

COUNTY OF SAN LUIS OBISPO
DEPARTMENT OF PLANNING & BUILDING
Initial Study – Environmental Checklist

PLN-2039
04/2019

Project Title & No. Vigeant, Minor Use Permit DRC2021-00146 (ED23-009)

ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED: The proposed project could have a "Potentially Significant Impact" for environmental factors checked below. Please refer to the attached pages for discussion on mitigation measures or project revisions to either reduce these impacts to less than significant levels or require further study.

<input type="checkbox"/> Aesthetics	<input type="checkbox"/> Greenhouse Gas Emissions	<input type="checkbox"/> Public Services
<input type="checkbox"/> Agriculture & Forestry Resources	<input checked="" type="checkbox"/> Hazards & Hazardous Materials	<input type="checkbox"/> Recreation
<input checked="" type="checkbox"/> Air Quality	<input type="checkbox"/> Hydrology & Water Quality	<input type="checkbox"/> Transportation

DETERMINATION:

On the basis of this initial evaluation, the Environmental Coordinator finds that:

- ☐ The proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.
- ☒ Although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.
- ☐ The proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.
- ☐ The proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect 1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and 2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.
- ☐ Although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

Initial Study – Environmental Checklist

Project Environmental Analysis

The County's environmental review process incorporates all of the requirements for completing the Initial Study as required by the California Environmental Quality Act (CEQA) and the CEQA Guidelines. The Initial Study includes staff's on-site inspection of the project site and surroundings and a detailed review of the information in the file for the project. In addition, available background information is reviewed for each project. Relevant information regarding soil types and characteristics, geologic information, significant vegetation and/or wildlife resources, water availability, wastewater disposal services, existing land uses and surrounding land use categories and other information relevant to the environmental review process are evaluated for each project. Exhibit A includes the references used, as well as the agencies or groups that were contacted as a part of the Initial Study. The County Planning Department uses the checklist to summarize the results of the research accomplished during the initial environmental review of the project.

Persons, agencies or organizations interested in obtaining more information regarding the environmental review process for a project should contact the County of San Luis Obispo Planning Department, 976 Osos Street, Rm. 200, San Luis Obispo, CA, 93408-2040 or call (805) 781-5600.

A. Project

DESCRIPTION: A request by **Rhonda and Phil Vigeant** for a Minor Use Permit (MUP) to authorize the phased construction of a 3,000 square foot (sf) single-family residence and a 2,400-sf agricultural accessory building as well as other site improvements that will include an all-weather access driveway, water storage tank and septic leach field. The project will result in an area of disturbance of approximately 1.0 acres and will include 200 cubic yards (cy) of cut, 140 cy of fill and 60 cy of export that will be spread on site. The project will be served by an existing well. A new, all-weather access drive will be constructed to CalFire standards to serve the residence and accessory building. The project site consists of 28.9 acres located at 5175 Martingale Court about two miles east of the City of Paso Robles. The site is within the Agriculture land use category and the El Pomar/Estrella Sub-Area of the North County Planning Area.

The project will be constructed in two phases. Phase I will consist of grading and construction of a 16-foot wide, all-weather access road and a 2,400-sf agricultural accessory building to be used for storage and a workshop to support ongoing wine grape production. Phase I will also include the extension of water and electrical utilities within the alignment of the driveway and the placement of a 5,000-gallon water storage tank. Phase II will consist of construction of a 3,000-sf residence with attached garage and a septic leach field.

The regional location of the project site is shown in Figure 1; an aerial view of the project site and vicinity is provided in Figure 2. Table 1 provides a summary of project phasing and associated project components.

Initial Study – Environmental Checklist

Table 1 – Project Phasing and Associated Components

Components		Quantities
Phase I		
Ag Accessory Building	Storage	1,400 sf
	Workshop	1,000 sf
	Total:	2,400 sf
Grade and construct a new 16 foot wide all weather access road, including 200 cubic yards (cy) of cut, 140 cy of fill. Extend utilities to building sites. Install 5,000 gal. water storage tank.		36,660 sf
Sub-Total:		39,060 sf
Phase II		
Single Family Residence		3,000 sf
Septic Leach Field		1,500 sf
Sub-Total:		4,500 sf
Total Area of Disturbance:		43,560 sf/ 1.0 acre

Baseline Conditions

The project site consists of an irregularly shaped parcel of 28.9 acres located on the east side of Martingale Court which extends southward in a loop from Estrella Road (Figure 2). The project site consists of a level plateau overlooking the broad alluvial plain that trends northwest to southeast along the south side of the Estrella River. The topography drops off with moderate steepness to the east to an ephemeral drainage that is tributary to the Estrella River. The level area of the site has been planted with about 16 acres of irrigated wine grapes that consume an estimated 19.2 acre-feet of water per year (16 acres x 1.2 AFY per acre = 19.2 AFY); the steeper slopes contain sparse assemblages of mature blue oaks. There are no structures on the project site except for an existing well; the site is served by a network of unimproved access roads.

Surrounding parcels range in size from 20 to over 160 acres; many have been planted with wine grapes and contain residences and accessory buildings. Others are used for grazing and rural residences.

Ordinance Modification. No ordinance modifications are requested for this project.

ASSESSOR PARCEL NUMBER(S): 015-023-009

C. Environmental Analysis

The Initial Study Checklist provides detailed information about the environmental impacts of the proposed project and mitigation measures to lessen the impacts.

I. AESTHETICS

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
<i>Except as provided in Public Resources Code Section 21099, would the project:</i>				
(a) Have a substantial adverse effect on a scenic vista?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
(b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
(c) In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
(d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Setting

The project site consists of an irregularly shaped parcel of 28.9 located on the east side of Martingale Court which extends southward in a loop from Estrella Road (Figure 2). The project site consists of a level plateau overlooking the broad alluvial plain that trends northwest to southeast along the south side of the Estrella River; the level area of the site has been planted with irrigated wine grapes. The remaining nine acres of the site drop off with moderate steepness to the north and east to an ephemeral drainage that is tributary to the Estrella River. These steeper slopes contain sparse assemblages of mature blue oaks. Improvements to the site include an existing well, perimeter fencing and a network of interior unimproved access roads; there are no structures.

The visual qualities of the project site and surrounding area are considered moderately high. The project site is located in a rural area of the County where the dominant land use is agriculture on parcels ranging in size from 20 acres to over 160 acres. The primary vantage for public views in the area is provided by Estrella Road as it follows a relatively linear course through the valley formed by the Estrella River. El Pomar Road is

Initial Study – Environmental Checklist

a County-maintained rural collector and the primary roadway serving the region. The roadway parallels the Estrella River between State Route 46 to the community of San Miguel and serves the ranches and agricultural operations in the area. Traffic counts taken on Estrella Road at Hog Canyon Road in 2021 revealed an average traffic volume of 1,803 and an afternoon peak hour volume of 172.

The project site takes vehicular access from Martingale Court, a county-maintained rural roadway that extends south from Estrella Road through gently rolling hills to a relatively level area that has been subdivided into 29-acre parcels that have been planted with wine grapes. Traffic volumes on Martingale Court are very low, a reflection of the small number of parcels served by the roadway and the rural, agricultural character of the area.

Conservation and Open Space Element. The Conservation and Open Space Element (COSE) identifies several goals for visual resources in rural parts of the county:

- Goal VR 1: The natural and agricultural landscape will continue to be the dominant view in rural parts of the county.
- Goal VR 2: The natural and historic character and identity of rural areas will be preserved.
- Goal VR 3: The visual identities of communities will be preserved by maintaining rural separation between them.
- Goal VR 7: Views of the night sky and its constellation of stars will be maintained.

Some of the strategies identified to accomplish the goals listed above include encouraging project designs that emphasize native vegetation and conforming grading to existing natural forms, as well as ensuring that new development follows the Countywide Design Guidelines to protect rural visual and historical character.

Countywide Design Guidelines. The Countywide Design Guidelines identify objectives for both urban and rural development. Rural area guidelines applicable to the project include the following:

- Objective RU-5: Fences and screening should reflect an area's rural quality.
- Objective RU-7: Landscaping should be consistent with the type of plants naturally occurring in the County and should limit the need for irrigation.

Inland Land Use Ordinance. The Land Use Ordinance sets forth standards for exterior lighting (LUO Section 22.10.060). In accordance with these standards, exterior lighting must be shielded and directed onto the source parcel and away from roadways and adjacent parcels.

The only Officially Designated State Scenic Highway in San Luis Obispo County is Highway 1. The project site is not visible from Highway 1.

Discussion

(a) *Have a substantial adverse effect on a scenic vista?*

For the purposes of determining significance under CEQA, a scenic vista is defined as a viewpoint that provides expansive views of a highly valued landscape for the benefit of the general public. If the project would substantially degrade the scenic landscape as viewed from public roads, designated scenic routes, or from other public or recreation areas, this would be considered a potentially significant impact on the scenic vista.

While the project vicinity has a moderately high scenic value and an appealing rural and agricultural character, it is not considered a scenic vista as it does not offer expansive public views of a highly

Initial Study – Environmental Checklist

valued landscape and is not officially or unofficially designated as a scenic vista. Therefore, the project would not result in a substantial adverse effect on a scenic vista, and *no impacts would occur*.

- (b) *Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?*

The project site is not located along, nor visible from, a designated state scenic highway or eligible state scenic highway (Caltrans 2022). Therefore, the project would not result in substantial damage to scenic resources within a state scenic highway, and *no impacts would occur*.

- (c) *In non-urbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?*

The project site is located at the top of a series of hills that trend southeast to northwest that form the visual backdrop of views enjoyed by travelers on Estrella Road which is about 0.4 miles to the north (Figure 8). As discussed in the setting above, Estrella Road carries an average daily traffic volume of 1,803 and a peak hour volume of 172. Therefore, public viewership of the project site from Estrella Road is currently moderate.

Figure 8 -- View of the Project Site Looking Northwest From Estrella Road

The project site is also visible from Martingale Court (Figure 9) which carries a very low traffic volume; therefore, public viewership of the site is correspondingly low.

Initial Study – Environmental Checklist

Figure 9 -- View of the Project Site Looking East From Martingale Court

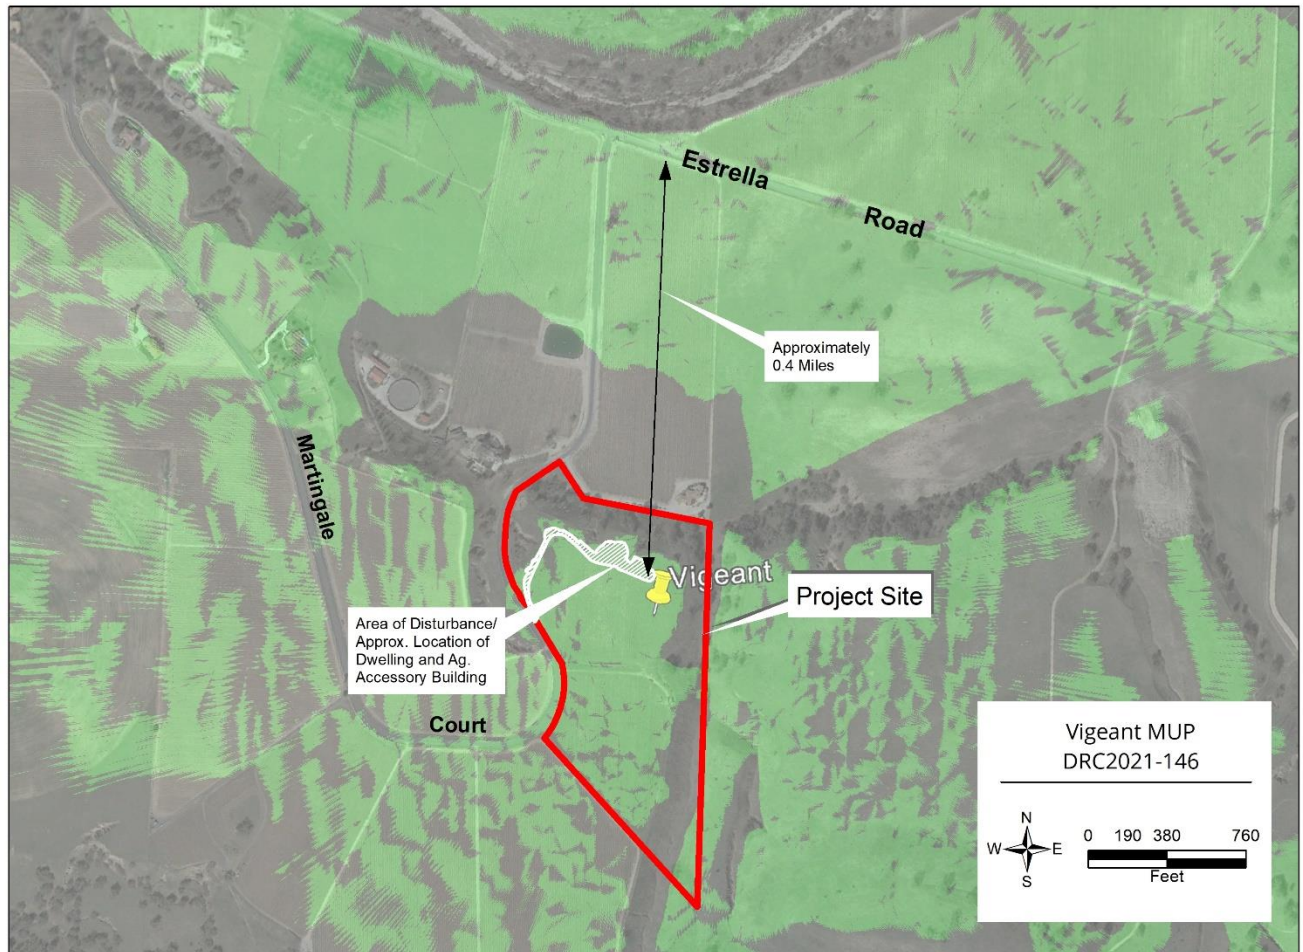

The removal of about 0.8 acres of wine grapes and construction of the residence, ag. accessory building and driveway improvements will change the visual and aesthetic character of the project site. The site plan (Figure 5) shows the two new buildings located on a relatively level area located in the northeastern portion of the parcel currently planted with wine grapes. The residence will be a split-level structure with grey batten and board siding, dark grey window trim and a horizontal wood shiplap accent band around the base. The residence will have a gable roof (Figure 6) and will be oriented to capture expansive views to the north and south. The agricultural accessory buildings will be one story buildings with exterior materials to match the dwelling and will incorporate a cupola with metal grey roofing and wood siding. Neither building or associated improvements will require retaining walls.

According to the plans, the access road will extend north and eastward from Martingale Court generally following the alignment of an existing unimproved access road. The access road and buildings will all be visible from Martingale Court; the upper portions of the residence will be visible from Estrella Road.

Figure 10 provides an illustration of areas (shown in green) with a line of sight view of the residence, assuming the residence and ag. Accessory buildings are about 32 feet high above the existing grade and assuming no intervening visual obstructions such as terrain or vegetation. As shown in Figure 10, the upper portions of the residence and ag. building will be visible from Estrella Road and the entire residence, garage and accessory building will be visible from Martingale Court.

Initial Study – Environmental Checklist

Figure 10 -- Areas With A Line of Sight View of the Project Site (shown in green)

As conditioned, the project is not expected to substantially degrade the existing visual character or quality of public views because:

- The existing visual character of public views in the vicinity of the project site consists of rolling hills with scattered oak trees and wine grapes. Although few of the parcels surrounding the project site have been developed with single-family residences, the dwellings that have been constructed are commonly located at the top of the slope. The size, scale and character of development associated with the project are consistent with the visual character of existing surrounding development.
- Both new buildings incorporate design elements that are agrarian in nature and include muted colors and materials that help minimize their visual prominence.
- The primary opportunity for the public to view the project site is associated with motorists travelling on Estrella Road. As shown in Figure 10, the project site will be in view to passing motorists from a one-mile stretch of the roadway. Assuming an average speed of 55 miles per hour, the project site will be in view to passing motorists on Estrella Road for about 1 minute at a distance that varies between 0.4 miles and 0.75 miles. Assuming 172 peak hour

Initial Study – Environmental Checklist

trips, about three vehicles will pass within view of the project site every minute during the afternoon peak hour. Therefore, although the project will be visible from portions of Estrella Road, views of the project components will be brief, viewed at a considerable distance, and viewed by a small number of people. In addition, views to the west from Estrella Road are partially screened by intermittent stands of valley oaks between the project site and the roadway.

- Views of the project site from Martingale Court will be relatively unobstructed except for the intervening grape vines. However, due to the very low volume of traffic on Martingale Court, the the project site will not significantly impact the quality of views currently enjoyed by the public.
- The project includes a preliminary landscape plan that shows foundation planting along the roadway to help soften the visual transition to the surrounding terrain.

Based on the preceding analysis, project impacts associated with the potential degradation of the existing visual character or quality of public views are expected to be *less than significant*.

- (d) *Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?*

The project would result in a significant impact if it subjects public viewing locations to a substantial amount of point-source lighting visible at night, or if project illumination results in a noticeable spillover effect into the nighttime sky, increasing the ambient light over the region. The placement of lighting, source of illumination, and fixture types combined with viewer locations, adjacent reflective elements, and atmospheric conditions can affect the degree of change to nighttime views. If the project results in direct visibility of a substantial number of lighting sources, or allows a substantial amount of light to project toward the sky, significant impacts on nighttime views and aesthetic character would result.

The project is located in an area with low existing levels of light pollution (Darksitefinder.com 2019). The dwelling and ag. accessory building will introduce new sources of light to the project site that is comparable to a single-family residence. The project will be conditioned to comply with county standards for exterior lighting. Therefore, potential impacts associated with the creation of a new source of substantial light would be *less than significant*. See also Mitigation Measure BIO-11 in Section IV. Biological Resources).

Conclusion

The project is not located within view of a scenic vista and would not result in a substantial change to scenic resources in the area. The project would be consistent with existing policies and standards in the County LUO and COSE related to the protection of scenic resources. New sources of light will be subject to compliance with the County's exterior lighting standards as prescribed in LUO Section 22.10.060. Impacts to aesthetic resources would be *less than significant*.

Mitigation

None are required.

Provided in Exhibit A.

Initial Study – Environmental Checklist

II. AGRICULTURE AND FORESTRY RESOURCES

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
<p><i>In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. In determining whether impacts to forest resources, including timberland, are significant environmental effects, lead agencies may refer to information compiled by the California Department of Forestry and Fire Protection regarding the state's inventory of forest land, including the Forest and Range Assessment Project and the Forest Legacy Assessment project; and forest carbon measurement methodology provided in Forest Protocols adopted by the California Air Resources Board. Would the project:</i></p>				
(a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
(b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
(c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
(d) Result in the loss of forest land or conversion of forest land to non-forest use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
(e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Setting

The California Department of Conservation (CDOC) Farmland Mapping and Monitoring Program (FMMP) produces maps and statistical data used for analyzing impacts to California's agricultural resources. Agricultural land is rated according to soil quality as well as current and previous land use. For purposes of CEQA compliance, the FMMP categories of Prime Farmland, Farmland of Statewide Importance, Unique

Initial Study – Environmental Checklist

Farmland, Farmland of Local Importance, and Grazing Land as “agricultural land.” Non-agricultural designations include Urban and Built-up Land, Other Land, and Water.

Chapter 6 of the County Conservation and Open Space Element (COSE) identifies resource management goals, policies, and strategies to protect agricultural soils from conversion to urban and residential uses. Important Agricultural Soils within the County are identified in Table SL-2 of the COSE and Policy SL 3.1 states that proposed conversion of agricultural lands to non-agricultural uses shall be evaluated using the applicable policies in the COSE and Agricultural Element.

Soils of the site are described in detail below. The acreage and corresponding farmland classifications are provided in Tables 2 and 3.

Arbuckle-San Ysidro complex, 2 to 9 percent slopes

Arbuckle: 40 percent

The Arbuckle component makes up 40 percent of the map unit. Slopes are 2 to 9 percent. This component is on terraces. The parent material consists of alluvium from mixed rock sources. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 1 percent. This component is in the R014XE003CA Coarse Loamy ecological site. Nonirrigated land capability classification is 4e. Irrigated land capability classification is 3e. This soil does not meet hydric criteria.

San ysidro: 20 percent

The San Ysidro component makes up 20 percent of the map unit. Slopes are 2 to 9 percent. This component is on terraces. The parent material consists of alluvium derived from mixed rocks. Depth to a root restrictive layer, abrupt textural change, is 20 to 37 inches. The natural drainage class is moderately well drained. Water movement in the most restrictive layer is low. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is moderate. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 1 percent. This component is in the R014XE029CA Loamy Claypan ecological site. Nonirrigated land capability classification is 4e. Irrigated land capability classification is 3e. This soil does not meet hydric criteria.

Arbuckle-Positas complex, 30 to 50 percent slopes

Arbuckle: 40 percent

The Arbuckle component makes up 40 percent of the map unit. Slopes are 30 to 50 percent. This component is on terraces. The parent material consists of alluvium from mixed rock sources. Depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 1 percent. This component is in the R014XE003CA Coarse Loamy ecological site. Nonirrigated land capability classification is 7e. Irrigated land capability classification is 7e. This soil does not meet hydric criteria.

Initial Study – Environmental Checklist

Positas: 30 percent

The Positas component makes up 30 percent of the map unit. Slopes are 30 to 50 percent. This component is on terraces. The parent material consists of alluvium from mixed rock sources. Depth to a root restrictive layer, abrupt textural change, is 9 to 20 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is low. Available water to a depth of 60 inches (or restricted depth) is low. Shrink-swell potential is high. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 1 percent. This component is in the R014XE005CA Coarse Loamy Claypan ecological site. Nonirrigated land capability classification is 7e. Irrigated land capability classification is 7e. This soil does not meet hydric criteria.

Arbuckle-Positas complex, 50 to 75 percent slopes

Arbuckle: 35 percent

The Arbuckle component makes up 35 percent of the map unit. Slopes are 50 to 75 percent. This component is on terraces. The parent material consists of alluvium from mixed rock sources. The depth to a root restrictive layer is greater than 60 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is moderately high. Available water to a depth of 60 inches (or restricted depth) is moderate. Shrink-swell potential is low. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 1 percent. This component is in the R014XE003CA Coarse Loamy ecological site. Nonirrigated land capability classification is 7e. Irrigated land capability classification is 7e. This soil does not meet hydric criteria.

Positas: 25 percent

The Positas component makes up 25 percent of the map unit. Slopes are 50 to 75 percent. This component is on terrace escarpments. The parent material consists of alluvium from mixed rock sources. Depth to a root restrictive layer, abrupt textural change, is 9 to 20 inches. The natural drainage class is well drained. Water movement in the most restrictive layer is low. Available water to a depth of 60 inches (or restricted depth) is low. Shrink-swell potential is high. This soil is not flooded. It is not ponded. There is no zone of water saturation within a depth of 72 inches. Organic matter content in the surface horizon is about 1 percent. This component is in the R014XE005CA Coarse Loamy Claypan ecological site. Nonirrigated land capability classification is 7e. Irrigated land capability classification is 7e. This soil does not meet hydric criteria.

As shown in Table 2, the Arbuckle-San Ysidro complex, 2 to 9 percent slopes is considered prime farmland and Farmland of Statewide Importance by the COSE. The Arbuckle-Positas complexes are considered not prime.

Table 2 – Farmland Classifications of the COSE and Corresponding Acreages

Soil	COES Classification	Acreage
Arbuckle-San Ysidro complex, 2 to 9 percent slopes	Prime Farmland, Farmland of Statewide Importance	16.6
Arbuckle-Positas complex, 30 to 50 percent slopes	Not Prime	7.3
Arbuckle-Positas complex, 50 to 75 percent slopes	Not Prime	5.0
Total:		28.9

Initial Study – Environmental Checklist

Source: Classifications based on Table SL-2 of the County General Plan's Conservation/Open Space Element

Table 3 provides a summary of farmland classifications for soils on the project site as determined by the FMMP. As shown in Table 3, about 18.5 acres of the project site are considered important farmland for crop production.

Table 3 – Farmland Classifications of the FMMP and Corresponding Acreages

FMMP Classification	Acres
Grazing	10.4
Farmland of Statewide Importance	14.3
Farmland of Local Potential	2.38
Unique Farmland	1.82
Total:	28.9

Source: Department of Conservation Farmland Mapping and Monitoring Program

The Land Conservation Act of 1965, commonly referred to as the Williamson Act, enables local governments to enter into contracts with private landowners for the purpose of restricting specific parcels of land to agriculture or related open space use. In return, landowners receive property tax assessments that are much lower because they are based upon farming and open space uses as opposed to full market value. The project site is within the El Pomar Agricultural Preserve but is not subject to an active Williamson Act contract but.

According to California Public Resources Code (PRC) Section 12220(g), forest land is defined as land that can support 10% native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits. Timberland is defined as land, other than land owned by the federal government and land designated by the State Board of Forestry and Fire Protection as experimental forest land, which is available for, and capable of, growing a crop of trees of a commercial species used to produce lumber and other forest products, including Christmas trees.

The project site contains about 16 acres of land planted in wine grapes. Historical aerial photography of the project site indicates grape cultivation has occurred since at least 2003 and continues to the present.

- (a) *Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?*

The project site consists of 28.9 acres; about 16 acres are planted with wine grapes. As shown in Table 3, according to the FMMP, the project site contains 14.3 acres mapped as Farmland of Statewide Importance and 1.82 acres mapped as Unique Farmland, primarily on the level portion of the site where the dwelling, ag. accessory building, and driveway access road will be constructed. The proposed access road and driveway will be partially located in an area where an existing unimproved access road has been maintained. Nonetheless, construction of the new all-weather roadway and secondary residence will result in the permanent conversion of about 1.0 acres of Farmland of Statewide Importance to a non-agricultural use. This impact is considered *less than significant* because:

Initial Study – Environmental Checklist

- The conversion of 1.0 acres is a small fraction of the total productive farmland within the County as mapped by the FMMP;
- The remaining 15 acres of Farmland of Statewide Importance and Unique Farmland on the project site will continue to be available for crop production.

In addition, the project is consistent with the following policies of the Agriculture Element with regard to the protection and preservation of productive agricultural land:

AGP8: Intensive Agricultural Facilities.

- a. Allow the development of compatible intensive agricultural facilities that support local agricultural production, processing, packing, and support industries.*
- b. Locate intensive agricultural facilities off of productive agricultural lands unless there are no other feasible locations. Locate new structures where land use compatibility, circulation, and infrastructure capacity exist or can be developed compatible with agricultural uses.*
- Discussion: The accessory building will be used to support ongoing grape production on the site. There are no other suitable locations for construction of the buildings on less productive soils.

