Subject: 4590 Patrick Henry Drive  
Santa Clara, California

## PHASE II ENVIRONMENTAL SITE ASSESSMENT

Dear Mr. Park:

We are pleased to submit the findings of our phase II environmental site assessment at the subject property (Property) in Santa Clara, California.

### SITE BACKGROUND

The Property is approximately 2.8 acres in area and is identified as Assessor's Parcel Number (APN) 104-04-123 (Figure 1). The Property is currently occupied by a single-story commercial structure, along with associated parking and landscaping. The building on the Property was constructed in 1990 and was previously occupied by California Eastern Laboratories (CEL), the original tenant, and Benvenue Medical, Inc. (Benvenue). CEL used the building for offices and research and development of circuit board prototypes. The building is currently vacant. A phase II environmental site assessment (ESA) was conducted at the Property to evaluate potential impacts resulting from past on-site and off-site activities.

We understand that the proposed development on the Property consists of an eight-story multi-family residential building with approximately 284 units. The building's first three levels will consist of above-grade parking.

### SCOPE OF ENVIRONMENTAL FIELD EXPLORATION

Field activities were conducted on September 22, 2022. Prior to exploration, an ENGEO representative visited the Property to mark/locate the sample locations and contacted USA North Service Alert to facilitate the notification of operators of utilities at or near the Property. ENGEO also retained a private utility locator to clear exploratory sampling locations of potential subsurface utilities. ENGEO retained Penecore Drilling of Woodland, California, a C-57 licensed drilling contractor, to advance the soil, groundwater, and soil gas borings at the Property. Sample locations are presented in Figure 2.

### Soil Sampling

As requested, soil samples were collected from two borings (S-1 and S-2) from the southern portion of the Property, planned to be a future City park. Soil samples were collected from each of the borings at depths of 0 to 6 inches and 18 to 24 inches below ground surface (bgs) in order to characterize the near-surface soil.

Soil samples were retrieved within Geoprobe® acetate core liners. New, one-time-use acetate sleeves were used at each sampling location to prevent cross contamination. Soil samples were collected for laboratory analysis by cutting 6-inch portions of the Geoprobe® soil core liners corresponding to the respective desired sampling depths in each location. Samples were capped with Teflon® sheets. Upon collection of samples, a label was placed on each sample, including a unique sample number and time/date collected. The samples were submitted under documented chain-of-custody to Torrent Laboratory, Inc., a State-accredited laboratory located in Milpitas, California. The soil samples were analyzed for the following analytes.

- Organochlorine pesticides (EPA Method 8081)
- CAM 17 metals (EPA Methods 6010/6020/7471)
- Total petroleum hydrocarbons (TPH) as gasoline (TPH-g) and full-suite volatile organic compounds (VOCs) (EPA Test Method 8260B)
- TPH as diesel (TPH-d) and TPH as motor oil (TPH-mo) (EPA Test Method 8015M)

Borings were grouted upon completion of the sampling.

### **Soil Gas Sampling**

Temporary soil gas probes were installed at Borings SG-1 through SG-4, to a depth of 6 feet bgs. Each probe was placed in the middle of an 18-inch-thick sand layer, with 6 inches of dry granular bentonite over the probe, then grouted with hydrated bentonite to the ground surface. Soil gas probes consisted of a stainless-steel probe tip connected to ¼-inch-diameter Teflon® tubing with a closed T-fitting at the terminal end. Each probe was left to equilibrate for 2 hours prior to sampling.

Sampling was conducted in general accordance with the Department of Toxic Substances Control (DTSC) *Final Advisory: Active Soil Gas Investigations* (July 2015) and the CalEPA/DTSC/SWRCB DRAFT Supplemental Guidance: *Screening and Evaluating Vapor Intrusion* (February 2020). A leak test was conducted prior to purging or sampling. The probe T-fittings were closed, and manifold connections tightened; the purge summa canister was opened. An increase in vacuum of approximately 20 inches of mercury (inHg) was observed in the manifold as measured using the vacuum gauge on the flow regulator, and the purge summa canister was closed. If the vacuum held for 2 minutes, the test passed; if vacuum decreased over this period, fittings were retightened and the test repeated until passed. Prior to sampling, manifolds were assembled and connected to each probe's closed T-fitting. The sample manifolds consisted of a flow regulator set to 200 milliliters per minute (mL/min), connected to a 6-liter purge summa canister and a 1-liter sample summa canister.

