moderate or high potential to occur within the BSA.

4.2.2 Project Impacts

No special-status plant species were identified within the BSA and no special-status plants, including those referenced in the USFWS IPaC Trust Resources List (2019b), are expected to have a moderate or high potential to occur due to the extent of developed land and disturbed vegetation within the BSA. Additionally, proposed project activities will primarily occur within existing paved areas (i.e., roadways, bridge decks, concrete channel bottom); therefore, no impacts to potentially occurring special-status plant species are anticipated to occur.

4.2.3 Avoidance and Minimization Efforts/Compensatory Mitigation

No avoidance or minimization measures or compensatory mitigation are required for special-status plant species because impacts to special-status plant species are not expected to occur.

4.3 Special Status Wildlife Species

Special-status wildlife includes those listed as endangered, rare, or threatened species, as defined in CEQA Guideline Section 15380(b) (14 CCR 15000 et seq.). These species also include those listed as endangered or threatened species recognized in the context of the CESA and ESA (CDFW 2019b); California SSC (CDFW 2019c), as designated by the CDFW; and (4) mammals and birds that are fully protected species (FP), as described in CFG Code, Section 4700 and 3511.

4.3.1 Survey Results

A total of eight wildlife species were recorded during the field survey. A full list of wildlife species observed within the proposed project area is provided in Appendix D.

No special-status wildlife species were observed during the biological reconnaissance survey. Due to the extent of developed lands and disturbed vegetation within the BSA, there is limited suitable habitat for special-status wildlife species. Table 3 includes occurrences of special-status wildlife species that have been recorded in the USGS 7.5-minute South Gate quadrangle and surrounding eight quadrangles (CDFW 2019d) as well as species included in the USFWS IPaC Trust Resource List (2019b) (Appendix B). Table 3 also analyzes each of these special-status species' potential to occur based on known range and habitat requirements. There are no special-status wildlife species with a moderate or high potential to occur within the BSA.

No bats or signs of bats (i.e., urine staining and guano droppings) were visually observed at the time of the site visit; however, it should be noted that specific focused surveys for bats were not conducted. Common bat species that could roost in the bridge include Mexican free-tailed bat (*Tadarida brasiliensis*) and California myotis (*Myotis californicus*). Seven special-status bat species have recorded occurrences in the project vicinity (CDFW 2019d): pallid bat (*Antrozous pallidus*), western mastiff bat (*Eumops perotis californicus*), silver-haired bat (*Lasionycteris noctivagans*), hoary bat (*Lasiurus cinereus*), western yellow bat (*Lasiurus xanthinus*), pocketed free-tailed bat (*Nyctinomops femorosaccus*), and big free-tailed bat (*Nyctinomops macrotis*). All of the species have potential to forage over the project site, but only pallid bat has a potential to roost within the bridge due to the lack of suitable roosting habitat for the other six species. Pallid bat is commonly found on bridges (Erickson et al. 2002); however, the BSA lacks the habitat that the species is associated with and there are few modern records from the Los Angeles Basin (CDFW 2019d). Additionally, the project is within a highly urbanized area, which is a deterrent to roosting (Erickson et al. 2002).

Ornamental vegetation within the BSA provides suitable nesting habitat for a number of common resident and migratory bird species protected under the MBTA and CFG Code Section 3500. Suitable nesting habitat for common, urban-adapted species such as house sparrow (*Passer domesticus*), house finch (*Haemorhous mexicanus*), and lesser goldfinch (*Spinus psaltria*) occurs within the BSA.

4.3.2 Project Impacts

No special-status wildlife species were identified within the BSA and no special-status wildlife, including those referenced in the USFWS IPaC Trust Resources List (2019b), are expected to have a moderate or high potential to occur due to the lack of suitable habitat and the extent of developed land and disturbed vegetation within the BSA. Therefore, no impacts to potentially occurring special-status wildlife species are anticipated to occur.

Common bat species could roost in the bridge and there may be a potential direct impact to roosting non-special-status bats if project activities commence during the bat maternity roosting

period of March through August. The potential impact would only occur during construction and the bridge, and potential roosting within it, would be available to bats following the completion of the project.

Ornamental vegetation within the BSA could provide suitable habitat for nesting birds. The proposed project involves the removal of one tree located on private property immediately northeast of the project boundary and potentially several public trees. The trees proposed for removal are non-native species, commonly used for ornamental landscaping, thus not considered sensitive. However, these trees could provide nesting habitat for bird species protected under MBTA and CFG Code. Additionally, ornamental vegetation scattered throughout the BSA could provide suitable habitat for nesting birds. Nesting birds could be indirectly impacted from short-term construction-related noise, resulting in decreased reproductive success or nest abandonment. Therefore, if project activities were to occur during the general avian breeding season of February 1 through September 1, the project may directly and indirectly impact nesting birds protected under MBTA and CFG Code.

4.3.3 Avoidance and Minimization Efforts/Compensatory Mitigation

No avoidance or minimization measures or compensatory mitigation are required for special-status wildlife species because impacts to special-status wildlife species are not expected to occur.

To avoid potential direct and indirect impacts to bat maternity roosts, a qualified biologist will conduct a roosting bat survey in April or May to determine occupancy of the bridge by bats. These months are within the bat maternity season. The bat presence/absence survey will consist of a daytime roost assessment throughout the project site to identify any sign indicating presence (i.e. guano, staining, etc.). In order to observe if bats are actively roosting within the bridge and to gather additional information on the number of bats roosting, if any, one night of visual emergence observation will be conducted at dusk along with the use of an acoustic monitoring detector to determine what bat species are present.

If bats are found to be roosting in the bridge, then bat roost exclusion will be performed the following October or November, after maternity roosts are completed and bat activity is still high. This increases the potential to exclude all bats from the bridge and minimize the potential for a significant impact to occur by avoiding the maternity roosting season. The primary exit points for roosting bats will be identified, and all secondary ingress/egress locations on the bridge will be covered with a tarp or wood planks to prevent bats from leaving from other locations. The primary exit points will remain uncovered to allow exclusion devices to be installed. Exclusion devices will consist of a screen (poly netting, window screen, or fiberglass screening) with mesh 1/6 of an inch or smaller, installed at the exit point and passing two feet below the exit point. The exclusion devices will be installed at night to increase the potential that bats have already left the roost and are less likely to return. Exclusion devices will be left in place for a one-week period to ensure any remaining bats in the bridge are excluded. Periodic monitoring during the exclusion period should also be conducted to observe if any bats are still emerging from the bridge, and an active monitoring survey conducted on the final night of exclusion to ensure no bats are emerging from

the bridge and to determine exclusion has been successful. Any continued presence of roosting bats would require an adjustment to the exclusion devices and schedule.

To avoid potential direct and indirect impacts to nesting birds protected by the MBTA and CFG Code, project activities should avoid the general nesting season of February 1 through September 1. If this season cannot be avoided, then a pre-construction clearance survey should be conducted seven days prior to project activities to determine the presence/absence of any nesting bird species within the tree proposed for removal, as well as vegetation within 300 feet (for non-raptor bird species) and 500 feet (for raptor species) of the proposed work area. If a nesting bird is found, an avoidance buffer will be established around the nest, based on the species sensitivity to disturbance and proximity to impact areas. The buffer will remain in place as long as the nest is considered active, as determined by an on-site monitor. No encroachment into the buffer may occur within the consent of the on-site monitor, as long as a nest is still active.

5. Conclusions & Regulatory Determination

5.1 Federal Endangered Species Act Consultation Summary

The project site is primarily located within developed portions of urban areas in southern Los Angeles County (i.e. City of Compton) and will not result in the removal or degradation of any natural communities. The proposed project area is primarily developed with the bridge site spanning over an existing concrete-lined flood control channel (i.e., Compton Creek), reducing the potential for special-status plant and wildlife species to occur. No designated Critical Habitat is mapped within the BSA. Additionally, no primary constituent elements for Critical Habitat in the region occur within the BSA. Therefore, the proposed project will have no effect on species or occupied habitat of species regulated by FESA.

5.2 Essential Fish Habitat Consultation Summary

No direct consultation with NMFS was conducted for this project. However, an official species list was obtained through email from NMFS, and the species listed were considered for their potential to occur within the BSA. The NMFS species list is provided in Appendix B.

5.3 Wetlands and Other Waters Coordination Summary

No coordination with any wetland or waters regulatory agencies have been conducted for the proposed project.

A formal jurisdictional waters delineation was not conducted; however, the project would occur over and within the Compton Creek flood control channel that are likely to be Waters of the U.S. and Waters of the State. Temporary and permanent impacts to waters of the U.S. and State are anticipated to occur as a result of the proposed project. Therefore, the proposed project would likely require a Section 404 Permit from ACOE, a Section 401 Water Quality Certification from the RWQCB, and a 1600 Streambed Alteration Agreement from CDFW.

5.4 Invasive Species

Invasive plants are a subset of nonnative plants that spread into undisturbed ecosystems and generally negatively impact native plants and alter ecosystem processes. One species was found in the BSA that is rated as “Moderate” by California Invasive Plant Council (2019): shortpod mustard (*Hirschfeldia incana*). Shortpod mustard is common in the BSA vicinity in disturbed habitats. BMPS that would be implemented as part of the project design would include the cleaning of construction equipment prior to entering the site to reduce the spread of invasive plant seeds. No compensatory mitigation is proposed.

5.5 Other

Nesting bird species protected by the MBTA and CFG Code may be indirectly impacted by the project should activities commence during the general nesting season of February 1 through September 1. Nesting season avoidance is proposed in Section 4.3 to reduce any potential impact

to nesting birds, and a pre-construction clearance survey should the project occur during the nesting season. Active nests found during the pre-construction clearance survey will be flagged for avoidance. If a nesting bird is found, an avoidance buffer will be established around the nest, based on the species sensitivity to disturbance and proximity to impact areas. The buffer will remain in place as long as the nest is considered active, as determined by an on-site monitor. No encroachment into the buffer may occur without the consent of the on-site monitor, as long as a nest is still active.

Consultation Code: 08ECAR00-2019-SLI-0921

Event Code: 08ECAR00-2020-E-01086

Project Name: Compton Boulevard over Compton Creek

Subject: Updated list of threatened and endangered species that may occur in your proposed project location, and/or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, and proposed species, designated critical habitat, and candidate species that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)(c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

<http://www.fws.gov/endangered/esa-library/pdf/TOC-GLOS.PDF>

Please be aware that bald and golden eagles are protected under the Bald and Golden Eagle Protection Act (16 U.S.C. 668 *et seq.*), and projects affecting these species may require development of an eagle conservation plan (http://www.fws.gov/windenergy/eagle_guidance.html). Additionally, wind energy projects should follow the wind energy guidelines (<http://www.fws.gov/windenergy/>) for minimizing impacts to migratory birds and bats.

Guidance for minimizing impacts to migratory birds for projects including communications towers (e.g., cellular, digital television, radio, and emergency broadcast) can be found at: <http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers.htm>; <http://www.towerkill.com>; and <http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/comtow.html>.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Tracking Number in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

Endangered Species Act Species

There is a total of 1 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries¹, as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

-
1. [NOAA Fisheries](#), also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

**COMPTON BOULEVARD BRIDGE OVER COMPTON CREEK 53C-0925
COUNTY BRIDGE NO. 2752
GEOTECHNICAL SUBSURFACE EXPLORATION
PROJECT ID RDC0015754 (PCA NO. X220000461)**

On November 26, 2012, we were requested to perform a limited geotechnical investigation for the Compton Boulevard Bridge over Compton Creek in the City of Compton. The approximate site location is provided in Figure 1. Our scope of work was to perform subsurface explorations and provide soil testing to determine subsurface conditions.

Subsurface Exploration

To evaluate subsurface conditions at this site, two exploratory borings were drilled on January 29, 2013 and January 31, 2013, and two Cone Penetration Test (CPT) soundings were advanced on January 28, 2013 and January 30, 2013. One boring and one CPT were performed on each side of the bridge. The two borings were drilled with a CME 75 drill rig using a 6.5-inch-diameter hollow stem auger to depths of 75 feet, each below ground surface (bgs). The two CPTs were advanced using a 25-ton truck-mounted CPT rig. The CPT on the east side of the bridge included a seismic shear wave velocity test (SCPT-01) and was advanced to a depth of 100 feet bgs. The CPT on the west side of the bridge (CPT-02) was advanced to 75 feet bgs. The approximate locations of the borings and CPTs are provided in Figure 2. The logs of borings and soundings are provided in Appendix A.

In-situ Testing

In-situ testing was conducted with the CPTs performed by Fugro Consultants. Pore pressure dissipation tests were conducted to determine the approximate depth to ground water. Seismic shear wave velocity measurements were taken at SCPT-01 to determine the site specific shear wave velocity for the upper 100 feet. The test results for the seismic shear wave velocity measurements are provided in Appendix B.

Laboratory Testing

Selected samples were collected for laboratory analysis to confirm soil classifications made in the field and to provide engineering properties of the existing soils. Soil tests were performed by the Geotechnical and Materials Engineering Division's Materials Laboratory. A summary of laboratory test results is provided in Appendix C.