AGP18: Location of Improvements.

- a. Locate new buildings, access roads, and structures so as to protect agricultural land.*
- Discussion: The buildings will be clustered in a single area of about 0.2 acres and will be located to take advantage of the existing roadways for construction of the all-weather access road. Roads currently used to support ongoing grape operations will remain accessible for this use.

AGP14: Agricultural Preserve Program.

- a. Encourage eligible property owners to participate in the county's agricultural preserve program.*

Discussion: The project site is not subject to an active LCA contract.

AGP24: Conversion of Agricultural Land.

- a. Discourage the conversion of agricultural lands to non-agricultural uses through the following actions:*
 - 1. Work in cooperation with the incorporated cities, service districts, school districts, the County Department of Agriculture, the Agricultural Advisory Liaison Board, Farm Bureau, and affected community advisory groups to establish urban service and urban reserve lines and village reserve lines that will protect agricultural land and will stabilize agriculture at the urban fringe.*

Discussion: The project site is not located in proximity to an urban reserve or city.

Initial Study – Environmental Checklist

2. *Establish clear criteria in this plan and the Land Use Element for changing the designation of land from Agriculture to non-agricultural designations.*
3. *Avoid land redesignation (rezoning) that would create new rural residential development outside the urban and village reserve lines.*
4. *Avoid locating new public facilities outside urban and village reserve lines unless they serve a rural function or there is no feasible alternative location within the urban and village reserve lines.*

Discussion: The project is consistent with the allowable land uses in the Agriculture land use category and does not propose a change in the land use designation.

For the above reasons, project impacts would be *less than significant* and *less than cumulatively considerable*.

(b) *Conflict with existing zoning for agricultural use, or a Williamson Act contract?*

The subject property is located within the Agriculture land use category and is not subject to a Williamson Act Contract; a single family dwelling and accessory building are allowable uses. Therefore, as conditioned, the project would not result in a conflict with existing zoning for agricultural use or a Williamson Act contract and *no impacts would occur*.

(c) *Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?*

The project site does not include land use designations or zoning for forest land or timberland as defined by the Public Resources Code; *no impacts would occur*.

(d) *Result in the loss of forest land or conversion of forest land to non-forest use?*

The project site does not support resources that meet the definition of “forest land” as prescribed in Public Resources Code Section 12220(g):

“Forest land” is land that can support 10-percent native tree cover of any species, including hardwoods, under natural conditions, and that allows for management of one or more forest resources, including timber, aesthetics, fish and wildlife, biodiversity, water quality, recreation, and other public benefits.

Therefore, there would be *no impact* relating to the conversion of forest land to a non-forest use.

(e) *Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?*

The project site is generally surrounded by small agricultural operations. As discussed in the project description, the project site supports wine grapes that were established at least by 2003. The project will include the removal of about 0.8 acres of existing grape vines for the construction of the dwelling, garage, accessory building, and other site improvements. Therefore, the majority of the existing vines will be maintained on the site following construction of the project.

Surrounding agricultural uses (primarily grazing and grape production) would be temporarily affected by noise and dust generated during the construction phase of the project. These impacts would be temporary in nature and would not result in the direct impairment or conversion of agricultural land to other uses.

Initial Study – Environmental Checklist

Therefore, potential impacts would be *less than significant*.

Conclusion

The project would result in less than significant impacts relating to the conversion of farmland, forest land, or timber land to non-agricultural uses or non-forest uses and would not conflict with agricultural zoning or otherwise adversely affect agricultural resources or uses. Potential impacts to agricultural resources would be *less than significant* and *less than cumulatively considerable* and no mitigation measures are necessary.

Mitigation

None necessary.

(d) Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Setting

San Luis Obispo County Clean Air Plan

The San Luis Obispo County Air Pollution Control District (SLOAPCD) San Luis Obispo County 2001 Clean Air Plan (CAP) is a comprehensive planning document intended to evaluate long-term air pollutant emissions and cumulative effects and provide guidance to the SLOAPCD and other local agencies on how to attain and maintain the state standards for ozone and particulate matter 10 micrometers or less in diameter (PM₁₀).

The CAP presents a detailed description of the sources and pollutants that impact the jurisdiction's attainment of state standards, future air quality impacts to be expected under current growth trends, and an appropriate control strategy for reducing ozone precursor emissions, thereby improving air quality. Project consistency with the CAP is determined by considering whether the project incorporates the relevant land use planning and transportation control measures and strategies outlined in the CAP.

The County is currently designated as a non-attainment area for ozone and PM₁₀ under state ambient air quality standards. Construction and operation of the project would result in emissions of ozone precursors including reactive organic gases (ROG) and nitrous oxides (NO_x) as well as fugitive dust emissions (PM₁₀) and exhaust particulates.

SLOAPCD Criteria Pollutant Thresholds

The SLOAPCD has developed a CEQA Air Quality Handbook (most recently updated with a November 2017 Clarification Memorandum) to help local agencies determine the significance of project-specific air quality impacts and to determine whether mitigation measures are needed. To assist in this task, the Handbook includes screening criteria to determine the significance of project impacts. For example, according to the Handbook, a project with grading in excess of 4.0 acres and results in the movement of 1,200 cubic yards of earth per day can exceed the construction threshold for respirable particulate matter (PM₁₀).

Initial Study – Environmental Checklist

The use of heavy equipment and earth-moving operations during project construction can generate fugitive dust and engine combustion emissions that may have substantial temporary impacts on local air quality. Combustion emissions, such as nitrogen oxides (NOx), reactive organic gases (ROG), greenhouse gases (GHG), and diesel particulate matter (DPM), are most significant when using large, diesel-fueled scrapers, loaders, bulldozers, haul trucks, compressors, generators, and other heavy equipment. The SLOAPCD has established thresholds of significance for each of these contaminants.

Operational impacts are focused primarily on the indirect emissions (i.e., motor vehicles) associated with residential, commercial, and industrial development. Certain types of projects can also include components that generate direct emissions, such as power plants, gasoline stations, dry cleaners, and refineries (referred to as stationary source emissions). Table 1-1 of the APCD's CEQA Handbook provides screening criteria based on the size of different types of projects that would normally generate sufficient motor vehicle trips that would cause an exceedance of the operational thresholds for ozone precursors. A project consisting of 99 single family residences generating 970 average daily vehicle trips would be expected to exceed the 25 lbs/day operational threshold for ozone precursors.

The APCD has also estimated the number of vehicular round trips on an unpaved roadway necessary to exceed the 25 lbs/day threshold of significance for the emission of particulate matter (PM10). According to the APCD estimates, an unpaved roadway of one mile in length carrying 6.0 round trips would likely exceed the 25 lbs/day PM10 threshold.

The prevailing winds in the project vicinity are from the north and west.

Sensitive Receptors

Sensitive receptors are people with an increased sensitivity to air pollution or environmental contaminants, such as the elderly, children, people with asthma or other respiratory illnesses, and others who are at a heightened risk of negative health outcomes due to exposure to air pollution. Some land uses are considered more sensitive to changes in air quality than others, due to the population that occupies the uses and the activities involved. Sensitive receptor locations include schools, parks and playgrounds, day care centers, nursing homes, hospitals, and residences. The nearest sensitive receptors to the site are single-family residences located to the east and northeast.

Naturally Occurring Asbestos

Naturally Occurring Asbestos (NOA) is identified as a toxic air contaminant by the California Air Resources Board (CARB). Serpentine and other ultramafic rocks are fairly common throughout San Luis Obispo County and may contain NOA. If these areas are disturbed during construction, NOA-containing particles can be released into the air and have an adverse impact on local air quality and human health. Based on SLOAPCD's NOA Screening Map, the project site is not located in an area identified as having potential for soils containing NOA.

Developmental Burning

As of February 25, 2000, the APCD prohibits developmental burning of vegetative material within San Luis Obispo County. However, under certain circumstances where no technically feasible alternatives are available, limited developmental burning under restrictions may be allowed. Any such exception must complete the following prior to any burning: APCD approval; payment of fee to APCD based on the size of the project; and issuance of a burn permit by the APCD and the local fire department authority. As a part of APCD approval, the applicant shall furnish them with the study of technical feasibility (which includes costs and other constraints) at the time of application.

Initial Study – Environmental Checklist

Discussion

(a) *Conflict with or obstruct implementation of the applicable air quality plan?*

In order to be considered consistent with the 2001 San Luis Obispo County CAP, a project must be consistent with CAP's land use planning and transportation control measures and strategies (SLOAPCD 2012). These strategies include, but are not limited to, planning compact communities with higher densities, providing for mixed land use, and balancing jobs and housing. The project does not include development of retail or commercial uses that would be open to the public, therefore, land use planning strategies such as mixed-use development and planning compact communities are generally not applicable. The project would result in the construction of a single-family residence that would typically be occupied by three full-time residents. Therefore, the project would not generate a significant number of employees and would not significantly affect the local area's jobs/housing balance.

Adopted transportation control measures include, but are not limited to, a voluntary commute options program, local and regional transit system improvements, bikeway enhancements, and telecommuting programs. The voluntary commute options program targets employers in the county with more than 20 full time employees; the project consists of a single-family residence and secondary residence and would have no employees. The project would not conflict with regional plans for transit system or bikeway improvements.

Overall, the project would not conflict with or obstruct implementation of the CAP; therefore, impacts would be *less than significant*.

(b) *Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?*

The County is currently designated as non-attainment for ozone and PM₁₀ under state ambient air quality standards. Construction and operation of the project would result in emissions of ozone precursors including reactive organic gases (ROG) and nitrous oxides (NO_x) as well as fugitive dust emissions (PM₁₀).

Construction Emissions

Based on the project description, the project will have an area of disturbance of about 1.0 acres and will involve 200 cubic yards (cy) of cut, 140 cy of fill and 60 cy of export that will be spread on site. Construction activities will result in the generation of dust, as well as short-term construction vehicle emissions. Using the SLOAPCD's CEQA Air Quality Handbook (2012) and Clarification Memorandum (2017), construction-related emissions were calculated for the project and are shown in Table 4 below.

Initial Study – Environmental Checklist

Table 4 -- Estimated Construction-Related Emissions

Pollutant	Total Estimated Emissions	APCD Emissions Threshold	Mitigation Required?
Reactive Organic Gases (ROG) + Nitrogen Oxide (NO _x) (combined)	3.84 lbs./day ¹	137 lbs./day	No
	0.019 tons/quarter ¹	2.5 tons/quarter	No
Diesel Particulate Matter (DPM)	0.17 lbs./day ²	7 lbs./day	No
	0.0008 tons/quarter ²	0.13 tons/quarter	No
Fugitive Particulate Matter (PM ₁₀)	0.75 tons ³ /quarter	2.5 tons/quarter	No

Notes:

1. Based on 340 cubic yards of material moved and 0.113 pounds of combined ROG and NO_x emissions per cubic yard of material moved and 10 construction days.
2. Based 340 cubic yards of material moved and 0.0049 pounds of diesel particulate emissions per cubic yard of material moved.
3. Based on 1.0 total acres of disturbance and 0.75 tons of PM₁₀ generated per acre of disturbance per month and 10 days of construction.

As shown in Table 4, project construction related emissions are not expected to exceed the daily and quarterly emissions thresholds for ozone precursors, diesel particulates or fugitive dust. Therefore, project impacts associated with the exceedance of SLOAPCD daily and quarterly emissions thresholds will be considered *less than significant*.

Operation-Related Emissions. The project consists of a single-family residence that will likely generate about 9.0 average daily trips. Accordingly, project-specific and cumulative operational impacts are considered a *less than significant* and *less than cumulatively considerable*.

The project site does not require travel on an unpaved roadway.

Overall, impacts related to exceedance of federal, state, or SLOAPCD ambient air quality standards due to operational activities would be *less than significant*.

(c) *Expose sensitive receptors to substantial pollutant concentrations?*

Sensitive receptors are people or other organisms that may have a significantly increased sensitivity to exposure to air pollution by virtue of their age and health (e.g. schools, day care centers, hospitals, nursing homes), regulatory status (e.g. federal or state listing as a sensitive or endangered species), or proximity to the source. The nearest sensitive receptors are residences located on the properties to the east and northwest that are within 1,000 feet of potential construction activities. These residences may be occupied by sensitive receptors, and the close proximity, combined with the prevailing winds could result in exposure to diesel particulates and fugitive dust from construction activities. Therefore, potential impacts to sensitive receptors would be *less than significant with mitigation*.

Initial Study – Environmental Checklist

- (d) *Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?*

The project site is not located in an area identified as containing NOA by the SLOAPCD. The project does not propose to burn any onsite vegetative materials and would be subject to SLOAPCD restrictions on developmental burning of vegetative material; therefore, the project would not result in substantial air pollutant emissions from such activities and there would be *no impact*.

Conclusion

The project would be consistent with the SLOAPCD's Clean Air Plan but diesel emissions associated with construction activities could adversely impact surrounding sensitive receptors. Therefore, potential impacts to air quality would be *less than significant with mitigation*.

Mitigation

AQ-1 Fugitive Dust Construction Control Measures. Prior to issuance of construction permits, the following measures shall be incorporated into the construction phase of the project and shown on all applicable plans:

1. Reduce the amount of the disturbed area where possible;
2. Use water trucks or sprinkler systems in sufficient quantities to prevent airborne dust from leaving the site. Increased watering frequency would be required whenever wind speeds exceed 15 miles per hour. Reclaimed (non-potable) water should be used whenever possible;
3. All dirt stock-pile areas shall be sprayed daily as needed;
4. All roadways, driveways, sidewalks, etc. to be paved shall be completed as soon as possible, and building pads shall be laid as soon as possible after grading unless seeding or soil binders are used;
5. All of these fugitive dust mitigation measures shall be shown on grading and building plans; and
6. The contractor or builder shall designate a person or persons to monitor the fugitive dust emissions and enhance the implementation of the measures as necessary to minimize dust complaints, reduce visible emissions below 20% opacity, and to prevent transport of dust offsite. Their duties shall include holidays and weekend periods when work may not be in progress.

AQ-2 ROG, NO_x, DPM Emissions. The following measures based on the SLOAPCD standard mitigation measures for construction equipment for reducing nitrogen oxides (NO_x), reactive organic gases (ROG), and diesel particulate matter (DPM) emissions from construction equipment shall be implemented to reduce exposure of sensitive receptors to substantial pollutant concentrations. These measures shall be shown on grading and building plans:

- a. Implement Mitigation Measure AQ-1, as identified above.
- b. On-road diesel vehicles shall comply with Section 2485 of Title 13 of the California Code of Regulations. This regulation limits idling from diesel-fueled commercial motor vehicles with gross vehicular weight ratings of more than 10,000 pounds and licensed for operation on

Initial Study – Environmental Checklist

highways. It applies to California and non-California based vehicles. In general, the regulation specifies that drivers of said vehicles:

- i. Shall not idle the vehicle's primary diesel engine for greater than 5 minutes at any location, except as noted in Subsection (d) of the regulation; and,
 - ii. Shall not operate a diesel-fueled auxiliary power system to power a heater, air conditioner, or any ancillary equipment on that vehicle during sleeping or resting in a sleeper berth for greater than 5.0 minutes at any location when within 1,000 feet of a restricted area, except as noted in Subsection (d) of the regulation.
- c. Maintain all construction equipment in proper tune according to manufacturer's specifications.
 - d. Fuel all off-road and portable diesel-powered equipment with ARB certified motor vehicle diesel fuel (non-taxed version suitable for use off-road).
 - e. Use diesel construction equipment meeting ARB's Tier 2 certified engines or cleaner off-road heavy-duty diesel engines and comply with the State Off-Road Regulation.
 - f. Idling of all on and off-road diesel-fueled vehicles shall not be permitted when not in use. Signs shall be posted in the designated queuing areas and or job site to remind drivers and operators of the no idling limitation.
 - g. Electrify equipment when possible.
 - h. Substitute gasoline-powered in place of diesel-powered equipment, when available. and,
 - i. Use alternatively fueled construction equipment on-site when available, such as compressed natural gas (CNG), liquefied natural gas (LNG), propane or biodiesel.

IV. BIOLOGICAL RESOURCES

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
<i>Would the project:</i>				
(a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
(b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
(c) Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
(d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
(e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
(f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Initial Study – Environmental Checklist

Regulatory Setting

Federal Laws and Regulations

Bald and Golden Eagle Protection Act. The Bald and Golden Eagle Protection Act (BGEPA) prohibits anyone, without a permit issued by the Secretary of the Interior, from taking (pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, molest, or disturb) bald or golden eagles, including their parts, nests, or eggs. This includes substantially interfering with normal breeding, feeding, or sheltering behavior. Activities that may result in the take of a bald or golden eagle require permits; the three activities eligible for permits include to remove or relocate an eagle nest; to transport, exhibit, collect, or control eagles or eagle parts, and for incidental take of eagles.

Clean Water Act. The Clean Water Act (CWA) establishes the basic structure for regulating discharges of pollutants into the waters of the United States and regulating quality standards for surface waters. The purpose of the CWA is to restore and maintain the chemical, physical, and biological integrity of all waters of the U.S. Permitting is required for filling waters of the U.S. (including wetlands). Permits may be issued on an individual basis or may be covered under approved nationwide permits.

Endangered Species Act. The federal Endangered Species Act (FESA) provides the legal framework for the listing and protection of species (and their habitats) identified as being endangered or threatened with extinction. “Critical Habitat” is a term within the FESA designed to guide actions by federal agencies and is defined as “an area occupied by a species listed as threatened or endangered within which are found physical or geographical features essential to the conservation of the species, or an area not currently occupied by the species which is itself essential to the conservation of the species.” Actions that jeopardize endangered or threatened species and/or critical habitat are considered a ‘take’ under the FESA. “Take” under federal definition means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct.

Projects that would result in “take” of any federally listed threatened or endangered species, or critical habitats, are required to obtain permits from the USFWS through either Section 7 (interagency consultation with a federal nexus) or Section 10 (Habitat Conservation Plan) of FESA, depending on the involvement by the federal government in permitting and/or funding of the project. Through Section 10, it is required to prepare a Habitat Conservation Plan (HCP) to be approved by the United States Fish and Wildlife Service (USFWS), which results in the issuance of an Incidental Take Permit (ITP). Through Section 7, which can only occur when a separate federal nexus in a project exists (prompting interagency consultation), a consultation by the various federal agencies involved can take place to determine appropriate actions to mitigate negative effects on endangered and threatened species and their habitat.

Migratory Bird Treaty Act. All migratory, non-game bird species that are native to the U.S. or its territories are protected under the federal Migratory Bird Treaty Act (MBTA) of 1918 (50 C.F.R. Section 10.13), as amended under the Migratory Bird Treaty Reform Act of 2004. MBTA makes it illegal to purposefully take (pursue, hunt, shoot, wound, kill, trap, capture, or collect) any migratory bird, or the parts, nests, or eggs of such a bird, except under the terms of a valid Federal permit. Migratory non-game native bird species are protected by international treaty under the Federal Migratory Bird Treaty Act (MBTA).

Initial Study – Environmental Checklist

State Law and Regulations

California Endangered Species Act. The California Endangered Species Act (CESA), similar to FESA, contains a process for listing of species and regulating potential impacts to listed species. State threatened and endangered species include both plants and wildlife, but do not include invertebrates. The designation “rare species” applies only to California native plants. State threatened and endangered plant species are regulated largely under the Native Plant Preservation Act in conjunction with the CESA. State threatened and endangered animal species are legally protected against “take.” The CESA authorizes the California Department of Fish and Wildlife (CDFW) to enter into a memorandum of agreement for take of listed species to issue an incidental take permit for a state-listed threatened and endangered species only if specific criteria are met.

Section 2080 of the CESA prohibits the take of species listed as threatened or endangered pursuant to the Act. Section 2081 allows CDFW to authorize take prohibited under Section 2080 provided that: 1) the taking is incidental to an otherwise lawful activity; 2) the taking will be minimized and fully mitigated; 3) the applicant ensures adequate funding for minimization and mitigation; and 4) the authorization will not jeopardize the continued existence of the listed species.

California Environmental Quality Act (CEQA). CEQA defines a “project” as any action undertaken from public or private entity that requires discretionary governmental review (a non-ministerial permittable action). All “projects” are required to undergo some level of environmental review pursuant to CEQA, unless an exemption applies. CEQA’s environmental review process includes an assessment of existing resources, broken up by categories (i.e., air quality, aesthetics, etc.), a catalog of potential impacts to those resources caused by the proposed project, and a quantifiable result determining the level of significance an impact would generate. The goal of environmental review under CEQA is to avoid or mitigate impacts that would lead to a “significant effect” on a given resource; section 15382 of the CEQA Guidelines defines a “significant effect” as *a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the environment, but may be considered in determining whether the physical change is significant.*

California Fish and Game Code (CFGF). The California Fish and Game Code (CFGF) is one of the 29 legal codes that form the general statutory law of California. A myriad of statutes regarding fish and game are specified in the CFGF; the following codes are specifically relevant to the proposed Project:

California Native Plant Protection Act. Sections 1900-1913 of the California Fish and Game Code contain the regulations of the Native Plant Protection Act of 1977. The intent of this act is to help conserve and protect rare and endangered plants in the state. The act allowed the CFGF to designate plants as rare or endangered.

Lake and Streambed Alteration. Section 1602 of the CFGF requires any person, state, or local governmental agency to provide advance written notification to CDFW prior to initiating any activity that would: 1) divert or obstruct the natural flow of, or substantially change or remove material from the bed, channel, or bank of any river, stream, or lake; or 2) result in the disposal or deposition of debris, waste, or other material into any river, stream, or lake. The state definition of “lakes, rivers, and streams” includes all rivers or streams that flow at least periodically or permanently through a well-defined bed or channel with banks that support fish or other aquatic life, and watercourses with surface or subsurface flows that support or have supported riparian vegetation.

Initial Study – Environmental Checklist

Nesting Birds. Sections 3503, 3503.5 and 3513 of CFGC states that it is “unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by this code or any regulation made pursuant thereto,” and “unlawful to take, possess, or destroy any birds of prey or to take, possess, or destroy the nest or eggs of any such bird” unless authorized.

Regional Water Quality Control Board. The Regional Water Quality Control Board (RWQCB) not only regulates impacts to water quality in federal waters of the U.S. under Section 401 of the Clean Water Act, but also regulates any isolated waters that are impacted under the state Porter Cologne Act utilizing a Waste Discharge Requirement. Discharge of fill material into waters of the State not subject to the jurisdiction of the USACE pursuant to Section 401 of the Clean Water Act may require authorization pursuant to the Porter Cologne Act through application for waste discharge requirements or through waiver of waste discharge requirements.

Special Status Species and Sensitive Habitat Regulations

For the purposes of this biological resources assessment, special status species are those plants and animals listed, proposed for listing, or candidates for listing as threatened or endangered by the USFWS under the FESA; those listed or proposed for listing as rare, threatened, or endangered by the CDFW under the CESA; animals designated as “Species of Special Concern,” “Fully Protected,” or “Watch List” by the CDFW; and plants with a California Rare Plant Rank (CRPR) of 1, 2, 3, or 4.

California Natural Diversity Database (CNDDDB)

“Special Plants” and “Special Animals” are broad terms used to refer to all the plant and animal taxa inventoried by the CNDDDB, regardless of their legal or protection status (CNDDDB 2020a and 2020b). The Special Plants list includes vascular plants, high priority bryophytes (mosses, liverworts, and hornworts), and lichens. The Special Animals list is also referred to by the California Department of Fish and Wildlife (CDFW) as the list of “species at risk” or “special status species.”

According to the CNDDDB (2020a, 2020b), Special Plants and Animals lists include: taxa that are officially listed or proposed for listing by California or the Federal Government as Endangered, Threatened, or Rare; taxa which meet the criteria for listing, as described in Section 15380 of CEQA Guidelines; taxa deemed biologically rare, restricted in range, declining in abundance, or otherwise vulnerable; population(s) in California that may be marginal to the taxon’s entire range but are threatened with extirpation in California; and/or taxa closely associated with a habitat that is declining in California at a significant rate. Separately, the Special Plants List includes taxa listed in the California Native Plant Society’s Inventory of Rare and Endangered Plants of California, as well as taxa determined to be Sensitive Species by the Bureau of Land Management, U.S. Fish and Wildlife Service, or U.S. Forest Service. The Special Animals List distinctively includes taxa considered by the CDFW to be a Species of Special Concern (SSC) and taxa designated as a special status, sensitive, or declining species by other state or federal agencies.

Federal and State Endangered Species Listings

The Federal and California Endangered Species Acts are the regulatory documents that govern the listing and protection of species, and their habitats, identified as being endangered or threatened with extinction (see Sections 1.5.1 and 1.5.2). Possible listing status under both Federal and California ESA includes Endangered and Threatened (FE, FT, CE, or CT). Species in the process of being listed are given the status of either Proposed Federally Endangered/Threatened, Candidate for California Endangered/Threatened (PE, PT, CCE, or CCT). The CESA has one additional status: Rare (CR).

Initial Study – Environmental Checklist

Global and State Ranks

Global and State Ranks reflect an assessment of the condition of the species (or habitats, see 1.6.6 below) across its entire range. Basic ranks assign a numerical value from 1 to 5, respectively for species with highest risk to most secure. Other ranking variations include rank ranges, rank qualifiers, and infraspecific taxon ranks. All Heritage Programs, such as the CNDDDB use the same ranking methodology, originally developed by The Nature Conservancy, and now maintained and recently revised by NatureServe. Procedurally, state programs such as the CNDDDB develop the State ranks. The Global ranks are determined collaboratively among the Heritage Programs for the states/provinces containing the species. Rank definitions, where G represents Global and S represents State, are as follows:

- **G1/S1:** Critically imperiled globally/in state because of extreme rarity (5 or fewer populations).
- **G2/S2:** Imperiled globally/in state because of rarity (6 to 20 populations).
- **G3/S3:** Vulnerable; rare and local throughout range or in a special habitat or narrowly endemic (on the order of 21 to 100 populations).
- **G4/S4:** Apparently secure globally/in state; uncommon but not rare (of no immediate conservation concern).
- **G5/S5:** Secure; common, widespread, and abundant.
- **G#G#/S#S#:** Rank range - numerical range indicating uncertainty in the status of a species, (e.g., G2G3 more certain than G3, but less certain that G2).
- **G/S#?:** Inexact numeric rank
- **Q:** Questionable taxonomy - Taxonomic distinctiveness of this entity is questionable.
- **T#:** Infraspecific taxa (subspecies or varieties) – indicating an infraspecific taxon that has a lower numerical ranking (rarer) than the given global rank of species.