A piece of cloth soaked in the leak check compound, 1,1-difluoroethane (1,1-DFA), was then placed on the manifold and covered with a shroud. The purge canister was opened, and three purge volumes of dead space (pore space of sand pack and dry bentonite, plus tubing volume) were removed. After purging, the sample summa canister was opened, and sampling conducted until the sample summa canister registered approximately 5 inHg.

The samples were labeled with a unique sample ID and submitted under documented chain-of-custody to Torrent Laboratory, Inc. The soil gas samples were analyzed as follows.

- VOCs by EPA Test Method TO-15.
- Oxygen (fixed gas analysis) by ASTM Test Method D1946.

Borings were grouted upon completion of the sampling.

### Groundwater Sampling

In addition, grab groundwater samples were collected from two of the borings (GW-1 and GW-2) to characterize groundwater. A bailer was used to collect groundwater samples. Groundwater was encountered at a depth of approximately 10 to 12 feet bgs. The groundwater samples were analyzed for VOCs (EPA Test Method 8260B). Borings were grouted upon completion of the sampling.

### Subsurface Conditions

Soil was logged on boring logs using the Unified Soil Classification System (USCS), presented in Appendix A. Soil was screened with a Mini-RAE photoionization detector (PID) for VOC emissions. The subsurface beneath the pavement/aggregate base primarily consisted of dark grayish brown moist lean clay with organics in the liner. A layer of wet sand was observed beginning around 10 feet to 12 feet bgs, and groundwater was collected at this depth. We reviewed EnviroStor, a website maintained by the State of California Department of Toxic Substances Control, and GeoTracker, a website maintained by the State of California Water Resources Control Board, for nearby facilities with records that include depth-to-groundwater measurements. The following information was obtained regarding local groundwater conditions.

**TABLE 1: Local Groundwater Conditions**

FACILITY	PROXIMITY TO PROPERTY	REPORTED DEPTH TO GROUNDWATER	REPORTED GROUNDWATER FLOW DIRECTION
Exxon #7-9370	0.1 mile west	9-13 feet	North-northeast
Shell – 1101 Lawrence	0.1 mile west	7 to 11 feet	North

### ANALYTICAL RESULTS

#### Soil Analytical Results

Soil sample results were compared to the San Francisco Bay Regional Water Quality Control Board (RWQCB) Environmental Screening Levels (ESLs)<sup>1</sup> for a residential land use.

Various TPH analytes, VOCs, metals, and OCPs were detected in the soil samples above laboratory reporting limits. None of the soil samples exhibited concentrations of exceeding applicable screening levels. The following is a summary of the detected analytes.

<sup>1</sup> Regional Water Quality Control Board (RWQCB); Environmental Screening Levels (ESLs); Direct Exposure Residential Soil (Table S-1); 2019 (Rev. 2).

- All metals were detected at concentrations below the corresponding screening levels, with the exception of arsenic. Arsenic exceeded respective residential screening levels in all of the samples analyzed, but the detected concentrations were below the typical naturally occurring arsenic background level of 11 milligrams per kilogram (mg/kg) for arsenic in the San Francisco Bay Area. Although, below health-based screening levels based on total chromium concentrations, two soil samples exhibited chromium concentrations in excess of 50 mg/kg, which is greater than 10 times the soluble threshold limit concentration (STLC)<sup>2</sup> of 5 milligrams per liter (mg/L). If the soil at these locations is to be excavated and offhauled, solubility testing for chromium should be conducted to determine whether the soil is categorized as California hazardous material.
- TPH-g was not detected in any of the soil samples. TPH-d and TPH-mo were detected below their corresponding residential screening levels.
- Methylene chloride, toluene, and trichloroethylene (TCE) were the VOCs detected in the soil samples, all at concentrations below their corresponding residential screening levels.
- OCPs, including DDE, alpha-chlordane, dieldrin, and gamma-chlordane were detected in the soil samples, all at concentrations below their corresponding residential screening levels.

A summary of the soil analytical results is presented in Table A. The analytical laboratory reports are presented in their entirety in Appendix B.

