## EXECUTIVE SUMMARY

---

The purpose of this study is to evaluate the potential for transportation impacts resulting from development of the proposed project in the context of the City of Loma Linda's discretionary authority for conformance with locally established operational standards. Although this is a technical report, effort has been made to write the report clearly and concisely. A glossary is provided in Appendix A to assist the reader with technical terms.

This study was prepared in consultation with City of Loma Linda staff and in accordance with the procedures and methodologies for assessing transportation impacts established by the City of Loma Linda. To assess the project's conformance with local operational standards, this study evaluates the project's effect on traffic operations and, if necessary, identifies recommended improvements or corrective measures to alleviate operational deficiencies substantially caused or worsened by the proposed project. For compliance with California Environmental Quality Act (CEQA) requirements, a vehicle miles traveled (VMT) assessment for the project is provided in a separate document (see *Canyon Ranch Vehicle Miles Traveled Assessment*, Ganddini Group, Inc., January 19, 2022).

### *Project Description*

#### Annexation Area

The approximately 141.4-acre proposed annex area is generally located south of Barton Road, west of San Timoteo Canyon Road/Nevada Street, and northeast of the Union Pacific Railroad line in the City of Loma Linda sphere of influence (currently unincorporated). The annexation includes a General Plan Amendment and Zoning Map Amendment to change four lots from the current designation and zone of General Commercial to Low Density Residential. The two tentative tract maps (TTM) and adjacent lots found within this portion of the sphere of influence will be annexed into the City.

#### Residential Projects TTM-20403 and TTM-20404

The approximately 66.7-acre proposed residential project site is located within the annexation area, north and south of Bermudez Street between San Timoteo Creek and San Timoteo Canyon Road in the City of Loma Linda, California. The project site is currently undeveloped and zoned for Low Density and Very Low Density Residential. The proposed residential project involves construction of two tentative tract maps consisting of 126 residential lots and 3 lettered lots [Project]. TTM-20403 consists of 37 lots (7,200 square feet minimum), a basin, and open space. TTM-20404 consists of 89 lots (2 units per acre density) and open area.

Vehicular access for the project site will be maintained at Barton Road, New Jersey Street, San Timoteo Road and Nevada Street. Additionally, the proposed project will vacate the Bermudez Street and San Timoteo Canyon Road intersection and construct a new cul-de-sac on the northern side of parcel 0293-091-04 with a 30-foot access driveway for the adjacent parcel on the east.

### *Project Trip Generation*

#### Annexation Area

The proposed annex area is forecast to generate approximately 4,429 daily trips, including 382 trips during the AM peak hour and 1,136 trips during the PM peak hour. The proposed annexation/zone change is forecast to result in a net of 1,189 more daily trips, including 87 more trips during the AM peak hour and 118 more trips during the PM peak hour.

## Residential Projects TTM-20403 and TTM-20404

The proposed project is forecast to generate approximately 1,188 daily trips, including 88 during the AM peak hour and 119 trips during the PM peak hour.

### *Level of Service Analysis*

The study intersections are forecast to operate within acceptable Levels of Service (C or better) during the peak hours for Existing, Existing Plus Project, Opening Year (2024) Without Project and Opening Year (2024) With Project conditions. Therefore, the proposed project is forecast to result in no project-related Level of Service deficiencies at the study intersections for the Existing Plus Project scenario.

The study intersections are forecast to operate within acceptable Levels of Service (C or better) during the peak hours for Year 2040 Without Project conditions, with the exception of the following study intersection that is forecast to operate at Levels of Service D or worse during peak hours:

5. Nevada Street (NS) at San Timoteo Canyon Road (EW) (D-AM / E-PM peak hour)

The proposed project is forecast to result in project related traffic deficiency at one (1) study intersection for Opening Year (2024) Without Project conditions without improvement based on the city-established thresholds.

The installation of a traffic signal is recommended at the Nevada Street and San Timoteo Canyon Road intersection. The study intersections are forecast to operate within acceptable Levels of Service (C or better) during the peak hours with improvements.

The study intersections are forecast to operate within acceptable Levels of Service (C or better) during the peak hours for Year 2040 With Project conditions, with the exception of the following study intersection that is forecast to operate at Levels of Service D or worse during peak hours:

5. Nevada Street (NS) at San Timoteo Canyon Road (EW) (D-AM / E-PM peak hour)

The study intersections are forecast to operate within acceptable Levels of Service (C or better) during the peak hours with the previously listed improvements.

### *Site Access Queuing Analysis*

The traffic volumes for project site access locations are forecast to operate within the available storage length during the peak hours for the evaluated scenarios conditions. Therefore, the proposed project is forecast to result in no project-related Level of Service deficiencies at the study intersections for evaluated scenarios.

### *Mitigation Measures*

The following improvement is required for Year 2040 Without and With Project conditions to maintain an acceptable Level of Service at the study intersection:

5. Nevada Street (NS) at San Timoteo Canyon Road (EW)
- Install a traffic signal.
  - Construct one southbound left turn lane.
  - Construct one westbound right turn lane.

Improvements at the project driveways are project design features which shall be constructed by the project. Site-adjacent improvements shall be constructed in conjunction with the project.

The project shall pay the appropriate transportation Development Impact Fee(s) as required by the City, as well as any fair share cost included in the report.

# 1. INTRODUCTION

---

This section introduces the proposed project and the general scope of the analysis.

## PROJECT DESCRIPTION

### Annexation Area

The approximately 141.4-acre proposed annex area is generally located south of Barton Road, west of San Timoteo Canyon Road/Nevada Street, and northeast of the Union Pacific Railroad line in the City of Loma Linda sphere of influence (currently unincorporated). The annexation includes a General Plan Amendment and Zoning Map Amendment to change four lots from the current designation and zone of General Commercial to Low Density Residential. The two tentative tract maps (TTM) and adjacent lots found within this portion of the sphere of influence will be annexed into the City. Figure 1 and Figure 2 show the regional location map and annexation area map.

### Residential Projects TTM-20403 and TTM-20404

The approximately 66.7-acre proposed residential project site is located within the annexation area, north and south of Bermudez Street between San Timoteo Creek and San Timoteo Canyon Road in the City of Loma Linda, California. The project site is currently undeveloped and zoned for Low Density and Very Low Density Residential. The proposed residential project involves construction of two tentative tract maps consisting of 126 residential lots and 3 lettered lots [Project]. TTM-20403 consists of 37 lots (7,200 square feet minimum), a basin, and open space TTM-20404 consists of 89 lots (2 units per acre density) and open area. Figure 3 and Figure 4 illustrates the project location map and project site plan.

Vehicular access for the project site will be maintained at Barton Road, New Jersey Street, San Timoteo Road and Nevada Street. Additionally, the proposed project will vacate the Bermudez Street and San Timoteo Canyon Road intersection and construct a new cul-de-sac on the northern side of parcel 0293-091-04 with a 30-foot access driveway for the adjacent parcel on the east.

## STUDY AREA

Based on the study intersections identified in the approved scoping agreement (Appendix B), the study area consists of the following study intersections within the City of Loma Linda and City of Redlands:

### Study Intersections<sup>1</sup>

1. California Street (NS) at Barton Road (EW)
2. New Jersey Street (NS) at Barton Road (EW)
3. New Jersey Street (NS) at Bermudez Street (EW)
4. San Timoteo Canyon Road (NS) at Barton Road (EW)
5. Nevada Street (NS) at San Timoteo Canyon Road (EW)
6. Nevada Street (NS) at Beaumont Avenue (EW)
7. Project Access (F) (NS) at Bermudez Street (EW)
8. San Timoteo Canyon Road (NS) at Project Access (G) (EW)
9. Nevada Street (NS) at Project Access (B) (EW)