Subsurface Information

- The soil types encountered during drilling consisted predominantly of lean clays and silt in medium stiff to very stiff condition. A layer of very dense well-graded sand was encountered in both borings from depths of 65 to 75 feet bgs. Hard silt was found below the layer of well-graded sand in both borings.
- Bedrock was not encountered in the borings or CPTs conducted at the subject site.
- Perched water was encountered at 60 feet and 50 feet bgs in Boring B-1 and Boring B-2 respectively. CPT in-situ pore pressure dissipation tests indicated subsurface water at approximately 52 feet deep in SCPT-01, east of the bridge. A measurement was not obtained in CPT-02, west of the bridge.

The boring logs and soundings provided herein contain observations and interpretations that are valid only for the specific date and location of the borings and soundings. Subsurface conditions may vary between borings and with time.

If you have any questions regarding the reported information or if additional analyses or recommendations are needed, please contact Yonah Halpern or Yoshiya Morisaku at Extension 4925. To provide feedback on our services, please access <http://dpw.lacounty.gov/go/gmedsurvey> to complete a Customer Service Survey.

Executive Summary

The primary purpose of the Water Quality Assessment Report (WQAR) is to fulfill the requirements of the National Environmental Policy Act (NEPA) of 1969 and the California Environmental Quality Act (CEQA), and provide information, to the extent possible, for the National Pollutant Discharge Elimination System (NPDES) permitting. This WQAR includes a discussion of the project, the physical setting of the project study area, and the regulatory framework with respect to water quality. It also provides data on existing water quality, surface water, and groundwater resources within the project study area, describes water quality impairments and beneficial uses, identifies potential water quality impacts/benefits associated with the project, and recommends avoidance and/or minimization measures.

The County of Los Angeles, in coordination with the City of Compton, proposes removal and replacement of the Compton Boulevard Bridge over Compton Creek. The existing bridge includes two 12-foot-wide travel lanes and one left-turn lane in each direction and is classified as structurally deficient due to extensive cracking and delamination of the bridge deck. The proposed bridge would be a 130-foot-long, 76-foot-wide, two-span precast pre-stressed concrete box beam structure supported by pile foundation. New bridge abutments would be constructed at approximately 15 feet behind the existing abutments/channel walls, which would be left in place with modifications to provide clearance to accommodate the new bridge superstructure. Pile drilling would be utilized at the abutment and pier locations. Full road closure would be required during project construction.

Compton Creek is a tributary of the Los Angeles River. The Compton Creek channel begins in the City of Los Angeles near Main Street and 107th Street and flows south approximately 8.5 miles to the Los Angeles River in Rancho Dominguez. Beneficial uses of Compton Creek include groundwater recharge, municipal and domestic water supply, water contact recreation, noncontact water recreation, warm freshwater habitat, wetlands, and wildlife habitat. The creek has been listed for several pollutants on the Clean Water Act (CWA) 303(d) list; pollutants include benthic community effects, copper, indicator bacteria, lead, pH, trash, and zinc.

Project construction would last approximately 280 working days. Construction activities would include grading, demolition, pile drilling, excavation, bridge construction, and pavement installation. Project construction could result in temporary increases of pollutant loads due to construction activities. Measures **WQ-1** through **WQ-4**, listed in Section 5, Avoidance and Minimization Measures, would be implemented as part of the project. Additionally, a Storm Water Pollution Prevention Plan (SWPPP) would be prepared to outline appropriate construction Best Management Practices (BMP) that would be implemented to prevent any pollutants from entering the creek within the project area.

The project would not result in substantial permanent changes to the line and grade of surface hydraulic conditions. The existing channel is completely lined with concrete and would remain channelized following project completion. The project could result in a permanent minor increase in impervious surface area (approximately 0.05 acre), resulting from an access road (currently dirt) on the southwest corner of the bridge that would be reconstructed with a concrete slab. However, potential minor increases in impervious surface area would result in negligible impacts to drainage, stormwater runoff, and water quality conditions.

Proposed activities within Compton Creek would require coordination with, and permits from, several regulatory agencies, which include:

- Clean Water Act (CWA) Section 401 Water Quality Certification (Los Angeles Regional Water Quality Control Board (RWQCB))
- CWA Section 402 National Pollution Discharge Elimination System (NPDES) Permit (Los Angeles RWQCB, Order No. R4-2012-0175, NPDES Permit No. CAS004001) and Construction General Permit (State Water Resources Control Board (SWRCB), 2009-0009-DWQ amended by 2010-0014-DWQ & 2012-0006-DWQ)
- CWA Section 404 Pre-Construction Notification (U.S. Army Corps of Engineers [USACE], Nationwide Permit 14 for Multiple Crossings and Nationwide Permit 33 for Temporary Construction, Access, and Dewatering)
- California Fish and Game Code Section 1602 Streambed Alteration Agreement (California Department of Fish and Wildlife (CDFW))

1 INTRODUCTION

1.1 Approach to Water Quality Assessment

The purpose of the Water Quality Assessment Report (WQAR) is to fulfill the requirements of the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA), and to provide information for National Pollutant Discharge Elimination System (NPDES) permitting. The document includes a discussion of the proposed project, the general environmental setting of the project area, and the regulatory framework with respect to water quality; it also provides data on surface water and groundwater resources within the project area and the water quality of these waters, describes water quality impairments and beneficial uses, and identifies potential water quality impacts/benefits associated with the proposed project, and recommends avoidance and/or minimization measures for potentially adverse impacts.

As part of this analysis, reviews were conducted of the Water Quality Control Plan for the Los Angeles Region (Basin Plan), the FEMA Flood Insurance Rate Maps for Los Angeles County, Geotechnical Subsurface Exploration data, and hydraulic analysis modeling data. To determine the impacts on water quality, the increase in impervious surface area was calculated, and impacts of the construction activities were also considered.

1.2 No Build Alternative

The No Build Alternative would maintain the existing configuration of the Compton Boulevard Bridge and would not result in improvements. The proposed project purpose and need would not be met, and operational and safety conditions (structural deficiency) would continue to worsen.

1.3 Build Alternative

1.3.1 History

The existing two-span steel girder bridge as built in 1938 and is currently supported by abutments and a middle pier. The existing bridge includes two 12-foot-wide travel lanes and one left-turn lane in each direction.

1.3.2 Project Purpose and Need

The proposed project would correct existing bridge deficiencies, enhance vehicular safety on the bridge and improve transportation efficiency by enabling larger trucks to utilize the bridge. The project is being proposed because the existing steel girder bridge and middle pier have been determined to be structurally deficient due to extensive cracking and delamination of the bridge deck. The proposed project would include replacing the existing, steel girder bridge and pier with a new pre-cast, pre-stressed, concrete box beam structure supported by pile foundations, a new pier and new abutments.

1.3.3 Project Description

The proposed project would be located at Compton Boulevard where it crosses over Compton Creek within the City of Compton (City) in southern Los Angeles County (County) (see **Figure 1**, Regional Location Map, and **Figure 2**, Project Location Map). The bridge replacement would be located within the South Gate U.S. Geological Survey (USGS) 7.5-minute quadrangle in Section 22, Township 3 South, Range 13 West. The area surrounding the existing bridge is largely developed with existing land uses comprised of residential and commercial development, existing right-of-way (ROW), as well as a concrete-lined flood control channel.

The proposed project would include demolition and construction activities. Generally, construction activities would include demolition, grading, pile drilling, installation of metal beam guardrail system, construction of bridge abutments, bridge pier reconstruction, reconstruction of sidewalks, drainage improvements (catch basins at driveway entrances) bicycle path reconstruction, roadway reconstruction to accommodate the raise in bridge elevation, and full road closures within project limits.

Under the proposed project, the existing two-span Compton Boulevard Bridge over Compton Creek would be demolished. Specifically, the existing pier timber piles would be removed three feet below the finished grade, followed by the removal of the existing steel girders, cross brace members, reinforced concrete, asphalt pavement (bridge deck), and any excavated soil within the project limits of work. Specifically, the concrete bridge deck would be demolished by saw cutting and the steel girders would be removed by torch cutting before the transporting the fragmented pieces to the dump trucks using a crane.

The new concrete bridge pier would be constructed in the Compton Creek channel, at the same location as the existing pier. Bridge pier construction would involve the installation of cast-in-drilled-hole (CIDH) concrete piles (reinforced concrete piles cast in holes that are drilled to predetermined elevations), construction of concrete pier footings and the stem wall. Specifically, a hydraulic crane and drill rig would be utilized to drill the holes and install the rebar cages, while a concrete truck, concrete pump, forklifts and loaders would be needed to fill the drilled holes and construct the footings and stem wall. A new, sloping concrete pier nose would be constructed upstream from the bridge as part of the proposed project.

The new abutments would be constructed approximately 15 feet behind the existing abutments, which would be protected in place to accommodate clearance for the new bridge structure. Similar to the construction of the bridge pier, the construction of the bridge abutments would involve the installation of CIDH concrete piles, pile caps, and backwalls, which would utilize a drill rig and hydraulic crane, while an excavator and crane would be utilized to install the formwork and the reinforcement for the pile caps. Additional equipment needed to install the pile caps and backwall includes forklifts, loaders, concrete pumps, and a concrete truck.

The construction of the bridge superstructure would involve the installation of precast/pre-stressed adjacent concrete box beams, a cast-in-place reinforced concrete deck, sidewalks, and bridge barriers. Installation of these superstructure components would utilize a hydraulic crane, concrete slipform machine, concrete truck, and concrete pump. After the superstructure has been constructed, the bike paths, and access ramp would be reconstructed, and the roadway would be paved and restriped.

FIGURE 2. PROJECT LOCATION MAP
Compton Boulevard over Compton Creek

Project construction would also include the reconstruction of the sidewalks adjacent to the project limits. The project would include the removal of a private tree, relocation of catch basins, driveways, and a street lighting median located 80 feet west of the bridge, within the Compton Boulevard ROW.

Project construction would also include the reconstruction of the bike paths along the Compton Creek channel. Specifically, reconstruction of the bike paths would include 380 feet (190 feet on either side) of bike path along the north side of the channel along Compton Boulevard, where the bike path would be supported on a concrete slab structure with CIDH piles. An access road, approximately 190 feet long, would be reconstructed along the channel at the southwest corner to accommodate the one-foot change in bridge elevation.

1.3.4 Construction Schedule

Project construction is anticipated to occur between January 2023 and May 2024, and would last for approximately 280 working days. Construction would occur Monday through Friday from 7:00 a.m. to 3:30 p.m.

2 REGULATORY SETTING

2.1 Federal Laws and Requirements

Clean Water Act

In 1972 Congress amended the Federal Water Pollution Control Act, making the addition of pollutants to the waters of the United States (U.S.) from any point source unlawful unless the discharge is in compliance with a NPDES permit. Known today as the Clean Water Act (CWA), Congress has amended it several times. In the 1987 amendments, Congress directed dischargers of stormwater from municipal and industrial/construction point sources to comply with the NPDES permit program. Important CWA sections are:

- Sections 303 and 304 require states to promulgate water quality standards, criteria, and guidelines.
- Section 401 requires an applicant for a federal license or permit to conduct any activity, which may result in a discharge to waters of the U.S., to obtain certification from the State that the discharge will comply with other provisions of the act. (Most frequently required in tandem with a Section 404 permit request. See below).
- Section 402 establishes the NPDES, a permitting system for the discharges (except for dredge or fill material) of any pollutant into waters of the U.S. The Federal Environmental Protection Agency delegated to the California State Water Resources Control Board (SWRCB) the implementation and administration of the NPDES program in California. The SWRCB established nine Regional Water Quality Control Boards (RWQCBs). The SWRCB enacts and enforces the Federal NPDES program and all water quality programs and regulations that cross Regional boundaries. The nine RWQCBs enact, administer and enforce all programs, including NPDES permitting, within their jurisdictional boundaries. Section 402(p) requires permits for discharges of stormwater from industrial, construction, and Municipal Separate Storm Sewer Systems (MS4s).
- Section 404 establishes a permit program for the discharge of dredge or fill material into waters of the U.S, including wetlands. This permit program is administered by the U.S. Army Corps of Engineers (USACE).

The objective of the CWA is “to restore and maintain the chemical, physical, and biological integrity of the Nation’s waters.”

The USACE issues two types of 404 permits: General and Individual. There are two types of General permits: Regional and Nationwide permits. Regional permits are issued for a general category of activities when they are similar in nature and cause minimal environmental effect. Nationwide permits are issued to authorize a variety of minor project activities with no more than minimal effects.

There are also two types of Individual permits: Standard Individual permit and Letter of Permission. Ordinarily, projects that do not meet the criteria for a Nationwide Permit may be permitted under one of USACE’s Individual permits. For Standard Individual permit, the USACE decision to approve is based on compliance with U.S. Environmental Protection Agency’s (EPA) Section 404 (b)(1) Guidelines (U.S. EPA CFR 40 Part 230), and whether permit approval is in the public interest. The 404(b)(1) Guidelines were developed by the U.S. EPA in conjunction

with USACE and allow the discharge of dredged or fill material into the aquatic system (waters of the U.S.) only if there is no practicable alternative which would have less adverse effects. The Guidelines state that USACE may not issue a permit if there is a least environmentally damaging practicable alternative (LEDPA), to the proposed discharge that would have less effects on waters of the U.S., and not have any other significant adverse environmental consequences. Per the Guidelines, documentation is needed that a sequence of avoidance, minimization, and compensation measures have been followed, in that order. The Guidelines also restrict permitting activities that violate water quality or toxic effluent standards, jeopardize the continued existence of listed species, violate marine sanctuary protections, or cause “significant degradation” to waters of the U.S. In addition, every permit from the USACE, even if not subject to the 404(b)(1) Guidelines, must meet general requirements. See 33 CFR 320.4.