### Groundwater Analytical Results

Groundwater samples were compared to the RWQCB ESLs based on Maximum Concentration Limit (MCL) Priority<sup>3</sup> and Vapor Intrusion<sup>4</sup> under a residential land use scenario. TCE was the only VOC detected above the laboratory detection limit in one groundwater sample (GW-1) below the corresponding MCL, as well as the vapor intrusion ESL.

A summary of the groundwater analytical results is presented in Table B. The analytical laboratory reports are presented in their entirety in Appendix B.

### Soil Gas Analytical Results

Soil gas results were compared to the RWQCB Subslab/Soil Gas ESLs<sup>5</sup> with an attenuation factor (AF) of 0.03. Three of the four soil gas samples reported exceedances of residential ESLs (using a 0.03 AF) for various VOCs. These exceedances are discussed below.

- Benzene was detected above the residential ESL of 3.2 micrograms per cubic meter ( $\mu\text{g}/\text{m}^3$ ), with a 0.03 AF in soil gas samples SG-2 (9.4  $\mu\text{g}/\text{m}^3$ ) and SG-4 (3.8  $\mu\text{g}/\text{m}^3$ ).

---

<sup>2</sup> Used for California regulated hazardous waste. Source is California Code of Regulations, Title 22, Chapter 11, Article 3. If a substance's total concentration is ten times the STLC value, the Waste Extraction Test (WET) is indicated. If any substance in the waste extract is equal to or greater than the STLC value, it is considered California regulated hazardous waste.

<sup>3</sup> Regional Water Quality Control Board (RWQCB); Environmental Screening Levels (ESLs); Direct Exposure Maximum Concentration Limit (MCL) Priority Groundwater (Table GW-1); 2019 (Rev. 2).

<sup>4</sup> Regional Water Quality Control Board (RWQCB); Environmental Screening Levels (ESLs); Vapor Intrusion Human Health Risk Levels (Table GW-3); 2019 (Rev. 2).

<sup>5</sup> RWQCB Subslab/Soil Gas Vapor Intrusion: Human Health Risk Levels (Table SG-1); Residential; January 2019 (Rev. 1).

- Chloroform, ethylbenzene, tetrachloroethylene (PCE), and naphthalene concentrations exceeded the corresponding residential ESLs, with a 0.03 AF in soil gas Sample SG-1.
- TCE was detected above the residential ESL of 16 µg/m<sup>3</sup>, with a 0.03 AF in Samples SG-2 (280 µg/m<sup>3</sup>), SG-3 (24 µg/m<sup>3</sup>), and SG-4 (48 µg/m<sup>3</sup>).
- Oxygen was detected ranging between 13 percent (in SG-3) and 20 percent (in SG-1) in the samples collected. This represents a potential bioattenuation zone.

A summary of the soil gas analytical results is presented in Table C. The analytical laboratory reports are presented in their entirety in Appendix B.

## DISCUSSION

### Soil Gas Screening Levels

Screening levels for chemicals in soil, groundwater, and soil gas are not intended to establish regulations or restrictions on land use, nor to establish any mitigation or remediation requirements, and “the presence of a chemical at concentrations in excess of a screening does not necessarily indicate adverse effects on human health or the environment, rather that additional evaluation is warranted.”<sup>6</sup> Health and Safety Code Section 57008(a)(3) of SB 32 states the following.

*“A screening number is solely an advisory number, and has no regulatory effect, and is published solely as a reference value that may be used by citizen groups, community organizations, property owners, developers, and local government officials to estimate the degree of effort that may be necessary to remediate a contaminated property. A screening number may not be construed as, and may not serve as, a level that can be used to require an agency to determine that no further action is required or a substitute for the cleanup level that is required to be achieved for a contaminant on a contaminated property.”*

The concern with elevated VOCs in soil gas, with respect to a risk to human health, is if soil gas enters indoor air through vapor intrusion. The screening levels for soil gas are therefore calculated based on a ratio of the acceptable indoor air concentration to the soil gas concentration. This ratio is referred to as an attenuation factor. The indoor air screening levels for select VOCs are shown in Table 1 below and are the same for both the RWQCB and DTSC.

In January 2019, the RWQCB updated its environmental screening levels to use the United States Environmental Protection Agency’s (EPA) generic attenuation factor of 0.03 (or 33)<sup>7</sup>. This dramatically reduced the screening levels for numerous VOCs.