California Rare Plant Ranks

Plant species are considered rare when their distribution is confined to localized areas, their habitat is threatened, they are declining in abundance, or they are threatened in a portion of their range.

The California Rare Plant Rank (CRPR) categories range from species with a low threat (4) to species that are presumed extinct (1A). All but a few species are endemic to California. All of them are judged to be vulnerable under present circumstances, or to have a high potential for becoming vulnerable. Threat ranks are assigned as decimal values to a CRPR to further define the level of threat to a given species. The rare plant ranks and threat levels are defined below.

- **1A:** Plants presumed extirpated in California and either rare or extinct elsewhere.
- **1B:** Plants rare, threatened, or endangered in California and elsewhere.
- **2A:** Plants presumed extirpated in California, but common elsewhere
- **2B:** Plants rare, threatened, or endangered in California, but more common elsewhere
- **4:** Plants of limited distribution - a watch list
- **0.1:** Seriously threatened in California (over 80% of occurrences threatened/high degree and immediacy of threat)

Initial Study – Environmental Checklist

- **0.2:** Moderately threatened in California (20-80% occurrences threatened/moderate degree and immediacy of threat)
- **0.3:** Not very threatened in California (less than 20% of occurrences threatened/low degree and immediacy of threat or no current threats known)

California Department of Fish and Wildlife Animal Rank

The California Department of Fish and Wildlife (CDFW) assigns one of three ranks to Special Animals: Watch List (WL), Species of Special Concern (SSC), or Fully Protected (FP). Unranked species are referred to by the term Special Animal (SA).

Animals listed as Watch List (WL) are taxa that were previously designated as SSC, but no longer merit that status, or taxa that do not yet meet SSC criteria, but for which there is concern and a need for additional information to clarify status.

Animals listed as California Species of Special Concern (SSC) may or may not be listed under California or federal Endangered Species Acts. They are considered rare or declining in abundance in California. The Special Concern designation is intended to provide the CDFW biologists, land planners, and managers with lists of species that require special consideration during the planning process to avert continued population declines and potential costly listing under federal and state endangered species laws. For many species of birds, the primary emphasis is on the breeding population in California. For some species that do not breed in California but winter here, emphasis is on wintering range. The SSC designation thus may include a comment regarding the specific protection provided such as nesting or wintering.

Animals listed as Fully Protected (FP) are those species considered by CDFW as rare or faced with possible extinction. Most, but not all, have subsequently been listed under the CESA or FESA. Fully Protected species may not be taken or possessed at any time and no provision of the California Fish and Game code authorizes the issuance of permits or licenses to take any Fully Protected species.

Sensitive Habitats

Sensitive Natural Community is a state-wide designation given by CDFW to specific vegetation associations of ecological importance. Sensitive Natural Communities rarity and ranking involves the knowledge of range and distribution of a given type of vegetation, and the proportion of occurrences that are of good ecological integrity (CDFW 2018a). Evaluation is conducted at both the Global (G) and State (S) levels, resulting in a rank ranging from 1 for very rare and threatened to 5 for demonstrably secure. Natural Communities with ranks of S1-S3 are considered Sensitive Natural Communities in California and may need to be addressed in the environmental review processes of CEQA and its equivalents.

Environmental Setting

A biological resources assessment (BRA) was prepared for the project site in 2022 (Pax Environmental, Inc.) which is incorporated herein by reference and available for review in its entirety at the Department of Planning and Building. The BRA included field surveys and an assessment of potential project impacts to sensitive biological resources within a 16-acre study area as shown in Figure 11. The BRA assumed an area of disturbance of approximately 1.8 acres based on a site plan which showed the new access driveway extending eastward along an existing unpaved ag road, then bending northward to a level area where the proposed ag accessory building and dwelling were to be constructed. Subsequent to the preparation of the BRA, the site plan was revised to relocate the driveway closer to Martingale Circle and extending northward along another unpaved ag road before bending eastward to the proposed dwelling and ag structure.

Initial Study – Environmental Checklist

Nonetheless, the findings and conclusions of the BRA remain valid for assessing the potential impacts of the revised site plan because:

- The area of disturbance used for CEQA compliance is located entirely within the area surveyed by the BRA;
- The area of disturbance for CEQA compliance is somewhat smaller (about 1.0 acre) and affects the same habitats impacted by the site plan used in the BRA.

The following is a summary of the findings and recommendations of that study.

The Project site consists of approximately 1.0 acres within a 16.9 acres study area. The site is primarily composed of active agriculture. There are graded access roads surrounding the agricultural area. Topography is irregular in the Project site with a plateau in the area of the active agriculture which slopes down on the north and west. Study area elevations range from 793 to 879 feet above mean sea level (amsl).

Soils in the study area are mostly uniform and consist mostly of Arbuckle Positas complex (97%), very deep, well drained soils that formed in alluvium from sedimentary and metamorphic rocks weathered from alfisol deposits and typically occur on low terraces with slopes up to 75%. Hanford and Greenfield gravelly sandy loams (3%) is present in the northwestern corner of the study area and consists of very deep, well drained soils that formed in moderately coarse textured alluvium dominantly from granite weathered from entisols. This soil type is found in stream bottoms, floodplains, and alluvial fans with slopes ranging from 0 to 15 percent (USDA 2021).

Methodology

Prior to performing the field survey, the biologists performed a records search for special-status plant and wildlife species potentially occurring in the Project region. Sources utilized during the records search included the California Natural Diversity Database (CNDDDB) (CDFW 2021), the Calflora Observation Hotline (Calflora 2021), and the Jepson Flora Project website (eFlora, 2021). The CNDDDB records search was performed on a 10-mile radius around the study area in the eight cardinal directions.

Surveys

A reconnaissance-level survey was performed on August 27, 2021. The study area consisted of the Project disturbance area and 250 to 500-foot (ft) buffer, for a total study area of 16.9 acres. A visual search for plants and wildlife, or evidence of their presence (scat, tracks, burrows, nests, etc.) was performed with 100% visual coverage of the Project disturbance area. All vegetation alliances, as described in the California Manual of Vegetation (Sawyer Keeler Wolf 2009), and/or wildlife habitats, as described in the Guide to California Wildlife Habitats (Holland 1986), were mapped in the study area and digitized on an aerial using ArcGIS. In addition, the site was examined for wetland boundaries, including presence or absence of bed and bank, cracked surface soils, and wetland indicator plants.

Identifiable species were noted and recorded upon detection while voucher photographs of polytypic species were collected for subsequent identification. Following the survey, a determination of the likelihood of occurrence was made for special-status species that were not detected based on species or habitat elements observed during the survey as well as putative flowering phenology (e.g., habitat type, elevation, slope, soil, etc.).

The study area was surveyed on foot to document all plant species occurring in the Project footprint during the survey visit. Below average rainfall totals and weather conditions for the 2020/2021 rainy season were not ideal for plant fecundity and prolonged flowering duration.

Initial Study – Environmental Checklist

The site was fully accessible, and several transects were walked throughout the project area to ensure that any special status species would be found if present. Scientific nomenclature follows the Jepson Interchange List of Currently Accepted Names of Native and Naturalized Plants of California (eFlora 2021).

Habitats

Vegetation in the study area is representative of repeated disturbance and was dominated by active agriculture. Habitat acreages and distribution in the study area are presented below in Table 5 and Figure 11.

Table 5 -- Vegetation Communities of the Study Area

Community	Acres	Percent of Study Area
Active Agriculture	7.81	46.2%
Ruderal	3.71	22.0%
Blue Oak Woodland	3.71	21.9%
Disturbed	1.68	9.9%
Total Study Area:	16.91	100%

Active Agriculture

The most prevalent vegetation community was active agriculture (7.81 acres) comprised of wine grapevines (*Vitis vinifera*) representing 46.2% of the study area and 96.7% of the Project footprint. Non-native grasses and ruderal species were dominant throughout with native species present at much lower densities.

Non-native plants observed during the survey include prostrate pigweed (*Amaranthus albus*), ripgut brome (*Bromus diandrus*), soft chess (*Bromus hordaceus*), yellow star thistle (*Centaurea solstitialis*), red stemmed filaree (*Erodium cicutarium*), rattail grass (*Festuca myuros*), foxtail barley (*Hordeum murinum*), prickly lettuce (*Lactuca serriola*), narrowleaf cottonrose (*Logfia gallica*), bur clover (*Medicago polymorpha*), and purple vetch (*Vicia benghalensis*). Native plants observed during the survey include remnant species from native grassland habitat that occurred historically on the site. Species observed during the survey include, turkeymullein (*Croton setiger*), common cryptantha (*Cryptantha intermedia*), western tansy mustard (*Descurainia pinnata*), horseweed (*Erigeron canadensis*), sticky lessingia (*Lessingia pectinate* var. *tenuipes*), California cottonrose (*Logfia filaginoides*), and vinegar weed (*Trichostema lanceolatum*).

Blue Oak Woodland

Blue oak woodland in the study area consists of the *Quercus douglasii* Forest & Woodland Alliance (Sawyer et al. 2009). The alliance comprises 3.71 acres primarily in the north and east of the property representing 21.9% of the study area and none of the project footprint. It includes oak stands where three or more oaks are codominant in the upper canopy, including blue oak (*Q. douglasii*). The shrub and herbaceous layers are sparse to intermittent and most frequently grassy, and forbs are present seasonally.

Dominant native species observed in these areas included interior goldenbush (*Ericameria linearifolia*), common hareleaf (*Lagophylla ramosissima*), California plantain (*Plantago erecta*), included ripgut brome (*B. diandrus*), soft chess (*B. hordaceus*), yellow star thistle (*C. solstitialis*), red stemmed filaree (*E. cicutarium*), foxtail barley (*H. murinum*), and purple vetch (*V. benghalensis*).

Initial Study – Environmental Checklist

Ruderal

Ruderal areas are an unclassified habitat type that comprises approximately 3.71 acres (22.0%) of the study area and none of the Project footprint. These areas are primarily composed of nonnative grasses and forbs and more ruderal native species. Dominant native species in this area include California plantain (*Plantago erecta*) and California everlasting (*Pseudognaphalium californicum*). Dominant non-native species observed in this area include ripgut brome (*B. diandrus*), red broome (*B. madritensis*), and soft chess (*B. hordeaceus*), and Russian thistle (*Salsola tragus*).

Disturbed

Disturbed/barren areas is an unclassified habitat type that composes approximately 1.68 acres (9.9%) of the study area and 3.3% of the Project footprint. This habitat type includes the access roads around the active agriculture. This area is barren due to repeated disturbance associated with road traffic and repeated human use. Plant species observed in barren areas include mostly introduced weedy species or native weeds that can tolerate repeated disturbance. Nonnative species observed include cheeseweed (*Malva parviflora*), knotweed (*Polygonum aviculare ssp. depressum*), Russian thistle (*S. tragus*), and Indian hedge mustard (*Sisymbrium orientale*). Native species observed included small wire lettuce (*Stephanomeria exigua*).

Wildlife

Wildlife species observed during the survey included those common to oak woodlands, scrub, and agricultural habitats. No fish or amphibian species were detected due to lack of natural surface water in the vicinity. Reptile species observed during the survey include Coast Range fence lizard (*Sceloporus occidentalis bocourtii*) and western side-blotched lizard (*Uta stansburiana elegans*).

Bird species observed during the survey include turkey vulture (*Cathartes aura*), red-tailed hawk (*Buteo jamaicensis*), California quail (*Callipepla californica*), mourning dove (*Zenaida macroura*), Anna's hummingbird (*Anna calypte*), acorn woodpecker (*Melanerpes formicivorus*), Say's phoebe (*Sayornis saya*), western scrub-jay (*Aphelocoma californica*), common raven (*Corvus corax*), bushtit (*Psaltiriparus minimus*), California towhee (*Pipilo crissalis*), and Brewer's blackbird (*Euphagus cyanocephalus*).

Mammals, or evidence of their presence detected during the survey, include southern pocket gopher (*Thomomys bottae*), California ground squirrel (*Otospermophilus beecheyi*), and coyote (*Canis latrans*).

Aquatic Resources

Wetlands are protected under Section 404 of the Clean Water Act (CWA) and are under the jurisdiction of the United States Army Corps of Engineers (USACE). According to the USACE, areas considered to be a "wetland" (and subject to the regulatory jurisdiction of the USACE) must exhibit hydrology, hydric soils, and hydrophilic vegetation that meet federal criteria, as indicated in the Corps of Engineers Wetlands Delineation Manual (Environmental Laboratory 1987) and the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (USACE 2008).

In addition, if drainages meet the criteria established by Section 1600 of the California Fish and Game Code, the CDFW may require a Streambed Alteration Agreement prior to any modification of the bed, bank, or channel of streambeds. CDFW jurisdiction generally includes the streambed and the canopy of associated riparian vegetation.

No surface water was observed in the study area during the survey and no depressions that could become inundated during rain events were identified. There was no evidence of standing water, and no wetland indicator plant species or soils were identified. A search of the National Hydrographic Dataset (NHD) and

Initial Study – Environmental Checklist

National Waters Inventory (NHI) identified an intermittently flooded riverine streambed on the eastern portion of the property. This riverine feature is located 220 ft from the closest point of the driveway, 235 ft from the barn, and 305 ft from the proposed future house.

Special Status Resources

The following discussion addresses special-status biological resources having the potential to occur in the Project study area. These resources include plant and wildlife species and habitats that have been afforded special status and/or recognition by the U.S. Fish and Wildlife Service (USFWS), CDFW, and California Native Plant Society (CNPS). In general, the principal reason an individual taxon (i.e., species, subspecies, or variety) is given such recognition is the documented or perceived decline or limitations of its population size, geographic range, and/or distribution resulting in most cases from habitat loss.

Special-status plant species considered by the analysis include those potentially occurring within the direct impact footprint that are listed as Threatened and/or Endangered by the California or federal Endangered Species Act(s), as well as those assigned a California Rare Plant Rank (CRPR) by the CNPS that clearly meet the definition of Rare or Endangered under Guideline §15380 of the California Environmental Quality Act (CEQA).

Table 2 of the BRA, Special-Status Plant Species, and Table 3 of the BRA, Special-Status Wildlife Species, provide a summary of special-status plant and wildlife species known to occur in the Project region including information on the status, potential for occurrence within the Project site, and definitions for the various status designations. Figure 5 of the BRA presents the locations of special-status resources in proximity to the Project site, as determined by records searches. Sources used to determine the special-status of biological resources are as follows:

- Plants – Electronic Inventory of Rare and Endangered Vascular Plants of California. (California Native Plant Society [CNPS] [2021]). California Natural Diversity Database (CNDDDB) List of Special Plants (CDFW 2021).
- Wildlife - CNDDDB List of Special Animals (CDFW 2021)
- Habitats – CNDDDB List of Sensitive Natural Communities (CDFW 2021)

Critical Habitats and Special Status Natural Communities

No USFWS-Designated Critical Habitat overlapped the BSA. The nearest occurrence was vernal pool fairy shrimp (*Branchinecta lynchi*) USFWS-Designated Critical Habitat approximately 3.5 miles northeast of the BSA (USFWS, 2021a).

Natural Communities are evaluated using NatureServe's Heritage Methodology, the same system used to assign global and state rarity ranks for plant and animal species in the CNDDDB. They are assigned an overall rarity score for a single rank of 1 through 5. Evaluation is done at both the Global (full natural range within and outside of California) and State (within California) levels resulting in a single G (global) and S (state) rank ranging from 1 (very rare and threatened) to 5 (demonstrably secure). Natural Communities with ranks of S1-S3 are considered Sensitive Natural Communities to be addressed in the environmental review processes of CEQA and its equivalents.

No sensitive natural communities as defined by CDFW were documented within five miles of the BSA. The nearest occurrence was Valley Oak Woodland, approximately eleven miles northeast of the BSA (CDFW, 2021a). The CNDDDB records search did not identify any special status natural communities as occurring in the Project region. Vegetation on the study area consists of the active agriculture, blue oak woodland, ruderal,

Initial Study – Environmental Checklist

and disturbed. Within the Project site vegetation communities are active agriculture and developed/disturbed. None of the above-mentioned natural communities are considered special status.

Special-status Plant Species

The CNDDDB and CNPS on-line inventory listed 10 plants as occurring in the Project region which are considered special status (CNPS List 1 and 2 species). No special status plants were observed during the survey in a below-average rainfall year. Based on the habitats in the area none of these species are expected to occur.

Special-status Wildlife Species

The CNDDDB on-line inventory listed 21 special status wildlife species in the region. No special status wildlife species were observed on the Project site or throughout the study area during the surveys. Three species were determined to have a low potential to occur on the Project site.

Invertebrates

The study area was determined to have a moderate potential for occurrence of Crotch's bumble bee (*Bombus crotchii*), a candidate for listing as Endangered under the California Endangered Species Act (CESA). This species is known to inhabit rodent burrows and other refugia in scrub and grassland habitats. California ground squirrel burrows were observed in the study area during surveys. The marginal suitability of habitat on the Project site results in a low potential for occurrence.

Birds

The study area was determined to have a low potential for Swainson's hawk (*Buteo swainsonii*), a state listed Threatened species. The closest CNDDDB record for Swainson's hawk is approximately 3.5 miles northeast. This species typically occupies flats and agricultural fields in desert areas. Given the marginal suitability of the habitat in the study area and the distance to known records, this species has a low potential for occurrence.

Mammals

This species occurs in relatively flat to gently rolling grasslands and open scrub with friable soils where it will excavate burrows or expand California ground squirrel burrows (Zeiner et al. 1990). No burrows for this species were identified in the study area. The closest CNDDDB record for SJKF is more than 3-miles to the southeast.

The County has identified a kit fox habitat area where remaining SJKF habitat is known to occur. New development within the kit fox habitat area may be subject to standard mitigation measures that, when implemented, will avoid take and reduce impacts to kit fox habitat to an insignificant level. The kit fox habitat area has been assigned mitigation ratios that reflect the quality of remaining SJKF habitat: higher quality habitat is subject to a higher mitigation ratio.

If the project site lies within the kit fox habitat area, and is less than 40 acres in size, the County will inform the project applicant of the pre-determined standard mitigation ratio for the project area. The standard ratio is based on the results of previous kit fox habitat evaluations and determines the amount of mitigation acreage based on the total area of disturbance from project activities. For example, if a project results in 2 acres of permanent disturbance and the standard mitigation ratio is 3:1, the applicant must mitigate for a total of 6 acres (2 acres X 3:1 ratio = 6 acres). An applicant has the option of accepting the standard mitigation ratio or hiring a biologist to conduct a kit fox habitat evaluation. If the project occurs on a site at least 40 acres in size, a habitat evaluation must be done.

Initial Study – Environmental Checklist

The project site is within the kit fox habitat mitigation area where the standard mitigation ratio is 3:1.

Figure 11 -- Habitats of the Project Site

Initial Study – Environmental Checklist

Discussion

A biological resource impact evaluation must consider both the resource itself and how that resource fits into a regional or local context. Impacts that diminish or eliminate a regionally important biological resource, or conflict with local, state, or federal resource conservation plans designed to protect said resources are considered substantial. Whereas impacts to resources considered locally important may not be significant according to CEQA if there is not a regional effect.

- (a) *Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?*

Special-Status Plants

The Project site is composed of annual active agriculture and disturbed areas that have been invaded by non-native, weedy species occurring at much higher densities than natives. These conditions are considered unsuitable for all special status plants known to occur in the Project region. Habitat impacts are presented in Table 6 below.

Table 6 -- Summary of Project Impacts to Different Habitats

Habitat Type	Acres Impacted
Active Agriculture	0.8
Disturbed	0.2
Total:	1.0

Based on the absence of suitable undisturbed plant habitat, project impacts to special status plant species are considered *less than significant*. However, active agriculture on the Project site primarily consists of non-native species. Spreading the seed of invasive species from the Project site into new areas may result in indirect impacts to special-status plant populations and sensitive habitats within the region. Implementation of the recommended mitigation measures would reduce potential impacts to a level considered *less than significant*.

Special Status Wildlife

The total area of direct disturbance is approximately 0.8 acres of active agriculture, a non-natural vegetation, and 0.06 acres of disturbed or barren areas (ie, unimproved roadways). These habitat types are repeatedly disturbed and dominated by weedy species, represent little value to native wildlife, and are not expected to support substantial populations of common or special status wildlife. Short-term direct impacts to habitat could cause injury or death to wildlife because of construction-related disturbances, such as vegetation removal, grading, and construction. However, the loss of these habitats would not be expected to substantially reduce the extent, diversity, or quality of native or other important vegetation for wildlife or result in substantial loss of native wildlife.

Initial Study – Environmental Checklist

Invertebrates

The study area was determined to have a moderate potential for occurrence of Crotch's bumble bee (*Bombus crotchii*), a candidate for listing as Endangered under the California Endangered Species Act (CESA). This species is known to inhabit rodent burrows and other refugia in scrub and grassland habitats. California ground squirrel burrows were observed in the study area during surveys. Given the limited size of the Project site and limited extent of occupiable habitat for this species, the likelihood of impact is considered low. Implementation of the recommended mitigation measures would avoid or reduce potential direct and indirect impacts to *less than significant with mitigation*.

Birds

The Project has the potential for direct and/or indirect impacts to active nests during construction, including direct impacts to ground-nesting bird species. Threatened birds, including Swainson's hawk, and indirect impacts to common raptors and/or other passerines nesting in the study area and/or adjacent areas. Nest failure or take resulting from Project activities would conflict with the Migratory Bird Treaty Act (16 U.S.C. §§ 703–712) and California Fish and Game Code (FGC Division 4, Part 2, §§ 3503 and 3513). With implementation of the recommended mitigation measures, potential impacts to special status birds and all nesting birds would be considered *less than significant with mitigation*.

Amphibians and Reptiles

According to the BRA, the project site and vicinity contain no aquatic resources or other suitable habitat for listed amphibians or reptiles. Potential impacts to special status amphibians and reptiles are considered *less than significant*.

Mammals

The project site lies within the SJKF habitat area where a standard mitigation ratio of 3:1 has been established. Given the proximity to known records of occurrence, this species is considered to have the potential to occur on the project site and the standard mitigation ratio will apply. Based on the previous site plan, the BRA concluded that the project will adversely impact 1.8 acres of SJKF habitat. Based on the revised site plan, the area of SJKF habitat impacted by the project is estimated to be about 1.0 acres. Therefore, the total compensatory mitigation required for the project would be 3.0 acres (3 x 1.0 acres impacted). It should be noted that this is a conservative estimate based on the preliminary site plan used for CEQA compliance. A final determination of the area of kit fox habitat impacted by the project, and the corresponding mitigation requirements, will be made based on the construction plans approved by the County through the building permit process. If the final construction plans indicate that the project may impact more than 1.0 acres of SJKF habitat, the project may require additional environmental review before a building permit will be issued. Such additional review may also require coordination with CDFW.

In addition, indirect impacts may occur to kit foxes potentially occupying the study area beyond the Project disturbance area during long-term Project activities, including increased light-pollution and restriction of movement across the Project site. With implementation of the recommended mitigation measures, potential impacts to SJKF are considered *less than significant with mitigation*.

Overall, the project site contains suitable habitat to support listed invertebrates, migratory and nesting birds, and mammals. With recommended mitigation measures, project impacts to listed wildlife species is considered *less than significant with mitigation*.

Initial Study – Environmental Checklist

- (b) *Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?*

The CNDDDB records search did not identify any special status natural communities occurring in the Project region. The Project site consists of active agriculture, a non- natural community that is dominated by non-native, weedy species, and disturbed/barren areas. No sensitive natural communities were identified during the survey. One riverine feature was identified in the NHD and NWI. Project implementation would not have direct or indirect impacts to this feature based on the distance from the proposed development. Therefore, the project will have *no impact* to riparian habitat or other sensitive natural communities.

- (c) *Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?*

There are no wetland or vernal pool resources within the area of disturbance or on nearby properties that would be impacted by the project. Therefore, there would be *no impact* to state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.).

- (d) *Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?*

Wildlife Corridors

Maintaining connectivity between areas of suitable habitat is critical for dispersal, migration, foraging, and genetic health of plant and wildlife species. A functional network of connected habitats is essential to the continued existence of California's diverse species and natural communities in the face of both human land use and climate change. Terrestrial species must navigate a habitat landscape that meets their needs for breeding, feeding and shelter. Projects that introduce substantial barriers to movement of resident or migratory wildlife species or hinder the normal activities of wildlife require mitigation to offset Project effects.

The study area is surrounded by undeveloped areas and active agriculture with some natural habitats. Project implementation would not directly impact the area and development would not be expected to substantially inhibit wildlife movement through the area. The Project does not introduce significant features that would be expected to affect wildlife movement through surrounding natural habitats and impacts to wildlife movement are considered *less than significant*.

Migratory Nesting Birds and Sensitive Avian Species

In addition to those species protected by the state or federal government, all native avian species are protected by state and federal legislation, most notably the Migratory Bird Treaty Act (MBTA) and the CDFW Fish and Game code. Collectively, these and other international regulations make it unlawful to collect, sell, pursue, hunt, or kill native migratory birds, their eggs, nests, or any parts thereof. The laws were adopted to eliminate the commercial market for migratory bird feathers and parts, especially those of raptors and other birds of prey.

Migratory bird species may utilize the project site for foraging; however, the usage is likely transient and limited to species that forage over open grassland areas. The project site does not possess any characteristics that would indicate a locally significant stopover point for migratory species including raptors or waterfowl.

Initial Study – Environmental Checklist

The project site contains suitable nesting habitat for ground-nesting birds and for other birds that are protected while nesting. Blue oak woodland to the north and east of the project site serve as suitable nesting habitat for various common and special-status bird species, including raptors. Construction activities that occur during the nesting bird season (January 1 through September 15) have potential to result in the direct or indirect take of nesting birds.

With implementation of the recommended mitigation measures, impacts related to interference with the movement of migratory fish or wildlife would be *less than significant with mitigation*.

- (e) *Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?*

Impacts to, or removal of, mature oak trees (i.e., greater than six inches in diameter at breast height [DBH]) or oak woodland habitat is evaluated under CEQA. As a CEQA Lead Agency, the County of San Luis Obispo currently applies a 4:1 mitigation ratio for removed trees and a 2:1 mitigation ratio for impacted trees.

No oak trees or other native trees are proposed for removal. Therefore, there would be *no impacts* associated with conflict with local ordinances or policies protecting biological resources.