2.2 State Laws and Requirements

Porter-Cologne Water Quality Control Act

California’s Porter-Cologne Act, enacted in 1969, provides the legal basis for water quality regulation within California. This Act requires a “Report of Waste Discharge” for any discharge of waste (liquid, solid, or gaseous) to land or surface waters that may impair beneficial uses for surface and/or groundwater of the State. It predates the CWA and regulates discharges to waters of the State. Waters of the State include more than just waters of the U.S., like groundwater and surface waters not considered waters of the U.S. Additionally, it prohibits discharges of “waste” as defined and this definition is broader than the CWA definition of “pollutant”. Discharges under the Porter-Cologne Act are permitted by Waste Discharge Requirements (WDRs) and may be required even when the discharge is already permitted or exempt under the CWA.

The State Water Resources Control Board (SWRCB) and RWQCBs are responsible for establishing the water quality standards as required by the CWA, and regulating discharges to protect beneficial uses of water bodies. Details regarding water quality standards in a project area are contained in the applicable RWQCB Basin Plan. In California, Regional Boards designate beneficial uses for all water body segments in their jurisdictions, and then set standards necessary to protect these uses. Consequently, the water quality standards developed for particular water body segments are based on the designated use and vary depending on such use. Water body segments that fail to meet standards for specific pollutants are included in a Statewide List in accordance with CWA Section 303(d). If a Regional Board determines that waters are impaired for one or more constituents and the standards cannot be met through point source or non-source point controls (NPDES permits or Waste Discharge Requirements), the CWA requires the establishment of Total Maximum Daily Loads (TMDLs). TMDLs specify allowable pollutant loads from all sources (point, non-point, and natural) for a given watershed. The SWRCB implemented the requirements of CWA Section 303(d) through Los Angeles County’s MS4 Permit, as it includes specific TMDLs for which the County is the named stakeholder.

State Water Resources Control Board and Regional Water Quality Control Boards

The SWRCB adjudicates water rights, sets water pollution control policy, and issues water board orders on matters of statewide application, and oversees water quality functions throughout the state by approving Basin Plans, TMDLs, and NPDES permits. RWQCBs are

responsible for protecting beneficial uses of water resources within their regional jurisdiction using planning, permitting, and enforcement authorities to meet this responsibility.

National Pollutant Discharge Elimination System (NPDES) Program

Municipal Separate Storm Sewer Systems (MS4)

Section 402(p) of the CWA requires the issuance of NPDES permits for five categories of stormwater dischargers, including MS4s. The U.S. EPA defines an MS4 as “any conveyance or system of conveyances (roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, human-made channels, and storm drains) owned or operated by a state, city, town, county, or other public body having jurisdiction over storm water, that are designed or used for collecting or conveying stormwater.” Los Angeles County is the MS4 owner and operator for the project area under Order No. R4-2012-0175, NPDES Permit No. CAS004001. The SWRCB or the RWQCB issues NPDES permits for five years, and permit requirements remain active until a new permit has been adopted.

Construction General Permit

The State’s Construction General Permit (NPDES No. CAS000002, SWRCB Order No. 2009-0009-DWQ adopted on November 16, 2010) became effective on February 14, 2011 and was amended by Order No. 2010-0014-DWQ and Order No. 2012-0006-DWQ. The permit regulates stormwater discharges from construction sites which result in a Disturbed Soil Area (DSA) or one acre or greater, and/or smaller sites that are part of a larger common plan of development.

For all projects subject to the CGP, the applicant is required to hire a Qualified Storm Water Pollution Prevention Plan (SWPPP) Developer (QSD) to develop and implement an effective SWPPP. All Project Registration Documents, including the SWPPP, are required to be uploaded into the SWRCB’s on-line Stormwater Multiple Application and Report Tracking System (SMARTS), at least 30 days prior to construction.

Section 401 Permitting

Under Section 401 of the CWA, any project requiring a federal license or permit that may result in a discharge to a water of the United States must obtain a 401 Certification, which certifies that the project will be in compliance with State water quality standards. The most common federal permit triggering 401 Certification is a CWA Section 404 permit, issued by USACE. The 401 permit certifications are obtained from the appropriate RWQCB, dependent on the project location, and are required before USACE issues a 404 permit.

In some cases the RWQCB may have specific concerns with discharges associated with a project. As a result, the RWQCB may prescribe a set of requirements known as Waste Discharge Requirements (WDRs) under the State Water Code (Porter-Cologne Act). WDRs may specify the inclusion of additional project features, effluent limitations, monitoring, and plan submittals that are to be implemented for protecting or benefiting water quality. WDRs can be issued to address both permanent and temporary discharges of a project.

2.3 Regional and Local Requirements

Basin Plan for the Los Angeles Region

Section 13240 of the Porter-Cologne Water Quality Control Act requires each RWQCB to formulate and adopt water quality control plans, or basin plans, for all areas within the region. Water quality in the project study area is regulated by the Los Angeles RWQCB through the *Water Quality Control Plan* (Los Angeles RWQCB Basin Plan) (California Regional Water Quality Control Board, Los Angeles Region 2014).

The Basin Plan lists the beneficial uses of surface waters and groundwaters in the region. Beneficial uses are uses that may be protected against quality degradation. These uses include and are not limited to domestic, municipal, agricultural, and industrial supply; power generation; recreation; aesthetic enjoyment; navigation; and preservation and enhancement of fish, wildlife, and other aquatic resources or preserves. The beneficial uses of surface waters and groundwaters in the basin are designated in the water quality control plans.

The Basin Plan also includes water quality objectives, which are the limits or levels of water quality constituents or characteristics, which are established for the reasonable protection of beneficial uses of water or the prevention of nuisance within a specific area.

Los Angeles Regional Water Quality Control Board Waste Discharge Requirements for Municipal Separate Storm Sewer System

Phase I of the SWRCB's MS4 program, issued in 1990, requires medium and large cities or certain counties with populations of 100,000 or more to obtain NPDES permit coverage for their stormwater discharges. A municipal NPDES stormwater permit was issued to the County of Los Angeles and 84 incorporated cities (with the exception of the City of Long Beach) under Order No. R4-2012-0175, NPDES Permit No. CAS004001 by the Los Angeles RWQCB on November 8, 2012 (Los Angeles Regional Water Quality Control Board 2012).

Los Angeles County Code and Flood Control District Code

The Los Angeles County Code applies to the unincorporated areas that are directly affected by the Build Alternatives. Chapter 21 (Storm Water and Runoff Pollution Control) sets forth standards to regulate the stormwater and non-stormwater discharges to the facilities of the Los Angeles County Flood Control District to protect those facilities, the water quality of the waters in and downstream of those facilities, and the quality of the water that is being stored in underground water-bearing zones (County of Los Angeles 2013).

Los Angeles County General Plan

The *Los Angeles County General Plan* (County's General Plan) contains the County's goals related to land use and is designed to serve as the basis for development decisions. The following objective and policy from the County's General Plan, Conservation and Open Space Element are applicable to the project (County of Los Angeles 1980):

- Objective: To conserve water and protect water quality.
- Policy 5: Encourage the maintenance, management, and improvement of the quality of imported domestic water, groundwater supplies, natural runoff, and ocean water.

The Greater Los Angeles County Integrated Regional Water Management Plan

The Greater Los Angeles County Region Integrated Regional Water Management group finalized the *Greater Los Angeles County Region Integrated Regional Water Management Plan* in 2014. Integrated Regional Water Management Plans are regional plans designed to improve collaboration in water resources management. The first Integrated Regional Water Management Plan for the Greater Los Angeles County Region Integrated Regional Water Management group was published in 2006 following a multiyear effort among water retailers, wastewater agencies, stormwater and flood managers, watershed groups, the business community, tribes, agriculture, and nonprofit stakeholders to improve water resources planning in the Los Angeles Basin. The plan provides a mechanism for: (1) coordinating, refining, and integrating existing planning efforts within a comprehensive, regional context; (2) identifying specific regional and watershed-based priorities for implementation projects; and (3) providing funding support for the plans, programs, projects, and priorities of existing agencies and stakeholders.

Los Angeles River Master Plan

Compton Creek is a tributary of the Los Angeles River. In July 1991, the Los Angeles County Board of Supervisors directed the County Departments of Public Works, Parks and Recreation, and Regional Planning to coordinate all interested public and private parties in the planning, financing, and implementation efforts of the *Los Angeles River Master Plan* (Los Angeles County Public Works 1996). The master plan identifies ways to enhance and revitalize the publicly owned rights of way along the Los Angeles River and Tujunga Wash.

The Compton Creek Master Plan 2006

The *Compton Creek Master Plan* was developed in 2006 to establish a vision for the future uses and needs of Compton Creek. The plan includes several design concepts for Compton Creek and surrounding land, which includes recreation opportunities, stormwater management, art, safety, and potential events and partnerships.

3 AFFECTED ENVIRONMENT

3.1 General Environmental Setting

3.1.1 Population and Land Use

Land use is an important factor in water quality. Surrounding land uses affect the quality and quantity of stormwater runoff that results from a precipitation event. Urbanized areas typically include greater proportions of impervious surface area, which could result in greater runoff potential and pollutant loads. The project area is in the City of Compton and is surrounded by low density residential, mixed use, and general commercial land uses. The project area includes, and is adjacent to, an existing transportation corridor, single-family residential homes, automotive and retail businesses, and open vacant land. A paved trail runs along the east side of the creek and is separated from the channel by chain-link fencing.

The project area overlaps with a vacant parcel, approximately one acre in size, and is directly southeast of the Compton Boulevard and Compton Creek intersection. Additionally, there are several parks and open spaces near the project area. Walter R. Tucker Park includes approximately four acres of open space and is 0.2 mile to the south of the project area. A second park, approximately one acre in size, is approximately 0.3 mile to the southwest of the project area. The Davis Middle School property includes a large recreational field that is approximately 13.1 acres and is 0.3 mile to the north of the project area. Compton High School includes three recreational fields that are 10.3 acres in total, approximately 0.4 mile to the southeast of the project area.

3.1.2 Topography

California is divided into 11 geomorphic provinces, which are naturally defined geologic regions that display a distinct landscape or landform. The project area is in the central portion of the Peninsular Ranges geomorphic province. The Peninsular Ranges province is distinguished by northwest-trending mountain ranges and valleys following faults branching from the San Andreas Fault (California Geological Survey 2002). The Peninsular Ranges are bound to the east by the Colorado Desert and extend north locally to the Santa Monica Mountains, west into the submarine continental shelf, and south to the California state line.

The topography of the project area and surrounding land uses is mostly flat. Compton Creek is a completely concrete-lined rectangular channel with an approximately 0.1% bottom grade. Areas adjacent to the channel are relatively flat with a slight slope towards the channel.

3.1.3 Hydrology

3.1.3.1 Regional Hydrology

The Los Angeles RWQCB, Region 4, oversees the protection of surface water and groundwater quality in the Los Angeles Region, where the project study area is located (Los Angeles Regional Water Quality Control Board 2014). The Los Angeles Region encompasses 10 Watershed Management Areas, which generally consist of a single large watershed within which exist smaller subwatersheds that are tributary to the main river. The project area is in the Los Angeles River Watershed, as shown on **Figure 3**, Watershed Map.