In April 2019, DTSC’s HERO released an update to the Human Health Risk Assessment Note (referred to as HERO Note 3) that recommended using both the tailored attenuation factors included in the 2011 Vapor Intrusion Guidance and the U.S. EPA generic attenuation factor of 0.03. Therefore, this assessment compares the measured soil gas concentrations to screening levels based on the U.S. EPA’s generic attenuation factor of 0.03.

<sup>7</sup> San Francisco Bay Regional Water Quality Control Board Update to Environmental Screening Levels dated January 24, 2019.

**TABLE 2: Indoor Air and Soil Gas Screening Levels**

CHEMICAL	INDOOR AIR (residential) in $\mu\text{g}/\text{m}^3$		SOIL GAS (residential) in $\mu\text{g}/\text{m}^3$
	SF REGIONAL BOARD	DTSC	
Benzene	0.097	0.097	3.2
Trichloroethylene	0.48	0.48	16
Vinyl chloride	0.0095	0.0095	0.32
Chloroform	0.12	0.12	4
Ethylbenzene	1.1	1.1	36.3
Naphthalene	0.083	0.083	2.8

## CONCLUSIONS AND RECOMMENDATIONS

Based on the results, soil does not appear to have been impacted by pesticides, heavy metals, or petroleum hydrocarbons. Although, below health-based screening levels based on total chromium concentrations, two soil samples exhibited chromium concentrations in excess of 50 mg/kg, which is greater than 10 times the STLC of 5 mg/L. If the soil at these locations is to be excavated and offhauled, solubility testing for chromium should be conducted to determine whether the soil is categorized as California hazardous material.

TCE was the only VOC detected above the laboratory detection limit in one groundwater sample (GW-1) below the corresponding MCL, as well as the vapor intrusion ESL. No other VOCs were detected in the grab groundwater samples collected from the Property.

Several VOCs, including benzene, naphthalene, chloroform, ethylbenzene, PCE, and TCE, were detected in the soil gas samples collected from the Property, at concentrations exceeding the corresponding residential ESLs.

With respect to petroleum hydrocarbons, oxygen was detected at concentrations ranging between 13 to 20 percent in the soil gas samples, which suggests a potential bioattenuation zone. As discussed in the OSWER *Technical Guide for Assessing and Mitigating the Vapor Intrusion Pathway from Subsurface Vapor Sources to Indoor Air*<sup>8</sup>, substantial attenuation of petroleum hydrocarbons can occur relatively quickly when oxygen supply from the atmosphere is sufficient.

Based on these factors, it is our opinion that soil gas mitigations should be considered for the proposed development to address potential soil gas impacts.

## LIMITATIONS

We strive to perform our professional services in accordance with generally accepted principles and practices currently employed in the area; there is no warranty, express or implied. This report is based upon field and other conditions discovered at the time of report preparation. We developed our conclusions with limited subsurface exploration data. If unexpected conditions are

encountered, ENGEO must be notified immediately to review these conditions and provide additional and/or modified conclusions, as necessary.

Because prevailing practice and applicable regulatory standards may change over time, our conclusions are limited to the circumstances under which we performed our services. In addition, the samples recovered and tested as part of this assessment are only representative of the noted locations/depths and the analytes tested. It is not possible to eliminate all risks; therefore, we are unable to guarantee or warrant the results of our services.

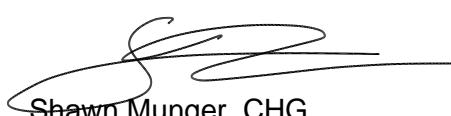

If you have any questions or comments regarding this letter, please call and we will be glad to discuss them with you.

Sincerely,

ENGEO Incorporated

RE: 4590 Patrick Henry Drive

Work Order No.: 2209168

Dear Divya Bhargava:

Torrent Laboratory, Inc. received 6 sample(s) on September 22, 2022 for the analyses presented in the following Report.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.

Torrent Laboratory, Inc. is certified by the State of California, ELAP #1991. If you have any questions regarding these test results, please feel free to contact the Project Management Team at (408)263-5258; ext 204.

A handwritten signature in blue ink that reads "Kathie Evans". The signature is fluid and cursive, with "Kathie" on the left and "Evans" on the right.

