Purpose

This study will estimate the post-development peak flow rate for the 100-year storm event at the project site. A 100-year 24-hour Unit Hydrograph analysis is also included to satisfy WQMP volume runoff requirements.

Project Description

This hydrology study is for the Rancho Road Development Project in Adelanto, California. The site is in the vacant land southeast of Rancho Road and Adelanto Road in Adelanto, California. The site is mostly undeveloped, vacant land to the north and south. It is bounded by a stadium on the west and commercial/industrial buildings to the east. The site is 35.01 acres.

Location Map

Methodology

Calculations and design criteria contained within this report are consistent with the San Bernardino County Hydrology requirements. The hydrology and storage calculations are per rational method runoff equations and are in accordance with County design criteria as performed in the CivilDesign software.

Rainfall depths contained in this report used for CivilDesign software are based on NOAA Atlas 14 Point Precipitation Frequency Estimates.

The hydrologic soil type for the majority of the site is "A", with a portion of "C" on the east side of the lot. This value was taken from USDA Web Soil Survey. A "commercial" land use was used for the project site with AMC III for the proposed condition.

Project Site Drainage

Existing Site Drainage Conditions:

Currently, the existing site is undeveloped. The existing site generally slopes from south to north. There are no existing storm drains within the project site. The slopes within the project site range from flat to mild slopes, ranging from 2% to 10% in some areas. With the majority of the site being type A soils, the drainage percolates into the ground, and the remaining runoff flows to Rancho Road.

Proposed Site Drainage Conditions:

In the proposed condition, on site drainage on the south side of the lot will sheet flow within the proposed driveways into catch basins at various locations on site. Off-site drainage from the south sheet flows on-site across the proposed parking lot driveways and into the proposed catch basins. The drainage is then piped to the detention basin on the east side of the lot.

The drainage on the north side of the lot will sheet flow off site onto Rancho Road into catch basins along Rancho Road. Drainage is then piped to the detention basin on the east side of the lot.

Summary

The following table shows the pre-development peak flow rate for the project site at the following nodes:

Node	100-Year Storm Event
101	Q ₁₀₀ = 20.633 cfs
	T _c = 15.230 min
102	Q ₁₀₀ = 82.029 cfs
	T _c = 25.39 min
201	Q ₁₀₀ = 6.640 cfs
	T _c = 17.38 min

Total runoff = 109.302 cfs

The following table shows the post-development peak flow rate for the project site at the following nodes:

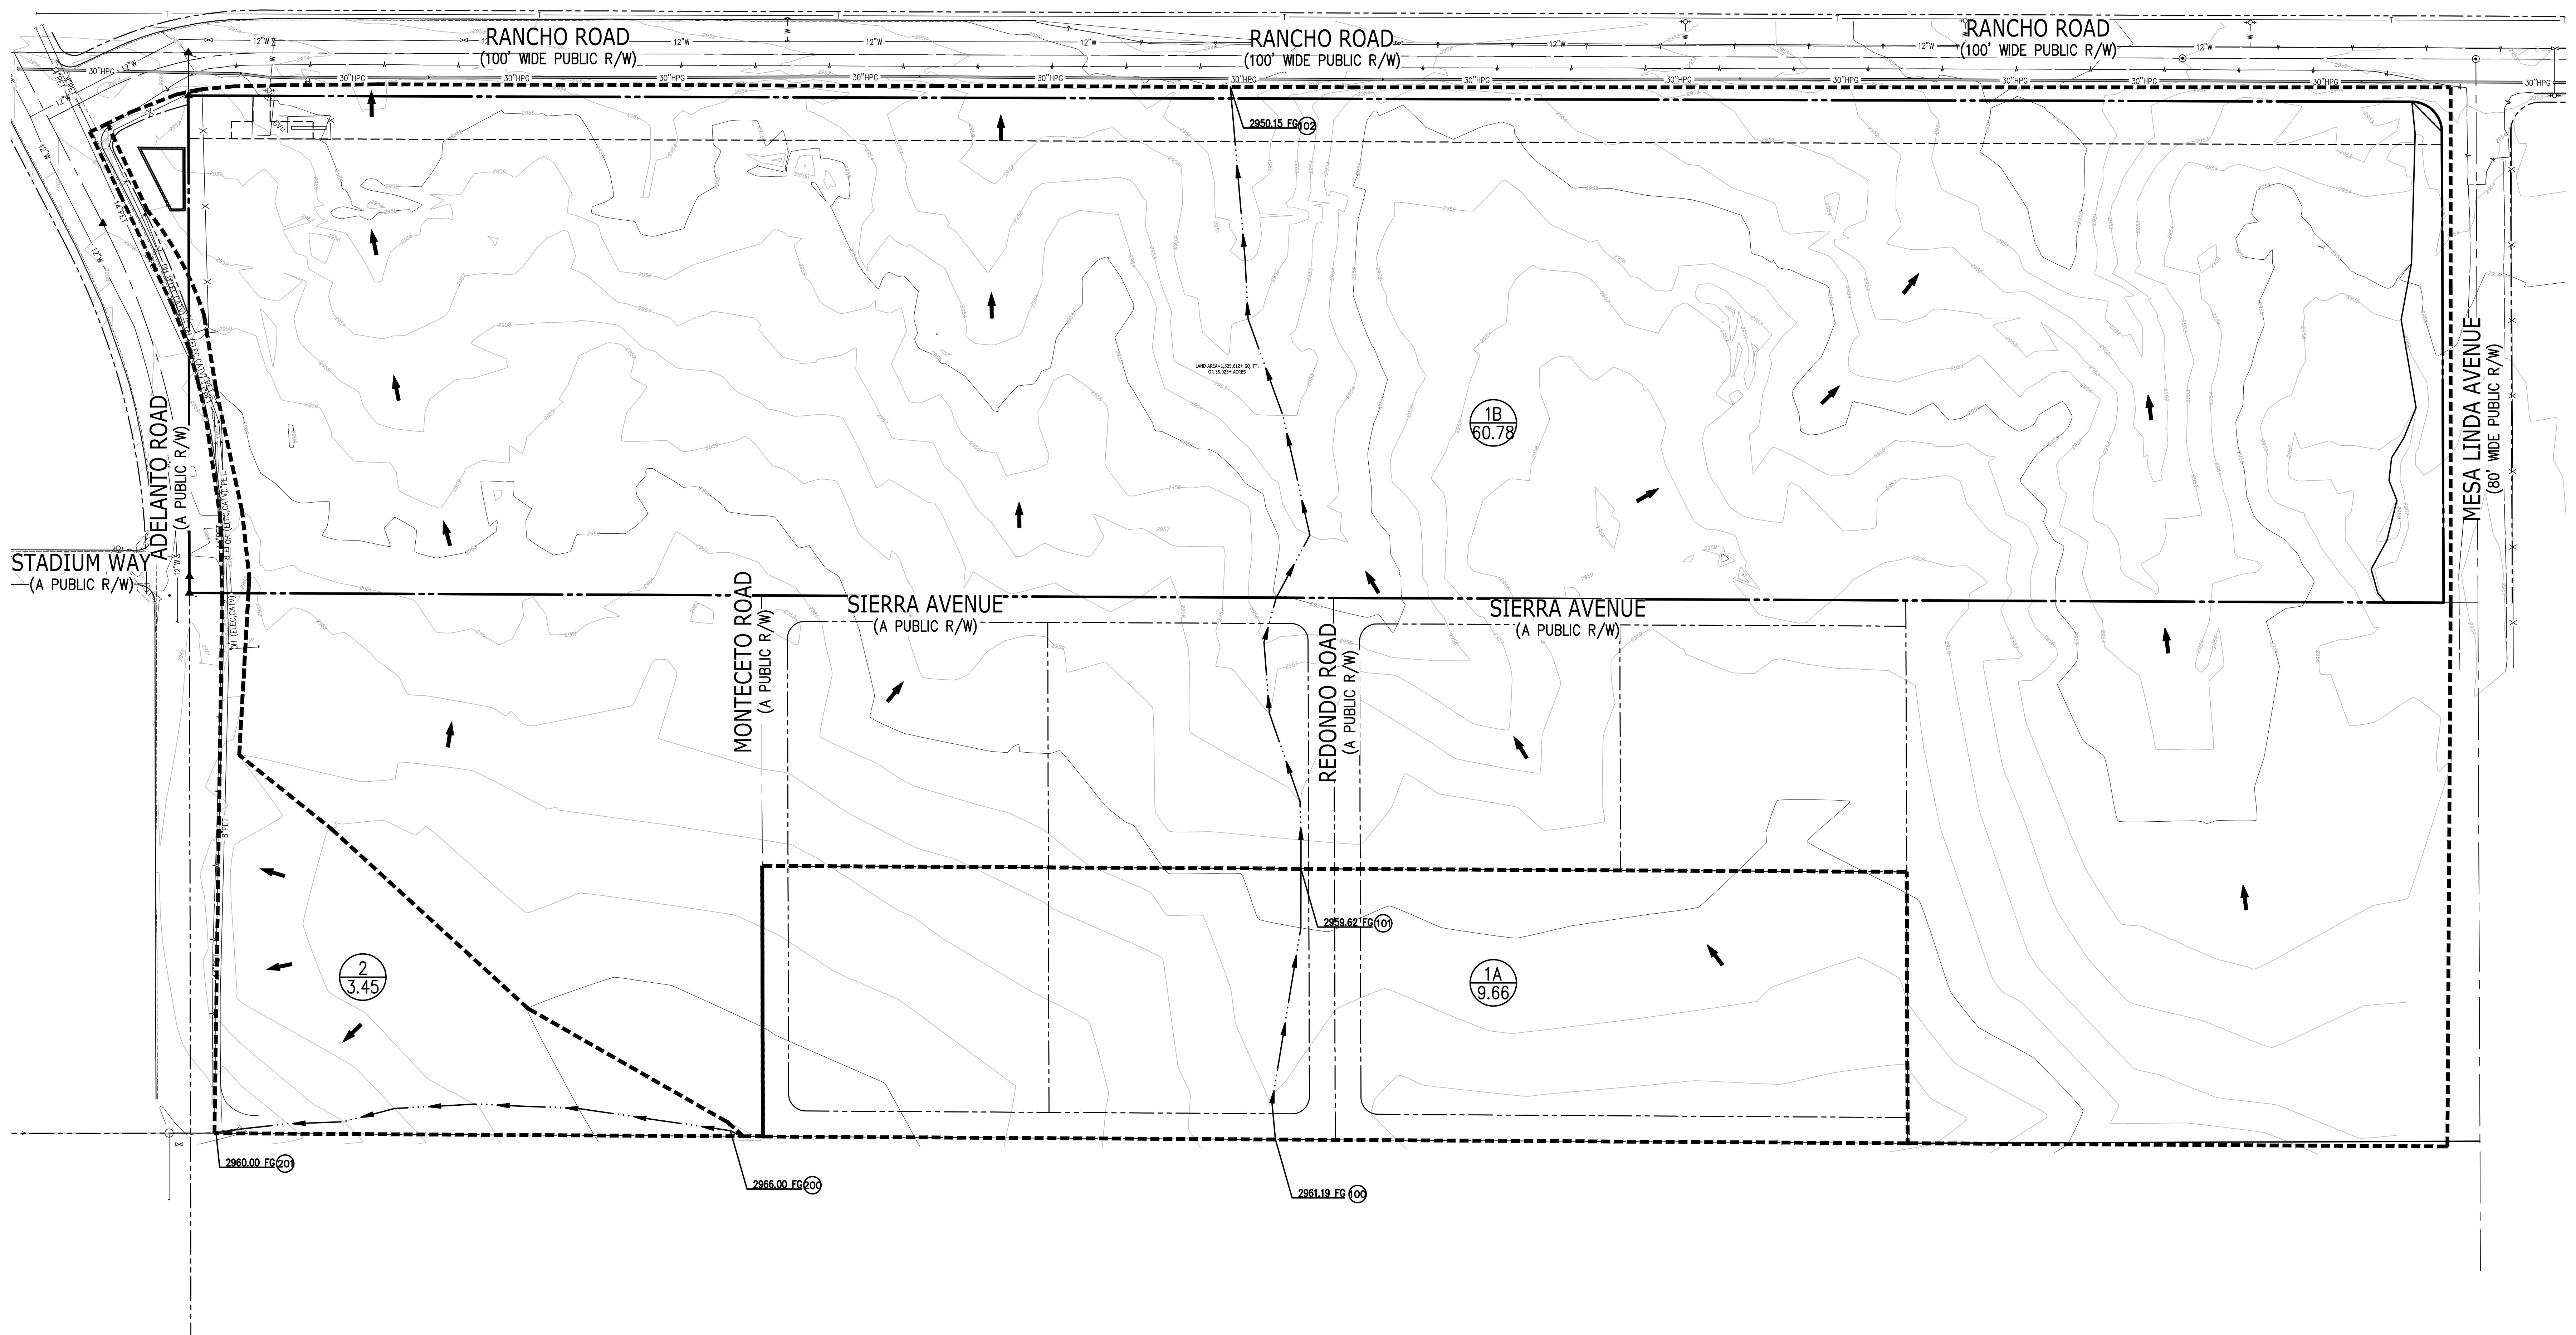

Node	100-Year Storm Event
101	Q ₁₀₀ = 9.913 cfs
	T _c = 9.56 min
102	Q ₁₀₀ = 11.868 cfs
	T _c = 15.84 min
103	Q ₁₀₀ = 12.281 cfs
	T _c = 22.19 min
201	Q ₁₀₀ = 25.140 cfs
	T _c = 10.32 min
202	Q ₁₀₀ = 19.422 cfs
	T _c = 10.70 min
203	Q ₁₀₀ = 87.564 cfs
	T _c = 13.42 min
301	Q ₁₀₀ = 6.053 cfs
	T _c = 17.134 min