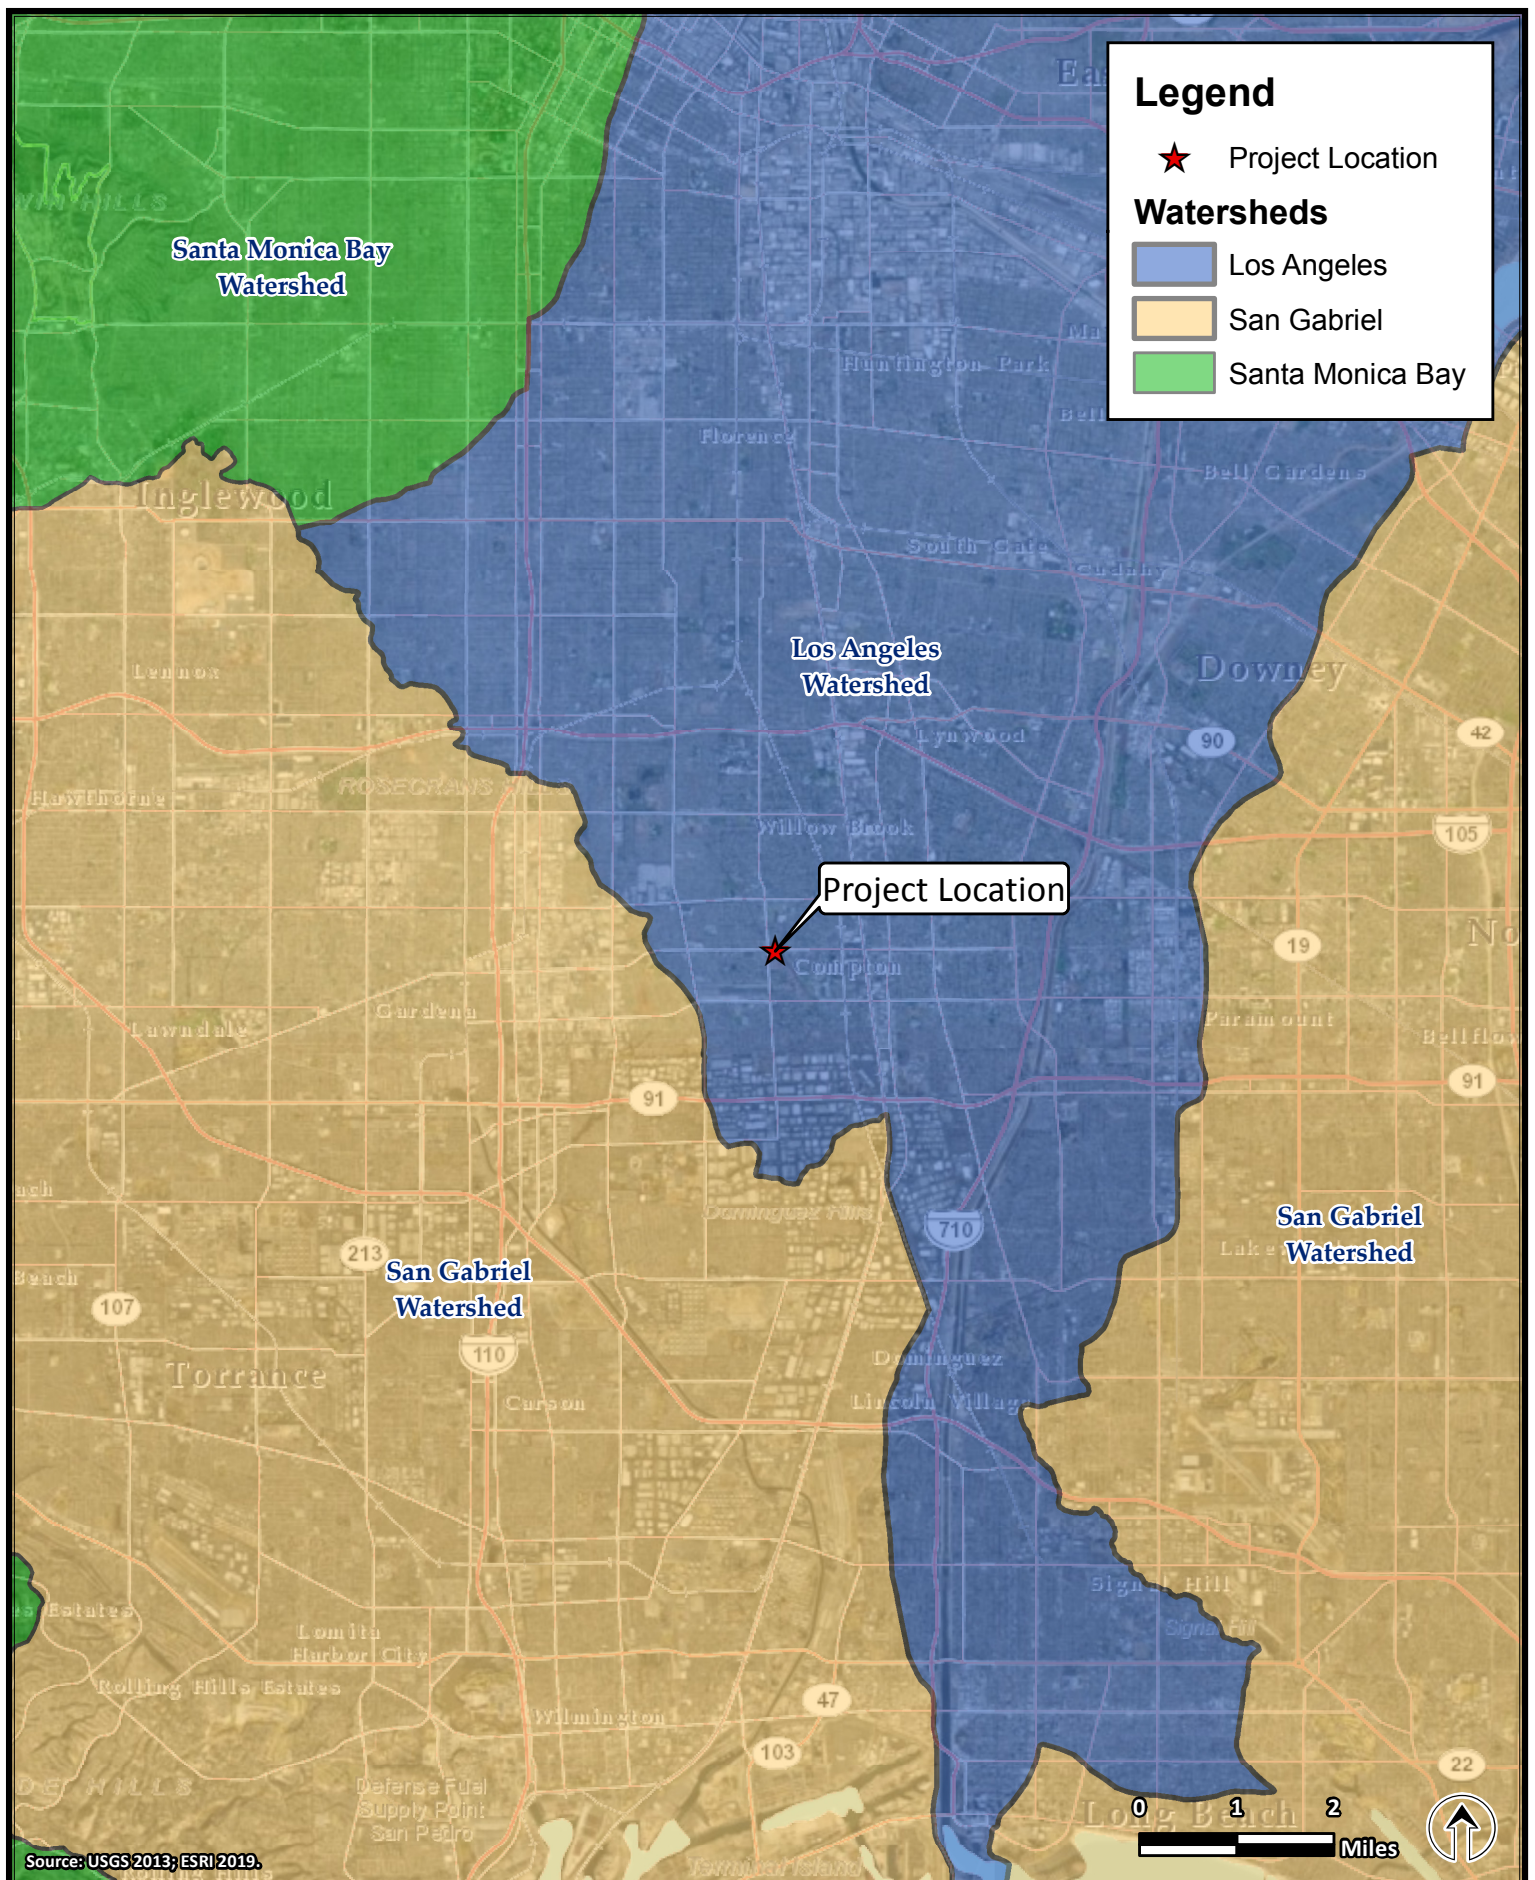

FIGURE 3. WATERSHED MAP
Compton Boulevard over Compton Creek

The Los Angeles River Watershed is one of the largest in the region, at 824 square miles, with almost half of that covered by forest or open space, including the area near the headwaters, which originate in the Santa Monica, Santa Susana, and San Gabriel mountains (California State Water Resources Control Board 2018). The rest of the watershed is intensely urbanized, and the river itself is highly modified, having been lined with concrete along most of its length by the USACE. The project area is in the Compton Creek subwatershed of the Los Angeles River Watershed (California Department of Transportation 2019).

3.1.3.2 Local Hydrology

3.1.3.2.1 *Precipitation and Climate*

The project area has a subtropical Mediterranean climate, characterized by mild rainy winters and warm dry summers. As moist air from the Pacific Ocean is carried inland, it is forced upward by the mountains, resulting in storms, which are common from November through March.

Precipitation in the project area in the year 2018 totaled approximately 6.94 inches of rainfall, as measured by the Hawthorn Municipal Airport weather station (National Oceanic Atmospheric Administration 2018). The project area does not receive snowfall.

3.1.3.2.2 *Surface Waters*

Compton Creek is a tributary of the Los Angeles River. These waterways are shown on **Figure 4**, Surface Waters Map. The Compton Creek channel begins in the City of Los Angeles near Main Street and 107th Street, and flows south approximately 8.5 miles to the Los Angeles River in Rancho Dominguez (University of California Cooperative Extension 2019). The portion of the Compton Creek channel in the project area is owned and operated by the Los Angeles County Flood Control District. The creek has historically received water from surrounding freshwater marshes and willow-cottonwood forest. The creek landscape is now highly urbanized and is mostly channelized within a concrete box. The lower 2.7 miles of creek is reinforced by concrete along the sides and has an earthen bottom that supports wetland habitat. This portion of the creek begins approximately 1.4 miles to the southeast from the project area.

Beneficial uses of Compton Creek include groundwater recharge, municipal and domestic water supply, water contact recreation, noncontact water recreation, warm freshwater habitat, wetlands, and wildlife habitat (California Department of Transportation 2019). The creek is not considered a sediment-sensitive waterbody. The creek has been listed for several pollutants on the CWA 303(d) list; pollutants include benthic community effects, copper, indicator bacteria, lead, pH, trash, and zinc.

The project area generally slopes down from west to east, and surface water runoff flows from west to east, matching the existing drainage pattern. The flow from the west of the bridge along the south side of Compton Boulevard is collected by the catch basin at the southwest corner of Compton Boulevard and Sherer Place, approximately 70 feet west of the bridge. An additional catch basin is at the south end of Sherer Place, approximately 280 feet south of Compton Boulevard, to collect flow from Compton Boulevard. The residual flow crosses the bridge and continues to flow east along the existing flow line. The flow along the north side of Compton Boulevard travels east across the bridge and north into Paulsen Avenue.