## ANALYSIS SCENARIOS

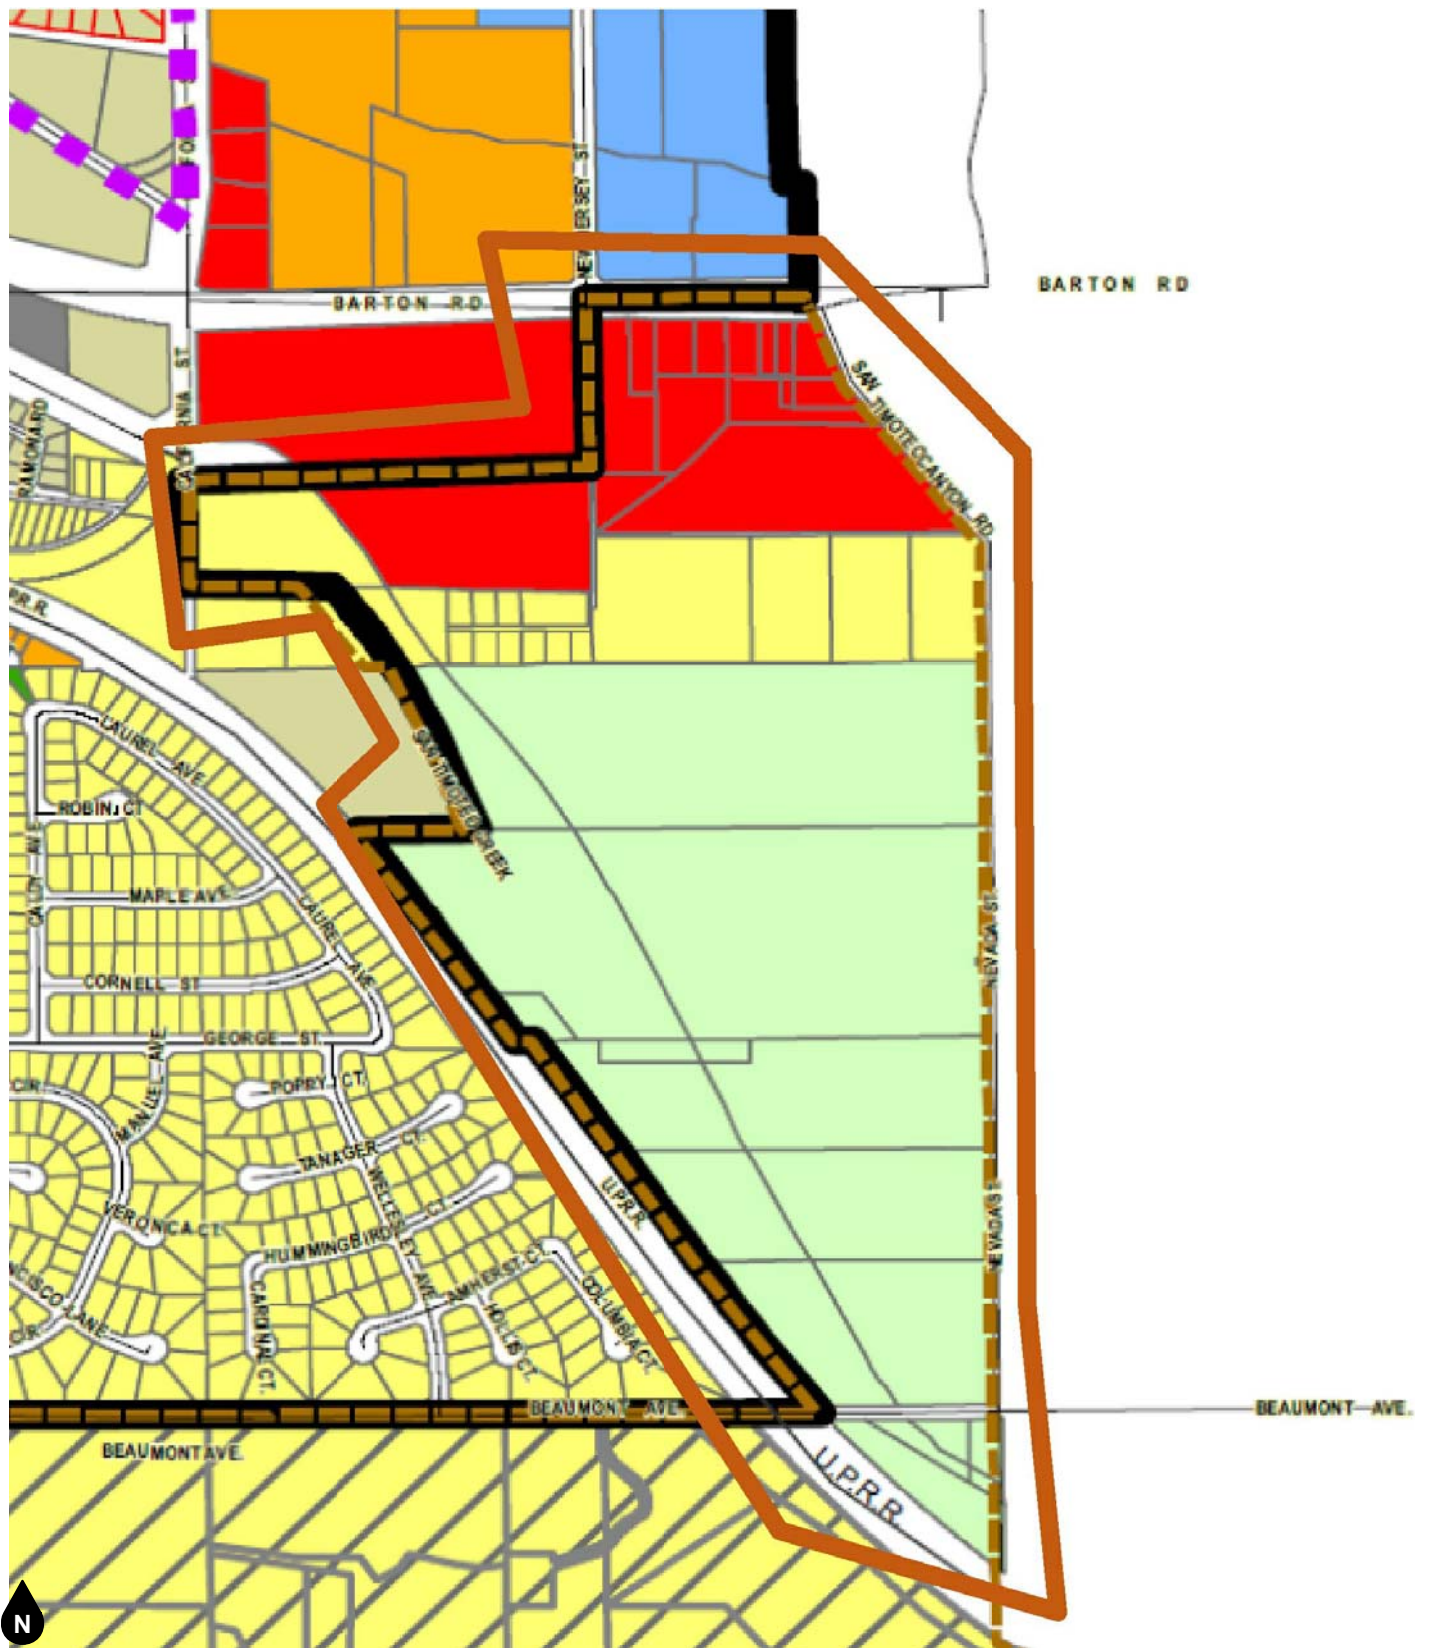

The traffic study shall evaluate the following analysis scenarios for typical weekday AM and PM peak hour conditions:

- Existing
- Existing Plus Project
- Opening Year (2024) Without Project
- Opening Year (2024) With Project
- General Plan Buildout (Year 2040) Without Project Conditions
- General Plan Buildout (Year 2040) With Project Conditions

Site Plan

## 2. METHODOLOGY

This section discusses the analysis methodologies used to assess transportation facility performance as adopted by the respective jurisdictional agencies. This traffic impact analysis is based on by standard City of Loma Linda procedures, and the County of San Bernardino *Transportation Impact Study Guidelines*, July 2019; ["County Guidelines"]

### LEVEL OF SERVICE/OPERATIONAL ANALYSIS METHODOLOGY (Non-CEQA)

Level of Service analysis is performed for assessing conformance with General Plan and operational standards established by the applicable agencies. In accordance with current CEQA provisions, a project's effect on automobile delay (as measured by Level of Service) shall not constitute a significant environmental impact.

#### Intersection Delay Methodology

Unsignalized intersections within the City of Loma Linda and Caltrans jurisdiction are analyzed using the intersection delay methodology based on procedures contained in the *Highway Capacity Manual* (Transportation Research Board, 6th Edition). The methodology considers the traffic volume and distribution of movements, traffic composition, geometric characteristics, and signalization details to calculate the average control delay per vehicle and corresponding Level of Service. Control delay is defined as the portion of delay attributed to the intersection traffic control (such as a traffic signal or stop sign) and includes initial deceleration, queue move-up time, stopped delay, and final acceleration delay. The intersection control delay is then correlated to Level of Service based on the following thresholds:

Level of Service	Intersection Control Delay (Seconds / Vehicle)	
	Signalized Intersection	Unsignalized Intersection
A	≤ 10.0	≤ 10.0
B	> 10.0 to ≤ 20.0	> 10.0 to ≤ 15.0
C	> 20.0 to ≤ 35.0	> 15.0 to ≤ 25.0
D	> 35.0 to ≤ 55.0	> 25.0 to ≤ 35.0
E	> 55.0 to ≤ 80.0	> 35.0 to ≤ 50.0
F	> 80.0	> 50.0

Source: Transportation Research Board *Highway Capacity Manual* (6th Edition).

Level of Service is used to qualitatively describe the performance of a roadway facility, ranging from Level of Service A (free-flow conditions) to Level of Service F (extreme congestion and system failure). At intersections with traffic signal or all way stop control, Level of Service is determined by the average control delay for the overall intersection. At intersections with cross street stop control (i.e., one- or two-way stop control), Level of Service is determined by the average control delay for the worst minor street approach or major street left-turn movement. Intersection delay analysis was performed using the Vistro software with default capacity values and adjustment factors recommended in the *Highway Capacity Manual*.

The Level of Service analysis for signalized intersections has been performed using optimized signal timing. This analysis has included an assumed lost time of two seconds per phase. Traffic signal timing optimization has considered pedestrian safety and signal coordination requirements. Appropriate time for pedestrian crossings has also been considered in the signalized intersection analysis. The following formula has been used to calculate the pedestrian minimum times for all Highway Capacity Manual runs:

$(\text{Curb to curb distance}) / (3.5 \text{ feet/second}) + 7 \text{ seconds.}$

Saturation flow rates of 1,800 vehicles per hour of green for through and right turn lanes and 1,700 vehicles per lane for single left turn lanes, 1,600 vehicles per lane for dual left turn lanes, and 1,500 vehicles per lane for triple left turn lanes have been assumed for the capacity analysis.

The peak hour intersection turning movement volumes have been adjusted to peak 15-minute volumes for analysis purposes using the existing observed peak 15 minute to peak hour factors for all scenarios analyzed. Where feasible improvements in accordance with the local jurisdiction's General Plan and which result in acceptable operations cannot be identified, the General Plan Buildout (Year 2040) peak hour factor has been adjusted upwards to 0.95. This is to account for the effects of congestion on peak spreading. Peak spreading refers to the tendency of traffic volumes to spread more evenly across time as congestion increases.

If the paved lane width of a shared through/right turn lane is wide enough to permit a separate right turn, it is common practice for a right turn lane to be considered "de facto". To function as a de facto right turn lane there must be sufficient width for right turning vehicles to travel outside the through lane. This analysis uses a minimum lane width of 19 feet from curb to lane stripe, but in most cases the lane was 20 feet or greater. Additionally, a de facto right turn lane was only considered where on-street parking is prohibited near the intersection approach.

## **PERFORMANCE STANDARDS**

The definition of an intersection deficiency has been obtained from the City of Loma Linda General Plan. The General Plan Policy T-6.10.1, seeks to maintain Level of Service (C or better) for peak hour intersection operations.

In any location where the Level of Service (LOS) is Level of Service (D or worse) at the time an application for a development project is submitted, roadway improvement measures shall be imposed on that development project to assure, at a minimum, that the level of traffic service is maintained at Levels of Service that are no worse than those existing at the time an application for development is filed.

A traffic impact is considered a project-related impact if the project both: i) contributes measurable traffic to and ii) substantially and adversely changes the Level of Service at any off-site location projected to experience deficient operations under foreseeable cumulative conditions, where feasible improvements consistent with the City of Loma Linda General Plan cannot be constructed.

The City of Redlands General Plan and Measure U Section 1A.60 Principle Six has established the minimum acceptable Level of Service (C or better) for roadway segment and peak hour intersection operations. Where the current operation is Level of Service (D or worse), roadway improvements shall be provided such that the LOS is not reduced below the LOS at the time of the application, or as provided in Section 5.20 of the Redlands General Plan where a more intense Level of Service is specifically permitted, for Existing Plus Project conditions.

## **VEHICLE MILES TRAVELED ANALYTICAL METHODOLOGY (CEQA)**

The metric used to evaluate the transportation impact of land use and transportation projects under CEQA is known as vehicle miles traveled (VMT). In general terms, VMT quantifies the amount and distance of automobile travel attributable to a project or region. Additional information and a detailed project assessment are provided in a separate Vehicle Miles Traveled Analysis Assessment Document.

### 3. EXISTING CONDITIONS

---

This section describes the existing transportation setting.

#### EXISTING ROADWAY SYSTEM

Figure 5 shows the lane geometry and intersection traffic controls for existing conditions based on a field survey of the study area. Regional access to the project site is provided by Interstate 10 approximately 1.7 miles to the north-west. Local north-south circulation is provided by Nevada Street, San Timoteo Canyon Road, New Jersey Street, and east-west circulation is provided by Barton Road.

**San Timoteo Canyon Road:** This two-lane undivided roadway trends in a northwest-southeast direction and is currently unclassified on the City of Loma Linda circulation system; however, it is classified as a four-lane divided Rural Arterial (56 feet roadway section and 72 feet of right-of-way) and designated truck route on the City of Redlands General Plan Circulation Element in the study area. Based on roadway width, on-street parking is generally prohibited on both sides of the roadway. There are currently no bike signs or marking on the roadway; however, the City's Bicycle Facilities and Pedestrian Trails Master Plan identifies San Timoteo Canyon Road as a proposed bike route. Sidewalks are currently not provided in the project vicinity.

**New Jersey Street:** This two-lane undivided roadway trends in a north-south direction and is unclassified on the City of Redlands General Plan Circulation Element in the study area. Based on roadway width, on-street parking is generally prohibited on both sides of the roadway. There are currently no bike signs or marking on the roadway. Sidewalks are currently not provided in the project vicinity.

**Nevada Street:** This two-lane undivided roadway trends in a north-south direction and is currently unclassified on the City of Loma Linda circulation system; however it is classified as a Collector (40 feet roadway section and 64 feet of right-of-way) on the City of Redlands General Plan Circulation Element south of San Timoteo Canyon Road intersection. Based on roadway width, on-street parking is generally prohibited on both sides of the roadway. There are currently no bike signs or marking on the roadway; however, the City's Bicycle Facilities and Pedestrian Trails Master Plan identifies Nevada Street as a proposed bike route. Sidewalks are currently not provided in the project vicinity.

**Barton Road:** This four-lane divided roadway trends in an east-west direction and is classified as a four-lane divided roadway on the City of Loma Linda General Plan Circulation Element and as a Major Arterial (80 feet roadway section and 110 feet of right-of-way) on the City of Redlands General Plan Circulation Element in the study area. On-street parking is prohibited on the south side of the roadway east of San Timoteo Canyon Road. There are currently bike signs or marking on the roadway consistent with the Class II bike route designation by the City. Sidewalks are currently not provided on the south side of the road in the project vicinity.

#### PEDESTRIAN FACILITIES

Existing pedestrian facilities in the project vicinity are shown on Figure 6. As shown on Figure 6, sidewalks are currently not provided along the project site frontage.

#### TRANSIT FACILITIES

Figure 7 shows the existing Omnitrans system map in the project vicinity. As shown on Figure 7, Local Route 19 runs along Barton Road with a bus stop located at the southeast corner of New Jersey Street and Barton Road.

## GENERAL PLAN CONTEXT

### **City of Loma Linda**

Figure 8 shows the City of Loma Linda General Plan Circulation Element roadway classifications map. This figure shows the nature and extent of arterial and collector highways that are needed to adequately serve the ultimate development depicted by the Land Use Element of the General Plan. The City of Loma Linda standard roadway cross-sections are illustrated on Figure 9.