- (f) *Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?*

The project site is not located within an area subject to an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan. Therefore, the project would not conflict with the provisions of an adopted plan and there would be *no impact*.

Conclusion

Upon implementation of mitigation measures BIO-1 through BIO-11 potential impacts to biological resources would be *less than significant with mitigation*.

Mitigation

BIO-1 Prior to issuance of grading and/or construction permits, the applicant shall provide evidence that they have retained a qualified biologist acceptable to the County Department of Planning and Building to perform the training and monitoring activities described in the adopted mitigation measures for biological resources.

BIO-2 Environmental Awareness Training – Prior to major construction activities (e.g., site mobilization, clearing, grubbing, preparation for installing new facilities, etc.), an environmental awareness training shall be presented to all project personnel by a qualified biologist prior to the start of any project activities. The training shall include color photographs and a description of the ecology of all special-status species known or determined to have potential to occur, as well as other sensitive resources requiring avoidance near project impact areas. The training shall also include a description of protection measures required by the project's discretionary permits, an overview of the federal Endangered Species Act, the California Endangered Species Act, and implications of noncompliance with these regulations, as well as an overview of the required avoidance and minimization measures. A sign-in sheet with the name and signature of the qualified biologist who

Initial Study – Environmental Checklist

presented the training and the names and signatures of the trainees will be kept and provided to the County of San Luis Obispo (County). If new project personnel join the project after the initial training period, they will receive the environmental awareness training from a designated crew member on site before beginning work. A qualified biologist will provide refresher trainings during site visits or other monitoring events.

BIO-3 Prior to issuance of grading and/or construction permits, all SJKF protection measures required before construction (prior to any project activities) and during construction shall be included as a note on all project plans.

BIO-4 San Joaquin Kit Fox (*Vulpes macrotis mutica*; SJKF) Habitat Mitigation Measures - Prior to issuance of grading and/or construction permits, the applicant shall submit evidence to the County and CDFW that one or a combination of the following three SJKF mitigation measures for loss of SJKF habitat has been implemented:

- a. Habitat Set Aside. Provide for the protection in perpetuity, through acquisition of fee or a conservation easement of [insert area of project impact] of suitable habitat in the kit fox corridor area (e.g. within the San Luis Obispo County kit fox habitat area), either on site or off site, and provide for a non-wasting endowment to provide for management and monitoring of the property in perpetuity. Lands to be conserved shall be subject to the review and approval of CDFW and the County.

Mitigation alternative (a.) requires that all aspects of this program be in place before County permit issuance or initiation of any ground-disturbing activities.

- b. In Lieu Fee. Deposit funds into an approved in-lieu fee program, which would provide for the protection in perpetuity of suitable habitat in the kit fox corridor area within San Luis Obispo County and provide for a non-wasting endowment for management and monitoring of the property in perpetuity.

Mitigation alternative (b.) can be completed by providing funds to The Nature Conservancy (TNC) pursuant to the Voluntary Fee-Based Compensatory Mitigation Program (Program). The Program was established in agreement between CDFW and TNC to preserve SJKF habitat, and to provide a voluntary mitigation alternative to project proponents who must mitigate the impacts of projects in accordance with the CEQA. This fee is calculated based on the current cost-per-unit of \$2,500 per acre of mitigation, which is scheduled to be adjusted to address the increasing cost of property in San Luis Obispo County; the actual cost may increase depending on the timing of payment. This fee must be paid after CDFW provides written notification about mitigation options but prior to County permit issuance and initiation of any ground disturbing activities. The fee, payable to "The Nature Conservancy", would total \$7,500 based on \$2,500 per acre 1.0 acres impacted * 3:1* \$2,500 per acre).

- c. Purchase Mitigation Credits. Purchase 3.0 credits in a CDFW-approved conservation bank, which would provide for the protection in perpetuity of suitable habitat within the kit fox corridor area and provide for a non-wasting endowment for management and monitoring of the property in perpetuity.

Initial Study – Environmental Checklist

Mitigation alternative (c.) can be completed by purchasing credits from the Palo Prieto Conservation Bank. The Palo Prieto Conservation Bank was established to preserve SJKF habitat, and to provide a voluntary mitigation alternative to project proponents who must mitigate the impacts of projects in accordance with CEQA. The cost for purchasing credits is payable to the owners of The Palo Prieto Conservation Bank and would total \$7,500 (1.0 acres impacted * 3:1 * \$2,500 per acre). This fee is calculated based on the current cost-per-credit of \$2,500 per acre of mitigation. The fee is established by the conservation bank owner and may change at any time. The actual cost may increase depending on the timing of payment. Purchase of credits must be completed prior to County permit issuance and initiation of any ground-disturbing activities.

It should be noted that the estimated area of SJKF habitat mitigation required (3.0 acres) is a conservative estimate based on the preliminary plans used for CEQA compliance. A final quantification of the area of kit fox habitat impacted by the project, and the corresponding mitigation requirements, will be made based on the construction plans approved by the County through the building permit process. If the final construction plans indicate that the project may impact more than 1.0 acres of SJKF habitat, the project may require additional environmental review before a building permit will be issued. Such additional review may also require coordination with CDFW.

BIO-5 Pre-construction survey for SJKF. A qualified biologist shall complete a pre-construction survey for SJKF no less than 14 days and no more than 30 days prior to the start of initial project activities to ensure SJKF is not present within all proposed work areas and at least a 200-foot buffer around work areas per USFWS Standard Recommendations (2011). The biologist will survey for sign of SJKF and known or potential SJKF dens. The result of the survey shall be submitted to the County within 5 days of the survey and prior to the start of initial project activities. The submittal shall include the date the survey was conducted, survey method, and survey results, including a map of the location of any SJKF sign, and/or known or potential SJKF dens, if present. If no SJKF sign, potential or known SJKF dens are identified, then the SJKF Standard Protection Avoidance and Protection Measure shall be applied.

- If the qualified biologist identifies potential SJKF den(s), the den(s) will be monitored for 3 consecutive nights with an infra-red camera, prior to any project activities, to determine if the den is being used by SJKF. If no SJKF activity is observed during the 3 consecutive nights of camera placement, then project work can begin with the Standard SJKF Avoidance and Protection Measures and the SJKF Protection Measures if SJKF are observed.
- If a known den is identified within 200-feet of any proposed project work areas, no work may start in that area.

If 30 days lapse between different phases of project activities (e.g., vegetation trimming and the start of grading), where no or minimal work activity occurs, the SJKF survey shall be updated.

BIO-6 Standard SJKF Avoidance and Protection Measures

- If a SJKF is discovered at any time to be occupying an area within the project boundaries, all work must stop. The County will be notified, and they will consult with other agencies as needed.

Initial Study – Environmental Checklist

- A maximum of 25 mph speed limit shall be required at the project site during project activities. Speed limit signs shall be installed on the project site prior to the start of all work.
- All project activities shall cease at dusk and not start before dawn. This includes driving on the site for security purposes.
- To prevent entrapment of SJKF and other special-status wildlife, all excavations, steep-walled holes or trenches greater than two feet deep shall be completely covered at the end of each workday by plywood or similar materials, or one or more escape ramps constructed of earth fill or wooden planks shall be installed a minimum of every 200 feet. All escape ramps shall be angled such that wildlife can feasibly use them to climb out of an area. All excavations, holes, and trenches shall be inspected daily for SJKF or other special-status species and immediately prior to being covered or filled. If a SJKF is entrapped, CDFW, USFWS, and the County will be contacted immediately to document the incident and advise on removal of the entrapped SJKF.
- All pipes, culverts, or similar structures with a diameter of 4 inches or greater, stored overnight at the project site shall be thoroughly inspected for sheltering SJKF before burying, capping, or moving. All exposed openings of pipes, culverts, or similar structures shall be capped or temporarily sealed prior to the end of each working day. No pipes, culverts, similar structures, or materials stored on site shall be moved if there is a SJKF present within or under the material. A 50-foot exclusion buffer will be established around the location of the SJKF until it leaves. The SJKF shall be allowed to leave on its own before the material is moved.
- All food-related trash items such as wrappers, cans, bottles, and food scraps shall be disposed of in animal-proof closed containers only and regularly removed from the site.
- No deliberate feeding of wildlife shall be allowed.
- Water sources shall be managed to ensure no leaks occur or are fixed immediately upon discovery in order to prevent SJKF from being drawn to the project area to drink water.
- Trash will be disposed of into containers rather than stockpiling on site prior to removal.
- Materials or other stockpiles will be managed in a manner that will prevent SJKF from inhabiting them. Any materials or stockpiles that may have had SJKF take up residence shall be surveyed (consistent with pre-construction survey requirements) by a qualified biologist before they are moved.
- The use of pesticides or herbicides shall be in compliance with all local, state, and federal regulations so as to avoid primary or secondary poisoning of endangered species and the depletion of prey upon which SJKF depend.
- Permanent fences shall allow for SJKF passage through or underneath by providing frequent openings (8-inch x 12-inch) or an approximately 4-inch or greater passage gap between the ground and the bottom of the fence. Any fencing constructed after issuance of a final permit shall follow the above guidelines.
- During project activities and/or the operation phase, any contractor or employee that inadvertently kills or injures a SJKF or who finds any such animal either dead, injured, or

Initial Study – Environmental Checklist

entrapped shall be required to report the incident immediately to the applicant and County. In the event that any observations are made of injured or dead SJKF, the applicant shall immediately notify the USFWS, CDFW, and the County by telephone. In addition, formal notification shall be provided in writing within 3 working days of the finding of any such animal(s). Notification shall include the date, time, location, and circumstances of the incident.

- If potential SJKF dens are identified on site during the pre-construction survey, a qualified biologist shall be on site immediately prior to the initiation of project activities to inspect the site and dens for SJKF activity. If a potential den appears to be active or there is sign of SJKF activity on site and within the above-recommended buffers, no work can begin.
- A qualified biologist shall conduct weekly site visits during site-disturbance activities (e.g., clearing, grading, disking, excavation, stock piling of dirt or gravel, etc.) that proceed longer than 14 days, to check the site for special-status species. Site-disturbance activities lasting up to 14 days do not require weekly monitoring by a biologist unless a potential SJKF den was identified on-site, or the qualified biologist recommends monitoring for other sensitive species protection. When weekly monitoring is required, the biologist shall submit weekly monitoring reports to the County.

BIO-7 Site Maintenance and General Operations - The following measures are required to minimize impacts during active construction and ongoing operations. All measures applicable during construction shall be included on the plans. All measures applicable to operation shall be clearly posted on-site in a location(s) visible to workers and anyone visiting the site:

- The use of heavy equipment and vehicles shall be limited to the proposed project limits and defined staging areas/access points. The boundaries of each work area shall be clearly defined and marked with high visibility fencing (e.g., t-posts and yellow rope) and/or flagging. No work or travel shall occur outside these limits.
- Project plans, drawings, and specifications shall show the boundaries of all work areas on site and the location of erosion and sediment controls, limit delineation, and other pertinent measures to ensure the protection of sensitive habitat areas and associated resources.
- Staging of equipment and materials shall occur in designated areas at least 100 feet from aquatic habitat (e.g., swales, drainages, ponds, vernal pools, if identified on site).
- Secondary containment such as drip pans shall be used to prevent leaks and spills of potential contaminants.
- Washing of concrete, paint, equipment, and refueling and maintenance of equipment shall occur only in designated areas. Sandbags and/or absorbent pads shall be available to prevent water and/or spilled fuel from leaving the site.
- Equipment shall be inspected by the operator daily to ensure that equipment is in good working order and no fuel or lubricant leaks are present.

BIO-8 Noxious Weed Species. To prevent the potential spread of invasive botanical species identified within the Project site, all vehicles and equipment used at the site shall be cleaned of all dirt, mud, and plant debris prior to entering or exiting the site (e.g., driven over rumble strips) to prevent

Initial Study – Environmental Checklist

tracking of potential seed stock to or from the property. Rumble strips will also be regularly cleaned and maintained to prevent the accumulation of non-native seed stock.

BIO-9 Pre-construction Survey for Sensitive and Nesting Birds. If work is planned to occur between February 1 and September 15, a qualified biologist shall survey the area for nesting birds within one week prior to initial project activity beginning, including ground disturbance and/or vegetation removal/trimming. If nesting birds are located on or near the proposed project site, they shall be avoided until they have successfully fledged, or the nest is no longer deemed active.

- A 50-foot exclusion zone shall be placed around non-listed, passerine species, and a 250-foot exclusion zone will be implemented for raptor species. Each exclusion zone shall encircle the nest and have a radius of 50 feet (non-listed passerine species) or 250 feet (raptor species). All project activities, including foot and vehicle traffic and storage of supplies and equipment, are prohibited inside exclusion zones. Exclusion zones shall be maintained until all project-related disturbances have been terminated, or it has been determined by a qualified biologist that the young have fledged or that proposed project activities would not cause adverse impacts to the nest, adults, eggs, or young.
- If special-status avian species (aside from the burrowing owl or tricolored blackbird [if identified in biological report]) are identified and nesting within the work area, no work will begin until an appropriate exclusion zone is determined in consultation with the County and any relevant resource agencies.
- The results of the survey shall be provided to the County prior to initial project activities. The results shall detail appropriate fencing or flagging of exclusion zones and include recommendations for additional monitoring requirements. A map of the project site and nest locations shall be included with the results. The qualified biologist conducting the nesting survey shall have the authority to reduce or increase the recommended exclusion zone depending on site conditions and species (if non-listed).

If two weeks lapse between different phases of project activities (e.g., vegetation trimming and the start of grading), during which no or minimal work activity occurs, the nesting bird survey shall be repeated.

BIO-10 Crotch's Bumblebee Survey and Minimization Measures. Within 30 days prior to initiation of ground disturbance between March and September, the Project footprint will be surveyed for Crotch's bumble bee using a photograph survey methodology. The site will be slowly walked by two biologists equipped with >8-megapixel point and shoot or DSLR cameras using transects to obtain 100% coverage of the project site. All insects observed during the survey will be photographed with attention to family Apidae (bees). All bees observed will be photographed to the greatest extent feasible without handling. Photographs should clearly show the entire top side of the abdomen, the side of the thorax/abdomen and the face/head. Several photos should be taken of each specimen to obtain an identification. If a bee is observed entering a burrow or other cavity, a GPS point should be recorded and attention should be focused on the cavity to determine if multiple individuals may be entering/exiting, indicating the potential presence of a colony. Biologists will submit photos to Bumble Bee Watch (www.bumblebeewatch.org), BeeSpotter (<https://beespotter.org>), or a similar website that employs bumble bee experts to verify the identifications. Qualified scientific experts may also be used to verify photographic records. CDFW will be notified as soon as possible if a *B.*

Initial Study – Environmental Checklist

crotchii observation is verified. If a *B. crotchii* colony is detected on the Project site, the colony will be mapped and avoided. No vegetation or soil disturbance will be permitted within a 50-foot radius of the colony. If avoidance is infeasible, CDFW will be consulted regarding potential conservation measures.

BIO-11 Lighting. Any temporary construction lighting or permanent lighting introduced for the Project shall avoid nighttime illumination of potentially suitable habitat features for special-status species (i.e., off-site adjacent grasslands). Temporary construction lighting will be kept to the minimum amount necessary and shall be directed toward active work areas and away from open spaces and/or drainages. To minimize the effects of future exterior lighting on special-status wildlife species, all outdoor lighting fixtures shall be positioned and/or shielded to avoid direct lighting of off-site natural or semi-natural habitat areas.

Initial Study – Environmental Checklist

V. CULTURAL RESOURCES

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
<i>Would the project:</i>				
(a) Cause a substantial adverse change in the significance of a historical resource pursuant to § 15064.5?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
(b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
(c) Disturb any human remains, including those interred outside of dedicated cemeteries?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Setting

San Luis Obispo County possesses a rich and diverse cultural heritage and has an abundance of historic and prehistoric cultural resources dating as far back as 9,000 B.C. The County protects and manages cultural resources in accordance with the provisions detailed by CEQA and local ordinances.

As defined by CEQA, a historical resource includes:

1. A resource listed in or determined to be eligible for listing in the California Register of Historical Resources (CRHR).
2. Any object, building, structure, site, area, place, record, or manuscript that a lead agency determines to be historically significant or significant. The architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural records of California may be considered to be a historical resource, provided the lead agency's determination is supported by substantial evidence.

The COSE identifies and maps anticipated culturally sensitive areas and historic resources within the county and establishes goals, policies, and implementation strategies to identify and protect areas, sites, and buildings having architectural, historical, Native American, or cultural significance.

Discussion

- (a) *Cause a substantial adverse change in the significance of a historical resource pursuant to § 15064.5?*

A Phase I Archaeological Surface Survey Report was prepared for the project site in September 2021 (Padre Associates, Inc.) which is incorporated herein by reference and available for review in its entirety at the Department of Planning and Building. The Phase I survey included a records search using the Central Coast Information Center (CCIC) of the California Historical Resources Information System. The Phase I survey also included field surveys and an assessment of potential project impacts to cultural resources within a 7-acre study area located in the northerly portion of the project site on the level plateau where new development is proposed. Subsequent to the preparation of the Phase I study, the site plan was revised to relocate the driveway closer to Martingale Circle and extending

Initial Study – Environmental Checklist

northward along another unpaved ag road before bending eastward to the proposed dwelling and ag structure. Nonetheless, the findings and conclusions of the Phase I study remain valid for assessing the potential impacts of the revised site plan because the area of disturbance used for CEQA compliance is located entirely within the area surveyed by the Phase I field survey.

Based on the results of the field survey and literature searches, the project site does not contain any historic resources identified in the National Register of Historic Places or California Register of Historic Resources. According to the Phase I study, the project site does not contain a site under the Historic Site (H) combining designation and does not contain other structures of historic age (50 years or older) that could be potentially significant as a historical resource. Therefore, the project would result in *no impacts* associated with an adverse change in the significance of a historical resources.

- (b) *Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5?*

As discussed under item a., above, a Phase I Archaeological Surface Survey Report was prepared for the project site in 2021 that included a records search using the Central Coast Information Center (CCIC) of the California Historical Resources Information System and a full-coverage pedestrian survey was performed. The purpose of the Phase I survey was to determine the likely presence or absence of cultural resources with the project area in a timely and cost-effective manner.

On September 10, 2021, an archaeologist examined an approximately seven-acre portion of the Project site for archaeological resources. This area, which includes the area of disturbance associated with the revised site plan, was surveyed in transect intervals of no greater than 10 meters, where not constrained by dense vegetation.

A records search of the files of the Regional Archaeological Information Center in Santa Barbara was requested to determine if any research had been done previously in the area. The project area and its immediate vicinity were included in the search, including historic and prehistoric resources. The Information Center is one of a number of centers coordinated from the Office of Historic Preservation in Sacramento that maintains comprehensive records of most cultural resources in the state. A copy of the Phase I report was filed with them at the conclusion of work, in a format consistent with the Guidelines for Cultural Resource Management Reports (OHP 1989) recommended by the Office of Historic Preservation.

No evidence of prehistoric archaeological resources were noted on the property during the Phase I survey conducted at the project site. There was no evidence of bedrock mortars or other prehistoric remains in the project area and no evidence was present to suggest that they may exist in the immediate vicinity but have not yet been identified. It is the opinion of the archaeologists that the project will not impact any cultural resources.

In the unlikely event that resources are uncovered during grading activities, implementation of LUO 22.10.040 (Archaeological Resources) would be required. This section requires that in the event archaeological resources are encountered during project construction, construction activities shall cease, and the County Planning and Building Department must be notified of the discovery so that the extent and location of discovered materials may be recorded by a qualified archaeologist, and the disposition of artifacts may be accomplished in accordance with state and federal law. This protocol would ensure full compliance with California State Health and Safety Code Section 7050.5 as well as CDFA requirements regarding accidental discovery of cultural resources.

Initial Study – Environmental Checklist

Therefore, impacts related to a substantial adverse change in the significance of archaeological resources would be *less than significant*.

(c) *Disturb any human remains, including those interred outside of dedicated cemeteries?*

Based on existing conditions and results of the archaeological surface survey, buried human remains are not expected to be present in the area proposed for development. In the event of an accidental discovery or recognition of any human remains, California State Health and Safety Code Section 7050.5 and LUO 22.10.040 (Archaeological Resources) require that no further disturbances shall occur until the County Coroner has made the necessary findings as to origin and disposition pursuant to Public Resources Code Section 5097.98. With adherence to State Health and Safety Code Section 7050.5 and County LUO, impacts related to the unanticipated disturbance of archaeological resources and human remains would be reduced to less than significant; therefore, potential impacts would be *less than significant*.

Conclusion

No historical resources are known or expected to occur within or adjacent to the areas proposed for development. Adherence with County LUO standards and State Health and Safety Code procedures would reduce potential impacts. Accordingly, impacts related to a substantial adverse change in the significance of archaeological resources would be *less than significant*.

Mitigation

None required.

Sources

Provided in Exhibit A.

Initial Study – Environmental Checklist

VI. ENERGY

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
<i>Would the project:</i>				
(a) Result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?		<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
(b) Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?		<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Setting

Local Utilities

The Pacific Gas & Electric Company (PG&E) is the primary electricity provider for urban and rural communities within San Luis Obispo County. Approximately 39% of electricity provided by PG&E is sourced from renewable resources and an additional 47% is sourced from non-renewable GHG-free resources (PG&E 2019).

PG&E offers two programs through which consumers may purchase electricity from renewable sources: the Solar Choice program and the Regional Renewable Choice program. Under the Solar Choice program, a customer remains on their existing electric rate plan and pays a modest additional fee on a per kilowatt-hour (kWh) basis for clean solar power. The fee depends on the type of service, rate plan, and enrollment level. Customers may choose to have 50% or 100% of their monthly electricity usage to be generated via solar projects. The Regional Renewable Choice program enables customers to subscribe to renewable energy from a specific community-based project within PG&E's service territory. The Regional Renewable Choice program allows a customer to purchase between 25% and 100% of their annual usage from renewable sources.

The Southern California Gas Company (SoCalGas) is the primary provider of natural gas for urban and rural communities within San Luis Obispo County. SoCalGas has committed to replacing 20% of its traditional natural gas supply with renewable natural gas by 2030 (Sempra 2019).

Local Energy Plans and Policies

The COSE establishes goals and policies that aim to reduce vehicle miles traveled (VMT), conserve water, increase energy efficiency and the use of renewable energy, and reduce GHG emissions. This element provides the basis and direction for the development of the County's EnergyWise Plan (EWP), which outlines in greater detail the County's strategy to reduce government and community-wide GHG emissions through a number of goals, measures, and actions, including energy efficiency and development and use of renewable energy resources.

Initial Study – Environmental Checklist

State Building Code Requirements

The California Building Code (CBC) contains standards that regulate the method of use, properties, performance, or types of materials used in the construction, alteration, improvement, repair, or rehabilitation of a building or other improvement to real property. The CBC includes mandatory green building standards for residential and nonresidential structures, the most recent version of which is referred to as the *2019 Building Energy Efficiency Standards*. These standards focus on four key areas: smart residential photovoltaic systems, updated thermal envelope standards (preventing heat transfer from the interior to the exterior and vice versa), residential and nonresidential ventilation requirements, and non-residential lighting requirements. While the CBC has strict energy and green-building standards, U-occupancy structures (such as greenhouses used for cultivation activities) are typically not regulated by these standards.

Vehicle Fuel Economy Standards

In October 2012, the U.S. Environmental Protection Agency (EPA) and the National Highway Traffic Safety Administration (NHTSA), on behalf of the Department of Transportation, issued final rules to further reduce GHG emissions and improve corporate average fuel economy (CAFE) standards for light duty vehicles for model years 2017 and beyond. NHTSA's CAFE standards have been enacted under the Energy Policy and Conservation Act since 1978. This national program requires automobile manufacturers to build a single light-duty national fleet that meets all requirements under both federal programs and the standards of California and other states. This program would increase fuel economy to the equivalent of 54.5 miles per gallon (mpg) limiting vehicle emissions to 163 grams of carbon dioxide (CO₂) per mile for the fleet of cars and light-duty trucks by the model year 2025.

As part of California's overall approach to reducing pollution from all vehicles, the California Air Resources Board (CARB) has established standards for clean gasoline and diesel fuels and fuel economies of new vehicles. CARB has also put in place innovative programs to drive the development of low-carbon, renewable, and alternative fuels such as their Low Carbon Fuel Standard (LCFS) Program pursuant to California Assembly Bill (AB) 32 and the Governor's Executive Order S-01-07.

In January 2012, CARB approved the Advanced Clean Cars Program which combines the control of Greenhouse Gas (GHG) emissions and criteria air pollutants, as well as requirements for greater numbers of zero-emission vehicles, into a single package of standards for vehicle model years 2017 through 2025. The new rules strengthen the GHG standard for 2017 models and beyond. This will be achieved through existing technologies, the use of stronger and lighter materials, and more efficient drivetrains and engines. The program's zero-emission vehicle regulation requires a battery, fuel cell, and/or plug-in hybrid electric vehicles to account for up to 15 percent of California's new vehicle sales by 2025. The program also includes a clean fuels outlet regulation designed to support the commercialization of zero-emission hydrogen fuel cell vehicles planned by vehicle manufacturers by 2015 by requiring increased numbers of hydrogen fueling stations throughout the state. The number of stations will grow as vehicle manufacturers sell more fuel cell vehicles. By 2025, when the rules will be fully implemented, the statewide fleet of new cars and light trucks will emit 34 percent fewer global warming gases and 75 percent fewer smog-forming emissions than the statewide fleet in 2016 (CARB 2016).

All self-propelled off-road diesel vehicles 25 horsepower (hp) or greater used in California and most two-engine vehicles (except on-road two-engine sweepers) are subject to the CARB's Regulation for In-Use Off-Road Diesel Fueled Fleets (Off-Road regulation). This includes vehicles that are rented or leased (rental or leased fleets). The overall purpose of the Off-Road regulation is to reduce emissions of oxides of nitrogen (NO_x) and particulate matter (PM) from off-road diesel vehicles operating within California through the

Initial Study – Environmental Checklist

implementation of standards including, but not limited to, limits on idling, reporting and labeling of off-road vehicles, limitations on use of old engines, and performance requirements.