Total runoff = 172.241 cfs

Results

The required capture volume is 221,071 cubic feet of storm water per the unit hydrograph and stage storage calculations. The basin has been sized to store 16.14 acre feet and can hold a total of 703,274.30 cubic feet of storm water. Since the runoff of the proposed development is greater than the existing runoff, detention of the additional runoff is required. Unit hydrograph calculations were prepared to establish the baseline Q_s for the 100-year 24-hour storm for the project. In order to mitigate the extra runoff, the basin has been sized to prevent extra runoff from leaving the site during the storm event. The basin drains before 72 hours.

 Runoff from this stream = 6.640(CFS)
 Time of concentration = 17.38 min.
 Rainfall intensity = 2.428(In/Hr)
 Area averaged loss rate (Fm) = 0.2900(In/Hr)
 Area averaged Pervious ratio (Ap) = 1.0000
 Summary of stream data:

Stream No.	Flow rate (CFS)	Area (Ac.)	TC (min)	Fm (In/Hr)	Rainfall Intensity (In/Hr)
------------	-----------------	------------	----------	------------	----------------------------

1	102.66	70.440	25.39	0.243	1.862
2	6.64	3.450	17.38	0.290	2.428

$$Q_{max}(1) = \frac{1.000 * 1.000 * 102.662}{0.735 * 1.000 * 6.640} + = 107.544$$

$$Q_{max}(2) = \frac{1.350 * 0.684 * 102.662}{1.000 * 1.000 * 6.640} + = 101.470$$

Total of 2 streams to confluence:

Flow rates before confluence point:

102.662 6.640

Maximum flow rates at confluence using above data:

107.544 101.470

Area of streams before confluence:

70.440 3.450

Effective area values after confluence:

73.890 51.665

Results of confluence:

Total flow rate = 107.544(CFS)

Time of concentration = 25.388 min.

Effective stream area after confluence = 73.890(Ac.)

Study area average Pervious fraction(Ap) = 1.000

Study area average soil loss rate(Fm) = 0.245(In/Hr)

Study area total (this main stream) = 73.89(Ac.)

End of computations, Total Study Area = 73.89 (Ac.)

The following figures may

be used for a unit hydrograph study of the same area.

Note: These figures do not consider reduced effective area effects caused by confluences in the rational equation.

Area averaged pervious area fraction(A_p) = 1.000
Area averaged SCS curve number = 70.1

***** Hydrology Study Control Information *****

Rational hydrology study storm event year is 100.0

10 Year storm 1 hour rainfall = 0.590(In.)

100 Year storm 1 hour rainfall = 1.020(In.)

Computed rainfall intensity:

Storm year = 100.00 1 hour rainfall = 1.020 (In.)

Slope used for rainfall intensity curve b = 0.7000

Soil antecedent moisture condition (AMC) = 3

+++++
Process from Point/Station 100.000 to Point/Station 101.000

**** INITIAL AREA EVALUATION ****

COMMERCIAL subarea type

Decimal fraction soil group A = 1.000

Decimal fraction soil group B = 0.000

Decimal fraction soil group C = 0.000

Decimal fraction soil group D = 0.000

SCS curve number for soil(AMC 2) = 32.00

Adjusted SCS curve number for AMC 3 = 52.00

Pervious ratio(A_p) = 0.1000 Max loss rate(F_m)= 0.079(In/Hr)

Initial subarea data:

Initial area flow distance = 638.400(Ft.)

Top (of initial area) elevation = 2964.300(Ft.)

Bottom (of initial area) elevation = 2955.840(Ft.)

Difference in elevation = 8.460(Ft.)