**Project:** 4590 Patrick Henry Drive

**Work Order:** 2209168

### CASE NARRATIVE

---

Unless otherwise indicated in the following narrative, no issues encountered with the receiving, preparation, analysis or reporting of the results associated with this work order.

Unless otherwise indicated in the following narrative, no results have been method and/or field blank corrected.

Reported results relate only to the items/samples tested by the laboratory.

This report shall not be reproduced, except in full, without the written approval of Torrent Laboratory, Inc.

Analytical Comment for SW 6010B, Note: The spikes in the MS/MSD for Barium are not recoverable. The sample concentration is greater than 4X the spike concentration. No corrective action is required.

## Laboratory Qualifiers and Definitions

### DEFINITIONS:

<b>Accuracy/Bias (% Recovery)</b> - The closeness of agreement between an observed value and an accepted reference value.
<b>Blank (Method/Preparation Blank)</b> -MB/PB - An analyte-free matrix to which all reagents are added in the same volumes/proportions as used in sample processing. The method blank is used to document contamination resulting from the analytical process.
<b>Duplicate</b> - a field sample and/or laboratory QC sample prepared in duplicate following all of the same processes and procedures used on the original sample (sample duplicate, LCSD, MSD)
<b>Laboratory Control Sample (LCS ad LCSD)</b> - A known matrix spiked with compounds representative of the target analyte(s). This is used to document laboratory performance.
<b>Matrix</b> - the component or substrate that contains the analyte of interest (e.g., - groundwater, sediment, soil, waste water, etc)
<b>Matrix Spike (MS/MSD)</b> - Client sample spiked with identical concentrations of target analyte (s). The spiking occurs prior to the sample preparation and analysis. They are used to document the precision and bias of a method in a given sample matrix.
<b>Method Detection Limit (MDL)</b> - the minimum concentration of a substance that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero
<b>Practical Quantitation Limit/Reporting Limit/Limit of Quantitation (PQL/RL/LOQ)</b> - a laboratory determined value at 2 to 5 times above the MDL that can be reproduced in a manner that results in a 99% confidence level that the result is both accurate and precise. PQLs/RRLs/LODs reflect all preparation factors and/or dilution factors that have been applied to the sample during the preparation and/or analytical processes.
<b>Precision (%RPD)</b> - The agreement among a set of replicate/duplicate measurements without regard to known value of the replicates
<b>Surrogate (S) or (Surr)</b> - An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. Surrogates are used in most organic analysis to demonstrate matrix compatibility with the chosen method of analysis
<b>Tentatively Identified Compound (TIC)</b> - A compound not contained within the analytical calibration standards but present in the GCMS library of defined compounds. When the library is searched for an unknown compound, it can frequently give a tentative identification to the compound based on retention time and primary and secondary ion match. TICs are reported as estimates and are candidates for further investigation.
<b>Units:</b> the unit of measure used to express the reported result - <b>mg/L</b> and <b>mg/Kg</b> (equivalent to PPM - parts per million in <b>liquid</b> and <b>solid</b> ), <b>ug/L</b> and <b>ug/Kg</b> (equivalent to PPB - parts per billion in <b>liquid</b> and <b>solid</b> ), <b>ug/m3</b> , <b>mg/m3</b> , <b>ppbv</b> and <b>ppmv</b> (all units of measure for reporting concentrations in air), % (equivalent to 10000 ppm or 1,000,000 ppb), <b>ug/Wipe</b> (concentration found on the surface of a single Wipe usually taken over a 100cm <sup>2</sup> surface)

### LABORATORY QUALIFIERS

<b>B</b> - Indicates when the analyte is found in the associated method or preparation blank
<b>D</b> - Surrogate is not recoverable due to the necessary dilution of the sample
<b>E</b> - Indicates the reportable value is outside of the calibration range of the instrument but within the linear range of the instrument (unless otherwise noted) Values reported with an E qualifier should be considered as estimated.
<b>H</b> - Indicates that the recommended holding time for the analyte or compound has been exceeded
<b>J</b> - Indicates a value between the method MDL and PQL and that the reported concentration should be considered as estimated rather than quantitative
<b>NA</b> - Not Analyzed
<b>N/A</b> - Not Applicable
<b>ND</b> - Not Detected at a concentration greater than the PQL/RL or, if reported to the MDL, at greater than the MDL.
<b>NR</b> - Not recoverable - a matrix spike concentration is not recoverable due to a concentration within the original sample that is greater than four times the spike concentration added
<b>R</b> - The % RPD between a duplicate set of samples is outside of the absolute values established by laboratory control charts
<b>S</b> - Spike recovery is outside of established method and/or laboratory control limits. Further explanation of the use of this qualifier should be included within a case narrative
<b>X</b> -Used to indicate that a value based on pattern identification is within the pattern range but not typical of the pattern found in standards. Further explanation may or may not be provided within the sample footnote and/or the case narrative.