### **City of Redlands**

Figure 10 shows the City of Redlands General Plan Circulation Element roadway classifications map. This figure shows the nature and extent of arterial and collector highways that are needed to adequately serve the ultimate development depicted by the Land Use Element of the General Plan. The City of Redlands standard roadway cross-sections are illustrated on Figure 11.

## BICYCLE FACILITIES AND PEDESTRIAN TRAILS

### **City of Loma Linda**

The City of Loma Linda Bicycle Master Plan is shown Figure 12. This figure shows the bicycle facilities master plan. As shown on Figure 12, there is an existing Class II bike lane in an east-west direction along Barton Road.

### **City of Redlands**

The City of Redlands Bicycle Master Plan is shown on Figure 13. This figure shows the bicycle facilities master plan. As shown on Figure 13, there is an existing Class II bike lane in an east-west direction along Barton Road and there is a proposed bike route in a north-south direction along San Timoteo Canyon Road and Nevada Street.

## EXISTING ROADWAY VOLUMES

Figure 14 shows the existing (year 2021) average daily traffic volumes. The existing average daily traffic volumes have been factored from peak hour intersection turning movement volumes at locations using the following formula for each intersection leg:

$$\text{PM Peak Hour (Approach Volume + Exit Volume)} \times 11.5 = \text{Leg Volume}$$

Figure 15 and Figure 16 show the existing (year 2021) AM and PM peak hour intersection turning movement volumes. Existing peak hour intersection turning movement volumes are based upon AM peak period and PM peak period intersection turning movement counts obtained in November 2021 during typical weekday conditions. The weekday AM peak period was counted between 7:00 AM and 9:00 AM and the weekday PM peak period was counted between 4:00 PM and 6:00 PM; these periods generally capture the peak times for commuter traffic when the roadway system is typically experiencing peak demand. The actual peak hour within each two-hour count period is determined based on the sum of the four consecutive 15-minute periods with the highest total volume entering the intersection. Thus, the weekday PM peak hour at one intersection may be 4:45 PM to 5:45 PM and may vary at other intersections depending on the four consecutive 15-minute periods that have the highest total volume. Intersection turning movement count worksheets are provided in Appendix C.

To account for lingering effects of the COVID-19 pandemic on current traffic volumes, the peak hour intersection volumes collected in November 2021 were compared to historical traffic counts to assess whether adjustments were necessary to reflect non-pandemic conditions. Appendix D contains adjustment

factor calculations for comparing the new 2021 counts to non-pandemic estimates derived from January 2018 counts with application of annual growth to year 2021. As shown in Appendix D, the new 2021 counts were determined to be slightly lower than the pre-pandemic volumes with annual growth. To provide a conservative analysis, an adjustment factor of 1.0595 was applied to the traffic counts (5.95% increase).

#### **EXISTING INTERSECTION LEVEL OF SERVICE**

The study intersection Levels of Service for Existing (Year 2021) conditions are shown in Table 1. Detailed Level of Service worksheets are provided in Appendix G.

As shown in Table 1, the study intersections currently operate within acceptable Levels of Service (C or better).

**Table 1**  
**Existing Intersection Levels of Service**

ID	Study Intersection	Traffic Control <sup>1</sup>	AM Peak Hour		PM Peak Hour	
			Delay <sup>2</sup>	LOS <sup>3</sup>	Delay <sup>2</sup>	LOS <sup>3</sup>
1.	California Street at Barton Road	TS	28.0	C	19.8	B
2.	New Jersey Street at Barton Road	TS	9.5	A	10.9	B
3.	New Jersey Street at Bermudez Street	CSS	8.3	A	8.3	A
4.	San Timoteo Canyon Rd at Barton Road	TS	13.5	B	20.0	B
5.	Nevada Street at San Timoteo Canyon Rd	CSS	17.1	C	17.3	C
6.	Nevada Street at Beaumont Avenue	CSS	10.6	B	9.4	A

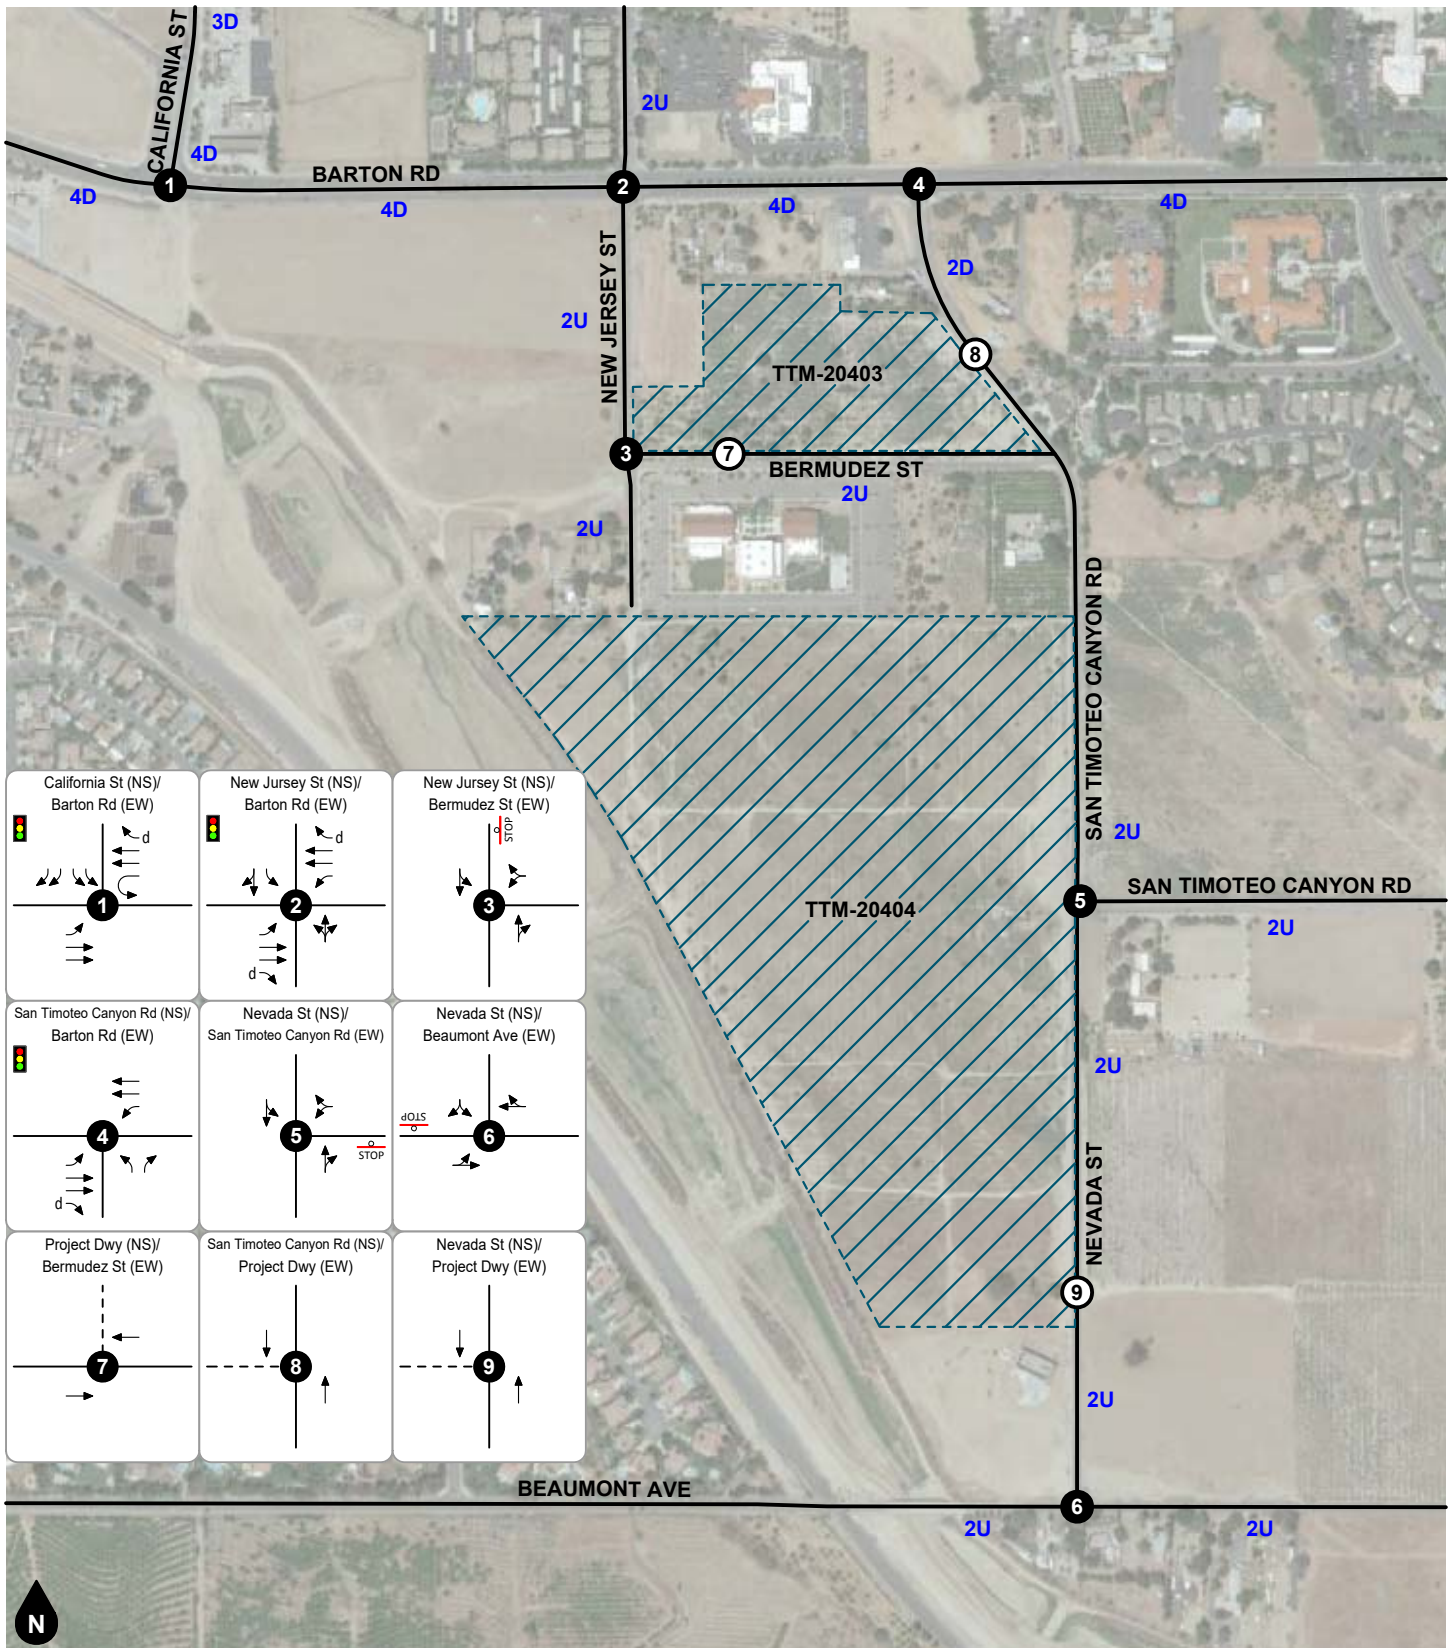

Notes:

(1) TS = Traffic Signal; CSS = Cross Street Stop

(2) Delay is shown in seconds per vehicle. For intersections with traffic signal or all way stop control, overall average intersection delay and LOS are shown. For intersections with cross street stop control, LOS is based on average delay of the worst minor street approach or major street left turn movement.

(3) LOS = Level of Service

## 4. PROJECT TRIP FORECASTS

---

This section describes how project trip generation, trip distribution, and trip assignment forecasts were developed. The forecast project volumes are illustrated on figures contained in this section.