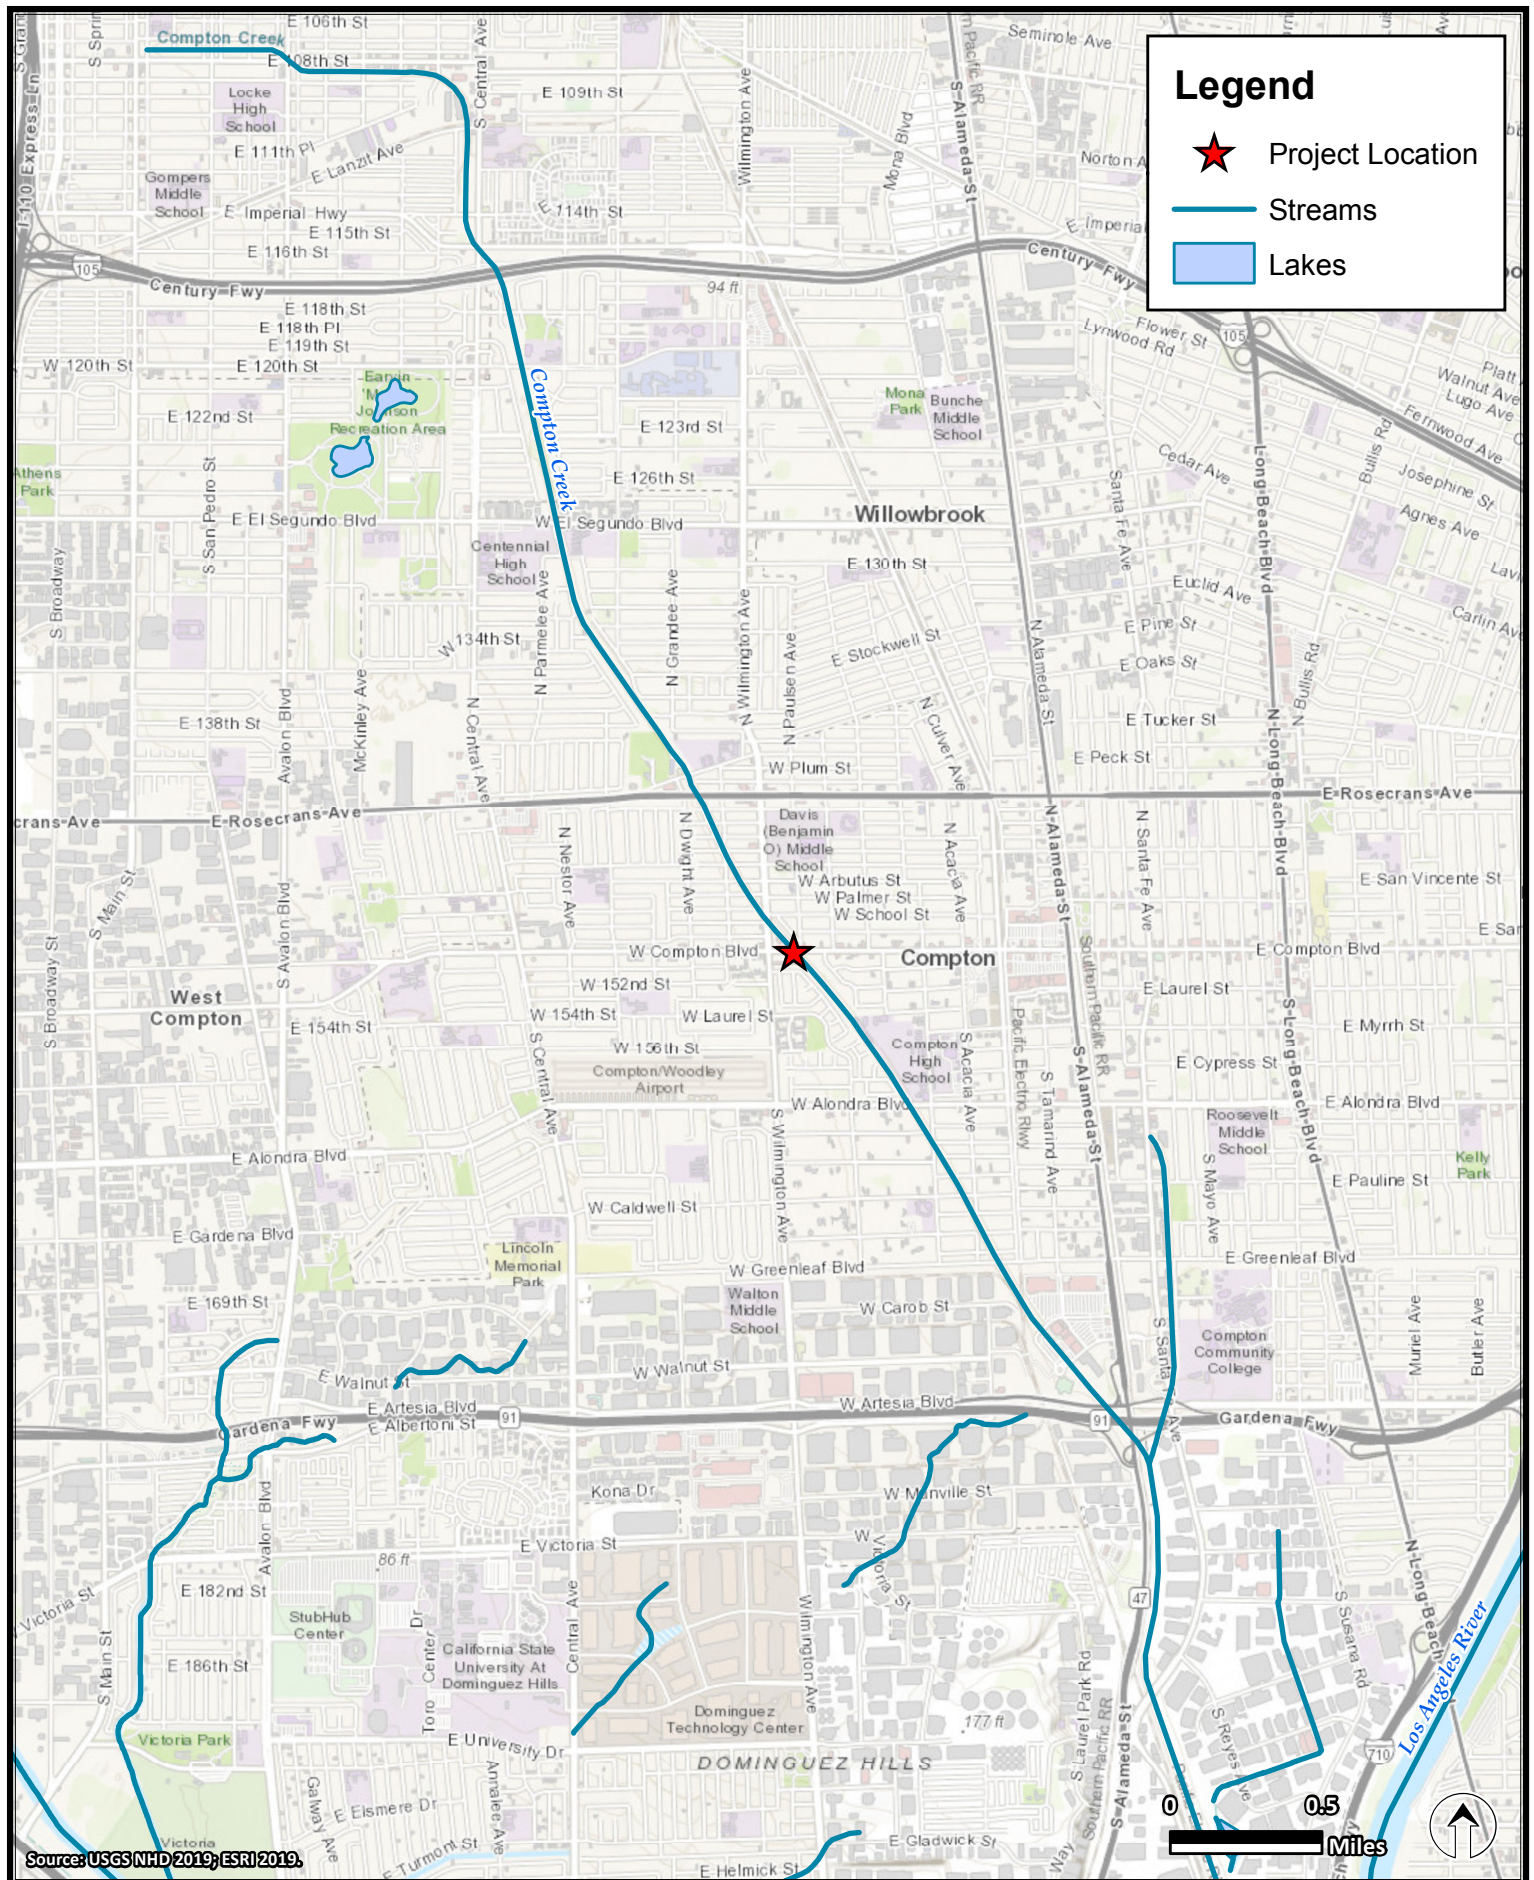

FIGURE 4. SURFACE WATERS MAP
Compton Boulevard over Compton Creek

The flow is collected by two catch basins at the intersection of Paulsen Avenue and Magnolia Court, approximately 160 feet north of Compton Boulevard. The creek, its tributaries, and contributing storm water infrastructure empty into San Pedro Bay at the eastern edge of Long Beach Harbor (City of Compton n.d.).

3.1.3.2.3 *Floodplains*

The project area is included in Panel 1815F of the Federal Emergency Management Agency (FEMA) Flood Insurance Risk Map (FIRM) for Los Angeles County, California. The project area is identified as Zone X, which is defined as an area determined to be outside of the 0.2 percent annual chance floodplain (see **Figure 5**, Flood Hazard Zones Map). Therefore, the project area is not considered to be within a floodplain. The Los Angeles River floodplain is approximately 0.4 mile to the east of the project area.