## Sample Receipt Checklist

Client Name: Engeo Inc (SJ)

Date and Time Received: 9/22/2022 5:30:00PM

Project Name: 4590 Patrick Henry Drive

Received By: Katherene Evans

Work Order No.: 2209168

Physically Logged By: Katherene Evans

Checklist Completed By: Katherene Evans

Carrier Name: Client Drop Off

### Chain of Custody (COC) Information

Chain of custody present? Yes

Chain of custody signed when relinquished and received? Yes

Chain of custody agrees with sample labels? Yes

Custody seals intact on sample bottles? Not Present

### Sample Receipt Information

Custody seals intact on shipping container/cooler? Not Present

Shipping Container/Cooler In Good Condition? Yes

Samples in proper container/bottle? Yes

Samples containers intact? Yes

Sufficient sample volume for indicated test? Yes

### Sample Preservation and Hold Time (HT) Information

All samples received within holding time? Yes

Container/Temp Blank temperature in compliance? No Temperature: 10.0 °C

Water-VOA vials have zero headspace? Yes

Water-pH acceptable upon receipt? N/A

pH Checked by: na pH Adjusted by: na

RE: 4590 Patrick Henry Drive

Work Order No.: 2209173

Dear Divya Bhargava:

Torrent Laboratory, Inc. received 4 sample(s) on September 22, 2022 for the analyses presented in the following Report.

All data for associated QC met EPA or laboratory specification(s) except where noted in the case narrative.

Torrent Laboratory, Inc. is certified by the State of California, ELAP #1991. If you have any questions regarding these test results, please feel free to contact the Project Management Team at (408)263-5258; ext 204.

A handwritten signature in blue ink, appearing to read "Patti L Sandrock".

### CASE NARRATIVE

---

Unless otherwise indicated in the following narrative, no issues encountered with the receiving, preparation, analysis or reporting of the results associated with this work order.

Unless otherwise indicated in the following narrative, no results have been method and/or field blank corrected.

Reported results relate only to the items/samples tested by the laboratory.

This report shall not be reproduced, except in full, without the written approval of Torrent Laboratory, Inc.

Oxygen data for sample 003 could not be reported due to low initial canister pressure of the sample.