### PROJECT TRIP GENERATION

#### Annexation Area

Table 2 shows proposed annex area trip generation is based upon trip generation rates obtained from the Institute of Transportation Engineers (ITE) *Trip Generation Manual* (11th Edition, 2021). Trip generation rates for ITE Land Use Code 210 (single-family residential) and ITE Land Use Code 820 (commercial retail) were used for the total previously approved zoning area, and rates from ITE Land Use Code 210 (single-family residential), ITE Land Use Code 254 (assisted living), ITE Land Use Code 560 (church), ITE Land Use Code 562 (mosque) and ITE Land Use Code 820 (commercial retail) were used for the existing commercial and church development as well as the areas for the proposed residential properties. As shown in Table 2, the previously approved zoning and the future development were computed in acres and converted using residential density in dwellings per acre and commercial density in floor area ratio. When the actual commercial, church and proposed residential projects are accounted for and added to the remaining balance of the proposed zoning areas there is a slight reduction in the forecast trip generation for the General Plan Buildout condition.

As shown in Table 2, the proposed annex area is forecast to generate approximately 4,429 daily trips, including 382 trips during the AM peak hour and 1,136 trips during the PM peak hour. The proposed annexation/zone change is forecast to result in a net of 1,189 more daily trips, including 87 more trips during the AM peak hour and 118 more trips during the PM peak hour.

#### Residential Projects TTM-20403 and TTM-20404

Table 3 shows proposed project trip generation is based upon trip generation rates obtained from the (ITE) *Trip Generation Manual*. Trip generation rates for ITE Land Use Code 210 (single-family residential) were used for the proposed project. As shown in Table 3, the proposed project is forecast to generate approximately 1,188 daily trips, including 88 during the AM peak hour and 119 trips during the PM peak hour.

### PROJECT TRIP DISTRIBUTION & ASSIGNMENT

Figure 17 and Figure 18 show the forecast outbound and inbound directional distribution patterns for the project generated trips, respectively. The project trip distribution patterns were determined in consultation with City staff based on review of existing traffic data, surrounding land uses, and the local and regional roadway facilities in the project vicinity.

Based on the identified project trip generation and distributions, project weekday average daily traffic volumes are shown on Figure 19. Project-generated AM peak hour and PM peak hour intersection turning movement volumes are shown on Figure 20 and Figure 21.

## 5. FUTURE VOLUME FORECASTS

---

This section describes how future volume forecasts for each analysis scenario were developed. Forecast study area volumes are illustrated on figures contained in this section.

### **METHOD OF PROJECTION**

To assess future conditions, existing volumes were combined with project trips, ambient growth, and other development trips. The project completion year for analysis purposes in this report is 2024.

#### **Ambient Growth**

To account for ambient growth on roadways, existing (year 2021) volumes were increased by a growth rate of one percent (2.0%) per year over a three-year period. This equates to a total growth factor of approximately 1.06. This is a conservative assumption since the ambient growth was applied to all movements at the study intersections.

#### **Other Developments**

To account for growth associated with other development projects, trips generated by other pending or approved but unconstructed developments in the City of Loma Linda and City of Redlands were reviewed and added to the study area as appropriate. The other development trip generation summary is shown in Table 4. The regional ambient growth is assumed to account for any additional trips generated by other developments not specifically listed in Table 4. Figure 22 shows the other development location map.

Average daily traffic volumes generated by other developments are shown on Figure 23. Figure 24 and Figure 25 show the forecast AM peak hour and PM peak hour intersection turning movement volumes for trips generated by other developments.

#### **Model General Buildout Growth**

General Buildout (Year 2040) forecasts have been determined using a growth increment approach with the San Bernardino Transportation Analysis Model (SBTAM) base year and horizon year travel demand model plots. This difference defines the incremental growth in forecast volumes over the model growth period. The incremental growth in average daily traffic volume has been factored to reflect the forecast growth between the measured count year (2021) and year 2040. For analysis purposes, linear growth between the base year condition and the horizon year condition was assumed.

To derive am and pm peak hour intersection turning movement volumes, the traffic volume growth forecasts were further refined using a spreadsheet program developed by the federal highway administration and consistent with traffic volume forecasting procedures outlined in the national cooperative highway research program report 255. The spreadsheet program uses a linear programming algorithm to calculate future turning movements based on the relationship of existing intersection turning movements and forecast model growth. The forecast turning movements developed by the spreadsheet program were reviewed for reasonableness and adjusted as necessary to ensure growth over near-term forecasts. The end results of the post-processing procedures are future intersection turning movement volumes suitable for analysis. Travel demand model plots are provided in Appendix E. Travel demand model post-processing worksheets are provided in Appendix F.

## ANALYSIS SCENARIO VOLUMES

### **Existing Plus Project**

The Existing Plus Project volume forecast was developed by adding project-generated trips to existing (year 2021) volumes. Existing Plus Project average daily traffic volumes are shown on Figure 26. Existing Plus Project AM peak hour and PM peak hour intersection turning movement volumes are shown on Figure 27 and Figure 28.

### **Opening Year (2024) Without Project**

The Opening Year (2024) Without Project volume forecast was developed by applying the ambient growth factor to existing (year 2021) volumes and adding trips generated by other developments. Opening Year (2024) Without Project average daily traffic volumes are shown on Figure 29. Opening Year (2024) Without Project AM peak hour and PM peak hour intersection turning movement volumes are shown on Figure 30 and Figure 31.

### **Opening Year (2024) With Project**

The Opening Year (2024) With Project volume forecast was developed by adding project-generated trips to the Opening Year (2024) Without Project volumes. Opening Year (2024) With Project average daily traffic volumes are shown on Figure 32. Opening Year (2024) With Project AM peak hour and PM peak hour intersection turning movement volumes are shown on Figure 33 and Figure 34.

### **Year 2040 Without Project**

The Year 2040 Without Project volume forecast was developed based on SBTAM travel demand growth forecasts and post-processing procedures described above. Year 2040 Without Project average daily traffic volumes are shown on Figure 35. Year 2040 Without Project AM peak hour and PM peak hour intersection turning movement volumes are shown on Figure 36 and Figure 37.

### **Year 2040 With Project**

The Year 2040 With Project volume forecast was developed by adding project-generated trips to the Year 2040 Without Project scenario. Year 2040 With Project average daily traffic volumes are shown on Figure 38. Year 2040 With Project AM peak hour and PM peak hour intersection turning movement volumes are shown on Figure 39 and Figure 40.

Notes:

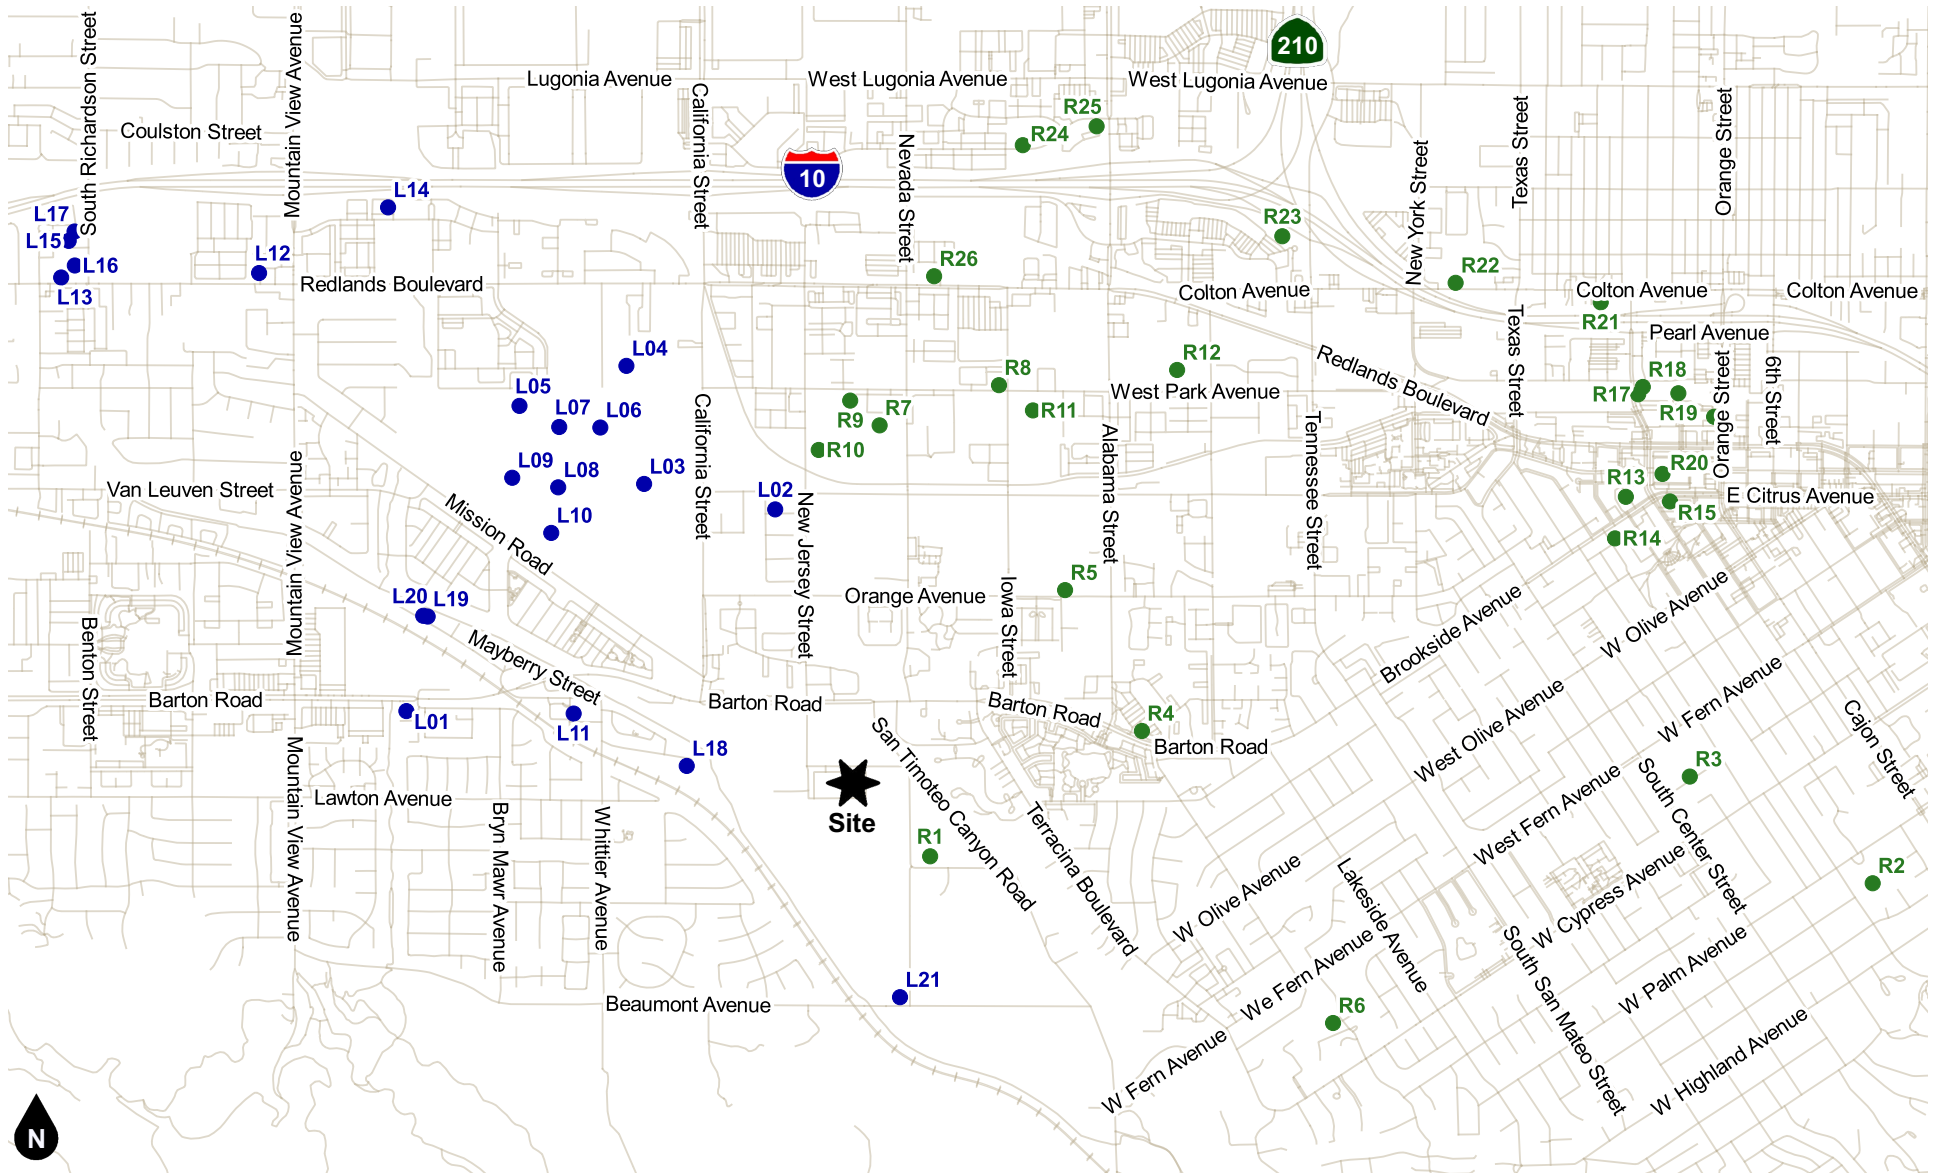

(1) ITE = Institute of Transportation Engineers *Trip Generation Manual* (11th Edition, 2021); ### = Land Use Code. All rates based on General Urban/Suburban rates, unless otherwise noted.