3.1.3.2.4 *Municipal Supply*

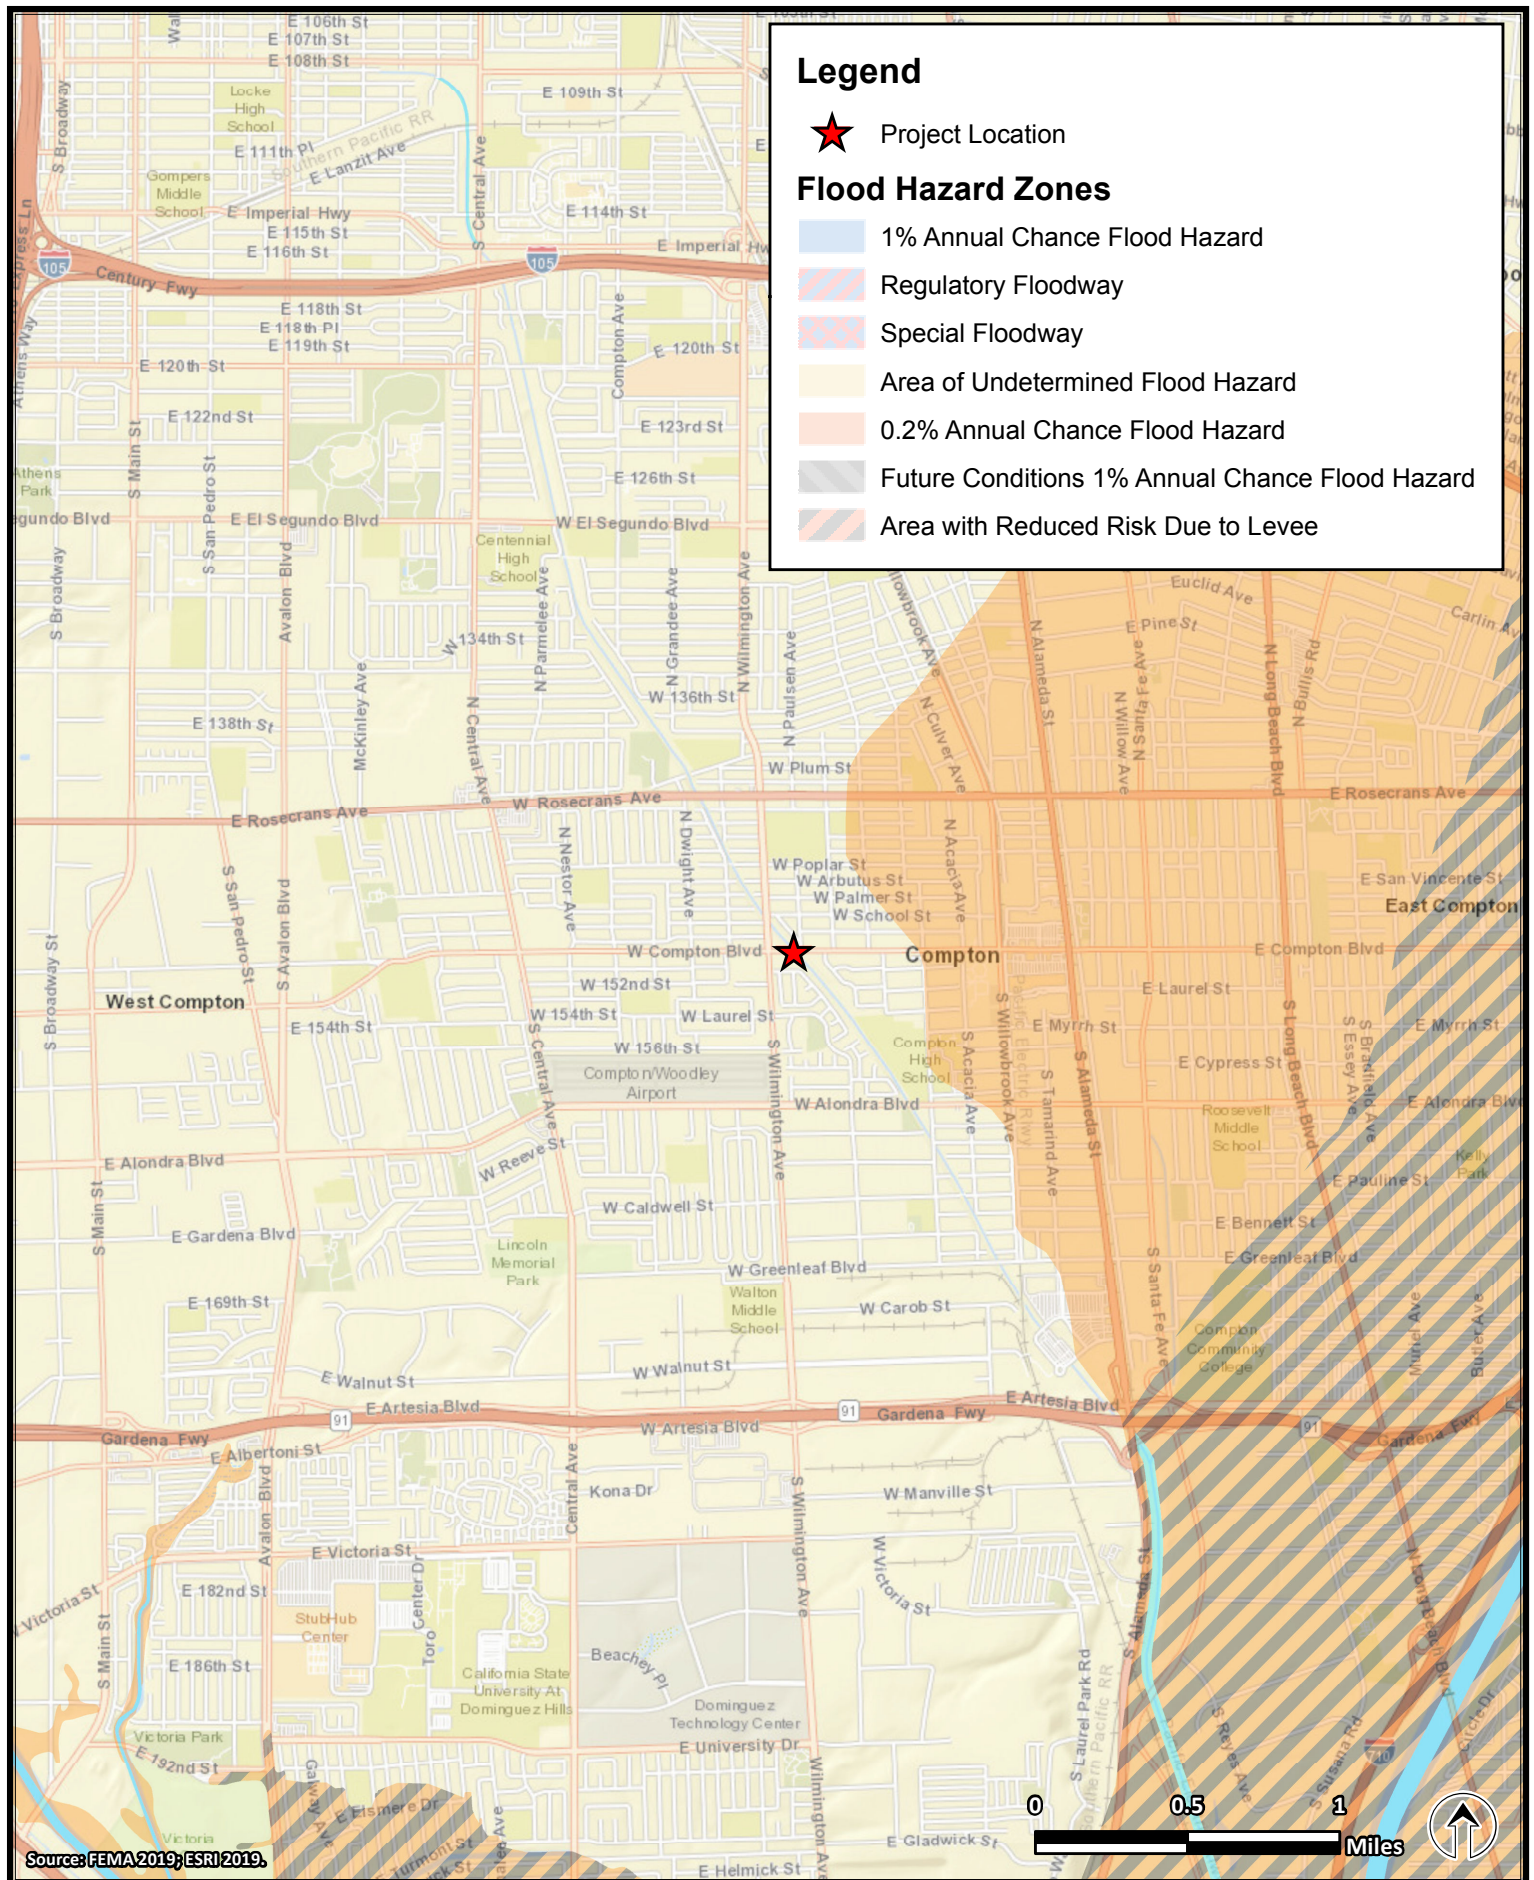

The City of Compton's water supply is a blend of mostly groundwater from the Central Basin groundwater basin and surface water imported by the Metropolitan Water District of Southern California (MWD). MWD's imported water sources are a blend of State Water Project water from Northern California, and water from the Colorado River Aqueduct. The City utilizes eight groundwater wells to pump potable water from a natural underground reservoir. The nearest groundwater well to the project area is well number 870H, approximately 0.4 mile to the northeast (Los Angeles County Department of Public Works n.d.). The City also has three imported water connections that help supplement the City's water demands.

3.1.3.3 *Groundwater Hydrology*

The classification system for groundwater was developed by the California Department of Water Resources (CDWR), and divides groundwaters into hydrologic regions (HR), basins, and subbasins (California Department of Water Resources 2003a). HRs are areas defined by physical hydrologic features such as watershed boundaries (California Department of Conservation 2010).

The project area is in the South Coast HR, which is bounded by the Pacific Ocean to the west, the crest of the San Jacinto Mountains to the east, the crest of the Transverse Ranges through the San Gabriel and San Bernardino mountains to the north, and the international boundary with the Republic of Mexico to the south. The South Coast HR contains the San Fernando, San Gabriel, Santa Ana River, and Santa Clara River valleys (California Department of Water Resources 2003b). The South Coast HR includes all of Orange County, most of San Diego and Los Angeles Counties, parts of Riverside, San Bernardino, and Ventura Counties, and a small amount of Kern and Santa Barbara Counties.

The South Coast HR has 56 delineated groundwater basins. Twenty-one basins are in subregion 4 (Los Angeles), eight basins are in subregion 8 (Santa Ana), and 27 basins are in subregion 9 (San Diego) (California Department of Water Resources 2003b). The project area is in the Central Groundwater Subbasin of the South Coast HR. The Central Subbasin extends over approximately 177,000 acres, and occupies a large portion of the southeastern part of the Coastal Plain of Los Angeles Groundwater Basin.

**FIGURE 5. FLOOD HAZARD ZONES MAP
Compton Boulevard over Compton Creek**

The depth of groundwater in the project area is approximately 45 feet below ground surface (bgs). Surface flows through Whittier Narrows are the major source of replenishment of the groundwater supply in the Central Subbasin. Groundwater also enters from surface and subsurface flow, and percolation of precipitation, stream flow, and imported and recycled water (California Department of Water Resources 2004b). Percolation is limited in some areas because of the number of paved surfaces. Water levels have historically varied over a range of about 5 to 25 feet since 1961. Most water wells show levels in 1999 that are in the upper portion of their recent historical range. Beneficial uses for groundwater supply from the Central Subbasin include municipal and domestic supply, industrial process supply, industrial service supply, and agricultural supply.

3.1.4 Geology/Soils

The project area is within the Los Angeles Basin, which is an actively subsiding basin bound by the Santa Monica and San Gabriel mountains to the north, the Santa Ana Mountains to the east, and the Palos Verdes Hills to the south (United States Geological Survey 1965). The project area is on the border of the Southwestern and Central blocks of the Los Angeles Basin. The project area is underlain by Quaternary nonmarine terrace deposits to the west of Compton Creek, and Alluvium to the east of the creek (California Department of Conservation 1962). Quaternary rocks include unconsolidated (i.e., loose materials such as clay and sand) and semi-consolidated sediments that are formed from alluvium, lake, playa, and terrace deposits and are mostly nonmarine in origin.

The soil-erodibility factor (K) represents: (1) the susceptibility of soil or surface material to erosion, (2) the transportability of the sediment, and (3) the amount and rate of runoff given a particular rainfall input, as measured under a standard condition. Fine-textured soils that are high in clay have low K values (about 0.05 to 0.15) because the particles are resistant to detachment. Coarse-textured soils, such as sandy soils, also have low K values (about 0.05 to 0.2) because of high infiltration resulting in low runoff, although these particles are easily detached. Medium-textured soils, such as a silt loam, have moderate K values (about 0.25 to 0.45) because they are moderately susceptible to particle detachment and they produce runoff at moderate rates. Soils having a high silt content are especially susceptible to erosion and have high K values, which can exceed 0.45 and can be as large as 0.65. Silt-size particles are easily detached and tend to crust, producing high runoff rates and large runoff volumes. The project area has a K-factor rating of 0.32, which means that underlying soil is medium-textured and yields runoff at a moderate rate. However, the creek is entirely paved with no potential for soil erosion within the channel.

3.1.5 Biological Communities

A *Natural Environment Study Minimal Impacts* (NESMI) was prepared to evaluate potential biological impacts that could occur as a result of the project (Dudek 2019). The following discussion incorporates findings from the NESMI.

The project area is surrounded by urban development and adjacent to a variety of land uses including residential and commercial. The project area also includes a recreational trail. Vegetation communities and land covers found within the project area are entirely non-native and non-natural land covers comprised of urban/developed land, disturbed habitat, ornamental vegetation, as well as concrete-lined channels associated with Compton Creek.

Areas of potential jurisdiction were evaluated according to the USACE, RWQCB, and CDFW criteria as part of the NESMI. Within the project area, Compton Creek is a rectangular concrete-lined flood control channel devoid of vegetation in the channel bottom with a clear demarcation of the potential limits of regulatory agency jurisdiction. The limits of jurisdiction for channelized rectangular channels are defined as the channel bottom for USACE and RWQCB, and the top of the channel bank or vertical wall for CDFW. Channels with vertical concrete walls have the same limit of jurisdiction for all three regulatory agencies. Therefore, the project area contains regulated non-wetland Waters of the U.S. and State. Temporary and permanent impacts to waters of the U.S. and State are anticipated to occur as a result of the project. Therefore, the project would require a Section 404 Permit from USACE, a Section 401 Water Quality Certification from the RWQCB, and a 1600 Streambed Alteration Agreement from CDFW.

3.1.5.1 Aquatic Habitat

The proposed project is centered on Compton Creek (United States Geological Survey [USGS] Hydrologic Unit Code [HUC] 12: 180701050402), a north-south trending, USGS intermittent watercourse, and tributary to the Los Angeles River (USGS HUC8: 18070105) (United States Geological Survey 2019). Compton Creek within the project area conveys flow from upstream headwaters, through a heavily urbanized portion of the southern Los Angeles Basin, and eventually converges with the Los Angeles River approximately four miles southeast of the project area. Within the project area, Compton Creek is a rectangular concrete-lined flood control channel devoid of vegetation in the channel bottom with a clear demarcation of the potential limits of regulatory agency jurisdiction.

3.1.5.1.1 *Special Status Species*

Thirty-eight special-status plant species are reported to occur within the USGS 7.5-minute South Gate quadrangle and surrounding eight 7.5-minute quadrangles (i.e., Hollywood, Los Angeles, El Monte, Inglewood, Whittier, Torrance, Long Beach, and Los Alamitos) or included within the United States Fish and Wildlife Service (USFWS) Information Planning and Conservation (IPaC) Trust Resource List for the proposed project. Potential habitat was determined to be absent for all of the thirty-eight species due to the heavily urbanized nature of the project area.

Forty-seven special-status wildlife species are reported to occur within the USGS 7.5-minute South Gate quadrangle and surrounding eight 7.5-minute quadrangles (i.e., Hollywood, Los Angeles, El Monte, Inglewood, Whittier, Torrance, Long Beach, and Los Alamitos) (California Department of Fish and Wildlife 2019, United States Fish and Wildlife Service 2019, National Marine Fisheries Service 2016). Thirteen of these species are federally- and/or State-listed (or proposed for listing) as endangered or threatened species. Potential habitat was determined to be absent for forty-four species. Of the three species determined to have potential habitat present, none were determined to have a moderate or higher potential to occur.

3.1.5.1.2 *Stream/Riparian Habitats*

Streams are defined in the California Code of Regulations (CCR) (14 CCR Section 1.72) as “a body of water that flows at least periodically or intermittently through a bed or channel having banks and that support fish or other aquatic life. This includes watercourses having surface or subsurface flow that supports or has supported riparian vegetation.” Under the California Fish and Game Code, the limits of CDFW’s jurisdiction within streams and other drainages extends

from the top of the stream bank to the top of the opposite bank, to the outer drip line in areas containing riparian vegetation, and/or within the 100-year floodplain of a stream or river system containing fish or wildlife resources. Compton Creek Channel is completely lined with concrete in the project area. The lower 2.7 miles of creek, which is outside the project area, is reinforced by concrete along the sides and has an earthen bottom that supports wetland habitat. This portion of the creek begins approximately 1.4 miles to the southeast from the project area. Compton Creek is considered a stream for the purposes of this report per 14 CCR Section 1.72.

3.1.5.1.3 Wetlands

CDFW has jurisdictional authority over waters of the state, including wetlands. In practice, CDFW follows the USFWS definition of wetlands in Cowardin's Classification of Wetlands and Deepwater Habitats of the United States: "Wetlands are lands transitional between terrestrial and aquatic systems where the water table is usually at or near the surface or the land is covered by shallow water. For purposes of this classification, wetlands must have one or more of the following three attributes: 1) at least periodically, the land supports hydrophytes; 2) the substrate is predominantly undrained hydric soil; and 3) the substrate is non-soil and is saturated with water or covered by shallow water at some time during the growing season of each year" (Cowardin, Carter, Golet, & LaRoe, 1979).

A formal jurisdictional waters delineation was not conducted for the project; however, the project would occur over and within the Compton Creek flood control channel that are likely to be Waters of the U.S. and Waters of the State. Temporary and permanent impacts to waters of the U.S. and State are anticipated to occur as a result of the proposed project. Therefore, the proposed project would likely require a Section 404 Permit from ACOE, a Section 401 Water Quality Certification from the RWQCB, and a 1600 Streambed Alteration Agreement from CDFW.

3.1.5.1.4 Fish Passage

An official species list was obtained through email from the National Marine Fisheries Service (NMFS), and the species listed were considered for their potential to occur within the BSA. The NMFS species list is provided in Appendix B of the NESMI. One federal endangered/state fully protected and state endangered fish species, the Mohave tui chub (*Siphateles bicolor mohavensis*), is known to occur in areas surrounding the BSA. However, the fish species is not expected to occur in the project area because suitable associated habitat is not present in the BSA. In addition, the project area does not include Essential Fish Habitat (National Marine Fisheries Service 2019). Therefore, the project area does not include fish habitat or support fish passage.

4 ENVIRONMENTAL CONSEQUENCES

4.1 Introduction

Impacts to water quality can include temporary and/or long-term effects. Generally, temporary impacts apply to the construction phase of a project. The project would result in a DSA of 1.0 acre or more and is required to obtain coverage under Construction General NPDES Permit Number CAS000002 (CGP) (see Section 5, Avoidance and Minimization Measures).

Long-term impacts are usually caused by addition of net impervious surface area. As discussed below, the project could result in negligible increases in impervious surface area that would be accommodated by existing drainage systems. Therefore, proposed stormwater improvements are not included as part of the project. The project would comply with the *County of Los Angeles Best Management Practices Design Manual* (County of Los Angeles 2010)(see Section 5, Avoidance and Minimization Measures).