Slope = 0.01325 s(%)= 1.33
TC = $k(0.304)*[(\text{length}^3)/(\text{elevation change})]^{0.2}$
Initial area time of concentration = 9.560 min.
Rainfall intensity = 3.690(In/Hr) for a 100.0 year storm
Effective runoff coefficient used for area (Q=KCIA) is C = 0.881
Subarea runoff = 9.913(CFS)
Total initial stream area = 3.050(Ac.)
Pervious area fraction = 0.100
Initial area Fm value = 0.079(In/Hr)

+++++
Process from Point/Station 101.000 to Point/Station 102.000
**** STREET FLOW TRAVEL TIME + SUBAREA FLOW ADDITION ****

Top of street segment elevation = 2955.840(Ft.)
End of street segment elevation = 2950.380(Ft.)
Length of street segment = 975.000(Ft.)
Height of curb above gutter flowline = 6.0(In.)
Width of half street (curb to crown) = 40.000(Ft.)
Distance from crown to crossfall grade break = 38.000(Ft.)
Slope from gutter to grade break (v/hz) = 0.020
Slope from grade break to crown (v/hz) = 0.020
Street flow is on [1] side(s) of the street
Distance from curb to property line = 10.000(Ft.)
Slope from curb to property line (v/hz) = 0.020

Total of 3 streams to confluence:

Flow rates before confluence point:

34.062 132.125 6.053

Maximum flow rates at confluence using above data:

130.996 167.473 148.639

Area of streams before confluence:

19.150 51.640 3.110

Effective area values after confluence:

73.900 65.661 69.539

Results of confluence:

Total flow rate = 167.473(CFS)

Time of concentration = 13.422 min.

Effective stream area after confluence = 65.661(Ac.)

Study area average Pervious fraction(A_p) = 0.138

Study area average soil loss rate(F_m) = 0.077(In/Hr)

Study area total (this main stream) = 73.90(Ac.)

End of computations, Total Study Area = 73.90 (Ac.)

The following figures may

be used for a unit hydrograph study of the same area.

Note: These figures do not consider reduced effective area effects caused by confluences in the rational equation.

Area averaged pervious area fraction(A_p) = 0.138

Area averaged SCS curve number = 41.1

***** Area-averaged max loss rate, Fm *****

SCS curve No.(AMCII)	SCS curve NO.(AMC 3)	Area (Ac.)	Area Fraction	Fp(Fig C6) (In/Hr)	Ap (dec.)	Fm (In/Hr)
82.9	95.8	73.90	1.000	0.084	0.590	0.049

Area-averaged adjusted loss rate Fm (In/Hr) = 0.049

***** Area-Averaged low loss rate fraction, Yb *****

Area (Ac.)	Area Fract	SCS CN (AMC2)	SCS CN (AMC3)	S	Pervious Yield Fr
43.60	0.590	82.9	95.8	0.44	0.865
30.30	0.410	98.0	98.0	0.20	0.935

Area-averaged catchment yield fraction, Y = 0.893

Area-averaged low loss fraction, Yb = 0.107

User entry of time of concentration = 0.224 (hours)

++++++

Watershed area = 73.90(Ac.)

Catchment Lag time = 0.179 hours

Unit interval = 5.000 minutes

Unit interval percentage of lag time = 46.5030

Hydrograph baseflow = 0.00(CFS)

Average maximum watershed loss rate(Fm) = 0.049(In/Hr)

Average low loss rate fraction (Yb) = 0.107 (decimal)

VALLEY DEVELOPED S-Graph proportion = 0.750

VALLEY UNDEVELOPED S-Graph proportion = 0.000

FOOTHILL S-Graph proportion = 0.250

MOUNTAIN S-Graph proportion = 0.000

DESERT S-Graph proportion = 0.000

Computed peak 5-minute rainfall = 0.484(In)

Computed peak 30-minute rainfall = 0.828(In)

Specified peak 1-hour rainfall = 1.020(In)

Computed peak 3-hour rainfall = 1.537(In)

Specified peak 6-hour rainfall = 1.990(In)

Specified peak 24-hour rainfall = 3.570(In)

Rainfall depth area reduction factors:

Using a total area of 73.90(Ac.) (Ref: fig. E-4)

5-minute factor = 0.997 Adjusted rainfall = 0.482(In)

30-minute factor = 0.997 Adjusted rainfall = 0.826(In)

1-hour factor = 0.997 Adjusted rainfall = 1.016(In)

3-hour factor = 1.000 Adjusted rainfall = 1.536(In)

6-hour factor = 1.000 Adjusted rainfall = 1.990 (In)
 24-hour factor = 1.000 Adjusted rainfall = 3.570 (In)

¹ Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: San Bernardino County, California, Mojave River Area

Survey Area Data: Version 13, Sep 13, 2021

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Mar 27, 2021—May 24, 2021

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
105	BRYMAN LOAMY FINE SAND, 0 TO 2 PERCENT SLOPES	C	12.7	15.7%
112	CAJON SAND, 0 TO 2 PERCENT SLOPES	A	68.1	84.3%
Totals for Area of Interest			80.8	100.0%

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Rating Options

Aggregation Method: Dominant Condition

Component Percent Cutoff: None Specified

Tie-break Rule: Higher