[a] = San Diego Association of Governments (SANDAG) *Vehicular Traffic Generation Rates* (April 2002). Where the daily or peak hour rate is not provided by ITE, the SANDAG percentage of peak hour to daily rate is used to calculate the missing data. Where the peak hour distribution is not provided by ITE, the SANDAG peak hour distribution is used.

[b] = ITE *Trip Generation Handbook* (3rd Edition, 2017), pass-by rates calculated in accordance with procedures in the handbook. For time periods with no pass-by data provided in ITE Trip Generation Handbook, pass-by rates assumed as half of ITE peak hour rate.

[c] = Mosque trip generation rate for AM peak from ratio of AM/PM generator rates times the PM Peak hour rate. Daily rate based on SANDAG percentage of PM to Daily rates for Church/Synagogue.

(2) TSF = Thousand Square Feet; DU = Dwelling Unit; RM = Hotel Room.

## 6. FUTURE LEVELS OF SERVICE ANALYSIS

---

Detailed intersection Level of Service calculation worksheets for each of the following analysis scenarios are provided in Appendix G.

Project design features, such as improvements necessary to provide project site access, are assumed to be constructed by the proposed project and are described in further detail in the Site Access & Circulation section presented later in this report.

### EXISTING PLUS PROJECT

The study intersection Levels of Service for Existing Plus Project conditions are shown in Table 5. As shown in Table 5, the study intersections are forecast to operate within acceptable Levels of Service (C or better) during the peak hours for Existing Plus Project conditions. Therefore, the proposed project is forecast to result in no project-related Level of Service deficiencies at the study intersections for the Existing Plus Project scenario.

### OPENING YEAR (2024) WITHOUT PROJECT

The study intersection Levels of Service for Opening Year (2024) Without Project conditions are shown in Table 6. As shown in Table 6, the study intersections are forecast to operate within acceptable Levels of Service (C or better) during the peak hours for Opening Year (2024) Without Project conditions.

### OPENING YEAR (2024) WITH PROJECT

The study intersection Levels of Service for Opening Year (2024) With Project conditions are shown in Table 7. As shown in Table 7, the study intersections are forecast to operate within acceptable Levels of Service (C or better) during the peak hours for Opening Year (2024) With Project conditions. Therefore, the proposed project is forecast to result in no project-related Level of Service deficiencies at the study intersections for the Opening Year (2024) With Project scenario.

### YEAR 2040 WITHOUT PROJECT

The study intersection Levels of Service for Year 2040 Without Project conditions are shown in Table 8. As shown in Table 8, the study intersections are forecast to operate within acceptable Levels of Service (C or better) during the peak hours for Year 2040 Without Project conditions, except for the following study intersection that is forecast to operate at Levels of Service D or worse during peak hours:

5. Nevada Street (NS) at San Timoteo Canyon Road (EW) (D-AM / E-PM peak hour)

The installation of a traffic signal is recommended at the Nevada Street (NS) at San Timoteo Canyon Road intersection. The study intersections are forecast to operate within acceptable Levels of Service (C or better) during the peak hours with improvements.

### YEAR 2040 WITH PROJECT

The study intersection Levels of Service for Year 2040 With Project conditions are shown in Table 9. As shown in Table 9, the study intersections are forecast to operate within acceptable Levels of Service (C or better) during the peak hours for Year 2040 With Project conditions, except for the following study intersection that is forecast to operate at Levels of Service D or worse during peak hours:

5. Nevada Street (NS) at San Timoteo Canyon Road (EW) (D-AM / E-PM peak hour)

The study intersections are forecast to operate within acceptable Levels of Service (C or better) during the peak hours with the previously listed improvements.

### **Traffic Signal Warrant Analysis**

The potential need for installation of a traffic signal at crossroad stop control study intersections was evaluated based on the California Manual on Uniform Traffic Control Devices ("California MUTCD", November 2014), Section 4C-101, peak hour volume warrant (Warrant 3). The California MUTCD states that a traffic control signal should not be installed unless one or more warrants are satisfied. Application of the traffic signal warrants should be based on engineering judgement and satisfaction of one or more traffic signal warrants shall not in itself require the installation of a traffic signal.

A traffic signal is projected to be warranted at the following study intersection based upon the California Manual on Uniform Traffic Control Devices (2014), peak hour volume warrant (Warrant 3):

5. Nevada Street (NS) at San Timoteo Canyon Road (EW)

Traffic signal warrant worksheets are provided in Appendix H.

**Table 5**  
**Existing Plus Project Intersection Levels of Service**

ID	Study Intersection	Traffic Control <sup>1</sup>	Existing Plus Project			
			AM Peak Hour		PM Peak Hour	
			Delay <sup>2</sup>	LOS <sup>3</sup>	Delay <sup>2</sup>	LOS
1.	California Street at Barton Road	TS	28.2	C	20.2	C
2.	New Jersey Street at Barton Road	TS	10.0	A	11.9	B
3.	New Jersey Street at Bermudez Street	CSS	8.5	A	8.4	A
4.	San Timoteo Canyon Rd at Barton Road	TS	13.9	B	20.6	C
5.	Nevada Street at San Timoteo Canyon Rd	CSS	17.7	C	18.1	C
6.	Nevada Street at Beaumont Avenue	CSS	10.8	B	9.6	A
7.	Project Access (F) at Bermudez Street	CSS	8.3	A	8.3	A
8.	San Timoteo Canyon Rd at Project Access (G)	CSS	13.4	B	14.3	B
9.	Nevada Street at Project Access (B)	CSS	8.8	A	9.0	A

Notes:

- (1) TS = Traffic Signal; CSS = Cross Street Stop
- (2) Delay is shown in seconds per vehicle. For intersections with traffic signal or all way stop control, overall average intersection delay and LOS are shown. For intersections with cross street stop control, LOS is based on average delay of the worst minor street approach or major street left turn movement.
- (3) LOS = Level of Service
- (4) The study intersections are forecast to operate within acceptable Levels of Service (C or better) during the peak hours; therefore, the proposed project is forecast to result in no project-related Level of Service deficiencies at the study intersections.

Notes:

(1) TS = Traffic Signal; CSS = Cross Street Stop

(2) Delay is shown in seconds per vehicle. For intersections with traffic signal or all way stop control, overall average intersection delay and LOS are shown. For intersections with cross street stop control, LOS is based on average delay of the worst minor street approach or major street left turn movement.

(3) LOS = Level of Service

## 7. SITE ACCESS & ON-SITE CIRCULATION

---

This section describes the project site access and on-site circulation. Vehicular access would be provided via project access intersections with Bermudez Street, San Timoteo Canyon Road and Nevada Street.

### PROJECT DESIGN FEATURES

This analysis assumes the following improvements will be constructed by the project to provide project site access:

#### 7. Project Access (F) (NS) at Bermudez Street (EW)

- Install southbound stop control.
- Construct the southbound approach to consist of one shared left/right turn lane.

#### 8. San Timoteo Canyon Road (NS) at Project Access (G) (EW)

- Install eastbound stop control.
- Construct the westbound approach to consist of one shared left/right turn lane.

#### 9. Nevada Street (NS) at Project Access (B) (EW)

- Install eastbound stop control.
- Construct the eastbound approach to consist of one shared left/right turn lane.

This analysis also assumes the project shall comply with the following conditions as part of the City of Loma Linda standard development review process to ensure adequate geometric design and emergency access:

- Site-adjacent roadways shall be constructed or repaired at their ultimate half-section width, including landscaping and parkway improvements in conjunction with development, or as otherwise required by the City of Loma Linda.
- All on-site and off-site roadway design, traffic signing and striping, and traffic control improvements relating to the proposed project shall be constructed in accordance with applicable State/Federal engineering standards and to the satisfaction of the City of Loma Linda.
- The final grading, landscaping, and street improvement plans shall demonstrate that sight distance requirements are met in accordance with applicable City of Loma Linda/California Department of Transportation sight distance standards.
- A construction work site traffic control plan shall comply with State standards set forth in the California *Manual of Uniform Traffic Control Devices* and shall be submitted to the County for review and approval prior to the issuance of a grading permit or start of construction. The plan shall identify any roadway, sidewalk, bike route, or bus stop closures and detours as well as haul routes and hours of operation. All construction related trips shall be restricted to off-peak hours to the extent possible.
- The project shall comply with the City of Loma Linda municipal parking requirements which will be reviewed as a part of the standard development review process.

### SITE ACCESS QUEUING ANALYSIS

Table 10 summarizes the results of a queue analysis for key turn movements providing project site access. The forecasted queue lengths shown in Table 10 are based on the Highway Capacity Manual 95th-percentile back-of-queue methodology as reported in the delay/Level of Service worksheets (see Appendix G). As shown

in Table 10, the traffic volumes for project site access locations is forecast to operate within the available storage length during the peak hours for the evaluated scenarios conditions. Therefore, the proposed project is forecast to result in no project-related Level of Service deficiencies at the study intersections for evaluated scenarios.

**Table 10**  
**Study Area Queuing Analysis Summary**

ID	Intersection	Approach	Lane	Storage Length (Feet) <sup>2</sup>	95th-Percentile Queue Length (Feet) <sup>1</sup>						Adequate Storage Provided		
					Existing		Opening Year (2024) With Project		Year (2040) With Project				
					AM	PM	AM	PM	AM	PM	Existing	2024	OY2
5.	Nevada Street at San Timoteo Canyon Rd	Northbound	Shared	1000	<20	<20	<20	30	40	65	YES	YES	YES
		Southbound	Shared	1000	<20	<20	<20	<20	<20	<20	YES	YES	YES
		Westbound	Shared	300	<20	<20	<20	<20	<20	<20	YES	YES	YES
7.	Project Access (F) at Bermudez Street	Southbound	Shared	75	-	-	<20	<20	<20	<20	YES	YES	YES
		Eastbound	Shared	75	-	-	<20	<20	<20	<20	YES	YES	YES
		Westbound	Shared	75	-	-	<20	<20	<20	<20	YES	YES	YES
8.	San Timoteo Canyon Rd at Project Access (G)	Northbound	Left	75	-	-	<20	<20	<20	<20	YES	YES	YES
		Northbound	Thru	75	-	-	<20	<20	<20	<20	YES	YES	YES
		Eastbound	Shared	75	-	-	<20	<20	<20	<20	YES	YES	YES
9.	Nevada Street at Project Access (B)	Northbound	Shared	75	-	-	<20	<20	<25	<25	YES	YES	YES
		Southbound	Shared	75	-	-	<20	<20	<25	<25	YES	YES	YES
		Eastbound	Shared	75	-	-	<20	<20	<25	<25	YES	YES	YES
5.	Nevada Street at San Timoteo Canvon Rd With Improvements	Northbound	Shared	1000	-	-	-	-	50	90	YES	YES	YES
		Southbound	Left	1000	-	-	-	-	525	690	YES	YES	YES
		Southbound	Thru	1000	-	-	-	-	<20	35	YES	YES	YES
		Westbound	Left	150	-	-	-	-	<20	<20	YES	YES	YES
		Westbound	Right	300	-	-	-	-	285	300	YES	YES	YES

Notes:

- (1) The forecast 95th-percentile queue lengths shown in the delay calculation worksheets have been rounded up to nearest 5-foot increment.
- (2) Length of turning lane storage or distance to the adjacent driveway (existing or proposed future development).