4.2 Potential Impacts to Water Quality

As discussed below, with implementation of the proposed minimization measures and BMPs, direct and indirect impacts on water quality would be minimized. In addition, no substantial or adverse changes in the physical/chemical, biological, or human use characteristics of the aquatic environment are anticipated to result from the project.

4.2.1 Anticipated Changes to the Physical/Chemical Characteristics of the Aquatic Environment

4.2.1.1 Substrate

Project construction would require work within the Compton Creek channel. Proposed construction activities within the channel include removal and reconstruction of the middle bridge pier. Hydraulic hammers and a backhoe would be utilized to demolish and remove the existing concrete pier. Grading would be required for the foundation supporting the pile cap. A drill rig would be utilized to drill holes for the piles, and manual installation and a crane would be required to install the reinforcement and forms for the piles, pile cap, and pier wall. The project would include cut and fill activity for the construction of the abutment pile caps behind the existing channel walls. Excavation to approximately 10 feet deep along the cap length would be needed to construct the cap, and structural backfill would be needed after the cap is constructed. Concrete would be installed using a concrete pump truck behind the existing channel walls. Pier construction would last approximately two months.

The project construction area would encompass approximately 1.21 acres. Temporary impacts on substrate could result from construction crews and equipment accessing the creek channels, temporary water diversions and support structures, excavation of the channel bottom for cap construction, and the use of other heavy equipment within the channel. However, disturbance of substrate in the channel would be localized within relatively small areas directly beneath the bridge pier and footings. Temporary water diversions and support structures would be removed following construction, and disturbed areas would be restored to the extent feasible. Therefore, the project would temporarily affect the substrate of the waterway during construction; however,

the channel is concrete-lined, and these impacts would not adversely affect the beneficial uses of the creek.

Following project construction, no disturbance to the substrate would be required while the project is in operation. Therefore, no substantial changes to the substrate are anticipated.

4.2.1.2 Currents, Circulation or Drainage Patterns

The project would require in-channel work to replace the existing bridge. Project construction would include pile drilling at the pier locations. During construction, temporary water diversion and temporary structures could be required for work within the creek; however, these structures would be removed following construction. Therefore, any changes to circulation or drainage from these structures would be temporary. With implementation of BMPs, which include soil stabilization, sediment control, wind erosion control, tracking control, non-stormwater management, and waste management and material pollution control (see avoidance and minimization measure **WQ-3** listed in Section 5, Avoidance and Minimization Measures), project construction would not result in an altered flow rate or an increased volume of flow. In addition, construction of the project would not result in seasonal changes or tidal influences in the channel. The depth of Compton Creek would not change as a result of the project.

The project could result in negligible increases in impervious surface area (approximately 0.05 acre), resulting from an access road (currently dirt) on the southwest corner of the bridge that would be reconstructed with a concrete slab. All of the other project components (bridge, sidewalks, bike path, new bridge abutments, and a sloping pier nose for the new bridge) are already impervious surfaces (concrete or asphalt). Because any potential change in impervious surface area would be minor, the drainage facilities at the bridge and creek channel would be able to accommodate future stormwater flows following project implementation. The project would not result in any permanent impacts on currents, circulation, or drainage patterns. Therefore, no substantial changes to currents, circulation, or drainage patterns are anticipated to result from the project.

4.2.1.3 Suspended Particulates (Turbidity)

Compton Creek is completely channelized with concrete. Some grassy areas and vegetation are adjacent to the channel walls. Construction activities and vehicle access within the channel would be required during project construction. The existing channel is lined with concrete and is not susceptible to erosion. However, existing pier timber piles would be removed three feet below the finished grade, and new pile caps would be graded in preparation for the new bridge structure. Additionally, project construction would include excavation and reconstruction of existing roadway, sidewalks, and bike path adjacent to the channel.

Removal and reconstruction of the bridge piers and adjacent roadways, sidewalks, and bike paths could result in temporary increases in debris and soil erosion. Therefore, soil disturbance could result in increased turbidity and total suspended solids during project construction. Measures **WQ-1** through **WQ-4**, listed in Section 5, Avoidance and Minimization Measures, include compliance with the applicable NPDES Permit, SWPPP, and SWRCB CGP, which would include requirements to stabilize soils and minimize potential for discharge of suspended particulates in the creek. The contractor would develop a list of BMPs and inspection protocols that would comply with Caltrans standards. The existing roadway and embankment would be restored to match existing stabilized conditions. Therefore, temporary impacts related to suspended particulates would be minimized.

Following project construction, no soil-disturbing or erosive activity would be required while the project is in operation. Therefore, no substantial changes to suspended particulates and turbidity would be anticipated as a result of the project.

4.2.1.4 Oil, Grease and Chemical Pollutants

During construction, use of equipment and materials could result in the release of pollutants into waterbodies, including oil, grease or other chemical pollutants, such as metals and pesticides. Construction equipment would be staged on 200 feet of approach roadway on either side of the bridge. Additionally, project construction would require access and operation of construction equipment within the channel. The project would include implementation of measures **WQ-1** through **WQ-4**, listed in Section 5, Avoidance and Minimization Measures. Prior to construction, a SWPPP would be prepared to outline appropriate construction BMPs, which would include requirements to stabilize soils and minimize potential for discharge of suspended particulates, to prevent any pollutants from entering the creek within the project area. Therefore, no substantial changes to levels of oil, grease, and chemical pollutants are anticipated during project construction.

During project operation, oil, grease, and chemical pollutants could be discharged onto roadways as a result of incidental drippings from vehicles and accidental maintenance spills that could be carried into the creek through stormwater runoff. Potential pollutants could include oils, bridge paint, and surface treatments. The project would not result in increased vehicular use of a roadway or expansion of roadway surface area that could result in increased deposition of oil, grease, and other chemical pollutants typically collected on roadways. The project could result in a minor permanent increase in impervious surface area; however, potential minor impervious surface area increases would result in negligible impacts to drainage, stormwater runoff, and water quality conditions. Therefore, the project would not result in a substantial increase in discharge of oil, grease, and chemical pollutants into the creek.

4.2.1.5 Temperature, Oxygen, Depletion and Other Parameters

Project construction could result in the generation of trash and debris that have potential to enter the creek, which could affect temperature, oxygen, and other parameters in the creek. Prior to construction, a SWPPP would be prepared to outline appropriate construction BMPs that would be implemented to prevent any pollutants from entering the creek within the project area. Additionally, the project would include implementation of measures **WQ-1** through **WQ-4**, listed in Section 5, Avoidance and Minimization Measures, to prevent pollutants from entering the creek during construction.

Following project construction, the project would not generate additional sources of pollution that could affect temperature, oxygen, or other parameters. Therefore, the project would not result in permanent impacts related to these conditions.

4.2.1.6 Flood Control Functions

According to **Figure 4**, Flood Hazard Zones Map, the project area is identified as Zone X, which is defined as an area determined to be outside of the 0.2 percent annual chance floodplain. The maximum water depth of the channel in the project vicinity ranges from approximately 12.84 to 13.42 feet. During construction, the project would require work within the Compton Creek

channel to replace the existing bridge. During project construction, minor, temporary supports could be required within the channel for the removal and reconstruction of the bridge pier; however, the supports would be minor structures that would be completely removed following construction.

The project could result in a permanent minor increase in impervious surface area; however, potential minor impervious surface area increases would result in negligible impacts to drainage, stormwater runoff, and water quality conditions. In addition, the proposed bridge structure is similar to the existing structure. Because proposed drainage conditions would be similar to existing conditions, stormwater runoff and creek flows would remain similar to existing flow conditions. Therefore, no substantial changes to the floodplains or flood control functions are anticipated.

4.2.1.7 Storm, Wave and Erosion Buffers

Wetlands may serve as buffer zones, shielding upland areas from wave actions, storm damage and erosion, per 40 CFR § 230.41. Storm, wave, and erosion buffers, including wetlands, are not located in the project area. Therefore, no substantial changes to storm, wave, and erosion buffers are anticipated during project construction or operation.

4.2.1.8 Erosion and Accretion Patterns

Some grassy areas and vegetation are adjacent to the channel walls. Equipment staging, movement of construction vehicles, and construction activity in and adjacent to the channel could result in increased erosion potential; however, the project would include implementation of measures **WQ-1** through **WQ-4**, listed in Section 5, Avoidance and Minimization Measures, to avoid/minimize erosion during construction. A SWPPP would be prepared to outline appropriate construction BMPs that would be implemented to prevent erosion during project construction.

During project operation, there is no potential for erosion within the project area, as the project includes replacement and reconstruction of existing facilities, including the bridge, roadway, bicycle ramps, and embankments, which are paved and stabilized. Therefore, no substantial changes to erosion and accretion patterns are anticipated as a result of the project.

4.2.1.9 Aquifer Recharge/Groundwater

Groundwater is approximately 45 feet bgs in the project area. Project construction would include excavation to approximately 10 feet deep along the cap length to construct the cap and structural backfill. Therefore, project construction is not anticipated to require dewatering. Construction activity is not anticipated to reach groundwater and would not result in groundwater depletion or contamination.

The project could result in a permanent minor increase in impervious surface area (approximately 0.05 acre), resulting from an access road (currently dirt) on the southwest corner of the bridge that would be reconstructed with a concrete slab; however, potential minor impervious surface area increases would result in negligible impacts to drainage, stormwater runoff, and water quality conditions. The project would include the replacement of the existing bridge, and the reconstruction of existing roadway and bicycle ramps, which are existing impervious surfaces. The project would not affect the infiltration of stormwater or groundwater recharge in the project area. Additionally, the project would not result in additional traffic or an

increase in pollutant discharge that could contribute to groundwater contamination. Therefore, the project would not be anticipated to result in substantial changes to aquifer recharge or groundwater conditions.

4.2.1.10 Baseflow

Baseflow is the portion of water in a channel that is the constant stream flow in the absence or stormwater runoff. Year-round low flow in the project area is primarily from urban runoff. Compton Creek is a subwatershed of the Los Angeles River Watershed that drains approximately 42.1 square miles. The project could result in a permanent minor increase in impervious surface area (approximately 0.05 acre), resulting from an access road (currently dirt) on the southwest corner of the bridge that would be reconstructed with a concrete slab. However, potential minor impervious surface area increases would result in negligible impacts to drainage, stormwater runoff, and water quality conditions. Avoidance and minimization measures **WQ-1** through **WQ-3** would be implemented to avoid and minimize potential impacts on stormwater runoff and water quality as a result of the project. Therefore, the project would not result in substantial changes to baseflow of the creek.

4.2.2 Anticipated Changes to the Biological Characteristics of the Aquatic Environment

4.2.2.1 Special Aquatic Sites

According to Code of Federal Regulations 40 Part 230, special aquatic sites are geographic areas that have special ecological characteristics, such as productivity, habitat, wildlife protection, or other important and easily disrupted ecological values. These areas, which include wetlands, mudflats, vegetated shallow, coral reefs, and riffle and pool complexes, are generally recognized as areas that substantially influence or positively contribute to the general overall environmental health or vitality of the entire ecosystem of a region. The project area does not include any geographic areas characterized as special aquatic sites. Therefore, the project would not result in impacts on special aquatic sites.

4.2.2.2 Habitat for Fish and Other Aquatic Organisms

The aquatic environment of the project area does not support fish habitat or habitat for other aquatic organisms; therefore, the project would have no impact on habitat for fish and other aquatic organisms.

4.2.2.2.1 Fish Passage (*Beneficial Uses*)

The aquatic environment of the project area does not support fish passage; therefore, the project would have no impact on fish passage.

4.2.2.3 Wildlife Habitat

The project area is unlikely to contain wildlife or potential wildlife habitat. Project construction would include ground disturbance within the Compton Creek Channel and along the channel banks. Although the proposed project is not expected to impact special-status wildlife species, ornamental vegetation within the project area could provide suitable habitat for nesting birds.

The proposed project involves the removal of one tree located on private property immediately northeast of the project boundary and may potentially involve the removal of several public trees. Nesting birds could be indirectly impacted from short-term construction-related noise, resulting in decreased reproductive success or nest abandonment. Therefore, if project activities were to occur during the general avian breeding season of February 1 through September 1, the project may directly and indirectly impact nesting birds protected under the Migratory Bird Treaty Act (MBTA) and California Fish and Game (CFG) Code. However, with implementation of avoidance and minimization measure **WQ-6**, the project would avoid impacts to nesting birds and potential nesting bird habitat. Therefore, the project is not anticipated to result in impacts on wildlife habitat.

4.2.2.3.1 *Wildlife Passage (Beneficial Uses)*

The project area is surrounded by urban, developed land uses, and does not contain any greenbelts for wildlife movement, or native vegetation and undeveloped land capable of facilitating the movement of species between large tracts of native habitat. The Compton Creek watershed is entirely urban, so the channel does not connect any large natural areas upstream with the Los Angeles River and Pacific Ocean downstream. Therefore, the project is not anticipated to result in impacts on wildlife passage.

4.2.2.4 Endangered or Threatened Species

The project area is located within a developed portion of southern Los Angeles County (i.e. City of Compton) and would not result in the removal or degradation of any natural communities. The project area is primarily developed with the bridge site spanning over an existing concrete-lined flood control channel (i.e., Compton Creek), reducing the potential for special-status plant and wildlife species to occur. No designated Critical Habitat is mapped within the project area. Additionally, no primary constituent elements for Critical Habitat in the region occur within the project area. Therefore, the project is not anticipated to result in impacts on endangered or threatened species.