Discussion

- (a) *Result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?*
- (b) *Conflict with or obstruct a state or local plan for renewable energy or energy efficiency?*

Construction Activities

During construction activities, fossil fuels, electricity, and natural gas would be used by construction vehicles and equipment. The energy consumed during construction would be temporary in nature and would be typical of other similar construction activities in the county. Based on the size and scope of proposed earthwork and building construction, the project would not have the potential to result in adverse environmental impacts through its use of diesel fuel for construction equipment. In addition, project contractors save costs by avoiding the wasteful, inefficient, or unnecessary consumption of energy resources, such as idling. Therefore, potentially significant environmental impacts associated with the consumption of energy resources during construction would be avoided and project construction activities would not result in a conflict with a state or local plan for renewable energy or energy efficiency. Therefore, project construction impacts associated with energy use would be *less than significant*.

Project Operations

Electricity and Natural Gas Use. There are no occupied buildings or accessory structures on the project site; there is a very small energy demand associated with the use of the existing well pump during dry weather months. The project's operational electricity needs would be met by a connection to PG&E infrastructure. Natural gas is provided by PG&E.

The CBC 2019 Building Energy Efficiency Standards include mandatory energy efficiency standards. A new single-family residence is subject to compliance with these standards. Lastly, the new residence, garage and the accessory building will be required to comply with the relevant provisions of the 2016 California Green Building Code and the County of San Luis Obispo's Green Building Ordinance.

Therefore, project impacts associated with electricity and natural gas use are considered *less than significant* and *less than cumulatively considerable*.

Fuel Use. The ongoing occupation of the project would result in fuel use associated with motor vehicle trips generated by residential occupancy. All vehicles used by residents would be subject to applicable state and federal fuel economy standards and State-mandated smog inspections.

Based on adherence to applicable state and federal vehicle fuel regulations and the size and scope of proposed activities, project fuel use would not result in a potentially significant environmental impact and would not be wasteful, inefficient, or unnecessary.

Therefore, potential impacts associated with potentially significant environmental impacts due to wasteful, inefficient, or unnecessary consumption of energy resources and potential conflict with state or local plans regarding renewable energy or energy efficiency would be *less than significant* and *less than cumulatively considerable*.

Initial Study – Environmental Checklist

Conclusion

The project would not result in a potentially significant energy demand and inefficient energy use during long-term operations that would be considered wasteful, inefficient, and unnecessary. Potential impacts related to energy would be *less than significant* and *less than cumulatively considerable*.

Mitigation

None are required.

(f) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Setting

The Alquist-Priolo Earthquake Fault Zoning Act (Alquist-Priolo Act) is a California state law that was developed to regulate development near active faults and mitigate the surface fault rupture potential and other hazards. The Alquist-Priolo Act identifies active earthquake fault zones and restricts the construction of habitable structures over known active or potentially active faults. San Luis Obispo County is located in a geologically complex and seismically active region. The Safety Element of the County of San Luis Obispo General Plan identifies three active faults that traverse through the county and are currently zoned under the Alquist-Priolo Act: the San Andreas, the Hosgri-San Simeon, and the Los Osos.

The County Safety Element also identifies 17 other faults that are considered potentially active or have uncertain fault activity. The Safety Element establishes policies that require new development to be located away from active and potentially active faults. The element also requires that the County enforce applicable building codes relating to seismic design of structures and require design professionals to evaluate the potential for liquefaction or seismic settlement to impact structures in accordance with the Uniform Building Code. The nearest potentially capable fault line is the San Marcos section of the Rinconada fault located approximately 6 miles to the west.

The County LUO identifies a Geologic Study Area (GSA) combining designation for areas where geologic and soil conditions could present new developments and/or their occupants with potential hazards to life and property. The project site is not located within a Geologic Study Area (GSA) combining designation. Based on the Safety Element, the project site is not located in an area with high landslide risk potential and has a low liquefaction potential.

The project site is located on early to late Pleistocene alluvial deposits.

Discussion

(a) *Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:*

(a-i) *Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.*

The project site is not located within the Alquist-Priolo Fault Hazard Zone. The potential for ground rupture at the site during ground shaking is considered low. The closest known Quaternary age fault is the San Marcos section of the Rinconada fault located approximately 6 miles west of the site which is considered potentially active but does not underly the project site. Therefore, there would be *no impact* associated with potential impacts related to the rupture of a known earthquake fault.

Initial Study – Environmental Checklist

(a-ii) *Strong seismic ground shaking?*

Groundshaking refers to the motion that occurs in response to local and regional earthquakes. Seismic groundshaking is influenced by the proximity of the site to an earthquake fault, the intensity of the seismic event, and the underlying soil composition. As discussed above, the closest known Quaternary age fault is the Rinconada fault located approximately 6 miles west of the site which is considered potentially active but does not underly the project site.

The project would be required to comply with the CBC and other applicable standards to ensure the effects of a potential seismic event would be minimized through compliance with current engineering practices and techniques. Implementation of the project in compliance with relevant construction codes would not expose people or structures to significant increased risks associated with seismic ground shaking; therefore, impacts would be *less than significant*.

(a-iii) *Seismic-related ground failure, including liquefaction?*

Based on the Safety Element Liquefaction Hazards Map, the project site is located in an area with low potential for liquefaction.

In addition, the project would be required to comply with CBC seismic requirements to address the site's potential for seismic-related ground failure including liquefaction; therefore, the potential impacts would be *less than significant*.

(a-iv) *Landslides?*

Based on the Safety Element Landslide Hazards Map the project site is located in an area with a low potential for landslides. The project would be required to comply with CBC seismic requirements to address the site's potential for landslides. Therefore, the potential impacts would be *less than significant*.

(b) *Result in substantial soil erosion or the loss of topsoil?*

The project would result in approximately 1.0 acres of site disturbance and would require 200 cubic yards (cy) of cut, 140 cy of fill and 60 cy of export that will be spread on site. During site preparation and grading/leveling activities, there would be a potential for erosion to occur. The project application materials include a detailed preliminary grading and erosion control plan that includes drainage collection, storage, and conveyance infrastructure to ensure runoff does not cause erosion or adversely impact the quality of downstream surface or groundwater bodies.

Section 22.51.120 of the LUO requires any project that would change the runoff volume or velocity leaving any point of the site, result in an impervious surface of more than 20,000 square feet, or involve hillside development on slopes steeper than 10 percent to prepare and implement a sedimentation and erosion control plan. LUO Section 22.51.120 includes requirements for specific erosion control materials and states that Best Management Practices (BMPs) shall be employed to control sedimentation and erosion. These mandatory BMPs are set forth in LUO Section 22.52.150 B. and C. Compliance with these mandatory BMPs will ensure water quality is protected.

In addition, the project would be subject to Regional Water Quality Control Board (RWQCB) requirements for preparation of a Storm Water Pollution Prevention Plan (SWPPP) (LUO Section 22.52.130), which may include the preparation of a Storm Water Control Plan to further minimize on-site erosion. Upon implementation of the recommended BMPs, impacts related to soil erosion would be *less than significant*.

Initial Study – Environmental Checklist

- (c) *Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?*

As discussed above under item a-iv, based on the Safety Element Landslide Hazards Map, the project site is located in an area with a low landslide risk. Based on the Safety Element and U.S. Geological Survey (USGS) data, the project is not located in an area of historical or current land subsidence (USGS 2019) and is located in an area with low potential for liquefaction risk. Due to the distance to the nearest active fault zone and topography of the project site, lateral spreading is not likely to occur on-site. The project would be required to comply with the CBC standards designed to significantly reduce potential risks associated with unstable earth conditions. Therefore, impacts related to on- or off-site landslides, lateral spreading, subsidence, liquefaction, or collapse would be *less than significant*.

- (d) *Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?*

According to the NRCS, soils underlying the area of disturbance (the *Arbuckle-San Ysidro complex*, 2 to 9 percent slopes) has a low shrink-swell potential. In addition, the residence and ag. accessory building will be required to comply with applicable CBC standards designed to reduce potential risks associated with expansive soils. Therefore, potential impacts associated with expansive soil would be *less than significant*.

- (e) *Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of waste water?*

The project includes the construction of a new septic system to serve the residence. A shallow soil percolation test was conducted for the project site by GeoSolutions, Inc. on October 28, 2021. Percolation test bores were taken in the general area to be used for the leach field. So long as the septic leach fields are designed to accommodate the measured percolation rate, soils at the site are adequate to support septic leach fields.

Therefore, potential impacts associated with having soils incapable of adequately supporting the use of septic tanks would be *less than significant*.

- (f) *Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?*

The underlying geologic material is considered to have low to moderate paleontological sensitivity (County of Monterey 2014, SWCA Environmental Consultants 2019). Potential impacts to paleontological resources would be *less than significant*.

Conclusion

The project site is not subject to significant geologic hazards such as landslides and shallow groundwater. Compliance with the relevant provisions of the CBC and with Incorporation of the findings and recommendations of the soils and percolation investigations, impacts associated with geology and geologic hazards would be *less than significant*.

Mitigation

None are required.

Provided in Exhibit A.

Initial Study – Environmental Checklist

VIII. GREENHOUSE GAS EMISSIONS

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
<i>Would the project:</i>				
(a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
(b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Setting

Greenhouse gases (GHGs) are any gases that absorb infrared radiation in the atmosphere. The primary GHGs that are emitted into the atmosphere as a result of human activities are carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), and fluorinated gases. These are most commonly emitted through the burning of fossil fuels (oil, natural gas, and coal), agricultural practices, decay of organic waste in landfills, and a variety of other chemical reactions and industrial processes (e.g., the manufacturing of cement). Carbon dioxide (CO₂) is the most abundant GHG and is estimated to represent approximately 80–90% of the principal GHGs that are currently affecting the earth's climate. According to the California Air Resources Board (CARB), transportation (vehicle exhaust) and electricity generation are the main sources of GHGs in the state.

In October 2008, the CARB published the *Climate Change Proposed Scoping Plan*, which is the state's plan to achieve GHG reductions in California required by Assembly Bill (AB) 32. The Scoping Plan included CARB-recommended GHG reductions for each emissions sector of the state's GHG inventory. The largest proposed GHG reduction recommendations were associated with improving emissions standards for light-duty vehicles, implementing the Low Carbon Fuel Standard program, implementation of energy efficiency measures in buildings and appliances, the widespread development of combined heat and power systems, and developing a renewable portfolio standard for electricity production.

Senate Bill (SB) 32 and Executive Order (EO) S-3-05 extended the state's GHG reduction goals and require CARB to regulate sources of GHGs to meet the following goals:

- Reduce GHG emissions to 1990 levels by 2020;
- Reduce GHG emissions to 40% below 1990 levels by 2030;
- Reduce GHG emissions to 80% below 1990 levels by 2050.

The initial Scoping Plan was first approved by CARB on December 11, 2008, and is updated every 5 years. The first update of the Scoping Plan was approved by the CARB on May 22, 2014, which looked past 2020 to set mid-term goals (2030–2035) toward reaching the 2050 goals. The most recent update released by CARB is the 2017 Climate Change Scoping Plan, which was released in November 2017. The 2017 Climate Change

Initial Study – Environmental Checklist

Scoping Plan incorporates strategies for achieving the 2030 GHG-reduction target established in SB 32 and EO S-3-05.

When assessing the significance of potential impacts for CEQA compliance, an individual project's GHG emissions will generally not result in direct significant impacts because climate change is global in nature. However, an individual project could be found to contribute to a potentially significant cumulative impact. Projects that have GHG emissions above the noted thresholds may be considered cumulatively considerable and require mitigation. Accordingly, in March 2012, the SLOAPCD approved thresholds for GHG impacts that were incorporated into their 2012 CEQA Air Quality Handbook. The Handbook recommended applying a 1,150 MTCO₂e per year Bright Line Threshold for commercial and residential projects and included a list of general land uses and estimated sizes or capacities of uses expected to exceed this threshold. According to the SLOAPCD, this threshold was based on a 'gap analysis' and was used for CEQA compliance evaluations to demonstrate consistency with the state's GHG emission reduction goals associated with the Global Warming Solutions Act (AB32) and the 2008 Climate Change Scoping Plan which have a target year of 2020. However, in 2015, the California Supreme Court issued an opinion in the case of *Center for Biological Diversity vs California Department of Fish and Wildlife* ("Newhall Ranch") that determined that AB 32 based thresholds derived from a gap analysis are invalid for projects with a planning horizon beyond 2020. Since the bright-line and service population GHG thresholds in the Handbook are AB 32 based, and project horizons are now beyond 2020 and the SLOAPCD no longer recommends the use of these thresholds for CEQA evaluations. Instead, the following threshold options are recommended for consideration by the lead agency:

- Consistency with a Qualified Climate Action Plan: CAPs conforming to CEQA Guidelines § 15183 and 15183.5 would be qualified and eligible for project streamlining under CEQA.

The County of San Luis Obispo EnergyWise (EWP), adopted in 2011, serves as the County's GHG reduction strategy. The GHG-reducing policy provisions contained in the EWP were prepared for the purpose of complying with the requirements of AB 32 and achieving the goals of the AB 32 Scoping Plan, which have a horizon year of 2020. Therefore, the EWP is not considered a qualified GHG reduction strategy for assessing the significance of GHG emissions generated by projects with a horizon year beyond 2020.

- No-net Increase: The 2017 Scoping Plan states that no-net increase in GHG emissions relative to baseline conditions *"is an appropriate overall objective for new development"* consistent with the Court's direction provided by the Newhall Ranch case which demonstrated that no-net GHG increase was feasible and defensible. Although a desirable goal, the application of this threshold may not be appropriate for a small project where it can be clearly shown that it will not generate significant GHG emissions (ie, di minimus: too trivial or minor to merit consideration).
- Lead Agency Adopted Defensible GHG CEQA Thresholds: Under this approach, a lead agency may establish SB 32-based local operational thresholds:

- *Meeting Local GHG Emission Targets with Best Management Practices*

On April 23, 2020, the Sacramento Metropolitan Air Quality Management District (SMAQMD) adopted Greenhouse Gas Thresholds for Sacramento County. This substantial evidenced based document sets SB 32-based local GHG emission targets for 2030 by evaluating the GHG inventory for local emission sectors relative to statewide sector inventories and the state's GHG reduction target of 40% below 1990 levels. Relative to business-as-usual, the document considered the commercial and residential sector emission reductions needed

Initial Study – Environmental Checklist

from new development to help achieve the SB 32 goal. To help secure these reductions, best management practices were established for new development.

- *GHG Bright-line and Efficiency Thresholds*

SB 32 based local bright-line and operational efficiency thresholds can be established by evaluating local emission sectors in a jurisdiction's GHG inventory relative to statewide sector inventories and the state's GHG reduction target of 40% below 1990 levels. This approach is found in earlier drafts of SMAQMD's SB 32 threshold work and the AEP Climate Change Committee may provide guidance on a similar approach.

As discussed above, SB 32 requires the state to reduce GHG levels by 40 percent below 1990 levels by the year 2030. According to the California Greenhouse Gas Emissions for 2000 to 2017, Trends of Emissions and Other Indicators published by the California Air Resources Board, emissions of GHG statewide in 2017 were 424 million MMTCO₂e, which was 7 million MTCO₂e below the 2020 GHG target of 431 MMTCO₂e established by AB 32. At the local level, an update of the County's EnergyWise Plan prepared in 2016 revealed that overall GHG emissions in San Luis Obispo County decreased by approximately seven percent between 2006 and 2013, or about one-half of the year 2020 target of reducing greenhouse gas emissions by 15% relative to the 2006 baseline¹. Therefore, application of the 1,150 MTCO₂e Bright Line Threshold in San Luis Obispo County, together with other local and State-wide efforts to reduce GHG emissions, proved to be an effective approach for achieving the reduction targets set forth by AB32 for the year 2020. It should be noted that the 1,150 MTCO₂e per year Bright Line Threshold was based on the assumption that a project with the potential to emit less than 1,150 MTCO₂e per year would result in impacts that are less than significant and less than cumulatively considerable impact and would be consistent with state and local GHG reduction goals.

Since SB 32 requires the state to reduce GHG levels by 40 percent below 1990 levels by the year 2030, the application of an interim "bright line" SB32-based working threshold that is 40 percent below the 1,150 MMTCO₂e Bright Line threshold ($1,150 \times 0.6 = 690$ MMTCO₂e) would be expected to produce comparable GHG reductions "in the spirit of" the targets established by SB32. Therefore, for the purpose of evaluating the significance of GHG emissions for a project after 2020, emissions estimated to be less than 690 MMTCO₂e per year GHG are considered *de minimus* (too trivial or minor to merit consideration) and will have a less than significant impact that is less than cumulatively considerable and consistent with state and local GHG reduction goals.

Discussion

- (a) *Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?*

The California Energy Emissions Model (CalEEMod, 2022) was utilized to estimate the project's annual carbon dioxide equivalent emissions in metric tons (MTCO₂e; Table 6). The estimated emissions were then compared with the interim threshold of 690 MMTCO₂e per year to determine their significance.

¹ AB32 and SB32 require GHG emissions to be reduced to 1990 levels by the year 2020. The EnergyWise Plan assumes that the County's 1990 GHG emissions were about 15% below the levels identified in the 2006 baseline inventory.

Initial Study – Environmental Checklist

Table 6 – Existing and Projected Operational GHG Emissions

Project Component	Quantity	Emissions Rate (Annual MTCO ₂ e/sf)		Estimated Projected Annual CO ₂ Emissions (MT/year) Without Mitigation ¹
		Construction	Operation	
Single Family Residence and Ag. Accessory Building	1	n/a	4.20	4.20

Sources: County of San Luis Obispo Department of Planning and Building, 2020, CalEEMOD version 2022

Notes:

1. CalEEMOD CalEEMOD version 2022

As shown in Table 6, project related GHG emissions will be well below the 690 MTCO₂e interim threshold. As stated above, a project estimated to generate less than 690 MTCO₂e GHG is assumed to have a less than significant adverse impact that is not cumulatively considerable and consistent with the GHG reduction objectives of AB32 and SB32.

Therefore, potential impacts associated with GHG emissions would be *less than significant* and *less than cumulatively considerable*.

- (b) *Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?*

Energy inefficiency contributes to higher GHG emissions which in turn may conflict with the following state and local plans for energy efficiency.

2011 EnergyWise Plan (EWP). As discussed above, the County of San Luis Obispo EnergyWise plan (EWP), adopted in 2011, serves as the County's GHG reduction strategy. The GHG-reducing policy provisions contained in the EWP were prepared for the purpose of complying with the requirements of AB 32 and achieving the goals of the AB 32 Scoping Plan, which have a horizon year of 2020. The policy provisions are divided into community-wide measures and measures aimed at reducing GHG emissions associated with County operations. The GHG reduction measures contained in the EWP are generally programmatic and intended to be implemented at the community level. Measure No. 7. encourages energy efficient new development and provides incentives for new development to exceed Cal Green energy efficiency standards. The following is a summary of project consistency with the relevant supporting actions identified in the EWP for promoting energy efficiency in new development.

Initial Study – Environmental Checklist

Supporting Action	Project Consistency
Require the use of energy-efficient equipment in all new development, including but not limited to Energy Star appliances, high-energy efficiency equipment, heat recovery equipment, and building energy management systems.	All new energy using fixtures will satisfy current energy efficiency requirements.
Encourage new projects to provide ample daylight within the structure through the use of lighting shelves, exterior fins, skylights, atriums, courtyards, or other features to enhance natural light penetration.	The proposed dwelling and accessory building will be subject to current building codes relating to energy efficiency.
Minimize the use of dark materials on roofs by requiring roofs to achieve a minimum solar reflectivity index (SRI) of 10 for high-slope roofs and 64 for low-slope roofs (CALGreen 5.1 Planning and Design).	

San Luis Obispo County 2019 Regional Transportation Plan (RTP) and Sustainable Communities Strategy (SCS). The 2019 RTP, which was adopted by the SLOCOG Board in June 2019, includes the region's Sustainable Communities Strategy and outlines how the region will meet or exceed its GHG reduction targets by creating more compact, walkable, bike-friendly, transit-oriented communities, preserving important habitat and agricultural areas, and promoting a variety of transportation demand management and system management tools and techniques to maximize the efficiency of the transportation network. The RTP and SCS provide guidance for the development and management of transportation systems county-wide to help achieve, among other objectives, GHG reduction goals. The RTP/SCS recommend strategies for community planning such as encouraging mixed-use, infill development that facilitate the use of modes of travel other than motor vehicles. The project consists of one single family residence and an ag. accessory building barn located in a predominantly agricultural area.

As discussed in Section III. Air Quality, the project does not include development of retail or commercial uses that would be open to the public, therefore, land use planning strategies such as mixed-use development and planning compact communities are generally not applicable. The project would result in the construction and occupancy of a single-family residence that would typically be occupied by three residents. Therefore, the project would not significantly affect the local area's jobs/housing balance.

California Air Resources Board (CARB) 2017 Scoping Plan. Pursuant to AB 32, the California Air Resources Board (CARB or Board) prepared and adopted the initial Scoping Plan to “identify and make recommendations on direct emissions reductions measures, alternative compliance mechanisms, market-based compliance mechanisms, and potential monetary and non-monetary incentives” in order to achieve the 2020 goal, and to achieve “the maximum technologically feasible and cost-effective GHG emissions reductions” by 2020 and maintain and continue reductions beyond 2020. AB 32 requires CARB to update the Scoping Plan at least every five years.

The 2017 Climate Change Scoping Plan recommends strategies for achieving the 2030 GHG-reduction target established in SB 32 and EO S-3-05. These strategies include the following:

Initial Study – Environmental Checklist

- Implement SB350 which is aimed at Reduce GHG emissions in the electricity sector;
- 2030 Low Carbon Fuel Standard (LCFS) -- Transition to cleaner/less-polluting fuels that have a lower carbon footprint.
- Implement the 2030 Mobile Source Strategy (Cleaner Technology and Fuels [CTF] Scenario) -- Reduce GHGs and other pollutants from the transportation sector through transition to zero-emission and low-emission vehicles, cleaner transit systems and reduction of vehicle miles traveled.
- Implement SB 1383 which is aimed at reducing Short-Lived Climate Pollutants to reduce highly potent GHGs.
- Implement the 2030 California Sustainable Freight Action Plan aimed at improving freight efficiency, transition to zero emission technologies, and increase competitiveness of California's freight system.
- Implement the Post-2020 Cap-and-Trade Program which is aimed at reducing GHGs across the largest GHG emissions sources.

The strategies described in the 2017 Scoping Plan are programmatic and intended to be implemented state-wide and industry-wide. They are therefore not applicable at the level of an individual project. However, as discussed in Section XVII. Transportation, the project is not expected to generate a significant increase in construction-related or operational traffic trips or Vehicle Miles Traveled (VMT) which is consistent with Scoping Plan strategies for reducing vehicle miles traveled. Overall, the project would have a *less than significant impact* relating to consistency with adopted plans and policies aimed at reducing GHG emissions.

Conclusion

GHG emissions would be *less than significant and less than cumulatively considerable* and consistent with plans adopted to reduce GHG emissions.

Mitigation

None are required.

Sources

Provided in Exhibit A.

Initial Study – Environmental Checklist

IX. HAZARDS AND HAZARDOUS MATERIALS

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
<i>Would the project:</i>				
(a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
(b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
(c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
(d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
(e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
(f) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
(g) Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Initial Study – Environmental Checklist

Setting

The Hazardous Waste and Substances Site List (Cortese List), which is a list of hazardous materials sites compiled pursuant to California Government Code (CGC) Section 65962.5, is a planning document used by the state, local agencies, and developers to comply with CEQA requirements related to the disclosure of information about the location of hazardous materials release sites. The project is not located in an area of known hazardous material contamination and is not on a site listed on the Cortese List (State Water Resources Control Board [SWRCB] 2021; California Department of Toxic Substance Control [DTSC] 2021).

The County has adopted general emergency plans for multiple potential natural disasters, including the Local Hazard Mitigation Plan, County Emergency Operations Plan, Earthquake Plan, Dam and Levee Failure Plan, Hazardous Materials Response Plan, County Recovery Plan, and the Tsunami Response Plan.

The California Health and Safety Code provides regulations pertaining to the abatement of fire-related hazards and requires that local jurisdictions enforce the CBC, which provides standards for fire resistive building and roofing materials, and other fire-related construction methods. The Safety Element of the County of San Luis Obispo General Plan provides a Fire Hazard Zones Map that indicates unincorporated areas in the county within moderate, high, and very high fire hazard severity zones. The project is located within the State Responsibility Area in a high fire hazard severity zone. Based on the Safety Element map of response times, it would take approximately 5-10 minutes to respond to a call regarding fire or life safety. For more information about fire-related hazards and risk assessment, see Section XX, Wildfire.

The Paso Robles Municipal Airport is located about three miles to the west. However, the project site is not located within an Airport Review Area.

Discussion

- (a) *Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?*

Construction activities may involve the use of oils, fuels, and solvents. In the event of a leak or spill, persons, soil, and vegetation down-slope from the site may be affected. The use, storage, and transport of hazardous materials is regulated by DTSC (22 Cal. Code of Regulations Section 66001, et seq.). The use of hazardous materials on the project site for construction and maintenance is required to be in compliance with local, state, and federal regulations. In addition, compliance with best management practices (BMPs) for the use and storage of hazardous materials would also address impacts. These BMPs may include, but are not limited to, the following:

- Determining whether a product constitutes a hazardous material in accordance with federal and state regulations;
- Properly characterizing the physical properties, reactivity, fire and explosion hazards of the various materials;
- Using storage containers that are appropriate for the quantity and characteristics of the materials;
- Properly labeling of containers and maintaining a complete and up to date inventory;
- Ongoing inspection and maintenance of containers in good condition;
- Proper storage of incompatible, ignitable and/or reactive wastes;

Initial Study – Environmental Checklist

Project operations would involve the intermittent use of small amounts of household hazardous materials such as fertilizer and pesticides that are not expected to be acutely hazardous.

The project will be conditioned to comply with all applicable fire protection standards as determined by CAL FIRE, including, but not limited to, preparation of a fire safety plan. Compliance with the Uniform Fire Code and the recommendations of CalFIRE will ensure that potential impacts associated with hazards to the public or the environment through the routine transport, use, or disposal of hazardous materials would be *less than significant*.

- (b) *Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?*

Oils, gasoline, lubricants, fuels, and other potentially hazardous substances would be used and temporarily stored onsite during construction activities. A spill or leak of these materials under accident conditions during construction activities could create a potentially significant hazard to the surrounding environment including the ephemeral drainage immediately to the east and downslope of the area of disturbance. Mitigation measures HAZ-1 and HAZ-2 have been recommended to reduce potential impacts associated with upset or accident conditions during project construction.

Through required compliance with these standards, potential operational hazards associated with the use of ethanol onsite would be effectively minimized. Therefore, potential impacts associated with hazards to the public or the environment through reasonably foreseeable upset or accident conditions would be *less than significant with mitigation*.