## 8. MITIGATION MEASURES

---

As mitigation for the identified improvements necessary to maintain acceptable Levels of Service and mitigate project impacts, the proposed project shall contribute through an adopted traffic impact fee program in addition to any fair share contributions shown within the traffic impact analysis which is not covered within this fee program.

Since the identified improvements are necessary to address a degradation of Level of Service for already deficient intersection operations under “without project” traffic conditions, the project shall pay its fair share of fees to an applicable program for the required mitigation measure improvements.

### SUMMARY OF IMPROVEMENTS

The proposed project is forecast to result in no significant traffic impacts at the study intersections for Year 2040 With and Without Project conditions, except for the following study intersection that is projected to operate at unacceptable Level of Service without improvements.

#### 5. Nevada Street (NS) at San Timoteo Canyon Road (EW)

The following improvement is required with project development within the study area to maintain an acceptable Level of Service at the study intersection:

- 5. Nevada Street (NS) at San Timoteo Canyon Road (EW)
  - Install a traffic signal.
  - Construct one southbound left turn lane.
  - Construct one westbound right turn lane.

Improvements at the project driveways are project design features which shall be constructed by the project. Site-adjacent roadway improvements shall be constructed in conjunction with the project.

### FAIR SHARE ANALYSIS

The project fair share is based on the proportion of project peak hour traffic volume contributed to the improvement location relative to the total new peak hour traffic volume for General Plan Buildout (Year 2040) With Project traffic conditions. The cost estimates for the identified improvements have been obtained from the County of San Bernardino Congestion Management Program (2003 Update); **Error! Reference source not found.**

- 5. Nevada Street (NS) at San Timoteo Canyon Road (EW)
  - Install a traffic signal.
  - Construct one southbound left turn lane.
  - Construct one westbound right turn lane.

The project proportional intersection trip contributions have been calculated in Table 11 for General Plan Buildout (Year 2040) With Project traffic conditions. The project fair share shown above represents a rough order of magnitude; it is intended only for the discussion purposes of this traffic impact analysis and does not imply any legal responsibility or formula for contributions or mitigation.

### DEVELOPMENT IMPACT FEE

The proposed project shall contribute towards the City of Loma Linda Development Impact Fee program as adopted in 2021 (Resolution Number 2841). The Development Impact Fee provides a funding mechanism for

arterial streets, traffic signals, interchange improvements as well as emergency services. The purpose of such fees is to minimize, to the greatest extent practicable, the impact that new development has on the city's public services and public facilities. Toward that end, the city intends that applicants for such development projects pay their fair share of the costs of providing such public services and public facilities. Unless otherwise approved by the City, all development projects are required to pay the Development Impact Fee as a condition of development.

### **CONSTRUCTION TRAFFIC CONTROL MEASURES**

A construction work site traffic control plan shall be submitted to the City for review and approval prior to the start of any construction work. The plans shall show the location of any roadway, sidewalk, bike route, bus stop or driveway closures, traffic detours, haul routes, hours of operation, protective devices, warning signs and access to abutting properties. Temporary traffic controls used around the construction area should adhere to the standards set forth in the *California Manual of Uniform Traffic Control Devices* (2014, including latest revisions) and construction activities should adhere to applicable local ordinances.

Site development would require the use of haul trucks during site clearing and excavation and the use of a variety of other construction vehicles throughout the construction work at the site. Transportation of heavy construction equipment and or materials, which requires the use of oversized vehicles, will require the appropriate transportation permit.

**Table 11**  
**Fair Share Analysis**

ID	Study Intersection	Estimated Construction Cost <sup>1</sup>	Peak Hour	Peak Hour Volume				Project % at Intersection <sup>2</sup>	Project Fair Share Cost
				Existing	Year (2040) With Project	Project Trips	New Trips	Project % of New Trips	
1.	California Street at Barton Road	NA <sup>3</sup>	AM	3,016	3,775	30	759	4.0%	-
			PM	3,104	3,900	42	796	5.3%	-
2.	New Jersey Street at Barton Road	NA <sup>3</sup>	AM	2,662	3,371	48	709	6.8%	-
			PM	2,691	3,438	68	747	9.1%	-
3.	New Jersey Street at Bermudez Street	NA <sup>3</sup>	AM	17	109	34	92	37.0%	-
			PM	14	79	49	65	75.4%	-
4.	San Timoteo Canyon Rd at Barton Road	NA <sup>3</sup>	AM	2,756	3,576	36	820	4.4%	-
			PM	2,847	3,668	49	821	6.0%	-
5.	Nevada Street at San Timoteo Canyon Rd	\$800,000	AM	769	1,211	18	442	4.1%	\$38,835
			PM	855	1,370	25	515	4.9%	
6.	Nevada Street at Beaumont Avenue	NA <sup>3</sup>	AM	387	602	27	215	12.6%	-
			PM	283	468	36	185	19.5%	-
7.	Project Access (F) at Bermudez Street	Project Feature	AM	6	23	12	17	70.6%	-
			PM	7	35	18	28	64.3%	-
8.	San Timoteo Canyon Rd at Project Access (G)	Project Feature	AM	769	1,211	27	442	6.1%	-
			PM	851	1,288	37	437	8.5%	-
9.	Nevada Street at Project Access (B)	Project Feature	AM	65	231	41	166	24.7%	-
			PM	87	226	55	139	39.6%	-
Total		\$800,000							\$38,835

Notes:

- (1) Cost estimate based on values from the San Bernardino County Transportation Authority *Preliminary Construction Cost Estimates For Congestion Management Program* (2003). Costs estimates are sensitive to the quantity and location of work specified for a given installation. These values represent the relative magnitude of the cost and should be verified through the bidding process.
- (2) Project share of new trips shown are the greater of the AM or PM percent contribution.
- (3) For intersections with no significant impact project percentages are shown for information purposes only.

## 9. CONCLUSIONS

---

This section summarizes the findings, operational improvements (if any), and recommendations identified and described in previous sections of this study. Figure 41 summarizes the recommended improvements.

### PROJECT TRIP GENERATION

#### Annexation Area

The proposed annex area is forecast to generate approximately 4,429 daily trips, including 382 trips during the AM peak hour and 1,136 trips during the PM peak hour. The proposed annexation/zone change is forecast to result in a net of 1,189 more daily trips, including 87 more trips during the AM peak hour and 118 more trips during the PM peak hour.

#### Residential Projects TTM-20403 and TTM-20404

The proposed project is forecast to generate approximately 1,188 daily trips, including 88 during the AM peak hour and 119 trips during the PM peak hour.

### LEVEL OF SERVICE ANALYSIS

The study intersections are forecast to operate within acceptable Levels of Service (C or better) during the peak hours for Existing, Existing Plus Project, Opening Year (2024) Without Project and Opening Year (2024) With Project conditions. Therefore, the proposed project is forecast to result in no project-related Level of Service deficiencies at the study intersections for the evaluated scenarios.

The study intersections are forecast to operate within acceptable Levels of Service (C or better) during the peak hours for Year 2040 Without Project conditions, with the exception of the following study intersection that is forecast to operate at Levels of Service D or worse during peak hours:

5. Nevada Street (NS) at San Timoteo Canyon Road (EW) (D-AM / E-PM peak hour)

The installation of a traffic signal is recommended at the Nevada Street (NS) at San Timoteo Canyon Road intersection. The study intersections are forecast to operate within acceptable Levels of Service (C or better) during the peak hours with improvements.

The study intersections are forecast to operate within acceptable Levels of Service (C or better) during the peak hours for Year 2040 With Project conditions, with the exception of the following study intersection that is forecast to operate at Levels of Service D or worse during peak hours:

5. Nevada Street (NS) at San Timoteo Canyon Road (EW) (D-AM / E-PM peak hour)

The study intersections are forecast to operate within acceptable Levels of Service (C or better) during the peak hours with the previously listed improvements.

### SITE ACCESS QUEUING ANALYSIS

The traffic volumes for project site access locations are forecast to operate within the available storage length during the peak hours for the evaluated scenarios conditions. Therefore, the proposed project is forecast to result in no project-related Level of Service deficiencies at the study intersections for evaluated scenarios.