Carbon Monoxide	200	500	ND	2500	99.4	85.9	14.3	65 - 135	30	

## Laboratory Qualifiers and Definitions

### DEFINITIONS:

<b>Accuracy/Bias (% Recovery)</b> - The closeness of agreement between an observed value and an accepted reference value.
<b>Blank (Method/Preparation Blank)</b> -MB/PB - An analyte-free matrix to which all reagents are added in the same volumes/proportions as used in sample processing. The method blank is used to document contamination resulting from the analytical process.
<b>Duplicate</b> - a field sample and/or laboratory QC sample prepared in duplicate following all of the same processes and procedures used on the original sample (sample duplicate, LCSD, MSD)
<b>Laboratory Control Sample (LCS ad LCSD)</b> - A known matrix spiked with compounds representative of the target analyte(s). This is used to document laboratory performance.
<b>Matrix</b> - the component or substrate that contains the analyte of interest (e.g., - groundwater, sediment, soil, waste water, etc)
<b>Matrix Spike (MS/MSD)</b> - Client sample spiked with identical concentrations of target analyte (s). The spiking occurs prior to the sample preparation and analysis. They are used to document the precision and bias of a method in a given sample matrix.
<b>Method Detection Limit (MDL)</b> - the minimum concentration of a substance that can be measured and reported with a 99% confidence that the analyte concentration is greater than zero
<b>Practical Quantitation Limit/Reporting Limit/Limit of Quantitation (PQL/RL/LOQ)</b> - a laboratory determined value at 2 to 5 times above the MDL that can be reproduced in a manner that results in a 99% confidence level that the result is both accurate and precise. PQLs/RRLs/LODs reflect all preparation factors and/or dilution factors that have been applied to the sample during the preparation and/or analytical processes.
<b>Precision (%RPD)</b> - The agreement among a set of replicate/duplicate measurements without regard to known value of the replicates
<b>Surrogate (S) or (Surr)</b> - An organic compound which is similar to the target analyte(s) in chemical composition and behavior in the analytical process, but which is not normally found in environmental samples. Surrogates are used in most organic analysis to demonstrate matrix compatibility with the chosen method of analysis
<b>Tentatively Identified Compound (TIC)</b> - A compound not contained within the analytical calibration standards but present in the GCMS library of defined compounds. When the library is searched for an unknown compound, it can frequently give a tentative identification to the compound based on retention time and primary and secondary ion match. TICs are reported as estimates and are candidates for further investigation.
<b>Units:</b> the unit of measure used to express the reported result - <b>mg/L</b> and <b>mg/Kg</b> (equivalent to PPM - parts per million in <b>liquid</b> and <b>solid</b> ), <b>ug/L</b> and <b>ug/Kg</b> (equivalent to PPB - parts per billion in <b>liquid</b> and <b>solid</b> ), <b>ug/m3</b> , <b>mg/m3</b> , <b>ppbv</b> and <b>ppmv</b> (all units of measure for reporting concentrations in air), % (equivalent to 10000 ppm or 1,000,000 ppb), <b>ug/Wipe</b> (concentration found on the surface of a single Wipe usually taken over a 100cm <sup>2</sup> surface)

### LABORATORY QUALIFIERS

<b>B</b> - Indicates when the analyte is found in the associated method or preparation blank
<b>D</b> - Surrogate is not recoverable due to the necessary dilution of the sample
<b>E</b> - Indicates the reportable value is outside of the calibration range of the instrument but within the linear range of the instrument (unless otherwise noted) Values reported with an E qualifier should be considered as estimated.
<b>H</b> - Indicates that the recommended holding time for the analyte or compound has been exceeded
<b>J</b> - Indicates a value between the method MDL and PQL and that the reported concentration should be considered as estimated rather than quantitative
<b>NA</b> - Not Analyzed
<b>N/A</b> - Not Applicable
<b>ND</b> - Not Detected at a concentration greater than the PQL/RL or, if reported to the MDL, at greater than the MDL.
<b>NR</b> - Not recoverable - a matrix spike concentration is not recoverable due to a concentration within the original sample that is greater than four times the spike concentration added
<b>R</b> - The % RPD between a duplicate set of samples is outside of the absolute values established by laboratory control charts
<b>S</b> - Spike recovery is outside of established method and/or laboratory control limits. Further explanation of the use of this qualifier should be included within a case narrative
<b>X</b> -Used to indicate that a value based on pattern identification is within the pattern range but not typical of the pattern found in standards. Further explanation may or may not be provided within the sample footnote and/or the case narrative.

## Sample Receipt Checklist

Client Name: Engeo Inc (SJ)

Date and Time Received: 9/22/2022 5:30:00PM

Project Name: 4590 Patrick Henry Drive

Received By: Katherene Evans

Work Order No.: 2209173

Physically Logged By: Katherene Evans

Checklist Completed By: Katherene Evans

Carrier Name: Client Drop Off

### Chain of Custody (COC) Information

Chain of custody present? Yes

Chain of custody signed when relinquished and received? Yes

Chain of custody agrees with sample labels? Yes

Custody seals intact on sample bottles? Not Present

### Sample Receipt Information

Custody seals intact on shipping container/cooler? Not Present

Shipping Container/Cooler In Good Condition? Yes

Samples in proper container/bottle? Yes

Samples containers intact? Yes

Sufficient sample volume for indicated test? Yes

### Sample Preservation and Hold Time (HT) Information

All samples received within holding time? Yes

Container/Temp Blank temperature in compliance? Temperature: °C

Water-VOA vials have zero headspace? No VOA vials submitted

Water-pH acceptable upon receipt? N/A

pH Checked by: na pH Adjusted by: na

### Comments:

Summas rec'd at ambient temp