- (c) *Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?*

The closest school facility is located approximately 5 miles west of the project site. Therefore, the project site is not located within 0.25 mile of an existing or proposed school; therefore, *no impacts* would occur.

- (d) *Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?*

Based on the California DTSC's Envirostor and SWRCB's GeoTracker, the proposed project site is not listed on, nor is it located in close proximity to, a site listed on the Cortese List, which is a list of hazardous materials sites compiled pursuant to CGC Section 65962.5; therefore, *no impacts* would occur.

- (e) *For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area?*

The nearest airstrip in proximity to the project site is the Paso Robles Airport located approximately 3 miles west of the site. The project site is not located within an Airport Review designation or adjacent to a private airstrip. The project site is not located within or adjacent to an airport land use plan or within 2 miles of a public airport or private airstrip; therefore, *no impacts* would occur.

Initial Study – Environmental Checklist

- (f) *Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?*
- The project does not require any road closures and would be required to be designed to accommodate emergency vehicle access. The project would not impair implementation or physically interfere with County hazard mitigation or emergency plans; therefore, impacts would be *less than significant*.
- (g) *Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires?*

The project is located in a High Fire Hazard Severity Zone. The project will be conditioned to implement building and site improvements in accordance with the Fire Code, as detailed in the referral response letter, including, but not limited to implementation of a fire safety plan. Therefore, potential impacts associated with exposure of people or structures to significant risk involving wildland fires would be *less than significant*.

Conclusion

The project may include the use of potentially hazardous materials during construction. Mitigation measures have been identified below to reduce potential impacts associated with routine transport, use, and disposal of these materials, as well as potential hazards associated with upset and accident conditions and wildland fire risk. Upon implementation of measures HAZ-1 and HAZ-2, potential impacts associated with hazards and hazardous materials would be *less than significant with mitigation*.

Mitigation

- HAZ-1 Equipment Maintenance and Refueling.** During all construction activities, the cleaning, refueling, and maintenance of equipment and vehicles shall occur only within designated staging areas. The staging areas shall conform to all Best Management Practices applicable to attaining zero discharge of stormwater runoff. At a minimum, all equipment and vehicles shall be checked and maintained on a daily basis to ensure proper operation and to avoid potential leaks or spills.
- HAZ-2 Spill Response Protocol.** During all construction activities, all project-related spills of hazardous materials shall be cleaned up immediately. Appropriate spill prevention and cleanup materials shall be onsite at all times during construction.

Initial Study – Environmental Checklist

Setting

The RWQCB's Water Quality Control Plan for the Central Coast Basin (Basin Plan; RWQCB 2017) describes how the quality of surface water and groundwater in the Central Coast Region should be managed to provide the highest water quality reasonably possible. The Basin Plan outlines the beneficial uses of streams, lakes, and other water bodies for humans and other life. There are 24 categories of beneficial uses, including, but not limited to, municipal water supply, water contact recreation, non-water contact recreation, and cold freshwater habitat. Water quality objectives are then established to protect the beneficial uses of those water resources. The RWQCB implements the Basin Plan by issuing and enforcing waste discharge requirements to individuals, communities, or businesses whose discharges can affect water quality.

In accordance with the LUO, a project that would change the runoff volume or velocity leaving any point of the site, result in an impervious surface of more than 20,000 square feet or involve hillside development on slopes steeper than 10 percent is required to prepare a drainage plan for review and approval by the County. A drainage plan is not required where grading is exclusively for an exempt agricultural structure, crop production, or grazing. The LUO also requires the preparation of an erosion and sedimentation control plan for all construction and grading permit projects and site disturbance activities of one-half acre or more in geologically unstable areas, on slopes steeper than 30 percent, on highly erodible soils, or within 100 feet of any watercourse.

The County Department of Public Works is responsible for ensuring that new construction sites implement Best Management Practices (BMPs) during construction, and that site plans incorporate appropriate post-construction stormwater runoff controls. Construction sites that disturb 1 acre or more must obtain coverage under the SWRCB's Construction General Permit. The Construction General Permit requires the preparation of a SWPPP to minimize on-site sedimentation and erosion. There are several types of projects that are exempt from preparing a SWPPP, including routine maintenance to existing developments, emergency construction activities, and projects exempted by the SWRCB or RWQCB. Projects that disturb less than 1 acre must implement all required elements within the site's erosion and sediment control plan as required by the LUO.

The project water demand will be served by an existing groundwater well. A well pump test conducted by Wayne Cooper Ag Services, LLC in September 2022, revealed that the well can sustain a pumping rate of 37 gallons per minute and produce 0.2-acre feet over a 24-hour period. A new 5,000-gallon water tank will be installed near the well to serve the new residence.

The project lies within the Paso Robles Groundwater Basin (PRGB) as defined by the Department of Water Resources (DWR) Bulletin 118. The DWR has designated the Paso Robles Subbasin as one of 21 groundwater basins in the state that are critically overdrafted. Accordingly, in accordance with the Sustainable Groundwater Management Act (SGMA), a Groundwater Sustainability Plan (GSP) is required to be prepared for the Basin and adopted by January 31, 2020. A revised GSP was published on June 13, 2022, formally adopted by the four affected groundwater sustainability agencies involved in June and July 2022, and submitted to DWR on July 20, 2022. DWR is anticipated to provide a final GSP determination on the GSP in late 2022 or early 2023.

In addition, the portion of the basin within San Luis Obispo County has been assigned a Level of Severity III by the County Resource Management System. This means that the water demand from the basin projected over 15 years equals or exceeds the estimated dependable supply, or the time required to correct the problem is longer than the time available before the dependable supply is reached. Lastly, the project is located within an Area of Severe Decline as identified in the Map of Updated Paso Basin Area of Severe Decline as shown on the Department of Planning and Building website:

Initial Study – Environmental Checklist

<https://www.slocounty.ca.gov/Departments/Planning-Building/Department-Services/Agriculture,-Water,-and-Energy/Water-Programs/Programs-and-Services/PRGWB-Area-of-Severe-Degline.aspx>.

For planning purposes, the flood event most often used to delineate areas subject to flooding is the 100-year flood. The Safety Element of the County of San Luis Obispo General Plan establishes policies to reduce flood hazards and reduce flood damage, including, but not limited to, prohibition of development in areas of high flood hazard potential, discouragement of single-road access into remote areas that could be closed during floods, and review of plans for construction in low-lying areas.

Discussion

- (a) *Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality?*

The project will involve 200 cubic yards of cut, 140 of fill and 60 cy of export and an area of disturbance of about 1.0 acres. Accordingly, a sedimentation and erosion control plan will be required to minimize the potential for soil erosion, which will be subject to the review and approval of the County Building Division in accordance with LUO Section 22.52.120. The erosion and sedimentation control plan must set forth measures to minimize potential impacts related to erosion and will include requirements for specific erosion control materials, setbacks from creeks, and siltation. In addition, the project is located outside of a stormwater management area (MS4) and proposes a disturbance area greater than 1.0 acre, therefore, the project will be required to prepare and implement a Stormwater Pollution Prevention Plan (SWPPP) by a qualified SWPPP developer in order to demonstrate compliance with the Federal Clean Water Act which prohibits certain discharges of stormwater containing pollutants.

The project will be conditioned to require all potentially hazardous materials to be stored, refilled, and dispensed on-site in full compliance with applicable County Department of Environmental Health standards and Mitigation Measures HAZ-1 and HAZ-2, maintaining a minimum setback from the nearest creek or water feature, and compliance with existing County and state water quality, sedimentation, and erosion control standards. Therefore, the project would not result in a violation of any water quality standards, discharge into surface waters, or otherwise alter surface water quality; therefore, impacts would be *less than significant*.

- (b) *Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?*

Project water demand would be served by an existing groundwater well and shared with the ongoing agricultural operations. Future water demand was derived by multiplying a water duty factor for each component of the project as summarized in Table 7.

Initial Study – Environmental Checklist

Table 7 -- Estimate of Total Project Water Demand

Project Component	Quantity	Water Duty Factor	Total Water Demand (Acre-Feet Per Year ¹)
Residence	1	0.8 AFY per dwelling unit ²	0.80
Ornamental Landscaping	0.05 Acres	855 gallons per week ³	0.01
Sub-Total of New Demand:			0.81
Removal of irrigated vineyards	1.0 acres	1.2 AF per acre ⁴	-1.20
Net New Water Demand:	--	--	-0.39 AFY

Sources:

1. One acre-foot is approximately 325,851 gallons.
2. Carollo Engineers, San Luis Obispo County 2012 Master Water Report, Volume III, Table 8. Water duty factors for inland areas. Indoor water use only.
3. University of California, Division of Agriculture and Natural Resources Landscape Water Requirement Calculator, 2022
4. Carollo Engineers, San Luis Obispo County 2012 Master Water Report, Volume III, Table 8. Water duty factors for inland areas.

Assuming the irrigated vineyards consume about 1.2 AFY, net water demand associated with the project would be slightly lower than the baseline conditions following removal of 1.0 acres of vines and construction of a single-family residence. As discussed above, the pump test results suggest that the well can produce 0.2 acre-feet of water over a 24-hour period. Therefore, the well can produce sufficient water to support annual demand associated with the residence every four days (0.81 AFY divided by 0.2 AF per day = 4.0 days) regardless of any water demand savings associated with the removal of existing irrigated vineyards.

As discussed in the setting, the project site lies within the PRGB which is in a critical state of overdraft and has been assigned a Level of Severity III by the County Resource Management System. In addition, the project site is within an Area of Severe Decline. Land Use Ordinance Section 22.94.025 sets forth regulations aimed at mitigating the effects of water demand associated with new development within the PRGB. Section 22.94.025 F. requires all new development requiring discretionary approval to offset the net new water demand at a ratio of 2:1 by participating in one or more of the following water conservation programs:

- Retiring the development potential of lots in the Paso Robles Groundwater basin through an agreement with the County or qualified land trust.
- Retrofitting plumbing fixtures in the Paso Robles Groundwater Basin.
- Purchasing supplemental water for a water supplier that uses groundwater from the main Paso Robles Groundwater Basin.
- Participating in an approved water conservation program in the Paso Robles Groundwater Basin that results in water savings.

Initial Study – Environmental Checklist

- Reducing water demand in the Paso Robles Groundwater Basin through other means approved by the Planning Director.

The regulations state that any required offset of net new water demand must be completed at the time of final inspection or issuance of a certificate of occupancy unless an alternative completion time is approved by the review authority. In any case, the review authority must find the offsets to be verifiable, permanent and enforceable.

The project will be conditioned to comply with LUO Section 22.94.025. Through compliance with this code section, project impacts relating to water supply are not expected to substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin and project impacts are considered *less than significant*.

- (c) *Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:*

- (c-i) *Result in substantial erosion or siltation on- or off-site?*

The project would result in approximately 1.0 acres of site disturbance and 240 cubic yards of cut, 140 cy of fill and 60 cy of export. A sedimentation and erosion control must be prepared to minimize the potential for soil erosion, which would be subject to the review and approval of the County Building Division in accordance with LUO Section 22.52.120 to minimize potential impacts related to erosion, and include requirements for specific erosion control materials, setbacks from creeks, and siltation.

The project application materials include a preliminary grading, and erosion control plan that includes drainage collection, storage, and conveyance infrastructure to ensure runoff does not adversely impact the quality of downstream surface or groundwater bodies.

The project will be required to comply with all National Pollution Discharge Elimination System (NPDES) requirements and prepare a SWPPP that incorporates BMPs during construction. Water quality protection measures would include protection of stockpiles, protection of slopes, protection of all disturbed areas, protection of access roads, and perimeter containment measures. Therefore, potential impacts associated with erosion and siltation from substantial alteration of the existing on-site drainage pattern would be *less than significant*.

- (c-ii) *Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?*

The project application materials include a preliminary grading and erosion control plan that includes drainage collection, storage, and conveyance infrastructure to ensure runoff does not adversely impact the quality of downstream surface or groundwater bodies.

The project will be subject to post-construction stormwater requirements through preparation and implementation of a SWPPP, which would identify appropriate Best Management Practices to capture and treat runoff before it leaves the site. Based on required compliance with applicable state and County drainage and stormwater control regulations, the project's impacts associated with increased surface runoff resulting in flooding on- or off-site would be *less than significant*.

Initial Study – Environmental Checklist

- (c-iii) *Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?*

The project will be subject to post-construction stormwater requirements through preparation and implementation of a SWPPP, which would identify appropriate Best Management Practices to capture and treat runoff before it leaves the site. Based on required compliance with applicable state and County drainage and stormwater control regulations, the project's impacts associated with increased surface runoff resulting in exceedance of the capacity of existing or planned drainage systems or provide substantial additional sources of polluted runoff would be *less than significant*.

- (c-iv) *Impede or redirect flood flows?*

Based on the County Flood Hazard Map, the project site is not located within a 100-year flood zone. Therefore, *no impacts would occur*.

- (d) *In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?*

Based on the Safety Element Flood Hazard Map, the project site is not located within a 100-year flood zone (County of San Luis Obispo 2013). Based on the San Luis Obispo County Tsunami Inundation Maps, the project site is not located in an area with potential for inundation by a tsunami (CDOC 2021). The project site is not located within close proximity to a standing body of water with the potential for a seiche to occur. Therefore, the project site has no potential to release pollutants due to project inundation and *no impacts would occur*.

- (e) *Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?*

As discussed in the setting, the project site lies within the PRGB and may be subject to the requirements of the GSP following adoption. As discussed in the setting, the project is required to comply with relevant permitting of the RWQCB. Therefore, potential impacts associated with conflict or obstruction of a water quality control plan or sustainable groundwater management plan would be *less than significant*.

Conclusion

The project will result in *less than significant impacts* associated with water supply, water quality and hydrology.

Mitigation

None are required.

See Exhibit A.

Initial Study – Environmental Checklist

XI. LAND USE AND PLANNING

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
<i>Would the project:</i>				
(a) Physically divide an established community?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
(b) Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Setting

The LUO was established to guide and manage the future growth in the county in accordance with the County of San Luis Obispo General Plan; regulate land use in a manner that will encourage and support orderly development and beneficial use of lands; minimize adverse effects on the public resulting from inappropriate creation, location, use, or design of buildings or land uses; and protect and enhance significant natural, historic, archeological, and scenic resources within the county. The LUO is the primary tool used by the County to carry out the goals, objectives, and policies of the General Plan.

The Land Use Element (LUE) of the County of San Luis Obispo General Plan provides policies and standards for the management of growth and development in each unincorporated community and rural areas of the county and serves as a reference point and guide for future land use planning studies throughout the county. The LUE identifies strategic growth principles to define and focus the County's proactive planning approach and balance environmental, economic, and social equity concerns. Each strategic growth principle correlates with a set of policies and implementation strategies that define how land will be used and resources protected. The LUE also defines each of the 14 land use designations and identifies standards for land uses based on the designation they are located within. The project parcel and surrounding properties are all within the Agriculture land use designation. The project site is currently undeveloped.

The inland LUE also contains the area plans of each of the four inland planning areas: Carrizo, North County, San Luis Obispo, and South County. The area plans establish policies and programs for land use, circulation, public facilities, services, and resources that apply "areawide," in rural areas, and in unincorporated urban areas within each planning area. Part three of the LUE contains each of the 13 inland community and village plans, which contain goals, policies, programs, and related background information for the County's unincorporated inland urban and village areas.

The project site is located within the North County Planning Area and the El Pomar Sub-Area and is not subject to any Combining Designations.

Initial Study – Environmental Checklist

Discussion

(a) *Physically divide an established community?*

The project does not propose project elements or components that would physically divide the site from surrounding areas and uses. The project would be consistent with the general level of development within the project vicinity and would not create, close, or impede any existing public or private roads, or create any other barriers to movement or accessibility within the community. Therefore, the proposed project would not physically divide an established community and *impacts would be less than significant*.

(b) *Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect?*

The project would be consistent with the property's land use designation and the guidelines and policies for development within the applicable area plan, inland LUO, and the COSE. The project, as it may be conditioned, was found to be consistent with standards and policies set forth in the County of San Luis Obispo General Plan, the San Luis Obispo Area Plan, the SLOAPCD Clean Air Plan, and other land use policies for this area. The project would be required to be consistent with standards set forth by County Fire/CAL FIRE and the County Public Works Department.

The project would be required to implement measures to mitigate potential impacts associated with air quality, biological resources, hydrology and hazardous materials; therefore, with mitigation, the project would not conflict with policies or regulations adopted for the purpose of avoiding or mitigating environmental effects and impacts would be *less than significant with mitigation*.

Conclusion

The project would be consistent with local and regional land use designations, plans, and policies and would not divide an established community. Potential impacts related to land use and planning would be *less than significant with mitigation* measures associated with air quality, biological resources, hazards and hazardous materials.

Mitigation

Implement mitigation measures AQ-1 and AQ-2, BIO-1 through BIO-11, HAZ-1 and HAZ-2.

Sources

Provided in Exhibit A.

Initial Study – Environmental Checklist

XII. MINERAL RESOURCES

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
<i>Would the project:</i>				
(a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
(b) Result in the loss of availability of a locally- important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Setting

The California Surface Mining and Reclamation Act of 1975 (SMARA) requires that the State Geologist classify land into mineral resource zones (MRZ) according to the known or inferred mineral potential of the land (California PRC Sections 2710–2796).

The three MRZs used in the SMARA classification-designation process in the San Luis Obispo-Santa Barbara Production-Consumption Region are defined below (California Geological Survey [CGS] 2015):

- **MRZ-1:** Areas where available geologic information indicates that little likelihood exists for the presence of significant mineral resources.
- **MRZ-2:** Areas where adequate information indicates that significant mineral deposits are present, or where it is judged that a high likelihood for their presence exists. This zone shall be applied to known mineral deposits or where well-developed lines of reasoning, based upon economic-geologic principles and adequate data, demonstrate that the likelihood for occurrence of significant mineral deposits is high.
- **MRZ-3:** Areas containing known or inferred aggregate resources of undetermined significance.

The LUO provides regulations for development in delineated Energy and Extractive Resource Areas (EX) and Extractive Resource Areas (EX1). The EX combining designation is used to identify areas of the county where:

1. Mineral or petroleum extraction occurs or is proposed to occur;
2. The state geologist has designated a mineral resource area of statewide or regional significance pursuant to California PRC Sections 2710 et seq. (SMARA); and
3. Major public utility electric generation facilities exist or are proposed.

The purpose of this combining designation is to protect significant resource extraction and energy production areas identified by the County LUE from encroachment by incompatible land uses that could hinder resource extraction or energy production operations, or land uses that would be adversely affected by extraction or energy production.

Initial Study – Environmental Checklist

Discussion

- (a) *Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?*

Based on the California Geological Survey (CGS) Information Warehouse for Mineral Land Classification, the project site is not located within an area that has been evaluated for mineral resources and is not in close proximity to an active mine (CGS 2021).

In addition, based on Chapter 6 of the County of San Luis Obispo General Plan Conservation and Open Space Element – Mineral Resources, the project site is not located within an extractive resource area or an energy and extractive resource area. The project is not located within a designated mineral resource zone area or within an Extractive Resource Area combining designation. There are no known mineral resources in the project area; therefore, there would be *no impact* to mineral resources.

- (b) *Result in the loss of availability of a locally- important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?*

The project is not located within a designated mineral resource zone or within an Extractive Resource Area combining designation. There are no known mineral resources in the project area; therefore, there would be *no impact* to mineral resources.

Conclusion

No impacts to mineral resources would occur and no mitigation measures are necessary.

Mitigation

None necessary.

Sources

Provided in Exhibit A.

Initial Study – Environmental Checklist

XIII. NOISE

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
<i>Would the project result in:</i>				
(a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
(b) Generation of excessive groundborne vibration or groundborne noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
(c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Setting

The Noise Element of the County of San Luis Obispo General Plan provides a policy framework for addressing potential noise impacts in the planning process. The purpose of the Noise Element is to minimize future noise conflicts. The Noise Element identifies the major noise sources in the county (highways and freeways, primary arterial roadways and major local streets, railroad operations, aircraft and airport operations, local industrial facilities, and other stationary sources) and includes goals, policies, and implementation programs to reduce future noise impacts. Among the most significant policies of the Noise Element are numerical noise standards that limit noise exposure within noise-sensitive land uses and performance standards for new commercial and industrial uses that might adversely impact noise-sensitive land uses.

Noise sensitive uses that have been identified by the County include the following:

- Residential development, except temporary dwellings
- Schools (preschool to secondary, college and university, and specialized education and training)
- Health care services (e.g., hospitals, clinics, etc.)
- Nursing and personal care
- Churches
- Public assembly and entertainment
- Libraries and museums
- Hotels and motels

Initial Study – Environmental Checklist

- Bed and breakfast facilities
- Outdoor sports and recreation
- Offices

All sound levels referred to in the Noise Element are expressed in A-weighted decibels (dBA). A-weighting de-emphasizes the very low and very high frequencies of sound in a manner similar to the human ear.

The LUO establishes acceptable standards for exterior and interior noise levels and describes how noise shall be measured. Exterior noise level standards are applicable when a land use affected by noise is one of the sensitive uses listed in the Noise Element. Exterior noise levels are measured from the property line of the affected noise-sensitive land use.

Table 8 -- Maximum allowable exterior noise level standards⁽¹⁾

Sound Levels	Daytime 7 a.m. to 10 p.m.	Nighttime ⁽²⁾
Hourly Equivalent Sound Level (L_{eq} , dB)	50	45
Maximum level, dB	70	65

¹ When the receiving noise-sensitive land use is outdoor sports and recreation, the noise level standards are increased by 10 db.

² Applies only to uses that operate or are occupied during nighttime hours.

The existing ambient noise environment is characterized by marginal traffic on Martingale Court as well as noise associated with ongoing agricultural operations on the project site and surrounding properties. The nearest sensitive receptors are offsite residences located about less than 1,000 feet from potential construction areas.

Discussion

- (a) *Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?*

Construction Impacts. The County LUO noise standards are subject to a range of exceptions, including noise sources associated with construction, provided such activities do not take place before 7 a.m. or after 9 p.m. on weekdays, or before 8 a.m. or after 5 p.m. on Saturday or Sunday. Noise associated with agricultural land uses (as listed in Section 22.06.030), traffic on public roadways, railroad line operations, and aircraft in flight are also exempt.

According to the 2005 Federal Highway Administration's Roadway Construction Noise Mode Database, noise associated with heavy construction equipment can range from about 73 to 101 dBA for non-impact equipment. Noise levels 50 feet from stationary equipment can range from 68 to 88 dBA, with. Table 9 provides an estimate of noise generated by temporary construction activities that may be used for construction of the project.

Initial Study – Environmental Checklist

Table 9 -- Estimate of Noise From Construction Equipment

Equipment	Quantity	dBA at 50 Feet ¹
Backhoe	1	78
Dozer	1	82
Excavator	1	81
Dump Truck	1	76
Generator	1	81
Pickup Truck	2	75
Total:	7	872 ²

Notes:

1. Source: Federal Highway Administration's Roadway Construction Noise Mode Database.
2. Assumes all equipment are operating concurrently.

As shown in Table 9, construction related noise would likely temporarily exceed the maximum hourly daytime levels allowed by the County's noise standards at the nearest property line located to the east of the area of disturbance. Project construction would result in a temporary increase in noise levels associated with construction activities, equipment, and vehicle trips. Construction noise would be variable, temporary, and limited in nature and duration. The County LUO requires that construction activities be conducted during daytime hours and that construction equipment be equipped with appropriate mufflers recommended by the manufacturer. Compliance with these standards would ensure short-term construction noise would be *less than significant*.

Operational Impacts. Operational noise will be limited to motor vehicle traffic associated with home ownership. Therefore, operational noise will be below County standards and impacts would be *less than significant*.

Impacts associated with the generation of a substantial temporary or permanent increase in ambient noise levels would be *less than significant*.

(b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

The project will not involve the use of pile driving, or other high impact activities that would generate substantial groundborne noise or groundborne vibration during construction. In addition, construction equipment has the potential to generate minor groundborne noise and/or vibration, but these activities would be limited in duration. The project does not propose a use that would generate long-term operational groundborne noise or vibration. Therefore, impacts related to exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels would be *less than significant*.

(c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

The nearest airstrip in proximity to the project site is the Paso Robles Airport located approximately 3 miles to the east. The project site is not located within an Airport Review designation or adjacent to a private airstrip. The project site is not located within or adjacent to an airport land use plan or within 2 miles of a public airport or private airstrip; therefore, *no impact would occur*.

Initial Study – Environmental Checklist

Conclusion

Short-term construction activities would be limited in nature and duration and conducted during daytime periods per LUO standards. Operational noise levels will be less than the standards set forth in the LUO and are considered less than significant. No other potentially significant impacts were identified, and no mitigation measures are necessary.

Mitigation

None are required.

Sources

Provided in Exhibit A.

Initial Study – Environmental Checklist

XIV. POPULATION AND HOUSING

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
<i>Would the project:</i>				
(a) Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
(b) Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Setting

The Housing Element of the County of San Luis Obispo General Plan recognizes the difficulty for residents to find suitable and affordable housing within San Luis Obispo County. The Housing Element includes an analysis of vacant and underutilized land located in urban areas that is suitable for residential development and considers zoning provisions and development standards to encourage development of these areas. Consistent with state housing element laws, these areas are categorized into potential sites for very low- and low-income households, moderate-income households, and above moderate-income households.

The County's Inclusionary Housing Ordinance requires the provision of new affordable housing in conjunction with both residential and nonresidential development and subdivisions. In its efforts to provide for affordable housing, the County currently administers the Home Investment Partnerships (HOME) Program and the Community Development Block Grant (CDBG) program, which provide limited financing to projects relating to affordable housing throughout the county.

The project site is currently vacant.

Discussion

- (a) *Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?*

The project proposes construction of a residence and ag. accessory building that would be occupied by about three persons. Employed residents would not require new or additional housing as a result of the proposed project. The project would not generate new employment opportunities that would encourage population growth in the area. The project does not include the extension or establishment of new public roads, utilities, or other infrastructure to the site that would induce development and population growth in new areas. In addition, the project would be subject to inclusionary housing fees to offset any potential increased need for housing in the area. Therefore, the project would not directly or indirectly induce substantial growth and impacts would be *less than significant*.

Initial Study – Environmental Checklist

- (b) *Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?*

The project would not displace existing housing or necessitate the construction of replacement housing elsewhere; therefore, impacts would be *less than significant*.

Conclusion

No impacts to population and housing would occur and no mitigation measures are necessary.