## MITIGATION MEASURES

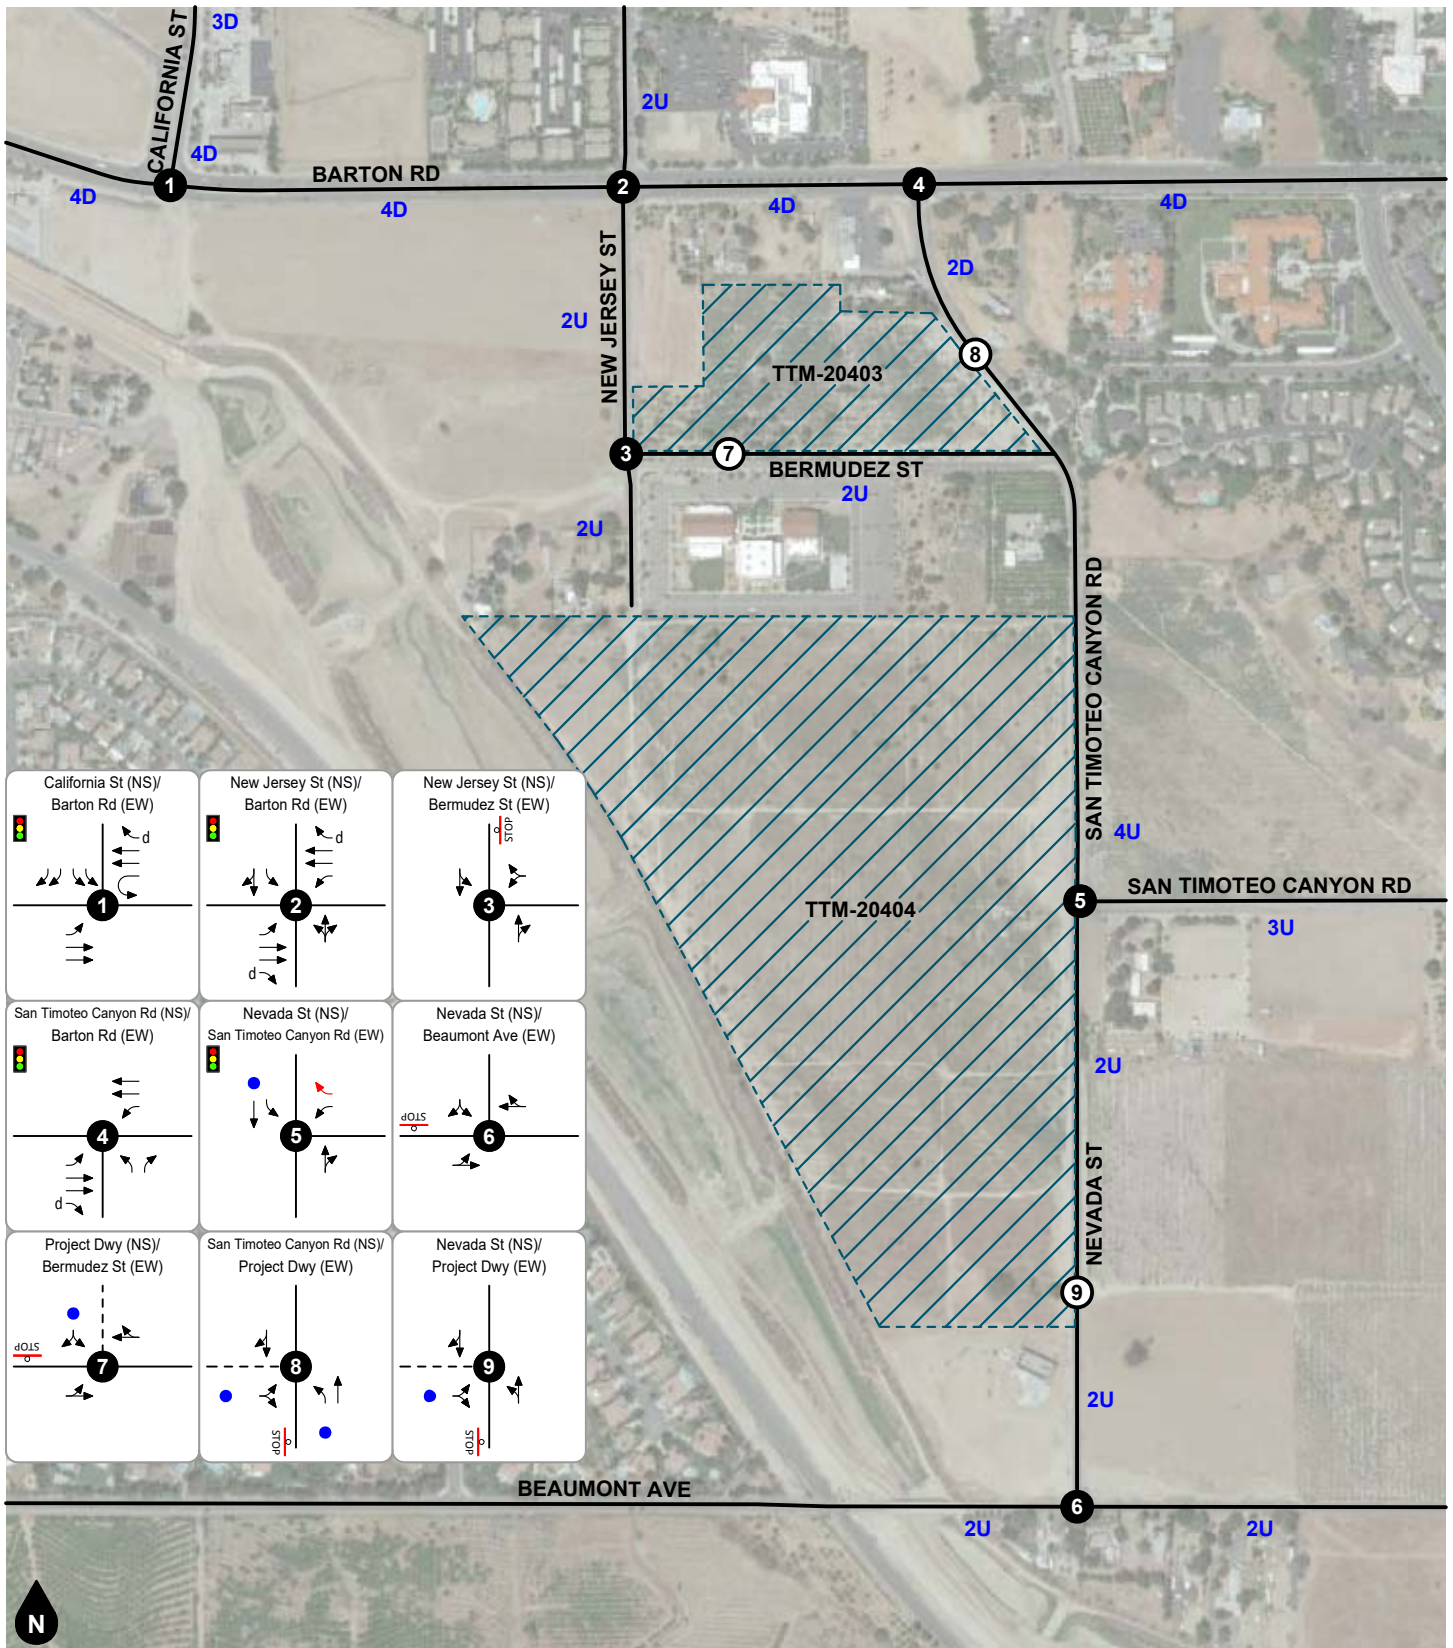

The following improvement is required for Year 2040 Without and With Project conditions to maintain an acceptable Level of Service at the study intersection:

5. Nevada Street (NS) at San Timoteo Canyon Road (EW)

- Install a traffic signal.
- Construct one southbound left turn lane.
- Construct one westbound right turn lane.

Figure 41 graphically illustrates the identified improvements. Improvements at the project driveways are project design features which shall be constructed by the project. Site-adjacent improvements shall be constructed in conjunction with the project.

The project shall pay the appropriate transportation Development Impact Fee(s) as required by the City, as well as any fair share cost included in the report.

## **TERMS**

**ACTUATED SIGNAL CONTROL:** A type of traffic signal control in which display of each phase depends on whether the corresponding phase detector has registered a service call or the phase is on recall.

**ACTUATION:** Detection of a roadway user that is forwarded to the signal controller.

**AVERAGE DAILY TRAFFIC:** The average 24-hour volume for a stated period divided by the number of days in that period. For example, Annual Average Daily Traffic is the total volume during a year divided by 365 days.

**BANDWIDTH:** The number of seconds of green time available for through traffic in a signal progression.

**BOTTLENECK:** A point of constriction along a roadway that limits the amount of traffic that can proceed downstream from its location.

**CALL:** An indication within a signal controller that a particular phase is waiting for service, either through actuation from a roadway user or phase recall.

**CAPACITY:** The maximum number of vehicles that can be reasonably expected to pass through a roadway facility during a specified period.

**CHANNELIZATION:** The separation of conflicting traffic movements by use of pavement markings, raised curbs, or other suitable means to facilitate free flow movement.

**CLEARANCE INTERVAL:** Equal to the yellow plus all-red time, if any, when a traffic signal changes between phases (i.e., the amount of time between the end of a green light from one movement to the beginning of a green light for the next).

**COORDINATED SIGNAL CONTROL:** A type of traffic signal control in which non-coordinated phases associated with minor movements are constrained such that the coordinated phases are served at a specific time during the signal cycle, thus maintaining the efficient progression of traffic flow along the major roadway.

**CONTROL DELAY:** The portion of delay attributed to the intersection traffic control (such as a traffic signal or stop sign). It includes initial deceleration, queue move-up time, stopped delay, and final acceleration delay.

**CORDON:** An imaginary boundary line around or across a study area across which vehicles, persons, or other information can be collected for survey and analytical purposes.

**CORNER SIGHT DISTANCE:** The minimum sight distance required by the driver of a vehicle to cross or enter the lanes of the major roadway without requiring approaching traffic traveling at a given speed to radically alter their speed or trajectory.

**CYCLE:** A complete sequence of signal indications for all phases.

**CYCLE LENGTH:** The total time for a traffic signal to complete one full cycle.

**DAILY CAPACITY:** A theoretical value representing the daily traffic volume that will typically result in a peak hour volume equal to the capacity of the roadway.

**DELAY:** The total additional travel time experienced by a roadway user (driver, passenger, bicyclist, or pedestrian) beyond that required to travel at a desired speed.

**DENSITY:** The number of vehicles occupying in a unit length of the through traffic lanes of a roadway at any given instant. Usually expressed in vehicles per mile.

**DETECTOR:** A device used to count or determine the presence of a roadway user.

**DESIGN SPEED:** A speed used for purposes of designing horizontal and vertical alignments of a highway.

**DIRECTIONAL SPLIT:** The percent of two-way traffic traveling in a specified direction.

**DIVERSION:** The rerouting of traffic from a normal path of travel between two points, such as to avoid congestion or perform a secondary trip.

**FREE FLOW:** Traffic flow that is unaffected by a traffic control and/or or upstream or downstream conditions.

**GAP:** Time or distance between two vehicles measured from rear bumper of the front vehicle to front bumper of the second vehicle.

**GAP ACCEPTANCE:** The method by which a driver accepts an available gap in traffic to enter or cross the road.

**HEADWAY:** Time or distance between two successive vehicles measured from same point on both vehicles (i.e., front bumper to front bumper).

**LEVEL OF SERVICE:** A grading scale of quantitative performance measures representing the quality of service of a transportation facility or service from an average traveler's perspective.

**LOOP DETECTOR:** A vehicle detector consisting of a loop of wire embedded in the roadway, energized by alternating current and producing an output circuit closure when passed over by a vehicle.

**MULTI-MODAL:** More than one mode, such as automobile, transit, bicycle, and pedestrian.

**OFFSET:** The time interval between the beginning of a traffic signal cycle at one intersection and the beginning of signal cycle an adjacent intersection.

**PLATOON:** A set of vehicles traveling at similar speed and moving as a general group with clear separation between other vehicles ahead and behind.

**PASSENGER CAR EQUIVALENT:** A metric used to assess the impact of larger vehicles, such as trucks, recreational vehicles, and buses, by converting the traffic volume of larger vehicles to an equivalent number of passenger cars.

**PEDESTRIAN CLEARANCE INTERVAL:** Also known as the “Flashing Don’t Walk” interval, it signals the end of pedestrian entry into the crosswalk following the “Walk” indication and provides time for pedestrians who have already entered the crosswalk to finishing crossing.

**PEAK HOUR:** The hour within a day in which the maximum volume occurs.

**PEAK HOUR FACTOR:** The peak hour volume divided by the four times the peak 15-minute flow rate. This

**PHASE:** In traffic signals, the green, yellow, and red clearance intervals assigned to a specified traffic movement.

**PRETIMED SIGNAL:** A traffic signal operation in which the cycle length, phasing sequence, and phasing times are predetermined and fixed, regardless of actual demand for any given traffic movement. Also known as a fixed time signal.

**PROGRESSION:** The coordinated movement of vehicles through signalized intersections along a corridor.

**QUEUE:** The number of vehicles waiting at a service area such as a traffic signal, stop sign, or access gate.

**QUEUE LENGTH:** The length of vehicle queue, typically expressed in feet, waiting at a service area such as a traffic signal, stop sign, or access gate.

**RECALL:** A signal phasing operation in which a specified phase places a call to the signal controller each time a conflicting phase is served, thus ensuring the specified phase will be serviced again.

**SEMI-ACTUATED CONTROL:** A type of traffic signal control in which only the minor movements are provided detection.

**SIGHT DISTANCE:** The continuous length of roadway visible to a driver or roadway user.

**STACKING DISTANCE:** The length of area available behind a service area, such as a traffic signal or gate, for vehicle queuing to occur.

**STOPPING SIGHT DISTANCE:** The minimum distance required by the driver of a vehicle traveling at a given speed to bring the vehicle to a stop after an object on the road becomes visible, including reaction and response time.

**TRIP OR TRIP END:** The one-directional movement of a person or vehicle. Every trip has an origin and a destination at its respective ends (i.e., trip ends). In terms of site trip generation, the same vehicle entering and exiting a site generates two trips: one inbound trip and one outbound trip.

**TRIP GENERATION RATE:** The rate at which a land use generates trips per the specified land use variable, such per dwelling unit or per thousand square feet.

**TRUCK:** A heavy motor vehicle generally used for transporting goods.

**VEHICLE MILES TRAVELED:** A measure of the amount and distance of automobile travel essentially calculated as the sum of each trip times the trip length.

---

Jeff / Jarb,

As discussed this morning, the intersections of California Street at Barton and Nevada Street at Beaumont have been added to the scoping agreement for Canyon Ranch which was previously submitted on October 27, 2021 to Lorena Matarrita.

Please review the figure 1 and confirm that these are the final intersections and approve the scoping agreement for the traffic report for this project.

Thank you

Sincerely,

*Perrie Ilercil*, PE (AZ)  
Senior Engineer

## MEMORANDUM OF UNDERSTANDING

**TO:** Lorena Matarrita, Associate Planner | CITY OF LOMA LINDA

**FROM:** Perrie Ilercil, PE (AZ) | GANDDINI GROUP, INC.

**DATE:** December 20, 2021

**SUBJECT:** Canyon Ranch Project Traffic Impact Analysis MOU  
19409

---

### INTRODUCTION

The purpose of this scoping document is to outline the proposed traffic analysis parameters and assumptions for the Canyon Ranch Project for review/concurrence by the City of Loma Linda staff.

### PROJECT DESCRIPTION

The approximately 136-acre proposed annex area is generally located south of Barton Road, west of San Timoteo Canyon Road/Nevada Street, and northeast of the Union Pacific Railroad line in the City of Loma Linda sphere of influence (currently unincorporated). The annexation includes a General Plan Amendment and Zoning Map Amendment to change four lots from the current designation and zone of General Commercial to Low Density Residential. The two tentative tract maps (TTM) and adjacent lots found within this portion of the sphere of influence will be annexed into the City. See Attachment A for proposed annex area.