4.2.2.5 Invasive Species

Invasive plants are a subset of nonnative plants that spread into undisturbed ecosystems and generally negatively impact native plants and alter ecosystem processes. One species was found in the project area that is rated as “Moderate” by California Invasive Plant Council (2019): shortpod mustard (*Hirschfeldia incana*). Shortpod mustard is common in the project vicinity in disturbed habitats. General BMPs that would be implemented as part of the project design would include the cleaning of construction equipment prior to entering the site to reduce the spread of invasive plant seeds. Therefore, the project is not anticipated to result in impacts related to invasive species.

4.2.3 Anticipated Changes to the Human Use Characteristics of the Aquatic Environment

4.2.3.1 Existing and Potential Water Supplies; Water Conservation

Beneficial uses of Compton Creek include groundwater recharge, municipal and domestic water supply, water contact recreation, noncontact water recreation, warm freshwater habitat,

wetlands, and wildlife habitat (California Department of Transportation 2019). During project construction and operation, minimal water would be required for construction activities. Water would be brought in by truck and would not be sourced from the creek. Project operation would not require a water supply. Therefore, the project would not result in a substantial change to existing or potential water supplies.

4.2.3.2 Recreational or Commercial Fisheries

No recreational or commercial fisheries are located within the project area. Therefore, the project would not result in impacts to recreational or commercial fisheries.

4.2.3.3 Other Water Related Recreation

Beneficial uses of Compton Creek include noncontact water recreation and contact water recreation. The noncontact recreational use in the project area includes multipurpose trails used by bicyclists and pedestrians. During construction, the project could result in temporary closures of Compton Creek Bike Trail that runs adjacent to the creek; however, a temporary detour would be provided during project construction, and access to the trail would resume following project construction (see measure **WQ-4**, listed in Section 5, Avoidance and Minimization Measures). The portion of Compton Creek in the project area does not directly support any contact water recreation. Therefore, the project would not result in a substantial change in water-related recreation opportunities.

4.2.3.4 Aesthetics of the Aquatic Ecosystem

During project construction, construction equipment and activities would be visible in and around the aquatic ecosystems of the project area; however, the aesthetic quality of the aquatic ecosystems would return to similar conditions following project construction. During project operation, the project area would appear similar to existing conditions with regard to color, material, and scale. Infrastructure in the creek would be repurposed and would not be substantially modified. Therefore, the project would not result in substantial changes to the aesthetics of the aquatic ecosystem.

4.2.3.5 Parks, National and Historic Monuments, National Seashores, Wild and Scenic Rivers, Wilderness Areas, etc.

The nearest park, Walter R. Tucker Park, is approximately 0.2 mile south of the project area. The project area includes the Compton Creek Bike Trail along the east side of the creek. The project would include reconstruction of Paulsen Avenue from Compton Boulevard to 105 feet southerly; reconstruction of 1030 feet of sidewalks along Compton Boulevard and adjacent roadways; 190 feet of bike path along the Compton Creek channel; and 150 feet of roadway approach on each side of the bridge.

During construction, the project could result in temporary closures of Compton Creek Bike Trail that runs adjacent to the creek; however, a temporary detour would be provided during project construction and access to the trail would resume following project completion (see measure **WQ-4**, listed in Section 5, Avoidance and Minimization Measures). The project area does not include national and historic monuments, national seashores, wild and scenic rivers, or wilderness areas. Therefore, the project is not anticipated to result in substantial impacts on these resources.

4.2.3.6 Traffic/Transportation Patterns

During project construction, full road closures on the Compton Boulevard Bridge would be required for approximately 280 days, and planned detour routes would be provided on Rosecrans Avenue, Wilmington Avenue, and Alameda Street (see measure **WQ-5**, listed in Section 5, Avoidance and Minimization Measures). Specifically, eastbound traffic on Compton Boulevard would be routed north onto Wilmington Avenue, east onto Rosecrans Avenue, and then south onto Alameda Street to connect back to Compton Boulevard. Similarly, westbound traffic on Compton Boulevard would be routed north onto Alameda Street, west onto Rosecrans Avenue, and then south onto Wilmington Avenue to connect back to Compton Boulevard.

During operation, traffic and transportation would improve because the project would address nonstandard features and design deficiencies. Therefore, no substantial traffic or transportation changes are anticipated that would substantially alter water resources or water quality in the project area.

4.2.3.7 Energy Consumption or Generation

Project construction would require a temporary need for energy to operate construction vehicles and equipment. Energy consumption would be minimal. The project would not include adding any lanes on the bridge, and therefore, traffic levels and energy required for vehicle use would not increase in the project area as a result of the project. Additional long-term energy resources would not be required for project operation. Therefore, the project would not result in substantial changes to energy consumption or generation.

4.2.3.8 Navigation

Navigation is not permitted in Compton Creek; therefore, the project would result in no changes to navigation.

4.2.3.9 Safety

Temporary detours and signage would be provided during construction of the project to maintain vehicle and pedestrian safety (see measures **WQ-4** and **WQ-5**, listed in Section 5, Avoidance and Minimization Measures). The existing bridge is classified as structurally deficient due to extensive cracking and delamination of the bridge deck. The project would include replacement of the bridge to comply with structural safety standards. Therefore, existing traffic safety and operations are expected to improve.

4.2.4 Temporary Impacts to Water Quality

4.2.4.1 No Build Alternative

Under the No Build Alternative, no change would result in existing water quality conditions; therefore, this alternative would not result in temporary impacts on water quality.

4.2.4.2 Build Alternative

The project would require construction activity that could result in temporary impacts on water quality. Proposed activities within Compton Creek would require coordination with, and permits from, several regulatory agencies, which could require additional time to coordinate. The anticipated reviews/permits associated with the improvements would include:

- CWA Section 401 Water Quality Certification (Los Angeles RWQCB)
- CWA Section 402 NPDES Permit (Los Angeles RWQCB, Order No. R4-2012-0175, NPDES Permit No. CAS004001) and Construction General Permit (SWRCB, 2009-0009-DWQ amended by 2010-0014-DWQ & 2012-0006-DWQ)
- CWA Section 404 Pre-Construction Notification (USACE) (Nationwide Permit 14 for Multiple Crossings and Nationwide Permit 33 for Temporary Construction, Access, and Dewatering)
- California Fish and Game Code Section 1602 Streambed Alteration Agreement (California Department of Fish and Wildlife (CDFW))

4.2.4.2.1 *Physical/Chemical Characteristics*

Project construction is anticipated to be completed between January 2023 and May 2024, and would last for approximately 280 working days. Construction activities would include grading, demolition, pile drilling, excavation, bridge construction, and pavement. Project construction could result in temporary increases of pollutant loads due to construction activities, such as oil and grease spills or leaks from heavy equipment or vehicles used for construction, trash from workers, construction debris, petroleum products from construction equipment, sanitary wastes from portable toilets, and other chemicals used for construction equipment, such as coolants, concrete curing compounds, and concrete waste.

Measures **WQ-1** through **WQ-4**, listed in Section 5, Avoidance and Minimization Measures, would be implemented as part of the project. Additionally, a SWPPP would be prepared to outline appropriate construction BMPs that would be implemented to prevent any pollutants from entering the creek within the project area. Through implementation of avoidance and minimization measures, pollutant discharges would be prevented throughout project construction. Therefore, the project would not be anticipated to result in substantial changes to the physical or chemical characteristics of the creek.

4.2.4.2.2 *Biological Characteristics*

Compton Creek within the project area does not include special aquatic sites or support habitat for fish and other aquatic organisms, wildlife, and endangered or threatened species. The project would require construction within the creek; however, the project is not anticipated to result in impacts on biological resources with implementation of BMPs and avoidance and minimization measure **WQ-6**.

4.2.4.2.3 *Human Use Characteristics*

Within the project area, existing beneficial uses include noncontact water recreation (California Department of Transportation 2019). During construction, access to the Compton Creek Bike Trail could be temporarily closed in some areas. Detours and signage would be implemented for trail users throughout the duration of construction (see measure **WQ-4**, listed in Section 5,

Avoidance and Minimization Measures). Following project completion, full access to the trails would resume. Therefore, the project would not result in substantial temporary changes to the human use characteristics of the creek.

4.2.5 Long-term Impacts During Operation and Maintenance

4.2.5.1 No Build Alternative

Under the No Build Alternative, no change would result in existing water quality conditions; therefore, this alternative would not result in long-term impacts on water quality.

4.2.5.2 Build Alternative

4.2.5.2.1 *Physical/Chemical Characteristics*

The project could result in a permanent minor increase in impervious surface area (approximately 0.05 acre), resulting from an access road (currently dirt) on the southwest corner of the bridge that would be reconstructed with a concrete slab; however, potential minor impervious surface area increases would result in negligible impacts to drainage, stormwater runoff, and water quality conditions. The project would not result in substantial changes to the line and grade of surface hydraulic conditions. The existing channel is completely lined with concrete and would remain channelized following project completion. Therefore, the project is not anticipated to result in substantial changes to the physical or chemical characteristics of the creek.

4.2.5.2.2 *Biological Characteristics*

Compton Creek within the project area does not include special aquatic sites or support habitat for fish and other aquatic organisms, wildlife, and endangered or threatened species. The project could result in a permanent net increase to impervious surface area (approximately 0.05 acre). However, changes to net impervious surface area would be minor and would not result in impacts on biological resources. Project operation would not require long-term creek access. Therefore, the project is not anticipated to result in impacts on biological resources.

4.2.5.2.3 *Human Use Characteristics*

The project would include reconstruction of 190 feet of the Compton Creek Bike Trail in the same place as the existing trail. Soil excavated from roadway and structural excavation would be used to fill portions of the trail at both corners of the bridge on Compton Boulevard. The alignment and features of the proposed trail would be similar to the existing trail. Following project construction, the trail would function the same as existing conditions. Therefore, the project would not result in substantial long-term changes to the human use characteristics of the creek.

4.3 Impact Assessment Methodology

Impacts that would result from the project have been assessed for the Build Alternative. With the implementation of BMPs and standard measures, direct and indirect impacts on water quality would be minimized.

4.4 Cumulative Impacts

The cumulative setting is considered the Los Angeles watershed. The Los Angeles watershed includes the project area and Compton Creek. Existing and continuing development, as well as flood control measures and structures, contribute to cumulative water quality impacts. The project would include bridge removal and replacement and would not contribute to development in the project area or surrounding vicinity.

During project construction, the project could result in disturbance of 1.21 acres. The project would have the potential to result in temporary increases to construction-related pollutants and turbidity within Compton Creek and its receiving water bodies. However, with implementation of measures **WQ-1** through **WQ-5**, listed in Section 5, Avoidance and Minimization Measures, the project is not anticipated to contribute to substantial cumulative impacts on water quality.

The project could result in a minor net increase to impervious surface area (approximately 0.05 acre), resulting from an access road (currently dirt) on the southwest corner of the bridge that would be reconstructed with a concrete slab. The imperviousness of a drainage area contributes to the runoff volume and pollutant loads that a water body receives following a storm event. The minor increase in impervious surface as a result of the project would be considered negligible. Existing drainage systems in the project area would be able to accommodate any minor increases to stormwater runoff. Although minor, the long-term implementation of transportation projects that add to the imperviousness of the Los Angeles Watershed could be considered a cumulatively considerable impact to overall water quality of receiving waters. However, the project would not result in a substantial contribution to cumulative water quality impacts in the Los Angeles watershed.

5 AVOIDANCE AND MINIMIZATION MEASURES

To avoid and/or minimize potential impacts to water quality, the following measures would be implemented:

- WQ-1:** The project would comply with the applicable RWQCB NPDES Permit (Order No. R4-2012-0175, NPDES Permit No. CAS004001), SWPPP, and SWRCB CGP (2009-0009-DWQ amended by 2010-0014-DWQ & 2012-0006-DWQ).
- WQ-2:** The project would comply with the *County of Los Angeles Best Management Practices Manual*.
- WQ-3:** The contractor would develop a BMP Inspections and Checklist that follows criteria identified in the Los Angeles County Department of Public Works Construction Site Best Management Practices Manual. The checklist would list standard construction BMPs, which include soil stabilization, sediment control, wind erosion control, tracking control, non-stormwater management, and waste management and material pollution control. BMPs would be inspected at a minimum of once per week, within 48 hours prior and after a qualifying rain event, and at least 24 hours during extended precipitation events during project construction.
- WQ-4:** A temporary trail detour would be provided during temporary closures of the Compton Creek Bike Trail. Signage would be placed in the project area to notify the public of the temporary detour route.
- WQ-5:** During construction, temporary detours and signage would be provided to maintain the flow of vehicle traffic.
- WQ-6:** To avoid potential direct and indirect impacts to nesting birds protected by the MBTA and CFG Code, project activities would avoid the general nesting season of February 1 through September 1. If this season cannot be avoided, then a pre-construction clearance survey should be conducted seven days prior to project activities to determine the presence/absence of any nesting bird species within the tree proposed for removal, as well as vegetation within 300 feet (for non-raptor bird species) and 500 feet (for raptor species) of the proposed work area. If a nesting bird is found, an avoidance buffer will be established around the nest, based on the species sensitivity to disturbance and proximity to impact areas. The buffer will remain in place as long as the nest is considered active, as determined by an on-site monitor. No encroachment into the buffer may occur within the consent of the on-site monitor, as long as a nest is still active.