Mitigation

None necessary.

Sources

Provided in Exhibit A.

Initial Study – Environmental Checklist

XV. PUBLIC SERVICES

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
(a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:				
Fire protection?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Police protection?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Schools?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Parks?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
Other public facilities?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

Setting

Fire protection services in unincorporated San Luis Obispo County are provided by CAL FIRE, which has been under contract with the County to provide full-service fire protection since 1930. Approximately 180 full-time state employees operate the County Fire Department, supplemented by as many as 100 state seasonal fire fighters, 300 County paid-call and reserve fire fighters, and 120 state inmate fire fighters. CAL FIRE responds to emergencies and other requests for assistance, plans for and takes action to prevent emergencies and reduce their impact, coordinates regional emergency response efforts, and provides public education and training in local communities. CAL FIRE has 24 fire stations located throughout the county, and the project would be served by CAL FIRE station #53, located approximately 3 miles south of the project site on State Route 46. Emergency personnel would be able to reach the site within 5 - 10 minutes of receiving a call.

Police protection and emergency services in the unincorporated portions of the county are provided by the San Luis Obispo County Sheriff's Office. The Sheriff's Office Patrol Division responds to calls for service, conducts proactive law enforcement activities, and performs initial investigations of crimes. Patrol personnel are deployed from three stations throughout the county, the Coast Station in Los Osos, the North County Station in Templeton, and the South Station in Oceano. The project would be served by the County Sheriff's Office, and the nearest sheriff station is located approximately in the community of Templeton about 5 miles southwest of the project site.

Initial Study – Environmental Checklist

San Luis Obispo County has a total of 12 school districts that currently enroll approximately 34,000 students in over 75 schools. The project site is located within the Paso Robles Unified School District.

Within the County's unincorporated areas, there are currently 23 parks, three golf courses, four trails/staging areas, and eight Special Areas that include natural areas, coastal access, and historic facilities currently operated and maintained by the County.

Public facilities fees, Quimby fees, and developer conditions are several ways the County currently funds public services. A public facility fee program (i.e., development impact fee program) has been adopted to address impacts related to public facilities (county) and schools (CGC Section 65995 et seq.). The fee amounts are assessed annually by the County based on the type of proposed development and the development's proportional impact and are collected at the time of building permit issuance. Public facility fees are used as needed to finance the construction of and/or improvements to public facilities required to serve the new development, including fire protection, law enforcement, schools, parks, and roads.

Discussion

- (a) *Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:*

Fire protection?

The project will be designed to comply with all fire safety rules and regulations, including the California Fire Code and California PRC, which include improvements to the existing access road to accommodate emergency vehicle access, vegetation clearing or trimming around all existing and proposed structures, and potential installation of a water storage tank for fire protection (if fire sprinklers are required). The project will be conditioned to implement all requirements identified by the County Fire Department/CAL FIRE for the project including items to be completed prior to final inspection/operation. Based on the limited amount of development proposed, the project would not create a significant new demand for fire services. In addition, the project will be subject to public facility fees to offset the increased cumulative demand on fire protection services. Therefore, impacts would be *less than significant*. Additional information regarding wildfire hazard impacts is discussed in Section XX, Wildfire. Additional information regarding fire related hazard impacts is discussed in Section IX, Hazards and Hazardous Materials.

Police protection?

The project would be subject to public facility fees to offset the project's cumulative contribution to demand on law enforcement services. Therefore, impacts related to police services would be *less than significant*.

Schools?

As discussed in Section XIV, Population/Housing, the project would not induce significant population growth and would not result in the need for additional school services or facilities. However, the project would be subject to school impact fees, pursuant to California Education Code Section 17620, to help fund construction or reconstruction of school facilities. Therefore, impacts would be *less than significant*.

Initial Study – Environmental Checklist

Parks?

As discussed in Section XIV, Population and Housing, the project would not induce a substantial increase in population growth and would not result in the need for additional parks or recreational services or facilities to serve new populations; therefore, potential impacts would be *less than significant*.

Other public facilities?

As discussed above, the proposed project would be subject to applicable fees to offset negligible increased demands on public facilities; therefore, there would be *no impacts* related to other public facilities.

Conclusion

The project does not propose development that would substantially increase demands on public services and would not induce population growth that would substantially increase demands on public services. The project would be subject to payment of development impact fees to reduce the project's negligible contribution to increased demands on public services and facilities. Therefore, potential impacts related to public services would be less than significant and no mitigation measures are necessary.

Mitigation

None are necessary.

Sources

Provided in Exhibit A.

Initial Study – Environmental Checklist

XVI. RECREATION

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
(a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
(b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Setting

The Parks and Recreation Element (Recreation Element) of the County of San Luis Obispo General Plan establishes goals, policies, and implementation measures for the management, renovation, and expansion of existing parks and recreation facilities and the development of new parks and recreation facilities in order to meet existing and projected needs and to assure an equitable distribution of parks throughout the county.

Public facilities fees, Quimby fees, and developer conditions are several ways the County currently funds public parks and recreational facilities. Public facility fees are collected upon construction of new residential units and currently provide funding for new community-serving recreation facilities. Quimby Fees are collected when new residential lots are created and can be used to expand, acquire, rehabilitate, or develop community-serving parks. Finally, a discretionary permit issued by the County may condition a project to provide land, amenities, or facilities consistent with the Recreation Element.

The County Bikeways Plan identifies and prioritizes bikeway facilities throughout the unincorporated area of the county, including bikeways, parking, connections with public transportation, educational programs, and funding. The Bikeways Plan is updated every 5 years and was last updated in 2016. The plan identifies goals, policies, and procedures geared towards realizing significant bicycle use as a key component of the transportation options for San Luis Obispo County residents. The plan also includes descriptions of bikeway design and improvement standards, an inventory of the current bicycle circulation network, and a list of current and future bikeway projects within the county.

Discussion

- (a) *Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?*

The project proposes the construction of a single-family residence that could be occupied by as many as three persons. The project is not proposed in a location that would affect any existing trail, park, recreational facility, coastal access, and/or natural area. The project would not result in substantial growth within the area and would not substantially increase demand on any proximate

Initial Study – Environmental Checklist

existing neighborhood or regional park or other recreational facilities. Payment of standard development impact fees would ensure any incremental increase in use of existing parks and recreational facilities would be reduced to *less than significant*.

- (b) *Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?*

The project does not include the construction of new recreational facilities and would not result in a substantial increase in demand or use of parks and recreational facilities. Implementation of the project would not require the construction or expansion of recreational facilities; therefore, impacts would be *less than significant*.

Conclusion

The project would not result in the significant increase in use, construction, or expansion of parks or recreational facilities. Therefore, potential impacts related to recreation would be less than significant and no mitigation measures are necessary.

Mitigation

None necessary.

Provided in Exhibit A.

Initial Study – Environmental Checklist

XVII. TRANSPORTATION

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
<i>Would the project:</i>				
(a) Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
(b) Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
(c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
(d) Result in inadequate emergency access?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Setting

The County Department of Public Works maintains updated traffic count data for all County-maintained roadways. In addition, Traffic Circulation Studies have been conducted within several community areas using traffic models to reasonably simulate current traffic flow patterns and forecast future travel demands and traffic flow patterns. These community Traffic Circulation Studies include the South County Circulation Study, Los Osos Circulation Study, Templeton Circulation Study, San Miguel Circulation Study, Avila Circulation Study, and North Coast Circulation Study. The California Department of Transportation (Caltrans) maintains annual traffic data on state highways and interchanges within the county.

The County has established Level of Service (LOS) "C" or better for rural roadways. The project site is currently undeveloped and generates a very low volume of traffic. The project site is served by Martingale Court, a county-maintained rural roadway that extends south from Estrella Road through gently rolling hills. No traffic counts are available for Martingale Court; however, counts taken on Estrella Road at Hog Canyon Road revealed 1,803 Average Daily Trips and 172 afternoon peak hour trips.

In 2013 SB 743 was signed into law with the intent to "more appropriately balance the needs of congestion management with statewide goals related to infill development, promotion of public health through active transportation, and reduction of greenhouse gas emissions" and required the Governor's Office of Planning and Research (OPR) to identify new metrics for identifying and mitigating transportation impacts within CEQA. As a result, in December 2018, the California Natural Resources Agency certified and adopted updates to the State CEQA Guidelines. The revisions included new requirements related to the implementation of SB 743 and identified VMT per capita, VMT per employee, and net VMT as new metrics for transportation analysis under CEQA (as detailed in Section 15064.3[b]). Beginning July 1, 2020, the newly adopted VMT criteria for determining significance of transportation impacts must be implemented

Initial Study – Environmental Checklist

statewide. Also in December, 2018, the Office of Planning and Research (OPR) published a Technical Advisory On the Evaluation of Transportation Impacts In CEQA to assist local governments in implementing the new VMT requirements. The 2018 Technical Advisory states that a development project that generates less than 110 average daily trips (ADT) will not have a project-specific or cumulatively considerable impact with respect to vehicle miles travelled.

The County's Framework for Planning (Inland), includes the Land Use and Circulation Elements of the County of San Luis Obispo General Plan. The Framework establishes goals and strategies to meet pedestrian circulation needs by providing usable and attractive sidewalks, pathways, and trails to establish maximum access and connectivity between land use designations. Due to the remote location of the project site, there are no pedestrian, bicycle, or public transit facilities serving of the project site.

Discussion

- (a) *Conflict with a program plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?*

The project does not propose the substantial temporary or long-term alteration of any proximate transportation facilities. Motor vehicle trips associated with the project are expected to be about 9.6 trips per day. Construction activities will require temporary construction trips to and from the site.

The project would not noticeably impact traffic operations on Martingale Court or Estrella Road, would not reduce levels of service on nearby roads, conflict with adopted policies, plans or programs for transportation, and would not cause congestion on the local circulatory network. The project is not likely to generate foot or bicycle traffic or generate public transit demand and would have a less than impact on levels of service/conditions for these facilities.

Marginal increases in traffic can be accommodated by existing local streets and the project would not result in any long-term changes in traffic or circulation or reduce the Level of Service below LOS "C". The project does not propose uses that would interfere or conflict with applicable policies related to circulation, transit, roadway, bicycle, or pedestrian systems or facilities. The project would be consistent with the County Framework for Planning (Inland) and consistent with the projected level of growth and development identified in the 2019 RTP. Therefore, potential impacts would be *less than significant*.

No significant traffic impacts were identified, and no mitigation measures above what are already required by existing regulations are necessary.

- (b) *Would the project conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?*

The County has not yet identified an appropriate model or method to estimate VMT for proposed land use development projects. Section 15064.3(b) states that if existing models or methods are not available to estimate the VMT for the particular project being considered, a lead agency may analyze the project's VMT qualitatively.

The project is not expected to generate a significant increase in construction-related or operational traffic trips or VMT because:

- A single-family residence typically generates about 9.6 trips per day which is considerably less than the 110 ADT threshold identified in the 2018 VMT Technical Advisory.

Initial Study – Environmental Checklist

- The project would be subject to standard development impact fees to offset the relative impacts on surrounding roadways. Therefore, potential impacts would be *less than significant*.

(c) *Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?*

A project referral package was sent to the Public Works Department; in their response of April 9, 2021, no traffic related issues were identified. The project will be conditioned to construct all access improvements from Martingale Court consistent with County standards. Therefore, impacts would be *less than significant*.

(d) *Result in inadequate emergency access?*

The project will be conditioned to construct all access improvements from Martingale Court consistent with County standards. The project would not result in road closures during short-term construction activities or long-term operations. Individual access to adjacent properties would be maintained during construction activities and throughout the project area. Project implementation would not affect long-term access through the project area and sufficient alternative access exists to accommodate regional trips. Therefore, the project would not adversely affect existing emergency access and impacts would be *less than significant*.

Conclusion

The project would not alter existing transportation facilities or result in the generation of substantial additional trips or vehicle miles traveled. Payment of standard development fees and compliance with existing regulations would ensure potential impacts were reduced to less than significant.

Mitigation

None are required.

Sources

Provided in Exhibit A.

Initial Study – Environmental Checklist

XVIII. TRIBAL CULTURAL RESOURCES

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
(a) Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:				
(i) Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k), or	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
(ii) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resource Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Setting

Approved in 2014, AB 52 added tribal cultural resources to the categories of resources that must be evaluated under CEQA. Tribal cultural resources are defined as either of the following:

1. Sites, features, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are either of the following:
 - a. Included or determined to be eligible for inclusion in the CRHR; or
 - b. Included in a local register of historical resources as defined in subdivision (k) of California PRC Section 5020.1.
2. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth California PRC Section 5024.1(c).

Initial Study – Environmental Checklist

In applying these criteria for the purposes of this paragraph, the lead agency shall consider the significance of the resource to a California Native American Tribe.

Recognizing that tribes have specific expertise regarding their tribal history and practices, AB 52 requires lead agencies to provide notice to tribes that are traditionally and culturally affiliated with the geographic area of a proposed project if they have requested notice of projects proposed within that area. If the tribe requests consultation within 30 days upon receipt of the notice, the lead agency must consult with the tribe regarding the potential for adverse impacts on tribal cultural resources as a result of a project. Consultation may include discussing the type of environmental review necessary, the presence and/or significance of tribal cultural resources, the level of significance of a project's impacts on the tribal cultural resources, and available project alternatives and mitigation measures recommended by the tribe to avoid or lessen potential impacts on tribal cultural resources.

In accordance with AB 52 Cultural Resources requirements, outreach to the Salinan Tribe of Monterey and San Luis Obispo Counties, *titvu titvu yak tihini* Northern Chumash, and Northern Chumash Tribal Council.

Discussion

(a) *Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:*

(a-i) *Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in Public Resources Code section 5020.1(k)?*

According to the Phase I cultural resources survey, the project site does not contain any known tribal cultural resources that have been listed or been found eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in PRC Section 5020.1. Potential impacts associated with the inadvertent discovery of tribal cultural resources would be subject to LUO 22.10.040 (Archaeological Resources), which requires that in the event resources are encountered during project construction, construction activities shall cease, and the County Planning and Building Department shall be notified of the discovery so that the extent and location of discovered materials may be recorded by a qualified archaeologist, and the disposition of artifacts may be accomplished in accordance with state and federal law. Therefore, there would be *no impact* related to a substantial adverse change in the significance of tribal cultural resources.

(a-ii) *A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Public Resources Code Section 5024.1. In applying the criteria set forth in subdivision (c) of Public Resources Code Section 5024.1, the lead agency shall consider the significance of the resource to a California Native American tribe.*

As discussed in Section V. Cultural Resources, the Phase I survey of the project site revealed no evidence of cultural resources in the areas of disturbance. Impacts associated with potential inadvertent discovery would be minimized through compliance with existing standards and regulations (LUO 22.10.040), would reduce potential impacts to *less than significant*.

Conclusion

Cultural resources are not expected to occur within or adjacent to the project site. In the event unanticipated sensitive resources are discovered during project activities, adherence with LUO standards

Initial Study – Environmental Checklist

and State Health and Safety Code procedures would reduce potential impacts to less than significant; therefore, potential impacts to tribal cultural resources would be *less than significant*.

Mitigation

None are required.

Sources

Provided in Exhibit A.

Initial Study – Environmental Checklist

XIX. UTILITIES AND SERVICE SYSTEMS

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
<i>Would the project:</i>				
(a) Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
(b) Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
(c) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
(d) Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
(e) Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Setting

The County Department of Public Works provides water and wastewater services for specific County Service Areas (CSAs) that are managed through issuance of water/wastewater "will serve" letters. The Department of Public Works currently maintains CSAs for the communities of Nipomo, Oak Shores, Cayucos, Avila Beach, Shandon, the San Luis Obispo County Club, and Santa Margarita. Other unincorporated areas in the county rely on on-site wells and individual wastewater systems. Regulatory standards and design criteria for on-site wastewater treatment systems are provided by the Water Quality Control Policy for Siting, Design, Operation, and Maintenance of Onsite Wastewater Treatment Systems (California OWTS Policy).

The Department of Public Works is responsible for ensuring that new construction sites implement BMPs during construction, and that site plans incorporate appropriate post-construction stormwater runoff controls. Construction sites that disturb 1 acre or more must obtain coverage under the SWRCB's

Initial Study – Environmental Checklist

Construction General Permit. PG&E is the primary electricity provider and both PG&E and SoCalGas provide natural gas services for urban and rural communities within the county. The project would be served by an existing well. The project's energy needs would be provided by PG&E.

There are three landfills in San Luis Obispo County: Cold Canyon Landfill, located near the city of San Luis Obispo; Chicago Grade Landfill, located near the community of Templeton; and Paso Robles Landfill, located east of the city of Paso Robles. The project's solid waste needs would be served by the Chicago Grade landfill.

Discussion

- (a) *Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?*

The project will be served by an existing on-site well and a new septic system. The project, as conditioned, would not result in a substantial increase in demand on water, wastewater, or stormwater collection, treatment, or disposal facilities. The project would not result in a substantial increase in energy demand, natural gas, or telecommunications; no new or expanded facilities would be required. No utility relocations are proposed. Therefore, impacts would be *less than significant*.

- (b) *Have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?*

As discussed in Section X, Hydrology and Water Quality, the project will result in an estimated new water demand of 0.81 AFY and will be served by an existing well. A well pump test conducted by Wayne Cooper Ag Services, LLC in September 2022, revealed that the well can sustain a pumping rate of 37 gallons per minute and produce 0.2-acre feet over a 24-hour period. A new 5,000-gallon water tank will be installed near the well to serve the new residence.

Assuming the existing 0.8 acres of irrigated vineyards to be removed consume about 1.2 AFY, net water demand associated with the project would be slightly lower than the baseline conditions following removal of 1.0 acres of vines and construction of a single-family residence. As discussed above, the pump test results suggest that the well can produce 0.2 acre-feet of water over a 24-hour period. Therefore, the well can produce sufficient water to support annual demand associated with the residence every four days (0.81 AFY divided by 0.2 AF per day = 4.0 days) regardless of any water demand savings associated with the removal of existing irrigated vineyards. The project will be conditioned to demonstrate that the new well can meet the estimated demand prior to building permit issuance and to comply with the water offset requirements of LUO Section 22.94.025. As conditioned, impacts related to water supplies would be *less than significant*.

- (c) *Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?*

The project will not be served by a community wastewater provider. Therefore, *no impacts would occur*.

Initial Study – Environmental Checklist

- (d) *Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?*

The nearest landfill to the site is the Chicago Grade Landfill located approximately 5 miles to the south. The landfill has a remaining capacity of approximately four million cubic yards as of 2019. The incremental amount of waste generated by the project that is not recycled/reused would be within the service capacity of the landfill. Construction activities would result in the generation of minimal solid waste materials; no significant long-term increase in solid waste would occur. Local landfills have adequate permit capacity to serve the project and the project does not propose to generate solid waste in excess of State or local standards or otherwise impair the attainment of solid waste reduction goals. Therefore, potential impacts would be *less than significant*.

- (e) *Comply with federal, state, and local management and reduction statutes and regulations related to solid waste?*

The project would not result in a substantial increase in waste generation during project construction or operation. Construction waste disposal would comply with federal, state, and local management and reduction statutes and regulations related to solid waste. Therefore, potential impacts would be *less than significant*.

Conclusion

The project would not result in significant increased demands on wastewater or stormwater infrastructure and facilities. No substantial increase in solid waste generation would occur. Therefore, potential impacts to utilities and service systems would be *less than significant*.

Mitigation

None are required.

Provided in Exhibit A.

Initial Study – Environmental Checklist

XX. WILDFIRE

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
<i>If located in or near state responsibility areas or lands classified as very high fire hazard severity zones, would the project:</i>				
(a) Substantially impair an adopted emergency response plan or emergency evacuation plan?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
(b) Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
(c) Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
(d) Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>

Setting

In central California, the fire season usually extends from roughly May through October; however, recent events indicate that wildfire behavior, frequency, and duration of the fire season are changing in California. Fire Hazard Severity Zones (FHSZ) are defined by CALFIRE based on the presence of fire-prone vegetation, climate, topography, assets at risk (e.g., high population centers), and a fire protection agency's ability to provide service to the area (CAL FIRE 2007). FHSZs throughout the county have been designated as "Very High," "High," or "Moderate." In San Luis Obispo County, most of the area that has been designated as a "Very High Fire Hazard Severity Zone" is located in the Santa Lucia Mountains, which extend parallel to the coast along the entire length of San Luis Obispo County. The project would be located within the State Responsibility Area and a "High" fire hazard severity zone, and based on CAL FIRE's referral response letter, it would take approximately 5 - 10 minutes to respond to a call regarding fire or life safety.

The County Emergency Operations Plan (EOP) addresses several overall policy and coordination functions related to emergency management. The EOP includes the following components:

- Identifies the departments and agencies designated to perform response and recovery activities and specifies tasks they must accomplish;

Initial Study – Environmental Checklist

- Outlines the integration of assistance that is available to local jurisdictions during disaster situations that generate emergency response and recovery needs beyond what the local jurisdiction can satisfy;
- Specifies the direction, control, and communications procedures and systems that will be relied upon to alert, notify, recall, and dispatch emergency response personnel; alert the public; protect residents and property; and request aid/support from other jurisdictions and/or the federal government;
- Identifies key continuity of government operations; and
- Describes the overall logistical support process for planned operations.

Topography influences wildland fire to such an extent that slope conditions can often become a critical wildland fire factor. Conditions such as speed and direction of dominant wind patterns, the length and steepness of slopes, direction of exposure, and/or overall ruggedness of terrain influence the potential intensity and behavior of wildland fires and/or the rates at which they may spread (Barros et al. 2013).

The Safety Element establishes goals, policies, and programs to reduce the threat to life, structures, and the environment caused by fire. Policy S-13 identifies that new development should be carefully located, with special attention given to fuel management in higher fire risk areas, and that new development in fire hazard areas should be configured to minimize the potential for added danger. Implementation strategies for this policy include identifying high risk areas, developing and implementing mitigation efforts to reduce the threat of fire, requiring fire resistant material be used for building construction in fire hazard areas, and encouraging applicants applying for subdivisions in fire hazard areas to cluster development to allow for a wildfire protection zone.

The California Fire Code provides minimum standards for many aspects of fire prevention and suppression activities. These standards include provisions for emergency vehicle access, water supply, fire protection systems, and the use of fire-resistant building materials.

The County EOP outlines the emergency measures that are essential for protecting public health and safety. These measures include, but are not limited to, public alert and notifications, emergency public information, and protective actions. The EOP also addresses policy and coordination related to emergency management.

Discussion

(a) *Substantially impair an adopted emergency response plan or emergency evacuation plan?*

The project does not require any road closures and would be designed to accommodate emergency vehicle access. Implementation of the proposed project would not have a permanent impact on any adopted emergency response plans or emergency evacuation plans. Temporary construction activities and staging would not substantially alter existing circulation patterns or trips. Access to adjacent areas would be maintained throughout the duration of the project.

Based on the County's Land Use View tool and Dam and Levee Failure Plan, the project is not located within an area that would be inundated in the event of a dam failure. The project would not impair implementation or physically interfere with County hazard mitigation or emergency plans; therefore, no impacts related to emergency plans would occur.

Therefore, the project would not substantially impair an adopted emergency response plan or emergency evacuation plan. Potential impacts would be *less than significant*.

Initial Study – Environmental Checklist

- (b) *Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire?*

The residence and ag. accessory building would be located on flat land. Winds in the area vary from 6-8 miles per hour and primarily come from the north and west. As described in Section 6, Geology and Soils, the potential for landslides in the project area is low, and the project is not proposing disturbance in areas of steep slopes that would be conducive to the formation of debris flows in the nearby existing channels.

The site is located within a State Responsibility Area and based on the County's fire response time map, it would take approximately 5 -10 minutes to respond to a call regarding fire or life safety. The project would be designed to comply with all fire safety rules and regulations, including the California Fire Code and Public Resources Code, which includes improvements to the site to accommodate emergency vehicle access, vegetation clearing or trimming, and installation of a water storage tank for fire protection. The project will be conditioned to comply with all applicable fire protection standards as determined by CAL FIRE, including, but not limited to, preparation of a fire safety plan and the applicant will be required to comply with the requirements of the plan for the life of the project. Compliance with the Uniform Fire Code and the recommendations of CalFIRE will ensure that potential impacts associated with slope, prevailing winds, and other factors will be *less than significant*.

Therefore, potential impacts would be *less than significant*.

- (c) *Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment?*

The project would be designed to comply with all fire safety rules and regulations, including the California Fire Code and Public Resources Code, which includes construction of an access road/driveway to accommodate emergency vehicle access, vegetation clearing or trimming around all proposed structures, and installation of water storage for fire protection. These infrastructure improvements would reduce fire risk. Therefore, potential impacts would be *less than significant*.

- (d) *Expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes?*

The residence and ag. accessory structure would be located on flat land. Winds in the area vary from 6-8 miles per hour and primarily come from the north and west. As described in Section VI., Geology and Soils, the potential for landslides in the project area is low, and the project is not proposing disturbance in areas of steep slopes that would be conducive to the formation of debris flows in nearby existing channels. The project includes the construction of a primary and secondary residence and barn and other design elements that would not expose people or structures to significant risks such as downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes. Therefore, impacts would be *less than significant*.

Conclusion

As conditioned, the project would not expose people or structures to new or exacerbated wildfire risks and would not require the development of new or expanded infrastructure or maintenance to reduce wildfire risks. Therefore, potential impacts associated with wildfire would be less than significant and no mitigation measures are necessary.

Initial Study – Environmental Checklist

Mitigation

None are required.

Sources

Provided in Exhibit A.

Initial Study – Environmental Checklist

XXI. MANDATORY FINDINGS OF SIGNIFICANCE

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporated	Less Than Significant Impact	No Impact
(a) Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
(b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
(c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Discussion

- (a) *Does the project have the potential to substantially degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?*

As discussed in each resource section above, upon implementation of identified mitigation measures, the proposed project would not result in significant impacts to biological or cultural resources and would not substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal, or

Initial Study – Environmental Checklist

eliminate important examples of the major periods of California history or prehistory. Therefore, impacts would be *less than significant with mitigation incorporated*.

- (b) *Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?*

The State CEQA Guidelines define cumulative impacts as "two or more individual effects that, when considered together, are considerable or which compound or increase other environmental impacts." Section 15355 of the State CEQA Guidelines further states that individual effects can be various changes related to a single project or the change involved in a number of other closely related past, present, and reasonably foreseeable future projects. The State CEQA Guidelines state that the discussion of cumulative impacts should reflect the severity of the impacts as well as the likelihood of their occurrence. However, the discussion need not be as detailed as the discussion of environmental impacts attributable to the project alone. Furthermore, the discussion should remain practical and reasonable in considering other projects and related cumulatively considerable impacts.