The approximately 66.9-acre proposed residential project site is located within the annexation area, north and south of Bermudez Street between San Timoteo Creek and San Timoteo Canyon Road in the City of Loma Linda, California. The project site is currently undeveloped and zoned for Low Density and Very Low Density Residential. The proposed residential project involves construction of two tentative tract maps consisting of 126 residential lots and 3 lettered lots [Project]. TTM-20403 consists of 37 lots (7,200 square feet minimum), a basin, and open space. TTM-20404 consists of 89 lots and a basin (20,000 square feet minimum). The project location map is shown on Figure 1. The project site plan for TTM-20403 and TTM-20404 are illustrated on Figure 2.

Vehicular access for the project site will be maintained at Barton Road, New Jersey Street, San Timoteo Road and Nevada Street. Additionally, the proposed project will vacate the Bermudez Street and San Timoteo Canyon Road intersection and construct a new cul-de-sac on the northern side of parcel 0293-091-04 with a 30-foot access driveway for the adjacent parcel on the east.

### PROJECT TRIP GENERATION & DISTRIBUTION

#### Annexation Area

Table 1 shows proposed annex area trip generation is based upon trip generation rates obtained from the Institute of Transportation Engineers (ITE) *Trip Generation Manual* (11th Edition, 2021). Trip generation rates for ITE Land Use Code 210 (single-family residential) and ITE Land Use Code 820 (commercial retail) were

used for the total previously approved zoning area, and rates from ITE Land Use Code 210 (single-family residential), ITE Land Use Code 560 (church) and ITE Land Use Code 820 (commercial retail) were used for the existing commercial and church development as well as the areas for the proposed residential properties. As shown in Table 1, the previously approved zoning and the future to be determined development were computed in acres and converted using residential density in dwellings per acre and commercial density in floor area ratio. When the actual commercial, church and proposed residential projects are accounted for and added to the remaining balance of the proposed zoning areas there is a slight reduction in the proposed is forecast to trip generation for the General Plan Buildout condition. The proposed annex area is forecast to generate approximately 13,763 daily trips, including 438 trips during the AM peak hour, and 1,274 trips during the PM peak hour. The proposed annex area is forecast to generate net reduction of 8,038 fewer daily trips, with 187 less trips during the AM peak hour, and 749 less trips during the PM peak hour.

#### Residential Projects TTM-20403 and TTM-20404

Table 2 shows proposed project trip generation is based upon trip generation rates obtained from the (ITE) *Trip Generation Manual*. Trip generation rates for ITE Land Use Code 210 (single-family residential) were used for the proposed project. As shown in Table 2, the proposed is forecast to generate approximately 1,188 daily trips, including 88 during the AM peak hour, and 119 trips during the PM peak hour.

#### Project Trip Distributions

Figure 3 illustrates the forecast directional distribution patterns of the project generated trips. The project trip distribution patterns are based on review of existing volume data, surrounding land uses, and the local and regional roadway facilities in the project vicinity.

### STUDY AREA

The project was reviewed with the City of Loma Linda staff to determine the study area which consists of the following study intersections:

Study Intersections		Jurisdiction
1	California Street (NS) at Barton Road (EW)	City of Loma Linda
2.	New Jersey Street at Barton Road	City of Loma Linda
3.	New Jersey Street at Bermudez Street	City of Loma Linda
4	San Timoteo Canyon Road at Barton Road	City of Loma Linda/ Redlands
5	Nevada Street at San Timoteo Canyon Road	City of Loma Linda /Redlands
6	Nevada Street (NS) at Beaumont Avenue (EW)	City of Loma Linda /Redlands
7	Project Access (F) (NS) at Bermudez Street (EW)	City of Loma Linda
8	San Timoteo Canyon Road (NS) at Project Access (G) (EW)1	City of Loma Linda /Redlands
9	Nevada Street (NS) at Project Access (B) (EW)	City of Loma Linda /Redlands

1. San Timoteo Canyon at Bermudez Street (to be vacated)

### TRAFFIC COUNTS

New intersection turning movement counts will be collected at the study intersections during the typical weekday AM and PM peak hour (7:00 AM – 9:00 AM and 4:00 - 6:00 PM). A historical 2018 count at the intersection of Barton Road and California Street will be increased by one percent per year to estimate non-pandemic year 2021 volumes and compared to the new counts. If necessary, new counts shall be adjusted

as appropriate based on a factor derived from the difference between the adjusted historical count and new count volumes.

## INTERSECTION ANALYSIS METHODOLOGY

In accordance with the City of Loma Linda standard procedures, and the County of San Bernardino *Transportation Impact Study Guidelines, July 2019*, intersections shall be analyzed using the intersection delay methodology based on procedures contained in the *Highway Capacity Manual* (Transportation Research Board, 6th Edition). Default values not specifically identified in the City or County guidelines will be based *Highway Capacity Manual* recommended values. Intersection analysis shall be performed using the Vistro software (Version 6.00-00).

## PERFORMANCE STANDARDS

The City of Loma Linda General Plan Policy T-6.10.1, seeks to maintain Level of Service (C or better) for peak hour intersection operations.

In any location where the Level of Service is below Level of Service C at the time an application for a development project is submitted, roadway improvement measures shall be imposed on that development project to assure, at a minimum, that the level of traffic service is maintained at Levels of Service that are no worse than those existing at the time an application for development is filed.

A traffic impact is considered a project-related impact if the project both: i) contributes measurable traffic to and ii) substantially and adversely changes the Level of Service at any off-site location projected to experience deficient operations under foreseeable cumulative conditions, where feasible improvements consistent with the City of Loma Linda General Plan cannot be constructed.

The City of Redlands General Plan and Measure U Section 1A.60 Principle Six has established the minimum acceptable Level of Service (C or better) for roadway segment and peak hour intersection operations. Where the current Level of Service is lower C, roadway improvements shall be provided such that the LOS is not reduced below the LOS at the time of the application, or as provided in Section 5.20 of the Redlands General Plan where a more intense Level of Service is specifically permitted, for Existing Plus Project conditions.

## ANALYSIS SCENARIOS

The traffic study shall evaluate the following analysis scenarios for typical weekday AM and PM peak hour conditions:

- Existing
- Existing Plus Project
- Opening Year (2024) Without Project
- Opening Year (2024) With Project
- Year 2040 Without Project
- Year 2040 Buildout With Project

## FORECASTING METHODOLOGY

Other Development

In addition, a list of pending and approved other development projects shall be requested from the City of Loma Linda and the City of Redlands. Trip forecasts for other development projects within the project study area shall be determined from the other development traffic study or calculated based on the Institute of Transportation Engineers (ITE), *Trip Generation Manual* and will be manually assigned to the study intersections.

#### Model Interpolated Background Growth

In addition to other development trips, the Opening Year (2024) projections will be interpolated by utilizing a portion of the total growth between existing and Year 2040 San Bernardino Transportation Analysis Model (SBTAM) traffic volumes. The incremental growth in average daily traffic volume has been factored to reflect the forecast growth between the measured count year (2021) and year 2040. For analysis purposes, linear growth between the base year condition and the horizon year condition was assumed.

#### Model General Buildout Growth

General Buildout (Year 2040) AM and PM peak hour intersection turning movement volumes will be determined using the SBTAM Year 2040 travel demand model plots and forecasting procedures outlined in the National Cooperative Highway Research Program Report 255.

### **VEHICLE MILES TRAVELED (VMT) ASSESSMENT**

A VMT letter report supplemental to the traffic study shall be submitted to provide VMT screening analysis for CEQA compliance based on State-recommended screening criteria or those adopted by the City of Loma Linda at the time of preparation. The VMT letter report shall include a narrative of VMT requirements under CEQA and documentation of the project screening results based on the applicable criteria.

#### Annexation Area

Based on preliminary review, the proposed annex area is anticipated to satisfy the County-established VMT screening criteria for less than 110 daily trip generation forecast; therefore, the project may be presumed to result in a less than significant VMT impact.

#### Residential Projects TTM-20403 and TTM-20404

Based on preliminary review, the proposed project is anticipated to satisfy the County-established VMT screening criteria for low VMT area. If necessary, to assess the significance of the project VMT impact relative to the applicable thresholds of significance, the project VMT will be estimated using the San Bernardino County Transportation Authority (SBCTA) VMT Screening Tool. VMT for project traffic analysis zone (TAZ) shall be used as a proxy for the proposed project since the proposed project is not regionally significant. Therefore, new model runs are not anticipated to be required or included in this scope of work.

### **CONCLUSION**

We appreciate the opportunity to provide this memorandum of understanding for your review. Should you have any questions or comments regarding the proposed scope, please contact me at (714) 795-3100 or 949-257-3126.

## AM PEAK HOUR

### Intersection Level Of Service Report

#### Intersection 1: California St (NS) at Barton Rd (EW)

Control Type:	Signalized	Delay (sec / veh):	28.0
Analysis Method:	HCM 6th Edition	Level Of Service:	C
Analysis Period:	15 minutes	Volume to Capacity (v/c):	0.648

#### Intersection Setup

Name	California St		Barton Rd		Barton Rd		
Approach	Southbound		Eastbound		Westbound		
Lane Configuration							
Turning Movement	Left	Right	Left	Thru	U-turn	Thru	Right
Lane Width [ft]	12.00	12.00	12.00	12.00	12.00	12.00	12.00
No. of Lanes in Pocket	1	0	1	0	1	0	0
Pocket Length [ft]	100.00	100.00	76.00	100.00	178.00	100.00	100.00
Speed [mph]	45.00		55.00		55.00		
Grade [%]	0.00		0.00		0.00		
Curb Present	No		No		No		
Crosswalk	Yes		No		Yes		

#### Volumes

Name	California St		Barton Rd		Barton Rd

95th-Percentile Queue Length [veh/ln]	3.49	27.45	1.36	0.04	11.93
95th-Percentile Queue Length [ft/ln]	87.18	686.22	34.06	1.03	298.21

**Movement, Approach, & Intersection Results**

d_M, Delay for Movement [s/veh]	32.60	32.60	46.95	5.12	37.17	12.53
Movement LOS	C	C	D	A	D	B
d_A, Approach Delay [s/veh]	32.60		40.80		12.58	
Approach LOS	C		D		B	
d_I, Intersection Delay [s/veh]	29.20					
Intersection LOS	C					
Intersection V/C	0.666					

**Other Modes**

g_Walk,mi, Effective Walk Time [s]	11.0	11.0	11.0
M_corner, Corner Circulation Area [ft <sup>2</sup> /ped]	0.00	0.00	0.00
M_CW, Crosswalk Circulation Area [ft <sup>2</sup> /ped]	0.00	0.00	0.00
d_p, Pedestrian Delay [s]	49.50	49.50	49.50
I_p,int, Pedestrian LOS Score for Intersection	1.878	2.670	2.560
Crosswalk LOS	A	B	B
s_b, Saturation Flow Rate of the bicycle lane	2000	2000	2000
c_b, Capacity of the bicycle lane [bicycles/h]	0	0	0
d_b, Bicycle Delay [s]	60.00	60.00	60.00
I_b,int, Bicycle LOS Score for Intersection	4.276	5.433	4.132
Bicycle LOS	E	F	D

**Sequence**

Ring 1	1	2	-	4	-	-	-	-	-	-	-	-	-	-	-	-
Ring 2	-	6	7	-	-	-	-	-	-	-	-	-	-	-	-	-
Ring 3	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Ring 4	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

**ATTACHMENT H**

**TRAFFIC SIGNAL WARRANT WORKSHEETS**

**Figure E-1**

**San Timoteo Cyn Rd/NV Street (NS) / San Timoteo Cyn Rd (EW) - #9**  
**Year 2040 With Project**  
**PM**

Major Street: <u>San Timoteo Cyn Rd</u>	Volume: <u>1287</u>
Minor Street: <u>San Timoteo Cyn Rd/NV Street</u>	Volume: <u>83</u>

**Warrant 3, Peak Hour Vehicular Volume (70% Factor)**

(Community less than 10,000 population or above 40 mph on the major street)

**TRAFFIC SIGNAL WARRANT IS SATISFIED**

\*Note: 100 vph applies as the lower threshold volume for a minor street approach with two or more lanes and 75 vph applies as the lower threshold volume for a minor street approach with one lane.