Aesthetics

The analysis provided in Section I., Aesthetics, concludes that the project will result in development that is consistent with the type, scale, character and location of surrounding properties and areas visible from public vantages. Project impacts, when combined with additional development and activities likely to occur on surrounding properties within the viewshed are considered *less than cumulatively considerable*.

Agriculture and Forestry Resources

The analysis provided in Section II, Agriculture and Forestry Resources, indicates that the project would have a less than significant impact on important farmland and would not result in the conversion of surrounding farmland to another use. In addition, no potential impacts to forest land or timberland would occur. The project would not result in a conflict with existing zoning for agricultural use or with the existing Williamson Act contract. Therefore, when considered with the potential impacts of other reasonably foreseeable development, the contribution of the project's potential impacts to agriculture and forestry resources is considered *less than cumulatively considerable*.

Air Quality

The analysis provided in Section III, Air Quality, concludes that the project's potential construction-related emissions would not exceed SLOAPCD thresholds of significance for construction emissions. However, construction related emissions could adversely impact sensitive receptors on the surrounding parcels. With implementation of recommended mitigation measures AQ-1 and AQ-2, project construction, operational, and cumulative impacts would be *less than cumulatively considerable with mitigation*.

Biological Resources

The analysis provided in Section IV, Biological Resources, concludes that the project would have a less-than-significant impact upon implementation of the identified avoidance and mitigation measures for special-status wildlife species and their habitats. With implementation of measures BIO-1 through BIO-11 potential impacts to biological resources would be less than significant.

Initial Study – Environmental Checklist

Based on the mitigation measures identified to reduce potential project impacts, when considered with the potential impacts of other reasonably foreseeable development in the area, project impacts associated with biological resources would be *less than cumulatively considerable with mitigation*.

Cultural Resources

The analysis provided in Section V. Cultural Resources concludes that project development would not result in significant impacts to cultural resources and project related impacts are considered less than significant.

Therefore, when considered with the potential impacts of other reasonably foreseeable development in the area, project impacts associated with cultural resources would be *less than cumulatively considerable*.

Energy

The analysis provided in Section VI. Energy concludes that the project's contribution to the overall increased demand for electricity and natural gas would not have the potential to result in potentially cumulatively considerable environmental impacts the wasteful, inefficient and unnecessary use of energy because the residence would be required to comply with relevant building codes relating to energy conservation. Therefore, the project's environmental impacts associated with energy use would be *less than cumulatively considerable*.

Geology and Soils

As discussed in Section VII. Geology and Soils, the project is not located within an Alquist-Priolo Fault Hazard Zone and would be required to comply with the CBC and other applicable standards to ensure the effects of ground instability or a potential seismic event would be minimized through compliance with current engineering practices and techniques. Therefore, project related impacts to soils and geologic resources is considered *less than cumulatively considerable*. Based on the underlying geologic formation, the project's potential impacts to previously unknown paleontological resources would be *less than significant* and *less than cumulatively considerable*.

Greenhouse Gas Emissions

As discussed in Section VI, Energy, the project is estimated to generate approximately 4.2 metric tons of CO₂. As stated in Section VIII., a project estimated to generate less than 690 MMTCO₂e GHG is assumed to have a less than significant adverse impact that is not cumulatively considerable and consistent with the GHG reduction objectives of AB32 and SB32.

Therefore, cumulative impacts associated with GHG emissions would be *less than cumulatively considerable*.

Hazards and Hazardous Materials

As discussed in Section IX. Hazards and Hazardous Materials, construction activities may include the use of hazardous materials that could result in potential hazards through routine transport, use, and disposal as well as under upset or accident conditions. Mitigation measures HAZ-1 and HAZ-2 have been identified to reduce potential impacts by restricting the location of equipment maintenance, refueling and other potentially hazardous activities, and identifying the appropriate response protocol for immediate cleanup of any spills.

Project impacts associated with hazards and hazardous materials would be *less than cumulatively considerable with mitigation*.

Initial Study – Environmental Checklist

Hydrology and Water Quality

As discussed in Section X. Hydrology and Water Quality, project new water demand is estimated to be 0.81 AFY and will be offset at a 2:1 ratio as required by LUO Section 22.94.025. Therefore, project impacts are considered *less than cumulatively considerable*.

Noise

As discussed in Section XIII, Noise, project related noise associated with construction activities and outdoor cultivation would be less than significant.

Therefore, when considered with the potential impacts of other reasonably foreseeable development, the contribution of the subject project to potential noise impacts is considered *less than cumulatively considerable*.

Population and Housing

The most recent projection of regional growth for San Luis Obispo County is the 2050 Regional Growth Forecast (RGF) for San Luis Obispo County, prepared and adopted by SLOCOG in 2017. Using the Medium Scenario, the total county population, housing, and employment for both incorporated and unincorporated areas is projected to increase at an average annual rate of 0.50% per year. Between 2015 and 2050, the County's population is projected to increase by 44,000, or about 1,260 residents per year. Within the unincorporated area, the population is expected to increase by about 19,500 residents, or about 557 per year. Employment is expected to increase by about 6,441, or about 184 per year.

The project could be expected to be occupied by about three residents. Therefore, when considered with the potential impacts of other reasonably foreseeable development in the unincorporated county, the contribution of the subject project to impacts related to housing and population is considered *less than cumulatively considerable*.

Public Services

The project would be subject to adopted public facility (County) and school (CGC Section 65995 et seq.) fee programs to offset impacts to public services. Therefore, when considered with the potential impacts of other reasonably foreseeable projects, the contribution of the subject project to potential public services impacts would be less than cumulatively considerable.

Transportation

As discussed in Section XVII, Transportation, the project would not result in a conflict with a plan or policy addressing the circulation system or increase hazards due to a geometric design feature. Therefore, the project's potential traffic impacts would be *less than cumulatively considerable*.

County Fire/CAL FIRE requirements will be enforced as conditions of approval.

The County has not yet identified an appropriate model or method to estimate VMT for proposed land use development projects. State CEQA Guidelines Section 15064.3(b) states that if existing models or methods are not available to estimate the VMT for the particular project being considered, a lead agency may analyze the project's VMT qualitatively.

The most recent estimate of total VMT for the county is from 2013, at which time total VMT per day was estimated to be 7,862,000 VMT. Assuming a 1% annual growth in VMT during the intervening 6 years, the current daily total is estimated to be around 8,333,720 VMT. Accordingly, the VMT associated with other development throughout the county is estimated to result in a marginal

Initial Study – Environmental Checklist

increase in the total county VMT. The marginal increase in VMT is not expected to result in a reduction of the level of service on county streets and intersections.

Moreover, each new project will be required to mitigate the project-specific impacts to the transportation network. Such mitigation may include, but is not limited to, the installation of roadway and intersection improvements necessary to serve the project and the payment of applicable road improvement fees. Therefore, when considered with the potential impacts of other reasonably foreseeable development, the contribution of the subject project to roadway impacts would be *less than cumulatively considerable*.

Other Impact Issue Areas

Based on the project's less-than-significant impacts and the discretionary review of all surrounding reasonably foreseeable future development, the project's potential impacts associated with the following issue areas would be *less than cumulatively considerable*:

- Land Use Planning;
- Mineral Resources;
- Recreation;
- Tribal Cultural Resources;
- Utilities and Service Systems; and
- Wildfire.

- (c) *Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?*

Environmental impacts that may have an adverse effect on human beings, either directly or indirectly, are analyzed in each environmental resource section above. In addition, implementation of mitigation measures AQ-1 and AQ-2, HAZ-1 and HAZ-2, and identified in the resource sections above would reduce potential adverse effects on human beings to less than significant; therefore, impacts would be *less than significant with mitigation*.

Conclusion

Potential impacts would be less than significant upon implementation of mitigation measures identified in the resource sections above.

Initial Study – Environmental Checklist

Exhibit B - Mitigation Summary Table

Per Public Resources Code Section 21081.6, the following measures also constitute the mitigation monitoring and/or reporting program that would reduce potentially significant impacts to less than significant levels. These measures would become conditions of approval (COAs) should the project be approved. The Lead Agency (County) or other Responsible Agencies, as specified in the following measures, are responsible for verifying compliance with these COAs.

Air Quality

AQ-1 Fugitive Dust Construction Control Measures. Prior to issuance of construction permits, the following measures shall be incorporated into the construction phase of the project and shown on all applicable plans:

1. Reduce the amount of the disturbed area where possible;
2. Use water trucks or sprinkler systems in sufficient quantities to prevent airborne dust from leaving the site. Increased watering frequency would be required whenever wind speeds exceed 15 miles per hour. Reclaimed (non-potable) water should be used whenever possible;
3. All dirt stock-pile areas shall be sprayed daily as needed;
4. All roadways, driveways, sidewalks, etc. to be paved shall be completed as soon as possible, and building pads shall be laid as soon as possible after grading unless seeding or soil binders are used;
5. All of these fugitive dust mitigation measures shall be shown on grading and building plans; and
6. The contractor or builder shall designate a person or persons to monitor the fugitive dust emissions and enhance the implementation of the measures as necessary to minimize dust complaints, reduce visible emissions below 20% opacity, and to prevent transport of dust offsite. Their duties shall include holidays and weekend periods when work may not be in progress.

AQ-2 ROG, NO_x, DPM Emissions. The following measures based on the SLOAPCD standard mitigation measures for construction equipment for reducing nitrogen oxides (NO_x), reactive organic gases (ROG), and diesel particulate matter (DPM) emissions from construction equipment shall be implemented to reduce exposure of sensitive receptors to substantial pollutant concentrations. These measures shall be shown on grading and building plans:

- a. Implement Mitigation Measure AQ-1, as identified above.
- b. On-road diesel vehicles shall comply with Section 2485 of Title 13 of the California Code of Regulations. This regulation limits idling from diesel-fueled commercial motor vehicles with gross vehicular weight ratings of more than 10,000 pounds and licensed for operation on highways. It applies to California and non-California based vehicles. In general, the regulation specifies that drivers of said vehicles:
 - i. Shall not idle the vehicle's primary diesel engine for greater than 5 minutes at any location, except as noted in Subsection (d) of the regulation; and,
 - ii. Shall not operate a diesel-fueled auxiliary power system to power a heater, air conditioner, or any ancillary equipment on that vehicle during sleeping or resting in a

Initial Study – Environmental Checklist

sleeper berth for greater than 5.0 minutes at any location when within 1,000 feet of a restricted area, except as noted in Subsection (d) of the regulation.

- c. Maintain all construction equipment in proper tune according to manufacturer's specifications.
- d. Fuel all off-road and portable diesel-powered equipment with ARB certified motor vehicle diesel fuel (non-taxed version suitable for use off-road).
- e. Use diesel construction equipment meeting ARB's Tier 2 certified engines or cleaner off-road heavy-duty diesel engines and comply with the State Off-Road Regulation.
- f. Idling of all on and off-road diesel-fueled vehicles shall not be permitted when not in use. Signs shall be posted in the designated queuing areas and or job site to remind drivers and operators of the no idling limitation.
- g. Electrify equipment when possible.
- h. Substitute gasoline-powered in place of diesel-powered equipment, when available. and,
- i. Use alternatively fueled construction equipment on-site when available, such as compressed natural gas (CNG), liquefied natural gas (LNG), propane or biodiesel.

Biological Resources

BIO-1 Prior to issuance of grading and/or construction permits, the applicant shall provide evidence that they have retained a qualified biologist acceptable to the County Department of Planning and Building to perform the training and monitoring activities described in the adopted mitigation measures for biological resources.

BIO-2 Environmental Awareness Training – Prior to major construction activities (e.g., site mobilization, clearing, grubbing, preparation for installing new facilities, etc.), an environmental awareness training shall be presented to all project personnel by a qualified biologist prior to the start of any project activities. The training shall include color photographs and a description of the ecology of all special-status species known or determined to have potential to occur, as well as other sensitive resources requiring avoidance near project impact areas. The training shall also include a description of protection measures required by the project's discretionary permits, an overview of the federal Endangered Species Act, the California Endangered Species Act, and implications of noncompliance with these regulations, as well as an overview of the required avoidance and minimization measures. A sign-in sheet with the name and signature of the qualified biologist who presented the training and the names and signatures of the trainees will be kept and provided to the County of San Luis Obispo (County). If new project personnel join the project after the initial training period, they will receive the environmental awareness training from a designated crew member on site before beginning work. A qualified biologist will provide refresher trainings during site visits or other monitoring events.

BIO-3 Prior to issuance of grading and/or construction permits, all SJKF protection measures required before construction (prior to any project activities) and during construction shall be included as a note on all project plans.

Initial Study – Environmental Checklist

BIO-4 San Joaquin Kit Fox (*Vulpes macrotis mutica*; SJKF) Habitat Mitigation Measures - Prior to issuance of grading and/or construction permits, the applicant shall submit evidence to the County and CDFW that one or a combination of the following three SJKF mitigation measures for loss of SJKF habitat has been implemented:

- d. Habitat Set Aside. Provide for the protection in perpetuity, through acquisition of fee or a conservation easement of [insert area of project impact] of suitable habitat in the kit fox corridor area (e.g. within the San Luis Obispo County kit fox habitat area), either on site or off site, and provide for a non-wasting endowment to provide for management and monitoring of the property in perpetuity. Lands to be conserved shall be subject to the review and approval of CDFW and the County.

Mitigation alternative (a.) requires that all aspects of this program be in place before County permit issuance or initiation of any ground-disturbing activities.

- e. In Lieu Fee. Deposit funds into an approved in-lieu fee program, which would provide for the protection in perpetuity of suitable habitat in the kit fox corridor area within San Luis Obispo County and provide for a non-wasting endowment for management and monitoring of the property in perpetuity.

Mitigation alternative (b.) can be completed by providing funds to The Nature Conservancy (TNC) pursuant to the Voluntary Fee-Based Compensatory Mitigation Program (Program). The Program was established in agreement between CDFW and TNC to preserve SJKF habitat, and to provide a voluntary mitigation alternative to project proponents who must mitigate the impacts of projects in accordance with the CEQA. This fee is calculated based on the current cost-per-unit of \$2,500 per acre of mitigation, which is scheduled to be adjusted to address the increasing cost of property in San Luis Obispo County; the actual cost may increase depending on the timing of payment. This fee must be paid after CDFW provides written notification about mitigation options but prior to County permit issuance and initiation of any ground disturbing activities. The fee, payable to "The Nature Conservancy", would total \$7,500 based on \$2,500 per acre 1.0 acres impacted * 3:1* \$2,500 per acre).

- f. Purchase Mitigation Credits. Purchase 3.0 credits in a CDFW-approved conservation bank, which would provide for the protection in perpetuity of suitable habitat within the kit fox corridor area and provide for a non-wasting endowment for management and monitoring of the property in perpetuity.

Mitigation alternative (c.) can be completed by purchasing credits from the Palo Prieto Conservation Bank. The Palo Prieto Conservation Bank was established to preserve SJKF habitat, and to provide a voluntary mitigation alternative to project proponents who must mitigate the impacts of projects in accordance with CEQA. The cost for purchasing credits is payable to the owners of The Palo Prieto Conservation Bank and would total \$7,500 (1.0 acres impacted * 3:1 * \$2,500 per acre). This fee is calculated based on the current cost-per-credit of \$2,500 per acre of mitigation. The fee is established by the conservation bank owner and may change at any time. The actual cost may increase depending on the timing of payment. Purchase of credits must be completed prior to County permit issuance and initiation of any ground-disturbing activities.

BIO-5 Pre-construction survey for SJKF. A qualified biologist shall complete a pre-construction survey for SJKF no less than 14 days and no more than 30 days prior to the start of initial project activities to

Initial Study – Environmental Checklist

ensure SJKF is not present within all proposed work areas and at least a 200-foot buffer around work areas per USFWS Standard Recommendations (2011). The biologist will survey for sign of SJKF and known or potential SJKF dens. The result of the survey shall be submitted to the County within 5 days of the survey and prior to the start of initial project activities. The submittal shall include the date the survey was conducted, survey method, and survey results, including a map of the location of any SJKF sign, and/or known or potential SJKF dens, if present. If no SJKF sign, potential or known SJKF dens are identified, then the SJKF Standard Protection Avoidance and Protection Measure shall be applied.

- If the qualified biologist identifies potential SJKF den(s), the den(s) will be monitored for 3 consecutive nights with an infra-red camera, prior to any project activities, to determine if the den is being used by SJKF. If no SJKF activity is observed during the 3 consecutive nights of camera placement, then project work can begin with the Standard SJKF Avoidance and Protection Measures and the SJKF Protection Measures if SJKF are observed.
- If a known den is identified within 200-feet of any proposed project work areas, no work may start in that area.

If 30 days lapse between different phases of project activities (e.g., vegetation trimming and the start of grading), where no or minimal work activity occurs, the SJKF survey shall be updated.

BIO-6 Standard SJKF Avoidance and Protection Measures

- If a SJKF is discovered at any time to be occupying an area within the project boundaries, all work must stop. The County will be notified, and they will consult with other agencies as needed.
- A maximum of 25 mph speed limit shall be required at the project site during project activities. Speed limit signs shall be installed on the project site prior to the start of all work.
- All project activities shall cease at dusk and not start before dawn. This includes driving on the site for security purposes.
- To prevent entrapment of SJKF and other special-status wildlife, all excavations, steep-walled holes or trenches greater than two feet deep shall be completely covered at the end of each workday by plywood or similar materials, or one or more escape ramps constructed of earth fill or wooden planks shall be installed a minimum of every 200 feet. All escape ramps shall be angled such that wildlife can feasibly use them to climb out of an area. All excavations, holes, and trenches shall be inspected daily for SJKF or other special-status species and immediately prior to being covered or filled. If a SJKF is entrapped, CDFW, USFWS, and the County will be contacted immediately to document the incident and advise on removal of the entrapped SJKF.
- All pipes, culverts, or similar structures with a diameter of 4 inches or greater, stored overnight at the project site shall be thoroughly inspected for sheltering SJKF before burying, capping, or moving. All exposed openings of pipes, culverts, or similar structures shall be capped or temporarily sealed prior to the end of each working day. No pipes, culverts, similar structures, or materials stored on site shall be moved if there is a SJKF present within or under the material. A 50-foot exclusion buffer will be established around the location of the SJKF until it leaves. The SJKF shall be allowed to leave on its own before the material is moved.

Initial Study – Environmental Checklist

- All food-related trash items such as wrappers, cans, bottles, and food scraps shall be disposed of in animal-proof closed containers only and regularly removed from the site.
- No deliberate feeding of wildlife shall be allowed.
- Water sources shall be managed to ensure no leaks occur or are fixed immediately upon discovery in order to prevent SJKF from being drawn to the project area to drink water.
- Trash will be disposed of into containers rather than stockpiling on site prior to removal.
- Materials or other stockpiles will be managed in a manner that will prevent SJKF from inhabiting them. Any materials or stockpiles that may have had SJKF take up residence shall be surveyed (consistent with pre-construction survey requirements) by a qualified biologist before they are moved.
- The use of pesticides or herbicides shall be in compliance with all local, state, and federal regulations so as to avoid primary or secondary poisoning of endangered species and the depletion of prey upon which SJKF depend.
- Permanent fences shall allow for SJKF passage through or underneath by providing frequent openings (8-inch x 12-inch) or an approximately 4-inch or greater passage gap between the ground and the bottom of the fence. Any fencing constructed after issuance of a final permit shall follow the above guidelines.
- During project activities and/or the operation phase, any contractor or employee that inadvertently kills or injures a SJKF or who finds any such animal either dead, injured, or entrapped shall be required to report the incident immediately to the applicant and County. In the event that any observations are made of injured or dead SJKF, the applicant shall immediately notify the USFWS, CDFW, and the County by telephone. In addition, formal notification shall be provided in writing within 3 working days of the finding of any such animal(s). Notification shall include the date, time, location, and circumstances of the incident.
- If potential SJKF dens are identified on site during the pre-construction survey, a qualified biologist shall be on site immediately prior to the initiation of project activities to inspect the site and dens for SJKF activity. If a potential den appears to be active or there is sign of SJKF activity on site and within the above-recommended buffers, no work can begin.
- A qualified biologist shall conduct weekly site visits during site-disturbance activities (e.g., clearing, grading, disking, excavation, stock piling of dirt or gravel, etc.) that proceed longer than 14 days, to check the site for special-status species. Site-disturbance activities lasting up to 14 days do not require weekly monitoring by a biologist unless a potential SJKF den was identified on-site, or the qualified biologist recommends monitoring for other sensitive species protection. When weekly monitoring is required, the biologist shall submit weekly monitoring reports to the County.

BIO-7 Site Maintenance and General Operations - The following measures are required to minimize impacts during active construction and ongoing operations. All measures applicable during construction shall be included on the plans. All measures applicable to operation shall be clearly posted on-site in a location(s) visible to workers and anyone visiting the site:

Initial Study – Environmental Checklist

- The use of heavy equipment and vehicles shall be limited to the proposed project limits and defined staging areas/access points. The boundaries of each work area shall be clearly defined and marked with high visibility fencing (e.g., t-posts and yellow rope) and/or flagging. No work or travel shall occur outside these limits.
- Project plans, drawings, and specifications shall show the boundaries of all work areas on site and the location of erosion and sediment controls, limit delineation, and other pertinent measures to ensure the protection of sensitive habitat areas and associated resources.
- Staging of equipment and materials shall occur in designated areas at least 100 feet from aquatic habitat (e.g., swales, drainages, ponds, vernal pools, if identified on site).
- Secondary containment such as drip pans shall be used to prevent leaks and spills of potential contaminants.
- Washing of concrete, paint, equipment, and refueling and maintenance of equipment shall occur only in designated areas. Sandbags and/or absorbent pads shall be available to prevent water and/or spilled fuel from leaving the site.
- Equipment shall be inspected by the operator daily to ensure that equipment is in good working order and no fuel or lubricant leaks are present.

BIO-8 Noxious Weed Species. To prevent the potential spread of invasive botanical species identified within the Project site, all vehicles and equipment used at the site shall be cleaned of all dirt, mud, and plant debris prior to entering or exiting the site (e.g., driven over rumble strips) to prevent tracking of potential seed stock to or from the property. Rumble strips will also be regularly cleaned and maintained to prevent the accumulation of non-native seed stock.

BIO-9 Pre-construction Survey for Sensitive and Nesting Birds. If work is planned to occur between February 1 and September 15, a qualified biologist shall survey the area for nesting birds within one week prior to initial project activity beginning, including ground disturbance and/or vegetation removal/trimming. If nesting birds are located on or near the proposed project site, they shall be avoided until they have successfully fledged, or the nest is no longer deemed active.

- A 50-foot exclusion zone shall be placed around non-listed, passerine species, and a 250-foot exclusion zone will be implemented for raptor species. Each exclusion zone shall encircle the nest and have a radius of 50 feet (non-listed passerine species) or 250 feet (raptor species). All project activities, including foot and vehicle traffic and storage of supplies and equipment, are prohibited inside exclusion zones. Exclusion zones shall be maintained until all project-related disturbances have been terminated, or it has been determined by a qualified biologist that the young have fledged or that proposed project activities would not cause adverse impacts to the nest, adults, eggs, or young.
- If special-status avian species (aside from the burrowing owl or tricolored blackbird [if identified in biological report]) are identified and nesting within the work area, no work will begin until an appropriate exclusion zone is determined in consultation with the County and any relevant resource agencies.
- The results of the survey shall be provided to the County prior to initial project activities. The results shall detail appropriate fencing or flagging of exclusion zones and include

Initial Study – Environmental Checklist

recommendations for additional monitoring requirements. A map of the project site and nest locations shall be included with the results. The qualified biologist conducting the nesting survey shall have the authority to reduce or increase the recommended exclusion zone depending on site conditions and species (if non-listed).

If two weeks lapse between different phases of project activities (e.g., vegetation trimming and the start of grading), during which no or minimal work activity occurs, the nesting bird survey shall be repeated.

BIO-10 Crotch's Bumblebee Survey and Minimization Measures. Within 30 days prior to initiation of ground disturbance between March and September, the Project footprint will be surveyed for Crotch's bumble bee using a photograph survey methodology. The site will be slowly walked by two biologists equipped with >8-megapixel point and shoot or DSLR cameras using transects to obtain 100% coverage of the project site. All insects observed during the survey will be photographed with attention to family Apidae (bees). All bees observed will be photographed to the greatest extent feasible without handling. Photographs should clearly show the entire top side of the abdomen, the side of the thorax/abdomen and the face/head. Several photos should be taken of each specimen to obtain an identification. If a bee is observed entering a burrow or other cavity, a GPS point should be recorded and attention should be focused on the cavity to determine if multiple individuals may be entering/exiting, indicating the potential presence of a colony. Biologists will submit photos to Bumble Bee Watch (www.bumblebeewatch.org), BeeSpotter (<https://beespotter.org>), or a similar website that employs bumble bee experts to verify the identifications. Qualified scientific experts may also be used to verify photographic records. CDFW will be notified as soon as possible if a *B. crotchii* observation is verified. If a *B. crotchii* colony is detected on the Project site, the colony will be mapped and avoided. No vegetation or soil disturbance will be permitted within a 50-foot radius of the colony. If avoidance is infeasible, CDFW will be consulted regarding potential conservation measures.

BIO-11 Lighting. Any temporary construction lighting or permanent lighting introduced for the Project shall avoid nighttime illumination of potentially suitable habitat features for special-status species (i.e., off-site adjacent grasslands). Temporary construction lighting will be kept to the minimum amount necessary and shall be directed toward active work areas and away from open spaces and/or drainages. To minimize the effects of future exterior lighting on special-status wildlife species, all outdoor lighting fixtures shall be positioned and/or shielded to avoid direct lighting of off-site natural or semi-natural habitat areas.

Hazards and Hazardous Materials

- HAZ-1 Equipment Maintenance and Refueling.** During all construction activities, the cleaning, refueling, and maintenance of equipment and vehicles shall occur only within designated staging areas. The staging areas shall conform to all Best Management Practices applicable to attaining zero discharge of stormwater runoff. At a minimum, all equipment and vehicles shall be checked and maintained on a daily basis to ensure proper operation and to avoid potential leaks or spills.
- HAZ-2 Spill Response Protocol.** During all construction activities, all project-related spills of hazardous materials shall be cleaned up immediately. Appropriate spill prevention and cleanup materials shall be onsite at all times during construction.
